BRAMAH, **JOSEPH**, an English engineer and machinist. See *SUPPLEMENT*.

BRAMANT, a town of Savoy in the valley of Maurich, seated on the river Arck, in E. Long. 4. 15. N. Lat. 45. 0.

BRAMBER, a town of Sussex in England, with 95 inhabitants, though formerly of some account; however, it sends two members to parliament. W. Long. 0. 15. N. Lat. 50. 50.

BRAMBLE, in *Botany*, the English name of the **RUBUS**. See *BOTANY Index*.

BRAMBLE-Net, otherwise called *hallier*, is a net to catch birds in of several sizes: the great meshes must be four inches square; those of the least size are three inches square; and those of the biggest, five. In the depth they should not be above three or four inches; but as for the length, they may be enlarged at pleasure; the shortest being 18 feet long.

BRAMBLE, or *Brambling*, in *Ornithology*, the trivial name of a species of **FRINGILLA**.

BRAMER, **LEONARD**, history-painter, was born at Delft in 1596; but learned the art of painting in the school of Rembrandt, and imitated the manner of his master in small. In the 18th year of his age he went to Rome for his improvement; but although he continued in Italy for some years, and acquired somewhat in his style rather more graceful than Rembrandt, yet he could never divest himself of the Flemish gout. He had a fine taste of design; his expression is generally good, and in some of his compositions truly noble. His pencil is delicate, and his colouring very peculiar in the tints, being also remarkably thin in many parts, so as barely to cover the pannel; yet, by great skill in the management of the chiaro-scuro, his colouring is bright, bold, and full of lustre; particularly in the vases, which he was fond of introducing in every subject that could admit them, as he knew how to give them a rich and fine relief. He had accustomed himself to paint with a very thin body of colour, especially in the browns and shadowy parts, in order to give his pictures a greater transparency. At Venice, Naples, Florence, Mantua, and other cities of Italy, as well as at Rome, he left many proofs of his extraordinary merit, which rendered his name deservedly famous; and his works are rarely to be met with out of Italy, where he painted most; but whenever they are to be purchased they are bought at considerable prices, if they are entire and undamaged. One of the most capital pictures of Bramer is the *Raising of Lazarus*, in which there is a charming opposition of light and shadow; and another is the *Denial of St Peter*: They are both painted in his best manner; they are bright, transparent, and finely penciled, and are still preserved at Rome. Likewise at the palace of Ryswick, there are several valuable paintings by this master; in which the invention and execution are highly commendable. But none of his works can be more admired than a small picture on copper representing the story of Pyramus and Thisbe.

BRAMHALL, **Dr JOHN**, archbishop of Armagh, was born of an ancient family at Pontefract in Yorkshire, about the year 1593. He was invited over to Ireland by the lord deputy Wentworth; and soon after obtained the arch-deaconry of Meath, the best in that kingdom. In 1634, he was made bishop of Londonderry, which see he improved very much; but the greatest service he did to the church of Ireland, was by getting, with the deputy's assistance, several acts passed for abolishing fee-farms, recovering impropriations, &c. by which, and by other means, he regained to the church in the space of four years 30,000l. or 40,000l. a-year. In the convocation he prevailed upon the church of Ireland to unite in the same faith with the church of England, by adopting the 39 articles.

Bramhall,
Bramins.

cles of that church; and would willingly have introduced the English canons, but could only prevail on their accepting such as they deemed proper. Articles of treason were exhibited against him in the Irish parliament; and at the treaty of Uxbridge in 1644, the English parliament made it a preliminary article, that Bishop Bramhall, with Archbishop Laud, and others, should be excepted from the general pardon. He went abroad; but on the restoration was appointed archbishop of Armagh, primate and metropolitan of all Ireland, and was chosen speaker of the house of lords. He died in 1663; and was the author of several works, which are collected in one vol. folio.

BRAMINS, the name of the priests among the idolatrous Indians; the successors of the ancient Brachmans. See the article BRACHMANS.

Their name is formed from *Brama*, their particular deity. They are found in Siam, Malabar, China, Coromandel, and most other eastern nations anywise civilized; but their chief seat is in Indostan*, or the Mogul's country. They have a language peculiar to themselves, which they call *Sanscrit*; in which they have several ancient books, written, as is alleged, by their great prophet Brahma; as the *Shastram*, which is their bible; and *Purane*, a history which they esteem sacred, and pretend to have been dictated by God himself.

There are several orders of Bramins. Those who mix in society are for the most part very corrupt in their morals: they believe that the water of the Ganges will wash away all their crimes; and, as they are not subject to any civil jurisdiction, live without either restraint or virtue, excepting that character of compassion and charity which is so commonly found in the mild climate of India. The others, who live abstracted from the world, are either weak-minded men or enthusiasts; and abandon themselves to laziness, superstition, and the dreams of metaphysica. We find in their disputes the very same ideas that occur in the writings of our most celebrated metaphysicians; such as, substance, accident, priority, posteriority, immutability, indivisibility, &c.

Their religion, which was anciently of the allegorical and moral kind, hath degenerated into a heap of extravagant and obscene superstitions, owing to their having realized those fictions which were intended merely as so many symbols and emblems. Were it possible to obtain a sight of their sacred books, the only remains there are of the Indian antiquities, we might in some measure be enabled to remove the veil that envelopes those numerous mysteries; but the following story will show how little reason there is to hope that we shall ever be intrusted with such a communication.

The emperor Mahmud Akbar had an inclination to make himself acquainted with the principles of all the religious sects throughout his extensive provinces. Having discarded the superstitious notions with which he had been prepossessed by his education in the Mahometan faith, he resolved to judge for himself. It was easy for him to be acquainted with the nature of those systems that are formed upon the plan of making *preclites*; but he found himself disappointed in his design when he came to treat with the Indians, who

will not admit any person whatever to the participation of their mysteries. Neither the authority nor promises of Akbar could prevail with the Bramins to disclose the tenets of their religion; he was therefore obliged to have recourse to artifice. The stratagem he made use of, was to cause a boy, of the name of Feizi, to be committed to the care of these priests, as a poor orphan of the sacerdotal line, who alone could be initiated into the sacred rites of their theology. Feizi, having received the proper instructions for the part he was to act, was conveyed privately to Benares, the seat of knowledge in Indostan; he was received into the house of a learned Bramin, who educated him with the same care as if he had been his own son. After the youth had spent ten years in study, Akbar was desirous of recalling him: but he was struck with the charms of the daughter of his preceptor. The women of the sacerdotal tribe are looked upon as the greatest beauties in Indostan. The old Bramin laid no restraint upon that growing passion of the two lovers: he was fond of Feizi, who had gained his affection by his address and docility; and offered him his daughter in marriage. The young man, divided between love and gratitude, resolved to conceal the fraud no longer; and falling at the feet of the Bramin, discovered the imposture, and asked pardon for his offence. The priest, without reproaching him in the least, seized a poignard, which hung at his girdle, and was going to plunge it in his breast, if Feizi had not prevented him by taking hold of his arm. The young man used every means to pacify him, and declared himself ready to do any thing to expiate his treachery. The Bramin, bursting into tears, promised to pardon him on condition that he should swear never to translate the *Bedas* or sacred volumes, or disclose to any person whatever the symbol of the Bramin creed. Feizi readily promised all that the Bramin required: how far he kept his word is not known; but the sacred books of the Indians have never been translated by him, or any one else, to this day. As the Bramins are the only persons who understand the language of the sacred books, their comments on the text are the same as those that have ever been made on religious books; all the maxims which fancy, interest, passion, or false zeal can suggest, are to be found in these volumes. See the articles SHASTAH and VEDAM.

They own a supreme God, who created Brama, and gave him a power to create the world. They have also their subaltern deities, their pagods or temples, and idols, whom they fan to defend from flies, dancing before them. They also hold a feast in honour of the sun considered as the source of light and heat, whereby all nature is fecundified.

Their pagods or temples consist of three parts. The first is a vaulted roof, supported on stone columns: it lies open, and all persons, without distinction, are allowed to enter into it. It is adorned with symbolical figures made of wood, as elephants, oxen, and horses. The second part is open in the day time, and shut at night. It is filled with grotesque and monstrous figures, as men with many heads and arms. The third, which is a kind of chancel, is kept always shut, with a very strong gate. In this is placed the statue of the deity to whom the pagod is dedicated. A great num-

Bramins.

dostan.Raynal's
Hist. of the
Indies

Bramins
|
Bran.

ber of lamps burn day and night before the idol. The Bramins, before they go into the pagod, pull off their shoes, and leave them at the door.

The Bramins of Siam and Coromandel maintain that the earth will be destroyed by fire; and the former assert that another will arise out of its ashes, in which there shall be no sea, nor any change of seasons, but an eternal spring; and the latter maintain a plurality of worlds, which are alternately destroyed and renewed.

Robert de Nobili, an Italian Jesuit, and one of the Indian missionaries, in the beginning of the 17th century, in order to secure success to his mission, assumed the title and appearance of a Bramin, and at length persuaded the credulous people that he was in reality a member of that venerable order. He forged a deed in the ancient Indian characters, showing that the Bramins of Rome were elder than those of India, and that the Jesuits of Rome descended in a direct line from the god Brama. He farther declared on oath, that he derived his origin from this Indian deity. By this imposture he proselyted twelve eminent Bramins, whose influence proved very favourable to his mission. After his death, the Portuguese Jesuits carried on the imposture with very considerable success. These missions, however, were suspended and abandoned in consequence of a papal mandate, issued out in the year 1744, by Benedict XIV. who declared his disapprobation of the artifices that had been used in the conversion of the Indians. See further under the article OBSERVATORY.

BRAMPOUR, or BRAMPORE, a city of Asia, in Hindostan, and once capital of Candish. It formerly stood on as much ground as London; but it is now greatly decayed, and chiefly inhabited by Baniens. The streets are numerous but narrow, with low thatched houses made of earth, though a few are covered with varnished tiles. In rainy weather many of the streets are overflowed. In the market place is the statue of an elephant in red stone, as big as life. On the other side of the river they have built a new town, which is in a better situation. A great trade is carried on in this town, and throughout all the province, where there is made a prodigious quantity of cotton-cloths, as cotton is in greater plenty here than in any other place of the empire. E. Long. 77. 25. N. Lat. 21. 10.

BRAMPTON, a town of Cumberland in England, seated not far from the Picts wall, and on the river Irthin. It is a very ancient place, and contained 2043 inhabitants in 1811. W. Long. 2. 40. N. Lat. 54. 50.

BRAN, the skins or husks of corn, especially wheat, ground, separated from the flour by a sieve or boulder. It contains, besides, a portion of the farinaceous matter; this is less glutinous than the finer flour, and is supposed to have a detergent quality. Infusions of bran are not unfrequently employed in this intention externally, and sometimes likewise taken inwardly.

Among the ancients bran was used as an erotic, to excite love. Bran boiled purges scurf, dandruff, and cleanses the hands in lieu of soap. The dyers reckon it among the nut-coloured drugs; and use it for making what they call the *sour waters*, with which they prepare their several dyes. Bran is also used as a medicine for horses. See FARRIERY Index.

Branch
|
Branchio-
stegi.

BRANCH, in *Botany*, an arm of a tree, or a part which, sprouting out from the trunk, helps to form the head or crown thereof. Branches do not spring out of the mere surface of the trunk, but are profoundly rooted therein, so as not only to penetrate into the cortical, but also the woody substance, and even the pith. The constituent parts therefore of a *branch* are the same as of the trunk, viz. skin, bark, wood, and pith. See the article PLANTS.

BRANCHES of a Bridle, in the manege, are two pieces of iron bended, which, in the interval between the one and the other, bear the bit-mouth, the cross-chains, and the curb; so that on one end they answer to the head-stall, and on the other to the reins, in order to keep the horse's head in subjection. With regard to their form and structure, branches are either straight, in form of a pistil, for young horses to form their mouth; or after the constable of France's fashion, proper for a horse that carries his head well. Some are in form of a gigot or leg, which will prevent horses from carrying too low: Some are in form of a bent knee, contrived for horses that arm themselves against the operation of the bit; and others after the French fashion, which is hardly above one third of an inch at the seville hole, and kneed $1\frac{1}{2}$ inch at the jarret or ham.

It is to be observed, 1. That the farther the branch is from the horse's neck, the more effect it will have. 2. That short branches, *ceteris paribus*, are ruder, and their effects more sudden, than those of longer. 3. That the branch is to be proportioned to the length of a horse's neck; and one may sooner err in choosing one too short than too long.

BRANCHES of Ogives, in *Architecture*, are the arches of Gothic vaults. These arches, traversing from one angle to another diagonal-wise, form a cross between the other arches, which make the sides of the square, of which the arches are diagonal.

BRANCH-Stand, with falconers, a term used to signify the making a hawk leap from tree to tree, till the dog springs the game.

BRANCHER, among sportsmen, a young hawk, newly taken out of the nest, that can hop from bough to bough.

BRANCHIÆ, or GILLS, in the anatomy of fishes, the parts corresponding to the lungs of land-animals. All fishes, except the cetaceous ones, and the pteromyzum, which have lungs, are furnished with these organs of respiration. See ANATOMY Index.

BRANCHIDÆ, in Grecian antiquity, priests of the temple of Apollo, which was at Didymus in Ionia, a province of Lesser Asia, towards the Ægean sea, upon the frontier of Caria. They opened to Xerxes the temple of Apollo, the riches whereof he took away. After which, thinking it unsafe to stay in Greece, they fled to Sogdiana, on the other side of the Caspian sea, upon the frontiers of Persia, where they built a city called by their own name: but they did not escape the punishment of their crime; for Alexander the Great having conquered Darius king of Persia, and being informed of their treachery, put them all to the sword, and razed their city, thus punishing the impiety of the fathers in their posterity.

BRANCHIOSTEGI, in *Ichthyology*, a term used to express one of the general classes of fishes; the characters of which are, that the rays of the fins are of a bony

Branchio-
stegi
|
Branden-
burg.

bony substance, but these fish have no bones or ossicula at the branchiæ, as the malacopterygious and acanthopterygious fishes all have.

BRANCHON, a town of the Netherlands, in the province of Namur, seated on the river Mehaigne. E. Long. 4. 40. N. Lat. 50. 32.

BRAND SUNDAY, *Dimanche des Brandons*, in French ecclesiastical writers, denotes the first Sunday in Lent, which is thus called on account of an ancient practice in the Lyonnais, where the peasants, in the night of this day, walked about their orchards, gardens, &c. with torches lighted, or fire-brands in their hands; in which plight they visited every tree, and addressing themselves to them one after another, threatened, that if they did not bear fruit well the ensuing season, they should be cut down to the ground and burnt. This is evidently a relick of Paganism; the like of which was practised by the ancient idolaters in the month of February; hence called *Februarius, à febrando*.

BRANDEIS, a town of Bohemia, seated on the river Elbe. E. Long. 14. 25. N. Lat. 50. 15.

BRANDENBURG, Marquisate of, a large country of Germany, having Mecklenburg and Pomerania on the north; Poland, on the east; Silesia, with the Lusatia, the electorate of Saxony, Anhalt, and duchy of Magdeburg, on the south; and part of the same duchy, and that of Lunenburg, on the west. Its greatest length is near 200 miles, and its greatest breadth near 100. Its northern situation makes it very cold for seven or eight months in winter. The soil in general is far from being fruitful, a great part of it consisting of sand: yet there are several fruitful spots in it; and the whole, under the last and present reign, has been greatly improved, and much better peopled. In some parts there is great plenty of potatoes and turnips; in others of buck-wheat, millet, and flax; in others of tobacco, woad, and other herbs for dyeing. All sorts of colour-earth, together with alum, salt-petre, amber, iron, stone, and medicinal springs, are found in it. Abundance of cattle, especially sheep, are bred here; and the woods not only supply the inhabitants with fuel, but with timber, charcoal, tar, and wood-ashes, both for domestic uses and for exportation. The culture of silk is also carried on in this country with great success. The principal rivers by which it is watered are the Elbe, the Oder, the Prignitz, the Havel, the Warte, and the Spree. Some of the rivers and lakes abound in fish, and are united by canals for the benefit of navigation. They reckon in the whole Mark 120 towns, 2500 villages; and in 1801 about 1,100,000 inhabitants. The states here consist of the nobility and towns, whose assembly-house is in the Spandau-street at Berlin, and who still enjoy some small remains of their ancient privileges. The hereditary officers of the marquisate are a marshal, chamberlain, cup-bearer, purveyor, sewer, treasurer, and ranger. The king of Prussia, who is also elector of Brandenburg, with his whole court, are Calvinists; but the religion of most of the inhabitants is Lutheranism. The churches of both persuasions are well endowed, and the laity jointly employed by the government. The Roman Catholics are also tolerated here. In short, every inhabitant enjoys full liberty of conscience. A great variety of manufactures, most of which were

Branden-
burg.

introduced by the French refugees, are carried on in the marquisate, especially at Berlin and Potsdam; where are also excellent painters, statuaries, and engravers. By means of these manufactures, fabrics, and arts, not only large sums are kept in the country, but also imported from other parts, to which considerable quantities of the manufactures and natural productions are exported. For the education of youth and the advancement of learning, besides Latin schools in several places, and gymnasia, there is an university at Frankfort on the Oder, and an academy of sciences at Berlin.

The Brandenburg family is of great antiquity. Some historians say it was founded by the Sclavonians, who gave it the name of *Branber*, which signifies the "Guards of the Forests;" and the Germans called it *Branburg*. Henry I. surnamed the Fowler, fortified this place in the year 923, to serve as a rampart against the Huns, a warlike nation, who were extremely troublesome by their frequent incursions. He bestowed the government on Sifro, count of Ringelheim, with the title of Margrave or Marquis, which signifies Protector of the Marches or Frontiers, in 923. It descended to Gerod, margrave of Lusatia; and in succession of time passed into the families of Staden, Ascania, Bellenstadt, and that of Bavaria, till the emperor Sigismund, with the consent of the states of the empire, in 1416, gave perpetual investiture to Frederick VI. of Nuremberg; who also the following year received from the emperor, at the diet of Constance, the investiture of the county of Brandenburg as Frederick I.; having had previously conferred upon him the dignity of elector and arch-chamberlain of the Holy Roman empire.

Brandenburg remained long in subjection to Poland; and the investiture of Prussia was granted by the Polish kings to each succeeding margrave. Frederick-William, having concluded a treaty with the king of Poland, was acknowledged to be sovereign of Ducal Prussia by an assembly of the states at Königsberg, A. D. 1663. By the treaty of Vienna the emperor confirmed this title; and Frederick, the son of Frederick-William, was proclaimed king of Prussia, January 18. 1701. He was succeeded by his son, who performed the greatest services to his country, and prepared the materials of the future grandeur of the late sovereign, Frederick III. who began his reign on the 31st of May, 1740, at the age of 28. See PRUSSIA.

Among the electors he possesses the seventh place. As arch-chamberlain, he carries the sceptre before the emperor at his coronation, and brings him water in a silver basin to wash with. In the college of princes of the empire he has five voices. His assessment, as elector, is 60 horse and 277 foot, or 1828 florins in lieu of them. To the chamber of Wetzlar, his quota is 811 rix-dollars 58 kruitzers, each term. As to the orders of the knights of the Black Eagle, and of Merit, it is sufficient here to observe, that the former was instituted by Frederick I. at his coronation, and the other by the present king. For the government of this country and the administration of justice, there are several supreme colleges and tribunals; particularly for the departments of war, foreign affairs, and the finances, there are distinct boards. Here is a supreme ecclesiastical council and consistory for the Lutherans, a supreme directory

Brandenburg.
Brandem

directory of the Calvinist church; a supreme medicinal college; a supreme mine-office; a college or board of trade, &c. These of the French nation, settled in this country, are allowed particular courts of their own. The amount of the yearly revenues of the Mark, arising from the domains, protection money paid by the Jews, tolls, land-tax, mines, forests, duties on stamp-paper, salt, and variety of other imposts and excises, is computed at about 2,500,000 crowns; but the money is said to be much inferior in goodness to that of Saxony and the dominions of Hanover. Of late it was extremely debased. Since 1815 the whole number of the inhabitants of the royal and electoral dominions have been estimated at 10,000,000, and the revenues at about 7,000,000 sterling. Upwards of 200,000 men are kept on foot in time of peace, which are said to cost more than half of the royal revenue. These troops are under strict discipline, very expert at their exercise, always in readiness to march, and always complete. Each regiment has a particular canton or district allotted it for its quarters and raising recruits. The infantry are clothed in blue, and the horse and dragoons in white; and both are required to hear sermon twice a-day when in quarters or garrisons. In time of peace they are allowed, for several months in the year, to hire themselves out, or to follow their business either as burghers or peasants, in the canton where they are quartered; but they are not allowed to marry. A considerable part of these troops are stationed in the Mark, particularly at Berlin and Potsdam. The corps of bussars alone amounts to about 10,000 men. The Mark of Brandenburg is divided, in general, into the electoral and new Marks. The former is again subdivided into the old Mark, the Pregnitz, the middle Mark, and the Ucker Mark. The old Mark, which lies on the west side of the Elbe, between that river and Lunenburg, is about 50 miles in length, and 30 in breadth.

BRANDENBURG, a city of Germany, and capital of the marquisate of that name, situated on the river Havel, in E. Long. 13. 0. N. Lat. 52. 25. It is divided into the old and new town, and was anciently the see of a bishop. The mountain in the neighbourhood, called *Marientberg*, is planted with vines. Here is a small colony of French Calvinists, with a manufacture of cloth, fustian, and canvas; and a pretty good trade is carried on by the Havel. The fort here looks like a suburb, and contains a riding school, with the cathedral church. The greater part also of the members of the chapter, which still subsists, and is composed of a Lutheran provost, dean, senior, sub-senior, and three other canons, reside in it. They are distinguished by a cross of gold enamelled with violet, terminating in eight points; and have a considerable estate. The town contains about 13,000 inhabitants.

BRANDEUM, in ecclesiastical writers, a linen cloth or veil put over the tombs of the apostles St Peter and St Paul, and left there for some time; by which it is supposed to acquire a degree of sanctity, so as to be worshipped as a relic; and for that purpose frequently sent by the pope as a present to some prince. In this sense, Brandeum amounts to the same with what was otherwise called *sanctuarium*, *sudarium*, *orarium*, and *velum*. The use of brandea was introduced as a means of diffusing and propagating the virtues and in-

fluences of relics, without moving, or any way impairing, the substance of them; and the translation of relics in early days being forbidden.

BRANDING, in the face or hand, denotes a punishment inflicted by law on various offences, by burning with a hot iron, after the offender hath been once admitted to benefit of clergy.

BRANDON, a town of Suffolk in England, seated on the little river Ouse, over which it has a bridge, and a ferry at a mile's distance: whence it is divided into Brandon, and Brandon ferry; which last has the most business, because commodities are brought thither from the isle of Ely. This place gives the British title of duke to the family of Hamilton in Scotland. Population 1360. E. Long. 0. 55. N. Lat. 52. 30.

BRANDRITH, denotes a tretet or other iron stand, whereon to set a vessel over the fire.

BRANDRITH, among builders, denotes a fence or rail about the mouth of a well.

BRANDT, GERARD, a learned divine of the reformed religion, was born at Amsterdam in 1626, and was successively minister in several places of the Netherlands. He wrote some works which are esteemed, particularly the history of the reformation of the Netherlands, 4 vols 4to; and *The Life of Admiral Ruyter*; both written in the Flemish tongue. He died at Rotterdam in 1685.

BRANDY, a spirituous and inflammable liquor, extracted from wine and other liquors by distillation. See DISTILLATION.

Wine-brandy, made in France, is esteemed the best in Europe. They make it wherever they make wine, and for that purpose use wine that is pricked rather than good wine. The chief brandies for foreign trade, and those accounted best, are the brandies of Bourdeaux, Rochelle, Cogniac, Charenton, the isle of Rhe, Orleans, the county of Blaisois, Poitou, Touraine, Anjou, Nantz, Burgundy, and Champaiga.

BRANK, an instrument used in some parts of Scotland, and in Staffordshire, for correcting scolding women. It is a sort of head-piece, which opens and encloses the head of the impatient, while an iron, sharp as a chisel, enters the mouth, and subdues the more dreadful weapon within. Thus harnessed, the offender is led in triumph through the streets. Dr Plott, in his *History of Staffordshire*, has favoured the world with a minute description and figure of the instrument*, which is there called a *scolding bridle*; and tells us, he looks upon it "as much to be preferred to the ducking-stool, which not only endangers the health of the party, but also gives the tongue liberty betwixt every dip; to neither of which this is at all liable."

BRANLIN, in *Ichthyology*, a species of salmon, with several transverse black streaks, resembling the impression of so many fingers.

BRANNODUNUM (Notitiæ), with a garrison of the Equites Dalmatiæ, a town of Britain, on the Sinus Metaris: now Brancester, in Norfolk, on the Washes.

BRANOGENIUM, or BRANONIUM, a town of the Coritani, a people in the heart of Britain: from the distances of the Itinerary, Camden supposes it to be Worcester.

BRANSKA, a town of Transilvania, situated on the river Marish. E. Long. 23. 15. N. Lat. 46. 0.

BRASIDA,

Brandem
Branska

*Page 310
tab. 32.

Brasida
Brasil.

BRASIDA, an anniversary solemnity at Sparta, in memory of Brasidas, a Lacedæmonian captain, famous for his achievements at Methone, Pylos, and Amphipolis. It was celebrated with sacrifices and games, wherein none were permitted to attend but free-born Spartans. Whoever neglected to be present at the solemnity was fined.

BRASIDAS, a celebrated general of the Lacedæmonians, about 424 years before the birth of Christ. He defeated the Athenians by land and sea, took many places, and rendered his country formidable to all the neighbouring states. He conquered the Athenians on their attempting to surprise Amphipolis, but died of the wounds he received in that battle. See **ATTICA** and **LACEDÆMON**.

BRASIL, a large country of South America, being the easternmost part of that continent lying between the equinoctial line and the tropic of Capricorn. It is about 1560 miles in length, and 1000 in breadth; but measuring along the coast, it is 2000 miles long, and is bordered with mountains that open from time to time, and form good harbours where vessels may lie in safety. It was accidentally discovered by the Portuguese in 1500. Emmanuel king of Portugal had equipped a squadron of 13 sail, carrying 1200 soldiers and sailors destined for the East Indies, under the conduct of Peter Alvarez Cabral. This admiral, quitting Lisbon on the 19th of March 1500, struck out to sea to avoid the coast of Guinea, and steered his course southward, that he might the more easily turn the Cape of Good Hope, which projects a good way into the ocean. On the 24th of April, he got sight of the continent of South America, which he judged to be a large island at some distance from the coast of Africa. Coasting along for some time, he ventured to send a boat on shore; and was astonished to observe the inhabitants entirely different from the Africans in features, hair and complexion. It was found, however, impracticable to seize upon any of the Indians, who retired with great celerity to the mountains on the approach of the Portuguese; yet, as the sailors had discovered a good harbour, the admiral thought proper to come to an anchor, and called the bay *Puerto Segura*. Next day he sent another boat on shore, and had the good fortune to lay hold on two of the natives, whom he clothed and treated kindly, and then dismissed, to make a proper report to their countrymen. The stratagem had the desired effect. The Indians, having heard the relation of the prisoners, immediately crowded to the shore, singing, dancing, and sounding horns of different kinds; which induced Cabral to land, and take solemn possession in the name of his Portuguese majesty.

As soon as the court of Lisbon had ordered a survey to be taken of the harbours, bays, rivers, and coasts of Brasil, and was convinced that the country afforded neither gold nor silver, they held it in such contempt, that they sent thither none but condemned criminals and abandoned women. Two ships were sent every year from Portugal, to carry the refuse of the kingdom to this new world, and to bring home parrots and woods for the dyers and cabinet-makers. Ginger was afterwards added; but soon after prohibited, lest it should interfere with the sale of the same article from India.

In 1548, the Jews, many of whom had taken re-

fuge in Portugal, beginning to be persecuted by the inquisition, were stripped of their possessions, and banished to Brasil. Here, however, they were not entirely forsaken. Many of them found kind relations and faithful friends; others, who were known to be men of probity and understanding, obtained money in advance from merchants of different nations with whom they had formerly had transactions. By the assistance of some enterprising men, they were enabled to cultivate sugar canes, which they first procured from the island of Madeira. Sugar, which till then had been used only in medicine, became an article of luxury. Princes and great men were all eager to procure themselves this new species of indulgence. This circumstance proved favourable to Brasil, and enabled it to extend its sugar plantations. The court of Lisbon, notwithstanding its prejudices, began to be sensible that a colony might be beneficial to the mother country, without producing gold or silver; and this settlement, which had been wholly left to the capricious management of the colonists, was now thought to deserve some kind of attention; and accordingly Thomas de Souza was sent thither, in 1549, to regulate and superintend it.

This able governor began by reducing these men, who had always lived in a state of anarchy, into proper subordination, and bringing their scattered plantations closer together: after which he applied himself to acquire some information respecting the natives, with whom he knew he must be incessantly engaged either in traffic or war. This it was no easy matter to accomplish. Brasil was full of small nations, some of which inhabited the forests, and others lived in the plains and along the rivers. Some had settled habitations; but the greater number of them led a roving life, and most of them had no intercourse with each other. It is not to be supposed that such a people would be at all disposed to submit to the yoke which the Portuguese wanted to put upon them on their arrival. At first they only declined all intercourse with these strangers: but finding themselves pursued in order to be made slaves, and to be employed in the labours of the field, they took the resolution to murder and devour all the Europeans they could seize upon. The friends and relations of the savages that were taken prisoners also ventured to make frequent attempts to rescue them, and were sometimes successful: so that the Portuguese were forced to attend to the double employments of labour and war.

Souza did not bring a sufficient number of forces to change the situation of affairs. Indeed, by building San Salvador, he gave a centre to the colony; but the honour of settling, extending, and making it really useful to the mother country, was reserved for the Jesuits who attended him. These men, who for their arts of insinuation and address have been equalled by none, dispersed themselves among the Indians. When any of the missionaries were murdered, they were immediately replaced by others; and seeming to be inspired only with sentiments of peace and charity, the Indians, in process of time, grew not only familiar to but passionately fond of them. As the missionaries were too few in number to transact all the business themselves, they frequently deputed some of the most intelligent Indians in their stead. These men having distributed hatchets, knives, and looking-glasses, among the savages they

Brasil.

met

Brasil. met with, represented the Portuguese, as a harmless, humane, and good sort of people.

The prosperity of the colony of Brasil, which was visible to all Europe, excited the envy of the French, Spaniards, and Dutch successively. The latter, indeed, bid fairest for the conquest of the whole. Their admiral Henry Lonk arrived, in the beginning of the year 1630, with 46 men of war, on the coast of Fernambucca, one of the largest and best fortified captainships of these parts. He reduced it after several obstinate engagements, in which he was always victorious. The troops he left behind subdued the captainships of Tamaraca, Pareiba, and Rio Grande, in the years 1633, 1634, and 1635. These, as well as Fernambucca, furnished annually a large quantity of sugar, a great deal of wood for dyeing, and other commodities. The Hollanders were so elated with the acquisition of this wealth, which flowed to Amsterdam instead of Lisbon, that they determined to conquer all the Brasils, and intrusted Maurice of Nassau with the conduct of this enterprise. That general reached the place of his destination in the beginning of the year 1637. He found the soldiers so well disciplined, the commanders such experienced men, and so much readiness in all to engage, that he directly took the field. He was successively opposed by Albuquerque, Banjola, Lewis Rocca de Borgia, and the Brazilian Cameron, the idol of his people, passionately fond of the Portuguese, brave, active, cunning, and who wanted no qualifications necessary for a general, but to have learned the art of war under able commanders. These several chiefs exerted their utmost efforts to defend the possessions that were under their protection; but their endeavours proved ineffectual. The Dutch seized upon the captainships of Siara, Seregippe, and the greater part of that of Bahia. Seven of the 15 provinces which composed the colony had already submitted to them, and they flattered themselves that one or two campaigns would make them masters of the rest of their enemies possessions in that part of America; when they were suddenly checked by the revolution happening on the banishment of Philip IV. and placing the duke of Braganza on the throne. After this, the Portuguese recovering their spirits, soon drove the Dutch out of Brasil, and have continued masters of it ever since.

The country of Brasil is divided into the following provinces, viz. Paria, Maragnano, Sira, Rio Grande, Pareiba, Tamaraca, Fernambucca, Seregippe, Bahia, Porto Seguro, Esperito Santo, Rio de Janeiro, Angra, St Vincent, and Del Rey. See these articles.

The first aspect of the country from the sea is rather unfavourable, as it appears high, rough, and unequal; but, on a more narrow inspection, nothing can be more delightful, the eminences being covered with woods, and the valleys and savannahs with the most refreshing verdure. In so vast a tract of land, it cannot be imagined that the climate will be found at all equal, or the seasons uniform. The northern provinces are subject to heavy rains and variable winds, like other countries under the same parallels. Tornadoes, storms, and the utmost fury of the elements, wreak their vengeance here; while the southerly regions are blessed with all the comforts which a fine fertile soil and temperate climate can afford. In some of the provinces, the heat of the climate is thought to prove favourable to the gene-

Brasil. ration of a great variety of poisonous reptiles: some of which, as the *liboy* or *roebuck* snake, are said to extend to the length of 30 feet, and to be two or three yards in circumference. The rattlesnake and other reptiles of the same kind, grow likewise to an enormous size; and the serpent called *ibibaboka* is affirmed to be 7 yards long, and half a yard in circumference, possessed too of a poison instantaneously fatal to the human race. Here also are scorpions, ant-bears, tygers, armadillos, porcupines, janonveras, and an animal called *tapirasson*, which is the production of a bull and an ass, having a great resemblance to both. No country on earth affords a greater number of beautiful birds, nor variety of the most exquisite fruits; but the chief commodities are Brasil wood, ebony, dyeing woods, ambergris, rosin, balsams, indigo, sweetmeats, sugar, tobacco, gold, diamonds, beautiful pebbles, crystal, emeralds, jasper, and other precious stones; in all which the Portuguese carry on such an amazing trade as may justly be reputed the support, and indeed the vital fountain, of the mother country. The gold and diamond mines are but a recent discovery: they were first opened in the year 1681; and have since yielded above five millions sterling annually, of which sum a fifth belongs to the crown. So plentiful are diamonds in this country, that the court of Portugal had found it necessary to restrain their importation, to prevent too great a diminution of their value. They are neither so hard nor so clear as those of the East Indies, nor do they sparkle so much, but they are whiter. The Brazilian diamonds are sold ten per cent. cheaper than the Oriental ones, supposing the weights to be equal. The largest diamond in the world was sent from Brasil to the king of Portugal. It weighs 1680 carats, or 12 $\frac{1}{2}$ ounces; and has been valued at 56,787,500l. Some skilful lapidaries, however, are of opinion that this supposed diamond is only a topaz; in which case a very great abatement must be made in its value. The crown revenue arising from this colony amounts to two millions sterling in gold, if we may credit some late writers, besides the duties and customs on merchandisè imported from that quarter. This indeed is more than a fifth of the precious metal produced by the mines; but, every other consequent advantage considered, it probably does not much exceed the truth. The excessive confluence of people to the Brasil colonies, as well from other countries as from Portugal, not only enlarges the imports of gold, but, what is of infinitely more importance to Europe in general, the exportation of the manufactures of this hemisphere; of which the principal are the following. Great Britain sends woollen manufactures; such as fine broad medley cloths, fine Spanish cloths, scarlet and black cloths; serges, duroys, druggets, sagathies, shalloons, camblets, and Norwich stuffs; black Colchester baize; says, and perpetuanas, called *long ells*; hats, stockings, and gloves. Holland, Germany, and France, chiefly export fine hollands, bone-lace, and fine thread: silk manufactures, pepper, lead, block tin, and other articles, are also sent from different countries. Besides the particulars already specified, England likewise trades with Portugal, for the use of the Brasils, in copper and brass, wrought and unwrought pewter, and all kinds of hardware: all which articles have so enlarged the Portuguese trade, that, instead of 12 ships usually employed in the Brasil commerce, there are now never fewer

Brasil
 ↳
 Brass.

fewer than 100 sail of large vessels constantly going and returning to those colonies. To all this may be added the vast slave-trade carried on with the coast of Africa for the use of the Brasil colonies; which, we may believe, employs a great number of shipping, from the multitude of slaves that are annually transported. Indeed the commerce of Brasil alone is sufficient to raise Portugal to a considerable height of naval power, as it maintains a constant nursery of seamen; yet a certain infatuation in the policy of the country has prevented that effect, even amidst all these extraordinary advantages. All the ships in this trade, being under the direction of the government, have their appointed seasons of going and returning, under convoy of a certain number of men of war. In 1806, in consequence of the violence of the French government, the court of Portugal retired to Brasil, where it still remains. In March 1817 a revolt broke out in the city of Pernambuco. Some individuals, who were marked out for proscription, being apprized of the intention of the government, took up arms, and, supported by the people, drove out the military and got possession of the town. A provisional government was installed, and a republic proclaimed. An army was then sent against the town, and the republicans being defeated on the 18th May, retired into the interior, when the royal government was re-established. See BRASIL, SUPPLEMENT.

BRASIL-Wood, or *Brasil-wood*, an American wood of a red colour, and very heavy. It is denominated variously, according to the places from whence it is brought: Thus we have brasil of Fernambucca, Sappan, Lamou, &c. For its description, &c. see CÆSALPINIA, BOTANY Index.

BRASILETTO, the same with Brasil wood.

BRASLAW, a considerable town of Poland, in Lithuania, and palatinate of Wilna, with a castle. It is seated on a small lake, in E. Long. 17. 5. N. Lat. 55. 45.

BRASS, or, as the French call it, *yellow copper*, is a factitious metal, composed of copper and zinc. See CHEMISTRY Index, and BRASS, SUPPLEMENT.

The first formation of brass, as we are assured by scripture, was prior to the flood, and discovered even in the seventh generation from Adam*. But the use of it was not, as is generally believed, and the Arundelian marbles assert, previous to the knowledge of iron. They were both first known in the same generation, and first wrought by the same discoverer. And the knowledge of them must have been equally carried over the world afterwards, with the spreading of the colonies of the Noachidæ. An acquaintance with the one or the other was absolutely necessary to the existence of the colonists; the clearing away of the woods about their settlements, and the erection of houses for their habitation.

The ancient Britons, though acquainted from the remotest periods with the use of both these metals, remained long ignorant that they were to be obtained in the island. Before this discovery they imported all their iron and brass from the continent. And when they had at length detected the former in their own hills, and had ceased to introduce it, they continued to receive the latter. Their want of the metal remained, and no mines of it were opened in the island. In the earliest ages whose manners have been delineated by history, we find the weapons of their warriors invariably framed of this factitious metal; and the most au-

VOL. IV. Part I.

thentic of all the profane records of antiquity, the Arundelian marbles, for that reason, mistakenly date the first discovery of iron a couple of centuries below the Trojan war. Every military nation, as such, is naturally studious of brightness in its arms; and the Britons, particularly, gloried in the neatness of theirs. For this reason the nations of the world still fabricated their arms of brass, even long after the Arundelian era for the discovery of iron; and the Britons continued to import it from the continent, though they had found iron to be a native of the country, and could have supplied themselves with a sufficient quantity of it.

Mr Whitaker* supposes, that when the Britons derived their iron and brass from the continent, they purchased the latter at an easier expence than the former. The Gauls had many large brass works carried on in the kingdom, but seem to have had but few iron forges within it. And this would naturally induce the Belgæ to be less diligent in their inquiry after the veins of copper and calamine at home, than for the courses of iron ore; though the one was equally discoverable in the island as the other, and lay equally within the Belgic regions of it. Brass being thus cheaper than iron, they necessarily formed with it some domestic as well as military implements. Such were common among the Gauls; and such were familiar to the Britons, either imported into the island, as some actually were, or manufactured within it, as others also assuredly were. The Britons had certainly brass founderies erected among them, and minted money and fabricated weapons of brass.

In this condition of the works, the Romans entered the island. And seeing to great a demand among the natives for this article, they would speedily instruct them to discover the materials of it among themselves. This must unavoidably have resulted from the conquest of the Romans. The power of surprising their new subjects with so unexpected a discovery would naturally stimulate the pride of the Roman intellect; and the desire of obliging themselves with so cheap a supply of that useful metal, stationary as they were in that kingdom, would also equally actuate the selfishness of the Roman breast. The veins of copper and calamine would be easily found out by any experienced inquirer after them; and the former metal is therefore distinguished among the Welsh, only by the Roman appellation of *cyprium*, *koppr*, or copper. And many founderies of brass appear to have been established in the island. Some had been erected before, one perhaps within the confines of every kingdom, and probably in the vicinity of every capital. One at least would be necessary, in order to supply the armoury of the principality: and one perhaps was sufficient for most of the British states. But several appear now to have been settled in every kingdom, and one perhaps near every stationary town. Two have been discovered in the single county of Essex, and within a narrow portion of it, at Fifield and Danbury. And a third was placed upon Easterly Moor in Yorkshire, 12 miles to the north-west of York, and in the neighbourhood of Isurium or Aldborough.

Corinthian BRASS, famous in antiquity, is a mixture of gold, silver, and copper. L. Mummius having sacked and burnt the city of Corinth, 146 years before Christ, it is said this metal was formed from the immense quantities of gold, silver, and copper, wherewith

Brass. that city abounded, thus melted and run together by the violence of the conflagration.

BRASS, in the glass trade.—Thrice calcined brass is a preparation which serves the glassmen to give many very beautiful colours to their metal. The manner of preparing it is this: Place thin plates of brass on tiles on the leet of the furnace near the occis; let it stand to be calcined there for four days, and it will become a black powder sticking together in lumps. Powder this, sift it fine, and recalcine it four or five days more; it will not then stick together, but remain a loose powder, of a russet colour. This is to be calcined a third time in the same manner; but great care must be taken in the third calcination, that it be not overdone nor underdone; the way to be certain when it is right is, to try it several times in glass while melting. If it makes it, when well purified, to swell, boil, and rise, it is properly calcined; if not, it requires longer time. This makes, according to the different proportions in which it is used, a sea-green, an emerald-green, or a turcoise colour.

Brass, by long calcination alone, and without any mixture, affords a fine blue or green colour for glass; but they have a method of calcining it also with powdered brimstone, so as to make it afford a red, a yellow, or a chalcidony colour, according to the quantity and other variations in the using it. The method of making the calcination is this: Cut thin plates of brass into small pieces with shears, and lay them stratum super stratum, with alternate beds of powdered sulphur, in a crucible; calcine this for 24 hours in a strong fire; then powder and sift the whole; and finally expose this powder upon tiles for 12 days to a reverberating furnace; at the end of this time powder it fine, and keep it for use. The glass-makers have also a method of procuring a red powder from brass, by a more simple calcination, which serves them for many colours. The method of preparing it is this: They put small and thin plates of brass into the arches of the glass furnaces, and leave them there till they are sufficiently calcined, which the heat in that place, not being enough to melt them, does in great perfection. The calcined matter, powdered, is of a dusky red, and requires no farther preparation.

BRASS-COLOUR, one prepared by the braziers and colour-men to imitate brass. There are two sorts of it; the red brass or bronze, and the yellow or gilt brass; the latter is made only of copper-filings, the smallest and brightest that can be found; with the former they mix some red ochre, finely pulverized; they are both used with varnish.—In order to make a fine brass that will not take any rust or verdigris, it must be dried with a chafing dish of coals as soon as it is applied.—The finest brass-colour is made with powder-brass imported from Germany, diluted into a varnish, made and used after the following manner: The varnish is composed of one pound four ounces of spirit of wine, two ounces of gum-lac, and two ounces of sandarac; these two last drugs are pulverized separately, and afterwards put to dissolve in spirit of wine, taking care to fill the bottle but half full. The varnish being made, you mix such quantity as you please of it with the pulverized brass, and apply it with a small brush to what you would brass over. But you must not mix too much at once, because the varnish being very apt to dry, you

would not have time to employ it all soon enough; it is therefore better to make the mixture at several times. After this manner they brass over figures of plaster, which look as well as if they were of cast brass.

BRASS LEAF is made of copper, beaten out into very thin plates, and afterwards rendered yellow. The German artists, particularly those of Nuremberg and Augsburg, are said to possess the best method of giving to these thin plates of copper a fine yellow colour like gold, by simply exposing them to the fumes of zinc, without any real mixture of it with the metal. These plates are cut into little pieces, and then beaten out fine like leaves of gold; after which they are put into books of coarse paper, and sold at a low price for the vulgar kinds of gilding. The parings or shreds of these very thin yellow leaves being well ground on a marble plate, are reduced to a powder similar to gold; which serves to cover, by means of gum-water, or some other glutinous fluid, the surface of various mouldings or pieces of curious workmanship, giving them the appearance of real bronze, and even of fine gold, at a very trifling expence, because the gold colour of this metallic powder may be easily raised and improved by stirring it on a wide earthen bason over a slow fire.

BRASS-LUMPS, a common name given by miners to the globular pyrites. See PYRITES, MINERALOGY *Index*.

BRASSAW, or **CRONSTADT**, a strong town of Transylvania in Burezland; seated on the river Buxel, in E. Long. 22. 35. N. Lat. 46. 30.

BRASSE, a species of perca. See ICHTHYOLOGY *Index*.

BRASSICA, **CABBAGE**, in *Botany*, for the classification of which see *BOTANY Index*. But as many of the species of this genus are of considerable importance as articles of food, we shall here lay before our readers a more particular account of their uses and mode of culture, under the names known to practical gardeners.

The species called *campestris* grows naturally on the sea-shore near Dover, has a perennial branching stalk, and in this it differs from all the other species. In very severe winters, when the other sorts are destroyed, this is a necessary plant, for the most severe frosts do not injure it. The flower-stalks grow from the end of the branches, and spread out horizontally; but those which arise from the centre of the plants grow erect, and seldom put out branches. The cauliflower has been much more improved in Britain than in any other part of Europe. In France they rarely have cauliflowers till Michaelmas, and Holland has been often supplied with them from Britain. In many parts of Germany there were none of them cultivated till within a few years past, and most parts of Europe are supplied with seeds from Britain. That which is generally known by the title of *rape* or *cole seed* is much cultivated in the isle of Ely, and some other parts of England, for its seed, from which rape-oil is drawn; and it hath also been cultivated of late years, in other places, for feeding of cattle, to great advantage. The cole-seed, when cultivated for feeding of cattle, should be sown about the middle of June. The ground for this should be prepared for it in the same manner as for turnips. The quantity of seeds for an acre of land is from six to eight pounds; and as the price of the seed is not great, so it is better to allow eight

Brassica. eight pounds; for if the plants are too close in any part they may be easily thinned when the ground is hoed, which must be performed in the same manner as is practised for turnips, with this difference only, of leaving these much nearer together; for as they have fibrous roots and slender stalks, so they do not require near so much room. These plants should have a second hoeing about five or six weeks after the first, which, if well performed in dry weather, will entirely destroy the weeds, so they will require no farther culture. Where there is not an immediate want of food, these plants had better be kept as a reserve for hard weather, or spring feed, when there may be a scarcity of other green food. If the heads are cut off, and the stalks left in the ground, they will shoot again early in the spring, and produce a good second crop in April; which may be either fed off, or permitted to run to seeds, as is the practice where this is cultivated for the seeds: but if the first is fed down, there should be care taken that the cattle do not destroy their stems, or pull them out of the ground. As this plant is so hardy as not to be destroyed by frost, so it is of great service in hard winters for feeding of ewes; for when the ground is so hard frozen as that turnips cannot be taken up, these plants may be cut off for a constant supply. This will afford late food after the turnips are run to seed; and if it is afterwards permitted to stand for seed, one acre will produce as much as, at a moderate computation, will sell for five pounds, clear of charges. Partridges, pheasants, turkeys, and most other fowl, are very fond of this plant; so that wherever it is cultivated, if there are any birds in the neighbourhood, they will constantly lie among these plants. The seeds of this plant are sown in gardens for winter and spring salads, this being one of the small salad herbs.

The common white, red, flat, and long-sided cabbages, are chiefly cultivated for autumn and winter use. The seeds of these sorts must be sown the beginning or middle of April, in beds of good fresh earth; and when the young plants have about eight leaves, they should be pricked out into shady borders, about three or four inches square, that they may acquire strength, and to prevent their growing long shanked. About the middle of June you must transplant them out, where they are to remain. If they are planted for a full crop in a clear spot of ground, the distance from row to row should be three feet and a half, and in the rows two feet and a half asunder: if the season should prove dry when they are transplanted out, you must water them every other evening until they have taken fresh root; and afterwards, as the plants advance in height, you should draw the earth about the stems with a hoe, which will keep the earth moist about their roots, and greatly strengthen the plants. These cabbages will some of them be fit for use soon after Michaelmas, and will continue until the end of February, if they are not destroyed by bad weather; to prevent which, the gardeners near London pull up their cabbages in November, and trench their ground up in ridges, laying their cabbages against their ridges as close as possible on one side, burying their stems in the ground: in this manner they let them remain till after Christmass, when they cut them for the market; and although the outer part of the cabbage be decayed (as is often the case in very wet or hard

winters), yet, if the cabbages were large and hard when laid, the inside will remain sound. *Brassica.*

The Russian cabbage was formerly in much greater esteem than at present, it being now only to be found in particular gentlemen's gardens, who cultivate it for their own use. This must be sown late in the spring of the year, and managed as those before directed, with this difference only, that these must be sooner planted out, and must have an open clear spot of ground, and require much less distance every way, for it is but a very small hard cabbage. This sort will not continue long before they will break and run up to seed.

The early and sugar loaf cabbages are commonly sown for summer use, and are what the gardeners about London commonly call *Michaelmas cabbages*. The season for sowing of these is about the end of July, or beginning of August, in an open spot of ground; and when the plants have got eight leaves, you must prick them into beds at about three or four inches distance every way, that the plants may grow strong and short shanked; and toward the end of October you should plant them out: the distance that these require is, three feet row from row, and two feet and a half asunder in the rows. The ground must be kept clean from weeds, and the earth drawn up about your cabbage plants. In May, if your plants were of the early kind, they will turn in their leaves for cabbaging; at which time, the gardeners near London, in order to obtain them a little sooner, tie in their leaves close with a slender osier-twig to blanch their middle; by which means, they have them at least a fortnight sooner than they could have if they were left untied.

The early cabbage being the first, we should choose to plant the fewer of them, and a greater quantity of the sugar-loaf kind, which comes after them: for the early kind will not supply the kitchen long, generally cabbaging apace when they begin, and as soon grow hard and burst open; but the sugar-loaf kind is longer before it comes, and is as slow in its cabbaging; and being of a hollow kind, will continue for a good long time. The sugar-loaf kind may be planted out in February, and will succeed as well as if planted earlier; with this difference only, that they will be later before they cabbage. You should also reserve some plants of the early kind in some well sheltered spot of ground, to supply your plantation, in case of a defect; for in mild winters many of the plants are apt to run to seed, especially when their seeds are sown too early, and in severe winters they are often destroyed.

The Savoy cabbages are propagated for winter use, as being generally esteemed the better when pinched by the frost: these must be sown about the end of April, and treated after the manner as was directed for the common white cabbage: with this difference, that these may be planted at a closer distance than those; two feet and a half square will be sufficient. These are always much better when planted in an open situation, which is clear from trees and hedges; for in close places they are very subject to be eaten almost up by caterpillars and other vermin, especially if the autumn prove dry.

The broccoli may also be treated in the same manner, but need not be planted above one foot asunder in the rows, and the rows two feet distant; these are ne-

Brassica. ver eaten till the frost hath rendered them tender; for otherwise they are tough and bitter.

The seeds of the broccoli (of which there are several kinds, viz. the Roman or purple, the Neapolitan or white, and the black broccoli, with some others, but the Roman is preferred to them all), should be sown about the latter end of May, or beginning of June, and when the plants are grown to have eight leaves, transplant them into beds (as was directed for the common cabbage); and towards the latter end of July they will be fit to plant out, which should be done into some well-sheltered spot of ground, but not under the drip of trees: the distance these require is about a foot and a half in the rows, and two feet row from row. The soil in which they should be planted ought to be rather light than heavy: if your plants succeed well (as there will be little reason to doubt, unless the winter prove extremely hard), they will begin to show their small heads, which are somewhat like a cauliflower, but of a purple colour, about the end of December, and will continue eatable till the middle of April. The brown or black broccoli is by many persons greatly esteemed, though it doth not deserve a place in the kitchen garden where the Roman broccoli can be obtained, which is much sweeter, and will continue longer in season: indeed, the brown sort is much hardier, so that it will thrive in the coldest situations, where the Roman broccoli is sometimes destroyed in very hard winters. The brown sort should be sown in the middle of May, and managed as hath been directed for the common cabbage, and should be planted at the same distance, which is about two feet and a half asunder. This will grow very tall, so should have the earth drawn up to their stems as they advance in height. This doth not form heads so perfect as the Roman broccoli; the stems and hearts of the plants are the parts which are eaten. The Roman broccoli (if well managed) will have large heads, which appear in the centre of the plants like clusters of buds. These heads should be cut before they run up to seed, with about four or five inches of the stem; the skin of the stems should be stripped off before they are boiled. After the first heads are cut off, there will be a great number of side-shoots produced from the stems, which will have small heads to them, but are full as well flavoured as the large. The Naples broccoli hath white heads very like those of the cauliflower, and eats so like it as not to be distinguished from it.—Besides this first crop of broccoli (which is usually sown in the end of May), it will be proper to sow another crop the beginning of July, which will come in to supply the table the latter end of March and the beginning of April; and being very young, will be extremely tender and sweet.

In order to save good seeds of this kind of broccoli, you should reserve a few of the largest heads of the first crop, which should be let remain to run up to seed, and all the undershoots should be constantly stripped off, leaving only the main stem to flower and seed. If this be duly observed, and no other sort of cabbage permitted to seed near them, the seeds will be as good as those procured from abroad, and the sort may be preserved in perfection many years.

The turnip-rooted cabbage was formerly more cultivated in Britain than at present; for since other sorts have been introduced which are much better flavoured,

this sort has been neglected. There are some persons who esteem this kind for soups, but it is too strong for most palates; and is seldom good but in hard winters, which will render it tender and less strong. At the end of June the plants should be transplanted out where they are to remain, allowing them two feet distance every way, observing to water them until they have taken root; and as their stems advance, the earth should be drawn up to them with a hoe, which will preserve a moisture about their roots, and prevent their stems from drying and growing woody, so that the plants will grow more freely; but it should not be drawn very high, for as it is the globular part of the stalk which is eaten, so that should not be covered. In winter they will be fit for use, when they should be cut off, and the stalks pulled out of the ground and thrown away, being good for nothing after the stems are cut off. As food for cattle, however, the cultivation of this species deserves particular attention. See *AGRICULTURE Index*.

The curled colewort or Siberian broccoli is now more generally esteemed than the former, being extremely hardy, so is never injured by cold, but is always sweeter in severe winters than in mild seasons. This may be propagated by sowing of the seeds the beginning of July; and when the plants are strong enough for transplanting, they should be planted in rows about a foot and a half asunder, and ten inches distance in the rows. These will be fit for use after Christmas, and continue good until April, so that they are very useful in a family.

The musk cabbage. This may be propagated in the same manner as the common cabbage, and should be allowed the same distance: it will be fit for use in October, November, and December; but, if the winter proves hard, these will be destroyed much sooner than the common sort.

The common colewort, or Dorsetshire kale, is now almost lost near London, where their markets are usually supplied with cabbage plants instead of them. The best method to cultivate this plant in the fields is, to sow the seeds about the beginning of July, choosing a moist season, which will bring up the plants in about ten days or a fortnight; the quantity of seed for an acre of land is nine pounds: when the plants have got five or six leaves they should be hoed, as is practised for turnips, cutting down all the weeds from amongst the plants, and also thinning the plants where they are too thick; but they should be kept thicker than turnips, because they are more in danger of being destroyed by the fly: this work should be performed in dry weather, that the weeds may be killed. About six weeks after, the plants should have a second hoeing, which, if carefully performed in dry weather, will entirely destroy the weeds, and make the ground clean, so that they will require no farther culture: in the spring they may be either drawn up and carried out to feed the cattle, or they may be turned in to feed upon them as they stand; but the former method is to be preferred, because there will be little waste; whereas, when the cattle are turned in amongst the plants, they will tread down and destroy more than they eat, especially if they are not fenced off by hurdles.

The two last sorts of cabbages are varieties fit for a botanic garden, but are plants of no use. They are

annual

Brassica. annual plants, and perish when they have perfected their seeds.

The best method to save the seeds of all the sorts of cabbages is, about the end of November you should make choice of some of your best cabbages, which you should pull up, and carry to some shed or other covered place, where you should hang them up for three or four days by their stalks, that the water may drain from between their leaves; then plant them in some border near a hedge or pale, quite down to the middle of the cabbage, leaving only the upper part of the cabbage above ground, observing to raise the earth about it, so that it may stand a little above the level of the ground; especially if the ground is wet, they will require to be raised pretty much above the surface. If the winter should prove very hard, you must lay a little straw or pease haulm lightly upon them, to secure them from the frost, taking it off as often as the weather proves mild, lest by keeping them too close they should rot. In the spring of the year these cabbages will shoot out strongly, and divide into a great number of small branches: you must therefore support their stems, to prevent their being broken off by the wind; and if the weather should be very hot and dry when they are in flower, you should refresh them with water once a-week all over the branches, which will greatly promote their seeding, and preserve them from mildew. When the pods begin to change brown, you will do well to cut off the extreme parts of every shoot with the pods, which will strengthen your seeds; for it is generally observed, that those seeds which grow near the top of the shoots, are very subject to run to seed before they cabbage; so that by this there will be no loss, but a great advantage. When your seed begins to ripen, you must be particularly careful that the birds do not destroy it, for they are very fond of these seeds. The best method to prevent this, is to get a quantity of birdlime, and daub over a parcel of slender twigs, which should be fastened at each end to stronger sticks, and placed near the upper part of the seed in different places, so that the birds may alight upon them, by which means they will be fastened thereto; where you must let them remain, if they cannot get off themselves: and although there should not be above two or three birds caught, yet it will sufficiently terrify the rest, that they will not come to that place again for a considerable time after.

When your seed is fully ripe, you must cut it off; and after drying, thrash it out, and preserve it in bags for use.

But in planting of cabbages for seed, it will be proper never to plant more than one sort in a place, or near one another: for example, never plant red and white cabbages near each other, nor Savoy with white or red cabbages; for they will, by the commixture of their effluvia, produce a mixture of kinds: and it is said to be owing to this neglect, that the gardeners rarely save any good red cabbage seed in Britain, but are obliged to procure fresh seeds from abroad; as supposing the soil or climate of Britain alters them from red to white, and of a mixed kind betwixt both; whereas, if they should plant red cabbages by themselves for seed, and not suffer any other to be near them, they might continue the kind as good in Britain as in any other part of the world.

Brassica. Cauliflowers have of late years been so far improved in Britain, as to exceed in goodness and magnitude what are produced in most parts of Europe, and by the skill of the gardener are continued for several months together; but the most common season for the great crops is in May, June, and July. Having procured a parcel of good seeds, you must sow it about the 21st of August, upon an old cucumber or melon bed, sifting a little earth over the seeds, about a quarter of an inch thick; and if the weather should prove extremely hot and dry, you should shade the beds with mats, to prevent the earth from drying too fast, and give it gentle waterings as you may see occasion. In about a month's time after sowing, your plants will be fit to prick out: you should therefore put some fresh earth upon your cucumber or melon beds; or where these are not to be had, some beds should be made with a little new dung, which should be trodden down close, to prevent the worms from getting through it; but it should not be hot dung, which would be hurtful to the plants at this season, especially if it proves hot; into this bed you should prick your young plants at about two inches square, observing to shade and water them at first planting; but do not water them too much after they are growing, nor suffer them to receive too much rain if the season should prove wet, which would be apt to make them black shanked, as the gardeners term it, which is no less than a rottenness in their stems, and is the destruction of the plants so affected. In this bed they should continue till about the 30th of October, when they must be removed into the place where they are to remain during the winter season; which, for the first sowing, is commonly under bell or hand glasses, to have early cauliflowers, and these should be of an early kind: but in order to have a succession during the season, you should be provided with another more late kind, which should be sown four or five days after the other, and managed as was directed for them. In order to have very early cauliflowers, you should make choice of a good rich spot of ground that is well defended from the north, east, and west winds, with hedges, pales, or walls; but the first are to be preferred, if made with reeds, because the winds will fall dead in these, and not reverberate as by pales or walls. This ground should be well trenched, burying therein a good quantity of rotten dung; then level your ground, and if it be naturally a wet soil, you should raise it up in beds about two feet and a half, or three feet broad, and four inches above the level of the ground; but if your ground is moderately dry, you need not raise it at all: then plant your plants, allowing about two feet six inches distance from glass to glass in the rows, always putting two good plants under each glass, which may be at about four inches from each other; and if you design them for a full crop, they may be three feet and a half row from row: but if you intend to make ridges for cucumbers between the rows of cauliflower plants (as is generally practised by the gardeners near London), you must then make your rows about eight feet asunder; and the ground between the rows of cauliflowers may be planted with cabbage plants, to be drawn off for coleworts in the spring. When you have planted your plants, if the ground is very dry, you should give them a little water, and then set your glasses over them, which may remain quite close down over them till

Brassica. till they have taken root, which will be in about a week or ten days time, unless there should be a kindly shower of rain; in which case you may set off the glasses, that the plants may receive the benefit of it; and in about ten days after planting, you should be provided with a parcel of forked sticks or bricks, with which you should raise your glasses about three or four inches on the side toward the south, that your plants may have free air; in this manner your glasses should remain over the plants night and day, unless in frosty weather, when you should set them down as close as possible; or if the weather should prove very warm, which many times happens in November, and sometimes in December, in this case you should keep your glasses off in the day-time, and put them on only in the night, lest, by keeping the glasses over them too much, you should draw them into flower at that season; which is many times the case in mild winters, especially if unskillfully managed. Toward the latter end of February, if the weather proves mild, you should prepare another good spot of ground to remove some of the plants into, from under the glasses, which should be well dunged and trenched (as before): then set off your glasses; and, after making choice of one of the most promising plants under each glass, which should remain, take away the other plant, by raising it up with a trowel, &c. so as to preserve as much earth to the root as possible; but take care not to disturb or prejudice the roots of the plants which remain. Then plant the plants which you have taken out at the distance before directed, viz. if for a full crop, three feet and a half, row from row; but if for ridges of cucumbers between them, eight feet, and two feet four inches distance in the rows: then, with a small hoe, draw the earth up to the stems of the plants which were left under the glasses, taking great care not to let the earth fall into their hearts; and set your glasses over them again, raising your props an inch or two higher than before, to give them more air, observing to take them off whenever there may be some gentle showers, which will greatly refresh the plants.

In a little time after, if you find your plants grow so fast as to fill the glasses with their leaves, you should then slightly dig about the plants, and raise the ground about them in a bed broad enough for the glasses to stand, about four inches high, which will give your plants a great deal of room, by raising the glasses so much higher when they are set over them; and by this means they might be kept covered until April, which otherwise they could not, without prejudice to the leaves of the plants; and this is a great advantage to them, for many times we have returns of severe frosts at the latter end of March, which prove very hurtful to these plants, if exposed thereto, especially after having been nursed up under glasses.

After you have finished your beds, you may set your glasses over your plants again, observing to raise your props pretty high, especially if the weather be mild, that they may have free air to strengthen them; and in mild soft weather set off your glasses, as also in gentle showers of rain; and now you must begin to harden them by degrees to endure the open air; however, it is advisable to let your glasses remain over them as long as possible, if the nights should be frosty, which will greatly forward your plants; but you must not let your

Brassica. glasses remain upon them in very hot sunshine, especially if their leaves press against the sides of the glasses; for it hath often been observed in such cases, that the moisture which hath risen from the ground, together with the perspiration of the plants, which by the glasses remaining over them hath been detained upon the leaves of the plants, when the sun hath shone hot upon the sides of the glasses, have acquired such a powerful heat from the beams thereof, as to scald all their larger leaves, to the no small prejudice of the plants: nay, sometimes large quantities of plants have been so affected therewith, as never to be worth any thing after.

If your plants have succeeded well, toward the end of April some of them will begin to fruit: you must therefore look over them carefully every other day, and when you see the flower plainly appear, you must break down some of the inner leaves over it to guard it from the sun, which would make the flower yellow and unsightly if exposed thereto; and when you find your flower at its full bigness (which you may know by its outside parting as if it would run), you must then draw it out of the ground, and not cut them off, leaving the stalk in the ground, as is by some practised; and if they are designed for present use, you may cut them out of their leaves; but if designed to keep, you should preserve their leaves about them, and put them into a cool place; the best time for pulling them is in a morning, before the sun have exhale the moisture; for cauliflowers pulled in the heat of the day, lose that firmness which they naturally have, and become tough.

But to return to our second crop (the plants being raised and manured as was directed for the early crop, until the end of October), you must then prepare some beds, either to be covered with glass-frames, or arched over with hoops, to be covered with mats, &c. These beds should have some dung laid at the bottom, about six inches or a foot thick, according to the size of your plants; for if they are small, the bed should be thicker of dung to bring them forward, and so *vice versa*; this dung should be beat down close with a fork, in order to prevent the worms from finding their way through it; then lay some good fresh earth about four or five inches thick thereon, in which you should plant your plants about two inches and a half square, observing to shade and water them until they have taken new root: but you must not keep your coverings close, for the warmth of the dung will occasion a large damp in the bed, which, if pent in, will greatly injure the plants. When your plants have taken root, you must give them as much free open air as possible, by keeping the glasses off in the day-time as much as the weather will permit; and in the night, or at such times as the glasses require to be kept on, raise them up with props to let in fresh air, unless in frosty weather; at which time the glasses should be covered with mats, straw, pease-haulm, &c. but this is not to be done but in very hard frosts; you must also observe to guard them against great rain, which in winter time is very hurtful to them, but in mild weather, if the glasses are kept on, they should be propped to admit fresh air; and if the under leaves grow yellow and decay, be sure to pick them off: for if the weather should prove very bad in winter, so that you should be obliged to keep them close covered for two or three days together, as it sometimes happens, these

Brassica. these decayed leaves will render the inclosed air very noxious; and the plants perspiring pretty much at that time, are often destroyed in vast quantities.

In the beginning of February, if the weather be mild, you must begin to harden your plants by degrees, that they may be prepared for transplantation: the ground where you intend to plant your cauliflowers out (which should be quite open from trees, &c. and rather moist than dry) having been well dunged and dug, should be sown with radishes a week or a fortnight before you intend to plant out your cauliflowers; the sowing of radishes is particularly mentioned, because if there are not some radishes among them, and the month of May should prove hot and dry, as it sometimes happens, the fly will seize your cauliflowers, and eat their leaves full of holes, to their prejudice, and sometimes their destruction; whereas, if there are radishes upon the spot, the flies will take to them, and never meddle with the cauliflowers so long as they last: indeed, the gardeners near London mix spinach with their raddish-seed, and so have a double crop; which is an advantage where ground is dear, or where persons are straitened for room; otherwise it is very well to have only one crop amongst the cauliflowers, that the ground may be cleared in time.

Your ground being ready and the season good, about the middle of February you may begin to plant out your cauliflowers; the distance which is generally allowed by the gardeners near London (who plant other crops between their cauliflowers to succeed them, as cucumbers for pickling, and winter cabbages) is every other row four feet and a half apart, and the intermediate rows two feet and a half, and two feet two inches distance in the rows; so that in the latter end of May or beginning of June (when the radishes and spinach are cleared off, they put in seeds of cucumbers for pickling, in the middle of the wide rows, at three feet and a half apart; and in the narrow rows plant cabbages for winter use, at two feet two inches distance, so that these stand each of them exactly in the middle of the square between four cauliflower plants; and these, after the cauliflowers are gone off, will have full room to grow, and the crop be hereby continued in a succession through the whole season.

There are many people who are very fond of watering cauliflower plants in summer; but the gardeners near London have almost wholly laid aside this practice, as finding a deal of trouble and charge to little purpose; for if the ground be so very dry as not to produce tolerable good cauliflowers without water, it seldom happens that watering of them makes them much better: and when once they have been watered, if it is not constantly continued, it had been much better for them if they never had any; as also, if it be given them in the middle of the day, it rathers helps to scald them: so that, upon the whole, if care be taken to keep the earth drawn up to their stems, and clear them from every thing that grows near them, that they may have free open air, you will find that they will succeed better without than with water, where any of these cautions are not strictly observed.

But in order to have a third crop of cauliflowers, you should make a slender hot-bed in February, in which you should sow the seeds, covering them a quarter of an inch thick with light mould, and covering the bed

with glass frames. When the plants are come up, and have gotten four or five leaves, you should prepare another hot-bed to prick them into, which may be about two inches square; and in the beginning of April harden them by degrees, to fit them for transplanting, which should be done the middle of that month, at the distance directed for the second crop, and must be managed accordingly: these, if the soil is moist where they are planted, or the season cool and moist, will produce good cauliflowers about a month after the second crop is gone, whereby their season will be greatly prolonged.

There is also a fourth crop of cauliflowers, which is raised by sowing the seeds about the 23d of May; and, being transplanted, as hath been before directed, will produce good cauliflowers in a kindly season and good soil after Michaelmas, and continue through October and November, and, if the season permit, often a great part of December.

All the species of cabbage are supposed to be hard of digestion, to afford little nourishment, and to produce flatulencies, though probably on no very good foundation. They tend strongly to putrefaction, and run into this state sooner than almost any other vegetable; when putrefied, their smell is likewise the most offensive, greatly resembling that of putrefied animal substances. A decoction of them is said to loosen the belly. Of all these plants cauliflower is reckoned the easiest of digestion. The white is the most fetid, and the red most emollient or laxative; a decoction of this last is recommended for softening acrimonious humours in some disorders of the breast, and in hoarseness. The red cabbage is chiefly used for pickling. In some countries they bury the white cabbage when full grown in the autumn, and thus preserve it all winter. The Germans cut them to pieces, and, along with some aromatic herbs and salt, press them close down in a tub, where they soon ferment, and are eaten under the name of *Sour-cROUT*. See that article.

BRASSICAVIT, or **BRACHICAVIT**, in the manege, is a horse whose forelegs are naturally bended archwise: being so called by way of distinction from an arched horse, whose legs are bowed by hard labour.

BRAULS, Indian cloths with blue and white stripes. They are otherwise called *turbans*, because they serve to cover those ornaments of the head, particularly on the coast of Africa.

BRAUNA, a town of Germany, in Bavaria, seated on the river Inn. It has a strong fortress: notwithstanding, it was taken by the Austrians in 1743. E. Long. 13. 3. N. Lat. 48. 10.

BRAUNSBURG, a town of Poland, in Regal Prussia, with a very commodious harbour, and belonging to the king of Prussia. It is seated near the Baltic sea, in E. Long. 20. 0. N. Lat. 54. 15.

BRAUNSFELD, a town of Germany, in the circle of the Upper Rhine, and country of Solmes, with a handsome palace or castle. E. Long. 8. 32. N. Lat. 50. 22.

BRAVO, one of the Cape de Verd islands on the coast of Africa, remarkable for its excellent wines, and inhabited by Portuguese. The land is very high, and consists of mountains which look like pyramids. It abounds in Indian corn, gourds, water melons, potatoes, horses, asses, and hogs. There is also plenty of fish on the

Brassica
||
Bravo.

Bravo
||
Bray.

the coast, and the island produces salt-petre. W. Long. 25. 35. N. Lat. 14. 0.

BRAVO, a town of Africa, on the coast of Ajan, with a pretty good harbour. It is an independent place, and is about 80 miles distant from Magadoxo. E. Long. 41. 35. N. Lat. 1. 0.

BRAURONIA, in Grecian antiquity, a festival in honour of Diana, surnamed *Brauronia*, from its having been observed at Brauron, an Athenian borough. This festival was celebrated once in five years, being managed by ten men, called in Greek *isoprosos*. The victim offered in sacrifice was a goat, and it was customary for certain men to sing one of Homer's Iliads. The most remarkable persons at this solemnity were young virgins, habited in yellow gowns, and consecrated to Diana. It was unlawful for any of them to be above ten or under five years of age.

BRAWN, the flesh of a boar souced or pickled: for which end the boar should be old; because the older he is, the more horny will the brawn be.—The method of preparing brawn is as follows: The boar being killed, it is the flitches only, without the legs, that are made brawn; the bones of which are to be taken out, and then the flesh sprinkled with salt, and laid in a tray, that the blood may drain off: Then it is to be salted a little, and rolled up as hard as possible. The length of the collar of brawn should be as much as one side of the boar will bear, so that when rolled up it will be nine or ten inches in diameter.

The collar being thus rolled up, it is to be boiled in a copper or large kettle, till it is so tender, that you can run a straw through it; then set it by till it is thorough cold, and put it into the following pickle. To every gallon of water, put a handful or two of salt, and as much wheat-bran: Boil them together, then drain the bran as clear as you can from the liquor; and when the liquor is quite cold, put the brawn into it.

BRAY, SIR REGINALD, a celebrated architect and politician, was the second son of Sir Richard Bray, one of the privy council to King Henry VI. Sir Reginald was instrumental in the advancement of King Henry VII. to the throne of England; and was greatly in favour with that prince, who bestowed honours and wealth upon him. His skill in architecture appears from Henry VII.'s chapel at Westminster, and the chapel of St George at Windsor, as he had a principal concern and direction in the building of the former, and the finishing and bringing to perfection the latter, to which he was also a liberal benefactor. In the middle of the south aisle of the above chapel is a spacious chapel built by him, and still called by his name. He died in 1501; and was interred in the above chapel, probably under the stone where lies Dr Waterland; for, on opening the vault for that gentleman, who died in 1740, a leaden coffin of ancient form was found, which, by other appearances, was judged to be that of Sir Reginald, and was, by order of the dean, immediately arched over.

BRAY, Dr Thomas, an eminent, learned, and pious divine, was born at Marton, in Shropshire, in the year 1656, and educated at Oxford. He was at length presented to the vicarage of Over-Whitacre, in Warwickshire: and in 1690, to the rectory of Sheldon, where he composed his Catechetical Lectures; which procured

him such reputation, that Dr Compton, bishop of London pitched upon him as a proper person to model the infant church of Maryland, and establish it upon a solid foundation, and for that purpose he was invested with the office of commissary. He now engaged in several noble undertakings. He procured sums to be raised for purchasing small libraries for the use of the poor ministers in the several parts of our plantations: and the better to promote this design, he published two books; one entitled *Bibliotheca parochialis*, or a scheme of such theological and other heads as seem requisite to be perused or occasionally consulted by the clergy, together with a catalogue of books which may be profitably read on each of those points; the other, *Apostolical Charity*, its nature and excellency considered. He endeavoured to get a fund established for the propagation of the gospel, especially among the uncultivated Indians; and by his means a patent was obtained for erecting the corporation called *The society for the propagation of the gospel*. He, by his industry, procured relief for prisoners; and formed the plan for the society for the reformation of manners, charity-schools, &c. He wrote, 1. His Martyrology, or papal usurpation, in one volume, folio; 2. *Directorium missionarium*; and other works. This excellent man died in 1730, aged 73.

BRAY, a port town of Ireland, in the county of Wicklow, and province of Leinster, seated on St George's channel, eight miles south of Dublin. W. Long. 6. 16. N. Lat. 53. 8.

BRAY sur Seine, a town of France in Champagne, and in Senonois, on the confines of Brie. E. Long. 2. 15. N. Lat. 48. 35.

BRAYLE, among sportsmen, a piece of leather slit to put upon the hawk's wing, to tie it up.

BRAZED, in *Heraldry*, a term serving to describe three cheverons, one clasping another.

BRAZEN, something consisting of brass, or formed out of it. See **BRASS**.

BRAZEN Age. See **AGE**.

BRAZEN Dish, among miners, is the standard by which the other dishes are gauged, and is kept in the king's hall.

BRAZEN Sea, in Jewish antiquity, one of the sacred utensils in the temple of Solomon. It was cast in the plain of Jordan, and removed from thence into the inner court of the temple; where it was placed upon 12 oxen, three of which looked towards each quarter of the world. It was ten cubits from the one brim to the other, five cubits in height, and 30 cubits in circumference, and contained 3000 baths. The brim of it was perfectly round, and so it continued in the two upper cubits; but below the brim, in the three lower cubits, it was square. It was a handbreadth thick, and the brim was wrought like the brim of a cup, with flowers of lilies. About the body of this huge vessel there were two borders of engravings, being the heads of oxen in demi-relief: out of which some suppose the water issued, and that they were made as cocks and conveyances for that purpose.—This brazen or molten sea, was designed for the priests to wash themselves in before they performed the service of the temple. The supply of water was through a pipe out of the well Etam; though some are of opinion, that it was constantly supplied with water by the Gibeonites.

BRAZIER,

Bray
||
Brazen.

Brazier
||
Bread.

BRAZIER, an artificer who makes and deals in all kinds of brass ware. This trade, as exercised in Britain, may be reckoned a branch of the smithery, though they seldom keep forges, except for brazing or soldering, and tinning the insides of their vessels, which they work up chiefly out of copper and brass prepared rough to their hands. They consist of a working part, and a shop-keeping part, which latter many carry on to a great extent, dealing as well in all sorts of iron and steel, as copper and brass goods for household furniture; and lately have fallen much into selling what is called *French plate*, made of a sort of white metal, silvered and polished to such a degree that the eye cannot soon distinguish it from real silver.

BRAZIL. See **BRASIL**.

BRAZING, the soldering or joining two pieces of iron together by means of thin plates of brass, melted between the pieces that are to be joined. If the work be very fine, as when two leaves of a broken saw are to be brazed together, they cover it with pulverized borax, melted with water, that it may incorporate with the brass powder, which is added to it: The piece is then exposed to the fire without touching the coals, and heated till the brass is seen to run.

BRAZING is also the joining two pieces of iron together by beating them hot, the one upon the other, which is used for large pieces by farriers, &c.

BRAZZA, a town and island on the coast of Dalmatia, in the gulf of Venice, opposite to Spalatro, and subject to Venice. E. Long. 28. o. N. Lat. 43. o.

BREACH, in a general sense, denotes a break or rupture in some part of a fence or enclosure, whether owing to time or violence.—Inundations, or overflowings of lands, are frequently owing to breaches in the dikes or sea banks. Dagenham breach is famous; it was made in 1707, by a failure of the Thames wall in a very high tide. The force wherewith it burst in upon the neighbouring level tore up a large channel or passage for water 100 yards wide, and in some places 20 feet deep, by which a multitude of subterraneous trees that had been buried many ages before were laid bare.

BREACH, in *Fortification*, a gape made in any part of the works of a town by the cannon or mines of the besiegers, in order to make an attack upon the place. To make the attack more difficult, the besieged sow the breach with crow-feet, or stop it with *chevaux de frize*.—A practicable breach, is that where the men may mount and make a lodgment, and ought to be 15 or 20 fathoms wide. The besiegers make their way to it, by covering themselves with gabions, earth-bags, &c.

BREACH, in a legal sense, is where a person breaks through the condition of a bond or covenant; on an action upon which, the breach must be assigned: And this assignment must not be general, but particular, as, in an action of covenant for not repairing houses, it ought to be assigned particularly what is the want of reparation: and in such certain manner, that the defendant may take an issue.

BREAD, a mass of dough kneaded and baked in an oven. See **BAKER**, **BAKING**, and **BARN**.

Macquer's
Chem. Dict.

The grains of all vegetables are almost entirely composed of substances very proper for the nourishment of animals; and amongst grains those which contain a
VOL. IV. Part I. †

farinaceous matter are the most agreeable and most nutritive.

Bread.

Man, who appears to be designed by nature to eat of all substances which are capable of nourishing him, and still more of vegetables than animals, has, from time immemorial, and in all parts of the earth, used farinaceous grains as the principal basis of his food: but as these grains cannot be without difficulty eaten by men in their natural state, this active and intelligent animal has gradually found means not only to extract the farinaceous part, that is, the only nutritive part of these grains, but also to prepare it so that it becomes a very agreeable and wholesome aliment, such as the bread we now generally eat.

Nothing appears so easy at first sight as to grind corn, to make a paste with the flour and water, and to bake this paste in an oven. They who are accustomed to enjoy the advantages of the finest human inventions, without reflecting on the labour it has cost to complete them, think all these operations common and trivial. However, it appears very certain, that for a long time men no otherwise prepared their corn than by boiling and forming compact viscous cakes, not very agreeable to the taste, and of difficult digestion. Before they were able to make bread of good taste and quality, as we have now, it was necessary to invent and complete ingenious machines for grinding corn, and separating the pure flour with little trouble and labour; and that inquiries, or rather some happy chance, which some observing person availed himself of, should discover, that flour, mixed with a certain quantity of water, is susceptible of a fermentation which almost entirely destroys its viscosity, heightens its taste, and renders it proper to make a light bread, very agreeable to the taste, and of easy digestion.

This essential operation, on which the good quality of bread depends, is entirely of the province of chemistry. It would add to the honour of the ancient cultivators of chemistry, to attribute to them so useful and important a discovery; but, unhappily, it is too probable that they had no share in it. The ancient chemists were engaged in other pursuits than that of bread and other common objects. They hoped to make gold; and what is bread in comparison with gold?

However that be, to the fortunate invention of raising the paste before baking we owe the perfection of the art of making bread. This operation consists in keeping some paste or dough, till by a peculiar spirituous fermentation it swells, rarefies, and acquires a smell and taste quick, pungent, spirituous, somewhat sour, and rather disagreeable. This fermented dough is well worked with some fresh dough, which is by that mixture and moderate heat disposed to a similar but less advanced fermentation than that above mentioned. By this fermentation the dough is attenuated, and divided; air is introduced into it, which being incapable of disengaging itself from the tenacious and solid paste, forms in it small cavities, raises and swells it: hence the small quantity of fermented paste which disposes the rest to ferment, is called *leaven*, from the French word *lever*, signifying to raise.

When the dough is thus raised, it is in a proper state to be put into the oven; where, while it is baked, it dilates

Bread. dilates itself still more by the rarefaction of the air, and of the spirituous substance it contains, and it forms a bread full of eyes or cavities; consequently light, and entirely different from the heavy, compact, viscous, and indigested masses, made by baking unfermented dough.

The invention of beer, or wine of grains, furnishes a new matter useful in the making of bread. This matter is the froth which forms upon the surface of these liquors during fermentation. When it is mixed with dough, it raises it better and more quickly than ordinary leaven. It is called *yeast* or *barm*. By means of this, the finest lightest bread is made. It often happens, that bread made with leaven dough has a sourish and not agreeable taste; which may proceed from too great a quantity of leaven, or from leaven in which the fermentation has advanced too far. This inconvenience does not happen to bread made with yeast; because the fermentation of this substance is not too far advanced, or because more attention is given to that finer bread.

It may be asked, Why, since dough is capable of fermenting spontaneously and singly, as we see from the leaven, a substance is added to dispose it to ferment: The true reason is, That all the parts of a fermenting substance do not ferment at the same time, nor to the same degree; so that some parts of this substance have finished their fermentation, while others have not yet begun. The fermentable liquors which contain much sugar, as hydromel, and must of wines, give proofs of this truth; for, after these liquors have become very vinous, they have still very distinctly a saccharine taste: but all saccharine matter is still susceptible of fermentation; and, in fact, if vinous hydromel, or must, or even new beer, be distilled, so that all their ardent spirit shall be separated, and the residuum diluted with water, we shall see a second fermentation take place, and a new quantity of ardent spirit formed.

The same thing precisely happens to dough, and still more sensibly, from its viscosity and want of fluidity; so that if it be left to ferment alone, and without the help of leaven, as the fermentation proceeds very slowly and successively, the parts which ferment first will have become sour and vapid before all the rest be sufficiently attenuated and changed, by which the bread will acquire a disagreeable taste.

A mixture of a small quantity of leaven with dough effectually prevents this inconvenience; because the effect of this leaven, and of all fermenting substances, is to dispose to a similar fermentation all matters capable of it, with which it is mixed; or rather, by means of leaven, the fermentation of all the parts of such substances is effected more nearly at the same time.

Bread well raised and baked differs from unfermented bread, not only in being less compact, lighter, and of a more agreeable taste, but also in being more easily miscible with water, with which it does not form a viscous mass, which circumstance is of great importance in digestion.

It is observable, that without bread, or somewhat of this form, no nation seems to live. Thus the Laplanders, having no corn of their own, make a sort of bread of their dried fishes, and of the inner rind of the pine, which seems to be used, not so much for their

nourishment as for supplying a dry food. For this mankind seem to have an universal appetite, rejecting bland, slippery, and mucilaginous foods. This is not commonly accounted for, but seems to depend on very simple principles. The preparation of our food depends on the mixture of the animal fluids in every stage. Among others the saliva is necessary, which requires dry food as a necessary stimulus to draw it forth, as bland, slippery, fluid aliments are too inert, and make too short stay in the mouth, to produce this effect, or to cause a sufficient degree of manducation to emulge that liquor. For this reason we commonly use dry bread along with animal food, which otherwise would be too quickly swallowed. For blending the oil and water of our food nothing is so fit as bread, assisted by a previous manducation. For which purpose, bread is of like necessity in the stomach, as it is proper that a substance of solid consistence should be long retained there. Now the animal fluids must be mixed with our aliment, in order to change the acescency it undergoes. But liquid foods would not attain this end, whereas the solid stimulates and emulges the glands of the stomach. The bread then appears to be exceedingly proper, being bulky without too much solidity, and firm without difficulty of solution.

Among the ancients we meet with various denominations of bread; as, 1. *Panis siligineus*, called also *mundus*, *athleticus*, *isungia*, *coliphus*, and *robys*, answering to our white bread; being made of the purest flour of the best wheat, and only used by the richer sort. 2. *Panis secundus* or *secundarius*, called also *smilaceus* or *smilagineus*, the next in purity; being made of fine flour, only all the bran not sifted out. 3. *Autopyrus*, called also *syncomistus* and *confusaneus*, made of the whole substance of the wheat, without either retrenching the finer flour or coarser bran; answering to our household bread. 4. *Cacabaceus*, apparently the same with what was otherwise denominated *sordidus*, as being given to dogs; *furfuraceus*, *furfureus*, or *furfurativus*, because made in great part of bran; and, in the middle age, *bissus*, on account of its brownness; sometimes also *leibo*. There were other sorts of bread, denominated from the manner in which they were made, or the uses they were applied to; as, 1. *The militaris*, which was prepared by the soldiers and officers in camp with their own hands; for which purpose some had hand-mills, others pounded the corn in a mortar, and baked it on the coals. 2. *Clibanites*, that baked in an oven, by way of contradistinction from that baked on the hearth or under the embers. 3. That called *subcineritius*, or *sub cinere coctus*; sometimes also *reversatus*, because it was to be turned in the baking. 4. *Nauticus*, answering to our sea-biscuit, and denominated accordingly *bis coctus*, because baked several times over to make it keep the longer. Other kinds of bread were denominated from their qualities and accidents; as, 1. *The panis siccus*, that which had been long baked; such as were the *bis coctus*, naval and buccellated bread. 2. *Madidus*, a sort made of rye or bear, sometimes also made of fine flour, wherewith they smeared their faces, by way of a cosmetic, to render them smooth. 3. *Acidus*, or sour bread, which was acidulated with vinegar. 4. *Azymus*, that unleavened or unfermented.

The French have also a great variety of breads; as

Bread.

Cullen on

Med.

Bread.

queen's bread, alamode bread, bread de Segovie, de Gentillay, quality-bread, &c. all prepared in peculiar manners by the bakers of Paris. The bread de Gonesse excels all others, on account of the waters at Gonesse, a town three leagues from Paris. It is light, and full of eyes, which are the marks of its goodness. *Pain de manège*, is that which each family bakes for itself. Spice-bread, *pain d'épice*, denotes bread baked and iced over with the scum taken off sugar in refining houses; it is sometimes also made with honey and other sorts of seasoning, and answers to what the ancients call *panis mellitus*.

Among us, bread is chiefly divided into white, wheaten, and household; differing only in degrees of purity. In the first, all the bran is separated; in the second, only the coarser; in the third, none at all: so that fine bread is made only of flour; wheaten bread of flour and a mixture of the finer bran; and household, of the whole substance of the grain, without taking out either the coarse bran or fine flour. We also meet with symnel bread, manchet or roll bread, and French bread: which are only so many denominations of the finest and whitest bread, made of the purest flour; except that in ill-roll bread there is an addition of milk, and in French bread, of eggs and butter also. In Lancashire, and several of the northern counties of England, they have several sorts of oaten bread; as, 1. The bannock, which is an oat-cake, kneaded only with water, and baked on the embers. 2. Clap-bread, which is made into thin hard cakes. 3. Bitchiness bread, which is made of thin batter, and made into thin soft oat-cakes. 4. Riddle-cakes, which are thick and sour, have but little leaven, and are kneaded stiff. And, 5. Jannock, which is oaten bread made up into loaves. Add to these, *pease-bread*, much used in many parts of Scotland; being bread consisting either wholly of the flour of pease, or of this and oat-meal mixed: the dough, sometimes leavened, sometimes made only with water, is formed either into bannocks or cakes, and baked over the embers; or into what they call *baps*, i. e. a kind of flattish rolls, and baked in the oven. In the statute of assize of bread and ale, 51 Hen. III. mention is made of wastel-bread, cocket-bread, and bread of treet; which answer to the three kinds of bread now in use, called *white*, *wheaten*, and *household* bread. In religious houses, they heretofore distinguished bread by the names esquires bread, *panis armigerorum*; monks bread, *panis conventualis*; boys bread, *panis puerorum*; and servants bread, *panis famulorum*, called also *panis servientalis*. A like distribution obtained in the households of nobles and princes; where, however, we find some other denominations; as messengers bread, *panis nuncius*, that given to messengers as a reward of their labour; court-bread, *panis curialis*, that allowed by the lord for the maintenance of his household; eleemosynary bread, that distributed to the poor by way of alms.

It is for the interest of the community that the food of the poor should be as various as possible, that, in time of dearth and scarcity of the ordinary kinds, they may not be without ready and cheap resources. To the discovery of such resources several benevolent philosophers having successfully turned their inquiries, we

shall lay before the reader the result of their experiments.

1. *BREAD of Potatoes**. Potatoes, previously deprived of their skin, cut into thin slices, and put between paper, will dry in a heat somewhat less than 35° of Reaumur's thermometer; and, when thus dried, they will preserve their white colour. By this process they lose about two thirds of their weight, and they may then be reduced to a fine powder. A little of this powder thrown upon the fire sends out a smoke, accompanied with a smell resembling burnt bread. As this smell is perceived from all farinaceous vegetables when treated in the same manner, M. Parmentier thinks it may be considered as the characteristic of the presence of an *amylaceous* † matter. This smell does not, however, he observes, arise from the amylaceous or fibrous part separately, but from both taken together. The powder of potatoes, obtained in the manner described above, has the smell and taste of wheat; and, like it, is devoured by rats and mice; but, even when most finely powdered, it has not the feel or brightness of the flour of wheat; although, on a chemical analysis, it yields the same products. It is also nutritious, and keeps well for a long time.

Finding so great a similarity between the meal of wheat and what may be called the meal of potatoes, M. Parmentier next endeavoured to make bread of them when mixed in different proportions. His trials were made with one-fourth, one-third, one-half, and two-thirds, of the potato-meal, the remainder being flour from wheat. These proportions, with the addition of a little salt and yeast, yielded bread which was well tasted, but which had fermented little, was brown, and covered with hard brown crusts. Bread made from the meal of potatoes alone, with the addition of salt and yeast, was eatable, but very heavy, unfermented, and exceedingly brown. This bread, from the meal of potatoes alone, was apt to crumble into powder. To give it more adhesion, he mixed with the meal a decoction of bran, or a mixture of honey and water; either of which made it lighter and more fermented: it obtained also a crust of a golden colour, became well tasted, and sufficiently adhesive. M. Parmentier obtained bread also, well fermented, and of a good colour and taste, from a mixture of raw potato-pulp with meal of wheat, or potato-meal, with the addition of yeast and salt.

Potatoes, when used for making bread, are not readily disposed to ferment; without which, bread is very insipid, and not easily digested. But M. Parmentier found, from a variety of experiments, that good bread might be made from equal quantities of flour and potato-meal. He concludes, therefore, with recommending the mixture of potatoes, in times of scarcity, with the flour of wheat, instead of employing rye, barley, or oats, as has frequently been done.

When grain is altogether wanting, he recommends the use of bread made from a mixture of the amylaceous powder of potatoes and of their pulp, this mixture being fermented with leaven or with honey. The meal of this root, when diluted with hot water, acquires a tenacious and gluey consistence. However fair the meal of potatoes may be, it always gives a gray colour to the bread made by mixing it with the flour of

3 C 2

wheat:

Bread.

* From *Examen Chymique des Pommes de Terre*, &c. par M. Parmentier, apoth. major de l'hôtel des invalides Paris.

† See the note *infra*.

Bread. wheat: but a mixture of the pulp of potatoes with the flour of wheat does not produce brown-coloured bread.

M. Parmentier made bread, very much like that of wheat, by a mixture of the following four substances, viz. four ounces of amylaceous powder of potatoes, one dram of mucilage extracted from barley, one dram of the bran of rye, and a dram and a half of glutinous matter dried and powdered.

2. *BREAD from different Vegetables not commonly in Use* *. Although horse-chesnut has not hitherto been employed, yet it is certain that wholesome bread, without any bitterness, may be obtained from it. M. Parmentier advises, that the fruit, after the skin is taken off, and the juice pressed from it, be made into a paste. This mass must be diluted in water, and then strained through a sieve. A milky-coloured liquor is thus separated, which, on standing, deposits a fine powder. This, being dried, is without either smell or taste, and very fit for aliment; the mass from which it is procured retaining the bitterness of the fruit.

The roots of the bryona, when treated in the same manner, yielded a similar white powder. By the same treatment also, fine, white, insipid, inodorous powders may be procured from the roots of the iris, gladiolus, ranunculus, fumaria, arum dracunculus, mandragora, colchicum, filipendula, and helleborus; plants which grow spontaneously, and in great abundance.

Of acorns bread has frequently been made; and to this day, in some countries, they are in common use. The method of preparation which M. Parmentier recommends is, that they be deprived of their cover by boiling, then dried and powdered, and afterwards baked in the same manner as the flour of wheat. When fully ripe, and made into a paste, they were deprived of their astringency by merely pressing their juice from them. The mass remaining after the pressure, when dried, was easily reduced to a fine powder by no means disagreeable.

The *gramen caninum arvense*, in its appearance, approaches to corn; and some naturalists have consider-

ed it as the original species from which all our grain is produced. Its roots are sweet tasted, and have long been employed in making ptisans. In the preparation of them for bread, it is only necessary that the roots should be cleansed, cut small, dried, and pounded. This powder, M. Parmentier observes, does not dissolve in cold water or spirits; but it does in boiling water, which it renders thick and cloudy, and, upon cooling, the whole mass obtains a gelatinous consistence. Upon a chemical analysis, it yields an acid empyreumatic oil, which possesses a singular odour, resembling that which is perceived on burning the plant. The spongy residuum, calcined in the air, gives a fixed alkali. These properties incontestably prove, that it contains an *amylaceous* (A) matter similar to that of grain, which appears to be the nutritive part of vegetables. This amylaceous matter, formed into a jelly, and diffused in water, keeps for a long time without suffering any change; it then turns acid, and at length putrefies.

The amylaceous matter of acrid and poisonous plants, although innocent and nutritive, cannot be converted into bread without the addition of some mucilaginous substance. In times of great scarcity, common bran will answer the purpose; but when potatoes are to be had, the addition of a proper proportion of these is to be preferred.

M. Parmentier gives an account of the bread which he obtained from the amylaceous powders of the different vegetables mentioned above, with the addition of potatoes and a small quantity of common leaven of grain. This bread appeared in general to be well fermented; it was of a good white colour, and free from any disagreeable odour: but to the taste, it was somewhat insipid; which, however, he imagines, might have been corrected by the addition of a proper quantity of salt.

As the resources against scarcity here pointed out can be procured only at particular seasons, the author proposes a method for preserving the matter thus obtained. For this purpose, he advises, that bread prepared in the manner mentioned above should be carefully

(A) M. Beccari of the Bolognian academy has discovered in the flour of wheat two distinct substances. The one he terms an *animal* or *glutinous* matter; the other, an *amylaceous* matter or *vegetable paste*.

The *gluten* has been supposed to be the nutritive part of corn, from its not dissolving unless in vegetable acids; from its assuming a spongy form in boiling water; from its supposed analogy to the animal lymph; and, lastly, from the similitude which the products it affords, on a chemical analysis, bear to those obtained from animal substances. M. Parmentier, however, from various experiments, was led to conclude, with the celebrated Model of Petersburg, that the gluten or animal matter of Beccari exists in the bran, and is not the nutritive part of the wheat. Having made experiments with four different kinds of flour, it appeared that the quantity of animal matter was always proportioned to the coarseness of the flour. Hence, were this gluten the nutritive part, the coarsest bread, or that which contained most bran, would afford the greatest quantity of nourishment. The contrary of this, however, is now known to be fact.

The *amylaceous* part, or, as some have termed it, the *fecula*, of wheat and other vegetables, is a peculiar gum, not soluble in spirit of wine, vinegar, or cold water. It contains more acid, and less water, than the ordinary gums. It is found in many of those plants that make the nourishment of men and other animals. Hence M. Parmentier concludes it to be the nutritive matter.

Though we are not to consider the glutinous matter as the nutritious part of vegetables, yet it is a very necessary ingredient. It is that which preserves the cohesion of the paste in fermenting bread: it is that which forms the viscid pellicle, and stops the air in fermentation; gives the savoury taste to bread; occasions it to be light, to ferment, and which forms the small cells seen in it. It is found especially near the cortical part of grain; and this accounts for its being found in the greatest quantity in coarse brown meal. It is this gluten which renders wheat a superior aliment to the other grains and roots.

* From *Memoire sur les vegetaux qui pourroient suppléer en temps de disette a ceux que l'on employe communément a la nourriture des hommes*, &c. par M. Parmentier.

Bread. fully dried, reduced to powder, and then kept in a close cask. By this means, he is of opinion that it may be preserved for a very long time, and will always be ready to make an agreeable and wholesome panada by the addition of a little butter and salt.

M. Parmentier, in order to discover the degree of power wherewith this alimentary powder nourished, made himself the subject of experiment; and found, that three ounces of it for dinner, and as much for supper, made into panada with water, was a sufficient quantity of aliment for a day. From his discharge by stool while he used it, he had reason to believe that it is almost totally alimentary. He concludes with recommending it not only as useful in times of scarcity, but as a proper substitute for sea biscuit, and as a species of food well adapted for armies and hospitals.

3. *Cheap method of making wholesome BREAD*, when wheat-flour is dear, by mixing turnip with it*.

* From a letter in the *Museum Rusticum et Commerciale*.

"At the time I tried this method, bread was very dear, insomuch that the poor people, in the country where I live, could hardly afford themselves half a meal a-day. This put me upon considering whether some cheaper method might not be found than making it of wheat-meal. Turnips were at that time very plentiful. I had a number of them pulled, washed clean, pared, and boiled; when they were become soft enough to mash, I had the greatest part of the water pressed out of them, and afterwards had them mixed with an equal quantity in weight of coarse wheat-meal; the dough was then made in the usual manner, with yeast or barm, salt, water, &c. It rose very well in the trough; and after being well kneaded, was formed into loaves, and put into the oven to be baked. I had at the same time some other bread made with common meal in the ordinary way. I baked my turnip bread rather longer than the other. When they were drawn from the oven, I caused a loaf of each sort to be cut; and found, on examination, the turnip-bread was sweeter than the other, to the full as light and as white, but had a little taste (though novise disagreeable) of the turnip. Twelve hours afterwards I tasted my turnip-bread again, when I found the taste of the turnip in it scarcely perceivable, and the smell quite gone off. On examining it when it had been baked 24 hours, had I not known that there were turnips in its composition, I should not have imagined it: it had, it is true, a peculiar sweetish taste, but by no means disagreeable; on the contrary, I rather preferred it to the bread made of wheat-meal alone. After it had been baked 48 hours, it underwent another examination, when it appeared to me to be rather superior to the other; it ate fresher and moister, and had not at all abated in its good qualities: to be short, it was still very good after a week: and, as far as I could see, kept as well as the bread made of common wheat-meal.

"In my trials of this bread by the taste, I was not satisfied with eating it by itself; I had some of it spread with butter; I tasted it with cheese; I ate of it toasted and buttered, and finally in boiled milk and in soup: in all these forms it was very palatable and good.

BREAD, in *Medicine*. Besides the alimentary, bread has also medical, qualities.—Decoctions, creams, and jellies of bread, are directed in some dispensaries. Bread

Bread. carefully toasted, and infused or lightly boiled in water, imparts a deep colour, and a sufficiently agreeable restringent taste. This liquor, taken as common drink, has done good service in a weak lax state of the stomach and intestines; and in bilious vomiting and purging, or the cholera morbus: examples are related in the Edinburgh essays of several cases of this kind cured by it, without the use of any other medicine.—In Westphalia there is a very coarse bread eaten, which still retains the opprobrious name given it by a French traveller of *Bonpournikel*, "good for his horse *Nickel*." It is the same with what the Romans called *panis surfuraceus*, or *panis impurus*, from its not being cleansed from the husk; and *panis ater*, from the blackness of its colour: though we learn from Pliny, that the Romans for 300 years knew no other bread. The Germans* make two sorts of waters by distillation from this bread; the one with, the other without, the addition of a spirituous liquor: to both which great virtues are ascribed. That without any thing spirituous, is made out of the juice of craw-fish, may-dew, rose-water, nutmegs, and saffron, distilled from a large quantity of this bread. This is esteemed a great restorative, and given in hectic habits. The other is distilled from this bread and Rhenish wine, with nutmegs and cinnamon. This is given in all the disorders of the stomach, vomiting, loss of appetite, and other complaints of the same kind: and besides these, there is a spirit distilled from it by the retort in the dry way, which, when separated from its fetid oil, is esteemed a powerful sudorific, and very valuable medicine in removing impurities of the blood.

Bread is also medicinal, applied *externally*, as is vulgarly known*. Mr Boyle assures us he drew a menstruum from bread stronger than aquafortis, and which would act even upon glass itself †.

BREAD-Fruit Tree. See SUPPLEMENT.

Bees-BREAD. See BEE.

Cassada BREAD. See JATROPHA, BOTANY Index.

Earth BREAD †. "In the lordship of Moscow in the Upper Lusatia, a sort of white earth is found, which the poor, urged by the calamities of the wars which raged in those parts, make bread. It is taken out of a hill where they formerly worked at saltpetre. When the sun has somewhat warmed this earth, it cracks, and small white globules proceed from it as meal; it does not ferment alone, but only when mixed with meal. Mr Sarlitz, a Saxon gentleman, was pleased to inform us, that he has seen persons who in a great measure lived upon it for some time. He assured us that he procured bread to be made of this earth alone, and of different mixtures of earth and meal; and that he even kept some of this bread by him upwards of six years: he further says, a Spaniard told him, that this earth is also found near Geronne in Catalonia."

Eucharist or Sacramental BREAD, in the Protestant churches, is common leavened bread, in conformity to the ancient practice. In the Romish mass, azymous or unleavened bread is used, particularly in the Gallican church, where a sort is provided for this purpose, called *pain à chanter*, made of the purest wheaten flour pressed between two iron plates graven like wafer-moulds, being first rubbed with white wax to prevent the paste from sticking. The Greeks observe divers ceremonies in their making the eucharist bread. It is necessary

Bread
|
Bread.

Bread. the person who bakes it have not lain with his wife the day before ; or, if it be a woman, that she have not conversed with her husband. The Abyssinians have an apartment in their churches for this service, being a kind of sacristy. F. Sirmoad, in his disquisition on azymous bread, shows, from the council of Toledo, that anciently there were as many ceremonies used in the Latin church in the preparation of the unleavened bread as are still retained in the eastern churches. He cites the example of Queen Radegonda, who distributed with her own hands in the church, the bread which she herself had made. It appears also from the dispute of Cardinal Humbert against the Greeks, that in the Latin church no bread was used for the eucharist, but what was taken out of the sacristy, and had been made by the deacons, subdeacons, and even priests, who rehearsed several psalms during the process.

Ecclesiastical writers enumerate other species of bread allotted for purposes of religion ; as, 1. *Calendarius*, that anciently offered to the priest at the kalends. 2. *Prebendarius*, the same with *capitularis*, that distributed daily to each prebendary or canon. 3. *Benedictus*, that usually given to catechumens before baptism, in lieu of the eucharist bread, which they were incapable of partaking of. The *panis benedictus*, was called also *panagium* and *eulogium*, being a sort of bread blessed and consecrated by the priest, whereby they prepare the catechumens for the reception of the body of Christ. The same was used afterwards, not only by catechumens, but by believers themselves, as a token of their mutual communion and friendship. Its origin is dated from the 7th century, at the council at Nantz. In the Gallican church we still find *panis benedictus*, *pain benit*, used for that offered for benediction, and afterwards distributed to pious persons who attend divine service in chapels. 4. Consecrated bread is a piece of wax, paste, or even earth, over which several ceremonies have been performed with benedictions, &c. to be sent in an *Agnus Dei*, or relic-box, and presented for veneration. 5. Unleavened bread, *panis azymus*. The Jews eat no other bread during their passover : and exact search was made in every house, to see that no leavened bread was left. The usage was introduced in memory of their hasty departure from Egypt, when they had not leisure to bake leavened. 6. Shew-bread was that offered to God every Sabbath-day, being placed on the golden table in the holy of holies.

Horse-BREAD is made of wheat, oats, and beans ; to which sometimes are added aniseed, gentian, liquorice, fenugreek, eggs, and ale ; and sometimes rye and white wine are used.

For race-horses three sorts of bread are usually given with success, for the second, third, and fourth nights feeding : they are all made of beans and wheat worked with barm ; the difference consisting chiefly in the proportion of the two former. In the first kind, three times the quantity of beans is used to one of wheat ; in the second, equal quantities of both ; in the third, three times the quantity of wheat to one of beans.

Sago-BREAD. See SAGO.

Assize * of *BREAD.* The price and weight of bread is regulated by the magistrates according to the price of wheat. We have divers tables of the weights of the loaves both of wheat, wheaten, and household bread, at every price of wheat. If bread want one ounce in 36,

the baker formerly was to suffer the pillory : now, to forfeit 5s. for every ounce wanting ; and for every defect less than an ounce, 2s. 6d. ; such bread being complained of and weighed before a magistrate within 24 hours after it is baked or exposed to sale within the bills of mortality, or within three days in any other place. It is to be observed, bread loses weight by keeping : in some experiments, recited by Bartholine, the diminution was near one-fourth in six months. The same author assures us, that in Norway, they make bread which keeps 30 or 40 years ; and that they are there fonder of their old hard bread, than elsewhere of new or soft ; since the older it is, the more agreeable it grows. For their great feasts, particular care is taken to have the oldest bread ; so that, at the christening of a child, they have usually bread which had been baked perhaps at the christening of his grandfather. It is made of barley and oat-meal baked between two hollow stones.

BREAD-Room, in a ship, that destined to hold the bread or bisket.

The boards of the bread-room should be jointed and caulked, and even lined with tin-plates or mats. It is also proper to warm it well with charcoal for several days before the bisket is put into it ; since nothing is more injurious to the bread than moisture.

BREADTH, in *Geometry*, one of the three dimensions of bodies, which multiplied into their length constitutes a surface.

BREAK, in a general sense, signifies to divide a thing into several parts with violence.

In the art of war, to *break ground*, is to open the trenches before a place.

Among sportsmen, to *break a horse* in trotting, is to make him light upon the hand in trotting, in order to make him fit for a gallop. To *break a horse* for hunting, is to supple him, to make him take the habit of running.

BREAKERS, a name given by sailors to those billows that break violently over rocks lying under the surface of the sea. They are distinguished both by their appearance and sound, as they cover that part of the sea with a perpetual foam, and produce a hoarse and terrible roaring, very different from what the waves usually have in a deeper bottom. When a ship is unhappily driven among breakers, it is hardly possible to save her.

BREAKING, in a mercantile style, denotes the becoming bankrupt. See **BANKRUPT**.

BREAKING-Bulk, in the sea-language, is the same with unloading part of the cargo.

BREAKSPEAR, **NICHOLAS**. See **ADRIAN IV**.

BREAKWATER, a sort of rampart of stone or wood, placed in the water before a harbour to break the force of the waves. See **SUPPLEMENT**.

BREAM. See **CYPRINUS**, **ICHTHYOLOGY Index**.

To *BREAM*, to burn off the filth, such as grass, ooze, shells, or sea-weed, from a ship's bottom, that has gathered to it in a voyage, or by lying long in a harbour. This operation is performed by holding kindled fozze, faggots, or such materials to the bottom, so that the flame incorporating with the pitch, sulphur, &c. that had formerly covered it, immediately loosens and throws off whatever filth may have adhered to the planks. After this, the bottom is covered anew with a composition of sulphur, tallow, &c. which not only makes

Breast.
Breast.

makes it smooth and slippery, so as to divide the fluid more readily, but also poisons and destroys those worms which eat through the planks in the course of a voyage. Breaming may be performed either when the ship lies aground after the tide has ebbed from her, or by docking, or by careening.

BREAST, in *Anatomy*, denotes the fore-parts of the thorax. See ANATOMY *Index*.

Smiting the breast is one of the expressions of penitence. In the Romish church, the priest beats his breast in rehearsing the general confession at the beginning of the mass.

BREASTS, or *Mammæ*, in *Anatomy*. See ANATOMY *Index*.

The breasts are usually two; though we also meet with instances of *trimamie* or women with three breasts*, and even some with four, all yielding milk alike†.

* Barthol. Act. Med. p. 191.
Cast. Laz. Med. p. 718.
† Cabrol. Obscr. 7. Blas. Com. ad Vesting. p. 133.

BREAST-HOOKS, in *Ship-Building*, are thick pieces of timber incurvated into the form of knees, and used to strengthen the fore-part of the ship, where they are placed at different heights directly across the stem, so as to unite it with the bows on each side. The breast-hooks are strongly connected to the stem and hawse-pieces by tree-nails, and by bolts driven from without through the planks and hawse-pieces, and the whole thickness of the breast-hooks, upon whose inside those bolts are forelocked or clinched upon rings. They are usually about one-third thicker, and twice as long, as the knees of the decks they support.

BREAST-Plate, in antiquity, a piece of armour worn to defend the breast, originally believed to be made of hides, or hemp, twisted into small cords, but afterwards made of brass, iron, or other metals, which were sometimes so exquisitely hardened, as to be proof against the greatest force.

BREAST-Plate, in Jewish antiquity, one part of the priestly vestments anciently worn by the high-priests. It was a folded piece of the same rich embroidered stuff of which the *ephod* was made; and it was set with twelve precious stones, on each of which was engraven the name of one of the tribes. They were set in four rows, three in each row; and were divided from each other by little golden squares or partitions in which they were set. The names of these stones, and that of the tribes engraven on them, as also of their disposition on the breast-plate, are as follows:

Sardine REUBEN.	Emerald JUDAH.	Ligare GAD.	Beryl ZEBULON.
Topaz SIMEON.	Sapphire DAN.	Agate ASHER.	Onyx JOSEPH.
Carbuncle LEVI.	Diamond NAPHTALI.	Ametbyst ISSACHAR.	Jasper BENJAMIN.

This breast-plate was fastened at the four corners; those on the top to each shoulder by a golden hook or ring at the end of a wreathed chain; and those below, to the girdle of the *ephod*, by two strings or ribbons, which had likewise two rings and hooks.

This ornament was never to be severed from the priestly garment; and it was called the *memorial*, to put the high-priest in mind how dear those tribes ought

to be to him, whose names he wore on his breast. It is also called the *breast-plate of judgment*, because it had the divine oracle of *Urim and Thummim* annexed to it. See URIM AND THUMMIM.

Breast
||
Brechin.

BREAST-Plate, in the manege, the strap of leather that runs from one side of the saddle to the other, over the horse's breast, in order to keep the saddle tight, and hinder it from sliding backwards.

BREAST-Work, in *Fortification*, the same with PARAPET.

BREATH, the air inspired and expelled again in the action of respiration.

The ancients were very watchful over the last breath of dying persons, which the nearest relations, as the mother, father, brother or the like, received in their mouths.

BREATHING, the same with RESPIRATION.

BRECHIN, a town of Scotland, in the county of Angus, situated in W. Long. 2. 18. N. Lat. 56. 40. It consists of one large handsome street, and two smaller; and is on the side of a small hill, washed by the Southesk, over which there is a stone-bridge of two large arches. It contained 5000 inhabitants in 1811. At the foot of the town is a long row of houses independent of it, built on ground held in feu from the family of Northesk. It is a royal borough, and, with four others, sends a member to parliament. It has a small share of the linen manufacture, which has lately declined. It lies at no great distance from the harbour of Montrose; and the tide flows within two miles of the town; to which a canal might be made, which perhaps might create a trade, but would be of certain service in conveying down the corn of the country for exportation.

Brechin was a rich and ancient bishopric, founded by David I. about the year 1150. At the Reformation, its revenues, in money and in kind, amounted to 700l. a-year; but, after that event, were reduced to 150l. chiefly by the alienation of lands and tythes by Alexander Campbell, the first Protestant bishop, to his chieftain the earl of Argyll.—The Culdees had a convent here. Their abbot Leod was witness to the grant made by King David to his new abbey of Dunfermline. In after times, they gave way to the Mathurines or Red Friars. The ruins of their house, according to Maitland, are still to be seen in the Colledge Wynd.—Here was likewise an hospital called *Maison de Dieu*, founded in 1256, by William de Brechin, for the repose of the souls of the kings William and Alexander; of John earl of Chester and Huntingdon his brother; of Henry his father, and Juliana his mother. Albinus bishop of Brechin, in the reign of Alexander II. was witness to the grant. By the walls which are yet standing, behind the west end of the chief street, it appears to have been an elegant little building.

The cathedral is a Gothic pile, supported by 12 pillars; is in length 166 feet, in breadth 61: part is ruinous, and part serves as the parish-church. The west end of one of the aisles is entire: its door is Gothic, and the arch consists of many mouldings; the window of it neat tracery. The steeple is a handsome tower, 120 feet high; the four lower windows in form of long narrow openings; the belfry windows adorned with that species of opening called the *quatrefoil*: the top battle-mented, out of which rises a handsome spire.—At a small

Brechin, small distance from the aisle stands one of those singular round towers whose use has so long baffled the conjectures of antiquaries. These towers appear to have been peculiar to North Britain and Ireland: in the last they are frequent; in the former, only two at this time exist. That at Brechin stood originally detached from other buildings. It is at present joined near the bottom by a low additional aisle to the church, which takes in about a sixth of its circumference. From this aisle there is an entrance into it of modern date, approachable by a few steps, for the use of the ringers; two handsome bells are placed in it, which are got at by means of six ladders placed on wooden semicircular floors, each resting on the circular abutments withinside of the tower. The height from the ground to the roof is 80 feet; the inner diameter, within a few feet of the bottom, is 8 feet; the thickness of the wall at that part, 7 feet 2 inches; so that the whole diameter is 15 feet 2 inches: the circumference very near 48 feet; the inner diameter at top is 8 feet 7 inches; the thickness of the walls 4 feet 6 inches; the circumference, 38 feet 8 inches: which proportion gives the building an inexpressible elegance: the top is roofed with an octagonal spire 23 feet high, which makes the whole 103. In this spire are four windows placed alternately on the sides, resting on the top of the tower; near the top of the tower are four others facing the four cardinal points: near the bottom are two arches, one within another, in relief; on the top of the outmost is a crucifixion: between the mouldings of the outmost and inner are two figures; one of the Virgin Mary; the other of St John, the cup, and lamb. On each corner of the bottom of this arch is a figure of certain beasts; one possibly the Caledonian bear; and the other, with a long snout, the boar. The stone-work within the inner arch has a small slit or peep-hole, but without the appearance of there having been a door within any modern period; yet there might have been one originally; for the filling up consists of larger stones than the rest of this curious rotund. The whole is built with most elegant masonry, which Mr Gough observed to be composed of 60 courses.—This tower hath often been observed to vibrate with a high wind.

The castle of Brechin was built on an eminence, a little south of the town; it underwent a long siege in the year 1303; was gallantly defended against the English under Edward III.; and, notwithstanding all the efforts of that potent prince, the brave governor Sir Thomas Maule, ancestor of the family of Panmure, held out this small fortress for 20 days, till he was slain by a stone cast from an engine on the 20th of August, when the place was instantly surrendered. The family of Panmure have now a noble house on the site of the old castle.—Brechin is also remarkable for a battle fought near it, in consequence of the rebellion raised in 1452, on account of the murder of the earl of Douglas in Stirling castle. The victory fell to the royalists under the earl of Huntly. The malecontents were headed by the earl of Crawford, who, retiring to his castle of Finhaven, in the frenzy of disgrace declared, that he would willingly pass seven years in hell, to obtain the glory that fell to the share of his antagonist.

BRECKNOCK, or **BRECON**, a town of Brecknockshire in Wales, and capital of the county. It is called by the Welsh *Aber Hondey*, and is seated at the con-

fluence of the rivers Hondey and Usk, over which there is a handsome stone bridge. It is an ancient place, containing three churches, one of which is collegiate, and is seated at the west end of the town. The houses are well built. Here was formerly a stately castle, and a strong wall, through which there were three gates, that are all demolished. It sends one member to parliament. It is well inhabited, which is in some measure owing to its being the town where the assizes are kept; and there is here a considerable woollen manufactory. The markets are well supplied with cattle, corn, and provisions. W. Long. 3. 15. N. Lat. 52. 0.

BRECKNOCKSHIRE, a county of Wales, bounded by Radnorshire, on the north; Cardiganshire and Caermarthenshire, on the west; Herefordshire and Monmouthshire, on the east; and by Glamorganshire and Monmouthshire, on the south. It is 35 miles in length, 30 in breadth, about 100 in circumference, and contained 37,735 inhabitants in 1811. It is surrounded with hills, which renders the air in the valleys pretty temperate. The soil on the hills is very stony, but the streams descending from thence into the valleys render them fruitful both in corn and grass. The chief commodities here are corn, cattle, fish, and otter's fur, besides manufactures of cloth and stockings. The principal rivers are the Usk, the Wye, and the Yvron. The chief towns are Brecknock, Bealt, and Hay.

Two miles to the east of Brecknock is a large lake, called *Brecknock Meer*, and by the Welsh *Llyn Savodan*; it is two miles in length, and nearly the same in breadth, and contains otters, tench, &c. The county sends one member to parliament. It is in the diocese of Landaff, and contains 61 parishes, and is divided into six hundreds. See **BRECONSHIRE**, SUPPLEMENT.

BREDA, a town in Holland, the capital of Dutch Brabant. It is a large, populous, well-built city, regularly fortified after the modern way, and is one of the strongest places on the Dutch frontiers. It is seated on the river Merck, in a marshy country, which may be overflowed and rendered inaccessible to an army. It is 4000 paces in circumference, and contains upwards of 11,000 inhabitants. The town is of a triangular figure, and the ramparts are all planted round with elms. At every angle there is a gate built with brick. The great church is a noble structure, remarkable for its fine spire, which is 362 feet high. The mausoleum of Angelbert II. count of Nassau, is a curious piece, adorned with several statues and inscriptions suitable to the occasion. In 1577, the garrison delivered this city to the states-general; but it was taken in 1581 by Claude de Barlaimount, assisted by the baron de Fresin, who was prisoner therein. In 1590, Prince Maurice took it again from the Spaniards.

In 1625 it was invested by Spinola; when it endured a siege too remarkable not to deserve a particular detail.

The citadel, which formed the residence of the princes of that family, was surrounded by a ditch of prodigious depth filled with water, and a strong wall defended by three great bastions; and the arsenal was celebrated for its extent, and the vast quantities of arms and military stores it contained. Spinola, perfectly acquainted with the strength of the place, thought he should expose his whole army to immediate destruction, should he attempt an assault before he had regularly carried

Breda.

carried on his approaches. He even resolved upon reducing the city by famine, as the method attended with least danger to his army; and accordingly began with drawing trenches round, for the space of four miles, erecting forts and redoubts at certain distances.

On the other hand, the garrison, consisting of seven thousand infantry, and several troops of horse, composed of English, French, and Dutch soldiers, took the most vigorous measures for their own defence. The English were under the command of Colonel Morgan, who had frequently distinguished his valour in the service of the States: the French were directed by Colonel de Hauterive; and the Dutch troops were subject to the immediate orders of Colonel Lohre, though the whole received their instructions from Justin de Nassau, the governor. The first advantage was gained by Baglioni, who seized a large convoy of provisions and stores coming up the river, converting the boats into a bridge. This loss dispirited the besieged, and reduced them to a stated allowance of bread; and what added to their misfortunes, though they were ignorant of it, was the death of Prince Maurice, from whom they were in hopes of receiving relief.

Meanwhile Spinola prosecuted the siege with the utmost diligence and vigour. On his pushing his trenches near the bastions, the besieged began a terrible fire to retard his approaches, and kept it up with such vehemence and obstinacy, that Spinola was in hopes they must soon surrender for want of ammunition. But here he formed a false judgment of the prudence of Justin de Nassau, who finding he could not accomplish his purpose by his firing, resolved to try the effect of water. With this view, he stopped up the course of the river Marck; and having formed a large basin of water, opened the sluices, swept away men, horses, and houses, in an inundation, and overflowed the whole country. The chief force of the torrent fell upon Spinola's quarters, and he exerted his utmost ability to remove the consequences. He dug large pits, and cut out ditches and canals to receive the water; but these being filled, and the whole ground covered over, so as to appear one uniform mass of water, served only to entrap his cavalry. The inundation was augmented by the rains which happened to fall; a mortality among the soldiers and horses ensued; and of his whole army, Spinola had scarce twelve thousand men fit for service by the month of December. With these inconsiderable remains, lines of vast extent were to be defended, the works were to be advanced, the sallies from the garrison repulsed, and provisions to be conveyed into the camp, while Spinola, the soul of action, was confined to a sick-bed.

In the garrison, an epidemical disease and scarcity likewise prevailed; but the excellent regulations made, and strictly observed, enabled the town to hold out three or four months beyond the time expected. The magistrates bought the corn for the bakers; obliging them to sell the bread to the inhabitants and garrison at a fixed price, and returning the overplus of their pay to the soldiers. A variety of other prudent regulations were established by the magistrates and governor, such as we do not find equalled by any instances recorded in history upon a similar occasion, and all evincing the steadiness, sagacity, courage, and ability of

VOLF IV. Part I.

†

Breda.

Justin de Nassau. A kind of rivalry appeared between him and Spinola, which should best fulfil their several duties. The Spanish general caused himself to be carried about the works in a litter; he inspected and directed every thing; and displayed the activity of full health at the time his life was in imminent danger from an acute malady. He ordered several breaches in the lines to be repaired. These the Hollanders had made by sap, with a view of introducing succours to the besieged. He drove piles into all the ditches and canals through which their boats could pass. He made drains to clear off the waters of the river Marck; and succeeded in a great measure by dint of perseverance, vigilance, and conduct. He was now reinforced with a body of eight thousand foot, and one thousand five hundred horse; many of the sick were perfectly recovered by his extreme care; and his army was again become formidable, amounting to twenty-five thousand infantry, and eight thousand cavalry. Nor was Prince Henry idle, who now succeeded to the titles and dominions of his brother Maurice, and was elected governor of Holland, Zealand, Guelderland, Utrecht, and Overysse. He pressed France for assistance, and was joined by a body of cavalry under the conduct of the count de Roussi and the marquis de Rambures. With this reinforcement, and a body of German infantry, he attacked the enemy's lines, and after an obstinate conflict was repulsed. He advanced a second time; but Spinola, who entertained a high opinion of his valour and conduct, did not choose to wait for him in his lines; he marched out with the greater part of his army, seized upon a convenient post, and obliged the prince a second time to retire towards Boisleduc. Henry, finding no prospect of being able to relieve the garrison, sent a permission to the governor to surrender on the best conditions he could obtain. This plan, which was signed with no name, fell into the hands of the besiegers, and Spinola sent it open, by a trumpet, to Justin de Nassau, offering him an honourable capitulation; but that intrepid governor, suspecting the letter was forged, because it was anonymous, replied civilly, that a permission was not an order to surrender; and that he should better follow the prince of Orange's intentions, and show his respect for Spinola, by continuing to defend the city to the last extremity.

By this time the garrison was diminished by disease, fatigue, want, and hardship, to half the original number; but Justin put on such a countenance, as concealed his situation from Spinola. He frequently sallied out upon Baglioni's quarters, where the Italians were perishing with cold and hunger, the whole subsistence of the besiegers depending on the contributions raised in the neighbouring territories. This inconvenience produced a mutiny in the camp, that could not be appeased without applying violent remedies, and executing within sight of the whole army the chief ringleaders. One of the mutineers blew up Spinola's chief magazine, valued at two hundred thousand livres. Urged more by necessity than compassion for the besieged, Spinola sent a message to the governor, exhorting him not to force him to extremities, which might be attended with fatal consequence to a brave garrison; but Justin, with equal art and dissimulation, answered, that Spinola was certainly ill served by his

3 D

spies,

Breda.

spies, as he appeared wholly unacquainted with the state of affairs in Breda, which was fully provided for a siege of several months, and defended by soldiers who preferred death to the necessity of surrendering. At that time the besieged were not informed of the death of the prince of Orange. They flattered themselves with the hopes of speedy succour, and were entirely ignorant of Prince Henry's late disappointment. When they wrote to the army an account of their miserable condition, Henry returned an answer, written with his own hand, and signed with his name, apprising them of the death of Maurice, the unsuccessful attempts made to raise the siege and throw in succours, the great inferiority of his troops in point of numbers, and the death of King James, whereby he was disappointed of a strong reinforcement; concluding, that he left the city entirely to the discretion of the governor and other principal officers. Justin was thunderstruck with the contents of this letter. He had hitherto concealed the total want of provision and ammunition from the enemy, and his own garrison, except a few officers and other persons in whom he reposed confidence. The colonels Hauterive and Morgan would listen to no propositions, saying, that the honour of their several countries was concerned, and that they were responsible for the conduct of the English and French forces. They therefore required an express order from the prince of Orange to surrender, notwithstanding they pined under the united pressure of fatigue, scarcity, and disease. Justin acquainted the prince with their resolution, and he sent back an order to surrender, threatening with capital punishment whoever should disobey; but he requested that the garrison would first acquaint him by a certain number of fires, lighted up in different parts of the city, how many days they should be able to hold out. Upon receipt of this order, eleven fires were kindled; but as the prince had sent a duplicate of the order by another messenger, and this fell into the hands of the enemy, Spinola was now acquainted with the desperate circumstances of the besieged. By this acquisition, he likewise discovered the mystery of the eleven fires: a council of war was assembled to deliberate whether they should stay the eleven days, and then oblige the garrison to surrender at discretion, or immediately offer conditions worthy of so brave a garrison. The Spanish officers were of the former opinion; the count de Berg and Spinola supported the latter. At last the marquis, determined to pursue the dictates of his noble generosity, sent such terms as could not be refused. The count de Berg conducted the negotiation. Two separate capitulations were drawn up, one for the garrison and the other for the city, and both the most honourable and advantageous that could be devised. They were accepted, and the garrison marched out on the 6th of June, after having sustained a siege for ten months, whereby they were diminished two thirds; nor was the loss inferior on the part of the inhabitants. Spinola drew up his army to salute them, and, surrounded by his field officers, paid particular compliments to the governor, the colonels Morgan, Hauterive, and Lohre. He distributed money among the soldiers, ordered the sick and wounded to be treated with the utmost tenderness, conveyed the rest in the manner most commodious for them to Gertruydenburg, and displayed all the senti-

ments of a hero in the regard paid to the valour and merits of his enemies.

Breda was retaken by the prince of Orange, for the United Provinces, in 1637. There was a congress held there, and peace concluded, in 1667, between the Dutch and the English. E. Long. 4. 45. N. Lat. 51. 35.

BREDA, *John Van*, painter of history, landscape, and conversations, was born at Antwerp in 1683, the son of Alexander Van Breda, an artist who was much esteemed for landscapes, views of particular scenes in Italy, fairs, and markets, with a variety of animals and figures. He was instructed by his father: and having the advantage of a good example and a good director, added to his own great application, he continued his studies with his father till he was 18 years of age. Among the variety of capital paintings which were at that time in the possession of John de Wit at Antwerp, Breda fixed upon those of Velvet Breughel, which he copied with extraordinary success; and he was also employed for nine years in copying the pictures of several other great masters; which he performed with such incredible exactness as scarcely to leave it in the power of any judicious person to distinguish the originals from the copies. Having at length established his reputation in Holland, he went to London with Rysbrack the sculptor, and there gradually rose into such esteem, that he was visited by persons of the highest rank, and particularly patronized by the unfortunate earl of Derwentwater, who was beheaded for rebellion in 1715. He found so much encouragement in London, that he was employed by the court and the nobility, and could scarce execute the large demands for his performances. After a residence of some years in England, he returned to Antwerp loaded with riches, the honourable testimonies of English liberality, as well as of his own merit; and in the year 1746, when Louis XV. arrived in that city, he so far honoured this master as to purchase four of his pictures: One represented Christ at the sea of Tiberias; another, Christ performing miracles; and the other two were landscapes, with a number of figures, so exquisitely drawn and finished that it would be difficult to distinguish them from those of Velvet Breughel. He certainly approached nearer to those great masters, whose manner he imitated, namely, Breughel and Wouvermans, than any other artist of this time. His landscapes are in the style and taste of the former; and his conversations, historical figures, fairs, skirmishes, or battles, are in the manner of the latter. His colouring is good; his touch neat; his skies and distances natural and beautiful; and his taste of design agreeable. He had as much fire in his composition, and perhaps more genius, than Breughel, in those subjects which he painted in the style of that master: his figures are generally well placed; his grounds skillfully broken; every small figure has its particular character, and occupies its proper place; and, in short, he is a painter of such a rank, that the value and estimation of his works must always increase. He died in 1750.

BREECH of a great gun, or cannon, the end next the touch-hole.

BREECHES, a garment worn by males, reaching from the girdle to the knees, and serving to cover the hips, thighs, &c.

The

Breeches The ancient Romans had nothing in their dress answering to our breeches and stockings; instead of which, under their lower tunics and waistcoats they sometimes bound their thighs and legs round with silken scarves or fasciæ, called *tibiaia* and *femoralia*. Breeches appear to be a habit peculiar to the barbarous nations, especially those inhabiting the colder countries of the north; whence Tacitus calls them *barbarum tegmen*. We find mention made of them among the ancient Goths, Sarmatæ, Gauls, Germans, and Britons; they also obtained among the Medes and Persians, as being a people of Scythian origin; they also afterwards got footing in Italy, some pretend, as early as the time of Augustus; but without much foundation, that emperor's breeches, mentioned by Suetonius, being apparently only swaths tied over his thighs. However this be, breeches were at last received into Italy, and grew so highly into fashion, that it was thought necessary, under Honorius and Arcadius, to restrain them by law, and expel the *bracarii* or breeches-makers out of the city; it being thought unworthy of a nation that commanded the world, to wear the apparel of barbarians.

BREECHINGS, in the sea-language, the ropes with which the great guns are lashed or fastened to the ship's side. They are thus called, because made to pass round the breech of the gun.

BREEDING, in a general sense, the producing, nourishing, and educating, all manner of young animals.

BREEDING, in a moral sense, denotes a person's deportment or behaviour in the external offices and decorums of social life. In this sense we say *well-bred, ill-bred, a man of breeding*, &c. Good-breeding is hard to define; none can understand the speculation but those who have the practice. Good-breeding amounts to much the same with what is otherwise called *politeness*, among the ancient Romans *urbanity*. Good-breeding is near to virtue, and will of itself lead a man a great part of the way towards the same. It teaches him to rejoice in acts of civility, to seek out objects of compassion, and to be pleased with every occasion of doing them good offices. Lord Shaftesbury compares the well-bred man with the real philosopher; both characters aim at what is excellent, aspire to a just taste, and carry in view the model of what is beautiful and becoming. The conduct and manners of the one are formed according to the most perfect ease, and good entertainment of company; of the other, according to the strictest interest of mankind: the one according to his rank and quality in his private station; the other according to his rank and dignity in nature. Horace seems to have united both characters,

Quid verum atque decens curo et rogo, et omnis in hoc sum.

See the article *Good-MANNERS*.

BREEDING of Horses. See *EQUUS*.

BREEDING of Fish. The necessary qualities of a pond, to make it serve well for breeding fish, are very different from those which are to make it serve for the feeding of them, insomuch that some particular ponds serve only for one of these purposes, and others for the other; and scarce ever the same pond is found to answer for them both. In general, it is much more rare to find a good breeding pond than a good feeding one.

The best indications of a good breeding pond are these; that there be a good quantity of rushes and grass about its sides, with gravelly shoals, such as horse-ponds usually have: when a pond has this property, and takes to the breeding of fish, it is amazing what a progress will be made in a little time. The spawn of fish is prodigious in quantity; and where it succeeds, one is able to produce many millions; thus, in one of these breeding ponds, two or three milters, and as many spawners, will, in a very little time, stock the whole country. When these ponds are not meant entirely for breeding, but the owner would have the fish to grow to some size in them, the method is to thin the numbers, because they would otherwise starve one another, and to put in other fish that will prey upon the young, and thin them in the quickest manner. Eels and perch are the most useful on this account; because they prey not only upon the spawn itself, but upon the young fry from the first hatching to the time they are of considerable size. Some fish are observed to breed indifferently in all kinds of waters, and that in considerable plenty; of this nature are the roach, pike and perch.

BREENBERG, BARTHOLOMEW, an excellent painter, was born in 1620. He is best known by the name of *Bartolomeo*, an appellation bestowed upon him, for distinction sake, by the society of Flemish painters at Rome called *Bentvogels*. He was born at Utrecht; but in the early part of his life went to Rome. His studies in the art of painting were attended with such success, that his pictures were held in the highest estimation. He greatly excelled in landscapes, and these he enriched with historical subjects. The figures and animals which he introduced were very spirited, and drawn in a masterly manner; especially when they were not larger than the size in which he usually painted them. He died in 1660, aged 40 years. He also etched from his own designs a set of 24 *Views and Landscapes, ornamented with Ruins*.

BREEZE, a shifting wind that blows from sea or land for some certain hours in the day or night; common in Africa and some parts of the East and West Indies.

Breezes differ from *etnixæ* or trade-winds, as the former are diurnal, or have their periods each day; and the latter are anniversary, and blow at a distance from land. The sea-breezes rule by day, and the land-breezes by night; so that, dividing their empire, they remain constant as the seasons of the year, or course of the sun, on which they seem to depend; not but that they appear sooner or later, stronger or weaker, in some places than in others; and vary the alternative according to the several latitudes, situations, and soils, &c. of the countries where they are found. See the article *WIND*.

BREEZE-Fly. See *TABANUS*, *ENTOMOLOGY Index*.

BREGENTZ, or *BERGENTZ*, a town of Tyrol in Germany, situated at the east end of the lake of Constance, in E. Long. 9. 40. N. Lat. 47. 36.

BREGMA, in *Anatomy*, the same with *sinciput*. See *ANATOMY Index*.

BREHAR, one of the Scilly islands, lying almost directly west of the Land's End in Cornwall, about the distance of 30 miles. It lies between the isles of Miscarol, Guel, Trescaw, and Samson. It is the roughest and most mountainous of them all, and not many years

Brehar
Bremen.

since, there were only two families in it, but now there are 13. There are a few poor houses, called the *town of Brehar*; and there are several BARROWS edged with stone, in which they buried considerable persons in ancient times; besides many monuments of the DRUIDS. Some are of opinion, that this with the rest made but one island, which is the reason why so many antiquities are now found in most of them.

BREHONS, the provincial judges among the ancient Irish, by whom justice was administered, and controversies decided. These sages were a distinct tribe or family, to whom competent lands were allowed in inheritance. In criminal cases the brehon had the eleventh part of all the fines; which could not but be considerable at a time when murders, rapes, robberies, and the like offences, were only subject to pecuniary commutations.

BREHON-Laws, or *Leges Brehonicae*, denote the general maxims or rules of law observed by the brehons, and having the force of laws throughout all the provinces of Ireland. Several fragments of the *leges brehonicae* are still extant in public and private libraries. The most complete collection is that belonging to the duke of Chandos; containing 22½ sheets close written, full of abbreviated words, and not very legible. By the statute of Kilkenny, made under Edward III. it is enacted that no English subject shall submit to a trial by the *brehon* law, on the penalty of high treason. Notwithstanding which, many were still under a necessity of being concluded by the Irish laws and customs, till the whole kingdom was settled on an English bottom by King James I.

BREMEGARTON, a handsome and pretty considerable town of Switzerland, which, since 1798, forms the head town of a district in the new canton of Argau. The inhabitants deal chiefly in paper; and their religion is the Roman-catholic. It is divided into the upper and lower towns, and is very advantageously seated on the river Russ. E. Long. 8. 25. N. Lat. 47. 20.

BREMEN, a large, populous, and very strong town of Germany, capital of a duchy of the same name, with an archbishop's see, secularized in favour of the Swedes, but now belongs to the king of Hanover. The river Weser runs through the middle, and divides it into the old and new town. In September 1739, while the inhabitants were asleep, the magazine of powder was set on fire by lightning, and all the houses were shaken, as if there had been a violent earthquake, which threw them into a terrible consternation. The town is divided into four quarters, each of which has a burgomaster; and in the middle there is a large market-place, with the statue of Rolando. Bremen drives a very large trade for iron, flax, hemp, and linen, with France, England, Spain, and Portugal; and in return takes back other provisions, with which it supplies Westphalia and the countries about Hanover. It also gets a great deal by its fisheries. It contains 5350 houses, and about 40,000 inhabitants. E. Long. 8. 45. N. Lat. 53. 40.

BREMEN, a duchy of Germany, in the province of Lower Saxony, lying between the rivers Weser and the Elbe; of which the former separates it from the duchy of Oldenburg, and the other from that of Holstein. The air is cold; but the country is fertile, and well

peopled. It formerly belonged to the Swedes, but was afterwards sold to the king of Great Britain, as elector of Hanover, in 1716. In the winter it is subject to inundations. In 1617, on Christmas-day, several thousand cattle were drowned, besides several hundred of men: and the country was so covered with water, that it has cost immense sums to repair the dykes. Bremen is the capital town.

BREMEN-*Veerd*, a town of Germany, in the circle of Lower Saxony, and duchy of Bremen. It is an open town, seated on the river Oost, and was formerly the place of residence of the archbishop. E. Long. 8. 35. N. Lat. 53. 58.

BRENNAGE, BRENNAGIUM, in middle-age writers, a kind of tribute paid in lieu of bran, or bran itself, which the tenants were obliged to furnish for the support of the lord's hounds. The word is also written *brenage*, *brenagium*, and *brenaigne*, *bernagium*, *brenaticum*, and *brennaticum*.

BRENNUS, a celebrated captain among the Gauls, who, about 388 years before the Christian era, entered Italy with a powerful army; made great conquests there; defeated the Romans; and sacked Rome. The capitol alone was defended; and Camillus coming to its relief, drove the Gauls not only out of Rome, but out of all Italy. See (*History of*) ROME.

BRENT, a town of Devonshire, with a market on Saturdays; and two fairs, on May 13th and October 10th, for horned cattle. It contains 1230 inhabitants, and lies on the road from Exeter to Plymouth, being 26 miles south-west from the former, and 198 west by south of London. W. Long. 5. 7. N. Lat. 50. 30.

BRENT-Goose, a species of goose with a black neck, and a white collar round; usually confounded with the barnacle, though in reality a distinct species. See ANAS, ORNITHOLOGY *Index*.

BRENTFORD, a town of Middlesex, on the great London road to the west. It is divided into old and new Brentford, in which last are the church and market-house, and where the county elections are held. It is a long place, well stocked with public houses, and is seated on the river Thames. Population, 1733. W. Long. 0. 10. N. Lat. 51. 26.

BRENTWOOD or BURNTWOOD, a town of Essex in England. It stands on a rising ground in the road from London to Colchester, and contained 1233 inhabitants in 1811. E. Long. 0. 25. N. Lat. 51. 38.

BREREWOD, EDWARD, a very learned English mathematician and antiquary, was the son of Robert Brerewod, a tradesman, who was thrice mayor of Chester; and born in that city in the year 1565. He was educated in grammar learning at the free school in Chester; and afterwards admitted, in 1581, of Brazen-nose-college in Oxford. In the year 1596, he became the first professor of astronomy in Gresham-college in London; where he led the same private and retired course of life that he had before done in Oxford. He died there of a fever, upon the 4th of November 1613, much lamented. He was a great searcher into antiquity and curious knowledge; but is remarkable for having never published any thing during his lifetime. After his death came out the following works. 1. *De ponderibus et pretiis veterum nummorum*. 2. Inquiries touching the diversities of languages and religion through the chief parts of the world. 3. *Elementa logica in gratiam*

Bremen
Brentwood.

Brewood *tiam studiosa juventutis in Acad. Oxon.* 4. *Tractatus quidam logici.* 5. 6. Two treatises on the Sabbath. **Breslau.** 7. *Tractatus duo, quorum primus est de meteoris, secundus de oculo.* 8. *Commentarii in ethica Aristotelis.* Mr Wood tells us, that the original manuscript of this, written with his own hand, is in the smallest and neatest characters that his eyes ever beheld: and that it was finished by him on the 27th of October 1586. 9. Patriarchal government of the ancient church.

BRESCIA, a strong and handsome town of Italy, with a bishop's see and good citadel. It is the capital of Bresciano, contains 48,000 inhabitants, and is seated in an agreeable plain on the river Garza, in E. Long. 10. 5. N. Lat. 45. 31.

BRESCIANO, a province of Italy in the territories of Austria; bounded on the north, by the Grisons and the bishopric of Trent; on the east, by the lake Garda, the Veronese, and the duchy of Mantua; on the south, by the duchy of Mantua and the Cremonese; and on the west by the Cremasco, the Bergamasco, and the Valtelina. It is watered by several small rivers, which renders it very fertile; and is full of towns and villages, of which Brescia is the capital.

BRESCELLO, a small town of Italy, in the duchy of Modena, seated on the river Po, in E. Long. 10. 25. N. Lat. 44. 55.

BRESCICATE, in *Commerce*, a kind of baize, in which there is some trade carried on with the negroes, between the river Gambia and Sierra Leona. The best sorts for that purpose are the blue and the red.

BRESLAU, a small duchy of Lower Silesia, in Germany, lying between those of Wolaw, Olsee, Brieg, Schwednitz, and Lignitz. It is everywhere level and flat: is an excellent corn country, yielding also good pasture; abounding also with herds of cattle and flocks of sheep; but destitute of wood, except in one district or circle; and the roads in general are very bad. It is an immediate principality, that is, one of which both the property and jurisdiction belong to the king, forming a part of one of the three bailiwicks into which all the immediate principalities are divided.

BRESLAU, the chief town of the duchy of that name, and of all Silesia, is situated at the conflux of the Oder and Ohlau, in E. Long. 17. 5. N. Lat. 51. 4. It contained 3096 houses in 1794, and has many large regular squares, broad streets, stately public and private edifices; but the fortifications are of no great importance. Here are in particular a great many churches and convents belonging to the Catholics; of the former are several also belonging to the Lutherans, one to the Calvinists, and another to the Greeks. The Jews have likewise two synagogues, the bishop a stately palace, and the Lutherans two gymnasiums. The Popish university is a noble structure, nor is the exchange destitute of magnificence. This city is the seat of all the high colleges; and the third in rank, next to Berlin and Konigsberg, in all the Prussian dominions. The magistracy of it is Lutheran, and its trade and manufactures are very considerable. Several of the monasteries and nunneries are very magnificent; and there are also some good public libraries in it, with two armouries, a college of physicians, and a mint. Breslau is very populous, and much frequented by Hungarian, Bohemian, Polish, and other merchants, having several

yearly fairs. The city was taken by the king of Prussia in 1741, and retaken by the Austrians in 1757; but the king of Prussia took it back again in the same year. The suburbs were destroyed when it was taken by the confederates of the French in January 1807.

BRESSE, a province of France, bounded on the north by Burgundy and the Franche Comte; on the east, by Savoy; on the south, by Viennois; on the west, by the principality of Dombes and the Somme. It is 40 miles from north to south, and 23 from east to west. It is fertile in corn and hemp, has fine pastures, and several lakes with plenty of fish: It is divided into the higher and lower; the first is on the side of Bourges, and the second towards St Trivier and the river Sonne. The French got possession of it in 1601. The principal places are Bourg en Bresse, Montluel, Pont de Vaux, and Coligny.

BRESSICI, in *Geography*. See **BRESTE**.

BREST, a maritime town of France, in the department of Finisterre, seated on the declivity of a hill on the side of its port, which is the largest in the kingdom, and will hold 500 ships at a time. There is an arsenal with sea-stores, which was placed there on account of its nearness to the woods, mines of iron, and other things proper for the building of ships. It was entirely consumed by fire in 1744, which was an irreparable loss to France. The entrance into the port is guarded by a strong castle seated on a rock, which cannot be attempted on the sea-side, because it is craggy, and is defended on the land-side by a large ditch and other fortifications. The streets of Brest are very narrow, ill contrived, few in number, and have all a descent. A great quay surrounds this side of the port, which is above a mile in length, and 200 paces broad; and there are magazines on the quay full of all foreign merchandises. On the other side of the port the fine church of Notre Dame is situated; and in a suburb, which is as big as half the city, there is a strong tower opposite to the castle, at the entrance of the port; there is also a great quay on this side, bordered with large magazines, partly within the rock, which has been cut away to enlarge the place. These are extended almost as far as the bottom of the harbour, where there are two docks very commodious for the building of large ships: the shops and houses of the workmen are all around them: the rope-walks are separated from the city by one of these docks. The entrance into the harbour is called the *gullet*, and is a passage extremely difficult on account of the sunk rocks on both sides of the shore; but there are experienced pilots who carry ships in very safely. The English attempted to take possession of this harbour in 1694, but were disappointed. Population 24,180 in 1815. W. Long. 4. 26. N. Lat. 48. 23.

BREST, or *Breast*, in *Architecture*, a term sometimes used for the member of a column, more usually called *torus*. See **TORUS**.

BEST Summers, in timber buildings, are pieces in the outward side thereof, into which the girders are framed: this, in the ground-floor, is called a *cell*; and, in the garret-floor, a *beam*.—As to their size, it is the same with that of girders. See **GIRDERS**.

BRESTE, the palatinate of, is one of the provinces of Cujava, in Poland. It lies between the palatinates of Ploesko, Rava, and Lencici Windislaw. It is divid-

Breslau.
Breste.

Breste ed into four chatelannies, and Breste is the capital of the whole.

BRESTE, or *Bressici*, the capital of the palatinate of Bressici, and of Polesia in Poland, seated on the river Bog, 80 miles east of Warsaw, and subject to Poland. It is a fortified town, and has a castle built upon a rock. Here is a famous synagogue, resorted to by the Jews from all the countries in Europe. E. Long. 24. O. N. Lat. 41. 35.

BRET, a name the people on the coasts of Lincolnshire give to the common turbot, a fish extremely plentiful with them, and taken in vast abundance. The way of catching them is in a net trailed on the ground by two horses; the one going up to the middle of his body in water, the other on shore.

BRETESSE, in *Heraldry*, denotes a line embattled on both sides.

BRETHREN AND SISTERS OF THE FREE SPIRIT, in Ecclesiastical History, an appellation assumed by a new sect which sprung up towards the close of the thirteenth century, and gained many adherents in Italy, France, and Germany. They took their denomination from the words of St Paul, Rom. chap. viii. ver. 2. 14.; and maintained, that the true children of God were invested with the privilege of a full and perfect freedom from the jurisdiction of the law. They were enthusiasts to a degree of distraction, both in their principles and practice. They resembled the *Beghards*, by which name they were sometimes called, in their aspect, apparel, and manner of living. Some of their professed principles resembled those of the Pantheists; for they held, that all things flowed by emanation from God; that rational souls were portions of the Deity, and that the universe was God; and that, by the power of contemplation, they were united to the Deity, and acquired hereby a glorious and sublime liberty, both from the sinful lusts and the common instincts of nature: and hence they concluded, that the person, who was thus absorbed in the abyss of the Deity, became a part of the Godhead, and was the son of God, in the same sense and manner that Christ was, and that he was freed from the obligation of all laws human and divine. They treated with contempt all Christian ordinances, and all external acts of religion, as unsuitable to the state of perfection at which they were arrived. Some of them were honest but deluded enthusiasts; and they endured the torments inflicted upon them by the inquisitors with astonishing calmness and triumph. Others proceeded to the most extravagant licentiousness of conduct. They held their secret assemblies stark naked, and lay in the same beds with their spiritual sisters, and indiscriminately with other women, without the least scruple or hesitation: modesty and decency being, according to their creed, marks of inward corruption. And some of them proceeded still farther, and maintained, that the *divine man*, or believer, could not sin, let his conduct be ever so horrible or atrocious. Many edicts were published against them; but notwithstanding the severities they suffered, they continued till about the middle of the fifteenth century. They were called by several other names, such as *Schwestriones*, *Picards*, *Adamites*, and *Turlopins*.

BRETHREN and Clerks of the Common Life, a denomination assumed by a religious fraternity towards the lat-

ter end of the fifteenth century. They lived under the rule of St Augustin, and were eminently useful in promoting the cause of religion and learning. Their society was first formed in the preceding century, by Gerard de Groete, a native of Deventer; but did not flourish till about the period above mentioned, when it obtained the approbation of the council of Constance, and became very respectable in Holland, the Lower Germany, and the adjacent provinces. It was divided into two classes; the *lettered brethren or clerks*, and the *illiterate*: they lived in separate habitations, but maintained the closest fraternal union. The former applied to the study of polite literature, and the education of youth; whilst the latter were employed in manual labour, and the mechanic arts. They were frequently called *Beghards* and *Lollards*, by way of reproach.

White BRETHREN, fratres albi, were the followers of a leader, about the beginning of the fifteenth century, who was arrayed in a white garment; and as they were also clothed in white linen, they were distinguished by this title. Their leader was a priest from the Alps, who carried about a cross, like a standard, and whose apparent sanctity and devotion drew together a number of followers. This deluded enthusiast practised many acts of mortification and penance, endeavoured to persuade the European nations to renew the holy war, and pretended that he was favoured with divine visions. Boniface IX. ordered him to be apprehended and committed to the flames, upon which his followers dispersed.

BRETON, or **CAPE-BRITAIN**, an island near the eastern continent of North America, lying between 45 and 47 degrees of north latitude. It is separated from Nova Scotia by a narrow strait called *Casco*, and is about 100 miles in length, and 50 in breadth. It is surrounded with little sharp-pointed rocks, separated from each other by the waves, above which some of their tops are visible. All its harbours are open to the east, turning towards the south. On the other parts of the coast there are but a few anchoring places for small vessels, in creeks, or between islets. Except in the hilly parts, the surface of the country has but little solidity, being everywhere covered with a light moss, and with water. The dampness of the soil is exhaled in fogs, without rendering the air unwholesome. In other respects, the climate is very cold; owing either to the prodigious quantity of lakes, which cover above half the island, and remain frozen a long time; or to the number of forests, that totally intercept the rays of the sun; the effect of which is besides decreased by perpetual clouds.

Though some fishermen had long resorted to this island every summer, not more than 20 or 30 had ever fixed there. The French, who took possession of it in August 1713, were properly the first inhabitants. They changed its name into that of *Ile Royale*, and fixed upon Fort Dauphin for their principal settlement. This harbour was two leagues in circumference. The ships came to the very shore, and were sheltered from winds. Forests affording oak sufficient to fortify and build a large city, were near at hand; the ground appeared less barren than in other parts, and the fishery was more plentiful. This harbour might have been rendered impregnable at a trifling expence; but the difficulty

Breton.

difficulty of approaching it (a circumstance that had at first made a stronger impression than the advantages resulting from it) occasioned it to be abandoned, after great labour had been bestowed upon the undertaking. They then turned their views to Louisbourg, the access to which was easier; and convenience was thus preferred to security: the fortification of Louisbourg, however, was not begun till 1720.

In the year 1714, some fishermen, who till then had lived in Newfoundland, settled in this island. It was expected that their number would soon have been increased by the Acadians, who were at liberty, from the treaties that had been granted them, to remove with all their effects, and even to dispose of their estates; but these hopes were disappointed. The Acadians chose rather to retain their possessions under the dominion of Britain, than to give them up for any precarious advantage they might derive from their attachment to France. Their place was supplied by some distressed adventurers from Europe, who came over from time to time to Cape Breton, and the number of inhabitants gradually increased to 4000. They were settled at Louisbourg, Fort Dauphin, Port Toulouse, Nerucka, and on all the coasts where they found a proper beach for drying the cod. The inhabitants never applied themselves to agriculture, the soil being unfit for it. They often sowed corn, but it seldom came to maturity; and when it did thrive so much as to be worth reaping, it had degenerated so considerably, that it was not fit for seed for the next harvest. They have only continued to plant a few pot-herbs that are tolerably well tasted, but must be renewed every year from abroad. The poverty and scarcity of pastures has likewise prevented the increase of cattle. In a word, the soil of Cape Breton seemed calculated to invite none but fishermen and soldiers.

Though the island was entirely covered with forests before it was inhabited, its wood has scarce ever been an object of trade. A great quantity, however, of soft wood was found there fit for firing, and some that might be used for timber; but the oak has always been scarce, and the fir never yielded much resin. The peltry trade was a very inconsiderable object. It consisted only in the skins of a few lynxes, elks, musk-rats, wild cats, bears, otters, and foxes both of a red and silver-gray colour. Some of these were procured from a colony of Micmac Indians who had settled on the island with the French, and never could raise more than 60 men able to bear arms. The rest came from St John's, or the neighbouring continent. Greater advantages might possibly have been derived from the coal-mines which abound in the island. They lie in a horizontal direction: and being no more than six or eight feet below the surface, may be worked without digging deep, or draining off the waters. Notwithstanding the prodigious demand for this coal from New England, from the year 1745 to 1749, these mines would probably have been forsaken, had not the ships which were sent out to the French islands wanted ballast. In one of these mines a fire has been kindled, which could never yet be extinguished.

The people of Cape Breton did not send all their fish to Europe. They sent part of it to the French southern islands, on board 20 or 25 ships from 70 to 120 tons burden. Besides the cod, which made at least half

Breton.

their cargo, they exported to the other colonies timber, planks, thin oak-boards, salted salmon and mackerel, train-oil, and sea-coal. All these were paid for in sugar and coffee, but chiefly in rum and molasses. The island could not consume all these commodities. Canada took off but a small part of the overplus; it was chiefly bought by the people of New England, who gave in exchange fruits, vegetables, wood, brick, and cattle. This trade of exchange was allowed; but a smuggling trade was added to it, carried on in flour and salt fish.

This island, the key of Canada, was attacked by the English in 1745; and the event is of so singular a nature, that it deserves a particular detail. The plan of this first invasion was laid at Boston, and New England bore the expence of it. A merchant named *Popperel*, who had excited, encouraged, and directed the enterprise, was entrusted with the command of an army of 6000 men, which had been levied for this expedition.

Though these forces, convoyed by a squadron from Jamaica, brought the first news to Cape Breton of the danger that threatened it; though the advantage of a surprise would have secured the landing without opposition; though they had but 600 regular troops to encounter, and 800 inhabitants hastily armed; the success of the undertaking was still precarious. What great exploits, indeed, could be expected from a militia suddenly assembled, who had never seen a siege or faced an enemy, and were to act under the direction of sea-officers only. These unexperienced troops stood in need of the assistance of some fortunate incident, which they were indeed favoured with in a singular manner.

The construction and repairs of the fortifications had always been left to the care of the garrison of Louisbourg. The soldiers were eager of being employed in these works, which they considered as conducive to their safety, and as the means of procuring them a comfortable subsistence. When they found that those who were to have paid them, appropriated to themselves the profit of their labours, they demanded justice. It was denied them, and they were determined to assert their right. As these depredations had been shared between the chief persons of the colony and the subaltern officers, the soldiers could obtain no redress. Their indignation against these rapacious extortioners rose to such a height, that they despised all authority. They had lived in an open rebellion for six months, when the British appeared before the place.

This was the time to conciliate the minds of both parties, and to unite in the common cause. The soldiers made the first advances; but their commanders mistrusted a generosity of which they themselves were incapable. It was firmly believed that the soldiers were only desirous of sallying out, that they might have an opportunity of deserting; and their own officers kept them in a manner prisoners, till a defence so ill managed had reduced them to the necessity of capitulating. The whole island shared the fate of Louisbourg, its only bulwark.

This valuable possession, restored to France by the treaty of Aix-la-Chapelle, was again attacked by the British in 1758. On the 2d of June, a fleet of 23 ships of the line and 18 frigates, carrying 16,000 well-disciplined troops, anchored in Gabarus bay, within half a league

Breton. League of Louisbourg. As it was evident it would be to no purpose to land at a great distance, because it would be impossible to bring up the artillery and other necessaries for a considerable siege, it had been attempted to render the landing impracticable near the town. In the prudent precautions that had been taken, the besiegers saw the dangers and difficulties they had to expect; but, far from being deterred by them, they had recourse to stratagem, and while by extending their line they threatened and commanded the whole coast, they landed by force of arms at the creek of Cormorant.

This place was naturally weak. The French had fortified it with a good parapet planted with cannon. Behind this rampart they had posted 2000 excellent soldiers and some Indians. In front they had made such a close hedge with branches of trees, that would have been very difficult to penetrate, even if it had not been defended. This kind of pallasade, which concealed all the preparations for defence, appeared at a distance to be nothing more than a verdant plain.

This would have preserved the colony, had the assailants been suffered to complete their landing, and to advance with the confidence that they had but few obstacles to surmount. Had this been the case, overpowered at once by the fire of the artillery and the small arms, they would infallibly have perished on the shore or in the hurry of embarking; especially as the sea was just then very rough. This unexpected loss might have interrupted the whole project.

But all the prudent precautions that had been taken were rendered abortive by the impetuosity of the French. The English had scarce begun to move towards the shore, when their enemies hastened to discover the snare they had laid for them. By the brisk and hasty fire that was aimed at their boats, and still more by the premature removal of the boughs that masked the forces, which it was so much the interest of the French to conceal, they guessed at the danger they were going to rush into. They immediately turned back, and saw no other place to effect their landing but a rock, which had been deemed always inaccessible. General Wolfe, though much taken up in reembarking his troops, and sending off the boats, gave the signal to Major Scot to repair thither. That officer immediately removed to the spot with his men. His own boat coming up first, and sinking at the very instant he was stepping out, he climbed up the rock alone. He was in hopes of meeting with 100 of his men who had been sent thither some hours before. He found only ten. With these few, however, he gained the summit of the rock. Ten Indians and 60 Frenchmen killed two of his men, and mortally wounded three. In spite of his weakness, he stood his ground under cover of a thicket, till his brave countrymen, regardless of the boisterous waves and the fire of the cannon, came up to him, and put him in full possession of that important post, the only one that could secure their landing. The French, as soon as they saw that the enemy had got a firm footing on land, betook themselves to the only remaining refuge, and shut themselves up in Louisbourg. The fortifications were in a bad condition, because the sea sand, which they had been obliged to use, is by no means fit for works of masonry. The revetments of the several curtains were entirely crumbled away. There was only one casemate

and a small magazine that were bomb proof. The garrison which was to defend the place consisted only of 2900 men.

Notwithstanding all these disadvantages, the besieged were determined to make an obstinate resistance. It is scarce credible that the French were confirmed in their resolution by the courage of a woman. Madame Drucourt was continually upon the ramparts, with her purse in her hand; and firing herself three guns every day, seemed to dispute with the governor her husband the glory of his office. The besieged were not dismayed at the ill success of their several sallies, or the masterly operations concerted by Admiral Boscawen and General Amberst. It was but at the eve of an assault, which it was impossible to sustain, that they talked of surrendering. They made an honourable capitulation; and the conqueror showed more respect for his enemy and for himself, than to sully his glory by any act of barbarity or avarice.—The possession was confirmed to Great Britain by the peace in 1763; since which the fortifications have been blown up, and the town of Louisbourg dismantled.

BRETTIGAW, a territory or valley of the Grisons, lying between the Rhine and the county of Tyrol, and along the river Lanquet. The fortress of Castels is the principal town.

BREVE, in *Law*, is any writ directed to the chancellor, judges, sheriffs, or other officers, whereby a person is summoned, or attached, to answer in the king's court, &c.

BREVE Perquirere, the purchasing of a writ or license for trial in the king's courts; whence comes the present use of paying 6s. 8d. fine to the king in suit, for money due in bond, where the debt is 40l. and of 10s. where it is 100l. &c.

BREVE de Recto, is a writ of right or license for a person ejected, to sue for the possession of the estate detained from him.

BREVE, in *Music*, a note or character of time, in the form of a diamond or square, without any tail, and equivalent to two measures or minims.

BREVET, in the French customs, denotes the grant of some favour or denation from the king; in which sense it partly answers to our warrant, and partly to letters patent.

BREVET, more particularly denotes the commission of a subaltern officer, being only written on parchment, and without seal. A brevet officer is one whose rank in the army is above his pay: for instance, a brevet major serves only as a captain, and receives pay as such.

BREUGHEL, PETER, an eminent painter, commonly called *Old Breughel*, to distinguish him from his son, was born at a village of the same name near Breda, in the year 1565; and was the first pupil of Peter Cock, whose daughter he married. It was customary with him to dress like a country-man, in order to be more easily admitted into the company of country-people, and be allowed to join in their frolics, by which means he became perfectly acquainted with their manners and gestures, of which he made excellent use in his pictures. He travelled to France and Italy, and for a long time studied landscapes on the mountains of Tyrol. His humorous turn of mind displayed itself in all his pictures, which generally consisted of country-dances, marriages,

Breton
Breughel

Breughel
Breviary.

marriages, sports, and diversions; though he sometimes performed pieces from the historical parts of the holy Scriptures. At his return from Italy, he settled at Antwerp, and in his last illness caused his wife to gather together all his immodest pieces and burn them before his face. It is uncertain in what year he died. Of the works of old Breughel, the great duke of Tuscany has, Christ carrying his cross, with a great number of figures; and a country feast. The emperor has the tower of Babel, the massacre of the Innocents, and the conversion of St Paul, of his painting: the elector Palatine, a landscape, with St Philip baptizing Queen Candace's eunuch; and St John preaching in the wilderness, with a great many figures. Old Breughel also, for his amusement, is said to have engraved some few plates of landscapes and grotesque subjects.

BREUGHEL, *Peter*, the younger, was the son of the above-mentioned artist, and named *Hellish Breughel*, from the horrible subjects he delighted to represent. He engraved also, according to M. Heineken; but his works are not specified. He died in 1642.

BREUGHEL, *John*, commonly called *Velvet Breughel*, from his generally wearing velvet clothes, was the son of Peter Breughel, and born about the year 1575. He first applied himself to painting flowers and fruit, in which he excelled; and afterwards had great success in drawing landscapes, and views of the sea, set off with small figures. He lived long at Cologne, where he acquired great reputation. He travelled to Italy, where his fame had got before him; and where his fine landscapes, adorned with small figures, superior to those of his father, gave very great satisfaction. If a good judgement may be formed from the great number of pictures he left behind him, all highly finished, he must have been exceedingly industrious. Nor did he satisfy himself with embellishing his own works only, but was very useful in this respect to his friends. Even Rubens made use of Breughel's hand in the landscape part of several of his small pictures, such as his *Vertumnus* and *Pomona*; the satyr viewing the sleeping nymph; and the terrestrial paradise, which is looked upon as his masterpiece. He died in 1642.—Several of his works are to be seen in the archbishop's gallery at Milan; particularly a hunting-piece with a vast many figures; a landscape representing a desert, with the picture of St Hierom painted by Cerano, alias Gio Baptista Crespi. In the Ambrosian library are 20 pieces of this masterly hand; particularly Daniel in the lion's den, the inside of the great church at Antwerp, the four seasons on copper, and the burning of Gomorrah. In the possession of the elector Palatine at Dusseldorp, Christ preaching on the sea-shore; a country-dance; a sea-port, with a great many figures; a coach and two chariots, with a multitude of figures and animals; a landscape, wherein Flora is crowned by a nymph; St John preaching in the wilderness; a small sea-landscape, and several other pieces. In the possession of the late king of France, a woman playing with a dog, the battle between Alexander and Darius, both in wood: Orpheus in hell, &c.

BREVIARY, a daily office, or book of divine service, in the Roman church. It is composed of matins, lauds, first, third, sixth, and ninth vespers, and the compline or post comunio.

The breviary of Rome is general, and may be used
Vol. IV. Part II. †

in all places; but on the model of this various others have been built, appropriated to each diocese, and each order of religious.

The breviary of the Greeks is the same in almost all churches and monasteries that follow the Greek rites: the Greeks divide the psalter into 20 parts. In general, the Greek breviary consists of two parts: the one containing the office for the evening, the other that of the morning, divided into matins, lauds, first, third, sixth, and ninth vespers, and the compline; that is, of seven different hours, on account of that saying of David, *Septies in die laudem dixi tibi*.

The institution of the breviary is not very ancient; there have been inserted in it the lives of the saints, full of ridiculous and ill-attested stories, which gave occasion to several reformations of it, by several councils, particularly those of Trent and Cologne; by several popes, particularly Pius V. Clement VIII. and Urban VIII.; and also by several cardinals and bishops, each lopping off some extravagancies, and bringing it nearer to the simplicity of the primitive offices. Originally, every body was obliged to recite the breviary every day; but by degrees the obligation was reduced to the clergy only, who are enjoined, under penalty of mortal sin and ecclesiastical censures, to recite it at home, when they cannot attend in public. In the 14th century, there was particular reserve granted in favour of bishops, who were allowed, on extraordinary occasions, to pass three days without rehearsing the breviary.

This office was originally called *cursor*; and afterwards, the *breviarium*: which latter name imports that the old office was abridged; or rather, that this collection is a kind of abridgement of all the prayers.

The breviaries now in use are innumerable; the difference between them consists principally in the number and order of the psalms, hymns, paternosters, ave-Maries, creeds, magnificates, cantemus's, benedictus's, canticamus's, nunc dimittis's, miserere's, hallelujahs, gloria patri's, &c.

BREVIARY, in Roman antiquity, a book first introduced by Augustus, containing an account of the application of the public money.

BREVIATOR, an officer under the eastern empire, whose business it was to write and translate briefs.—At Rome those are styled *breviators*, or *abbreviators*, who dictate and draw up the pope's briefs.

BREVIUS, A ROTULIS LIBERANDIS, a writ or command to a sheriff to deliver to his successor the county, with the appurtenances, and the rolls, writs, and other things to his office belonging.

BREVIER, among printers, a small kind of type or letter between bourgeois and minion.

BREVITY, in a general sense, that which denominates a thing brief or short.

BREVITY is more particularly used in speaking of the style or composition of discourse. Brevity of discourse is by some called *brachylogia* and *breviloquentia*; sometimes *laconismus*. Tacitus and Persius are remarkable for the brevity of their style. There are two kinds of brevity, one arising from dryness, poverty, and narrowness of genius; the other from judgment and reflection; which latter alone is laudable. Brevity is so essential to a tale, a song, and an epigram, that without it they necessarily languish and become dull. Rhetoricians make brevity one of the principal marks

Breviary
Brevity.

Brevity
||
Brewer.

or conditions of eloquence: but the rules they prescribe for attaining it are difficult to apply, so as still to keep the due medium between too much and too little. A just brevity is attained by using all the words which are necessary, and none but those which are necessary. Sometimes it may also be had, by choosing a word which has the force of several. It is this last kind which Quintilian admires so much in Sallust; and the imitation of which, by other writers, has caused so much obscurity.

BREVIUM CUSTOS. See CUSTOS.

BREVORDT, a town of Guelderland, in the United Netherlands, situated in E. Long. 6. 35. N. Lat. 52.

BREWER, ANTHONY, a dramatic poet who flourished in the reign of King Charles I. and appears to have been held in high estimation by the wits of that time, as may be more particularly gathered from an elegant compliment paid to him in a poem called *Steps to Parnassus*, wherein he is supposed to have a magic power to call the muses to his assistance, and is even set on an equality with the immortal Shakespeare himself. There are, however, great disputes among the several writers, as to the number of his works. Those which have been ascribed to him with any certainty are, 1. The country girl, a comedy. 2. The love-sick king, a comedy. And, 3. *Lingua*: a piece in regard to which Winstanley records a remarkable anecdote, which points it out to have been in some measure the innocent cause of those troubles that disturbed the peace of these realms in the middle of the 17th century. He tells us, that when this play was acted at Cambridge, Oliver Cromwell (then a youth) acted a part in it. The substance of the piece is a contention among the Senses for a crown, which *Lingua* had laid for them to find. The part allotted to young Cromwell was that of *Tactus* or Touch; who having obtained the contested coronet, makes this spirited declamation:

Roses and bays, pack hence! this crown and robe
My brows and body circles and invests:
How gallantly it fits me! sure the slave
Measur'd my head who wrought this coronet.—
They lie that say complexions cannot change!
My blood's ennobled, and I am transform'd
Unto the sacred temper of a king.
Methinks I hear my noble parasites
Styling me *Cæsar*, or *Great Alexander*,
Licking my feet, &c.

It is said that he felt the whole part so warmly, and more especially the above-quoted speech, that it was what first fired his soul with ambition, and excited him, from the possession of an imaginary crown, to stretch his views to that of a real one; for the accomplishment of which he was content to wade through seas of blood.

BREWER, a person who professes the art of brewing.

There are companies of brewers in most capital cities; that of London was incorporated in 1427 by Henry VI. and that of Paris is still older.

The apparatus and utensils of a brewer, or a brew-house, are, A furnace made close and hollow for saving fuel, and with a vent for the smoke lest it taint the liquor; a copper, which is preferable to lead; a mask-vat near the head; a cooler near the mask-vat; and a

guile-vat under the cooler: adjoining to all are several clean tubs, to receive the worts and liquors.

BREWERS Haven, a good harbour at the north end of the island of Chiloe on the coast of Chili, in South America, and in the South sea. The Dutch landed forces here in 1643, designing to get possession of some part of Chili; but they were driven from thence by the Spaniards and the natives. W. Long. 82°, S. Lat. 42°.

BREWING, the operation of preparing ale or beer from MALT.

Though the art of brewing is undoubtedly a part of chemistry, and certainly depends upon fixed and inviolable principles, as well as every other branch of that science, these principles have never yet been thoroughly investigated. For want of a settled theory, therefore, the practice of this art is found to be precarious; and to succeed unaccountably with some, and misgive as unaccountably with others. Some few hints, however, have been thrown out, in order to establish a regular theory of brewing; the principal of which we shall lay before our readers.

The usual process of brewing is as follows: A quantity of water being boiled, is left to cool till the height of the steam be over; when so much is poured to a quantity of malt in the mashing tub, as makes it of a consistence stiff enough to be just well rowed up: after standing thus a quarter of an hour, a second quantity of the water is added, and rowed up as before: lastly, the full quantity of water is added; and that in proportion as the liquor is intended to be strong or weak.—This part of the operation is called *mashing*.—The whole now stands two or three hours, more or less, according to the strength of the wort or the difference of weather, and is then drawn off into a receiver; and the mashing repeated for a second wort, in the same manner as for the first, only the water must be cooler than before, and must not stand above half the time. The two worts are then to be mixed, the intended quantity of hops added, and the liquor close covered up, gently boiled in a copper for the space of an hour or two; then let into the receiver, and the hops strained from it into the coolers. When cool, the barm or yeast is applied; and it is left to work or ferment till it be fit to tun up. For small beer there is a third mashing with the water near cold, and not left to stand above three quarters of an hour; to be hopped and boiled at discretion. For double beer or ale, the liquors resulting from the two first mashings must be used as liquor for the third mashing of fresh malt.

From considering this process, and the multiplicity of circumstances to be attended to in it, we may easily see that it must be a very precarious one. The success of the operation, i. e. the goodness of the beer, must depend upon the quality of the malt from which it is made; on that of the water with which it is infused; on the degree of heat applied in the infusion; on the length of time the infusion is continued; on the proper degree of boiling, the quantity and quality of the hops employed; on the proper degree of fermentation, &c.: all which, as already observed, have never yet been thoroughly investigated and ascertained.

The manner of making malt Sir Robert Murray de-scribes as follows.—Take good barley newly thrashed, &c.; put about six English quarters in a stone trough

Brewing.

full of water, where let it steep till the water be of a bright reddish colour; which will be in about three days, more or less according to the moisture or dryness, smallness or bigness, of the grain, the season of the year, or the temperature of the weather. In summer, malt never makes well; in winter it requires longer steeping than in spring or autumn. It may be known when it is steeped enough by other marks besides the colour of the water; as by the excessive swelling of the grain, if it be over-steeped, and by too much softness; being, when it is in a right temper, like the barley prepared to make broth of. When it is sufficiently steeped, take it out of the trough, and lay it in heaps to let the water drain from it; then, after two or three hours, turn it over with a scoop, and lay it in a new heap, 20 or 24 inches deep. This is called the *coming heap*, in the right management whereof lies the principal skill. In this heap it may lie 40 hours, more or less according to the forementioned qualities of the grain, &c. before it come to the right temper of malt; which that it may do equally, is mainly desired. While it lies in this heap, it must be carefully looked to after the first 15 or 16 hours: for about that time the grains begin to put forth roots; which when they have equally and fully done, the malt must, within an hour after, be turned over with a scoop; otherwise the grains will begin to put forth the blade and spire also, which must by all means be prevented. If all the malt do not come equally, but that which lies in the middle, being warmest, come the soonest; the whole must be turned, so that what was outmost may be inmost; and thus it is managed till it be all alike. As soon as the malt is sufficiently come, turn it over, and spread it to a depth not exceeding five or six inches; and by the time it is all spread out, begin and turn it over again three or four times. Afterwards turn it over in like manner once in four or five hours, making the heap deeper by degrees; and continue to do so for the space of 48 hours at least. This frequent turning it over, cools, dries, and deadens the grain; whereby it becomes mellow, melts easily in brewing, and separates entirely from the husk. Then throw up the malt into a heap as high as you can; where let it lie till it grow as hot as your hand can endure it, which usually happens in about the space of 30 hours. This perfects the sweetness and mellowness of the malt. After it is sufficiently heated, throw it abroad to cool; and turn it over again about six or eight hours after; and then lay it on a kiln with a hair-cloth or wire spread under it; where, after one fire which must last 24 hours, give it another more slow, and afterwards, if need be, a third: for if the malt be not thoroughly dried, it cannot be well ground, neither will it dissolve well in the brewing; but the ale it makes will be red, bitter, and unfit for keeping.

From this account of the process of malting, it appears, that, besides the proper management in wetting, turning, &c. the drying is an article of the utmost consequence; and concerning the proper degrees of heat to be employed for this purpose, Mr Combrune has related the following experiments. "In an earthen pan, of about two feet diameter, and three inches deep, I put as much of the palest malts, very unequally grown, as filled it on a level to the brim. This I placed over a little charcoal lighted in a small stove, and

kept continually stirring it from bottom to top; at first it did not feel so damp as it did about half an hour after.

"In about an hour more, it began to look of a bright orange colour on the outside, and appeared more swelled than before. Every one is sensible how long-continued custom alone makes us sufficient judges of colours. Then I macerated some of the grains, and found they were nearly such as are termed *brown malts*. On stirring and making a heap of them towards the middle, I placed therein at about half depth the bulb of my thermometer, and found it rose to 140 degrees: here the malt felt very damp, and had but little smell.

"At 165 degrees I examined it in the same manner as before, and could perceive no damp: the malt was very brown; and, on being macerated, some few black specks appeared.

"Now many corns, nearest the bottom, were become black and burnt; with all the diligence I could use, I placed my thermometer nearly there, and it rose to 175 degrees. But the particles of fire, arising from the stove, act on the thermometer in proportion to the distance of the situation it is placed in; for which, through the whole experiment, an abatement of 5 degrees should be allowed, as near as I could estimate; so, a little after, putting my thermometer in the same position, where nearly half the corns were black, it showed 180 degrees. I now judged that the water was nearly all evaporated, and the heap grew black apace.

"Again, in the centre of the heap raised in the middle of the pan, I found the thermometer at 180 degrees; the corn tasted burnt; and the whole, at top, appeared about one half part a full brown. The rest black: on being macerated, still some white specks appeared; which I observed to proceed from the barley corns which had not been thoroughly germinated, and whose parts, cohering more together, the fire, at this degree of heat, had not penetrated them: their taste was insipid, the malts brittle, and readily parting from the skin: but the thermometer was now more various, as it was nearer to or farther from the bottom; and here I judged all the true malt to be charred.

"However, I continued the experiment; and, at 190 degrees, still found some white specks on macerating the grain; the acrospire always appearing of a deeper black or brown than the outward skin: the corn now fried at the bottom of the pan.

"I next increased the fire; the thermometer, placed in the mean between the bottom of the pan and the upper edge of the corn, showed 210 degrees. The malt hissed, fried, and smoked abundantly; though, during the whole process, the grain had been kept stirring, yet, on examination, the whole had not been equally affected with the fire. I found a great part thereof reduced to perfect cinders, easily crumbling to dust between the fingers, some of a very black hue without gloss, some very black with oil shining on the outside. Upon the whole, two-thirds of the corn were perfectly black; the rest were of a deep brown, more or less so as they were hard, steely, or imperfectly germinated; which was easily discovered by the length of the shoot. Most of them seemed to have lost their cohesion, and had a taste resembling that of high roasted coffee.

Brewing.

"In the last stage of charring the malt, I set thereon a wine glass inverted, into which arose a pinguious oily matter, which tasted very salt. Perhaps it may not be unnecessary to say, that the length of time this experiment took up was four hours, and that the effect it had both on myself and the person who attended me was such as greatly resembled the case of inebriation.

"Though, from hence, it is not possible to fix the exact degree of heat in which malts charr, yet we see some black appeared when the thermometer was at 165 degrees, that some were entirely black at 175 and at 180 degrees, that the grains thus affected were such as had been perfectly germinated, and that those which bore a greater heat were defective in that point; whence we may conclude, with an exactness that will be sufficient for the purposes of brewing, that true germinated malts are charred in heats between 175 and 180 degrees; and that, as these correspond to the degrees in which pure alcohol, or the finest spirit of the grain itself boils, or disengages itself therefrom, they may point out to us the reason of barley being the fittest grain for the purposes of brewing."

From these experiments, our author has constructed the following table of the different degrees of the dryness of malt, with the colour occasioned by each degree.

Deg.	
119	White.
124	Cream colour.
129	Light yellow.
134	Amber colour.
138	High amber.
143	Pale brown.
148	Brown.
152	High brown.
157	Brown inclining to black.
162	High brown speckled with black.
167	Blackish brown with black specks.
171	Colour of burnt coffee.
176	Black.

"The above table (says he) not only shows us how to judge of the dryness of malt from its colour, but also when a grist is composed of several sorts of malt, what effect the whole will have when blended together by extraction; and although possibly some small errors may arise in judgments thus formed by our senses, yet as malts occupy different volumes in proportion to their dryness in the practice of brewing, if the result of the water coming in contact with the malt show the degree expected, such parcel of malt may be said to have been judged of rightly in the degree of dryness it was estimated at; so that the first trial either confirms, or sets us numerically right as to our opinion thereof."

It is found by experience, that the less heat employed in drying the malt, the shorter time will be required before the beer is fit to be used; and of this our author has given the following table.

Deg.		Deg.	
119	2 weeks.	143	8 months.
124	1 month.	147	10 months.
129	3 months.	152	15 months.
134	4 months.	157	20 months.
138	6 months.	162	two years.

Brewing.

Lastly, Mr Combrune hath given the following table, showing the tendency beers have to become fine, when properly brewed from malts of different degrees of dryness.

Deg. Colour of malt.

119	White.	} These, when properly brewed, become spontaneously fine, even as far as 138°; when brewed for amber by repeated fermentations, they become pellucid.
124	Cream colour.	
129	Light yellow.	
134	Amber colour.	} By precipitation these grow bright in a short time.
138	High amber.	
143	Pale brown.	} With precipitation these require 8 or 10 months to become bright.
148	Brown.	
152	High brown.	} With precipitation these may be fined, but will never become bright.
157	Brown inclining to black.	
162	Brown speckled with black.	} These with difficulty can be brewed without setting the goods, and will by no means become bright, not even with the strongest acid menstruum.
167	Blackish brown speckled with black.	
171	Colour of burnt coffee.	
176	Black.	

In a pamphlet entitled "Theoretic hints on an improved practice of brewing malt-liquors, &c. by John Richardson," we have the following observations on the nature and properties of malt.

"The process of making malt is an artificial or forced vegetation, in which the nearer we approach the footsteps of nature in her ordinary progress, the more certainly shall we arrive at that perfection of which the subject is capable. The farmer prefers a dry season to sow his corn in, that the common moisture of the earth may but gently insinuate itself into the pores of the grain, and thence gradually dispose it for the reception of the future shower, and the action of vegetation. The maltster cannot proceed by such slow degrees, but makes an immersion in water a substitute for the moisture of the earth, where a few hours infusion is equal to many days employed in the ordinary course of vegetation; and the corn is accordingly removed as soon as it appears fully saturated, lest a solution, and consequently a destruction, of some of its parts, should be the effect of a longer continuance in water, instead of that separation which is begun by this introduction of aqueous particles into the body of the grain.

"Were it to be spread thin after this removal, it would become dry, and no vegetation would ensue; but being thrown into the couch, a kind of vegetative fermentation commences, which generates heat, and produces the first appearance of germination. This state of the barley is nearly the same with that of many days continuance in the earth after sowing: but being in so large a body it requires occasionally to be turned over, and spread thinner; the former to give the outward parts of the heap their share of the required warmth and moisture, both of which are lessened by exposure to the air; the latter to prevent the progress of the vegetative to the putrefactive fermentation, which would be the consequence of suffering it to proceed beyond a certain degree.

"To supply the moisture thus continually decreasing by evaporation and consumption, an occasional but spring

Brewing. sparing sprinkling of water should be given to the floor to recruit the languishing powers of vegetation, and imitate the shower upon the corn-field. But this should not be too often repeated; for, as in the field, too much rain, and too little sun, produce rank stems and thin ears, so here would too much water, and of course too little dry warmth, accelerate the growth of the malt, so as to occasion the extraction and loss of such of its valuable parts, as by a slower process would have been duly separated and left behind.

“By the slow mode of conducting vegetation here recommended, an actual and minute separation of the parts takes place. The germination of the radicles and acrospire carries off the cohesive properties of the barley, thereby contributing to the preparation of the saccharine matter, which it has no tendency to extract or otherwise injure, but to increase and meliorate, so long as the acrospire is confined within the husk; and by how much it is wanting of the end of the grain, by so much does the malt fall short of perfection, and in proportion as it has advanced beyond, is that purpose defeated.

“This is very evident to the most common observation, on examining a kernel of malt in the different stages of its progress. When the acrospire has shot but half the length of the grain, the lower part only is converted into that yellow saccharine flour we are solicitous about, whilst the other half affords no other signs of it than the whole kernel did at its first germination. Let it advance to two-thirds of the length, and the lower end will not only have increased its saccharine flavour, but will have proportionally extended its bulk, so as to have left only a third part unmalting. This, or even less than this, is contended for by many malsters, as a sufficient advance of the acrospire, which they say has done its business as soon as it has passed the middle of the kernel. But we need seek no farther for their conviction of error, than the examination here alluded to.

“Let the kernel be slit down the middle, and tasted at either end, whilst green; or let the effects of mastication be tried when it is dried off; when the former will be found to exhibit the appearances just mentioned, the latter to discover the unwrought parts of the grain, in a body of stony hardness, which has no other effect in the mash-tun than that of imbibing a large portion of the liquor, and contributing to the retention of those saccharine parts of the malt which are in contact with it; whence it is a rational inference, that three bushels of malt, imperfect in this proportion, are but equal to two of that which is carried to its utmost perfection. By this is meant the farthest advance of the acrospire, when it is just bursting from its confinement, before it has effected its enlargement. The kernel is then uniform in its internal appearance, and of a rich sweetness in flavour, equal to any thing we can conceive obtainable from imperfect vegetation. If the acrospire be suffered to proceed, the mealy substance melts into a liquid sweet, which soon passes into the blade, and leaves the husk entirely exhausted.

“The sweet thus produced by the infant efforts of vegetation, and lost by its more powerful action, revives and makes a second appearance in the stem, but

is then too much dispersed and altered in its form to answer any of the known purposes of art.

“Were we to enquire, by what means the same barley, with the same treatment, produces unequal portions of the saccharine matter in different situations, we should perhaps find it principally owing to the different qualities of the water used in malting. Hard water is very unfit for every purpose of vegetation, and soft will vary its effects according to the predominating qualities of its impregnations. Pure elementary water is in itself supposed to be the only vehicle of the nutriment of plants, entering at the capillary tubes of the roots, rising into the body, and there dispersing its acquired virtues, perspiring by innumerable fine pores at the surface, and thence evaporating by the purest distillation into the open atmosphere, where it begins anew its round of collecting fresh properties, in order to its preparation for fresh service.

“This theory leads us to the consideration of an attempt to increase the natural quantity of the saccharum of malt by adventitious means; but it must be observed on this occasion, that no addition to water will rise into the vessels of plants, but such as will pass the filter; the pores of which appearing somewhat similar to the fine strainers or absorbing vessels employed by nature in her nicer operations, we by analogy conclude, that properties so intimately blended with water as to pass the one, will enter and unite with the economy of the other, and *vice versa*.

“Supposing the malt to have obtained its utmost perfection, according to the criterion here inculcated; to prevent its farther progress, and secure it in that state, we are to call in the assistance of a heat sufficient to destroy the action of vegetation, by evaporating every particle of water, and thence leaving it in a state of preservation, fit for the present or future purpose of the brewer.

“Thus having all its moisture extracted, and being by the previous process deprived of its cohesive property, the body of the grain is left a mere lump of flour, so easily divisible, that, the husk being taken off, a mark may be made with the kernel, as with a piece of soft chalk. The extractible qualities of this flour are, a saccharum closely united with a large quantity of the farinaceous mucilage peculiar to bread-corn, and a small portion of oil enveloped by a fine earthy substance, the whole readily yielding to the impression of water applied at different times and different degrees of heat, and each part predominating in proportion to the time and manner of its application.

“In the curing of malt, as nothing more is requisite than a total extrication of every aqueous particle, if we had in the season proper for malting, a solar heat, sufficient to produce perfect dryness, it were practicable to reduce beers nearly colourless; but that being wanting, and the force of custom having made it necessary to give our beers various tinctures and qualities resulting from fire, for the accommodation of various tastes, we are necessitated to apply such heats in the drying as shall not only answer the purpose of preservation, but give the complexion and property required.

“To effect this with certainty and precision, the introduction

Brewing.

Brewing.

introduction of the thermometer is necessary ; but the real advantages of its application are only to be known by experiment, on account of the different construction of different kilns, the irregularity of the heat in different parts of the same kiln, the depth of the malt, the distance of the bulb of the thermometer from the floor, &c. &c. ; for though similar heats will produce similar effects in the same situation, yet is the dispersion of heat in every kiln so irregular, that the medium spot must be found for the local situation of the thermometer ere a standard can be fixed for ascertaining effects upon the whole. That done, the several degrees necessary for the purposes of porter, amber, pale beers, &c. are easily discovered to the utmost exactness, and become the certain rule of future practice.

“ Though custom has laid this arbitrary injunction of variety in our malt liquors, it may not be amiss to intimate the losses we often sustain, and the inconveniences we combat, in obedience to her mandate.

“ The further we pursue the deeper tints of colour by an increase of heat beyond that which simple preservation requires, the more we injure the valuable qualities of the malt. It is well known that scorched oils turn black, and that calcined sugar assumes the same complexion. Similar effects are producible in malts, in proportion to the increase of heat, or the time of their continuing exposed to it. The parts of the whole being so united by nature, an injury cannot be done to the one, without affecting the other : accordingly we find, that such parts of the subject, as might have been severally extracted for the purposes of a more intimate union by fermentation, are, by great heat in curing, burnt and blended so effectually together, that all discrimination is lost, the unfermentable are extracted with the fermentable, the integrant with the constituent, to a very great loss both of spirituousity and transparency. In paler malts, the extracting liquor produces a separation which cannot be effected in brown, where the parts are so incorporated, that unless the brewer is very well acquainted with their several qualities and attachments, he will bring over, with the burnt mixture of saccharine and mucilaginous principles, such an abundance of the scorched oils, as no fermentation can attenuate, no precipitants remove ; for, being in themselves impediments to the action of fermentation, they lessen its efficacy, and being of the same specific gravity with the beer, they remain suspended in, and incorporated with the body of it, an offence to the eye, and a nausea to the palate, to the latest period.”

7
Quality of
the water
to be em-
ployed in
brewing.

The next consideration is the quality of the water to be employed in brewing ; and here soft water is universally allowed to be preferable to hard, both for the purposes of mashing and fermentation. Transparency is, however, more easily obtained by the use of hard than soft water : first, from its inaptitude to extract such an abundance of that light mucilaginous matter, which, floating in the beer for a long time, occasions its turbidity ; secondly, from its greater tendency to a state of quietude after the vinous fermentation is finished, by which those floating particles are more at liberty to subside ; and, lastly, from the mutual aggregation of the earthy particles of the water with those of the materials, which by their greater

specific gravity thus aggregated, not only precipitate themselves, but carry down also that lighter mucilage just mentioned. For these reasons, hard water is not well adapted to the brewing of porter, and such beers as require a fulness of palate, when drawn to the great lengths of the London brewery, and of some country situations.

Brewing.

The purity of water is determined by its lightness ; and in this, distilled water only can claim any material degree of perfection. Rain water is the purest of all naturally produced : but by the perpetual exhalations of vegetables, and other fine substances floating in the atmosphere, it does not come down to us entirely free from those qualities which pond and river waters possess in a greater degree. These, especially of rivers running through fens and morasses, from the quantity of grass and weeds growing therein, imbibe an abundance of vegetable solutions which occasions them to contain more fermentable matter, and consequently to yield a greater portion of spirit ; but at the same time induces such a tendency to acidity as will not easily be conquered. This is more to be apprehended towards the latter end of the summer than at any other time ; because these vegetable substances are then in a state of decay, and thence more readily impart their pernicious qualities to the water which passes over them.

At such an unfavourable time, should the brewer be necessitated to pursue his practice, it will behove him to pay the utmost attention to the cause of this disposition in his liquor, and thence endeavour to prevent the ill consequences, by conducting his process to the extraction and combination of such parts of the materials as his judgment informs him will best counteract its effects.

Where there is the liberty of choice, we would recommend the use of that water which, from natural purity, equally free of the austerity of imbibed earths, and the rankness of vegetable saturation, has a soft fulness upon the palate, is totally flavourless, inodorous, and colourless ; whence it is the better prepared for the reception and retention of such qualities as the process of brewing is to communicate and preserve.

The next thing to be considered is the proper degree of heat to be employed in making the infusion ; and here it is evident, that though this must be an object of the utmost importance to the success of the operation, it is extremely difficult, perhaps impossible, to fix upon a precise standard that shall at all times fully answer the purpose. On this subject Mr Richardson presents us with the following observations.

“ The quality of the saccharine part of malt resembles that of common sugar, to which it is practicable to reduce it ; and its characteristic properties are entirely owing to its intimate connexion with the other parts of the malt, from which such distinguishing flavours of beers are derived as are not the immediate result of the hop. Were it not for these properties, the brewer might adopt the use of sugar, molasses, honey, or the sweet of any vegetable, to equal advantage ; which cannot now be done, unless an eligible succedaneum be found to answer that purpose. As we are at present circumstanced, a search on the other side would turn more to the brewer's account. We have in malt a superabundance of the grosser principles ; and would government

3
Mr Rich-
ardson's
observa-
tions on
the degree
of heat.

Brewing. government permit the introduction of a foreign addition to the saccharine, which is too deficient, many valuable improvements might be made from it; as we could, by a judicious application of such adventitious principle, produce a second and third wort, of quality very little inferior to the first.

“But in these experiments a very particular attention would be necessary to the solvent powers of the water at different degrees of heat, and to the inquiry how far a menstruum saturated with one principle may be capable of dissolving another. Such a consideration is the more necessary on this occasion to direct us clear of two extremes equally disagreeable: the first is, that of applying the menstruum pure, and at such a heat as to bring off an over proportion of the oleaginous and earthy principles, which would occasion in the beer, thus wanting its natural share of saccharum, a harshness and austerity which scarce any time the brewer could allow would be able to dissipate: the other is, that of previously loading the menstruum with the adopted sweet in such an abundance as to destroy its solvent force upon the characteristic qualities we wish to unite with it, and thereby leave it a mere solution of sugar. The requisite mean is that of considering what portion of the saccharine quality has been extracted in the first wort, according to the quantity of water and degree of heat applied; and then to make such a previous addition of artificial sweet as will just serve to counterbalance the deficiency, and assimilate with that portion of the remaining principles we are taught to expect will be extracted with the succeeding wort.

“From the nature of the constituent principles of malt, it is easy to conceive, that the former, or saccharine or mucilaginous parts, yield most readily to the impression of water, and that at so low a degree of heat, as would have no visible effect upon the latter. If, therefore, we are to have a certain proportion of every part, it is a rational inference, that the means of obtaining it rest in a judicious variation of the extracting heat according to the several proportions required.

“A low degree of heat, acting principally upon the saccharum, produces a wort replete with a rich soft sweet, fully impregnated with its attendant mucilage, and in quantity much exceeding that obtainable from increased heat; which by its more powerful insinuation into the body of the malt acting upon all the parts together, extracts a considerable portion of the oleaginous and earthy principles, but falls short in softness, fulness, sweetness, and quantity. This is occasioned by the coagulating property of the mucilage, which, partaking of the nature of flour, has a tendency to run into paste in proportion to the increase of heat applied; by which means it not only locks up a considerable part of the saccharum contained therein, but retains with it a proportionate quantity of the extracting liquor, which would otherwise have drawn out the imprisoned sweet, thence lessening both the quantity and quality of the worts. And this has sometimes been known to have had so powerful an effect, as to have occasioned the *setting of the goods*, or the uniting the whole into a pasty mass; for though heat increases the solvent powers of water in most instances, there are some in which it totally destroys them. Such is the

presence of flour, which it converts into paste; besides those of blood, eggs, and some other animal substances, which it invariably tends to harden.

“From a knowledge of these effects, we form our ideas of the variations necessary in the heat of the extracting liquor: which are of more extensive utility than has yet been intimated, though exceedingly limited in their extent from one extreme to the other.

“The most common effects of too low a heat, besides sometimes producing immediate acidity, are an insipidity of the flavour of the beer, and a want of early transparency, from the superabundance of mucilaginous matter extracted by such heats, which, after the utmost efforts of fermentation, will leave the beer turbid with such a cloud of its lighter feculencies as will require the separation and precipitation of many months to disperse.

“The contrary application of too much heat, at the same time that it lessens this mucilage, has, as we have seen before, the effect of diminishing the saccharum, also; whence that lean thin quality observable in some beers; and, by extracting an over proportion of oleaginous and earthy particles, renders the business of fermentation difficult and precarious, and impresses an austerity on the flavour of the liquor which will not easily be effaced.

“Yet the true medium heat for each extract cannot be universally ascertained. An attention not only to the quality of the malt, but to the quantity wetted, is absolutely necessary to the obtaining every due advantage; nor must the period at which the beer is intended for use be omitted in the account. The quality of the water also claims a share in the consideration, in order to supply that deficient thinness and want of solvent force in hard, and to allow for the natural fulness and fermentative quality of soft; a particular to which London in a great measure owes the peculiar mucilaginous and nutritious quality of its malt liquors.

“Although the variations above alluded to are indispensable, it is easy to conceive, from the small extent of the utmost variety, that they cannot be far distant. If, therefore, we know that a certain degree extracts the first principles in a certain proportion, we need not much consideration to fix upon another degree that shall produce the required proportion of the remaining qualities, and effect that equal distribution of parts in the extract which it is the business of fermentation to form into a consistent whole.”

The principal use of boiling, as it respects the worts ⁹ Of boiling particularly, is to separate the grosser or more palpable worts. parts of the extract, preparatory to that more minute separation which is to be effected in the gyle tun. The eye is a very competent judge of this effect; for the concretions into which the continued action of boiling forms these parts are obvious to the slightest inspection, whilst the perfect transparency of the interstices of the worts points out its utility in promoting that desirable quality in the beer. These coagulable parts are formed from the superabundant mucilage already mentioned; and hence they are found in greater proportion in the first worts than in those that come after; at the same time, they are in these last so mingled with a quantity of oleaginous matter, that they become much more difficultly coagulable in the weak worts.

Brewing. worts than in such as are stronger, and hence these require to be much longer boiled than the others.

During this operation the hops are generally added, which are found to be absolutely necessary for preventing the too great tendency of beer to acidity. The fine essential oil of hops being most volatile and soonest extracted, we are therefore taught the advantage of boiling the first wort no longer than is sufficient to form the extract, without exposing it to the action of the fire so long as to dissipate the finer parts of this most valuable principle, and defeat the purpose of obtaining it. To the subsequent worts we can afford a larger allowance, and pursue the means of preservation so long as we can keep in view those of flavour; to which no rules can positively direct, the process varying with every variety of beer, and differing as essentially in the production of porter and pale ale as the modes of producing wine and vinegar.

The consequence of not allowing a sufficient time for the due separation of the parts of the wort and extraction of the requisite qualities of the hop must be obvious. If we proceed to the other extreme, we have every thing to apprehend from the introduction of too large a quantity of the grosser principles of the hop, which are very inimical to fermentation; and from impairing the fermentative quality of the worts themselves, by suffering their too long exposure to the action of the fire passing through them, whereby they are reduced to a more dense consistence, and their parts too intimately blended to yield to the separating force of fermentation with that ease the perfection of the product requires.

¹⁰
Of fermentation.

The last step in the process of brewing is to ferment the liquor properly; for if this is not done, whatever care and pains have been taken in the other parts, they will be found altogether insufficient to produce the liquor desired. The first thing to be done here is to procure a proper ferment; for though all fermentable liquors would in time begin to ferment of themselves, yet, being also susceptible of putrefaction, the vinous and putrefactive ferments would both take place at the same time in such a manner that the product would be entirely spoiled. There are only two kinds of artificial ferments procurable in large quantity, and at a low price, viz. beer-yeast and wine- lees. A prudent management of these might render the business of the brewery for distillation, as in the business of the malt-distiller, &c. much more easy and advantageous*. Brewers have always found it a considerable difficulty to procure these ferments in sufficient quantities, and preserve them constantly ready for use; and this has been so great a discouragement to the business, that some have endeavoured to produce other ferments, or to form mixtures or compounds of particular fermentable ingredients; but this has been attempted without any great success, all these mixtures falling short even of common baker's leaven in their use. Whoever has a turn for making experiments and attempting improvements of this kind, will find it much easier and more advantageous to preserve and raise nurseries of the common ones, than to devise mixtures of others. Yeast may be preserved by freeing it from its moister parts. This may be done by the sun's heat, but slowly and imperfectly. The best method is by gently pressing it in canvas bags: Thus the liquid part, in which there

* See Distillation.

Brewing. is scarce any virtue, will be thrown off, and the solid will remain behind in form of a cake, which may be packed in a barrel or box, and will keep for a long time sweet and fragrant, and fit for the finest uses; and the same method may be taken either with wine- lees or the flowers of wine. The former may be brought from abroad with great ease in this manner: the latter may be made with us from the lees, by only dissolving them in water, and stirring them about with a stick; by this means, the lighter, more moveable, and more active part of the lees will be thrown up to the top, and may be taken off and preserved, in the manner above mentioned, in any quantity desired. By this means, an easy method is found of raising an inexhaustible fund; or a perpetual supply of the most proper ferments may be readily formed in the way of successive generations, so as to cut off all future occasion of complaint for want of them in the business of distillation. It must be observed that all ferments abound in essential oil much more than the liquors which produce them; whence they very strongly retain the particular flavour and scent of the subject from whence they were made. It is requisite, therefore, before the ferment is applied, to consider what flavour ought to be introduced, and accordingly what species of ferment is most suited to the liquor. The alteration thus caused by ferments is so considerable, as to determine or bring over any naturally fermentable liquor of a neutral kind to be of the same kind with that which yielded the ferment. The benefit of this, however, does not extend to malt, or to any other matter that does not naturally yield a tolerably pure and tasteless spirit, as it otherwise makes not a simple, pure, and uniform flavour, but a compound and mixed one.

The greatest circumspection and care are necessary in regard to the quality of the ferment. It must be chosen perfectly sweet and fresh: for all ferments are liable to grow musty and corrupt; and if in this case they are mixed with the fermentable liquor, they will communicate their nauseous and filthy flavour to it in such a manner as never to be got off. If the ferment is sour, it must by no means be used for any liquor; for it will communicate its flavour to the whole, and even prevent its rising to a head, and give it an acetous, instead of a vinous, tendency. When the proper quantity is got ready, it must be put to the liquor in a state barely tepid, or scarce lukewarm. The best method of putting them together, so as to make the fermentation strong and quick, is as follows. When the ferment is solid, it must be broken to pieces, and gently thinned with some of the warm liquor; but a complete or uniform solution of it is not to be expected or desired, as this would weaken its efficacy for the future business. The whole intended quantity being thus loosely mixed in some of the lukewarm liquor, and kept near the fire or elsewhere in a tepid state, free from too rude commerce with the external air, more of the insensibly warm liquor ought at proper intervals to be brought in, till thus by degrees the whole quantity is set at work together. When the whole is thus set at work, secured in a proper degree of warmth, and kept from a too free intercourse with the external air, it becomes as it were the business of nature to finish the operation.

In the operation of fermentation, however, the degree

Brewing. gree of heat employed is of the utmost consequence. In forming the extracts of the malt, the variation of a few degrees of heat produces an important difference in the effect. In the heat of fermentation, similar consequences result from similar variety. Under a certain regulation of the process, we can retain in the beer, as far as art is capable, the finer mucilage, and thereby preserve that fulness upon the palate which is by many so much admired : on the other hand, by a slight alteration, we can throw it off, and produce that evenness and uniformity of flavour which has scarce any characteristic property, and is preferred by some only for want of that heaviness which they complain of in full beers. If a more vinous racy ale be required, we can, by collecting and confining the operation within the body of the wort, cause the separation and absorption of such an abundant portion of the oleaginous and earthy principles, as to produce a liquor in a perfect state at the earliest period, and so highly flavorful as to create a suspicion of an adventitious quality. But though all this may be done, and often hath been done, the proper management of fermenting liquors depends so much upon a multiplicity of slight and seemingly unimportant circumstances, that it hath never yet been laid down in an intelligible manner; and no rules, drawn from any thing hitherto published on the subject of brewing, can be at all sufficient to direct any person in this matter, unless he hath had considerable opportunities of observing the practice of a brewhouse.

See *Morrice on Brewing*, London, 1802.

To what we have now said we shall only add, from a practical treatise on brewing lately published, the names of the materials and their proportions, which are employed by the London brewers in the manufacture of the different kinds of malt liquors.

PORTER.

Kinds of Malt.		cwt. qrs. lbs.	
West country pale,	3	Hops,	1 2 0
Herts pale	6	Coculus indic.	0 0 6
— brown,	8	Leghorn juice,	0 0 30
— amber,	8		

Quarters, 25

This yielded 89 barrels and 2 firkins of porter.

Another proportion of materials for Porter.

See BREWING, SUPPLEMENT.

BREY, a town of Germany, on the frontiers of Brabant, seated on a rivulet, in E. Long. 5. 35. N. Lat. 51. 6.

BREYNIA, in *Botany*, a synonyme of the capparid. See CAPPARIS, *BOTANY Index*.

BRIANCON, a town of France, in Upper Dauphiny, capital of the Briançonnois. E. Long. 6. 45. N. Lat. 44. 46.

BRIANCONNOIS, a territory of France, in Dauphiny, bounded by Grenoblois, Gapennois, Ambrunois, Piedmont, and Savoy. It comprehends several valleys, which lie among the mountains of the Alps; and though it is extremely cold, yet it is fertile in corn and pastures. The inhabitants have a great deal of wood; yet they choose to be in the stables with their cattle six months in the year, to keep themselves warm. Briançon is the capital town.

BRIAR, in *Botany*, the English name of a species of rosa. See ROSA, *BOTANY Index*.

BRIARE, a town of France, in the department of Loiret, seated on the river Loire. It is remarkable for nothing but a long street full of inns and farriers, it being on the great road to Lyons; and the canal of Briare, which is 33 miles in length, and maintains a communication between the Loire and the Seine. E. Long. 2. 45. N. Lat. 47. 40.

BRIAREUS, in fabulous history, a giant: the son of Æther, Titan, or Cælus, and Terra. This was his name in heaven; on the earth he was called *Ægeon*. He was of singular service to Jupiter, when Juno, Pallas, Neptune, and the rest of the gods, endeavoured to bind him in chains and dethrone him. Afterwards, however, he conspired with the rest of his gigantic brethren to dethrone Jupiter. Virgil, on this occasion, describes him as having 100 hands, 50 heads, and breathing out fire †. The fable says that Jupiter, to punish him, threw him under Mount Ætna, which, as often as he moves, belches out fire. See ÆTNA.

BRIBE, a reward given to pervert the judgment. See the next article.

The word is French, *bribe*, which originally denotes a bit, fragment, or relic of meat taken off the table; on which footing, bribe imports as much as *panis mendicatus*, and still keeps up the idea of the matter whereof bribes anciently consisted. Hence also the Spaniards use *bribar* and *brivar* for *begging*; and *brivia*, *brivoneria*, and *brivonismo*, for *beggary*. In middle-age writers, a bribe given a judge is called *quato litis*, and the receiver, *campi particeps*, or *cambi particeps*; because the spoils of the field, i. e. the profits of the cause, were thus shared with the giver.

BRIBERY, in *Law*, is a high offence, where a person in a judicial place takes any fee, gift, reward, or brockage, for doing his office, but of the king only. But, taken largely, it signifies the receiving or offering any undue reward to or by any person concerned in the administration of public justice, whether

judge, officer, &c. to act contrary to his duty; and sometimes it signifies the taking or giving a reward for a public office.

In the east it is the custom never to petition any superior for justice, not excepting their kings, without a present. This is calculated for the genius of despotic countries; where the true principles of government are never understood, and it is imagined that there is no obligation due from the superior to the inferior, no relative duty owing from the governor to the governed. The Roman law, though it contained many severe injunctions against bribery, as well for selling a man's vote in the senate or other public assembly, as for the bartering of common justice; yet, by a strange indulgence in one instance, it tacitly encouraged this practice; allowing the magistrate to receive small presents, provided they did not on the whole exceed 100 crowns a-year; not considering the insinuating nature and gigantic progress of this vice, when once admitted. Plato, therefore, in his ideal republic, orders those who take presents for doing their duty to be punished in the severest manner: and by the laws of Athens, he that offered a bribe was also prosecuted, as well as he that received a bribe. In England this offence of taking bribes is punished, in inferior officers, with fine and imprisonment; and in those that offer a bribe, though not taken, the same. But in judges, especially the superior ones, it has been always looked upon as so heinous an offence, that the chief justice Thorpe was hanged for it in the reign of Edward III. By a statute 11 Henry IV. all judges and officers of the king convicted of bribery, shall forfeit treble the bribe, be punished at the king's will, and be discharged from his service for ever. And some notable examples have been made in parliament, of persons in the highest stations, and otherwise very eminent and able, but contaminated with this sordid vice. Thus in the reign of King James I. the earl of M. lord treasurer of England, being impeached by the commons, for refusing to hear petitions referred to him by the king, till he had received bribes, &c. was, by sentence of the lords, deprived of all his offices, and disabled to hold any for the future, or to sit in parliament; he was also fined 50,000l. and imprisoned during the king's pleasure. In the 11th year of King George I. the lord chancellor M—— had a somewhat milder punishment: he was impeached by the commons, with great zeal, for bribery, in selling the places of masters in chancery for exorbitant sums, and other corrupt practices, tending to the great loss and ruin of the suitors of that court; and the charge being made good against him, being before divested of his office, he was sentenced to pay a fine of 30,000l. and imprisoned till it was paid. It is said that one of the peers, if not two, who voted against him, had been possessed of the office of chancellor, and sold the places of masters in chancery whenever vacant.

BRIBERY in *Elections*. See ELECTIONS.

BRICIANI, those of the order of that name. This was a military order, instituted by St Bridget, queen of Sweden, who gave them the rules and constitutions of those of Malta and St Augustin. This order was approved by Pope Urban V. They were to fight for the burying of the dead, to relieve and assist widows, orphans, the lame, sick, &c.

BRICK, a fat reddish earth, formed into long squares,

Bribery
||
Brick.

Blackst.
Comment.

† En x.
365.

Brick. squares, four inches broad, and eight or nine long, by means of a wooden mould, and then baked or burnt in a kiln, to serve the purposes of building.

Bricks are of great antiquity, as appears by the sacred writings, the tower and walls of Babylon being built with them.

The Greeks chiefly used three kinds of bricks; the first whereof was called *διδαρος*, i. e. of two palms; the second *τετραδαρος*, of four palms; the third *πενταδαρος*, of five palms. They had also other bricks, just half each of those, to render their works more solid, and also more agreeable to the sight, by the diversities of the figures and sizes of the bricks.

The dimensions of the brick chiefly used by the Romans, according to Pliny, were a foot and a half long, and a foot broad; which measures agree with those of several Roman bricks in England, which are about 17 inches long, and 11 broad, of our measure. Sir Henry Wotton speaks of a sort of bricks at Venice, of which stately columns were built; they were first formed in a circular mould, and cut, before they were burnt, into four or more quarters or sides; afterwards, in laying, they were jointed so close, and the points concentrated so exactly, that the pillars appeared one entire piece*.

* Wotton's
Elem. of
Architecture,
l. ii.

The ordinary Paris brick is eight inches long, four broad, and two thick, French measure, which makes something more than ours. But this smallness is an advantage to a building, the strength of which consists much in the multitude of angles and joints, at least if well laid, and having a good bond.

Supplement
to Chambers.

Bricks among us are various, according to their various forms, dimensions, uses, method of making, &c. The principal are, compass-bricks, of a circular form, used in styning of walls: concave or hollow bricks, on one side flat like a common brick, on the other hollowed, and used for conveyance of water: feather-edged bricks, which are like common statute-bricks, only thinner on one edge than the other, and used for penning up the brick pannels in timber buildings: cogging bricks are used for making the indented works under the capping of walls built with great bricks: capping bricks, formed on purpose for capping of walls: Dutch or Flemish bricks, used to pave yards, stables, and for soap-boiler's vaults and cisterns: clinkers, such bricks as are glazed by the heat of the fire in making: sandel or samel-bricks, are such as lie outmost in a kiln or clamp, and consequently are soft and useless, as not being thoroughly burnt: great bricks are those twelve inches long, six broad, and three thick, used to build fence-walls: plaster or buttress bricks, have a notch at one end, half the breadth of the brick; their use is to bind the work which is built of great brick: statute-bricks, or small common bricks, ought, when burnt, to be nine inches long, four and a quarter broad, and two and a half thick; they are commonly used in paving cellars, sinks, hearths, &c.

Worlidge, and others after him, have endeavoured to excite brick-makers to try their skill in making a new kind of brick, or a composition of clay and sand, whereof to form window-frames, chimney-pieces, door-cases, and the like. It is to be made in pieces fashioned in moulds, which, when burnt, may be set together with a fine red cement, and seem as one entire piece, by which may be imitated all manner of stone work. The thing should seem feasible, by the earthen pipes made

fine, thin, and durable, to carry water under ground at Portsmouth; and by the earthen backs and grates for chimneys, formerly made by Sir John Winter, of a great bigness and thickness. If chimney-pieces thus made in moulds, and dried and burnt, were not found smooth enough, they might be polished with sand and water; or were care taken, when they were half dry in the air, to have them polished with an instrument of copper or iron, then leave them till they were dry enough to burn, it is evident they would not want much polishing afterwards. The work might even be glazed, as potters do their fine earthen ware, either white or of any other colour; or it might be veined in imitation of marble, or be painted with figures of various colours, which would be much cheaper, perhaps equally durable, and as beautiful, as marble itself.

Brick.

Bricks are commonly red, though there are some also of a white colour, for which sort Walpit in Suffolk is famous. Bricks may be made of any earth that is clear of stones, even sea-ouse; but all will not burn red, a property peculiar to earths which contain ferruginous particles. In England, bricks are chiefly made of a hazelly, yellowish-coloured, fatty earth, somewhat reddish, vulgarly called *loam*. The earth, according to Leibourn, ought to be dug before winter, but not made into bricks before spring. For the making of such bricks as will stand the fiercest fires, Stourbridge clay or Windsor loam are esteemed the best. In general, the earth whereof bricks are made ought not to be too sandy, which would render them heavy and brittle; nor too fat, which would make them crack in drying.

The first step in the process of brick-making is casting the clay, or earth. The next step is to tread or temper it, which ought to be performed doubly of what is usually done; since the goodness of the bricks depends chiefly upon this first preparation. The earth itself, before it is wrought, is generally brittle and dusty; but adding small quantities of water gradually to it, and working and incorporating it together, it opens its body, and tinges the whole with a tough gluey band or substance. If, in the tempering, you overwater them, as the usual method is, they become dry and brittle, almost as the earth they are made of; whereas, if duly tempered, they become smooth and solid, hard and durable. A brick of this last sort takes up near as much earth as a brick and a half made the contrary way; in which the bricks are spongy, light, and full of cracks, partly through want of due working, and partly by mixing of ashes and light sandy earth to make it work easy and with greater dispatch; as also, to save culm or coals in the burning. We may add, that for bricks made of good earth, and well tempered, as they become solid and ponderous, so they take up a longer time in drying and burning than the common ones; and that the well drying of bricks before they are burned prevents their cracking and crumbling in the burning.

Bricks are burnt either in a kiln or clamp. Those that are burnt in a kiln, are first set or placed in it; and then the kiln being covered with pieces of bricks, they put in some wood to dry them with a gentle fire; and this they continue till the bricks are pretty dry, which is known by the smoke's turning from a darkish colour to transparent smoke: they then leave off putting in wood, and proceed to make ready for burning; which is performed by putting in brush furze, spray, heath,

Brick. brake or fern faggots: but before they put in any faggots, they dam up the mouth or mouths of the kiln with pieces of bricks (which they call *shinlog*) piled up one upon another, and close it up with wet brick-earth instead of mortar. The *shinlog* they make so high, that there is but just room above it to thrust in a faggot: then they proceed to put in more faggots, till the kiln and its arches look white, and the fire appears at the top of the kiln; upon which they slacken the fire for an hour, and let all cool by degrees. This they continue to do, alternately heating and slacking, till the ware be thoroughly burnt, which is usually effected in 48 hours.

About London they chiefly burn in *clamps*, built of the bricks themselves, after the manner of arches in kilns, with a vacancy between each brick, for the fire to play through; but with this difference, that instead of arching, they span it over by making the bricks project one over another on both sides of the place, for the wood and coals to lie in till they meet, and are bounded by the bricks at the top, which close all up. The place for the fuel is carried up straight on both sides, till about three feet high; then they almost fill it with wood, and over that lay a covering of sea-coal, and then overspan the arch; but they strew sea-coal also over the clamp, betwixt all the rows of bricks; lastly, they kindle the wood, which gives fire to the coal; and when all is consumed, then they conclude the bricks are sufficiently burnt.

* Vol. i.
p. 302.

In Dr Percival's essays*, we have the following experiment of the effects of bricks on water. "Two or three pieces of common brick were steeped four days in a bason full of distilled water. The water was then decanted off, and examined by various chemical tests. It was immiscible with soap, struck a lively green with syrup of violets, was rendered slightly lactescent by the volatile alkali, and quite milky by the fixed alkali and by a solution of saccharum saturni. The infusion of tormentil root produced no change in it." This experiment, he observes, affords a striking proof of the impropriety of lining wells with brick, a practice very common in many places, and which cannot fail of rendering the water hard and unwholesome. Clay generally contains a variety of heterogeneous matters. The coloured loams often participate of bitumen, and the ochre of iron. Sand and calcareous earth are still more common ingredients in their composition; and the experiments of Mr Geoffroy and Mr Pott prove, that the earth of alum also may in large quantity be extracted from clay. Now as clay is exposed to the open air for a long space of time, is then moulded into bricks, and burnt, this process resembles in many respects that by which the alum-stone is prepared. And it is probable that the white efflorescence which is frequently observable on the surface of new bricks, is of an aluminous nature. The long exposure of the clay to the air, the sulphureous exhalations of the pit-coal used for burning it, together with the bituminous vapour which arises from the ignited clay itself, sufficiently account for the combination of a vitriolic acid with the earth of alum. See BRICKMAKING, SUPPLEMENT.

Oil of BRICKS, olive oil imbibed by the substance of bricks, and afterwards distilled from it. This oil was once in great repute for curing many diseases, but is now justly laid aside.

BRICK-Layer, an artificer, whose business is to build with bricks, or make brick-work.

Brick.
Bricklag.

Brick-layers work, or business, in London, includes tiling, walling, chimney-work, and paving with bricks and tyles. In the country it also includes the mason's and plasterer's business.

The materials used by brick-layers are bricks, tyles, mortar, laths, nails, and tyle pins. Their tools are a brick trowel, wherewith to take up mortar; a brick-axe, to cut bricks to the determined shape; a saw, for sawing bricks; a rub-stone, on which to rub them; also a square, wherewith to lay the bed or bottom, and face or surface of the brick, to see whether they are at right angles; a bevel, by which to cut the under sides of bricks to the angles required; a small tranel of iron, wherewith to mark the bricks; a float-stone, with which to rub a moulding of brick to the pattern described; a banker, to cut the bricks on; line pins to lay their rows or courses by; plumb-rule, whereby to carry their work upright; level, to conduct it horizontal; square, to set off right angles; ten-foot rod, wherewith to take dimensions; jointer, wherewith to run the long joints; rammer, wherewith to beat the foundation; crow and pick-axe, wherewith to dig through walls.

The London brick-layers make a regular company, which was incorporated in 1568; and consists of a master, two wardens, 20 assistants, and 78 on the livery.

BRICK-Laying, the art of framing edifices of bricks.

Moxon hath an express treatise on the art of brick-laying; in which he describes the materials, tools, and method of working, used by brick-layers.

Great care is to be taken, that bricks be laid joint on joint in the middle of the walls as seldom as may be; and that there be good bond made there, as well as on the outsides. Some brick-layers, in working a brick and half wall, lay the header on one side of the wall perpendicular to the header on the other side, and so all along the whole course; whereas, if the header on one side of the wall were toothed as much as the stretcher on the other side, it would be a stronger toothing, and the joints of the headers of one side would be in the middle of the headers of the course they lie upon of the other side. If bricks be laid in winter, let them be kept as dry as possible; if in summer, it will quit cost to employ boys to wet them, for they will then unite with the mortar better than if dry, and will make the work stronger. In large buildings, or where it is thought too much trouble to dip all the bricks separately, water may be thrown on each course after they are laid, as was done at the building the physicians college, by order of Dr Hooke. If bricks are laid in summer, they are to be covered; for if the mortar dries too hastily, it will not bind so firmly to the bricks as when left to dry more gradually. If the bricks be laid in winter, they should also be covered well, to protect them from rain, snow and frost; which last is a mortal enemy to mortar, especially to all such as have been wetted just before the frost assaults it.

BRICK-Maker, is he who undertakes the making of BRICKS. This is mostly performed at some small distance from cities and towns; and though some, through ignorance, look upon it as a very mean employ, because laborious, yet the masters about London, and other capital cities, are generally men of substance.

BRICKING, among builders, the counterfeiting of

Bricking

a brick-wall on plaster: which is done by smearing it over with red ochre, and making the joints with an edged tool; these last are afterwards filled with a fine plaster.

BRIDE, a woman newly married. Among the Greeks, it was customary for the bride to be conducted from her father's house to her husband's in a chariot, the evening being chosen for that purpose, to conceal her blushes; she was placed in the middle, her husband sitting on one side, and one of her most intimate friends on the other; torches were carried before her, and she was entertained on the passage with a song suitable to the occasion. When they arrived at their journey's end, the axle-tree of the coach they rode in was burnt, to signify that the bride was never to return to her father's house.—Among the Romans, the bride was to seem to be ravished by force from her mother, in memory of the rape of the Sabines under Romulus: she was to be carried home in the night-time to the bridegroom's house, accompanied by three boys, one whereof carried a torch, and the other two led the bride; a spindle and distaff being carried with her: she brought three pieces of money called asses, in her hand to the bridegroom, whose doors on this occasion were adorned with flowers and branches of trees: being here interrogated who she was, she was to answer *Caia*, in memory of *Caia Cecilia* wife of *Tarquín the Elder*, who was an excellent *lanifica* or spinstress; for the like reason, before her entrance, she lined the door-posts with wool, and smeared them with grease. Fire and water being set on the threshold, she touched both; but starting back from the door refused to enter, till at length she passed the threshold, being careful to step over without touching it: here the keys were given her, a nuptial supper was prepared for her, and minstrels to divert her; she was seated on the figure of a priapus, and here the attendant boys resigned her to the *pronuba*, who brought her into the nuptial chamber and put her to bed. This office was to be performed by matrons who had only been once married, to denote that the marriage was to be for perpetuity.

BRIDEGROOM, a man newly married, the spouse of the bride.

The Spartan bridegrooms committed a kind of rape upon their brides. For matters being agreed on between them two, the woman that contrived and managed the match, having shaved the bride's hair close to her skin, dressed her up in man's clothes, and left her upon a mattress: this done, in came the bridegroom, in his usual dress, having supped as ordinary, and stealing as privately as he could to the room where the bride lay, and untying her virgin girdle, took her to his embraces; and having staid a short time with her, returned to his companions, with whom he continued to spend his life, remaining with them by night as well as by day, unless he stole a short visit to his bride, which could not be done without a great deal of circumspection, and fear of being discovered. Among the Romans, the bridegroom was decked to receive his bride; his hair was combed and cut in a particular form; he had a coronet or chaplet on his head, and was dressed in a white garment.

By the ancient canons, the bridegroom was to forbear the enjoyment of his bride the first night, in honour of the nuptial benediction given by the priest.

on that day*. In Scotland, and perhaps also some parts of England, a custom called *marchet*, obtained; by which the lord of the manor was entitled to the first night's habitation with his tenant's bride †.

BRIDEWELL, a work-house, or place of correction for vagrants, strumpets, and other disorderly persons. These are made to work, being maintained with clothing and diet; and when it seems good to their governors, they are sent by passes into their native countries; however, while they remain here, they are not only made to work, but, according to their crimes, receive once a fortnight such a number of stripes as the governor commands.

BRIDEWELL, near Fleet-street, is a foundation of a mixt and singular nature, partaking of the hospital, the prison, and work-house; it was founded in 1553, by Edward VI. who gave the place where King John had formerly kept his court, and which had been repaired by Henry VIII. to the city of London, with 700 merks of land, bedding, and other furniture. Several youths are sent to the hospital as apprentices to manufacturers, who reside there; they are clothed in blue doublets and breeches, with white hats. Having faithfully served their time of seven years, they have their freedom, and a donation of 10l. each, for carrying on their respective trades.

BRIDGE. A bridge is a mode of conveyance from one part of space to another, the intermediate part being either impassable, or difficult, or otherwise of an inconvenient access. The strength must be in proportion to the weight which is to be supported; the extent or width of the passage being likewise taken into consideration. This passage may be of a considerable distance, and the weight to be supported considerable; for example a spider is the greatest weight to be supported; and she can spin as much matter from her bowels as will answer her purpose, and can find supports upon which she can make the extremities of her bridge to rest. But not to take up time to mention the ingenuity (or under whatever name it may be designed) of insects, birds, or quadrupeds, who discover admirable instances of art suitable to their nature, and uses fitted for their situation, our chief intention is to investigate the different exertions of the rational part of the creation, and their manner of accommodating themselves to answer their necessary exigencies, particularly at present confining ourselves to the formation of bridges of different kinds. The most simple part of these, we cannot doubt, were in use from the beginning of time. When any passage exceeded the step or stretch of a man's legs, we cannot imagine, but his natural invention would lead him to apply a stone, if of sufficient length to answer his purpose; but if not, a piece of wood, or trunk of a tree, would be employed in the same way to render the passage more easy for himself.

History does not inform us that this useful art was carried to any great extent, in the ages of the antediluvians; but we can scarcely imagine but they were acquainted with it, so far as we have mentioned, and even to a greater degree. Can we suppose that such geniuses as discovered the method of founding and working in iron and brass, and the formation and use of musical instruments, would be wanting in discovering methods so intimately connected with their

Brdge.

own advantage? We have no accounts handed down to us, that they occupied houses composed of different apartments, and of different stories or flats; yet we find the infinitely wise and merciful Governor of the universe, when admonishing Noah respecting the building of an ark for his safety, speak to him of different rooms and stories, of which it was to consist, in terms with which Noah was well acquainted. As the Almighty always accommodates himself to the capacities of his creatures, if Noah had not been acquainted with these terms, can we doubt that the Almighty would not have furnished his favourite servant with a perspective view of these rooms and stories as he did to Moses, when giving him instructions to raise and construct a fabric of which he formerly never had obtained a view? But this amounts to no more than that it might be, and therefore we will not dwell upon it.

Of what took place after the flood, we have no remains of antiquity, for many years, of this art being cultivated to any extent; although it is surprising, that upon viewing the beautiful and superb dome of the heavens, and the variegated arch that at times made its appearance, that an imitation of neither of these was not earlier attempted. Among the eastern nations, and after them the Egyptians, who have left us so many monuments of grandeur and art, very little of the arch is to be found in any degree of elegance. In some of the late researches into their antiquities, a zodiac painted in lively colours, and some vaultings cut in a rock, have been discovered; but what is formed of different stones is but of a rude composure; yet being of the more early period, we cannot but conclude, that they gave the idea to the Greeks, who improved it in a more elegant style.

It is probable that the Chinese, even at an earlier period, arrived at a degree of perfection and elegance in this art, which neither the Greeks nor the Romans ever reached. We, who boast, and not without some reason, of the elegance and extent to which we have carried it, have not outdone them. We find that they have constructed a bridge of one arch, the span 400 cubits, in the ordinary computation 600 feet, from one mountain to another; the height of this arch is likewise given of 500 cubits or 750 feet. It is universally allowed, that if Noah was not the founder of that monarchy, it was some of his grand-children, at a very early period; their form of government resembles the patriarchal, which is in favour of Noah's being their founder, and that they cultivate these arts, of which he instructed them in the rudiments: but this is not a place for discussion of this subject.

But to return to the Greeks and Romans, of whose history we know more than we do of the other: Although we have admitted the Egyptians to have struck out the plan, yet, in point of elegance, in combining the parts of the arch, we will not deny the Greeks to have the first share. On account of an effigy, having Janus upon the one side, and a bridge on the opposite, some have ascribed the honour of the art to him; he might indeed, on account of his improvements of the art, shewn himself deserving of having, along with his effigy, the distinguished art he had excelled in, engraved on the metal, as a memorial of his merit. Whether

Brdge.

the bridge improved by Janus were over land or water we are not informed; but certain it is, that necessity, which is the mother of invention, could not fail to form schemes for conveyance over water. We find boats, or some species of ships, used at a pretty early period; and we are surprised not to find them more early than we have account of. A boat or ship is an inverted arch turned down into the water. Of a bridge of this kind, we find Darius avail himself in passing the Hellespont, or the Bosphorus, for we find different historians of different opinions which of them he passed, and the word Propontis answers to either; although we rather agree with those that make the passage at the Dardanelles, or in that strait. This mode of passage is still in use, and found very convenient; but we can scarcely suppose that Darius, and his officers, and court, never heard of a bridge before that idea struck them, in the execution of which they so happily succeeded. It is highly probable that they were acquainted with, and had formed bridges in their own country, and that want of materials to make a solid wall, induced them and others to construct arches, for the purpose of aqueducts, of which there is so much occasion in Persia, on account of the scarcity of water; and as they knew not the mode of conveying their water in pipes.

Among the Romans we find arches of different kinds, and particularly triumphal arches, although these were not always formed of lasting materials; but their aqueducts were, of which the remains of several are found in France, Spain, and others of their ancient territories. Cæsar formed a bridge over the Rhine, Trajan over the Danube; with many others, the particular mention of which would not much amuse our readers: at the same time we hope it will not be disagreeable to give a short account of Trajan's bridge, in the words of Dion Cassius. "Trajan built a bridge over the Danube, which in truth one cannot sufficiently admire; for though all the works of Trajan are very magnificent, yet this far exceeds all the others. The piers were 20 in number, of square stone; each of them 150 feet high above the foundation, 60 feet in breadth, and distant from one another 170 feet. Though the expence of this work must have been exceeding great, yet it becomes more extraordinary by the river's being very rapid, and its bottom of a soft nature; where the bridge was built was the narrowest part of the river thereabout, for in other parts of the river it was double or treble this breadth; and although on this account it became so much the deeper, and more rapid, yet no other place was so suitable for this undertaking. The arches were afterwards broken down by Adrian; but the piers are still remaining, which seems as it were to testify, that there is nothing which human ingenuity is not able to effect." From this account, the whole length of this bridge is 4770 feet, that is 500 feet less than an English mile. The architect of this great work is said to be Apollodorus of Damascus, who, it is likewise said, left a description of the work; but how much it is to be regretted that it is nowhere found on record!

Among the moderns, the French and German engineers, and perhaps the Italians, ought not to be neglected. Of those who have written on the subject,

we

Bridge. we may name Belidor, of whom it is said, that he had the best information, from his acquaintance and knowledge of the chief works of France and Germany, as well as from his experience as an engineer. His directions as to an arch or bridge are shortly thus ; that the piers ought to be one-fifth part of the opening, and not less than one-sixth ; that the arch stones ought to be one thirty-fourth part of the opening : In general, that the pier ought to be of that strength, that it will support its arch as an abutment, which by practice he finds one-fifth part of the opening to be sufficient ; but gives as a rule, one-sixth part, and two feet more : that is, an arch of 36 feet, one-sixth is $6 + 2 = 8$, the thickness of the pier. And where the arch is 72 or more, he deduces three inches for every six feet above 48 ; therefore the pier of 72 would be 14, that is two feet more than the one sixth-part ; but with the above allowance the pier is only 13 ; when the width is 96 or above, he allows the one sixth part of the opening as quite sufficient : this he seems only to deduce from observation, without adducing a reason ; now why a wide arch should be supported by more slender piers, in proportion, does not appear quite consistent with his principles ; that the pier must be of such strength as to serve for an abutment to the arch thrown upon it, independent of the other arches, which when thrown, are allowed to be a counterpoise to the pressure. Although we do not see why it is applicable to his principles, we will afterwards have occasion to show, that it tends to corroborate the principles we mean to advance.

We find another experienced engineer, Mr Gautier, who only differs from Belidor, in so far as we observe, as to the length of the arch-stones. Gautier directs, that if the arch is 24 feet, the arch-stone ought to be 2 feet ; if 45, 3 feet ; if 60, 4 feet ; if 75, 5 feet ; if 96, 6 feet ; if the stone is of a durable nature : if soft, of greater dimensions. Belidor gives the general rule, one twenty-fourth part of the opening : this must certainly be considered under some limitation ; for, if the arch is only 12 feet, the arch-stone would be only six inches, which, we think, will be thought too slight ; and arches over doors and windows would not be three inches ; but although he mentions no limitation, we suppose, if a 24 feet arch is allowed 2 feet of an arch-stone, the rule may with safety be followed ; and that a six-foot stone, of a durable nature, may be an arch-stone, although the span was 150 or 200 feet.

Under whatever names later engineers have acted, we find Belidor has in general been followed ; both by Mr Mylne and others. Peter of Colechurch, a priest, architect of London bridge, has given his pier a much greater strength, being more than half the opening ; the piers being from 25 to 34 feet, 18 in number ; the width of the river only 900 feet, over which this bridge extends.

An ample reparation is made for these inconveniences in Westminster bridge ; the piers more slender, a more easy passage for the water, the piers being only 17 feet. The breadth of the river 1223 feet. The arches are all semicircular, and spring from about two feet above low-water mark ; they consist of 13 large arches and two smaller ; the middle arch is 76 feet span, and the other arches decrease on each side by four feet. The passage for carriages is not of an easy

ascnt, having 30 feet of rise in 611.5 feet ; it is supplied with plainstones for foot passengers on each side ; the ledges adorned with balustrades, and semi-octagonal towers, which form the recesses of the foot-way ; the whole width is 44 feet. The whole is allowed to be elegant and well executed.

Bridge. We now take a view of Blackfriars bridge (fig. 12. Plate CXXX.), which presents us with something novel, is agreeable to the eye, and no precaution is neglected that could contribute to its strength, or give addition to its elegance. Its arches are of the elliptic form, at least nearly so. Upon examination of the figure of which we are possessed, the middle arch is a span of 100 feet, the flat part of the arch is described with a radius of about 57 feet ; and the lesser circles on each side $35\frac{1}{2}$ or 36 nearly ; this small arch is continued below its diameter, till its chord become 16 feet nearly, and its versed sine 5 feet, which gives it the degree of novelty alluded to ; and which is far from being disagreeable to the eye. The shoulders are compactly filled with rubble-work ; the bed of each row tending to the centre of the arch. To the height the arch can be raised without a supporting frame, an inverted semicircle is drawn, the convexity of the arch resting upon this rubble-work, which is formed of Kentish rag, but other hard stone will equally answer the purpose, as this cannot be everywhere procured. This inverted arch answers two material uses ; it prevents this rubble being raised by any lateral pressure ; and which we think the most material is, that it makes these parts of the arch, which form the greatest lateral pressure, to abut upon one another ; of consequence there is little or no lateral pressure upon the pier. But we shall refer our observations upon this as well as the preceding arches, till we have given some account of other bridges ; as we wish to make the article conduce to the information of our readers, and at the same time methodical.

The bridge of the greatest extent in England, is that built over the Trent at Burton ; its length is 1545 feet, supported by 34 arches.

The most stupendous bridge in Europe, is that built over the Tave in Glamorganshire, consisting only of one arch, the segment of a circle whose diameter is 175 feet ; the chord of the segment or span of the arch is 140 feet ; the height 35, and abutments 32 feet ; the architect of this stupendous arch was William Edward, a country mason ; it was executed in the year 1756.

We have likewise an account of the famous bridge the Rialto at Venice, the design of Michael Angelo. On account of its flatness and extent, being $98\frac{1}{2}$ feet span, it is reckoned a master-piece of art. It was built in the year 1591. Its height is only 23 feet above the water, but we find it now outdone by a country mason in Britain.

The next species of bridge to be noticed is a rushen bridge ; this species of bridge is formed of bundles of rushes, which being covered with boards and planks, form a passage over marshy ground. Bridges formed of casks, bottles, or sometimes bullocks bladders blown up, and attached to one another, have been used upon occasions by armies. They have been named *ascogafri*. The materials are carried along with the army in their march, which when joined, form

Bridge. form a ready passage over rivers, or other obstructions by water; which they term a portable bridge: materials of the above kind being light, and many of them, as barrels, being useful for other purposes. Bridges may be used of them to a very great extent.

Draw-bridges differ only in form and materials, being made of wood, and turning at one end upon hinges, or, when opening in the middle, at both ends, for the purpose of allowing ships to pass up and down a river; in this case the passage over the middle arch is formed by a draw-bridge; the manner of raising them being so universally known, it would be superfluous to describe.

A Flying-bridge, is a bridge formed of one or more boats joined together, and covered with planks in the manner of flooring, surrounded with a rail or balustrade; according to its breadth it has one or more masts to support a rope at a proper height; one end turns round a windlass, the other end of the rope is fastened to an anchor in the middle of the water; the rope is kept from sinking in the water, by resting on small boats at proper distances, that float and support the rope. The bridge is then wrought by one or more rudders, from side to side of the river; the rope is lengthened or shortened by the windlass, according to the breadth of the river. Some of these bridges are formed with an upper and lower deck, for conveying cavalry and infantry at the same time, or a greater number of infantry; it being well understood by military gentlemen, that the greater number that can be conveyed over at once, they can the sooner form into defensible corps, and support one another till their strength is so augmented that they can act on the offensive.

In Plate CXXIX. we have represented a flying bridge of this kind. Fig. 1. is the perspective view of the course of a river and its banks; *a, b, c, d*, two long boats, or batteaux, which support the bridge; *GH, KL*, two masts joined at their tops by two transverse beams, and a central arch supported in a vertical position, by two pairs of shrouds, and two chains *LN, HR*. *M*, a horse, or cross-piece, upon which the cable *MF* rests; the use of this cable is to re-act upon the working of the rudders, and prevent the bridge from being carried down by the current of the water. *E* is the windlass formerly mentioned; *a, b*, the rudders. *AB, CD*, two portions of bridges of boats, fastened to the banks on each side of the river, and between which the bridge traverses. *e, f*, Chains supported by small floats, sometimes five or six of them placed at proper distances; the number to be used will be regulated according to the length of the cable; one of them is placed at the anchor, so as the cable may swing above the surface of the water as near as the depth of the river will permit.

Fig. 2. is a plan of the same bridge; *a, b, c, d*, the two boats that support it. *K, G*, the two masts. *KFG*, the transverse piece, over which the cable passes; *E*, the windlass about which the cable is wound; *a, b*, the rudders; *o*, a boat; *c*, one of the floaters that support the chain; *N, N*, pumps for extracting the water out of the boat; *P, P*, capstans.

Fig. 3. A lateral elevation of the bridge, *A, c*, one of the boats; *b*, the rudder; *E*, the windlass; *M*, the horse; *GH*, one of the masts; *E, N, H, F*, the cable.

In this view the balustrade along the side of the bridge is in full view.

Fig. 4. is an elevation of the hinder part of the bridge or stern. *a, b*, The two boats; *GH, KL*, the two masts; *HI*, the upper transverse beam; *p, q*, the lower transverse beam, over which the cable passes, and occasionally slides from the one mast to the other; and must on that account be kept well greased; *p, k, g, g*, shrouds extending from the sides of the bridge to the top of the masts; *M*, the cross-piece, over which the cable passes to the windlass.

Besides these temporary bridges of boats already mentioned, there are permanent bridges formed of boats, as at Rouen, Beaucaire, and Seville. Those of Rouen and Seville are the most noted; that at Rouen was constructed to supply the stone bridge built by the Romans, said to have been a stately fabric. The boats are very firm, well moored with strong chains, and kept in proper repair. It is almost 300 yards in length, paved with stones as a street. A bridge of boats has the advantage of other bridges, if well moored, for as the water rises, whether by rains or tides, they keep afloat. This bridge is represented by some as a wonder of the present age; others say, it is far surpassed by that of Seville; but when we reflect upon that constructed by Darius over the straits of the Dardanelles; and on that by Cæsar over the Rhine, we cannot view either of them with so much surprise.

We find some of a different construction, called floating bridges; which we think should rather be stiled sliding bridges; they are so constructed that the one lies above the other, when not in use. When intended to be used, by drawing of ropes turned over pulleys, the upper one moves forward, till it passes over the other, when they are joined in one, and form the intended passage. It will readily occur to our readers, that these must be much limited as to their length, both on account of their weight, and the strength of the rope that would be necessary, both to push them over, and return them to their place; they can only be of use in passing a moat, in besieged places, or such as are of inconvenient access and little frequented.

We cannot omit taking notice of some natural bridges, in particular two very remarkable ones; the one in Virginia, described by Mr Jefferson in his State of Virginia. It commences at the ascent of a hill, which seems to have been cloven asunder, by some convulsion of nature; the fissure at the bridge is by some measurements said to be 270 feet; by others only 205; width at bottom 45 feet, at top 90, which gives the length of the bridge; the thickness at the summit of the arch is 40 feet: considerable part is of earth, upon which grow many large trees; the residue is of the same materials with the hill on both sides, which is a solid limestone rock, and forms the arch, which is of a semi-elliptical form, very flat; the height of this arch above the water (the whole being 205 and 40 the thickness) is 165 feet; the breadth at the middle is about 60 feet. It has no ledges, but what is formed on some parts by the rock, but even at these few can stand upon their feet to look down; but go on hands and feet to peep over. On the contrary the view from below is most delightful, and enchanting. The fissure continuing narrow, and straight, both above and below; and of such height that

Bridge. that it exhibits a prospect, for about five miles; gives a short but very pleasing view of Blue ridge on the one side, and North mountain on the other; the stream that passes below it is called Cedar creek, and falls into James river. The bridge is in the county of Rock-bridge, to which it has given the name. We have no account of the time when it was produced. It has, however, formed a passage between two mountains otherwise impassable but at a great distance from it.

The other is in the province of Angaraez in S. America, described by Don Ulloa. It is from 16 to 22 feet wide; 111 feet deep, of breadth one and one-third of a mile, and is not sensibly greater at top than at bottom. Don Ulloa thinks it has been effected by the wearing of the water, which runs below it; if, so it would have worn down plain and smooth; or most to that side, on its descent, where the rock was of softer materials; but he informs us that the cavities on the one side, where equally hard, so tally with protuberances of the other, that if they met they would fit in all their indentures, so as to leave no space void; from which we are rather inclined to conclude, that it has been formed by some violent convulsion of nature.

In comparing the two, although we find in the bridge in Virginia, the same quality of rock on both sides, and with the bridge itself, we do not find the protuberances on the one side answering to cavities on the other: if any such have been, the protuberances must have been effaced by time.

Before we proceed to make observations on the different forms already described, and the principles of their construction; we will lay down a theory founded upon approved philosophical principles; and we will endeavour to simplify our expression, so as to be understood by the mechanic, and, we hope, not despised by the philosopher.

The bridges we have described, are formed of arches of different curves; those of the circle and ellipse are the most prevalent. These are formed of certain materials, so joined together, as to retain the curvilinear form of the original curve from which it is taken, whether circle, ellipse, or other curve; and as it is only a part of the curve, and composed of different materials, the extremities of the arch must have some sufficient support to retain the materials in the form of the intended curve. Although authors that have treated upon this subject, have not agreed upon fixed principles to ascertain the strength of these abutments or supports; yet all agree, that they must be sufficient to sustain the impressing force.

It is an universal principle in nature, that all bodies, on or near the surface of the earth, tend by the laws of gravity towards its centre, unless prevented by some force, that has the power to resist them, or change their direction. If we attend particularly to one body, having all its parts tending equally to the centre of the earth, and supported in that position, it will retain its position. If we suppose another body to press upon it, so as to change that position it has on its support or force away its support, in whole, or in such part, that a greater part of the body has a tendency to the centre, more than it has to its support; it will fall toward the earth in a direction to its centre.

Let A, B, fig. 5. Plate CXXIX. be two supports, suppose one foot square, of height 5 feet, or any other height less or more, standing perpendicular; and let a

VOL. IV. Part II.

piece of the same dimensions, wood or stone, of three feet in length, be placed across in equilibrium; the perpendicular support is not pressed by this weight, but in the perpendicular direction; if a second piece of five feet is laid upon the other, in the same way, projecting two feet over on each side, they will still remain in equilibrio, and so on till the two bodies upon the two uprights meet one another, as in the figure, the planks or logs DD meet in E, without affecting the supports, except in the perpendicular direction; the equilibrium being preserved, no force imposed will make the supports give way, that will not separate the particles of matter, or break its contexture; neither will any weight push it over, that is not greater than the perpendicular pressure: for action and reaction are equal, acting in contrary directions. The force, then, that it will support before it yield, to press upon its support, is equal to the number of square feet that rests on the surface, and turns upon the angular point F. Now suppose this operation continued the whole length of the bridge, and the whole level blocks in contact with one another, received by the abutments, or landstools, the bridge will support any weight that the strength of these blocks could sustain, and the abutments react upon; this would be a bridge formed of the Egyptian arches, not very elegant, but of great strength, as each block is supported at one foot distance; and the upper ones in contact with one another, only react by their own strength, at one foot distance without support; and by the reaction of the land abutments, cannot yield to give any lateral pressure upon the pier.

Let us now suppose a semicircle or any other arch described, the superfluous matter is carried off, and the arch remains in strength and beauty. Now instead of balancing the blocks by counterpoise on each side of the support, let this be taken off, and applied as weights above the pier, being equal in weight to those that form the arch, the equilibrium is still preserved, without any lateral pressure. This may be illustrated by a very simple experiment. Let A, B, C, D, fig. 6. be four blocks; the first A, a square, which represents the base; the second B, a pentagon, inscribed in a circle of the same radius about which the square is described, placed with one of its angles to the perpendicular edge of the square, a perpendicular or plumb falls within the base, it is therefore firmly supported; let the hexagon C, be placed upon one of the sides of the pentagon, the two angles likewise coinciding; in this the perpendicular falls over the base, it will therefore be no longer firmly supported, but will fall, and if attached to the pentagon, would carry a part of it along with it, except prevented by friction and consistency of the texture of the materials. In this situation let it be retained, till a pentagon is placed on the opposite side of the hexagon; the plumb-line or perpendicular, as it now stands, falls within the base, and will be again supported so as to carry an additional block raised upon it, or require a considerable force to pull it over to that side, to which the hexagon was inclined to fall. The conclusion we would draw from the above, is that if the column or pier is of such dimensions at top, where the spring of the arch rises, that a weight of such materials as the arch is composed of can be raised, not exceeding the height of the vertex or crown of the arch, as will counterpoise that part of the arch, that produces the lateral pressure; then a

3 G

pier

Bridge.

pier of such dimension is of sufficient strength to support such an arch, till the other arches are thrown, and the whole made to abut upon columns that will counterpoise the whole with any incumbent weight proposed.

The manner we would recommend to apply the arches to their pier, and to one another is, that they abut upon one another, as in fig. 7, 8, and 9. In fig. 10, Plate CXXX. we take a semicircular arch of 75 feet span; our arch-stone we think of a sufficient strength at three feet length; our pier six feet, equal to the two arch stones. As every arch can be raised to a certain height, without the support of the centre arch; allowed, to the 30th degree or one-third of the distance to the crown of the arch. We have divided the quadrant or half of the arch into 83 equal parts; and where more than half of the arch-stone falls over the perpendicular, we consider as the height, not to be exceeded without support: the weight of matter upon the pier to this height, we compare with the weight of matter from that contained in the arch-stones; or, rather, what breadth of pier will contain a quantity of matter that will counterpoise the weight of the arch-stones, of an arch of given span, and length of arch-stones to the crown of the arch.

In investigations of this kind, we find recourse is had to trigonometrical calculations, and to algebraic and fluxionary equations. Foreign writers, as Belidor, give us rules, collected from such constructions as suited their taste; and most of the algebraic and fluxionary equations that we have investigated, take their data from some bridge, the construction of which pleases them, and bring their result agreeable thereto; and with some degree of confidence tell us that they are right, as it has agreed to the construction of so able an engineer. If we allow ourselves to follow this method, we can never expect to make improvements.

A late writer (Atwood) has treated learnedly, and we think judiciously, upon this subject; he considers each of the arch-stones, as a wedge abutting upon one another, and the whole upon the landstool, or upon the pier of the particular arch, and is resisted by a force or pressure, with a force which he expresses by a line placed at right angles to an arch-stone, at that part of the arch which would begin to rest upon the centre arch, which here he calls BS, but says, that the length of the line or the point S is not determined: this, we hope, will be found to be determined in the result of our theory.

We hope our readers will excuse us in departing from the method of investigation formerly mentioned; and, in following that plain geometrical method, which every mechanic is able to understand, and judge of; and which, at the same time, we flatter ourselves the learned will not find cause to challenge.

The thickness of our pier we have taken is, *Ab*, fig. 10. six feet; each division of our arch is equal to two feet on the outside, and tending to the centre of the circle as a wedge: the inside measures 1.8 feet; the mean is 1.9×3 ; the length of the stone is 5.7 feet of surface; we suppose it taken three feet into the arch, equal 17.1 solid feet, in each of our divisions; the scale half an inch to 10 feet. The solid measure, on the whole, is easily found; the 30° is at *a*, but the

arch will rise without the support of the centre arch to *c*. Now, the number of divisions from *a*, to the centre of the arch, is 22.2; 17.1 solid feet each, is 374.75 solid feet; our pier of six feet contains to the height *a*, the surface *Abda*; at a mean, taken as in the table, *a* is 72.75, being each two feet, is 145.5 superficial feet, $\times 3$, the assumed depth is 436.5 solid feet, being fully in equilibrium with the arch-stones; but, as the arch will rise to *c*, there is an additional weight of 229.5 solid feet, which will be allowed more than a counterpoise to the pressure of the arch, without any aid from the pier, which has only the perpendicular pressure to support. The counterpoise is, therefore, by this ascertained, which will support this arch till the other arches are raised; which, as they all abut upon one another, the landstool must be made of such strength as to counterpoise the whole; which is ascertained upon the same principles, and leaves no stress upon the piers but the perpendicular pressure alone. This pier is scarce one-twelfth part of the opening, by which, the river having so free a passage, will affect the bridge by pressure but very little: but this will fall in our way to consider afterwards. Fig. 7. is a perspective view of one arch of a bridge, on this construction, with part of an adjoining arch on each side.

When the situation of the river, or other circumstances, or when a segment of a circle is made choice of for the ease of the passage, or economy in the use of materials and mason work; or the base of the arch, or surface of the pier, will not admit of mason work to bear upon the spring of the arch, of such weight as to produce a sufficient counterpoise to the arch-stones that produce the lateral pressure, the pier must be made of greater breadth, as, if much flatter than fig. 8. the pier, in that case, ought to have been of the breadth as represented by the dotted line *ab*, *ab*; but this is ascertained in projecting the plan. Fig. 8. is a perspective view of one arch, with its adjoining arch, and part of the abutment on the land side, which will be considered afterwards. At the same time, as the fall of an arch is attended with very great loss, both in money, time, and loss of materials; which might prove hurtful to many ingenious undertakers of such works; by way of precaution, if they shall doubt that the slenderness of our pier will support the arch till the others are thrown, for none can doubt them afterwards, beams may be made to abut upon one another, and upon each pier, as in fig. 8: this is no loss of time or materials, as it will supply, in part, the supports of the centre arches, upon which the arch of the bridge is raised; and it is a precaution used, upon a smaller scale, when in front-walls of houses; the whole is often supported upon arcades of shop-doors and windows, many of their piers not exceeding nine or ten inches: a cross-bar or piece of wood is laid across, to prevent their yielding or losing the perpendicular, till the whole is completed. Now, the pressure upon the arch is not so great as most writers have assigned to it; that is, the whole incumbent weight of all the materials above it, together with that of passage. The art of masonry is such, that the beds or rows of stones so bind, one with another, that each makes a pressure on its contiguous part, so as to form an arch of themselves. We see in well-built walls a vast excavation made

Bridge.

Bridge. made in the lower part, or in the middle of the wall, and the upper part of the building not affected. In like manner, the arches being all raised to the height that they can be, without support of the centre arch, they are completed and filled up to the level of the keystone, but not higher. The arch is properly secured, if the principles of equilibration, in filling up, are properly attended to; but if one side is overloaded either in filling up, or in building, it must twist the arch, and if not instantly to break it, must tend to an uncertainty as to its durability. For although some have concluded, they say, from a result of their calculation, that the mathematical theory of equilibrated arches is of little value to the engineer; we do not hesitate to assert, that, if preserving the equilibrium, both in raising the arch, and filling up the haunches, is not attended to, we would not assert it to be in favour of its durability; and we know of no principles in philosophy that will support the opinion, that these can be neglected with propriety; neither do we think such a practice will be readily adopted by a skilful engineer.

Among the various writers upon bridges, some prefer the circular arch, both for strength and elegance. Others contend, that it is exceeded in both by the elliptic arch. Others will give the preference to the catenarian arch; and we are told, that the excellency lies on the side of the parabolic curve. We do not think it incumbent on us to combat each of these, neither do we think our readers would thank us for so doing. It may, however, be expected that we should not pass them entirely unnoticed. In the first place, then, we are of opinion, that the arch that bears most equably throughout the whole, one part upon another, has the best claim to strength. Our reason is, which we illustrate thus, let AB, AC , be placed as in fig. 11. Suppose a weight placed upon them in such manner as to press equally upon the point A , the two bodies AB, AC , will in that point support the greatest weight: if the same weight is laid in the middle, between A and C , or A and B , they will each yield to the pressure; for the weight is not equally divided between them. But if these bodies are so placed, that in every position on which a weight can be applied to them, that the weight being equally supported by both, this being the case with the circle (fig. 7.) inclines us to give it the preference as to strength. As to elegance, we know, that regularity is a qualification that suits every taste: and here the circle cannot be outvied. It is not, however, without its disadvantages; with regard to expediency, the semicircular arch is sometimes too high for the situation of some bridges. In this case, the elliptic arch (fig. 9.), formed upon the greater axis, offers itself in point of expediency, and refuses to yield in point of elegance. It is bold enough to assert, that if strength of materials forms its composition, and be properly abutted, it will not yield, in point of strength, in any exigence to which it may be opposed. In point of economy, it claims a preference to the semicircular arch; for our part, we are inclined to own the reasonableness of its claim, and to give it the preference to the segment of a circle (fig. 8.), which might perhaps be preferred in point of expediency, as it can be rendered as flat as the ellipse; but its flatness we rather consider as a dis-

advantage, as in the rise of the water, it is apt to choke its course and overturn it; whereas, the ellipse being nearly formed of two segments of circles of different radii, the smaller arches at its extremity rise more in the perpendicular, and give more scope to the current of the water; and likewise, it does not require a stronger pier than a semicircle of the same diameter. The segment, on the other hand, if flat, requires a stronger pier, and therefore tends more to choke the current of the river, which ought always to be avoided when it can be done.

In the catenarian arch, as every one will observe, when a chain or rope is fixed at each end, and allowed to fall down in the middle, the curvature is not equal throughout; and we therefore cannot think it entitled to equal claim with the circle or ellipse. The same objection may, with equal propriety, be made to the parabola. This curve, near its vertex, has nearly the property of a circle; but every one who knows a parabola, is convinced how much it deviates from it afterwards; although everywhere it retains the property of its own curve.

We now take a review of the different bridges we have mentioned, and make some observations upon them. In general, we remark, that all the writers upon this art have formed the abutments of each particular arch, to be placed in the pier below the spring of the arch; on which account many have constructed their piers of greater strength than necessary. The first we mentioned, was that by the Roman emperor Trajan, over the Danube: the arches being broken down by the emperor to impede the passage of his invaders, we cannot, with certainty, compute the lateral pressure upon the piers; but their height being 150 feet from the foundation, must have considerable strength to react upon an arch of 170 feet span; which would act upon this column as upon a lever of 150 feet length. We find this pier is 60 feet of thickness, more than one-third of the opening; one-fifth would have been 34 feet: we cannot think this architect has acted without principles; but it is unnecessary for us to conjecture what those were. If we had been informed of the figure of the arch, we might have come near; it probably was a semicircle, and if so, perhaps 20 feet thick of pier, even at that height, might have been of sufficient strength.

The next we have mentioned, are those formed upon the principles, or rather by the rules, given by Belidor; for, although he has not condescended to lay down his principles, it does not appear that he has proceeded without principles. Upon investigating what must be the breadth of a pier that will form an abutment to an arch of 75 feet span, we have formerly stated that this arch can be raised to c (fig. 10.), without applying the centre arch: from the centre of this arch-stone we raised a perpendicular pe , and from the lower part of the arch-stone drew the line fg parallel to it: this line fg we supposed to cut the centre of the pier in g . Suppose him to have allowed a part of the pier equal to the length of his arch-stone, which we have in this figure taken three feet, one twenty-fourth of the opening nearly, viz. $h\bar{h}, A\bar{k}$, for the perpendicular support of the arch-stones to c . We find hg measures five and a half feet, we therefore extend hg to l , which is 11 feet, and Al 14 feet for the breadth

Bridge.

of the pier: in place of taking the whole width of the bridge, we take only three feet as formerly. The number of equal divisions from *c* to the vertex or middle of the keystone, is $20\frac{1}{2}$: each of the equal divisions at three breadth contains 17.1 solid feet, as by our former measure, which multiplied by $20\frac{1}{2}$ is 350.55 solid feet. The pier, 14 feet breadth by six in height, viz. the height he supposes his pier, and three deep, is 252 solid feet: the solid building *c f g m* being supported in the perpendicular, he considers as a part of his abutment, of which *f g* measures 26 feet, by *c f* 3, and by 3 in depth, is $234 + 252 = 486$ solid feet, to counterpoise 350.55 solid feet, which he considers more than sufficient. Suppose then the pier is 13 feet, at the above height it contains 234 feet + 234 as before = 468 feet, which to account for accidents, and from his practice and observation gives his rule, which we suppose is fully accounted for. If the height of the pier is more than six feet, he would add to the breadth of his pier in proportion, which he does not take notice of, but asserts, that when the span is above 80, that one-sixth of the opening is sufficient in strength to resist every exigence; but if the arch is a segment, the same rule we have given will find the breadth of the pier, but would give it more than 14 feet. Belidor confines his rule to the semicircular arches. We have already mentioned what we think a proper limitation to his rule for taking the 24th part of the arch for the length of his arch-stone.

London bridge was executed in stone, under the direction of Peter of Colechurch, a priest; it was 33 years in building, being begun by King Henry in 1176, and finished by King John in 1209. The piers are 18 in number, from 25 to 34 feet thick. In what manner this priest executed so great an undertaking at that time, and in these days of ignorance, we are not informed; he has, however, given it superabundant strength of pier, and choked up the course of the river from 900 feet to 194: but as this objection is about to be removed, we need say no more about it.

Westminster bridge is generally allowed to be an elegant and noble fabric. The height of the pier is only eight feet from the bed of the river; the thickness, for a sufficient counterpoise to the arch, could not exceed 14 feet: the architect, Mr Labley, has given it 17: his arches are semicircular, the middle 76 feet span; his ascent one-twentieth part of the half width of the river, which is here 1223 feet, one-half is 621.15, the rise $30\frac{1}{2}$ feet in that extent.

The next we notice is Blackfriars (fig. 12). executed by Mr Mylne, whose ingenuity and ability as an engineer are universally acknowledged. The middle arch is a span of 100 feet, of the elliptic form; by which, with other advantages, the passage is rendered more commodious, the ascent being more easy; the quickness of the rise of the arches of the small circles, with the flatness of the large circle, are particularly well adapted to give a more easy passage to the river, rising either from a tide or other accidental causes, renders the choice of the elliptic arch here very judicious: we are likewise much pleased with the ingenuity of the inverted arch; it effectually prevents any rising of the rubble work that fills the interstices between the arches, by any pressure whatever; as it

2

abut upon the arch-stones at E, it presses their joints upon one another, in a more effectual manner than perhaps could be accomplished by any other method; but the effect produced by it, and in which we think its excellency mostly consists, is, that it makes the arches, at that point, where they produce the greatest lateral pressure, to abut upon one another, and thus take off the lateral pressure from the pier. It does not a little surprise us, that Mr Mylne did not avail himself of this, by which his pier would have been at least one-half thinner: in place of this, he has made it at the extremity of the greater axis, A *a*, B *b*, 19 feet, and increased it in a circular form to 22 feet; experience having proved, that when the resisting force is placed in the pier, one-fifth of the opening is more than sufficient for the resisting force; why he, after taking off the resisting force, should contract the course of the river from 100 feet to 70, when 19 feet, as has been shewn, by many experiments in practice, was more than sufficient, although he had not taken off this resistance, by making the two arches abut upon one another. The depth of the water, at ordinary tides, is not less than 16 feet, and by the principles of hydrostatics, the pressing force of a solid foot of water, at that depth, is equal to 8500 lb. \times 30 the number of feet contracted, is 255,000 lb. or 113.8 tons upon the found of his pier, more than necessary; and which he might have avoided. We hope we shall be excused for these remarks, as a work of this kind is executed for general use, and to point out what might escape the most eminent, and far superior to what we can pretend to. We must likewise point out, under the same apology, and at the same time apologize for our own ignorance, in not understanding the signification of the word *joggle*, as here applied; we understand the Scots phrase *to joggle*, which is loose and infirm in position: when a mason is bedding a stone, if it is too heavy for trial by his arms, he stands upon it with his feet; if he do not find it firm, he says it is not firm, it joggles in such a position, and we think the Teutonic favours this Scoticism. Now, how a phrase that signifies infirm, should be used to give firmness, may be owing to our ignorance of that language that gives it such a signification; but this does not at all derogate from the method. It is, beyond doubt, that each stone is so bound with another by it, that they are rendered as one stone; and that one cannot be forced from its place without carrying the whole along with it, or pulling the stone asunder, which no weight that can come upon a bridge would do.

That the above may be the better understood, we have given a drawing of the middle arch, and part of the adjoining arches: AB, fig. 12. is the length of the greater axis of the ellipse, and span of the arch 100 feet; C the centre of the ellipse; *c* the centre of the circle, that describes the flat part of the arch; *f, f*, represent the two foci, or in this, the centres of the lesser circles; D, D the inverted arches abutting upon the arch-stones E, E; V the vertex or crown of the arch; F, F the thickness of the pier at the bed of the river; A *a* B *b* the thickness of the pier at the extremity of the greater axis. We have put on the bolting in one of the arches, done with the Kentish rag-stone; the bolts about a cubic foot sunk half-way into each stone; the stones in the pier are bolted with firm oak.

Bridge.

Bridge.

oak, of a solid foot, dovetailed into each stone, which renders the whole pier firm as if one stone.

What has been said on the breadth of piers, renders any observations on the bridge over the Trent at Burton, or the single arch over the Tave in Glamorganshire, unnecessary; the abutments of the last being on land, the method of obtaining their strength will be pointed out when we speak of the abutments of iron bridges, of which there are now several in England.

Vol. x.

The first, as described in the Philosophical Magazine, over the Severn near Coalbrookdale in Shropshire, was built by Mr Abraham Darley; the iron work was cast at Coalbrookdale in 1779. It consists of one arch of 100 feet six inches of span; rises to the height of 45 feet; consists of ribs, each cast in two pieces, secured at the crown by a cast iron key-plate; and connected horizontally and vertically, by cast iron braces formed with dovetails and forelocks; the ribs are covered with cast iron plates; the railing is of iron; the weight of the whole is $387\frac{1}{2}$ tons. The iron work executed by Mess. Wilkison and Darley, iron-masters, of which they have great credit, being the first instance of that material being applied in the bridge way. In 1801 it appeared as perfect as when put up, except what was owing to the failure in the stone abutments, which had occasioned some cracks in some of the small pieces.

The second bridge of this kind was built over the same river at Builtwas, at the expence of the county of Salop, agreeable to a plan under the direction of Mr Telford surveyor of the public works in that county; the iron work was cast at Coalbrookdale in 1795, and 1796: it consists of an arch of 130 feet span; the rise of the arch 27 feet from the spring to the soffit. The situation of the road here rendered it necessary to be kept low; the outside ribs are made to go up as high as the tops of the railing, and are connected with the ribs that bear the covering plates by bars of iron cast with deep flanches close to each other, and form an arch of themselves; so that the bridge is made upon the whole, compact and firm; the weight of the whole is 173 tons 18½ cwt. Some smaller arches and an aqueduct at Longdon, have been made under Mr Telford's direction in the same county.

The next upon a large scale made of iron, is that over the river Wear at Monk-Wearmouth, in the county of Durham. This bridge, fig. 13. is the segment of a circle, whose radius is 443 or 444 feet; the span of the arch, or length of the bridge, is 236 feet; the height of its vertex above the spring of the arch is 34 feet; and height above the surface of the water 60 feet, so that vessels of considerable burden may pass below it without interruption. The width of the bridge or breadth of the road-way is 32 feet; it is formed of six ribs, placed about five feet distant from one another; each rib consists of 125 blocks of cast iron, five feet in height, and two feet broad at the middle; the lines drawn from this to the centre of curvature determine the length of the block above and below, and a circle described with the radius of curvature gives the convexity of the upper part of the block, and the concavity in the lower, agreeable to the curvature of the whole arch of the bridge; the parts of the block are represented in fig. 14. upon a large scale.

In each of the three longitudinal parts of the block

there is a square groove one inch deep, into which is fitted a bar of wrought iron of the same dimensions with the groove, into which it is inserted, marked *b, b, b*, by which the blocks are joined together to form the rib. These ribs are connected laterally by a hollow bar of cast iron, fig. 15. about four inches diameter, and five feet long, with flanches, through which iron bolts are made to pass it, and the sides of the ribs fixed with screws or forelocks; two of the blocks are joined by the bars of wrought iron, and connected with a bar of another rib by the iron hollow bar, as represented in fig. 16. All the ribs joined together, and connected in the same manner as in fig. 16. complete the arch of the bridge. To support the beams that form the road-way, circular pieces are formed of cast iron, to abut upon one another at their horizontal diameter, the beams that form the road-way resting upon the circular pieces at the vertical diameter, which gives a firmness to these supports, that no weight coming upon the bridge can injure. The beams or planks are then covered with plates of iron, and such materials as are reckoned to be best adapted to form the road, and prevent water passing through to the injury of the bridge; we have therefore no doubt of the strength of the circular supports, and this figure is always pleasing to the eye; but perhaps in point of economy the form of a support we have given in fig. 13. and added a short description, might be sufficiently strong, and we think contains less metal, which will produce a saving. As we have at the end of this paragraph given a description of the parts agreeable to the figure, we only add, that it was constructed under the direction, and chiefly at the expence of Rowland Burdon, Esq. then M. P. for that county; it was cast at the manufactory of Mess. Walker of Rotheram in Yorkshire, and does honour to the projector and iron-masters; it is nearly double the span of that at Builtwas, and more than double the middle arch of Blackfriars Bridge. We have seen what is called a perspective drawing of this bridge, but as it is in many instances faulty, and in some instances ridiculous, we would not wish such a piece to appear in our work; in the back ground drawing, the houses vanish in the direction quite opposite to the point of sight, and the view which is allowed to be from below, the eye is made to see quite through between the arch, and the road-way at both ends of the bridge, although at the height of 60 feet, and distance of 236. Our drawing we describe thus: A, fig. 14. is one of the blocks; *b, b, b*, are bars of wrought iron sunk into their grooves, B, fig. 15. is the hollow cross bar which joins the ribs in the manner as represented fig. 16. which shews two pieces joined, and bolted by the wrought iron bars, and the bolts represented at 1, 2, 3, and the two ribs joined by B, B, B, in which manner the whole bridge is connected; the front of the ribs in length is represented on fig. 9. by *a, a, a, a*, the other ribs by the different lines, which appear in the perspective; E is an arch, through which a road passes, and stretches along behind the three houses by the side of the hill. The blocks placed in a vertical position, in the same manner as in the front of the bridge, are to be considered as curvilinear; but the great extent of the radius could not be conveniently applied, and at that small distance would differ little from a right line when viewed separately. Fig. 17. is the support we proposed in point

Bridge.

of:

Bridge. of economy to supply the place of the circles, the flanches resting and coinciding with the curvature of the arch, and all abutting with one another form a covering arch, by which the blocks perhaps might be thought of sufficient strength, although somewhat less than five feet in height, the upright *g*, of such height along, as the beams of the road-way might rest at the distance of five feet, or thereby, from one another.

Our only doubt of the durability of iron bridges is, that the water being blown in by storms, rests on the flats of the iron, and tends to corrode it and waste its parts; and what will be of the worst consequence, find its way into the joints. Perhaps if between these, thin plates of lead were placed, the two pieces might have their joints closed, by abutting upon the lead, and the same precaution being taken with the wrought iron, where inserted into the grooves of the cast metal, the water would be prevented from entering, or settling in the interstice.

Two other bridges we find described, for both of which patents are obtained, the one by Mr Jordan for a suspended bridge, inrolled in December 1796, the patent obtained, and description January 1797, which exhibits the principle of the invention with its advantages, and a perspective drawing. It consists of two suspending ribs, one on each side of the bridge, which are to extend over the whole breadth of the river: if this distance is thought to be too great for one stretch, it is proposed to raise two other ribs on the opposite side, to meet and abut upon one another; on this account a pier is required, upon which the two abutting ends may rest, and as it bears only the perpendicular pressure, it may be so thin, as to make little obstruction to the current of the river. The suspending arch being erected, is to be understood to be of such strength as to bear the bridge suspended to it from the arch; bars descend on each side to which cross beams or bars of iron are fixed on each side of the bridge at proper distances; along these others are extended in a direction across the river, and covered in such a way as to form a passage for carriages and passengers of every description. It has this particular advantage, that it admits of a drawbridge.

The advantages proposed by the patentee are: That the span may be greater by this than by other constructions, and that the distances between the abutresses and intermediate pier, may be greater than heretofore, or if more piers are requisite, between pier and pier: more particularly, 1. A bridge of this construction requires less time to execute, it not being subject to the interruption of tides. 2. That it is done at less expence. 3. The ascent is easier. 4. They are not so liable to decay. 5. They may be repaired with more certainty and facility, and at less expence. 6. They will not be subject to the accidents which have destroyed others. 7. They may be erected at any extent, in regard to length and width. 8. They can be secured so as to form one entire piece. 9. They can be preserved in their parts from decays of an accidental nature, and assisted in their durability, by the application of different preservatives. 10. And lastly, It is clearly evident on inspection of the figure, that bridges of this construction, whatever their length be, are in no respect subject to the continual accidents which arise to

bridges on the common construction, from currents, tides, swells, inundations, &c. &c. Bridge.

In this bridge, there is much ingenuity displayed; and very considerable advantages attached to the use of it; as it is a level, the passage over it is easy; it being well adapted for a draw-bridge where requisite, renders it worthy of attention, and in several situations it might be advisable to adopt it; but at the same time, we are not certain, that so many advantages would accrue from the use of it, as is proposed by the patentee; for instance the suspending arch must be raised by scaffolding as well as other arches; and this scaffolding, we apprehend, must be preserved till the whole of the bridge is finished. On the other hand, if piers are to be raised, they may be slender, having only the perpendicular weight to sustain, and will on that account be little interruption to the course of the river.

The other patent is obtained by Mr John Nash, architect, Dover-street, London, for his invention of an iron bridge, Feb. 7. 1797, on a new and improved construction. What the patentee here proposes, is that in forming the arches and piers for a bridge, in place of arch-stones, that boxes of cast iron, or plate iron, be formed to the size and figure of the arch stone; and that these boxes be cast with a bottom, or that the bottom may be put in before using. The piers are raised by like boxes, the first row of boxes being laid for the found of the bridge, and fixed to the bed of the river by piles driven into the ground; the boxes are then filled with clay, sand, sand mixed with lime, stone of any kind, small or great, brick, with or without lime; being thus filled, another row of boxes is placed, and bedded as if stone; filled up in the same manner till prepared for throwing the arch. The arch-boxes being prepared as already mentioned, are placed in the same manner as arch-stones are placed in an arch; and being filled as before directed, the arch is completed and formed of solid materials cased with iron; and that iron may not abut on iron, he proposes plates of lead laid between each box, and in this manner the bridge is finished, forming one solid mass cased with iron.

In some parts of this, and other countries, the situation is such, that neither stone nor lime can be procured, but at an enormous expence; in such a situation the invention would be meritorious; as a bridge could be erected forming a convenient passage, the boxes being filled with such earthy or stony materials as the place could supply, and if filled with small or round stones, the interstices might be filled with mortar, to render them solid. In some places so situated, that although stone is to be got in quantity and quality sufficient, yet lime cannot easily be procured, the invention might succeed; but we suppose that when both stone and lime can be procured, few would think of casing it with iron, which is less durable than stone, when constantly exposed to the air, in wet and dry. A body of solid iron is very different from a thin plate, exposed on both sides to materials different from itself.

We come now to the description of the greatest undertaking of this kind, that ever graced the British annals, or was accomplished in Europe or the world, that we have accounts of, except in China, as formerly mentioned. The London Bridge, which, though clumsily

Bridge.

clumsily executed, and with no great judgment, has performed its service faithfully for near 600 years; but on account of the advance in trade, and necessary improvements, it must now be superseded by this noble fabric, that will even dazzle the eyes of the enlightened world.

This interesting project has so far engaged the attention of the legislature, that a select committee has been appointed of such members as were no ways concerned in any of the plans brought forward; they have made three valuable reports, that respecting this bridge being contained in the third report, viz. the rebuilding of London bridge, by which colliers, and coasting vessels, and all vessels of light burdens, are to be admitted to pass the new London bridge, and to ship and discharge goods immediately at wharfs, and warehouses, to be constructed along the banks of the river, and opposite to the centre of the city; for which purpose this new bridge is to be formed of cast iron 65 feet high, clear above high water, with inclined planes connecting it with the present streets, and such other improvements as may grow out of this alteration. The bed of the river is to be deepened, so as to admit ships of 200 tons lying afloat at low water; and that no incroachment may be made on the property of those connected with the shore, it is proposed to contract the course of the river to 600 feet, according to Mr Jesson's report, by which room will be procured for the inclined plane, or wharfs and warehouses. The plan of the bridge is projected by Messrs Telford and Douglas; the span 600 feet, equal to the width of the river when contracted, which is now accomplished, and we understand the plan is far advanced in the execution; but a plan of so great extent must be subject to many unavoidable interruptions.

A short account of the plan of the bridge will not be unacceptable to our readers, as it will enable them to form a more perfect judgment of this magnificent structure. The whole is of cast iron, which is less liable to corrode than hammered iron; the ribs are cast in as large portions, as can conveniently be moulded; they are connected together by cross and diagonal tie-braces, in such a manner, that any of the pieces of the ribs or braces can be taken out, and replaced, without injuring the whole, or interrupting the passage, thus the bridge can be kept in repair with ease, and convenience; all the frames are so connected vertically and horizontally, from the soffit of the arch to the road way, that the whole will act as one solid frame; and are so disposed from the middle of the arch, to the abutment, as to give a greater width to the bridge at entrance from the shore, from the different inclined planes, which enter to the bridge from three different directions, by which the public will be accommodated by three different bridges, as to entrance and egress.

The inclined planes which afford entrance to the bridge from the shore, and streets, will give ample room for warehouses, vaults, and other conveniences for depositing the goods, before they can be put on board, or after they are unshipped, till they can be conveniently carried off by the proprietors.

We come now, as proposed, to ascertain the strength of an abutment that will support, or counteract the pressure of any number of arches, abutting upon one ano-

Bridge.

ther, in the manner we have proposed. Throw up the contents of the number of feet in all the arch-stones, from the one end of the bridge to the other; divide this between the two abutments, and find what base is necessary to contain a number of feet equal to the half, upon each pier from the spring of the arch to the height of the road-way, with one-fourth or one-third added, for allowance made for superincumbent weight upon the bridge, or any default in equilibration or otherways, care being always taken to secure a proper found to abutments. To find the abutments of iron bridges, being of so great extent as those now raised, or may be raised; take a base that will contain a weight of stone, equal to half the weight of the bridge from the spring to the road-way, with what is thought necessary to add for extra weight upon the bridge; here it is still more necessary to attend to a proper found, and further it may be necessary in large arches of stone, or an iron arch, to bolt the stones together according to Mr Mylne's method; as the great pressure is laid upon them before the cement has fastened the stones, this may be the cause of the failure in the abutment in the Shropshire bridges, and also of others. Such magnificent structures are worthy of every attention.

We have already treated, and we hope with satisfaction to our readers, of the principles upon which this theory is founded. We shall now adduce some undeniable instances, from the practice of modern and ancient architects. First, upon a small scale, we find vaults thrown, of 8, 10, or more feet, of arches abutting upon one another, upon thin walls; some not exceeding 10 inches, and 6 feet in height; and arches from 18 to 20 feet, the supporting wall from which the arch springs not exceeding 14 inches, the arches below the semicircle, the main abutments being of sufficient strength. Upon a larger scale, in the Gothic architecture, it has universally been practised to support the arches by abutments on the outside of the wall, but not without exception, and where this exception has been made, we find the arch equally well secured, and with much superior grandeur and elegance. In that superb structure of Gothic architecture, St Giles's Church, commonly known by the name of the High Church, Edinburgh, the steeple stands upon four columns, not stronger in proportion to its weight than the six feet pier we propose for an arch of 75 feet span; this centre part of the building is supported by the parts to the east and west, and by arcades, forming aisles in the other direction, none of them exceeding half its height or thereby; it rises above them with its majestic head, adorned with an imperial crown; and for supporting the stately arches that form this crown, no outside abutments are prepared; in this, the exception above referred to consists; it seems as if by the artist intended for the support of our theory. The weight is laid upon the shoulder at the spring of the arch, but with so much elegance as if it were only intended to form an ornamental part of the proposed figure; and under the appearance of an ornament concealing its real use. Some of the arch-stones likewise are projected outward, in the horizontal direction, ornamented at their extremity, and, at the same time that they enrich the crown with an additional ornament, they are a counterpoise to the arch at that place. To complete the deception,

ception, to adorn the proposed figure throughout, and to finish a well proportioned and elegant crown, the summit is put upon it, at the same time securing the keystone, which without this precaution would by the side pressure have sprung upwards, and have brought the whole arches to ruin.

That these arches are as well protected by the weight placed at the spring of the arch, as any that are supported by abutments, we need only as a proof produce their stability, in resisting, notwithstanding of its great height and exposure in situation, the boisterous effects of the elements, and the concussion arising from the vibration of large bells, suspended in it, and so frequently rung.

From the principles formerly laid down, and the authority now adduced in support of our theory, we hope that it has received ample confirmation. And we venture to conclude, that we have pointed out a method to every mason, and engineer, how in drawing his plan, he may be able to ascertain the weight to be laid on the shoulder of his arch, to counterpoise the weight, according to the intended span, and what thickness he has occasion to make his pier, without encumbering it, not only with useless matter, but what is materially injurious to the strength of his bridge, by choking the current, and causing it act with ten times more force upon it, than it otherwise would do, as we have formerly shown.

We cannot pass the instance of ancient architecture last mentioned, without observing what attention has been paid to the principles of equilibration; and, although the architects have not communicated the principles upon which they executed their plans, they give evident proofs of their having followed some regular theory. Can we suppose that the projector of St Giles's church, Westminster abbey, and innumerable others, could have produced such elegant and well-proportioned structures accidentally, without a well regulated principle to act upon, or that the projector of this imperial crown we have been describing, had not thoroughly digested all its parts and ornaments, before it began to be erected. The ancient architects have, however, thought proper to leave to posterity to collect their principles from the works that have been executed. The moderns are actuated with more liberality of sentiment, in laying down their principles, as well as executing their projects, many of which will do honour to the age, and leave posterity both principles and examples to follow and improve upon.

After having treated upon the rise and progress of bridges, from what we know, from the most early periods, it may appear somewhat awkward that the foundation is neglected, and the manner of preparing: but when it is considered that this must be regulated by the superstructure to be raised upon it; that although it, must be the first part with which we begin, it must be the last in the plan, and in founding a bridge there is indeed much to be considered; and as we propose to offer some methods for founding, which so far as we know have not appeared, we will be attentive to lay them before our readers, under the article FOUNDATION.

We have described bridges of different materials, but have mentioned none of wood; this will come pro-

perly to offer itself under the article CENTRE, in which we intend to offer some concise and simple construction, and some forms of wooden bridges, that in point of elegance and strength, may not only vie with, but supersede the use of iron bridges in many instances.

Bridge,
Bridge-
town.

Explanation of the above Table referred to in fig. 10.

From the spring of the arch (fig. 10.), parallel lines are drawn from the divisions of the arch, to the perpendicular *db*, being each two feet at the outer part of the arch-stone. These divisions are marked in the figure 1, 2, 3, &c.; the measures of each of these lines are inserted in column 2d; the first and second are added together as marked in column 1st, their sum is inserted in column 3d, the half or arithmetical mean in column 4th. In the same manner the 2d and 3d, the 3d and 4th, &c. The sum of the means when added make 72.75, being each 2 feet distant; 145.5 superficial feet \times 3 in depth is 436.5 solid feet; but as these parallel divisions decrease in breadth as they ascend from the spring of the arch, the mean deficiency in solid measure, as above, in the work, .39375, being deducted from the 436.5, leaves the remainder 436.1 solid feet. Between the 10th and 13th division the deficiency is greater, as above, amounting to 2.655 solid feet, to be deducted from 229.5; there remains 226.845 solid feet, which, added to 436.1 is 662.945, the resisting force, to counteract the lateral pressure of the arch-stones 374.75, reckoned from *a*; but reckoned from *c*, which the counterpoise is raised to, there being only 20 $\frac{1}{2}$ divisions, the lateral pressure only amounts to 347.55 solid feet, little more than one half of the opposing force. The arch then must be sufficiently secured without any addition to the pier, more than furnishing a base for this weight.

We have chosen to express both forces by solid feet, in place of weight, as the weight will differ according to the quality of the stone; whereas the solid foot is applicable to every quality of stone of which an arch is raised, stones from the same quarry being nearly of the same specific gravity, and of consequence a solid foot will be as nearly of the same weight. If from different quarries, the weight of a solid foot of each can be easily ascertained. The above table, and work of means and deficiency, we might have expressed in algebraic and fluxionary equations, the small increment of deficiency being the fluxions. We should have had the appearance of being more learned, but whether we should have been more useful to the generality of our readers, we leave them to judge; but we think it becoming in every learned man, to express himself so, as to be universally understood. See the article BRIDGE in the SUPPLEMENT.

BRIDGE, in *Gunery*, the two pieces of timber which go between the two transoms of a gun-carriage, on which the bed rests.

BRIDGE, in *Music*, a term for that part of a stringed instrument over which the strings are stretched. The bridge of a violin is about one inch and a quarter high, and near an inch and a half long.

BRIDGE-TOWN, the capital of the island of Barbadoes, situated in W. Long. 61°. N. Lat. 13°. It stands in the inmost part of Carlisle bay. This originally was a most unwholesome situation, and was chosen entirely for its convenience for trade; but is now deemed to be as healthy as any place in the island. The town itself would make a figure in any European kingdom. It is said to contain 1500 houses, and some contend that it is the finest the British possess in America.

VOL. IV. Part II.

The houses in general are well built and finished, and their rents as high as such houses would let for in London. The wharfs and quays are well defended from the sea, and very convenient. The harbour is secured from the north-east wind, which is the constant trade-wind there; and Carlisle bay is capable of containing 500 ships, and is formed by Needham and Pelican points. But what renders Bridge-town the finest and most desirable town in the West Indies, is its security against any attacks from foreign enemies. It is defended on the westward by James-fort, which mounts 18 guns. Near this is Willoughby's fort, which is built upon a tongue of land running into the sea, and mounts 12 guns. Needham's fort has three batteries, and is mounted with 20 guns; and St Anne's fort, which is the strongest in the island, stands more within land. In short, according to Mr Douglas, there is all along the lee-shore, a breastwork and trench, in which, at proper places, were 29 forts and batteries, having 308 cannon mounted, while the windward shore is secured by high rocks, steep cliffs, and foul ground. Such was the state of the fortifications in 1717; but since that time they have been much strengthened. Bridgetown is destitute of few elegancies or conveniences of life that any city of Europe can afford. The church of St Michael exceeds many English cathedrals in beauty, largeness, and conveniency; and has a fine organ, bells, and clock. Here also is a free-school for the instruction of poor boys, an hospital, and a college. The latter was erected by the society for propagating the Christian religion, in pursuance of the will of Colonel Christopher Codrington, who left about 2000l. a-year for its endowment, for maintaining professors and scholars to study and practise divinity, surgery, and physic. See CODRINGTON.

BRIDGENORTH, a town of Shropshire in England, seated on the river Severn, which divides it into two parts; but they are united by a handsome stone bridge, and these are called the *upper* and the *lower town*. It is said to have been built by Ethelfleda, widow of Etheldred king of the Mercians, about the year 675. Robert de Belizma, son of Robert de Montgomery, built the castle, and maintained it against King Henry I. by which means it was forfeited to the crown, and remained so till the reign of Richard III. who gave it to John Sutton Lord Dudley. This town has undergone several sieges; and in the civil war it suffered very much, many fine buildings, and the whole town, being almost destroyed by fire, when Sir Lewis Kirke defended the citadel for King Charles. There are now no other remains of the castle than a small part of the towers, and a place yet called the *castle*, within the walls of the old one; within which stands one of the churches, dedicated to St Mary Magdalen, which was made a free chapel, and exempted from episcopal jurisdiction. The other church is at the north end of the town, on the highest part of the hill, near to whose churchyard stood a college, which was destroyed by fire in the civil wars, together with the church just mentioned; which has been since rebuilt by the inhabitants. In this town is a free-school which sends and maintains eighteen scholars at the university of Oxford. On the west banks of the river are the remains of an ancient and magnificent convent, under which were several remarkable vaults and caverns running to a great length.

Bridport.

length. Part of the Cowgate street is a rock, rising perpendicularly, in which are several houses and tenements that form a very agreeable though grotesque group. In many other places there are also caves and dwellings for families in the rocks; and indeed the whole town has a very singular appearance. This town sends two members to parliament. Population 4179 in 1811. W. Long. 2. 30. N. Lat. 52. 40.

BRIDGEWATER, a town of Somersetshire in England, seated on the river Parret, over which there is a stone-bridge, near which ships of 100 tons burden may ride with ease. It is a large well frequented place, with the title of a duchy, and sends two members to parliament. There are in it several large inns, and the market is well supplied with provisions. Population 4911 in 1811. W. Long. 3. 0. N. Lat. 51. 15.

BRIDLE, in the manege, a contrivance made of straps or thongs of leather and pieces of iron, in order to keep a horse in subjection and obedience.

The several parts of a bridle are the bit or snaffle; the head-stall, or leathers from the top of the head to the rings of the bit; the fillet, over the fore-head and under the fore-top; the throat-band, which buttons from the head-band under the throat; the reins, or long thongs of leather that come from the rings of the bit, and being cast over the horse's head, the rider holds them in his hand; the nose-band, going through loops at the back of the head-stall, and buckled under the cheeks; the trench; the cavesson; the martingal; and the chaff-halter.

Pliny assures us that one Pelethronius first invented the bridle and saddle; though Virgil ascribes the invention to the Lapithæ, to whom he gives the epithet *Pelethronii*, from a mountain in Thessaly named *Pelethronium*, where horses were first begun to be broken.

The first horsemen, not being acquainted with the art of governing horses with bridles, managed them only with a rope or a switch, and the accent of the voice. This was the practice of the Numidians, Getulians, Libyans, and Massilians. The Roman youth also learned the art of fighting without bridles, which was an exercise or lesson in the manege; and hence it is, that on Trajan's column, soldiers are represented riding at full speed without any bridles on.

Scolding BRIDLE. See BRANK.

BRIDLINGTON, a sea-port town in the east riding of Yorkshire in England. It is seated on a creek of the sea near Flamborough-head, having a commodious quay for ships to take in their lading. It has a safe harbour, and contained 3741 inhabitants in 1811. It is more generally known by the name of *Burkington*, as it gave title to an earl of that name, though the earldom is now extinct. E. Long. 0. 10. N. Lat. 54. 15.

BRIDON, or SNAFFLE, after the English fashion, is a very slender bit-mouth without any branches. The English make great use of them, and scarcely use any true bridles except in the service of war. The French call them *bridons*, by way of distinction from bridles.

BRIDPORT, a seaport town of Dorsetshire in England. It has a low situation between two rivers, which unite a little lower down, and fall into the sea. Its inhabitants amounted to 3666 in 1814. It sends two members to parliament, who are chosen by the inhabitants who are house-keepers. It is noted for making of ropes and cables for shipping; whence arises

a proverb of a man that is hanged, that he is *stabbed with a Bridport dagger.* W. Long. 3. 0. N. Lat. 50. 40.

Bridport
Briceni

BRIEF, in *Law*, an abridgement of the client's case, made out for the instruction of counsel on a trial at law; wherein the case of the plaintiff, &c. is to be briefly but fully stated: the proofs must be placed in due order, and proper answers made to whatever may be objected to the client's cause by the opposite side; and herein great care is requisite, that nothing be omitted, to endanger the cause.

BRIEF, in *Scots Law*, a writ issued from the chancery, directed to any judge-ordinary, commanding and authorizing that judge to call a jury to inquire into the case mentioned in the brief, and upon their verdict to pronounce sentence.

Apostolical BRIEFS, letters which the pope dispatches to princes, or other magistrates, relating to any public affair.—These briefs are distinguished from bulls, in regard the latter are more ample, and always written on parchment, and sealed with lead or green wax; whereas briefs are very concise, written on paper, sealed with red wax, and with the seal of a fisherman, or St Peter in a boat.

BRIEG, a town of Silesia in Germany, situated in E. Long. 17. 35. N. Lat. 50. 40. It might have passed for a handsome place before the last siege; the castle, the college, and the arsenal, being very great ornaments, and most of the houses very well built. But the Prussians, who besieged it in 1741, threw 2172 bombs into it, and 4714 cannon bullets, which reduced a great part of the town to ashes, and quite ruined a wing of the castle. It was obliged to surrender, after sustaining seven days continual fire. The Prussians, to whom this place was ceded by the peace, have augmented the fortifications, and built a new suburb.—The town stands upon the Oder; on the other side of which there are plenty of fallow-deer, and large forests of beech and oak trees. They have a yearly fair, at which they sell above 12,000 horned cattle. Since 1728, they have begun to manufacture fine cloth.

BRIEL, a maritime town of the United Provinces, and capital of the island of Voorn: It was one of the cautionary towns which were delivered into the hands of Queen Elizabeth, and garrisoned by the English during her reign and part of the next. The Dutch took it from the Spaniards in 1572, which was the foundation of their republic. It is seated at the mouth of the river Meuse, in E. Long. 3. 56. N. Lat. 52. 53.

BRIESCIA, a palatinate in the duchy of Lithuania, in Poland. The name given to it by some is *Polesia*. It is bounded on the north by Novogrode, and Troki; on the west, by those of Bielsko and Lublin; on the south by that of Chelm and Upper Volhinia; and on the east, by the territory of Rziczica. This province is of considerable extent from east to west, and is watered by the rivers Bug and Pripese: it is full of woods and marshes; and there are lakes that yield large quantities of fish, that are salted by the inhabitants, and sent into the neighbouring provinces.

BRIEUX, St., a town of France, in Upper-Brittany, now called the department of the North-Coast, with a bishop's see. It is seated in a bottom, surrounded with mountains, which deprive it of a prospect of the sea, though it is not above a mile and a quarter from

Brigant
Brigantini-
nus.

from it, and there forms a small port. The churches, streets, and squares, are tolerably handsome; but the town is without walls and ditches. The church of Michael is in the suburb of the same name, and is the largest in the place. The convent of the Cordeliers is well built, and the garden is spacious. The college, which is very near, is maintained by the town for the instruction of youth. Population 6250 in 1815. W. Long. 2. 38. N. Lat. 48. 33.

BRIG, or **BRIGANTINE**, a merchant-ship with two masts. This term is not universally confined to vessels of a particular construction, or which are masted and rigged in a manner different from all others. It is variously applied, by the mariners of different European nations, to a peculiar sort of vessel of their own marine. Amongst British seamen, this vessel is distinguished by having her main-sails set nearly in the plane of her keel; whereas the main-sails of larger ships are hung athwart, or at right angles with the ship's length, and fastened to a yard which hangs parallel to the deck: but in a brig, the foremost edge of the mainsail is fastened in different places to hoops which encircle the mainmast, and slide up and down it as the sail is hoisted or lowered: it is extended by a gaff above and a boom below.

BRIGADE, in the military art, a party or division of a body of soldiers, whether horse or foot, under the command of a brigadier.—An army is divided into brigades of horse and brigades of foot: a brigade of horse is a body of eight or ten squadrons; a brigade of foot consists of four, five, or six battalions. The eldest brigade has the right of the first line, and the second the right of the second; the two next take the left of the two lines, and the youngest stand in the centre.

BRIGADE-Major, is an officer appointed by the brigadier, to assist him in the management and ordering of his brigade.

BRIGADIER, is the general officer who has the command of a brigade. The eldest colonels are generally advanced to this post. He that is upon duty is brigadier of the day. They march at the head of their own brigades, and are allowed a serjeant and ten men of their own brigade for their guard.—But the rank of brigadier-general in the British service is now abolished.

BRIGADIERS, or *Sub-brigadiers*, are posts in the horse-guards.

BRIGANDINE, a coat of mail, a kind of ancient defensive armour, consisting of thin jointed scales of plate, pliant and easy to the body.

BRIGANTES, (Tacitus), a people of Britain, reaching from sea to sea, the whole breadth of the island (Ptolemy). Now Yorkshire, Lancashire, Durham, Westmoreland, and Cumberland (Camden.) Also a people of Ireland, of uncertain position.

BRIGANTIA, or **BRIGANTIUM**, in *Ancient Geography*, a town of Vindelicia; now *Bregentz*, in Tyrol, at the east end of the lake of Constance.—Another *Brigantium* in the Alpes Cottiae; which last is probably Briançon, a town on the borders of Dauphiny.

BRIGANTINE. See **BRIG**.

BRIGANTINUS LACUS, in *Ancient Geography*, a lake of Rhetia, or Vindelicia, which Tacitus includes in Rhetia. Ammian calls the lake *Brigantia*.

It took its name either from the Brigantii, the people inhabiting on it, or from the adjoining town. Now the lake of *Constance* or *Bodensee*.

BRIGANTINUS Portus, in *Ancient Geography*, a port of the Hither Spain; so called from Flavium Brigantium. Now *El Puerto de la Corunna*, commonly the *Groynce*.

BRIGG, by some called *Clamford Bridges*, a town of England, in Lincolnshire, seated on the river Ankam. W. Long. 0. 20. N. Lat. 53. 40.

BRIGGS, **HENRY**, one of the greatest mathematicians in the 16th century, was born at Warley Wood in the parish of Halifax in Yorkshire, in 1556. In 1592, he was made examiner and lecturer in mathematics, and soon after reader of the physic lecture founded by Dr Linacre. When Gresham college in London was established, he was chosen the first professor of geometry there, about the beginning of March 1596. In 1609, Mr Briggs contracted an intimacy with the learned Mr James Usher, afterwards archbishop of Armagh, which continued many years by letters, two of which, written by our author, are yet extant. In one of these letters, dated in August 1610, he tells his friend he was engaged in the subject of eclipses; and in the other, dated March 10. 1615, he acquaints him with his being wholly employed about the noble invention of logarithms, then lately discovered, in the improvement of which he had afterwards a large share. In 1619, he was made Savilian professor of geometry at Oxford; and resigned his professorship of Gresham college on the 25th of July 1620. Soon after his going to Oxford, he was incorporated master of arts in that university; where he continued till his death, which happened on the 26th of January 1630. Dr Smith gives him the character of a man of great probity; a contemner of riches, and contented with his own station; preferring a studious retirement to all the splendid circumstances of life. He wrote, 1. *Logarithmorum chilias prima*. 2. *Arithmetica logarithmica*. 3. *Trigonometria Britannica*. 4. A small tract on the north-west passage; and some other works.

BRIGGS, *William*, an eminent physician in the latter end of the 17th century, was the son of Augustin Briggs, Esq. four times member for the city of Norwich, where our author was born. He studied at the university of Cambridge; and his genius leading him to the study of physic, he travelled into France, where he attended the lectures of the famous anatomist M. Vieussens at Montpellier. After his return, he published his *Ophthalmographia* in 1676. The year following he was created doctor of medicine at Cambridge, and soon after was made fellow of the college of physicians at London. In 1682, he quitted his fellowship to his brother; and the same year, his *Theory of Vision* was published by Hooke. The ensuing year he sent to the Royal Society a continuation of that discourse, which was published in their Transactions; and the same year, he was by King Charles II. appointed physician to St Thomas's hospital. In 1684, he communicated to the Royal Society two remarkable cases relating to vision, which were likewise printed in their Transactions; and in 1685 he published a Latin version of his *Theory of Vision*, at the desire of Mr Newton, afterwards Sir Isaac, professor of mathematics at Cambridge, with a recommendatory epistle from him prefixed

Brigge fixed to it. He was afterwards made physician in ordinary to King William, and continued in great esteem for his skill in his profession till he died, September 4th 1704.

BRIGHTHELMSTONE, a sea-port town of Sussex in England. It is a large and populous town, has a pretty good harbour, and contained 12,012 inhabitants in 1811. W. Long. 0. 10. N. Lat. 50. 50. It was at this place King Charles II. embarked for France in 1651, after the battle of Worcester. It has lately been considerably extended and embellished, in consequence of its having become a place of great resort for sea-bathing. It is a favourite residence of the present king.

BRIGITTINS, or **BRIDGETINS**, more properly *Brigittins*, a religious order, denominated from their founder, St Bridget or *Birgit*, a Swedish lady in the 14th century; whom some represent as a queen; but Fabricius, on better grounds, as a princess, the daughter of King Birgenes, legislator of Upland, and famous for her revelations. The Brigittins are sometimes also called the *Order of our Saviour*; it being pretended, that Christ himself dictated the rules and constitutions observed by them to St Bridget. In the main, the rule is that of St Augustin; only with certain additions supposed to have been revealed by Christ, whence they also denominate it the *Rule of our Saviour*.—The first monastery of the Bridgetin order was erected by the foundress about the year 1344, in the diocese of Lincopen; on the model of which all the rest were formed. The constitution of these houses was very singular: though the order was principally intended for nuns, who were to pay a special homage to the holy Virgin, there are also many friars of it, to minister to them spiritual assistance. The number of nuns is fixed at 60 in each monastery, and that of friars to 13, answerable to the number of apostles, of whom St Paul made the 13th; besides which there are to be four deacons, to represent the four doctors of the church, St Ambrose, St Augustin, St Gregory, and St Jerome; and eight lay-brothers; making together, says our author, the number of Christ's 72 disciples.—The order being instituted in honour of the Virgin, the direction is committed to an abbess, who is superior not only of the nuns, but also of the friars, who are obliged to obey her. Each house consists of two convents or monasteries, separately enclosed, but having one church in common; the nuns being placed above, and the friars on the ground. The Bridgetins profess great mortification, poverty, and self-denial, as well as devotion; and they are not to possess any thing they can call their own, not so much as a half-penny; nor even to touch money on any account. This order spread much through Sweden, Germany, the Netherlands, &c. In England we read but of one monastery of Brigittins, and this built by Henry V. in 1415, opposite to Richmond, now called *Ston house*; the ancient inhabitants of which, since the dissolution, are settled at Lisbon. The revenues were reckoned at 1495l. per annum.

BRIGNOLES, a town of France, in the department of Var, formerly Provence, famous for its prunes. It is seated among mountains, in a pleasant country, 275 miles S. E. of Paris, and had 9000 inhabitants in 1815. E. Long. 6. 15. N. Lat. 43. 24.

BRIHUEGA, a town of Spain, in New Castile,

where General Stanhope with the English army were taken prisoners, after they had separated themselves from that commanded by Count Staremberg. It is seated at the foot of the mountain Tajuna; 43 miles north-east of Madrid. W. Long. 3. 20. N. Lat. 41. 0.

BRIL, **MATTHEW** and **PAUL**, natives of Antwerp, and good painters.—Matthew was born in the year 1550, and studied for the most part at Rome. He was eminent for his performances in history and landscape, in the galleries of the Vatican; where he was employed by Pope Gregory XIII. He died in 1584, being no more than 34 years of age.—Paul was born in 1554; followed his brother Matthew to Rome: painted several things in conjunction with him; and, after his decease, brought himself into credit by his landscapes, but especially by those which he composed in his latter time. The invention of them was more pleasant, the disposition more noble, all the parts more agreeable, and painted with a better gusto than his earlier productions in this way; which was owing to his having studied the manner of Hannibal Carrache, and copied some of Titian's works in the same kind. He was much in favour with Pope Sixtus V.; and for his successor Clement VIII. painted the famous piece, about 68 feet long, wherein the saint of that name is represented cast into the sea with an anchor about his neck. He died at Rome the year 1626, aged 72.

BRILLIANT, in a general sense, something that has a bright and lucid appearance.

BRILLIANT, in the *Manege*. A brisk, high-mettled stately horse is called *brilliant*, as having a raised neck, a fine motion, and excellent haunches, upon which he rises, though ever so little put on.

BRILLIANTS, a name given to diamonds of the finest cut. See **DIAMOND**.

BRIM denotes the outmost verge or edge, especially of round things. The brims of vessels are made to project a little over, to hinder liquors, in pouring out, from running down the side of the vessel. The brimming of vessels was contrived by the ancient potters, in imitation of the supercilium or drip of the cornices of columns: it is done by turning over some of the double matter when the work is on the wheel.

BRIM, in country affairs. A sow is said to *brim*, or to *go to brim*, when she is ready to take the bear.

BRIMSTONE. See **SULPHUR**, **CHEMISTRY** *Index*.

BRIMSTONE *Medals, Figures, &c.* may be cast in the following manner: Melt half a pound of brimstone over a gentle fire: with this mix half a pound of fine vermilion; and, when you have cleared the top, take it off the fire, stir it well together, and it will dissolve like oil: then cast it into the mould, which should be first anointed with oil. When cool, the figure may be taken out; and in case it should change to a yellowish colour, you need only wipe it over with aquafortis, and it will look like the finest coral*.

BRIN, a strong town of Bohemia, in Moravia. It is pretty large, and well built: the assembly of the states is held alternately there and at Olmutz. The castle of Spilberg is on an eminence, out of the town, and is its principal defence. It was invested by the king of Prussia in 1742, but he was obliged to raise the siege. It is near the river Swart, in E. Long. 7. 8. N. Lat. 49. 8.

BRINDISI, an ancient celebrated town of Italy,

Brigue
Brindisi

Pilking.
ton's Dict.

Brindisi. in the Terra d'Otranto, and kingdom of Naples, with an archbishop's see. Its walls are still of great extent, but the inhabited houses do not fill above half the enclosure. The streets are crooked and rough; the buildings poor and ruinous; no very remarkable church or edifice. The cathedral, dedicated to St Theodore, is a work of King Roger, but not equal in point of architecture to many churches founded by that monarch, who had a strong passion for building. Little remains of ancient Brundisium, except innumerable broken pillars fixed at the corners of streets to defend the houses from carts; fragments of coarse mosaic, the floors of former habitations; the column of the lighthouse; a large marble bason, into which the water runs from brazen heads of deer; some inscriptions, ruins of aqueducts, coins, and other small furniture of an antiquary's cabinet. Its castle, built by the emperor Frederick II. to protect the northern branches of the harbour is large and stately. Charles V. repaired it. The port is double, and the finest in the Adriatic. The outer part is formed by two promontories, which stretch off gradually from each other as they advance into the sea, leaving a very narrow channel at the base of the angle. The island of St Andrew, on which Alphonsus I. built a fortress, lies between the capes, and secures the whole road from the fury of the waves. In this triangular space, large ships may ride at anchor. At the bottom of the bay the hills recede in a semicircular shape, to leave room for the inner haven; which, as it were, clasps the city in its arms, or rather encircles it, in the figure of a stag's head and horns. This form is said to have given rise to the name of *Brundisium*, which, in the old Messapian language, signified *the head of a deer*. In ancient days, the communication between the two havens was marked by lights placed upon columns of the Corinthian order, standing on a rising ground, in a direct line with the channel.

Of these one remains entire upon its pedestal. Its capital is adorned with figures of Syrens and Tritons, intermingled with the acanthus leaf, and upon it a circular vase, which formerly held the fire. A modern inscription has been cut upon the plinth. Near it is another pedestal of similar dimensions, with one piece of the shaft lying on it. The space between these pillars answered to the entrance of the harbour. "The whole kingdom of Naples (says Mr Swinburne) cannot show a more complete situation for trade than Brindisi. Here goodness of soil, depth of water, safety of anchorage, and a central position, are all united; yet it has neither commerce, husbandry, nor populousness. From the obstructions in the channel which communicates with the two havens, arises the tribe of evils that afflict and desolate this unhappy town. Julius Cæsar may be said to have begun its ruin, by attempting to block up Pompey's fleet. He drove piles into the neck of land between the two ridges of hills; threw in earth, trees, and ruins of houses; and had nearly accomplished the blockade, when Pompey sailed out and escaped to Greece. In the 15th century, the prince of Taranto sunk some ships in the middle of the passage, to prevent the royalists from entering the port, and thereby provided a resting place for sea weeds and sand, which soon accumulated, choked up the mouth, and rendered it im-

practicable for any vessels whatsoever. In 1752 the evil was increased, so as to hinder even the waves from beating through; and all communication was cut off, except in violent easterly winds, or rainy seasons, when an extraordinary quantity of fresh water raises the level. From that period the port became a fetid green lake, full of infection and noxious insects; no fish but eels could live in it, nor any boats ply except canoes made of a single tree. They can hold but one person, and overset with the least irregularity of motion. The low grounds at each end were overflowed and converted into marshes, the vapours of which created every summer a real pestilence; and in the course of very few years, swept off or drove away the largest portion of the inhabitants. From the number of eighteen thousand, they were reduced in 1766 to that of five thousand livid wretches, tormented with agues and malignant fevers. In 1775 above fifteen hundred persons died during the autumn; a woful change of climate! Thirty years ago, the air of Brindisi was esteemed so wholesome and balsamic, that the convents of Naples were wont to send their consumptive friars to this city for the recovery of their health. This state of misery and destruction induced the remaining citizens to apply for relief to Don Carlo Demarco, one of the king's ministers, and a native of Brindisi. In consequence of this application, Don Vito Caravelli was ordered to draw up plans, and fix upon the means of opening the port afresh: Don Andrea Pigonati was last year sent to execute his projects; and, by the help of machines and the labour of galley-slaves, has succeeded in some measure. The channel has been partly cleared, and has now two fathom of water. It can admit large boats, a great step towards the revival of trade; but what is of more immediate importance, it gives a free passage to the sea, which now rushes in with impetuosity, and runs out again at each tide; so that the water of the inner port is set in motion, and once more rendered wholesome. The canal or gut is to be seven hundred yards long, and drawn in a straight line from the column. At present its parapets are defended by piles and fascines; but if the original plan be pursued, stone piers will be erected on both sides. When the canal shall be scooped out to a proper depth, and its piers solidly established, vessels of any burden may once more enter this land-locked port, which affords room for a whole navy. Docks wet and dry may be dug, goods may be shipped at the quay, and convenient watering-places be made with great ease. If merchants should think it a place of rising trade, and worthy of their notice, there is no want of space in the town for any factory whatever. Circulation of cash would give vigour to husbandry, and provisions would soon abound in this market. The sands at the foot of the hills, which form the channel, are to be laid out in beds for muscles and oysters. Some ecclesiastics are raising nurseries of orange and lemon trees; and other citizens intend introducing the cultivation of mulberry-trees, and breeding of silk-worms. The engineer would have done very little for the health of Brindisi, had he only opened a passage, and given a free course to the waters; the marshes at each extremity of the harbour would still have infected the air: he, therefore, at the expence of about a thousand ducats, had the seas filled up with earth, and a dam raised to con-

Brindisi.

see

Brindisi, fine the waters, and prevent their flowing back upon the meadows. The people of Brindisi, who are sensible of the blessings already derived from these operations, who feel a return of health, and see an opening for commerce and opulence, seem ready to acknowledge the obligation. They intend to erect a statue to the king, with inscriptions on the pedestal in honour of the minister and agents. The workmen, in cleaning the channel, have found some medals and seals, and have drawn up many of the piles that were driven in by Cæsar. They are small oaks stripped of their bark, and still as fresh as if they had been cut only a month, though buried above eighteen centuries seven feet under the sand. The soil about the town is light and good. It produces excellent cotton, with which the Brindisians manufacture gloves and stockings.

“ It is impossible to determine who were the founders of Brundisium, or when it was first inhabited. The Romans took early possession of a harbour so convenient for their enterprises against the nations dwelling beyond the Adriatic. In the year of Rome 509, they sent a colony thither. Pompey took refuge here; but finding his post untenable, made a precipitate retreat to Greece. In this city Octavianus first assumed the name of *Cæsar*, and here he concluded one of his short-lived peaces with Antony. Brundisium had been already celebrated for giving birth to the tragic poet Pacuvius, and about this time became remarkable for the death of Virgil. The barbarians, who ravaged every corner of Italy, did not spare so rich a town; and, in 836, the Saracens gave a finishing blow to its fortune. The Greek emperors, sensible of the necessity of having such a port as this in Italy, would have restored it to its ancient strength and splendour, had the Normans allowed them time and leisure. The Greeks struggled manfully to keep their ground; but, after many varieties of success, were finally driven out of Brindisi by William I. The frenzy for expeditions to Palestine, though it drained other kingdoms of their wealth and subjects, contributed powerfully to the re-establishment of this city, one of the ports where pilgrims and warriors took shipping. It was also benefited by the residence of the emperor Frederick, whose frequent armaments for the Holy Land required his presence at this place of rendezvous. The loss of Jerusalem, the fall of the Grecian empire, and the ruin of all the Levant trade after the Turks had conquered the East, reduced Brindisi to a state of inactivity and desolation, from which it has never been able to emerge.” E. Long. 18. 5. N. Lat. 40. 52.

BRINDLEY, JAMES, a most uncommon genius for mechanical inventions, and particularly excellent in planning and conducting inland navigations, was born, in 1716, at Tunsted in Derbyshire: Through the mismanagement of his father (for there was some little property in his house) his education was totally neglected; and, at seventeen, he bound himself apprentice to a mill-wright, near Macclesfield, in Cheshire. He served his apprenticeship, and, afterwards, setting up for himself, advanced the mill-wright business, by inventions and contrivances of his own, to a degree of perfection which it had not attained before. His fame, as a most ingenious mechanic, spreading widely, his genius was no longer confined to the business of his profession: for, in 1752, he erected a very extraordi-

nary water-engine at Clifton, in Lancashire, for the purpose of draining coal-mines; and, in 1755, was employed to execute the larger wheels for a new silk mill, at Congleton, in Cheshire. The potteries of Staffordshire were also, about this time, indebted to him for several valuable additions in the mills used by them for grinding flint-stones. In 1756, he undertook to erect a steam-engine near Newcastle under Line upon a new plan; and it is believed that he would have brought this engine to a great degree of perfection, if some interested engineers had not opposed him.

His attention, however, was soon afterwards called off to another object, which, in its consequences, hath proved of high importance to trade and commerce; namely, the projecting and executing “ Inland navigations.” By these navigations the expence of carriage is lessened; a communication is opened from one part of the kingdom to another, and from each of these parts to the sea; and hence products and manufactures are afforded at a moderate price. The duke of Bridgewater hath, at Worsley, about seven miles from Manchester, a large estate abounding with coal, which had hitherto lain useless, because the expence of land-carriage was too great to find a market for consumption. The duke, wishing to work these mines, perceived the necessity of a canal from Worsley to Manchester; upon which occasion Brindley, now become famous, was consulted; and declaring the scheme practicable, an act for this purpose was obtained in 1758 and 1759. It being, however, afterwards discovered, that the navigation would be more beneficial, if carried over the river Irwell to Manchester, another act was obtained to vary the course of the canal agreeably to the new plan, and likewise to extend a side-branch to Longford bridge in Stretford. Brindley, in the mean time, had begun these great works, being the first of the kind ever attempted in England, with navigable subterraneous tunnels and elevated aqueducts; and as, in order to preserve the level of the water, it should be free from the usual obstructions of locks, he carried the canal over rivers, and many large and deep valleys. When it was completed as far as Barton, where the Irwell is navigable for large vessels, he proposed to carry it over that river, by an aqueduct of thirty-nine feet above the surface of the water; and though this project was treated as wild and chimerical, yet, supported by his noble patron, he began his work in Sept. 1760, and the first boat sailed over it in July 1761. The duke afterwards extended his ideas to Liverpool; and obtained, in 1762, an act for branching his canal to the tideway in the Mersey; this part of the canal is carried over the rivers Mersey and Boland, and over many wide and deep valleys.

The success of the duke of Bridgewater's undertakings encouraged a number of gentlemen and manufacturers in Staffordshire, to revive the idea of a canal-navigation through that county; and Brindley was, therefore, engaged to make a survey from the Trent to the Mersey. In 1766, this canal was begun, and conducted under Brindley's direction as long as he lived; but finished after his death by his brother-in-law Mr Marshall, of whom he had a great opinion, in May 1777. The proprietors called it, “ the canal from the Trent to the Mersey;” but the engineer, more emphatically, “ the Grand Trunk Navigation;”

Brindley. on account of the numerous branches, which, as he justly supposed, would be extended every way from it. It is 93 miles in length; and, besides a large number of bridges over it, has 76 locks and five tunnels. The most remarkable of the tunnels is the subterraneous passage of Harecastle, being 2880 yards in length, and more than 70 yards below the surface of the earth. The scheme of this inland-navigation had employed the thoughts of the ingenious part of the kingdom for upwards of 20 years before; and some surveys had been made: but Harecastle hill, through which the tunnel is constructed, could neither be avoided nor overcome by any expedient the most able engineers could devise. It was Brindley alone who surmounted this and other the like difficulties, arising from the variety of strata and quicksands, as no one but himself would have attempted to conquer.

Brindley was engaged in many other similar undertakings; for a fuller account of which, not being consistent with our plan, we refer the reader to the "Biographia Britannica;" or rather to a curious and valuable pamphlet, published some years since, and entitled, "The History of Inland Navigations, particularly that of the duke of Bridgewater." He died at Turnhurst in Staffordshire, September 27. 1772, in his 56th year; somewhat immaturity, as it should seem: but he is supposed to have shortened his days by too intense application, and to have brought on a hectic fever, which continued on him for some years before it consumed him. For he never indulged and relaxed himself in the common diversions of life, as not having the least relish for them; and though once prevailed on to see a play in London, yet he declared that he would on no account be present at another; because it so disturbed his ideas for several days after, as to render him unfit for business. With any extraordinary difficulty occurred to him in the execution of his works, he generally retired to bed; and has been known to lie there one, two, or three days, till he has surmounted it. He would then get up, and execute his design without any drawing or model: for he had a prodigious memory, and carried every thing in his head.

As his station in life was low, and his education totally neglected, so his exterior accomplishments were suitable to them. He could indeed read and write, but both very indifferently; and he was perhaps, in his way, as *abnormis sapiens*—"of mother-wit, and wise without the schools,"—as any man that ever lived. "He is as plain a looking man as one of the boors in the Peake, or one of his own carters: but when he speaks, all ears listen; and every mind is filled with wonder, at the things he pronounces to be practicable." The same author gives us also no ungracious idea of his moral make: "being great in himself, he harbours no contracted notions, no jealousy of rivals: he conceals not his method of proceeding, nor asks patents to secure the sole use of the machines, which he invents and exposes to public view. Sensible that he must one day cease to be, he selects men of genius, teaches them the power of mechanics, and employs them in carrying on the various undertakings in which he is engaged. It is not to the duke of Bridgewater only that his services are confined; he is of public utility, and employs his talents in rectifying the mistakes of despairing workmen, &c. His powers shine most

in the midst of difficulties; when rivers and mountains seem to thwart his designs, then appears his vast capacity, by which he makes them subservient to his will." Brindley,
Brine.

BRINE, or **PICKLE**; water replete with saline particles.

Brine taken out of brine-pits, or brine-pans, used by some for curing or pickling of fish, without boiling the same into salt, and rock salt, without refining it into white salt, are prohibited by 1 Ann. cap. 21.

Brine is either native, as the sea-water, which by coction turns to salt; or factitious, formed by dissolving salt in water. In the salt-works at Upwick in Worcestershire, there are found, at the same time, and in the same pit, three sorts of brine, each of a different strength. They are drawn by a pump; and that in the bottom, first brought up, is called *first man*; the next, *middle man*; and the third, *last man*.

Leach-Brine, a name given to what drops from the corned salt in draining and drying, which they preserve and boil again; being stronger than any brine in the pit. There is sand found in all the Staffordshire brines after coction: but naturalists observe, it did not pre-exist in the water, but rather is the product of the boiling. Some steep their seed-wheat in brine to prevent the smut. Brine is also commended as of efficacy against gangrenes.

BRINE also denotes a pickle pregnant with salt, wherein things are steeped to keep.

BRINE Pans, the pits where the salt-water is retained, and suffered to stand, to bear the action of the sun, whereby it is converted into salt. There are divers sorts of salt pans, as the water-pans, second-pan, sun-pan; the water being transferred only from one to another.

BRINE-Pit, in salt-making, the salt spring from whence the water to be boiled into salt is taken. There are of these springs in many places; that at Namptwich in Cheshire, is alone sufficient, according to the account of the people of the place, to yield salt for the whole kingdom; but it is under the government of certain lords and regulators, who, that the market may not be overstocked, will not suffer more than a certain quantity of the salt to be made yearly. See the next article.

BRINE-Springs, are fountains which flow with salt-water instead of fresh. Of these there are a good number in South Britain, but though not peculiar to this island, are far from being common in the countries on the continent. There are some of them in several different counties; and perhaps, on a due search, others might be discovered*. The most remarkable of these already known are, one at East Chennock in Somersetshire, about 20 miles from the sea. Another at Leamington in Warwickshire, very near the river Leam; which, however, is but weak. Such a spring likewise runs into the river Cherwell in Oxfordshire, and several more in Westmoreland and Yorkshire: but as they are but poor, and the fuel in most of those countries scarce and dear, no salt is prepared from them. At Borrowdale near Grange, three miles from Keswick in Cumberland, a pretty strong spring rises in a level near a moss; 16 gallons of the water of which yield one of pure salt; which is the more remarkable, when

when it is considered that the same quantity of salt cannot be obtained from less than 22 gallons of the waters of the German ocean. At a place called *Salt-Water Haugh*, near Butterby, in the bishopric of Durham, there is a multitude of salt-springs which rise in the middle of the river Weare, for the space of about 40 yards in length and ten in breadth; but particularly one out of a rock, which is so strong that in a hot summer's day the surface will be covered with a pure white salt. At Weston, in Staffordshire, there are brine pits which afford about a ninth part of very fine white salt. There are others at Enson, St Thomas, and in the parish of Ingestre, but so weak that they are not wrought; though it is believed, that by boring, stronger springs might be found in the neighbourhood. In Lancashire there are several salt springs, but (if we except that at Barton, which is as rich as the spring at Northwich) by no means so famous as those of Cheshire, called in general by the name of the *wiches*. Namptwich on the river Weever, has a noble spring not far from the river, which is so rich as to yield one-sixth part of pure white salt. At six miles distant stands Northwich, at the confluence of the Weever and the Dan; where the brine is still richer, since they obtain six ounces of salt from 16 of water. There are, even at this day, some visible remains of a Roman causeway between these two towns. The inhabitants of Wales, who, before that country was incorporated into England, were supplied chiefly, if not solely, with that necessary commodity from these two towns, called the former *Hellath Wen*, and the latter *Hellath Du*; i. e. the white and black salt pit. In 1670, a rock of salt was discovered at a small distance from Northwich, which has been wrought to a great depth, and to a vast extent, so as to be justly esteemed one of the greatest curiosities in England; and it is highly probable, that there is an immense body of fossil salt in the bowels of the earth, under this whole county; since, upon boring, brine pits have been found in many places on both sides the river Weever. This is the more likely, since at Middlewich, which stands at the confluence of the Croke and the Dan, there are salt springs with a fresh brook running between them. The brines from these pits are of unequal strength; but when mixed, they commonly obtain four ounces of salt from a pound of brine. Experience shows, that in these springs the water is strongest nearest the bottom, richer in dry weather than in wet, and when long drawn than when first wrought. But these are no rules in respect to other salt-springs, since in those of Franche Compte the brine is strongest in wet weather. There are several other bodies dissolved in these brines besides salt; in some a sulphureous substance, which sublimes as the brine heats; a sort of dirty ochre which discolours the brine, but if suffered to stand, speedily subsides; and in most brines a calcareous, or rather selenitic earth, which settles to the bot-

and Spring.

tom of the pans*.
To BRING-TO, in *Navigation*, to check the course of a ship when she is advancing, by arranging the sails in such a manner, that they shall counteract each other, and prevent her either from retreating or moving forward. In this situation the ship is said to lie by, or to lie to; having, according to the sea-phrase, some of her sails *aback*, to oppose the force of those

which are full; or having them otherwise shortened by being *furled*, or *hauled up in the brails*.

BRINGING-TO, is generally used to detain a ship in any particular station, in order to wait the approach of some other that may be advancing towards her; or to retard her course occasionally near any port in the course of a voyage.

BRINGING-IN a Horse, in the manege, the same as to say, keep down the nose of a horse that bores and tosses his nose in the wind: this is done by means of a branch.

BRINING OF CORN, in husbandry, an operation performed on the wheat-seed, in order to prevent the smut. A liquor is to be prepared for this purpose, by putting 70 gallons of water into a tub (like a mash-tub used for brewing, and a corn-busbel of unslaked limestone. This is to be well stirred till the whole is dissolved, and left to stand for 30 hours; after which it is to be drained off into another tub, in the manner practised for beer. In this way about a hogshead of strong lime-water will be obtained, to which must be added three pecks of salt. The wheat must be steeped in this pickle, by running it gently, and in small quantities, into a broad-bottomed basket of about 24 inches in diameter, and 20 inches deep, and stirring it. The light seed that floats must be strained off with a strainer, and must not be sown. When the basket has been drawn up, and drained of the pickle, the wheat will be fit for sowing in two hours after the brining.

BRINING of hay-ricks, a practice common in America, of mixing salt with the hay as it is stacked.

BRIONNE, a town of France in Normandy, seated on the river Rille. E. Long. 0. 51. N. Lat. 49. 51.

BRIOUDE, a town of France, in the department of Upper Loire, formerly Lower Auvergne. There are two Brioudes, three quarters of a mile from each other; the one is called *Church Brioude*, the other *Old Brioude*. The houses are built after the antique manner, and are badly disposed. The canons are all temporal lords and counts. It is in no diocese, but depends immediately on the pope. There are several convents; and, among the rest, the church of St Ferrol, which is highly celebrated. Near the Old Town is a stone-bridge on the river Allier, which consists of one arch: this is esteemed a stupendous structure, and is thought to be a work of the Romans. The inhabitants, 5000 in number, have no manufactures. It is situated in E. Long. 3. 25. N. Lat. 45. 14.

BRIQUERAS, a town of Piedmont, seated in the valley of Lucern, three miles from the town of that name, and four south of Pignerol. It had a very strong castle towards the latter end of the 16th century; but when the French got footing in it, it was ruined, that is, before they delivered it up to the duke of Savoy in 1696. E. Long. 7. 24. N. Lat. 44. 41.

BRISACH, a town of Germany, and capital of Brisgaw, now in the territories of Baden. It was twice in the possession of the French; but restored to the house of Austria, by treaties of peace. It was a very strong place, but the fortifications have been demolished. It is seated on the Rhine, where there is a bridge of boats. E. Long. 7. 49. N. Lat. 48. 5.

Bristol

BRISACH, New, a town of France, in the department of the Upper Rhine, built by order of Louis XIV. over against Old Brisach, and fortified by Vauban. It is 32 miles south of Strasburg. E. Long. 7. 46. N. Lat. 48. 5.

BRISEIS, or **HIPPODAMIA**, in fabulous history, the wife of Mynes king of Lyrnessa. After Achilles had taken that city, and killed her husband, she became his captive. That hero loved her tenderly; but Agamemnon taking her from him, she became the accidental cause of sad disorders in the Grecian army.

BRISGAW, a territory of Germany, in the circle of Suabia, on the eastern bank of the Rhine, about 50 miles in length, and 30 in breadth, now subject to the grand duke of Baden. The principal places are Old Brisach, New Brisach, Freyburgh, and Rbinmarck.

BRISIACUS MONS, in *Ancient Geography*, a town on the right or east side of the Rhine. Now *Brisach*, situated on a round hill; a fortified town of Suabia, and distinguished by the name of *Old Brisach*. E. Long. 7. 15. N. Lat. 48. 10.

BRISSON, M. J. an eminent French naturalist. See SUPPLEMENT.

BRISSOT, PETER, one of the ablest physicians of the 16th century, was born at Fontenai le Comte in Poitou. He studied at Paris; and, having taken his doctor's degree, bent his thoughts to the reforming of physic, by restoring the precepts of Hippocrates and Galen, and exploding the maxims of the Arabians: for this purpose he publicly explained Galen's works, instead of those of Avicenna, Rhasis, and Messue. He afterwards resolved to travel to acquire the knowledge of plants; and going to Portugal, practised physic in the city of Eborá. His new method of bleeding in pleurisies, on the side where the pleurisy was, raised a kind of civil war among the Portuguese physicians; it was brought before the university of Salamanca, who at last gave judgment, that the opinion ascribed to Brissot was the pure doctrine of Galen. The partizans of Denys, his opponent, appealed in 1529 to the emperor, to prevent the practice, as being attended with destructive consequences; but Charles III. duke of Savoy happening to die at this time of a pleurisy, after having been bled on the opposite side, the prosecution dropped. He wrote an Apology for his practice; but died before it was published, in 1552; but Anthony Luceus, his friend, printed it at Paris three years after. Renatus Moreau procured a new edition of it at Paris, in 1622; and annexed to it a treatise entitled *De missione sanguinis in pleuritide*, together with the Life of Brissot.

BRISSOT, John Peter, leader of the Brissotine party in the French revolution. See SUPPLEMENT.

BRISTLE, a rigid glossy kind of hair found on swine, and much used by brush-makers, &c.

BRISTOL, a city of England, and inferior to none, except London, for wealth, trade, and number of inhabitants. Bristol is a corruption of *Brightstow*, as it was called by the Saxons. It is thought to have stood anciently altogether on the west or Somersetshire side of the Avon, before the bridge was built; but after that, it came to be partly in Somersetshire and partly in Gloucestershire, until it was made a county of itself, though even before that, in the parliament rolls, it was always placed in Somersetshire. At present, the

east side is by much the largest and most populous. It had anciently a castle, built by Robert earl of Gloucester, natural son to Henry I. which was demolished by Cromwell; and the ground is now laid out into streets. The corporation consists of a mayor; recorder; twelve aldermen, of whom the recorder is one; two sheriffs; and twenty-eight common council men. The recorder is generally a serjeant at law, and sits as judge in capital and all other criminal causes. The mayor, to support his dignity, and defray his extraordinary expence, is entitled to certain fees from ships, which long ago amounted to 500l. or 600l. Bristol is a bishop's see, being one of the six erected by King Henry VIII. out of the spoils of the monasteries and religious houses which that monarch had got dissolved. The cathedral church was the church of the abbey of St Austin in Bristol, founded by Robert Fitzharding son to a king of Denmark, once a citizen here, and by him filled with canons regular in the year 1148. At the reformation King Henry VIII. placed therein a dean and six prebendaries, which mode of government still continues. During a great part of Queen Elizabeth's reign, this see was held *in commendam* by the bishop of Gloucester. This diocese was formed chiefly out of the diocese of Salisbury, with a small part from the dioceses of Wells and Worcester. It contains most of the city of Bristol, and all the county of Dorset, in which are 236 parishes, of which 64 are impropriated. It hath only one archdeaconry, viz. of Dorset; is valued in the king's books at 338l. 8s. 4d. and is computed to be annually worth 1500l. including its *commendams*. The tenths of the clergy are 353l. 18s. 0½d. This see hath yielded to the state one lord privy seal. The revenues of the abbey of St Augustine, or St Austin, in Bristol, were valued at the dissolution at 6700l. 13s. 11d. when it was erected into a cathedral by King Henry VIII. by the name of the *Cathedral Church of the Holy Trinity*. To this cathedral belong a bishop, a dean, an archdeacon, a chancellor, six prebendaries, and other inferior officers and servants. Besides the cathedral, there are 18 parish-churches; and here are dissenters of all denominations, of whom the Quakers are very respectable both for their wealth and numbers. Of the parish-churches, St Mary Ratcliff is reckoned one of the finest, not only here, but in the whole kingdom. In this church, besides two monuments of the founder William Cannings, who had been five times mayor of this city, one in the habit of a magistrate, and another in that of a priest (for in his latter days he took orders), there is one of Sir William Penn, father to the famous Quaker. The old bridge over the Avon consisted of four broad arches, with houses on both sides like those formerly on London bridge; but this has been lately pulled down, and another erected in its place. No carts or waggons are admitted into Bristol, for fear of damaging the vaults and gutters made under ground for carrying the filth of the city into the river. Queen's-square, in this city, is larger than any in London, except Lincoln's-Inn Fields, and has in the centre an equestrian statue of King William III. All the gates of the city remain entire, and a part of the walls; the rest were razed in the reign of William Rufus. It is almost as broad as long; and, including the out-parishes, is supposed to contain 100,000 inhabitants. Of the hospitals, the chief

Bristol.

Bristol. are, 1. That called Queen Elizabeth's, in which 100 boys are taught reading, writing, arithmetic, and navigation; six of whom, when they go out, have 10l. and the rest 8l. 8s. to bind them apprentices: the master is allowed 450l. a-year, for the maintenance of the boys. 2. Colston's hospital; in which 100 boys are maintained for seven years, and taught and apprenticed, as in Queen Elizabeth's. 3. Another founded by the same gentleman in 1691, for 12 men and 12 women, with an allowance of 3s. per week, and 24 sacks of coals in the year. This charity cost the founder 25,000l. 4. Another founded partly by Mr Colston and partly by the merchants, in which 18 men on account of the merchants, and 12 men and women on account of Mr Colston, are maintained. 5. An infirmary, which was opened in 1736 for the sick, lame, and distressed poor of the city, which is maintained by subscription, besides 5000l. bequeathed to it by John Eldridge, Esq. formerly comptroller of the customs at this port. There are, besides these, a bridewell, several alms-houses, and charity schools. There is also a guildhall for the sessions and assizes; the mayor's and sheriffs courts; a council-house, where the mayor and aldermen meet every day, except Sundays, to administer justice; a handsome new exchange, with three entrances, about two-thirds as large as that in London, and a quay half a mile in length, the most commodious in England for shipping and landing goods, for which purpose it is provided with several cranes. In College-green is a stately high cross, with the effigies of several kings round it. In Winch-street is a guard-house, with barracks for soldiers. As to the trade of this city, it was computed many years ago to be much greater in proportion, especially to America and the West Indies, than that of London. Fifty sail, some of them ships of considerable burthen, have arrived here at one time, or very near one another, from the West Indies. For this trade, and that to Ireland, it is much better situated than London, besides the great advantages it possesses of an inland navigation by the Wye and Severn. Their trade extends to the Baltic, Norway, Holland, Hamburg, Guinea, and the Straits. The largest ships are discharged at Kingroad, four miles below the city, and the goods are brought to the quay by lighters. For building, equipping, and repairing ships, there are docks, yards, rope-walks, and ship-wrights. In 1809 various improvements were completed upon the harbour, which cost 600,000l. Here are some considerable woollen manufactures; and no less than 15 glass-houses, for which Kingswood and Mendip furnish the coals. The city companies are 13: 1. The merchant adventurers. 2. The merchant tailors. 3. The mercers. 4. The soap boilers. 5. The tobacconists. 6. The butchers. 7. The barbers. 8. The tylers. 9. The holliers, who are the sled-men. 10. Shoemakers. 11. Coopers. 12. Bakers. 13. Smiths. For supplying the city with water there are six public conduits. There are also stage coaches, which set out every day for Bath, London, and other places. A mile below the city, close by the river, is the hot well, whose waters are specific for the diabetes, and good in phthisical, scorbutic, and inflammatory disorders. Hither is a great resort in the summer of invalids, as well as other company; for whose accommodation and entertainment there is a pump-room, ball-room, coffee-house, with ta-

verns, and a great number of elegant lodging houses, both below on a level with the well, and above in the delightful village of Clifton, which is situated on the brow of a hill, from whence there are downs extending several miles, where the company ride out for exercise. Nothing can be more pure and salutary than the air of these downs, which afford a variety of the most romantic and agreeable prospects, comprehending Kingroad, with the ships at anchor, the mouth of the Severn, and the mountains of Wales. In the rocks above the well are found those six-cornered stones called *Bristol-stones*; but they are not so plentiful now as in Camden's days, when, he says, whole bushels might have been easily gathered. In this city is a theatre, where plays are acted almost every night during the recess of the comedians from the metropolis. There are two annual fairs, to which the concourse is so great, that the neighbouring inns have filled 100 beds a piece with their guests. In the winter season there is an assembly every Thursday for the gayer part of the citizens of both sexes. About half way betwixt Bristol and Bath, at a place called *Warmly*, a company of Bristol merchants have erected a noble manufacture of pins and other brass utensils, which employs a great number of hands, including about 200 children of both sexes from seven to twelve or thirteen years of age. All the different operations of melting, pitting, drawing, hammering, turning, &c. are performed by wheels worked with water, which is raised by two fire engines of a very curious mechanism. The city of Bristol gives the title of earl to the family of Hervey, and sends two members to parliament. It is worth observing, that whoever marries a citizen's daughter becomes free of the city.

NEW-BRISTOL, the capital of the county of Bucks in Pennsylvania, situated on the river Delaware, about 20 miles north of Philadelphia, in W. Long. 75. N. Lat. 40. 45.

BRISTOL Water. Of the four principal warm waters naturally produced in England, this is the least so. As the Bath waters are proper where the secretions are defective, so the Bristol water is of service where they exceed the requirements of health. The Bath water warms; the Bristol cools. Bath water helps the stomach, intestines, and nerves; the Bristol favours the lungs, kidneys, and bladder. Except a jaundice attend, the Bristol water may be of use in dropsies by its drying and diuretic qualities. Dr Winter asserts, that there is no iron in Bristol water: and that its mineral contents are chalk, lapis calcareus and calaminaris. Five gallons of this water, after evaporation, afforded only 3 iii. and gr. 2. of mineral substances. The diseases in which this water is useful are internal hæmorrhagies, immoderate menses, internal inflammations, spitting blood, dysentery, purulent ulcers of the viscera, consumption, dropsy, scurvy with heat, stone, gravel, strangury, habitual gout, atrophy, slow fever, scrophula, gleets, and diabetes, in which last it is a specific, and may be drank as freely as the thirst requires it. The hotter months are the best for using it. The Bristol and Matlock waters are of exactly the same qualities. Doctors Mead and Lane first established the reputation of Bristol waters in diseases of the kidneys and bladder.

BRITAIN.

¹ Britain. **BRITAIN**, or **GREAT BRITAIN**, the most considerable of all the European islands, extends from the Lizard Point, in the latitude of about 50°, to Dunesbay-head, in latitude 58. 30. N. or, taking it in a straight line from north to south, about eight degrees or 550 miles; and from Dover-head on the east to Land's-end on the west comprehends about seven degrees of longitude, which may be computed at about 290 miles; but the form being very irregular, and lessening continually towards the north, proper allowances must be made in computing its dimensions.

¹ Albion the ancient name. The ancient name of this island was *Albion*, the name *Britain* being then common to all the islands round it. Hence Agathemerus, speaking of the British islands: "They are many in number (says he); but the most considerable among them are Hibernia and Albion." And Ptolemy, to the chapter wherein he describes the island now called *Great Britain*, prefixes the following title: "The situation of *Albion*, a British island." But as this far excelled the other British islands, the name of *Albion* in process of time was laid quite aside, and that of *Britain* used in its stead. By this name it was known in Pliny's time, and even in Cæsar's. The origin of both these names is very uncertain. Some derive that of *Albion* from the Greek word *alphon*, which, according to Festus, signifies *white*; others from the Hebrew *alben*, *white*, or the Phœnician *alp*, *high*. The origin of the name *Britain* is no less uncertain than that of *Albion*. Nennius and some other British writers derive it from Brutus, whom they likewise call *Brito*, the fifth in descent from the celebrated Æneas. Others derive it from the British words *pryd cain*, that is, a *white form*, softened by degrees into *Britannia*. Camden derives it from the word *brith*, which, in the ancient language, of the island, signifies *painted*; and *tania*, importing, in Greek, a region or country: so that the word *Brithania*, changed in process of time into *Britannia*, expresses what the Britons really were, that is, *painted*. Mr Whittaker, in his History of Manchester, derives it from the word *brith*, *briet*, *brit*, *bris*, or *brig*, which, he says, signifies *divided* or *striped*. Against the first of these etymologies it may be objected, that it is founded on a fable; and against the other three lies one common and unanswerable objection; which is, that the name of *Britain* was given to the island by foreigners, who could not borrow it from the British tongue, with which they were in all likelihood unacquainted. That the island received the name of *Britain* from foreigners is evident, since the natives never styled themselves *Britons*, nor their country *Britain*; their true name being *Cumri*, or *Cumbrî*; whence *Cambria* the name of Wales to this day among the Welsh.

² Origin of the different names. The learned Bochart, speaking of the colonies and language of the Phœnicians, offers a conjecture which most of our modern writers have adopted as the most natural. The Phœnicians, according to that writer, called this island, and some others near it, *Barat Anac*, that is, *the land or country of tin or lead*, and more contractedly *Bratanac*; which name, passing from the

³ Bochart's opinion.

Phœnicians to the Greeks, and from these to the Romans, might have been softened into that of *Britannica*, and *Britannia*. That the Phœnicians first discovered these islands, which were afterwards by the Greeks called *Cassiterides*, and are proved by Camden to be our Scilly islands, appears both from Strabo and Pliny; of whom the former tells us, that the Phœnicians first brought tin from the *Cassiterides*, which they sold to the Greeks, but kept the trade to themselves, and the place private; and the latter writes, that Mediocritus was the first who brought lead from the *Cassiterides*; where Bochart shows that we ought to read *Melichartus*, who is the Phœnician Hercules of Sancho-niatho, to whom that nation ascribes their first western discoveries. But notwithstanding the care of the Phœnicians to conceal these islands, the Greeks at last discovered them; and gave them the name of *Cassiterides*, which, in the Greek tongue, signifies the same with *Barat Anac* in the Phœnician. This name was at first given to the islands of Scilly already mentioned; but by degrees communicated to all the others lying in the same sea. Thus Bochart. But after all, his opinion, however plausible in appearance, may be as foreign to the purpose as any of the rest; many instances of names given to new discovered countries showing that the origin of such names is not always owing to reason, but often to chance or caprice.

The general division of Britain is into ENGLAND, SCOTLAND, and WALES; for a particular description and history of which, see these articles.

⁴ In the year 1603, the kingdoms of Scotland and James VI. England fell under the dominion of one sovereign, by of Scotland succeeds to the crown of England. He derived his title to the latter from being the grandson of Margaret, eldest daughter to Henry VII. of that kingdom; and, on the failure of all the male line, his hereditary right remained incontestable. Queen Elizabeth, with her latest breath, had recognized him for her successor; so that few sovereigns ever ascended a throne with more approbation of their subjects, or greater hopes of a peaceable and happy reign.

These hopes, however, were soon blasted; and the history of this monarch's reign consists of little else than a detail of disputes and contentions between him and his parliament. A particular and minute account of such transactions could afford very little entertainment; but it is of importance to know their origin, as they are to be reckoned the ultimate causes of those succeeding events which make so conspicuous a figure in the annals of Britain.

⁵ In those barbarous ages which preceded the period we are now entering upon, the human mind, enervated by superstition, and obscured by ignorance of every art and science, seemed to have given up all pretensions to liberty, either religious or civil. Unlimited and untrouled despotism prevailed everywhere; and though England suffered less in this respect than almost any other nation, the many examples of arbitrary power exerted by her sovereigns, Queen Elizabeth herself, James's immediate predecessor, not excepted, show that they

Britain.

6
Parliaments of little consideration.

they were very far from being then a free people. An incontestable proof of this, and an evidence how little restraint at that time the people could lay upon the authority of the sovereign, is, that the proceedings of parliament were accounted, even by themselves, of so little consequence, that they were not at the trouble to keep journals of them. It was not till the year 1607, four years after the accession of James, that parliamentary journals were kept, at the motion of Sir Edwin Sandys, a member of great authority in the house.

The proceedings of the parliament being at that time of so little consequence, it is no wonder that the sessions were not regular, or that little attention was paid to the choice or continuance of the members. In the reign of Elizabeth, and her predecessors, the sessions of parliament did not continue above the twelfth part so long as the vacations. It was then usual, after parliaments had been prolonged beyond one session, for the chancellor to exert a discretionary authority of issuing new writs to supply the place of any members whom he judged incapable of attending, either on account of their employment, sickness, or other impediment. No practice could be more dangerous to liberty than this, as it gave the chancellor, and consequently the sovereign, an opportunity of garbling at pleasure the representatives of the nation: yet so little was liberty at that time understood, that the commons, of their own accord, without the least court influence or intrigue, and contrary to some former votes of their own, confirmed the chancellor's power in this respect in the 23d of Elizabeth. Nor did they proceed any farther in the assertion of their privileges, than to vote, that "during the sitting of parliament there do not, at any time, any writ go out for the choosing or returning any member without the warrant of the house."

7
Origin of the patriotic party.

Towards the end of the 16th or beginning of the 17th century, a great revolution took place, though insensibly, throughout all Europe. Arts and sciences began to flourish, commerce and navigation were greatly extended, and learning of all kinds began to diffuse itself. By more enlarged views, the love of freedom began, in England especially, to take place in the breasts of most people of birth and education; and this was greatly promoted by an acquaintance with the ancient Greek and Latin historians. From the example of the republics of Greece and Rome, whose members had so often sacrificed their lives for the sake of liberty, a patriotic spirit began to arise; and a desire of circumscribing the excessive prerogative and arbitrary proceedings of the crown began secretly to take place throughout the nation.

8
Grievances the nation at that time laboured under.

Nor was the desire unreasonable, or without a solid foundation. During the last years of Queen Elizabeth's reign, the commerce, navigation, and number of seamen in England, had sensibly decayed. A remonstrance from the Trinity-house in 1602 says, that since 1588, the number of seamen and shipping had decayed about a third part. Every species of domestic industry was fettered by monopolies; and by exclusive companies, which are only another species of monopoly, almost all foreign trade, except that to France, was brought into the hands of a few rapacious engrossers, and all prospect of future improvement in commerce was for ever sacrificed to a little temporary advantage of the sovereign.

2

Britain.

These companies, though arbitrarily erected, had carried their privileges so far, that almost all the commerce of England centered in London; the customs of that port alone amounted to 110,000*l.* a-year; while those of all the kingdom besides amounted only to 17,000*l.*; nay, the whole trade of London was confined to about 200 citizens, who were easily enabled, by combining among themselves, to fix whatever price they pleased both on the exports and imports of the nation. Besides this, the subjects were burdened by wardships and purveyances. The latter was an old prerogative of the crown, by which the officers of the household were empowered to take, without consent of the owners, provisions for the king's family, and carts and horses for the removal of his baggage, upon paying a stated price for them. The king had also a power of sending any person, without his consent, on whatever message he pleased; and thus he could easily force any individual to pay him whatever money he chose, rather than be sent out of the country on a disagreeable errand. Money extorted from individuals, by this or any other method, was called a *benevolence*.

These were some of the grievances under which the nation at this time laboured, and these the rising spirit of patriotism tended to redress. This disposition, however, the severe government of Elizabeth had confined within very narrow bounds: but when James succeeded to the throne; a foreign prince, less dreaded and less beloved; symptoms of a more free and independent genius immediately appeared. Happily James neither perceived the alteration, nor had sufficient capacity to check its early advances. He had established in his own mind a speculative system of absolute government, which few of his subjects, and none but traitors and rebels, he thought, would make any scruple to admit. He considered himself as entitled to equal prerogatives with other European sovereigns, not considering the military force with which their despotism was supported. The almost unlimited power which, for upwards of a century, had been exercised by the English sovereigns, he considered as due to royal birth and title, not to the prudence and spirit of those monarchs, or the conjunctures of the times. In his person, therefore, he imagined all legal power to be centered by an hereditary and a divine right; nay, so fully was he persuaded that he was the absolute proprietor of his subjects, that in his speech to the parliament in 1621, he told them, that he "wished them to have said that their privileges were derived from the grace and permission of him and his ancestors." And when the same parliament protested that "the liberties, franchises, privileges, and jurisdictions of parliament, are the ancient and undoubted birthright and inheritance of the subjects of England," he was so enraged, that sending for the journals of the commons, he, with his own hand, before the council, tore out this protestation; and ordered his reasons to be inserted in the council book.

9
James's arbitrary system of government.

Such were the opposite dispositions of the prince and parliament, at the commencement of the Scottish line; dispositions just beginning to exist and to appear in parliament, but thoroughly established, and openly avowed on the part of the king, throughout his whole reign.

The consequence of such opposite dispositions prevailing in the king and parliament was, that during this reign

Britain.

10
Reasons of the dissen- sions be- tween the king and parliament

11
Aversion of James to the Puri- tan.

reign the prerogatives of the crown were violently and openly attacked; but the chief grounds of discontent were money and religion. The king's high notions of the royal prerogative made him imagine he had a right to whatever sums he pleased to demand; and his profusion caused him to dissipate in a short time the scanty supplies he could extort from the parliament, who seem to have behaved as unreasonably on the one hand as James himself did on the other. With regard to religious matters, the nation was at that time greatly infected with puritanism. Though the severities of Elizabeth had almost totally suppressed the Papists, it had been otherwise with the Puritans. So much had they increased by the very means which had diminished the number of Catholics, that no less than 750 clergymen of that persuasion signed a petition to James on his succession. They hoped that the king, having received his education in Scotland, and having always professed an attachment to the church established there, would at least abate the rigour of the laws enacted against the Puritans, if he did not show them particular favour and encouragement. But in this they were mistaken. He had observed in their Scots brethren a violent turn towards republicanism, and a zealous attachment to civil liberty. In the capacities both of monarch and theologian, he had experienced the little complaisance they were disposed to show him. They contoured his commands; disputed his tenets; and to his face, before the whole people, censured his conduct and behaviour. This superiority assumed by the presbyterian clergy, the monarchic pride of James could never digest. Though he had been obliged while in Scotland to court their favour, he treasured up on that account the stronger resentment against them; and was determined to make them feel in their turn the weight of his authority. He therefore not only rejected the petition of the 750 clergymen above mentioned, but throughout his whole reign refused to relax in the least the severity of the laws against Protestant nonconformists, though very often petitioned in their favour by his parliament.

12
He favours the Episco- pals and Papi- sts.

The same principles which occasioned in James such an aversion to the Puritans, prompted him greatly to favour the Episcopal, and even the Papists, as being greater friends to despotism. In his youth he had been suspected of a bias towards the religion of the latter; and when he ascended the throne of England, it is certain he often endeavoured to procure some mitigation of the laws against them, if not an absolute toleration. But in this he was constantly opposed by the parliament; and indeed the strong inclination shown by James to establish Episcopacy throughout every corner of his dominions, tended very much to alienate the minds of the generality of his subjects, especially in Scotland, entirely from him.

13
Attempts to establish Episcopacy in Scotland.

In May 1617, the king set out for Scotland, expressly with the design of establishing Episcopacy in that kingdom. He did not, however, propose to abolish Presbytery entirely, and set up absolute Episcopacy in its room. He designed to content himself with establishing the royal authority above the ecclesiastical, and introducing some ceremonies into the public worship, such as kneeling at the sacrament, private communion, private baptism, confirmation of children, and the observance of Christmas, &c. But as

his design was fully seen from the beginning, every advance towards Episcopacy gave the greatest discontent, and those trivial ceremonies were rejected as so many mortal sins.

Britain.

At this time the power of the Scots clergy was exceedingly great; and the gloomy enthusiastic spirit with which they were actuated, prompted them to exercise it in such a manner as to make their tyranny insupportable to those who were of a different way of thinking from themselves. Every ecclesiastical court possessed the power of excommunication; which was then attended with some very serious temporal consequences, besides the spiritual ones which are supposed to flow from it. The person excommunicated was shunned by every one as profane and impious; his whole estate during his life-time, and all his moveables for ever, were forfeited to the crown. A sentence of excommunication was sometimes pronounced in a summary manner, by any ecclesiastical court, however inferior, against any person, whether he lived within the bounds of their jurisdiction or not. And by this means, the whole tyranny of the inquisition, though without its orders, was introduced into Scotland. But the clergymen were not satisfied with this unbounded authority in ecclesiastical matters; they assumed a censorial power over every part of administration; and in all their sermons and even prayers, mingling politics with religion, they inculcated the most seditious and turbulent principles. One Black, a minister of St Andrew's, went so far as to pronounce in one of his sermons, that all kings were the devil's children; and in his prayer for the queen he used these words, "We must pray for her for the fashion's sake, but we have no cause: she will never do us any good." Another minister preaching in the principal church of that capital, said, that the king was possessed with a devil; and that, one devil being expelled, seven worse had entered in his place. To which he added, that the subjects might lawfully rise, and take the sword out of the hands of their sovereign.

14
Tyranny of the Scots clergy.

15
Anecdotes of some of them.

We can scarcely wonder that James should be desirous of subjugating such rebellious and turbulent spirits as these; and, on the other hand, considering the extreme weakness of this monarch's understanding, and that he imagined himself able to manage not only furious religionists, but even the most powerful foreign nations, with no other weapon than mere argumentation, we can as little wonder at his want of success.— In short, so far was James from being able to establish his royal authority above the ecclesiastical, that he found himself unable to introduce a single ceremony. He returned therefore with the mortification not only of seeing his schemes entirely baffled with regard to Scotland, but of having disgusted even the few of that nation over whom religious prejudices did not prevail: for they, considering the ceremonies so much insisted on by the king as trivial and insignificant, could not help thinking the national honour sacrificed by a servile imitation of the modes of worship practised in England, and that their sovereign betrayed equal narrowness of mind, though in an opposite manner, with those he so much condemned.

16
The king's design mis- gives in Scotland.

The like bad success attended James when he attempted some opposition to the puritanical innovations in England. He had observed in his progress through

17
His bad success a- gainst the Puritans in England. that

Britain.

that kingdom, that a judicial observance of the Sunday gained ground every day; and that by this means, under colour of religion, the people were debarred from such sports and recreations as contributed to their health as well as amusement. Imagining, therefore, that it would be easy to infuse cheerfulness into the dark spirit of devotion which then prevailed, he issued a proclamation to allow and encourage, after divine service, all kinds of lawful games and exercises; and this proclamation his subjects regarded as an instance of the utmost profaneness and impiety. In 1620 a bill was brought in by the commons for the more strict observance of the Sunday, which they affected to call the *sabbath*. One Shepherd opposed this bill, objected to the appellation of *sabbath* as puritanical, and seems even to have justified sports on that day. For this he was expelled the house by the suggestion of Mr Pym; and in the sentence pronounced against Shepherd, his offence is said to be *great, exorbitant, and unparalleled*.

This sketch, we hope, will be sufficient to give the reader a tolerable idea of the situation of affairs during the reign of James I. We now proceed to give an account of the few remarkable transactions which occurred in this period.

18
Sir Walter
Raleigh's
conspiracy.

The first thing of any consequence was a conspiracy formed, the very year of the king's accession to the throne, to displace him, and bestow the kingdom on Arabella Stuart, a near relation of James's, and equally descended from Henry VII. With regard to this conspiracy every thing remains still mysterious, as it was at the time when the conspiracy itself was discovered. What renders it remarkable is the concern Sir Walter Raleigh was said to have in it; for which he was tried, condemned without sufficient proof, suffered 13 years imprisonment in the Tower, and was afterwards executed out of complaisance to the Spaniards. See *BALEIGH*.

19
Account of
the gun-
powder
treason.

In 1605 was discovered the famous *gunpowder treason*, the anniversary of which discovery hath ever afterwards been celebrated with rejoicings. Its origin was as follows: On the accession of James, great expectations had been formed by the catholics, that he would prove favourable to them, both as that was the religion of his mother, and as he himself had been suspected of a bias towards it in his youth. It is even pretended that he had entered into a positive engagement to grant them a toleration as soon as he should mount the throne of England. Here, however, they found their hopes built on a false foundation. James on all occasions expressed his intention of executing strictly the laws enacted against them, and of persevering in all the rigorous measures of Queen Elizabeth. A plan of revenge was first thought of by one Catesby, a gentleman of good parts, and of an ancient family. He communicated his mind to Percy, a descendant of the house of Northumberland. The latter proposed to assassinate the king; but this seemed to Catesby very far from being adequate to their purpose. He told Percy, that the king would be succeeded by his children, who would also inherit his maxims of government. He told him, that even though the whole royal family were destroyed, the parliament, nobility, and gentry, who were all infected with the same heresy, would raise another Protestant prince to the throne.

"To serve any good purpose (says he), we must destroy, at one blow, the king, the royal family, the lords and commons; and bury all our enemies in one common ruin. Happily they are all assembled on the first meeting of parliament; and afford us the opportunity of glorious and useful vengeance. Great preparations will not be requisite. A few of us may run a mine below the hall in which they meet; and choosing the very moment when the king harangues both the houses, consign over to destruction those determined foes to all piety and religion. Meanwhile, we ourselves standing aloof, safe and unsuspected, shall triumph in being the instruments of divine wrath, and shall behold with pleasure those sacrilegious walls, in which were passed the edicts for proscribing our church and butchering her children, tossed into a thousand fragments; while their impious inhabitants, meditating perhaps still new persecutions against us, pass from flames above to flames below, there for ever to endure the torments due to their offences."

Britain.
20
Catesby's
speech.

This terrible scheme being approved of, it was resolved to communicate it to a few more. One Thomas Winter was sent over to Flanders in quest of Fawkes, an officer in the Spanish service, of approved zeal and courage. All the conspirators were bound by the most solemn oaths, accompanied with the sacrament; and to such a degree had superstition effaced every principle of humanity from their minds, that not one of them ever entertained the smallest compunction for the cruel massacre they were going to commit. Some indeed were startled at the thoughts of destroying a number of catholics who must necessarily be present as spectators, or attendants on the king, or as having seats in the house of peers. But Tesmond a Jesuit, and Garnet superior of that order in England, removed those scruples, by showing that the interest of religion required in this case the sacrifice of the innocent with the guilty.

This happened in the spring and summer of 1604; when the conspirators also hired a house in Percy's name, adjoining to that in which the parliament was to assemble. Towards the end of that year they began to pierce through the wall of the house, in order to get in below that where the parliament was to sit. The wall was three yards thick, and consequently occasioned a great deal of labour. At length, however, they approached the other side, but were then startled by a noise for which they could not well account. Upon inquiry, they found that it came from a vault below the house of lords; that a magazine of coals had been kept there; and that the coals were then selling off, after which the vault would be let to the highest bidder. Upon this the vault was immediately hired by Percy; 36 barrels of powder lodged in it; the whole covered up with faggots and billets; the doors of the cellar boldly flung open; and every body admitted as if it contained nothing dangerous.

Being now, as they thought, assured of success, the conspirators began to plan the remaining part of their enterprise. The king, the queen, and Prince Henry, were expected to be present at the opening of the parliament. The duke, by reason of his tender age, would be absent, and it was resolved that Percy should seize or murder him. The princess Elizabeth, likewise a child, was kept at Lord Harrington's house in Warwickshire; and some others of the conspirators engaged

to

²² **Conspiracy discovered.** ^{Britain.} to assemble their friends on pretence of a hunting match, when they were to seize that princess, and immediately proclaim her queen. The day so long wished for at last approached; the dreadful secret, though communicated to more than 20 persons, had been religiously kept for near a year and a half; and nothing could be foreseen which could possibly prevent the success of their design. Ten days before the meeting of parliament, however, Lord Monteagle, a catholic, son to Lord Morley, received the following letter, which had been delivered to his servant by an unknown hand.

"My lord, out of the love I bear to some of your friends, I have a care for your preservation. Therefore I would advise you, as you tender your life, to devise some excuse to shift off your attendance on this parliament. For God and man have determined to punish the wickedness of this time. And think not slightly of this advertisement; but retire yourself into the country, where you may expect the event in safety. For though there be no appearance of any stir; yet, I say, they shall receive a terrible blow this parliament; and yet they shall not see who hurts them. This counsel is not to be contemned, because it may do you good, and can do you no harm: for the danger is over as soon as you have burned this letter. And I hope God will give you the grace to make a good use of it, to whose holy protection I commend you."—Though Monteagle imagined this letter to be only a ridiculous artifice to frighten him, he immediately carried it to Lord Salisbury, secretary of state; who laid it before the king on his arrival in town a few days after.

The king looked upon the letter in a more serious light. From the manner in which it was wrote he concluded that some design was forming to blow up the parliament-house with gunpowder, and it was thought advisable to search the vaults below. The lord chamberlain, to whom this charge belonged, purposely delayed the search till the day before the meeting of parliament. He remarked those great piles of wood and faggots which lay in the vault under the upper house; and casting his eye upon Fawkes, who stood in a corner and passed himself for Percy's servant, he took notice of that daring and determined courage, which was conspicuous in his face, and so much distinguished this conspirator even amongst the other heroes in villany that were concerned in the scheme. Such a quantity of fuel, also, for one who lived so little in the town as Percy, appeared somewhat extraordinary; and, upon comparing all circumstances, it was resolved to make a further search. About midnight, Sir Thomas Knevet, a justice of peace, was sent with proper attendants; and before the door of the vault, finding Fawkes, who had just finished all his preparations, he immediately seized him, and, turning over the faggots, discovered the powder. The matches and every thing proper for setting fire to the train were taken in Fawkes's pocket; who seeing now no refuge but in boldness and despair, expressed the utmost regret that he had lost the opportunity of firing the powder at once, and of sweetening his own death with that of his enemies. For two or three days he displayed the same obstinate intrepidity; but, on being confined in the Tower, and the rack just shown to him, his courage at last failed, and he made a full discovery of all the conspirators—

²³ **Fawkes seized.**

Catesby, Percy, and the other criminals, on learning that Fawkes was arrested, hurried away to Warwickshire; where Sir Edward Digby, imagining that his confederates had succeeded, was already in arms to seize the princess Elizabeth. She had escaped into Coventry; and they were obliged to put themselves in a posture of defence against the country-people, who were raised from all quarters and armed by the sheriffs. The conspirators, with all their attendants, never exceeded the number of 80 persons; and being surrounded on every side, could no longer have any hope either of prevailing or escaping. Having therefore confessed themselves, and received absolution, they boldly prepared for death, and resolved to sell their lives as dear as possible. But even this miserable consolation was denied them. Some of their powder took fire and disabled them from defending themselves. The people then rushed in upon them. Percy and Catesby were killed with one shot. Digby, Rookwood, Winter, and others, being taken prisoners, were tried, confessed their guilt, and died, as well as Garnet, by the hands of the common executioner. The lords Stonrton and Mordaunt, two catholics, were fined, the former of 4000l. the latter of 10,000l. by the star-chamber; because their absence from parliament had occasioned a suspicion of their being made acquainted with the conspiracy. The earl of Northumberland was fined 30,000l. and detained several years a prisoner in the Tower; because, not to mention other grounds of suspicion, he had admitted Percy into the number of gentlemen pensioners, without his taking the requisite oaths.

²⁴ **Conspirators punished.** ^{Britain.} In 1612, James appears in his most advantageous point of view, namely, as legislator of Ireland, and the person who undertook to civilize the barbarous inhabitants of that kingdom, and to render their subjection durable and useful to the crown of England. In this work, James proceeded by a steady, regular, and well-concerted plan. He began with abolishing the ancient Irish customs which supplied the place of laws, and which were exceedingly barbarous and absurd. By the Brehon law, every crime however enormous was punished, not with death, but by a fine. Murder itself was compensated in this way. Every one had a value affixed to him, called his *eric*; and whoever was able to pay this, might kill him when he pleased. As for such slight offences as oppression, extortion, or other things of that nature, no penalty was affixed to them, nor could any redress for them ever be obtained. By the custom of *gavelkinde*, upon the death of any person, his land was divided among all the males of the sept or family, both bastard and legitimate: and after partition made, if any of the sept died, his portion was not shared out among his sons; but the chieftain at his discretion made a new partition of all the lands belonging to that sept, and gave every one his share: as no man, by reason of this custom, enjoyed the fixed property of any land; to build, cultivate, or improve, must have been so much lost labour. Their chieftains were established by election, or, more properly speaking, by force and violence. Their authority was absolute; and, notwithstanding certain lands were assigned to the office, its chief profit resulted from enactions, duces, assessments, for which there was no fixed law, and which were levied at pleasure.

²⁵ **James's wise conduct in the legislation of Ireland.**

After

Britain.

After abolishing these customs, and substituting English law in their place; James having taken all the natives under his protection, and declared them free citizens, proceeded to govern them by a regular administration, military as well as civil. A sufficient army was maintained, its discipline inspected, and its pay transmitted from England, in order to prevent the soldiery from preying upon the country, as had been usual in former reigns. When O'Doghartie raised an insurrection, a reinforcement was sent over, and the rebellion immediately extinguished. All minds being first quieted by an universal indemnity, circuits were established, justice administered, and crimes of every kind severely punished. As the Irish had been universally engaged in a rebellion against Elizabeth, a resignation of all the rights formerly granted them to separate jurisdictions was rigorously exacted; a resignation to private estates was even required; and when they were restored, the proprietors received them under such conditions as might prevent all future tyranny and oppression over the common people. The whole province of Ulster having fallen to the crown by the attainder of rebels, a company was established in London for planting new colonies in that fertile country. The property was divided into moderate shares, the largest not exceeding 2000 acres; tenants were brought over from England and Scotland: The Irish were removed from the hills and fastnesses, and settled in the open country: Husbandry and the arts were taught them: and by these means Ulster, from being the most wild and disorderly province in Ireland, soon became the best cultivated and most civilized.

26
Death of
Henry
prince of
Wales.

This year was also remarkable for the death of Henry prince of Wales, who died suddenly on the 6th of November, not without strong suspicions of poison, for which the king himself was blamed. On opening his body, however, no symptoms of poison appeared; but his death diffused an universal grief throughout the nation, he being reckoned a prince of extraordinary accomplishments.

27
Marriage
of the prin-
cess Eliza-
beth with
the elector
palatine.

The marriage of the princess Elizabeth with Frederic elector palatine, which was celebrated February 14. 1613, served to dissipate the grief which had arisen on account of Prince Henry's death. But this marriage, in the event, proved unhappy to the king as well as his son-in-law. The elector, trusting to so great an alliance, engaged in enterprises beyond his strength; and James, not being able, and indeed perhaps not willing to assist him in his distress, lost entirely what remained of the affections of his people.

28
The elector
chosen king
of Bohemia.

These bad consequences did not begin to appear till the year 1619. At that time the states of Bohemia having taken arms against the emperor Matthias, in defence of the Protestant religion, and continued their revolt against his successor Ferdinand II. and being alarmed at his mighty preparations against them, made an offer of their crown to the elector palatine. To this they were induced by the greatness of his connections, as being son-in-law to the king of England, and nephew to Prince Maurice, whose authority in the United Provinces was almost absolute; and the young palatine, stimulated by ambition, without consulting either James or Maurice, whose opposition he foresaw, immediately accepted the offer, and march-

ed all his forces into Bohemia, in support of his new subjects. Britain.

The affairs of the new king were not long of coming to an unfortunate crisis. It was known almost at one time in England, that Frederic being defeated in the great and decisive battle of Prague, had fled with his family into Holland; and that Spinola the Spanish general had invaded the palatinate, where meeting with little resistance, except from one body of 2400 Englishmen commanded by the brave Sir Horace Vere, he had in a little time reduced almost the whole principality. In 1621, the ban of the empire was published against the unfortunate elector, and the execution of it was committed to the duke of Bavaria. The upper palatinate was in a little time conquered by that prince; and measures were taken in the empire for bestowing on him the electoral dignity of which the palatine was despoiled. Frederic was now obliged to live with his numerous family in poverty and distress, either in Holland, or at Sedan, with his uncle the duke of Bouillon; and the new conquests of the Catholics throughout all Germany were attended with persecutions against the Protestants.

At this news the religious zeal of the English was inflamed to the highest degree; and they would have plunged headlong into a war with the house of Austria, without reflecting in the least on the consequences that might ensue. The sufferings of their Protestant brethren in Germany were the only objects of consideration, and the neutrality and inactive spirit shown by James was loudly exclaimed against. But though James might have defended his pacific measures by very plausible arguments, it is certain that some of his motives were the most ridiculous that can be imagined. Such was the opinion that he himself entertained of his own wisdom, that he imagined himself capable of disarming hostile nations by dint of argument; and that the whole power of Austria, though not awed by the power of England, would submit to his arbitration, merely out of respect to his virtue and moderation.— So much also was he wedded to his opinion concerning the prerogative of kings, that he imagined, wherever there was a contention between any sovereign and his subjects, the latter behoved always to be in the wrong; and for this reason, from the very first he had denied his son-in-law the title of *king of Bohemia*, and forbade him to be prayed for in the churches under the appellation. Besides these reasons, James was on another account extremely averse to come to a rupture with Spain. He had entertained an opinion peculiar to himself, which was, that any alliance below that of a king was unworthy a prince of Wales; and he never would allow any princess but a daughter of France or Spain to be mentioned as a match for his son. This piece of pride, which really implied meanness, as if he could have received honour from any alliance, gave Spain an opportunity of managing this monarch in his most important concerns. With a view to engage him to a neutrality with regard to the succession of Cleves, the elder daughter of the king of Spain had been indirectly offered during the life of Prince Henry. The bait, however, did not then take; James, in consequence of his alliance with the Dutch, marched 4000 men to the assistance of the Protestants, by which means

the succession was secured to the Protestant line. In 1618, Gondomar the Spanish ambassador made offer of the king's second daughter to Prince Charles; and, that he might render the temptation irresistible to the necessitous James, gave hopes of an immense fortune that should attend the princess. Upon this match James had built great hopes, not only of relieving his own necessities, but of recovering the palatinate for his son-in-law; which last, he imagined, might be procured from the mere motives of friendship and personal attachment.

33
Commons
averse to
this mea-
sure.

This last step was equally disagreeable to the commons with the rest; and, joined to the other pieces of James's conduct, at last blew into a flame the contention which had so long subsisted between their sovereign and them. On the 14th of November 1621, the commons framed a remonstrance which they intended to carry to the king. They represented, that the enormous growth of the Austrian power threatened the liberties of Europe; that the progress of the Catholic religion in England bred the most melancholy apprehensions lest it should again acquire an ascendant in the kingdom; that the indulgence of his majesty towards the professors of that religion had encouraged their insolence and temerity; that the uncontroled conquests made by the Austrian family in Germany raised mighty expectations in the English Papists; but above all, that the Spanish match elevated them so far as to hope for an entire toleration, if not a final re-establishment, of their religion. They therefore intreated his majesty, that he would immediately undertake the defence of the palatinate, and maintain it by force of arms; that he would turn his sword against Spain, whose armies and treasures were the chief support of the Catholic interest in Europe; that he would enter into no negotiation for the marriage of his son but with a Protestant princess; that the children of Popish recusants should be taken from their parents, and committed to the care of Protestant teachers and schoolmasters; and that the fines and confiscations to which the Catholics by law were liable, should be levied with the utmost severity.

34
They frame
a remon-
strance a-
gainst it.

35
Contention
between
the king
and com-
mons.

The king, who was then at Newmarket, hearing of the intended remonstrance, wrote a letter to the speaker, in which he sharply rebuked the house for debating on matters far above their reach and capacity; and he strictly forbade them to meddle with any thing that regarded his government, or deep matters of state, and especially not to touch on his son's marriage with the Spanish princess. Upon this the commons framed a new remonstrance, in which they asserted their right of debating on all matters of government, and that they possessed entire freedom of speech in their debates. The king replied, that their remonstrance was more like a denunciation of war, than an address of dutiful subjects; that their pretension to inquire into all state affairs without exception, was such a plenipotence as none of their ancestors, even during the reign of the weakest princes, had ever pretended to; that public transactions depended on a complication of views and intelligence, with which they were entirely unacquainted; that they could not better show their wisdom, as well as duty, than by keeping within their proper sphere; and that in any business which depended on his prerogative, they had no title to interpose

VOL. IV. Part II.

†

Britain.

with their advice, unless when he pleased to ask it, &c. The commons in return framed the protestation already mentioned, which the king tore out of their journals, and soon after dissolved the parliament. The leading members of the house, Sir Edward Coke and Sir Robert Phillips, were committed to the Tower; three others, Selden, Pym, and Mallory, to other prisons; and, as a lighter punishment, some others were sent into Ireland to execute the king's business. Sir John Saville, however, a powerful man in the house of commons, and a zealous opposer of the court, was made comptroller of the household, a privy counsellor, and soon after a baron. This event is memorable; as being the first instance in the English history, of any king's advancing a man on account of parliamentary interest, and of opposition to his measures.

This breach between the king and parliament soon made politics become a general subject of discourse, and every man began to indulge himself in reasonings and inquiries concerning matters of state; and the factions which commenced in parliament were propagated throughout the nation. In vain did James, by reiterated proclamations, forbid discourses of this kind. Such proclamations, if they had any effect, served rather to inflame the curiosity of the public. In every company or society the late transactions became the subject of argument and debate; some taking the side of monarchy, others of liberty; and this was the origin of the two parties since known by the names of *Whigs* and *Tories*.

36
Origin of
the factions
of Whig
and Tory.

For five years, James continued the dupe of the court of Spain. Though firmly resolved to contract no alliance with a heretic, the king of Spain had continued to procrastinate and invent one excuse after another, while he pretended to be very willing to conclude the match. At last the king of England, finding out what was really the matter, resolved to remove that obstacle if possible. He issued public orders for discharging all Popish recusants who were imprisoned; and it was daily apprehended that he would forbid, for the future, the execution of the penal laws against them. For this conduct he was obliged to apologize, and even pretend that it was done in order to procure for foreign princes a toleration for the Protestants; the severity of the English laws against Catholics, he said, having been urged as a reason against showing any favour to Protestants residing in catholic kingdoms.

37
James gains
the favour
of the court
of Spain.

These concessions in favour of the Catholics, however ill relished by his subjects, at last obtained James's end with regard to the marriage. The earl of Bristol, ambassador at the court of Spain, a minister of vigilance and penetration, and who had formerly opposed the alliance with Catholics, being now fully convinced of the Spanish sincerity, was ready to congratulate the king on the completion of his projects. The Spanish princess is represented as very accomplished; she was to bring with her a fortune of 600,000l.; and, what was more, not only Bristol considered this match as an infallible prognostic of the palatine's restoration, but the Spaniards themselves did the same. All things being therefore agreed upon between the parties, nothing was wanting but the dispensation from Rome, which might be considered as a matter of mere formality. The king exulted in his pacific counsels, and boasted of his superior sagacity and penetration; when all his

38
Marriage

fanta a-
greed upon.

3 K

flattering

Britain. flattering prospects were blasted by the temerity of the duke of Buckingham, who governed both court and nation with almost unlimited sway.

This nobleman had suddenly been raised to the highest honours. Though possessed of some accomplishments of a courtier, he was utterly devoid of every talent of a minister; but at once partook of the insolence which attends a fortune newly acquired, and the impetuosity which belongs to persons born in high stations, and unacquainted with opposition. Among those who had experienced the arrogance of this overgrown favourite, the prince of Wales himself had not been entirely spared; and a great coldness, if not enmity, had for that reason taken place between them. Buckingham being desirous of putting an end to this coldness, and at the same time envious of the great reputation of the earl of Bristol, persuaded the prince to undertake a journey to Madrid; which, he said, would be an unexpected gallantry; would equal all the fictions of Spanish romance; and, suiting the amorous and enterprising character of that nation, must immediately introduce him to the princess under the agreeable character of a devoted lover and daring adventurer. Little persuasion was necessary to prevail with Prince Charles to undertake this journey; and the impetuosity of Buckingham having extorted a consent from James, our two adventurers set out, Prince Charles as the knight-errant, and Buckingham as the squire. They travelled through France in disguise, assuming the names of Jack and Tom Smith. They went to a ball at Paris, where the prince first saw the princess Henrietta, whom he afterwards married, who was then in the bloom of youth and beauty, and with whom the novelists of that time say, he then fell in love. On their arrival at Madrid, every body was surprised by a step so little usual among great princes. The Spanish monarch made Charles a visit, expressed the utmost gratitude for the confidence he reposed in him, and made warm protestations of a correspondent confidence and friendship. He gave him a golden key which opened all his apartments, that the prince might, without any introduction, have access to him at all hours: he took the left hand of him on every occasion, except in the apartments assigned to Charles; for there, he said, the prince was at home: Charles was introduced into the palace with the same pomp and ceremony which attended the kings of Spain on their coronation: the council received public orders to obey him as the king himself: Olivarez too, the prime minister, though a grandee of Spain, who has the right of being covered before his own king, would not put on his hat in the prince's presence: all the prisons of Spain were thrown open, and all the prisoners received their freedom, as if an event the most honourable and most fortunate had happened to the monarchy; and every sumptuary law with regard to apparel was suspended during Prince Charles's residence in Spain. The infanta, however, was only shown to her lover in public; the Spanish ideas of decency being so strict, as not to allow any farther intercourse till the arrival of the dispensation. The point of honour was carried so far by these generous people, that no attempt was made, on account of the advantage they had acquired by having the prince of Wales in their power, to impose any harder conditions of treaty: their pious zeal

only prompted them on one occasion to desire more concessions in the religious articles; but, on the opposition of Bristol, they immediately desisted. The pope, however, hearing of Charles's arrival in Madrid, tacked some new clauses to the dispensation; and it became necessary to transmit the articles to London, that the king might ratify them. This treaty, which was made public, consisted of several articles, chiefly regarding the exercise of the Catholic religion by the infanta; and, among these, nothing could reasonably be found fault with, except one article, in which the king promised that the children should be educated by the princess till they were ten years of age; which undoubtedly was insisted upon with a view of seasoning their minds with catholic principles. But, besides this public treaty, there were some private articles sworn to by James, which could not have been made public without grievous murmurs. A suspension of the penal laws against the English Catholics was promised, as likewise a repeal of them in parliament, and a toleration for the exercise of that religion in private houses. Meanwhile Gregory XV. who granted the dispensation, died; and Urban VIII. was chosen in his place. Upon this event, the nuncio refused to deliver the dispensation till it should be renewed by Urban. This the crafty pontiff delayed, in hopes that, during the prince's residence in Spain, some expedient might be fallen upon to effect his conversion. The king of England, as well as the prince, became impatient: but, on the first hint, Charles obtained leave to return; and Philip graced his departure with all the circumstances of civility and respect which had attended his arrival. He even erected a pillar on the spot where they took leave of each other, as a monument of mutual friendship: and the prince, having sworn to the observance of all the articles, embarked on board the English fleet at St Andero.

The modest, reserved, and decent behaviour of Charles, together with his unparalleled confidence in them, and the romantic gallantry he had practised with regard to their princess, had endeared him to the whole court of Madrid. But in the same proportion that Charles was beloved and esteemed, was Buckingham despised and hated. His sallies of passion; his indecent freedoms with the prince; his dissolute pleasures; his arrogant impetuous temper, which he neither could nor would disguise; were to the Spaniards the objects of peculiar aversion. They lamented the infanta's fate, who must be approached by a man whose temerity seemed to respect no laws divine or human. Buckingham, on the other hand, sensible how odious he was become to the Spaniards, and dreading the influence which that nation would naturally acquire after the arrival of the infanta, resolved to employ all his credit in order to prevent the marriage. By what arguments he could prevail on the prince to offer such an insult to the Spanish nation, from whom he had received such generous treatment; by what colours he could disguise the ingratitude and imprudence of such a measure; these are totally unknown to us: certain it is, however, that when the prince left Madrid, he was firmly determined, in opposition to his most solemn promises, to break off the treaty with Spain. On their arrival at London, therefore, the prince and Buckingham assumed the entire direction of the negotiation; and it

was

Britain. was their business to seek for pretences by which they could give a colour to their intended breach of treaty. At last, after many fruitless artifices were employed to delay or prevent the espousals, Bristol received positive orders not to deliver the proxy which had been left in his hands, or to finish the marriage, till security was given for the full restitution of the palatinate. Philip understood this language: but being determined to throw the whole blame of the rupture on the English, he delivered into Bristol's hand a written promise, by which he bound himself to procure the restoration of the palatinate either by persuasion or by every other possible means; and when he found that this concession gave no satisfaction, he ordered the infanta to lay aside the title of *princess of Wales*, which she bore after the arrival of the dispensation from Rome, and to drop the study of the English language; and as he knew that such rash counsels as now governed the court of England would not stop at the breach of the marriage-treaty, he immediately ordered preparations for war to be made throughout all his dominions.

44 Philip obliges himself to procure the restitution of the palatinate.

Match with Henrietta, princess of France. A match for Prince Charles was soon after negotiated with Henrietta, daughter of the great Henry IV. and this met with much better success than the former. However, the king had not the same allurements in prosecuting this match as the former, the portion promised him being much smaller; but, willing that his son should not be altogether disappointed of a bride, as the king of France demanded only the same terms that had been offered to the court of Spain, James thought proper to comply. In an article of this treaty of marriage, it was stipulated, that the education of the children till the age of 13 should belong to the mother; and this probably gave that turn towards popery which has since proved the ruin of the unfortunate family of Stuart.

46 War declared against Spain. James now, being deprived of every other hope of relieving his son-in-law but by force of arms, declared war against Spain and the emperor, for the recovery of the palatinate; 6000 men were sent over into Holland to assist Prince Maurice in his schemes against those powers; the people were everywhere elated at the courage of their king, and were satisfied with any war which was to exterminate the Papists. This army was followed by another consisting of 12,000 men, commanded by Count Mansfeldt; and the court of France promised its assistance. But the English were disappointed in all their views: the troops being embarked at Dover, upon sailing to Calais, found no orders for their admission. After waiting for some time, they were obliged to sail towards Zealand, where no proper measures were yet consulted for their disembarkation. Meanwhile, a pestilential disorder crept in among them, so long cooped up in narrow vessels: half the army died while on board; and the other half weakened by sickness, appeared too small a body to march into the palatinate; and thus ended this ill-concerted and fruitless expedition. Whether this misfortune had any effect on the king's constitution or not, is uncertain; but he was soon after seized with a tertian ague, which put an end to his life on the 27th of March 1625, after having lived 59 years, and reigned over England 22, and over Scotland almost as long as he lived.

47 Unsuccessful expedition of Count Mansfeldt.

48 Death of King James.

49 Succeeded by his son Charles I. James was succeeded by his son Charles I. who

ascended the throne amidst the highest praises and caresses of his subjects, for what was perhaps the most blame-worthy action of his life, namely, his breaking off the match with the Spanish princess, and procuring the rupture with the house of Austria. Being young and unexperienced, he regarded these praises as his cere: and therefore was so impatient to assemble the great council of the nation, that he would gladly, for the sake of despatch, have called together the same parliament which sat under his father, and which lay at that time under prorogation. But being told that such a measure would appear unusual, he issued writs for summoning a new parliament on the 7th of May; and it was not without regret that the arrival of the princess Henrietta, whom he had espoused by proxy, obliged him to delay, by repeated prorogations, their meeting till the 18th of June, when they assembled at Westminster for the despatch of business.

Britain. His affection for his people.

Charles inherited from his father great distrest money, very high notions of the royal prerogative, and a violent attachment to Episcopacy. As to his character, he seems to have been obstinate, though not resolute; and therefore, though it was scarce ever possible to make him give up his point, he never could carry on his designs with that spirit which was necessary for their success. In other respects, he appears to have possessed every virtue requisite to constitute the character of a good man. At present believing his subjects to be in perfect friendship with him, as he was with them, he resolved that their bounty to him should be entirely unasked, and the genuine effect of mutual confidence and regard. Accordingly, his discourse to the parliament was full of simplicity and cordiality. He lightly mentioned the occasion he had for supply. He employed no intrigue to influence the suffrages of the members. He would not even allow the officers of the crown, who had seats in the house, to mention any particular sum which he had occasion for; but trusted entirely to the wisdom and affection of his parliament, who perfectly well knew his circumstances.

His character.

His first speech to his parliament.

It is almost impossible to read without indignation an account of the return made by the commons to this generous behaviour of their sovereign. They knew that all the money granted by the last parliament had been expended on military and naval preparations; and that great anticipations were likewise made on the revenues of the crown. They were not ignorant that Charles was loaded with a debt contracted by his father, who had borrowed money both from foreign princes, and from his own subjects. They had learned by experience, that the public revenues could with difficulty maintain the dignity of the crown, even under the ordinary charges of government. They were sensible that the present war was, very lately, the result of their own importunate applications and entreaties, and that they had solemnly engaged to support their sovereign in the management of it. They were acquainted with the difficulty of military enterprises directed against the whole house of Austria; against the king of Spain, possessed of the greatest riches and most extensive dominions of any prince in Europe; against the emperor Ferdinand, hitherto the most fortunate monarch of the age, who had subdued and astonished Germany by the rapidity of his victories. Deep impressions they saw must be made by the British sword,

Their scandalous proceedings.

Britain. sword, and a vigorous offensive war be waged against these mighty potentates, ere they would resign the palatine which they had now fully subdued, and which they held in secure possession by its being surrounded with all their other territories. To answer, therefore, all these great and important ends; to satisfy their young king in the first request he made them; to prove their sense of the many royal virtues, particularly economy, with which Charles was endued; the commons thought proper to confer on the king a supply of 112,000*l*. To search for the reasons of such an extravagant piece of conduct would be needless; it is impossible they could be good.

It is not to be supposed that Charles, or any person of common sense, could be insensible of such treatment as this; he behaved, however, with great moderation. He represented in the most explicit manner the necessity there was for a large supply: he even condescended to use entreaties: he said that this request was the first he had ever made them; that he was young, and in the commencement of his reign; and if he now met with kind and dutiful usage, it would endear him to the use of parliaments, and would for ever preserve an entire harmony between him and his people.—To these reasons and entreaties, the commons remained inexorable; they even refused the addition of two fifteenths to the former supply. Instead of this, they renewed their ridiculous complaints against the growth of Popery, which was now their only grievance. They showed their intolerant spirit by demanding a strict execution of the penal laws against the Catholics; and remonstrated against some late pardons granted to priests. They attacked Montague, one of the king's chaplains, on account of a moderate book which he had lately composed, and which, to their great disgust, saved virtuous Catholics as well as other Christians from eternal torments. Charles gave them a gracious and complaisant answer; but firmly resolved to abate somewhat of the rigorous laws against that unfortunate party, which his engagements with France absolutely required. No measure, however, throughout the whole reign of this prince, was more disgusting to his bigotted subjects, or by its consequences more fatal to himself than this resolution. The Puritans had continued to gain ground during the whole reign of James, and now formed the majority of the house of commons; in consequence of which, petitions were presented to the king for placing such *able* clergymen as had been silenced for want of conformity to the ceremonies. They also enacted laws for the strict observance of Sunday, which they affected to call the *sabbath*, and which they sanctified with the most melancholy indolence; and it is worthy of notice, that the different appellations of *Sunday* and *Sabbath* were at that time known symbols of the different parties.

⁵⁴
King's resolution to favour the Catholics.

⁵⁵
Parliament dissolved.

⁵⁶
His scheme to raise money.

In consequence of this behaviour in Charles's first parliament, it was dissolved on the 12th of August 1625, and a new one called on February 6. 1626.

During this interval Charles had been obliged to borrow from his subjects on privy seals; the advantage of which was but a small compensation for the disgust it occasioned. By means, however, of that supply, and some other expedients, he was enabled to equip his fleet, though with difficulty. It was designed against Spain, but performed nothing worth notice.

and its bad success increased the clamours against the court. Britain.

Charles's second parliament immediately adopted the same views with the former; however, they voted him a supply of three subsidies (168,000*l*.), and three fifteenths; but the passing this vote into a law was reserved until the end of the session, that in the mean time they might have an opportunity of forcing the king to make what concessions they pleased. This harsh and undutiful conduct was greatly resented by Charles; but he found himself obliged to submit, and wait the event with patience. In the mean time they attacked the duke of Buckingham, who was become generally obnoxious; and he was also, impeached by the earl of Bristol, on account of his conduct with regard to the Spanish negotiation. The earl's impeachment, however, was entirely overlooked, and the commons were able to prove nothing otherwise of any consequence against him. The king imagining that Buckingham's greatest crime was the having been so much in favour with his sovereign, commanded the house expressly not to meddle with his minister and servant, but to finish in a few days the bill they had begun for the subsidies; otherwise they must expect to sit no longer.

⁵⁷
Proceedings of his second parliament.

Suggestions of this kind had a bad effect; and when the king proceeded further to throw into prison two members of the house who had managed the impeachment against Buckingham, the commons declared that they would proceed no further in business till they had satisfaction in their privileges. Charles alleged as the reason of this measure, certain seditious expressions, which, he said, had, in their accusation of the duke, dropped from these members. Upon inquiry it appeared that no such expressions had been used, and the members were accordingly released. Soon after, the house of lords, moved by the example of the commons, claimed liberty for the earl of Arundel, who had been lately confined in the Tower; and after many fruitless evasions, the king was obliged, though somewhat ungracefully, to comply.

⁵⁸
The commons disgusted.

The next attack made by the commons would have proved decisive, had it succeeded, and would have reduced the king to an absolute dependence on his parliament. They were preparing a remonstrance against the levying of tonnage and poundage without consent of parliament. This article, together with the new impositions laid on merchandise by James, constituted near one half of the crown revenues; and after having gained this point, they were to petition the king, which then would have been the same thing with commanding him, to remove Buckingham from his presence and councils. The king, however, being alarmed at the yoke they were preparing for him, dissolved his parliament a second time, June 15. 1626.

⁵⁹
Parliament dissolved.

Charles having thus made such a breach with his parliament as there was no hopes of repairing, was obliged to have recourse to the exercise of every branch of his prerogative in order to supply himself with money. A commission was openly granted to compound with the Catholics, and agree for dispensing with the penal laws enacted against them; and by this expedient the king, indeed, filled his coffers, but gave universal disgust to his subjects. From the nobility he desired assistance: from the city he required a loan of 100,000*l*.

The

⁶⁰ Britain. The former contributed slowly: but the latter, covering themselves under many pretences and excuses, gave at last a flat denial. In order to equip a fleet, a distribution by order of the council was made to all the maritime towns; and each of them was required, with the assistance of the adjacent counties, to arm as many vessels as were appointed them. The city of London was rated at 20 ships: and this is the first appearance, in Charles's reign, of ship-money; a taxation which had once been imposed by Elizabeth, but which, when carried some steps farther by Charles, produced the most violent discontents.—These methods of supply were carried on with some moderation, till news arrived of the king of Denmark being totally defeated by Count Tilly the imperial general; but money then becoming more than ever necessary, it was suggested in council, that the most speedy, equal, and convenient method of supply was by a general loan from the subject, according as every man was assessed in the rolls of the last subsidy. That precise sum was required which each would have paid, had the vote of four subsidies been passed into a law: care, however, was taken, that the sums thus exacted were not to be called subsidies but loans; but it was impossible to avoid observing, that thus the liberty of the subject was entirely destroyed, and all parliaments rendered at once superfluous.

⁶¹ A general loan required.

Many people throughout England refused these loans, and some were even active in encouraging their neighbours to insist upon their common rights and privileges. By warrant of the council, these were thrown into prison. Most of them patiently submitted to confinement, or applied by petition to the king, who commonly released them. Five gentlemen, however, Sir Thomas Darnel, Sir John Corbet, Sir Walter Earl, Sir John Heweningham, and Sir Edmond Hambden, demanded release, not as a favour from the court, but as their due by the laws of their country. No particular cause was assigned for their commitment. The special command of the king and council alone was pleaded. And it was alleged, that by law this was not sufficient reason for refusing bail or releasement to the prisoners. The question was brought to a solemn trial before the court of king's bench; and the whole kingdom was attentive to the issue of the cause. By the debates on this subject it appeared, that personal liberty had been secured by no less than six different statutes, and by an article in magna charta itself. It appeared, that, in times of turbulence and sedition, the princes infringed upon these laws; and of this also many examples were produced. The difficulty then lay to determine when such violent measures were necessary; but of that the court pretended to be the supreme judge. As it was legal, therefore, that these five gentlemen should plead the statute, by which they might demand bail, so it was expedient in the court to remand them to prison, without determining on the necessity of taking bail for the present. This was a cruel evasion of justice; and, in fact, satisfied neither party. The court insisted that no bail could be taken: the country exclaimed that the prisoners ought to be set free.

⁶² Five gentlemen resolve to stand trial.

While the king was thus embroiled with his parliament at home, and with powerful nations abroad, he rashly engaged in a war with France, a kingdom which he had but lately formed the most natural alli-

ance. All historians agree that this war proceeded from the rivalship of the duke of Buckingham and Cardinal Richelieu; both of whom were in love with the queen of France; and an inveterate enmity being thus produced between these favourites, they resolved to involve their respective nations in the dispute. However this be, war was declared against France; and Charles was taught to hope, that hostilities with that kingdom would be the surest means of procuring tranquillity at home.—The success of this war was proportionable to the wisdom with which it was commenced. Buckingham was appointed commander; and he being entirely unacquainted both with sea and land service, managed matters so ill, that he lost two-thirds of his army, and returned in total discredit both as an admiral and general.

Britain.

⁶⁴ Bad success of Buckingham.

The discontents in England now rose to such a height, that there was reason to apprehend an insurrection or rebellion. Charles was also reduced to the greatest distress for want of money. That which he had levied by virtue of his prerogative came in very slowly, and it was dangerous to renew the experiment on account of the ill humour of the nation in general. A third parliament therefore was called, March 17. A third 1628; whom Charles plainly told at the beginning of the session, that "if they should not do their duties, in contributing to the necessities of the state, he must, in discharge of his conscience, use those other means which God had put into his hands, in order to save that which the follies of some particular men might otherwise put in danger." This parliament behaved in a much more reasonable manner than either of the two former ones. The nation was now really aggrieved by the late arbitrary proceedings. They began with voting against arbitrary imprisonments and forced loans; after which, five subsidies (280,000l.) were voted to the king. With this sum, though much inferior to his wants, Charles declared himself well satisfied; and even tears of affection started in his eye when informed of this concession: the commons, however, resolved not to pass this vote into a law, before they had obtained from the king a sufficient security that their liberties should be no longer violated as they had formerly been. They resolved to frame a law, which they were to call a *petition of right*, in which they should collect all the arbitrary exertions of the prerogative which Charles had exposed to their view, and these they were to assault at once by their petition. The grievances now complained of were, forced loans, benevolences, taxes without consent of parliament, arbitrary imprisonments, billeting soldiers, and martial law. They pretended not, as they affirmed, to any unusual power or privileges; nor did they intend to infringe the royal prerogative in any respect: they aimed only at securing those rights and privileges derived from their ancestors.

⁶⁵ A third parliament called.

⁶⁶ Petition of right framed.

The king, on his part, now began plainly to show, that he aimed at nothing less than absolute power. This reasonable petition he did his utmost to evade, by repeated messages to the house, in which he always offered his royal word that there should be no more infringements on the liberty of the subject. These messages, however, had no effect on the commons: they knew how insufficient such promises were, without further security; and therefore the petition at last passed both houses, and nothing was wanting but the royal assent

⁶⁷ Duplicity of the king.

assent to give it the force of a law. The king accordingly came to the house of peers, sent for the commons, and being seated in the chair of state, the petition was read to him. In answer to it, he said, "The king will-eth, that right be done according to the laws and customs of the realm, and that the statutes be put into execution; that his subjects may have no cause to complain of any wrong or oppression contrary to their just rights and liberties, to the preservation whereof he holds himself in conscience as much obliged as of his own prerogative."

This equivocal answer was highly resented. The commons returned in very ill humour. Their indignation would undoubtedly have fallen on the unfortunate Catholics, had not their petition against them already received a satisfactory answer. To give vent to their present wrath, therefore, they fell on Dr Manwaring, who had preached a sermon, and, at the special command of the king, printed it; which was now found to contain doctrines subversive of all civil liberty. It taught, that though property was commonly lodged in the subject, yet, whenever any exigency required supply, all property was transferred to the sovereign; that the consent of parliament was not necessary for the imposition of taxes; and that the divine laws required compliance with every demand, however irregular, which the prince should make upon his subjects. For these doctrines Manwaring was sentenced to be imprisoned during the pleasure of the house; to be fined 1000*l.* to the king; make submission and acknowledgement for his offence; be suspended three years; be incapable of holding any ecclesiastical dignity or secular office; and that his book be called in and burnt. No sooner, however, was the session ended, than Manwaring received a pardon, and was promoted to a living of considerable value. Some years afterwards he was promoted to the see of St Asaph. At last, the king, seeing it was impossible to carry his point, yielded to the importunities of parliament. He came to the house of peers, and pronouncing the usual form of words, "Let it be law as is desired," gave full sanction and authority to the petition. The house resounded with acclamations, and the bill for five subsidies immediately passed.

The commons, however, were not yet satisfied; they began again to attack Buckingham, against whom they were implacable; they also asserted, that the levying of tonnage and poundage without consent of parliament was a palpable violation of the ancient liberties of the people, and an open infringement of the petition of right so lately granted. The king, in order to prevent a remonstrance on that subject, suddenly prorogued the parliament, on June 26. 1628.

The commons soon got rid of their enemy Buckingham; who was murdered on the 23d of August this same year, by one Felton, who had formerly served under him as a lieutenant. The king did not appear much concerned at his death, but retained an affection for his family throughout his whole lifetime. He desired also that Felton might be tortured, in order to extort from him a discovery of his accomplices; but the judges declared, that though that practice had been formerly very common, it was altogether illegal.

In 1629, the usual contentions between the king and his parliament continued. The great article on

which the commons broke with their sovereign, and which finally created in him a disgust at all parliaments, was their claims with regard to tonnage and poundage. The dispute was, whether this tax could be levied without consent of parliament or not. Charles, supported by multitudes of precedents, maintained that it might; and the parliament, in consequence of their petition of right, asserted that it could not. The commons were resolved to support their rights: and the disputes concerning tonnage and poundage went hand in hand with some theological controversies; particularly concerning Arminianism, which the Puritans, who now formed the majority of the nation, opposed with the greatest violence, and which consequently crept in among those who professed Episcopacy, where it hath still maintained its ground more than in any other party.

The commons began with summoning before them the officers of the custom-house, to give an account by what authority they had seized the goods of those merchants who had refused to pay the duties of tonnage and poundage. The barons of exchequer were questioned with regard to their decrees on that head. The sheriff of London was committed to the Tower for his activity in supporting the officers of the custom-house. The goods of Rolles, a merchant, and member of the house, being seized for his refusal to pay the duties, complaints were made of this violence, as if it were a breach of privilege. Charles, on the other hand, supported his officers in all these measures, and the quarrel between him and the commons became every day higher. Sir John Elliot framed a remonstrance against tonnage and poundage, which he offered to the clerk to read; but it was refused, and he then read it himself. The question being called for, Sir John Finch the speaker said, that he had a command from the king to adjourn, and to put no question; upon which he rose and left the chair. The whole house was in an uproar; the speaker was pushed back into the chair, and forcibly held in it, till a short remonstrance was formed, which was instantaneously passed by almost universal acclamation. Papists and Arminians were now declared capital enemies to the commonwealth. Those who levied tonnage and poundage were branded with the same epithet. And even the merchants, who should voluntarily pay these duties, were declared betrayers of English liberty, and public enemies. The doors being locked, the gentleman-usher of the house of lords, who was sent by the king, could get no admittance till this remonstrance was finished. By the king's order he took the mace from the table, which put an end to their proceedings, and on the 10th of March the parliament was dissolved. Some of the members were imprisoned and fined; but this severity served only to increase the general discontent, and point out the sufferers as proper leaders for the popular party.

Charles being now disgusted with parliaments, resolved to call no more; but finding himself destitute of resources, was obliged to make peace with the two powers with which he was at war. A treaty was signed with France on the 14th of April, and another with Spain on the 5th of November 1630, by which Charles bound himself to observe a neutrality with regard to the affairs on the continent. His conduct to his subjects cannot now appear entirely blameless, nor the general discontent

⁷⁴ Britain. discontent altogether without foundation. As if, however, he had resolved to ruin himself, and to lose the small degree of affection which remained among his subjects, Charles now began to set about making innovations in religion. Archbishop Laud had obtained a prodigious ascendancy over the king; and, by his superstitious attachment to foolish ceremonies, led him into a conduct that proved fatal to himself and to the kingdom in general. The humour of the nation ran at that time in a channel perfectly the reverse of superstition. The ancient ceremonies which had been sanctified by the permission and practice of the first reformers, could scarce be retained in divine service. Laud chose this time, of all others the most improper, for renewing the ceremonies of the fourth and fifth century, when the Christian church, as is well known, was sunk into the superstitions which were afterwards continued and augmented by the policy of the church of Rome. So openly were these tenets espoused, that not only the discontented Puritans believed the church of England to be relapsing fast into the Romish superstition, but the court of Rome itself entertained hopes of regaining its authority in this island. To forward Laud's good intentions, an offer was twice made to him, in private, of a cardinal's hat; which he declined accepting. His answer was (as he says himself), that "something dwelt within him which would not suffer his compliance till Rome was other than it is." It must be confessed, however, that though Laud deserved not the appellation of a *Papist*, the genius of his religion was, though in a less degree, the same with that of the Romish. The same profound respect was exacted to the sacerdotal character; the same submission to the creeds and decrees of synods and councils required; the same pomp and ceremony was affected in worship; and the same superstitious regard to days, postures, meats, and vestments. Orders were given, and rigorously insisted on, that the communion table should be removed from the middle of the area where it had hitherto stood in all churches except cathedrals. It was placed at the east end, railed in, and denominated an *altar*; as the clergyman who officiated commonly received the appellation of *priest*. All kinds of ornaments, especially pictures, were introduced. Some of these, upon inquiry, were found to be the very same that were to be met with in the mass-book. The crucifix too, that perpetual consolation of all pious Catholics, and terror to all sound Protestants, was not forgot on this occasion.

⁷⁴ The king attempts to introduce new religious ceremonies.

In return for Charles's indulgence towards the church, Laud and his followers took care to magnify on every occasion the regal authority, and to treat with the utmost disdain or detestation all puritanical pretensions to a free and independent constitution. From this subjection, however, they took care to exclude themselves, and insisted upon a divine and apostolical charter in preference to a legal and parliamentary one. The sacerdotal character was magnified as sacred and indefeasible; all right to spiritual authority, or even to private judgment in spiritual subjects, was refused to profane laymen: ecclesiastical courts were held by bishops in their own name, without any notice taken of the king's authority: and Charles, though extremely jealous of every claim in popular assemblies,

Britain. seemed rather to encourage than repress those encroachments of his clergy.

The principles which exalted prerogative were put in practice during the whole time that Charles ruled without parliaments. He wanted money for the support of government; and he levied it, either by the revival of obsolete laws, or by violations of the privileges. Though humane and gentle in his nature, he gave way to severities in the star chamber and high commission, which seemed necessary in order to support the present mode of administration, and suppress the rising spirit of liberty throughout the kingdom. Tonnage and poundage were continued to be levied by royal authority alone. The former arbitrary impositions were still exacted; and even new impositions laid upon the different kinds of merchandise. The custom-house officers received orders from the council to enter into any house, warehouse, or cellar; to search any trunk or chest; and to break any bulk whatever, in default of the payment of customs. In order to exercise the militia, each county, by an edict of the council, was assessed in a certain sum for maintaining a muster-master appointed for that service. Compositions were openly made with recusants, and the Popish religion became a regular part of the revenue. A commission was granted for compounding with such as were possessed of crown-lands on defective titles; and on this pretence some money was exacted of the people, &c.

While the English were in the utmost discontent, ⁷⁶ He at- and almost ready to break out in open rebellion by ^{tempt} these arbitrary proceedings, Charles thought proper ^{to establish} to attempt setting up Episcopacy in Scotland. The canons for established ecclesiastical jurisdiction were promulgated in 1635, and were received without much appearance of opposition; yet with great inward apprehension and discontent. The first reading of the liturgy was attempted in the cathedral church of St Giles in Edinburgh, in 1637; but this produced such a tumult, that it was not thought safe to repeat the experiment. An universal combination against the religious innovations began immediately to take place; but Charles, as if obstinately bent on his own destruction, continued inflexible in his purpose, though he had nothing to oppose to the united force of the kingdom, but a proclamation, in which he pardoned all past offences, and exhorted the people to be more obedient for the future, and to submit peaceably to the use of the liturgy. This proclamation hastened forward the ⁷⁷ Which occasions an insurrection. insurrection, which had been slowly advancing before. Four *tables*, as they were called, were formed in Edinburgh. One consisted of nobility, another of gentry, a third of ministers, and the fourth of burgesses. The table of gentry was divided into many subordinate ones, according to the different counties. In the hands of the four tables, the authority of the whole kingdom was placed. Orders were issued by them, and everywhere obeyed with the utmost regularity; and among the first acts of their government was the production of the COVENANT.

This famous covenant consisted of a renunciation of ⁷⁸ Account of the covenant. Popery, formerly signed by James in his youth, and filled with many virulent invectives against that party. A bond of union followed, by which the subscribers obliged themselves to resist all religious innovations, and

⁷⁹ **Britain.** and to defend each other against all opposition whatsoever: And all this for the greater glory of God, and the greater honour and advantage of their king and country. The covenant was subscribed by people of all ranks and conditions. Few disapproved of it in their hearts, and still fewer dared openly to condemn it. The king's ministers and counsellors themselves were mostly of the same way of thinking; and none but rebels to God, and traitors to their country, it was thought, would withdraw themselves from so salutary and pious a combination.

⁷⁹ Charles attempts to appease the covenanters.

The king now began to be alarmed. He sent the marquis of Hamilton, as commissioner, with authority to treat with the covenanters. He required the covenant to be renounced and recalled; and he thought that on his part he made very satisfactory concessions, when he offered to suspend the canons and liturgy till in a fair and legal way they could be received, and so to model the high commission that it should no longer give offence to his subjects. In answer to this demand the covenanters told him, they would sooner renounce their baptism; and invited the commissioner himself to sign it. Hamilton returned to London; made another fruitless journey with new concessions to Edinburgh; returned again to London, and was immediately sent back with still more satisfactory concessions. The king was now willing to abolish entirely the canons, the liturgy, and the high commission court; he even resolved to limit extremely the power of the bishops, and was content if on any terms he could retain that order in the church of Scotland. And to ensure all these gracious offers, he gave Hamilton authority to summon first an assembly, and then a parliament, where every national grievance should be redressed.—These successive concessions only showed the weakness of the king, and encouraged the malcontents to rise in their demands. The offer, however, of an assembly and a parliament, in which they expected to be entirely masters, was very willingly embraced by the covenanters.

⁸⁰ Covenant entered into by the royalists.

Charles perceiving what advantage his enemies had reaped from their covenant, resolved to have a covenant also on his side; and he ordered one to be drawn up for that purpose. It consisted of the same violent renunciation of Popery with the other; which, though the king did not approve of it, he thought proper to adopt, in order to remove all the suspicions entertained against him. As the covenanters, in their bond of mutual defence against all opposition, had been careful not to except the king; Charles had formed a bond which was annexed to this renunciation, and which expressed the subscribers loyalty and duty to his majesty. But the covenanters perceiving that this new covenant was only meant to weaken and divide them, received it with the utmost scorn and detestation. And, without delay, they proceeded to model the assembly from which such great achievements were expected.

⁸¹ Violent proceedings of the assembly.

The assembly met at Glasgow in 1638. A firm determination had been entered into of utterly abolishing Episcopacy; and, as a preparative to it, there was laid before the presbytery of Edinburgh, and solemnly read in all the churches of the kingdom, an accusation against the bishops, as guilty, all of them, of heresy, simony, bribery, perjury, cheating, incest, adultery, fornication,

common-swearing, drunkenness, gaming, breach of the sabbath, and every other crime which had occurred to the accusers. The bishops sent a protest, declining the authority of the assembly; the commissioner too protested against that court, as illegally constituted and elected; and, in his majesty's name, dissolved it. This measure was foreseen, and little regarded. The court still continued to sit and do business. All the acts of assembly, since the accession of James to the crown of England, were, upon pretty reasonable grounds, declared null and invalid. The acts of parliaments which affected ecclesiastical affairs were on that very account supposed to have no authority. And thus the whole fabric which James and Charles, in a long course of years, had been rearing with much care and policy, fell at once to the ground. The covenant likewise was ordered to be signed by every one, under pain of excommunication.

Britain.

⁸² In 1639, the covenanters prepared in earnest for Preparations for war. The earl of Argyle, though he long seemed to temporise, at last embraced the covenant; and he became the chief leader of that party. The earls of Rothes, Cassils, Montrose, Lothian, the lords Lindesey, Loudoun, Yester, and Balmerino, also distinguished themselves. Many of their officers had acquired reputation in the German wars, particularly under Gustavus; and these were invited over to assist their country in its present necessity. The command was entrusted to Lesly, a soldier of experience and ability. Forces were regularly enlisted and disciplined. Arms were commissioned and imported from foreign countries. A few castles which belonged to the king, being unprovided of victuals, ammunition, and garrisons, were soon seized. And the whole country, except a small part where the marquis of Huntly still adhered to the king, being in the covenanters hands, was soon put into a tolerable posture of defence.

Preparations for war by the covenanters.

⁸³ Charles, on the other hand, was not deficient in his By the endeavours to oppose this formidable combination. By regular economy he had not only paid all the debts contracted in the French and Spanish wars, but had amassed a sum of 200,000l.; which he had reserved for any sudden exigency. The queen had great interest with the Catholics, both from the sympathy of religion, and from the favours and indulgencies which she had been able to procure them. She now employed her credit, and persuaded them, that it was reasonable to give large contributions, as a mark of their duty to the king, during this urgent necessity: And thus, to the great scandal of the Puritans, a considerable supply was gained. The king's fleet was formidable and well supplied. Having put 5000 land forces on board, he intrusted it to the marquis of Hamilton, who had orders to sail to the frith of Forth, and cause a diversion in the forces of the malcontents. An army was levied of near 20,000 foot and 3000 horse; and was put under the command of the earl of Arundel, a nobleman of great family, but celebrated neither for military nor political abilities. The earl of Essex, a man of strict honour, and extremely popular, especially among the soldiery, was appointed lieutenant-general: The earl of Holland was general of the horse. The king himself joined the army, and he summoned all the peers of England to attend him. The whole had the

⁸³ Britain. the appearance of a splendid court rather than a military armament, and in this situation the camp arrived at Berwick.

Britain. the convocation to sit; a practice of which, since the Reformation, there had been very few examples, and which was now by many deemed very irregular. Besides granting to the king a supply from the spirituality, the convocation, jealous of innovations similar to those which had taken place in Scotland, imposed an oath on the clergy and the graduates in the universities, by which every one swore to maintain the established government of the church, by archbishops, bishops, deans, chapters, &c. These steps were deemed illegal, because not ratified by consent of parliament; and the oath, containing an &c. in the middle of it, became a subject of general ridicule.

⁸⁴ Peace concluded.

The Scottish army was equally numerous with that of the king, but inferior in cavalry. The officers had more experience; and the soldiers, though ill disciplined and armed, were animated, as well by the national aversion to England, and the dread of becoming a province to their old enemy, as by that religious enthusiasm which was the occasion of the war. Yet so prudent were their leaders, that they immediately sent very submissive messages to the king, and craved leave to be admitted to a treaty. Charles, as usual, took the worst course. He concluded a sudden pacification, in which it was stipulated, that he should withdraw his fleet and army; that within 48 hours the Scots should dismiss their forces; that the king's forts should be restored to him, his authority be acknowledged, and a general assembly and parliament be immediately summoned, in order to compose all differences.

The king, disappointed of parliamentary subsidies, was obliged to have recourse to other expedients. The ecclesiastical subsidies served him in some stead; and it seemed but just that the clergy should contribute to the expence of a war which had been in a great measure of their own raising. He borrowed money from his ministers and courtiers: and so much was he beloved among them, that above 300,000*l.* were subscribed in a few days. Some attempts were made towards forcing a loan from the citizens: but still repelled by the spirit of liberty, which was now become unconquerable. A loan of 40,000*l.* was extorted from the Spanish merchants who had bullion in the Tower. Coat and conduct money for the soldiery was levied on the counties; an ancient practice, but which was supposed to be abolished by the petition of right. All the pepper was bought from the East India Company upon trust; and sold, at a great discount, for ready money. A scheme was proposed for coining two or three hundred thousand pounds of base money. Such were the extremities to which Charles was reduced. The fresh difficulties, which amidst the present distresses were every day raised, with regard to the payment of ship-money, obliged him to exert continual acts of authority, augmented extremely the discontents of the people, and increased his indigence and necessities.

⁸⁵ Charles distressed for money.

⁸⁵ War again declared.

This peace was of no long duration. Charles could not prevail on himself to abandon the cause of Episcopacy, and secretly intended to seize every favourable opportunity to recover the ground he had lost. The assembly, on the other hand, proceeded with the utmost fury and violence. They voted Episcopacy to be unlawful in the church of Scotland: they stigmatized the canons and liturgy as popish: they denominated the high commission tyranny. The parliament, which sat after the assembly, advanced pretensions which tended to diminish the civil power of the monarch; and, what probably affected Charles still more, they were proceeding to ratify the acts of assembly, when by the king's instructions Traquair the commissioner prorogued them. And on account of these claims, which might have been easily foreseen, war was recommenced the same year.

The present expedients, however, enabled the king, though with great difficulty, to march his army, consisting of 19,000 foot and 2000 horse. The earl of Northumberland was appointed general; the earl of Strafford, who was called over from Ireland, lieutenant-general; Lord Conway, general of the horse. A small fleet was thought sufficient to serve the purposes of this expedition. The Scots, though somewhat superior, were sooner ready than the king's army, and marched to the borders of England. Notwithstanding their warlike preparations and hostile attempts, the covenanters still preserved the most submissive language to the king; and entered England with no other design, they said, than to obtain access to the king's presence, and lay their humble petition at his royal feet. At Newburn upon Tyne they were opposed by a detachment of 4500 men under Conway, who seemed resolute to dispute with them the passage of the river. The Scots first entreated them, with great civility, not to stop them in their march to their gracious sovereign; and then attacked them with great bravery, killed several, and chased the rest from their ground. Such a panic seized the whole English army, that the forces at Newcastle fled immediately to Durham; and not yet thinking themselves safe, they deserted that town, and retreated into Yorkshire.

⁸⁶ A parliament called.

No sooner had Charles concluded the peace, than he found himself obliged to disband his army, on account of his want of money; and as the soldiers had been held together merely by mercenary views, it was not possible, without great trouble, expence, and loss of time, to reassemble them. On the contrary, the covenanters, in dismissing their troops, had been careful to preserve nothing but the appearance of a pacification. The officers had orders to be ready on the first summons: The soldiers were warned not to think the nation secure from an English invasion: And the religious zeal which animated all ranks of men made them immediately fly to their standards, as soon as the trumpet was sounded by their spiritual and temporal leaders.

⁸⁷ Royalists defeated at Newburn.

⁸⁷ Dissolved.

In 1640, however, the king made shift to draw an army together; but finding himself unable to support them, was obliged to call a parliament after an intermission of about 11 years. As the sole design of the king's calling this parliament was to obtain a supply, and the only reason they had for attending was to procure a redress of grievances, it is not to be supposed there could be any good agreement between them. The king accordingly insisted for money, and the parliament on their grievances, till a dissolution ensued.—To add to the unpopularity of this measure, the king, notwithstanding his dissolving the parliament, allowed

Britain.

The Scots continued to advance: they dispatched messengers to the king, who was now arrived at York. They took care, after the advantage they had gained, to redouble their expressions of loyalty, duty, and submission to his person: and they even made apologies full of sorrow and contrition for their late victory. Charles was in a very distressed condition; and, in order to prevent the further advance of the Scots, agreed to a treaty, and named 16 English noblemen to meet with 11 Scots commissioners at Rippon. Strafford, upon whom, by reason of Northumberland's sickness, the command of the army had devolved, advised Charles rather to put all to hazard, than to submit to such unworthy terms as he saw would be imposed upon him. He advised him to push forward and attack the Scots, and bring the affair to a quick decision; and if he was ever so unsuccessful, nothing worse could befall him than what from his inactivity he would certainly be exposed to; and, to show how easily this project might be executed, he ordered an assault to be made on some quarters of the Scots, and gained an advantage over them. This salutary advice Charles had not resolution to follow. He therefore resolved to call a council of the peers; and as he foresaw that they would advise him to call a parliament, he told them in his first speech, that he had already taken that resolution. In order to subsist both armies (for the king was obliged to pay his enemies, in order to save the northern counties), Charles wrote to the city, desiring a loan of 200,000*l*. And the peers at York, whose authority was now much greater than that of their sovereign, joined in the same request.

90
Parliament
meets.
91
Unhappy
situation of
Strafford.

The parliament met November 3. 1640: the house of commons had never been observed so numerous; and, that they might strike a decisive blow at once against the court, they began with the impeachment of the earl of Strafford. That nobleman, who was considered as prime minister, both on account of the credit he possessed with his master, and his own uncommon vigour and capacity, had now the misfortune of having incurred the hatred of all the three kingdoms. The Scots looked upon him as the capital enemy of their country. He had engaged the parliament of Ireland to advance large subsidies to be employed in a war against them; he had levied an army of 9000 men, with which he had menaced all their western coast: he had obliged the Scots who lived under his government to renounce the covenant, &c.: he had governed Ireland, first as deputy, and then as lord-lieutenant, during eight years, with great vigilance, activity, and prudence, but with very little popularity. In a nation so averse to the English government and religion, these very virtues were sufficient to draw on him the public hatred. His manners, besides, were at bottom haughty, rigid, and severe; and no sooner did adversity begin to seize him, than the concealed aversion blazed up at once, and the Irish parliament used every expedient to aggravate the charge against him.

The universal discontent which prevailed throughout the English nation was all pointed against the earl of Strafford; though for no other reason but because he was the minister of state whom the king most favoured and trusted. His extraction was honourable, his paternal fortune considerable: yet envy attended his sudden and great elevation; and his former associates in popu-

lar counsels, finding that he owed his advancement to the desertion of their cause, represented him as the great apostate of the commonwealth, whom it behoved them to sacrifice as a victim to public justice.

Britain.

From so terrible a combination against a single person, nothing else could be expected, than what really happened. Strafford was impeached, most unjustly condemned, and at last executed, in the year 1641. It was not without extreme difficulty that the king could be brought to consent to his execution. He came to the house of lords, where he expressed his resolution never to employ Strafford again in any public business; but with regard to the treason for which he was condemned, he professed himself totally dissatisfied. The commons voted it a breach of privilege for the king to take notice of any bill depending before the house. Charles did not perceive, that his attachment to Strafford was the chief motive for the bill; and the greater proof he gave of this attachment to his favourite minister, the more inevitable did he render his destruction. The house of lords were intimidated, by popular violence, into passing the bill of attainder against the unfortunate earl. The same battery was next employed to force the king's assent. The populace flocked about Whitehall, and accompanied their demand of justice with the loudest clamours and most open menaces. A thousand idle reports of conspiracies, insurrections, and invasions, were spread abroad. On whatever side the king cast his eyes, he saw no resource nor security. All his servants, consulting their own safety rather than their master's honour, declined interposing with their advice between him and his parliament. The queen, terrified at the appearance of so great danger, pressed Charles, with tears, to satisfy his people in this demand, which it was hoped would finally content them. Archbishop Juxon alone had the courage to advise him, if he did not approve of the bill, by no means to consent to it.

92
Unjustly
executed.

93
Distress
of the king on
account of
his execution.

Strafford hearing of the king's irresolution and anxiety, wrote to him a letter, in which he desired his own execution, in order to give peace to the nation: and at last, after the most violent anxiety and doubt, Charles granted a commission to four noblemen, in his name, to give the royal assent to the bill; flattering himself perhaps, that as neither his will consented to the deed, nor was his hand immediately engaged in it, he was the more free from all the guilt which attended it. These commissioners he empowered at the same time to give his assent to a bill yet more fatal to himself, viz. That the present parliament should not be dissolved, prorogued, or adjourned, without their own consent.

94
Charles
renders the
parliament
perpetual.

By this last bill Charles rendered the power of his enemies perpetual, as it was already uncontrollable. The reason of this extraordinary step was, that the commons, from policy, more than necessity, had embraced the expedient of paying the two armies by borrowing money from the city. These loans they repaid afterwards by taxes levied on the people. At last the citizens, either of themselves, or by suggestion, began to start difficulties with regard to a farther loan which was demanded. "We make no scruple of trusting the parliament (said they), were we certain that the parliament was to continue till our repayment. But, in the present precarious situation of affairs, what security can

he given us for our money?" In order to obviate this objection, the above-mentioned bill was suddenly brought in, and having passed both houses with great rapidity, was at last brought to the king; who, being oppressed with grief on account of the unhappy fate of Strafford, did not perceive the pernicious consequence of the bill.

the tempers of others, nor their own, as to ensure themselves against all exorbitancies.

Had the parliament stopped here it had been happy for the nation; but they were now resolved to be satisfied with nothing less than the total abolition of monarchy. The king had promised to pay a visit, this summer, to his subjects in Scotland, in order to settle their government; and though the English parliament was very importunate with him to lay aside that journey, they could not prevail with him so much as to delay it. Having failed in this, they appointed a small committee of both houses to attend him, in order, as was pretended, to see the articles of pacification executed, but really to be spies upon the king, to extend still farther the ideas of parliamentary authority, as well as eclipse his majesty. Endeavours were even used, before Charles's departure, to have a protector of the kingdom appointed, with a power to pass laws without having recourse to the king. About this time, the king concluded the marriage of the princess Mary with William prince of Orange. He did not conclude this alliance without communicating his intentions to parliament, who were very well satisfied with the proposal. They adjourned from Sept. 9th to October 20th, 1641.

96
Laud imprisoned.

97
New crime of delinquency.

All this time the commons had ruled in other respects with an uncontrollable sway. Soon after the impeachment of Strafford, Laud was accused of high treason, and committed to custody. To avoid the like fate, Lord keeper Finch and Secretary Windebank fled, the one into Holland, the other into France. The house instituted a new species of guilt, termed *delinquency*: those who had exercised the powers necessary for the defence of the nation, during the late military operations, were now called *delinquents*. In consequence of this determination, many of the nobility and prime gentry of the nation, while only exerting as they justly thought, the legal powers of magistracy, found themselves unexpectedly involved in this new crime of delinquency. The commons, however, by their institution, reaped this multiplied advantage; they disarmed the crown, they established the maxims of rigid law and liberty, and they spread the terror of their own authority. All the sheriffs who had formerly exacted ship money, though by the king's express command, were now declared delinquents. The farmers and officers of the customs who had been employed during so many years in levying tonnage, poundage, &c. were likewise denominated criminals of the same kind, and were afterwards glad to compound for a pardon, by paying 150,000*l.* Every discretionary or arbitrary sentence of the star-chamber and high commission courts, which from their very nature were arbitrary, underwent a severe scrutiny; and all those who had concurred in such sentences, were voted to be liable to the penalties of law. No minister of the king, no member of the council, but what found himself exposed by this determination. The judges who had formerly given judgment against Hamden for refusing to pay ship money, were accused before the peers, and obliged to find security for their appearance. Berkley, a judge of the king's bench, was seized by order of the house, even when sitting in his tribunal. The sanction of the lords and commons, as well as that of the king, was declared necessary for the confirmation of ecclesiastical canons. Monopolists and projectors, if of the king's party, were now expelled the house; but one Mildmay, a notorious monopolist, was allowed to keep his seat, because he was of the popular party. In short, the constitution was completely new-modelled; and during the first period of the transactions of this remarkable parliament, if we except Strafford's attainder, their merits in other respects so much overbalance their mistakes, as to entitle them to very ample praises from all lovers of liberty. Not only were former abuses remedied, and grievances redressed; great provision for the future was made, by excellent laws against the return of the like complaints. And if the means by which they obtained such mighty advantages savoured often of artifice, sometimes of violence; it is to be considered, that revolutions of government cannot be effected by mere force of argument and reasoning; and that, factions being once excited, men can neither so firmly regulate

98
Partiality and injustice of the parliament.

Charles arrived in Scotland August 14th 1641, with a design to give full satisfaction if possible to this restless kingdom. Some good regulations were made; the bench of bishops, and lords of articles, were abolished; it was ordained that no man should be created a Scottish peer, who possessed not 10,000 merks (above 500*l.*) of annual-rent in the kingdom; a law for triennial parliaments was likewise enacted; and it was ordained, that the last act of every parliament should be to appoint the time and place for holding the parliament next ensuing: the king was also deprived of that power, formerly exercised, of issuing proclamations which enjoined obedience under the penalty of treason. But the most fatal blow given to royal authority, and what in a manner dethroned the prince, was an article, that no member of the privy-council, in whose hands, during the king's absence, the whole administration lay, no officer of state, none of the judges, should be appointed but by advice and approbation of parliament. Charles even agreed to deprive of their seats four judges who had adhered to his interests; and their place was supplied by others more agreeable to the ruling party. Several of the covenanters were also sworn of the privy-council; and all the ministers of state, counsellors and judges, were, by law, to hold their places during life or good behaviour. The king, while in Scotland, conformed himself to the established church; he bestowed pensions and preferments on Henderson, Gillespy, and other popular preachers: he practised every art to soften, if not to gain, his greatest enemies; the earl of Argyle was created a marquis, Lord Loudon an earl, and Lesly was dignified with the title of *Lord Leven*. But though Charles was thus obliged to heap favours on his enemies and overlook his friends, the former were not satisfied, as believing all he did proceeded from artifice and necessity; while some of the latter were disgusted, and thought themselves ill rewarded for their past services.

Argyle and Hamilton, being seized with an apprehension, real or pretended, that the earl of Crawford

Britain. and others meant to assassinate them, left the parliament suddenly, and retired into the country: but, upon invitation and assurances, returned in a few days. This event, which in Scotland had no visible consequence, was commonly denominated the *incident*; but though the incident had no effect in Scotland, it was attended with very serious consequences in England. The English parliament immediately took the alarm; or rather probably were glad of the hint: they insinuated to the people, that the *malignants*, so they called the king's party, had laid a plot at once to murder them and all the godly in both kingdoms. They applied therefore to Essex, whom the king had left general of the south of England; and he ordered a guard to attend them.

103
Rebellion
breaks out
in Ireland

In the mean time a most dangerous rebellion broke out in Ireland, with circumstances of unparalleled horror, bloodshed, and devastation. The old Irish, by the wise conduct of James, had been fully subdued, and proper means taken for securing their dependence and subjection for the future; but their old animosity still remained, and only wanted an occasion to exert itself. This they obtained from the weak condition to which Charles was reduced, and this was made use of in the following manner.

One Roger More, a gentleman descended from an ancient Irish family, but of narrow fortune, first formed the project of expelling the English, and asserting the independency of his native country. He secretly went from chieftain to chieftain, and roused up every latent principle of discontent. He maintained a close correspondence with Lord Macguire and Sir Phelim O'Neale, the most powerful of the old Irish: and by his persuasions soon engaged not only them, but the most considerable persons of the nation, into a conspiracy; and it was hoped, the English *of the pale*, as they were called, or the old English planters, being all Catholics, would afterwards join the party which restored their religion to its ancient splendour and authority. The plan was, that Sir Phelim O'Neale, and the other conspirators, should begin an insurrection on one day throughout the provinces, and should attack all the English settlements; and that, on the very same day, Lord Macguire and Roger More should surprise the castle of Dublin. They fixed on the beginning of winter for the commencement of this revolt; that there might be more difficulty in transporting forces from England. Succours to themselves, and supplies of arms, they expected from France, in consequence of a promise made them by Cardinal Richelieu; and many Irish officers who had served in the Spanish troops had given assurances of their concurrence, as soon as they saw an insurrection entered upon by their Catholic brethren. News, which every day arrived from England, of the fury expressed by the commons against all Papists, struck fresh terror into the Irish nation, stimulated the conspirators to execute their fatal purpose, and assured them of the concurrence of their countrymen.

Such a propensity was discovered in all the Irish to revolt, that it was deemed unnecessary as well as dangerous to trust the secret in many hands; and though the day appointed drew nigh, no discovery had yet been made to government. The king, indeed, had received information from his ambassadors, that something

was in agitation among the Irish in foreign parts; but though he gave warning to the administration in Ireland, his intelligence was entirely neglected. They were awakened from their security only that very day before the commencement of hostilities. The castle of Dublin, by which the capital was commanded, contained arms for 10,000 men, and 35 pieces of cannon, and a proportionable quantity of ammunition. Yet was this important place guarded, and that too without any care, by no greater force than 50 men. Macguire and More were already in town with a numerous band of their retainers; others were expected that night; and next morning they were to enter upon what they esteemed the easiest of all enterprises, the surprisal of the castle. O'Conolly, however, an Irishman, but a Protestant, discovered the conspiracy. The justices and council fled immediately to the castle, and reinforced the guards. The city was immediately alarmed, and all the Protestants prepared for defence. More escaped, but Macguire was taken; and Mahon, one of the conspirators, being likewise seized, first discovered to the justices the project of a general insurrection.

But though O'Conolly's discovery saved the castle from a surprise, Mahon's confession came too late to prevent the intended insurrection. O'Neale and his confederates had already taken arms in Ulster. The houses, cattle, and goods of the English were first seized. Those who heard of the commotions in their neighbourhood, instead of deserting their habitations, and assembling together for mutual protection, remained at home in hopes of defending their property; and fell thus separately into the hands of their enemies. An universal massacre now commenced, accompanied with circumstances of unequalled barbarity. No age, sex, or condition, was spared. All connections were dissolved, and death was dealt by that hand from which protection was implored and expected. All the tortures which wanton cruelty could devise, all the lingering pains of body, the anguish of mind, the agonies of despair, could not satiate revenge excited without injury, and cruelty derived from no cause. Such enormities, in short, were committed, that though attested by undoubted evidence, they appear almost incredible. The stately buildings or commodious habitations of the planters, as if upbraiding the sloth and ignorance of the natives, were consumed with fire, or laid level with the ground; and where the miserable owners, shut up in their houses, and preparing for defence, perished in the flames, together with their wives and children, a double triumph was afforded to their insulting foes. If anywhere a number assembled together, and resolved to oppose the assassins; they were disarmed by capitulations and promises of safety, confirmed by the most solemn oaths. But no sooner had they surrendered, than the rebels, with perfidy, equal to their cruelty, made them share the fate of their unhappy countrymen. Others tempted their prisoners, by the fond love of life, to imbrue their hands in the blood of friends, brothers, or parents; and having thus rendered them accomplices in their own guilt, gave them that death which they sought to shun by deserving it.

Such were the barbarities by which Sir Phelim O'Neale and the Irish in Ulster signaled their rebellion. More, shocked at the recital of these enormities, flew

to.

Britain. to O'Neale's camp; but found that his authority, which was sufficient to excite the Irish to a rebellion, was too feeble to restrain their inhumanity. Soon after, he abandoned the cause, and retired to Flanders. From Ulster, the flames of rebellion diffused themselves in an instant over the other three provinces of Ireland. In all places, death and slaughter were not uncommon; though the Irish in these other provinces pretended to act with moderation and humanity. But cruel and barbarous was their humanity! Not content with expelling the English from their houses, they stripped them of their very clothes, and turned them out naked and defenceless to all the severities of the season. The heavens themselves, as if conspiring against that unhappy people, were armed with cold and tempest unusual to the climate, and executed what the sword had left unfinished. By some computations, those who perished by all these cruelties are supposed to amount to 150,000 or 200,000: but by the most reasonable and moderate, they are made to amount only to 40,000; though probably even this account is not free of exaggeration.

The English of the pale, who probably were not at first in the secret, pretended to blame the insurrection, and to detest the barbarity with which it was accompanied. By their protestations and declarations they engaged the justices to supply them with arms, which they promised to employ in defence of government. But in a little time, the interests of religion were found to be more prevalent over them than regard and duty to their native country. They chose Lord Gormonstone their leader; and, joining the old Irish, rivalled them in every act of cruelty towards the English Protestants. Besides many smaller bodies, dispersed over the kingdom, the main army of the rebels amounted to 20,000 men, and threatened Dublin with an immediate siege. Both the English and Irish rebels conspired in one imposture, by which they seduced many of their countrymen. They pretended authority from the king and queen, but especially the latter, for their insurrection; and they affirmed that the cause of their taking arms was to vindicate the royal prerogative, now invaded by the puritanical parliament. Sir Phelim O'Neale, having found a royal patent in the house of Lord Caulfield, whom he had murdered, tore off the seal, and affixed it to a commission which he had forged for himself.

¹⁰⁵
Scots refuse to assist in quelling the rebellion.

The king received intelligence of this insurrection while in Scotland, and immediately acquainted the Scots parliament with it. He hoped, as there had all along been such an outcry against Popery, that now, when that religion was appearing in its blackest colours, the whole nation would vigorously support him in the suppression of it. But here he found himself mistaken. The Scots considering themselves now as a republic, and conceiving hopes from the present distresses of Ireland, they resolved to make an advantageous bargain for the succours with which they should supply the neighbouring nation. Except dispatching a small body of forces, to support the Scots colonies in Ulster, they would, therefore, go no farther than to send commissioners to London, in order to treat with the parliament, to whom the sovereign power was in reality transferred. The king, too, sensible of his utter inability to subdue the Irish rebels, found himself obliged,

in this exigency, to have recourse to the English parliament, and depend on their assistance for supply. He told them that the insurrection was not, in his opinion, the result of any rash enterprise, but of a formed conspiracy against the crown of England. To their care and wisdom, therefore, he said, he committed the conduct and prosecution of the war, which, in a cause so important to national and religious interests, must of necessity be immediately entered upon, and vigorously pursued.

Britain.

¹⁰⁶
The English parliament, now re-assembled, discovered in each vote the same dispositions in which they had separated. Nothing less than a total abolition of monarchy would serve their turn. But this project it had not been in the power of the popular leaders to have executed, had it not been for the passion which seized the nation for the presbyterian discipline, and the wild enthusiasm which at that time attended it. By the difficulties and distresses of the crown, the commons, who possessed alone the power of supply, had aggrandized themselves; and it seemed a peculiar happiness, that the Irish rebellion had succeeded, at such a critical juncture, to the pacification in Scotland. That expression of the king's by which he committed to them the care of Ireland, they immediately laid hold of, and interpreted in the most unlimited sense. They had on other occasions been gradually encroaching on the executive power of the crown, which forms its principal and most natural branch of authority; but with regard to Ireland, they at once assumed it, fully and entirely, as if delivered over to them by a regular gift or assignment. And to this usurpation the king was obliged passively to submit, both because of his inability to resist, and lest he should expose himself still more to the charge of favouring the rebels; a reproach eagerly thrown upon him by the popular party as soon as they heard that the Irish pretended to act by his commission. Nay, to complete their character, while they pretended the utmost zeal against the insurgents, they took no steps for their suppression, but such as likewise gave them the superiority in those commotions which they foresaw must be soon excited in England. They levied money under pretence of the Irish expedition, but reserved it for purposes which concerned them more nearly; they took arms from the king's magazines, but still kept them with a secret intention of making use of them against himself: whatever law they deemed necessary for aggrandizing themselves, they voted, under colour of enabling them to recover Ireland; and if Charles withheld his royal assent, the refusal was imputed to those pernicious counsels which had at first excited the Popish rebellion, and which still threatened total ruin to the Protestant interest throughout his dominions. And though no forces were for a long time sent over into Ireland, and very little money remitted during the extreme distress of that kingdom; so strong was the people's attachment to the commons, that the fault was never imputed to those pious zealots, whose votes breathed nothing but death and destruction to the Irish rebels.

¹⁰⁶
Infamous conduct of the English parliament.

The conduct of the parliament towards the king now became exceedingly unreasonable, unjust, and cruel. It was thought proper to frame a general remonstrance of the state of the kingdom; and accordingly the committee, which at the first meeting of the parliament had been

Britain.
107
King re-
turns from
Scotland.

been chosen for that purpose, were commanded to finish their undertaking. The king returned from Scotland November 25th 1641. He was received in London with the shouts and acclamations of the populace, and with every demonstration of regard and affection. Sir Richard Gournay, lord mayor, a man of great merit and authority, had promoted these favourable dispositions; and had engaged the populace, who so lately insulted the king, and who so soon after made furious war upon him, to give him these marks of their dutiful attachment. But all the pleasure which Charles reaped from this joyful reception was soon damped by the remonstrance of the commons, which was presented to him together with a petition of the like nature. The bad counsels which he followed were there complained of; his concurrence in the Irish rebellion plainly insinuated; the scheme laid for the introduction of popery and superstition was inveighed against; and for a remedy to all these evils, the king was desired to entrust every office and command to persons in whom his parliament should have cause to confide. By this phrase, which was very often repeated in all the memorials and addresses of that time, the commons meant themselves and their adherents. To this remonstrance Charles was obliged to make a civil reply, notwithstanding his subjects had transgressed all bounds of respect, and even good manners, in their treatment of their sovereign.

108
Commons
assume the
sovereign-
ty.

It would be tedious to point out every invasion of the prerogative now attempted by the commons: but finding themselves at last likely to be opposed by the nobility, who saw their own depression closely connected with that of the crown, they openly told the upper house, that "they themselves were the representatives of the whole body of the kingdom, and that the peers were nothing but individuals, who held their seats in a particular capacity; and therefore, if their lordships would not consent to acts necessary for the preservation of the people, the commons, together with such of the lords as were more sensible of the danger, must join together and represent the matter to his majesty." Every method proper for alarming the populace was now put in practice. The commons affected continual fears of destruction to themselves and to the whole nation. They excited the people by never-ceasing inquiries after conspiracies, by reports of insurrections, by feigned intelligence of invasions from abroad, and by discoveries of dangerous combinations at home, against Papists and their adherents. When Charles dismissed the guard which they had ordered during his absence, they complained; and, upon his promising them a new guard under the command of the earl of Lindsey, they absolutely refused the offer: they ordered halberts to be brought into the hall where they assembled, and thus armed themselves against those conspiracies with which they pretended they were hourly threatened. Several reduced officers, and young gentlemen of the inns of court, during this time of distress and danger, offered their service to the king. Between them and the populace there passed frequent skirmishes, which ended not without bloodshed. By way of reproach, these gentlemen gave the rabble the name of *round-heads*, on account of their short cropt hair; while they distinguished the others by the name of *cavaliers*. And thus the nation, which was before

109
Round-
heads and
Cavaliers.

sufficiently provided with religious as well as civil causes of quarrel, was also supplied with party-names, under which the factions might rendezvous and signalize their mutual hatred.

Britain.

These tumults continued to increase about Westminster and Whitehall. The cry continually resounded against bishops and *rotten-hearted lords*. The former especially, being easily distinguishable by their habit, and being the object of violent hatred to all the sectaries, were exposed to the most dangerous insults. The archbishop of York, having been abused by the populace, hastily called a meeting of his brethren. By his advice a protestation was drawn up and addressed to the king and the house of lords. The bishops there set forth, that though they had an undoubted right to sit and vote in parliament, yet in coming thither they had been menaced, assaulted, affronted, by the unruly multitude, and could no longer with safety attend their duty in the house. For this reason they protested against all laws, votes, and resolutions, as null and invalid, which should pass during the time of their forced absence. This protestation, which, though just and legal, was certainly ill-timed, was signed by twelve bishops, and communicated to the king, who hastily approved of it. As soon as it was presented to the lords, that house desired a conference with the commons, whom they informed of this unexpected protestation. The opportunity was seized with joy and triumph. An impeachment of high treason was immediately sent up against the bishops, as endeavouring to subvert the fundamental law, and to invalidate the authority of the legislature. They were, on the first demand, sequestered from parliament, and committed to custody. No man in either house ventured to speak a word in their vindication: so much was every one displeased at the egregious imprudence of which they had been guilty. One person alone said, that he did not believe them guilty of high treason; but that they were stark mad, and therefore desired they might be sent to bedlam.

110
Bishops re-
tire from
the house
of lords.

This was a fatal blow to the royal interest; but it soon felt a much greater from the imprudence of the king himself. Charles had long suppressed his resentment, and only strove to gratify the commons by the greatness of his concessions; but finding that all his compliance had but increased their demands, he could no longer contain. He gave orders to Herbert his attorney-general to enter an accusation of high treason, in the house of peers, against Lord Kimbolton, one of the most popular men of his party, together with five commoners, Sir Arthur Haslerig, Hollis, Hambden, Pym, and Strode. The articles were, that they had traitorously endeavoured to subvert the fundamental laws and government of the kingdom, to deprive the king of his regal power, and to impose on his subjects an arbitrary and tyrannical authority; that they had invited a foreign army to invade the kingdom; that they had aimed at subverting the very right and being of parliaments; and had actually raised and countenanced tumults against the king. Men had scarce leisure to wonder at the precipitancy and imprudence of this impeachment, when they were astonished by another measure still more rash and unsupported. A serjeant at arms, in the king's name, demanded of the house the five members, and was sent back without any positive answer.

Britain.
114
He goes in person to seize them.

answer. This was followed by a conduct still more extraordinary. The next day, the king himself was seen to enter the house of commons alone, advancing through the hall, while all the members stood up to receive him. The speaker withdrew from his chair, and the king took possession of it. Having seated himself, and looked round him for some time, he told the house, that he was sorry for the occasion that forced him thither; that he was come in person to seize the members whom he had accused of high treason, seeing they would not deliver them up to his serjeant at arms. Then addressing himself to the speaker, he desired to know whether any of them were in the house; but the speaker, falling on his knees, replied, that he had neither eyes to see, nor tongue to speak, in that place, but as the house was pleased to direct him; and he asked pardon for being able to give no other answer. The king sat for some time, to see if the accused were present; but they had escaped a few minutes before his entry. Thus disappointed, perplexed, and not knowing on whom to rely, he next proceeded amidst the invectives of the populace, who continued to cry out, *Privilege! privilege!* to the common council of the city, and made his complaints to them. The common council answered his complaints by a contemptuous silence; and, on his return, one of the populace, more insolent than the rest, cried out, "To your tents, O Israel!" a watch-word among the Jews, when they intended to abandon their princes.

113
Bad consequences of this attempt.

When the commons assembled the next day, they pretended the greatest terror; and passed an unanimous vote that the king had violated their privileges, and that they could not assemble again in the same place, till they should obtain satisfaction, and have a guard for their security. The king had retired to Windsor, and from thence he wrote to his parliament, making every concession, and promising every satisfaction in his power. But they were resolved to accept of nothing unless he would discover his advisers in that illegal measure; a condition to which, they knew, that, without rendering himself for ever vile and contemptible, he could not possibly submit.

114
Commons demand possession of the executive power of the state.

The commons had already stript the king of almost all his privileges; the bishops were fled, the judges were intimidated: it now only remained, after securing the church and the law, that they should get possession of the sword also. The power of appointing governors and generals, and of levying armies, was still a remaining prerogative of the crown. Having therefore first magnified their terrors of Popery, which perhaps they actually dreaded, they proceeded to petition that the Tower might be put into their hands; and that Hull, Portsmouth, and the fleet, should be intrusted to persons of their choosing. These were requests, the complying with which subverted what remained of the constitution; however, such was the necessity of the times, that they were first contested, and then granted. At last, every compliance only increasing the avidity of making fresh demands, the commons desired to have a militia, raised and governed by such officers and commanders as they should nominate, under pretence of securing them from the Irish Papists, of whom they were under the greatest apprehension.

115
Refused by the king.

It was here that Charles first ventured to put a stop to his concessions; and that not by a refusal, but a delay. He was at that time in Dover attending the queen

Britain.

and the princess of Orange, who had thought it prudent to leave the kingdom. He replied to the petition, that he had not now leisure to consider a matter of such great importance; and therefore would defer an answer till his return. But the commons were well aware, that though this was depriving him even of the shadow of power, yet they had now gone too far to recede; and they were therefore desirous of leaving him no authority whatever, being conscious that themselves would be the first victims to its fury. They alleged, that the dangers and distempers of the nation were such as could endure no longer delay; and unless the king should speedily comply with their demands, they should be obliged, both for his safety and that of the kingdom, to embody and direct a militia by the authority of both houses. In their remonstrances to the king, they desired even to be permitted to command the army for an appointed time: which so exasperated him, that he exclaimed, "No, not for an hour." This peremptory refusal broke off all further treaty; and both sides were now resolved to have recourse to arms.

116
War resolved on between the king and parliament.

Charles, taking the prince of Wales with him, retired to York, where he found the people more loyal, and less infected with the frenzy of the times. He found his cause there backed by a more numerous party among the people than he had expected. The queen, who was in Holland, was making successful levies of men and ammunition by selling the crown-jewels. But before war was openly declared, the shadow of a negotiation was carried on, rather with a design to please the people, than with a design of reconciliation. Nay, that the king might despair of all composition, the parliament sent him the conditions on which they were willing to come to an agreement. Their demands were contained in 19 propositions, and amounted to a total abolition of monarchical authority. They required that no man should remain in the council who was not agreeable to parliament: that no deed of the king's should have validity unless it passed the council, and was attested under their hand; and that all the officers of state should be chosen with consent of parliament; that none of the royal family should marry without consent of parliament or council; that the laws should be executed against Catholics; that the votes of Popish lords should be excluded; that the reformation of the liturgy and church-government should take place according to the advice of parliament; that the ordinance with regard to the militia be submitted to; that the justice of parliament may pass upon all delinquents; that a general pardon be granted, with such exceptions as should be advised by parliament; that the forts and castles be disposed of by consent of parliament; and that no peers be made but with consent of both houses. War on any terms was esteemed by the king and all his counselors, preferable to so ignominious a peace. Charles accordingly resolved to support his authority by force of arms. "His towns (he said) were taken from him; his ships, his army, and his money: but there still remained to him a good cause, and the hearts of his loyal subjects; which, with God's blessing, he doubted not would recover all the rest." Collecting therefore some forces, he advanced southwards, and erected his royal standard at Nottingham.

117
Shameful requisitions of parliament.

118
Rejected by Charles.

The king found himself supported in the civil-war by

Britain. by the nobility and more considerable gentry. They, dreading a total confusion of rank from the fury of the populace, inlisted themselves under the banner of their monarch: from whom they received, and to whom they communicated, their lustre. The concurrence of the bishops and church of England also increased the adherents of the king; but it may be safely affirmed, that the high monarchical doctrines so much inculcated by the clergy, had never done him any good. The bulk of the nobility and gentry who now attended the king in his distresses, breathed the spirit of liberty as well as of loyalty: and in the hopes alone of his submitting to a limited and legal government, they were willing to sacrifice their lives and fortunes.

On the other hand, the city of London, and most of the great corporations, took part with the parliament; and adopted with zeal those democratical principles on which these assemblies were founded. The example of the Dutch commonwealth, too, where liberty had so happily supported industry, made the commercial part of the nation desire to see a like form of government established in England. Many families also, who had enriched themselves by commerce, saw with indignation, that, notwithstanding their opulence, they could not raise themselves to a level with the ancient gentry; they therefore adhered to a power by whose success they hoped to acquire rank and consideration.

119
Distressed
condition
of the
royalists.

At first every advantage seemed to lie against the royal cause. The king was totally destitute of money. London, and all the sea-ports, except Newcastle, being in the hands of parliament, they were secure of a considerable revenue; and the seamen naturally following the disposition of the ports to which they belonged, the parliament had the entire dominion of the sea. All the magazines of arms and ammunition they seized at first; and their fleet intercepted the greatest part of those sent by the queen from Holland. The king, in order to arm his followers, was obliged to borrow the weapons of the train bands, under promise of restoring them as soon as peace should be settled. The nature and qualities of his adherents alone gave the king some compensation for all the advantages possessed by his adversaries. More bravery and activity were hoped for from the generous spirit of the nobles and gentry, than from the base disposition of the multitude. And as the landed gentlemen, at their own expence, levied and armed their tenants, besides an attachment to their masters, greater force and courage were to be expected from these rustic troops than from the vicious and enervated populace of cities. Had the parliamentary forces however, exerted themselves at first, they might have easily dissipated the small number the king had been able to collect, and which amounted to no more than 800 horse and 300 foot; while his enemies were within a few days march of him with 6000 men. In a short time the parliamentary army were ordered to march to Northampton; and the earl of Essex, who had joined them, found the whole to amount to 15,000. The king's army too was soon reinforced from all quarters; but still, having no force capable of coping with the parliamentary army, he thought it prudent to retire to Derby, and from thence to Shrewsbury, in order to countenance the levies which his friends were making in those parts. At Wellington, a day's march from Shrewsbury, he made a rendezvous of all his forces,

and caused his military orders to be read at the head of every regiment. That he might bind himself by reciprocal obligations, he here protested solemnly before his whole army, that he would maintain the Protestant religion according to the church of England; that he would govern according to the known statutes and customs of the kingdom; and particularly, that he would observe inviolable the laws to which he had given his consent during this parliament, &c.

While Charles lay at Shrewsbury, he received the news of an action, the first which had happened in these parts, and wherein his party was victorious. On the appearance of commotions in England, the princes Rupert and Maurice, sons of the unfortunate elector palatine, had offered their service to the king; and the former at that time commanded a body of horse which had been sent to Worcester in order to watch the motions of Essex, who was marching towards that city: No sooner had the prince arrived, than he saw some cavalry of the enemy approaching the gates. Without delay he briskly attacked them, as they were defiling from a lane, and forming themselves. Colonel Sandys their commander was killed, the whole party routed, and pursued above a mile.

120
They gain
an advan-
tage over
their ene-
mies.

In 1642, October 23d, happened a general engagement at Edgehill, in which, though the royalists were at first victorious, their impetuosity lost the advantage they had gained, and nothing decisive happened. Five thousand men, it is said, were found dead on the field of battle. Soon after, the king took Banbury and Reading; and defeated two regiments of his enemies at Brentford, taking 500 prisoners. Thus ended the campaign in 1642; in which, though the king had the advantage, yet the parliamentary army amounted to 24,000 men, and was much superior to his; notwithstanding which, his enemies had been so far humbled as to offer terms of peace.

121
Battle of
Edgehill

In 1643, the treaty was carried on, but without any cessation of hostilities; and indeed the negotiation went no farther than the first demand on each side; for the parliament, finding no likelihood of coming to an accommodation, suddenly recalled their commissioners. On the 27th of April, Reading surrendered to the parliamentary forces under the earl of Essex, who commanded a body of 18,000 men. The earl of Northumberland united in a league for the king the counties of Northumberland, Cumberland, Westmoreland, and the bishopric; and engaged some time after other counties in the same association. The same nobleman also took possession of York, and dislodged the forces of the parliament at Tadcaster, but his victory was not decisive. Other advantages were also gained by the royalists; the most important of which was the battle of Stratton, where the poet Waller, who commanded the parliament's army, was entirely defeated, and forced to fly with only a few horse to Bristol. This happened on the 13th of July; and was followed by the siege of that city, which surrendered to Prince Rupert on the 25th of the same month.

122
Association
of the king.

123
Parliamentary forces
defeated at
Stratton.

Though the taking of Bristol had cost the royalists dear, yet such a continual run of success had greatly dispirited the opposite party; and such confusion now prevailed at London, that some proposal to the king to march directly to that city, which it was hoped might be reduced either by an insurrection of the citi-

zens

¹¹⁴ **Britain.** zens by victory or by treaty, and thus an end put to the civil disorders at once. This advice, however, was rejected, on account of the great number of the London militia; and it was resolved first to reduce Gloucester, in consequence of which the king would have the whole course of the Severn under his command. The rich and malcontent counties of the west having then lost all protection from their friends, might be enforced to pay large contributions as an atonement for their disaffection; an open communication could be preserved between Wales and these new conquests; and half the kingdom being entirely freed from the enemy, and thus united into one firm body, might be employed in re-establishing the king's authority throughout the remainder.

¹¹⁴ Charles besieges Gloucester.

The siege of this city commenced August 10th; but being defended by Massey a resolute governor, and well garrisoned, made a vigorous defence. The consternation at London, however, was as great as if the enemy had been already at their gates; and in the midst of the general confusion, a design was formed by Waller of forcing the parliament to accept of some reasonable conditions of peace. He imparted his design to some others; but a discovery being made of their proceedings, he and two others were condemned to death. Waller, however, escaped with a fine of 10,000*l.* The city of Gloucester in the mean time was reduced to the utmost extremity; and the parliament, as their last resource, despatched Essex with an army of 14,000 men, in order to force the king to raise the siege of that city. This he accomplished; and when he entered, found only one barrel of gun-powder left, and their whole provisions nearly exhausted. On his return to London, he was intercepted by the king's army, with whom a desperate battle ensued at Newbury, which lasted till night. Though the victory was left undecided, Essex next morning proceeded on his march, and reached London in safety, where he received the applause for his conduct he deserved. The king followed him on his march; and having taken possession of Reading after the earl left, he there established a garrison, and straitened by that means London and the quarters of the enemy.

¹¹⁵ He is forced to raise the siege.

¹¹⁶ Battle of Newbury.

In the north, during the summer, the earl, now created marquis of Newcastle, had raised a considerable force for the king; and great hopes of success were entertained from that quarter. There appeared, however, in opposition to him, two men on whom the event of the war finally depended, and who began about this time to be remarked for their valour and military conduct: These were, Sir Thomas Fairfax, son to the lord of that name; and Oliver Cromwell. The former gained a considerable advantage over the royalists at Wakefield, and took General Goring prisoner: the latter obtained a victory at Gainsborough over a party commanded by the gallant Cavendish, who perished in the action. But both these defeats were more than compensated by the total rout of Lord Fairfax at Atherton moor, and the dispersion of his army, which happened on the 21st of July. After this victory, the marquis of Newcastle sat down before Hull with an army of 15,000 men; but being beaten off by a sally of the garrison, he suffered so much that he thought proper to raise the siege. About the same time, Manchester, who advanced from the eastern associated counties, li-

ving joined Cromwell and young Fairfax, obtained a considerable victory over the royalists at Horn Castle; where the two last-mentioned officers gained renown by their conduct and gallantry. And though fortune had thus balanced her favours, the king's party still remained much superior in those parts of England; and had it not been for the garrison of Hull, which kept Yorkshire in awe, a conjunction of the northern forces with the army of the south might have been made, and had probably enabled the king, instead of entering on the unfortunate, perhaps imprudent enterprise of Gloucester, to march directly to London, and put an end to the war. The battle of Newbury was attended with such loss on both sides, that it put an end to the campaign of 1643, by obliging both parties to retire into winter quarters.

Britain.

The event of the war being now very doubtful, the king and parliament began both of them to look for assistance from other nations. The former cast his eyes on Ireland, the latter on Scotland. The parliament of England had ever invited the Scots, from the commencement of the civil dissensions, to interpose their mediation, which they knew would be very little favourable to the king, and which for that reason he had declined. Early in the spring 1643, this offer of mediation had been renewed, with no better success than before. The commissioners were also empowered to press the king to a compliance with the presbyterian worship and discipline. But this he absolutely refused, as well as to call a parliament in Scotland; so that the commissioners, finding themselves unable to prevail in any one of their demands, returned home highly dissatisfied. The English parliament being now in great distress, gladly sent commissioners to Edinburgh, to treat of a more close confederacy with the Scotch nation. The person they principally trusted to on this occasion was Sir Henry Vane, who in eloquence, address, capacity, as well as in art and dissimulation, was not even surpassed by any one in that age so famous for active talents. By his persuasions was framed at Edinburgh the SOLEMN LEAGUE AND COVENANT; which effaced all former protestations and vows taken in both kingdoms, and long maintained its credit and authority. In this covenant, the subscribers, besides engaging mutually to defend each other against all opponents, bound themselves to endeavour, without respect of persons, the extirpation of popery and prelacy, superstition, heresy, and profaneness; to maintain the rights and privileges of parliaments, together with the king's authority; and to discover and bring to justice all incendiaries and malignants. They vowed also to preserve the reformed religion established in the church of Scotland; but by the artifice of Vane, no declaration more explicit was made with regard to England and Ireland, than that those kingdoms should be reformed according to the word of God, and the example of the purest churches.

¹¹⁹ English parliament ask assistance from the Scots.

¹³⁰ Solemn league and covenant framed.

Great were the rejoicings among the Scots, that they should be the happy instruments of extending their mode of religion, and dissipating the profound darkness in which the neighbouring nations were involved. And being determined that the sword should carry conviction to all refractory minds, they prepared themselves with great vigilance and activity for their military enterprises; so that, having added to their other

3 M forces

¹¹⁷ Advantages gained by Fairfax and Cromwell.

¹¹⁸ Lord Fairfax defeated at Atherton.

¹³¹ Britain. forces the troops which they had recalled from Ireland, they were ready about the end of the year to enter England under their old general the earl of Leven, with an army of above 20,000 men. The king, in order to secure himself, concluded a cessation of arms with the Irish rebels, and recalled a considerable part of his army from Ireland. Some Irish Catholics came over with these troops, and joined the royal army, where they continued the same cruelties and disorders to which they had been accustomed. The parliament voted, that no quarter in any action should ever be given them. But Prince Rupert, by making some reprisals, soon repressed this inhumanity.

The campaign of 1644 proved very unfortunate to the royal cause. The forces brought from Ireland were landed at Mostyne in North Wales, and put under the command of Lord Biron. They besieged and took the castles of Hawarden, Beeston, Acton, and Deddington-house. No place in Cheshire or the neighbourhood now adhered to the parliament, except Lantwich; and to this place Biron laid siege in the depth of winter. Sir Thomas Fairfax, alarmed at so great a progress, assembled an army of 4000 men in Yorkshire; and having joined Sir William Brereton, was approaching to the camp of the royalists. Biron and his soldiers, elated with successes in Ireland, entertained a most profound contempt for their enemies. Fairfax suddenly attacked their camp. The swelling of the river by a thaw divided one part of the army from another. That part opposed to Fairfax, being driven from their post, retired into the church at Acton, where being surrounded, they were all taken prisoners. The other retreated with precipitation; and thus was dissipated or rendered useless that body of forces which had come from Ireland. This happened on the 25th of January; and on the 11th of April, Colonel Bellasis was totally defeated at Selby in Yorkshire by Sir Thomas Fairfax, who had returned from Cheshire with his victorious forces. Being afterwards joined by Lord Leven, the two generals sat down before the city of York; but being unable to invest that city completely, they were obliged to content themselves with incommoding it by a loose blockade. Hopeton, having assembled a body of 14,000 men, endeavoured to break into Sussex, Kent, and the southern association, which seemed well disposed to receive him; but was defeated by Waller at Cherington. At Newark, however, Prince Rupert totally defeated the parliamentary army which besieged that place; and thus preserved the communication open between the king's northern and southern quarters.

The great advantages the parliament had gained in the north, seemed now to second their unwarrantable enterprises, and finally to promise them success. Manchester having taken Lincoln, had united his army to that of Leven and Fairfax; and York was now closely besieged by their numerous forces. That town, though vigorously defended by the marquis of Newcastle, was reduced to the last extremity, when Prince Rupert, having joined Sir Charles Lucas who commanded Newcastle's horse, hastened to its relief with an army of 20,000 men. The Scots and parliamentary generals raised the siege, and drawing up on Marston moor, proposed to give battle to the royalists. Prince Rupert approached the town by another quarter, and in-

terposing the river Ouse between him and the enemy, safely joined his forces to those of Newcastle. The marquis endeavoured to persuade him, that having so successfully effected his purpose, he ought to be contented with the present advantages, and leave the enemy, now much diminished by their losses, and discouraged by their ill success, to dissolve by those mutual dissensions which had begun to take place among them. The prince, however, hurried on by his natural impetuosity, gave immediate orders for fighting. The battle was lost, the royal army entirely pushed off the field, and the train of artillery taken. Immediately after this unfortunate action the marquis of Newcastle left the kingdom, and Prince Rupert retired into Lancashire. The city of York was surrendered in a few days, and Newcastle soon after taken by storm.

This was a fatal blow to the royal cause, and far from being balanced by an advantage gained at Cropredy bridge, by the king over Waller, or even by the disarming of Essex's forces, which happened on the 1st of September. On the 27th of October, another battle was fought at Newbury, in which the royalists were worsted, but soon after retrieved their honour at Dennington castle, which finished the campaign in 1644.

In 1645, a negotiation was again set on foot, and the commissioners met at Uxbridge on the 30th of January; but it was soon found impossible to come to any agreement. The demands of the parliament were exorbitant; and, what was worse, their commissioners owned them to be nothing but preliminaries. The king was required to attain, and except from a general pardon, 40 of the most considerable of his English subjects, and 19 of his Scots, together with all the Popish recusants who had borne arms for him. It was insisted that 48 more, with all the members of either house who had sat in the parliament called by the king at Oxford, all lawyers and divines who had embraced the king's party, should be rendered incapable of any office, be forbidden the exercise of their profession, be prohibited from coming within the verge of the court, and forfeit the third of their estates to the parliament. It was required, that whoever had borne arms for the king should forfeit the tenth of their estates, or if that did not suffice, the sixth, for the payment of public debts. As if royal authority were not sufficiently annihilated by these terms, it was demanded that the court of wards should be abolished; that all the considerable officers of the crown, and all the judges, should be appointed by parliament; and that the right of peace and war should not be exercised without consent of parliament. A little before the commencement of this fruitless treaty, the parliament, to show their determined resolution to proceed in the same haughty imperious method in which they had begun, brought to the block Archbishop Laud, who had long been a prisoner in the Tower, and was incapable of giving offence to any.

While the king's affairs thus went into decay in England, they seemed to revive a little in Scotland, through the conduct and valour of the earl of Montrose, a young nobleman newly returned from his travels. He had been introduced to the king; but not meeting with an agreeable reception, had gone over to the covenanters, and been active in forwarding all

Britain. their violence. Being commissioned, however, by the tables, to wait upon the king while the army lay at Berwick, he was so gained by the civilities and caresses of that monarch, that he thenceforth devoted himself entirely, though secretly, to his service. For attempting to form an association in favour of the royal cause, Montrose was quickly thrown into prison; but being again released, he found the king ready to give ear to his counsels, which were of the boldest and most daring kind. Though the whole nation of Scotland was occupied by the covenanters, though great armies were kept on foot by them, and every place guarded by a vigilant administration, he undertook by his own credit, and that of a few friends who remained to the king, to raise such commotions, as would soon oblige those malcontents to recal the forces which had so sensibly thrown the balance in the favour of parliament. The defeat at Marston-moor had left him no hopes of any succours from England; he was therefore obliged to stipulate with the earl of Antrim, a nobleman of Ireland, for some supply of men from that country. And he himself having used various disguises, and passed through many dangers, arrived in Scotland, where he lay for some time concealed in the borders of the Highlands.

The Irish did not exceed 1100 foot, very ill armed. Montrose immediately put himself at their head; and being joined by 1300 Highlanders, attacked Lord Elcho, who lay at Perth with 6000 men, utterly defeated him, and killed 2000 of the covenanters. He next marched northwards, in order to rouse again the marquis of Huntly and the Gordons, who had taken arms before, but been suppressed by the covenanters. At Aberdeen, he attacked and entirely defeated Lord Burley, who commanded 2500 men. Montrose, however, by this victory, did not obtain the end he proposed; the marquis of Huntly showed no inclination to join an army where he was so much eclipsed by the general.

Montrose was now in a very dangerous situation. Argyle, reinforced by the earl of Lothian, was behind him with a great army. The militia of the northern counties, Murray, Ross, and Caithness, to the number of 5000, opposed him in front, and guarded the banks of the Spey, a deep and rapid river. In order to save his troops, he turned aside into the hills; and after some marches and countermarches, Argyle came up with him at Faivy castle; and here, after some skirmishes, in which he was always victorious, Montrose got clear of a superior army, and by a quick march through these almost inaccessible mountains put himself absolutely beyond their power.

It was the misfortune of this general, that very good or very ill fortune were equally destructive of his army. After every victory his Scots soldiers went home to enjoy the spoil they had acquired; and had his army been composed of these only, he must have soon been abandoned altogether: but his Irishmen, having no place to which they could retire, adhered to him in every fortune. With these, therefore, and some reinforcements of the Atholmen and Macdonalds, Montrose fell suddenly upon Argyle's country, letting loose upon it all the horrors of war. Argyle, collecting 3000 men, marched in quest of the enemy, who had retired with their plunder; and he lay at Innerlochy,

supposing himself to be still at a good distance from them. The earl of Seaforth, at the head of the garrison of Inverness, and a body of 5000 new levied troops, pressed the royalists on the other side, and threatened them with total destruction. By a quick and unexpected march, Montrose hastened to Innerlochy, and presented himself in order of battle before the covenanters. Argyle alone, seized with a panic, deserted his army. They made a vigorous resistance, however; but were at last defeated and pursued with great slaughter: after which Montrose was joined by great numbers of Highlanders; Seaforth's army dispersed of itself; and the lord Gordon, eldest son of the marquis of Huntly, having escaped from his uncle Argyle, who had hitherto detained him, now joined Montrose with a considerable number of his followers, attended by the earl of Aboyne.

The council at Edinburgh, alarmed at these victories, sent for Baillie, an officer of reputation, from England; and, joining him in command with Urrey, sent them with a considerable army against the royalists. Montrose, with a detachment of 800 men, had attacked Dundee, a town extremely attached to the covenant: and having carried it by assault, had given it up to be plundered by his soldiers; when Baillie and Urrey with their whole force came upon him. He instantly called off his soldiers from the plunder; put them in order; secured his retreat by the most skilful measures; and having marched 60 miles in the face of an enemy much superior, without stopping, or allowing his soldiers the least sleep or refreshment, at last secured himself in the mountains. His antagonists now divided their forces, in order to carry on the war against an enemy who surprised them as much by the rapidity of his marches as by the boldness of his enterprises. Urrey met him with 4000 men, at Alderne near Inverness; and trusting to his superiority in numbers (for Montrose had only 2000 men), attacked him in the post which he had chosen. Montrose, having placed his right wing in strong ground, drew the best of his forces to the other, and left no main body between them; a defect which he artfully concealed by showing a few men through trees and bushes with which that ground was covered. That Urrey might have no leisure to perceive the stratagem, he instantly led his wing to the charge, made a furious attack on the covenanters, drove them off the field, and obtained a complete victory over them. Baillie now advanced, in order to revenge Urrey's defeat; but he himself met with a like fate at Alford. Montrose, weak in cavalry, lined his troops of horse with infantry; and, after putting the enemy's horse to rout, fell with united force upon their foot, which were entirely cut in pieces, though with the loss of the gallant Lord Gordon on the part of the royalists.—Having thus prevailed in so many battles, which his vigour always rendered as decisive as they were successful, he prepared for marching into the southern provinces, in order to put a total period to the power of the covenanters, and dissipate the parliament, which with great pomp and solemnity they had ordered to meet at St Johnstone's.

While Montrose was thus signaling his valour in the north, Fairfax, or rather Oliver Cromwell, under his name, employed himself in bringing in a new modelled.

Britain.

138
He defeats two armies, each double in number to his own.

139
Parliamentary army new modelled.

Britain.

del into the parliamentary army, and throwing the whole troops into a different shape; and never surely was a more singular army established, than that which was now set on foot by the parliament. To the greatest number of the regiments chaplains were not appointed. The officers assumed the spiritual duty, and united it with their military functions. During the intervals of action, they occupied themselves in sermons, prayers, and exhortations. Rapturous ecstasies supplied the place of study and reflection; and while the zealous devotees poured out their thoughts in unpremeditated harangues, they mistook that eloquence, which to their own surprise, as well as that of others, flowed in upon them, for divine illuminations, and illapses of the Holy Spirit. Wherever they were quartered, they excluded the minister from his pulpit; and usurping his place, conveyed their sentiments to the audience with all the authority that followed their power, their valour, and their military exploits, united to their apparent zeal and fervour. The private soldiers were seized with the same spirit; and in short, such an enthusiasm seized the whole army as was perhaps scarce ever equalled.

The royalists ridiculed this fanaticism of the parliamentary armies, without being sensible how much reason they had to dread it. They were at this time equal, if not superior, in number to their enemies; but so licentious, that they were become more formidable to their friends than their enemies. The commanders were most of them men of dissolute characters; in the west especially, where Goring commanded, universal spoil and havock were committed; and the whole country was laid waste by the rapine of the army; so that the most devoted friends both to the church and state wished there for such success to the parliamentary forces as might put an end to these disorders.

140
Royalists
defeated at
Naseby.

The natural consequence of such enthusiasm in the parliamentary army, and licentiousness in that of the king, was, that equal numbers of the latter would no longer maintain their ground against the former. This appeared in the decisive battle of Naseby, where the forces were nearly equal; but after an obstinate engagement, Charles was entirely defeated, 500 of his officers and 4000 private men made prisoners, all his artillery and ammunition taken, and his infantry totally dispersed; so that scarce any victory could be more complete.

After this fatal battle, the king retired first to Hereford, then to Abergavenny; and remained some time in Wales, from the vain hope of raising a body of infantry in these quarters, already harassed and exhausted. His affairs now, however, went to ruin in all quarters. Fairfax retook Leicester on the 17th of June. On the 10th of July, he raised the siege of Taunton; and the royalists retired to Lampport, an open town in the county of Somerset. Here they were attacked by Fairfax, and beat from their post, with the loss of 300 killed and 1400 taken prisoners. This was followed by the loss of Bridgewater, which Fairfax took three days after; making the garrison, to the number of 2600 men, prisoners of war. He then reduced Bath and Sharburn; and on the 11th of September Bristol was surrendered to him by Prince Rupert, though a few days before he had boasted in a

141
Bristol taken.

letter to Charles, that he would defend the place for four months. This so enraged the king, that he immediately recalled all the prince's commissions, and sent him a pass to go beyond sea.

Britain.

The Scots in the meantime, having made themselves masters of Carlisle after an obstinate siege, marched southwards and invested Hereford; but were obliged to raise the siege on the king's approach. And this was the last glimpse of success that attended his arms. Having marched to the relief of Chester, which was anew besieged by the parliamentary forces under Colonel Jones, his arrears were attacked by Pointz, and an engagement immediately ensued. While the fight was continued with great obstinacy, and victory seemed to incline to the royalists, Jones fell upon them from the other side, and defeated them with the loss of 600 killed and 1000 taken prisoners. The king with the remains of his army fled to Newark; and from thence escaped to Oxford, where he shut himself up during the winter season.

142
Charles retires to Oxford.

After the surrender of Bristol, Fairfax and Cromwell having divided their forces, the former marched westwards in order to complete the conquest of Devonshire and Cornwall; the latter attacked the king's garrisons which lay to the east of Bristol. Nothing was able to stand before these victorious generals; every town was obliged to submit, and every body of troops that pretended to resist were utterly defeated. At last, news arrived, that Montrose himself, after some more successes, was defeated; and thus the only hope of the royal party was destroyed.

143
Montrose defeated.

When that brave general descended into the southern counties, the covenanters, assembling their whole force, met him with a numerous army, and gave him battle at Kilsyth. Here he obtained his most memorable victory: 6000 of the covenanters were killed on the spot, and no remains of an army left them in Scotland. Many noblemen, who secretly favoured the royal cause, now declared openly for it, when they saw a force able to support them. The marquis of Douglas, the earls of Annandale and Hartfield, the lords Fleming, Seton, Maderty, Carnegy, with many others, flocked to the royal standard. Edinburgh opened its gates, and gave liberty to all the prisoners there detained by the covenanters. Among the rest was Lord Ogilvy, son to Airly, whose family had contributed very much to the victory gained at Kilsyth. —David Lesly was detached from the army in England, and marched to the relief of his distressed party in Scotland. Montrose advanced still further to the south, allured by the vain hopes, both of rousing to arms the earls of Hume, Traquair, and Roxburgh, who had promised to join him; and of obtaining from England some supply of cavalry, in which he was very deficient. By the negligence of his scouts, Lesly, at Philiphaugh in the Forest, surprised his army, much diminished in numbers from the desertion of the Highlanders, who had retired to the hills, according to custom, to secure their plunder. After a sharp conflict, in which Montrose exerted great valour, his forces were routed by Lesly's cavalry, and he himself forced to fly to the mountains.

Nothing could be more affecting than the situation in which the king now was. He now resolved to grant the parliament their own terms, and sent them

repeated

Britain. repeated messages to this purpose, but they never deigned to make him the least reply. At last, after reproaching him with the blood spilt during the war, they told him that they were preparing some bills, to which, if he would consent, they would then be able to judge of his pacific inclinations. Fairfax, in the mean time, was advancing with a victorious army in order to lay siege to Oxford; and Charles, rather than submit to be taken captive and led in triumph by his insolent subjects, resolved to give himself up to the Scots, who had never testified such implacable animosity against him, and to trust to their loyalty for the rest. After passing through many bye-ways and cross-roads, he arrived in company with only two persons, Dr Hudson and Mr Ashburnham, at the Scots camp before Newark, and discovered himself to Lord Leven their general.

144 Charles surrenders himself to the Scots.

145 who sell him to the English.

146 The army begin to usurp the sovereign power.

The reception he met with was such as might be expected from these infatuated bigots, destitute of every principle of reason, honour, or humanity. Instead of endeavouring to alleviate the distresses of their sovereign, they suffered him to be insulted by the clergymen. They immediately sent an account of his arrival to the English parliament, and they as quickly entered into a treaty with the Scots about delivering up their prisoner. The Scots thought this a proper time for the recovery of their arrears due to them by the English. A great deal was really due them, and they claimed much more than actually belonged to them. At last, after various debates between them and the parliament, in which they pretended to great honour, and insisted upon many punctilios, it was agreed, that, upon payment of 400,000*l.* the Scots should deliver up the king to his enemies: and this was cheerfully complied with. Thus the Scots justly fell under the censure of having sold their king, who had thrown himself upon their mercy; a stain peculiar to the nation, and unparalleled in history either ancient or modern. It must, however, be acknowledged, that the infamy of this bargain had such an influence on the Scots parliament, that they once voted that the king should be protected and his liberty insisted on. But the general assembly interposed; and pronounced, that as he had refused to take the covenant which was pressed on him, it became not the godly to concern themselves about his fortunes. In consequence of this, the parliament were obliged to retract their vote. The king, being delivered over to the English commissioners, was conducted under a guard to Holdenby in the county of Northampton, where he was very rigorously confined; his ancient servants being dismissed, himself debarred from visits, and all communication cut off with his friends or family.

The civil war being now over, the king absolved his followers from their allegiance, and the parliament had now no enemy to fear but their own troops. From this quarter their danger only arose; and it was not long before they found themselves in the same unfortunate situation to which they had reduced the king. The majority of the house were presbyterians, but the majority of the army were independents. The former, soon after the retreat of the Scots, seeing every thing reduced to obedience, proposed to disband a considerable part of the army, and send the rest over to Ireland. This was by no means relished, and Cromwell

took care to heighten the disaffection. Instead of preparing to disband, therefore, the soldiers resolved to petition; and they began by desiring an indemnity, ratified by the king, for any illegal actions which they might have committed during the war. The commons voted that this petition tended to introduce mutiny, &c. and threatened to proceed against the promoters of it as enemies to the state and disturbers of the public peace. The army now began to set up for themselves. In opposition to the parliament at Westminster, a military parliament was formed. The principal officers formed a council to represent the body of peers; the soldiers elected two men out of each company to represent the commons, and these were called the *agitators of the army*; and of this assembly Cromwell took care to be a member. The new parliament soon found many grievances to be redressed; and specified some of the most considerable. The commons were obliged to yield to every request, and the demands of the agitators rose in proportion. The commons accused the army of mutiny and sedition; the army retorted the charge, and alleged that the king had been deposed only to make way for their usurpations. Cromwell, in the mean time, who secretly conducted all the measures of the army, while he ex-claimed against their violence, resolved to seize the king's person. Accordingly a party of 500 horse appeared at Holmby castle, under the command of one Joyce, originally a tailor, but now a cornet; and by this man was the king conducted to the army, who were hastening to their rendezvous at Triplo-beath near Cambridge. Next day Cromwell arrived among them where he was received with acclamations of joy, and immediately invested with the supreme command.

Britain. 147 A military parliament formed.

148 Cromwell seizes the king.

The commons now saw the designs of the army; but it was too late, all resistance was become vain; Cromwell advanced with precipitation, and was in a few days at St Alban's. Even submission was now to no purpose; the army still rose in their demands, in proportion as these demands were gratified, till at last they claimed a right of modelling the whole government, and settling the nation.

Cromwell began with accusing eleven members of the house, the very leaders of the presbyterian party, as guilty of high treason, and being enemies of the army. The commons were willing to protect them; but the army insisting on their dismissal, they voluntarily left the house. At last the citizens of London, finding the constitution totally overturned, and a military despotism beginning to take place, instead of the kingly one they were formerly afraid of, began to think seriously of repressing the insolence of the troops. The common council assembled the militia of the city; the works were manned; and a manifesto published, aggravating the hostile intentions of the army. Finding that the commons, in compliance with the request of the army, had voted that the city militia should be disbanded, the multitude rose, besieged the door of the house, and obliged them to reverse that vote they had so lately passed. The assembly was, of consequence, divided into two parties; the greater part siding with the citizens; but the minority, with the two speakers at their head, were for encouraging the army. Accordingly the two speakers, with 62 of the members, secretly,

Britain. secretly retired from the house, and threw themselves under the protection of the army, who were then at Hounslow-heath. They were received with shouts and acclamations; their integrity was extolled; and the whole force of the soldiery, to the number of 20,000 men, now moved forward to reinstate them in their places.

¹⁴⁹
Sixty-two members of parliament join the army.

In the mean time, the part of the house which was left, resolved to resist the encroachments of the army. They chose new speakers, gave orders for enlisting troops, ordered the train-bands to man the lines; and the whole city boldly resolved to resist the invasion. But this resolution only held while the enemy was at a distance; for when Cromwell appeared, all was obedience and submission; the gates were opened to the general, who attended the two speakers and the rest of the members peaceably to their habitations. The eleven impeached members being accused as causes of the tumult, were expelled; and most of them retired to the continent. The mayor, sheriff, and three aldermen, were sent to the Tower: several citizens, and officers of the militia, were committed to prison; the lines about the city levelled with the ground; and the command of the Tower was given to Fairfax.

¹⁵⁰
The rest submit.

It now only remained to dispose of the king, who remained a prisoner at Hampton-court. The independent army, at the head of whom was Cromwell, on one hand; and the presbyterians, in the name of both houses, on the other; treated with him separately in private. He had sometimes even hopes, that, in these struggles for power, he might have been chosen mediator in the dispute; and he expected that the kingdom at last, being sensible of the miseries of anarchy, would of its own accord be hushed into its former tranquil condition. At this time he was treated with some flattering marks of distinction; he was permitted to converse with his old servants; his chaplains were permitted to attend him, and celebrate divine service their own way. But the most exquisite pleasure he enjoyed was in the company of his children, with whom he had several interviews. The meeting on these occasions was so pathetic, that Cromwell himself, who was once present, could not help being moved, and was heard to declare, that he never beheld such an affecting scene before. But these instances of respect were of no long continuance. As soon as the army had gained a complete victory over the house of commons, the king was treated not only with the greatest disrespect, but even kept in continual alarms for his

¹⁵¹
Charles resolves to leave the kingdom.

own personal safety. The consequence of this was, that Charles at last resolved to withdraw himself from the kingdom. Accordingly, on the 11th of November 1647, attended only by Sir John Berkeley, Ashburnham, and Leg, he privately left Hampton-court; and his escape was not discovered till near an hour after; when those who entered his chamber, found on the table some letters directed to the parliament, to the general, and to the officer who had attended him. All night he travelled through the forest, and arrived next day at Titchfield, a seat of the earl of Southampton, where resided the countess dowager, a woman of honour, to whom the king knew he might safely entrust his person. Before he arrived at this place, he had gone to the sea-coast: and expressed great anxiety that a ship which he seemed to look for had not ar-

rived. He could not hope to remain long concealed at Titchfield: the question was, what measure should next be embraced? In the neighbourhood lay the isle of Wight, of which Hammond was governor. This man was entirely dependent on Cromwell, which was a very unfavourable circumstance: yet, because the governor was nephew to Dr Hammond the king's favourite chaplain, and had acquired a good reputation in the army, it was thought proper to have recourse to him in the present exigence, when no other rational expedient could be thought of. Ashburnham and Berkeley were dispatched to the island. They had orders not to inform Hammond of the place where the king lay concealed, till they had first obtained a promise of him not to deliver up his majesty, even though the parliament and army should require him; but restore him to his liberty, if he could not protect him. The promise would have been but a slender security: yet even without exacting it, Ashburnham imprudently, if not treacherously, brought Hammond to Titchfield; and the king was obliged to put himself into his hands, and to attend him to Carisbroke castle in the isle of Wight, where, though he was received with great demonstrations of respect and kindness, he was in reality a prisoner.

Britain.
¹⁵²
He is seized and confined in the isle of Wight.

While the king continued in this forlorn situation, Cromwell found himself upon the point of losing all the fruits of his former schemes, by having his own principles turned against himself. Among the Independents, who in general were for no ecclesiastical subordination, a set of men grew up, called *levellers*, who disallowed all subordination whatsoever, and declared that they would have no other chaplain, king, or general, but Jesus Christ. Though this would have gone down very well with Cromwell, as long as it was only directed against his enemies, he did not so well relish it when applied to himself. Having intimation that the levellers were to meet at a certain place, he unexpectedly appeared before them at the head of his red regiment, which had hitherto been deemed invincible. He demanded in the name of God, what these meetings and murmurings meant? he expostulated with them upon the danger and consequence of their precipitant schemes, and desired them immediately to depart. Instead of obeying, however, they returned an insolent answer; wherefore, rushing on them in a fury, he laid two of them dead at his feet. His guards dispersing the rest, he caused several of them to be hanged upon the spot, and sent others to London; and thus dissipated a faction no otherwise criminal than in having followed his own example.

Cromwell's authority was greatly increased by the last-mentioned action; but it became irrealisable in consequence of a new and unexpected addition to his successes. The Scots, perhaps ashamed of the reproach of having sold their king, and stimulated farther by the Independents, who took all occasions to mortify them, raised an army in his favour, and the chief command was given to the earl of Hamilton: while Langdale, who professed himself at the head of the more bigotted party who had taken the covenant, marched at the head of his separate body, and both invaded the north of England. Though these two armies amounted to above 20,000 men, yet Cromwell at the head of 8000 of his hardy veterans, feared not to give them battle.

He

¹⁵³
Cromwell in danger from the levellers.

¹⁵⁴
He defeats the Scots.

Britain. He attacked them one after another; routed and dispersed them; took Hamilton prisoner; and, following his blow, entered Scotland, the government of which he settled entirely to his satisfaction. An insurrection in Kent was quelled by Fairfax with the same ease; and nothing but success attended all this usurper's attempts.

155
Negotia-
tion be-
tween the
king and
parliament.

During these contentions, the king, who was kept a prisoner at Carisbroke castle, continued to negotiate with the parliament for settling the unspeakable calamities of the kingdom. The parliament now saw no other method of destroying the military power, but to depress it by the kingly. Frequent proposals for an accommodation passed between the captive king and the commons; but the great obstacle which had all along stood in the way, still kept them from agreeing. This was the king's refusing to abolish Episcopacy, though he consented to alter the liturgy. However, the treaty was still carried on with vigour, and the parliament for the first time seemed in earnest to conclude their negotiations. But all was now too late. The victorious army, with Cromwell at their head, advanced to Windsor, and with furious remonstrances began to demand vengeance on the king. The unhappy monarch had been lately sent under confinement to that place; and from thence he was now conveyed to Hurst castle in Hampshire, opposite to the isle of Wight. The parliament in the mean time began to issue ordinances for a more effectual opposition to these military encroachments, when they were astonished by a message from Cromwell, that he intended paying them a visit next day with his whole army; and in the mean time ordering them to raise him 40,000l. on the city of London.

The commons, though destitute of all hopes of prevailing, had still the courage to resist, and to attempt in the face of the whole army to finish the treaty they had begun with the king. They had taken into consideration the whole of his concessions; and though they had formerly voted them unsatisfactory, they now renewed the consultation with great vigour. After a violent debate which lasted three days, it was carried in the king's favour by a majority of 129 against 83, that his concessions were a foundation for the houses to proceed upon in settling the affairs of the nation. This was the last attempt in his favour; for the next day Colonel Pride, at the head of two regiments, blockaded the house; and seizing in the passage 41 members of the Presbyterian party, sent them to a low room belonging to the house, that passed by the denomination of *Hell*. Above 160 members more were excluded; and none were allowed to enter but the most furious and determined of the Independents, in all not exceeding 60. This atrocious invasion of parliamentary rights commonly passed by the name of *Pride's Purge*, and the remaining members were called the *Rump*. These soon voted, that the transactions of the house a few days before were entirely illegal, and that their general's conduct was just and necessary.

156
Colonel
Pride's
purge.

157
Charge
against
the king
brought in.

Nothing now remained, to complete the wickedness of this parliament, but to murder the king. In this assembly, therefore, composed of the most obscure citizens, and officers of the army, a committee was appointed to bring in a charge against the king; and on their report, a vote passed declaring it treason in a

king to levy war against his parliament. It was therefore resolved, that a high court of justice should be appointed, to try his majesty for this new invented treason. For form's sake, they desired the concurrence of the few remaining lords in the upper house; but there was virtue enough left in that body unanimously to reject the proposal. The commons, however, were not to be stopped by so small an obstacle. They voted that the concurrence of the house of lords was unnecessary, and that the people were the origin of all just power. To add to their zeal, a woman of Herefordshire, illuminated by prophetic visions, desired admittance, and communicated a revelation she pretended to have received from heaven. She assured them that their measures were consecrated from above, and ratified by the sanction of the Holy Ghost. This intelligence gave them great comfort, and much confirmed them in their present resolutions.

Britain.

Colonel Harrison, the son of a butcher, was commanded to conduct the king from Hurst castle to Windsor, and from thence to London. His afflicted subjects, who ran to have a sight of their sovereign, were greatly affected at the change that appeared in his face and person. He had permitted his beard to grow; his hair was become venerably gray, rather by the pressure of anxiety than the hand of time; while the rest of his apparel bore the marks of misfortune and decay. He had long been attended by an old decrepid servant whose name was *Sir Philip Warwick*, who could only deplore his master's fate without being able to revenge his cause. All the exterior symbols of sovereignty were now withdrawn, and his attendants had orders to serve him without ceremony. He could not, however, be persuaded that his adversaries would bring him to a formal trial; but he every moment expected to be despatched by private assassination.

From the 6th to the 20th of January was spent in His trial. making preparations for this extraordinary trial. The court of justice consisted of 133 persons named by the commons; but of these never above 70 met upon the trial. The members were chiefly composed of the principal officers of the army, most of them of very mean birth, together with some of the lower house, and a few citizens of London. Bradshaw a lawyer was chosen president; Coke was appointed solicitor for the people of England; Dorislaus, Steele, and Aske, were named assistants. The court sat in Westminster-hall. When the king was brought forward before the court, he was conducted by the mace-bearer to a chair placed within the bar. Though long detained a prisoner, and now produced as a criminal, he still maintained the dignity of a king. His charge was then read by the solicitor, accusing him of having been the cause of all the bloodshed which had flowed since the commencement of the war; after which Bradshaw directed his discourse to him, and told him that the court expected his answer.

The king began his defence with declining the authority of the court. He represented, that having been engaged in treaty with his two houses of parliament, and having finished almost every article, he expected a different treatment from what he had now received. He perceived, he said, no appearance of an upper house, which was necessary to constitute a just tribunal. He alleged that he was himself the king and

Britain. and fountain of law, and consequently could not be tried by laws to which he had never given his assent; that having been intrusted with the liberties of the people, he would not now betray them by recognizing a power founded in usurpation; that he was willing, before a proper tribunal, to enter into the particulars of his defence; but that before them he must decline any apology for his innocence, lest he should be considered as the betrayer of, and not a martyr for, the constitution. Bradshaw, in order to support the authority of the court, insisted, that they had received their authority from the people, the source of all right. He pressed the king not to decline the authority of the court that was delegated by the commons of England, and interrupted and overruled him in his attempts to reply. In this manner the king was three times produced before the court, and as often persisted in declining its jurisdiction. The fourth and last time he was brought before this self-created tribunal, as he was proceeding thither, he was insulted by the soldiers and the mob, who cried out, "Justice! justice! Execution! execution!" but he continued undaunted. His judges having now examined some witnesses, by whom it was proved that the king had appeared in arms against the forces commissioned by parliament, they pronounced sentence against him. He seemed very anxious at this time to be admitted to a conference with the two houses, and it was supposed that he intended to resign the crown to his son; but the court refused compliance, and considered his request as an artifice to delay justice.

159
He is insulted by the soldiers.

The behaviour of Charles under all these instances of low-bred malice was great, firm, and equal. In going through the hall from this execrable tribunal, the soldiers and rabble were again instigated to cry out Justice and execution! They reviled him with the most bitter reproaches. Among other insults, one miscreant presumed to spit in the face of his sovereign. He patiently bore their insolence: "Poor souls (cried he), they would treat their generals in the same manner for sixpence." Those of the populace who still retained the feelings of humanity expressed their sorrow in sighs and tears. A soldier, more compassionate than the rest, could not help imploring a blessing on his royal head. An officer overhearing him, struck the honest centinel to the ground before the king; who could not help saying, that the punishment exceeded the offence.

160
His execution.

At his return to Whitehall, Charles desired permission of the house to see his children, and to be attended in his private devotions by Dr Juxon late bishop of London. These requests were granted, and also three days to prepare for execution. Every night between his sentence and execution, the king slept sound as usual, though the noise of the workmen employed in framing the scaffold continually resounded in his ears. The fatal morning being at last arrived, he rose early; and calling one of his attendants, he bade him employ more than usual care in dressing him, and preparing him for so great a solemnity. The street before Whitehall was the place destined for his execution; for it was intended that this should increase the severity of his punishment. He was led through the banquetting house to the scaffold adjoining to that edifice, attended by his friend and servant Bishop Juxon, a man of the same mild and steady virtues with his master. The scaffold, which was

covered with black, was guarded by a regiment of soldiers under the command of Colonel Tomlinson; and on it were to be seen the block, the axe, and two executioners in masks. The people, in crowds, stood at a greater distance. The king surveyed all these solemn preparations with calm composure; and, as he could not expect to be heard by the people at a distance, he addressed himself to the few persons who stood round him. He there justified his own innocence in the late fatal wars: he observed, that he had not taken arms till after the parliament had shown him the example; and that he had no other object in his warlike preparations, than to preserve that authority entire which had been transmitted to him by his ancestors. But, though innocent towards his people, he acknowledged the equity of his execution in the eyes of his Maker: he owned that he was justly punished for having consented to the execution of an unjust sentence against the earl of Strafford. He forgave all his enemies; exhorted the people to return to their obedience, and acknowledge his son as his successor; and signified his attachment to the Protestant religion as professed by the church of England. So strong was the impression made by his dying words on those who could hear him, that Colonel Tomlinson himself, to whose care he had been committed, acknowledged himself a convert. At one blow his head was severed from his body. The other executioner then, holding up the head, exclaimed, "This is the head of a traitor."

Britain.

It is impossible to describe the grief, indignation, and astonishment, which took place not only among the spectators, who were overwhelmed with a flood of sorrow, but throughout the whole nation, as soon as the report of this fatal execution was conveyed to them. Each blamed himself either with active disloyalty to the king, or a passive compliance with his destroyers. The very pulpits that used to resound with insolence and sedition were now bedewed with tears of unfeigned repentance; and all united in their detestation of those dark hypocrites, who, to satisfy their own enmity, involved a whole nation in the guilt of treason.—Charles was executed on the 30th of January 1649, in the 49th year of his age, and 24th of his reign. He was of a middling stature, robust, and well proportioned. His visage was pleasant, but melancholy; and it is probable that the continual troubles in which he was involved might have made that impression on his countenance.

161
Grief of the nation on that account.

It being remarked, that the king, the moment before he stretched out his neck to the executioner, had said to Juxon, with a very earnest accent, the single word REMEMBER, great mysteries were supposed to be concealed under that word; and the generals vehemently insisted with the prelate that he should inform them of the king's meaning. Juxon told them, that the king, having frequently charged him to inculcate on his son the forgiveness of his murderers, had taken this opportunity in the last moment of his life, when his commands, he supposed, would be regarded as sacred and inviolable, to reiterate that desire; and that his mild spirit thus terminated its present course by an act of benevolence to his greatest enemies.

162
Piety of the king in his last moments.

The dissolution of the monarchy in England soon followed the death of the monarch. When the peers met on the day appointed in their adjournment, they entered upon business; and sent down some votes to

163
Dissolution of the English monarchy.

¹⁶⁴ **Enthusiasm and tyranny of the republicans.** ^{Britain.} the commons, of which the latter deigned not to take the least notice. In a few days after, the commons voted, that the house of lords was useless and dangerous; for which reason it was abolished. They voted it high treason to acknowledge Charles Stuart, son of the late king, as successor to the throne. A great seal was made; on one side of which were engraven the arms of England and Ireland, with this inscription: "The great seal of England." On the reverse was represented the house of commons sitting, with this motto: "On the first year of freedom, by God's blessing restored, 1649." The forms of all public business were changed from being transacted in the king's name, to that of the *keepers of the liberties of England*. The court of king's bench was called the court of *public bench*. Nay, so cautious on this head, it is said, were some of the republicans, that, in reciting the Lord's prayer, they would not say, "thy kingdom," but "*thy commonwealth, come.*" The king's statue in the Exchange was thrown down; and on the pedestal these words were inscribed: *Exit tyrannus, regum ultimus*; "The tyrant is gone, the last of the kings." The commons, it is said, intended to bind the princess Elizabeth apprentice to a button-maker; the duke of Gloucester was to be taught some other mechanical employment: but the former soon died of grief, as is supposed, for her father's tragical end; the latter was sent beyond sea by Cromwell. The commons next proceeded to punish those who had been most remarkable for their attachment to their late sovereign. The duke of Hamilton, Lord Capel, and the earl of Holland, were condemned and executed; the earl of Norwich and Sir John Owen were also condemned, and afterwards pardoned. These executions irritated the Scots: their loyalty began to return; and the insolence of the independents, with their victories, inflamed them still more. They determined, therefore, to acknowledge Prince Charles for their king, but at the same time to abridge his power by every limitation which they had attempted to impose on his father.

¹⁶⁵ **Charles II. invited into Scotland.** Charles, after the death of his father, having passed some time at Paris, and finding no likelihood of assistance from that quarter, was glad to accept of any conditions. The Scots, however, while they were thus professing loyalty to their king, were nevertheless cruelly punishing his adherents. Among others, the brave marquis of Montrose was taken prisoner, as he endeavoured to raise the Highlanders in the royal cause; and being brought to Edinburgh, was hanged on a gibbet 30 feet high, then quartered, and his limbs stuck up in the principal towns of the kingdom. Yet, notwithstanding all this severity, Charles ventured into Scotland, and had the mortification to enter the gate of Edinburgh where the limbs of that faithful adherent were still exposed.

¹⁶⁶ **His hard usage there.** The young king soon found that he had only exchanged his exile for imprisonment. He was surrounded and incessantly importuned by the fanatical clergymen, who having brought royalty under their feet, were resolved to keep it still subservient, and to trample upon it with all the contumely of upstarts. Charles pretended to give ear to their discourses; but, however, made an attempt to escape. He was overtaken and brought back; when he owned the greatness of his fault, and testified his repentance for what he had done. Cromwell,

^{Britain.} in the mean time, who had been appointed by the parliament to command the army in Ireland, prosecuted the war in that kingdom with his usual success. He had to encounter the royalists commanded by the duke of Ormond, and the native Irish led on by O'Neale. These troops he quickly overcame; and most of the towns, intimidated by his cruelty, opened their gates at his approach. He was on the point of reducing the whole kingdom, when he was recalled by the parliament to defend his country against the Scots, who had raised a considerable army in support of the royal cause.

¹⁶⁷ **Cromwell's success in Ireland.** On the return of Cromwell to England, he was chosen commander in chief of the parliamentary forces, in the room of Fairfax, who declined opposing the presbyterians. The new general immediately set forward for Scotland with an army of 16,000 men, where he was opposed by General Lesly, who formed an excellent plan for his own defence. This prudent commander, knowing his men to be inferior in valour and discipline, however superior in numbers, to those of Cromwell, kept himself carefully in his intrenchments. At last Cromwell was drawn into a very disadvantageous post near Dunbar, where his antagonist waited deliberately to take advantage of him. From this imminent danger, however, he was delivered by the madness of the Scots clergy. They, it seems, had been wrestling in prayer with the Lord night and day, and at last fancied that they had obtained the superiority. Revelations were made to them, that the heretical army, together with Agag their general, would be delivered into their hands. Upon the assurances of these visions, they obliged their general to descend into the plain, and give the English battle. When Cromwell saw this mad action, he assured his followers, that the Lord had delivered them into his hands, and ordered his army to sing psalms, as if already certain of victory. The Scots, though double the number of the English, were soon put to flight, and pursued with great slaughter, while Cromwell did not lose in the action above 40 men.

¹⁶⁹ **They are defeated by Cromwell.** After this defeat, Charles put himself at the head of the remains of his army; and these he further strengthened by the royalists, who had been for some time excluded from his service by the covenanters. He was so closely pursued by Cromwell, however, that he soon found it impossible to maintain his army. Observing, therefore, that the way was open to England, he immediately directed his march towards that country, where he expected to be reinforced by all the royalists in that part of the kingdom. In this, however, he was deceived: the English, terrified at the name of his opponent, dreaded to join him. But his mortification was greatly increased, when at Worcester he was informed that Cromwell was marching with hasty strides from Scotland with an army of 40,000 men. This news was scarcely arrived, when Cromwell himself was there. He fell upon the town on all sides: the whole Scots army was either killed or taken prisoners; and the king himself, having given many proofs of personal valour, was obliged to fly.

¹⁷¹ **His adventures the most romantic that can be imagined.** After his hair was cut off, the better to disguise his person, he worked for some days in the habit of a peasant, cutting

^{Britain.} cutting faggots in a wood. He next made an attempt to retire into Wales, under the conduct of one Pendrel a poor farmer, who was sincerely attached to his cause. In this attempt, however, he was disappointed; every pass being guarded to prevent their escape. Being obliged to return, he met one Colonel Careless, who had escaped the carnage at Worcester. In his company the king was obliged to climb a spreading oak; among the thick branches of which they spent the day together, while they heard the soldiers of the enemy in pursuit of them below. From thence he passed with imminent danger, feeling all the varieties of famine, fatigue, and pain, till he arrived at the house of Colonel Lane, a zealous royalist in Staffordshire. There he deliberated about the means of escaping into France; and Bristol being supposed the properest port, it was resolved that he should ride thither before this gentleman's sister, on a visit to one Mrs Norton, who lived in the neighbourhood of that city. During this journey, he every day met with persons whose faces he knew, and at one time passed through a whole regiment of the enemy's army.

When they arrived at Mrs Norton's, the first person they saw was one of his own chaplains sitting at the door and amusing himself with seeing people play at bowls. The king, after having taken proper care of his horse in the stable, was shown to an apartment which Mrs Lane had provided for him, as it was said he had the ague. The butler, however, being sent to him with some refreshment, no sooner beheld his face, which was very pale with anxiety and fatigue, than he recollected his king and master; and falling on his knees, while the tears streamed down his cheeks, cried out, "I am rejoiced to see your majesty." The king was alarmed; but made the butler promise that he would keep the secret from every mortal, even from his master; and the honest servant punctually obeyed him.

No ship being found that would for a month set sail from Bristol either for France or Spain, the king was obliged to go elsewhere for a passage. He therefore repaired to the house of Colonel Wyndham in Dorsetshire, where he was cordially received. His mother, a venerable matron, seemed to think the end of her life nobly rewarded in having it in her power to give protection to her king. She expressed no dissatisfaction at having lost three sons and one grandchild in the defence of his cause, since she was honoured in being instrumental in his own preservation.

Pursuing from thence his journey to the sea-side, he once more had a very narrow escape at a little inn, where he set up for the night. The day had been appointed for a solemn fast; and a fanatical weaver, who had been a soldier in the parliamentary army, was preaching against the king in a little chapel fronting the house. Charles, to avoid suspicion, was himself among the audience. It happened that a smith, of the same principles with the weaver, had been examining the horses belonging to the passengers, and came to assure the preacher, that he knew by the fashion of the shoes, that one of the strangers horses came from the north. The preacher immediately affirmed; that this horse could belong to no other than Charles Stuart, and instantly went with a constable to search the inn. But Charles had taken timely precautions, and left the inn before the constable's arrival.

At Shoreham, in Sussex, a vessel was at last found, in which he embarked. He was known to so many, that if he had not set sail, at that critical moment, it had been impossible for him to escape. After 41 days concealment, he arrived safely at Feschamp in Normandy. No less than 40 men and women had at different times been privy to his escape.

Cromwell in the mean time returned in triumph; and his first care was to depress the Scots, on account of their having *withstood the work of the gospel*, as he called it. An act was passed for abolishing royalty in Scotland, and annexing that kingdom as a conquered province to the English commonwealth. It was empowered, however, to send some members to the English parliament. Judges were appointed to distribute justice; and the people of that country, now freed from the tyranny of the ecclesiastics, were not much dissatisfied with the government.

All parts of the British dominions being now reduced to perfect subjection to the parliament, they next resolved to chastise the Dutch, who had given but very slight causes of complaint. It happened that one Dr Dorislaus, who was of the number of the late king's judges, being sent by the parliament as their envoy to Holland, was assassinated by one of the royal party who had taken refuge there. Some time after, also, Mr St John, appointed their ambassador to that court, was insulted by the friends of the prince of Orange. These were thought sufficient reasons for a declaration of war against the Hollanders by the commonwealth of England. The parliament's chief dependence lay in the activity and courage of Blake their admiral; who, though he had not embarked in naval command till late in life, yet surpassed all that went before him in courage and dexterity. On the other side, the Dutch opposed to him their famous admiral Van Tromp, to whom their country never since produced an equal. Many were the engagements between those celebrated admirals, and various was their success. Several dreadful encounters served rather to show the excellency of the admirals than to determine their superiority. At last the Dutch, who felt many great disadvantages by the loss of their trade, and by the total suspension of their fisheries, were willing to treat of a peace. The parliament, however, gave but a very unfavourable answer. They studied to keep their navy on foot as long as they could; rightly judging, that while the force of the nation was exerted by sea, it would diminish the formidable power of Cromwell by land.

This great aspirer, however, quickly perceived their designs; and therefore, secure in the attachment of the army, resolved to seize the sovereign power. He persuaded the officers to present a petition for payment of arrears, and redress of grievances. His orders were obeyed: a petition was drawn up and presented, in which the officers, after demanding their arrears, desired the parliament to consider how many years they had sat, and what pretensions they had formerly made of their designs to new-model the house, and establish freedom on its broadest basis. They alleged, that it was now full time to give place to others; and however meritorious their actions might have been, yet the rest of the nation had some right, in their turn, to manifest their patriotism in defence of their country. The house was highly offended: they appointed a committee

to prepare an act, ordaining that all persons who presented such petitions for the future should be deemed guilty of high treason. To this the officers made a very warm remonstrance, and the parliament as angry a reply. Cromwell, being informed of this altercation, started up in the utmost seeming fury, and turning to Major Vernon, cried out, "that he was compelled to do a thing that made the very hair of his head stand on end." Then hastening to the house with 300 soldiers, and with the marks of violent indignation on his countenance, he entered, took his place, and attended to the debates for some time. When the question was ready to be put, he suddenly started up, and began to lead the parliament with the vilest reproaches for their tyranny, ambition, oppression, and robbery of the public. Upon which, stamping with his foot, which was the signal for the soldiers to enter, the place was immediately filled with armed men. Then, addressing himself to the members, "For shame (said he), get you gone. Give place to honest men; to those who will more faithfully discharge their trust. You are no longer a parliament; I tell you, you are no longer a parliament; the Lord has done with you." Sir Harry Vane exclaiming against this conduct, "Sir Harry! (cries Cromwell with a loud voice), O Sir Harry Vane! The Lord deliver me from Sir Harry Vane!" Taking hold then of one of the members by his cloak, "Thou art a whoremaster," cries he; to another, "Thou art an adulterer;" to a third, "Thou art a drunkard;" to a fourth, "Thou art a glutton, &c." "It is you (continued he to the members), that have forced me upon this. I have sought the Lord night and day, that he would rather slay me than put me upon this work." Then pointing to the mace, "Take away that bauble," cried he: after which, turning out all the members, and clearing the hall, he ordered the doors to be locked; and putting the keys in his pocket, returned to Whitehall.

177
and chooses
another.

Thus the whole civil and military power centered in Cromwell, who by this bold transaction became, in effect, king of Great Britain, with uncontrollable authority. Being willing, however, to amuse the people with the form of a commonwealth, he proposed to give his subjects a parliament; but such a one as should be altogether obedient to his commands. For this purpose it was decreed, that the sovereign power should be vested in 144 persons, under the denomination of a parliament; and he undertook to make the choice himself. The persons pitched upon were the lowest, meanest, and most ignorant among the citizens, and the very dregs of the fanatics. To go further than others in the absurdities of fanaticism was the chief qualification upon which each of these valued himself. Their very names, borrowed from scripture, and rendered ridiculous by their misapplication, served to show their excess of folly. One of them particularly, who was called *Praise God Barebone*, a canting leather-seller, gave his name to this odd assembly, and it was called *Barebone's Parliament*. They were chiefly composed of Antinomians; a sect that, after receiving the spirit, supposed themselves incapable of error; and the fifth monarchy-men, who every hour expected Christ's second coming on earth. They began by choosing eight of their tribe to seek the Lord in prayer, while the rest calmly sat down to deliberate upon the suppres-

Britain.

sion of the clergy, the universities, and courts of justice; and instead of all this, it was their intention to substitute the law of Moses.

It was impossible such a legislature as this could stand; even the vulgar began to exclaim against it, and Cromwell himself to be ashamed of their absurdities. He had carefully chosen many persons among them who were entirely devoted to his interests, and these he commanded to dismiss the assembly. These accordingly met by concert earlier than the rest of their fraternity; and observing to each other that this parliament had sat long enough, they hastened to Cromwell, with Rouse their speaker at their head, and into his hands resigned the authority with which he had invested them. Cromwell accepted their resignation with pleasure: but being told that some of their number were refractory, he sent Colonel White to clear the house of such as ventured to remain there. They had placed one Moyer in the chair by the time that the colonel had arrived; and he being asked by the colonel, What they did there? Moyer replied very gravely, That they were seeking the Lord. "Then you may go elsewhere (cried White); for, to my certain knowledge, the Lord hath not been here these many years."

178
Who are
again turn-
ed out.

The shadow of a parliament being thus dissolved, the officers, by their own authority, declared Cromwell protector of the commonwealth of England. The mayor and aldermen were sent for to give solemnity to his appointment, and he was instituted into his new office at Whitehall, in the palace of the kings of England. He was to be addressed by the title of *Highness*; and his power was proclaimed in London, and other parts of the kingdom. It was now, indeed, in a great measure necessary that some person should take the supreme command; for affairs were brought into such a situation, by the furious animosities of the contending parties, that nothing but absolute power could prevent a renewal of former bloodshed and confusion.

179
Cromwell
declared
protector.

The government of the kingdom was adjusted in the following manner. A council was appointed, which was not to exceed 21, nor to be under 13 persons. These were to enjoy their offices for life, or during good behaviour; and, in case of a vacancy, the remaining members named three, of whom the protector chose one. The protector was appointed the supreme magistrate of the commonwealth, with such powers as the king was possessed of. The power of the sword was vested in him jointly with the parliament when sitting, or with the council at other times. He was obliged to summon a parliament once every three years, and to allow them to sit five months without adjournment. A standing army was established of 20,000 foot and 10,000 horse; and funds were assigned for their support. The protector enjoyed his office for life; and on his death, the place was to be supplied by the council. Of all these clauses the standing army was sufficient for Cromwell's purpose; for, while possessed of that instrument, he could mould the rest of the constitution to his pleasure at any time. He chose his council from among his officers, who had been the companions of his dangers and victories, to each of whom he assigned a pension of 1000*l.* a-year. He took care to have his troops, upon whose fidelity he depended for support, paid a month in advance: the magazines were also well provided, and the public treasure managed with frugality

180

ment.

¹⁸¹ Britain. and care; while his activity, vigilance, and resolution, were so well exerted, that he discovered every conspiracy against his person, and every plot for an insurrection, before they took effect.

¹⁸¹ His vigorous administration. Thus Cromwell continued to govern, though without assuming the title of *king*, in as absolute a manner as the most despotic prince in Europe. As he was feared at home, so he made himself respected abroad. The Dutch, having been humbled by repeated defeats, were obliged to sue for peace. Cromwell obliged them to pay deference to the British flag. He compelled them to abandon the interests of the king, to pay 85,000*l.* as an indemnification for former expences, and to restore to the English East India Company a part of those dominions which they had been dispossessed of by the Dutch during the former reign. The ministry of France thought proper to pay deference to the imperious character of the protector; and he having lent that court a body of 6000 men to attack the Spanish dominions in the Netherlands, who obtained a signal victory, the French put Dunkirk into his hands as a reward for his attachment. By means of the celebrated admiral Blake* he humbled Spain prodigiously, as also the Algerines and Tunesines. Penn and Venables, two other admirals, made an attempt on the island of Hispaniola; but failing of this, they steered to Jamaica, which was surrendered to them without a blow. Yet so little was thought of the importance of this conquest, that, on their return, the two admirals were committed to the Tower, on account of the failure of the principal object of their equipment.

* See the article *Blake*.

¹⁸² Jamaica conquered.

¹⁸³ His arbitrary methods of procuring money.

¹⁸⁴ He convenes a parliament.

¹⁸⁵ Who offer him the crown,

It is not to be supposed that a numerous standing army could be maintained, and so many foreign wars carried on, without incurring extraordinary expences. The protector's revenues were so much exhausted, that he was obliged to have recourse to methods which he probably would not have chosen, had he not been driven to them by necessity. One or two conspiracies entered into by the royalists, which were detected and punished, served him as a pretence to lay a heavy tax upon all that party, of the tenth penny of all their possessions. In order to raise this oppressive imposition, ten major-generals were instituted, who divided the whole kingdom into so many military jurisdictions. These men had power to subject whom they pleased to this tax, and to imprison such as denied their jurisdiction. Under colour of these powers they exercised the most arbitrary authority; the people had no protection against their exactions; the very mask of liberty was thrown off, and all property was at the disposal of a military tribunal. It was in vain that the nation cried out for a free parliament. Cromwell assembled one in consequence of their clamours; but as speedily dissolved it when he found it refractory to his commands. At last, as parliaments were always held in such estimation by the people, he resolved to give them one, but such as should be entirely of his own choosing, and chiefly composed of his creatures. Lest any of a different complexion should enter the house, guards were placed at the door, and none admitted but such as produced a warrant from his council.

The principal design of convening this assembly was, that they should offer him the crown, with the title of *king*, and all the other ensigns of royalty. His creatures, therefore, took care to insinuate the confusion

there was in legal proceedings, without the name of a ¹⁸⁶ king; that no man was acquainted with the extent or limits of the present magistrates authority, but those of a king had been well ascertained by the experience of ages. The motion was at last formally made in the house, easily carried through, and nothing was now wanting but Cromwell's own consent to have his name enrolled among the kings of England. This consent, however, he never had resolution enough to give. His doubts continued for some days; and the conference carried on with the members who made him the offer, so far as it is on his part intelligible, seems to argue that he was desirous of being compelled to accept the offer: however, the conference ended in his total ¹⁸⁷ refusal.

With all these proffered honours, and with all his ¹⁸⁷ despotic power, the situation of Cromwell was far from His miserable situation. being enviable. Perhaps no situation, however mean, or loaded with contempt, could be more truly distressful than his, at the time the nation was loading him with congratulations and addresses. He had at last rendered himself hateful to every party, and he owed his safety to their mutual hatred and diffidence of one another. His arts of dissimulation were exhausted; none could be deceived by them; even those of his own party and principles disdaining the use to which he had converted his zeal and professions. Though the whole nation silently detested his administration, he had not been completely wretched if he could have found domestic consolation. But even his own family had embraced republican principles with so much vehemence, that they could not without indignation behold him invested with uncontrollable power; and Mrs Claypole, his favourite daughter, upbraided him on her death-bed, with all the crimes which led him to trample on the throne. To add to all this, not only were conspiracies formed against him, but he was at last taught, upon reasoning principles, that his death was not only desirable, but his assassination would be meritorious. A book was published by Colonel Titus, a man who had formerly been attached to his cause, entitled *Killing no Murder*. Of all the pamphlets that appeared at that time, or perhaps of those that have since appeared, this was the most eloquent and masterly. Cromwell read it, and is said never to have smiled afterwards.

The usurper now found, that the grandeur to which he had sacrificed his former tranquillity was only an inlet to fresh inquietudes. He was haunted with perpetual fears of assassination. He wore armour under his clothes, and always kept pistols in his pockets. His aspect was clouded by a settled gloom, and he regarded every stranger with suspicion. He was always attended by a numerous guard, and travelled in a hurry. He never returned from any place by the road he went; and never slept above three nights together in the same chamber. At last he was delivered from this life ¹⁸⁸ and death. of horror and anxiety by a tertian ague, of which he died September 3. 1658, after having usurped the government nine years.

Oliver Cromwell was succeeded in his office of pro-¹⁸⁹ Richard protector by his son Richard, who immediately called a Cromwell parliament. To this assembly the army presented a re-protector. monstrance, desiring some person for their general in whom they could confide. The house voted such meetings

Britain. ings and remonstrances unlawful : upon which the officers, surrounding Richard's house, forced him to dissolve the parliament ; and soon after he signed an abdication of the government. His younger brother Henry, who had been appointed to the command in Ireland, followed Richard's example, and resigned his commission without striking a blow.

Rump parliament restored.

The officers, thus left at liberty, resolved to restore the *rump parliament* as it was called, consisting of that remnant of a parliament which had condemned Charles. They were no sooner reinstated in their authority, however, than they began to humble the army by cashiering some of the officers, and appointing others on whom they could have more dependence. The officers immediately resolved to dissolve the assembly. Lambert, one of the general officers, drew up a chosen body of troops ; and placing them in the streets which led to Westminster-hall, when the speaker Lenthall proceeded in his carriage to the house, he ordered the horses to be torned, and very civilly conducted him home. The other members were likewise intercepted ; and the army returned to their quarters to observe a solemn fast, which generally either preceded or attended their outrages. A committee was then elected, of 23 persons ; of whom seven were officers. These they pretended to invest with sovereign authority ; and a military government was established, which gave the nation a prospect of endless servitude and tyranny without redress.

Upon hearing that the officers had by their own authority dissolved the parliament, General Monk, who was then in Scotland with 8000 veteran troops, protested against the measure, and resolved to defend the national privileges. As soon as he put his army in motion, he found himself eagerly sought after by all parties ; but so cautious was he of declaring his mind, that, till the very last, it was impossible to know which side he designed to take. A remarkable instance of this cautious behaviour was, that, when his own brother came to him with a message from Lord Granville in the name of the king, he refused all conversation with him upon hearing that he had told his errand to Mr Price, the general's own chaplain, and a man of known probity and honour.

Hearing that the officers were preparing an army to oppose him, Monk amused them with negotiations ; and the people, finding themselves not entirely defenceless, began to declare for a free parliament. The *Rump*, finding themselves invited also by the navy and part of the army, again ventured to resume their seats, and to thunder votes in their turn against the officers and that party of the army by which they had been ejected. Without taking any notice of Lambert, they sent orders to the troops to repair immediately to the garrisons appointed for them. The soldiers obeyed ; and Lambert at last found himself deserted by his whole army. Monk in the mean time proceeded with his army to London. The gentry, on his march, flocked round him with addresses, expressing their desire of a new parliament ; but that general, still continuing his inflexible taciturnity, at last came to St Albans, within a few miles of the capital, leaving all the world in doubt as to his motives and designs. Here he sent the parliament a message, desiring them to remove such forces as remained in London to country quarters. Some of the regiments willingly obeyed this order ;

and such as did not, Monk turned out by force : after which he took up his quarters with his army in Westminster. The house voted him thanks for his services : he desired them to call a free parliament ; and this soon inspired the citizens to refuse submission to the present government. They resolved to pay no taxes until the members formerly excluded by Colonel Pride should be replaced. For this they were punished by Monk, at the desire of the parliament. He arrested 11 of the most obnoxious of the common-council ; broke the gates and portcullises ; and, having exposed it to the scorn and contempt of all who hated it, he returned in triumph to his quarters at Westminster. The next day, however, he made an apology for this conduct, and promised for the future to co-operate with the mayor and common council in such schemes as they should approve.

The commons were now greatly alarmed. They tried every method to gain off the general from his new alliance. Some of them even promised to invest him with the dignity of supreme magistrate, and to support his usurpation. But Monk was too just, or too wise, to hearken to such wild proposals ; he resolved to restore the secluded members, and by their means to bring about a new election.

The restoration of the expelled members was easily effected, and their number was so much superior to that of the *Rump*, that the chiefs of this last party now thought proper to withdraw in their turn. The restored members began with repealing all those orders by which they had been expelled. They renewed and enlarged the general's commission ; fixed a proper stipend for the support of the fleet and army ; and, having passed these votes, they dissolved themselves, and gave orders for the immediate assembling of a new parliament. Meanwhile, Monk new-modelled his army to the purposes he had in view. Some officers, by his direction, presented him with an address, in which they promised to obey implicitly the orders of the ensuing parliament. He approved of this engagement, which he ordered to be signed by all the different regiments ; and this furnished him with a pretence for dismissing all the officers by whom it was rejected.

In the midst of these transactions, Lambert, who had been confined in the Tower, escaped from his prison, and began to raise forces ; and as his activity and principles were sufficiently known, Monk took the earliest precautions to oppose his measures. He dispatched against him Colonel Ingoldsby, with his own regiment, before Lambert had time to assemble his dependents. That officer had taken possession of Daventry with four troops of horse : but the greater part of them joined Ingoldsby ; to whom he himself surrendered, not without exhibiting strong marks of pusillanimity.

All this time Monk still persisted in his reserve ; nor would he intrust his secret intentions with any person, except one Morrice, a gentleman of Devonshire. He was of a sedentary and studious disposition ; and with him alone did the general deliberate on the great and dangerous enterprise of the restoration. Sir John Granville, who had a commission from the king, applied for access to the general ; but he was desired to communicate his business to Morrice. Granville refused, though twice urged, to deliver his message to any but the general himself : so that Monk, now finding he could de-

pend on this minister's secrecy, opened to him his whole intentions; but with his usual caution, refused to commit any thing to paper. In consequence of these, the king left the Spanish territories, where he very narrowly escaped being detained at Breda by the governor, under pretence of treating him with proper respect and formality. From thence he retired to Holland, where he resolved to wait further advice.

The new parliament being assembled, Sir Harbottle Grimstone was chosen speaker, a man known to be a royalist in his heart. The affections of all were turned towards the king; yet such were their fears, and such dangers attended a freedom of speech, that no one dared for some days to make any mention of his name. At length Monk gave directions to Annesley, president of the council, to inform them that one Sir John Granville, a servant of the king's, had been sent over by his majesty, and was now at the door with a letter to the house of commons. This message was received with the utmost joy. Granville was called in, the letter read, and the king's proposals immediately accepted of. He offered a general amnesty to all persons whatsoever, and that without any exceptions but what should be made by parliament. He promised to indulge scrupulous consciences with liberty in matters of religion; to leave to the examination of parliament the claims of all such as possessed lands with contested titles; to confirm all these concessions by act of parliament; to satisfy the army under General Monk with respect to their arrears, and to give the same rank to his officers when they should be enlisted in the king's army.

In consequence of this good agreement between king and parliament, Montague the English admiral waited on his majesty to inform him that the fleet expected his orders at Scheveling. The duke of York immediately went on board, and took the command as lord high admiral. The king embarked, and landing at Dover, was received by the general whom he tenderly embraced. He entered London in 1660, on the 29th of May, which was his birth-day; and was attended by an innumerable multitude of people, who testified their joy by the loudest acclamations.

Charles II. was 30 years of age at the time of his restoration. Being naturally of an engaging countenance, and possessed of an open and affable disposition, he became the favourite of all ranks of his subjects. They had now felt the miseries of anarchy, and in proportion to these miseries was the satisfaction they felt on the accession of their young monarch. His first measures were calculated to give universal satisfaction. He seemed desirous of losing the memory of past animosities, and of uniting every party in affection for their prince and country. He admitted into his council the most eminent men of the nation, without regard to former distinctions. The presbyterians shared this honour equally with the royalists. Calamy and Baxter, presbyterian clergymen, were even made chaplains to the king. Admiral Montague was created earl of Sandwich, and General Monk duke of Albemarle. Morrice, the general's friend, was created secretary of state. But what gave the greatest contentment to the nation was the judicious choice which the king at first made of his principal ministers and favourites. Sir Edward Hyde, created earl of Clarendon, was prime minister and chancellor. The marquis, created duke of Ormond,

was steward of the household; the earl of Southampton high-treasurer; Sir Edward Nicholas secretary of state. These men, united together in the strictest friendship, and combining in the same laudable inclinations, supported each others credit, and pursued the interests of the public.

The parliament having been summoned without the king's consent, received at first only the title of a *convention*; and it was not till after an act passed for that purpose, that they were acknowledged by the name of *parliament*. Both houses owned the guilt of the former rebellion, and gratefully received in their own name, and in that of all the subjects, his majesty's gracious pardon and indemnity. The king had before promised an indemnity to all criminals, but such as should be excepted by parliament: he now issued a proclamation, declaring, that such of the late king's judges as did not surrender themselves within 14 days should receive no pardon. Nineteen surrendered themselves; some were taken in their flight; others escaped beyond sea. The peers seemed inclined to great severity on this occasion; but were restrained by the king, who in the most earnest terms pressed the act of general indemnification.

After repeated solicitations, the act of indemnity passed both houses, with the exception of those who had an immediate hand in the king's death. Even Cromwell, Ireton, and Bradshaw, though dead, were considered as proper objects of resentment: their bodies were dug from their graves; dragged to the place of execution; and, after hanging some time, buried under the gallows. Of the rest who sat in judgment on the late monarch's trial, some were dead, and some thought worthy of pardon. Ten only, out of 80, were doomed to immediate destruction; and these were enthusiasts who had all along acted from principle, and who, in the general spirit of rage excited against them, showed a fortitude that would have done honour to a better cause.

This was all the blood that was shed at the restoration. The rest of the king's judges were reprieved, and afterwards dispersed into several prisons. The army was disbanded, that had for so many years governed the nation; prelacy, and all the ceremonies of the church of England, were restored; at the same time that the king pretended to preserve the air of moderation and neutrality. In fact, with regard to religion, Charles, in his gayer hours, was a professed deist; but in the latter part of his life he shewed an inclination to the Catholic persuasion, which he had strongly imbibed in his infancy and exile.

On the 13th of September this year, died the young duke of Gloucester, a prince of great hopes. The princess of Orange, having come to England, in order to partake of the joy attending the restoration of her family, with whom she lived in great friendship, soon after sickened and died. The queen-mother paid a visit to her son, and obtained his consent to the marriage of the princess Henrietta with the duke of Orleans, brother to the French king. The parliament having met on the 6th of November, and carried on business with the greatest unanimity and dispatch, were dissolved by the king on the 29th of December 1660.

During

Britain.
207
General
state-of-the
nation du-
ring Charles
II.'s reign.

During the reign of Charles II. the spirit of the people seemed to take a turn quite opposite to that in the time of Charles I. The latter found his subjects animated with a ferocious though ignorant zeal for liberty. They knew not what it was to be free, and therefore imagined that liberty consisted in throwing off entirely the royal authority. They gained their point: the unhappy monarch was dethroned and murdered; but instead of liberty, they found themselves involved in much worse tyranny than before. Being happily freed from this tyranny by the restoration, they ran into the contrary extreme; and instead of an unbounded spirit of opposition, there was nothing now to be found but as unbounded a spirit of submission; and through the slavish submissions and concessions of the people of this reign, Charles found means to render himself at last almost quite absolute, and to govern without requiring, or indeed without having any occasion for parliament.

A like revolution took place with regard to religious matters. During the former reigns a spirit of the most gloomy enthusiasm had overspread the whole island, and men imagined that the Deity was only to be pleased by their denying themselves every social pleasure, and refusing every thing that tended to make life agreeable. The extreme hypocrisy of Cromwell and his associates, and the absurd conduct of others, showed that this was not religion; but, in avoiding this error, they ran into one equally dangerous; and every thing religious or serious was discountenanced. Nothing but riot and dissipation took place everywhere. The court set them the example; nothing but scenes of gallantry and festivity were to be seen; the horrors of the late war became the subject of ridicule; the formality of the sectaries was displayed on the stage, and even laughed at from the pulpit. In short, the best mode of religion now was to have as little as possible; and to avoid not only the hypocrisy of the sectaries, but even the common duties of morality.

208
Ingratitude
of Charles.

In the midst of this riot and dissipation, the old and faithful followers of the royal family were left unrewarded. Numbers who had fought both for the king and his father, and who had lost their whole fortunes in his service, still continued to pine in want and oblivion; while in the mean time their persecutors, who had acquired fortunes during the civil war, were permitted to enjoy them without molestation. The wretched royalists petitioned and murmured in vain; the monarch fled from their expostulations to scenes of mirth and festivity; and the act of indemnity was generally said to have been an act of *forgiveness* to the king's enemies, and of *oblivion* to his friends.

209
Submissive
disposition
of both par-
liaments.

In 1661, the Scotch and English parliaments seemed to vie with each other in their protestations to the king. In England, monarchy and episcopacy were raised to the greatest splendor. The bishops were permitted to resume their seats in the house of peers; all military authority was acknowledged to be vested in the king. He was empowered to appoint commissioners for regulating corporations, and expelling such members as had intruded themselves by violence, or professed principles dangerous to the constitution. An act of uniformity was passed, by which it was required that every clergyman should be re-ordained, if he had not before received episcopal ordination; that he should

Britain.

declare his consent to every thing contained in the book of Common Prayer, and should take the oath of canonical obedience. In consequence of this law, above 2000 of the presbyterian clergy resigned their cures at once. In Scotland the right of the king was asserted in the fullest and most positive terms to be hereditary, divine, and indefeasible. His power was extended to the lives and possessions of his subjects, and from his original grant was said to come all that they enjoyed. They voted him an additional revenue of 40,000l.; and all their former violences were treated with a degree of the utmost detestation.

This intoxication of loyalty, however, began soon to wear off. The king's profusion and extravagance in his pleasures, together with his indolence in administration, furnished opportunities of making very disadvantageous comparisons between him and Oliver Cromwell. These animosities were heightened by the ejected clergy, especially when they saw Dunkirk, which had been acquired during the usurper's vigorous administration, sold to the French for 40,000l. and that merely to supply the king's extravagance. From this time (August 17. 1662) Charles found himself perpetually opposed, and his parliaments granted supplies much more reluctantly than before.

210
The nation
disgusted
with the
king's ex-
travagance.

A few months before, the continual exigencies of the king had forced him to conclude a marriage with the infanta of Portugal for the sake of her portion, which was 500,000l. in money, together with the fortress of Tangier in Africa, and of Bombay in the East Indies. The chancellor Clarendon, the dukes of Ormond and Southampton, urged many reasons against this match, particularly the likelihood of her never having any children; but all their objections could not prevail, and therefore Clarendon set himself to promote it as far as lay in his power. Still, however, the king's necessities were greater than his supplies. He therefore resolved to sacrifice his minister the great Clarendon to the resentment of the parliament, to whom he was become obnoxious, in order to procure some more supplies for himself. In 1663, an extraordinary supply was demanded: the king sent for the commons, on the 12th of June, to Whitehall. He complained of their inattention; and by acquainting them of a conspiracy to seize the castle of Dublin, he hoped to furnish a reason for demanding a present supply. Four subsidies were immediately granted, and the clergy in convocation followed the example of the commons. On this occasion the earl of Bristol ventured to impeach the chancellor in the house of peers; but as he did not support his charge, the affair was dropped for the present.

212

With a view probably of having the money to be employed for that purpose in his hands, Charles was induced to declare war against the Dutch in 1664. In this war the English, under the command of Sir Robert Holmes, expelled the Dutch from Cape-Corse castle on the coast of Africa, and likewise seized on their settlements of Cape Verd and the isle of Goree. Sailing from thence to America, the admiral possessed himself of Nova Belgia, since called *New York*; and which has ever since continued subject to Britain. On the other hand, De Ruyter, the Dutch admiral, dispossessed the English of all their settlements in Guinea except Cape Corse. He afterwards sailed to America, where

he

Britain.
213
Terrible
battles at
sea.

he attacked Barbadoes and Long Island, but was repulsed. Soon after, the two most considerable fleets of each nation met; the one under the duke of York, to the number of 114 sail; the other commanded by Opdam admiral of the Dutch navy, of nearly equal force. The engagement began at four in the morning, and both sides fought with equal intrepidity. The duke of York was in the hottest part of the engagement, and behaved with great spirit and composure, while many of his lords and attendants were killed beside him. In the heat of the action the Dutch admiral's ship blew up; which so discouraged and disheartened them, that they fled towards their own coast, having 30 ships sunk and taken, while the victors lost only one. This success of the English so much excited the jealousy of the neighbouring states, that France and Denmark immediately resolved to protect the republic from such formidable enemies. De Ruyter the great Dutch admiral, on his return from Guinea, was appointed, at the head of 76 sail, to join the duke of Beaufort the French admiral, who it was supposed was then entering the British channel from Toulon. The duke of Albemarle and Prince Rupert now commanded the British fleet, which did not exceed 74 sail. Albemarle detached Prince Rupert with 20 ships to oppose the duke of Beaufort; against which piece of rashness Sir George Ayscue protested in vain. The fleets thus engaging upon unequal terms, a most memorable battle ensued. The first day, the Dutch admiral Evertzen was killed by a cannon-ball, one of their ships was blown up, and three of the English ships taken; the combatants were parted by darkness. The second day they renewed the battle with incredible fury. Sixteen fresh ships joined the Dutch; and the English were so shattered, that their fighting ships were reduced to 28. Upon retreating towards their own coast, the Dutch followed them; where another dreadful conflict was beginning, but parted by the darkness of the night as before. The morning of the third day the English continued their retreat, and the Dutch their pursuit. Albemarle came to the desperate resolution of blowing up his own ship rather than submit to the enemy, when he found himself happily reinforced by Prince Rupert with 16 ships of the line. By this time it was night; and the next day the fleets came again to a close combat, which was continued with great violence, till they were parted by a mist. Sir George Ayscue, having the misfortune to strike on the Galoper sands, was taken, with a ship of 100 guns.

214
Dutch fleet
appears
in the
Thames.

Both sides claimed the victory, but the Dutch certainly had the advantage in this engagement. A second, however, equally bloody, happened soon after, with larger fleets on both sides, commanded by the same admirals. In this the Dutch were vanquished; but they were soon in a condition to face their enemies, by the junction of Beaufort the French admiral. The Dutch fleet appeared in the Thames, conducted by their great admiral. The English were thrown into the utmost consternation: a chain had been drawn across the river Medway; and some fortifications had been added to the forts along the bank. But all these were unequal to the present force: Sheerness was soon taken; the Dutch passed forward and broke the chain, though fortified by some ships sunk by Albemarle's or-

ders. Destroying the shipping in their passage, they still advanced, with six men of war and five fire-ships, as far as Upnore castle, where they burned the men of war. The whole city of London was in consternation; it was expected that the Dutch might sail up next tide to London bridge, and destroy not only the shipping, but even the buildings of the metropolis. The Dutch, however, were unable to prosecute that project from the failure of the French who had promised them assistance. Spreading therefore an alarm along the coast, and having insulted Norwich, they returned to their own coasts.

During these transactions abroad, happened a great Plague and fire at London, which destroyed 100,000, of the inhabitants. This calamity was soon followed by another, still more dreadful if possible. A fire broke out in a baker's house in Pudding-lane near the bridge, and spread with such rapidity, that no efforts could extinguish it till it laid in ashes the most considerable part of the city. This calamity, though it reduced thousands to beggary, proved in the end both beneficial and ornamental to the city. It rose from its ruins in greater beauty than ever; the streets being widened, and the houses built of brick instead of wood, became thus more wholesome and secure. In so great a calamity it is remarkable that not a single life was lost.

These complicated misfortunes did not fail to excite many murmurs among the people: The blame of the fire was laid on the Papists: the Dutch war was exclaimed against as unsuccessful and unnecessary, as being an attempt to humble that nation who were equal enemies to Popery with themselves. Charles himself also began to be sensible, that all the ends for which he had undertaken the Dutch war were likely to be entirely frustrated. Instead of being able to lay up money for himself, the supplies of parliament had hitherto been so scanty, that he found himself considerably in debt. A treaty therefore was set on foot, which was concluded at Breda on the 21st of July 1667. By this treaty the only advantage gained by Britain was, the cession of the colony of New York. It was therefore judged disgraceful, and the blame of it thrown upon the unhappy earl of Clarendon. Along with this, he was charged with the sale of Dunkirk; the bad payment of the seamen; the disgrace by the Dutch fleet; and his own ambition. His daughter, while yet in Paris, had commenced an amour with the duke of York; and under a solemn promise of marriage had admitted him to her bed. Her lover, however, either of his own accord, or through the persuasions of his brother Charles, afterwards married her; and this was imputed as a crime to Clarendon. On these accusations, the king, who on account of his rigid virtue had never much loved this nobleman, ordered the seals to be taken from him, and given to Sir Orlando Bridgemen. Clarendon was again impeached; and though the charges were manifestly frivolous, yet so strong was the popular torrent against him, that he thought proper to withdraw into France. Soon after, the king formed an alliance with Holland and Sweden, in order to prevent the French king from completing his conquest of the Netherlands. The greatest part of this country he had already subdued, when he was unexpectedly stopped by this league; in which it was agreed by the contracting powers,

²¹⁹ **Britain.** powers, that they would constitute themselves arbiters of the differences between France and Spain, and check the exorbitant pretensions of either.

Arbitrary proceedings of Charles.

The king now began to act in a very arbitrary manner. He had long wished to extend his prerogative, and to be able to furnish himself with whatever sums he might want for his pleasures, and therefore was most likely to be pleased with those ministers who could flatter both his wishes at once. These he found in Clifford, Ashley, Buckingham, Arlington, and Lauderdale, a junto distinguished by the name of the *cabal*; a word formed by the initials of their names. The first effects of their advice was a secret alliance with France, and a rupture with Holland. Soon after this the duke of York declared himself a Papist; and liberty of conscience was proclaimed to all sectaries, whether dissenters or Papists: a proclamation was issued containing very rigorous clauses in favour of pressing; another full of menaces against those who should speak undutifully of his majesty's measures; and even against those who heard such discourses, unless they informed in due time against the offenders. All these things gave very great and just offence to the people; but they were especially alarmed at the alliance with France, and justly afraid of the treachery of that nation.

²²⁰ New war with Holland.

²²¹ A desperate naval engagement.

On the 28th of May 1672, the English fleet under the duke of York was surprised by the Dutch in Southwold bay. About eight in the morning began a most furious engagement. The gallant Sandwich, who commanded the English van, drove his ship into the midst of the enemy, beat off the admiral that ventured to attack him, sunk another ship that attempted to board him, and three fire ships that offered to grapple with him. Though his vessel was torn with shot, and out of 1000 men there only remained 400, he still continued to fight. At last, a fire-ship, more fortunate than the rest, having laid hold of his vessel, her destruction became inevitable, and the earl himself was drowned in attempting to swim to some other ship. Night parted the combatants; the Dutch retired, and were not followed by the English. The loss sustained by the two maritime powers was nearly equal; but the French suffered very little, not having entered into the heat of the engagement. It was even supposed that they had orders for this conduct, and to spare their own ships, while the Dutch and English should weaken each other by their mutual animosities.

²²² Success of Louis XIV. against the Dutch.

The combined powers were much more successful against the Dutch by land. Louis conquered all before him, crossed the Rhine, took all the frontier towns of the enemy, and threatened the new republic with a final dissolution. Terms were proposed to them by the two conquerors. Louis offered them such as would have deprived them of all power of resisting an invasion from France by land. Those of Charles exposed them equally to every invasion by sea. At last the murmurs of the English at seeing this brave and industrious people, the supporters of the Protestant cause, totally sunk and on the brink of destruction, were too loud not to reach the king. He was obliged to call the parliament, to take the sense of the nation upon his conduct; and he soon saw how his subjects stood affected.

²²³ The parliament called.

The parliament met on the 24th of February 1673. They began by repressing some of the king's extraordinary stretches of prerogative, and taking means for

uniformity in religious matters. A law was passed, entitled the *test act*, imposing an oath on all who should enjoy any public benefice. Besides the taking the oaths of allegiance and the king's supremacy, they were obliged to receive the sacrament once a year in the established church, and to abjure all belief in the doctrine of transubstantiation. As the dissenters also had seconded the efforts of the commons against the king's declaration of indulgence to Roman Catholics, a bill was passed for their ease and relief, which, however, went with some difficulty through the house of peers. The Dutch, in the mean time continued to defend themselves with such valour, that the commons began to despair of success. They therefore resolved that the standing army was a grievance: they next declared, that they would grant no more supplies to carry on the Dutch war, unless it appeared that the enemy were so obstinate as to refuse all reasonable conditions. To cut short these disagreeable altercations, the king resolved to prorogue the parliament; and with that intention, went unexpectedly to the house of peers, from whence he sent the usher of the black-rod to summons the house of commons to attend. It happened that the usher and the speaker met nearly at the door of the house; but the speaker being within, some of the members suddenly shut the door, and cried, "To the chair." Upon which the following motions were instantly made in a tumultuous manner: That the alliance with France was a grievance; that the evil counsellors of the king were a grievance; that the earl of Lauderdale was a grievance: and then the house rose in great confusion. The king soon saw that he could expect no supply from the commons for carrying on the war which was so disagreeable to them; he resolved, therefore, to make a separate peace with the Dutch, on terms which they had proposed by the Spanish ambassador. For form's sake, he asked the advice of his parliament: who concurring heartily in his intentions, a peace was concluded accordingly.

²²⁴ Britain. Test act framed.

²²⁵ Tumult in the house of commons.

The prepossession which Charles had all along shewn for France, and his manifest inclination upon all occasions to attach himself to that kingdom, had given great offence to his people. Along with this, other circumstances conspired to raise a general discontent. The toleration of Catholics, so much wished for by the king; the bigotry of the duke of York, the heir apparent to the crown, and his zeal for the propagation of the Catholic religion; excited a consternation not altogether without foundation, as if the Protestant religion was in danger. This fear and discontent was carefully kept up and fomented by wicked and designing men, who to promote their own interests would not scruple to advance the grossest falsehoods. In 1678, an account of a plot, formed by the Papists for destroying the king and the Protestant religion, was given in by one Kirby a chemist, Dr Tong, a weak credulous clergyman, and Titus Oates, who had likewise been a clergyman, but one of the most abandoned miscreants that can be imagined. The circumstances attending this pretended discovery were so perfectly incredible, that it appears amazing how any person of common sense could give ear to them. Nevertheless, so much were the minds of the nation in general inflamed against the Catholics at this time, that it not only produced the destruction of individuals of the Romish persuasion, but an universal

²²⁶ National discontents

See Oates

Britain.

massacre of that unhappy sect was apprehended. The parliament, who ought to have repressed these delusions, and brought back the people to calm deliberate inquiry, were found more credulous than even the vulgar themselves. The cry of plot was immediately echoed from one house to the other; the country party could not slip so favourable an opportunity of managing the passions of the people; the courtiers were afraid of being thought disloyal if they should doubt the guilt of those who were accused of designs against the king's person. Danby, the prime minister, himself entered into it very furiously, and persisted in his inquiries notwithstanding all the king's advice to the contrary. Charles himself, who was the person that ought to have been most concerned, was the only one who treated it with contempt. Nothing, however, could stop the popular fury; and for a time the king was obliged to give way to it.

227
Lord Danby impeached.

During the time of this general uproar and persecution, the lord treasurer Danby was impeached in the house of commons by Seymour the speaker. The principal charge against him was, his having written a letter to Montague the king's ambassador at Paris, directing him to sell the king's good offices at the treaty of Nimeguen, to the king of France, for a certain sum of money; contrary to the general interests of the confederates, and even of those of his own kingdoms. Though the charge was just, yet Danby had the happiness to find the king resolved to defend him. Charles assured the parliament, that, as he had acted in every thing by his orders, he held him entirely blameless; and though he would deprive him of all his employments, yet he would positively insist on his personal safety. The lords were obliged to submit: however, they went on to impeach him, and Danby was sent to the Tower; but no worse consequences followed.

228
Exclusion bill brought in.

These furious proceedings had been carried on by a house of commons that had continued undissolved for above 17 years. They were now dissolved, and another parliament was called; which, however, proved as unmanageable as the preceding. The members resolved to check the growth of Popery by striking at the root of the evil; and therefore brought in a bill for the total exclusion of the duke of York from the crown of England and Ireland, which passed the lower house by a majority of 79. They next voted the king's standing army and guards to be illegal. They proceeded to establish limits to the king's power of imprisoning delinquents at will. It was now also that the celebrated statute called the *habeas corpus act* was passed, which confirms the subject in an absolute security from oppressive power.

During these troubles, the duke of York had retired to Brussels; but an indisposition of the king led him back to England, to be ready in case of any sinister accident, to assert his right to the throne. After prevailing upon his brother to disgrace his natural son the duke of Monmouth, who was now become very popular, he himself retired to Scotland, under pretence of quieting the apprehensions of the English nation, but in reality to strengthen his interests in that part of the empire. This secession served still more to inflame the country party, who were strongly attached to the duke of Monmouth, and were resolved to support him against the duke of York. Mobs, petitions, pope burnings,

Britain.

were artifices employed to keep up the terrors of Popery, and alarm the court. The parliament had shown favour to the various tribes of informers, and that served to increase the number of these miscreants: but plots themselves also became more numerous. Plot was set up against plot; and the people were kept suspended in the most dreadful apprehension.

But it was not by plots alone that the adverse parties endeavoured to supplant each other. Tumultuous petitions on the one hand, and flattering addresses on the other, were sent up from all quarters. Wherever the country party prevailed, petitions were sent to the king filled with grievances and apprehensions. Wherever the church or court party prevailed, addresses were framed, containing expressions of the highest regard to his majesty, and the deepest abhorrence of those who endeavoured to disturb the public tranquillity. Thus the nation came to be distinguished into *petitioners* and *abhorrrers*. *Whig* and *Tory*, also, were now first used as terms of reproach. The Whigs were so denominated from a cant name given to the sour presbyterian conventicles, (*whig* being *milk turned sour*). The Tories were denominated from the Irish banditti so called, whose usual manner of bidding people deliver was by the Irish word *Toree*, or "Give me."

229
Petitioners and abhorrrers, who.

All this time the king had tyrannized over the Scots in a very cruel manner. Being apprized of the tendency of presbyterian principles to a republican form of government, Charles, like his predecessors, had endeavoured to introduce Episcopacy there, but in a much more violent manner than had been formerly attempted. The rights of patrons had for some years been abolished; and the power of electing ministers had been vested in the kirk-sessions and lay elders: but it was now enacted, that all incumbents who had been admitted upon this title should receive a presentation, and be instituted anew by the bishop, under the penalty of deprivation. In consequence of this, 340 parishes were at once declared vacant. New ministers were sought for all over the kingdom, and none was so vicious or ignorant as to be rejected. The people, as might have been expected, were displeased to the highest degree; they resolved, however, to give no sign of mutiny or sedition, notwithstanding their discontent. This submission made their case still worse; it being foolishly imagined, that, as they did not complain for a little ill usage, they would submit altogether if they were worse treated.

230
Attempt to establish episcopacy in Scotland.

231
Occasional discontent.

Affairs remained in a peaceable situation, till, in 1661, a very severe act was passed in England against conventicles, and this severity was imitated by the Scots parliament, who passed an act of the same kind. Military force was next let loose. Wherever the people had generally forsaken their churches, the guards were quartered throughout the country. They were commanded by Sir James Turner, a man of a very furious temper and dissolute life. He went about and received lists from the clergy of those who absented themselves from the churches, or were supposed to frequent conventicles. Without any proof, or legal conviction, he demanded a fine from them; and quartered soldiers on the supposed criminals till he received payment. An insurrection being dreaded during the Dutch war, new forces were levied, and entrusted to the command of Dalziel and Drummond, two men of very cruel dispositions,

232
Presbyterians persecuted.

²³³ **Britain.** sitions, and the Scots parliament gave full scope to all their enormities.

²³³ An insurrection.

Representations were now made to the king, who promised some redress. But his lenity came too late. The people, in 1668, rose in arms. They surprised Turner in Dumfries, and resolved to have put him to death; but finding his orders to be more violent than his execution of them, they spared his life. At Lanark they renewed the covenant, and published their manifesto; where they professed their submission to the king, and only desired the re-establishment of presbytery, and of their former ministers. Their force never exceeded 2000 men; and though the country in general bore them great favour, men's spirits were so subdued, that the insurgents could expect no farther increase of numbers. Dalziel took the field to oppose them. The number of the covenanters was now reduced to 800, and these no way capable of contending with regular forces. Having advanced near Edinburgh, they attempted to find their way back into the west by Pentland-hills. Here they were attacked by the king's troops, and received the first charge very resolutely: but that was all the action. Immediately they fell into confusion, and fled. About 40 were killed on the spot, and 130 taken prisoners.

²³⁴ Insurgents defeated at Pentland-hills.

²³⁵ Cruelty of Archbishop Sharpe.

So long ago as the year 1661, the presbyterians had deputed one Sharpe to lay their grievances before the king. Instead of this, their deputy abandoned the cause altogether, became their violent enemy, and as a reward of his treachery was made archbishop of St Andrew's. After the battle of Pentland-hills, this man was the foremost to take vengeance on the unhappy insurgents, whose oppressed state and inoffensive behaviour had made them objects of universal compassion. Ten were hanged on one gibbet in Edinburgh; 35 before their own doors in different places. They might all have saved their lives if they would have renounced the covenant; but this they absolutely refused. The executions were going on, when the king wrote a letter to the privy-council, in which he ordered that such of the prisoners as should simply promise to obey the laws for the future should be set at liberty, and that the incorrigible should be sent to the plantations. This letter was brought to the council by Burnet, but was not immediately delivered by Sharpe. What his motives were for this delay, we pretend not to say; but certain it is, that no action of his life will bear a worse construction than this. It had been customary to put these poor creatures to very severe tortures, in order to make them confess that to be falsehood which they believed to be true. By Sharpe's delay, one Hugh Maccaill had been tortured, who would otherwise have escaped; and so violent were the torments he endured, that he expired under them. He seemed to die in an ecstasy of joy. His last words were uttered with an accent which struck all the bystanders with astonishment. "Farewell (said he) sun, moon, and stars; farewell world and time; farewell weak frail body: welcome eternity; welcome angels and saints; welcome Saviour of the world; and welcome God the judge of all."

²³⁶ Last words of Mr Maccaill.

²³⁷ Act against conventicles.

In 1670, an act against conventicles was passed, seemingly with a design of mitigating the former persecuting laws; though even this was severe enough. By this act, the bearer in a conventicle (that is, in a dis-

senting assembly where more than five besides the family were present) was fined 5s. for the first offence, and 10s. for the second; the preacher 20l. for the first offence, and 40l. for the second. The person in whose house the conventicle met was fined in a like sum with the preacher. One remarkable clause was, that if any dispute should arise with regard to the interpretation of any part of the act, the judges should always explain the doubt in the sense least favourable to conventicles, it being the intention of parliament entirely to suppress them.

Britain.

As the violent methods used by the king were found ineffectual to obtain his purpose in Scotland, in 1678 a scheme of comprehension was tried, by which it was proposed to diminish greatly the authority of the bishops, to abolish their negative voice in the ecclesiastical courts, and to leave them little more than the right of precedency among the presbyters: but this too was rejected by the people, who well knew its tendency. The next scheme was an indulgence. By this, the most popular of the expelled preachers, without requiring any terms of submission to the established religion, were settled in vacant churches; and small salaries of about 20l. a-year were offered to the rest, till they should be otherwise established. This bounty was rejected as the wages of criminal silence, and the replaced ministers soon repented of their compliance; conventicles multiplied, and the covenanters daily met in arms at their places of worship, though they usually dispersed themselves after divine service.

²³⁸ Schemes of comprehension and indulgence.

These mild methods being rejected, a renewal of the persecution commenced under the administration of the duke of Lauderdale, and in which Archbishop Sharpe had a principal hand. It was an old law, and but seldom put in execution, that a man who was accused of any crime, and did not appear to take his trial, might be *intercommuned*; that is, he might be publicly outlawed; and whoever afterwards, either on account of business, relation, or charity, had the least intercourse with him, was subjected to the same penalties which the law could inflict on the criminal himself. A great many writs of intercommuning were now issued against the covenanters; by which absurd method of proceeding, crimes and punishments were multiplied to an extreme degree.

²³⁹ Persecution renewed.

Application was made to Charles for some redress of these grievances; but he was too much taken up with his pleasures to take any effectual means of putting a stop to them; nay, even while he retracted them, he was persuaded to avow and praise them in a letter to the privy-council. The consequence of all this was, that the covenanters were at last so much enraged against Sharpe, whom they considered as an apostate, and experienced to be an unrelenting persecutor, that, on the 3d of May 1679, he was way-laid and murdered with all the circumstances of unrelenting cruelty. The murder of Sharpe produced a persecution still more violent, which at last brought on another insurrection.

²⁴⁰ Archbishop Sharpe murdered.

The covenanters finding themselves obliged to meet in large bodies, and bring arms along with them for their own security, set forth a declaration against prelacy, which they published at Rutherglen, a small borough near Glasgow; and in the market-place there they burned several acts of parliament which had established

²⁴¹ Second insurrection.

^{Britain.} blished that mode of ecclesiastical government, and had prohibited all conventicles. For this purpose they chose the 29th of May, the anniversary of the restoration; and previously extinguished the bonfires that had been kindled on that occasion. Count Graham, afterwards Viscount Dundee, an active and enterprising officer, attacked a great conventicle upon Loudon-hill, but was repulsed with the loss of 30 men. The covenanters then finding themselves unwarily engaged in rebellion, were obliged to persevere; and therefore pushed on to Glasgow, which, though repulsed at first, they afterwards made themselves masters of. Here they dispossessed the established clergy, and issued proclamations, in which they declared that they fought against the king's supremacy, against Popery and Prelacy, and against a Popish successor.

²⁴²
Insurgents
defeated at
Bothwell-
bridge.

Charles, being now alarmed, dispatched against the covenanters a small body of English cavalry under the duke of Monmouth. He joined the Scots guards, and some regiments of militia levied from the well-affected counties; and with great celerity marched in quest of the insurgents. They had taken post at Bothwell-bridge between Hamilton and Glasgow; where there was no access but by the bridge, and where a small body was able to defend it against the king's army. The whole army of the covenanters never exceeded 8000 men, and they had in reality no other generals than their clergymen. Monmouth attacked the bridge, and the covenanters maintained their post as long as their ammunition lasted. When they sent for more, they received orders to quit their post and retire; and this imprudent measure occasioned an immediate defeat. Monmouth passed the bridge without opposition, and drew up his forces opposite to the enemy. His cannon alone put them to the rout. About 700 were killed in the pursuit; for, properly speaking, there was no action. Twelve hundred were taken prisoners, and treated with humanity by Monmouth. Such as promised to live peaceably under the present government were dismissed: and about 300 who refused this condition were shipped for Barbadoes, but unfortunately perished by the way. Two of their clergymen were hanged. Soon after, an act of indemnity was passed: but Lauderdale took care that it should afford little protection to the unhappy covenanters; for though orders were given to connive thenceforward at all conventicles, he found means under a variety of pretences to elude the execution of them.

²⁴³
Violent
proceedings
of parlia-
ment.

It is now certainly known, the King Charles II. had formed a scheme of overturning the established religion, and substituting Popery in its place; as also of rendering himself absolute. In this, however, he met with violent opposition from his parliaments; and as this one of 1679 seemed even to surpass their predecessors in violence, the king was induced to dissolve them and call another in 1680. By this step, however, he was no gainer. They voted the legality of petitioning the king; and fell with extreme violence on the abhorers, who in their addresses to the crown had expressed their disapprobation of those petitions. Great numbers of these were seized by their order in all parts of England, and committed to close custody: the liberty of the subject, which had been so carefully guarded by their own recent law, was every day violated by their arbitrary and capricious imprisonments. One Stowel of

Exeter put a stop to their proceedings: he refused to obey the serjeant at arms who was sent to apprehend him; he stood upon his defence, and said he knew no law by which the house of commons pretended to commit him. The house, finding it equally dangerous to proceed or recede, got off by an evasion. They voted that Stowel was indisposed: and a month's time was allowed him for his recovery. It is happy for the nation, that should the commons at any time overleap the bounds of their authority, and capriciously order men to be put in prison, there is no power, in case of resistance, that can compel the prisoners to submit to their decrees.

^{Britain.}

The chief point, however, laboured by the present parliament, was, to obtain the seclusion bill, which, though the former house had voted, was never yet passed into a law. It passed by a great majority in the house of commons, but was thrown out by the house of peers. All the bishops except three voted against it; for they were of opinion that the church of England was in much greater danger from the prevalence of Presbyterianism than Popery. The commons were extremely mortified at the rejection of their favourite bill: in revenge they passed several other disagreeable acts, among which one was, That, till the exclusion bill was passed, they could not, consistent with the trust reposed in them, grant the king any manner of supply; and that whoever should hereafter lend, by way of advance, any money upon the branches of the king's revenue, should be responsible to parliament for his conduct. Charles, therefore, finding that there was no hopes either of extorting money or obedience from the commons, came to a resolution of once more dissolving the parliament. His usher of the black rod accordingly came to dissolve them while they were voting that the dissenters should be encouraged, and that the Papists had burned the city of London.

²⁴⁴
Parliament
dissolved.

It was for some time a doubt whether the king would ever call another parliament: his necessities, however, surmounted all his fears of their violence; and, in 1681, he summoned his parliament to meet him at Oxford, ²⁴⁵ ^{New one} that he might thus have an opportunity of punishing ^{called at} the city of London by showing his suspicions of their ^{Oxford.} loyalty. In this, as in all former parliaments, the country party predominated; and they trode exactly in the same paths with their predecessors. The same speaker was chosen, and the exclusion bill urged more fiercely than before. Ernely, one of the king's ministers, proposed that the duke should be banished 500 miles from England; and that on the king's decease, the next heir should be constituted regent with regal power. Yet even this expedient, which left the duke the bare title of *king*, could not obtain the attention of the house. Nothing but a total exclusion could satisfy them.

Each party had now for some time reviled and ridiculed each other in pamphlets and libels; and this practice at last was attended with an incident that deserves notice. One Fitzharris, an Irish papist, employed a Scotsman named *Everhard* to write a libel against the king and the duke of York. The Scot was actually a spy for the contrary party; and supposing this a trick to entrap him, he discovered the whole to Sir William Waller, an eminent justice of the peace; and, to convince them of the truth of his information, posted the magistrate and two other persons privately, where they heard

²⁴⁶
Care of
Fitzharris.

Britain.

heard the whole conference between Fitzharris and himself. The libel composed between them was replete with the utmost rancour and scurrility. Waller carried the intelligence to the king, and obtained a warrant for committing Fitzharris, who happened at that very time to have a copy of the libel in his pocket. Seeing himself in the hands of a party from whom he expected no mercy, he resolved to side with them, and throw the odium of the libel upon the court, who, he said, were willing to draw up a libel which should be imputed to the exclusioners, and thus render them hateful to the people. He enhanced his services to the country-party by a new Popish plot more tremendous than any of the foregoing, and in which he brought in the duke of York as a principal accomplice.

The king imprisoned Fitzharris; the commons avowed his cause. They voted that he should be impeached by themselves, to screen him from the ordinary forms of justice; the lords rejected the impeachment; the commons asserted their right: a commotion was likely to ensue; and the king, to break off the contest, went to the house and dissolved the parliament, with a fixed resolution never to call another.

247 Parliament dissolved.

From this moment the king ruled with despotic power. His temper, which had always been easy and merciful, now became arbitrary and cruel; he entertained spies and informers round the throne, and imprisoned all such as he thought most daring in their designs. He resolved to humble the Presbyterians: they were divested of their employments and their places; and their offices given to such as held with the court, and approved the doctrine of non-resistance. The clergy began to testify their zeal and their principles by their writings and sermons; but though among these the partizans of the king were the most numerous, those of the opposite faction were the most enterprising. The king openly espoused the cause of the former; and thus placing himself at the head of a faction, he deprived the city of London, which had long headed the popular party, of their charter. It was not till after an abject submission that he restored it to them, having previously subjected the election of their magistrates to his immediate authority.

248 Arbitrary proceedings of the king.

249 London deprived of its charter.

Terrors also were not wanting to confirm this new species of monarchy. Fitzharris was brought to a trial before a jury, and condemned and executed. The whole gang of spies, witnesses, informers, suborners, which had long been encouraged and supported by the leading patriots, finding now that the king was entirely master, turned short upon their ancient drivers, and offered their evidence against those who first put them in motion. The king's ministers gave them encouragement; and in a short time the same injustice and the same cruelties were practised against Presbyterian schemes that had formerly been practised against Catholic treasons. The king's chief resentment was levelled against the earl of Shaftesbury; and, indeed, not without reason, as he had had a very active hand in the late disturbances. No sums were spared to seek for evidence, or even to suborn witnesses, against this intriguing and formidable man. A bill of indictment being presented to the grand jury, witnesses were examined, who swore to such incredible circumstances as must have invalidated their testimony, even if they had not been branded as perjured villains. Among his

Britain.

papers, indeed, a draught of an association was found, which might have been construed into treason; but it was not in the earl's hand-writing, nor could it be proved that he had ever communicated this scheme to any body, or signified his approbation of any such project. The sheriffs had summoned a jury, whose principles coincided with those of the earl; and that probably, more than any want of proof, procured his safety.

In 1683, the city of London was deprived of its charter; which was restored only upon terms of the utmost submission, and giving up the nomination of their own magistrates. This was so mortifying a circumstance, that all the other corporations in England soon began to fear the same treatment, and were successively induced to surrender their charters into the hands of the king. Considerable sums were exacted for restoring these charters; and all the offices of power and profit were left at the disposal of the crown. Resistance now, however justifiable, could not be safe; and all prudent men saw no other expedient but submitting patiently to the present grievances.

250 Other corporations resign theirs.

There was a party, however, in England, that still cherished their former ideas of freedom, and resolved to restore liberty to their country by dethroning the king who acted in such a despotic manner. The principal conspirators were Monmouth, Shaftesbury, Russel, Essex, Howard, Algernon Sidney, and John Hampden grandson to the great man of that name. Monmouth engaged the earl of Macclesfield, Lord Brandon, Sir Gilbert Gerard, and other gentlemen in Cheshire. Lord Russel fixed a correspondence with Sir William Courtney, Sir Francis Knowles, and Sir Francis Drake, who promised to raise the west. Shaftesbury, with one Ferguson, an independent clergyman, and a restless plotter, managed the city, upon which the confederates chiefly relied. These schemes had been laid in 1681: but the caution of Lord Russel, who induced the duke of Monmouth to put off the enterprise, saved the kingdom from the horrors of a civil war; while Shaftesbury was so struck with a sense of his impending danger, that he left his house, and lurking about the city, attempted, but in vain, to drive the Londoners to an open insurrection. At last, enraged at the numberless cautions and delays which clogged and defeated his projects, he threatened to begin with his own friends singly. However, after a long struggle between fear and rage, he abandoned all hopes of success, and fled to Amsterdam, where he soon after died.

251 Conspiracy against the king.

The loss of Shaftesbury, though it retarded, did not suppress, the designs of the conspirators. The remaining six formed a council; they corresponded with Argyle and the malecontents in Scotland; and resolved to prosecute the scheme of the insurrection, though they widely differed in principles from one another. Monmouth aspired to the crown; Russel and Hampden proposed to exclude the duke of York from the succession, and redress the grievances of the nation; Sidney was for restoring the republic, and Essex joined in the same wish. Lord Howard was an abandoned man, who, having no principles, sought to embroil the nation, to gratify his private interest in the confusion.

Besides these, there was a set of subordinate conspirators, who frequently met together, and carried on projects quite unknown to Monmouth and his council.

252 Design of assassinating him formed.

Britain.
253
It miscarries.

oil. Among these was Colonel Rumsey, an old republican officer; Lieutenant-colonel Walcot, of the same stamp; Goodenough, under-sheriff of London, a zealous and noted party-man; Ferguson, an independent minister; and several attorneys, merchants, and tradesmen of London. But Rumsey and Ferguson were the only persons that had access to the great leaders of the conspiracy. These men undertook the desperate resolution of assassinating the king in his way to Newmarket; Rumbold, one of the party, possessed a farm upon that road, called the *Rye-house*, and from thence the conspiracy was called the *Rye-house plot*. They deliberated on a scheme of stopping the king's coach by overturning a cart on the highway at this place, and shooting him through the hedges. The house in which the king lived at Newmarket accidentally took fire, and he was obliged to leave Newmarket eight days sooner than was expected; to which circumstance he owed his safety. Soon after this the conspiracy was discovered; Russel, Sidney, and Walcot, were executed; Essex cut his own throat; Hampden was fined 40,000l.; and scarce one escaped who had been in any manner concerned, except the duke of Monmouth, who was the most culpable of all.

This was the last blood that was shed on account of plots or conspiracies, which continued during the greatest part of this reign. Severe punishments, however, were inflicted on many who treated the duke of York unworthily. The famous Titus Oates was fined 100,000l. for calling him a Popish traitor; and he was imprisoned till he should pay it, which he was absolutely incapable of. A similar sentence was passed upon Dutton Colt. Sir Samuel Barnadiston was fined 10,000l. for having in some private letters reflected on the government. The government of Charles was now as absolute as that of any prince in Europe; but to please his subjects by an act of popularity, he judged it proper to marry the lady Anne, his niece, to Prince George brother to the king of Denmark. This was the last remarkable transaction of this extraordinary reign. On February 2. 1685, about eight in the morning, the king was seized with a fit of the apoplexy; being dressed, and just come out of his closet, where he had been for some time after he rose from bed. By being blooded, he was restored perfectly to his senses; and there were great hopes of his recovery the next day. On the fourth day the physicians despaired of his life, and therefore sent for the queen. He was in his perfect senses when she arrived. She threw herself on her knees, and asked his pardon for all her offences. He replied, that she had offended in nothing; but that he had been guilty of offences against her, and asked her pardon. He spoke with great affection to the duke of York, and gave him excellent counsel for his future conduct. He advised him to adhere to the laws with strictness, and invariably to support the church of England. The duke seemed anxious to convince him before he died how little he intended to follow his advice. Having removed the bishops, and several of the lords who attended the bed of the king, he sent for Huddleston a Romish priest. In the presence of the duke, the earl of Bath, and Trevanion a captain in the guards, Huddleston gave the extreme unction to the king, and administered to him the sacrament according to the rites of the church of Rome.

254
Death of Charles II.

All this was done in the space of half an hour. The doors were then thrown open. Six prelates, who had before attended the king, were sent to give him the sacrament. Kenn, bishop of Bath and Wells, read the visitation of the sick; and after he said that he repented of his sin, the abolition. The king assisted with seeming devotion at the service; but his mouth being distorted with fits, and his throat contracted, he could not swallow the elements. He professed, however, his satisfaction in the church of England; and expired on the 6th of February between 11 and 12 o'clock: having reigned 25 years, and lived 55.

The first act of James II.'s reign was to assemble the privy council: where, after some praises bestowed on the memory of his predecessor, he made professions of his resolution to maintain the established government both in church and state; and as he had heretofore ventured his life in defence of the nation, he would still go as far as any man in maintaining all its just rights and privileges.

This discourse was received with great applause, not only by the council, but by the whole nation. Addresses came from all quarters, full of duty, nay of the most servile adulation. From this charge, however, we must except that of the Quakers, which is remarkable for its good sense and simplicity. "We are come (said they) to testify our sorrow for the death of our good friend Charles, and our joy for thy being made our governor. We are told that thou art not of the persuasion of the church of England no more than we: wherefore we hope that thou will grant us the same liberty which thou allowest thyself. Which doing, we wish thee all manner of happiness."

The king, however, soon showed, that he either was not sincere in his promises, or that he entertained so lofty an idea of his own regal power, that even his utmost sincerity could tend very little to the security of the liberties of the people. All the customs, and the greater part of the excise, which had been voted to the late king for his life only, were levied by James without a new act for that purpose. He went openly to mass with all the ensigns of his dignity; and even sent one Caryl as his agent to Rome to make submissions to the pope, and to pave the way for the readmission of England into the bosom of the Catholic church. From the suggestions of these men all his measures were undertaken. One day when the Spanish ambassador ventured to advise his majesty against putting too much confidence in such kind of people, "Is it not the custom in Spain (said James) for the king to consult with his confessor?" "Yes (answered the ambassador), and that is the reason why our affairs succeed so very ill."

James's first parliament, which was composed mostly of zealous Tories, was strongly inclined to comply with the measures of the crown. They voted unanimously, that they should settle on the present king, during life, all the revenue enjoyed by the late king till the time of his decease. For this favour, James assured them, that he would secure them in the full enjoyment of their laws; but with regard to religion, no answer could be extorted, for that he was resolved to alter. In every thing, however, religion excepted, James merited every praise. He applied himself to business with unremitting attention. He managed his revenue with the strictest

Britain. strictest economy. He retrenched superfluous expences, and showed himself zealous for the glory of the nation. He endeavoured to expel from court the vice which had prevailed so much during the former reign, and to restore decency and morality. He presided daily at the council, at the boards of admiralty and treasury. He even entered into the whole detail of the concerns of the great departments of the state. But his bigotry for the Romish religion sullied all his good qualities, and rendered him feared for his violence, where he was not despised for his weakness.

259
Monmouth's
conspiracy.

But whilst every thing was submitted in tranquillity to James at home, a storm was gathering abroad to disturb his repose. For a long time the prince of Orange had entertained hopes of ascending the British throne, and had even used all his endeavours to exclude James from it. Monmouth, who, since his last conspiracy, had been pardoned, but ordered to depart the kingdom, had retired to Holland. He was received by the prince of Orange with the highest marks of distinction, and even became his chief favourite, through whom all favours were to be obtained. When the news of Charles's death arrived, indeed, the prince made a show of altering his note, and dismissed Monmouth, though he still kept a close correspondence with him. The duke retired to Brussels, where, under the auspices of the prince of Orange, he resolved to invade England, with a design of seizing the crown for himself. He was seconded by the duke of Argyle, who formed the scheme of an insurrection in Scotland; and while Monmouth attempted to make a rising in the west of England, it was resolved that Argyle should also try his endeavours in the north. The generosity of the prince of Orange, however, did not correspond with the warmth of his professions. The unfortunate duke derived from his own plate and jewels his whole supply for the war; and the enthusiasm of a rich widow supplied Argyle with 10,000*l.* wherewith he purchased three vessels, which he loaded with arms and ammunition.

260
Defeat and
death of
Argyle.

Argyle was the first who landed in Scotland, where he published his manifestoes, put himself at the head of 2500 men, and strove to influence the people in his favour. But a formidable body of the king's forces coming against him, his army fell away; and he himself, after being wounded in attempting to escape, was taken prisoner by a peasant who found him standing up to the neck in water. He was from thence carried to Edinburgh, where, after suffering many indignities, he was publicly executed.

261
Monmouth
lands in
England.

By this time Monmouth had landed in Dorsetshire with scarcely 100 followers. His name, however, was so popular, and so great was the hatred of the people to James on account of his religion, that in four days he had assembled a body of above 2000 men. They were indeed all of them the lowest of the people, and his declarations were suited entirely to their prejudices. He called the king the duke of York; and denominated him a traitor, a tyrant, a murderer, and a Popish usurper. He imputed to him the fire of London, and even affirmed that he had poisoned the late king.

Monmouth continued to make a rapid progress, and in a short time found himself at the head of 6000 men; but was daily obliged to dismiss great numbers for want of arms. The king was not a little alarmed at

his invasion. Six regiments of British troops were called over from Holland; and a body of regulars, to the number of 3000, was sent, under the command of the earl of Feversham and Churchill, to check the progress of the rebels. They took post at Sedgemore, a village in the neighbourhood of Bridgewater, and were joined by considerable numbers of the country militia. Here Monmouth resolved, by a desperate effort, to lose his life or gain the kingdom. He drove the royal infantry from their ground, and was on the point of gaining a complete victory, when the cowardice of Gray, who commanded the horse, brought all to ruin. This nobleman fled at the first onset; and the rebels, being charged in flank, gave way after a three hours contest. About 300 were killed in the engagement, and 1000 in the pursuit. Monmouth fled above 20 miles from the field of battle, till his horse sunk under him. He then alighted; and, exchanging clothes with a shepherd, fled on foot, attended by a German cook who had accompanied him from Holland. Being quite exhausted with hunger and fatigue, they both lay down in a field, and covered themselves with fern. The shepherd being found in Monmouth's clothes by the pursuers, increased the diligence of the search; and by the means of blood-hounds he was detected in his miserable situation, with raw pease in his pocket, on which he had lived for some days. He burst into tears when seized by his enemies; and petitioned, with the most abject submissions, for his life. On his way to London, he wrote a submissive letter to the king, promising discoveries, should he be admitted into his presence. The curiosity of James being excited by the letter, he sent Sheldon a gentleman of his bed-chamber to meet Monmouth. In his conversation with Sheldon, he asked who was in chief confidence with the king? and being answered that it was Sunderland, Monmouth knocked his breast in a surprise, and said, "Why then, as I hope for salvation, he promised to meet me." He desired Sheldon to inform the king, that several of his accomplices in rebellion were in the confidence of his majesty; and he gave him a particular account of the part which the prince of Orange had acted in this whole affair.

Attempts in
vain to ob-
tain mercy.

Sheldon, on his return from the duke of Monmouth, began to give an account to the king of what he had learned from the unhappy prisoner. Sunderland, pretending business, came into the room. Sheldon stopped, and signified his desire to speak in private with the king. James told him he might say any thing before that lord. Sheldon was in great perplexity; but being urged, he told all that Monmouth had asserted. Sunderland appeared for some time confused: at length he said, with a laugh, "If that is all he can discover to save his life, he will derive little good from his information." Monmouth himself was soon after brought before the king. Sunderland by an artifice ensured the death of the unfortunate duke, to save himself and the other adherents of the prince of Orange. When he saw Monmouth's letter to James, and heard the discoveries made by Sheldon, he is said to have advised him, that, as he could assure him of the certainty of a pardon, he ought to deny what he had said in prejudice of his friends, who could serve him on some other more favourable occasion. The credulous duke, swayed by the advice of Sunderland, suppressed what he

he had said to Sheldon, when he was examined by the king. He mentioned nothing of the concern which the prince of Orange had taken in the invasion; though a point on which James was already sufficiently informed. D'Avaux, the French minister to the States, had given a circumstantial account of the whole conduct of the prince to Louis XIV. who had ordered it to be privately communicated to the king of England. The minister who had been sent from Holland to congratulate James on the suppression of Argyle's rebellion, was in a grievous agony when he heard that the king was resolved to see Monmouth. "Though he found that he said nothing of his master (said James), he was never quiet till Monmouth was dead."

The unfortunate duke made various attempts to obtain mercy. He wrote to the queen dowager; he sent a letter to the reigning queen, as well as to the king himself. He begged his life, when admitted into his presence, with a meanness unsuitable to his pretensions and high rank. But all his intreaties and submissions were of no avail. James told him, that he was much affected with his misfortunes, but that his crime was too dangerous in its example to be left unpunished. In his last moments he behaved with a magnanimity worthy of his former courage. When he came to the scaffold, he behaved with decency and even with dignity. He spoke little; he made no confession: nor did he accuse any of his friends. Circumstances are said to have attended his death that created a horror among the spectators. The executioner missed his blow, and struck him slightly on the shoulder. Monmouth raised his head from the block, and looked him full in the face, as if reproaching him for his mistake. He struck him twice again, but with feeble strokes; and then threw the axe from his hands. The sheriff forced him to renew his attempt; and the head of the duke, who seemed already dead, was at last severed from his body.

265
Terribly
mangled by
the execu-
tioner.

266
Rebels cru-
elly treated.

Those concerned in the duke of Monmouth's conspiracy were punished with the utmost severity. Immediately after the battle of Sedgemoor, Feversham hanged up above 20 prisoners; and was proceeding in his executions, when the bishop of Bath and Wells informed him that these unhappy men were now by law entitled to a trial, and that their execution would be deemed a real murder. Nineteen were put to death in the same manner at Bridgewater by Colonel Kirke, a man of a savage and bloody disposition. This vile fellow, practised in the arts of slaughter at Tangiers, where he served in garrison, took pleasure in committing instances of wanton barbarity. He ravaged the whole country, without making any distinction between friend and foe. His own regiment, for their peculiar barbarity, went under the ironical title of *Kirke's lambs*. It doth not, however, appear, that these cruelties were committed by the direction, or even with the approbation, of James; any more than the legal slaughters that were committed by Judge Jefferies, who was sent down to try the delinquents. The natural brutality of this man's temper was inflamed by continual intoxication. No fewer than 80 were executed by his orders at Dorchester; and on the whole, at Exeter, Taunton, and Wells, 250 are computed to have fallen by the hand of justice as it was called; nor were women exempted from the general severity, but suffered for harbouring their nearest kindred. Jefferies on his re-

turn was immediately created a peer, and soon after vested with the dignity of chancellor. In justice to the king, however, it must be owned, that in his Memoirs he complains, with apparent indignation, of "the strange havoc made by Jefferies and Kirke in the west;" and that he attributed the unpopularity, which afterwards deprived him of the crown, to the violence and barbarity of those pretended friends of his authority. He even ascribes their severities, in some degree, to a formed design of rendering his government odious to his subjects; and from thence it is probable, that no exact or impartial accounts of these cruelties had reached his ears, at least till long after they were committed.

James now began to throw off the mask, and to endeavour openly to establish Popery and arbitrary power. He told the house of commons, that the militia were found by experience to be of no use; that it was necessary to augment the standing army; and that he had employed a great many Catholic officers, in whose favour he had thought proper to dispense with the test required to be taken by all who were employed by the crown. He found them useful, he said, and he was determined to keep them employed. These stretches of power naturally led the lords and commons into some degree of opposition; but they soon acquiesced in the king's measures, and then the parliament was dissolved for their tardy compliance. This was happy for the nation; for it was perhaps impossible to pick out another house of commons that could be more ready to acquiesce in the measures of the crown; but the dissolution of this parliament was generally looked upon as a sign that James never intended to call another.

267
James en-
deavours to
establish
Popery.

268
Parliament
dissolved.

The parliament being dismissed, James's next step was to secure a Catholic interest in the privy council. Accordingly four Catholic lords were admitted, viz. Powis, Arundel, Belasis, and Dover. Sunderland, who saw that the only way to gain preferment was by Popery, became a convert. Rochester, the treasurer, was turned out of his office, because he refused to conform. Even in Ireland, where the duke of Ormond had long supported the royal cause, this nobleman was displaced as being a Protestant; and the lord Tyrconnel, a furious Roman Catholic, was placed in his stead. In his zeal for Popery, it is said, that James stooped so low as even to attempt the conversion of Colonel Kirke; but the daring soldier told him, that he was pre-engaged; for he had promised the king of Morocco, when he was quartered at Tangiers, that, if ever he changed his religion, he would turn Mahometan.

269
Catholics
promoted.

At last the clergy of the church of England began to take the alarm, and commenced an opposition to court measures. The pulpits now thundered out against Popery; and it was urged, that it was more formidable from the support granted it by the king. It was in vain that James attempted to impose silence on these topics; instead of avoiding the controversy, the Protestant preachers pursued it with greater warmth.

270
English

pose the
court mea-
sures.

To effect his designs, the king determined to revive the high commission court, which had formerly given the nation so much disgust, and which had been abolished for ever by act of parliament. An ecclesiastical commission was issued out anew, by which seven com-

missioners

Britain. missionaries were invested with a full and unlimited authority over the whole church of England.—The next step was to allow a liberty of conscience to all sectaries; and he was taught to believe, that the truth of the Catholic religion would then, upon a fair trial, gain the victory. In such a case, the same power that granted liberty of conscience might restrain it; and the Catholic religion alone be allowed to predominate. He therefore issued a declaration of general indulgence, and asserted that nonconformity to the established religion was no longer penal. In Scotland, he ordered his parliament to grant a toleration only to the Catholics, without interceding in the least for the other dissenters who are much more numerous. In Ireland, the Protestants were totally expelled from all offices of trust and profit, and Catholics put in their places. These measures sufficiently disgusted every part of the British empire; but to complete the work, James publicly sent the earl of Castlemaine ambassador extraordinary to Rome, in order to express his obedience to the pope, and reconcile his kingdoms to the Catholic communion. This proceeding was too precipitate to be relished even by the pope himself; and therefore the only return he made to this embassy was the sending a nuncio into England. The nuncio made a public and solemn entry into Windsor; which did not fail to add to the general discontent; and because the duke of Somerset refused to attend the ceremony, he was dismissed from his employment of one of the lords of the bed-chamber.

171
James sends an ambassador to Rome.

173
Dispute with the university of Cambridge.

Soon after this, the Jesuits were permitted to erect colleges in different parts of the kingdom, and to exercise the Catholic worship in the most public manner. Father Francis, a Benedictine monk, was recommended by the king to the university of Cambridge for the degree of master of arts. The university rejected him on account of his religion; and presented a petition to the king, beseeching him to recal his mandate. James disregarded their petition, and denied their deputies a hearing; the vice-chancellor himself was summoned to appear before the high commission court, and deprived of his office; yet the university persisted, and Father Francis was refused. The place of president of Magdalen college being vacant, the king sent a mandate in favour of one Farmer, a new convert, and a man of bad character in other respects. The fellows of the college made very submissive applications for recalling this mandate; but the election day coming on before they received an answer, they chose Dr Hough, a man of learning, integrity, and resolution. The king was incensed at their presumption; an inferior ecclesiastical court was sent down, who finding Farmer a man of scandalous character, issued a mandate for a new election. The man now recommended by the king was Doctor Parker; a man of an abandoned character, but very willing to embrace the Catholic religion. The fellows refused to comply with this injunction; which so irritated the king, that he came down to Oxford in person, and ordered the fellows to be brought before him. He reproached them with their insolence and disobedience; and commanded them to choose Parker without delay. Another refusal on their side served still more to exasperate him; and finding them resolute in the defence of their privileges, he ejected them all except two from their benefices, and Parker was put in

VOL. IV. Part II.

possession of the place. Upon this the college was filled with Catholics; and Charnock, one of the two that remained, was made vice-president.

Britain.

In 1686, a second declaration for liberty of conscience was published almost in the same terms with the former; but with this peculiar injunction, that all divines should read it after service in their churches; The clergy resolved to disobey this order. Loyde bishop of St Asaph, Kenn of Bath and Wells, Turner of Ely, Lake of Chichester, White of Peterborough, and Trelawney of Bristol, together with Sancroft the primate, concerted an address in form of a petition to the king, which, with the warmest expressions of zeal and submission, remonstrated that they could not read his declaration consistently with their consciences or the respect they owed the Protestant religion. The king received their petition with marks of surprise and displeasure. He said he did not expect such an address from the church of England, particularly from some amongst them; and persisted in his orders for their obeying his mandate.

173
Colleges filled with Catholics.

As the petition was delivered in private, the king summoned the bishops before the council, and there questioned them whether they would acknowledge it. They for some time declined giving an answer; but being urged by the chancellor, they at last owned the petition. On their refusal to give bail, an order was immediately drawn for their commitment to the Tower, and the crown lawyers received directions to prosecute them for a seditious libel. The king gave orders that they should be conveyed to the Tower by water, as the whole city was in commotion in their favour. The people were no sooner informed of their danger, than they ran to the river-side, in prodigious multitudes, craving their blessing; calling upon Heaven to protect them, &c. The very soldiers by whom they were guarded, kneeled down before them, and implored their forgiveness.

174
Bishops imprisoned.

175
The whole city in commotion in their favour.

The 29th of June 1686 was fixed for the trial of the bishops; and their return was still more splendidly attended than their imprisonment. Twenty-nine peers, a great number of gentlemen, and an immense crowd of people, waited upon them to Westminster-hall. The dispute was learnedly managed by the lawyers on both sides. The jury withdrew into a chamber where they passed the whole night; but next morning they returned into court, and pronounced the bishops not guilty. Westminster-hall instantly rang with loud exclamations, which were communicated to the whole extent of the city. They even reached the camp at Hounslow, where the king was at dinner in Lord Feversham's tent. His majesty demanding the cause of those rejoicings, and being informed that it was nothing but the soldiers shouting for the delivery of the bishops; "Call you that nothing? (cried he); but so much the worse for them." Immediately after this, the king struck out two of the judges, Powel and Holloway, who had appeared to favour the bishops. He issued orders to prosecute all those clergymen who had not read his declaration, and all had refused it except 200. He sent also a mandate to the new fellows whom he had obtruded on Magdalen college, to elect for president, in the room of Parker lately deceased, one Gifford, a doctor of the Sorbonne, and titular bishop of Madura.

to his measures, he was willing next day to try what he could do with the army. He thought if one regiment should promise implicit obedience, their example would soon induce others to comply. He therefore ordered one of the regiments to be drawn up in his presence, and desired that such as were against his late declaration of liberty of conscience should lay down their arms. He was surprised to see the whole battalion ground their arms, except two officers and a few Roman Catholic soldiers.—A fortunate circumstance happened about this time in his family. A few days before the acquittal of the bishops, the queen was brought to bed of a son, who was baptized by the name of JAMES. This would, if any thing could at that time, have served to establish him on the throne: but so great was the animosity against him, that a story was propagated that the child was supposititious; and so great was the monarch's pride, that he scorned to take any precautions to refute the calumny.

Though the enthusiasm of James himself bordered upon madness, the most wild of his religious projects seem to have been suggested by his enemies to accomplish his ruin. The earl of Sunderland, whom he chiefly trusted, was a man of abandoned principles, insatiable avarice, and fitted by nature for stratagem, deception, and intrigue. The love of money was his ruling passion, and he sold his influence to the highest bidder. To such a degree was he mercenary, that he became at once the pensioner of the prince of Orange and of the king of France. The former, who had long fixed his eye on the English throne, watched James's motions, and took every advantage of his errors. He had laid his schemes so extensively, that nothing but the birth of a male heir to the crown of England could possibly prevent him from an almost immediate possession of the kingdom. He had the address to render two-thirds of the powers of Europe interested in his success. The treaty of Augsburg, formed to break the power of France, could not accomplish its object without the accession of England. The house of Austria, in both its branches, preferred their political views to their zeal for the Romish faith, and promoted the dethronement of James as the only means to humble Lewis XIV. Odeschalchi, who under the name of Innocent XI. then filled the papal chair, was gained to the measures of the prince of Orange by other considerations, as well as through his fixed aversion to France. The prince of Orange sent his intimate friend the prince of Vaudemont to Rome, to procure the aid of the pope. He explained to his Holiness, that the Catholic princes were in the wrong to expect any advantage to their faith from James, as his being a declared Papist rendered his people averse to all his measures. As for himself, should he have the good fortune to mount the throne of England, he might take any step in favour of the Roman Catholics without jealousy: and he promised to procure a toleration for the Papists, should the pope, the emperor, and the king of Spain, favour his attempt. This negotiation procured the desired effect. Innocent contributed, with the money of the church, to expel a Roman Catholic prince from his throne.

Though the contest with the bishops had completed the king's unpopularity, he derived the suddenness of his ruin from the birth of a prince of Wales. That cir-

cumstance increased the fears of his subjects in proportion as it raised his security and hopes. In the reign of a prince to be educated under the prejudices of such a father, nothing but a continuance of the same unconstitutional measures could be expected. So low indeed was his credit sunk among his people at this time, and such prescience they all seemed to have of his fate, that the child had like to have died before a wet nurse could be procured to suckle him.

The prince of Orange, seeing the national discontent now raised to the highest pitch, resolved to take advantage of it. He began by giving over Dykevelt, his envoy, instructions to apply in his name to every religious sect in the kingdom. To the church-party he sent assurances of favour and regard; and protested, that his education in Holland had no way prejudiced him against Episcopacy. To the nonconformists he sent exhortations, not to be deceived by the insidious caresses of their known enemy, but to wait for a real and sincere protector, &c. In consequence of these insinuations, the prince soon received invitations from the most considerable persons in the kingdom. Admirals Herbert and Russel assured him in person of their own and the national attachment. Henry Sidney, brother to Algernon, and uncle to the earl of Sunderland, came over to him with assurances of an universal combination against the king. Lord Dumblaine, son to the earl of Danby, being master of a frigate, made several voyages to Holland, and carried from many of the nobility tenders of duty and even considerable sums of money to the prince of Orange. Soon after, the bishop of London, the earls of Danby, Nottingham, Devonshire, Dorset, and several other lords, gentlemen, and principal citizens, united in their addresses to him, and intreated his speedy descent. The people, though long divided between Whig and Tory, now joined against their unhappy sovereign as a common enemy. William therefore determined to accept of their invitations; and this the more readily, as he perceived the malecontents had conducted themselves with prudence and secrecy. Having the principal servants of James in pay, he was minutely informed of the most secret actions and even designs of that prince. His intelligence came through Sidney from Sunderland, who betrayed the very measures which he himself had advised. The prince had a fleet ready to sail, and troops provided for action, before the beginning of June 1688.

The king of France was the first who gave James warning of his danger, and offered to assist him in repelling it. But he declined the friendly offer, lest it should be said that he had entered into a private treaty with that monarch to the prejudice of the Protestant religion. Being also deceived and betrayed by Sunderland, he had the weakness to believe, that the reports of an invasion were invented in order to frighten him into a strict connection with France. He gave credit to the repeated assurances of the States, that the armament prepared in their ports was not designed against England. Nay, he even believed the assertions of the prince himself, whose interest it was to deceive. Sunderland descanted against the possibility of an invasion, and turned to ridicule all who believed the report. Having by the prior consent of James taken possession of all the foreign correspondence, he suppressed every intelligence

Britain.

281
 He applies to James's subjects;

 by whom he is invited into England.

283
 James warned of his danger by Louis XIV.

Britain. intelligence that might alarm; and even all others whom James trusted, except Dartmouth, affected long to give no faith to the reports of an invasion.

184
He rejects all assistance.

Louis finding his first offers rejected, next proposed to march down his army to the frontiers of the Dutch provinces, and thus detain their forces at home for their own defence. But this proposal met with no better reception than the former. Still Louis was unwilling to abandon a friend and ally whose interest he regarded as closely connected with his own. He ventured to remonstrate with the Dutch against the preparations they were making to invade England. The Dutch treated his remonstrances as an officious impertinence, and James himself declined his mediation.

185
His astonishment on the news of an intended invasion.

The king of England, having thus rejected the assistance of his friends, and being left to face the danger alone, was astonished with an advice from his minister in Holland, that an invasion was not only projected but avowed. When he first read the letter containing this information, he grew pale, and the letter dropt from his hand. He saw himself on the brink of destruction, and knew not to whom to apply for protection. In this emergency, Louis wrote to James in his own hand, that to divert the Dutch from their intended invasion of England, he would lay siege to Maestricht with 30,000 men. James communicated this intelligence to Sunderland, and he to the prince of Orange. Six thousand men were thrown into Maestricht; and the design of Louis, as being impracticable, was laid aside. On this Louis being disgusted with James, turned his arms towards Germany. The dauphin laid siege to Philipsburg, on the 5th of October; and Prince Clement of Bavaria, by throwing a strong garrison into Cologne, effectually secured the states of Holland from any sudden danger from the arms of France.

186
He is again betrayed by Sunderland.

187
James attempts to pacify his subjects;

James had now no resource but in retreating from those precipitate measures which had plunged him into inextricable distress. He paid court to the Dutch, and offered to enter into any alliance with them for their common security. He replaced in all the counties of England all the deputy lieutenants and justices who had been deprived of their commissions for their adherence to the test and penal law. He restored the charters of such corporations as he had possessed himself of; he annulled the high commission court; he reinstated the expelled president and fellows of Magdalen college; and was even reduced to caress those bishops whom he had so lately persecuted and insulted.

188
but in vain.

All these concessions, however, were now too late; they were regarded as the effects of fear and not of repentance. Indeed, it is said, he very soon gave proofs of his insincerity: for hearing that the Dutch fleet was dispersed, he recalled those concessions he had made in favour of Magdalen college; and to show his attachment to the Romish church, at the baptism of the prince of Wales, he appointed the pope one of the sponsors.

189
William lands in England.

In the mean time, William set sail from Helvoetsluys with a fleet of near 500 vessels, and an army of above 14,000 men. Fortune, however, seemed at first every way unfavourable to his enterprise. He was driven back by a dreadful storm; but he soon refitted his fleet, and again set sail for England. It was given out that this invasion was designed for the coasts of France;

and many of the English, who saw the fleet pass along their coasts, little suspected the place of its destination. It happened that the same wind which sent the Dutch to their place of destination, detained the English fleet in the river; so that the Dutch passed the straits of Dover without molestation; and after a voyage of two days, landed at Broxholme in Torbay, on the 5th of November, the anniversary of the gunpowder-treason.

Britain.

But though the invitation from the English was very general, the prince for some time had the mortification to find himself joined by very few. He continued for ten days in expectation of being joined by the malecontents, and at last was going to despair of success. But just when he began to deliberate about re-imbarking his forces, he was joined by several persons of consequence, and the whole country soon after flocked to his standard. The first person that joined the prince was Major Burrington, and he was quickly followed by the gentry of the counties of Devon and Somerset. Sir Edward Seymour made proposals for an association, which was signed by great numbers; and every day there appeared some effect of that universal combination into which the nation had entered against the measures of the king.

This was followed by the defection of the army. Lord Colchester, son to the earl of Rivers, first deserted to the prince. Lord Cornbury, son to the earl of Clarendon, carried off the greatest part of three regiments of cavalry at once; and several officers of distinction informed Feversham their general, that they could not in honour fight against the prince of Orange. Soon after this the unhappy monarch found himself deserted by his own servants and creatures. Lord Churchill had been raised from the rank of a page, and had been invested with a high command in the army; he had been created a peer, and owed his whole fortune to the king's bounty: yet even he deserted among the rest; and carried with him the duke of Grafton natural son to the late king, Colonel Berkeley, and others.

190
Defection of King James's army.

In this universal defection, James, not knowing where to turn, began to think of requesting assistance from France when it was now too late. He wrote to Leopold emperor of Germany: but in vain; that monarch only returning for answer, That what he had foreseen had happened. James had some dependence on his fleet; but they were entirely disaffected. In a word, his interests were deserted by all, for he had long deserted them himself. He still found his army, however, to amount to 20,000 men; and had he led them immediately to battle, it is possible they might then have fought in his favour. But James's misfortunes had deprived him of his natural firmness and resolution; and seeing himself deserted by those in whom he thought he could have placed most confidence, he became suspicious of all, and was in a manner deprived even of the power of deliberation. In this extremity of distress, the prince of Denmark, and Anne, James's favourite daughter, perceiving the desperation of his circumstances, cruelly resolved to take part with the prince of Orange. When the king was informed of this, he was stung with the most bitter anguish. "God help me (cried he), my own children have forsaken me." To add to his distress as a parent, he was

191
Distressed situation of the king.

²⁹¹ Britain. accused of being accessory to the death of his own child. Her nurse, and her uncle the earl of Clarendon, went up and down like distracted persons, affirming that the Papists had murdered the princess. They publicly asked the queen's servants, whither they had conveyed her? and they contributed to inflame the populace, whose zeal had already inflamed them to tumult and disorder. It was, however, soon known that she fled, under the conduct of the bishop of London, to Northampton.

²⁹² Haughty behaviour of William. On the 30th of November 1688, James sent three of his noblemen to treat with the prince of Orange. But though the latter knew very well that the king's commissioners were in his interests, his behaviour showed plainly that he now thought the time of treating was past. For some time he would not admit them to an audience; and when he did, would give no satisfactory answer. James now began to be afraid of his personal safety. But what most affected him was the terrors of the queen for herself and her infant son. He therefore resolved to send them abroad. They crossed the river in a boat, at Whitehall, in a stormy and rainy day. They were carried to Gravesend in a coach, under the conduct of the Count de Lauzun. A yacht, commanded by Captain Gray, which lay there ready for the purpose, soon transported them in safety to Calais.

²⁹³ James attempts to leave the kingdom. The king was now so dispirited and distracted, that he resolved to leave the kingdom at once, and thus throw every thing into confusion. He threw the great seal into the Thames; he left none with any authority to conduct affairs in his absence; and he vainly hoped to derive advantage to his affairs from anarchy and disorder. About twelve at night, on the 10th of December, he disguised himself, took a boat at Whitehall, and crossed the river. Sir Edward Hales, with another friend, met him at Vauxhall with horses. He mounted; and being conducted through by-ways by a guide, he passed in the night-time to the Medway, which he crossed by Ailesford bridge. At Woolpeck he took fresh horses, sent thither before by Sheldon one of his equerries who was in the secret of his flight. He arrived at 10 o'clock at Embyferry near Feversham, where a customhouse boy, hired by Sir Edward Hales, lay ready to receive them on board. But the wind blew fresh, and the vessel had no ballast. The master, therefore, easily persuaded the king to permit him to take in ballast at Shilness. It being half ebb when they ran ashore, they designed to sail as soon as the vessel should be afloat. But when the vessel was almost afloat, she was boarded by three fisher boats belonging to Feversham, containing 50 men. They seized the king and his two companions, under pretence of their being Papists that wanted to escape from the kingdom. They turned up Feversham water with the tide; but still the king remained unknown. Sir Edward Hales placed privately 50 guineas in the hands of the captain, as an earnest of more should he permit them to escape. He promised; but was so far from keeping his word, that he took what money they had, under pretence of securing it from the seamen; and having possessed himself of their all, he left them to their fate. The unfortunate fugitives were at length carried in a coach to Feversham, amid the insults, cla-

²⁹⁴ seized and insulted.

ours, and shouts of the sailors. When the king was brought to the inn, a seaman who had served under him knew him, and melted into tears; and James himself was so much moved at this instance of his affection, that he wept. The other fishermen who had treated him with such indignity before, when they saw his tears, fell upon their knees. The lower inhabitants of the whole village gathered round him; but the better sort fled from his presence. The seamen, however, formed themselves into a guard round him, and declared, that "a hair of his head should not be touched." In the mean time, Sir James Oxendon, under the pretence of guarding him from the rabble, came with the militia to prevent his escape. The king found a change in his condition when he was taken out of the hands of the sailors. The commanders of the militia showed him no respect. He was even insulted by the common soldiers. A letter which he intended to send to London for clothes, a change of linen, and some money, was stopped by those who pretended to protect his person.

All things in the mean time ran into confusion at London, and the prince of Orange exercised in his own person all the functions of royalty. He issued a declaration to the disbanded army to reassemble themselves. He ordered the secretary at war to bring him a list of the king's troops. He commanded the lord Churchill to collect his troop of horse guards. He sent the duke of Grafton to take possession in his name of Tilbury fort. The assembly of peers adjourned to the council-chamber at Whitehall, and, to give the appearance of legality to their meeting, chose the marquis of Halifax for their president. While this assembly was sitting, on the 13th of December, a poor countryman, who had been engaged by James, brought an open letter from that unfortunate prince to London. It had no subscription; and it was addressed to none. It contained, in one sentence only, his deplorable condition when in the hands of a desperate rabble. This poor messenger of their fallen sovereign had long waited at the council door, without being able to attract the notice of any who passed. The earl of Mulgrave at length, apprized of his business, had the courage to introduce him to the council. He delivered his open letter, and told the state of the king with tears. The assembly were so much moved, that they sent the earl of Feversham with 200 of the guards towards Feversham. His instructions were to rescue him first from danger, and afterwards to attend him to the sea coast, should he choose to retire. He chose, however, to return to London; but the prince of Orange sent a messenger to him, desiring him to advance no nearer the capital than Rochester. The messenger missed James by the way. The king sent Feversham with a letter to the prince of Orange, requesting his presence in London to settle the nation. He himself proceeded to that place, and arrived on the 16th of December. Doubting the fidelity of his troops who were quartered at Westminster, he chose to pass through the city to Whitehall. Never prince returning with victory to his capital was received with louder acclamations of joy. All the streets were covered with bonfires. The bells were rung, and the air was rent with repeated shouts of gladness. All orders of men crowded to his coach;

²⁹⁵ His great distress.

²⁹⁶ James returns to London.

^{Britain.} coach; and when he arrived at Whitehall, his apartments were crowded with people who came to express their joy at his return.

The prince of Orange received the news of his return with a haughty air. His aim from the beginning was to force him by threats and severities to relinquish the throne. The Dutch guards were ordered to take possession of Whitehall, and to displace the English. The king was soon after commanded by a message, which he received in bed at midnight, to leave his palace next morning, and to depart for Ham, a seat of the duchess of Lauderdale's. He desired, however, permission to retire to Rochester, a town not far from the sea coast, and opposite to France. This was readily granted: and it was now perceived that the harsh measures of the prince had taken effect, and that the king meditated an escape to France.

¹⁹⁷
Commanded by William to leave his palace.

The king, surrounded by the Dutch guards, arrived at Rochester on the 19th of December. The restraint put upon his person, and the manner in which he had been forced from London, raised the indignation of many, and the compassion of all. The English army, both officers and soldiers, began to murmur; and had it not been for the timidity and precipitation of James himself, the nation had certainly returned to their allegiance. He remained three nights at Rochester, in the midst of a few faithful friends. The earls of Arrian, Dumbarten, Ailesbury, Litchfield, and Middleton, were there; and with other officers of merit, the gallant Lord Dundee. They argued against his flight with united efforts. Several bishops, some peers, and many officers, entreated his stay in some part of England. Message followed message from London. They represented that the opinions of men began to change, and that events would daily rise in favour of his authority. Dundee added his native ardour to his advice.

¹⁹⁸
He is pressed to stay in the kingdom;

"The question, Sir, (said he), is Whether you shall stay in England, or fly to France? Whether you shall trust the returning zeal of your native subjects, or rely on a foreign power? Here you ought to stand. Keep possession of a part, and the whole will submit by degrees. Resume the spirit of a king. Summon your subjects to their allegiance. Your army, though disbanded, is not dispersed. Give me your commission. I will gather 10,000 of your troops. I will carry your standard at their head through England, and drive before you the Dutch and their prince." The king replied, "that he believed it might be done; but that it would raise a civil war, and he would not do so much mischief to a nation that would soon come to their senses again." Middleton urged his stay, though in the remotest part of the kingdom. "Your majesty (said he) may throw things into confusion by your departure; but it will be but the anarchy of a month: a new government will soon be settled, and you and your family will be ruined." These spirited remonstrances had no effect upon James. He resolved to quit the kingdom; and having communicated his design to a few of his friends, he passed at midnight through the back-door of the house where he lodged, and with his son the duke of Berwick, and Biddulph one of his servants, went in a boat to a smack which lay waiting for him without the fort at Sheerness. By reason of a hard gale they were forced to bear up toward Leigh, and to anchor on the Essex side, under

¹⁹⁹
but refuses.

the lee of the land. When the gale slackened, they reached the Buoy of the Narrows without tacking; but not being able to weather the Goodwin, they were forced to sail through the Downs. Seven ships lay there at anchor; but the smack passed unquestioned along. Unable to fetch Calais, she bore away for Boulogne, and anchored before Ambleteuse. The king landed at three o'clock in the morning of Tuesday, December 25th; and taking post, soon joined his queen at St Germain's.

^{Britain.}
³⁰⁰
He lands in France.

James having thus abandoned his dominions, the prince of Orange remained master of them of course. By the advice of the house of lords, the only member of the legislature remaining, he was desired to summon a parliament by circular letters; but the prince, unwilling to act upon so imperfect an authority, convened all the members who had sat in the house of commons during any parliament of Charles II. and to these were added the mayor, aldermen, and fifty of the common council of London; and the prince, being thus supported by an assembly deriving its authority from himself, wrote circular letters to the counties and corporations of England to call a new parliament.

The house being met, which was mostly composed of the Whig party, thanks were given to the prince of Orange for the deliverance he had brought them; after which they proceeded to settle the kingdom. A vote soon passed both houses, that King James II. having endeavoured to subvert the constitution of the kingdom, by breaking the original contract between the king and his people, and having by the advice of Jesuits and other wicked persons, violated the fundamental laws, and withdrawn himself out of the kingdom, had abdicated the government; and that the throne was thereby vacant.

³⁰¹
The throne declared vacant.

The king being thus deposed, it was easy for William to get himself appointed his successor. Proposals were made for electing a regent. Others were for investing the princess of Orange with legal power, and declaring the young prince supposititious. To these proposals, however, William opposed the following desisive argument, viz. that "he had been called over to defend the liberties of the British nation, and that he had happily effected his purpose; that he had heard of several schemes proposed for the establishing of the government; that, if they chose a regent, he thought it incumbent upon him to inform them that he would not be that regent; that he would not accept of the crown under the princess his wife, though he was convinced of her merits; that therefore, if either of these schemes was adopted, he could give them no assistance in the settlement of the nation; but would return home to his own country, satisfied with his aims to secure the freedom of theirs." Upon this, after a long debate in both houses, a new sovereign was preferred to a regent by a majority of two voices. It was agreed that the prince and princess of Orange should reign jointly as king and queen of England; while the administration of government should be placed in the hands of the prince only. The marquis of Halifax, as speaker of the house of lords, made a solemn tender of the crown to their highnesses, in the name of the peers and commons of England. The prince accepted the offer; and that very day, February 13. 1689, William and Mary were proclaimed king and queen of England.

³⁰²
William raised to the sovereignty.

Though

Britain.

Though Mary was comprehended in the royal title, she never possessed either the authority of a queen, or the influence of a wife. Her easy temper had long been subdued by the stern severity of a husband who had very few amiable qualities. Being brought up in a manner under the tuition of her spouse, and in some degree confined by his orders, she was accustomed to adopt implicitly his political maxims and even his thoughts; and in consequence of her want of importance with him, she ceased to be an object of consequence in the eyes of the nation.

William began his reign with issuing a proclamation for continuing in office all Protestants that had been in place on the first of the preceding December. On the 17th of the month he formed his privy council, which consisted chiefly of such persons as had been most active in raising him to the throne. To gratify as many as possible of his friends, the several boards, and even the chancery, were put into commission. The benches of the exchequer and common law were filled with persons who had distinguished themselves against the measures of the late king. The earl of Nottingham who had violently opposed the elevation of William, and the earl of Shrewsbury who had adhered to his views, were made secretaries of state. The marquis of Halifax, and the earl of Danby, though rivals in policy, were admitted into the cabinet; the first as lord privy seal, the second as president of the council. His Dutch friends in the mean time were not forgotten by the king. Bentinck, his favourite, was made a privy counsellor, groom of the stole, and privy purse. Auverquerque was appointed master of the horse. Zuylstein received the office of master of the robes. Schomberg was placed at the head of the ordnance.

303
National
discontents.

Though these instances of gratitude were no doubt necessary to William, the generality of the nation were displeased. The Tories were offended at being excluded from his favour, especially as they had departed from their principles in order to serve him. The nation in general were much prejudiced against foreigners, and universal discontent ensued upon seeing them preferred. The king, who had been bred a Calvinist, was also very strongly inclined to favour that sect; and his prejudices in favour of Calvinism were almost equal to those of James in favour of Popery. Finding, therefore, the clergy of the church of England little inclined to take the oaths to the new government, he began openly to indulge his own prejudices in favour of dissenters. Having come to the house of lords, to pass some bills, on the 16th of March, he made a speech, urging the necessity of admitting all Protestants indiscriminately into the public service. He told his parliament, that he had something to communicate, which would conduce as much to their settlement as to the disappointment of their enemies. He informed them, that he was employed in filling up the vacancies in offices of trust; and he hoped that they were sensible of the necessity of a law to settle the oaths to be taken by such persons as should be admitted into place. As he doubted not, he said, that they would sufficiently provide against Papists, so he hoped that they would leave room for the admission of all Protestants that were able and willing to serve.

304
His scheme
in favour
of dissent-
ers reject-
ed.

This proposition was rejected with vehemence. The

adherents of the church complained that the ruin which they feared from the Papists in the preceding reign was now to be dreaded from the Protestant dissenters. They affirmed, that if the established religion was to be destroyed, it mattered little by whose hands it must fall. A bill brought in by the ministry for abrogating the former oaths of supremacy and allegiance was rejected.

Britain.

An attempt to dispense with the sacramental test was made without success in another form. The court-party proposed that any man should be sufficiently qualified for any office by producing a certificate of his having received the sacrament in any Protestant congregation. But this motion was also rejected in the house of lords by a great majority. William repeated his attempts of a comprehension; but he was ultimately unsuccessful, and in the coronation-oath the church-party inserted a clause highly favourable to themselves, viz. that the king should maintain the Protestant religion "as established by law." To this clause William is said to have discovered an apparent unwillingness to swear.

For these and other reasons, the government of William was for some time but in a very tottering condition. The king, either through want of health or inclination, interfered but little in the affairs of the nation. Ireland was strangely neglected. Halifax and Danby, who had in a manner raised the king to the throne, caballed with his enemies. They perceived that the people, with the same levity that induced them to desert their former sovereign, were beginning to be discontented with their new prince. Every thing seemed to tend to a change. Halifax himself declared, that were James to conform with the Protestants, he could not be kept four months from reascending his throne. Danby averred, that, were the late king to give satisfaction for the security of religion, it would be difficult to oppose his restoration. From these apparent discontents of the nation, the friends and emissaries of James assumed more boldness. They tampered with the servants of the crown, and inflamed the army. The former they alarmed with the prospect of a sudden change; the latter they roused into indignation by the manifest preference given by William to his countrymen the Dutch.

305
Tottering
condition
of Wil-
liam's go-
vernment.

Though the kingdom of Scotland did not at first recognize the authority of William, yet the party of James never attained sufficient strength to be of any effectual service to him in that kingdom. Thirty Scots peers, and near 80 gentlemen, then in London, had waited in the beginning of January on the prince of Orange. Without any authority from the regency still subsisting in Edinburgh, they formed themselves into a kind of convention. The prince of Orange in a formal manner asked their advice. He withdrew, and they adjourned to the council-chamber at Whitehall. The duke of Hamilton being chosen president, explained the distracted state of Scotland. He represented, that disorders, anarchy, and confusion, prevailed; and he urged the necessity of placing the power somewhere till a convention of states should be called to form a lasting and solid settlement. When the heads of their address to the prince of Orange were settled, and ordered to be engrossed, the earl of Arran unexpectedly arose, and proposed to invite back the king. The meet-
ing,

306

land.

Britain. ing, however, adhered to the prince of Orange; and waited on him in a body, requesting him to take the administration into his hands. He thanked them for the trust they had reposed in him; and a convention was ordered to meet at Edinburgh on the 14th of March, and it was provided that no exception or limitation whatever should be made, except that the members should be Protestants.

A secession, however, was made from this convention, in favour of James. The archbishop of Glasgow, the earl of Balcarras, and the viscount Dundee, were authorised by an instrument signed by the late king, at that time in Ireland, to call a convention of the states at Stirling. But this measure was disappointed, first by the wavering disposition of the marquis of Athol, and afterwards by the delay and folly of the party. At last, the viscount Dundee, being alarmed by an information of a design formed by the covenanters to assassinate him, left Edinburgh at the head of 50 horse. When he passed under the walls of the castle, the duke of Gordon, who held that place, and favoured the cause of James, called him to a conference. He scrambled up the precipice, and informed the duke of his designs in favour of the late king. He conjured him to hold out the castle, under a certainty of being relieved. The novelty of the sight collected multitudes of spectators. The convention were alarmed, the president ordered the doors to be locked, and the keys to be laid upon the table. The drums were beat to alarm in the town. A parcel of ill-armed retainers were gathered together in the street by the earl of Leven. Dundee in the mean time rode off with his party. But when they found themselves secure, the duke of Hamilton adjourned the convention, which relieved the adherents of James from dreadful apprehensions for their own safety. Fifty members retired from Edinburgh; and that circumstance procured an unanimity in all the succeeding resolutions of the convention. Soon after this, it was determined in a committee, that James had *forefaulted* his right to the crown, by which was meant that he had perpetually excluded himself and his whole race from the crown, which was hereby become vacant. This resolution was approved by the convention, and another was drawn up for raising William and Mary to the vacant throne; in consequence of which they were proclaimed at Edinburgh on the 11th of April 1689.

The castle of Edinburgh was still kept, in the name of James, by the duke of Gordon: but despairing of any relief, and pressed by a siege, he surrendered it on the 13th of June, upon honourable terms. The adherents of James, terrified with this unexpected misfortune, now turned their eyes to the viscount Dundee. That nobleman having been in vain urged by the convention to return, they had declared him a fugitive, an outlaw, and a rebel. General Mackay had been sent to Scotland by William with four regiments of foot, and one of dragoons; and Dundee being apprised of his design to surprise him, retired to the Grampian mountains with a few horse. He marched from thence to Gordon castle, where he was joined by the earl of Dunfermline with 50 gentlemen. He then passed through the county of Murray to Inverness. Macdonald of Keppoch lay with 700 men before that town; after having ravaged, in his way from his own country,

the lands of the clan of Macintosh. Dundee having promised to the magistrates of Inverness, to repay, at the king's return, the money extorted from them by Macdonald, induced the latter to join him with all his men. He could not prevent them, however, from first returning home with their spoil. He accompanied them to Lochaber, and on the 8th of May arrived in Badenoch. From thence he wrote letters to the chiefs of all the clans, appointing them to meet at a general rendezvous in Lochaber, on the 18th of the same month. In the mean time, passing suddenly through Athol, he surprised the town of Perth. In hopes of gaining to his party the two troops of Scots dragoons who lay at Dundee, he marched suddenly to that place: but the fidelity of Captain Balfour, who commanded them, disappointed his views. Having raised the land-tax as he passed, Dundee returned through Athol and Rannoch to hold the diet of rendezvous at Lochaber. Here he was reinforced by several Highland chieftans, so that his army amounted to 1500 men. He pursued Mackay for four days, who had advanced to Inverness, but afterwards retreated to Strathbogie, leaving the whole Highlands exposed to the enemy.

Soon after, however, Dundee found himself surrounded with many difficulties. The officers of the Scots dragoons, who held a secret correspondence with him, wrote him false intelligence, as an excuse for their own fears. They informed him, that a party of Irish, who had endeavoured to land in Scotland, under the duke of Berwick, were driven back, and the duke himself taken prisoner; and that Mackay had been reinforced with a regiment of English horse, and another of foot. On this intelligence, Dundee, retreated to Badenoch. The natives of the low country who served in his army quitted him without leave; and the Highlanders plundered the country wherever they came: at last he himself fell sick, while Mackay hovered on his rear. A slight skirmish happened, in which the Highlanders prevailed; but they lost their baggage during the action. Dundee at length arrived at Ruthven; but Mackay being reinforced with a body of 1200 men advanced against him, and other regiments had arrived at Perth and Dumblain. The Highlanders now deserted every night by hundreds; their gallant leader himself was forced to retire to Lochaber, where only 200 of his whole force remained with him; and to complete his misfortunes, he received at the same time news of the surrender of the castle of Edinburgh.

On the 23d of June, letters arrived from King James, with a promise of immediate succours from Ireland; upon which Dundee ordered the neighbouring clans to assemble round his standard. But still he had scarce any thing but the mere bodies of his men with which he could prosecute the war. The Highlanders were armed only with their own proper weapons, and he had no more than 40 pounds of powder in his whole army. All difficulties, however, were surmounted by the active spirit of the general, for whom the army entertained an enthusiastic zeal. On the 17th of July, ³⁰⁸ He is slain: he met the king's forces under General Mackay, near at Killi-^{cranky.} the pass of Killicranky. An engagement ensued, in which the Highlanders were victorious. Two thousand of Mackay's men were lost either in the field or in

307
Attempts

James.

Britain. in the pursuit; but the victory cost the Highlanders very dear, for their brave general was mortally wounded. He survived the battle, however; and wrote an account of the victory to King James: he even imagined his wound was not mortal; but he died the next morning at Blair. With him ended all the hopes of James in Scotland. Colonel Cannon, who succeeded Dundee in the command, possessed neither his popularity nor his abilities. After some insignificant actions, in which the valour of the soldiers was more conspicuous than the conduct of their leader, the Highlanders dispersed themselves in disgust; and the war soon after ended favourably for William, without any repulse given to his enemies.

309
Ireland neglected by William.

During the troubles in England, which had terminated in placing William on the throne, the two parties in Ireland were kept in a kind of tranquillity by their mutual fears. The Protestants were terrified at the prospect of another massacre; and the Papists expected every day to be invaded by the joint force of the English and Dutch. Their terrors, however, were ill founded; for though Tyrconnel sent several messages to the prince, that he was ready to deliver up the kingdom to any force that might make a surrender decent, his offers were always rejected. William was persuaded by the marquis of Halifax, that, should Ireland yield, no pretence could remain for keeping an army in pay; that then, having no army to protect his authority, he might as easily be turned out as he had been brought in; that the English nation could never remain long in a state of good humour; and that he might perceive they already began to be discontented. These insidious arguments induced William to neglect Ireland in such a manner as is justly looked upon to be one of the greatest blemishes in his whole reign. His enemies, indeed, though perhaps without any good foundation, assign a worse cause, viz. that should England be confirmed under his government, Ireland could not long hold out; and that the obstinacy of his Irish enemies would give a pretence for forfeitures, to gratify his English, but especially his foreign friends.

310
An insurrection in favour of James.

Tyrconnel, disappointed in his views of surrendering Ireland to the prince of Orange, affected to adhere to James. The whole military force of the kingdom at that time amounted only to 4000 men, and of these only 600 were in Dublin; and what was still worse, all of them were so much disposed to quit the service, that the lord deputy was obliged to issue commissions for levying new forces. Upon this, a half-armed rabble, rather than an army, rose suddenly in various parts of the kingdom. Having no pay from the king, they subsisted by depredation, and regarded no discipline. The Protestants in the north armed themselves in their own defence; and the city of Londonderry, relying on its situation, and a slight wall, shut its gates against the new-raised army. Protestant parties in the mean time rose everywhere, declaring their resolution to unite in self-defence, to preserve the Protestant religion, to continue their dependence on England, and to promote the meeting of a free parliament.

311
Protestants take arms in their own defence.

To preserve appearances, William now sent General Hamilton, an Irishman and a Roman Catholic, to

Britain. treat with Tyrconnel; but instead of persuading that lord to yield to William, this messenger advised him to adhere to James. In the mean time James himself assured the lord deputy, that he was ready to sail from Brest with a powerful armament. Hamilton, assuming spirit from the hopes of this aid, marched against the northern insurgents. They were routed with considerable slaughter at Drumore; and Hillsborough, where they had fixed their head quarters, was taken without resistance: the city of Londonderry, however, resolved to hold out to the last extremity.

312
They are defeated at Drumore.

On the 7th of March 1689, James embarked at Brest. The whole force of his expedition consisted of 14 ships of war, six frigates, and three fire-ships. Twelve hundred of his native subjects in the pay of France, and 100 French officers, composed the whole army of James. He landed at Kinsale without opposition on the 12th of the month, where he was received with the utmost demonstrations of joy. His first care was to secure, in the fort of Kinsale, the money, arms, and ammunition, which he brought from France; and put the town in some posture of defence; which having done, he advanced to Cork. Tyrconnel arrived at this place soon after, and brought intelligence of the rout at Drumore. The king was so much pleased with his attachment and services, that he created him a duke; after which he himself advanced towards Dublin. The condition of the rabble, who poured round him under the name of an *army*, was not calculated to raise his hopes of success. The most of them were only provided with clubs; some had sticks tipped with iron; and even of those who were best armed, scarce two in a hundred had muskets fit for service. Their very numbers distressed their sovereign, and ruined the country; insomuch that James resolved to disband the greatest part of them. More than 100,000 were already on foot in the different parts of the island. Of these he reserved 14 regiments of horse and dragoons, and 35 regiments of foot; the rest he ordered to their respective homes, and armed those that were retained in the best manner he could.

313
James lands in Ireland.

Being received at Dublin with an appearance of universal joy, James proceeded immediately to business. He ordered, by proclamation, all Protestants who had abandoned the kingdom to return. He commanded, in a second proclamation, all Papists, except those in his army, to lay up their arms, and put an end to the robberies and depredations which they had committed in the violence of their zeal. He raised the value of the currency by a proclamation; and he summoned a parliament to meet on the 7th of May, to settle the affairs of the kingdom. The Protestant clergy represented their grievances in an address; and the university of Dublin appeared with complaints and congratulations. He assured the first of his absolute protection, and a full redress; and he promised the latter not only to defend, but even to enlarge, their privileges.

On the 8th of April, James left Dublin, resolving to lead his army against the insurgents in person, to raise the siege of Londonderry. The besieged made such a vigorous resistance as has made the place remarkable ever since: * See Londonderry. but being reduced to the last extremity, they would have been obliged to surrender, had not they been relieved

314

troable
measures.

lieved on the 28th of July by seven ships laden with provisions; upon which the siege was immediately raised.

In the mean time, the distressed situation of James, and his absolute dependence upon France, drove him into measures which otherwise he never would have thought of. His soldiers for some time had been supported by their officers, or subsisted by depredation. The funds of the officers were at last exhausted, and the country itself could no longer bear the riot and injustice of the soldiers. Pressed by these difficulties, James, by the advice of his council, resolved to coin pieces of copper, which should be received for silver. He saw well enough the inconveniencies of this measure: but all Ireland possessed not the means of paying the army in current coin to the middle of June. Of the French remittances only 200,000 livres remained; and the king found it absolutely necessary to reserve that sum, to forward his measures with regard to Britain, and to procure intelligence of the motions of his enemies. The army was satisfied even with this appearance of money, and the people received the fictitious coin in hopes of being repaid in a more favourable state of affairs. A tax of 20,000*l.* a month, granted for 13 months by the parliament, furnished government with an appearance of resources; and in the mean time the king endeavoured to support the former revenue. He opened a trade with France to supply the want of commerce with England. But the French, knowing their own importance, and the necessity of the unfortunate monarch's affairs, claimed and obtained advantages in traffic which offended his own subjects.

316
Ireland in-
vaded by
William's
army:

To add to the distress of James, Ireland was now invaded by 10,000 men under the command of the duke of Schomberg. They appeared on the 12th of August 1689, in 90 transports, on the coast of Donaghadee, in the county of Down. Next day Schomberg landed without opposition his army, horses, and train of artillery. Having marched to Belfast on the 15th, he continued in that place four days to refresh his troops. He invested Carrickfergus, and threw into it 1000 bombs, which laid the houses in ashes. The garrison having expended their powder to the last barrel, marched out with all the honours of war. But Schomberg's soldiers broke the capitulation. They disarmed and stripped the inhabitants, without any regard to sex or quality; even women, stark naked, were publicly whipped between the lines; and all this under pretence of cruelties of the same kind having been committed by the Papists.

Though Schomberg was an experienced general, who had passed a life of 80 years almost continually in the field, he found himself at a loss how to carry on the war in Ireland. He did not consider the dangers that threatened the health of his troops by confining them too long in one place; and he kept them in a low moist camp near Dandalk, almost without firing of any kind; so that the men fell into fevers and fluxes, and died in great numbers. The enemy were not less afflicted with similar disorders. Both camps remained for some time in sight of each other; and at last, the rainy season approaching, both armies quitted their camps at the same time, and retired into winter-quarters.

VOL. IV. Part II.

The bad success of the campaign, and the miserable situation of the Protestants in Ireland, at length induced William to attempt their relief in person. Accordingly he left London on the 4th of June 1690, and arrived at Carrickfergus on the 14th of that month. From thence he passed to Lisburn, the head quarters of the duke of Schomberg. He reviewed at Lough-Britland his army, which consisted of 36,000 men, and was composed of English, Dutch, Germans, Danes, and French. Being supplied with every necessary, and in high health and spirits, they seemed absolutely certain of victory. The Irish army, having abandoned Ardee at their approach, fell back to the south of the Boyne. On the bank of that river they were joined by James, who had marched from Dublin at the head of his French auxiliaries. The banks of the Boyne were steep; the south side hilly, and fortified with ditches. The river itself was deep, and it rose very high with the tide. These advantages induced James, contrary to the opinion of his officers, to keep possession of this post. His army was inferior in numbers, discipline, and every thing, to his enemies: but flight, he thought, would dispirit his troops, and tarnish his own reputation; he therefore resolved to put the fate of Ireland on the issue of a battle. Urged by his friends in England, and encouraged by a projected invasion of that kingdom, by France, he had resolved to quit Ireland; and to this he was farther encouraged by the assurance of aid from a powerful fleet that had already entered the narrow seas. But the strength of his situation, and the sudden appearance of the enemy, which made even a retreat dangerous, induced him to defer his purpose.

318
Battle at
the Boyne.

William was no sooner arrived, than he rode along the river's side, in sight of both armies, to make proper observations on the plan of battle; but in the mean time, being perceived by the enemy, a cannon was privately brought out and planted against him where he was sitting. The shot killed several of his followers, and he himself was wounded in the shoulder. The news of his being slain was instantly propagated through the Irish camp, and even sent off to Paris; but William, as soon as his wound was dressed, rode through the camp, and quickly undeceived his army.

319
William in
danger.

The next day (June 30th) the battle began at six in the morning. James's forces behaved with great resolution, but were at last defeated with the loss of 1500 men. The Protestants lost but about one-third of that number; but among these was their brave general the duke of Schomberg. He was killed by a discharge from his own troops, who, not knowing that he had been accidentally hurried into the midst of the enemy, fired upon the body of men who surrounded him. During the action, James stood on the hill of Dunmore, surrounded with some squadrons of horse; and at intervals was heard to exclaim, when he saw his own troops repulsing those of the enemy, "O spare my English subjects!" While his troops were yet fighting, he quitted his station; and leaving orders to guard the pass at Duleek, made the best of his way to Dublin. He advised the magistrates of that city to make the best terms they could with the victors; and he himself set out for Waterford, where he immediately embarked for France. When he first deserted his troops at the Boyne, O'Regan, an old Irish captain, was heard

Britain. to say, "That if the English would exchange generals, the conquered army would fight them over again."

322
War con-
tinued in
his absence.

The victory at the Boyne was by no means decisive, and the friends of James resolved to continue their opposition to William. Sarsfield, a popular and experienced general, put himself at the head of the army that had been routed at the Boyne, and went farther into the country to defend the banks of the river Shannon. James appointed one St Ruth to command over Sarsfield, which gave the Irish universal discontent. On the other hand, General Ginkle, who had been appointed to command the English army in the absence of William, who was gone over to England, advanced towards the Shannon to meet the enemy. The only place where it was fordable was at Athlone, a strong walled town built on both sides of the river, and in the hands of King James's party. The English soon made themselves masters of that part which was on the hither side of the river; but the part on the opposite bank being defended with great vigour, was for a long time thought impregnable. At length it was resolved in a council of war, that a body of forlorn hope should ford the stream in the face of the enemy; and this desperate enterprise was performed with great resolution: the enemy were driven from their works, and the town surrendered at discretion. St Ruth marched his army to its relief, but he came too late; for he no sooner approached, than his own guns were turned against him; upon which he instantly marched off, and took post at Aughrim, at ten miles distance, where he determined to wait the English army. Ginkle did not decline the combat, though he had only 18,000 men, while the Irish were above 25,000 strong. A desperate engagement ensued; but at last St Ruth being killed, his troops gave way on all sides, and retreated to Limeric, where they determined to make a final stand, after having lost near 5000 of their best men.

323
St Ruth,
James's ge-
neral, de-
feated, and
killed.

Ginkle, wishing to put an end to the war at once, suffered as many of the Irish as chose to retire to Limeric. In this last retreat the Irish forces made a brave defence. The siege commenced August 25, 1691. Six weeks were spent before the place without any decisive effect. The garrison was well supplied with provisions, and provided with all means of defence. The winter was approaching, and Ginkle had orders to finish the war upon any terms. He therefore offered such conditions as the Irish, had they been victors, could scarce have refused with prudence. He agreed that all in arms should receive their pardon: that their estates should be restored, their attainders annulled, and their outlawries reversed: that none should be liable for debts incurred through deeds done in the course of hostilities: that all Roman Catholics should enjoy the same toleration with regard to their religion as in the reign of Charles II.: that the gentry should be permitted to make use of arms: that the inferior sort should be allowed to exercise their callings and professions: that no oaths but that of allegiance should be required of high or low: that should the troops, or any number of them, choose to retire into any foreign service, they should be conveyed to the continent, at the expence of the king. Sarsfield, who had obtained the title of *earl of Lucan* from James after his abdication, was permitted to retain a dignity

Limeric be-
sieged.

325
Favourable
terms al-
lowed them
by Ginkle.

which the laws could not recognise. The lords justices arrived from Dublin on the first of October. They signed the articles together with Ginkle; and thus the Irish Papists put a happy period to a war which threatened their party with absolute ruin. In consequence of this treaty, about 14,000 of those who had fought for King James went over to France, having transports provided by government for conveying them thither. When they arrived, James thanked them for their loyalty, and told them that they should still fight for their old master; and that he had obtained an order from the king of France for their being new clothed, and put into quarters of refreshment. In this manner all James's expectations from Ireland were entirely frustrated, and the kingdom submitted quietly to the English government.

Britain.

In the beginning of the year 1692, an action of un-
326
Massacre
of Glenco.
exampleed barbarity disgraced the government of William in Scotland. In the preceding August, in consequence of a pacification with the Highlanders, a proclamation of indemnity had been issued to such insurgents as should take the oaths to the king and queen, on or before the last day of December. The chiefs of the few tribes who had been in arms for James complied soon after with the proclamation: but Macdonald of Glenco failed in submitting within the limited time; more, however, from accident than design. In the end of December, he came to Colonel Hill, who commanded the garrison in Fort William, to take the oaths of allegiance to the government. Hill having furnished Macdonald with a letter to Sir Colin Campbell, sheriff of the county of Argyle, directed him to repair immediately to Inverary, to make his submission in a legal manner before that magistrate. The way to Inverary lay through almost impassable mountains; the season was extremely rigorous, and the whole country covered with a deep snow. So eager, however, was Macdonald to take the oaths, before the limited time should expire, that though the road lay within half a mile of his own house, he would not stop to visit his family. After various obstructions, he arrived at Inverary. The time was elapsed, and the sheriff hesitated to receive his submission; but Macdonald prevailed on him by his importunities, and even tears. Sir John Dalrymple, afterwards earl of Stair, attended King William as secretary of state for Scotland. He took advantage of Macdonald's neglecting to take the oaths within the time prescribed, and procured from the king a warrant of military execution against him and his whole tribe. As a mark of his own eagerness, or to save Dalrymple, William signed the warrant both above and below, with his own hand. The secretary, in letters expressive of a brutal ferocity of mind, urged the officers who commanded in the Highlands to execute their orders with the utmost rigour. Campbell of Glenlyon, a captain in Argyle's regiment, and two subalterns, were ordered with 120 men to repair to Glenco on the first of February. Campbell, being uncle to young Macdonald's wife, was received by the father with all manner of friendship and hospitality. The men were treated in the houses of his tenants with free quarters and kind entertainment. Till the 13th of the month, the troops lived in good humour and familiarity with the people. The officers on the very night of the massacre passed the evening and played at cards in Macdonald's house. In the night,
Lieutenant

Britain. Lieutenant Lindsay, with a party of soldiers, called in a friendly manner at his door. He was instantly admitted. Macdonald, as he was rising to receive his guest, was shot dead behind his back with two bullets. His wife had already put on her clothes; but she was stripped naked by the soldiers, who tore the rings off her fingers with their teeth. The slaughter was become general. To prevent the pity of the soldiers to their hosts, their quarters had been changed the night before. Neither age nor infirmity was spared. Some women, in defending their children, were killed; boys, imploring mercy, were shot by officers, on whose knees they hung. In one place, nine persons, as they sat enjoying themselves at table, were shot dead by the soldiers. In Inverriggen; in Campbell's own quarters, nine men were first bound by the soldiers, and then shot at intervals, one by one. Near 40 persons were massacred by the troops. Several who fled to the mountains perished by famine and the inclemency of the season. Those who escaped owed their lives to a tempestuous night. Lieutenant-colonel Hamilton, who had the charge of the execution from Dalrymple, was on his march with 400 men, to guard all the passes from the valley of Glenco; but was obliged to stop by the severity of the weather; which proved the safety of the unfortunate tribe. He entered the valley next day; laid all the houses in ashes; and carried away all the cattle and spoil, which were divided among the officers and soldiers.

It can scarcely be imagined that a massacre attended with such circumstances of treachery and breach of the laws of hospitality, could pass without some animadversion; though the expressions of Cunningham, a writer very partial to the character of King William, seem to account it a fault that it should ever have been inquired into. "Mr James Johnstone, one of the secretaries of state (says he), from motives of revenge, caused the affair of Glenco to be laid before parliament. This being somewhat disingenuously managed, was the occasion of much trouble to many people. The earl of Breadalbin was committed to the castle of Edinburgh; but the lord viscount Stair, who lay under some suspicion on that account, in a very artful speech endeavoured to resolve the whole matter into a misapprehension of dates; which, he alleged, had led both the actor in the slaughter complained of, and those who now accused him, into mistakes. In conclusion he affirmed, that neither the king nor any other person was to be blamed, save only the misled captain, who did not rightly understand the orders that had been given him." The most disgraceful circumstances of the massacre are by the same author concealed; as he only tells us, that "it unhappily fell out, that the whole clan of Glenco, being somewhat too late in making their submission to King William, were put to the sword by the hands and orders of Captain Campbell; which gave great offence to the king. It is certain the king had cause of resentment against some of his courtiers on account of this foul action; but he thought fit not to question them for it till he could settle himself more firmly on the throne."

327
Account of
the Darien
expedition.

It is not improbable, that partly to efface the remembrance of this massacre, and the shah inquiry above mentioned, the king now caused his commissioner to declare in the Scots parliament (the same that had inquired into the affair of Glenco), "That if the members found

it would tend to the advancement of trade that an act should be passed for the encouragement of such as should acquire and establish a plantation in Africa, America, or any other part of the world where plantations might be lawfully acquired, that his majesty was willing to declare he would grant to the subjects of this kingdom, in favour of these plantations, such rights and privileges as he granted, in like cases, to the subjects of his other dominions." Relying on this and other flattering promises, the nobility and gentry of Scotland advanced 400,000*l.* towards the establishment of a company for carrying on an East and West India trade; and 1200 veterans who had served in King's William's wars were sent to effect a settlement on the peninsula of Darien, which lies between the Atlantic and Pacific oceans, and in the narrowest place is not above 60 miles over; and of consequence is equally well adapted for trading with both the Indies.

The new colony was well received by the natives, and matters began to wear a promising aspect, when the king, on the earnest solicitations of the English and Dutch East India Companies, resolved to gratify the latter at the expence of his Scottish subjects; and knowing that the new colony must want supplies of provisions, he sent orders to the governor of Jamaica and the English settlements in America to issue proclamations, prohibiting, under the severest penalties, all his majesty's subjects from holding any correspondence with the Scottish colony, or assisting it in any shape with arms, ammunition, or provisions: "Thus (says Mr Knox) the king's heart was hardened against these new settlers, whom he abandoned to their fate, though many of them had been covered with wounds in fighting his battles.

"Thus vanished all the hopes of the Scottish nation, which had engaged in this design with incredible alacrity, and with the most sanguine expectations that the misfortunes of their country would, by this new channel of commerce, be completely healed.

"The distresses of the people, upon receiving authentic accounts of the fortune of their colony, scarcely admit of any description. They were not only disappointed in their expectations of wealth and a renewal of their commerce, but hundreds, who had ventured their all, were absolutely ruined by the miscarriage of the design.

"The whole nation seemed to join in the clamour that was raised against their sovereign. They taxed him with double dealing, inhumanity, and basè ingratitude, to a people who had lavished their treasure and best blood in support of his government, and in the gratification of his ambition; and had their power been equal to their acrimony, in all probability the island would have been involved in a civil war."

Such is the account of this transaction given by Mr Knox; on the other hand, Mr Cunningham tells us, that "the same parliament (which had inquired into the Glenco affair) also had under their consideration a scheme for settling a trade and planting a colony in America, which proved afterwards an occasion of manifold evils, and was matter of great complaint both to the English and the Spaniards. The Scots, carrying on the settlement of the colony which has been just mentioned with extravagant parade, and noise, and subscriptions, filled not only England but all other countries

^{Britain.} countries also, with apprehensions lest Scotland should, in process of time, become the emporium of all the trade of Europe. But they never considered how few would trust their fortunes to the disposal of such a numerous nobility, nor calculated the frauds of their own managers: by which means the whole affair was afterwards ruined. Discords arising on this head between the two kingdoms, old hostilities were recalled to mind; the cattle were driven off from the borders; the customs were defrauded, and other injuries committed; and at last the Spaniards complained of the Scots. Therefore, to prevent the mischiefs which might arise to both kingdoms, the king had nothing so much at heart as to bring about an union upon as fair terms as he could," &c.

³²⁸
Plots in favour of James.

The total reduction of Ireland, and the dispersion and extermination of the Highland chieftains who favoured his cause, did not entirely put an end to the hopes of James. His chief expectations next were founded on a conspiracy among his English adherents, and in the succours promised him by the French king. A plot was first formed in Scotland by Sir James Montgomery; a person who, from being an adherent to William, now turned against him: but as the project was ill contrived, so it was as lightly discovered by the instigator. To this another succeeded, which seemed to threaten more serious consequences, as it was managed by the Whig party, who were the most formidable in the state. A number of these joined themselves to the Tories, and both made advances to the adherents of the late king. They assembled together; and the result of their deliberations was, that the restoration of James was to be effected entirely by foreign forces: that he should sail for Scotland, and be there joined by 5000 Swedes; who, because they were of the Protestant religion, would, it was thought, remove a part of the odium which attended an invasion by foreigners: it was concerted that assistance should at the same time be sent from France, and that full liberty of conscience should be proclaimed throughout the kingdom. In order to lose no time, it was resolved to send over to France two trusty persons to consult with the banished monarch; and Lord Preston and Mr Ashton were the two persons appointed for this embassy. Both of them, however, were seized, when they least expected it, by order of Lord Caermarthen. Both were condemned; and Ashton was executed without making any confession; but Lord Preston had not the same resolution. Upon an offer of pardon, he discovered a great number of associates; among whom the duke of Ormond, Lord Dartmouth, and Lord Clarendon, were foremost.

³²⁹
He is supported by the French.

The French at last became sensible of their bad policy in not having better supported the cause of James, and therefore resolved to make a descent upon England in his favour. In pursuance of this scheme, the French king supplied James with an army consisting of a body of French troops, some English and Scots refugees, and the Irish regiments which had been transported into France from Limeric, and were now become excellent soldiers by long discipline and severe duty. This army was assembled between Cherbourg and La Hogue, and commanded by King James in person. More than 300 transports were provided for landing it on the opposite coast; and Tourville, the French admiral, at

the head of 63 ships of the line, was appointed to favour the descent. His orders were, at all events, to attack the enemy, in case they should oppose him; so that every thing promised the banished king a change of fortune.

^{Britain.}

These preparations on the side of France were soon known at the English court, and every precaution taken for a vigorous opposition. All the secret machinations of the banished king's adherents were discovered to the English ministry by spies; and by these they found that the Tories were more faithful than even the Whigs who had placed King William on the throne. The duke of Marlborough, Lord Godolphin, and even the princess Anne herself, were violently suspected of disaffection. Preparations, however, were made with great tranquillity and resolution, to resist the growing storm. Admiral Russel was ordered to put to sea with all possible expedition; and he soon appeared with 99 ships of the line, besides frigates and fire-ships. At the head of this formidable fleet he set sail for the coast of France; and, near La Hogue, he discovered the enemy under Tourville, who prepared to give him battle. The engagement began between the two admirals with great fury, and the rest of the fleet soon followed their example. The battle lasted for ten hours; but at last ³³⁰ who are victory declared on the side of numbers: the French ^{defeated.} fled for Conquet road, having lost four ships in the first day's action. The pursuit continued for two days following: three French ships of the line were destroyed the next day; and 18 more, which had taken refuge in the bay of La Hogue, were burnt by Sir George Rooke. In this manner were all the French preparations frustrated; and so decisive was the blow, that from this time France seemed to relinquish all claims to the ocean.

This engagement, which happened on the 21st of May 1692, put a final period to the hopes of James. No further attempts were made in his favour, except some plots to assassinate King William, which ended only in the destruction of those who formed them. But it was never thoroughly proved that James countenanced these plots in the least; it rather appears, that in all cases he expressed the utmost abhorrence of such attempts. In 1697, the abbé de Polignac, ambassador ³³¹ James of from France in Poland, wrote to his master, that ^{ferred the} thoughts were entertained of the late king of Britain, ^{Poland;} crown of in the new election which happened on the death of John Sobieski king of Poland; and that James had been already named by some of the diets as his successor. Louis was eager to seize an opportunity of ridding himself with honour of a prince whose pretensions he could no longer support. The friends of ³³² which he James were also sanguine for the project; but he ^{refuses.} himself refused it. He told them, that "he would ever retain a grateful remembrance of his friends in Poland. That, however, he would not accept of the crown, had it actually been offered; much less would he endeavour to obtain by solicitation any crown which was not actually his due. That his acceptance of any other sceptre would amount to an abdication indeed of that which he deemed his right. That therefore he was resolved to remain in his present forlorn condition, possessing less hopes than ever of being restored, rather than to do the least act of prejudice to his family." The same year, at an interview between King William and Louis

³³³ **Britain.** Louis XIV. it was proposed that the prince of Wales (James's son) should succeed to the throne of England after the death of William. The king with little hesitation agreed to this request. He even solemnly engaged to procure the repeal of the act of settlement; and to declare, by another, the prince of Wales his successor to the throne. Even this proposal was rejected by James. He told the king of France, that though he could suffer with patience the usurpation of his nephew upon his right, he would never permit his own son to be guilty of the same injustice. He urged, that should the son reign in his father's lifetime, that circumstance would amount to a formal renunciation: that the prince of Wales, by succeeding to the prince of Orange, would yield his sole right, which was that of his father, &c.

³³⁴ **William engages to own James's son for his own successor ; which James refuses.** From this time James lost every hope of being restored to the throne, and resigned himself entirely to the austerities of religious enthusiasm. His constitution, though vigorous and athletic, had for some time begun to yield to the infirmities of age, and to that melancholy which superstition as well as his uncommon misfortunes had impressed on his mind. In the beginning of September 1701, when he was, according to his daily custom, at public prayers, he fell suddenly into a lethargy; and though he recovered his senses soon after, he languished for some days, and expired on the 6th of September. The French king, with great humanity, paid him several visits during his sickness; and exhibited every symptom of compassion, affection, and even respect.

³³⁵ **His death.** Louis, being under a difficulty how to proceed upon the unexpected death of James, called a council to take their advice, whether he should own the prince of Wales as king of Great Britain and Ireland. The king himself had hesitated long in this delicate point. But the dauphin, the duke of Burgundy, and all the princes of the blood, declared, that it was unbecoming the dignity of the crown of France not to own that the titles of the father devolved immediately upon the son. Louis approved of this resolution, and determined to acquaint the dying king with it in person. When he arrived at St Germain, he acquainted first the queen, and then her son, of his design. He then approached the bed in which James lay almost insensible with his disorder. The king, rousing himself, began to thank his most Christian majesty for all his favours; but Louis interrupted him. "Sir (said he), what I have done is but a small matter; but what I have to say is of the utmost importance." The people then began to retire. "Let no person withdraw (said Louis). I come to acquaint you, Sir, that when God shall please to call your majesty from this world, I shall take your family into my protection, and acknowledge your son, as he then will certainly be, king of Great Britain and Ireland."

³³⁶ **Protender owned by Louis to be the king of Britain.** Though the defeat of the French fleet at La Hogue had put King William out of all danger from any further attempt from that quarter, he by no means possessed his throne with any kind of tranquillity. The want of a common enemy produced dissensions among the people, and William began to find as much uneasiness from his parliament at home as from an enemy in the field. The uneasiness he felt from the refractory disposition of his subjects was not a little heightened

by the death of his queen, who was taken off by the smallpox on the 28th of December 1694. For some time he was under a sincere concern for her loss; but as politics had taken entire possession of his mind, he lost all other concerns in the greatness of his apprehensions for the balance of power and the fluctuating interests of Europe.

³³⁷ **Britain.** His chief motive for accepting the crown was to engage England more deeply in the concerns of Europe. His great object had been to humble the French, and all his politics consisted in forming alliances against them. On the other hand, many of the English had no such animosity against the French: and these, therefore, considered the interest of the nation as sacrificed to foreign connexions; and complained that the continental war fell most heavily on them, though they had the least interest in its success. These complaints were heard by William with the most phlegmatic indifference; he employed all his attention only on the balance of power, and the interests of Europe. He became unmindful of the cultivation of internal polity, and, as he formed alliances abroad, increased the influence of party at home. Patriotism began to be ridiculed as an ideal virtue; and the practice of bribing a majority in parliament became universal. The example of the great was caught up by the vulgar; principle, and even decency, was gradually banished; talents lay uncultivated, and the ignorant and profligate were received into favour.

³³⁸ **National discontent.** The king, upon accepting the crown, was resolved to preserve as much of the prerogative as possible; and he sometimes exerted a branch of it which his predecessors had never chosen to make use of, viz. the power of refusing his assent to some bills that had passed both houses. From this and other causes there were perpetual bickerings between him and his parliaments. At last William became fatigued with opposition. He admitted every restraint upon the prerogative in England, upon condition of being properly supplied with the means of humbling France. Provided the parliament supplied him with the means of executing this, he permitted them to rule the internal polity as they pleased. For the prosecution of the French war, the sums granted were indeed incredible. The nation, not contented with furnishing him such sums of money as they were capable of raising by the taxes of the year, mortgaged those taxes, and involved themselves in debts which they have never since been able to discharge.

The war with France continued during the greatest part of this king's reign; but at length the treaty of Ryswick, in 1697, put an end to those contentions in which England had engaged without policy, and came off at last without advantage. In the general pacification, her interests seemed entirely deserted; and for all the treasures she had sent to the continent, and all the blood which had been shed there, the only equivalent received was an acknowledgment of William's title from the king of France.

³³⁹ **William obliged to disband his forces.** The king, being now freed from a foreign war, set himself to strengthen his authority at home. As he could not bear the thoughts of being a king without military command, he conceived hopes of keeping up, in the time of a profound peace, those forces which had been granted during the time of danger. The commons, however, to his great mortification, passed a vote, that

Britain.

that all the forces in the English pay, exceeding 7000 men, should be forthwith disbanded; and that those retained should be natural-born subjects of England. With this vote the king was exceedingly displeased. His indignation, indeed was kindled to such a degree, that he actually conceived a design of abandoning the government. From this, however, his ministers diverted him, and persuaded him to consent to the passing of the bill.

These altercations continued during the remainder of this reign. William considered the commons as a body of men desirous of power for themselves, and consequently bent upon obstructing all his projects to secure the liberties of Europe. He seemed but little attached to any particular party in the house, all of whom he found at times deserted or opposed him. He therefore veered to Whigs and Tories indiscriminately, as interest or the immediate exigence demanded. He considered England as a place of labour, anxiety, and altercation. If he had any time for amusement or relaxation, he retired to Loo in Holland, where, among a few friends, he gave a loose to those coarse festivities which alone he was capable of relishing. Here he planned the different succession of the princes of Europe, and laboured to undermine the schemes and the power of Louis his rival in politics and fame.

340
He engages
Britain in
a confederacy
against
France.

But however feeble William's desire of other amusements might be, he scarce could live without being at variance with France. Peace had scarce been made with that nation, when he began to think of resources for carrying on a new war, and for enlisting his English subjects in the confederacy against that nation. Several arts were used for inducing the people to second his aims; and the whole nation seemed at last to join in desiring a French war. He had been in Holland concerting with his allies operations for a new campaign. He had engaged in a negotiation with the prince of Hesse; who assured him, that if he would besiege and take Cadiz, the admiral of Castile and several other grandees of Spain would declare for the house of Austria. The elector of Hanover had resolved to concur in the same measures; the king of the Romans, and Prince Louis of Baden, undertook to invest Landau, while the emperor promised to send a powerful reinforcement into Italy: but death put a period to his projects and his ambition.

341
His death.

William was naturally of a very feeble constitution; and it was by this time almost quite exhausted by a series of continual disquietude and action. He had endeavoured to repair his constitution, or at least to conceal its decays, by exercise and riding. On the 21st of February 1702, in riding to Hampton-court from Kensington, his horse fell under him; and he was thrown with such violence, that his collar-bone was fractured. His attendants conveyed him to the palace at Hampton-court, where the fracture was reduced; and in the evening he returned to Kensington in his coach. The jolting of the carriage disunited the fracture; and the bones were again replaced by Bidloo his physician. This, in a robust constitution, would have been a trifling misfortune; but to him it was fatal. For some time he appeared in a fair way of recovery; but falling asleep on his couch, was seized with a shivering, which terminated in a fever and diarrhoea, that soon became dangerous and desperate. Perceiving his end approaching,

Britain.

the objects of his former care lay next his heart; and the fate of Europe seemed to remove the sensations he might be supposed to feel for his own. The earl of Albemarle arriving from Holland, he conferred with him in private on the posture of affairs abroad. Two days after, having received the sacrament from Archbishop Tennison, he expired on Sunday March 8th; having lived 52 years, and reigned 13.—He was in his person of a middle stature, a thin body, and a delicate constitution. He had an aquiline nose, sparkling eyes, a large forehead, and a grave solemn aspect. He left behind him the character of a great politician, though he had never been popular; and of a formidable general, though he had been seldom victorious. His deportment was grave, phlegmatic, and sullen; nor did he ever show any fire but in the day of battle.

Cunningham says, that "at the very last moment, when his mind was otherwise oppressed, he retained a just sense of the redemption of mankind, and the remembrance of his good subjects. Thus he lay so quietly and composed, with his eyes fixed upon heaven, when his speech failed him, that no man could die either better prepared, or with greater constancy and piety, than this prince; of whose just praises no tongue shall be silent, and no time unmindful. And if any king be ambitious of regulating his councils and actions by the bright examples of the most famous great men, he may form to himself the idea of a great prince and a grand empire, not only from the king's life, but from the public records of the English and Dutch nations."

William was succeeded by the princess Anne, who had married George prince of Denmark. She ascended the throne in the 38th year of her age, to the general satisfaction of all parties. William had died at the eve of a war with France: and the present queen, who generally took the advice of her ministry on every important occasion, was now urged by opposite councils; a part of her ministry being inclined to war and another to peace. At the head of those who opposed a war with France was the earl of Rochester, lord lieutenant of Ireland, first cousin to the queen, and the chief of the Tory faction. At the head of the opposite party was the earl afterwards duke of Marlborough, and since so much renowned for his victories over the French. After giving the reasons for both their opinions, that of Marlborough preponderated: the queen resolved to declare war: and communicating her intentions to the house of commons, by whom it was approved, war was proclaimed accordingly. In this declaration of war, Louis was taxed with having taken possession of a great part of the Spanish dominions; with designing to invade the liberties of Europe, to obstruct the freedom of navigation and commerce; and with having offered an unpardonable insult to the queen and her throne, by acknowledging the title of the Pretender: he was accused of attempting to unite the crown of Spain to his own dominions, by placing his grandson upon the throne of that kingdom, and thus of endeavouring to destroy the equality of power that subsisted among the states of Europe. This declaration of war on the part of England was seconded by similar declarations by the Dutch and Germans, all on the same day.

342

ed against
France.

Britain. scribered by William, expected on the death of the latter to enter on a field open for new conquests and fame. At the news of the English monarch's death, therefore, he could not suppress his rapture; the people of Paris, and indeed through the whole kingdom, testified their joy in the most public manner. At seeing, therefore, such a combination against him, the French monarch was filled with indignation; but his resentment fell chiefly on the Dutch. He declared with great emotion that as for those gentlemen pedlars the Dutch, they should one day repent their insolence and presumption in declaring war against him whose power they had formerly felt and dreaded. By these threats, however, the affairs of the allies were no way influenced. Marlborough was appointed general of the British forces, and by the Dutch he was chosen generalissimo of the allied army; and indeed his after conduct showed, that no person could possibly have been chosen with greater propriety. He had learned the first rudiments of war under the famous Marshal Turenne, having been a volunteer in his army; and by that general his future greatness was prognosticated.

344
Duke of Marlborough appointed general.

345
His success in his first campaign.

346
Losses at sea.

The first attempt that Marlborough made to deviate from the general practices of the army was to advance the subaltern officers, whose merits had been hitherto neglected. Regardless of seniority, wherever he found abilities he was sure to promote them; and thus he had all the upper ranks of commanders rather remarkable for their skill and talents than for their age and experience. In his first campaign, in the beginning of July 1702, he repaired to the camp at Nimeguen, where he found himself at the head of 60,000 men well provided with all necessaries, and long disciplined by the best officers of the age. He was opposed on the part of France by the duke of Burgundy, a youth of very little experience in the art of war; but the real acting general was the marshal Boufflers, an officer of courage and activity. But wherever Marlborough advanced, the French were obliged to retire before him, leaving all Spanish Guelderland at his discretion. The duke of Burgundy finding himself obliged to retreat before the allied army, rather than expose himself longer to such a mortifying indignity, returned to Versailles, leaving Boufflers to command alone. Boufflers retired to Brabant: and Marlborough ended the campaign by taking the city of Liege; in which was found an immense sum of money and a vast number of prisoners.

This good fortune seemed to console the nation for some unsuccessful expeditions at sea. Sir John Munden had permitted a French squadron of 14 ships to escape him by taking shelter in the harbour of Corunna; for which he was dismissed the service by Prince George. An attempt was made upon Cadiz by sea and land, Sir George Rooke commanding the navy, and the duke of Ormond the land forces; but this also miscarried. At Vigo, however, the British arms were attended with better success. The duke of Ormond landed with 2500 men at the distance of six miles from the city, while the fleet forcing their way into the harbour, the French fleet that had taken refuge there were burned by the enemy to prevent their falling into the hands of the English. Eight ships were thus burned and run ashore; but ten ships of war were taken, together with eleven galleons, and above a million of money in silver. In the West

Indies, Admiral Benbow had been stationed with ten ships to distress the enemy's trade. Being informed that Du Casse the French admiral was in those seas with a force equal to his own, he resolved to attack him; and soon after discovered the enemy's squadron near St Martha steering along the shore. He quickly gave orders to his captains, formed the line of battle, and the engagement began. He found, however, that the rest of the fleet had taken some disgust at his conduct; and they permitted him to sustain, almost alone, the whole fire of the enemy. Nevertheless, the engagement continued till night, and he determined to renew it next morning. But he had the mortification to perceive that all the rest of his ships had fallen back except one, who joined him in urging the pursuit of the enemy. Four days this intrepid seaman, assisted by only one ship, pursued and engaged the enemy, while his cowardly officers remained at a distance behind. His last day's battle was more furious than any of the former: alone, and unsupported by any of the rest, he engaged the whole French squadron; when his leg was shattered by a cannon-ball, and he himself died soon after of his wounds. Two of his cowardly associates were shot on their arrival in England; one died on his passage thither; the rest were disgraced.

Britain.
347
Bravery and death of Admiral Benbow.

The next parliament, which was convened by the queen, was highly pleased with the success of the British arms on the continent. The house of commons was composed chiefly of Tories, who voted 40,000 sea-men, and the like number of land forces, to act in conjunction with those of the allies. Soon after, the queen informed her parliament, that she was pressed by the allies to augment her forces; and upon this it was resolved that 10,000 more men should be added to the continental army, but on condition that the Dutch should immediately break off all commerce with France and Spain; a condition which was very readily complied with.

348
Continental army increased.

In the beginning of April 1703, the duke of Marlborough crossed the sea, and assembling the allied army, opened the campaign with the siege of Bonn, the residence of the elector of Cologne. This held out but a short time. He next retook Huy; the garrison of which, after a vigorous defence, surrendered prisoners of war. Limburgh was next besieged, and surrendered in two days; and thus the campaign concluded, the allies having secured the country of Liege and the electorate of Cologne from the designs of the enemy.

349
Success of Marlborough.

In the campaign of 1704, the duke of Marlborough informed the Dutch that it was his intention to march to the relief of the empire, which had been for some time oppressed by the French forces; and the States gave him full powers to march as he thought proper, with assurances of their assistance in all his endeavours. The French king, finding Boufflers no longer capable of opposing Marlborough, appointed the marshal de Villeroy to command in his place. But Marlborough, who, like Hannibal of old, was remarkable for studying the disposition of his antagonists, having no great fears from Villeroy, immediately flew to the assistance of the emperor. Taking with him about 13,000 British troops, he advanced by hasty marches to the banks of the Danube; he defeated a body of French and Bavarians stationed at Donavert to oppose him; then passed the river, and laid under contribution the dukedom

of

Britain. of Bavaria which had sided with the enemy. Villeroy, who at first attempted to follow his motions, seemed all at once to have lost sight of his enemy; nor was he apprised of his route till informed of his successes. But, in the mean time, Marshal Tallard prepared by another route to obstruct Marlborough's retreat with an army of 30,000 men. He was soon after joined by the duke of Bavaria's forces; so that the French army in that part of the continent amounted to 60,000 veterans, commanded by the two best reputed generals then in France.

³⁵⁰ French defeated at Blenheim. To oppose these powerful generals, the duke of Marlborough was joined by a body of 30,000 men under the celebrated Prince Eugene. The allied army, with this reinforcement, amounted to about 52,000. After various marches and countermarches, the two armies met at Blenheim*. A terrible engagement ensued, in which the French were entirely defeated, and a country of 100 leagues extent fell into the hands of the conquerors. Soon after finishing the campaign, the duke repaired to Berlin, where he procured a reinforcement of 8000 Prussians to serve under Prince Eugene in Italy. Thence he proceeded to negociate for succours at the court of Hanover; and soon after returned to England, where he was received with every possible demonstration of joy.

³⁵¹ Gibraltar taken. The arms of Britain, in the mean time, were not less fortunate by sea than by land. The town of Gibraltar was taken by the prince of Hesse and Sir George Rooke: but so little was the value of the conquest at that time understood, that it was for some time in debate whether it was a capture worth thanking the admiral for; and at last it was considered as unworthy of public gratitude. Soon after, the British fleet, to the number of 53 ships of the line, came up with that of France, consisting of 52 men of war, commanded by the count de Thoulouse, off the coast of Malaga. This was the last great naval engagement in which the French ventured to face the British on equal terms. The battle began at ten in the forenoon, and continued with great fury for six hours; when the van of the French began to give way. The British admiral for two days attempted to renew the engagement; but this was as cautiously declined by the French, who at last disappeared totally. Both sides claimed the victory, but the consequence decided it in favour of the British.

³⁵³ Ineffectual attempt of the Spaniards on Gibraltar. In the mean time, the Spaniards, alarmed at the taking of Gibraltar, sent the marquis of Villadurias with a large army to retake it. France also sent a fleet of 13 ships of the line: but part of them were dispersed by a tempest, and part taken by the British. Nor was the land army more successful. The siege continued for four months; during which time the prince of Hesse, who commanded the town for the English, gave many proofs of valour. At length, the Spaniards having attempted to scale the rock in vain, finding no hopes of taking the place, were contented to draw off their men and abandon the enterprise.

³⁵⁴ Charles appointed king of Spain. While the British were thus victorious by land and sea, a new scene of contention was opened on the side of Spain. Philip V. grandson of Louis XIV. had been placed on the throne of that kingdom, and received with the joyful concurrence of the greatest part of his subjects. He had also been nominated successor to the crown by the late king of Spain's will. But in a

former treaty among the powers of Europe, Charles, son of the emperor of Germany, was appointed heir to that crown; and this treaty had been guaranteed by France herself, though she now resolved to reverse that consent in favour of a descendant of the house of Bourbon. Charles was still farther led on to put in for the crown of Spain, by the invitation of the Catalonians, who declared in his favour; and with the assistance of the British and Portuguese, promised to arm in his cause. Upon his way to his newly assumed dominions, he landed in England; where he was received on shore by the dukes of Somerset and Marlborough, who conducted him to Windsor. He was kindly received by the queen; and furnished with 200 transports, 30 ships of war, and 9000 men, for the conquest of that extensive empire. The earl of Peterborough, a man of romantic bravery, offered to conduct them; and his single service was reckoned equivalent to armies.

The first attempt of this general was on the city of Barcelona, at that time defended by a garrison of 5000 men. The fort Monjuc, situated on a hill that commanded the city, was attacked; the outworks were taken by storm, and the powder magazine was blown up by a shell; upon which the fort immediately surrendered, and the city capitulated in a short time after. The conquest of all Valencia succeeded the taking of Barcelona. Charles became master of Arragon, Carthage, Granada, and Madrid. The British general entered the capital in triumph, and there proclaimed Charles king of Spain without opposition.

To these successes, however, very little regard was paid in Britain. The victories of the duke of Marlborough alone engrossed their attention. In 1706, he opened the campaign with an army of 80,000 men. He was met by the French under Villeroy near the village of Ramillies*. An engagement ensued, in which the duke gained a victory almost as complete as that of Blenheim had been; and the whole country of Brabant was the reward of the victors. The French troops were now dispirited; the city of Paris was in confusion; Louis, who had long been flattered with conquest, was now humbled to such a degree as almost to excite the compassion of his enemies. He intreated for peace, but in vain; the allies carried all before them; and his very capital began to dread the approach of the conquerors. But what neither his armies nor his politics could effect, was brought about by a party in England. The dissension between the Whigs and Tories saved France, that now seemed tottering on the brink of ruin.

The councils of the queen had hitherto been governed by a Whig ministry; for though the duke of Marlborough started in the interest of the opposite party, he soon joined the Whigs, as he found them most sincere in the design of humbling France. The people, however, were now in fact beginning to change, and a general spirit of toryism to take place. The queen's personal virtues, her successes, her deference for the clergy, and their great veneration for her, began to have a prevailing influence over the whole nation. People of every rank were not ashamed to defend the most servile tenets, when they tended to flatter or increase the power of the sovereign. They argued in favour of strict hereditary succession, divine right, and non-resistance to the regal power. The Tories, though joining in vigorous

Britain. vigorous measures against France, were never ardently their enemies: they rather secretly hated the Dutch, as of principles very opposite to their own; and longed for an opportunity of withdrawing from their friendship. They began to meditate schemes of opposition to the duke of Marlborough. Him they considered as a self-interested man, who sacrificed the real advantages of the nation, in protracting a ruinous war for his own private emolument and glory. They saw their country oppressed with an increasing load of taxes, which by a continuance of the war must inevitably become an intolerable burden, Their discontent began to spread, and the Tories wanted only a few determined leaders to assist them in removing the present ministry.

³⁶⁰ **English defeated at Almanza.** In the mean time, a succession of losses began to dissipate the conquering frenzy that had seized the nation in general, and to incline them to wish for peace. The earl of Galway, who commanded the army in Spain, was utterly defeated at Almanza* by the duke of Berwick; and in consequence of this victory, all Spain, except the province of Catalonia, returned to their duty to Philip their lawful sovereign. An attempt was made upon Toulon, by the duke of Savoy and Prince Eugene by land, and an English fleet by sea; but to no purpose. The fleet under Sir Cloudsley

³⁶¹ **Shipwreck of Sir Cloudsley Shevel.** Shovel, having set sail for England, was driven by a violent storm on the rocks of Scilly. His own ship was lost, and every person on board perished. Three more ships met with the same fate; while three or four others were saved with the utmost difficulty. In Germany, Marshal Villars the French general carried all before him, and was upon the point of restoring the elector of Bavaria. The only hopes of the people lay in the activity and conduct of the duke of Marlborough, who opened the campaign of 1707, about the middle of May; but even here they were disappointed. The duke declined an engagement; and after several marchings and countermarchings, both armies retired into winter quarters about the end of October. The French made vigorous preparations for the next campaign; and the duke returned to England to meet with a reception he did not at all expect, and which, as far as appears, he did not deserve.

³⁶² **Union between Scotland and England.** The most remarkable transaction, however, of this year, and indeed of this whole reign, was the union between the two kingdoms of Scotland and England. Though governed by one sovereign since the time of James I. of England, yet each nation continued to be ruled by its respective parliament; and often professed to pursue opposite interests to those of its neighbour. The union had often been unsuccessfully attempted before, and had indeed been the cause of the bloody wars in the time of Edward I. and III. of England. In all the former proposals on that head, both nations were supposed to remain free and independent; each kingdom having its own parliament, and subject only to such taxes and other commercial regulations as those parliaments should judge expedient for the benefit of their respective states. After the destruction of the Darien colony, in the manner already related, King William had endeavoured to allay the national ferment by resuming the affair of an union with as much assiduity as his warlike disposition would allow. The terms proposed were the same with those formerly held out, viz. a federal union, somewhat like that of the

states of Holland. With this view the Scots were prevailed on to send 20 commissioners to London; who, with 23 on the part of England, met at Whitehall in the month of October 1702. Here they were honoured with a visit from the queen, in order to enliven their proceedings and stimulate them to a more speedy dispatch of business: but the treaty was entirely broken off at this time by the Scottish commissioners insisting, that the rights and privileges of their countrymen trading to Africa and the Indies should be preserved and maintained. It was, however, resumed in the year 1706, when the commissioners again met on the 16th of April, in the council chamber of Whitehall. The Scottish commissioners still proposed a federal union; but the English were determined on an incorporation, which should not afterwards be dissolved by a Scottish parliament. Nothing but this, they said, could settle a perfect and lasting friendship betwixt the two nations. The commissioners from Scotland, however, still continued to resist that article which subjected their country to the same customs, excises, and regulations of trade as England; but the queen being persuaded to pay two visits in person to the commissioners, exerted herself so vigorously, that a majority was at last gained over; and all the rest yielded, though with reluctance, excepting Lockhart of Carnwath, who could not by any means be persuaded either to sign or seal the treaty.

The articles being fully prepared on the 22d of July, they were presented next day to her majesty by the lord-keeper, in the name of the English commissioners; at the same time that a sealed copy of the instrument was likewise delivered by the lord-chancellor of Scotland. They were most graciously received; and the same day the queen dictated an order of council, threatening with prosecution such as should be concerned in any discourse or libel, or in laying wagers with regard to the union. Notwithstanding all this harmony, however, the treaty was received with the utmost disapprobation in Scotland. The terms had been carefully concealed, so that nothing transpired till the whole was at once laid before parliament. The ferment was then so general, that all ranks of people, however divided in other respects, united against this detested treaty. The nobility and gentry were exasperated at the annihilation of parliament, and the consequent loss of their influence and credit. The body of the people cried out, that the independence of the nation was sacrificed to treachery and corruption. They insisted that the obligations laid on their members to stay so long at London, in their attendance on the British parliament, would drain the country of its money, impoverish the members themselves, and subject them to the temptation of being corrupted. Nor was the commercial part of the people better satisfied. The dissolution of the India Company, the taxes laid on the necessaries of life, the vast number of duties, customs, and restrictions, laid upon trade, were all of them matter of complaint. Before this time the trade of Scotland had been open to the Levant, the Baltic, France, Spain, Portugal, Holland, and the Dutch plantations; and it seemed difficult to conceive how the commerce of the country could be advanced by laying restrictions upon it to these places, especially as the compensation allowed, viz. the privilege of trading to the English plantations

Britain.

³⁶³ **The articles most violently opposed in Scotland.**

Britain. plantations in America, must have been a very trifling advantage, when the amount of the whole exports to these places did not near equal the expence of defending them. The most violent disputes took place in the parliament. The lord Belhaven made a most pathetic speech, enumerating the miseries that would attend this treaty; which drew tears from the audience, and to this day is reckoned prophetic by many of the Scottish nation. Almost every article of the treaty was the subject of a protest; addresses against it were presented to parliament by the convention of royal boroughs, the commissioners of the general assembly, the company trading to Africa and the Indies, as well as from shires, stewartries, boroughs, towns, and parishes, without distinction of Whig, Tory, Presbyterian, or Episcopal.

Nor was the resentment of the common people without doors less than that of the members within. A coalition was formed betwixt the Presbyterians and Cavaliers: and to such a height did the resentment of the people arrive, that they chose officers, formed themselves into regiments, provided horses and ammunition, burnt the articles of union, justified their conduct by a public declaration, and resolved to take the route to Edinburgh and dissolve the parliament.

In the mean time, the privy council issued a proclamation against riots, commanding all persons to retire from the streets whenever the drum should beat; ordering the guards to fire on those who should disobey this command, and indemnifying them from all prosecution for maiming or slaying the lieges. Even these precautions were insufficient. The duke of Queensberry, the chief promoter of the union, though guarded by double lines of horse and foot, was obliged to pass through the streets at full gallop, amidst the curses and imprecations of the people, who pelted his guards, and even wounded some of his friends who attended him in the coach. In opposition to all this fury, the duke of Queensberry and others attached to the union magnified the advantages that would accrue to the kingdom from the union; they took off the resentment of the clergy, by promoting an act to be inserted in the treaty, by which the Presbyterian discipline was to be the only government of the church of Scotland, unalterable in all succeeding times, and a fundamental article of the union. Emissaries were employed to disunite the Cameronians from the Cavaliers, by demonstrating the absurdity, sinfulness, and danger, of such a proceeding. The India Company was flattered with the prospect of being indemnified for the losses they had sustained, and individuals by sharing an equivalent. Their last manœuvre was to bring over a party in the Scots parliament, nicknamed the *Squadron Volante*, from their fluctuating between ministry and opposition, without attaching themselves to any party till the critical moment, which was either to cement both kingdoms by a firm union, or involve them in the calamities of war. By this unexpected stroke, the ministry obtained a decisive victory, and all opposition was vain. The articles of treaty were ratified by parliament, with some trifling variations, on the 25th of March 1707; when the duke of Queensberry finally dissolved that ancient assembly, and Scotland ceased to be a separate independent kingdom.

On the conclusion of the treaty, the queen informed

Britain. both houses of the English parliament, that the treaty of union, with some additions and alterations, was ratified by an act of the parliament of Scotland: that she had ordered it to be laid before them, and hoped it would meet their approbation. She observed, that they had now an opportunity of putting the last hand to a happy union of the two kingdoms: and that she should look upon it as a particular happiness if this great work, so often attempted before without success, could be brought to perfection in her reign. Objections, however, were started by the Tory party; but they were at that time too weak to be heard with any attention. Sir John Parkington compared the new treaty to the marriage of a woman without her consent. It was an union carried on by corruption and bribery within doors, and by force and violence without. The promoters of it had basely betrayed their trust, by giving up their independent constitution: and he would leave it to the judgement of the house, whether or not men of such principles were fit to be admitted into their house of representatives. Lord Haversham, in the upper-house, said, the question was, Whether two nations, independent in their sovereignties, that had their distinct laws and interests, different forms of worship, church-government and order, should be united into one kingdom? He supposed it an union made up of so many incongruous ingredients, that should it ever take effect, it would require a standing power and force to keep them from falling asunder, and breaking in pieces, every moment. Above an hundred Scottish peers, and as many commoners, he said, were excluded from sitting and voting in parliament, though they had as much right to sit there as any English peer had to sit and vote in the parliament of England. The union, he said, was contrary to the sense of the Scottish nation: the murmurs of the people had been so loud as to fill the whole kingdom, and had reached even the doors of parliament. That the government had issued a proclamation, pardoning all slaughter, bloodshed, and maiming, committed upon those who should be found in tumults; and from all these circumstances he concluded, that the people of Scotland were averse to an incorporating union, which, he supposed, would be a most dangerous expedient to both nations. All these arguments, however, were answered by those of the opposite party with such success, that the union was unalterably completed on the first of May 1707; and the island took the name of "The United Kingdom of Great Britain." The queen expressed the highest satisfaction when it received the royal assent, and said, "She did not doubt but it would be remembered and spoken of hereafter, to the honour of those who had been instrumental in bringing it to such a happy conclusion. She desired that her subjects of both kingdoms should from henceforward behave with all possible respect and kindness towards one another; that so it might appear to all the world they had hearts disposed to become one people." The first of May was appointed a day of public thanksgiving; and congratulatory addresses were sent up from all parts of England, excepting the university of Oxford. The Scots, however, were totally silent on the occasion.

In this treaty, it must be observed, that the commissioners on the part of England were not only able statesmen,

³⁶⁴ **Britain.** statesmen, but, for the most part, well skilled in trade, which gave them an evident advantage over those of Scotland, who consisted of lords and gentlemen who had no commercial knowledge. Hence they were over-matched by the former in the great objects which were to give the turn to national prosperity; though they were very careful to preserve all their heritable offices, superiorities, jurisdictions, and other privileges and trappings of the feudal aristocracy. Had the English commissioners made a liberal use of the advantages afforded them at this time, it would have been in their power greatly to have enriched themselves as well as the inhabitants of Scotland; "but instead of this (says Mr Knox), in negotiating with a ruined kingdom, they were influenced by the then narrow short-sighted principle of commercial monopoly; and the consequences were such as might, with a small degree of reflection, have been foreseen. Instead of a solid compact, affording upon the whole, reciprocal advantages, and which it would have been the inclination as well as interest of both nations to preserve inviolate, the concessions on the part of Scotland, and the restrictions on their trade, were so quickly and severely felt, that about the sixth year after the ratification of the treaty, the sixteen peers who first represented Scotland in the upper-house, though most of them had been the supporters of administration in promoting the union, unanimously moved for its dissolution. The motion was followed by a violent debate, in which, however, the Scottish peers were at last overruled, and thenceforth the nation submitted reluctantly to its fate. The metropolis, having no manufactures, now beheld itself deprived of its only support by the translation of the parliament to London. The trading towns pined under the duties and restrictions on their commerce; the whole kingdom, after so many fatal disasters, seemed completely ruined beyond recovery, and all degrees of men sunk under the weight of these complicated misfortunes. The first fruits of the treaty in Scotland were a board of customs and another of excise, the appointment of commissioners, collectors, &c. with other necessary officers, who were immediately distributed over the several seaports and districts of the nation. In many parts they were roughly used, particularly the excise officers; and in the Orkneys, the officers were so frightened by the country people, that for some time the business was obliged to be postponed."

³⁶⁵ **Dissolution of the Scots privy council.** In 1708, there was a warm debate in the grand committee of the house of lords, occasioned by a bill passed by the commons for rendering the union of the

two kingdoms more entire and complete, whereby it was enacted, that, "from the first of May 1708, there should be but one privy council in the kingdom of Britain."—Of this affair Mr Cunningham gives a particular account, and informs us that he himself had a hand in the affair, and that he had "from his youth borne a just hate to the privy council of Scotland." The arguments for the dissolution were its enormous stretches of power and acts of cruelty; that it could now be of no other use in Scotland than that the court might thereby govern every thing at pleasure, and procure such members of parliament as they thought proper; against which both Scots and English ought now carefully to guard themselves. On the other hand, it was argued, that the abuse of the power complained of was no argument for the entire dissolution of the council, though it was for a restriction and limitation of it; that it was necessary that a privy council should remain in Scotland, out of regard to the ancient customs of the country, and to restrain the rage of the people, which was then ready to break out beyond all bounds. The dissolution, however, was carried by 50 against 40; after which the nation being deprived of this last fragment of their ancient government, the opposers of the union raised the animosities of the people to a dangerous height; but the ferment abated after an ineffectual attempt in favour of the Pretender.

³⁶⁶ We must now return to the duke of Marlborough, French de- who had gone over to Flanders, where he seemed re-seated at Oudenarde, solved to push his good fortune. Peace had been offered more than once; treaties entered upon, and as often frustrated. After the battle of Ramillies, the king of France had employed the elector of Bavaria to write letters in his name to the duke of Marlborough, containing proposals for opening a congress. He offered to give up either Spain and its dominions, or the kingdoms of Naples and Sicily, to Charles of Austria, and to give a barrier to the Dutch in the Netherlands. But these terms were rejected. The two armies once more met in numbers nearly equal at * Oudenarde (A). * See Oudenarde. Au engagement ensued, in which the French were defeated, and Lisle (B) the strongest town in Flanders, Ghent, Bruges, and all the other towns in that country, soon after fell into the hands of the victors. The campaign ended with fixing a barrier to the Dutch provinces, and it now only remained to force a way into the provinces of the enemy.

The French king being now in a manner reduced to despair, again sued for peace; but the demands of the allies were so high, that he was obliged to reject them, and

(A) In this engagement the electoral prince of Hanover, afterwards George II. of Britain, greatly distinguished himself, and gained the whole glory of the first attack. In the engagement his horse was killed under him, and Colonel Luschki close by his side. "On that day (says Cunningham) this excellent young prince discovered such courage as no man living ought to forget, and as all posterity will never surpass."

(B) At the siege of Lisle, Cunningham relates the following anecdote of the magnanimity of a common soldier. "This man had the good fortune to take prisoner Major-general Colbert, brother to the marquis de Torcy. The prisoner, greatly taken with the clemency, humanity, and good behaviour of the soldier, offered him 200 louis d'ors, and a captain's post for life, if he would give him his liberty. The soldier, however, resisted the temptation, alleging the dishonour that would attend such conduct; and asking him at the same time, how, when raised to the rank of a captain, he could look his general in the face for whom he had fought for so many years?—This instance of fidelity weighed so much with Prince Eugene and the duke of Marlborough, that the former made him a present, and the latter gave him a captain's commission."

Britain. and prepare for another campaign. This was in the year 1709. The first attempt of the allies was on the city of Tournay, garrisoned by 12,000 men, and exceedingly strong both by nature and art. After a terrible siege of 21 days, the town capitulated; and a month afterwards the citadel, which was still stronger than the town. Next followed the bloody battle of Malplaquet †; where the allied army, consisting of 110,000 men, attacked the French consisting of 120,000, strongly posted, and fortified in such a manner that they seemed quite inaccessible. Nothing, however, was able to stand before the allied army; they drove the French from their fortifications: but their victory cost them dear; 20,000 of their best troops lay dead on the field of battle (c). The consequence of this victory was the surrender of the city of Mons, which ended the campaign.

He is dis-
missed from
all his em-
ployments.

The last campaign of the duke of Marlborough, which happened in the year 1711, is said to have excelled all his former exploits. He was opposed by the marshal Villars, the same who had commanded the French in the battle of Malplaquet. He contrived his measures so, that, by marching and countermarching, he induced the enemy to quit a strong line of intrenchments without striking a blow, which he came afterwards and took possession of. This enterprise was followed by the taking of Bouchain, which was the last military achievement of this great general. By a continuance of conduct and success almost unparalleled, he had gained to the allies a prodigious tract of country. From the beginning of the war, which had now continued nine years, he had perpetually advanced, and never retreated before his enemies, nor lost an advantage he had obtained over them. He most frequently gained the enemy's posts without fighting; but where he was obliged to attack, no fortifications were able to resist him. He had never besieged a city which he did not take, nor engaged in a battle in which he did not come off victorious. Thus the allies had reduced under their command Spanish Guelderland, Limbourg, Brabant, Flanders, and Hainault; they were masters of the Scarpe; the capture of Bouchain had opened for them a way into the heart of France, and another campaign might have made them masters of Paris: but on the duke's return from this campaign, he was accused of having taken a bribe of 6000*l.* a-year from a Jew who had contracted to supply the army with bread; and the queen thought proper to dismiss him from all his employments.

On the removal of this great general, the command of the British forces was given to the duke of Ormond. The transactions which followed, as represented by Mr Cunningham, are by no means favourable to the character of the British nation. He represents the people at large as blinded by a headstrong and furious clergy, who wished to revive the absurdities of the Romish religion, and to unite the English and Galliean churches; the general of the army acting a most insidious part, by giving the enemy intelligence of the

designs of the allies before he declared that he was not to act in concert with them; and the queen herself, as commanding him to act such a shameful part, say as acting in a similar manner herself. Prince Eugene complained much of the inactivity of the English general, though he seemed to be unacquainted with his treachery; while the whole army loaded him with execrations, calling him "a stupid tool, and a general of straw." All this, however, was in vain; the duke continued to prefer the commands of his sovereign to every other consideration.

The disgrace of the duke of Marlborough had been owing to the prevalence of the Tory party, who had now got the Whig ministry turned out; the consequence of this was, that in spite of all the remonstrances, memorials, &c. of the allies, the British army in Flanders was ordered not to act offensively. Hence the operations languished, a considerably body of the allies was cut off at Denain, and the French retook some towns. A peace was at last concluded in 1713 between France and Britain. In this treaty it was stipulated, that Philip, now acknowledged king of Spain, should renounce all right to the crown of France, the union of two such powerful kingdoms being thought dangerous to the liberties of Europe. It was agreed, that the duke of Berry, Philip's brother, and after him in succession, should also renounce his right to the crown of Spain, in case he became king of France. It was stipulated, that the duke of Savoy should possess the island of Sicily with the title of king; together with Fenestrelles, and other places on the continent; which increase of dominion was in some measure made out of the spoils of the French monarchy. The Dutch had the barrier granted them which they so much desired; and if the crown of France was deprived of some dominions to enrich the duke of Savoy, on the other hand the house of Austria was taxed to supply the wants of the Hollanders, who were put in possession of the strongest towns in Flanders. The fortifications of Dunkirk were demolished. Spain gave up Gibraltar and the island of Minorca. France resigned her pretensions to Hudson's bay, Nova Scotia, and Newfoundland; but was left in possession of Cape Breton, and the liberty of drying fish upon the shore. Among the articles glorious to the British nation, their setting free the French Protestants confined in the prisons and galleys for their religion, was not the least meritorious. For the emperor it was stipulated, that he should possess the kingdom of Naples, the duchy of Milan, and the Spanish Netherlands. The king of Prussia was to have Upper Guelder; and a time was fixed for the emperor's acceding to these articles, as he had for some time obstinately refused to assist at the negotiation. This famous treaty was signed at Utrecht on the last day of March 1713.

This year was also remarkable for an attempt of the Scottish peers and commons to dissolve the union, which, as has been observed, had proved exceedingly disagreeable and distressful to the nation. During the debates

(c) Cunningham differs prodigiously from this account. His computation being no more than 6000 killed and 9000 wounded on the part of the allies, and 7000 killed and 10,000 wounded on the part of the French.

Britain. debates on this subject, the earl of Peterborough endeavoured to prove the impossibility of dissolving the treaty, which he compared to a marriage, that, being once contracted, could not be dissolved by any power on earth. He observed, that though England, who, in the national marriage, must be supposed to represent the husband, had in some instances been unkind to the lady, she ought not presently to sue for a divorce; and added, when the union was termed a mere political expedient, that it could not have been made more solemn, unless, like the ten commandments, it had come from heaven. The duke of Argyle, also, who had originally promoted the union, now, declared against it, and said, that unless it were dissolved, he did not long expect to have either property left in Scotland or liberty in England. By some other peers it was alleged, that the union had not produced its intended effect; that it had been designed to promote friendship between the two nations; but, so far from answering the purpose, the animosities between them were never so great as then; and if they were separated again, they would be better friends. This motion was overruled in the house; but the discontent of the people still continued, and addresses were prepared throughout the kingdom, and matters were in danger of coming to the worst extremities, when the attempt of the Pretender in 1715 so divided the minds of the people, that no unanimous effort could ever afterwards be made; though the union was long generally considered, and still is by some individuals, as a national grievance.

The history of the latter part of this reign consists entirely of the intrigues of the Whigs and Tories against each other; which, as they are now of no importance, it is needless to take up time in relating, farther than that the Tory influence continued to prevail. Whether the ministry at this time wished to alter the succession from the Hanoverian line, cannot now be easily made out; but certain it is, that the Whigs firmly believed it, and the Tories but faintly denied the charge. The suspicions of the former became every day stronger, particularly when they saw a total removal of the Whigs from all places of trust and confidence throughout the kingdom, and their employments bestowed on professed Tories, supposed to be maintainers of an unbroken hereditary succession.

373
Death of
the queen.

The violent dissensions between these two parties, their unbounded licentiousness, cabals, and tumults, made the queen's situation very disagreeable; her health declined; and on the 28th of July 1714, she fell into a lethargic insensibility. Notwithstanding all the medicines the physicians could prescribe, the distemper gained ground so fast, that next day they despaired of her life. All the members of the privy-council without distinction were now summoned from the different parts of the kingdom; and they began to provide for the security of the constitution. A letter was sent to the elector of Hanover, informing him of the queen's desperate situation, and desiring him to repair to Holland, where he would be attended by a British squadron to convey him to England. At the same time they dispatched instructions to the earl of Strafford at the Hague, to desire the States-general to be ready to perform the guarantee of the Protestant succession. Precautions were taken to secure the sea-ports; and the

command of the fleet was bestowed upon the earl of Berkeley, a professed Whig. These measures, which were all dictated by that party, answered a double end. They argued the alacrity of the Whigs in the cause of their new sovereign, and seemed to imply that the state was in danger from the disaffection of the opposite party.

Britain.

On the 30th of July the queen seemed to be somewhat relieved by the medicines which had been given her. She rose from her bed about eight in the morning and walked a little. After some time, casting her eyes on a clock that stood in her chamber, she continued to gaze at it for some minutes. One of the ladies in waiting asked her what she saw there more than usual? to which the queen only answered by turning her eyes upon her with a dying look. She was soon after seized with an apoplectic fit; from which, however, she was somewhat recovered by the assistance of Dr Mead. She continued all night in a state of stupefaction. She gave some signs of life betwixt twelve and one the next day; but expired the following morning, a little after seven o'clock, having lived 49 years, and reigned upwards of 12. This princess was remarkable neither for her learning nor her capacity. Like all the rest of her family, she seemed rather fitted for the duties of private life than a public station; being a pattern of conjugal fidelity, a good mother, a warm friend, and an indulgent mistress; and to her honour it certainly must be recorded, that during her reign none suffered on the scaffold for treason. In her ended the line of the Stuarts; a family who never rewarded their friends, nor ever avenged them of their adversaries; a family whose misfortunes and misconducts are not to be paralleled in history.

The queen had no sooner resigned her breath than the privy-council met, and three instruments were produced, by which the elector of Hanover appointed several of his known adherents to be added as lords justices to the seven great officers of the kingdom. Orders also were immediately issued out for proclaiming George king of England, Scotland, and Ireland. The regency appointed the earl of Dorset to carry him the intimation of his accession to the crown, and to attend him in his journey to England. They sent the general officers, in whom they could confide, to their posts; they reinforced the garrison of Portsmouth, and appointed the celebrated Mr Addison secretary of state. No tumult, no commotion, arose against the accession of the new king: and this gives a strong proof that the Tories, had they really intended to exclude him, never took any rational measures to accomplish their purpose.

374
She is succeeded by
George I.

The king first landed at Greenwich; where he was received by the duke of Northumberland, captain of the lifeguard, and the lords of the regency. From the landing-place he walked to his house in the park, accompanied by a great number of the nobility and other persons of distinction, who expected to make their court in this reign in consequence of their turbulence and opposition to the reigning party in the last. George I. was 54 years old when he ascended the British throne. His mature age, his sagacity and experience, his numerous alliances, and the general tranquillity of Europe, all contributed to establish his interests, and promise him a peaceable and happy reign. His virtues, though.

375
He arrives
in England.

^{Britain.} though not shining, were solid; and he was of a very different disposition from the Stuart family whom he succeeded. These were known to a proverb for leaving their friends in extremity; George, on the contrary, soon after his arrival in England, was heard to say, "My maxim is, never to abandon my friends, to do justice to all the world, and to fear no man." To these qualities of resolution and perseverance, he joined great application to business. One fault, however, with regard to England, remained behind: he studied the interests of the kingdom he had left, more than of those he came to govern.

³⁷⁶
He favours
the Whigs.

The new king soon discovered his inclination to support those who had raised him to the throne, that is, the Whig party. When he retired to his bed-chamber, after his first landing, he sent for such of the nobility as had distinguished themselves by their zeal for his succession. He expressed the greatest regard for the duke of Marlborough, just then arrived from the continent, whither he had been driven by the violence of the Tories. The same friendship he professed for the other leaders of the Whigs; but the Tories found themselves excluded from the royal favour. The king did not seem sensible that the monarch of a faction rules but one half of his subjects. It was his misfortune, and consequently that of the nation, that he was hemmed round by men who soured him with all their own interests and prejudices. The Whigs, while they pretended to secure the crown for the king, were using all their arts to confirm their own interests, extend their connections, and give laws to their sovereign. An instantaneous change was made in all the offices of trust, honour, or advantage. The names of the contending parties were changed into those of *Hanoverians* and *Jacobites*. The former governed the senate and court, oppressed whom they would, bound the lower orders of people by severe laws, and kept them at a distance by vile distinctions; and then taught them to call this *liberty*.

³⁷⁷
National
discontents.

In consequence of these partialities, the highest discontents were raised through the whole kingdom. The Tories or Jacobites raised the most terrible outcries; and had the Pretender been a man of any judgment or abilities, a fair opportunity was now offered him of striking a decisive blow. Instead of this, he continued a calm spectator on the continent, and only sent over his emissaries to disperse ineffectual manifestoes and delude the unwary. In these papers he observed, that the late queen had intentions of calling him to the crown. He expostulated with his people upon the injustice they had done themselves in proclaiming a foreign prince for their sovereign, contrary to the laws of the country, that gave him alone the real claim. Copies of a printed address were sent to the dukes of Shrewsbury, Marlborough, Argyle, and other noblemen of the first distinction; vindicating his right to the crown, and complaining of the injustice of his people. Yet, though he still complained of their conduct, he never took any step to correct his own, or remove that obstacle by which his father had lost his throne. He still continued to profess the truest regard to the Catholic religion; and, instead of concealing his sentiments on that head, gloried in his principles.

But, however much the Popish religion was at that time hated in England, the principles of the dissenters

were not in the least more agreeable to the generality. The Tories affirmed, that, under a Whig administration, heresy and impiety were daily gaining ground. The lower orders of the clergy joined in these complaints, and pointed out several tracts published in favour of Arianism and Socinianism. The ministry not only refused to punish the delinquents, but silenced the clergy themselves, and forbade their future disputations on these topics.—The parliament was now dissolved, and another called by a very extraordinary proclamation. In this the king complained of the evil designs of men disaffected to his succession; and of their having misrepresented his conduct and principles. He expressed his hopes, that his subjects would send up to parliament the fittest persons to redress the present disorders. He intreated that they would elect such in particular, as had expressed a firm attachment to the Protestant succession when it was in danger. In the election of this important parliament, uncommon vigour was exerted on both sides; but by dint of the moneyed interest that prevailed in corporations, and the activity of the ministry, a great majority of Whigs was returned both in England and Scotland.

^{Britain.}
³⁷⁸
Parliament
dissolved.

Upon the first meeting of this new parliament, the most violent measures were resolved upon against the late ministry. Part of them kept away from business. A committee was appointed to inspect all the papers relative to the late treaty, and to pick out such of them as might serve for grounds of accusation against the late ministry. The earl of Oxford was impeached of high treason, and sent to the Tower. The violence of the commons was answered with equal violence without doors. Tumults became every day more frequent, and every tumult served only to increase the severity of the legislature. They now passed an act, declaring, that if any persons to the number of 12, unlawfully assembled, should continue together one hour after being required to disperse by a justice of peace or other officer, and after hearing the act against riots read in public, they should be deemed guilty of felony without benefit of clergy. This is a very severe act, and one of the greatest restrictions on the liberty of the subject that has passed during this century; as, by it, all meetings of the people, either for the purposes of amusement or redress, are rendered criminal, if it shall please any magistrate to consider them as such.

³⁷⁹
Violent
proceedings
of the new
parliament.

These vindictive proceedings excited the indignation of the people, who perceived that the avenues of royal favour were closed to all but a faction. A rebellion commenced in Scotland, where to their other grievances they joined that of the union, which they were taught to consider as an oppression. The malecontents of this country had all along maintained a correspondence with their friends in England, who were now driven by resentment and apprehension into a system of politics they would not otherwise have dreamed of. Some of the Tory party, who were men attached to the Protestant religion, and of moderate principles in government, began to associate with the Jacobites, and to wish in earnest for a revolution. Scotland first showed them the example. The earl of Mar, assembling 300 of his vassals in the Highlands, proclaimed the Pretender at Castleton; and setting up his standard at Braemar, assumed the title of *lieutenant general of his majesty's forces*. To second these attempts, two vessels arrived from

³⁸⁰
Rebellion
in Scotland

Britain. from France, with arms, ammunition, and a number of officers, together with assurances to the earl, that the pretender himself would shortly come over to head his own forces. In consequence of this promise, the earl soon found himself at the head of 10,000 men well armed and provided. He secured the pass of Tay at Perth, where his head-quarters were established; and made himself master of the whole province of Fife, and all the sea-coast on that side of the frith of Forth. He marched from thence to Dumblain, as if he had intended to cross the Forth at Stirling-bridge; but there he was informed that the duke of Argyle, who on this occasion was appointed commander in chief of all the forces in North Britain, was advancing against him from Stirling with all his own clans, assisted by some troops from Ireland. Upon this he thought proper at first to retreat: but being soon after joined by some of the clans under the earl of Seaforth, and others under General Gordon, an experienced officer, who had signalized himself in the Russian service, he resolved to face the enemy, and directed his march towards the south.

³⁸¹
Battle near Dumblain. The duke of Argyle, apprized of his intentions, and at any rate willing to prove his attachment to the present government, resolved to give him battle in the neighbourhood of Dumblain, though his forces did not amount to half the number of the enemy. In the morning, therefore, he drew up his army, which did not exceed 3500 men, in order of battle; but he soon found himself greatly outflanked by the insurgents. The duke, therefore, perceiving the earl make attempts to surround him, was obliged to alter his disposition, which, on account of the scarcity of general officers, was not done so expeditiously as to be finished before the rebels began the attack. The left wing of the duke's army received the centre of the enemy, and supported the first charge without shrinking. It seemed even for a while victorious, and the earl of Clanronald was killed. But Glengary, who was second in command, undertook to inspire his intimidated forces with courage; and, waving his bonnet, cried out several times, *Revenge!* This animated the rebel troops to such a degree, that they followed him close to the points of the enemies bayonets, and got within their guard. A total rout began to ensue of that wing of the royal army; and General Witham, their commander, flying full speed to Stirling, gave out that the rebels were completely victorious. In the mean time, the duke of Argyle, who commanded in person on the right, attacked the left of the enemy; and drove them before him two miles, though they often faced about and attempted to rally. Having thus entirely broken that wing, and driven them over the river Allan, he returned back to the field of battle; where, to his great mortification, he found the enemy victorious, and patiently waiting for the assault. However, instead of renewing the engagement, both armies continued to gaze at each other, neither caring to begin the attack. In the evening, both parties drew off, and both claimed the victory. All the advantages of a victory, however, belonged to Argyle. He had interrupted the progress of the enemy; and, in their circumstances, delay was defeat. In fact, the earl of Mar soon found his losses and disappointments increase. The castle of Inverness, of which he was in possession, was

delivered up by Lord Lovat, who had hitherto professed to act in the interest of the Pretender. The marquis of Tullibardine forsook the earl, in order to defend his own part of the country; and many of the clans, seeing no likelihood of coming to a second engagement, returned quietly home.

In the mean time the rebellion was still more unsuccessfully prosecuted in England. From the time the Pretender had undertaken this wild project at Paris, in which the duke of Ormond and Lord Belingbroke were engaged, Lord Stair, the English ambassador there, had penetrated all his designs, and sent faithful accounts of all his measures and of all his adherents to the ministry at home. Upon the first rumour, therefore, of an insurrection, they imprisoned several lords and gentlemen, of whom they had a suspicion. But these precautions were not able to stop the insurrection in the western counties, where it was already begun. All their preparations, however, were weak and ill conducted; every measure was betrayed to government as soon as projected, and many revolts were repressed in the very outset. The university of Oxford was treated with great severity on this occasion. Major-general Pepper, with a strong detachment of dragoons, took possession of the city at day-break, declaring that he would instantly shoot any of the students who should presume to appear without the limits of their respective colleges.

³⁸²
Bad conduct of James's party. The insurrection in the northern counties came to greater maturity. In the month of October 1715, the earl of Derwentwater, and Mr Forster, took the field with a body of horse, and, being joined by some gentlemen from the borders of Scotland, proclaimed the Pretender. Their first attempt was to seize upon Newcastle, in which they had many friends; but finding the gates shut against them, they retired to Hexham. To oppose these, General Carpenter was detached by government with a body of 900 men, and an engagement was hourly expected. The rebels had two methods by which they might have conducted themselves with prudence and safety. The one was to march directly into the western parts of Scotland, and there join General Gordon, who commanded a strong body of Highlanders. The other was to cross the Tweed, and boldly attack General Carpenter, whose forces did not exceed their own. From the infatuation attendant on the measures of that party, neither of these courses was pursued. They took the route to Jedburgh, where they hoped to leave Carpenter on one side, and penetrate into England by the western border. This was the effectual means to cut themselves off either from retreat or assistance. A party of Highlanders, who had joined them by this time, at first refused to accompany them in such a desperate incursion, and one half of them actually returned to their own country. At Brampton, Mr Forster opened his commission of general, which had been sent him by the earl of Mar, and there he proclaimed the Pretender. They continued their march to Penrith, where the body of the militia that was assembled to oppose them fled at their appearance. From Penrith, they proceeded by the way of Kendal and Lancaster to Preston, of which place they took possession without any resistance. But this was the last stage of their ill-advised excursion; for General Wills, at the head of 7000 men, came up to.

³⁸³
Expedition of the earl of Derwentwater.

384
 Rebels forced to surrender at Preston.

to attack them; and from his activity there was no escaping. They now, therefore, began to raise barricades about the town, and to put the place in a posture of defence, repulsing the first attacks of the royal army with success. Next day, however, Wills was reinforced by Carpenter, and the town was invested on all sides. In this deplorable situation, to which they were reduced by their own rashness, Forster hoped to capitulate with the general; and accordingly sent Colonel Oxburgh, who had been taken prisoner, with a trumpeter to propose a capitulation. This, however, Wills refused; alleging that he would not treat with rebels, and that the only favour they had to expect was to be spared from immediate slaughter. These were hard terms, but no better could be obtained. They accordingly laid down their arms, and were put under a strong guard. All the noblemen and leaders were secured, and a few of their officers tried for deserting from the royal army, and shot by order of a court-martial. The common men were imprisoned at Chester and Liverpool: the noblemen and considerable officers were sent to London, and led through the streets pinioned and bound together, to intimidate their party.

385
 Absurd conduct of James's party in France.

Though the schemes of the Pretender appear to have been foolishly enough conducted in Britain, yet they were much more so in France. Bolingbroke had been made his secretary at Paris, and Ormond his prime minister. But these statesmen quickly found that nothing could be done in favour of his cause. The king of France, who had ever espoused the interest of the abdicated family, was just dead; and the duke of Orleans, who succeeded in the government of the kingdom, was averse to lending the Pretender any assistance. His party, however, which was composed of the lowest and the most ignorant exiles from the British dominions, affected the utmost confidence, and boasted of a certainty of success. The deepest secrets of his cabinet, and all his intended measures, were bandied about in coffee-houses by persons of the lowest rank both in fortune and abilities. Subaltern officers resolved to be his generals; and even prostitutes were entrusted to manage his negotiations. Little therefore could be expected from such assistance and such councils.

386
 Pretender lands in Scotland.

Though, by this time, the Pretender might easily have seen that his affairs were desperate; yet, with his usual infatuation, he resolved to hazard his person among his friends in Scotland, at a time when such a measure was too late for success. Passing, therefore, through France in disguise, and embarking in a small vessel at Dunkirk, he arrived, after a voyage of a few days, on the coast of Scotland, with only six gentlemen in his train. He passed unknown through Aberdeen to Fetteresso, where he was met by the earl of Mar, and about 30 noblemen and gentlemen of the first quality. There he was solemnly proclaimed; and his declaration, dated at Comerey, was printed and dispersed. He went from thence to Dundee, where he made a public entry; and in two days more he arrived at Scoon, where he intended to have the ceremony of his coronation performed. He ordered thanksgivings to be made for his safe arrival; he enjoined the ministers to pray for him in their churches; and without the smallest share of power, went through the ce-

remories of royalty, which threw an air of ridicule on all his conduct. Having thus spent some time in unimportant parade, he resolved to abandon the enterprise with the same levity with which it was undertaken. Having made a speech to his grand council, he informed them of his want of money, arms, and ammunition, for undertaking a campaign, and therefore deplored that he was obliged to leave them. He once more embarked on board a small French ship that lay in the harbour of Montrose, accompanied with several lords, his adherents; and in five days arrived at Graveline.

Britain.

General Gordon, who was left commander in chief of the forces, with the assistance of Earl Mareschal, proceeded at their head to Aberdeen, where he secured three vessels to sail northward, which took on board such persons as intended to make their escape to the continent. He then continued his march through the Highlands, and quietly dismissed his forces as he went forward. This retreat was made with such expedition, that the duke of Argyle, with all his activity, could never overtake his rear, which consisted of 1000 horse.

387
 And again leaves it.

The rebellion being ended, the law was put in force with all its terrors; and the prisons of London were crowded with those deluded persons, whom the ministry seemed resolved not to pardon. The commons, in their address to the crown, declared they would prosecute, in the most rigorous manner, the authors of the late rebellion; and their measures were as vindictive as their resolutions were speedy. The earls of Derwentwater, Nithsdale, Carnwath, and Wintown, the lords Widrinton, Kenmuir, and Nairne, were impeached; and, upon pleading guilty, all but Lord Wintown, received sentence of death. No intreaties could prevail on the ministry to spare these unhappy men. The house of lords even presented an address to the throne for mercy, but without effect; the king only answered, that on this, as on all other occasions, he would act as he thought most consistent with the dignity of the crown and the safety of the people. Orders were accordingly dispatched for executing the lords Derwentwater, Nithsdale, and Kenmuir, immediately; the rest were respited to a farther time. Nithsdale, however, had the good fortune to escape in woman's clothes that were brought him by his mother the night before his execution. Derwentwater and Kenmuir were brought to the scaffold on Tower-hill at the time appointed. Both underwent their sentence with calm intrepidity, and seemingly less moved than those who beheld them.

388
 Cruel treatment of the rebels.

An act of parliament was next made for trying the private persons in London, and not in Lancashire where they were taken in arms. This was considered, by some of the best lawyers, as an alteration of the ancient constitution of the kingdom, by which it was supposed that every prisoner should be tried in the place where the offence was committed, as a jury of neighbours would be best qualified to enter into the nature of the offence. In the beginning of April, commissioners for trying the rebels met in the court of common pleas, when the bills were found against Mr Forster, Mr Macintosh, and 20 of their confederates. Forster escaped from Newgate, and reached the continent in safety; the rest pleaded not guilty. Pitts

the

Britain. the keeper of Newgate, being suspected of having connived at Forster's escape, was tried for his life, but acquitted. After this, Macintosh, and several other prisoners, broke from Newgate, after having mastered the keeper and turnkey, and disarmed the centinel. The court proceeded to the trial of those that remained; four or five were hanged, drawn, and quartered, at Tyburn. The judges appointed to try the rebels at Liverpool found a considerable number of them guilty of high treason. Two-and-twenty were executed at Manchester and Preston; about 1000 experienced the king's mercy, if such it may be called, to be transported to North America.

389
Duration
of the par-
liament
lengthened.

The rebellion being thus extinguished, the danger of the state was made a pretence for continuing the parliament beyond the term fixed for its dissolution. An act, therefore, was made by their own authority, repealing that by which they were to be dissolved every third year, and the term of their duration was extended to seven years. This attempt in any delegated body of people to increase their own power by extending it, is contrary to the first principles of justice. If it was right to extend their duration to seven years, they might also perpetuate their authority; and thus cut off even the shadow of a nomination. The bill, however, passed both houses, and all objections to it were considered as disaffection. The people might murmur at this encroachment, but it was too late for redress.

390
Britain
threatened
with an in-
vasion by
Charles XII.

Domestic concerns being thus adjusted, the king resolved upon a voyage to the continent. He foresaw a storm gathering from Sweden. Charles XII. was highly provoked against him for having entered into a confederacy with the Russians and Danes during his absence at Bender, and for having purchased from the king of Denmark the towns of Bremen and Verden, which constituted a part of his dominions. In consequence of this, Charles maintained a close correspondence with the dissatisfied subjects of Great Britain; and a scheme was formed for landing a considerable body of Swedish forces, with the king at their head, in some part of the island, where it was expected they would be joined by all the malecontents in the kingdom. Count Gyllenburg, the Swedish minister in London, was peculiarly active in the conspiracy; but being seized with all his papers, by order of the king, the confederacy was broke for that time. A bill, however, was passed by the commons, forbidding all commerce with Sweden; the trade with which country was at that time of the utmost consequence to the English merchants. George having passed through Holland to Hanover, in order to secure his German dominions, entered into a new treaty with the Dutch and the regent of France, by which they agreed mutually to assist each other in case of an invasion; and for his further security, the commons granted him 250,000*l*. But the death of the Swedish monarch, who was soon after killed at the siege of Fredericksball in Norway, put an end to all disquietude from that quarter.

Among the many treaties for which this reign was remarkable, one had been concluded, which was called the *quadruple alliance*. It was agreed between the emperor, France, Holland, and Britain, that the emperor should renounce all pretensions to the crown of Spain, and exchange Sardinia for Sicily with the duke of Savoy; that the succession to the duchies of Tus-

cany, Parma, and Placentia, should be settled on the queen of Spain's eldest son, in case the present possessors should die without male issue. This treaty, however, was by no means agreeable to the king of Spain; and consequently it became prejudicial to the English, as it interrupted the commerce with that kingdom. A War with Spain. war soon after commenced between Spain and the emperor, who was considered as the principal contriver of the treaty; and a numerous body of Spanish forces were sent into Italy to support Philip's pretensions in that quarter. The regent of France attempted in vain to dissuade him, and the king of Britain offered his mediation with the like bad success; their interposition was considered as partial and unjust. A Spanish war was then resolved on. A squadron of 22 ships was equipped with all expedition, the command of which was given to Sir George Byng, and ordered to sail for Naples, at that time threatened with a Spanish army. He was received with the greatest joy by the Neapolitans; who informed him that the Spaniards, to the amount of 30,000, were then actually landed in Sicily. In this exigence, as no assistance could be given by land, he resolved to sail thither, fully determined to pursue the Spanish fleet on which the army was embarked. Upon coming round Cape Faro, he perceived two small Spanish vessels; and pursuing them closely, they led him to their main fleet, which, before noon, he discovered in line of battle, amounting in all to 27 sail. The Spaniards, however, notwithstanding of their superiority in number, attempted to sail away; but finding it impossible to make their escape, they kept up a running fight, and the commanders behaved with great courage and activity; in spite of which they were all taken except three, which were preserved by the conduct of one Cammoc, their vice-admiral, a native of Ireland. Sir George Byng behaved on this occasion with great prudence and resolution: and the king wrote him a letter with his own hand, approving his conduct.

The rupture with Spain was thought to be favourable to the interests of the Pretender; and it was hoped that by the assistance of Cardinal Alberoni, the Spanish minister, a new insurrection might be excited in England. The duke of Ormond was the person fixed upon to conduct this expedition; and he obtained from the Spanish court a fleet of ten ships of war and transports, having on board 6000 regular troops, with arms for 12,000 more. But fortune was still as unfavourable as ever. Having set sail, and proceeded as far as Cape Finisterre, he was encountered by a violent storm, which disabled his fleet and frustrated the expedition. This misfortune, together with the bad success of the Spanish arms in Sicily and other parts of Europe, induced Philip to wish for a cessation of arms; and he at last consented to sign the quadruple alliance, by which means peace was again restored to Europe.

Tranquillity being thus established, the ministry proceeded to secure the dependency of the Irish parliament on that of England. One Maurice Annesley had appealed to the house of peers of England from a decree made by the Irish peers, and their decree was reversed. The British peers ordered the barons of exchequer in Ireland to put Mr Annesley in possession of the lands he had lost by the decree of the lords in that kingdom. The barons obeyed this order; and the Irish peers pas-

Britain. sed a vote against them, as having attempted to diminish the just privileges of the parliament of Ireland; and at the same time ordered the barons to be taken under the custody of the black rod. On the other hand, the house of lords in England resolved, that the barons of the exchequer in Ireland had acted with courage and fidelity; and addressed the king to signify his approbation of their conduct, by some marks of his favour. To complete their intention, a bill was prepared, by which the Irish house of lords was deprived of all right of final jurisdiction. This bill was opposed in both houses, but particularly by the commons. It was there asserted by Mr Pitt, that it would only increase the power of the English peers, who were already but too formidable. Mr Hungerford demonstrated, that the Irish lords had always exerted their power of finally deciding causes. Notwithstanding all opposition, the bill was carried by a great majority, and soon after received the royal assent.

394
South sea
scheme.

This blow was severely felt by the Irish; but was by no means so great as that which the English about this time felt from the *South-sea scheme*, which commenced in the year 1721. To explain this as concisely as possible, it must be observed, that ever since the revolution under King William, the government not having sufficient supplies granted by parliament, or what was granted requiring time to be collected, they were obliged to borrow money from several different companies of merchants; and among the rest from that company which traded to the South sea. In the year 1716, the government was indebted to this company about nine millions and a half of money; for which they granted at the rate of 6 per cent. interest. As this company was not the only one to which government was indebted, Sir Robert Walpole formed a design of lessening the national debt, giving the several companies an alternative either of accepting a lower interest, namely 5 per cent. or of being paid the principal. The different companies chose rather to accept of the diminished interest than to be paid the principal. The South-sea Company, in particular, having augmented their loan to ten millions, were contented to receive 500,000l. annually as interest, instead of 600,000l. which they usually received. In the same manner, the governors and company of the bank, and other companies, were contented to receive a diminished annual interest for their respective loans; all which greatly lessened the debts of the nation.

In this situation of things, one *Blount*, a scrivener, proposed to the ministry, in the name of the South-sea Company, to buy up all the debts of the different companies, and thus for the South-sea Company to become the sole creditors of the state. The terms he offered to government were extremely advantageous. The South-sea Company was to redeem the debts of the nation out of the hands of the private proprietors who were creditors to the government, upon whatever terms they could agree on; and for the interest of this money which they had thus redeemed and taken into their own hands, they would be contented to be allowed by government 5 per cent. for six years; after which the interest should be reduced to 4 per cent. and should at any time be redeemable by parliament. For these purposes a bill passed both houses. But now came the part of the scheme big with fraud and ruin. As the direc-

tors of the South-sea Company could not of themselves be supposed to possess so much money as was sufficient to buy up the debts of the nation, they were empowered to raise it by opening a subscription to an imaginary scheme for trading in the South seas; from which commerce immense advantages were promised, and still greater expected by the rapacious credulity of the people. All the creditors of government, therefore, were invited to come in, and exchange their securities, viz. the security of government, for that of the South-sea Company. The directors books were no sooner opened for the first subscription, than crowds came to make the exchange of government stock for South-sea stock. The delusion was artfully continued and spread. Subscriptions in a few days sold for double the price they had been bought at. The scheme succeeded beyond even the projector's hopes, and the whole nation was infected with a spirit of avaricious enterprise. The infatuation prevailed; the stock increased to a surprising degree, even to near ten times the value of what it was first bought for.

After a few months, however, the people waked from their dream of riches; and found that all the advantages they expected were merely imaginary, while thousands of families were involved in one common ruin. Many of the directors, by whose arts the people were taught to expect such great benefits from a traffic to the South seas, had amassed considerable fortunes by the credulity of the public. It was some consolation, however, to the people, to find the parliament sharing in the general indignation, and resolving to strip those unjust plunderers of their possessions. Orders were first given to remove all the directors of the South-sea Company from their seats in parliament, and the places they possessed under government. The principal delinquents were punished by a forfeiture of all such possessions and estates as they had acquired during the continuance of this popular frenzy. The next care was to redress the sufferers. Several just and useful resolutions were taken by parliament, and a bill was speedily prepared for repairing the late sufferings as far as the inspection of the legislature could extend. Of the profit arising from the South-sea scheme, the sum of seven millions was given back to the original proprietors; several additions were also made to their dividends out of what was possessed by the company in their own right; and the remaining capital stock was also divided among the old proprietors at the rate of 33 per cent.—In the mean time, petitions from all parts of the kingdom were presented to the house, demanding justice; and the whole nation seemed exasperated to the highest degree. Public credit sustained a terrible shock. Some principal members of the ministry were deeply concerned in these fraudulent transactions. The bank was drawn upon faster than it could supply; and nothing was heard but the ravings of disappointment, and the cries of despair.

By degrees, however, the effects of this terrible calamity wore off, and matters returned to their former tranquillity. A new war with Spain commenced. Admiral Hosier was sent to South America to intercept the Spanish galleons; but the Spaniards being apprised of his design, relanded their treasure. The greatest part of the British fleet sent on that expedition was rendered entirely unfit for service. The seamen were cut off in great numbers by the malignity of the climate

Britain. mate and the length of the voyage, while the admiral himself is said to have died of a broken heart. In order to retaliate these hostilities, the Spaniards undertook the siege of Gibraltar; but with as little success on their side. In this dispute France offered her mediation; and such a reconciliation as treaties could procure was the consequence: a temporary peace ensued; both sides only watching an opportunity to renew hostilities with advantage.

Britain. tal was at first limited to 30,000l. but they afterwards increased it to 600,000l. This money was supplied by subscription, and the care of conducting the capital was intrusted to a proper number of directors. This company having continued for more than 20 years, the cashier, George Robinson, member for Marlow, and the warehouse-keeper, John Thompson, disappeared in one day. Five hundred thousand pounds of capital were found to be sunk or embezzled by means which the proprietors could not discover. They therefore, in a petition, represented to the house the manner in which they had been defrauded, and the distress to which many of the petitioners were reduced. A secret committee being appointed to examine into this grievance, a most iniquitous scene of fraud was soon discovered, which had been carried on by Thompson and Robinson, in concert with some of the directors, for embezzling the capital and cheating the proprietors. Many persons of rank and quality were concerned in this infamous conspiracy; and even some of the first characters in the nation did not escape censure. No less than six members of parliament were expelled for the most sordid acts of knavery. Sir Robert Sutton, Sir Archibald Grant, and George Robinson, for their frauds in the management of the charitable corporation scheme; Deanis Bond, and Serjeant Burch, for a fraudulent sale of the late unfortunate earl of Derwentwater's estate; and lastly John Ward, of Hackney, for forgery. It was at this time asserted in the house of lords, that not one shilling of the forfeited estates was ever applied to the service of the public, but became the reward of fraudulence and venality.

397
Death of
King Geo.
I.

Soon after the breaking up of the parliament in the year 1727, the king resolved to visit his electoral dominions of Hanover. Having appointed a regency in his absence, he embarked for Holland, and lay, upon his landing, at a little town called *Voet*. Next day he proceeded on his journey; and in two days more, between ten and eleven at night, arrived at Delden, to all appearance in perfect health. He supped there very heartily, and continued his journey early the next morning; but between eight and nine ordered his coach to stop. It being perceived that one of his hands lay motionless, Monsieur Fabrice, who had formerly been servant to the king of Sweden, and who now attended King George, attempted to quicken the circulation, by chafing it between his own. As this had no effect, the surgeon who followed on horseback was called, and he rubbed it with spirits. Soon after, the king's tongue began to swell, and he had just strength enough to bid them hasten to Osnaburgh. Then, falling insensible into Fabrice's arms, he never recovered; but expired about 11 o'clock the next morning, in the 68th year of his age, and 13th of his reign. His body was conveyed to Hanover, and interred among his ancestors.

This happened in the year 1731; and in 1732, a ⁴⁰¹Excise scheme rejected. scheme was formed by Sir Robert Walpole of fixing a general excise. He introduced it by recounting the frauds practised by the factors in London that were employed in selling the American tobacco. To prevent these frauds, he proposed, that instead of having the customs levied in the usual manner upon tobacco, all hereafter to be imported should be lodged in warehouses appointed for that purpose by the officers of the crown; and should from thence be sold, upon paying the duty of 4d. per pound, when the proprietor found a purchaser. This proposal raised a violent ferment, both within doors and without. At last the fury of the people was worked up to such a pitch, that the parliament-house was surrounded by multitudes, who intimidated the ministry, and compelled them to drop the design. The miscarriage of the bill was celebrated with public rejoicings in London and Westminster, and the minister was burned in effigy by the populace at London.

398
George II.
succeeds.

On the accession of George II. the two great parties into which the nation had been so long divided, again changed their names, and were now called the *court* and *country* parties. Throughout the greatest part of this reign, there seem to have been two objects of controversy, which rose up in debate at every session, and tried the strength of the opponents; these were the national debt, and the number of forces to be kept in pay. The government on the present king's accession owed more than 30,000,000 of money; and though there was a long continuance of profound peace, yet this sum was found constantly increasing. It was much wondered at by the country party how this could happen, and it was as constantly the business of the court to give plausible reasons for the increase. Thus, demands for new supplies were made every session of parliament, either for the purposes of securing friends upon the continent, of guarding the kingdom from internal conspiracies, or of enabling the ministry to act vigorously in conjunction with the powers in alliance abroad. It was vainly alleged that those expences were incurred without prescience or necessity; and that the increase of the national debt, by multiplying and increasing taxes, would at last become an intolerable burden to the poor. These arguments were offered, canvassed, and rejected; the court party was constantly victorious, and every demand was granted with cheerfulness and profusion.

and coun-
try parties.

400
Account of
the chari-
table cor-
poration.

The next thing worthy of notice in the reign of George II. is the *charitable corporation*. A society of men had united themselves into a company by this name; and their professed intention was to lend money at legal interest to the poor upon small pledges, and to persons of higher rank upon proper security. Their capi-

On this occasion an attempt was made to repeal the septennial bill, and bring back triennial parliaments, as settled at the Revolution. But notwithstanding the warmth of the opposition, the ministry, exerting all their strength, were victorious, and the motion was suppressed by the majority. However, as on this occasion ⁴⁰²Parliament dissolved. the country party seemed to have gained strength, it was thought proper to dissolve the parliament: and another was called by the same proclamation.

The same disputes were carried on this parliament, as in the former. New subjects of controversy offered every day, and both sides were eager to seize them. A convention agreed on by the ministry, at the Pra-

Britain. do, with Spain, became an object of warm altercation. By this the court of Spain agreed to pay 95,000*l.* to the English, as a satisfaction for all demands; and to discharge the whole in four months from the day of ratification. This, however, was considered as not equivalent to the damages that had been sustained, which were said to amount to 340,000*l.* On this occasion the minister was provoked into unusual vehemence, and branded the opposite party with the appellation of traitors. The ministry, as usual, were victorious; and the country party finding themselves out-numbered and out-voted in every debate, resolved to withdraw for ever: Walpole, being thus left without opposition, took the opportunity of passing several useful laws in their absence, in order to render the opposite party odious or contemptible.

403
War with
Spain.

In 1739, a new war commenced with Spain. Ever since the treaty of Utrecht, the Spaniards in America had insulted and distressed the commerce of Great Britain; and the British merchants had endeavoured to carry on an illicit trade in their dominions. As a right of cutting logwood in the bay of Campeachy, claimed by the British, gave them frequent opportunities of pushing in contraband commodities upon the continent, the Spaniards resolved to put a stop to the evil by refusing liberty to cut logwood in that place. The Spanish guarda-costas continued their severities upon the British, and many British subjects were sent to dig in the mines of Potosi. One remonstrance followed another to the court of Madrid; but the only answers given were promises of inquiry, which produced no reformation. In 1739, war was declared with all proper solemnity; and soon after, Admiral Vernon, with six ships only, destroyed all the fortifications of Porto Bello, and came away victorious, with scarce the loss of a man.

404
Porto Bello
taken.

As the war was thus successfully begun, supplies were cheerfully granted to prosecute it with all imaginable vigour. Commodore Anson was sent with a squadron of ships to distress the enemy in the South seas, and to co-operate occasionally with Admiral Vernon across the isthmus of Darien. This squadron was designed to act a subordinate part to a formidable armament that was to be sent against New Spain; but through the mismanagement of the ministry both these schemes were frustrated. Anson was detained till too late in the season; he then set out with five ships of the line, a frigate, and two store-ships, with about 1400 men. Coming into the stormy South seas at a very wrong season of the year, he encountered the most terrible storms; his fleet was dispersed, and his crew deplorably afflicted with the scurvy; so that with much difficulty he gained the delightful island of Juan Fernandez. Here he was joined by one ship and a frigate of seven guns. From thence sailing along the coast of Chili, he plundered and burnt the town of Païta. He next traversed the great Pacific ocean, in hopes of meeting with one of the immensely rich galleons that trade from the Philippine islands to Mexico. Having refreshed his men at the island of Tinian, he set forward to China; and returning the same way he came, at last discovered the galleon, which he engaged, and took; and with this prize, valued at 313,000*l.* together with other captures to the value of about as much more, he returned home, after a voyage of three

405
Anson's ex-
pedition.

years. By this expedition the public sustained the loss of a fine squadron of ships, but a few individuals became possessed of immense fortunes. Britain.

The other expedition-ended still more unfortunately. The armament consisted of 29 ships of the line, and almost an equal number of frigates, furnished with all kinds of warlike stores, near 15,000 seamen, and as many land forces. The most sanguine hopes of success were entertained; but the ministry detained the fleet without any visible reason, till the season for action in America was almost over. At last, however, they arrived before the wealthy city of Carthage. They soon became masters of the strong forts which defended the harbour. But though by this means they advanced a good deal nearer the town, they found great difficulties still before them. It was asserted, that the fleet could not lie near enough to batter the town, and therefore the remaining forts must be attempted by escalade. This dangerous experiment was tried; the guides were slain by the enemy's fire, and then the forces mistook their way. Instead of attempting the weakest place of the fort, they attacked the strongest, and where they were exposed to the fire of the whole town. Their scaling ladders were too short, and at last, after bearing a dreadful fire with great resolution for some hours, they retreated, leaving 600 men dead on the spot. The terrors of the climate now began to be more dreadful than those of war. The rainy season commenced with such violence, that it was impossible for the troops to continue their encampment. To these calamities was added the dissension between the sea and land commanders, who blamed each other, and at last could be only brought to agree in one mortifying measure, viz. to reembark the troops, and withdraw them as quick as possible.

406
Unsuccessful
attempt
on Carthage.

The miscarriage of this enterprise produced the greatest discontents; especially as other causes of complaint were now joined with it. Sir John Norris had twice sailed to the coast of Spain at the head of a very powerful squadron, without doing any thing to the purpose. The commerce of Britain was greatly annoyed by the Spanish privateers, who had taken 407 ships since the commencement of the war; while the British fleets seemed to be quite inactive, and to suffer one loss after another, without endeavouring in the least to make other reprisals. These discontents burst all at once upon Sir Robert Walpole; a majority in the house of commons was formed against him; he was created earl of Orford, the parliament being adjourned for a few days for that purpose; and he resigned all his employments.

407
Resignation
of Sir
Robert
Walpole.

The removal of this minister gave universal satisfaction. His antagonists entertained great hopes of seeing him punished: but he had laid his schemes too well to be under any apprehensions on that account; and what was worse, the new ministry were no sooner got in, than they trod in the footsteps of those they had so much exclaimed against. The nation had now become disgusted with naval operations. The people wished for a renewal of their victories in Flanders, and the king ardently joined in the same wish. An army of 16,000 men was therefore shipped over into Flanders, to take part in the quarrels that were then beginning on the continent. Immense triumphs were expected from this undertaking; but they forgot that

408
An army
sent into
Flanders.

⁴⁰⁹ **Britain.** the army was not now commanded by the duke of Marlborough.

⁴⁰⁹ Origin of the continental war.

In order to give some notion of the origin of these continental quarrels, it is necessary to go back for some years. After the duke of Orleans, who had been regent of France, died, Cardinal Fleury undertook to settle the confusion in which the kingdom was then involved. Under him France repaired her losses, and enriched herself by commerce. During the long interval of peace which this minister's counsels had procured for Europe, two powers, till now unregarded, began to attract the notice and jealousy of the neighbouring nations. These were Russia and Prussia. The other states were but little prepared to renew war. The empire remained under the government of Charles VI. who had been placed on the throne by the treaty of Utrecht. Sweden continued to languish from the destructive projects of Charles XII. Denmark was powerful enough, but inclined to peace; and part of Italy still remained subject to those princes who had been imposed upon it by foreign treaties.

All these states, however, continued to enjoy a profound peace, until the death of Augustus king of Poland, by which a general flame was once more kindled in Europe. The emperor, assisted by the arms of Russia, declared for the elector of Saxony, son to the deceased king. On the other hand, France declared for Stanislaus, who had long since been nominated king of the Poles by Charles of Sweden, and whose daughter the king of France had since married. Stanislaus was gladly received at Dantzic, and acknowledged king of Poland; but here he was besieged by 10,000 Russians, the city taken, and he himself with difficulty made his escape. France, however, still resolved to assist him, as this, it was thought, would be the most effectual method of distressing the house of Austria. These views of France were seconded by Spain and Sardinia, both of which hoped to grow rich by the spoils of Austria. A French army, therefore, overran the empire, under the conduct of the old marshal Villars; while the duke of Montemar, the Spanish general, was equally victorious in the kingdom of Naples. The emperor was soon obliged to sue for peace; which was granted, but Stanislaus was neglected in the treaty. It was stipulated that he should renounce all claim to the kingdom of Poland; for which the emperor gratified France with the duchy of Lorraine, and some other valuable territories.

⁴¹⁰ Desperate situation of the queen of Hungary.

The emperor dying in the year 1740, the French began to think this a favourable opportunity for exerting their ambition. Regardless of treaties, therefore, particularly that called the *Pragmatic Sanction*, by which the late emperor's dominions were settled upon his daughter, they caused the elector of Bavaria to be crowned emperor. Thus the queen of Hungary, daughter of Charles VI. was at once stripped of her inheritance, and was left for a whole year deserted by all Europe, and without any hopes of succour. At the same time she lost the province of Silesia by an irruption of the young king of Prussia, who took the opportunity of her defenceless state to renew his pretensions to that province, of which his ancestors had been unjustly deprived. France, Saxony, and Bavaria, attacked the rest of her dominions: Britain was the only ally that seemed willing to assist her; in which,

however, Sardinia, Holland, and Russia, soon after ^{Britain.} concurred.

It must be owned that Britain had no other reason for interfering in these disputes, than that the security of the electorate depended upon nicely balancing the different interests of the empire; and the ministry were willing to gratify the king. His majesty informed the parliament, that he had sent a body of British forces into the Netherlands, which he had augmented by 16,000 Hanoverians, to make a diversion upon the dominions of France, in favour of the queen of Hungary. When the supplies came to be considered, by which this additional number of Hanoverian troops was to receive pay from Britain for defending their own cause, most violent parliamentary debates ensued; but the ministry carried their point by the strength of numbers.

But, however prejudicial these continental measures ⁴¹¹ Relieved might be to the true interests of Great Britain, they by the British forces. effectually retrieved the queen of Hungary's desperate affairs, and soon began to turn the scale of victory on her side. The French were driven out of Bohemia. Her general, Prince Charles, at the head of a large army, invaded the dominions of Bavaria. Her rival, the nominal emperor, was obliged to fly before her; and being abandoned by his allies, and stripped even of his hereditary dominions, retired to Frankfort, where he lived in obscurity.

In the mean time, the British and Hanoverian army ⁴¹² Battle of advanced, in order to effect a junction with that of Dettingen. Prince Charles of Lorraine, in which case they would have outnumbered their enemies. To prevent this, the French opposed an army of 60,000 men, upon the river Mayne, under the command of the Marshal de Noailles, who posted his troops on the east side of that river. The British army was commanded by the earl of Stair, who had learned the art of war under the great Prince Eugene; nevertheless he suffered himself to be enclosed by the enemy on every side, near a village called *Dettingen*. In this situation, the whole army, with the king himself, who had by this time arrived in the camp, must have been taken, had the French behaved with prudence. Their impetuosity, however, saved the whole army. They passed a defile which they ought to have contented themselves with guarding; and, under the conduct of the duke of Gramont, their horse charged the British foot with great fury. They were received with great resolution; and at last obliged to repass the Mayne with precipitation, and the loss of about 5000 men.

Though the British were victorious in this engage- ⁴¹³ Intended ment, the French were very little disconcerted by it. invasion of. They opposed Prince Charles, and interrupted his at- Britain by tempts to pass the Rhine. In Italy they also gained the French. some advantages; but their chief hopes were placed on an intended invasion of England. From the violence of parliamentary disputes in England, France had been persuaded that the country was ripe for a revolution, and only wanted the presence of the Pretender to bring about a change. An invasion was therefore actually projected. The troops destined for the expedition amounted to 15,000; and preparations were made for embarking them at Dunkirk and some of the ports nearest to England, under the eye of the young Pretender. The duke de Roquesuille, with 20 ships of the.

^{Britain.} the line, was to see them safely landed on the opposite shore, and the famous Count Saxe was to command them when landed. But the whole project was disconcerted by the appearance of Sir John Norris, who, with a superior fleet, made up to attack them. The French fleet was obliged to put back; a very hard gale of wind damaged their transports beyond redress; and the French, now frustrated in their scheme of a sudden descent, thought fit openly to declare war.

⁴¹⁴
Battle of
Fontenoy.

The national joy for Sir John Norris's success, however, was soon damped by the miscarriage of Admirals Matthews and Lestock; who, through a misunderstanding between themselves, suffered a French fleet of 34 sail to escape them near Toulon. In the Netherlands the British arms were attended with still worse success. The French had there assembled an army of 120,000 men, commanded by Count Saxe, natural son to the late king of Poland, an officer of great experience. The English were headed by the duke of Cumberland, who had an inferior army, and was much inferior in the knowledge of war to the French general. Count Saxe, therefore, carried all before him. In 1743, he besieged Fribourg, and in the beginning of the campaign 1744, invested the strong city of Tournay. To save this place, if possible, the allies resolved to hazard an engagement; and on this ensued the bloody battle of Fontenoy, in which the allies left on the field of battle near 12,000 men, and the French almost an equal number. In consequence of this victory, Tournay was soon after taken by the French. To balance the bad success, however, Admirals Rowley and Warren had retrieved the honour of the British flag, and made several rich captures at sea. The fortress of Louisbourg, a place of great consequence to the British commerce, surrendered to General Pepperel; while a short time after, two French East India ships, and a Spanish ship from Peru laden with treasure, put into the harbour, supposing it still their own, and were taken.

⁴¹⁵
Louisbourg
taken.

⁴¹⁶
Young Pretender
lands in
Scotland.

During this gleam of returning success, Charles Edward, the son of the old pretender to the British crown, resolved to make an attempt to recover what he called *his right*. Being furnished with some money from France, he embarked for Scotland aboard a small frigate, accompanied by the marquis of Tullibardine, Sir Thomas Sheridan, and some others; and for the conquest of the whole British empire, only brought with him seven officers and arms for 2000 men.

Fortune, however, seemed noway more favourable to this attempt than to others similar to it. His convoy, a ship of 60 guns, was so disabled in an engagement with an English man of war, that it was obliged to return to Brest, while he continued his course to the western parts of Scotland. On the 27th of July 1745, he landed on the coast of Lochaber, and was in a little time joined by the Highlanders, to the number of 1500: the ministry at first could scarcely be induced to credit his arrival; but when they could no longer doubt of it, they sent Sir John Cope with a small body of forces to oppose his progress.

⁴¹⁷
Gains the
battle of
Preston-
pans.

By this time the young adventurer was arrived at Perth, where he performed the ceremony of proclaiming his father king of Great Britain. From thence descending towards Edinburgh, and his forces continually increasing, he entered the capital without oppo-

sition; but was unable, from want of cannon, to reduce the castle. Here he again proclaimed his father; and promised to dissolve the union, which was considered as one of the national grievances. In the mean time, Sir John Cope being reinforced by two regiments of dragoons, resolved to give the enemy battle. The rebels attacked him near Prestonpans, and in a few minutes put him and his troops to flight, with the loss of 500 men.

^{Britain.}

This victory gave the rebels great influence; and had the Pretender marched directly to England, the consequence might have been fatal to freedom. But he was amused by the promise of succours which never came; and thus induced to remain in Edinburgh till the season for action was lost. He was joined, however, by the earl of Kilmarnock, Lord Balmerino, lords Cromarty, Elcho, Ogilvy, Pitaligo, and the eldest son of Lord Lovat, who with their vassals considerably increased his army. Lord Lovat himself, so remarkable for his treachery, was an enthusiast in favour of the Pretender, but was unwilling to act openly for fear of the ministry. But while Charles was thus trifling away his time at Edinburgh, the British ministry were taking effectual methods to oppose him. Six thousand Dutch troops, that had come over to the assistance of the crown, were dispatched northward under the command of General Wade; but, as it was then said, these could lend no assistance, being prisoners of France upon their parole, and under engagements not to oppose that power for a year. But however this be, the duke of Cumberland soon after arrived from Flanders, and was followed by another detachment of dragoons and infantry, well disciplined and inured to action; and besides these, volunteers offered themselves in every part of the kingdom.

At last, Charles resolved upon an irruption into ⁴¹⁸ England. He entered that country by the western ^{Invasions} border, and took the town of Carlisle; after which he continued his march southwards, having received assurances that a considerable body of forces would be landed on the southern coasts to make a diversion in his favour. He established his head quarters at Manchester, where he was joined by about 200 English, formed into a regiment, under the command of Colonel Townley. From thence he pursued his march to Derby, intending to go by the way of Chester into Wales, where he hoped to be joined by a great number of malecontents; but in this he was prevented by the factions among his followers.

Being now advanced within 100 miles of London, ⁴¹⁹ Great con- that capital was in the utmost consternation: and had ^{sternation} he proceeded with the same expedition he had hitherto ^{at London.} used, perhaps he might have made himself master of it. But he was rendered incapable of pursuing this or any other rational plan, by the discontents which began to prevail in his army. In fact, the young Pretender was but the nominal leader of his forces; his generals, the Highland chiefs, being averse to subordination, and ignorant of command. They were now unanimous in ⁴²⁰ Rebels re- their resolution to return to their own country, and ^{solve to} Charles was forced to comply. They retreated to Car- ^{return.} lisle without any loss; and from thence crossing the rivers Eden and Solway, entered Scotland. They next marched to Glasgow, which was laid under severe contributions. From thence advancing to Stirling, they

Britain

they were joined by Lord Lewis Gordon at the head of some forces which had been assembled in his absence. Other clans likewise came in; and from some supplies of money received from Spain, and some skirmishes with the royalists, in which he was victorious, the Pretender's affairs began to wear a more promising aspect. Being joined by Lord Drummond, he invested the castle of Stirling, in the siege of which much time was consumed to no purpose. General Hawley, who commanded a considerable body of forces near Edinburgh, undertook to raise this siege, and advanced towards the rebel army as far as Falkirk. After two days spent in mutually examining each others strength, an engagement ensued, in which the king's forces were entirely defeated, with the loss of their tents and artillery.

Falkirk.

422
Entirely
defeated at
Culloden.

* See Cul-
loden.

This was the end of all the triumphs of the rebel army. The duke of Cumberland having arrived, was put at the head of the troops at Edinburgh, which amounted to about 14,000 men. With these he advanced to Aberdeen, where he was joined by several of the nobility attached to the house of Hanover; the enemy in the mean time retreating before him. He next advanced to the banks of the Spey, a deep and rapid river, where the rebels might have disputed his passage; but their contentions with one another were now risen to such a height, that they could scarce agree in any thing. At last they resolved to wait their pursuers. An engagement ensued at Culloden*, near Inverness; in which the rebels were defeated with great slaughter, and a final period was put to all the hopes of the young adventurer. The conquerors behaved with the greatest cruelty; refusing quarter to the wounded, the unarmed, and the defenceless; some were slain, who had only been spectators of the combat, and soldiers were seen to anticipate the base employment of the executioner. The duke immediately after the action ordered 36 deserters to be executed; the conquerors spread terror wherever they came; and after a short space, the whole country round was one dreadful scene of plunder, slaughter, and desolation.

423
Adven-
tures of
the young
Pretender.

Immediately after the engagement, the young Pretender fled away with a captain of Fitzjames's cavalry; and when their horses were fatigued, they both alighted, and separately sought for safety. There is a striking resemblance between the adventures of Charles II. after the battle of Worcester, and those of the young Pretender after the battle of Culloden. For some days he wandered in the country. Sometimes he found refuge in caves and cottages, without any attendants at all. Sometimes he lay in forests with one or two companions of his distress, continually pursued by the troops of the conqueror, there being a reward of 30,000*l.* offered for taking him either dead or alive. In the course of his adventures, he had occasion to trust his life to the fidelity of above 50 individuals; not one of whom could be prevailed upon, by so great a reward as was offered, to betray him whom they looked upon to be their king's son.

For six months the unfortunate Charles continued to wander in the frightful wilds of Glengary, often hemmed round by his pursuers, but still rescued by some providential accident from the impending danger. At length a privateer of St Maloes, hired by his adherents, arrived in Loch Ranach, in which he embarked

in the most wretched attire. He was clad in a short coat of black frize, thread-bare; over which was a common Highland plaid girt round him by a belt, from which hung a pistol and dagger. He had not been shifted for many weeks; his eyes were hollow, his visage wan, and his constitution greatly impaired by famine and fatigue. He was accompanied by Sullivan and Sheridan, two Irish adherents, who had shared all his calamities; together with Cameron of Lochiel, his brother, and a few other exiles. They set sail for France; and after having been chased by two English men of war, arrived in safety at a place called *Roscou* near Morlaix in Bretagne.

Britain

424
He escapes
to France.

While the Pretender was thus pursued, the scaffolds and gibbets were preparing for his adherents. Seventeen officers were hanged, drawn, and quartered, at Kennington common in the neighbourhood of London; nine were executed in the same manner at Carlisle, and eleven at York. A few obtained pardons, and a considerable number of the common men were transported to America. The earls of Kilmarnock and Cromarty, and Lord Balmerino, were tried and found guilty of high treason. Cromarty was pardoned; but Kilmarnock and Balmerino were executed; as was also Mr Radcliffe brother to the late earl of Derwentwater, who was sentenced upon a former conviction. Lord Lovat was tried, and suffered some time after.

425
Rebels ex-
ecuted.

Immediately after the suppression of the rebellion the legislature undertook to establish several regulations in Scotland, which were equally conducive to the happiness of the people and the tranquillity of the united kingdoms. The Highlanders had till that time continued to wear the military dress of their ancestors, and never went without arms. In consequence of this, they considered themselves as a body of people distinct from the rest of the nation, and were ready upon the shortest notice to second the insurrections of their chiefs. Their habits were now reformed by an act of legislature, and they were compelled to wear clothes of the common fashion. But what contributed still more to their real felicity was the abolition of that hereditary jurisdiction which their chieftains exerted over them. The power of their chieftains was totally destroyed, and every subject in that part of the kingdom was granted a participation in the common liberty.

426
New regu-
lations in
Scotland.

Soon after the battle of Culloden, the duke of Cumberland returned to Flanders, where he resumed the command of an army to which he was by no means equal. The French carried every thing before them; and they reduced under their dominion all those strong towns which had been taken by the duke of Marlborough, and formed a barrier to the United Provinces. They gained a considerable victory at Roncroux; which, however, cost them as many men as they destroyed of the enemy; but these they could more easily spare, as they were much more numerous. Another victory which they obtained at La Feldt, served to depress the allied army still lower. But the taking of Bergen-op-zoom, the strongest fortification of Brabant, reduced the Dutch to a state of desperation.

427
Allies de-
feated in
Flanders.

These victories and successes in Flanders were, however, counterbalanced by almost equal disappointments. In Italy, the marshal Belleisle's brother, attempting to penetrate at the head of 34,000 men into Piedmont,

was

Britain. was defeated and killed. A fleet was fitted out for the recovery of Cape Breton, but without success. Two others were fitted out, the one to make a descent upon the British colonies in America, and the other to carry on the operations in the East Indies; but these were attacked by Anson and Warren, and nine of their ships taken. Soon after this, Commodore Fox, with six ships of war, took above 40 French ships richly laden from St Domingo; and soon after this the French fleet was defeated by Admiral Hawke, who took seven ships of the line and several frigates.

429
Peace of
Aix-la-
Chapelle.

For a long time Louis had been desirous of a general tranquillity; and this desire he had even expressed to Sir John Ligonier, who was taken prisoner at the battle of La Feldt. But now the bad success of his admirals at sea, his armies in Italy, the frequent bankruptcies of his merchants at home, and the election of a stadtholder in Holland, who gave spirit to the opposition; all these contributed to make him weary of the war, and to propose terms of accommodation. This was what the allies had long wished for, but had been ashamed to demand. A congress, therefore, was held at Aix-la-Chapelle, where a treaty was concluded on the following terms: 1. That all prisoners on each side should be mutually given up, and all conquests restored. 2. That the duchies of Parma, Placentia, and Guastalla, should be ceded to Don Philip, heir apparent to the Spanish crown; after whom these dominions should return to the house of Austria. 3. That the fortifications of Dunkirk towards the sea should be demolished; and that the British ship annually sent with slaves to the coast of New Spain should have this privilege continued for four years. 4. That the king of Prussia should be confirmed in the possession of Silesia, and that the queen of Hungary should be secured in the possession of her patrimonial dominions. But the most mortifying clause was, that the king of Great Britain should immediately, after the ratification of this treaty, send two persons of rank to France as hostages, until restitution should be made of Cape Breton and all other British conquests made during the war. No mention was made of the searching British vessels in the American seas, though this was the original cause of the quarrel. The limits of their respective possessions in North America were not ascertained; nor did they receive any equivalent for those forts which they restored to the enemy.

430
Death of
the prince
of Wales.

In the year 1751, died Frederic prince of Wales, of a pleurisy, thought at first to be no way dangerous. He was greatly regretted; for his good-nature had rendered him popular, and those who opposed the present administration had grounded all their hopes of redress upon his accession to the throne.

Some time before this, viz. in the year 1749, a scheme was entered upon, which the nation in general imagined would be very advantageous. This was the encouraging those who had been discharged the army or navy to become settlers in Nova Scotia. This country is cold, barren, and almost incapable of cultivation. Nevertheless, on account of this barren spot, the English and French renewed the war, which soon after spread with such terrible devastation over every part of the globe. The possession of this country was reckoned necessary to defend the English colonies to the north, and to preserve their superiority in the fisheries in that

431
Hostilities
renewed.

part of the world. The French, however, who had been long settled in the back parts, resolved to use every method to dispossess the new comers, and spirited up the Indians to begin hostilities. Another source of dispute also sprung up soon after in the same part of the world. The French, pretending to have first discovered the mouth of the river Mississippi, claimed the whole adjacent country towards New Mexico on the east, quite to the Apalachian mountains on the west. In order to assert their claims, as they found several English who had settled beyond these mountains, they dispossessed them of their new settlements, and built such forts as would command the whole country round about.

Negotiations, mutual accusations, and hostilities, first took place between the two powers; at length, in 1756, four operations were undertaken by the British in America at once. Colonel Monkton had orders to drive the French from their encroachments upon the province of Nova Scotia. General Johnson was sent against Crown Point; General Shirley against Niagara, to secure the forts on the river; and General Braddock against Fort du Quesne. In these expeditions, Monkton was successful; Johnson also was victorious, though he failed in taking the fort against which he was sent; Shirley was thought to have lost the season of operation by delay; and Braddock was defeated and killed.

In return for this bad success, the British made reprisals at sea; and in this they were so successful, that the French navy was unable to recover itself during the continuance of the war that was shortly after declared on both sides. The first step of the French was to threaten an invasion. Several bodies of their troops were sent down to the coasts that lay opposite to the British shores; these were instructed in the manner of embarking and relanding from flat-bottomed boats, which were made in great numbers for that expedition. The number of men amounted to 50,000; but all discovered the utmost reluctance to the undertaking. The ministry were greatly alarmed. They applied to the Dutch for 6000 men, which they were by treaty obliged to furnish in case of an invasion. This supply was refused, the Dutch alleging, that their treaty was to send the troops in case of an actual, and not a threatened, invasion. The king, therefore, finding he could not have the Dutch forces till their assistance would be too late, desisted entirely from his demand; and the Dutch with great amity returned him thanks for withdrawing his request. Upon this, 10,000 Hessians and Hanoverians were brought over. But this occasioned great discontent. The ministry were reviled for such disgraceful condescension, as if the nation was unable to defend itself. The people only demanded a vigorous exertion of their own internal strength, and then feared no force that could be led to invade them.

The British invasion, however, never took place: but a French army landed in Minorca, and invested the citadel of St Philip's, which was reckoned the strongest in Europe; but the garrison was weak, and no way fitted to stand a vigorous siege. To raise this siege, Admiral Byng was dispatched with a squadron of ten men of war, with orders to relieve Minorca, or at any rate to throw a body of troops into the garrison.

Britain. son. This last he reckoned too hazardous an undertaking; nor did he even attempt it. Soon after, a French fleet appeared nearly equal in force to his own; but the admiral resolved to act only upon the defensive. The French advanced; a slight engagement ensued with part of the English fleet; after which, the French slowly sailed away, and another opportunity never occurred of coming to a closer engagement. After this, it was resolved in a council of war, to return to Gibraltar to refit, and that the relief of Minorca was impracticable. For this conduct Byng was brought home under arrest, tried, and sentenced to death. His sentence was to be shot; and he suffered with the greatest resolution, after delivering a paper filled with protestations of his innocence as to any treacherous intention.

437
Unsuccessful
expedition
against
France.

After the conquest of Minorca, the French declared that they would revenge all injuries they should sustain in their colonies on the king of Britain's dominions in Germany. Upon this, the court of London, eager to preserve Hanover, entered into a treaty with the court of Russia, by which it was stipulated, that a body of 50,000 Russians should be ready to act in the British service, in case Hanover should be invaded by the French. For this the czarina was to receive 100,000l. annually, to be paid in advance. This treaty was opposed by the king of Prussia. He had long considered himself as guardian of the interests of Germany, and was therefore alarmed at a treaty which threatened to deluge the empire with an army of barbarians. Besides, he was already apprised of an agreement between the Austrians and Russians, by which the latter were to enter the empire and strip him of his late conquest of Silesia. He therefore declared, that he would not suffer any foreign forces to enter the empire either as auxiliaries or principals. The king of Britain now found himself obliged to drop his Russian connexion, and conclude a treaty with the king of Prussia. As both monarchs wished only to prevent the invasion of Germany, they soon came to an agreement to assist each other mutually. From this alliance a new combination took place among the European powers, quite opposite to the former; and their forces were drawn out in the following manner. Britain opposed France in America, Asia, and on the ocean. France attacked Hanover; which the king of Prussia undertook to protect, while Britain promised him troops and money to assist his operations. Austria had her aims on the dominions of Prussia, and drew the elector of Saxony into the same designs. In these views the Austrians were seconded by France, Sweden, and Russia, who had hopes of acquiring a settlement in the west of Europe.

Thus the king of Prussia launched into the tumult of war, having only the king of Britain for his ally, while the most potent states of Europe were his antagonists. He now performed exploits perhaps unequalled in the annals of modern ages; for a particular account of which, see the article PRUSSIA. The British ministry, in order to procure a diversion in his favour, planned an enterprise against the coast of France. The destination of the fleet equipped for this purpose was kept a profound secret. At last it appeared before Rochefort; where the commanders, having trifled away their time in deliberating how to proceed, secured the

VOL. IV. Part II.

little island of Aix, an easy and an useless conquest: soon after which, they returned home without attempting any thing else. By this miscarriage the ministry were so discouraged, that they had thoughts of abandoning the king of Prussia to his fate; and the king was actually meditating a negociation of this nature, when he was prevented by the expostulations of his distressed ally. From motives of generosity, therefore, more than of interest, it was resolved to continue to assist him; and success, which had long fled from the British arms, once more began to return with double splendour.

Britain.

It was in the East Indies where this returning success first began to appear (for an account of which see the article INDOSTAN); and their conquests in the western part of the world were about this time still more splendid than those in the east. But these successes must, partly at least, be ascribed to the vigorous administration of Mr William Pitt, who about this time came into power. An expedition was set on foot against Cape Breton, under General Amherst and Admiral Boscawen: another under General Abercrombie, against Crown Point and Ticonderago; and a third, under Brigadier-General Forbes, against Fort du Quesne. The fortress of Louisbourg, which defended the island of Cape Breton, was very strong both by nature and art; the garrison was numerous, the commander vigilant, and every precaution had been taken to prevent a landing: but the activity of the British surmounted every obstacle, the place was surrendered by capitulation, and its fortifications were demolished. The expedition against Fort du Quesne was equally successful; but that against Crown Point once more miscarried. General Abercrombie attacked the French in their intrenchments, was repulsed with great slaughter, and obliged to retire to his camp at Lake George. But though in this respect the British arms were unsuccessful, yet, upon the whole, the campaign of 1758 was greatly in their favour. The taking of Fort du Quesne served to remove from their colonies the terror of the incursions of the Indians, while it interrupted the correspondence along a chain of forts with which the French had environed the British settlements in America; so that the succeeding campaign promised great success.

438
British success in the
East Indies.

439
Mr Pitt comes into
power.

In 1759, it was resolved to attack the French in several parts of their empire at once. General Amherst with a body of 12,000 men was commanded to attack Crown Point; General Wolfe was to undertake the siege of Quebec; while General Prideaux and Sir William Johnson were to attempt a French fort near the cataracts of Niagara. This last expedition was the first that succeeded. The siege was begun with vigour, and promised an easy conquest; but General Prideaux was killed in the trenches by the bursting of a mortar, so that the whole command devolved on General Johnson. A body of French troops, sensible of the importance of the place, attempted to relieve it; but were utterly defeated and dispersed; soon after which, the garrison surrendered prisoners of war. On his arrival at the forts of Crown Point and Ticonderago, General Amherst found them deserted and destroyed. There now remained, therefore, but one decisive blow to reduce all North America under the British dominion; and this was by the taking of Quebec, the capital of

440
Quebec taken, and
Canada reduced.

* See Quebec.

3 T

Britain.

Canada. This expedition was commanded by Admiral Saunders and General Wolfe. The enterprise was attended with difficulties which appeared unsurmountable; but all these difficulties were got over by the conduct of General Wolfe, and the bravery of his men. He engaged and put to flight the French under Montcalm; but, to the great regret of the British, their general was killed in the action. The surrender of Quebec was the consequence of this victory, which was soon followed by the cession of all Canada. The following season, indeed, the French made a vigorous effort to recover the city; but by the resolution of Governor Murray, and the appearance of a British fleet under the command of Lord Colville, they were obliged to abandon the enterprise. The whole province was soon after reduced by the prudence and activity of General Amherst, who obliged the French army to capitulate; and it has since remained annexed to the British empire. About the same time also the island of Guadaloupe was reduced by Commodore More and General Hopson.

441
Duke of Cumberland capitulates with the French.

The British affairs in Germany had at the beginning of the war worn a very unfavourable aspect. The Hanoverians were commanded by the duke of Cumberland, who was greatly outnumbered by the enemy. He was driven beyond the Weser, the passage of which might have been disputed with some appearance of success; but the French were suffered to pass it unmolested. The Hanoverians were driven from one part of the country to another, till at length they made a stand near a village called *Hastenback*, where it was hoped the numbers of the enemy would have the least opportunity of coming to a general engagement. The Hanoverians, however, left the field of battle to the French, after a faint resistance. Their enemies pursued, and the duke retired towards Stade; by which means he marched into a country from whence he could neither procure provisions nor attack the enemy with any hopes of success. Here, being unable either to escape or advance, he was compelled to sign a capitulation by which the whole army laid down their arms, and were dispersed into different quarters of cantonment. By this remarkable capitulation, which was called the *Capitulation of Closter Seven*, Hanover was obliged to submit quietly to the French, who were now determined to turn their arms against the king of Prussia.

442
The Hanoverians take up arms.

Soon after this capitulation, both sides began to complain that the treaty was not strictly observed. The Hanoverians exclaimed against the rapacity of the French general and the brutality of his soldiers. The French retorted the charge against them, accused them of insolence and insurrection; and being sensible of their own superiority, resolved to bind them strictly to their terms of agreement. The Hanoverians only wished for a pretence to take arms, and a general to head them. Neither was long wanting. The oppressions of the tax-gatherers, whom the French had appointed, were considered as so severe, that the army rose to vindicate the freedom of their country, while Ferdinand, prince of Brunswick, put himself at their head. As soon as this was known in Britain, large supplies were granted both for the service of the king of Prussia, and to enable the Hanoverian army to act vigorously in conjunction with him. A small body of

British forces was sent over to join Prince Ferdinand under the duke of Marlborough. After some inconsiderable successes at Crevelt, the duke of Marlborough dying, the command of the British forces devolved on Lord George Sackville. A misunderstanding arose between him and Prince Ferdinand, which appeared at the battle of Minden that was fought shortly after. Lord George pretended that he did not understand the orders sent him by the prince, and of consequence did not obey them. The allies gained the victory, which would have been more decisive had the British commander obeyed his orders. He was soon after recalled, tried by a court-martial, found guilty of disobedience, and declared incapable of serving in any military command for the future.

Britain.

443
French defeated at Minden.

After this victory it was imagined that one reinforcement more of British troops would terminate the war in favour of the allies; and that reinforcement was quickly sent. The British army in Germany was augmented to upwards of 30,000 men, and sanguine hopes of conquest were generally entertained. These hopes, however, were soon found to be ill-founded. The allies were defeated at Corbach; but retrieved their honour at Exdorf. A victory at Warbourg followed shortly after, and another at Zierenberg: But then they suffered a defeat at Compen; after which, both sides retired into winter-quarters.

444
German war continued with various success.

On the 25th of October 1760, happened the death of King George II. He had risen at his usual hour, and observed to his attendants, that as the weather was fine, he would take a walk into the garden of Kensington, where he then resided. In a few minutes after his return, being left alone, he was heard to fall down upon the floor. The noise of this bringing his attendants into the room, they lifted him into bed; where he desired, with a faint voice, that the princess Amelia might be sent for: but before she could reach the apartment, he expired, in the 77th year of his age and 33d of his reign. An attempt was made to bleed him, but without effect; and afterwards the surgeons, upon opening him, discovered that the right ventricle of the heart was ruptured, and a great quantity of blood discharged through the aperture.

445
Death of King George II.

King George III. ascended the throne amidst the greatest successes both by sea and land. At this time, indeed, the efforts of Britain in every quarter of the globe were truly astonishing. The king of Prussia received a subsidy; a large body of English forces commanded the extensive peninsula of India; another army of 20,000 men confirmed their conquests in North America; 30,000 men were employed in Germany; and a great many more were dispersed in the different garrisons in different parts of the world; but all this was surpassed by the astonishing naval force, which carried command wherever it came, and had totally annihilated the French maritime power. The courage and conduct of the English admirals excelled every thing that had been heard of before; neither superior force, nor number, nor even the terrors of the tempest, could intimidate them. Admiral Hawke gained a complete victory over an equal number of French ships in Quiberon Bay on the coast of Bretagne, in the midst of a tempest, during the darkness of night, and, what a seaman fears still more, in the neighbourhood of a rocky shore.

446
Great success of the British arms.

As

Britain. As soon as his present majesty had met with his parliament, which was on November 18. 1760, he confirmed the hopes of his allies, and gave assurances of his intentions to prosecute the war with vigour. By this time, however, the people were in some measure weary with conquests; especially with those in Germany, from which they could never hope for any solid advantage, and which were gained at an immense expence to the nation. Disputes concerning the propriety of the German war were carried on, and the general run of popular opinion seemed to be rather against than for it. For some time, however, no change took place in the method of carrying on the war. In 1761 proposals of peace were made between the belligerent powers of Europe; and for this purpose Mr Stanley was sent to Paris and Mr Bussy to London: But the French, designing to draw Spain into a confederacy with them, seem not to have been sincere in their intentions; and thus the treaty came to nothing. An enterprise was projected against the island of Belleisle, near the coast of France, which was conducted by Commodore Keppel and General Hodgson*. The place was conquered, with the loss of 1800 men killed and wounded on the part of the British; and however unimportant this conquest might be, the rejoicings on account of it were great. In Germany, the campaign was unsuccessful on the part of the allies. At first, indeed, they drove the French quite out of the territory of Hesse, and laid siege to the city of Cassel; but being defeated at Stangerod, they were forced to raise the siege, retire behind the Dymel, and again abandon Hesse to their enemies. Here they were followed and attacked by the French; who, though defeated in that attempt, were with difficulty prevented from making themselves masters of Munster and Bruuswick.

447
Proposals
of peace.

* See Bel-
leisic.

All this time an appearance of negociation had been carried on; but at last the French having brought their designs with the court of Spain to a bearing, Mr Bussy delivered to Mr Pitt a private memorial, signifying, that, in order to establish the peace on a lasting foundation, the king of Spain might be induced to guarantee the treaty: and to prevent the differences which then subsisted between Britain and Spain from producing a fresh war in Europe, he proposed, that in this negociation the three points which had been disputed between the crown of England and Spain might be finally settled. First, the restitution of some captures made upon the Spanish flag. Secondly, the privilege of the Spanish nation to fish upon the banks of Newfoundland. Thirdly, the demolition of the English settlements made in the bay of Honduras. This memorial was returned as wholly inadmissible. Mr Pitt declared, that it would be looked upon as an affront to the dignity of his master, and incompatible with the sincerity of the negociation, to make any further mention of such a circumstance.

448
Spanish
war propos-
ed by Mr
Pitt.

449
He resigns,
and is crea-
ted earl of
Chatham.

Mr Pitt being now thoroughly convinced of the sinister designs of Spain, proposed immediately to declare war against that kingdom. But this proposal being rejected, he resigned his employment of secretary of state; after which, he was created earl of Chatham, and had a pension of 3000l. per annum settled upon him for three lives.

Soon after this, however, the new administration

found that Mr Pitt was in the right, and war was declared between Great Britain and Spain. As Portugal was an useful ally of Britain, it was resolved by the French and Spaniards to attack that kingdom, which was then in no capacity of defending itself. The Portuguese monarch was by the most haughty memorials commanded to accede to the confederacy against Britain, and threatened with the vengeance of France and Spain in case of a refusal. It was in vain that he promised to observe a strict neutrality, and urged the obligations he was under to the king of Britain; this moderate and reasonable reply only drew on more haughty and insulting answers. His Portuguese majesty, however, continued to reject their proposals in the most resolute manner; and concluded his last declaration with these words, that "it would affect him less, though reduced to the last extremity, of which the great Judge is the sole arbiter, to let the last tile of his palace fall, and to see his faithful subjects spill the last drop of their blood, than to sacrifice, together with the honour of his crown, all that Portugal holds most dear; and to submit, by such extraordinary means, to become an unheard-of example to all pacific powers, who will no longer be able to enjoy the benefit of neutrality, whenever a war shall be kindled between other powers with which the former are connected by defensive treaties." The declaration was made on the 27th of April 1762; and soon after, France and Spain jointly declared war against Portugal.

Britain.
450
War with
Spain.

As the design of the courts of France and Spain in making war with Portugal, was professedly to prevent Great Britain from the military and commercial use of the ports of that kingdom, their principal endeavours were aimed at the two great ports where the British used to reside, viz. Oporto and Lisbon. With this view, three inroads were to be made; one to the north; another more to the south; while the third was made in the middle provinces, in order to sustain these two bodies, and preserve a communication between them. The first body of troops was commanded by the marquis of Savria; and entered the north-east angle of Portugal, marching towards Miranda. This town might possibly have retarded their progress, had not a powder magazine been blown up by accident; and the Spaniards entered on the 9th of May by the breaches made by this explosion. From thence they marched to Braganza, which surrendered six days after Miranda. Moncorvo was taken in like manner; every thing was clear before them to the banks of the Douro; and they became masters of almost the whole extensive province of Tralos Montes. Oporto was given up for lost, and the admiralty prepared transports to carry off the effects of the British merchants. On the banks of the Douro, however, the career of this body was stopped. The peasants, animated and guided by some British officers, seized a difficult pass, and drove the enemy back to Moncorvo.

451
France and
Spain de-
clare war
against
Portugal.

452
Portugal
invaded.

The second body of Spaniards entered the province of Beira, at the villages called *Val de Mula* and *Val de Coelha*. They were joined by strong detachments, amounting to almost the whole army in Tralos Montes; and immediately laid siege to Almeida, the strongest and best provided place on the frontiers of Portugal. This place was defended with sufficient resolution; but, like the rest, was obliged to surrender on the

Britain. 25th of August. The Spaniards then overran the whole territory of Castel Branco, a principal district of the province of Beira, making their way southward until they approached the banks of the Tagus. During the whole of their progress, and indeed during the whole of the campaign, the allied troops of Great Britain and Portugal had nothing that could be called an army in the field, and they could not think of opposing the enemy in a pitched battle. All that could be done was by the defence of passes, skirmish, and surprise.

By this time the count of La Lippe Buckeburg had arrived in Portugal, to the inexpressible joy of the whole nation. The third Spanish army had assembled on the frontiers of Estremadura, with a design to invade the province of Alentejo; and had this body of troops been joined to the others, they would probably, in spite of all opposition, have forced their way to Lisbon itself; had it acted separately, it might have greatly distracted the defendants, so as to enable some other body of forces to penetrate to that city. The count, therefore, resolved to prevent their entrance into the kingdom; and with this view dispatched Brigadier-general Burgoyne to attack an advanced body of Spaniards which lay on their frontiers, in a town called *Valentia de Alcantara*. On the 27th of August the town was surprised; the general was taken who intended to have commanded in the invasion, together with one colonel, two captains, and 17 subaltern officers. One of the best regiments in the Spanish service was also entirely destroyed; and thus the enemy were in all probability prevented from entering Alentejo.

That part of the Spanish army which acted in the territory of Castel Branco had made themselves masters of several important passes, which they obliged some bodies of Portuguese to abandon. The combined army of British and Portuguese pretended to retire before them, in order to draw them into the mountainous tracts. They attacked the rear of the allies, but were repulsed with loss. Still, however, they continued masters of the country, and nothing remained but the passage of the Tagus to enable them to take up their quarters in the province of Alentejo. This the count designed to prevent; and in this service General Burgoyne was employed, who formed a design of surprising them. The execution was committed to Colonel Lee, who, in the night of October 6th, fell upon their rear, dispersed the whole body with considerable slaughter, destroyed their magazines, and returned with scarce any loss. The season was now far advanced; immense quantities of rain fell; the roads were destroyed; and the Spaniards, having seized no advanced post where they could maintain themselves, and being unprovided with magazines for the support of their horse, everywhere fell back to the frontiers of Spain.

No less successful were the British arms in America and the East Indies. From the French were taken the islands of Martinico, St Lucia, St Vincent, and Grenada; from the Spaniards the strong fortress called *Havannah*, in the island of Cuba. By the acquisition of the first mentioned islands the British became the sole and undisturbed possessors of all the Caribbees; and held that chain of innumerable islands which forms

an immense bow, extending from the eastern point of Hispaniola, almost to the continent of South-America. The conquest of the Havannah cost a number of brave men; more of whom were destroyed by the climate than the enemy†. It was in this place that the fleets from the several parts of the Spanish West Indies, called the *galloons* and *flota*, assembled, before they finally set out on their voyage for Europe. The acquisition of this place, therefore, united in itself all the advantages which had been acquired in war. It was a military advantage of the highest class: it was equal to the greatest naval victory, by its effect on the enemy's marine; and in the plunder it equalled the produce of a national subsidy. Nine of the enemy's men of war, with four frigates, were taken; three of their capital ships had been sunk in the harbour at the beginning of the siege; two more were on the stocks in great forwardness, and these were destroyed. In money and valuable merchandises, the plunder did not fall short of 3,000,000l. sterling. To this success in the western part of the world may be added the capture of the Spanish register-ship called the *Hermione*, by the Active and Favourite king's ships. This happened on the 21st of May 1762, just as she was entering one of the ports of Old Spain, and the prize was little short of 1,000,000l. sterling.

In the East Indies an expedition was undertaken against the Philippine islands, which was committed to Colonel Draper, who arrived for this purpose at Madras in the latter end of June 1762. The 79th regiment was the only regular corps that could be spared for this service. Every thing was conducted with the greatest celerity and judgment. The British forces landed at Manilla on the 24th of September; on the 6th of October the governor was obliged to surrender at discretion; and soon after, the galleon bound from Manilla to Acapulco, laden with rich merchandise, the value of more than half a million, was taken by two frigates called the *Argo* and *Panther*. By the conquest of Manilla, 14 considerable islands fell into the hands of the British; which, from their extent, fertility, and convenience of commerce, furnished the materials of a great kingdom. By this acquisition, joined to our former successes, we secured all the avenues of the Spanish trade, and interrupted all communications between the parts of their vast but unconnected empire. The conquest of the Havannah had cut off in a great measure the intercourse of their wealthy continental colonies with Europe: the reduction of the Philippines excluded them from Asia; and the plunder taken was far more than sufficient to indemnify the charges of the expedition; a circumstance not very common in modern wars. It amounted to upwards of a million and a half; of which the East India Company, on whom the charge of the enterprise in a great measure lay, were by contract to have a third part.

All this time the war in Germany had continued with the utmost violence; the allies under Prince Ferdinand had continued to give the highest proofs of their valour, but no decisive advantage could be obtained against the French. It was, however, no longer the interest of Britain to continue a destructive war. There never had been a period so fortunate or glorious to this island. In the course of this war she had conquered a tract of continent of immense extent.

Britain: tent. Her American territory approached to the borders of Asia, and came near to the frontiers of the Russian and Chinese dominions. She had conquered 25 islands, all of them distinguishable for their magnitude, their riches, or the importance of their situation. By sea or land she had gained 12 battles, had reduced nine fortified cities, and near 40 castles and forts. She had taken or destroyed above 100 ships of war from her enemies, and acquired at least 10,000,000*l.* in plunder.

quest and riches ought to go hand in hand, were easily induced to believe that administration arbitrary and oppressive, which continued to load them with fresh taxes after such great successes as had attended the British arms for some years past.

Britain.

461
Articles of
the peace
in 1763.

By such unexampled and wide extended conquests, it is no wonder that the French and Spaniards were desirous of a peace; which was at length concluded at Paris on the 10th of February 1763. The terms granted them were by many thought too favourable. The principal of them were, That the French king should relinquish all claims to Nova Scotia; that he should likewise give up all the country of Canada; and that for the future the boundary betwixt the British and French dominions in America should be fixed by a line drawn along the middle of the river Mississippi from its source to the river Ibberville, and from thence by a line drawn along the middle of this river, and the lakes Maurepas and Pontchartrain, to the sea. The islands of St Pierre, Miquelon, Martinico, Guadaloupe, Marigalante, Desirade, St Lucia, and Belleisle, were restored to France: Minorca, Grenada and the Grenadines, St Vincent, Dominica, and Tobago, were ceded to Britain. In Africa, the island of Goree was restored to France; and the river Senegal, with all its forts and dependencies ceded to Great Britain. In the East Indies, all the forts and factories taken from the French were restored. In Europe, the fortifications of Dunkirk were to be destroyed; and all the countries, fortresses, &c. belonging to the electorate of Hanover, the duke of Brunswick, and the count of La Lippe Buckeburg, restored. With regard to Spain, the British fortifications on the Bay of Honduras were to be demolished; and the Spaniards were to desist from their claim of right to fish on the Newfoundland bank. The Havannah was restored; in consequence of which, Florida, St Augustine, and the bay of Pensacola, were ceded to Britain, and the Spaniards were to make peace with Portugal: all other countries not particularly mentioned were to be restored to their respective owners at the beginning of the war.

It must indeed be owned, that the new administration appear not to have been sufficiently wary in this respect. Among other methods of raising the supplies for 1763, they had thought proper to lay a duty of four shillings per hogshead upon cyder, payable by the maker, and to be collected in the same manner as other excises. The other articles of supply furnished also matter of declamation for the members in opposition; but this inflamed the popular fury to a great degree, and made them readily imbibe as truth whatever was thrown out by the minority in their parliamentary debates. Besides the usual declamations, that it was oppressive, unconstitutional, and injurious to the landholder and farmer, the smallness of the sum to be raised by it was now urged. This was said to indicate, that the supplying the wants of government could not be the sole motive for imposing such a duty. It was farther urged, with much show of lamentation, that now the houses of all orders of people, noblemen of the first rank not excepted, were liable to be entered and searched at the pleasure of excisemen, a proceeding which they denominated in express terms "a badge of slavery." Thus it was spoken of throughout all the cyder counties, by the city of London, and by most of the incorporations throughout the kingdom. The city had been displeas'd by the late changes in administration, and had not yet recovered their good humour. They instructed their representatives to oppose the passing of the bill with all possible vigour, and gave in petitions against it to every branch of the legislature; a measure till that time totally unprecedented: two protests were also entered against it in the house of lords; and in short the kingdom of England was thrown into an almost universal ferment.

463
Great clamour raised
by the cyder tax.

It is not to be doubted that the friends of administration were able to bring arguments sufficiently plausible in favour of their scheme: but the utmost force of reason will go but a very little way in quieting popular clamour: and while opposition was railing against ministry within doors, every method was taken to excite the fury of the people without. Virulent libels, the audacity of which far exceeded any thing known in former times, now made their appearance; and such was the general intemperance in this respect, that it would be difficult to determine which side paid least regard to any kind of decency or decorum.

462
Discouragements increased on the conclusion of this treaty.

The conclusion of the war did not by any means tend to heal those divisions which had arisen on the resignation of Mr Pitt; on the contrary, it furnished abundant matter of complaint for the discontented party, whose views seem at that time only to have been the embarrassment and disturbance of an administration which they were not able to subvert. At the time the treaty was under consideration, however, only some faint attempts were made to oppose it; but it soon appeared, that though this opposition had proved so feeble, the spirit of the party was far from being exhausted. The state of affairs at that time indeed greatly favoured the views of those who delighted in turbulence and faction. A long and expensive war had drained the national treasure, and greatly increased the public debt. Heavy taxes had already been imposed, and it was still as necessary to keep up these, and even to impose new ones, as though the war had not ceased. Thus the bulk of the nation, who imagined that con-

In the midst of this general ferment, the earl of Bute ⁴⁶⁴ unexpectedly resigned his place of first lord of the treasury. His resignation quickly became an object of general speculation; by some he was highly censured for leaving his friends at the time when a little perseverance might have defeated all the designs of his enemies, and established his own power on the most solid foundation. Such conduct, they said, must discourage the friends of government, and at the same time give proportionable encouragement to its adversaries to insult it, as they perceived ministry unable to resist the first gust of popular fury. Others contended, that the earl was perhaps the least influenced by popular opinion of any man in the world. He had demonstrated his.

464
Resignation of the earl of Bute.

^{Britain.} his firmness by taking a share in the dangerous but necessary affair of concluding peace; and, this being accomplished, he had fully obtained his end, and performed the service to his country which was desired. He now resolved that the factious party should not have even the pretence of objecting his personal ambition as the cause of disturbances which they themselves had excited; and thus his resignation would tend to put an end to these troubles, at the same time that it showed the authors of them in their proper colours.

⁴⁶⁵
Popular
ferment
still conti-
nues.

The event, however, showed that the former reasoning was, in the present case, nearest the truth. The popular resentment was not in the least abated by the resignation. His lordship, though now withdrawn from the ostensible administration of affairs, was still considered as principal director of the cabinet; and this opinion gained the more ground that none of the popular leaders were yet taken in, nor any apparent change made in the conduct of the new administration.

⁴⁶⁶
Characters
of the new
ministers.

No reasonable objection could now be made to those who filled the great offices of state. Mr Grenville, who succeeded the earl of Bute in the treasury, was a man of approved integrity, understanding, and experience. Lord Holland was universally considered as a very able man in office, and had already filled many high employments with a great degree of reputation. The other secretary, Lord Egremont, though he had not been long in office, was in every respect of an unexceptionable character. The other departments were filled in a similar manner, yet the discontents and public clamours were not diminished. It was now said that the new ministers were not chosen on account of any superior gifts of nature or fortune, but merely because they had the art of insinuating themselves into favour at court in such a manner that any inconvenience would be submitted to rather than part with them. The sole reason of their appointment therefore was, that they might act as the passive instruments of the late minister, who though, from considerations of his own personal safety, he had thought proper to retire from business, yet had not abandoned his ambitious projects, but continued to direct every thing as though he had still been present. Opposition to the new ministers was therefore opposition to him; and it became those who understood the true interest of their country, and had a real regard to it, not to suffer such a scheme of clandestine administration.

⁴⁶⁷
Lord Bute
supposed
still to be
at the head
of admini-
stration.

⁴⁶⁸
Different
political
principles
of the two
parties.

Whether the party who made these assertions really believed them or not cannot be known; but the effect was exactly the same as though they had. The great object of both parties most probably was power; but their different situations required that they should profess different political principles. The friends of Lord Bute and of the succeeding administration were for preserving to the crown the full exercise of a power which could not be disputed, viz. that of choosing its own servants. Their opponents, without denying this power, contended, that, according to the spirit of the constitution, the crown should be directed to the exercise of this public duty only by motives of national utility, and not by private friendship. In appointing the officers of state, therefore, they insisted that respect should be paid to those possessed of great talents

^{Britain.} who had done eminent services to the nation, enjoyed the confidence of the nobility, and had influence amongst the landed and mercantile interests. The observance of this rule, they contended, was the only proper balance which could be had against the enormous influence of the crown arising from the disposal of so many places; nor could the nation be reconciled to this power by any other means than a very popular use of it. Men might indeed be appointed according to the strict letter of the law; but unless these were men in whom the majority of the nation already put confidence, they never would be satisfied, nor think themselves secure against attempts on the constitution of the kingdom. When ministers also found themselves recommended to the royal favour, and as it were presented to their places, by the esteem of the people, they would be studious to deserve and secure themselves in it; and upon these (which they called the principles of Whigs) they said that the government had been honourably conducted since the Revolution, and the nation would never be at peace till they were again established on the same basis.

In the mean time the disposition to libel and in-⁴⁶⁹Mr Wilkes
vective seemed to have gone beyond all bounds. The apprehend-
peace, the Scots, and Scottish administration, afford-^{ed on a ge-}
ed such subjects of abuse to the pretended patriots, that neral war-
ministry resolved at last to make an example of one of rant.
them by way of deterring the rest from such licentiousness. For this purpose the paper called the North Briton was made choice of, which, in language much superior to any other political work of the time, had abused the king, the ministry, and the Scots, in an extravagant manner. One particular paper (N^o xlv.) was deemed by those in power to be actionable; and Mr Wilkes, member of parliament for Aylesbury, was supposed to be the author. A warrant was therefore granted for apprehending the author, publishers, &c. of this performance, but without mentioning Wilkes's name. In consequence of this, however, three messengers entered his house on the night between the 29th and 30th of April 1763, with an intention to seize him. He objected, however, to the legality of the warrant, because his name was not mentioned in it, and likewise to the lateness of the hour; and on threatening the messengers with violence, they thought proper to retire for that night. Next morning he was apprehended without making any resistance, though some violence was necessary to get him into a hackney-coach, which carried him before the secretaries of state for examination.

On the first intimation of Mr Wilkes's being in cu-⁴⁷⁰illegal pro-
stody, application was made for a *habeas corpus*; but ceedings a-
as this could not be sued out till four in the afternoon, gainst him.
several of his friends desired admittance to him, which was peremptorily refused on pretence of an order from the secretaries of state. This order, however, though repeatedly demanded, could not be produced, or at least was not so; on which account the gentlemen, conceiving that they were not obliged to pay any regard to messengers acting only by a verbal commission, entered the place where he was without farther question.

This illegal step was quickly followed by several others. Mr Wilkes's house was searched, and his papers seized in his absence; and though it was certain that a *habeas*

Britain.
471
He is committed to the Tower.

habeas corpus was now obtained, he was nevertheless committed to the Tower. Here not only his friends, but even several noblemen and gentlemen of the first distinction, were denied access; nor was his own brother allowed to see him more than others. On the third day of May he was brought before the court of common pleas, where he made a most patriotic speech, setting forth the love he had for his majesty, the bad conduct of ministry, not forgetting his own particular grievances, and that he had been treated "worse than a Scotch rebel." His case being learnedly argued by several eminent lawyers, he was remanded to the Tower for three days; after which he was ordered to be brought up, that the affair might be finally settled.

472
Deprived of his commission as colonel of the Buckinghamshire militia.

Next day Lord Temple received a letter from Secretary Egremont, informing him, that the king judged it improper that Mr Wilkes should continue any longer a colonel of the Buckinghamshire militia; and soon after Temple himself was removed from being lord-lieutenant of that county. Mr Wilkes then being brought to Westminster-hall at the time appointed, made another flaming speech; after which the judges took his case into consideration. Their opinion was, that the warrant of a secretary of state was in no respect superior to that of a common justice of peace; and on the whole, that Mr Wilkes's commitment was illegal. It was likewise determined, that his privilege as a member of parliament was infringed: this could not be forfeited but by treason, felony, or breach of the peace; none of which was imputed to him; for a libel, even though it had been proved, had only a tendency to disturb the peace, without any actual breach of it. Thus it was resolved to discharge him; but, before he quitted the court, a gentleman of eminence in the profession of the law stood up and acquainted the judges, that he had just received a note from the attorney and solicitor general, intreating his lordship not to give Mr Wilkes leave to depart till they came, which would be instantly, as they had something to offer against his plea of privilege. This motion, however, being rejected, the prisoner was set at liberty.

473
Is discharged, and his commitment declared illegal.

474
Endeavours to raise a general animosity against administration.

Mr Wilkes had no sooner regained his freedom than he showed himself resolved to make all the advantage he could of the errors committed by the ministry, and to excite as general a ferment as possible. For this purpose he wrote a very impudent letter to the earls of Egremont and Halifax, informing them, that his house had been robbed, and that the *stolen goods* were in the possession of one or both of their lordships, insisting upon immediate restitution. This letter was printed, and many thousand copies of it dispersed; soon after which an answer by the two noblemen was published in the newspapers, in which they informed him of the true cause of the seizure of his papers, that his majesty had ordered him to be prosecuted by the attorney-general, and that such of his papers as did not lead to a proof of his guilt should be restored. This was quickly succeeded by a reply, but the correspondence ceased on the part of their lordships. Mr Wilkes, however, erected a printing-press in his own house, where he advertised the proceedings of the administration, with all the original papers, at the price of a guinea. The North Briton now again made its

appearance; the popular party were elated beyond measure with their success; those who had suffered by general warrants sought redress at law, and commonly obtained damages far beyond not only their real sufferings, but even beyond their most sanguine expectations. During the whole summer, the minds of the people were kept in continual agitation by political pamphlets and libels of various kinds, while the affair of general warrants so engrossed the general attention, that by the time the parliament sat down, November 15. 1763, scarce any other subject of conversation could be started in company.

Britain.

On the meeting of parliament his majesty mentioned in his speech the attempts that had been made to divide the people; and before the addresses could be made in return, a message was sent to the commons, informing them of the supposed offence of Mr Wilkes, and of the proceedings against him, the exceptionable paper being also laid before the house. After warm debates, the North Briton was deemed a false, scandalous, and seditious libel, tending to excite traitorous insurrections, &c. This was followed by another, that the privilege of parliament does not extend to the writing and publishing of seditious libels, nor ought to obstruct the ordinary course of the laws in the speedy and effectual prosecution of so heinous and dangerous an offence. It did not, however, pass the house of commons without a vigorous opposition, and seventeen members of the upper house protested against it.

475
Proceedings against him in parliament.

The North Briton, N^o xlv. being condemned, as already mentioned, was ordered to be burnt by the hangman: but this could not be done without great opposition from the mob. The executioner, constables, officers, and even the chief persons concerned, were pelted with filth and dirt, and some of them insulted in the grossest manner. Mr Harley, one of the sheriffs and member of parliament for London, was wounded by a billet taken from the fire; the staves of the constables were broken, and the whole officers and executioner driven off the field; while the remains of the paper were carried off in triumph from the flames, and in return a large jack-boot was burnt at Temple-bar, while the half-burnt North Briton was displayed amidst the acclamations of the populace.

476
Disturbances on burning the North Briton.

Mr Wilkes, in the mean time, determined to make the best use of the victory he had already gained, and therefore commenced a prosecution in the court of common pleas against Robert Wood, Esq. the under secretary of state, for seizing his papers. The cause was determined in his favour, and Wood condemned in 1000*l.* damages, with full costs of suit.

477
The under secretary fined for seizing Mr Wilkes's papers.

The prosecution with which Mr Wilkes had been threatened was now carried on with great vigour; but in the mean time, having grossly affronted Samuel Martin, Esq. member for Camelford, by his abusive language in the North Briton, he was by that gentleman challenged, and dangerously wounded in the belly with a pistol-bullet. While he lay ill of his wound, the house of commons put off his trial from time to time; but beginning at last to suspect that there was some collusion betwixt him and his physician, they enjoined Dr Heberden, and Mr Hawkins an eminent surgeon, to attend him, and report his case. Mr Wilkes, however, did not think proper to admit

478
Mr Wilkes prosecuted, wounded in a duel, and outlawed.

Britain. admit a visit from these gentlemen; but soon after took a journey to France to visit his daughter, who, as he gave out, lay dangerously ill at Paris.

The commons having now lost all patience, and being certified that he had refused to admit the physician and surgeon sent by them, proceeded against him in his absence. The evidence appearing quite satisfactory, he was expelled the house, and a prosecution afterwards commenced against him before the house of lords, on account of an obscene and blasphemous pamphlet, in which he had mentioned a reverend and learned bishop in a most shameful manner. The event of all was, that, failing to appear to answer the charges against him, he was outlawed, which, it was then supposed, would for ever consign his patriotism to oblivion.

479
A general spirit of licentiousness still prevails.

The extreme severity shown to Mr Wilkes did not at all extinguish the spirit of the party. A general insatiation in favour of licentious and abusive writings seemed to have taken place; and to publish libels of this kind without the least regard to truth or justice was called *liberty*. At the very time that Mr Wilkes was found guilty of publishing the infamous pamphlet above mentioned, the common council of London presented their thanks to the city representatives for their zealous and spirited endeavours to assert the rights and liberties of the subject, "by their laudable attempt to obtain a reasonable and parliamentary declaration, That a general warrant for apprehending and seizing the authors, printers, and publishers of a seditious libel, together with their papers, is not warranted by law." Their gratitude they showed to lord chief justice Pratt, for his decision in Wilkes's affair, by presenting him with the freedom of the city, and desiring him to sit for his picture to be placed in Guild-hall. These extravagant proceedings, however, did not pass without strong opposition, and were considered by the sober part as highly unjust and improper, as well as indecent.

480
Abuse of franking letters corrected.

The violent clamours which had been excited and still continued, though in a less violent degree, did not prevent administration from paying that attention to the exigencies of the nation which its present situation undoubtedly required. The practice of franking blank covers to go free per post to any part of Great Britain or Ireland, had arisen to an incredible height, and greatly prejudiced the revenue. The hands of members of parliament were not only counterfeited, but the covers publicly sold without the least scruple; and besides this, the clerks of the post office claimed a privilege of franking, which extended even farther than that of the members of the house; the latter being restricted to a certain weight, but the former denying that they were subject to any restriction of this kind. The matter, however, was attended with considerable difficulty when it came to be examined in the house of commons. It was found, that though the vast increase of franks was detrimental to one branch of the revenue, it was serviceable to another by the immense consumption of stamps it occasioned; but at last the following act was passed as an effectual remedy, viz. That from the 1st of May 1764, no letters or packets should be exempted from postage, except such as were sent to or from the king; or such as, not exceeding two ounces in weight, should be signed

Britain. by a member of either house, the whole of the superscription being in his own handwriting; or such as should be directed to members of parliament, or other persons specified in the act. It was likewise enacted, that printed votes and proceedings in parliament, sent without covers, or in covers open at the sides, and only signed on the outside by a member, should go free, though such packets were liable to be searched; and to give the greater force to these regulations, it was made felony and transportation for seven years to forge a frank. At this time it was proved, that the annual postage of letters sent free would amount to 70,000*l.* and that the profits accruing to the clerks of the post-office amounted to between 800*l.* and 1700*l.* each.

481
Other plans for augmenting the revenue were that Plan for settling the island of St John, and for the sale of the the lately acquired American islands. The former was proposed by the earl of Egremont, who presented a memorial to his majesty on the subject. In this he desired a grant of the whole island of St John's, in the gulf of St Lawrence, to hold the same in fee of the crown for ever; specifying particularly the various divisions, government, &c.; but for reasons unknown, the plan was never put in execution. The sale of the conquered lands took place in March, 1764. These were particularly the islands of Grenada, the Grenadines, Dominica, St Vincent, and Tobago. Sixpence an acre was to be paid as a quit rent for cleared lands, and a penny a foot for ground-rent of tenements in towns, and sixpence an acre for fields; but no person was to purchase more than 300 acres in Dominica, or 500 in the other islands.

482
One of the most remarkable transactions of this year was the renewal of the charter of the bank, for which the latter paid the sum of 1,000,000*l.* into the exchequer as a present to the public, besides the advancing a million to government upon exchequer bills. 483
Taxation of other, and, by its consequences, still more momentous affair, however, was the consideration of methods to raise a revenue upon the American colonies. This had been formerly proposed to Sir Robert Walpole; but that prudent minister wisely declined to enter into such a dangerous affair, saying, that he would leave the taxation of the colonies to those who came after him in office. The reason given for such a proceeding was the defraying the necessary charges of defending them; which though extremely reasonable in itself, was done in such a manner as excited a flame not to be extinguished but by the total loss of the authority of the parent state. Before this time, indeed, hints had been thrown out, that it was not impossible for the colonists to withdraw their dependence on Britain; and some disputes had taken place betwixt the different provinces, which were quieted only by the fear of the French, and seemed to prognosticate no good. It was thought proper therefore now, when the colonies were not only secured but extended, to make the experiment whether they would be obedient or not. They contained more than two millions of people, and it was evidently necessary to raise a revenue from such a numerous body. Some thought it might be dangerous to provoke them; but to this it was replied by administration, that the danger must increase by forbearance; and as taxation was indispensable, the sooner the experiment was made the better. The fatal trial being thus determined,

Britain. ned, an act was passed for preventing smuggling, so that the duties laid on the American trade might come into the hands of government. At this time an illicit trade was carried on betwixt the British and Spanish colonies, which seemed to bid defiance to all law and regulation; and was no less disagreeable to the Spanish than to the British court. In some respects, however, the suppression of this was very inconvenient, and even intolerable to the colonists; for as the balance of trade with Britain was against them, it was impossible they could procure any specie except by trading with the Spaniards, by whom they were paid for their goods in gold and silver. This, and another act requiring them to pay certain duties in cash, was probably the reason of that excessive resentment shown by the Americans to government, and their absolute refusal to submit to the stamp-act which was also passed this year.

both in Bri-
tain and
America.

488
Vigorous
conduct of
administra-
tion.

The augmentation of the revenue being the principal object of administration at this time, the suppression of smuggling at home, as well as in America, was taken into consideration. Though the great number of cutters and other vessels fitted out by government for this purpose had produced very salutary effects, the isle of Man, which belonged to the duke of Athol, and was not subject to the customhouse laws, lay so conveniently for the purposes of smuggling, that the utmost vigilance of government was not sufficient to suppress it. The event was a treaty betwixt government and the duke, by which the latter, for a sum of money, ceded all the sovereignty in the island he could claim, and cutters were placed on the coasts and in the harbours of the island as in other places of the kingdom.

This disposition to augment the revenue by all possible methods, seems to have served to keep up the general opinion of the oppressive and arbitrary measures about to be pursued by government. The ill humour of the British patriots still continued; and the stamp bills were received in America with the utmost indignation. The arguments for and against American taxation are now of no importance; and the particulars of their opposition are related under the article *United States of AMERICA*. Here we shall only take notice, that the opposition of the colonists proved very distressing to the mother-country, on account of the vast sums they owed. At this time they were indebted to the merchants of London four millions sterling; and so ready were the latter to give them credit, that some of the American legislatures passed acts against incurring such credit for the future. A petition on the subject was presented to the house of commons; but as it denied the parliamentary right of taxation, it was not allowed to be read. It was then proposed on the part of administration, that the agents should join in a petition to the house for their being heard by counsel in behalf of their respective colonies against the tax. The agents, however, not thinking themselves empowered to grant such a petition, the negotiation was broken off, and matters went on in America as we have elsewhere related.

In other respects, the ministry took such steps as were undeniably proper for supporting the honour and dignity of the nation. Some encroachments having been made by the French and Spaniards, such remonstrances were made to their respective courts, that sa-

tisfaction was quickly made; and though every trifle was sufficient to open the mouths of the popular party, it was impossible as yet to find any just cause of complaint. The disposition to tumult and insurrection, however, seems to have been now very general. The silk-weavers residing in Spittalfields being distressed for want of employment, which they supposed to proceed from the clandestine importation of French silks, laid their case before his majesty in the year 1764, who graciously promised them relief. The sufferers were relieved by the bounty of the public; but this seemed to render the matter worse, by confirming them in habits of indolence and idleness. At the same time a bill, which was supposed to tend to their relief, being thrown out, they began to assemble in vast numbers, which, gradually increasing, are said to have amounted at last to 50,000; several disorders were committed, and it was not without the assistance of the soldiery, and the utmost vigilance of the magistrates, that the riot could be suppressed.

Britain.

tion of the
Spittal-
fields wea-
vers.

During this insurrection, the ferment betwixt the court and popular parties continued with unabated vigour. The ministers were still attacked in numberless publications, and accused as being merely dependants and substitutes to the earl of Bute; nor could the utmost care on the part either of that nobleman or the ministers blunt the shafts of calumny and misrepresentation. An accident, however, now produced a considerable revolution at court, though it had very little effect in calming the minds of the people. This was an illness with which the king was seized in the beginning of the year, which filled the public with apprehensions, and produced a bill for settling the affairs of the kingdom in case of the crown falling into the hands of a minor. In settling this bill, ministers were said to have behaved with very little respect to the princess-dowager of Wales, and industriously to have excluded her from a share of the government. These proceedings were thought in a great measure to have alienated the affection of his majesty from the ministry, who had hitherto been in great favour: Nor did their subsequent conduct show them to be at all desirous of regaining what they had lost. They now contrived to have the earl of Bute's brother turned out of a very lucrative post which he enjoyed in Scotland, and in which he had never given the least cause of complaint. A step of this kind could not be agreeable to his majesty, nor could it recommend them to the popular party in England, who always manifested a perfect indifference as to what passed in Scotland. On this occasion Lord Chatham is said to have been solicited again to accept the office which he had formerly filled so much to the satisfaction of the nation, and to have declined it. A new ministry, however, was soon formed, at the recommendation of the duke of Cumberland. The duke of Grafton and the honourable Mr Conway, brother to the earl of Hertford, were appointed secretaries of state, the marquis of Rockingham first lord of the exchequer, and Mr Dowdeswell chancellor and under treasurer of the exchequer. The office of lord privy seal was conferred on the duke of Newcastle, and all other places were filled with men not only of known integrity, but such as were agreeable to the people. These changes, however, were not yet able to give satisfaction. The opinion that affairs were still managed

Britain. god by the earl of Bute continued to prevail, and was industriously kept up by the political writers of the time. The city of London expressed their discontent on the occasion of addressing his majesty on the birth of a third son. They now took the opportunity of assuring him of "their faithful attachment to his royal house; and the true honour of his crown, whenever a happy establishment of public measures should present a favourable occasion; and that they would be ready to exert their utmost abilities in support of such wise counsels as apparently tended to render his majesty's reign happy and glorious."

493 The clamour against Lord Bute still kept up.

494 Death of his royal highness the duke of Cumberland.

These expressions showed such an evident disapprobation of his majesty's choice, that it could not fail to offend both king and ministry; but before the latter could show any token of resentment, they lost their great friend and patron the duke of Cumberland. His death happened on the 31st of October 1765. He had been that evening assisting at one of those councils frequently held in order to put matters in a way of being more speedily dispatched by the privy council; where being seized with a sudden disorder of which he had some symptoms the evening before, he fell senseless in the arms of the earl of Albemarle, and expired almost instantaneously. His death was greatly lamented, not only by their majesties, but by the whole nation, being universally esteemed not only as a brave commander, but an excellent member of society, an encourager of industry, and an active promoter of the arts of peace.

495 Arguments for and against the stamp act.

In the mean time, the discontents which inflamed the American colonies continued also to agitate the minds of the people of Great Britain; nor indeed was it reasonable to expect that they could be satisfied in their present condition; commerce being almost entirely destroyed, manufactures at a stand, and provisions extravagantly dear. The vast sums owing to the British merchants by the Americans also severely affected the trading and manufacturing part of the country. These amounting to several millions, the colonists absolutely refused to pay unless the obnoxious laws should be repealed. Administration were therefore under the necessity of instantly enforcing the stamp act by fire and sword, or of procuring its immediate repeal in parliament. The loss of the duke of Cumberland was now severely felt, as he had been accustomed to assist administration with his advice, and was highly respected by the nation for his good sense. At this period, however, it is doubtful if human wisdom could have prevented the consequences which ensued. Administration endeavoured, as much as perhaps was possible, to avoid the two extremes, either of rushing instantly into a civil war, or of sacrificing the dignity of the crown or nation by irresolution or weakness. They suspended their opinion until they should receive certain intelligence from the American governors how affairs stood in that country; and their letters on that occasion still do them honour. The opposite party animadverted severely on this conduct. They insisted on having the most coercive methods immediately put in execution for enforcing the laws in which they themselves had so great a share; and it is probable that they wished matters to come to extremities before the sitting down of parliament. Pacific measures, however, at this time prevailed: the stamp act was repealed;

496 It is repealed.

but at the same time another was made, declaring the right of parliament not only to tax the colonies, but to bind them in all cases whatever. Britain

497 The repeal of the stamp act occasioned universal joy both in Britain and America, though, as parliament insisted upon their right of taxation, which the opposite party denied, matters were still as far from any real accommodation as ever. This ill humour of the Americans was soon after augmented by the duties laid upon glass, painters colours, and tea, imported into their country, while at home the dearness of provisions, and some improper steps taken by ministry to remedy the evil, kept up the general outcry against them. A general disposition to tumult and riot still continued; and unhappily the civil power now seemed to lose its force, and a general anarchy, under the name of liberty, to be approaching.

498 Return of Mr Wilkes.

In this state of affairs administration were once more disturbed by the appearance of Mr Wilkes, who had returned from his exile, and on the dissolution of parliament in 1768, though an outlaw, stood a candidate for the city of London. He was received by the populace with loud acclamations, and several merchants and people of large property espoused his cause, and a subscription was entered into for the payment of his debts. He failed, however, in his design of representing the city of London, but instantly declared himself a candidate for Middlesex. The tumults and riots which now took place were innumerable; and such was the animosity betwixt the two parties, that a civil war seemed to be threatened. Our limits will not allow of any particular detail of these transactions. It will be sufficient to take notice, that on a legal trial the outlawry of Mr Wilkes was reversed, and he was condemned for his offences to pay a fine of 1000l. and to be imprisoned for twelve months. Being idolized by the people, however, and powerfully supported, he was repeatedly chosen member for Middlesex, and as often rejected by the house of commons. The tumults on this occasion were not always ended without bloodshed; and the interposition of the military was construed by the patriots as an indication of a design to establish ministerial authority by the most barbarous methods. In short, the behaviour of the people of England and America was at this time so very much alike, that both seemed to be actuated by one spirit, and the rage of the English patriots undoubtedly contributed to confirm the colonists in their disobedience.

499 Difference with Spain concerning Falkland's islands.

The dissensions which had so long prevailed in the kingdom did not pass unnoticed by the other European powers, particularly the French and Spaniards. Both had applied themselves with assiduity to the increase of their marine; and many began to prognosticate an attack from one or other of these nations. The Spaniards first showed an inclination to come to a rupture with Britain. The subject in dispute was a settlement formed on Falkland's islands, near the southern extremity of the American continent. A scheme of this kind had been thought of as early as the reign of Charles II. but it was not till after Lord Anson's voyage that much attention had been paid to it. In the printed account of it, his lordship showed the danger incurred by our navigators through the treachery of the Portuguese in Brazil; and that it was a matter of the greatest importance to discover

*See Falkland's islands.

500 An English settlement formerly proposed on these islands.

Britain. discover some place more to the southward, where ships might be supplied with necessaries for their voyage round Cape Horn; and, among others, he pointed out Falkland's islands as eligible for this purpose. When at the head of the admiralty his lordship also forwarded the scheme as much as possible; and some preparations were made for putting it in execution: but as it met with opposition at home, and gave offence to the court of Madrid, it was laid aside till the year 1764, when it was revived by Lord Egmont. Commodore Byron being then sent out with proper necessaries, took possession of them in the name of his majesty, and represented them in a favourable light; while his successor, Captain M'Bride, affirmed, that the soil was utterly incapable of cultivation, and the climate intolerable.

501
A French colony settles there.

Be this as it will, the islands in question had attracted also the notice of the French. So low, however, had that nation been reduced by the late war, that no project of the kind could yet be put in execution at the public expence. M. Bougainville, therefore, with the assistance of his friends, undertook to form a settlement on Falkland's island's at their own risk. The scheme was put in execution in the beginning of the year 1764; and a settlement formed on the eastern part of the same island where Commodore Byron had established an English colony on the western side. His account of the country was still more favourable than that of the English commander; but as the project had been undertaken with a view to other discoveries and advantages, which probably did not turn out according to expectation, the French adventurers soon became weary of their new colony; to which also the displeasure of the Spaniards, who were greatly offended, did not a little contribute. M. Bougainville, therefore, being reimbursed in his expences, and the French having given up every claim of discovery or right of possession, the Spaniards landed some troops in 1766, took possession of the fort built by the French, and changed the name of the harbour from Port Louis to Port Solidad.

502
They abandon it to the Spaniards.

In the year 1769, Captain Hunt of the Tamar frigate, happening to be on a cruise off Falkland's islands, fell in with a Spanish schooner which had been at Port Solidad. During all this time it is uncertain whether the British and Spanish settlers knew of one another or not. From the behaviour of Captain Hunt we should suppose that they did not; as he charged the commander of the schooner to depart from that coast, being the property of his Britannic majesty. The schooner, however, soon returned, bringing an officer from the governor of Buenos Ayres, who gave the like warning to Captain Hunt to depart from the coast, as belonging to the king of Spain. Some altercation ensued; but Captain Hunt, not choosing to carry matters to extremities, set sail for England, where he arrived in June 1770.

503
The Spaniards oblige the British to leave the islands.

At the departure of Captain Hunt, two frigates were left at Falkland's islands. One of these was lost in a short time after; and on the 4th of June 1770, a Spanish frigate arrived at the English settlement named *Port Egmont*, with a number of guns and other warlike utensils for carrying on a regular siege. In three days, four other frigates arrived, laden in the same manner; so that the English commander, Captain Farmer, finding all resistance vain, was obliged to ca-

pitulate. The English were ordered to depart within a limited time, carrying with them what stores they could; and the Spanish commander declared himself answerable for what they should leave on the island. The time allowed them to remain at Port Egmont was to be determined by the governor; and for the greater security, the rudder was taken off from Captain Farmer's ship, and kept on shore till the appointed period; after which the frigate was permitted to depart, and in 70 days arrived at Portsmouth.

Britain.

An insult to the British flag so audacious, seemed to render war inevitable unless proper reparation was very speedily made. It was accordingly mentioned in the speech from the throne, November 13. 1770; and an immediate demand of satisfaction for the injury was promised, and that the necessary preparations for war, which had been begun should not be discontinued. The affairs of America were also taken notice of, where grounds of complaint still existed, notwithstanding the cessation of those combinations which had distressed the commerce of this country. These promises, with regard to the affairs of Falkland's islands, however, were far from giving general satisfaction. The speech, as the work of ministry, was most violently attacked by opposition; and an address in answer to it, it was said, would be an eulogium on ministers, who did not deserve it. News had arrived, they said, from Falkland's islands in June, which sufficiently demonstrated the designs of Spain; and Gibraltar and Minorca were left open to the attacks of that power, without any preparation being made on our part to resist them. The whole conduct of the ministry was said to be pusillanimous; and the love of peace, which was given out as the reason of their unwillingness to resent the injury, was treated with contempt.

504
Parliamentary transactions relating to this affair.

A motion was now made in both houses for an inquiry into the conduct of the Spaniards on this occasion, and that all the papers and letters relative to it should be laid before parliament. The demand, however, was opposed by ministry, who insisted that the laws of negotiation precluded the idea of exposing any letters or papers sent in confidence while the negotiation was depending; and they asserted that the king of Spain had disavowed the conduct of his officer, and promised satisfaction. It would have been rash, they said, to proceed to extremities betwixt the two crowns, when perhaps the officer only was to blame; but if, after remonstrance, the court of Spain refused satisfaction, we were then authorized to force that justice which was refused in an amicable manner.

Some time before this, Mr Harris, the English minister at the court of Madrid, dispatched a letter to Lord Weymouth, informing him that a ship had arrived from Buenos Ayres, with an account of the intended expedition against Port Egmont, the number of men to be employed, and the time fixed for its departure; at the same time that it was asserted by Prince Maserans, the Spanish ambassador, that he had every reason to believe that the governor of Buenos Ayres had employed force at Port Egmont without any orders; and hoped that, by disavowing this proceeding, he might prevent any misunderstanding betwixt the two kingdoms. To this his lordship replied in a spirited manner, asking, among other things, Whether the prince had any orders to disavow the proceedings of the governor?

505
Negotiations with the Spanish ambassador.

Britain. And, on his reply in the negative, a formal disavowal was demanded. After some time, his lordship was informed that the prince had orders to disavow any particular orders given to M. Bucarelli, the governor of Buenos Ayres, and at the same time to say, that he had acted agreeably to his general instructions and oath as governor; that the island should be restored; and that it was expected the king of Britain would, on his part, disavow the conduct of Captain Hunt, whose menace had induced the governor to act as he did.

This reply did not by any means prove agreeable; and soon after the conduct of the court of Spain became so suspicious, that Mr Harris was ordered to quit the court of Madrid; and the correspondence between Prince Maserans and the court of England was no longer continued. About this time Lord Weymouth resigned his office, and was succeeded by the earl of Rochford; and the affair of Falkland's islands was no longer openly spoken of. On the sitting down of the parliament, January 22. 1771, however, it was again brought before the house, and the declaration of the Spanish ambassador, with Rochford's acceptance, were announced. Prince Maserans then disavowed, in the name of his master, the violence used at Port Egmont; to the restitution of which he agreed, and hoped that this restitution should be looked upon as ample satisfaction, and at the same time as not affecting the question concerning the prior sovereignty of the islands. This produced a new demand for copies of all papers, letters, and declarations of every kind relating to Falkland's islands: but though it was now seemingly complied with, the opposite party affirmed that it was still only in part; for besides a chasm of near two months, during which time there was no account whatever, none of the copies of the claims or representations made by the court of Spain since the first settlement of the islands were given up. Thus a suspicion was produced, that the concealment of these papers, and the deficiencies in the order of their dates, might proceed from some misconduct during the periods in question; and which administration was willing to conceal from the world. To these objections it was replied, that every paper which could be found in the several offices had been presented; and that if there had been any correspondence between the two courts of which no notice was taken in them, it must have been verbal; but, at any rate, there were papers sufficient to enable the house to determine the propriety or impropriety of their conduct throughout the whole transaction; for every thing decisive or explicit was in writing, and every writing was laid before them.

All these excuses, however, could not yet satisfy opposition. It was reported, and generally believed, that France had interposed in the affair; in consequence of which, a motion was made to address his majesty for information whether any such interference had taken place, and of what nature it was, or in what manner it had been conducted. The minister denied that there had been any such interference: but it was insisted that this was insufficient; that the word of the king was requisite, as that of the minister could not be satisfactory, even supposing him to be upright. It did not, however, appear that any correspondence in writing had taken place betwixt the two courts: and when the minister was asked, whether France had ever inter-

posed as mediator? he answered, that England "had not employed France in that capacity; but that the word *interposed* was of a meaning too vague for direct explanation; and it was unusual to demand verbal negotiations, while papers were laid before them: That as all Europe had an eye to the compromising of differences betwixt states, it was not to be supposed that France would be altogether silent; but nothing (says he) dishonourable has ever passed." Opposition still insisted that they had a right to have an account of verbal negotiations as well as others; and that if this right was given up, a minister had no more to do, when he wished to promote an insidious measure, than to conduct it by verbal correspondence. The motion, however, was lost by a great majority in both houses.

This manner of deciding the question was so far from ⁵⁰⁶ A general allaying the general ferment, that it rendered it much worse. The transaction was considered as entirely disgraceful to the British nation: nor were all the arguments that could be used by the ministerial party in any degree sufficient to overthrow the general opinion. ⁵⁰⁷ The restitution of the island was thought to be an inadequate recompense for the affront that had been offered; and the objections to it were urged on a motion for an address to return thanks for the communication of the Spanish declaration, and to testify their satisfaction with the redress that had been obtained. This address was not carried without considerable difficulty, and produced a protest from 19 peers. On the part of Spain, however, every part of the agreement was ostensibly fulfilled; Port Egmont was restored, and the ⁵⁰⁸ British once more took possession of it, though it was ⁵⁰⁹ The settle- in a short time after evacuated, according to a private ⁵¹⁰ agreement, as was suspected, between the ministry and ⁵¹¹ the court of Spain: but of this no evidence ever appeared to the public.

In other respects, the greatest discontents raged throughout the kingdom. A fire which happened at Portsmouth in the year 1770 excited numberless jealousies, and was by some imputed to our enemies on the continent. The affair of the Middlesex election was never forgotten; and notwithstanding many repulses, the city of London still ventured to present new petitions to the throne. In one presented this year by Mr Beckford, the lord mayor at that time, they lamented the heavy displeasure under which they seemed to have fallen with his majesty, and renewed a petition, frequently presented before, concerning a dissolution of parliament. This, however, met with a very unfavourable answer: his majesty informed the lord mayor, that his sentiments on that subject continued unchanged; and that "he should ill deserve the title of Father of his people, should he suffer himself to be prevailed on to make such a use of his prerogative as he could not but think inconsistent with the interest, and dangerous to the constitution, of the kingdom." Mr Beckford ⁵⁰⁸ was so far from being disheartened by this answer, that ⁵⁰⁹ he demanded leave to speak to the king: which being ⁵¹⁰ obtained, he made a speech of considerable length, and ⁵¹¹ concluded with telling his majesty, that "whoever had already dared, or should hereafter endeavour, by false insinuations and suggestions, to alienate his majesty's affections from his loyal subjects in general, and the city of London in particular, was an enemy to his majesty's person and family, a violator of the public peace,

Britain.
509
Gives of-
fence.

peace, and a betrayer of our happy constitution as it was established at the glorious revolution." To this no answer was made, though it gave great offence: and when Mr Beckford went afterwards to St James's with an address on the queen's safe delivery of a princess, he was told, that "as his lordship had thought fit to speak to his majesty after his answer to the late remonstrance; as it was unusual, his majesty desired that nothing of the kind might happen for the future."

510
His death.

This behaviour of Mr Beckford was by many of the court-party censured in an extreme degree, as indecent, unprecedented, impudent, and little short of high treason; while, on the other hand, he was on the same account raised to the highest pinnacle of popular favour. He did not long, however, enjoy the applause of the people, dying within a short time after he made the celebrated speech above mentioned, and his death was reckoned an irreparable loss to the whole party. Several other petitions were presented on the subject of popular grievances; but the perpetual neglect with which they were treated at last brought that mode of application into disuse. A new subject of contention, however, now offered itself. The navy was in a bad condition, and the sailors every where avoided the service. Towards the end of August 16 ships of the line were ready to put to sea; but the legality of press warrants being questioned, the manning of them became a matter of great difficulty. The new lord mayor, Brass Crosby, refused to back the warrants; which proved a vexatious matter to the ministry. They were further provoked by the unbounded liberty to which the press had been carried; and the mode of proceeding against some libellers had produced many complaints regarding the powers of the attorney general. He had filed informations and carried on prosecutions, *ex officio*, without going through the forms observed in all other cases.—"This (it was said by the patriotic party) was inconsistent with the nature of a free government. No power can be more dangerous to private liberty, nor to the virtue or principles of him who enjoys it. The attorney acts under a minister, and his sense of duty must be very strong, or his independence very thoroughly secured by contentment, if he is at no time tempted to swerve from the laws of conscience and equity. It is in his power to give what name he pleases to a paper, and call it seditious or treasonable; then, without the interference of a jury, he proceeds to try the offender; who, though he may be acquitted, may nevertheless be ruined by the expences attending his justification." Examples were cited on this occasion of very flagrant oppression and injustice from this very power: the laws, it was said, were become changeable at the pleasure of a judge; and the liberty of a subject was taken from him whenever he became obnoxious to his superiors. As these proceedings had therefore been the cause of very general complaint, a motion was made in the house of commons to bring in a bill for explaining and amending an act of the 4th and 5th of William and Mary to prevent invidious informations, and for the more easy reversal of outlawries in the court of king's bench. This motion was rejected by a great majority; the ministerial party urging, that the power of the attorney-general was the same that ever it had been, and found-

the attor-
ney gene-
ral.

512
Rejected.

Britain.

ed on common law. The abuse of power was no argument against the legal exercise of it; it was dangerous to overthrow established customs; the actions of the attorney-general were cognizable by parliament, which controul must for ever prevent a licentious exertion of his power, &c.

513
Disputes
concerning
the beha-
viour of the
judges.

These arguments, however, even with the rejection of the motion, did not put an end to the disputes on this head. The courts of justice themselves were at this time held up in a very despicable light, on account of some late decisions which had been deemed contrary to law and usual practice. By these the judges had assumed a power of determining whether a paper was a libel or not; and the business of the jury was confined to the determination of the fact regarding its publication; and thus it was said to have appeared that the judges had it in their power to punish a man who had been found guilty of publishing a paper, whether seditious or not. Lord Chatham, in a speech on the Middlesex election, took occasion to mention these abuses; and was answered by Lord Mansfield, who looked upon himself to be particularly pointed at. The former, however, was so little convinced by his answer, that he drew from it an additional confirmation of his own arguments; and moved that a day should be appointed for taking into consideration the conduct of the judges; in which he was ably seconded by the late lord chancellor. A committee was accordingly moved for on December 6th 1770, to inquire into the matter; but after much debate, was rejected by 184 to 76. The affair, however, did not yet seem to be terminated. Lord Mansfield gave notice next day, that on Monday he would communicate to the house of lords a matter of the utmost importance; but when that day came, he produced nothing but a paper containing the case of Woodfall the printer as tried in the court of king's bench, that whoever pleased might read or take copies of it. This was looked upon as exceedingly frivolous, and greatly disappointed the expectations of the whole house. His lordship was asked, whether he meant that the paper should be entered on the journals of the house or not? To which he answered, that he had no such intention, but only that it should be left in the hands of the clerk; on which the affair would probably have been overlooked altogether, had not the late lord chancellor, who all along strongly supported the motion, stood up to accuse Lord Mansfield, from the very paper to which he appealed, of a practice repugnant to the law of England. Hence he took occasion to propose some queries relative to the power of juries, and challenged his antagonist to a debate either at that time or soon after. But this method of proceeding was complained of as too precipitate, and an excuse was likewise made for not assigning a day for the debate at any other time; so that the matter soon sunk into oblivion. It was, however, loudly talked of without doors; and the judges, who had already fallen much in the estimation of the people, now became much more obnoxious. Pamphlets were printed containing the most severe accusations; comparisons were made betwixt some of the law lords and their predecessors, and even the print shops were filled with ridiculous and satirical pictures.

An accident which took place soon after contributed

Britain.

of lords.

buted also greatly to lessen the character not only of the ministerial party, but even that of both houses of parliament taken collectively, in the eyes of the vulgar, to an extreme degree; and indeed it must be owned that nothing could be more derogatory to the honour of the first assembly of the nation, or to that of the individuals who composed it. A motion was made on the 20th of December 1770 by the duke of Manchester, that an address be presented to his majesty, that he would be graciously pleased to give orders for quickening our preparations for defence in the West Indies and in the Mediterranean; and particularly for securing the posts of Gibraltar and Minorca. But while his grace was descanting on the negligence of ministry in leaving posts of such importance in a defenceless state, he was suddenly interrupted by Lord Gower, who insisted on having the house immediately cleared of all but those who had a right to sit there. "When motions (said he) are thus brought in by surprise, and without the knowledge of the house as to their contents, it is impossible but such things may be spoken as are improper for the general ear; especially as the enemy may have spies in the house, in order to convey secret intelligence, and expose the nakedness of our possessions." His lordship was answered by the duke of Richmond, who complained of the interruption given to the duke of Manchester as a proceeding both irregular and insidious. This produced a considerable degree of altercation; and the cry of "Clear the house!" resounded from all quarters. Several members attempted to speak, but finding it impossible, and piqued at this shameful behaviour, 18 or 19 of them left the house in a body. The members of the house of commons then present were not only commanded to depart, but some of the lords went personally to the bar, and insisted on their leaving the house immediately. These unfortunate members alleged in excuse, that they attended with a bill, and were there in the discharge of their duty; but this availed nothing: they were peremptorily ordered to withdraw till their message should be delivered; and after going through the usual forms, were turned out of doors amidst the greatest tumult and uproar. In the mean time the lords, who had just left the house of peers, had gone to the lower house, where they were listening to the debates, when the commoners, who had been turned out of the house of lords, arrived full of indignation, and making loud complaints of the affront they had received. This was resented by turning out indiscriminately all the spectators; among whom were the 18 peers just mentioned, who were thus shut out from both houses. The affair terminated in a misunderstanding betwixt the two houses, which continued during the whole session. Sixteen lords joined in a protest; and in the warmest terms censured the treatment they had met with, as well as the unprecedented behaviour of administration, who had thus attempted to suppress the freedom of argument, and render the conduct of the house an object of censure and ridicule to the whole world.

516
Monstrous
instance of
corruption
in New
Shorcham.

After the discussion of the affair of Falkland's islands in the manner already related, a most unheard of instance of corruption was laid before parliament in the borough of New Shoreham in Sussex. The contest

was occasioned by the returning officer, Mr Roberts, having returned a candidate with only 37 votes, when the other had 87; and on bringing him to trial for this strange proceeding, the following scene of villany was laid open. A great number of the freemen of the borough had formed themselves into a society called the *Christian Society or Club*; but instead of keeping up the character indicated by this title, it was clearly proved by the returning officer, who formerly belonged to it, that it was employed only for the purposes of venality. A select committee of the members were appointed to sell the borough to the highest bidder. The committee men never appeared at elections themselves, but gave orders to the rest, and directed them how to vote; and after the election was over, shared the profits among themselves. Though all this was clearly proved, the returning officer was dismissed with only a reprimand from the speaker of the house of commons, for having trespassed upon the forms to be sacredly observed by a returning officer. A more severe punishment, however, was reserved for the borough, and those wretches who had assumed the name of the *Christian Club*. A motion for an inquiry being carried unanimously, a bill was brought in to incapacitate 81 freemen of this borough, whose names were mentioned, from ever voting at parliamentary elections; and, for the more effectually preventing bribery and corruption, the attorney-general was ordered to prosecute the committee belonging to the *Christian Club*: the members were allowed counsel; and many different opinions were offered regarding the mode of punishment. Some were mercifully inclined only to reprimand them, while others proposed to disfranchise the borough; however, the bill for incapacitation was passed at length, though it did not receive the royal assent till the last day of the session.

The unbounded licentiousness of the press now called the attention of parliament, though the evil appeared in a manner incapable of being checked. At this time neither rank nor character were any security against the voice of calumny from one party or other; and indeed it was hard to say on what side the most intemperate violence appeared. The ministry, however, provoked by a long course of opposition, made the loudest complaints of the freedoms taken with their names; while it was retorted by opposition, that the abuse from one quarter was as great as from the other. Some members of the house of commons complained that their speeches had been misrepresented in the papers, and endeavoured to put a stop to the practice of printing them. It was now considered as a matter contrary to the standing order of the house to print the speeches of the members of parliament at all; and a motion for calling two of the principal printers to account was carried by a considerable majority. The printers, however, did not attend the summons of the messenger: and a final order for their appearance was directed to be left at their houses, and declared to be sufficient notice when left at their houses. The disobedience of the printers on this occasion was undoubtedly heightened by the favour they hoped to obtain from the popular party; and indeed it was not without the most severe animadversions that the ministry were able to carry their motions against them. This opposition increased by its being farther moved that

^{Britain.} that they should be taken into custody by the serjeant at arms for contempt of the orders of the house. The temper and disposition of the people towards the house was now objected, and the great impropriety of adding to their alarms by any unnecessary stretch of the executive power; but the majority urged the necessity of preserving the dignity of the house, and putting an end to those excessive freedoms which had been taken with its members. The serjeant at arms next complained, that not being able to meet with the printers at their houses, he had been treated with indignity by their servants; on which a royal proclamation was issued for apprehending Wheble and Thomson, the two obnoxious printers, with a reward of 50l. annexed. But in the mean time six other printers, who had rendered themselves equally obnoxious on a similar account, were ordered to attend the house, though the motion was not carried without great opposition, during which time the house divided between 20 and 30 times. Some of the delinquents were reprimanded at the bar, and one who did not attend was ordered to be taken into custody for contempt. Wheble being apprehended in consequence of the proclamation, was carried before Mr Alderman Wilkes, by whom he was discharged. To this magistrate it appeared that Mr Wheble had been apprehended in direct violation of his rights as an Englishman, as well as of the chartered privileges of a citizen of London; which opinion he declared in a letter to the earl of Halifax, one of the secretaries of state. Thomson was discharged in the same manner; but the captors received certificates from the magistrates, in order to obtain the promised rewards. J. Miller, one of the six who had refused to attend, was taken into custody from his own house by the messenger of the house of commons. On this he sent for a constable, and was carried along with the messenger before the lord mayor, and Aldermen Wilkes and Oliver, at the mansion-house. The lord mayor refused to deliver up the printer and messenger at the request of the serjeant at arms; and after some disputes the messenger was committed to prison, as he had been accused by Millar of assault and false imprisonment, and the serjeant had refused to find bail; however, he was immediately released upon the bail being given.

⁵¹⁹ Lord Mayor sets Millar at liberty, and imprisons the messenger of the house of commons.

By this affront not only the majority but many of the popular party also were greatly irritated; however, the members in opposition took care to lay all the blame on the absurd conduct of administration with regard to the Middlesex election; in consequence of which they had incurred such a general odium, that the people thwarted every measure proposed by them, and eluded and despised their power on every occasion. The lord mayor was ordered to attend the house next day; at which time he pleaded that he had acted in no manner of way inconsistent with the duties of his office; as, by an oath which he took when entering upon it, he was bound to preserve the franchises of the city, and his conduct was farther to be vindicated from the terms of the city charters, as recognised by act of parliament. It was then moved that he should be allowed counsel; the question appearing to belong to the lawyers, as his lordship did not pretend to deny the privileges of the house, though he contended for an exemption from that privilege by virtue of charters

⁵²⁰ Proceeds against him.

and an act of parliament. This motion, however, was overruled, it being insisted that no counsel could ever be permitted against the privileges of the house. This refusal of counsel took its rise from a transaction in the reign of Henry VIII. and was now pleaded as the custom of parliament. Some proposed that the lord mayor should be heard by counsel, provided the privileges of the house was not affected; but it was considered as absurd to the last degree, that his lordship should be heard by counsel on every point except the very one in question. At the same time a motion was carried, that the lord mayor's clerk should attend with the book of minutes; and notwithstanding all opposition, he was obliged to expunge out of it the recognizance of Whittam the messenger. This was followed by a resolution that there should be no more proceedings at law in the case; a great altercation ensued, and several of the minority at last left the house in the utmost rage.

^{Britain.}

Though it was now one o'clock in the morning, the ministerial party were so ardent in the prosecution of their victory, that they refused to adjourn; proceeding now to the trial of Mr Oliver, who, as well as the lord mayor, was far from expressing any sorrow for what he had done. Some proposed to censure his conduct, others were for expulsion; but when it was proposed to send him to the Tower, the utmost confusion and mutual reproach took place: some members declared that they would accompany him to the place of his confinement; others left the house, while the ministry used their utmost endeavours to persuade him into some kind of apology or concession for what he had done; but finding that to no purpose, they at last carried the motion for his imprisonment, and he was committed accordingly. Ample amends, however, were made for this punishment by the unbounded popular applause heaped on both the lord mayor and alderman on this occasion, and which indeed threatened very serious consequences. Some days after the commitment of Mr Oliver, when the lord mayor attended at the house of commons, several very alarming insults were offered to many of the members, particularly Lord North; who on this occasion lost his hat, and narrowly escaped with his life. Some of the members of the minority interposed, and expostulated with the mob on the impropriety of their conduct, by which means all further disturbance was prevented; and had it not been for this timely-interference, it is supposed that the fray would not have ended without much bloodshed.

⁵²¹ and against Alderman Oliver.

⁵²² Both committed to the Tower.

After the confusion was in some measure dispelled, the debates concerning the lord mayor again took place. Many arguments were brought against proceeding farther in the matter; but, being disregarded, the minority members left the house. His lordship refused the favour offered him of being committed to the custody of the serjeant at arms, upon which it was resolved to commit him to the Tower; the motion for this purpose being carried by 200 against 39. Mr Wilkes, on being ordered to attend, wrote a letter addressed to the speaker of the house, in which he observed, that no mention had been made of his being a member; and that if his seat in parliament, to which he had been duly elected, was to be granted him, he would attend and justify his conduct. Administration, however,

⁵²³ Ridiculous shift to avoid a contest with Wilkes.

⁵²⁴ **Committee for inquiring into the obstructions to the authority of the house of commons.** However, were too wise now to encounter this hero; and at the same time were under no little embarrassment how to get off; so at last they were reduced to the miserable shift of ordering him to attend on the 8th of April, 1771, at the same time that they adjourned the house to the 9th.

The many affronts and indignities which administration had of late been obliged to put up with now rendered it absolutely necessary to fall upon some method to show that their authority was not altogether lost. For this purpose a committee was appointed by ballot to inquire into the reason why there had been so many obstructions to the authority of the house of commons. This committee having sat from the 28th of March to the 30th of April, at last gave in the following report. "Your committee beg leave to observe, that in the diligent search they have made in the journals, they have not been able to find an instance that any court or magistrate has presumed to commit, during the sitting of parliament, an officer of the house for executing the orders of the house. They further beg leave to observe, that they have not been able to find, that there ever has been an instance wherein this house has suffered any person, committed by order of this house, to be discharged, during the same sessions, by any authority whatever, without again committing such persons. As therefore, with regard to J. Millar, who was delivered from the custody of the messenger by the lord mayor, who for the said offence is now under the censure of the house, it appears to your committee, that it highly concerns the dignity and power of the house to maintain its authority in this instance, by retaking the said J. Millar; the committee recommend to the consideration of the house, whether it may not be expedient that the house should order that the said J. Millar should again be taken into custody of the serjeant at arms; and that his deputy or deputies be strictly enjoined to call upon the magistrates, officers of the peace, and other persons, who by the speaker's warrant are required to be aiding and assisting to him in the execution thereof, for such assistance as the said serjeant, his deputy or deputies, shall find necessary, to enable him or them to take into custody the said J. Miller."

⁵²⁵ **The issue of this contest unfavourable to administration.** Nothing could have been more imprudent than the urging with such violence a contest against such contemptible adversaries; and in which they were finally baffled. What they intended for punishment really afforded the criminals matter of triumph and exultation. Every honour that the city of London could bestow was conferred upon the magistrates, while the complaints and execrations of the people at large became louder than ever. Every step taken about this time by administration seemed calculated to add to the public ill humour. Towards the end of the session a bill was brought in "for enabling certain persons to enclose and embark part of the river Thames, adjoining to Durham-yard, Salisbury-street, Cecil-street, and Beaufort-buildings in the county of Middlesex." This bill was opposed, as appearing contrary to the ancient rights and privileges of the city of London; but was easily carried through both houses, though it produced a protest in the upper house; and a few days before the rising of the session, the city of London petitioned against it. In this petition it was complained of as a

⁵²⁶ **Dissatisfaction on account of the embankment bill.** violent and unjust transaction; totally unprecedented; being an invasion of the property which the city claimed in the soil or bed of the river. It was afterwards complained of in a remonstrance, as an infringement of the rights of the people, and urged as a reason for the dissolution of parliament.

⁵²⁷ **East India session related to the East India Company.** The only other transaction of moment during this session related to the East India Company. It was proposed to raise 2000 men in England for the service of the company, the officers to be appointed by the king, and to be paid by the company. But after much speculation, it was rejected as unconstitutional and dangerous to keep an armed force in the kingdom which was not paid by government; and that, however inconsiderable the number proposed was at present, it might soon be increased on any frivolous pretence. It was likewise urged, that it would prove an obstruction to the recruiting service of our own army, on account of the superior advantages of enlisting in the company's service. The advocates for the bill urged the inconvenience of sending out a sufficient number of men annually to recruit the Indian forces; and that, unless parliament should adhere to the promise they formerly made of assisting the company in recruiting, they would be daily exposed to vast loss and expence from the tricks of recruiting parties. The session rose on the 8th of May. In the speech from the throne, it was observed, that the satisfaction obtained from his Catholic majesty for the injury done this kingdom, and the proofs of the pacific disposition which the courts of France and Spain had given by laying aside their armaments, enabled us to reduce our forces by sea and land. The zeal manifested by parliament could not fail to convince the world of its affectionate attachment to the crown and regard to the interests of the country. His majesty's endeavours were promised to put an end to the troubles which still prevailed in some parts of the continent; thanks were given to the commons for the unanimous cheerfulness, and public spirit with which they had granted the supplies; and an apology was made for the extraordinary demands which had been made. The speech concluded with advising the members to use their best endeavours, in their respective stations and counties, to render the national happiness complete, by discouraging needless suspicions and domestic disturbances. His majesty had no other objects, and could have no other interests, than to reign in the hearts of a free and happy people; and it was his earnest wish that his subjects might not be prevented, by mistakes or animosities among themselves, from enjoying the happiness they had in their power.

The many defeats that had been received by opposition during this and the foregoing sessions now began to discourage them from proceeding such lengths in the cause of patriotism as they had formerly done. Many of them had also lost much of their popularity by taking an active part against the printers; and as every motion had been carried in favour of administration by nearly two to one, a general discouragement and languor began to take place among the popular party. The only gainers indeed by the late contentions were the city magistrates and printers who had been punished by the house of commons. On the rising of the parliament, when the lord mayor and aldermen were released

⁵²⁸ **Popular party discouraged.**

Britain. released from the Tower, they were welcomed by every mark of congratulation. The city was illuminated; and the mob, as usual, took vengeance on the refractory by breaking their windows. A committee was even appointed to carry on a prosecution against the speaker of the house of commons; but as this did not seem likely to afford any redress, they determined once more to have recourse to the throne. Accordingly, on the 10th of July 1771, another petition and remonstrance was presented, the subjects of which were the embankments on the Thames, the proceedings against the magistrates; and a speedy dissolution of parliament was requested. But this met with an unfavourable answer as before. His majesty replied, that he was ready to put an end to the real grievances of his faithful subjects: but he was sorry to find that a part of them still renewed requests which he had repeatedly refused to comply with.

In the speech from the throne, when the parliament met, January 21. 1772, his majesty observed, that the performance of the king of Spain's engagements, and the behaviour of the other European powers, promised a continuance of peace; and though the necessity of keeping up a respectable naval force was evident, yet no extraordinary aid for that purpose would be necessary; and he concluded with recommending the most vigilant and active attention to the concerns of the country, with an assurance of the interposition of the crown to remedy abuses or supply defects. Little dispute was made about the addresses in answer to this speech, though an ample subject of altercation very soon occurred. This was a motion made by administration, intimating the necessity of raising 25,000 seamen for the service of the current year; it being always necessary, they said, for us to preserve a superiority to the French in the East Indies, which had not been the case since they sent a considerable fleet thither. "It was equally necessary (they added) to preserve the present strength of the West Indies unimpaired; as the Spaniards knew the importance of our settlements there too well not to make an attack upon them first if ever a rupture should take place. Twenty of the best ships in the navy were also now employed as guard-ships, and wanted nothing but men to fit them for actual service."

A declaration of this kind, coming immediately after the assurances of peace that had been given from the throne, was said to be a contradiction; that the peace establishment would thus be augmented till we were overburdened by it; 500,000l. would thus be added to the national expences; and as the same augmentation might every year be made on similar pretences, we should thus be obliged to submit to the hardships of war in time of a profound peace. If the assurances of peace from the throne were well founded, the force in the East Indies was already too great; if, on the contrary, a war was at hand, it would be too small notwithstanding the proposed augmentation; and the same way Jamaica was likely to suffer from the inferiority.

These remonstrances were by no means sufficient to put a stop to any measure which had at this time been suggested by administration. The question for the augmentation was carried without a division: after which the subject of religion came to be discussed.

VOL. IV. Part II.

This was occasioned by the general tendency to Arianism or Socinianism, which had for some time prevailed to a great degree, and had at last infected the established church in such a manner, that the subscription to her standards was reckoned intolerable by many of the clergy. Meetings had been frequently held by the discontented members, in order to consider of some mode of relief; and in the beginning of February 1772, about 250 of them, with several professors of law and physic, joined in a petition to the house of commons, expressing their dissatisfaction with subscription to any human forms, and praying for relief. In this petition they asserted, that they held certain rights and privileges from God alone, without being subject to any other authority; such as the exercise of their own reason and judgment, by which they were instructed and confirmed in their belief of the Christian religion, as contained in the Holy Scriptures. They accounted it a blessing to live under a government which maintained the sufficiency of the Scriptures to instruct in all things necessary to salvation. Hence they concluded, that they had a right from nature, as well as from the principles of the reformed religion, to judge for themselves what was or was not contained in the Scriptures. From this invaluable privilege, however, they found themselves in a great measure precluded by the laws relative to subscription; by which they were enjoined to acknowledge certain articles and confessions of faith framed by fallible men as entirely agreeable to Scripture. They prayed therefore to be relieved from such an imposition, and to be restored to their undoubted right of interpreting Scripture for themselves, without being bound by any human explanation of it, or being required to acknowledge by subscription or declaration the truth of any formulary of religious faith and doctrine whatever, excepting the Holy Scripture itself.

The affair of subscription they looked upon to be not only a grievance to themselves, but an encroachment on their rights as men and members of a Protestant establishment, as well as a great hinderance to the spreading of the Christian religion, tending to discourage further inquiry into the true sense of Scripture, to divide communions, and to cause a mutual dislike between fellow Protestants; giving occasion for unbelievers to reproach and vilify the clergy, by representing them as guilty of prevarication, and of accommodating their faith to lucrative views and political considerations. It afforded also to Papists, and others disaffected to the religious establishment of the church of England, an occasion of reflecting upon it as inconsistent, and authorizing doubtful and precarious doctrines, at the same time that the Scripture alone was acknowledged to be certain and sufficient for salvation. It had likewise a tendency to divide the clergy among themselves; subjecting one part, who asserted their privilege as Protestants, to be reviled both from the pulpit and the press, by another who seemed to judge the articles they had subscribed to be of equal authority with the Scripture itself; and, lastly, it occasioned scruples and embarrassments of conscience to those who were about to enter into the ministry, or prevented the cheerful exercise of it to those who were already entered. By reason of these embarrassments, the clerical part of the petitioners found themselves un-

Britain. ⁵³⁰ Petition against subscribing the XXXIX articles.

529 Debates on the augmentation of the number of seamen.

Britain. der great difficulties, being obliged in some sense to join with the adversaries of revelation, in supposing the one true sense of Scripture to be expressed in the present established system of faith; or else to incur the reproach of having deserted their subscription, &c. while such of the petitioners as had been educated with a view to the professions of civil law and physic could not but think it a great hardship to be obliged, as they all were in one of the universities, even at their first matriculation and admission, though at an age very improper for such important disquisitions, to subscribe their assent to a variety of theological tenets, concerning which their private opinions could be of no consequence to the public, in order to entitle them to academical degrees in those faculties; more especially as the course of their studies and attention to their practice did not afford them leisure sufficient to examine how far these tenets were consonant to the word of God.

This petition was presented by Sir William Meredith, who, along with the other members who favoured the cause, enforced it by many arguments drawn from the principles of toleration. They maintained also that nothing but hypocrisy and prevarication could arise from obliging men to subscribe what they did not believe; that the repeal of the laws for subscription would prevent the increase of dissenters, so very conspicuous at this time, and incline many of them to return to the church. The articles themselves were said to have been compiled in a hurry; that they contained doctrines highly controvertible; and that this restraint on the consciences of men was of all others the greatest hardship. The majority of parliament, however, were found inimical to the petition, though some who opposed it at present wished for time to consider it more deliberately, or to refer it to a committee of the clergy. By the rest it was urged, that the matter of the petition was a violent infraction of the laws of the English religion; and that if this was granted, another would soon follow against the liturgy. The conduct of many of the petitioners, instead of being founded in any regard for religion, had its origin in hypocrisy and dissoluteness, and certainly proceeded in many instances from a disbelief of the Trinity, and of the divinity of our Saviour. The complaints of men were to be disregarded when they wished to profit by the emoluments of the church without subscribing to its laws; besides, the king was bound by his coronation oath to continue the church-government without alteration. It was likewise urged, that if people were to be restrained by no other article than an assent to the truth of the scriptures, the church would soon be overrun with impiety. Many had already founded blasphemous tenets on the right of private opinion; and though it could not be denied that every man has this right for himself, yet none has a right to obtrude his singularities upon others; and if any of the clergy found the delicacy of their consciences affected after they had accepted of benefices, they were welcome to leave them.

Some of the more moderate opposers of the petition endeavoured to vindicate the character of the clergy from the imputations laid upon them; and contended that the legislature had a controuling power over the articles of the union, and confirmed their as-

sertion by mentioning the act against occasional conformity, as well as another against elective patronages, both of them passed since the union: and it seemed to be the general wish of the house that the professors of law and physic might be relieved from subscription, though they did not consider their share in the matter as of any great importance to the public. It was at last thrown out by a majority of near 150. ⁵³¹ Rejected.

The rejection of the subscription bill was followed by that of a bill for quieting the possessions of his majesty's subjects from dormant claims of the church; after which the attention of parliament was called to one of the utmost importance, and which was introduced by a message from the king. This was the famous ⁵³² Royal marriage-bill, occasioned by the marriage of the duke of Cumberland with Mrs Horton, a widow lady, daughter of Lord Irnham, and sister to Colonel Luttrell, and that of the duke of Gloucester with the countess-dowager of Waldegrave. By the message it was recommended to both houses to take it into their consideration, whether it might not be expedient to supply the defects of the laws then in being, and by some new regulations more effectually to prevent the descendants of his late majesty (excepting the issue of the princesses who had married, or might hereafter marry, into foreign families) from marrying without the consent of his majesty, his heirs, and successors. In consequence of this a bill was brought in, declaring all such marriages, without the consent above mentioned, to be null and void. The descendants of his majesty, however, if above the age of 25 years, might marry without the royal consent, provided they gave intimation twelve months beforehand to the privy council, and no opposition to the match was made by parliament during that interval.

This bill met with the most violent and powerful ⁵³³ opposition. The principal arguments against it were expressed in two protests from the upper house, and were to the following purpose: 1. The doctrine that marriages in the royal family are of the highest importance to the state, and that therefore the kings of this realm have ever been trusted with the care thereof, is both absurd and unconstitutional; though it would from that period have the force of a parliamentary declaration. The immediate tendency of this was to create as many prerogatives to the crown as there are matters of importance in the state; and to extend them in a manner as vague and exceptionable as had ever been done in the most despotic period. 2. The enacting part of the bill had an inconvenient and impolitic extent; namely, to all the descendants of Geo. II. In process of time, that description might become very general, and comprehend a great number of people; and it was apprehended that it would be an intolerable grievance, for the marriages of so many subjects, perhaps dispersed among the various ranks of civil life, to be subject to the restrictions of this act; especially as the abettors of this doctrine had also maintained, that the care and approbation of the marriage also included the education and custody of the person. This extensive power might in time make many of the first families of the kingdom entirely dependent on the crown; and it was regretted that all endeavours to limit, in some degree, the generality of that description, had proved ineffectual. 3. The time of nonage for the royal family appeared to be improperly extended beyond ⁵³⁴ it.

Britain. yond the limit of 21 years; a period which the wisdom of the constitution seems with great wisdom to have assigned to minority. 4. The deferring their marriage to the age of 26 might also be attended with other bad consequences, by driving them into a disorderly course of life, which ought to be particularly guarded against in those of such an exalted station. 5. The power given by this bill to a prince to marry after the age of 26, is totally defeated by the proviso which declares the consent of parliament to be ultimately necessary. Thus great difficulties must be laid on future parliaments, as their silence in such a case must imply a disapprobation of the king's refusal; and their concurrence with it might prove a perpetual prohibition from marriage to the party concerned. 6. The right of conferring a discretionary power of prohibiting all marriages, appears to be above the reach of any legislature whatever, as being contrary to the inherent rights of human nature; which, as they are not derived from, or held under, the sanction of any civil laws, cannot be taken away by them in any case whatever. The legislature no doubt has a right to prescribe rules to marriage as well as to every other kind of contract; but there is an essential difference between regulating the mode by which a right may be enjoyed, and establishing a principle which may tend entirely to annihilate that right. To disable a man during life from contracting marriage, or, which is the same thing, to make his power of contracting such marriage dependent neither on his own choice nor on any fixed rule of law, but on the arbitrary pleasure of any man, or set of men, is exceeding the power permitted by Divine Providence to human legislature, and directly contrary not only to the divine command, but also to the rights of domestic society and comfort, &c. 7. This bill has a natural tendency to produce a disputed title to the crown. If those who are affected by it are in power, they will easily procure a repeal of this act, and the confirmation of a marriage made contrary to it; and if they are not, it will at least be the source of the most dangerous faction that can exist in any country, viz. one attached to a pretender to the crown; whose claim, he may assert, has been set aside by no other authority than that of an act to which the legislature was not competent, as being contrary to the common rights of mankind. 8. The bill provides no security against the improper marriages of princesses married into foreign families, and those of their issue: which may full as materially affect the interest of this nation as the marriages of princes residing in the dominions of Great Britain. It provides no remedy against the improper marriage of the king reigning, though evidently the most important of all others to the public. It provides nothing against the indiscreet marriage of a prince of the blood, being regent at the age of 21; nor furnishes any remedy against his permitting such marriages to others of the blood-royal, being fully invested with the legal power for this purpose, without the assistance of council.

The answer to all these arguments was, that the inconveniences so much talked of were merely imaginary; and if the king should make any improper use of his authority, parliament had it either in their power to prevent the effect, or to punish the minister who advised it. The crown, it was said, was dishonoured by im-

proper connexions, and many of the greatest national calamities have proceeded from improper alliances between the royal family and subjects; and that if, from after experience, we should find any material grievances ensue from this act, it could as easily be repealed at that time as thrown out now, and on better grounds. It was very rapidly carried through both houses; in the upper house by 90 to 26; and in the lower by 165 to 115.

Though the late decision concerning subscription to the 39 articles did not seem to promise much success to any innovations in religious matters, yet the case of dissenting ministers was introduced soon after the discussion of the royal marriage act; the advocates for it being encouraged to bring it forward chiefly on account of some favourable hints thrown out in the debates on the subscription bill. A petition was now presented by a great body of these people, praying to be relieved from the hardship of subscribing to the articles of a church to which they did not belong. This, however, was most violently opposed by the opponents of the former bill, though with very little success in the house of commons, where it was carried through by a prodigious majority. Here it was maintained that nothing can advance the true interest of religion so much as toleration; and if articles of subscription are necessary, it must only be for men destitute of principle, and who would, in compliance with ambition or avarice, as readily subscribe to one set of articles as another. If thus any of the fundamental doctrines of Christianity are impugned, there are abundance of laws in existence to correct the impiety. The dissenters have indeed altered some of their original forms and doctrines, but that only in matters of indifference. It is the effect of learning, leisure, and refinement, to give men many opportunities of altering established forms. This has been the case formerly, and always will be. The dissenters have long been virtually exempted from this subscription; and yet the piety and decency of many of them, particularly in Scotland and Ireland, where no such laws are in being, sufficiently show that men, whose minds are steadfast in the purity of religion, will not be confined nor influenced by laws of human invention. But though the dissenters enjoy full liberty by connivance at present, where is their security against the sudden attacks of malice and envy, which may be backed by the sanction of law? Every neglect of a law by connivance is an additional proof of the necessity of abrogating that law: and liberty is but an empty name, where it is enjoyed by an oversight only, as it were, of our superiors. In the house of lords, however, the bill was rejected by a majority of 70. Here the doctrine of universal toleration was strenuously opposed, as well as the great danger set forth to which the church of England would be exposed by departing from the laws which guarded its privileges. The dissenters, it was said, had great cause to be satisfied with the favour they enjoyed by connivance; and the laws were only kept in record as a necessary curb, lest in the degeneracy of a declining kingdom, religion should be destitute of protection against heresy and blasphemy.

The only other affairs of this session were some attempts at an inquiry into the affairs of the East India Company, which were now in a very critical situation. These, however, did not come under consideration till

East India Affairs.

Britain. the next session, which took place November 26, 1772, when his majesty gave this situation of the affairs of the company as a reason why he had called them together sooner than usual. The continuance of the pacific disposition of other powers was mentioned, and satisfaction expressed that the continuance of peace had afforded an opportunity of reducing the naval establishment, though a great force must always be necessary for the defence of these kingdoms. Economy was promised with regard to the supplies, and it was recommended to take every method that could be devised to remedy the dearth of provisions.

The affairs of the East India Company took up the greatest part of the present session. It had been projected, as far back as the year 1667, when they were in a very flourishing condition, to bring them under the inspection of government, that the nation might share the immense wealth supposed to be enjoyed by the company. The design, however, did not succeed at that time, nor would it probably have been easily brought to bear, had not the affairs of the company been embarrassed by the bad conduct of their servants. During the last session a bill had been brought in for restraining the governor and council from all kind of trade, as well as for enlarging the power of the company over its servants. The bill, however, was rejected after the second reading, and indeed was thought to have been proposed only to introduce the succeeding business. The debates on the subject procured in a great measure the general belief of two points of much importance to the success of the scheme, viz. that the affairs of the East India Company were in a very bad situation, owing to the behaviour of its servants; and that the company was at any rate insufficient for the government of such extensive possessions; of consequence that there was an evident necessity of giving up the management of it to the crown. A motion was now made in parliament, by a gentleman unconnected with administration, for a select committee to inquire into the affairs of the company: but many reasons were urged against this appointment, particularly that the season was too far advanced for a business of such importance; that the committee, being a secret one, was not accountable for its conduct; and that as the minister would have it in his power to nominate the members of the committee, considerable partiality might on that account take place. The motion, however, was carried without a division; and the members were chosen by ballot.

The affairs of the East India Company proceeded from bad to worse during the recess. The treasury at home was quite exhausted; while bills to a vast amount drawn on Bengal were nearly due; which, with their debt to the bank and other public offices, along with the sum to be paid to government, reduced them almost to the brink of bankruptcy. They were therefore reduced to the expedient of borrowing a sum of money from administration: but their application was received with great indifference. The minister desired them to apply to parliament. The reports of the select committee, in the mean time, contrary to the promise of secrecy, were published, and gave the public no favourable opinion of the behaviour of the company's servants. On the meeting of parliament, the minister moved for another committee, under the title of the *committee of*

Britain. secrecy, to consist of 13 persons, for taking into consideration the state of the company's affairs; which might thus undergo a full investigation without any thing being known to the world, which had excited such indignation in the former case. The members of this new committee were also to be chosen by ballot; so that no objection could militate against them that did not militate with equal strength against the whole house. It was objected, that this mode of secret inquiry, by a small number, was unprecedented and unconstitutional; that the members would in effect be nominated by the minister, and act under his direction; and that a free investigation by the whole parliament was essentially different from that by a secret committee. In the latter case, every information that the minister thought proper to conceal would be withheld; at any rate, a committee of secrecy is an evident absurdity; a committee can be no longer a secret than during the time it takes up for inquiry. Its proceedings must be laid before the public; and in case of unjust accounts, the parliament had no means of being undeceived. These reasons, however, were of no avail at present. The committee of secrecy was carried, as the other had been, without a division; and, as had been predicted, the members though chosen by ballot, were almost all of them devoted to administration. The select committee was likewise revived, that they might be, as it was said, checks upon one another; so that between them the nation would have every requisite degree of information on the whole affair.

In a very short time after the appointment of the ⁵³⁷restraining secret committee, a report was given in, stating that the bill ^{proposed} company were in great distress for want of money; and as this was the case, a bill ought to be brought in for restraining them from sending out supervisors to India, a scheme which they had meditated at this time. The minister and his adherents enlarged greatly on the utility of this bill; which, they said, was highly expedient. It was the sincere wish of parliament to render them a great and glorious company: it was absolutely necessary for this purpose not to allow them to engage in an expensive commission, at a time when their affairs were so much embarrassed that they were obliged to apply to government for a loan. It was even doubted whether the company, without the sanction of parliamentary authority, had power to appoint a commission of this kind. On the other hand, the minister's proposal was said by opposition to be unconstitutional and insidious. The want of cash at present experienced by the East India Company was not of such great importance, their credit being then as fully established as ever. They had made choice of a set of men in whom they could confide; the many losses occasioned by their servants rendered the commission indispensably necessary; and the expence would be paid from the savings which must undoubtedly arise from so prudent a step. It was unreasonable, because the East India Company, or any other, are distressed, to allow them no opportunities of extricating themselves. The company could not be said to want respect for parliament; they had showed this already by delaying the departure of the commission till the inquiry begun by the house was finished: nor could they be wanting in respect to their own interest, character, and constitution; which they seemed to show by every possible mark of opposition to this bill.

Britain. bill. Administration boasted of their intentions and their wishes to render this company great and glorious; but how could we expect greatness or glory to proceed from a quarter where it did not exist? The dignity of parliament was lessened, and its glory effaced, by the conduct of ministers, and the many wanton acts of authority lately committed. It was a curious method of rendering a company great and glorious to plunder the proprietors of immense sums of money by exorbitant grants, or by taking away their charters; for after this act it was plain that charters could no longer be depended upon. Two gentlemen belonging to the company, and then present in the house, offered to pledge themselves, that the commission of supervision should not be allowed to depart, until, from further report, a full knowledge of the company's affairs should be acquired. This, however, was instantly rejected, it being said to be defective in security; that the East India Company would not scruple to make an agreement of this kind to day and break it to-morrow; which could only be prevented by an act of parliament, especially as the ministry had no motives for promoting this measure, but a regard for the welfare of the company, and a desire to restore its affairs to a better state.

538
Ineffectual attempts of the company to prevent the passing of the bill.

Notwithstanding all the arguments used by administration in favour of this bill, however, the company were so far from thinking it to their advantage, that they used every endeavour to prevent it passing into a law. They petitioned; and some of their servants were examined in the house of commons, in order to show the necessity of supervisors being sent out, who might be qualified to reduce their affairs to some order by being on the spot, and enabled to curb the excesses of which the company's servants had too frequently been guilty. During this examination it appeared, that from the year 1765 to 1773 the expenses of the company had increased from 700,000l. to 1,700,000l. annually, and that government had received near two millions from the company every year; that they had immense profits in extraordinaries, while the proprietors lost considerably of the dividend which the profits of their trade alone would have produced. In spite of all opposition, however, the bill for restraining the company from sending out any commission of supervision was carried by a majority of 153 to 28. In the house of lords it met with similar success, being carried by 26 to 6, though the minority thought proper to enter a protest. The reasons given against it in this protest were, that it took away from a great body corporate, and from several free subjects of this realm, the exercise of a legal franchise, without any legal cause of forfeiture assigned. The persons appointing the commissioners had by law a right to elect, and the persons chosen had a legal capacity of being elected. The supervisors had a full right vested in them agreeable to the powers and conditions of their appointment; but though no abuse was suggested, nor any delinquency charged upon them, those legal rights and capacities were taken away by, a mere arbitrary act of power, the precedent for which leaves no sort of security to the subject for his liberties. The bill seemed likewise a manifest violation of the public faith. The charter of the East India Company was granted by the crown, authorized by act of parliament,

539
Protest against it in the house of lords.

and purchased for valuable considerations of money lent and paid. By this the company were allowed to manage their own affairs as they thought proper, and by persons of their own appointment; but by this bill, the exercise of the power just mentioned was suspended for a time, and by grounding the supervision upon the actual interference of parliament with the affairs of the company, established a principle which might be used for perpetuating the restraint to an indefinite length of time. It is indeed difficult to settle the legal boundary of legislative power: but it is evident, that parliament is as much bound as any individual to observe its own compacts; otherwise it is impossible to understand what is meant by public faith, or how public credit can subsist. It appeared by evidence upon oath at the bar of the house of lords, that the company had received assurances from their chairman and deputy chairman, that the appointment of a commission for superintending and regulating their affairs would be approved by administration; and it was extremely hard that they should be able to find no security for their charter privileges against those very ministers under whose sanction they had reason to believe they were all along acting. It was also the more incumbent on the company at present to give the most strict attention to their affairs, to enable them to answer the exorbitant demands of government; as it appeared from the witnesses at the bar, that its exactions amounted to more than the whole profit of the late acquisitions, and the trade ensuing from them; while the proprietors, who had spent so much, and so often risked their all for obtaining these acquisitions, had not been permitted even to divide so much as the profits of their former trade would have afforded.

Britain.

The select committee now gave in their second report, containing a statement of the debt, credit, and effects of the company in England; beginning with an account of the cash in the company's treasury on the 1st day of December 1772, and containing a statement of all their debts and claims against them in every part of the world. Thus it appeared that the cash, credit, and effects of the company amounted, to 6,397,299l. 10s. 6d. and their debts to 2,032,306l. which being deducted from the above account of their effects, left a balance in favour of the company of 4,364,993l. 10s. 6d. without any valuation of the fortifications and buildings of the company abroad. The statement, however, was complained of as unfair; and it was said, that impartiality was not to be expected from a set of men who had it in their power to make what report they pleased for the interest of government measures: but the members protested their innocence; and administration insisted, that, until proof could be brought that the statement was unfair, the house was bound to adhere to it as just.

540

541
State of the company's affairs.

542
The statement unsatisfactory.

The business was revived after the holidays by an application from the company to government for a loan of 1,500,000l. for four years, at four per cent. interest, with liberty of paying the same according to the abilities of the company, in payments of not less than 300,000l.; and that the company should not make a dividend of more than 6 per cent. until the loan should be reduced to 750,000l.; that then they might raise their dividend to 8 per cent. and after the whole loan.

543
Application of the company to government for a loan.

Britain. loan was discharged, that the surplus of the nett profits arising in England, above the said dividend, would be appropriated in the payment of the company's bond debt, until it was reduced to 1,500,000l. when the surplus profits should be equally divided between the public and the company. It was also requested, that the company should be released from the heavy penal interest incurred by the non-payment of money owing in consequence of the late acts for the indemnity on teas; and that they should be discharged from the annual payment of the 400,000l. to the public for the remainder of the five years specified in the agreement. They farther requested, that the accounts of the Duannee revenues, of the charges of collection, expences of Bengal, company's accounts of sales, &c. should be delivered annually to parliament, and that leave might be given to export teas free of all duty to America, and to foreign parts. This request was judged expedient to be granted, and the following resolutions were agreed to: "That the affairs of the East India Company are in such a state as to require the assistance of parliament; that a loan is necessary to reinstate the company's affairs; that the supply be granted; and that care be taken that the company be prevented from experiencing the like exigencies for the future." The two following motions were also founded upon the report of the secret committee, viz. That, supposing the public should advance a loan to the East India Company, it was the opinion of the committee that the dividend should be restrained to 6 per cent. until the payment of the sum advanced; and that the company be allowed to divide no more than 7 per cent. until their bond-debt be reduced to 1,500,000l.

546
Territorial
right of the
company
to their
possessions
denied.

These several restrictions were judged proper by administration for the security of the public, and were such, they said, as every creditor has a right to make beforehand with a person who wishes to borrow money from him. The company, however, replied, that the restrictions were contrary to the proposals they had made, and void of foundation, as being built on the erroneous reports of the secret committee. The chairman of the company declared at a general court that the government had agreed, or would agree, to the proposed increase of dividend, before the participation of profits took place betwixt the government and company; the first lord of the treasury had told him so, and now wished to deny what he had said by using these expressions in private conversation, and when he did not consider the chairman as acting officially. But if this was the case, to what purpose did public men hold conversations, since they were afterwards to deny or forget what passed? Some time was also demanded to consider of these motions; but that being denied, the question was put and carried as ministry wished.

The next step was to deprive the company of their territorial right to the countries they possessed in the East Indies. This had been allowed them in the most explicit manner, as appears by some of the papers which passed between the French and English ministers during the negotiations for the treaty of Paris; from one of which papers the following is an extract: "Respecting those territorial acquisitions which the English East India Company have made in Asia, every dispute relative thereto must be settled by that com-

pany itself, the crown of England having no right to interfere in what is allowed to be the legal and exclusive property of a body corporate belonging to the English nation." This territorial right, however, was now denied. After reading the company's petition, Lord North told the house that it was the opinion of several great lawyers, that such territorial possessions as the subjects of any state shall acquire by conquest, are virtually the property of the state, and not of those individuals who acquire them. It was his opinion, however, that it would be more beneficial to the public and to the East India Company, to let the territorial acquisitions remain in the possession of the company for a limited time, not exceeding six years, to commence from the agreement betwixt the public and the company. At the same time it was moved, that no participation of profits should take place betwixt the public and the company until after the repayment of 1,400,000l. advanced to the company; and the reduction of the company's bond debt to 1,500,000l. That, after the payment of the loan advanced to the company, and the reduction of their bond-debts to the sum specified, three-fourths of the nett surplus profits of the company at home, above the sum of 8 per cent. upon their capital stock, should be paid into the exchequer for the use of the public, and the remaining fourth be set apart either for reducing the company's bond debt, or for composing a fund for the discharging of any contingent exigencies the company might labour under.

These proceedings were exceedingly disagreeable to the company. They now presented a petition complaining of the injustice of demanding any farther terms on account of a loan, after that loan was discharged. The limitations of the company's dividend to 7 per cent. after the discharge of the loan, until their bond-debt should be reduced to 1,500,000l. seemed not to be founded upon any just calculation of their commercial profits; nor could it with reason be alleged that it was necessary either to their credit or that of the public to restrain them in such a manner. The additional dividend of 1 per cent. was an object of some consequence to the proprietors, but very little to the discharge of their debt to the public; and the hardships of being limited in this manner were exceedingly aggravated by the losses sustained, and the expences they had incurred in acquiring and securing the territorial revenues in India, at the risk of their whole capital, while the public reaped such great advantages. The limitation of the company to a term not exceeding six years for the possession of their Indian territories they looked upon to be entirely arbitrary, as it might be construed into a final decision against the company respecting those territories to which they insisted that they had an undoubted right. Neither could they acquiesce in the resolutions by which three fourths of the surplus nett profits of the company at home, above the sum of 8 per cent. per annum upon their capital stock, should be paid into the exchequer for the use of the public, and the remainder be employed either in further reducing the company's bond-debt, or for composing a fund to be set apart for the use of the company in case of extraordinary emergencies; such unheard-of disposal of their property without their consent not being warranted by the largest pretensions ever

547

ally.

Britain. ver made against them. It was likewise subversive of all their rights and privileges, by denying them the disposal of their own property after their creditors were properly secured by law. Their petition concluded with assuring ministers, that, rather than submit to these conditions, they desired that any claims against the possessions of the company might receive a legal decision; from which, whatever might be the event, they would at least have the satisfaction to know what they could call their own.

548 They are allowed to export tea duty free.

No regard being shown to this petition, the motions were carried in favour of administration. To make some kind of recompense, however, it was agreed on their part, that as the company had a stock of teas amounting to about 17 millions of pounds in their warehouses, they should be allowed to export as much of it as they thought proper free of duty, and employ the money thence arising for the behoof of their own affairs.

549 East India regulation bill brought in.

This concession in favour of the East India Company proved in the event the loss of the American colonies; nor indeed could these arbitrary proceedings with such a considerable body tend to impress the minds of any part of the nation with ideas favourable to the views of administration. In other respects the minister abated nothing of the disposition he had from first to last shown with regard to the company. On the 3d of May 1773 the following resolutions were laid down by him as the foundation of a bill for the establishing certain regulations for the better management of the East India Company, as well in India as in Europe. These were, 1. That the court of directors should in future be elected for four years; six members annually, but not to hold their seats longer than four years. 2. That no person should vote at the election of the directors who had not possessed their stock twelve months. 3. That the stock of qualification should for the future be 1000l. instead of 500l. 4. The mayor's court of Calcutta should for the future be confined to small mercantile causes, to which its jurisdiction only extended before the territorial acquisitions. 5. That, instead of this court, thus taken away, a new one should be established, consisting of a chief justice and three puisne judges. 6. These judges to be appointed by the crown. 7. That a superiority be given to the presidency of Bengal over the other presidencies in India. Each of these resolutions was carried by a great majority. The salaries of the judges were fixed at 6000l. each, and that of the chief justice at 8000l. The governor of the council was to have 25,000l. annually, and the members of the council 10,000l. each. By the friends of the company, however, the bill was supposed to have a tendency to effect a total alteration in the company's constitution in England, as well as the administration of all its presidencies in Asia, in order to subject all their affairs, both at home and abroad, to the immediate power of the crown. No delinquency was charged, nor any specific ground of forfeiture assigned; yet by this bill more than 1200 freemen were to be disfranchised and deprived of any voice in the management of their property. By cutting off the 500l. stockholders, the proprietary would become more manageable by the crown; nor was there any security that the directors would be faithful to the interests of the company when

550 Is disagreeable to the company.

they were no longer responsible to them for their actions. By the establishment of a general presidency over all the affairs of the company, and by the nomination of judges for India, government would in effect transfer the whole management of the affairs of the company to the crown, and the company would have no farther share in the business than to pay what salaries the crown thought fit to assign them. The proprietors of 500l. stock presented a petition, setting forth, that, by King William's charter granted to the company, and repeatedly confirmed since that time, in consideration of many large sums repeatedly advanced by the company to the public, they were legally possessed of a right of voting at the election of directors, making of bye-laws, or in any other matter relating to the affairs and government of the company; but by a clause in this regulating bill they were deprived of this right, and that under a pretence of preventing the pernicious practice of splitting stock by collusive transfers; but so far were the proprietors from giving way to such practices, that in the year 1767 they petitioned parliament for an act, by which the several proprietors entitled to vote should be obliged to hold this qualification six months at least before the exercise of their right, afterwards extending the time to twelve months, rather than the act should fail of its intended effect. This proposed increase of the qualification of the voters, however, could not in any degree answer the end desired; for the splitting of stock being confined to such proprietors as held large quantities, they would find it an easy matter to place their stocks in the hands of half the number of persons, and thus extend their influence in a great and undue proportion; but if ever government conceived designs against the company, they would find it much easier to execute them, while the proprietors were few and opulent, than when they were numerous, and at the same time independent and possessed of moderate fortunes. This petition produced a motion in the house of commons, "That it does not appear that the proprietors of 500l. stock in the East India Company have been guilty of any delinquency in the exercise of their charter-rights according to the several acts of parliament made in their behalf." This, however, being rejected, their regulating bill passed in the house of commons by a majority of more than six to one. In the house of lords it passed by 74 to 17. The duke of Richmond moved for a conference with the house of commons; but this was refused. He then moved that copies of all the papers which had been laid before the commons should be laid before the lords also; but this being likewise refused, he joined six other members in a protest, the substance of which was, that the whole was a scheme of government to get the power and wealth of the company into their hands; pointing out at the same time the many particular infringements on public and private rights by passing the bill.

Britain. 551 Petition of the proprietors of 500l. stock.

552 Motion in their favour rejected in the house of commons.

All this time inquiries went on by the select and secret committees; the affairs of the company were investigated from the year 1756, and many witnesses examined concerning them. A report was presented by General Burgoyne, containing many charges of cruelty and rapacity in the conduct of several gentlemen concerned in the management of the affairs of the

553 Investigation of the company's affairs by the select and secret committees.

Britain.

the company; particularly with regard to the deposition of Surajah Dowlah in 1756. This was said to have been the origin of all the evils that had happened since that time. He insisted much on the treachery used in bringing about that revolution, and particularly the fictitious treaty with Omichund; exposing the conduct of Lord Clive, who had caused Admiral Watson's name to be affixed to that treaty, which the admiral had refused to sign in person*. He concluded with moving for the restitution of all the money received in presents or otherwise in India, while the receivers acted in a public capacity; and at last stated the following resolutions: "That all acquisitions made under the influence of a military force, or by treaty with foreign powers, do of right belong to the state; that to appropriate acquisitions obtained by such means is illegal; and that great sums of money had been obtained by such means from the sovereign princes in India." The general belief that many of the company's servants had acted in a most infamous manner, was at this time so strong, that the above resolutions were carried almost unanimously. Lord Clive defended himself by general protestations of innocence; which, however, gained but little credit, till he entered into a particular refutation of the charges against him. His friends were not of opinion that these were of an atrocious nature, and wished to excuse him by policy, necessity, &c. rather than load him with any great degree of guilt. The treaty with Omichund was justified by necessity. Some said, indeed, that as Omichund had the character of the most accomplished villain in Asia, an Englishman only wished to have a trial of skill with him. This severe sarcasm, however, was a mere piece of wit, without any solid foundation; for the crime, if any there was in that transaction, undoubtedly lay in the dethroning a sovereign prince by means of traitors, not the cheating of these traitors of their reward. Indeed, if once we admit treachery into our dealings at all, it is in vain to pretend any subjection to the rules of justice; for we are already beyond its jurisdiction.

General Burgoyne now moved, "That Lord Clive, in consequence of the powers vested in him in India, had received at various times presents to the amount of 234,000l. sterling, to the dishonour and detriment of the state;" but this being rejected after violent debates, the following was substituted: "That Lord Clive did, in so doing, abuse the power with which he was intrusted, to the evil example of the servants of the public." This also being rejected, another was added, "That Lord Clive, when he received the sum above mentioned, did at the same time render great and meritorious services to his country." Thus the matter was concluded, and the affairs of the company delivered into the hands of administration, who declared that their regard for its welfare was the sole motive for bringing about this revolution.

The affairs of the East India Company were succeeded by those of America. The ill humour occasioned by the taxes laid on that country has been already taken notice of. The stamp act had excited among them a spirit of industry, economy, and a desire of serving themselves with their own manufactures, which had never been forgotten. This was, at that time, as well as afterwards, imputed to wilfulness, or the discontent

of a few, which would afterwards subside of itself, or be suppressed by the voice of the majority; when things would of course revert to their old channel. The trifling tax on tea, however, which had not been repealed, and the allowance given to the company to export what quantities they pleased, now threw matters into a ferment not to be quelled by any means whatever. The various proceedings in America, the tumults, and subsequent war, are fully taken notice of under the article *United States of AMERICA*. Here it only remains to give an account of the manner in which the legislature and people of Great Britain were affected by these events. It has already been remarked, that ever since the conclusion of the peace in 1763 the disposition shown by government to augment the revenue, for which indeed there was at that time an evident necessity, had produced in the popular party of Great Britain a spirit very similar to that manifested by the Americans, though in an inferior degree; so that the patriots of Britain affected to consider the Americans as oppressed by government, and suffering in the same cause with themselves. The destruction of the tea at Boston and other places in America, however, considerably diminished the number of their friends, and made many of those who still adhered much less sanguine in their cause. The matter was announced to parliament by a special message from the throne. Lord North and the other ministers set forth the conduct of the colonists, particularly of the town of Boston, in a most atrocious light, and concluded that now government was perfectly justifiable in any measures they might think proper to redress the wrong, and inflict such punishment on the town as the enormity of the crime seemed to deserve. Opposition did not pretend to exculpate, though it was still attempted to excuse them, by deriving all the disturbances in that country from the arbitrary and absurd measures pursued and obstinately adhered to at home. This heavy charge the ministry evaded by drawing the attention of the house to the more important consideration, Whether the Americans were now to be dependent, or independent, on Great Britain? The Boston port-bill being then brought in, was carried, but not without considerable opposition, both within and without doors. A petition was first presented by Mr Bollen, agent for the council of Massachusetts Bay, urging an act of Queen Elizabeth for the security of the liberty of the colonies. This was presented before the bill had actually made its appearance; but so little regard was paid to it, that, during the very time it lay on the table, the bill was brought in by Lord North. After it had passed two readings, that gentleman presented another, desiring to be heard in behalf of the town of Boston, for the council of Massachusetts Bay. This was absolutely refused; because, though Mr Bollen was agent for the colony, he was not for the corporation of the town of Boston. Neither could he be so for the council of Massachusetts Bay; for as that was necessarily fluctuating, the body which had appointed him was now no longer existing. This appeared very inconsistent to many of the members, and produced a greater opposition in the house than would otherwise in all probability have ensued. A new petition quickly followed from the lord mayor, in the names of the natives and inhabitants of North America residing at that time

⁵⁵⁸ **Britain.** time in London. This was written in a more spirited style, and boldly insisted that the bill was illegal, unprecedented, unjust; and that, under such a precedent, no man or body of men in America could have a moment's security; the charge being brought by the enemies of the town, and the punishment inflicted without hearing them in their own defence, or even making them acquainted with the charge; and they concluded with these remarkable words, that "the attachment of America would not survive the justice of Britain." As little regard being paid to this, as to the former petitions, and all proposals for a delay rejected, the bill passed both houses without a division; the minority, notwithstanding their opposition, not choosing to dissent publicly from the first step taken by government to reduce the disobedient colonies. That this obnoxious bill might not be sent to America without some mitigation, however, they proposed the repeal of the duty on tea laid on in 1767; but this was also rejected, probably from a vain expectation that the opposition of the Americans was that of a mere tumultuous mob, and that by showing a proper spirit and perseverance the ministry could not fail to come off victorious at last.

558
Passes without a division.

559
Repeal of the tea duty refused.

560
Protest on the regulating bill.

561
On the impartial administration of justice bill.

The extreme obstinacy shown by ministers, in this first instance, undoubtedly proved very prejudicial to their cause, not only by exasperating the Americans, but by rousing the indignation of minority, and making their opposition so violent and determined, that the Americans could not but conclude that they had a very strong party in their favour on this side of the Atlantic. This appeared in every subsequent transaction relating to the colonies. The bill for regulating the government of Massachusetts Bay did not pass without a protest, from which we shall only extract the following sentence: "This act, unexampled in the records of parliament, has been entered on the journals of this house as voted *nemine dissentiente*, and has been stated in the debate of this day to have been sent to the colonies as passed without a division in either house, and therefore as conveying the uncontroverted universal sense of the nation. The despair of making effectual opposition to an unjust measure has been construed into an approbation of it."

The like consequences ensued on passing the act for the impartial administration of justice. In the protest on this occasion the lords used the following expressions: "The bill amounts to a declaration, that the house knows no means of retaining the colonies in due obedience, but by an army rendered independent of the ordinary course of law in the place where they are employed. A military force sufficient for governing upon this plan cannot be maintained without the inevitable ruin of the nation. This bill seems to be one of the many experiments towards the introduction of essential innovations into the government of this empire. The virtual indemnity provided by this bill for those who shall be indicted for murders committed under colour of office, can answer no other purpose. We consider that to be an indemnity which renders trial, and consequently punishment, impracticable. And trial is impracticable, when the very governor, under whose authority acts of violence may be committed, is empowered to send the instruments of that violence, to 3000 miles distance from the scene of their offence, be-

VOL. IV. Part II.

yeard the reach of their prosecutor, and the local evidence which may tend to their conviction. The authority given by this bill to compel the transportation from America to Great Britain of any number of witnesses at the pleasure of the parties prosecuting and prosecuted, without any regard to their age, sex, health, circumstances, business, or duties, seems to us so extravagant in its principle, and so impracticable in its execution, as to confirm us farther in our opinion of the spirit which animates the whole system of the present American regulations."

Britain.

A still greater opposition was made to the Quebec bill, inasmuch that, before it could be carried, the ministers were obliged to drop much of that high and aspiring tone to which they had accustomed themselves in talking of American affairs. The minority contended, that here, without any necessity pleaded, or even suggested, an arbitrary influence was extended by act of parliament to that province, furnishing a dangerous precedent, and an additional instance of the aversion which ministry bore to the rights of the people. They argued likewise in favour of the mode of trial by juries, and thought that the establishment of the Roman Catholic religion there gave it a preference over the Protestant, which was now only to be exercised by toleration. The people at large also were alarmed at the religious part of the bill, and it is not impossible that the suspicions conceived at this time might contribute in some measure to the dangerous insurrections of 1779 and 1780.

562
Debates on the Quebec bill.

At the conclusion of the session his majesty expressed the greatest satisfaction at what had been done, and hopes of the good effects that would attend the new regulations. The reception they met with in America is related in its proper place; in Britain the people seemed to wait the event with indifference, but their bad success with the colonists furnished the minority with new matter of reproach to cast on administration. The parliament in the mean time was dissolved by proclamation, and a very short time allowed for the election of new members; so that if opposition at that time had any strength, they had not now time to exert it. The new parliament met on the 30th of November 1774; when his majesty acquainted the houses that a most daring spirit of resistance still prevailed in America, notwithstanding the most proper means had been taken to prevent the mischiefs thence arising, and assured them that they might depend on a firm resolution to withstand every attempt to weaken or impair the supreme authority of this legislature over all the dominions of the crown. In answer to this speech, the minority demanded a communication of all the letters, orders, and instructions, relating to American affairs; but this being overruled, and the address carried as a matter of form. American affairs were delayed, in spite of all opposition, till after the holidays. In the question on the address, the strength of administration was to that of their adversaries as 264 to 73.

563
Parliamentary proceedings in 1774.

In the beginning of 1775 the minority received a considerable accession of strength by the return of Lord Chatham, who, after long absence, again made his appearance in parliament. He now testified his disapprobation of the measures which had been pursued with regard to America in the warmest terms; moved for addressing the king to recal the troops from Boston,

predicted,

Britain.

predicted, that if ministers went on in the way they had done for some time, they would make the crown not worth the king's wearing; that the kingdom was undone, &c. All his eloquence, however, proved at this time ineffectual; administration was determined upon forcing the Americans into subjection, and his motion was rejected by 68 to 18.

565
American papers laid before parliament.

Lord North now presented the papers which had been called for by the minority; but lest the publication of particular names should prove detrimental to individuals, only such parts as administration thought proper for public inspection were laid before the house. This was complained of, but to no purpose; and the papers, in their mutilated state, were laid before a committee of the whole house. In the mean time petitions against coercive measures with America had been received from most of the trading companies of the kingdom: which, though highly displeasing to administration, could not be absolutely rejected, though it was fully determined not to yield to their requests in the smallest degree. A committee was therefore appointed to take them into consideration, which was not to take place until the American affairs were also considered. The reason given for this method of proceeding was, that the consideration of commercial matters ought not to interfere with those of the political kind: each of them being sufficiently embarrassing without any other. This delay of hearing these petitions was supposed to be an absolute rejection of them in effect; and so indeed it proved to be, the committee to which they were consigned being humorously called the *committee of oblivion*. The merchants of London, however, were determined not to give up the point until they had exerted themselves to the utmost. They drew up a paper in which they denied the distinction established by ministry. They affirmed that the connection between Great Britain and America was chiefly of a commercial nature, and that the manifold regulations adopted for the mutual prosperity of the colonies and of the mother-country formed the great political chain which united them to one another. Questions of commerce and policy, therefore, with regard to them, ought never to be divided, but examined jointly, and could never be thoroughly understood if considered in any other way.

566
A great number of petitions from the trading companies.

567
Consigned to the committee of oblivion.

568
Ineffectual remonstrance.

This remonstrance was seconded by all the powers of opposition; but the truth was, that administration had already determined what line of conduct they were to follow, and therefore wished to hear as little as possible on the subject. "War (says Dr Andrews) was now the word: and notwithstanding no weightier reason could be given for not attending to what the merchants had to say, than this very determination, yet that was the very motive that impelled ministers to refuse them a hearing, lest these should make it appear how unwise it was to precipitate the nation into such a measure."

569
Arguments used in favour of administration.

But though there is not the least reason to doubt that administration were now fully determined upon a war, and therefore wished to be troubled with as few objections as possible, they were by no means deficient in arguments for the defence of their own conduct. They alleged that the petitions so much recommended to the attention of the house were principally the work of a factious party. The advantages accruing from the

American trade were owing to the dependent situation of the colonies, who now aimed at a superiority over Great Britain, or at least at shaking off entirely the superiority which the mother-country had till now exercised over them without the smallest complaint. It was the advantage of the merchants themselves that was consulted by maintaining that superiority; and the merchants themselves would be the first to feel the bad consequences of its being lost. War and its consequences are no doubt very terrible, but sometimes are necessary, to prevent greater evils. The greatest evil that can befall a trading nation is the loss of its commerce; and were the Americans to persist in their courses at that time for a few years longer, this consequence must inevitably ensue.

Britain.

It was besides insisted, that though administration were to yield the present contest, the warmest advocates for America could not pretend to say what would be the last of its demands. The Americans aimed in reality at the repeal of whatever appeared obnoxious to their immediate interest: But that and their real interest differed very much. The greatest political evil that could befall them was to be deprived of the political and commercial support they received from Great Britain; and to this they must ultimately submit, if they should ever succeed in the pursuit of that delusive phantom of independence which they now accounted their happiest situation. In short, administration insisted, not without a great show of reason, that the Americans were not to be reclaimed by concessions. Mercantile people, indeed, might imagine so, from the facility with which concessions would be made, and the speed with which tranquillity would be restored. But tranquillity procured in this manner would last no longer than till the colonies, unfettered by any regulations, perceived, or imagined they perceived, the benefit of dealing with other countries, and carried their own commodities wherever they thought proper. This was the point at which they incontestably aimed, whatever they might pretend to the contrary; for notwithstanding the boasts they made of the vast business transacted with Britain, it was well known to arise from the immense credit they were indulged with there, and which they could not expect elsewhere.

The honour and character of the nation were now also said to be at stake. The British had often taken up arms for matters of less consequence; why then should they now hesitate in a case like the present, where honour and interest both called upon them for the most vigorous and speedy exertions? Formerly it was the custom of the merchants to second the wishes of ministry in this respect, instead of opposing them. The inconvenience of suspending their profits for a time must be submitted to, and their enemies would experience as many if not more of the same kind; and it would be unworthy of the character they had so long sustained, to yield to indignities for the sake of profit. The losses above mentioned, however, would be but trifling in comparison of those that would follow in time to come, should Britain from want of spirit give up the assertion of her just rights. This was a policy hitherto unknown in Britain, which had heretofore been noted for the ardour and celerity with which they were maintained.

The end of all this altercation was, that the motion

Britain. in favour of the merchants petitions was rejected by 250 to 89. This point, however, was no sooner discussed, than a violent debate arose about the petition of congress to the king, which had been delivered, and by him referred to parliament. It was argued by administration, that no petition could be received from the continental congress, which was no legal body, and it would be admitting their legality to receive a petition from them; the general assemblies and their agents were the only lawful representatives of the colonies, and none else would be admitted. Opposition replied and argued as much as possible, but to no purpose; and, after an ineffectual struggle, they had the mortification to find that the petition was finally rejected by 218 to 68.

570
On the petition of congress to the king.

571
Chatham's conciliatory plan rejected.

In the mean time a conciliatory plan was prepared by the earl of Chatham, which was presented on the 1st of February 1775. The intent of this bill, he said, was to settle the troubles in America, and to assert at the same time the supreme legislative authority and superintending power of Great Britain over her colonies. This was to be done by their acknowledging on their part the supremacy of the British legislature and the superintending power of parliament. No taxes were to be levied in America, but with the free consent of their assemblies. It asserted a right in the crown to keep and station a military force established by law in any part of its dominions; but declared, that it could not be legally employed to enforce implicit and *unlawful* submission. A congress might also be held, in order to recognize the supreme sovereignty of Great Britain over the colonies, and to settle, at the same time, an annual revenue upon the crown, disposable by parliament, and applicable to the exigencies of the nation. On complying with these conditions, the acts complained of by congress were to be suspended, with every other measure pointed out as a grievance, and the constitution of their government to remain as settled by their charters. This bill was, however, deemed at once totally inadmissible, on account of its alleged partiality to America, by the various concessions it enacted, and particularly by empowering the colonies to assemble in congress; a measure which, of all others, was at that time the most offensive, and supposed to be the most injurious to the British interest.

Lord Chatham was by no means deficient in arguments in support of his favourite plan; but these, though supported by all the powers of eloquence, proved unsuccessful; the proposal was ultimately rejected by 61 to 32. So determined were the majority in giving this an entire rejection, that it was not even permitted to lie upon the table; which, however, may be considered as a piece of indignity offered to that great man, proceeding rather from the indifference with which he had been received at court for some time, than from any real and thorough conviction of the inutility of the plan he proposed.

572
Petition of the West India planters.

A new petition was next presented to the house of commons by the proprietors of estates in the West India islands: representing their alarm at the association of the Americans, and their intended stoppage of trade with the British islands; the situation of which, they said, would be very calamitous, if the acts in question were not immediately repealed. The trade of these

islands was at that time of the most extensive nature. All quarters of the globe were concerned in it; the returns centered in Britain, and were an immense addition to its opulence, insomuch that the British property there amounted to no less than 30 millions sterling. But the West Indies, however wealthy, did not produce the necessaries of life in sufficient abundance for their inhabitants. Large importations were continually wanted, which could only be supplied from North America; and were they to be cut off from a communication with that continent, they would shortly be reduced to the utmost distress. Such was the substance of this petition; to which no more attention was paid than had been to the rest. To administration all petitions now appeared to be the contrivance of faction; and it was said, that however inconvenient the coercive measures might be, they ought not to be retarded by the consideration of any temporary losses. As it was necessary, however, to let the nation know the ultimate resolves of administration respecting America, it was at last done by Lord North in a long speech, in which the most remarkable circumstances relating to the dispute were enumerated. It was asserted, that the universal fermentation, then prevailing in America, proceeded from the unwarrantable arts and practices used to dispose them against the ruling powers in Britain; and asserted, that, notwithstanding all their complaints, the public charges borne by individuals in America were, on the strictest computation, not more than 1 to 50, when compared with what was paid by individuals in England. Nothing, therefore, but a settled determination to quarrel with the parent state could induce the Americans to persist in their disobedience to the lawful injunctions laid upon them, which were neither injudicious nor oppressive; but on the contrary, framed with all possible lenity, and counterbalanced by advantages which were not possessed by Britain. It was therefore a spirit of resistance which animated America, and not a discontent at oppressions, which plainly had no existence. For this reason it was proposed to the house to send a greater force to America; and to pass a temporary act, suspending all the foreign trade of the different colonies of New England, and particularly the Newfoundland fishery, until they consented to acknowledge the supreme authority of the British legislature, &c. upon which these restrictions should be taken off, and their real grievances, if any such there were, redressed upon making proper application. New England, they said, was justly singled out upon this occasion, as being the most guilty of the whole. The others, as less faulty, it was hoped, would yield with less compulsion; but the question now was simply, Whether we would at once abandon all claims on the colonies, and instantly give up the advantages arising from our sovereignty, and the commerce dependent on it? or, Whether we should resort to the measures indispensably necessary to ensure both?

Britain.

573
Rejected.

An address was now carried, which, in the ideas of On the address on the American papers. opposition, amounted to an absolute declaration of war. The consequences, therefore, were painted out with the utmost freedom, and some even denied the charge of rebellion fixed on the province of Massachusetts's Bay. The people there, they said, had done nothing but what the constitution allowed; they had resisted arbitrary measures; and the examples so frequently set

Britain.

them at home were sufficient to justify their conduct. The appellation of *rebels*, they said, was dangerous, and might better be spared; it would only serve to render them desperate, and inspire them with a determination to resist to the last, from an apprehension that their lives and properties were forfeited. This last consideration, however, was made very light of by administration. Great stress, they said, was laid upon the union of the colonies, but a very little time would show with how much impropriety. The principles on which they were associated were too self-denying to be supported by human nature, and were too inimical to the interest and feelings of individuals to bind them long together. In other respects this union of the colonies might be viewed with indifference, and even contempt. The natives of America, it was said, were no soldiers; they were averse to military discipline, and incapable of subordination; they were of a slothful and spiritless disposition; uncleanly, liable to sickness, and easily overcome by fatigue. Such people as these would never face a British army: and a very small force would be necessary to put an end to all their projects of independence.

575
On the re-
commit-
ment of it.

These were the principal arguments for and against this address, which was carried by 296 to 106: but so important was the subject of it deemed by the minority, that a motion was made for recommitting it, on account of the consequences that would probably result from the prosecution of the measures recommended. A very long and violent debate ensued: the event of which was, that administration contended as usual for the necessity of enforcing obedience with fire and sword. The Americans, they said, were become incorrigible through forbearance; lenity was a subject of derision among them, and was imputed to imbecility and fear; they imagined themselves able to abolish the sovereignty of Britain in that country, and were now resolved to do it. It was therefore incumbent on every native of Britain in such a case to stand forth, and vindicate the interest and glory of his country; and it was the duty of parliament and ministry to call forth the whole spirit of the nation to a contest in which every thing dear to them, both in their public and private capacities, was so deeply concerned.

In this, and some former debates, the danger of being involved in foreign wars on account of the colonies had been insisted on; but this was looked upon by administration to be improbable. It was hardly to be imagined, they said, that foreign powers would behave in a manner so very impolitic as to encourage rebellions in other colonies, which might, in a very short time, become precedents for imitation in their own. The number of friends to government in America was likewise very much relied upon. A proper reinforcement to the troops already there would encourage those to declare themselves who were at present too timid to avow their sentiments: These, if duly supported, would be found to be no inconsiderable number; and when added to the forces stationed among them, would undoubtedly counterbalance the power of the malecontents. This project of arming the Americans against one another was reprobated by opposition more than all the rest. The address itself was a measure replete with barbarity as well as imprudence; tending to put

arms in the hands of every man throughout the continent who suspected the designs of the British administration, and to expose to ill usage and ruin every person who was known, or imagined, to be a friend to Great Britain. The Americans were said to aspire at independence; but if any thing could bring this about, it would be the conduct of ministry. The most obedient and loyal subjects cannot have patience for ever with a tyrannical government. They will undoubtedly rise at last and assert their rights; and those who style them rebels on that account ought to remember, that oppression not only produces but justifies resistance. It had always been believed by the Americans, without any contradiction from Britain, that internal taxation in America belonged to the assemblies of the colonies, and to them only. There were opinions in all nations, which the legislature would respect, while they produced no bad consequences. This opinion ought not therefore to have been attacked at such an improper season, after having been virtually recognized by the repeal of several acts, and approved by some of the most learned and intelligent people in the kingdom. It was the greatest misfortune that could befall a state, when its rulers endeavoured, without any apparent necessity, to alter the system and maxims of governing long adopted, and the utility of which had been confirmed by experience. This was, however, the case with Britain. The mildness and benignity which were wont to direct the measures of former ministers were now laid aside for severity and imperiousness; while implicit obedience was imposed upon the colonists, as the only condition by which they could purchase peace.

The aspersions of cowardice, so largely thrown upon the Americans by the ministerial party, did not pass unnoticed. It was observed, however, that were these ever so just, the very nature of their country would fight for them. By this alone our military enterprises would be retarded and impeded in a considerable degree; while the sinews of war would undoubtedly be greatly relaxed, as the suspension of such a considerable commerce as that of our colonies could not fail to be severely felt.

Besides all this, the views and principles of ministers were attacked in the most violent manner. They were said to be reviving the old exploded doctrines of hereditary right and passive obedience.—They required the Americans to submit unconditionally to the will of Great Britain, for no other reason but because she was the parent state: but if no better reason could be produced, they could not be justly blamed for their disobedience. The ties between Great Britain and her colonies, however, were of a far more noble as well as more binding nature than even origin and consanguinity. These ties were the constitution transmitted from Britain, and the brotherly assistance hitherto afforded them by Englishmen; and which ought to render the name dear to them. While those ties remained unviolated, there was no room to complain of their behaviour; but they would never submit to despotic authority in Englishmen more than in any others. Such unwarrantable principles rendered it no longer a question, whether the measures of administration should be considered, but whether the ministers themselves ought not to be deprived of the power they exercised so unconstitutionally.

Britain. constitutionally: And the question was not now between Great Britain and America, but, whether we should give up our colonies or our ministers.

Language of this kind excited the indignation of the ministerial party to a very high degree. They now charged the minority in very plain terms, with the guilt of all that had happened. A factious republican spirit, they said, was gone forth; by which every person who wrote or spoke on the American cause was actuated; and which had not only induced the Americans to commence a rebellion against the parent state, but had filled the house with incendiaries. The final issue of the dispute was, that the recommitment of the address was lost by 289 to 109. The debates were the most violent that had ever been known in the British parliament; and so important was the subject reckoned, that not only the natives of Britain, but even the foreign ministers in London, watched the motions of administration with the utmost anxiety, as considering it a point which might probably give a new face to the affairs of all Europe.

576
Petition from the West India merchants.

All these victories of administration were not sufficient to prevent new enemies from starting up. Petitions had been preparing by the London merchants trading to America, and from those concerned in the West India trade, to be presented to the house of lords. This task was undertaken by the marquis of Rockingham, but he was prevented by a previous motion in favour of the address. A long and violent debate, however, ensued concerning the necessity and propriety of receiving them. The papers on which the address had been founded were said to be partial and mutilated, for which reason the house ought to pay the greater regard to the representation of the merchants; whose testimony, as persons deeply and essentially interested in bringing truth to light, might be depended on with much greater safety. It was urged, that they earnestly desired to be heard before the house took any final determination with regard to America; a refusal would amount to a public declaration, that parliament was resolved to oppose the sense of the petition, right or wrong; and such treatment was in every respect unwarrantable, and no less contrary to sound policy than to equity and good manners.

577
Rejected.

All these representations, however, had no weight with administration: they affected great sorrow at being obliged to declare that the petition could not be received consistently with the interest of the kingdom; they put the merchants in mind that the American proceedings threatened fatally to diminish the commercial greatness of this kingdom, in which case none would suffer so much as themselves; and they insisted that confidence ought to be put in the wisdom of parliament, as it was not doubted that by properly asserting the supremacy of the British legislature in the manner proposed, all those advantages about which they were so anxious would be secured. They were therefore exhorted to submit to temporary inconveniences, which could not be avoided in the present posture of affairs, though probably they would not be of long duration.

In the mean time matters went on from bad to worse in New England; so that it was soon perceived either that the friends of government in that colony did not exert themselves, or that they were far from

being so numerous as had been imagined. In order to make their coercive plan the more effectual, therefore, it was now judged necessary to extend it so that every individual of the colony should become sensible of the punishment. This, it was supposed, would be done by a bill for restraining the four provinces of New England from commerce with Great Britain, Ireland, or the British West India islands; and prohibiting them from carrying on the fishery at Newfoundland. The reasons given for this were in substance the same with those for the others; and indeed both parties had now so much exhausted their arguments, that very little new matter was left for either. Every step taken by ministry, and every proposal made by them, however, produced a violent debate; and though they constantly gained the victory, it was not without the mortification of hearing their principles and conduct reprobated in the most opprobrious manner. In the present instance the bill was carried by 261 against 85; but a petition against it was quickly offered by the London merchants concerned in the American trade, setting forth the danger that would accrue to the fisheries of Great Britain from such a prohibition.

Britain.

578
On the New England restraining bill.

From the evidence brought in support of this petition it appeared, that ten years before the American fisheries had been in such a flourishing state, that the four provinces of New England alone employed near 46,000 ton of shipping and 6000 seamen; and that the produce of their fisheries in the foreign markets amounted in the year 1764 to upwards of 320,000l. Since that time they had greatly increased; and what rendered the fisheries particularly valuable was, that all the materials used in them, excepting only the timber for building the vessels, and the salt for curing the fish, were purchased in Britain, and the nett proceeds of the trade were also remitted thither. It appeared also, that it would not be practicable to transfer these fisheries to Halifax or Quebec, though ever so much encouragement were given to either of these places, as they had neither vessels nor people to man them, and would never be able to procure supplies of seamen from New England on account of the aversion of the inhabitants to the government of these two provinces.

579
General account of the American fisheries.

Some other circumstances were likewise urged as strong reasons against this bill; particularly the commercial concerns of the city of London with New England (to which alone the colony stood indebted for near a million), and the bad consequences of it to the people of Nantucket. This is a barren island, lying off the coast of New England, about 15 miles long and three broad, containing about 6000 inhabitants, most all Quakers. The natural produce of this island, it was alleged, could not maintain 20 families; but the industry of the inhabitants was such, that they kept 130 vessels constantly employed in the whale-fishery, which they carried on in the north seas, to the coasts of Africa and Brazil, and even as far as the Falkland islands and the shores of Terra Magellanica. These people, it was said, ought undoubtedly to have been exempted from the common calamity, were it only from the applause due to so much industry and resolution.

580
Of the inhabitants of Nantucket.

The instance of Nantucket was so strong, that administration, with all their obstinacy, were obliged to relax.

Britain. relax a little; and, of their own accord, afford them the relief they had such just reason to expect. That the petition in the main might prove unsuccessful, however, another was presented by the inhabitants of Poole, the tenor of which was directly opposite to that of the city of London. In this it was set forth, that the restrictions proposed by the bill would not prove detrimental to the trade of England, which was fully able, with proper exertions, to supply the demands of foreign markets. The advantage of the Newfoundland fishery more than that of New England to this country was, that it bred a great number of hardy seamen peculiarly fit for the service of the navy, while the New England seamen were by act of parliament, exempt from being pressed. It appeared also from the examination of witnesses taken in support of this petition, that the fishery from Britain to Newfoundland employed about 400 ships, amounting to 360,000 tons, and 2000 shallops carrying 20,000 tons and navigated by as many seamen. Each season produced 600,000 quintals of fish, and the returns at a moderate rate were valued at 500,000.

581
Remark-
able protest
against the
restraining
bill.

The bill was debated with great animosity in the house of peers, and produced a remarkable protest, in which the measures of government were spoken of with great severity. "That government (said they) which attempts to preserve its authority by destroying the trade of its subjects, and by involving the innocent and guilty in a common ruin, if it acts from a choice of such means, confesses itself unworthy; if from inability to find any other, admits itself wholly incompetent to the end of its institution." They also reprobated in severe terms the assertion already mentioned, that the Americans wanted spirit to resist, and that Britain would find them an easy conquest. Such language was represented as altogether void of foundation, and the mere effect of party-spirit and resentment. It was also the more imprudent and unadvised, as tending, in case of coercive measures, to slacken the care and solicitude with which they ought to be pursued, and to occasion remissness in those to whom they might be entrusted, from a persuasion that the enemy to be encountered was not to be feared, and could easily be overcome.

582
On the
force to be
sent to A-
merica.

The final resolution of reducing the colonies by force being now taken, it became necessary to make proper preparations for the purpose: and in this the conduct of administration was little less censured than in other respects. As the above-mentioned opinion, that the Americans were timid and incapable of becoming soldiers, prevailed greatly at that time, a force of 10,000 men was judged sufficient to reduce the province of New England to obedience. This was vehemently opposed by the minority. They insisted that the force was totally inadequate, and only calculated to produce expence to no purpose. The first impression, they very justly observed, ought to be decisive, if possible; and in order to render it so, it was necessary to send such a fleet and army as might ensure the confidence of the public, and be certainly capable of surmounting all obstacles. Many of the friends of administration were of the same sentiments in this respect; and the only reason assigned for acting otherwise was a hope that the Americans would, upon more mature consideration, desist from their opposition. That they might the more readily be induced to this submission,

Lord North's conciliatory proposition was formed. By this it was enacted, that when the governor, council, and assembly of any of the colonies, should propose to make a provision for the common defence, &c. and if such provision should be approved of by the king in parliament, the levying or imposing of taxes on that colony should then be forborne, those duties excepted which it might be expedient to impose for the regulation of commerce; the nett produce of which should be carried to the account of the colony where it was raised. But this proposal, though highly extolled by the friends of administration, was no less reprobated by minority than the others had been. It was said to be insidious, and calculated for the purpose of raising a revenue, which was now said to be the object of ministers. There was no essential difference between the present and former modes of taxation. The colonies were as effectually taxed without their consent by requiring them to pay a stated sum, as by laying a number of duties upon them to the same amount. There was besides a capital deficiency in the proposal, viz. that no sum was specified; so that the Americans were left totally ignorant of what the demands of Britain might be. After a long debate, however, the question was carried in favour of administration by 274 to 88.

The like fate attended a petition to the throne from the island of Jamaica. Instead of relaxing any thing of their severity, the ministry now included the southern colonies in the restrictions laid on New England. Still, however, the petitioners were indefatigable in their endeavours to be heard. The West India merchants and planters seconded their last petition by a large detail of circumstances relating to the British islands in that part of the world. This affair was conducted by Mr Glover, a gentleman equally celebrated for his literary talents and commercial knowledge. From his investigations it appeared, that, exclusive of the intrinsic worth of the islands themselves, their stock in trade and other property amounted to no less than 60 millions; the exportation to Britain had late been near 200,000 hogsheads and puncheons of sugar and rum, amounting to no less than four millions in value; the direct revenue arising from which was 700,000 pounds, besides that which accrued from the collateral branches depending upon it. All this, however, was urged in vain. Conciliatory proposals were made by Mr Burke and Mr Hartley, but they were rejected by great majorities. These proposals, indeed, instead of serving the cause they were meant to promote, did the very reverse. A dread was entertained of the consequences which might ensue from the republican opinions now so prevalent in the colonies, and all partiality towards them was looked upon in such a criminal light, that their opponents became deaf, on many occasions, to the voice of reason and humanity when urged in their behalf. On the other hand, the favourers of America urged on by a furious zeal, and even resentment against those whom they looked upon to be promoters of arbitrary measures, erred equally in their opposition to ministry. This violent party spirit appeared not only among the people at large, but broke forth with the utmost fury in parliament, where the debates often resembled the railings of Billingsgate rather than the deliberations of the first assembly in a great and powerful nation.

586
All conciliatory proposals not only ineffectual but detrimental.

587
Extreme
violence of
both parties.

In

Britain.
588
Misrepresentations on both sides.

In this temper of mind it is no wonder that the state of affairs was scarce ever truly represented by either party. Government continued to enact new laws, now in vain, against the Americans; their antagonists opposed these in a manner so little different from what has been already related, that any farther account of the debates would be as unentertaining as tedious. Other petitions were presented and treated with neglect. The increase of union and preparations for war among the colonists were by the ministerial party treated as the mere commotions of a headstrong mob; and by the other as an association of an injured and virtuous people, who were about to found a mighty empire in the west, while Britain was to sink in utter disgrace and contempt by their mere secession, without making any account of their exploits in the field, which could not fail to equal those of the heroes of antiquity. On the same principles the event of the skirmish at Lexington was magnified by the one into a "disgraceful defeat" on the part of the British; and by the other treated with absolute unconcern, as if no regard whatever was to be paid to it, nor any inference drawn from thence concerning the fate of the war in general. Thus also the battle at Bunkers Hill, and all the transactions of the year 1775, were unfairly stated by both parties; and the only consequence ensuing from these misrepresentations was the inflaming to a violent degree the resentment betwixt the two parties; one of which depressed the Americans to the rank of consummate poltroons, while the other exalted them almost to that of demigods.

While these altercations continued to agitate the minds of the superior classes of people in Britain, the middle and lower ranks remained in a kind of indifference, or rather were against the proceedings of ministry. This opposition could not indeed influence the councils of the nation, but in other respects it proved very troublesome. The levies were obstructed, and the recruiting service was never known to go on so heavily; numbers of people of that description not only refusing the usual proffers, but even reprobating the cause in which they were solicited to engage. Besides this, several officers of high rank showed a great aversion at the service. Lord Effingham, who had distinguished himself by his opposition to ministerial measures, resigned the command of his regiment rather than fight against the cause he had espoused so warmly. His example was followed by that of several other officers; and it is not to be doubted that, while this step conferred upon them a very considerable share of popularity, it excited in the minds of ministry an equal degree of resentment. Lord Effingham, in particular, received the public thanks of the cities of London and Dublin; both of which showed an extreme aversion to the commencement of hostilities with America. The former, indeed, could scarce restrain themselves within any bounds of moderation. After the affair at Lexington they framed a remonstrance and petition, animadverting in the most severe manner on the ministry and parliament; and it was not without the greatest difficulty that the more moderate party procured one to be drawn up, under the name of an "humble petition," couched in less reprehensible terms.

589
Resignation of Lord Effingham and other officers.

590
The city of Londonresents the conduct of ministry.

In the mean time several inconveniences began to be felt in different parts of the nation. The suspension of the sale and purchase of negro slaves in the West Indies and in North America, and the prohibition to export arms and gunpowder, had greatly impeded the African trade from Bristol and Liverpool. In consequence of this, a great number of ships which formerly sailed from these ports had been laid up, and near 3000 sailors belonging to Liverpool dismissed from service. Their situation soon rendered them riotous; and it was not without the assistance of the military that they were quelled. These distresses, however, made no impression on administration; who having once laid it down as a maxim, that the subjection of America was the greatest political good that could happen to Britain, were, in a consistence with their own principles, obliged to overlook every disaster that might happen in the mean time as a temporal inconvenience, which ought not to be regarded in the prosecution of a great and magnificent plan.

But whatever might be the views of administration in this respect, it was far otherwise with the generality of the nation. They felt the present inconveniences severely, while the subjugation of America presented them with no solid foundation to hope for an equivalent. It was with the utmost satisfaction, therefore, that they received the news of Mr Penn's arrival in 1775, with a new petition from the congress to be presented to the king; after which he was to give it to the public. Their expectation, however, was soon disappointed. The petition was delivered to Lord Dartmouth on the 1st of September; and in three days it was replied, that no answer would be given to it. This laconic procedure excited no small surprise, as it was universally allowed that the language of the petition was respectful, and that it expressed the highest desire of peace and reconciliation. Lord Dartmouth's answer, therefore, could not but be considered as a final renunciation of all friendly intercourse with the colonies, and which would drive them into a connexion with foreign powers; a resource at which they themselves had hinted when they first took up arms. It was also thought not only to be injudicious in itself, but very ill-timed, and not at all consistent with the situation of the affairs of Britain at that time. On the other hand, the friends of administration insisted, that the petition offered nothing that could in a consistency with the dignity of the British empire be taken any notice of. Instead of professing any repentance for their own conduct, they had offered stipulations, and even required concessions on the part of Britain. It was likewise said on the part of administration, that fear had a share in framing the proposals now held out. The Americans were very sensible, that though the first steps taken by Britain had not answered the purpose, much greater efforts would quickly follow; and that, without being allowed some time, it was impossible they could bring their matters to bear. The petition, therefore, might be considered as written with a view to procrastinate matters, which was by no means admissible on the part of Britain. The colonies were already well apprised of the conditions on which they would be restored to favour; and had it at any time in their power to put a stop to the operations of war by accepting these conditions: but it would be imprudent to

Britain.
591
Distresses of the nation in consequence of the American war.
592
Last petition of congress rejected.

^{Britain.} to stop the military preparations upon such an uncertain expectation as the petition from congress held out. It was also plain, that a great majority of the nation approved of the measures of government; for addresses were received from all quarters, recommending, in the most explicit manner, a vigorous exertion against America.

⁵⁹³
Revival of the distinction and animosity betwixt Whigs and Tories.

The rejection of this petition inflamed the minds of both parties more than ever against each other. The obsolete distinction of *Whig* and *Tory* was now revived, and that with such animosity, that Britain itself, as well as America, now seemed in danger of becoming a seat of war and bloodshed. The Tories were accused as the promoters of those sanguinary addresses already mentioned. They were said to be the great misinformers of government; and the false representations they industriously procured from all quarters had contributed more than any thing else to inflame the animosity and produce the civil war. They were upbraided with their attachment to the Stuart family. England, it was said, had, through their machinations, been made a scene of blood in the last century; and had been perpetually tottering on the brink of ruin from the Restoration to the Revolution. At that time indeed the more sensible part of the nation, wearied out with perpetual attempts to enslave them, took the resolution of expelling an ill-advised monarch, whom nothing could prevent from pursuing their pernicious plans to his own ruin. But the Tories were an incorrigible race, who could not be cured even by experience; for though they had seen repeated instances of the mischief attending their plans, they adhered to them with as great obstinacy as if the greatest benefits had on all occasions accrued from them. Dissension at home and disgrace abroad had been the constant attendants of their councils; while the only objects they ever had in view were the establishment and propagation of their own tenets; for these alone they laboured, the honour and interest of the nation being entirely out of the question. These they would willingly sacrifice to the points above mentioned; and as an instance of the effects of their councils, the treaty of Utrecht was mentioned. Here, said their antagonists, the fruits of a triumphant war, carried on for twelve years, were lost at once by those feuds which the Tories occasioned through their restless endeavours to compass their iniquitous projects.

On the other hand, the Tories said that the Whigs were the genuine descendants and representatives of those republican incendiaries who had in the last century overturned the constitution and desolated the kingdom. They pretended indeed to assert the liberty of Britain; but under this pretence they wished to engross all the authority to themselves, as might easily be proved by an impartial examination of their conduct in the unhappy times alluded to. In the present dispute, the principal question was, Whether the king and parliament, when united, were to be obeyed or resisted? The Tories insisted that they were to be obeyed; the Whigs that they were to be resisted. The truth was, therefore, that there were two parties in Britain; the one of which was of opinion, that the colonies owed obedience to Great Britain in all cases whatever, and that in case of refusal they ought to be compelled to obey; but the other, though it acknowledged the

same obligation on the colonies, thought it was unadvisable to force it. ^{Britain.} The only constitutional method of deciding this question was by an appeal to parliament. That appeal had already been made, and parliament had determined on compulsion. The decision ought therefore to be considered as that of the voice of the nation; and were a parliamentary majority to be viewed in any other light, all things would fall into confusion, and no rule of government remain. The doctrines of the Whigs were also said to be inadmissible in sound policy. Authority, sovereign and uncontrolled, must reside somewhere; and allowing every charge of bribery and corruption (which were brought by the other party most liberally) to be true, it were still better to be governed in some instances by such means, than to have no government at all. This must at last be the case were continual appeals to be made to the people; as they would undoubtedly be followed by perpetual broils at home as well as disasters abroad.

To these violent bickerings at home, some very serious commercial misfortunes were now added. It had been represented as very probable, during the last session of parliament, that the bill for depriving the people of New England of the benefits of the Newfoundland fishery, would redound greatly to the interest of Great Britain, by throwing into her hands alone the profits which were formerly divided with the colonies. This expectation, however, proved totally void of foundation. The number of ships fitted out that year was scarcely greater than usual. The congress had also prohibited them from being supplied with provisions; so that not only those on board the ships, but even the inhabitants on the island of Newfoundland itself, were in danger of perishing. Many of the ships were therefore obliged to go in quest of provisions, instead of prosecuting the business on which they came. On the whole, therefore, instead of any increase, the profits of the fishery suffered this year a diminution of near 500,000*l.* Along with this, some natural causes cooperated, which, by the more superstitious, were considered as the effects of divine wrath. A most violent and uncommon storm took place in these latitudes during the fishing season. The sea rose full 30 feet above its ordinary level; and that with such rapidity, that no time was allowed for avoiding its fury. Upwards of 700 fishing boats perished, with all the people in them; and some ships foundered, with their whole crews. Nor was the devastation much less on shore, as the waters broke in upon the land, occasioning vast loss and destruction.

By these misfortunes, the general stagnation of commerce, and the little success that had hitherto attended the British arms, the mercantile part of the nation were thrown into despair. Petitions were poured in from all quarters, the contents of which were similar to those already mentioned, and their reception was exactly the same. Ministers had determined on their plan; and the only difficulty was, how to put it in execution as quickly as they desired. For this purpose, application was made to the petty states of Germany, who are wont to hire out their forces, and who had frequently sent auxiliaries to Britain in former cases of exigency. At present, however, the scheme met with considerable difficulties, occasioned by the distance, as well as the danger,

Britain. danger, of the desertion of the mercenaries. The princes were likewise alarmed at the appearance of losing so many subjects for ever; while the latter were no less startled at the proposal of being transported across the ocean into a new world, there to be exposed to all the miseries of war, with very little hope of ever seeing their native country again. Other resources, however, were devised by calling in the assistance of the Hessians, and obtaining from Holland that body of Scots troops which had been so long in their service. But in both these views administration were disappointed. All the states of Europe looked upon Britain with an invidious eye, though none so much as Holland and France; these being the two powers who had most reason to hope for advantage from the quarrel. A very strong party in Holland contended for the American interest. Pamphlets were daily published at Amsterdam in justification of the colonies: their case was compared with that of the Netherlands in former times: and they were exhorted to persevere in their claims against the pretensions of Britain. Her they represented as insatiably covetous of wealth and power, and desirous of seizing every thing she could. She was asked with being of a domineering disposition, and that she had become intolerable, since her successes in the war of 1755, not only to her neighbours, but to the whole world: nay, that even during the war she had exercised an absolute sovereignty at sea, and did not scruple to avow a right and title to rule over that element.

598
France and Holland espouse the American cause.

599
Auxiliaries obtained from Hesse and Brunswick.

600
Vast sums expended to supply the garrison of Boston.

But though these powers thus early expressed their hostile disposition towards Britain, it was otherwise with the princes of Hesse and Brunswick; by whom, and some other German princes of inferior note, a considerable number of troops were supplied. At the same time, that as many British forces as possible might be employed, large draughts were made from the garrisons of Gibraltar and Minorca, who were supplied in return with an equal number of men from the electorate of Hanover. In justice to the ministers, indeed, it must be owned, that they prosecuted the scheme they had undertaken with all possible vigour; inasmuch that the expences already began to occasion considerable alarm. This was owing, in the first instance, to the bad success of the British arms, which occasioned a demand on this country altogether unlooked for. It had always been supposed, that the British army would be completely victorious; or at least would remain so far masters of the field, that they could easily command what supplies of fresh provisions were necessary. Instead of this, they were now cooped up in such a manner as to be actually in danger of perishing for want. The supplies, therefore, of necessity, were sent from Britain; and indeed the exertions for their relief were such as must give high ideas of the opulence and spirit of the British nation. For these troops there were shipped no fewer than 5000 live oxen, 14,000 sheep, with a proportionable number of hogs, immense quantities of vegetables, prepared with all possible care; 10,000 butts of small beer, and 5000 butts of strong beer. Some idea of the expences of these articles may be obtained from an account of what was paid for articles trifling in comparison of the above. For a regiment of light horse in Boston, 20,000l. were paid for oats, hay, and beans. The articles of vinegar, ve-

getables, and casks, at no less; and every thing else in proportion. The contingencies occasioned by military operations amounted to near 500,000l. The prodigious expences, therefore, of maintaining an inconsiderable armament at such a distance, could not fail to give a very unfavourable opinion of the war at large, and justly raise suspicions, that even the treasures of Britain would not be able to defray the expence. One advantage, however, was derived from such immense profusion; the price of every thing was augmented; that of shipping particularly rose one-fourth in the ton: and though the profits made by contractors and their numerous friends were complained of, the benefits which accrued to multitudes employed in the various branches of public business seemed in some measure to make amends for every thing.

Britain.

Misfortune, however, seemed now to attend every scheme in which Britain engaged herself. Some part of it, indeed, in the present case, might be derived from mismanagement. The sailing of the transports was delayed so long that their voyages were lost. They remained for a long time wind-bound; and, after leaving port, met with such stormy weather, that they were tossed to and fro in the Channel till most of the live stock they had on board perished. After clearing the coast of England, their progress was retarded by a continuance of bad weather. They were forced by the periodical winds from the coast of America into the ocean. Some were driven to the West Indies, others were captured by American privateers, and only a very few reached the harbour of Boston, with their cargoes, quite damaged, so that they could be of little or no use. Notwithstanding the immense supplies above-mentioned, therefore, a subscription was set on foot for the relief of the soldiers, as well as of the families of those who died in the service. This was liberal on the whole, though many refused to contribute, from their disapprobation of the cause; and bitter complaints were made of want of economy throughout the whole American department.

601

Almost all the Boston stores destroyed or taken.

All this time the violent animosities between the parties continued; the desire of peace was gradually extinguished on both sides; and the foundation laid between the of an enmity scarcely ever to be extinguished. Each seemed to be seriously of opinion that the other would willingly ruin the nation if possible; a remarkable instance of which was the commitment of Stephen Sayre, Esq. banker (one of the sheriffs of the preceding year), to the Tower for high treason. The accusation laid against him was no less than that of having formed a design to seize his majesty as he went to the house of lords: but the scheme itself, and the method in which it was to be executed, appeared both so ridiculous, that the prisoner was very soon discharged; after which he commenced a process against Lord Rochfort for false imprisonment.

602

Violent animosities between the two parties.

603

Mr Sayre committed to the Tower.

With respect to the parliamentary proceedings during this period, very little can be said, further than that every measure of administration, whether right or wrong, was violently opposed. The employment of foreign troops, and admitting them into the fortresses of Gibraltar and Minorca, were most severely censured, as being contrary to the bill of rights. Administration contended that this bill only forbade the introduction of a foreign military power into the kingdom during

604

Parliamentary debates.

Britain. ring peace; but the times were not peaceable, and the introduction of the troops was evidently with a view to quell a rebellion. The force designed for the conquest of America was then declared to be inadequate to the purpose; but it was replied, on the part of ministry, that the design was to conciliate, not to conquer. The force (25,000 men) was sufficient to strike terror; and though this should not instantly be produced, conciliatory offers would still be held out after every blow that was struck.

605
Military operations of the Americans.

In the mean time the Americans, sensible of the dangerous situation in which they stood, exerted themselves to the utmost to dislodge the British troops from Boston. This being at length accomplished in March 1776, they proceeded to put their towns in the most formidable state of defence; insomuch that they seem, if properly defended, to have been almost impregnable. This was evident from the repulse of Sir Peter Parker at Charlestown: but they did not exert equal spirit in the defence of New York; where, besides losing the town, they received such a defeat as seemed to threaten their affairs with total ruin. See AMERICA.

606
Their cause believed in Britain to be desperate.

In this view it appeared to the generality of the people in Britain. The successful campaign of 1776 was looked upon as so decisive, that little room was left to suppose the Americans capable of ever retrieving their affairs. Opposition were much embarrassed, and now almost reduced to the single argument of the interference of foreign powers, which they had often unsuccessfully used before. Besides this, indeed; the obstinacy of the Americans in refusing the offers of Lord Howe, even at the moment of their greatest depression, seemed to be a very bad presage. The strength of ministry, however, now became so decisive, that whatever they proposed was immediately carried. The number of seamen for 1777 was augmented to 45,000, and upwards of five millions voted for the expence of the navy, and to discharge its debt. The expences of the land-service amounted to near three millions, besides the extraordinaries of the former year, which amounted to more than 1,200,000l.; and though this vast provision became the subject of much complaint and animadversion, the power of ministry silenced every opposer.

607
Vast expences attending the war.

608
Perplexity of administration on the news of General Burgoyne's defeat.

But however administration might now triumph, their exultation was but of short continuance. The misfortune of General Burgoyne at Saratoga threw the whole nation into a kind of despair, and reduced the ministry to the greatest perplexity. The great difficulty now was to contrive means for raising a sufficient number of forces to carry on the war: but from this they extricated themselves by what must be allowed a masterly contrivance. This was the encouraging levies for government service by cities and private persons; and as the design was kept a profound secret before the Christmas recess, they were not disturbed by the dangerous clamours of opposition. The recess was purposely extended in order to give time for the scheme to take effect; and before parliament met again it was actually accomplished, so that ministers could once more face their opponents without any fear.

609
They extricate themselves with great dexterity.

610
The French resolve to assist America.

Another and more weighty consideration, however, now occurred. The European states in general had long beheld the grandeur of Britain with an invidious eye. The news of the disaster at Saratoga was there-

fore received among them as those of the defeat of Charles XII. at Pultowa was among the powers whom he had so long commanded. Of all these the French, for obvious reasons, were the most active in supporting the Americans. Numbers of the young nobility were eager to signalize themselves in the American cause; and among the rest the marquis de la Fayette, a young nobleman of the first rank and fortune. Impelled by an enthusiastic ardour in favour of the American cause, he purchased a vessel, loaded her with military stores, and sailed in her with several of his friends to America, where he presented his services to congress. From them he met with a most gracious reception, and was invested with a command, in which he lost no opportunity of distinguishing himself. Besides this nobleman, several other officers from France and Germany actually entered the American service; and by their military talents greatly contributed to the exertions which the colonies were afterwards enabled to make.

This assistance, however, would have been but trifling, had not the French court also interested itself in their behalf; for by the time, or very soon after, the news of General Burgoyne's disaster arrived in Britain, a treaty was on foot between the French court and the United States of America.

Even before this time France had showed such an extreme partiality towards the Americans, as might have plainly indicated their design of ultimately assisting them in their national capacity. The encouragement given to the American privateers in all the ports of France had produced strong remonstrances on the part of Britain; and an order was at last demanded, that all these privateers with their prizes should depart the kingdom. With this they found it necessary to comply at that time, lest reprisals should be made by capturing their whole Newfoundland fleet then out on the fishery. So many delays, however, were made on various pretence, that not a single vessel was dismissed from any of their ports. So far indeed were the French court from any design of this kind, that in the month of July 1777 the whole body of merchants throughout the kingdom were assured from government that they might depend on protection in their trade with America.

All this time the greatest preparations were made throughout the whole kingdom of France for war; so that the most judicious politicians were of opinion that a rupture with that power would have immediately followed the commencement of hostilities with America, and for which the behaviour of the former furnished abundant reasons of justification. Whatever might have been the motives of the British ministry, however, it is certain, that in defiance of probability, even when joined by the most acrimonious censures of opposition, they continued to pretend ignorance of any hostile intentions in the court of France, until that court of its own accord thought proper to announce them. This was done by a formal notification to the court of Britain in the month of March 1778, and that in the most mortifying terms. In this declaration it was announced, not only that a treaty of friendship and commerce was concluded betwixt France and America, but Britain was insulted with being told that America was actually in possession of independency, as if the former

611
Treaty with America announced to the court of Britain.

^{Britain.} mer had already exerted her utmost efforts without being able to reduce them. A merit was also made of having entered into no commercial stipulations in favour of France exclusive of Britain. Nothing, therefore, could be more offensive; and though it could not decently be said on the part of the French monarch that he wished for war, yet his pacific intentions were conveyed in such haughty terms, that the whole could only be considered as a declaration of those hostilities which he pretended to avoid.

⁶¹² Several charges against administration.

Both parties now united in their opinion that a war with France was unavoidable; but they were not for that reason any farther advanced towards a reconciliation. It must be owned, indeed, that the minority had now, according to their own account, received very great provocation. They had from the beginning reprobated the American war, and prognosticated its bad success. In this they had been overruled, and the character of the Americans represented in such a manner as almost to preclude the idea of their being able to resist. They had resisted, however; and by destroying or taking prisoners a whole army, verified those predictions which had been so often treated with ridicule. The popular party had, times without number, insisted in the most earnest manner for some kind of concession towards America; but this had constantly been refused with an unparalleled and inveterate obstinacy. They now saw these very concessions offered to America after the defeat of Burgoyne, which, had they been granted in time, would have prevented all the mischief. Added to all this, the expences for the ensuing year had been hurried through the house before the Christmas vacation; the levies had been raised by subscription without consent of parliament at all; yet both these proceedings had been determined to be strictly legal and constitutional. Every inquiry into the measures of government had been frustrated; and one into the state of the nation in general, which could not be absolutely rejected, was rendered ineffectual by delays and evasion. Lastly, They now saw their country involved in a foreign war with a nation well provided for all emergencies, while we had supinely suffered them to go on, without making the least effort to put ourselves in a proper state of defence.

⁶¹³ Removal of the ministers insisted upon.

For these reasons opposition insisted that the present ministry ought no longer to be trusted with the management of public affairs. An acknowledgment of the independence of America was now by many supposed to be the only rational step that could be taken, which might now be done with a good grace, and which we would unavoidably be obliged to take at last whether we would or not. By acknowledging this independence before they had time to enter into exclusive engagements with France, their trade would be open to all the world. This of course would lessen their correspondence with France, and leave them at liberty to form such connections as they thought most proper. The ministerial party, however, still insisted on vigorous measures, representing it as a spiritless and disgraceful measure to bend beneath the power of France, and setting forth the resources of Great Britain as sufficient to resist the efforts of all her enemies. The dishonour of leaving the American loyalists exposed to the resentment of their countrymen was also set forth in the strongest manner. These,

by very intelligent people, were said to be by far the greater number. Was it not more eligible, on the very strength of such an affirmation, to make trial of its veracity, and to put arms into their hands? Whatever the danger of the experiment might be, we could not abandon them without exposing our reputation, and losing that character of fidelity to our engagements for which we had hitherto been so justly respected. Unanimity in the present case was strongly, and indeed very justly, insisted upon; but when opposition complained of some occult irresistible influence, by which the counsels of the nation were directed, in despite of every suggestion of reason and argument, the charge was denied in the strongest manner, and ministers disclaimed every motive of their conduct, excepting that of an internal conviction of its own rectitude.

^{Britain.}

Notwithstanding the violence of these altercations, however, the greatest courage and steadiness was manifested by the cool and deliberate part of the nation. The French resolved in the first place to excite a general terror by threatening an invasion. This was evidently impracticable, without their procuring first the superiority at sea: yet as multitudes in the country were apt to be terrified by the very mention of a French invasion, orders were issued to draw out and embody the militia, which was then composed of men in every respect as well exercised and disciplined as any regular troops. It was complained, however, that a French squadron of 12 ships of the line had sailed from Toulon without any obstruction, under the command of the count d'Estaing. The most grievous apprehensions were entertained from the inferiority of Lord Howe's naval force, which might expose him to a total defeat, and the whole fleet of transports to be taken or destroyed by the enemy. But whatever might have been the probabilities in this case, it is certain that either the fortune or conduct of this commander were such, that no exploit of any great consequence was ever performed by him. That matters, however, might be put in the best situation possible, addresses were moved for the recalling of the fleets and armies from America, in order to station them in places where they might contribute more effectually to the defence of the kingdom. This was opposed not only by administration, but even by some of the most popular members of opposition themselves. Of this opinion were Lord Chatham and the earl of Shelburne; the former of whom resisted it with a vehemence of speech peculiar on this occasion.

⁶¹⁴ Invasion threatened by the French.

⁶¹⁵ D'Estaing sails with a squadron from Toulon.

The operations of the French in America, with the various success of the war, are related under the article *United States of America*. Here we have only to take notice, that d'Estaing having failed in his attempt on the British fleet at New York, and in assisting his allies in their attempt on Rhode island, as well as having by other parts of his conduct greatly disgusted them, sailed for the West Indies, where he unsuccessfully attacked the island of St Lucia*. Being repulsed in this attempt, he sailed to the island of Grenada, which he reduced, treating the vanquished in a very cruel manner; † while a body of troops dispatched by him also reduced the island of St Vincent. * See St Lucia. † See Grenada.

⁶¹⁶ Exploits of d'Estaing.

By this time the French admiral was powerfully reinforced; so that his fleet consisted of 26 sail of the

line and 12 frigates. During the time he was employed at Grenada, Admiral Byron with the British squadron was accompanying the homeward-bound West-India fleet till out of danger; after which he sailed with a body of troops under General Grant for the recovery of St Vincent; but before they could reach that island, certain intelligence was received of the descent at Grenada. On this they steered directly for that island, where they encountered the French fleet without hesitation, notwithstanding the great superiority of the latter. At this time the French squadron amounted to 27 sail of the line and seven frigates; while that of Britain consisted only of 21 line of battle ships and one frigate. The British admirals, Byron and Barrington, endeavoured to bring the enemy to a close engagement, but this was as studiously avoided by d'Estaing; and such was the dexterity and circumspection with which the latter conducted matters, that it was only by seizing the transient opportunities of the different movements occasioned by the wind and weather, that some of the British ships could close in with their antagonists. Even when this was the case, the engagement was carried on upon such unequal terms, that the British ships were terribly shattered. For some time Captains Collingwood, Edwards, and Cornwallis, stood the fire of the whole French fleet. Captain Fanshaw of the Monmouth, a 64 gun ship, singly threw himself in the way of the enemy's van to stop them. Several of the British ships forced their way to the very mouth of St George's harbour in the island of Grenada; but finding it in the hands of the French, an end was put to the engagement; nor did the French care to renew it, though the British ships had suffered very much.

Lucia.

D'Estaing now having received fresh reinforcements, set sail for the continent of America, after convoying the homeward-bound fleet of French merchantmen in their return from the West-India islands. His disastrous attempt on the town of Savannah, with the subsequent disorder betwixt him and the colonists, are related under the article *United States of AMERICA*. Here we have only to take notice, that thus the fears which had been excited by the superiority of the French in the West Indian seas were effectually dissipated. The islands of Dominica, St Vincent, and Grenada, were indeed lost; the first being taken by the marquis de Bouille, governor of Martinico, and the two last by d'Estaing as already related*: but these successes were balanced by the failure of the French commander in every other enterprise; by his terrible disaster at the Savannah; and by the acquisition of St Lucia, which was taken in the year 1778 by Admiral Barrington and Generals Prescott and Meadows†. In other parts of the West Indian seas also the honour of the British arms was very effectually supported by the bravery and vigilance of the commanders on that station. Here Admiral Hyde Parker, assisted by Admiral Rowley, kept the enemy in continual alarm, and intercepted the trade of the French islands in such a manner as greatly distressed them. Three large frigates dispatched by Count d'Estaing after his failure in America were taken, and a great part of a convoy seized or destroyed in sight of M. de la Motte Piquet's squadron in the harbour of Fort Royal

at Martinico, the admiral himself having narrowly escaped. He had sailed out of that harbour, in order to favour the escape of the convoy already mentioned; which having partly effected, he withdrew; but was pursued so closely, that he had scarcely time to shelter himself under the batteries on shore.

These successes, which happened in the years 1778, 1779, and beginning of 1780, kept the event of the war pretty much in an equilibrium on the western seas and continent; but in the mean time the most unhappy dissensions prevailed through every department of the British government in Europe, which threatened at last to involve the whole nation in confusion and bloodshed.

Among other charges brought by the members in opposition against the ministry, that of neglecting the navy had been one of the most considerable; nor indeed does it appear that the charge was altogether without foundation. Without a fleet, however, it was now impossible to avoid the danger of an invasion. At this time, indeed, the fleet was in a very weak condition, but the valour and experience of the officers seemed in some measure to compensate that defect. The chief command was given to Admiral Keppel, who had served with uncommon reputation during the last war. Admirals Sir Robert Harland and Sir Hugh Palliser served under him, both of them officers of undoubted courage and capacity. Arriving at Portsmouth towards the end of March 1778, Admiral Keppel exerted himself with so much industry and diligence, that, exclusive of those ships which it was found necessary to dispatch to the coast of North America under Admiral Byron, a fleet of 20 sail of the line was got in complete readiness by the beginning of June, and ten more in a forward state of preparation.

At the head of this fleet Admiral Keppel sailed from Portsmouth on the 13th of June, in order to protect the vast number of commercial shipping expected from all parts of the world, and at the same time to watch the motions of the French fleet at Brest.

On the arrival of the British fleet off the coast of France, two French frigates approached it, in order to make their observations. These were the *Licorne* of 32 guns and the *Belle Poule* of 26. In consequence of a signal to give chase, the *Milford* frigate overtook the *Licorne* towards the close of the day, and requested the French captain to come under the British admiral's stern; upon his refusal, a ship of the line came up, and compelled him to come into the fleet. Next morning, the *Licorne* seeming by her motions to be altering her course, a shot was fired across her way as a signal for keeping it. Hereupon she discharged a broadside and a volley of small arms into the *America* of 64 guns that lay close to her, and immediately struck. The behaviour of the French captain was the more astonishing, as Lord Longford, captain of the *America*, as at that instant engaged in conversation with him in terms of civility; but though such behaviour certainly merited severe chastisement, no hostile return was made.

The *Arethusa* of 26 guns, commanded by Captain Marshal, with the *Alert* cutter, was meanwhile in pursuit of the *Belle Poule*, that was also accompanied by a schooner, and the chase was continued till they were both out of sight of the fleet. On his coming up, he informed

fleet.

Britain.

informed the French captain of his orders to bring him to the admiral, and requested his compliance. This being refused, the *Arethusa* fired a shot across the *Belle Poule*, which she returned with a discharge of her broadside. The engagement thus begun, continued more than two hours with uncommon warmth and fury.

The *Belle Poule* was greatly superior not only in numbers, but in the weight of her metal: her guns were all 12 pounders; those of the *Arethusa* only six: Notwithstanding this inferiority, she maintained so desperate a fight, that the French frigate suffered a much greater loss of men than the British. The slain and wounded on board the former, amounted, by their own account, to near 100; on board the latter they were not half that proportion.

Captain Fairfax in the *Alert*, during the engagement between the two frigates, attacked the French schooner, which being of much the same force, the dispute continued two hours with great bravery on both sides, when she struck to the English cutter.

The *Arethusa* received so much damage, that she became almost unmanageable; the captain endeavoured to put her into such a position, as to continue the engagement; but was unable to do it. Being at the same time upon the enemy's coast, and close on the shore, the danger of grounding in such a situation obliged him to act with the more caution, as it was midnight. The *Belle Poule*, in the mean time, stood into a small bay surrounded with rocks, where she was protected from all attacks: she had suffered so much that the captain, apprehending that she could not stand another engagement, had resolved, in case he found himself in danger of one, to run her aground; but her situation prevented any such attempt; and as soon as it was day-light, a number of boats came out from shore, and towed her into a place of safety. Notwithstanding the evident and great superiority on the side of the French, this action was extolled by them as a proof of singular bravery, and the account of it received with as much triumph as if it had been a victory.

On the 18th of June, the day following the engagement with the *Belle Poule*, another frigate fell in with the British fleet; and was captured by the admiral's orders, on account of the behaviour of the *Licorne*.

The capture of those French frigates produced such intelligence to the admiral, as proved of the utmost importance, at the same time that it was highly alarming. He was informed that the fleet at Brest consisted of 32 ships of the line and 12 frigates. This was in every respect a most fortunate discovery, as he had no more with him than 20 ships of the line and three frigates. The superiority of the enemy being such as neither skill nor courage could oppose in his present circumstances; and as the consequences of a defeat must have been fatal to this country, he thought himself bound in prudence to return to Portsmouth for a reinforcement. Here he arrived on the 27th of June, and remained there till the ships from the Mediterranean, and the Spanish and Portuguese trade, and the summer fleet from the West Indies, coming home, brought him a supply of seamen, and enabled him to put to sea again, with an addition of ten ships of the line. But still there was a great deficiency of frigates, owing to the great numbers that were on the American station,

Britain.

and the necessity of manning the ships of the line preferably to all others.

In the mean time, the preparations at Brest being fully completed, the French fleet put to sea on the 8th of July. It consisted of 32 sail of the line, besides a large number of frigates. Count D'Orvilliers commanded in chief. The other principal officers in this fleet were Counts Duchaffault, de Guichen, and de Grasse; Monsieur de Rochechoart and Monsieur de la Motte Piquet. A prince of the blood royal had also been sent to serve on board of this fleet; this was the duke of Chartres, son and heir to the duke of Orleans, first prince of the blood royal of France in the collateral line. He commanded one of the divisions in quality of admiral.

On the 9th day of July, the British fleet sailed out of Portsmouth in three divisions; the first commanded by Sir Robert Harland, the third by Sir Hugh Palliser, and the centre by Admiral Keppel, accompanied by Admiral Campbell, an officer of great courage and merit. The French had been informed that the British fleet was greatly inferior to their own; which was but too true at the time when they received this information. Being yet unapprised of the reinforcement it was returned with, the admiral sailed at first in quest of it, intending to attack it while in the weak condition it had been represented to him.

As the British admiral was equally intent on coming to action as soon as possible, they were not long before they met. On the 23d of July they came in sight. But the appearance of the British ships soon convinced the French admiral of his mistake, and he immediately determined to avoid an engagement no less cautiously than he eagerly sought it before.

Herein he was favoured by the approach of night: All that could be done on the part of the British was to form the line of battle in expectation that the enemy would do the same. During the night the wind changed so favourably for the French, as to give them the weather gage. This putting the choice of coming to action, or of declining it, entirely in their own power, deprived the British admiral of the opportunity of forcing them to engage as he had proposed.

During the space of four days, the French had the option of coming to action; but constantly exerted their utmost care and industry to avoid it. The British fleet continued the whole time beating up against the wind, evidently with a resolution to attack them. But notwithstanding the vigour and skill manifested in this pursuit, the British admiral had the mortification to see his endeavours continually eluded by the vigilance and precaution of the enemy not to lose the least advantage that wind and weather could afford.

The chase lasted till the 27th of July. Between 10 and 11 in the morning, an alteration of wind and weather occasioned several motions in both fleets, that brought them, unintentionally on the part of the French, and chiefly through the dexterous management of the British admiral, so near each other, that it was no longer in their power to decline an engagement. Both fleets were now on the same tack: had they so remained, the British fleet on coming up with the French would have had an opportunity of a fair engagement, ship to ship; which would hardly have failed of proving very decisive: but this was a manner of combat-

ing

Britain.

ing quite contrary to the wishes of the French admiral. Instead of receiving the British fleet in this position, as soon as he found that an action must ensue, he put his ships on the contrary tack, that, sailing in opposite directions, they might only fire at each other as they passed by. By this means a close and sidelong action would be effectually evaded. As soon as the van of the British fleet, consisting of Sir Robert Harland's division, came up, they directed their fire upon it; but at too great a distance to make any impression: the fire was not returned by the British ships till they came close up to the enemy, and were sure of doing execution. In this manner they all passed close alongside each other in opposite directions, making a very heavy and destructive fire.

The centre division of the British line having passed the rearmost ships of the enemy, the first care of the admiral was to effect a renewal of the engagement, as soon as the ships of the different fleets, yet in action, had got clear of each other respectively. Sir Robert Harland, with some ships of his division, had already tacked, and stood towards the French; but the remaining part of the fleet had not yet tacked, and some were dropped to leeward, and repairing the damages they had received in the action. His own ship the *Victory* had suffered too much to tack about instantly; and had he done it, he would have thrown the ships astern of him into disorder. As soon as it was practicable, however, the *Victory* wore, and steered again upon the enemy before any other ship of the centre division; of which not above three or four were able to do the same. The other ships not having recovered their stations near enough to support each other on a renewal of action, in order to collect them more readily for that purpose, he made the signal for the line of battle ahead. It was now three in the afternoon; but the ships of the British fleet had not sufficiently regained their stations to engage. The *Victory* lay nearest the enemy, with the four ships above mentioned, and seven more of Sir Robert Harland's division. These twelve were the only ships in any condition for immediate service; of the others belonging to the centre and to Sir Robert Harland's division, three were a great way astern, and five at a considerable distance to leeward, much disabled in their rigging.

Sir Hugh Palliser who commanded the rear division during the time of action, in which he behaved with signal bravery, came of course the last out of it; and in consequence of the admiral's signal for the line, was to have led the van on renewing the fight; but his division was upon the contrary tack, and was entirely out of the line. The French, on the other hand, expecting directly to be re-attacked, had closed together in tacking, and were now spreading themselves into a line of battle. On discovering the position of the British ships that were fallen to leeward, they immediately stood towards them, in order to cut them off. This obliged the admiral to wear and to steer athwart the enemy's foremost division, in order to secure them; directing, at the same time, Sir Robert Harland to form his division in a line astern, in order to face the enemy till Sir Hugh Palliser could come up, and enable him to act more effectually.

The admiral, in moving to the protection of the leeward ships, was now drawing near the enemy. As

Sir Hugh Palliser still continued to windward, he made a signal for all the ships in that position to come into his wake: Sir Hugh Palliser repeated this signal; but it was unluckily mistaken by the ships of his division as an order to come into his own wake, which they did accordingly; and as he still remained in his position, they retained theirs of course.

Sir Robert Harland was now directed to take his station ahead, and the signal repeated for Sir Hugh Palliser's division to come into his wake; but this signal was not complied with, any more than a verbal message to that purpose, and other subsequent signals for that division's coming into its station in the line, before it was too late to recommence any operations against the enemy.

In the night, the French took the determination to put it wholly out of the power of the British fleet to attack them a second time. For this purpose, three of their swiftest sailing vessels were fixed in the stations occupied during the day by the three admirals ships of the respective divisions, with lights at the mast-heads, to deceive the British fleet into the belief that the French fleet kept its position with an intent to fight next morning. Protected by this stratagem, the remainder of the French fleet drew off unperceived and unsuspected during the night, and retired with all speed towards Brest: they continued this retreat the whole course of the following day, and entered that port in the evening. Their departure was not discovered till break of day; but it was too late to pursue them, as they were only discernible from the mast-heads of the largest ships in the British fleet. The three ships that had remained with the lights were pursued: but the vessels that chased them were so unable to overtake them from the damages they had received in the preceding day's engagement, that they were quickly recalled; and the admiral made the best of his way to Plymouth, as being the nearest port, in order to put his fleet into a proper condition to return in quest of the enemy.

The killed and wounded on board the British fleet, amounted to somewhat more than 500; but the French, it has been asserted on grounds of great credibility, lost 3000. This appears the less improbable, from the consideration that the French, in all their naval engagements, aim principally at the masts and rigging, and the British chiefly at the body of the ships.

This action, whatever might have been the merit of the commanders, proved a source of the most fatal animosities. The bulk of the nation had so long been accustomed to hear of great and glorious victories at sea, that it was supposed a kind of impossibility for a French and British fleet to encounter without the total ruin of the former. The event of the last engagement, therefore, became an object of very severe criticism; and complaints were made, that, through the bad conduct of the blue division, an opportunity had been lost of gaining a complete victory over the French fleet. These complaints were quickly introduced into the public papers; and were carried on with a warmth and vehemence that set the whole nation into a ferment of the most violent and outrageous nature. The friends of Sir Hugh Palliser, the vice-admiral of the blue, were no less violent in the defence of his conduct than his opponents were in its condemnation; while

discussions
and trial of
the admiral.

Britain. while those who espoused the cause of the admiral, manifested no less determination in accusing him of being the real cause of the escape of the French fleet, through his disobedience of the signals and orders of his commander, and by remaining at a distance with his division, instead of coming to the assistance of the rest of the fleet.

An accusation of so weighty a nature very much alarmed Sir Hugh Palliser. He therefore applied to Admiral Keppel for a justification of his conduct; and required of him to sign and publish a paper relative to the engagement of the 27th of July; therein specifying as a fact, that he did not intend by his signals on the evening of that day to renew the battle then, but to be in readiness for it the next morning.

On the rejection of this demand, Sir Hugh Palliser published in one of the daily papers a variety of circumstances concerning that engagement; reflecting severely on the conduct of the admiral, and prefacing the whole by a letter signed with his name.

An attack so public, and so detrimental to his character, induced Admiral Keppel to declare to the admiralty, that unless Sir Hugh Palliser should explain this matter to his satisfaction, he could not, consistently with his reputation, ever act conjointly with him.

This altercation happening before the meeting of parliament, was of course taken notice of when it met. In the house of peers an inquiry was demanded into the conduct of the commanders of the fleet on the 27th of July, on account of the declaration of Admiral Keppel, that he would not resume the command until such an inquiry had taken place.

In the house of commons also it was urged, that as Admiral Keppel had expressed a public refusal to serve in conjunction with Sir Hugh Palliser, the cause of such a declaration ought to be investigated. Admiral Keppel and Sir Hugh Palliser, who were both present in the house on this occasion, spoke severally to the point in question in support of their respective conduct. The issue of the contest between them was, that a motion was made for an address to the crown to bring Sir Hugh Palliser to a trial for his behaviour in the late engagement with the French fleet. In answer to this motion, Sir Hugh Palliser replied, in a speech of great warmth and vehemence, that he had already demanded and obtained a court martial to sit on Admiral Keppel, whom he charged with having through his misconduct caused the failure of success in that engagement.

This intelligence was received with great astonishment in the house. It had been, and still continued to be, the general desire of individuals of all parties, to heal this breach between the two officers at a time when the services of both were so much needed. It was therefore with universal concern the house was informed of the determination that had been taken to bring Admiral Keppel to a trial. The admiral, however, conducted himself on this occasion with remarkable temper and coolness of expression. He acquiesced without reluctance in the orders that had been laid upon him to prepare for a trial of his conduct; which he hoped would not, upon inquiry, appear to have been dishonourable or injurious to his country, any more than disgraceful to himself.

The conduct of the board of admiralty in admitting the charges against Admiral Keppel, and appointing a

Britain. trial, was greatly condemned in the house. It was said to have been their duty to have laboured with the utmost earnestness, and exerted their whole official influence, to stifle this unhappy disagreement between two brave and valuable men; the consequences of which they well knew, and ought to have obviated, by interposing as reconciliators, instead of promoting the dispute, by consenting to bring it to a judicial and public hearing. On the other hand, it was answered, that they could not, consistently with the impartiality which they owed to every officer of the navy, refuse to receive all matters of complaint relating to subjects of their department. They had no right to decide on the merits of any case laid before them, but were bound to refer it to a court composed of naval officers, who were the only proper and competent judges of each others conduct in professional matters. In conformity with these principles, which were founded upon the clearest equity, they left the decision of the present altercation to the gentlemen of the navy; whose honour and integrity in all instances of this kind had never been called in question, and by whose verdict alone it was but just and reasonable that every officer in that line of service should wish to stand or fall.

The arguments upon this subject were urged with great heat and violence on both sides. They produced uncommon animosity and rancour, and gave rise to a spirit of contention that diffused itself through all classes of society. Such was the height of passion that prevailed everywhere, that the critical circumstances of the nation were wholly forgotten, and the attention of the public entirely absorbed in this fatal dispute. Individuals of all ranks and all professions engaged in it with as much zeal as if they had been personally concerned in the issue. The dissatisfaction that was excited upon this occasion among the upper classes in the navy, appeared in a memorial presented to the king by twelve of the eldest and most distinguished admirals, at the head of whom was the name of Lord Hawke. The conduct of Sir Hugh Palliser was therein condemned without reserve; that of the admiralty itself was severely censured, as having established a precedent pregnant with the most ruinous consequences to the naval service of the kingdom. By the measure it had now adopted, that board had submitted to become the instrument of any individual who might be prompted by iniquitous motives to deprive the navy of its best and highest officers. It was a destructive violation, they said, of all order and discipline in the navy, to permit and countenance long concealed, and afterwards precipitately adopted charges, and recriminatory accusations of subordinate officers against their commanders in chief. It was no less improper and scandalous, to suffer men at once in high civil office, and in subordinate command, previous to their making such accusation, to attempt to corrupt the judgment of the public, by publishing libels on their officers in a common newspaper, which tended at once to excite dissensions in the navy, and to prejudice the minds of those who were to try the merits of the accusation against the superior officer.

It was remarkable in this memorial, that the majority of those who subscribed it were not only officers of the first rank and importance in the navy, but unconnected with the opposition, and attached by various motives

^{Britain.} motives to the court and ministry. This evinced their conduct in the present instance to have been uninfluenced by considerations of party.

No business of any consequence was agitated in either of the houses of parliament while the trial continued. It began upon the 7th of January 1779, and lasted more than a month, not ending till the 11th day of February ensuing. After a long and accurate investigation of every species of evidence that could be produced, the court-martial acquitted Admiral Keppel of all the charges that had been brought against him in the most complete and honourable manner. He was declared to have acted the part of a judicious, brave, and experienced officer; and the accusation was condemned in the most severe manner.

Both houses of parliament voted him their thanks for the eminent services he had performed, and the whole nation resounded with his applause. The city of London bestowed every honour and mark of respect in its power upon Admiral Keppel; while the resentment against his accuser was so strong, that it constrained him to retire wholly from public life, and to resign all his employments.

But notwithstanding the high degree of national favour and esteem in which Admiral Keppel now stood, he thought it prudent to withdraw from a situation wherein he found himself not acceptable to those in power, by resigning his command.

⁶¹³ ^{Unsuccessful attack on the board of admiralty.} The conduct of those who presided at the admiralty board now became an object of severe censure; and a number of facts were cited to prove that its conduct for many years past had been highly reprehensible. The debates were uncommonly violent; and the resolution to condemn the conduct of the admiralty was lost only by a majority of 34. Administration, however, still kept their ground; for though a second attempt was made to show that the state of the navy was inadequate to the vast sums bestowed upon it, the point was again lost by much the same majority. The argument used by the ministry in defence of their conduct in this case was, that the ships now constructed were of a much larger size, and consequently much more expensive than formerly. But however they might be victorious in argument, it is certain that the conduct of the admiralty was very far from giving general satisfaction at present. Not only Admiral Keppel, but Lord Howe, declared his resolution to relinquish the service while it continued under the direction of its managers at that time. Their resignation was followed by that of Sir Robert Harland, Sir John Lindsay, and several others; nay, so general was the dislike to the service now become, that no fewer than 20 captains of the first distinction had proposed to go in a body to resign their commissions at once; and were prevented from doing so only by the great occasion they saw there was at that time for their services.

⁶²⁴ ^{Resignation of admirals Keppel, Howe, and other officers.} This extreme aversion to the service produced a direct attack upon Lord Sandwich, at that time first lord of the admiralty. But though in this as well as other cases the ministry were still victorious, they could not prevent an inquiry into the cause of our want of success in the American war. This was insisted upon by Lord and General Howe, whose conduct had been so much reflected upon, that a vindication was become absolutely necessary. The inquiry was indeed very

⁶²⁵ ^{Inquiry into the conduct of the American war;} disagreeable to administration, and therefore evaded as long as possible. From the evidence of Lord Cornwallis and other officers of high rank, however, it appeared that the forces sent to America were not at any time sufficient to reduce it; that the Americans were almost universally unfriendly to the British cause; and that the nature of the country was such, that the conquest of it must be excessively difficult. It appeared also, that the camp of the Americans on Long island was so strong, that it could not have been attacked with any probability of success, after their defeat in 1776, without artillery and other necessary preparations. In every instance, therefore, the general's conduct was shown to have been the most eligible and judicious possible. These facts, however, being directly opposite to what the ministry wished to appear, counter evidence was brought in, with a view to invalidate the testimony of the very respectable witnesses above mentioned. In this business only two were examined, viz. Major-general Robertson, and Mr Joseph Galloway an American gentleman. From the evidence of Mr Galloway especially, it appeared, that the conduct of General Howe had not been unexceptionable; that the greater part of the Americans were friendly to the cause of Britain; that the country was not so full of obstructions as had been represented; woods and forests being no obstructions to the marching of armies in as many columns as they pleased; that soldiers might carry provisions for 19 days on their backs, &c.

^{Britain.} Though no stress could be laid upon such extravagant assertions proceeding undoubtedly from ignorance, yet they fully answered the purpose of ministry at this time, viz. procrastination, and preventing the disagreeable truths above-mentioned from striking the minds of the public too forcibly. The event of this inquiry, ⁶¹⁶ ^{into General Burgoyne's conduct.} however, encouraged General Burgoyne to insist for an examination of his conduct; which indeed had been so unmercifully censured, that even the ministers began to think he had suffered too much, and that he ought to be allowed to vindicate himself. He was accordingly permitted to bring witnesses in his own behalf; and from the most respectable evidence it appeared that he had acted the part, as occasion required, both of a general and soldier; that the attachment of his army to him was so great, that no dangers or difficulties could shake it; and that, even when all their patience and courage were found to be ineffectual, they were still ready to obey his commands, and die with arms in their hands. A great number of other particulars relating to his expedition were also cleared up entirely to the honour of the general, and several charges against him were totally refuted. It appeared, however, that the Americans, far from being the contemptible enemy they had been called, were intrepid and resolute. On the whole, it was remarked by a great number of the most judicious people in the nation, that the spirit of defamation, which for some time had been so prevalent, must at last produce the most fatal effects; by depriving the nation of its best officers, through the aversion that would be produced in them, both in the sea and land departments, to enter into a service where they were certain of being calumniated.

After the resignation of Admiral Keppel, the command of the Channel fleet was bestowed, though not without violent debates, on Sir Charles Hardy, a brave ⁶²⁷ ^{Accession of Spain to the confederacy against Britain.} and

Britain. and experienced officer, but now advanced in years, and who had retired from the service with a design of never returning to it, being at that time governor of Greenwich hospital. The choice of an admiral to command this fleet was now of the greater importance, on account of the accession of Spain to the general confederacy which took place this year †. The quarrel, like that with France, was formally intimated by the Spanish minister on the 17th of June 1779; and like that also was attended with new but ineffectual proposals of an accommodation with America, and removal of the ministry. The imminent danger, however, to which the nation was now exposed, required a vigorous exertion; and various projects for its internal defence were laid before the parliament. The principal of these were the raising of volunteer companies to be added to the regiments of militia belonging to the counties where they were raised, and the augmenting the number of militia. The latter was judged unadvisable, on account of the necessity there would be to send a great number of regular forces out of the kingdom, which would require new supplies of recruits; and the increase of the militia might prove detrimental to the recruiting service. The spirit and magnanimity displayed on this occasion, however, did the highest honour to the national character, and fully justified the opinion generally entertained of its opulence and valour. All parts of the kingdom seemed actuated by a laudable zeal to concur in every measure necessary for its defence; large sums were subscribed by people of rank and affluence; and companies were raised, and regiments formed, with such alacrity, as quickly banished all apprehensions for the safety of the kingdom.

628
Schemes for the internal defence of the nation.

629
Vigorous efforts of the people on this occasion.

630
British settlements in Africa reduced.

631
Unsuccessful attempt on Jersey.

On the other hand, the French, now thinking themselves secure of victory by the accession of the whole strength of Spain to their cause, began to extend their plans of conquest. A squadron was fitted out under the command of the marquis de Vadreuil, destined to reinforce the fleet commanded by D'Estaing. But before its proceeding thither, an attack was made on the British settlements on the rivers Senegal and Gambia in Africa. These were easily conquered; and on this occasion the French quitted their own island of Goree, which was very soon after taken possession of by Sir Edward Hughes in his way to the East Indies. These unimportant and distant conquests, however, being insufficient to produce any great eclat, it was resolved to strike a blow nearer home, by the conquest of Jersey and Guernsey. An attempt was accordingly made; but with so little success, that not a single man could be disembarked on the island they intended to conquer. The enterprise, however, proved indirectly of great service to the cause of America. A fleet of 400 merchantmen and transports was at that time on the point of sailing for New York, under the conduct of Admiral Arbuthnot; but that officer, being informed of the attack on Jersey, thought it his duty to come to the assistance of the island rather than proceed on his voyage. This delay was followed by another, occasioned by bad weather; so that the fleet, which was laden with warlike stores and necessaries, did not arrive till the end of August, and several important enterprises projected by Sir Henry Clinton were of course laid aside.

VOL. IV. Part II.

The French, in the mean time, determined to make a second attempt on Jersey; but their squadron, being attacked by another under Sir James Wallace, was driven ashore in a small bay on the coast of Normandy, under cover of a battery. Thither they were pursued by the British commander, who silenced the battery, took a large frigate of 34 guns, with two rich prizes, and burned two other frigates and several other vessels.

Britain.
632
French squadron of frigates destroyed by Sir James Wallace.

Thus disappointed in their attempt on Jersey, a project was formed of invading Great Britain itself; and the preparations for it, whether serious or not, were so formidable, that they very justly excited a considerable alarm in this country. Not only were the best troops in the French service marched down to the coasts of the British channel, but transports were provided in great numbers, and many general officers promoted; the commanders also who were to have the charge of this important expedition were named by government. A junction was formed betwixt the French and Spanish fleets, in spite of the endeavours used on the part of the British to prevent it; and then the allies made their appearance in the British seas with upwards of 60 ships of the line, besides a vast number of frigates and other armed vessels.

633
Invasion of Great Britain projected.

634
Formidable appearance of the British seas of the combined fleets.

All this formidable apparatus, however, ended in nothing more than the taking of a single ship, the Ardent, of 64 guns. They had passed the British fleet under Sir Charles Hardy in the mouth of the Channel without observing him. Sailing then along the coast of England, they came in sight of Plymouth, where they took the Ardent, as has been already mentioned; after which they returned, without making the least attempt to land anywhere. The British admiral made good his entrance, without opposition, into the Channel, on their quitting it, which a strong easterly wind obliged them to do. He endeavoured to entice them up the Channel in pursuit of him; but the great sickness and mortality on board their ships, as they gave out, obliged them to retire, in order to repair their ships, and recruit the health of their people. Thus ended the first, and indeed the greatest, exploit performed by the combined fleet in the British seas. An annual parade of a similar kind was afterwards kept up, which was as formally opposed on the part of the British; but not the least act of hostility was ever committed by either of the Channel fleets against each other.

635
They take only a single ship.

Though this ill success, or rather pusillanimity, manifest in the conduct of the combined fleets, was such that the French themselves were ashamed of it, the appearance of them in the Channel furnished opposition with abundance of matter for declamation. All ranks of men, indeed, now began to be wearied of the American war; and even those who had formerly been the most sanguine in defence of coercive measures, now began to be convinced of their inutility. The calamitous effects produced by the continuation of these measures, indeed, had by this time rendered the far greater part of the people exceedingly averse to them; and the almost universal wish was, that the oppressive burden of the American war should be cast off, and the whole national strength exerted against those whom, on account of our frequent contests with them, we had been accustomed to call our natural enemies.

636
American war generally disagreeable.

†

4 A

For

Britain. For this purpose the national spirit continued to be exerted with unabated vigour. Large sums were subscribed in the several counties, and employed in raising volunteers, and forming them into independent companies; associations were also formed in the towns, where the inhabitants bestowed a considerable portion of their time in training themselves to the use of arms. The East India Company now forgot their quarrels with ministry, and not only presented government with a sum sufficient for levying 6000 seamen, but at its own cost added three 74 gun ships to the navy. Administration were not yet, however, weary of the plans they had laid down, and which they seemed inclined to prosecute, and indeed did prosecute, as long as the nation would support them. The virulence of opposition, therefore, still continued; and what was worse, every part of the kingdom seemed to imbibe their sentiments.

637
Ministry become obnoxious to the people at large.

Among other charges now brought against them was that of misapplying the national force. An hundred thousand men were employed for the internal defence of the kingdom; which being much more than sufficient for the purpose, ought therefore to have been distributed into places where it might have acted to advantage. The army of Great Britain, it was said, now amounted to 300,000 men; the navy to 300 sail, including frigates and armed vessels; twenty millions had been expended on the service of the year 1779: and yet, with all this force and treasure, the utmost boast that ministers could make was, that the enemy had been hitherto kept at bay, and not allowed to invade Great Britain. Nor were the charges less heavy in other respects. Veteran officers had been passed by to make room for those of inferior merit. The discontents and miserable state of Ireland⁶, the losses of the West India islands, &c. were all put to the account of ministers; and it was said, that the universal cry of the nation was for their dismissal. Their incapacity was now visible to every body; and it was a matter of universal surprise how they durst retain their places in opposition to the general desire of the nation.

* See Ireland.

To all this ministry replied in a resolute and determined manner, denying or refuting every circumstance; and at last, after violent debates, gained their point of an address without any amendment proposing their removal, in the upper house by 82 to 41, and in the lower by 253 to 134. The enormous expence already incurred, however, and hereafter to be incurred, for the carrying on of the war, occasioned such a general alarm, that it was no longer possible to refuse compliance with some scheme of economy, or at least giving it a patient hearing. The duke of Richmond proposed that the crown should set the example, and moved for an address to this purpose; but the motion was lost by 77 to 36. The earl of Shelburne next undertook the discussion of the subject; and having, in a most elaborate speech, compared the expences of former times with the present, and shown the immense disparity, he proceeded to show the reasons. These were, that ministers formerly employed fewer persons, and obliged them to be content with smaller profits. One contractor supplied all the troops in America during the last war, and his agreement was to furnish a ration of provisions at sixpence; but so different was the management now, that the ration of provisions,

638
Various schemes of economy rejected.

instead of sixpence, cost two shillings. One person only had enjoyed contracts to the amount of 1,500,000l.; 3,700,000l. had passed through the hands of another contractor to be transmitted to America: but no voucher had been given for the expenditure of this immense sum; the accounts being contained in a few lines, accounting for 20,000l. in one line, 30,000l. in another, &c. Thus, he said, the ministry acquired a most unbounded and unconstitutional influence; and having the dangerous power of expending the national treasures without any check, corruption and venality everywhere abounded. He moved, therefore, that the expenditure of those vast sums annually sunk in extraordinary expenses should be brought under some control; and that to extend the public expences beyond the sums granted by parliament, was an invasion of its peculiar and exclusive rights.

Though this motion of the earl of Shelburne's, and some others of a similar tendency, were rejected on solid principles according to the ministry, the minds of the people were far from being conciliated to their views. Instead of this, the opinion began to be general, that ministers exercised an unconstitutional influence over the representatives; and that such influence was very much augmented within these few years, it was now supposed by numbers of people, that nothing short of a change in the constitution of parliament could remedy the evil complained of. To this purpose a petition was framed in the city of York, on the 30th of December 1779, where a number of the most respectable people in the county had assembled, and delegated 61 gentlemen as a committee to manage the correspondence necessary for carrying on the design, and forming an association to support and promote it. In the present petition it was set forth, that, in consequence of the war in which the nation was involved, the public debt was greatly augmented, taxes increased, and trade and manufactures much affected. The profusion attending the war was complained of; and parliament was requested, previous to the raising of any new taxes, to inquire into, and correct the abuse of expenture in the public money; to reduce exorbitant emoluments, abolish sinecure places and unmerited pensions, and apply the prodnee to the exigencies of the state. This petition was followed by others of a similar kind from 27 of the principal counties, and most of the large towns in England. The most severe and opprobrious language was used in the county-meetings with regard to the ministry and parliament. The latter were represented as void of all principle, ready to sacrifice both conscience and reputation to the will of those in power; and, in short, bound by no ties but those of the most sordid interest; ready on all occasions to enrich themselves by the spoils of their country; and persons to whom the honour or interest of the kingdom were matters of no consideration. The court, on the other hand, was looked upon as the receptacle of every one who harboured ill designs against the people of Britain, and where nobody stood any chance of advancing himself but by adulation and extreme servility.

The emissaries of America and the other enemies of Great Britain are said to have been active in fomenting these discords, which at this period arose to a height unknown for a century past. The ministry, however,

Britain. however, continued firm and undaunted. Previous to the taking of any of the petitions into consideration, they insisted on going through the business of the supply, by determining the ways and means; nor did either the number of English petitions, or an additional one from the island of Jamaica setting forth the extreme danger that island was in, make them alter their resolution in the least.

641 Mr Burke's plan of parliamentary independence and economy. At last, in the beginning of February 1786, a plan was brought forward by Mr Burke, for securing the independency of parliament, and introducing economy into the various departments of government. This plan, among other things, proposed the abolition of the offices of treasurer, comptroller, and cofferer of the household; treasurer of the chamber, master of the household, the board of green cloth, with several other places under the steward of the household; the great and removing wardrobe, the jewel office, the robes, board of works, and the civil branch of the board of ordnance. Other reformations were also proposed; but though the temper of the times obliged the minister to admit the bills, and even to pretend an approbation of the plan, he meant nothing less than to admit it in its full extent, or indeed in any part, if it could possibly be prevented. When the plan, therefore, which he had approved in general, came to be particularly considered, he was found to be determined against every part of it. The general temper of the people, without doors, however, seemed now to have affected many of the members of parliament, and made them desert their old standard. An economical plan proposed in the house of lords by the earl of Shelburne was rejected only by a majority of 101 to 55. This was the strongest opposition that had appeared in that house for many years; but in the lower house matters still went worse. The first proposition in Mr Burke's plan was to abolish the office of secretary of state for the colonies; and the utmost efforts of administration could preserve this office only by a majority of 208 to 201. The board of trade was abolished by 207 to 198: but this was the only defeat sustained by ministry at present; all the rest of the plan being rejected excepting only one clause, by which it was determined that the offices of lieutenant and ensign, &c. belonging to the yeomen of the guards, should not any longer be sold, but given to officers in the army and navy on half pay, and of 15 years standing in their respective lines of service.

642 Remarkable defeat of the ministry on the 6th of April 1780.

This ill success was very mortifying to Mr Burke, who had expected to save more than a million annually to the nation. Administration, however, had still a greater defeat to meet with than what they had experienced in the abolition of the board of trade. The 6th of April was the day appointed for taking into consideration the numerous petitions, from half the kingdom of England, already mentioned. They were introduced by Mr Dunning; who, in a very elaborate speech, set forth the many attempts that had been made to introduce reformation and economy into the plans of government. These had been defeated by ministerial artifice, or overthrown by mere dint of numbers; he concluded, therefore, and moved as a resolution of the house, That the influence of the crown had increased, was increasing, and ought to be diminished. This motion being carried after a long and

violent debate, he next moved, that the house of commons was as competent to examine into and correct abuses in the expenditure of the civil list as in any other branch of the public revenue. To this another was added by Mr Thomas Pitt, That it was the duty of the house to provide an immediate and effectual redress of the abuses complained of in the petitions. The ministry now requested that nothing farther might be done that night: but such was the temper of the house, that both these motions were carried without a division; after which they were read a first and second time, and agreed to without a division.

Ministry had never received such a complete defeat, nor ever been treated with so much asperity of language. The news of the proceedings of the day were received by the people at large with as much joy as if the most complete victory over a foreign enemy had been announced. Opposition, however, though masters of the field at present, did not imagine they had obtained any permanent victory, and therefore resolved to make the most of the advantages they had gained. It was moved by Mr Dunning at the next meeting, that to ascertain the independence of parliament, and remove all suspicions of its being under undue influence, there should, every session, seven days after the meeting of parliament, be laid before that house an account of all the sums issued out of the civil list, or any other branch of the revenue, since the last recess, in favour of any of its members. This passed with little difficulty; but when he moved that the treasurers of the chamber and household, the cofferer, comptroller, and master of the household, with the clerks of the green cloth, and their deputies, should be excluded from having seats in the house, a warm debate ensued, and the motion was carried only by 215 against 213. This was the last triumph of the popular party; their next motion, for the exclusion of revenue officers, being thrown out by 224 against 195. A last effort was made, by Mr Dunning's proposal of an address to the throne against proroguing or dissolving the parliament, until measures had been taken to prevent the improper influence complained of in the petitions. On this occasion the debates were long and violent: but the motion was lost by 254 against 203. Ministry would gladly have screened their friends from the vengeance of opposition; alleging the lateness of the hour, it being then past midnight. The speaker of the house, however, perceiving Mr Fox about to rise, insisted that the house should remain sitting; and thus the deserters from the popular party were condemned to hear their conduct set forth in such terms as perhaps were never applied on any other occasion to members of the British senate.

This last victory of administration confirmed the dissatisfaction and ill opinion which the people had conceived of the majority of their representatives. It was in the height of that ill temper which the conduct of parliament had created in the multitude, that those discontents broke out which were so near involving the kingdom in universal desolation. The hardships under which individuals professing the Roman Catholic persuasion had laboured for many years in England, had lately awakened the consideration of the liberal minded. The intility and impropriety of persecuting people from whom no danger was apprehended, and

Britain.

643 They again get a majority in their favour.

644 Dreadful disturbances on account of the popish bill.

Britain.

who were not suspected of disaffection to the civil constitution of this country, induced several persons of rank and influence to undertake the procuring them relief.

The calamities of the times had afforded the English Roman Catholics a very proper occasion to manifest their attachment to government. They presented a most loyal and dutiful address to the king, containing the strongest assurances of affection and fidelity to his person and the civil government of this country.

"Our exclusion (said they) from many of the benefits of that constitution, has not diminished our reverence for it. We behold with satisfaction the felicity of our fellow subjects; and we partake of the general prosperity which results from an institution so full of wisdom. We have patiently submitted to such restrictions and discouragements as the legislature thought expedient. We have thankfully received such relaxations of the rigour of the laws, as the mildness of an enlightened age, and the benignity of the British government have gradually produced; and we submissively wait, without presuming to suggest either time or measure, for such other indulgence as those happy causes cannot fail in their own season to effect.

"We beg leave to assure your majesty, that our dissent from the legal establishment in matters of religion is purely conscientious, that we hold no opinions adverse to your majesty's government, or repugnant to the duties of good citizens; and we trust that this has been shown more decisively by our irreproachable conduct for many years past, under circumstances of public discountenance and displeasure, than it can be manifested by any declaration whatever.

"In a time of public danger, when your majesty's subjects can have but one interest, and ought to have but one wish and one sentiment, we think it our duty to assure your majesty of our unreserved affection to your government, of our unalterable attachment to the cause and welfare of this our common country, and our utter detestation of the designs and views of any foreign power against the dignity of your crown, and the safety and tranquillity of your subjects.

"The delicacy of our situation is such, that we do not presume to point out the particular means by which we may be allowed to testify our zeal to your majesty, and our wishes to serve our country; but we entreat leave faithfully to assure your majesty, that we shall be perfectly ready, on every occasion, to give such proofs of our fidelity, and the parity of our intentions, as your majesty's wisdom and the sense of the nation shall at any time deem expedient."

This address was presented to the king on the first day of May 1778, and was signed by the duke of Norfolk, the earls of Surrey and Shrewsbury, the lords Stourton, Petre, Arundel, Dormer, Teynham, Clifford, and Linton; and by 163 commoners of rank and fortune.

The only obstacle that stood in the way of their wishes was, the difficulty of overcoming the prejudices of the lower classes, who would probably disapprove and condemn the indulgence shown to the people of a persuasion which they had been taught to look upon with horror and detestation. But notwithstanding the prepossessions of the vulgar, it was determined by several individuals of generous and liberal sentiments, to

Britain.

espouse their cause as far as it could be done consistently with the principles of the constitution and the general temper of the times. Their being patronized by some of the principal leaders in opposition, was a circumstance greatly in their favour; as it showed that those who professed to be the most strenuous friends to the freedom and constitution of this country, did not imagine they would be endangered by treating the Roman Catholics with more lenity than they had hitherto experienced.

About the middle of May, Sir George Saville made a motion for the repeal of some penalties enacted against them. He grounded his motion on the necessity of vindicating the honour and asserting the true principles of the Protestant religion, of which the peculiar merit was to admit of no persecution. It ill became the professors of such a religion to be guilty of that intolerance with which they reproached others. The statutes he meant to repeal were such as gave occasion to deeds that debased and were a disgrace to human nature, by inciting relations to divest themselves of the feelings of humanity, and by encouraging the rapacity of informers.

He represented the address above quoted as a full proof of the loyal dispositions of the Roman Catholics, and as an unfeigned testimony of the soundness of their political principles. In order, however, to silence the objections of those who might suspect them of duplicity, a test was proposed of so binding and solemn a nature, that no man could be supposed to imagine that any authority could annul its efficacy.

The pains and penalties of the statutes to be repealed were laid before the house by Mr Dunning. By these statutes it was made felony in a foreign clergyman of the Roman communion, and high treason in one that was a native of this kingdom, to teach the doctrines or perform divine service according to the rites of that church; the estates of persons educated abroad in that persuasion were forfeited to the next Protestant heir; a son or any other nearest relation, being a Protestant, was empowered to take possession of his own father's, or nearest of kin's estate, during their lives; a Roman Catholic was disabled from acquiring any legal property by purchase.

The mildness of the British government did not indeed countenance the practice of the severities enacted by these statutes: but still the prospect of gain subjected every man of the Roman persuasion to the ill usage of informers; as on their evidence the magistrates were bound, however unwilling, to carry these cruel laws into execution.

In consequence of these representations, the motion made in favour of the Roman Catholics was received without one dissenting voice; and a bill in pursuance to its intent was brought in and passed both houses. The test or oath by which they were bound, was conceived in the strongest and most expressive terms. They were enjoined to swear allegiance to the king's person and family, and to abjure especially the pretensions to the crown assumed by the person called *Charles III.* They were to declare their disbelief and detestation of the following positions: That it is lawful to put individuals to death on pretence of their being heretics; that no faith is to be kept with heretics; that princes excommunicated by the pope and council, or by the see

see

Britain. see of Rome, or any other authority, may be deposed or murdered by their subjects or by any others; that the pope of Rome, or any other foreign prelate or sovereign, is entitled to any temporal or civil jurisdiction or pre-eminence, either directly or indirectly, in this kingdom. They were solemnly to profess, that they made the aforesaid declarations with the utmost sincerity, and in the strictest and plainest meaning of the words and language of the test, without harbouring any secret persuasion that any dispensation from Rome, or any other authority, could acquit or absolve them from the obligation contracted by this oath, or declare it null and void.

The indulgence shown to the Roman Catholics in England, encouraged those of the same persuasion in Scotland to hope for a similar relief. Several gentlemen of that nation of great rank and character, and who were members of parliament, expressed their warmest wishes that it should be extended to their country; and declared their intention to bring in a bill for that purpose the following session. The design was approved by the general assembly of the church of Scotland; who rejected, by a majority of no less than 100, a remonstrance that had been proposed against it. In consequence of these flattering appearances, a petition was prepared for parliament on behalf of the Roman Catholics in Scotland. But these expectations were soon damped. A pamphlet was published against the doctrine and professors of the Popish religion, which represented them as the common foes to mankind and the disturbers of all states; and this being circulated among all classes, raised a number of enemies to the intended petition.

The opposition was at first chiefly conducted by some persons at Edinburgh, who assumed the title of Committee for the Protestant Interest; and under that denomination carried on a correspondence with all those who coincided with their opinions, and who formed a very large proportion of the common people in Scotland. As the committee at Edinburgh, from its residence in the capital of the kingdom, was deemed to consist of persons of the first importance, it directed in a manner the motions of all the others.

The persons who made up this committee, however, acted from no mean or mercenary views: they aimed only at the preservation of the Protestant religion, and the liberties of their country; both which they conceived were in danger, from the indulgence of government to individuals of the Roman Catholic persuasion.

Actuated by these ideas, they exerted themselves with so much activity, that the principal gentlemen of the Catholic persuasion thought it requisite for their safety to convey an intimation to the British ministry, that they were desirous to drop the application they had proposed to make for an indulgence similar to that which had been granted to their fellow-subjects in England of the same communion.

They published also in the newspapers the representation they had made to ministry; hoping thereby to convince the public, that they were sincerely desirous to remove any cause of dissatisfaction on their own account, and to submit to any inconveniency sooner than occasion disturbance. But matters were now gone too far to be conciliated by any means.

On the 2d day of February 1779, the populace met

Britain. according to appointment, in order to carry into execution the various projects they had in contemplation. They began by an attack upon a house inhabited by a Roman Catholic bishop, with others of his persuasion, and which contained a place of worship. They committed it to the flames. They destroyed in the same manner another house that had also a chapel; after which they proceeded to vent their resentment on several individuals of that persuasion by burning their effects.

The next objects of their vengeance were those who had patronized the Roman Catholics. They beset the houses of Dr Robertson and Mr Crosby; but, on hearing of the intentions of the rioters, the friends of both came to their assistance in such numbers, and so well prepared to repel the fury of the populace, that they did not dare to exercise the violence they had premeditated.

This disappointment, which was accompanied by farther precautions against their malevolent designs, put an end to the attempts of the mob at Edinburgh. But the spirit of dissatisfaction at the indulgence intended to the Roman Catholics still remained in full force. Ministry was held out as harbouring a secret determination to undermine the Protestant religion, and to introduce Popery; and loaded in consequence with the most outrageous invectives.

By degrees the same ungovernable spirit was communicated to part of the English nation. The cry against Popery became daily more loud among the inferior classes, and that inveteracy which had subsided during so many years, began to revive in as powerful a degree, as if the nation were actually under the impending terrors of persecution. To this were added the secret fears of others; who still imagined it was not inconsistent with good policy to discourage a religion, from the professors of which so much danger had accrued to the constitution of this country in former times. These, though averse to all acts of violence, thought it necessary to keep alive the antipathy to it, and by no means to show the least willingness to grant any further indulgence than it had hitherto experienced.

From this motive they were of opinion, that a suspension of the laws enacted against it, though tacit and unauthorised, was sufficient to remove all complaints of harshness and oppression on the part of the Roman Catholics; and they looked upon the penal statutes as a requisite bar to confine them within the bounds of submission, and fear of offending.

Thus a society was formed in London, which took the title of the Protestant Association, of which Lord George Gordon, who had rendered himself conspicuous in Scotland by his opposition to the repeal, was elected president: and it now prepared to act in a decisive manner against the resolutions of the legislature.

On the 29th of May 1780, the associators held a meeting in order to settle in what manner they should present a petition to the house of commons against the repeal of the penal statutes. A long speech was made on this occasion by their president, who represented the Roman persuasion as gaining ground rapidly in this country; that the only method of stopping its progress, was to go up with a spirited remonstrance to their

Britain. their representatives, and to tell them in plain and resolute terms that they were determined to preserve their religious freedom with their lives, &c.

This harangue being received with the loudest applause, he moved, that the whole body of the association should meet on the 2d day of June, in St George's Fields, at ten in the morning, to accompany him to the house of commons on the delivery of the petition. This being unanimously assented to, he informed them, that if he found himself attended by fewer than 20,000, he would not present the petition. He then directed they should form themselves into four divisions; the first, second, and third, to consist of those who belonged to the City, Westminster, and Southwark; the fourth, of the Scotch residents in London. They were, by way of distinction, to wear blue cockades in their hats.

Three days previous to the presentation of the petition, he gave notice of it to the house, and acquainted it with the manner in which it was to be presented; but this was received with as much indifference and unconcern as all his former intimations.

On the 2d day of June, according to appointment, about 50 or 60,000 men assembled in St George's Fields. They drew up in four separate divisions, as had been agreed, and proceeded to the parliament house, with Lord George Gordon at their head. An immense roll of parchment was carried before them, containing the names of those who had signed the petition.

On their way to the house, they behaved with great peaceableness and decency; but as soon as they were arrived, great disturbances took place. The rioters began by compelling all the members of both houses they met with, to put blue cockades in their hats, and call out, "No Popery." They forced some to take an oath that they would vote for the repeal of the Popery act, as they styled it. They treated others with great indignity, posting themselves in all the avenues to both houses; the doors of which they twice endeavoured to break open.

Their rage was chiefly directed against the members of the house of lords; several of whom narrowly escaped with their lives.

During these disturbances, Lord George Gordon moved for leave to bring up the petition. This was readily granted; but when he proposed it should be taken into immediate consideration, it was strenuously opposed by almost the whole house. Enraged at this opposition, he came out several times to the people during the debates, acquainting them how averse the house appeared to grant their petition, and naming particularly those who had spoken against it.

Several members of the house expostulated with him in the warmest terms on the unjustifiableness of his conduct; and one of his relations, Colonel Gordon, threatened to run him through, the moment any of the rioters should force their entrance into the house. It was some hours before the house could carry on its deliberations with any regularity, which was not done till the members were relieved by the arrival of a party of the guards. Order being restored, the business of the petition was resumed; when Lord George Gordon told them it had been signed by near 120,000 British Protestant subjects. He therefore insisted that the

petition should be considered without delay. Britain. But notwithstanding the dangers with which they were menaced, and the proof which the mover of the petition had given that no means should be left unemployed to compel them to grant it, the commons continued immovable in their determination. Of 200 members, then present in the house, six only voted for it.

In the mean time the mob had dispersed itself into various parts of the metropolis, where they demolished two Romish chapels belonging to foreign ministers; and openly vented the most terrible menaces against all people of that persuasion.

On the 4th of June they assembled in great numbers in the eastern parts of London; and attacked the chapels and houses of the Roman Catholics in that quarter, stripping them of their contents, which they threw into the street, and committed to the flames.

They renewed their outrages on the following day, destroying several Romish chapels, and demolishing the house of Sir George Saville, in resentment of his having brought into parliament the bill in favour of the Roman Catholics.

Next day both houses met as usual; but finding that no business could be done, they adjourned to the 19th.

During this day and the following, which were the 6th and 7th of June, the rioters were absolute masters of the metropolis and its environs.

Some of those who had been concerned in the demolition of the chapels belonging to foreign ministers, having been seized and sent to Newgate, the mob collected before that prison, and demanded their immediate release. On being refused, they proceeded to throw firebrands and all manner of combustibles into the keeper's house; which unhappily communicated the fire to the whole building; so that this immense pile was soon in flames. In this scene of confusion, the prisoners were all released. They amounted to about 300; among whom several were under sentence of death. They set fire, in the same manner, to the King's Bench and Fleet prisons, and to a number of houses belonging to Roman Catholics. The terror occasioned by these incendiaries was such that most people hung out of their windows pieces of blue silk, which was the colour assumed by the rioters; and chalked on their doors and shutters the words, "No Popery," by way of signifying they were friendly to their cause.

The night of the 7th of June concluded these horrors. No less than 36 different conflagrations were counted at the same time. The bank had been threatened, and was twice assailed: but happily was too well guarded for their attempts. In the evening, large bodies of troops arrived from all parts, and came in time to put a stop to the progress of the rioters. They fell upon them everywhere, and multitudes were slain and wounded, besides the numbers that perished through intoxication. It was not until the afternoon of the 8th, that people began to recover from their consternation. During great part of the day the disorders of the preceding night had created so terrible an alarm, that the shops were almost universally shut up over all London. The melancholy effects of misguided zeal were not, however, confined solely to London. The outrageous disposition of the populace was preparing to

Britain. to act the like horrid scenes in other parts of England. The mob rose in Hull, Bristol, and Bath; but through the timely interposition of the magistracy, these places were saved from their fury.

On the subsiding of this violent and unexpected commotion, it was thought proper to secure Lord George Gordon. He was arrested, and committed close prisoner to the Tower, after having undergone a long examination before the principal lords of the council.

On the 19th of June, both houses met again according to adjournment. A speech was made on this occasion from the throne, acquainting them with the measures that had been taken in consequence of the disturbances, and assuring them of the utmost readiness to concur in whatever could contribute to the safety and maintenance of the laws and liberties of the people. The speech was highly approved: but the conduct of administration was severely censured, and charged with unpardonable neglect for not calling forth the civil power, and employing the military, in due time to obviate the mischiefs that had been committed. Ministry excused itself, from the want of sufficient strength to answer all the demands of assistance that were made during the riots, and the absolute impossibility of suppressing them till the arrival of troops from the country. The various petitions were now taken into consideration that had been presented for the repeal of the act which had occasioned the riots; but the house continued in the same mind. Nevertheless it was thought proper to yield somewhat to the prejudices of the people, by passing a bill for preventing persons of the Popish persuasion from teaching or educating the children of Protestants; but this was afterwards thrown out by the lords.

645
Ministerial
power con-
firmed by
the riots.

Nothing could have happened more opportunely for the present ministry than the riots just now related; for such were the alarm and terror occasioned by them, that the ardour which had appeared for promoting popular meetings and associations, and for opposing the measures of government, was in a great degree suppressed. The county meetings were represented as having a tendency, like the Protestant Association, to bring on insurrections and rebellion. Many began to consider all popular meetings as extremely dangerous; and among the commercial and moneyed people, there was not an inconsiderable number, who were so panic-struck by the late riots, that all attention to the principles of the constitution was overruled by their extreme anxiety about the preservation of their property. Had it not been for these events, though the minister was again at the head of a majority in parliament, it is probable that the spirit of opposition which prevailed in the different counties would have compelled administration to make some concessions to the people. But these transactions extremely strengthened the hands of administration; and rendered the exertions of the popular leaders less formidable. The popular party were also somewhat weakened, by the dissensions which took place among them in the county meetings, and assemblies of that kind, relative to annual parliaments and other political regulations which were proposed to be adopted.

In the suppression of these riots, however, the interference of the military without the command of the

Britain. civil magistrate became a matter of suspicion to the people at large. In the house of lords the duke of Richmond expressed an expectation that some of his majesty's ministers would rise, and give their lordships assurances, that the measures taken in order to suppress the riots, which were defensible only upon the ground of necessity, would be so stated; and that what was illegally done, on the ground of necessity, would be cured by an act of indemnity.

Various other observations were thrown out relative to the king's prerogative and military law: upon which Lord Mansfield observed, that neither the king's prerogative nor military law had any thing to do with the conduct of government in their endeavours to quell the late outrages. All men, of all ranks, descriptions, and denominations, were bound, by their oath of allegiance, to interpose for the prevention of acts of high treason, or felony, wherever any attempts to perpetrate such crimes were made in their presence; and were criminal, if they did not do it. In the whole of these proceedings, therefore, the military had not acted in their technical capacity as military, but had merely exercised their duty as civil men, which they, in common with other civil men, had both a right and an obligation to exertise. When a body of men were convened, without proceeding to the actual perpetration of treasonable or felonious acts, then, by a clause in the riot-act, the presence of the civil magistrate was necessary, before the military could interpose at all; and for this reason, that as no acts of felony were committed, they could have no plea in the civil character for meddling at all. But by the statute-law of the country, it became felonious in any combination of men to persevere in that combination, after the riot-act had been read by a justice of the peace; and this being done, then, and not till then, they had a constitutional reason for their interposition; namely, the privilege and duty of hindering the commission of felony, whenever they had it in their power. This being, therefore, the plain voice of the law, his lordship did not see how any prerogative of the king had been exercised, nor how military law had been established. Nothing had been done out of the regular course of the law, and no power had been assumed by the soldiery, which they did not possess as civil individuals, and not in their technical capacity as members of the military.

This doctrine was far from being agreeable to the nation in general, and was very freely censured both in newspapers and pamphlets. It was admitted, that if soldiers came accidentally, as individuals, to any place where felonies were committing, they might interfere, as well as others of the king's subjects, in the prevention of them. But this was a different case from that of bodies of armed troops being sent under officers commissioned by the king, and with orders to act against riotous and disorderly persons without any authority from the civil magistrate. It was maintained that the constitution of England knew no such character as a mercenary soldier, at the sole will of the executive power. Soldiers were held to their duty by laws which affected no other part of the community: and no soldier, as such, could be employed in the service of the constitution, without a particular act of parliament in his favour. The idea that a mi-
litary

Britain.

lity man was convertible into a soldier, or a citizen, as royalty might move its sceptre, was a novel idea, and only made for the present occasion. Mercenary armies were understood to consist of men, who had either detached themselves or been forced from civil societies. Laws were made on those suppositions, regarding their liberties and lives, such as no members of civil society could submit to. Soldiers were only tolerated by annual bills, and under repeated pretences; and the very idea of blending them with the common subjects of the state, and giving persons of their description a right of judging on its most important occurrences, would have filled our ancestors with horror. The laws tolerated an army for certain periods, and under certain restrictions; but there was no law which admitted the interference of the military in any of the operations of civil government.

It was acknowledged, that the late atrocious riots had rendered an extraordinary exertion of power absolutely necessary: but it was at the same time contended, that the interposition of the army in those outrages, without any authority from the civil magistrate, was an act of prerogative unconstitutional and illegal, though perfectly seasonable and beneficial. The public safety and benefit might sometimes excuse exertions of power, which would be injurious and tyrannical on ordinary occasions: but the utmost care should be taken, that such extraordinary exertions should not be established as precedents, which might operate very fatally to the constitution. An act of indemnity to the ministry, therefore, on account of the necessity of the case, should be immediately passed. But if a large standing army was kept up, and the king was understood to be invested with a power of ordering the troops to act discretionally, whenever he should judge proper, without any authority from the civil magistrate, the people could have no possible security for their liberties. In vain might be their appeals to the courts of justice: for the efficacy of appeals of that kind, in such cases, would depend on the pleasure of the prince.

Many were filled with similar apprehensions, and alarmed at the dangerous precedent which the late exertions of the military afforded, however necessary they might be from the very singular circumstances of the case. Among others, Sir George Saville, in an address to his constituents some time afterwards, declared, that he considered them as "fully, effectually, and absolutely under the discretion and power of a military force, which was to act without waiting for the authority of the civil magistrates."

A letter written by Lord Amherst to Lieutenant-colonel Twisleton, who commanded the troops employed in London for the suppression of the riots, and which was understood to be an order for disarming the citizens, was much canvassed in both houses of parliament. The letter, however, was denied to have such a meaning, and was said to be levelled only at disorderly persons who were found in arms. It excited, nevertheless, no inconsiderable alarm; and was an inducement, added to the consideration of the late riots, to lead a great number of citizens to provide themselves with arms, and to join in plans of military association, that they might be enabled to protect themselves and

the city from violence and outrage, without any future interposition of the military. ^{Spain.}

We must now proceed to a detail of the operations of the war, which, notwithstanding the powerful confederacy against Great Britain, seemed rather to be in her favour than otherwise. The Spaniards had begun their military operations with the siege of Gibraltar, but with very little success*; and the close of the year 1779, and beginning of 1780, were attended with some considerable naval advantages to Great Britain. On the 18th of December 1779, the fleet under the command of Sir Hyde Parker in the West Indies captured nine sail of French merchant ships, which, with several others, were under the convoy of some ships of war. Two days after he detached Rear Admiral Rowley in pursuit of three large French ships, of which he had received intelligence, and which were supposed to be part of Mons. la Mothe Picquet's squadron returning from Grenada. His success there has been already mentioned; and about the same time several other vessels were taken by the same squadron commanded by Sir Hyde Parker. ^{Various engagements at sea, &c. See Gibraltar.}

On the 8th of January 1780, Sir George Brydges Rodney, who had been intrusted with the command of a fleet, one object of the destination of which was the relief of Gibraltar, fell in with 22 sail of Spanish ships, and in a few hours the whole fleet was taken.

In little more than a week after, the same fortunate admiral met with still more signal success. On the 16th of the month he engaged, near Cape St Vincent, a Spanish fleet, consisting of 11 ships of the line and two frigates, under Don Juan de Langara. The Spaniards made a gallant defence; but four of their largest ships were taken, and carried into Gibraltar. These were the Phoenix of 80 guns and 700 men, on board of which was the admiral, Don Juan de Langara: the Monarca, of 70 guns and 600 men, Don Antonio Oyarvide commander; the Princessa, of 70 guns and 600 men, Don Manuel de Leon commander; and the Diligente, of 70 guns and 600 men, Don Antonio Abornoz commander. Two other 70 gun ships were also taken; but one of them was driven on shore on the breakers and lost, and the other was likewise driven on shore, but afterwards recovered. Four ships of the line escaped, and the two frigates: but two of the former were much damaged in the action; in the course of which one Spanish ship, the San Domingo, of 70 guns and 600 men, was blown up. The five men of war taken were remarkably fine ships; and were afterwards completely refitted, manned, and put into the English line of battle. The Spanish admiral and his officers applied to Sir George Rodney to obtain the liberty of returning to Spain upon their parole of honour: but this he declined for some time, because he was informed that a great number of British seamen were then prisoners in Spain, who ought to have been released. However, afterwards receiving assurances that these should be immediately set at liberty, he released the Spanish admiral and officers upon their parole; and the prisoners in general were treated with such generosity and humanity, as appeared to make a great impression upon the court of Madrid and the Spanish nation. When Admiral Rodney had supplied the garrison of Gibraltar with

Britain.

with provisions, ammunition, and money, he proceeded on his voyage to the West Indies; having sent home part of his fleet, with his Spanish prizes, under the command of Rear-Admiral Digby; who took a French man of war on his return, the *Prothée*, of 64 guns and 700 men.

On the 20th of March there was an action in the West Indies, between some French and English men of war, the former under the command of Mons. de la Mothe Piquet, and the latter, being part of Sir Peter Parker's squadron, under that of Commodore Cornwallis. The engagement was maintained on both sides with great spirit; but the French at length gave up the contest, and made the best of their way for Cape François.

Admiral Rodney having arrived in the West Indies, and taken upon him the command of his majesty's ships at the Leeward islands, an action happened between him and the French fleet under the command of Count de Guichen, on the 17th of April. The British squadron consisted of 20 ships of the line, besides frigates; and the French fleet of 23 ships of the line, and several frigates. The action began a little before one, and continued till about a quarter after four in the afternoon. Admiral Rodney was on board the *Sandwich*, a 90 gun ship, which beat three of the French ships out of their line of battle, and entirely broke it. But such was at length the crippled condition of the *Sandwich*, and of several other ships, that it was impossible to pursue the French that night without the greatest disadvantage. The victory was, indeed, claimed on both sides; but no ship was taken on either: and the French retired to Gaudaloupe. Admiral Rodney's ship, the *Sandwich*, had suffered so much, that for 24 hours she was with difficulty kept above water. Of the British there were killed in this engagement 120, and 353 were wounded.

On the 15th of May, another action happened between the same commanders. It did not commence till near seven in the evening, only a few ships having engaged, which were soon separated; and the whole ended in nothing decisive. Of the British 21 were killed, and 100 wounded. The fleets met again on the 19th of the same month, when another action ensued; but this also terminated without any material advantage on either side. In the last engagement 47 of the British were killed and 193 wounded. According to the French accounts, the total of their loss, in these three actions, amounted to 158 killed, and 820 wounded.

It was a very unfavourable circumstance for Great Britain, that the French should have so formidable a fleet in the West Indies: and this great force of the enemy was augmented in June, by being joined with a Spanish squadron near the island of Dominica. The French and Spanish fleets, when united, amounted to 36 sail of the line. They did not, however, attack any of the British islands, or even reconnoitre the fleet under the command of Sir George Brydges Rodney, which then lay at anchor in Gros Islet bay. Such, indeed, were the vigilance and good conduct of that admiral, and so sensible were the inhabitants of these islands of his services, that the houses of assembly of St Christophers and Nevis presented addresses to him, testifying

VOL. IV. Part II.

their gratitude for the security they enjoyed in consequence of his spirited and seasonable exertions.

In the month of June, Admiral Geary, who commanded the grand fleet, took twelve valuable merchant ships bound from Port au Prince to Bourdeaux and other ports of France: But in the month of July a very important and unexpected capture was made by the Spaniards, which could not but excite much alarm in Great Britain. On the 8th of August, Captain Moutray, who had under his command the *Ramillies* of 74 guns and two frigates, with the trade bound for the East and West Indies under convoy, had the misfortune to fall in with the combined fleets of France and Spain, which had sailed from Cadiz the preceding day. The *Ramillies* and the two frigates escaped: but the rest were so completely surrounded, that five East Indiamen were taken, and 50 merchant ships bound for the West Indies. Their cargoes were extremely valuable: it was one of the most complete naval captures ever made; and was a heavy stroke to the commerce of Great Britain. The Spaniards on this occasion behaved to their prisoners with great attention and humanity; and appeared disposed to make an adequate return for the generous treatment which their countrymen had experienced from Admiral Rodney. This loss, however, great as it was, was scarcely sufficient to compensate the capture of Fort Omoa from the Spaniards, where upwards of three millions of dollars were gained by the victors, and, among other valuable commodities, 25 quintals of quicksilver, without which the Spaniards could not extract the precious metals from their ores; the loss of which consequently rendered their mines useless.

But while the British were making the most vigorous efforts, and even in the main getting the better of the powers who opposed them fairly in the field, enemies were raised up throughout all Europe, who, by reason of their acting indirectly, could neither be opposed nor resisted. The power which most openly manifested its hostile intentions was Holland; but besides this, a most formidable confederacy, under the title of the *armed neutrality*, was formed, evidently with a design to crush the power of Great Britain. Of this confederacy the empress of Russia declared herself the head; and her plan was intimated on the 26th of February 1780, in a declaration addressed to the courts of London, Versailles, and Madrid. In this piece it was observed, that though from the conduct of her imperial majesty it might have been hoped that her subjects would have been allowed peaceably to enjoy the fruits of their industry, and of the advantages belonging to all neutral nations, experience had proved the contrary: her imperial majesty's subjects had been often molested in their navigation, and retarded in their operations, by the ships and privateers of the belligerent powers. Her imperial majesty therefore declared, that she found herself under the necessity of removing those vexations which were offered to the commerce of Russia, as well as to the liberty of commerce in general, by all the means compatible with her dignity and the welfare of her subjects; but before she came to any serious measures, and in order to prevent all new misunderstandings, she thought it just and equitable to expose to the eyes of

Britain.

647 Account of the armed neutrality.

4 B all

Britain. all Europe the principles which she had adopted for her conduct, and which were contained in the following propositions :

1. That neutral ships should enjoy a free navigation, even from port to port, and on the coasts of the belligerent powers.

2. That all effects belonging to the subjects of the belligerent powers should be looked upon as free on board such neutral ships, excepting only such goods as were stipulated contraband.

3. Her imperial majesty, for the proper understanding of this, refers to the articles 10. and 11. of her treaty of commerce with Great Britain, extending her obligations to all the other belligerent powers.

In the treaty made between Great Britain and Russia in 1734, it is said, "The subjects of either party may freely pass, repass, and trade in all countries which now are, or hereafter shall be, at enmity with the other of the said parties, places actually blocked up or besieged only excepted, provided they do not carry any warlike stores or ammunition to the enemy : as for all other effects, their ships, passengers, and goods, shall be free and unmolested. Cannons, mortars, or other warlike utensils, in any quantity beyond what may be necessary for the ship's provision, and may properly appertain to and be judged necessary for every man of the ship's crew, or for each passenger, shall be deemed ammunition of war ; and if any such be found, they may seize and confiscate the same according to law ; but neither the vessels, passengers, or the rest of the goods, shall be detained for that reason, or hindered from pursuing their voyage." The same enumeration of the goods, stipulated as contraband, was given in the treaty concluded between Great Britain and Russia in 1766.

4. That in order to determine what characterizes a port blocked up, that denomination should not be granted but to such places before which there were actually a number of enemy's ships stationed near enough so as to make its entry dangerous.

5. That these principles should serve as rules in the judicial proceedings and sentences upon the legality of prizes.

Her imperial majesty declared, that she was firmly resolved to maintain these principles ; and that, in order to protect the honour of her flag and the security of the commerce and navigation of her subjects, she had given an order to fit out a considerable part of her naval forces. She added, that this measure would have no influence on the strict and rigorous neutrality which she was resolved to observe, so long as she should not be provoked and forced to depart from her principles of moderation and impartiality. It was only in that extremity that her fleet would be ordered to act wherever her honour, interest, and necessity should require. This declaration was also communicated to the States-general by Prince Gallitzin, envoy extraordinary from the empress of Russia ; and she invited them to make a common cause with her, so far as such an union might serve to protect commerce and navigation. Similar communications and invitations were also made to the courts of Copenhagen, of Stockholm, and of Lisbon, in order, it was said, that, by the united care of all the neutral maritime powers, the navigation of all the neutral trading nations might be established and legalized, and a system adopted found-

ed upon justice, and which, by its real advantage, might serve for rules to future ages. Britain.

The memorial of the empress of Russia, though very unfavourable to the views of Great Britain, received a civil answer from that court : but by other powers it was received, as it might naturally be expected, with much more cordiality. In the answer of the king of France it was said, that "what her imperial majesty claimed from the belligerent powers was nothing else than the rules prescribed to the French navy ; the execution whereof was maintained with an exactness known and applauded by all Europe." He expressed his approbation of the principles and views of her imperial majesty ; and declared, that from the measures she had now adopted, "solid advantages would undoubtedly result, not only to her subjects, but also to all nations." The kings of Sweden and Denmark also formally acceded to the armed neutrality proposed by the empress of Russia, and declared their perfect approbation of her sentiments. The States-general did the same : but on account of that slowness of deliberation which prevails in the councils of the republic, it was not till towards the close of the year that their concurrence was notified to the court of Russia. It was resolved by the powers engaged in this armed neutrality to make a common cause of it at sea against any of the belligerent powers who should violate, with respect to neutral nations, the principles which had been laid down in the memorial of the empress of Russia.

But though the British ministry could not openly engage in war with all the other powers of Europe, they determined to take severe vengeance on the Dutch, whose ingratitude and perfidy now became a general subject of speculation. It has already been observed, that, ever since the commencement of hostilities with the Americans, the Dutch had shown much partiality towards them. This continued to be the case even beyond what the natural avidity of a mercantile people could be supposed to produce : Frequent memorials and remonstrances had of consequence passed between the two nations, and the breach gradually grew wider and wider, until at last matters came to an extremity, by a discovery that the town of Amsterdam was about to enter into a commercial treaty with America. This happened in the beginning of September 1780, by the capture of Mr Laurens, lately president of the American congress, and who had been empowered by that body to conclude a treaty with Holland. Mr Laurens himself was instantly committed prisoner to the Tower of London, and a spirited remonstrance was made to the states of Holland, requiring a formal disavowal of the transaction. To this, however, no other answer could be obtained, than that they would take the matter into consideration according to the usages and forms of the country ; and that a reply would be given as soon as the nature of their government would admit.

Such an equivocal answer could not by any means be satisfactory ; and therefore the most vigorous measures were resolved on. On the 25th of January 1781, it was announced to the house, that his majesty had been obliged to direct letters of marque and reprisal to be issued against the States-general and their subjects. For the causes and motives of his conduct in this respect,

Britain. spect, he referred to a public manifesto against that republic, which he had ordered to be laid before the house. The charges against the republic, however, were briefly summed up by Lord North in his speech on the occasion. The States, he said, in open violation of treaties, had not only refused to give Great Britain that assistance which those treaties entitled her to claim when attacked by the house of Bourbon, but had also, in direct violation of the law of nations, contributed as far as they could to furnish France with warlike stores, and had also at length thought proper to countenance the magistracy of Amsterdam in the insult which they had offered to this country, by entering into a treaty with the rebellious colonies of Great Britain, as free and independent states. By the treaty of 1678, it was stipulated, that, in case Great Britain was attacked by the house of Bourbon, she had a right to take her choice of either calling upon the States-general to become parties in the war, and to attack the house of Bourbon within two months, or of requiring an aid of 6000 troops, and 20 ships of war, which the States were to furnish immediately after the claim was made. But though this country had always preserved her faith with Holland, yet that republic had refused to fulfil the terms of this treaty.

His lordship farther observed, that the States-general had suffered Paul Jones, a Scotchman and a pirate, acting without legal authority from any acknowledged government, to bring British ships into their ports, and to refit there (A). A rebel privateer had also been saluted at the Dutch island of St Eustatius, after she had been suffered to capture two British ships within cannon-shot of their forts and castles. A memorial was presented at the Hague, in June 1779, on the breaking out of the war with Spain, to claim the aid we were entitled to require by the treaty of 1678; but of this not the least notice was taken on the part of the States. Two other notices had since been delivered, each of which met with the same reception. The British ministry had done all in their power to bring the States to a true sense of their interest; and when the necessity of the case compelled them to seize on the Dutch ships carrying stores to France, they had paid the full value for the cargoes, and returned the ships; so that neither the private merchant, the private adventurer, nor the States, had suffered. France only had felt the inconvenience, by her being deprived of

that assistance which she would have received from those cargoes. Britain.

With respect to an observation that had been made, that the treaty laid before the house, between the Dutch and the Americans, was nothing more than a contemplative project, his lordship remarked, that it was actually signed and sealed; the names of Van Berkel the pensionary of Amsterdam, and Mons. de Neuville, a merchant and burgher of that city, being subscribed to it on the part of the magistracy of Amsterdam, and the name of John Lee, as commissioner or agent for the congress of America. The States-general had also refused to pay the least attention to the requisition in his majesty's memorial, delivered by Sir Joseph Yorke, that proper notice should be taken of Van Berkel and his associates; so far as such a refusal could be implied by a contemptuous silence. As to the principal magistrates of Amsterdam, they were so far from disavowing the fact, or attempting to palliate it, that they gloried in the whole transaction; and expressly declared, even to the States-general, that what they had done was what their indispensable duty required.

His lordship added, that he lamented the necessity of a war with Holland; but it appeared to him to be an unavoidable measure. He confessed the situation of this country to be truly alarming; but when he considered the powerful stand that had already been made against the most alarming confederacy that had ever been formed against Great Britain, the little success that the enemies of this country had met with in all their various attempts against it, and the spirit and resources of the nation, the public prospects appeared to him much less gloomy than some gentlemen thought proper to represent them. Our difficulties were certainly great; but he trusted that they were by no means insuperable. He was neither desirous of concealing their magnitude, nor afraid to meet them, great as they must be acknowledged; because he was convinced, that when the force of this country was fully exerted, it was equal to the contest; and that the only means of obtaining an honourable and a just peace, was to show ourselves capable of carrying on the war with spirit and with vigour.

Before this national resolution, however, could possibly have been communicated officially to the naval commanders in the West Indies, the Dutch were actually

(A) This man, who had been formerly a servant in Lord Selkirk's house, had landed in 1778 and plundered it of the plate, but without doing any farther mischief. The action, however, was very disagreeable to his own party; and at the desire of Dr Franklin, the plate was afterwards restored. After this exploit, he attempted to set fire to the town of Whitehaven, but without success. In 1779, he made a descent on the coast of Ireland, but without committing any act of hostility. His people indeed carried off some sheep and oxen, but their captain paid liberally for what they had taken. In the month of September 1779 he appeared in the frith of Forth with several prizes. They advanced up the frith above the island of Inchkeith, so as to be nearly opposite to Leith. His design was supposed to have been to burn the shipping there; but he was prevented from attempting this by a strong west wind; and such measures were also taken for the defence of the harbour, by erecting batteries and otherwise, that he would probably have miscarried had any attempt been made. On leaving the coast of Scotland, he fell in with the *Serapis* and *Scarborough*, both of which he took after a most desperate engagement; by which all the vessels were reduced almost to wrecks. These were carried into a Dutch harbour; and it was this transaction to which Lord North now alluded. He was called a *pirate*, on account of his not being at that time properly furnished with a commission either from France or America, though this was denied by the opposite party.

ally attacked. The defenceless island of St Eustatius was, on the 3d of February 1781, summoned by Admiral Rodney and General Vaughan to surrender to the arms of Great Britain, and only one hour given to consider of it. The immense property on the island was confiscated, and a sale instituted, with such circumstances of apparent rapacity, as not only became the subject of a discussion in parliament, but drew upon this nation, whether justly or not we pretend not to determine, the ill will of all Europe*.

The Dutch nation seem not in the present case to have behaved with any degree of prudence. Notwithstanding their provoking conduct towards Britain, they had made no preparations for war in case of being attacked. Notwithstanding this inactivity, however, it still appeared that they retained their ancient valour, and were in fact the most formidable naval enemies Britain had to contend with. By the month of August 1781 they had equipped a considerable squadron, the command of which was given to Rear-admiral Zoutman. On the 5th of that month, this squadron fell in with the British fleet commanded by Admiral Hyde Parker. The force commanded by the Dutch admiral consisted, according to their own account, of one of 74 guns, one of 68, one of 64, three of 54, and one of 44, besides frigates: but the English account represents the Dutch fleet as consisting of eight two-decked ships. No gun was fired on either side till they were within the distance of half musket-shot. The action began about eight in the morning, and continued with an unceasing fire for three hours and forty minutes. Both sides fought with equal ardour, and little advantage was gained on either. When the heat of the action was over, both squadrons lay to a considerable time near each other, when the Dutch ships of war with their convoy bore away for the Texel; and the English ships were all too much disabled to follow them. A Dutch 74 gun ship sunk soon after the action. On board the British fleet 104 were killed and 339 wounded; and the loss of the Dutch was probably greater. Admiral Zoutman, in the account of the engagement transmitted by him to the stadtholder, said, that his men "fought like lions;" and it was said by the British admiral, in the account sent by him to the admiralty, that "his majesty's officers and men behaved with great bravery, nor did the enemy show less gallantry." The admiral of the Dutch fleet was promoted, honorary rewards were given to the principal officers, and two months pay to the men, for their behaviour in the action. When Admiral Parker's fleet arrived at the Nore, his majesty, in order to testify his sense of his merit, went on board his ship, with the avowed design, as it is said, of conferring on him the honour of knighthood: but this the admiral thought proper to decline; and it was generally supposed, that this veteran officer was much disgusted, that more ships had not been sent to him, for which he had applied, and which he conceived might have been spared, so that he might have been enabled to obtain a complete victory.

Thus the war was still carried on in various parts of the globe in such a manner as seemed to evince the impossibility of crushing the power of Great Britain by any force whatever. In Europe, the utmost efforts of France and Spain were able to produce nothing more

than the annual parade of a mighty fleet in the Channel. This was answered by the appearance of a British fleet so formidable that the allies never durst attack them. The states of Holland had drawn out their force; and this too was opposed by one, which, if insufficient to conquer, was at least able to prevent their effecting any thing detrimental to our possessions. In the East Indies the united powers of the French and Indians had been conquered, and the Dutch settlements had suffered severely*. In the year 1781, however, the British naval power in the West Indies seemed to sink, and some events took place which threatened a total ruin of the empire in these parts. This was owing to the vast superiority of the combined fleets of France and Spain, by whom that of Britain was so far outnumbered, that they could not achieve any thing of consequence. An ineffectual attempt on the island of St Vincents† was made by Admiral Rodney; and an indecisive engagement took place, April 28th 1781, between Admiral Hood and the count de Grasse; the event of which, however, if not advantageous, was certainly honourable to Britain, as the French had a superiority of six ships of the line. The damage done to the British ships having obliged them to retire to Barbadoes to refit, the French took that opportunity to make a descent on the island of Tobago‡. The governor, Mr Ferguson, made a gallant resistance; but was at last obliged to surrender, as no prospect of succours appeared. On his return to England he complained loudly that the island had been unnecessarily lost. Admiral Rodney had sent Rear-admiral Drake with six sail of the line, three frigates, and some troops, to the assistance of the island; but they were sent too late, and the island had capitulated before any relief was afforded it. In a letter of Admiral Rodney, which was published in the gazette, some surprise was expressed, that the place had surrendered so soon: upon which Governor Ferguson published an account of the siege, signed with his name, in all the London papers, in which he recriminated on the admiral. The governor's narrative was so perspicuous, so apparently satisfactory, and his charge against the admiral so strong, that it was thought incumbent on the latter to vindicate his conduct: but no answer to the governor's accusation ever appeared.

Besides the inconveniences which the British West India islands suffered in consequence of the war, it was also a misfortune to some of them that they were involved in domestic disputes, occasioned by their dissatisfaction at the conduct of their governors. This was particularly the case with Jamaica and Barbadoes, in both which islands there were frequent contests about this time between the houses of assembly and the governors. But the remonstrances of the inhabitants on the subject did not meet with much attention from those who had it in their power to afford them relief: for it seemed, indeed, to be a kind of maxim with the British administration at this period, to pay little regard to any complaints from the subjects of the empire, respecting any abuse of authority, from whatever quarter they might come, Ireland only excepted; and, with respect to that kingdom, they were induced to relax a little from the high tone they were accustomed to assume, by the powerful and energetic arguments of the Irish volunteers. See IRELAND.

The

Britain.

The great and decisive stroke, however, which happened this year, was the capture of Lord Cornwallis with the division of the army under his command. Other events, indeed, were sufficiently mortifying. The province of West Florida had been reduced by the Spaniards; Minorca was besieged by them with an apparent impossibility of holding out; the island of St Eustatius was surprised by the French; and in short every circumstance seemed to proclaim the necessity of putting an end to a war so calamitous and destructive.

655
Ministry
still persist
in their
military
schemes.

All the disasters that had yet happened, however, were not sufficient to induce the ministry to abandon their favourite scheme of war with the colonies. The parliament met on the 27th of November 1781. It has already been observed, that in the year 1780 the ministry had received such a signal defeat as seemed to prognosticate the ruin of their power. They had indeed afterwards acquired a majority, and the extreme terror produced by the riots had contributed not a little to the establishment of their authority. The remembrance of what had passed, however, most probably induced them to a dissolution of parliament; while the successes at Charlestown and other parts of America, once more gave them a decided majority in both houses. But the disasters of the year 1781 involved them in the utmost difficulty and distress. In the speech from the throne, his majesty observed, that the war was still unhappily prolonged by that restless ambition which first excited the enemies of his crown and people to commence it, and which still continued to disappoint his earnest desire and diligent exertions to restore the public tranquillity. But he should not answer the trust committed to the sovereign of a free people, nor make a suitable return to his subjects for their zealous and affectionate attachment to him, if he consented to sacrifice, either to his own desire of peace, or to their temporary ease and relief, those essential rights and permanent interests, upon the maintenance and preservation of which the future strength and security of Great Britain must depend. The events of war, he said, had been very unfortunate to his arms in Virginia, having ended in the loss of his forces in that province. No endeavours, he added, had been wanting on his part to extinguish that spirit of rebellion which his enemies had found means to foment and maintain in the colonies, and to restore to his deluded subjects in America that happy and prosperous condition which they had formerly derived from a due obedience to the laws; but the late misfortune in that quarter called loudly for the firm concurrence and assistance of parliament, in order to frustrate the designs of their enemies, which were equally prejudicial to the real interests of America, and to those of Great Britain. At the close of the speech, his majesty observed, that among the many ill consequences which attended the continuation of the present war, he sincerely regretted the additional burdens which it must unavoidably bring upon his faithful subjects: but he still declared his perfect conviction of the justice of his cause; and that he had no doubt, but that, by the concurrence and support of his parliament, by the valour of his fleets and armies, and by a vigorous, animated, and united exertion of the faculties and resources of his people, he

should be enabled to restore the blessings of a safe and honourable peace to all his dominions.

Britain.

A motion for an address of thanks, couched in the usual style, was made in the house of commons. It was urged, that a durable and advantageous peace could result only from the firm, vigorous, and unremitting prosecution of the war. The present was not the time to relinquish hope, but to resolve upon exertion. By despair we should invite calamity to overwhelm us; and it would ill become a great and valiant people, whose resources were yet powerful and numerous, to submit where they should resist; to look with indifference upon their political importance; and to tarnish, by indolent pusillanimity, the national and dear-bought glories both of remote and recent eras, instead of opposing, with augmented force, a combination whose inveterate efforts to throw out of the scale of Europe the whole political existence of Great Britain, were strengthened by the late victory over Lord Cornwallis in Virginia. But if a general spirit of unanimity, so requisite at one of the most alarming and important periods in the British annals, were to arise within the walls of parliament, and thence to diffuse itself throughout the body of the people, the gloom that hovered round us would rapidly disperse, and great successes would conduct the nation back to all its pristine splendour and felicity.

This was vehemently opposed by Mr Fox and Mr Burke. The latter remarked, that if there could be a greater misfortune than had already been undergone by this kingdom in the present disgraceful contest, it was hearing men rise up in the great assembly of the nation to vindicate such measures. If the ministry and the parliament were not to be taught by experience; if neither calamities could make them feel, nor the voice of God make them wise; what had this fallen and undone country to hope for? If any thing could tend to deject the people of England, to make them despair of their situation, and resign themselves to their fate, it must be to receive information that their ministers, after all that had been suffered, were yet determined to go on with the American war. A battle might be lost, an enterprise might miscarry, an island might be captured, an army might be lost in the best of causes, and even under a system of vigour and foresight; because the battle, after all the wisdom and bravery of man, was in the hands of heaven: and if either or all these calamities had happened in a good cause, and under the auspices of a vigilant administration, a brave people would not despair. But it was not so in the present case. Amidst all their sufferings and their misfortunes, they saw nothing so distressing as the weakness or wickedness of their ministers. They seemed still determined to go on, without plan, and without foresight, in this war of calamities; for every thing that happened in it was a calamity. He considered them all alike, victories and defeats; towns taken, and towns evacuated; new generals appointed, and old generals recalled; they were all alike calamities in his eyes, for they all spurred us on to this fatal business. Victories gave us hopes, defeats made us desperate, and both instigated us to go on. They were, therefore, both calamities; and the king's speech was the greatest calamity of all; for the king's speech showed

656
King's
speech

Britain. showed us the disposition of the ministers: and this disposition was not to retreat an inch; to go on, to plunge us deeper, to make our situation more disgraceful and more unhappy.

In the course of the debate, it was contended on the part of administration, and particularly by Lord North, that by the address, as originally proposed, the house did not pledge themselves to any continuance of the American war: but this was strongly denied by the gentlemen in opposition. However, the point was at last decided in favour of ministry by a majority of 216 to 129; and the address was then carried as originally proposed.

In the house of peers, a motion for an address similar to that of the house of commons, was made by Lord Southampton, and seconded by Lord Walsingham. It was vigorously opposed by the earl of Shelburne; who observed, that seven years had now elapsed since blood was first drawn in America; and from that period to the present the affairs of Great Britain had been continually growing worse. A long progress in the war had left us in a situation in which there were no advantages to console; but dangers and calamities had arisen, which were unknown to us at the commencement of hostilities. Of nearly 87,000 men sent to America, how few had returned! What treasures had been in vain expended! What enormous debts accumulated! The most liberal national supplies had been followed by nothing but calamities; and the whole proceedings of the ministry manifested a want of system and of intelligence. Among other instances of mismanagement, his lordship remarked, that, instead of blocking up the French fleets within their own harbours, or immediately intercepting them on their putting out to sea, we had suffered them to sail far upon their expeditions to our distant settlements; and when they had acquired this great advantage, we slowly followed their powerful armaments with inconsiderable squadrons, and scarcely ever reached the place of destination till the enterprises of the enemy were totally accomplished. His lordship also declared it to be his opinion, that the capture of Earl Cornwallis was owing to the preceding capture of St Eustatius. As to the farther prosecution of the war with the least prospect of success, it was totally impossible: the nation was too much exhausted both of men and money; recruits were not to be procured for the army; and as to our navy, if we had the best first lord of the admiralty, and the ablest board that ever sat, it was impossible to provide for all the distant services of so extensive a war. The reason was obvious. The fine navy that belonged to Great Britain at the conclusion of the last war had been suffered to rot and moulder away; while France and Spain had recruited and repaired their marine during the whole period of the peace.

Among other strictures on ministerial conduct, it was observed by the duke of Richmond, that at present scarcely a seventh part of the people were represented, while all the remainder had no concern whatever, either virtually or individually, in the management of their own affairs; which their lordships well knew, the constitution of this country, as originally framed, gave them a right to have. He appealed to the house, whether many of their lordships did not name the

members for several boroughs, and whether the representatives were not chosen only by the management of two or three burgesses. Were this point reformed, his grace declared, that he should still expect to see the country capable of regaining some portion of its former greatness. He also made some observations on the interior cabinet, which had, he said, been the ruin of this country. To prove its mischievous tendency, he instanced the declaration of the late earl of Chatham, who confessed to the house, "that he was duped and deceived, and that he had not been ten days in the cabinet before he felt the ground rotten under his feet." His grace likewise said, that though it was the middle of war, he made no scruple to recommend it most strenuously to government, immediately to set about curtailing the numbers of the army, and that as much as possible. He recommended, that arms should be put into the hands of the people, for the purposes of domestic defence; and he did not doubt but that in this case, they would act with greater power and success, than even the most numerous military forces. He also advised withdrawing the troops from America, augmenting the navy as much as possible, and sending such succours to the West India islands as might enable them effectually to resist any attempts from the enemy.

Lord Stormont defended the address as originally proposed; and observed, that the language of the speech from the throne was proper to be held by any prince worthy of the crown, in a moment like the present; and the long established custom rendered such an address as had been moved the fit answer to it. The preservation of America, as a dependent part of the British empire, was too important to be relinquished; and the present crisis, so far from justifying despair, called for a redoubled ardour, and for immediate exertion.

The lord-chancellor said, that the present speech from the throne, like all others at the commencement of a session, was no more than a brief state of the nation, delivered in the ancient style of composition, and conformably to established usage, from almost the first existence of parliament; and as to the address, its language not being specifically binding, their lordships might vote in favour of it, without pledging themselves to support any future ministerial measure whatever. The house at length divided, when Lord Shelburne's amendment was rejected by a majority of 75 to 31. A short protest against the address was entered by the duke of Richmond, the marquis of Rockingham, and Earl Fitzwilliam; in which they declared, that they dissented "for reasons too often urged in vain for the last seven years, against the ruinous prosecution of the unjust war carrying on by his majesty's ministers against the people of North America; and too fatally confirmed by repeated experience, and the late disgraceful loss of a second army, to stand in need of repetition."

Though ministers thus succeeded in carrying the addresses in the usual form, they did not meet with the like success in their main plan of carrying on the war. After the debate on the number of seamen, which was fixed to 100,000 for the ensuing year, Sir James Lowther moved as a resolution of the house, "That the war carried on with America had been ineffectual for

war by Sir
James
Lowther.
the

Britain. the purposes for which it was undertaken; and that all farther attempts to reduce that continent by force of arms would be in vain, and must be injurious to this country, by weakening her powers to resist her ancient and confederated enemies." This was supported by a number of arguments interlarded with the most severe reflections on ministerial conduct. In the course of this debate it was observed, and indeed with evident truth, that every state of consequence in Europe withheld its succours, and left us to contend alone against a multitude of enemies; so that we should search in vain for an ally from one corner of the universe to the other. As to the American war, in which the ministry so madly persisted, it was not like a war between two rival and two neighbouring states, about a barrier or a boundary; a contest which, however it ended, could not detract much from the importance or weight of either. It was a war in which the conclusion of every campaign was against us; in which we weakened no enemy by our efforts; in which we had suffered every thing, without gaining any thing. The American war had been a war of delusion from the beginning to the end. Every promise had been broken, every assertion had been falsified, every object had been completely given up. The ministry had said one thing one day; and the next day they had come down again, and with grave faces said what was directly contrary. But it was time to put an end to these delusions; not the least prospect of success in the war now remained; the period was therefore come, when it was indispensably necessary that the parliament should interfere, in order to avert that ruin with which this unhappy country was so immediately threatened.

of his private fortune, could have purchased for his country a safe and honourable peace, he would have made that sacrifice with the utmost cheerfulness, and thought the opportunity of offering it the greatest blessing which could possibly have befallen him. His lordship added, that though he totally disapproved of the motion, yet he was willing to declare it to be his opinion, that it would not be wise nor right to go on with the American war as we had hitherto done; that is, to send armies to traverse from the south to the north of the provinces in their interior parts, as had been done in a late case, and which had failed of producing the intended and the desired effect.

Britain.

This new method of carrying on the war was as much disapproved of as the other; nor indeed did it seem to be generally believed that any material alteration was to take place in the ministerial system. General Burgoyne observed, that declaring a design of maintaining posts in America, of the nature of New York, was declaring a design of offensive war; and that such a maintenance of posts would prove an improvident and a preposterous war. The great if not the only purpose of keeping places of arms upon an enemy's coast, and especially upon a continent, must be for offensive war. During the glorious administration of the earl of Chatham, a place of arms was intended to be established at St Malo's; and it was afterwards established at Belleisle upon a more extensive view than that of a mere inlet into the country. It made a powerful diversion, and drew a great military force from Germany, to protect the whole range of coast from Bayonne to Dunkirk, which was threatened by an embarkation from that place of arms. But the circumstance which rendered that menace against the French coast either practicable or formidable was, our dominion of the sea. At that resplendent era, our naval flag rode in the very bays of France as securely as if anchored at Spithead; and a few frigates would have convoyed an army of 20,000 men to any one point of the French or Spanish coast. This then could be produced as a just precedent for a place of arms. But what other precedents existed? The command of a strait, by which it was possible either to give an inlet for commerce, or to divide the ports of an enemy. Of such a nature was Calais, which, together with Dover, kept separate as often as we thought proper the great ocean and the German sea. Such also was Gibraltar; a place of arms that gave a virtual superiority to the navy of England, though with an inferior number of ships, as separating the ports of the house of Bourbon in the ocean from their ports in the Mediterranean, and preventing the junction of their fleets. But New York, as a place of arms, could answer no possible purpose but to feed an impracticable war, and to multiply that system of contracts, loans, and influence, which, after having operated to the loss of every dependence of the country, was ready to give the final blow to the last remains of property and liberty in the country itself.

General
Burgoyne.

658
Different
plan of
war pro-
posed by
Lord
North.

The motion was opposed by Lord North; who said, that if it was agreed to by the house, it must put an end to the American war in every shape, and even cripple the hands of government in other respects. It would point out to the enemies of this country what were to be the mode and operations of the war; and thus inform the enemy in what manner they might best point their operations against this country during the next campaign. Great Britain must not retain any post in the colonies; for that would be considered as one mode of attempting to reduce the Americans to obedience by force. But was it not manifest, that there might be a necessity of retaining certain posts in America, for the convenience even of carrying on the war against France and Spain?

With respect to the American war in general, his lordship acknowledged, that it had been extremely unfortunate; but he affirmed, that the misfortunes and calamities which had attended it, though of a most serious and fatal nature, were matters rather to be deplored and lamented as the events of war, in themselves perpetually uncertain, than to be ascribed to any criminality in ministers. He had always considered the American war as a war of the most cruel necessity; but at the same time as a war commenced for the support of the just rights of the crown and of the parliament of Great Britain. He would also venture to declare, that as the war was unfortunate to all his fellow-subjects, so it was particularly distressing to himself. He had always considered it as the heaviest calamity of his life: and if, at any time, a sacrifice, not only of the emoluments of his situation, but even of the whole

660.
He recom-
his original
principles
concerning
America.
The general added, that he had not hitherto touched upon the principle of the American war. The impracticability of it was a sufficient justification for supporting the present motion. But he was now convinced that the principle of the American war was wrong, though he had not been of that opinion when he

Britain. he formerly engaged in the service in America. He had been brought to this conviction by observing the uniform conduct and behaviour of the people of America. Passion, prejudice, and interest, might operate suddenly and partially; but when we saw one principle pervading the whole continent, the Americans resolutely encountering difficulty and death for a course of years, it must be a strong vanity and presumption in our own minds, which could only lead us to imagine that they were not in the right. It was reason, and the finger of God alone, that implanted the same sentiment in three millions of people. He would assert the truth of the fact against all which either art or contrivance could produce to the contrary. He was likewise now convinced, upon comparing the conduct of the ministry, as time had developed their system, that the American war formed only a part of a general design levelled against the constitution of this country and the general rights of mankind.

After some farther debate, Sir James Lowther's motion was rejected by a majority of 220 to 179. This, however, was a majority in which the ministry had little reason to exult; as it was sufficiently apparent, from the numbers who voted against administration, that the uninfluenced sense of that house was clearly and decisively against any farther prosecution of the American war.

661
Debate on
the army
estimate.

Other arguments to the same purpose with those of General Burgoyne, just mentioned, were used in the debate on the army estimates. On the 14th of December, the secretary at war informed the house, that the whole force of the army, including the militia of this kingdom, required for the service of the year 1782, would amount to 186,220 men, and for this force the parliament had to provide. The sum required for these troops for pay, clothing, and other articles, amounted to four millions two hundred and twenty thousand pounds. This military force exceeded that of the last year by 4074 men; and the expence was consequently greater by 29,067l. 15s. The increase was occasioned by the greater number of troops already sent, or then going, to the East Indies. But the expence of those troops was to be reimbursed by the East India Company.

After some farther statements relative to the military force of the kingdom, and its expence, had been made by the secretary at war, Colonel Barré rose, and with great vehemence declared, that the estimates of the army which were laid before that house were scandalous and evasive. There was a much greater number of non-effective men than were stated in the estimates. In fact, they amounted to a fifth part of the army. The house should also recollect, that the estimates lying on the table did not compose the whole of the expences of the army; for extraordinaries of several millions were yet to come. Neither were the men under the several descriptions given by the secretary at war the whole number of military force employed. Other troops were employed solely at the discretion of the minister, and paid irregularly and unconstitutionally, without the assent or knowledge of the legislature; particularly the provincial corps in America, amounting to nine thousand men in actual service, the statement of which force, though it had been called for from year to year, was never brought into the estimates.

With respect to the army estimates, the colonel proceeded to observe, that in many instances they were filled with such abandoned impositions, that there appeared an actual design to treat inquiries from the parliament with sovereign contempt. Several regiments, of which the number of men did not amount to one hundred, were set down at eight hundred; and others not having more than fifty were mentioned in the estimates as consisting of five, six, or seven hundred men. Indeed, too large a part of the armies, for which that house had been persuaded to give their votes, existed only upon paper. Amongst other regiments, the royal English fusiliers had not even a fourth of their complement. The royal Scotch fusiliers were in a worse predicament. Their number fell short of even one hundred men. The 60th regiment was stated as amounting to 3500 men, when the fact was, that it did not consist of 1500; and many others might be enumerated in the same situation. The statement of the estimates relative to garrisons, particularly those of Gibraltar and Minorca, were equally delusive and overcharged.

Lord George Germaine said, that the reason why the provincial corps had not been included in the estimates was, that some share of the public money might be spared, by avoiding to vote an establishment for these troops. They were raised and paid in a manner by much the most economical for the nation. They were solely under the management of the commander in chief; and an officer, called the *inspector-general of the provincial corps*, regularly took care to muster them from time to time; nor was a single man paid for if not in actual employ. His lordship also informed the house, that the ministry were unanimously of opinion, that, considering the present situation of affairs, and the misfortunes of the war, it would not be right to continue any longer the plan on which it had hitherto been conducted; and therefore that a fresh army would not be sent to supply the place of that captured at York-town under Earl Cornwallis.

Sir George Saville expressed the strongest disapprobation of any farther prosecution of the American war, or of raising any more troops for that purpose. He adverted to the intimation which had been given by the ministry, that a change was to be made in the mode of conducting the American war. This, he said, was in fact telling the house that they were determined to prosecute the war with all the feeble efforts of which they were yet capable. Every unprejudiced and sensible observer must perceive, that so extraordinary a conduct resembled, if it did not indicate, the violence of insanity. General Conway declared, that he entirely disapproved of a continuance of the American war in any form, as he wished that it might totally cease. He eagerly desired the recal of our fleets and armies, and was anxious for an entire and immediate prevention of those calamities which had almost completed the destruction of the empire. He considered an avowal of the independence of America as a severe misfortune, and a debasing stroke against Great Britain; but of the two evils he would choose the least, and he would submit to the independency of America. In short, he would almost yield to any circumstance whatsoever, rather than persist a day longer in the prosecution of so pernicious a war. Ideas had been

Britain. been started relative to a war of posts, among which New York had been particularly mentioned. But on what military authority did the ministry presume to think that New York was tenable? What garrison would be able to maintain it? The diversity of military opinions given on this subject served rather to alarm than to convince. To secure New York, the possession of Long island, which is a hundred miles in length, is absolutely necessary; and it was well known that Sir Henry Clinton, with all his troops, did not consider himself as secure. Notwithstanding these and other arguments, however, the question was carried in favour of ministry by a considerable majority, and the supplies were voted accordingly.

Britain. that house, because it was connecting them with one whom every soldier was forbidden to associate with. It was an insult to the people; for what had the person raised to the peerage done to merit honours superior to his fellow-citizens? He had only one claim to any kind of promotion; and that was, that he had undone his country, by executing the plan of that accused, invisible, though efficient cabinet, from whom, as he had received his orders, so he had obtained his reward.

* See En-
statute.

Besides the grand question for and against the continuance of the American war, several other matters of smaller moment were agitated this session; particularly the affair of St Eustatius* as already mentioned, an inquiry into the state of the navy, and into the causes of our bad success in the American war. All these questions were carried in favour of ministry, though not without a strength of opposition they had never experienced before. A motion for censuring Lord Sandwich was lost only by 236 to 217; and so general did the desire of a change of administration now appear, that it excited no small degree of surprise that the present ministers should still retain their places.

66.
Debates on
admitting
Lord
George
Germaine
to sit in the
house of
peers.

Nothing could set in a more striking point of view the detestation in which they were held, than the extreme aversion shown at admitting Lord George Germaine to the dignity of peerage. On this occasion, the Minden business was not only ripped up, but after his actual investiture, and when he had taken his seat in the house, under the title of Lord Viscount Sackville, a second debate ensued relative to the dishonour the peers had sustained by his admission into their house. It was moved by the marquis of Caermarthen, that "it was reprehensible in any minister, and highly derogatory to the honour of that house, to advise the crown to exercise its indisputable right of creating a peer, in favour of a person labouring under the heavy censure of a court martial," which was particularly stated in the motion, and also the public orders given out on the occasion by the late king. The marquis urged, that the house of peers being a court of honour, it behoved them most carefully to preserve that honour uncontaminated, and to endeavour to mark out, as forcibly as possible, the disapprobation which they felt at receiving into their assembly, as a brother peer, a person stigmatized in the orderly books of every regiment in the service. The earl of Abingdon observed, that he could not help conceiving, that although there was not a right of election, there was and must be a right of exclusion, vested in that house, when the admission of any peer happened to be against the sense of their lordships. His judgment of this arose not only from the idea, that that house was possessed of original rights, as independent of the crown as of the people; but from the circumstance of their being the hereditary counsellors of the crown, against the sense of whom, he held, the crown could not of right exert itself. His lordship declared, that he considered the admission of Lord George Germaine to a peerage, to be no less an insufferable indignity to that house, than an outrageous insult to the people at large. It was an indignity to

Lord Sackville declared, that he neither knew by whose advice he had been raised to this dignity, nor thought, that, in a point of this nature, the recommendation of any minister was in the least needful. To bestow honours was the peculiar and universally admitted prerogative of the crown, provided that the parties advanced to them were competent to receive them. This he insisted was the case at present. The sentence of the court-martial was stated as the ground of the objection against his elevation to the peerage; but even such a sentence did not amount to any legal disability whatsoever. Twenty-three years had elapsed since the court-martial which sat upon him had pronounced that sentence; and he should naturally suppose, that such of their lordships, and of the public in general, as were at all acquainted with the peculiarly hard and unfair circumstances which accompanied his trial, had been long accustomed to behold this business in its proper point of view. Assailed by an excess of acrimony, at least equal to any that a British officer could have experienced from enemies at once implacable and unjust, he was condemned, unheard, and punished previously to his trial. In these circumstances, it was well known, that he had challenged his accusers to come forward; that he had provoked inquiry; and had insisted upon a trial. He was assured at the time, that if the determination of the court-martial should even prove capital, it would be carried into execution: but no intimations of this kind could dissuade him from insisting that a trial should take place; and he flattered himself, that the candour and equity of their lordships would lead them to conclude, that such behaviour, under such circumstances, could only result from a consciousness of innocence. To the sentence of it he had submitted; and, as the result of such submission, he thought that he had then acquitted himself to his country and to the public. At the present moment, it was extremely singular, that although neither the charge, nor the defence, nor the evidence, nor in short any one part of the proceedings on the trial, was before their lordships, they were called upon to put the sentence a second time in force against him. He trusted, however, that their lordships would call to mind the occurrences which had taken place with respect to himself, subsequent to that period. In 1765, not more than four years after the trial, he was appointed to an office in administration. Previously to his acceptance of the propositions then made to him that he should bear a part in administration, it was agreed for him to become a member of the council-board. There he accordingly took his seat; and thenceforward considered such a circumstance as virtually a repeal of the sentence of the court-martial. A revision of the proceedings of the court-martial was now unattainable; for during the space of

^{Britain.} 23 years, the period of time which had elapsed since the trial, every member who had sat upon it except one had been dead and buried. An attempt to investigate the motives which actuated the several members of the court was equally impracticable. He hoped, therefore, their lordships would be of opinion, that he was fully competent to receive the title which his sovereign had been graciously pleased to bestow upon him; and that it was neither expedient, necessary, nor becoming, for that house, to fly in the face of the crown, or to oppose its indisputable prerogative, because it had advanced an old and faithful servant to the dignity of a seat among their lordships.

The duke of Richmond observed, that from the reign of Edward III. to the time of Henry VII. it was expressly stated, in every new patent of the creation of a peer, that such creation was made *with the consent of parliament*; nor did a single instance occur, during the whole of this period, of any title being granted without the particular acquiescence of the house of lords. After the reign of Henry VII. the crown carried with a considerably less restraining hand this exercise of the prerogative; and during the later eras, it had been generally regarded as an incontestable and established right. It appeared, however, that the ancient principles of the British constitution had set boundaries to restrain this exercise of the prerogative; and that formerly a legal disability was not the only circumstance which might amount to a disqualification for the peerage. Some insinuations had been thrown out respecting the decision of the court-martial, which were far from being well-grounded. When the court-martial took place, for the purpose of determining the criminality or the innocence of the noble viscount, the times were not, as had been represented, remarkable for the predominance of clamour or of faction. He observed, that their lordships were not ignorant, that the noble viscount rested a considerable part of the vindication of his behaviour at the battle of Minden, upon the supposed existence of a striking variation in the orders delivered from Prince Ferdinand to the commander of the cavalry. It was understood that the first order was, that *the cavalry* should advance; and the second, that the *British cavalry* should advance. Yet even under these supposed contradictory orders, it was evident that the noble lord should advance; and, certainly, the distance being short, he enjoyed a sufficient space of time for obedience to his instructions. Lord Southampton, who delivered one of the messages, was now present in the house; and it should seem, that he had no choice, on this occasion, but to acknowledge, either that he did not properly deliver such orders to the noble viscount, or that the latter, having properly received them, neglected to obey them. But whatever difficulties might have arisen, during the endeavours to determine exactly how much time had actually been lost, in consequence of the non-compliance of the noble viscount with the orders which he received, his grace said, that he could with much facility have solved what all the witnesses examined as to this point were not able positively to determine. If, as he was summoned to appear upon the trial, his deposition had been called for, he could have proved, because he held all the while his watch within his hand, and seldom ceased to look

at it, that the time lost when the noble viscount delayed to advance, under pretence, that, receiving such contradictory orders, it was impossible for him to discover whether he ought to advance with the *whole* cavalry, or only with the British cavalry, was *one hour and a half*. It was, therefore, extremely evident, that the noble lord had it in his power to have brought up the cavalry from the distance of a mile and a quarter; in consequence of which, by joining in the battle, they might have rendered the victory more brilliant and decisive. But, before the arrival of this cavalry, the engagement was concluded. Such was the testimony, his grace said, which, having had the honour to serve, at the battle of Minden, under Prince Ferdinand of Brunswick, he must have borne, if, being summoned, the members of the court-martial had thought proper to have examined him on the trial. Under such circumstances, the noble viscount could have little reason to complain of the sentence of the court-martial, of the orders which followed, or of the loss of his commission.

The motion was powerfully supported by other arguments, both by the duke of Richmond himself and other peers; but, however, was rejected by a majority of 93 against 28. A protest was entered, signed ⁶⁶³ by nine peers, in which the sentence and the public orders were particularly stated; and in which they declared, that they "could not look upon the raising to the peerage a person so circumstanced, in any other light than as a measure fatal to the interests as well as to the glory of the crown, and to the dignity of that house; insulting to the memory of the late sovereign, and likewise to every surviving branch of the illustrious house of Brunswick; repugnant to every principle of military discipline, and directly contrary to the maintenance of the honour of that house, and to that honour which has for ages been the glorious characteristic of the British nation, and which, as far as could depend on them, they found themselves called upon, not more by duty than inclination, to transmit pure and unsullied to posterity."

The ruinous tendency of the American war was ⁶⁶⁴ now so strikingly apparent, that it became necessary ^{Motion for} for those who had a just sense of the dangerous situa- ^{an address} tion of their country, who wished well to its interests ^{against the} or even to prevent its destruction, to exert their most ^{American} vigorous efforts to put an end to so fatal a contest. ^{war reject-} Accordingly, on the 22d of February, a motion was made by General Conway, "That an humble address should be presented, earnestly imploring his majesty, that, taking into his royal consideration the many and great calamities which had attended the present unfortunate war, and the heavy burdens thereby brought on his loyal and affectionate people, he would be graciously pleased to listen to the humble prayer and advice of his faithful commons, that the war on the continent of North America might no longer be pursued for the impracticable purpose of reducing that country to obedience by force; and expressing their hope that the earnest desire and diligent exertion to restore the public tranquillity, of which they had received his majesty's most gracious assurances, might, by a happy reconciliation with the revolted colonies, be forwarded and made effectual; to which great end, his majesty's faithful commons would be ready most cheerfully to give

Britain. give their utmost assistance." In the speech by which he introduced this motion, the general set forth the enormities with which the British arms had so frequently been stigmatized by opposition, and the excessive animosity of the Americans. Not a single friend to the British government (he said) could be discovered amongst the inhabitants of North America from one end of the country to the other. We had, indeed, at present no object to contend for: for if it could be admitted for a moment, even for the sake of argument, that it were possible we might conquer at the last, what benefits would repay the struggle for the victory? We should then only gain a desert, a country depopulated by the war, which our despotism and barbarity, our avarice and ambition, our antipathy for freedom, and our passion for injustice, had kindled in her bosom. But all expectations of this kind were in the highest degree vain and absurd; though he had received intelligence (the general said) from a person lately arrived from America, in whose veracity, experience, and discernment, he could implicitly confide, that the people of that country, although in arms against us, were still anxious for the accomplishment of peace. He was also assured, that certain individuals, at no considerable distance, were empowered on the part of the congress to treat with the ministers of Great Britain for the attainment of so essential an object. These circumstances were not unknown to government; and a noble lord, who had lately retired from the office of a secretary of state for the American department, had been particularly applied to on this interesting occasion. What reason could the ministers assign why they had neglected to improve this singular advantage, and seemed to spurn at all ideas of negotiation? Could it be possible, that a series of ignominious miscarriages and defeats had not yet operated as a cure for the inhuman and destructive love of war? Such was the situation of the nation, that it behoved the ministers to negotiate for peace almost on any terms. But as they had hitherto done nothing of this kind, it was indispensably necessary that the parliament should interfere, and put an immediate end to a war so calamitous, so fatal, and so destructive. The motion was seconded by Lord John Cavendish, who remarked, that the American war had been a war of malice and resentment, without either dignity in its conduct, probability in its object, or justice in its origin. It was, however, vigorously opposed by administration, who had still sufficient strength to gain their point, though only by a single vote, the motion being rejected by 194 to 193.

66; Second motion for the address. The increasing strength of opposition now showed that the downfall of ministry was at hand. The decision of the last question was considered as a victory gained by the former, and Mr Fox instantly gave notice that the subject would be resumed in a few days, under another form. It was accordingly revived on the 27th of February; on which day a petition from the city of London was presented to the house, soliciting the house to interpose in such a manner as should prevent any farther prosecution of the American war; after which General Conway moved, that it should be resolved, "That it was the opinion of that house, that the farther prosecution of offensive war on the continent of North America, for the purpose of reducing

the revolted colonies to obedience by force, would be the means of weakening the efforts of this country against her European enemies, and tend, under the present circumstances, dangerously to increase the mutual enmity so fatal to the interests both of Great Britain and America; and, by preventing a happy reconciliation with that country, to frustrate the earnest desire graciously expressed by his majesty to restore the blessings of public tranquillity."

Britain.

In the speech by which he introduced this motion, the general took notice of some objections that had been made to his former motion, under the idea that it was unconstitutional in that house to interfere with its advice in those things which especially and indisputably belonged to the executive power. It appeared, however, from the journals, that from the days of Edward III. down to the present reign, parliament had at all times given advice to the crown in matters relating to war and peace. In the reign of Richard II. it was frequently done; and also in that of Henry IV. One remarkable instance of this was in the reign of Henry VII. when that prince consulted his parliament respecting the propriety of supporting the duke of Brittany against France, and also of declaring war against the latter; and he told his parliament that it was for no other purpose than to hear their advice on these heads that he called them together. In the reign of James I. the parliament interfered repeatedly with their advice respecting the Palatinate, the match with Spain, and a declaration of war against that power. In the time of Charles I. there were similar interferences; and in the reign of his son Charles II. the parliament made repeated remonstrances, but particularly in 1674 and 1675, on the subject of the alliance with France, which they urged ought to be renounced, and at the same time recommended a strict union with the United Provinces. To some of these remonstrances, indeed, answers were returned not very satisfactory; and the parliament were informed, that they were exceeding the line of their duty, and encroaching upon the prerogative of the crown. But so little did the commons of those days relish these answers, that they addressed the king to know who it was that had advised his majesty to return such answers to their loyal and constitutional remonstrances. In the reign of King William, repeated instances were to be found in the journals, of advice given by parliament relative to the Irish war and the war on the continent. The like occurred frequently in the reign of Queen Anne: that princess, in an address from the parliament, was advised, not to make peace with France until Spain should be secured to Austria; and also, not to consent to peace until Dunkirk should be demolished. In short, it was manifest from the whole history of English parliaments, that it was ever considered as constitutional for parliament to interfere, whenever it thought proper, in all matters so important as those of peace and war. The general urged other arguments in support of his motion, which was seconded by Lord Althorpe; and petitions from the mayor, burgesses, and commonalty of the city of Bristol, and from the merchants, tradesmen, and inhabitants of that city, against the American war, were read. In order to evade coming to any immediate determination on the question, a proposition was made by Mr Wal-

666 Parliament has a right to advise the king.

Britain. lace, the attorney-general, that a truce should be entered into with America; and that a bill should be prepared to enable his majesty's ministers to treat on this ground: and under the pretence of allowing time for this measure, he moved, "that the present debate should be adjourned for a fortnight." The house divided upon this motion, when there appeared for it 215, and against it 234; so that there was a majority of 19 against the minister. The original motion of General Conway was then put and carried without a division. The general immediately followed up his first motion with another for an address to the king, in which the American war was spoken of precisely in the same terms made use of in the motion, and in which his majesty was solicited to put a stop to any farther prosecution of offensive war against the colonies. This motion was agreed to; and it was also resolved, that the address should be presented to his majesty by the whole house. The address was accordingly presented on the first of March; when his majesty returned an answer, in which he declared, that there were no objects nearer to his heart than the ease, happiness, and prosperity of his people; that the house of commons might be assured, that, in pursuance of their advice, he should take such measures as should appear to him to be most conducive to the restoration of harmony between Great Britain and her revolted colonies, so essential to the prosperity of both; and that his efforts should be directed, in the most effectual manner, against our European enemies, until such a peace could be obtained as should consist with the interests and permanent welfare of his kingdoms. But though the proceedings of the house of commons, in addressing his majesty against any farther prosecution of the American war, gave general satisfaction, the royal answer, however, was not thought sufficiently explicit. It was therefore observed by General Conway, in the house of commons, on the 4th of March, that he hoped he should be supported by the house in his desire of securing the nation against the possibility of a doubt that the American war was not now completely concluded. Something, perhaps, might yet be wanting, by which ministers might be so expressly bound, that, however desirous of evasion, they would not have it in their power to evade the injunction of that house. He therefore moved, "That an humble address should be presented to his majesty, to return his majesty the thanks of that house for his gracious answer to their last address; that house being convinced, that nothing could, in the present circumstances of this country, so essentially promote those great objects of his majesty's paternal care for his people as the measures which his faithful commons had most humbly, but earnestly, recommended to his majesty." This motion was unanimously agreed to; after which the general made a second motion, that it should be resolved by that house, "That, after the solemn declaration of the opinion of that house, in their humble address presented to his majesty on Friday last, and his majesty's assurance of his gracious intentions, that house would consider as enemies to his majesty and this country, all those who should endeavour to frustrate his majesty's paternal care for the ease and happiness of his people, by advising, or by any means attempting, the farther prosecution of offensive war on the

continent of North America, for the purpose of reducing the revolted colonies to obedience by force." Britain, After some debate, the motion was agreed to without a division; and on the 6th of the month, after a number of papers had been read in the house of peers relative to the surrender of Earl Cornwallis and the army under his command, the two following motions were made by the duke of Chandos. First, "That it was the opinion of that house, that the immediate cause of the capture of the army under Earl Cornwallis in Virginia, appeared to have been the want of a sufficient naval force to cover and protect the same." Secondly, "That the not covering and protecting the army under Earl Cornwallis in a proper manner, was highly blameable in those who advised and planned the expedition." After some debate, the motions were rejected, upon a division, by a majority of 72 to 37.

Thus the ministry still kept their ground, and with the most astonishing resolution combated the powers of opposition, which were daily increasing. On the 8th of March several resolutions were moved by Lord John Cavendish; one of which was, that "the chief cause of all the national misfortunes was the want of foresight and ability in his majesty's ministers." Another respected the immense sum expended on the war, which was not denied to be less than 100 millions. The expenditure of this sum became an object of severe scrutiny; but still all inquiry was frustrated. Mr Burke affirmed, that all public documents relative to the finances, exhibited the mismanagement, profusion, and enormities, of an unprincipled administration; as an instance of which he adduced the presents given to the Indians for their services during the last year, amounting to no less than 100,000*l*. Several other particulars were pointed out; but the motions were lost by 226 to 216.

The unpopularity of Lord North was now farther augmented by his proposal of some new taxes, particularly on soap, the carriage of goods, and places of entertainment. Opposition therefore still determined to force him to resign; which indeed it seemed probable that he would voluntarily do. On the 15th of March it was moved by Sir John Rous, that "the nation could have no farther confidence in the ministers who had the conduct of public affairs." The debate was remarkable for an argument, in the affairs of America, perfectly original, and unprecedented in all that had been said or written on the subject. Sir James Marriot informed the house, that though it had been frequently pretended, that the inhabitants of the colonies were not represented in the British parliament, yet the fact was otherwise; for they were actually represented. The first colonization, by national and sovereign authority, he remarked, was the establishment of the colony of Virginia. The grants and charters made of those lands, and of all the subsequent colonies, were of one tenor, and expressed in the following terms: "To have and to hold of the king or queen's majesty, as part and parcel of the manor of East Greenwich, within the county of Kent, *reddendum*, a certain rent at our castle of East Greenwich, &c." So that the inhabitants of America were, in fact, by the nature of their tenure, represented in parliament by the knights of the shire of the county of Kent. This curious legal

gal discovery, that the American colonies were part and parcel of the manor of East Greenwich, though delivered by the learned judge with all proper gravity and solemnity, yet excited so much merriment in the house, that it was with great difficulty, for some time, that the speaker could preserve any kind of order.

673
Lord North's defence of his own conduct.

Lord North endeavoured to vindicate his own administration. He affirmed, that it could not be declared with truth, by that house, that the national calamities originated from the measures of the present administration. The repeal of the American stamp-act, and the passing of the declaratory law, took place before his entrance into office. As a private member of parliament, he gave his vote in favour of both; but, as a minister, he was not responsible for either. When he accepted his post, the times were scarcely less violent than the present. He approached the helm when others had deserted it; and, standing there, he had used his utmost efforts to assist his country. That the American war was just and requisite, and prosecuted for the purpose of supporting and maintaining the rights of the British legislature, was a position, for the truth of which he would ever contend, whilst he enjoyed the power of arguing at all upon the subject. As to peace, he not only wished most earnestly for it, but also for the formation of such a ministry as might at once prove welcome to the country, and with unanimous cordiality co-operate for the welfare and the honour of the state. It was not an attachment to the honours and emoluments of office which had kept him so long in place; and he should disdain to throw impediments in the way of any honourable and salutary coalition of parties, though for the adjustment of an administration from which he might perceive himself excluded. The house at length divided upon the question, when there appeared for it 227, and against it 236; so that there was a majority of nine in favour of administration.

674
The ministers at last quit their places.

Notwithstanding this seemingly favourable determination, it was so well known that the ministry could not stand their ground, that, four days after, a similar motion to that made by Sir John Rous was to have been made by the earl of Surrey; but when his lordship was about to rise for that purpose, Lord North addressed himself to the speaker, and endeavoured to gain the attention of the house. This occasioned some altercation, it being contended by many members, that the earl of Surrey ought to be heard first. But Lord North being at length suffered to proceed, he observed, that as he understood the motion to be made by the noble earl was similar to that made a few days before, and the object of which was the removal of the ministers, he had such information to communicate to the house, as must, he conceived, render any such motion now necessary. He could with authority assure the house, that his majesty had come to a full determination to change his ministers. Indeed, those persons who had for some time conducted the public affairs were no longer his majesty's ministers. They were not now to be considered as men holding the reins of government, and transacting measures of state, but merely remaining to do their official duty, till other ministers were appointed to take their places. The sooner those new ministers were appointed, his lordship declared, that, in his opinion, the better it would be

Britain.

for the public business, and the general interests of the nation. He returned thanks to the house for the many instances of favour and indulgence which he had received from them during the course of his administration; and he declared, that he considered himself as responsible, in all senses of the word, for every circumstance of his ministerial conduct, and that he should be ready to answer to his country whenever he should be called upon for that purpose.

The earl of Surrey informed the house, that the motion which he intended to have made was designed to declare to the nation, and to all Europe, that the ministry were not dismissed because they wanted to avoid the fatigues of office, but because the parliament had totally withdrawn from them their good opinion and their confidence, and were determined no longer to permit the perpetration of those violent abuses of their trust, to which, with impunity, and to the disgrace and detriment of the state, they had for such a length of time proceeded. His lordship, however, agreed, in consequence of the declaration of Lord North, to wave his intended motion; and, after some farther debate, the house adjourned.

Thus an end was put to an administration which had for so long been obnoxious to a great part of the nation, and whose removal contributed very much to lay those dangerous ferments by which every part of the British dominions had been so long agitated. Peace now became as much the object of ministry as war had been formerly. Before we proceed to any account of the negociation for that desirable event, however, it will be necessary to take notice of those military events which disposed the other belligerent powers to an accommodation. The bad success of Britain in America has already been taken notice of. The disaster of Cornwallis had produced a sincere desire of being at peace with America: but that could not be accomplished without making peace with France also; and that power was haughty and elated with success. Minorca had now fallen into the hands of the Spaniards; and though it is certain that the capture of a few miserable invalids, attended with such extreme difficulty as the Spaniards experienced †, ought rather to have intimidated them than otherwise, they now projected the most important conquests. Nothing less than the entire reduction of the British West India islands became the object of the allies; and indeed there was too much reason to suppose that this object was within their reach. In the beginning of the year 1782, the islands of Nevis and St Christopher's were obliged to surrender to M. de Grasse the French admiral, and the marquis de Bouville, who had already signalized himself by several exploits *. Jamaica was marked out as the next victim; but an end of all these and St aspiring hopes was fast approaching. The advantages hitherto gained by the French in their naval engagements with the British fleet had proceeded from their keeping at a great distance during the time of action, and from their good fortune and dexterity in gaining the wind. At last, the French admiral, de Grasse, probably prompted by his natural courage, determined, after an indecisive action on the 9th of April 1782, to stand a close engagement with his formidable antagonist Admiral Rodney. This, with him, appears to have been a matter of choice, as he interfered to prevent

vent the loss of a disabled ship, by parting with which he might have avoided the disaster that followed. This memorable engagement took place off the island of Dominica, three days after the former. The British fleet consisted of 37 ships of the line, and the French of 34. The engagement commenced at seven o'clock in the morning, and continued with unremitting fury till half past six in the evening. It is said, that no other signal was made by the admiral but the general one for action, and that for close fight. Sir George Rodney was on board the *Formidable*, a ship of 90 guns; and the count de Grasse was on board the *Ville de Paris*, a ship of 110 guns, which was a present to the French king from the city of Paris. In the course of the action, the *Formidable* fired nearly 80 broadsides; and for three hours the admiral's ship was involved in so thick a cloud of smoke, that it was almost invisible to the officers and men of the rest of the fleet. The van division of the British fleet was commanded by Sir Samuel Hood, and the rear division by Rear-admiral Drake; and both these officers greatly distinguished themselves in this important action. But the decisive turn on this memorable day was given by a bold manœuvre of the *Formidable*, which broke the French line, and threw them into confusion. The first French ship that struck was the *Cæsar*, a 74 gun ship, the captain of which fought nobly, and fell in the action. It is said, that when she struck she had not a foot of canvas without a shot hole. Unfortunately, soon after she was taken possession of, she took fire by accident, and blew up, when about 200 Frenchmen perished in her, together with an English lieutenant and ten English seamen. But the *Glorieux* and the *Hector*, both 74 gun ships, were also taken by the British fleet; together with the *Ardent* of 64 guns; and a French 74 gun ship was also sunk in the engagement. It was a very close and hard fought action on both sides, but the French fleet was at length totally defeated. It was almost dark when the *Ville de Paris* struck, on board of which the count de Grasse had fought very gallantly. Five thousand five hundred troops were on board the French fleet, and the havoc among them was very great, as well as among the French seamen. The British had 230 killed and 759 wounded. Captain Blair, who commanded the *Anson*, and several other officers, were killed in the action; and Lord Robert Manners, who commanded the *Resolution*, died of his wounds on his return home. On the 19th of the same month, a squadron which was detached from the main fleet, under the command of Sir Samuel Hood, captured the *Cato* and the *Jason*, two French men of war of 64 guns each, and also the *Aimable* of 32 guns, and the *Ceres* of 18. About the same time also the fleet under Admiral Barrington took from the French, off Ushant, the *Pegase* of 74 guns, the *Actionnaire* of 64, and ten sail of vessels under their convoy.

It was universally allowed, that in this engagement the French, notwithstanding their defeat, behaved with the greatest valour. De Grasse himself did not surrender till 400 of his people were killed, and only himself and two others remained without a wound. The captain of the *Cæsar*, after his ensign staff was shot away, and the ship almost battered to pieces, caused his colours to be nailed to the mast, and thus continued fighting till he was killed. The vessel, when taken, was a

mere wreck. Other French officers behaved in the same manner. The valour of the British requires no encomium; it was evident from their success.

This victory was a very fortunate circumstance both for the interest and reputation of the British admiral. Before this event, the new ministry had appointed Admiral Pigot to supersede him in the command in the West Indies; and it was understood, that they meant to set on foot a rigid inquiry into the transactions at St Eustatius. But the splendour of this victory put an end to all thoughts of that kind: he received the thanks of both houses of parliament for his services; and was created an English peer, by the title of Baron Rodney, of Rodney Stoke, in the county of Somerset. Sir Samuel Hood was also created Baron Hood of Catherington, in the kingdom of Ireland; and Rear-admiral Drake, and Captain Affleck, were created baronets of Great Britain. Some attempts were also made, in the house of commons, to procure a vote of censure against the new ministry, for having recalled Lord Rodney; but the motions made for this purpose were rejected by the majority.

The count de Grasse, after his defeat, was received on board the *Barfleur* man of war, and afterwards landed on the island of Jamaica, where he was treated with great respect. After continuing there some time, he was conveyed to England, and accommodated with a suit of apartments at the Royal Hotel in Pall-mall. His sword, which he had delivered up, according to the usual custom, to Admiral Rodney, was returned to him by the king. This etiquette enabled him to appear at court, where he was received by their majesties and the royal family in a manner suitable to his rank. From the time of his arrival in London to his departure, which was on the 12th of August 1782, he was visited by many persons of the first fashion and distinction, and was much employed in paying visits to the great officers of state, and some of the principal nobility of the kingdom, by whom he was entertained in a very sumptuous and hospitable style. He received, indeed, every mark of civility which the British nation could bestow; and was treated with much respect even by the common people, from the opinion that was generally entertained of his valour and merit.

Though the designs of the French against Jamaica were now effectually frustrated, the victory was not followed by those beneficial consequences which by many were expected. None of the British islands which had been taken by the French in the West Indies were afterwards recaptured; though it was hoped that this would have been the result of our naval superiority in those seas. It was also an unfortunate circumstance, that some of those ships which were taken by Admiral Rodney were afterwards lost at sea; particularly the *Ville de Paris*, *Glorieux*, and *Hector*. A British man of war, the *Centaur*, of 74 guns, was also sunk in lat. 48 deg. 33 min. and long. 43 deg. 20 min. on the 24th of September 1782, in consequence of the disabled state to which it was reduced by some very violent storms. Before the ship sunk, the officers and crew had sustained great hardships; most of them at last went down with the ship; but the lives of Captain Inglefield the commander, and ten other officers and seamen, were preserved by their getting on board a pinnace. But even this was leaky; and when they went

Britain. went into it they were nearly in the middle of the Western ocean, without compass, quadrant, great coat or cloak; all very thinly clothed, in a gale of wind, and with scarcely any provisions. After undergoing extreme hardships and fatigues for 16 days, they at length reached the island of Fayall, one of the Azores. They were so much reduced by want of food and incessant labour, that, after they had landed, some of the stoutest men belonging to the Centaur were obliged to be supported through the streets of Fayall. The Jamaica homeward-bound fleet was also dispersed this year by a hurricane off the banks of Newfoundland; when the Ramillies of 74 guns and several merchantmen foundered.

The British navy also sustained, about this time, a considerable loss at home, by the Royal George, of 100 guns, being overset and sunk at Portsmouth. This melancholy accident, which happened on the 29th of August, was occasioned by a partial heel being given to the ship, with a view to cleanse and sweeten her; but the guns on one side being removed to the other, or at least the greater part of them, and her lower deck ports not being lashed in, and the ship thwarting on the tide with a squall from the north-west, she filled with water, and sunk in the space of about three minutes. Admiral Kempenfelt, a very brave and meritorious officer, other officers, upwards of 400 seamen and 200 women, besides many children, perished in her.

Thus the prosecution of the war seemed to be attended with endless disasters and difficulties to all parties. The signal defeat above mentioned not only secured the island of Jamaica effectually from the attempts of the French, but prevented them from entertaining any other project than that of distressing the commerce of individuals. In the beginning of May an expedition was undertaken to the remote and inhospitable regions of Hudson's Bay; and though no force existed in that place capable of making any resistance, a 74 gun ship and two 36 gun frigates were employed on the service. All the people in that part of the world either fled or surrendered at the first summons. The loss of the Hudson's Bay company, on this occasion, amounted to 500,000l.; but the humanity of the French commander was conspicuous, in leaving a sufficient quantity of provisions and stores of all kinds for the use of the British who had fled at his approach.

Another expedition was undertaken by the Spaniards to the Bahama islands, where a like easy conquest was obtained. The island of Providence was defended only by 360 men, who being attacked by 5000, could make no resistance. A very honourable capitulation was granted by the victors, who likewise treated the garrison with great kindness afterwards. Some settlements on the Mosquito shore were also taken by the Spaniards: but the Bay-men, assisted by their negroes, bravely retook some of them; and having formed a little army with the Indians in those parts, headed by Colonel Despard, they attacked and carried the posts on the Black River, making prisoners of about 800 Spanish troops. The great disaster which befel this power, however, was their failure before Gibraltar, which happened in the month of September 1782, with such circumstances of horror and destruction as evinced the absurdity of persisting in the enterprise. Thus all

parties were taught that it was high time to put an end to their contests. The affair of Cornwallis had shown that it was impossible for Britain to conquer America; the defeat of de Grasse had rendered the reduction of the British possessions in the West Indies impracticable by the French; the final repulse before Gibraltar, and its relief afterwards by the British fleet*, put an end to that favourite enterprise, in which almost the whole strength of Spain was employed; while the engagement of the Dutch with Admiral Parker showed them that nothing could be gained by a naval war with Britain.

We have already taken notice, as fully as the limits of this article would admit, of the events which led to the removal of Lord North and the other ministers who for so long a time had directed public measures in this kingdom. On this occasion it was said that his majesty expressed a considerable agitation of mind at being in a manner compelled to make such an entire change in his councils: for the members in opposition would form no coalition with any of the old ministry, the lord chancellor only excepted. On the 29th and 30th of March 1782, the marquis of Rockingham was appointed first lord of the treasury; Lord John Cavendish chancellor of the exchequer; the earl of Shelburne and Mr Fox principal secretaries of state; Lord Camden president of the council; the duke of Richmond master of the ordnance; the duke of Grafton lord privy seal; Admiral Keppel first lord of the admiralty; General Conway commander in chief of all the forces in Great Britain: Mr Thomas Townshend secretary at war; Mr Burke paymaster of the forces; and Colonel Barré treasurer of the navy. Other offices and honours were likewise conferred on different members of the opposition; and some were raised to the peerage, particularly Admiral Keppel, Sir Fletcher Norton, and Mr Dunning.

The first business in which the new ministry engaged, was the taking such measures as were proper to effectuate a general peace. No time was lost in the pursuit of this great object, or in taking the necessary steps for its attainment. Accordingly, the empress of Russia, having offered her mediation, in order to restore peace between Great Britain and Holland, Mr Secretary Fox, within two days after his entrance in office, wrote a letter to Mons. Simolin, the Russian minister in London, informing him, that his majesty was ready to enter into a negotiation for the purpose of setting on foot a treaty of peace, on the terms and conditions of that which was agreed to in 1674 between his majesty and the republic of Holland; and that, in order to facilitate such a treaty, he was willing to give immediate orders for a suspension of hostilities, if the States-general were disposed to agree to that measure.

But the states of Holland did not appear inclined to a separate peace; nor perhaps would it have been agreeable to the principles of sound policy, if they had agreed to any proposition of this kind. However, immediately after the change of ministry, negotiations for a general peace were commenced at Paris. Mr Grenville was invested with full powers to treat with all the parties at war; and was also directed to propose the independency of the 13 United Provinces of America, in the first instance, instead of making it a condition of a general treaty. Admiral Digby and General Carleton were

were also directed to acquaint the American congress with the pacific views of the British court, and with the offer that was made to acknowledge the independence of the United States.

681

Death of the marquis of Rockingham occasions new changes in the ministry.

But before this work of pacification had made any considerable progress, the new ministry sustained an irreparable loss by the death of the marquis of Rockingham in July 1782. Even before this event, considerable apprehensions were entertained of their want of union; but the death of the nobleman just mentioned occasioned an absolute dissolution. The earl of Shelburne, who succeeded him as first lord of the treasury, proved so disagreeable to some of his colleagues, that Mr Fox, Lord John Cavendish, Mr Burke, Mr Frederick Montague, and two or three others, instantly resigned their places. Others, however, though little attached to the earl, kept their places; and his lordship found means to attach to his interest Mr William Pitt, son to the late earl of Chatham. Though then in an early stage of life, that gentleman had distinguished himself greatly in parliament, and was now prevailed upon to accept the office of chancellor. The succeeding members of the cabinet were at pains to explain their motives to the house for taking this step. These were in general a suspicion that matters would be managed differently from the plan they had proposed while in office, and particularly that American independence would not be allowed: but this was positively denied at the time; and with truth, as appeared by the event. There appeared indeed a duplicity in the conduct of the earl of Shelburne not easily to be accounted for. Even after it had been intimated by General Carleton and Admiral Digby, that the independence of the United Provinces should be granted by his majesty in the first instance, instead of making it a condition of a provisional treaty, his lordship expressed himself to the following purpose: "He had formerly been, and still was, of opinion, that whenever the independence of America was acknowledged by the British parliament, the sun of England's glory was set for ever. This had been the opinion of Lord Chatham and other able statesmen; nevertheless, as the majority of the cabinet were of a contrary opinion, he acquiesced in the measure, though his ideas were different. He did not wish to see England's sun set for ever, but looked for a spark to be left which might light us up a new day. He wished to God that he had been deputed to congress, that he might plead the cause of America as well as Britain. He was convinced that the liberties of the former were gone as soon as the independence of the states was allowed: and he concluded his speech with observing, that he was not afraid of his expressions being repeated in America; there being great numbers there who were of the same opinion with him, and perceived ruin and independence linked together."

683

Gives occasion to the Americans to rail against Britain.

If his lordship really was of opinion that his oratorical powers were able to persuade the Americans out of a system for which they had fought so desperately for a number of years, it is much to be feared he overrated them. No obstruction, however, arose to the general pacification. As early as November 30. 1782, the articles of a provisional treaty were settled between Britain and America*. By these it was stipulated, that the people of the United States should con-

tinue to enjoy, without molestation, the right to take fish of every kind on the grand bank, and on all the other banks of Newfoundland; and that they should likewise exercise and continue the same privilege in the gulf of St Lawrence, and at every other place in the sea, where the inhabitants used heretofore to fish. The inhabitants of the United States were likewise to have the liberty to take fish of every kind on such part of the coasts of Newfoundland as British seamen shall resort to; but not to cure or dry them on that island. They were also to possess the privilege of fishing on the coasts, bays, and creeks of the other dominions of his Britannic majesty in America; and the American fishermen were permitted to cure and dry fish in any of the unsettled bays, harbours, and creeks of Nova Scotia, Magdalen islands, and Labrador. But it was agreed, that, after such places should be settled, this right could not be legally put in practice without the consent of the inhabitants and proprietors of the ground. It was accorded, that creditors upon either side should meet with no impediment in the prosecution of their claims. It was contracted, that the congress should earnestly recommend it to the legislatures of the respective states, to provide for the restitution of all estates and properties which had been confiscated, belonging to real British subjects, and of the estates and properties of persons resident in districts in the possession of his majesty's arms, and who had not borne arms against the United States. It was resolved, that persons of any other description should have free liberty to go to any part whatsoever of any of the thirteen united states, and remain in it for twelve months unmolested in their endeavours to recover such of their estates, rights, and properties, as might not have been confiscated; and it was concerted that the congress should earnestly recommend to the several states a revision of all acts or laws regarding the premises, so as to render them perfectly consistent, not only with justice and equity, but with that spirit of conciliation which, on the return of the blessing of peace, should universally prevail. It was understood that no future confiscations should be made, nor prosecutions commenced against any person, or body of men, on account of the part which he or they had taken in the present war; and that those who might be in confinement on such a charge, at the time of the ratification of the treaty in America, should be immediately set at liberty. It was concluded that there should be a firm and perpetual peace between his Britannic majesty and the United States; that all hostilities by sea and land should immediately cease; and that prisoners on both sides should be set at liberty. It was determined that his Britannic majesty should expeditiously, and without committing destruction of any sort, withdraw all his armies, garrisons, and fleets, from every port, place, and harbour, of the United States. The navigation of the river Mississippi, from its source to the ocean, was to remain for ever free and open to the subjects of Great Britain and the citizens of the United States. In fine, it was agreed in the event, that if any place or territory belonging to Great Britain, or to the United States, should be conquered by the arms of either before the arrival of the provisional articles in America, it should be restored without compensation or difficulty.

Britain.

Preliminary
articles
with
France;

was agreed that Newfoundland should remain with England, as before the commencement of the war; and to prevent disputes about boundaries, it was accorded that the French fishery should begin from Cape St John on the eastern side, and going round by the north, should have for its boundary Cape Ray on the western side. The islands of St Pierre and Miquelon, which had been taken in September 1778, were ceded in full right to France. The French were to continue to fish in the gulf of St Lawrence, conformably to the fifth article of the treaty of Paris. The king of Great Britain was to restore to France the island of St Lucia, and to cede and guarantee to her that of Tobago. The king of France was to surrender to Great Britain the islands of Grenada and the Grenadines, St Vincent, Dominica, St Christopher's, Nevis, and Montserrat. The river of Senegal and its dependencies, with the forts of St Louis, Podor, Galam, Arguin, and Portedice, were to be given to France; and the island of Goree was to be restored to it. Fort James and the river Gambia were guaranteed to his Britannic majesty; and the gum trade was to remain in the same condition as before the commencement of hostilities. The king of Great Britain was to restore to his most Christian majesty all the establishments which belonged to him at the breaking out of the war on the coast of Orixa and in Bengal, with the liberty to surround Chandernagore with a ditch for draining the waters; and became engaged to secure to the subjects of France in that part of India, and on the coasts of Orixa, Coromandel, and Malabar, a safe, free, and independent trade, either as private traders, or under the direction of a company. Pondicherry, as well as Karical, was to be rendered back to France; and his Britannic majesty was to give as a dependency round Pondicherry the two districts of Valanour and Bahour; and as a dependency round Karical, the four contiguous Magans. The French were again to enter into the possession of Mahe, and of the comptoir at Surat. The allies of France and Great Britain were to be invited to accede to the present pacification; and the term of four months was to be allowed them, for the purpose of making their decision. In the event of their aversion from peace, no assistance on either side was to be given to them. Great Britain renounced every claim with respect to Dunkirk. Commissioners were to be appointed respectively by the two nations to inquire into the state of their commerce, and to concert new arrangements of trade on the footing of mutual convenience. All conquests on either side, in any part of the world whatsoever, not mentioned or alluded to in the present treaty, were to be restored without difficulty, and without requiring compensation. It was determined that the king of Great Britain should order the evacuation of the islands of St Pierre and Miquelon, three months after the ratification of the preliminary treaty, and that, if possible, before the expiration of the same period, he should relinquish all connexion with St Lucia in the West Indies, and Goree in Africa. It was stipulated in like manner, that his Britannic majesty should at the end of three months after the ratification of the treaty, or sooner, enter into the possession of the islands of Grenada and the Grenadines, St Vincent, Dominica, St Christopher's, Nevis, and Montserrat. France was to

Vol. IV. Part II.

be put into possession of the towns and comptoirs which were to be restored to her in the East Indies, and of the territories which were to serve as dependencies round Pondicherry and round Karical, six months after the ratification of the definitive treaty; and at the termination of the same term she was to restore the towns and districts which her arms might have taken from the English or their allies in that quarter of the globe. The prisoners upon each side were reciprocally to be surrendered, and without ransom, upon the ratification of the treaty, and on paying the debts they might have contracted during their captivity. Each crown was respectively to reimburse the sums which had been advanced for the maintenance of their prisoners by the country where they had been detained, according to attested and authentic vouchers. With a view to prevent every dispute and complaint on account of prizes which might be made at sea after the signing of the preliminary articles, it was mutually settled and understood that the vessels and effects which might be taken in the Channel, and in the North seas, after the space of twelve days, to be computed from the ratification of the present preliminary articles, were to be restored upon each side; that the term should be one month from the Channel and the North seas, as far as the Canary islands inclusively, whether in the ocean or the Mediterranean; two months from the Canary islands as far as the equinoctial line or equator; and lastly, five months without exception in all other parts of the world.

These preliminary articles of peace were concluded at Versailles on the 20th of January 1783, between Mr Alleyne Fitzherbert, minister plenipotentiary on the part of his Britannic majesty, and Charles Gravier, comte de Vergennes, the minister plenipotentiary on the part of the king of France. At the same time the preliminary articles of peace between Great Britain and Spain were also concluded at Versailles between Mr Fitzherbert and the comte d'Aranda, the minister plenipotentiary for the Spanish monarch. It was agreed that a sincere friendship should be re-established between his Britannic majesty and his Catholic majesty, their kingdoms, states, and subjects, by sea and land, in all parts of the world. His Catholic majesty was to keep the island of Minorca; and was to retain West Florida. East Florida was to be ceded to him by the king of Great Britain. Eighteen months from the date of the ratification of the definitive treaty were to be allowed to the subjects of the latter who had settled in the island of Minorca and in the two Floridas, to sell their estates, to recover their debts, and to transport their persons and effects, without being restrained upon account of their religion, or on any other pretence whatsoever, except that of debts and prosecutions for crimes. His Britannic majesty was, at the same time, to have the power to cause all the effects that might belong to him in East Florida, whether artillery or others, to be carried away. The liberty of cutting logwood, in a district of which the boundaries were to be ascertained, without molestation or disturbance of any kind whatsoever, was permitted to Great Britain. The king of Spain was to restore the islands of Providence and the Bahamas, without exception, in the condition in which they were when they were conquered by his arms. All other conquests of territories

Britain.

686
with Spain.

Britain. tories and countries upon either side, not included in the present articles, were to be mutually restored without difficulty or compensation. The epoch for the restitutions to be made, and for the evacuations to take place, the regulations for the release of prisoners, and for the cessation of captures, were exactly the same as those which have already been related, as stipulated in the preliminary articles with France.

687
The peace vehemently condemned.

No sooner were these articles ratified and laid before parliament, than the most vehement declamations against ministry took place. Never had the administration of Lord North himself been arraigned with more asperity of language. The ministry defended themselves with great resolution; but found it impossible to avoid the censure of parliament. An address without any amendment was indeed carried in the house of lords by 72 to 59; but in the lower house it was lost by 224 to 208. On the 21st of February, some resolutions were moved in the house of commons by Lord George Cavendish, of which the most remarkable were, that the concessions made by Britain were greater than its adversaries had a right to expect; and that the house would take the case of the American loyalists into consideration. The last motion indeed his lordship consented to wave; but all the rest were carried against ministry by 207 to 190. These proceedings, however, could make no alteration with regard to the treaty, which had already been ratified by all the contending powers, the Dutch only excepted. The terms offered them were a renewal of the treaty of 1674: which, though the most advantageous they could possibly expect, were positively refused at that time. Afterwards they made an offer to accept the terms they had formerly refused; but the compliment was then returned by a refusal on the part of Britain. When the preliminary articles were settled with the courts of France and Spain, a suspension of arms took place with Holland also; but though the definitive arrangements with the other powers were finally concluded by the month of September, it was not till then that the preliminary articles were settled with Holland. The terms were a general restitution of all places taken on both sides during the war, excepting only the settlement of Negapatnam in the East Indies, which was to remain in the hands of Britain, unless an equivalent was given on the part of Holland. The navigation of the eastern seas was to remain free and unmolested to all the British shipping. The other articles concerned only the exchange of prisoners and such other matters as are common to all treaties.

689
Event of the war more favourable to Britain than to her enemies.

Thus an end was put to the most dangerous war in which Britain was ever engaged; and in which, notwithstanding the powerful combination against her, she still remained in a state of superiority to all her enemies. At that time, and ever since, it has appeared, how much the politicians were mistaken who imagined that the prosperity of Britain depended in a great measure on her colonies: Though for a number of years she had not only been deprived of these colonies, but opposed by them with all their force; though attacked at the same time by three of the greatest powers in Europe, and looked upon with an invidious eye by all the rest; the damage done to her enemies still greatly exceeded that she had received. Their trade by sea was almost ruined; and on comparing the

loss of ships on both sides, the balance in favour of Britain was 28 ships of the line and 37 frigates, carrying in all near 2000 guns. Notwithstanding this, however, the state of the nation appears to have been really such, that a much longer continuance of the war would have been impracticable. In the debates, which were kept up with the greatest violence on account of the peace, Mr Pitt set forth our situation with great energy and strength of argument. "It was in vain (he said) to boast of the strength of our navy; we had not more than 100 sail of the line: but the fleets of France and Spain amounted nearly to 140 ships of the line. A destination of 72 ships of the line was to have acted against Jamaica. Admiral Pigot had only 46 sail to support it; and it was a favourite maxim of many members of the house, that defensive war must terminate in certain ruin. It was not possible that Admiral Pigot could have acted offensively against the islands of the enemy; for Lord Rodney, when flushed with victory, did not dare to attack them. Would Admiral Pigot have recovered by arms what the ministers had regained by negotiation? With a superior fleet against him, and in its sight, is it to be conceived that he could have retaken Grenada, Dominica, St Christopher's, Nevis, and Montserrat? On the contrary, is it not more than probable that the campaign in the West Indies must have terminated in the loss of Jamaica?"

"In the east, it was true that the services of Sir Edward Hughes had been highly extolled; but he could only be commended for a merely defensive resistance. Victory seemed to be out of the question; and he had not been able to prevent the disembarkation of a powerful European armament which had joined itself to Hyder Ally, and threatened the decolation of the Carnatic*. At home and in our own seas, the fleets of the enemy would have been nearly double to ours. We might have seized the intervals of their cruize, and paraded the channel for a few weeks; but that parade would have only served to disgrace us. It was yet the only achievement in our power; for to have hazarded an engagement would have been equivalent to a surrender of the kingdom.

"Neither, in his opinion, was the state of our army to be considered as formidable. New levies could not be raised in a depopulated country. We might send upon an offensive scheme five or six thousand men; and what expectation could be excited by a force of this kind? To have withdrawn troops from America was a critical game. There were no transports in which they might be embarked; and if it had been possible to embark them, in what miraculous manner were they to be protected against the fleets of the enemy.

"As to our finances, they were melancholy. Let the immense extent of our debts be weighed; let our resources be considered; and let us then ask, what would have been the consequence of the protraction of the war? It would have endangered the bankruptcy of the public faith; and this bankruptcy, it is obvious, if it had come upon us, might have dissolved all the ties of government, and have operated to the general ruin.

"To accept the peace on the terms already related, or to continue the war, was the only alternative in the power of ministers. Such was the *ultimatum* of France. At the same time, however, it ought to be remembered,

Britain. ed, that the peace obtained was better than could have been expected from the lowness of our condition. We had acknowledged the American independence; but what was that but an empty form? We had ceded Florida; but had we not obtained the islands of Providence and the Bahamas? We had granted an extent of fishery on the coast of Newfoundland; but had we not established an exclusive right to the most valuable banks? We had restored St Lucia, and given up Tobago; but had we not regained Grenada, Dominica, St Christopher's, Nevis, and Montserrat? And had we not rescued Jamaica from inevitable danger? In Africa we had given Goree; but Goree was the grave of our countrymen; and we had secured Fort James and the river Gambia, the best and the most healthy settlement. In Europe we had relinquished Minorca; but Minorca is not tenable in war, and in peace it must be supported at a ruinous expence. We had permitted the reparation of the port of Dunkirk; but Dunkirk could only be an object when ships of a far inferior draught to the present were in use; the change in the operations of naval war had taken away its importance. In the East Indies cessions had been made; but let it be remarked that these cessions are inconsiderable in themselves, and could not be protected by us in the event of hostilities. In fine, it was objected that we had abandoned the unhappy loyalists to their implacable enemies. What is this but to impute to congress by anticipation a violence which common decency forbids us to expect? But let it be considered, that the principle of assisting these unfortunate men would not have justified ministers to have continued the war. And let it be considered, that a continuation of the war would not have procured them any certain indemnity. The accumulation of our distresses must have added to theirs. A year or two hence, harder terms of peace might have been forced upon our acceptance. Their fate then must have been desperate indeed! But as matters were now situated, there were hopes of mercy and reconciliation."

691
A general distrust and suspicion of treachery prevailed during the war.

692
Heightened by a fire at Portsmouth,

Having thus given as full an account as our limits would allow of the great national events to the conclusion of the peace in 1783, we shall now give a detail of some others, which, though of sufficient importance to deserve notice, could not be previously inserted without interrupting the narrative. It has repeatedly been observed, that through the violence of parties, a general temper of distrust and suspicion took place throughout the nation, insomuch that the most improbable stories with respect to individuals began to gain credit, of which an instance was given in the case of Mr Sayre. From certain circumstances, however, it appeared, that there undoubtedly were persons in the kingdom who wished if possible to destroy the national strength in such a manner as to render it impossible for us to make head against the attempts of our enemies. On the 8th of December 1776, a fire broke out in the ropehouse of the dock-yard at Portsmouth, which totally consumed it, but without doing any very material damage. For some time the affair passed as an accident; but in clearing away the rubbish, a tin-box was found with a wooden bottom, containing matches which had been lighted, and underneath was a vessel with spirits of wine: however, the fire not having been properly supplied with air, had extinguished of itself before it touched the

spirit of wine. Had it caught fire, all the stores in the storehouse, sufficient to rig out 50 sail of men of war, would have been destroyed. In the beginning of the year 1777, a fire happened at Bristol, which consumed six or seven warehouses; and by the finding of machines similar to those already mentioned, it was evident that the fire had not been accidental. The terror of the public was now greatly increased, and the most violent accusations against each other were thrown out by the ministerial and popular parties. On this point, however, they soon came to a right understanding, by the discovery of the author of all this mischief. This was one James Aiken, *alias* John the Painter, a native of Edinburgh. Having been from his early years accustomed to a vagrant life, to which indeed his profession naturally led him, he had gone through many different adventures. He had enlisted as a soldier, deserted, and when pinched by want, made no scruple of betaking himself to the highway, or committing thefts. Having traversed a great part of America, he there imbibed the prejudices against Britain to such a degree, that he at last took the extraordinary resolution of singly overturning the whole power of the nation. This he was to accomplish by setting on fire the dockyards at Portsmouth and Plymouth, and afterwards the principal trading towns of the nation. With this view, he inspected with the utmost care those docks and other places on which his attempts were to be made, in order to learn with what care they were guarded. This he found in general as negligent as he could wish: and indeed had he not been some way or other very deficient in the construction of his machines, he must certainly have done a great deal of mischief; for as his attempts were always discovered by finding his machines, it was apparent that he had met with abundance of opportunities.

Britain. 693 and at Bristol.

694 The incendiary discovered.

For some time the affair at Portsmouth passed, as has already been mentioned, for an accident. It was soon recollected, however, that a person had been seen loitering about the rope-house, and had even been locked up one night in it; that he had worked as a painter, and taken frequent opportunities of getting into that house, &c. These circumstances exciting a suspicion that he was the incendiary, he was traced to different places, and at last found in a prison, to which he had been committed for a burglary. On his examination, however, he behaved with such assurance and apparent consciousness of innocence, as almost disconcerted those who were authorized to examine him. At last he was deceived into a confession by another painter, a native of America, who pretended to compassionate his case. Thus evidence was procured against him, but he still maintained his character to the very last; rejecting and invalidating the testimony of his false friend, on account of his baseness and treachery. He received his sentence with great fortitude; but at length not only confessed his guilt, but left some directions for preventing the dock-yards and magazines from being exposed to the like danger in time to come.

695 He is apprehended, tried, and executed.

Thus it appeared that the whole of this alarm of treason and American incendiaries was owing to the political enthusiasm of a wretched vagabond. Still, however, it appeared that the French court were very well

Britain.
696
Intelli-
gence

the French
court.

well acquainted with many particulars relating to the state of this kingdom, and the movements of our squadrons, which ought by all means to have been kept secret. These treacherous proceedings were first detected in the month of June 1780. One Ratcliffe, master of a cutter, gave information that he had been hired by one Mr Rogere to carry packets to France, for which he was to be paid 20l. each time, and to have 100l. besides at a certain period. Apprehending at last, however, that he might incur some danger by continuing this employment, he gave information of what was going on to one Mr Steward, a merchant at Sandwich, by whom his last packet was carried to the secretary of state. After being opened and sealed up again, it was returned, and he was directed to carry it to France as formerly. This was the fate of several succeeding packets, though it was some time before Ratcliffe saw the principal party concerned. At last this was accomplished by his complaining to Mr Rogere that he had not been paid the 100l. according to promise. A meeting being thus procured, it was found that the person who gave intelligence to the enemy was one M. Henry de la Motte, a French gentleman then residing in London. On searching his house, no papers of any consequence were found; but on his arrival, he being absent when the messengers first arrived, he threw some out of his pockets, unperceived by any body, as he thought. The papers, however, were taken up by the messengers, and gave plain indications not only of a treasonable correspondence with the enemy, but that he was connected with one Henry Luttreloch, Esq. a German, who then resided at Wickham near Portsmouth. This person being also apprehended, not only made a full discovery of the treasonable correspondence with France, but gave abundant proofs of himself being one of the most depraved and hardened of all mankind, lost to every sensation excepting the desire of accumulating wealth. His evidence, however, and other strong circumstances, were sufficient to convict M. de la Motte, who was accordingly executed, though the king remitted that dreadful part of his sentence, of having his heart taken out alive, &c. During his trial, and on every other occasion, he behaved in such a manner as showed him to be an accomplished gentleman; and not only excited the compassion, but the admiration of every one who saw him.

executed
for corre-
sponding
with the
French.

During the whole course of the war, only one other person was detected in any act of treason; and he appears to have been actuated merely by mercenary motives, though La Motte and John the Painter probably acted from principle. This was one David Tyrie, a native of Edinburgh. Having been bred in the mercantile line, and engaged in a number of speculations with a view to gain money, in all of which he discovered considerable abilities, he at last engaged in the dangerous one of conveying intelligence to the French of the ships of war fitted out in Britain, the time of their sailing, &c. For this he was apprehended in February 1782. The discovery was made by means of one Mrs Askew, who passed for his wife, having delivered a bundle of papers in a hurry to a school-mistress, and desiring her not to show them to any body. Instead of this, however, she not only inspected them herself, but showed them to another, by whom

they were sent to the secretary at war. By this, and another packet discovered by William James, who had been employed to carry it to France, Tyrie was convicted and executed in the month of August 1782. He behaved with great resolution, and at the last showed rather an indecent levity and unconcern, by laughing at the place of execution. The sentence not only took place in the dreadful manner appointed by law, but the crowd behaved with the most shameful and unexampled barbarity. "Such (say the accounts of his execution) being the *singular conduct* of many who were near the body, that happy was he who could procure a finger, or some vestige of the criminal!"—This unhappy man, while in prison, had, with his companions, contrived a method of effecting their escape, by working through a brick wall three feet thick, and covering the hole with a plank coloured like the bricks; but the scheme was discovered by the imprudence of Tyrie himself asking the keeper how thick the wall was.

Britain.
700
Barbarity
of the
crowd who
attended
his execu-
tion.

On the whole, it appears that notwithstanding the excessive altercation and virulence of parties, which even went to such a length as to produce duels between some members of parliament, neither the one nor the other entertained any designs against what they believed to be the true interest of the nation. The one seems to have regarded its honour too much, and been inclined to sacrifice even its existence to that favourite notion: the other perhaps regarded the national honour too little; as indeed no advantageous idea could have been formed of the spirit of the nation which could submit to the dismemberment of its empire without any struggle. The event, however, has shown, that the loss of the colonies, so far from being a disadvantage, has been the very reverse. The commerce of Britain, instead of being dependent on America, has arrived at a much greater height than ever, while the consequent increase of wealth enabled the nation to support that enormous debt, great part of which has been contracted, first in defending, and then attempting to conquer the colonies.

701
Present
state of
Great Bri-
tain.

Returning here to our narrative, it has been already remarked, that in the debates in the house of commons upon the treaties concluded under Lord Shelburne's administration, by which the American war was brought to a close, the terms of those treaties were disapproved of by the majority of the house, and this disapprobation was expressed by carrying an amendment to the ministerial motion for an address of thanks to his majesty. It does not appear, however, that the nation at large disapproved of the conditions of the peace. All ranks of men had long been weary of the war with the American colonies, and were willing to relinquish every claim of sovereignty over them. This point being decided, other objects of negotiation were of too diminutive value to excite any great degree of public interest. The majority which now voted against administration, consisted of men brought together by views little connected with the accomplishment of any patriotic object, and in a manner which well merits the attention of the historian.

703
The nature
of the opposi-
tion to
Lord Shel-
burne's ad-
ministra-
tion.

The death of the marquis of Rockingham left in a very disjointed state the party which opposed the American war. Lord Shelburne's administration appears to have been formed under the influence of the crown alone,

Britain. alone, to the exclusion of Lord North and his friends, as well as of Mr Fox and the other principal members of the former opposition. Thus an attempt appears to have been made to govern the kingdom without supporting the royal prerogative by the strength of any faction or political party. Here, however, an event occurred of a nature undoubtedly not a little dangerous to the constitution; but which, being new in itself, seems not to have been foreseen by speculative writers upon the British government.

704
Importance acquired by Lord North and his adherents.

The American war was conducted with a profusion of expence totally unexampled in former wars. The service of government became of itself an immense object of trade, or an employment in which thousands of all kinds of artists, manufacturers, and merchants, were engaged. The patronage enjoyed by the minister for the time was proportionally extensive. In consequence of this circumstance, he and his friends, and a long train of their friends and dependents, were enabled to accumulate great wealth, and rose to the enjoyment of influence in all parts of the country. The impracticability of accomplishing the great object of the war at last led to its termination; and the minister who had been unsuccessful in conducting it was dismissed, as had usually been done upon such occasions in Britain, to make way for his antagonists, who had long recommended, and who could, therefore, with a better grace, adopt measures of pacification. But the dismissal of the minister and his friends from their official situations, did not at once destroy their political importance in the state. They constituted a very formidable body of men in both houses of parliament; and such was the influence which the possession of power had conferred upon Lord North, that to the latest period of his life he was understood to be able to carry along with him, at all times, upwards of 40 votes in the house of commons. Such a power was evidently of a very dangerous nature, to be attached to a subject of a free state; and so indeed it proved to be.

705
Fox's party despair of getting into power by their own strength.

Mr Fox, and the other gentlemen who had led the opposition to Lord North's measures during the American war, but who had retired from administration on the accession of Lord Shelburne to the place of first lord of the treasury, after the death of the marquis of Rockingham, appear to have at last become weary of an unprofitable opposition, and to have become eager, upon almost any terms, to enter into the enjoyment of power. This passion had probably been augmented in their minds by the short gratification of it under the marquis of Rockingham. But the party, though possessing very great talents, was too weak, in point of numbers, to be able to contend against the minister of the day, supported by the whole patronage of the crown. On the other hand, though Lord North and his friends formed in both houses of parliament a very formidable phalanx, still they also were too few to contend against ministerial influence, and what were in these days usually called the *king's friends*. From the natural course of things they might also expect that their numbers would gradually diminish. They had risen by attaching themselves to the service of the state; and the changes which mortality produces, would, by degrees, enable the existing government to supplant them by a new race of ambitious men.

Britain. In this state of affairs, the national business, exposed to the strict inspection of rival factions, could not fail to have been well conducted under the legitimate authority of the ministers of the crown; but such an experiment was not suffered to be tried. The two opposition parties, led by Lord North and Mr Fox, thought fit to come to an agreement to unite their strength, which would enable them to form a complete majority in parliament, and thus to impose themselves upon the sovereign, as the only men whom he could have the power of employing as his ministers. In this way the majority was produced which opposed Lord Shelburne's administration, and it has been since known under the appellation of the *coalition*.

706
Coalition of Lord North and Mr Fox.

The effect produced upon the public mind by this coalition was extremely important; and it is probable, that even at the end of twenty years its consequences are not entirely understood. In almost any other country than Britain, and at many former periods of our history, such a combination of powerful men, possessing a predominance in the legislature, could not have failed to prove fatal to the constitution, and destructive of the internal tranquillity of the state. If the king gave way to such an aristocratical combination, and received its leaders into his service, it was to be feared, that by putting into their hands the whole patronage of the crown, together with the authority of the royal name, added to the majority which they already possessed in the rest of the legislature, they would speedily find means to fortify themselves by new institutions and laws, which would render them independent both of the king and people. No hope appeared from a dissolution of parliament, as the public at large were not at once aware of the critical situation into which the constitution had been brought by the coalition. A prince of a rash character, would, in such circumstances, perhaps, have seen no other resource for the protection of his own prerogative, than an attempt to govern without a parliament, the majority of which were evidently acting not the part of dutiful subjects or faithful representatives of the people, but of individuals conspiring to seize for their own private advantage, the emoluments and authority of office.

707
Dangerous tendency of the coalition.

This judgment will not be regarded as too severe, when it is considered, that at this time no pretext for opposition to the crown existed, founded upon any complaint of the nation against the abuse of its prerogatives; and that the individuals who now united could not be induced to do so upon any footing of political principle. Lord North, the steady assertor and supporter of the royal prerogative, and the conductor of the American war, now joined Mr Fox, the opponent of that war, and the eloquent champion of the privileges of the people. Neither of these men, nor their friends, pretended that they had relinquished their former opinions. The purpose of the present union was therefore notorious. The outrageous abuse with which they had formerly treated each other, served only to afford a new example how completely ambition is capable of subduing every resentment, and all the ordinary passions of the human mind.

The party now called the *coalition*, had displayed the superiority of their numbers in the house of commons in the debates upon the treaty of peace in the middle of February. From that period, it was considered as obvious,

ous,

ous, that a new administration must be formed. Hence from that time public business remained at a stand, and the nation was kept in suspense. The period was critical, on account of the termination of the war, at which great bodies of troops and seamen were to be discharged, and many pecuniary arrears paid off. The different regiments of militia were at this time disembodied, and sailors and soldiers dismissed in a state of turbulence, natural to men accustomed to arms, whose pay is not correctly paid. These and other circumstances, joined with the unsettled state of the government, produced various disorderly proceedings at Portsmouth, Plymouth, and other places. In the mean time, a loan could not be negotiated by the ministry while they wanted the countenance of the house of commons. They still, however, during the whole month of March, lingered in their places, and a variety of negotiations were carried on by the court for the purpose of attempting to form a new ministry, without an unconditional transfer of the government of the kingdom to the coalition. Confident of their own strength, however, this combination of men were desirous of attaining power upon their own terms, and continued to display their superiority in the house of commons, with a view to force their own reception at court. On the 24th of March, on the motion of Mr T. W. Coke, which was seconded by Lord Surrey, an address was voted, requesting his majesty to take into consideration the distracted state of the empire after an exhausting war, and to comply with the wishes of the house, by forming an administration entitled to the confidence of his people. His majesty answered, that it was his earnest desire to do every thing in his power to comply with the wishes of his faithful commons. The delay, however, continued, and all descriptions of men were involved in doubt, suspense, and anxiety. On the 31st of the same month, on the motion of Lord Surrey, a new address was voted, urging in very earnest terms the formation of what was called an "efficient and responsible administration, formed upon principles of strength and stability, suited to the state of his majesty's affairs both at home and abroad." At last, on the 2d of April, his majesty, yielding to what appeared necessity, appointed an administration consisting of the leaders of the coalition. The duke of Portland was promoted to be first lord of the treasury; Lord North and Mr Fox were appointed principal secretaries of state; Lord John Cavendish was made chancellor of the exchequer; Lord Keppel was made first lord of the admiralty; Lord Stormont was created president of the council, and the earl of Carlisle was advanced to be keeper of the privy-seal. These formed the cabinet; and the other offices of government were filled by their supporters and friends. The right honourable Charles Townshend was appointed treasurer of the navy; Mr Burke paymaster general of the forces; Lord Viscount Townshend was made master-general of the ordnance. The seals were put in commission: At the head of the commission was Lord Loughborough. The right honourable Richard Fitzpatrick was appointed secretary at war; James Wallace, Esq. was made attorney-general; John Lee, Esq. solicitor-general; the earl of Northington was appointed lord-lieutenant of Ireland; and, in Scotland, the honour-

708
Coalition
ministry.

able Henry Erskine was made lord-advocate, in the room of Mr Henry Dundas.

The new administration was no sooner installed, than an opposition to it was formed, which, in the house of lords, was led by the duke of Richmond and Lord Thurlow; and in the house of commons by Mr Pitt, and Mr Jenkinson, afterwards created, at different times, Lord Hawkesbury and earl of Liverpool.

The new administration, on entering into office, were under the necessity of instantly negotiating a loan of twelve millions, to supply the necessities of the state. To provide for the interest of this loan various taxes were proposed by Lord John Cavendish, the chancellor of the exchequer. These were imposed on bills of exchange, probates of wills and legacies, bonds, and law proceedings, stage coaches, quack medicines, carriages, letters-patent, &c.; registers of births, marriages, and deaths, were also taxed. These taxes gave rise to debates which produced little interest. The case was otherwise, however, with regard to another subject in which Mr Pitt took the lead.

Towards the close of the American war, when want of success had begun to render it unpopular, it had repeatedly been urged both in parliament and in various publications, that the ministerial majorities in favour of the measures pursued against the colonies, would never have existed if the people of this country had been fairly represented in the house of commons. By degrees this sentiment attracted attention; and to give countenance to a parliamentary reform, came to be regarded as a sure step towards the attainment of popular favour. Accordingly, Mr Pitt, then a very young man, thought fit to endeavour to recommend himself to notice, by engaging eagerly in the pursuit of this object. He opened the subject in the house of commons on the 7th of May, with an eloquent speech, in which, after declaring his admiration of the general fabric of the British constitution, and that he wished not to alter but to restore its true spirit, which time and changes, accident and events, had enfeebled and diminished, he asserted, that the state of parliamentary representation was partial and inadequate, the progress of undue influence alarming and ominous; that the true spirit of liberty had decayed, and that the powers of control, in different branches of the government, were debilitated: that wild speculations of reform were afloat without doors; but that he was about to propose the most moderate and safe, but necessary measures: He stated his plan of reform under three resolutions: 1. That measures ought to be taken to prevent bribery and expence at elections. 2. That for the future, when the majority of voters of any borough should be convicted of notorious corruption, the borough should be disfranchised; and the minority of votes, not so convicted, should be entitled to vote for the county in which the borough might be situated. Lastly, That an addition ought to be made to the representation, to consist of knights of the shire, and of representatives of the metropolis. Mr Pitt was opposed with much earnestness by Lords North and Malgrave, and also by Mr Powis. He was supported, however, by Mr Fox and Mr Beaufey, and also by Mr Thomas Pitt, who offered, as a testimony of his sincerity, to

Britain. make a voluntary sacrifice of his borough of Old Sarum. Mr Henry Dundas, who now attached himself to Mr Pitt, supported on this occasion the motion of his friend, and asserted, that to comply with the wishes of the people, would be the happiest means of putting an end to their complaints. Mr Pitt's resolutions were lost by a majority of 293 to 149.

712
Irish independence bill.

During the same session, the new administration brought forward a bill, admitting in express terms the exclusive rights and absolute supremacy of the parliament and courts of Ireland, in matters of legislation and judicature; and for preventing any writs of error or appeal from the courts of that country to the courts of Great Britain. The bill passed with little opposition. It tended at the time to gratify the people of Ireland, though, by increasing the line of separation between the countries, it placed them in greater hazard of disunion, an event which could not be intended by government, and which therefore seems to show, that this administration had formed no plan for establishing the connection between the two countries on a permanent basis. An act was passed during the same session for regulating the future commercial intercourse of Great Britain and America. This act, however, appears to have been merely intended as a temporary measure till a commercial treaty could take place.

713
Mr Dundas's India bill.

Mr Dundas, during the present session, obtained leave to bring into parliament a bill for regulating the affairs of India. The chief features of his plan consisted of subjecting the presidencies of Madras and Bombay, to a controlling jurisdiction, to be granted to the government of Bengal. This last government he wished to establish in the person of a governor, who should be entitled to act when he thought fit, in opposition to the opinion of his council. Another object of his bill was to secure to the native proprietors their estates in perpetuity, on payment of a fixed tribute, and to extend these provisions to the nabob of Arcot and the rajah of Tanjore. Mr Dundas justified the necessity of this statute, in consequence of the improper conduct and tyranny of the servants of the East India Company, and especially of their principal servant Mr Hastings, whom he proposed to recal, and to send out to India Lord Cornwallis, as governor-general, in his stead. The scheme, however, proved abortive, but it led to other legislative efforts upon the same subject.

714
Mr Pitt's office reform bill.

Though Mr Pitt had been unsuccessful in his proposal to reform the representation of the people in parliament; he did not fail immediately to bring forward a bill containing the project of an inferior species of reform, that of the fees, gratuities, and perquisites in the different departments of the public offices. The object of it was economy, for the purpose of enabling the nation to support the debt incurred in supporting the late war. The bill passed through the house of commons, but was rejected in the house of lords.

715
Petition of the American loyalists.

Towards the close of the session, a petition from the American loyalists was presented to the house of commons by Lord John Cavendish, in consequence of his majesty's command. It stated, that the petitioners, some of whom were men of the first character, fortune, and consequence, having adhered to Great Britain in the late contest with the colonies, had been attainted in N. America as traitors, and their effects confiscated by the legislatures of the different states. Many of the pe-

tioners were widows and orphans, who had lost husbands and fathers, in consequence of their adherence to the British cause, others were military and civil officers, clergy or other professional men, who had lost their means of subsistence in the same manner. They prayed the house of commons to grant them such relief as might seem adequate to their circumstances. Accordingly, upon the motion of the chancellor of the exchequer, an act was passed appointing commissioners to inquire into the circumstances of such persons as were reduced to distress by the late dissensions in America.

Britain.

On the 23d of June, a message from his majesty requested assistance towards making a separate establishment for the prince of Wales. Sixty thousand pounds only were demanded for this purpose; and it was stated by the minister of finance, Lord John Cavendish, that his majesty intended to allow the prince 50,000l. a year out of the civil list, without requiring from the public any farther assistance than the above sum of 60,000l. which would be requisite to defray the extraordinary expence attending a new establishment. This last sum was more readily granted, because rumours had gone abroad, which were alluded to by Mr Pitt in the house of commons, that an intention had existed on the part of the administration, particularly of Mr Fox, to give the prince a very splendid establishment at the public expence; but that this proposal was not acceptable to his majesty. Mr Fox said, that he undoubtedly considered the proposed establishment as too low; that if it had remained with him to have advised an establishment, he would most assuredly have proposed a sum more adequate to the object in view. The person, however, most proper to decide in the business, had been of an opinion very different, and it was his duty to submit.

716
Establishment of the prince of Wales.

Parliament was speedily thereafter prorogued. The nation was now in a state of tranquillity. Some anxiety, however, existed in the minds of men with regard to the public welfare. The load of public debt which had been incurred seemed excessive. Though commerce began to flow into new and extensive channels, the returns of trade necessarily required some time to exhibit themselves in the form of a flourishing revenue. In the interval, therefore, between the period at which the ministerial expenditure for the support of the war ceased, and that at which the first profits of foreign trade were received, a considerable shortcoming took place in the public revenue, and individuals experienced many difficulties. These, however, gradually passed away. Two inventions were, by degrees, brought to perfection, which of themselves brought a profit to the public, almost equivalent to the burdens to which it had submitted in consequence of the American war. These were the machine for spinning cotton, the invention of a man, originally of low rank (Arkwright), and the valuable kinds of pottery contrived by Mr Wedgwood. The first of these, by producing at a cheap rate the most beautiful cotton fabrics, put an end in a great measure to the use of silk, and gave to the British manufactures a kind of monopoly of many of the most useful articles of clothing; while the other not only drew to the nation immense sums from foreign countries, but from the bulky nature of the commodity, employed an immense tonnage of shipping in its exportation.

717
The Recess. State of the nation.

718
New inventions.

In the mean time, men had leisure to reflect upon the

⁷¹⁰ *Britain.* the nature of the coalition of political parties, which had recently taken place. The tendency of that measure, and the possible evils which might result from it, did not at once present themselves to the minds of men, because it was not known to the public at large, that the sovereign had felt his own independence affected by the event. The general sentiment, however, was that of indignation against the political parties, who had so far forgotten all the principles which they had so long and loudly professed, as to be capable of uniting with each other, for the sake of power or private emolument. It was universally said that no honesty was to be found among political men, and that no profession of patriotism ought henceforth to be trusted. Thus a severe wound was inflicted upon the public morals of the nation, by the want of consistency which its most conspicuous characters had exhibited. The wound was the more deep, in consequence of the apparent strength of administration, which included in itself the men of greatest political influence in the kingdom, who were considered as likely long to retain the power which they now possessed.

⁷²⁰ *Meeting of parliament, Nov. 1783.* In this state of affairs, parliament assembled on the 11th of November. In the speech from the throne, the necessity of providing for the security of the revenue, and of attending to the situation of the East India Company, were stated to both houses, as apologies for calling them together after so short a recess. After some days past in discussions relative to different parts of the revenue, Mr Secretary Fox moved for leave to bring in two bills relative to the affairs of the East India Company. By the first of these bills, it was proposed to take from the East India Company the whole administration of their territorial and commercial affairs, and to vest it in seven directors named in the bill; viz. Earl Fitzwilliam, the right honourable Frederick Montague, Lord Viscount Lewisham, the honourable George Augustus North, Sir Gilbert Elliot, Sir Henry Fletcher, and Robert Gregory, Esq. These directors, or commissioners, were to hold their office during four years, not to be removable by his majesty, without an address of either house of parliament. The directors were to be assisted by a board consisting of nine assistant directors, who were to be removable by five of the principal directors. The directors were to have full authority over all the company's servants and affairs, civil or military. The second bill, which accompanied the first in all its stages, was intended to regulate the administration of affairs in India. It forbade the exchange, acquisition, or invasion of any territory in India, by the general council, or any presidency there. It abolished all monopolies in India; prohibited the acceptance of presents, and made them recoverable by any person for his sole benefit. It secured an estate by inheritance to the native landholders, and provided against the alteration or increase of rents. It prohibited the molestation of princes subject to the company, and restrained the company's servants from collecting or farming their revenues, or having any pecuniary transactions with them. It prescribed a mode for adjusting the disputes between the nabob of Arcot, and the rajah of Tanjore, and between them and their British creditors. It disqualified the agents of the company, or of any protected Indian prince, from sit-

⁷²¹ *Mr Fox's India bill.*

ting in the British house of commons, and directed all offences against the act to be prosecuted in the courts of India, or in the court of king's bench. ⁷²² *Britain.*

The East India Company's affairs had hitherto ⁷²² *Boldness and novelty of the measure.* been governed in terms of the charters of the company, by a court of proprietors, and a court of directors, elected by the proprietors. The rights of these courts, however, were thus to be absolutely taken away, and their whole powers, or the sovereignty of British India, was to be vested during four years certain in the hands of seven individuals, nominated by the present administration, through the medium of their parliamentary majority. It was undoubtedly a bold measure openly to assault the privileges of such a body of men as the East India Company; but it was still more new and singular under the British constitution, in the form in which it had existed for more than a century, to vest a large portion of the executive power, including the command of armies, and an immense pecuniary patronage, in the hands of a few individuals, who were to hold their places for a fixed period, independent of the will of the crown. It was immediately said, that by taking possession in this manner of the patronage of Hindostan, the present administration had found means to render themselves for a certain time avowedly independent of their sovereign, and that they would not fail to renew their own powers at the end of that period. They were represented as not scrupulous in the measures adopted by them, to accomplish this object of their ambition, seeing they treated with contempt, what has always been accounted extremely sacred in England, the chartered privileges of an incorporation.

It is to be observed, however, that the present administration had in some degree been led by circumstances, which previously occurred, and which did not originate with them, to adopt some decisive measures for reducing India under better management than that in which it had been placed under the care of the East India Company. Of these it will not be improper here to take a short review.

⁷²³ *Circumstances which give rise to Mr Fox's bill.* The circumstance of a great and wealthy empire, having been vanquished by a company of merchants was a thing so new in the history of the world, that it could not fail to be attended with a variety of inconveniences. The European nations have a near resemblance to each other in laws, manners, arts, and religion. The mutual jealousy, which for some centuries they had been accustomed to entertain of each other, had prevented any of them from making great conquests. When any power happened to acquire an addition of territory, this addition was never very great; and the laws of neighbouring states being nearly alike, the conquered province scarcely experienced any misfortune from a change of masters. Hence the evils attending upon great conquests, had ceased to be known among the nations of Europe. The conquerors and the conquered, being in all cases men of similar characters and talents, easily mingled with each other. The nobles of Alsace were as well received at the court of France, as those belonging to the ancient dominions of that crown; and the natives of the Netherlands regarded with much indifference their transition from the dominion of Spain, to that of Austria and of France. But when the British made conquests in Hindostan, all the evils occurred

Britain.

ned, which, naturally, attend the loss of national independence, and that most wretched of all states of human affairs, in which a race of strangers enjoys permanent dominion, while the natives of a country are subjected to hopeless depression and slavery. The British invaders of India undoubtedly possessed, or speedily acquired, the same rapacity with other conquerors; and as they were the servants of a company of merchants, whose only principle of exertion is profit, it is probable that under them avarice and extortion assumed more vexatious forms, because accompanied with greater assiduity and a more persevering temper than could be exhibited by the former conquerors of that country, who issued from the deserts of Tartary and Arabia. The people of Great Britain, accustomed at home to the mildest of all governments, and to the most equitable administration of justice that the world ever saw, heard with horror of the crimes, the robberies, the perfidies, and the massacres which their countrymen had committed, and by which their national name and character had been rendered odious in the east. The British government being no party to these crimes, wished to see them remedied, and very naturally supposed, that the best remedy would consist of taking India under its own immediate management. Some public-spirited men dreaded the accession of influence which the crown would thus necessarily acquire. Men of humanity, however, were willing to encounter considerable hazard, for the sake of altering the unjustifiable mode of management, which was admitted to exist in the east.

Early in the year 1781, two committees were appointed by the house of commons, to inquire into the mal-administration of the East India Company's affairs both at home and abroad. All parties in the house appear to have concurred in these measures. The first, which was styled a select committee, was directed to take into consideration the state of the administration of justice, in the provinces of Bengal, Bahar, and Orissa, and how the British possessions in the East Indies might be held and governed with the greatest advantage to this country, and happiness to the native inhabitants. The business of this committee was conducted by some of the most distinguished members of opposition. The second was a secret committee, under the management of persons in the confidence of administration. It was directed to inquire into the causes of the war in the Carnatic, and the condition of the British possessions in those parts.

On the 9th of April 1782, Mr Henry Dundas, then lord advocate of Scotland, and chairman of the secret committee, moved that the reports of that committee should be referred to a committee of the whole house. On this occasion, Mr Dundas, in a speech which lasted nearly three hours, enumerated the causes of the calamities of the east, particularly the departure of the company's presidencies from the line of policy prescribed to them, of avoiding military operations with a view to conquest; the corrupt interference of their servants in the domestic and national quarrels of the country powers; their breaches of faith and disregard of treaties; their speculation and scandalous oppression of the natives; together with the criminal relaxation which prevailed on the part of the directors at home in the exercise of their controlling power over their servants, and their ready connivance at the grossest

VOL. IV. Part II.

misconduct. Instances of all these were given by Mr Dundas, and he inferred the necessity of legislative interposition for the purpose of punishing delinquents, and to take the power out of those hands in which it had been so grossly abused.

At the same time, Mr Dundas brought forward a variety of other resolutions, which were adopted by the house, and which criminated in strong terms the late governor of Madras, Sir Thomas Rumbold, and Mr Hastings, then governor-general of Bengal. Among various other charges, it was stated in the resolutions, that Sir Thomas Rumbold had remitted to Europe, between the 8th of February 1778 (the day of his arrival at Madras), and the beginning of August in the same year, the sum of 41,000*l.* and during the two subsequent years, a farther sum of 119,000*l.* the whole amounting to 160,000*l.* although his salary did not exceed 13,335*l.* per annum, and he had no other fair means of acquiring wealth. He was charged with having abolished the committees, instituted to superintend the payment of the revenue due by the zemindars, or natives holding lands under the company, and with having compelled those zemindars to travel many hundred miles, to negotiate separately with himself, the terms on which they were to be allowed to hold their estates. He was charged with having suffered his private secretary to receive a bribe of no less than 20,000*l.*; with having concealed other peculations of the company's servants; with having given a lease of lands to the nabob of Arcot, in direct disobedience to the company's orders; and with having violated the most solemn treaties, entered into with the nizam of the Decan. In consequence of these, and other accusations contained in the resolutions moved by Mr Dundas, leave was given to bring in a bill of pains and penalties against Sir Thomas Rumbold, and two of his associates, Peter Perry and John Whitehill, for breaches of public trust and high crimes and misdemeanours; at the same time, an act was passed, restraining those persons from leaving the kingdom, obliging a discovery of their property, and preventing its alienation. Sir Thomas Rumbold was heard by council at great length in his defence, so that nothing could be done during the short period that remained of the session 1782. The unsettled state of public affairs prevented much attention from being given to the subject, till the middle of the session 1783. The variety of accusations rendered a very minute defence necessary, to which the members gradually became somewhat remiss in giving attention. At last, on the 1st of July, a motion was made, and carried, for adjourning the further consideration of the bill till the 1st of October, by which means the whole proceeding fell to the ground. Sir Thomas Rumbold appears to have been willing to accept of indemnity without acquittal, and Mr Dundas never afterwards thought fit to revive the discussion.

In other resolutions brought forward on the 15th of April 1782, Mr Dundas stated a variety of accusations against Warren Hastings, Esq. and Mr Hornsby, and prevailed with the house to adopt a resolution, declaring it to be the duty of the directors of the East India Company to recal the governor-general, and Mr Hornsby the president, from their respective offices. Accordingly, the court of directors issued orders for this purpose; but these were appealed from, to a court

Sir Thomas Rumbold and Mr Hastings accused by Mr Dundas.

724
Report of the secret committee on India affairs.

Britain.

of proprietors, who, on the 31st of October 1782, prohibited the court of directors from complying with the resolution of the house of commons: the result was, that Mr Hastings retained his office, and Mr Dundas, in the following session of parliament, brought forward the bill which we have already mentioned, but which was not enacted into a law.

726
Report of
the select
committee.

At the same time that Mr Dundas, as chairman of the ministerial or secret committee, brought forward the resolutions already mentioned, the select committee, which chiefly consisted of members of opposition, presented their report; and on the 18th of April 1782, General Smith, their chairman, proposed various resolutions, in some of which Mr Hastings was criminated along with Sir Elijah Impey, chief justice of the supreme court of Bengal. It is understood that by means of investigations, which they carried on in this last committee, the leading members of opposition, particularly Mr Fox and Mr Burke, qualified themselves for directing at a future period the attention of the legislature, and of the public, to the state of Indian affairs.

727
Of the East
India Com-
pany.

Mr Fox made use of his knowledge to bring forward the two important bills already mentioned, which proposed to vest the management of the whole affairs in India, for behoof of the proprietors or stockholders, in seven commissioners to be named by parliament. To justify this strong measure, it was alleged, that, by the mismanagement of the courts of directors and proprietors, the affairs of the company had been brought into a state of extreme embarrassment. But the argument chiefly rested upon consisted of the enormous abuses committed under the company's government in India, which rendered it absolutely necessary to vest the administration in other hands. These abuses were arranged under three heads, as they affected, 1st, The independent powers of India; 2dly, The states in alliance with us; and 3dly, Our own territorial possessions.

728
Arguments
by which
Mr Fox
supported
the bills.

Under the first class were ranged the extravagant projects and expensive wars entered into by the company to extend their dominions; their violations of treaty; the sale of their assistance in support of the ambition, rapacity, and cruelty of others; and the betraying in his turn every prince, without exception, with whom they had formed any connexion in India. The second class of abuses comprehended the corrupt and ruinous interference of the company in the internal government of the princes dependent on them; the unjust exaction of exorbitant aids and tribute; the enormous peculations of the company's civil servants, and the rapacity of the military.

With respect to the management of the countries under the immediate dominion of the company, it was asserted by Mr Fox, and the supporters of administration, that the general system of their conduct in India was directed to a single end, the transmission of wealth from that country to this. With this view, at one time, monopolies had been established, not only of every article of trade, but even of the necessaries of life. At another period the privilege of pre-emption was secured to the company, and these were followed by a variety of no less ruinous arbitrary preferences. By this oppressive conduct the merchants and bankers of India, many of whom in extent of trade and credit, were scarcely equalled by those of the first class in

Europe, being disabled from all undertakings of magnitude, fell gradually into decay, whilst the native cultivators and manufacturers were obliged to accept of a bare sufficiency for their maintenance, measured out to them by the judgment of those who were to profit by their labour. But this was not the worst; for, in the progress of these destructive measures, the oppressions and cruelties used by those to whom the execution of them was committed went far beyond the extent of the original evil. The servants of the company adopting, as might naturally be expected, the principles of their employers; extended the practice of them to their own private purposes; and, to complete the mischief, they found themselves under the necessity of supporting the injuries done to the natives for their selfish ends, by new injuries done in favour of those before whom they were to account.

The case of the zemindars, and of the renters under them, was, if possible, still more deplorable. At the time we obtained the dewanee, or stewardship, from the Mogul, the provinces of Bengal and Bahar had been laid waste by a famine, that had carried off upwards of one-third of their inhabitants. The first thing done for their relief was to exact from the remaining part of the inhabitants the same tribute that had before been paid by the whole. The country daily declining, and the distress occasioned by this rapacious conduct threatening the loss of the object for the sake of which it had been adopted, the company's government in India had proceeded to perhaps one of the most arbitrary, the most unjust, and most cruel acts of power recorded in history. They had set up to public auction the whole landed interest of Bengal, without the least regard to the rights of private property, or even a preference being given to the ancient possessors. The zemindars, most of them persons of ancient families and respectable fortunes, were under the necessity either of bidding against every temporary adventurer and desperate schemer, or of seeing their estates transferred or delivered up to the management of strangers. The lowest and most knavish jobbers entered into their patrimonial lands; and the banyan or black steward of the governor-general, in particular, was found after this auction to be in possession of farms amounting to the annual value of upwards of 130,000l.

These sufferings of the natives under our dominion in India were greatly aggravated by their being almost wholly excluded from any share in the expenditures of the company's government. All the principal collections of the revenue, all the honourable and the lucrative situations in the army, all the supplies and contracts of every kind, were solely in the hands of the English. So that the natives, with very few exceptions, were only employed as the servants or agents of Europeans, in subordinate stations in the army, and in the inferior department of collection, where it was impossible to proceed a step without their assistance.

It was further urged, that the present government of India was not in its nature capable of reform. Nothing could be expected from the court of proprietors or stockholders, because the members, as individuals, derived more profit from giving support to Indian delinquents, than they could ever hope to receive from

the

^{Britain.} the fair dividends of the company. The court of directors, being a representative body, naturally partook of the imperfection of its constituents. The influence of delinquent servants in India equally domineered there, and from the same causes, as in the court of proprietors. The interest that a director possessed from his qualification in the company's profits did not exceed 160l. a-year; but the support he could thereby lend to an obnoxious servant abroad might be turned to much better account, by being repaid with a share of the boundless plunder of the east. It was stated, that the son of a person who had been for some time the chairman of that court, before he was in Bengal two months, sold the graut of a single contract for 40,000l.

Upon these and other topics, Mr Fox was supported by the highest efforts of the splendid eloquence of Mr Burke. This last gentleman pointed out a few of the many lines of difference which were to be found between the vices of the company's government and those of the conquerors who preceded us in India. The several irruptions of Arabs, Tartars, and Persians, had been, for the greater part, wasteful in the extreme: our entrance into the dominion had been with small comparative effusion of blood, and was less effected by open force than by various frauds and delusions. But the difference in favour of the first conquerors was this; the Asiatic conquerors had soon abated of their ferocity, because they made the conquered country their own. Fathers there deposited the hopes of their posterity, and children there beheld the monuments of their fathers. Poverty, sterility, and desolation, were not a recreating prospect to the eye of man, and few there were that could bear to grow old among the curses of a whole people. If their passion or their avarice drove the Tartar lords to acts of rapacity or tyranny, there had been time enough in the short life of man to repair the desolations of war by the arts of magnificence and peace. But under the English government all this order was reversed. Our conquest there, after 20 years, was as cruel as it had been the first day. The natives scarcely knew what it was to see the gray head of an Englishman. Young men (boys almost) governed there, without society and without sympathy with the natives. They had no more social habits with the people than if they still resided in England, nor indeed any species of intercourse but that which was necessary to the making a sudden fortune with a view to a remote settlement. Animated with all the avarice of age, and all the impetuosity of youth, they rolled in one after another, wave after wave; and there was nothing before the eyes of the natives but an endless hopeless prospect of new flights of birds of prey and passage, with appetites continually renewing for a food that was continually wasting. Every rupee of profit made by an Englishman, was lost for ever to India. With us were no retributory superstitions, by which a foundation of charity compensated for ages, to the poor, for the rapine and injustice of a day. With us no pride erected stately monuments, which repaired the mischiefs pride had produced, and adorned a country out of its own spoils. England had erected no churches, no hospitals, no palaces, no schools; England had built no bridges, made no high roads, cut no naviga-

tions, dug no reservoirs. Every other conqueror of every other description had left some monument, either of state or of beneficence, behind him. Were we to be driven out of India this day, nothing would remain to tell, that it had been possessed, during the inglorious period of our dominion, by any thing better than the ouran-outang or the tyger.

In opposition to all this, Mr William Pitt contended, that although India undoubtedly wanted reform, the alteration to be adopted ought to be constitutional, and not such as in its principle endangered the safety of every chartered incorporation in the kingdom. The India company's charter was not the result of the mad prodigality of a Plantagenet, a Tudor, or a Stuart, but a fair purchase deliberately made from parliament, which could not be violated without a gross disregard to public faith. He asserted, that by vesting the whole patronage of India in commissioners nominally appointed by parliament, but actually selected by administration, the influence of the crown would be augmented to a degree that would enable it, like an irresistible torrent, utterly to overpower and sweep away the remaining liberties of our country. On the other hand, Mr Dundas said, he did not object to the measure under consideration, because it increased the influence of the crown, but because it did what was much worse, it placed a new and unexampled influence in the hands of the minister and his party for five years, which would be independent both of the crown and of parliament. A fourth estate was about to be created in the realm of the most alarming nature, which in its progress might overturn the crown and subvert the British constitution.

On this occasion the bills were attacked not merely ⁷³⁰ by those persons who might be supposed to aspire to supplant ministers in their offices, but also by several country gentlemen of independent characters and high reputation for integrity. They said they had once regarded Mr Fox with the fondest admiration. They reminded him of his conduct when a leader of opposition, the perseverance, the animation, and the ardour of his efforts, which rendered it impossible to hear him without conviction, or to doubt the singleness of his zeal, and the sincerity of his reprobation. They declared they had expected from him the establishment of our liberties upon the most permanent basis; but that they must ever regard the connexion he had formed with Lord North, against whom his efforts had been so well and so successfully directed, as an instance of political defection and apostasy that would admit of no defence; they had augured every thing unhappy and tremendous from that moment, and the measure of that day proved their apprehensions to have been well founded; it was big with corruption and misfortune: in consequence of it the crown would be no longer worth wearing, and it was impossible that the man who had brought it forward could ever hereafter be trusted as the minister of this country.

The ordinary members of opposition also attacked Mr Fox's motives on this occasion in very pointed terms. It appeared, they said, that nothing could satisfy his inordinate ambition short of a perpetual dictatorship. They professed to perceive in him many respectable qualities; but they could by no means consent to see him exalted upon the ruins of the constitution.

Britain.

tion. "He would be crowned. How that might change his nature, there's the question." This idea was placed in a great variety of lights, and illustrated by comparisons borrowed from Cæsar, from Cromwell, and from Catiline. It was said, that he was prepared to sacrifice the king, the parliament, and the people, at the shrine of a party; and that he desired to elevate his present connexions to a situation in which no political convulsions, and no shiftings of power, might be able to destroy their importance and put an end to their ascendancy.

731
Enumeration of the principal speakers.

The bills were supported by various speakers, among whom were the two secretaries of state, Mr Burke, Mr Sheridan, Mr Erskine, Mr Lee, Mr Adam, Sir Grey Coupar, Mr Anstruther, Mr Courteney, Mr Rigby, Lord Maitland, and Sir Henry Fletcher. They were opposed by Mr William Pitt, Mr Thomas Pitt, Mr Jenkinson, Mr Powis, Mr Dundas, Mr Macdonald, Sir James Lowther, Mr Duncombe, Mr Martin, the marquis of Graham, Mr Arden, Mr William Grenville, Mr Beaufoy, Mr Wilberforce, Lord Mulgrave, and Mr Wilkes. During the progress of the bills the court of directors of the East India Company were heard against them by counsel; and the mayor and common council of the city of London presented a petition, praying they might not pass into laws. The first bill, however, was carried, first by a majority of 229 to 120, and afterwards on the 8th of December by a division of 208 to 102. On the 9th of December it was presented at the bar of the house of lords by Mr Fox, attended by a great number of members. On the first reading of the bill in the house of lords on the 11th of December, Earl Temple, Lord Thurlow, and the duke of Richmond, expressed their abhorrence of the measure in the most unqualified terms, but without attempting to call a vote of the house. Lord Thurlow, at the same time, pronounced an ample panegyric upon the character and services of Mr Hastings, who, according to his lordship, had established in Bengal a government of such order and energy, that he did not believe it would be in the power of the folly and ignorance of the most favourite clerks Mr Fox's directors could send out, to throw Bengal into confusion in the term that was assigned for the duration of his bill.

732
The first bill carried in the house of commons.

733
The king takes an alarm against the bill.

One of the peculiar advantages attending the British constitution, is the facility with which both prince and people receive political instruction, and are put upon their guard against any invasion of their rights. The parliamentary debates on this occasion being diffused through the nation in the usual way, by periodical publications, excited great interest, and probably produced much alarm in the mind of the sovereign. He had reluctantly given way to the strength of the coalition, and conferred upon its leaders the first offices of the state. He now saw it alleged, with much plausibility, that this combination of ambitious men, not satisfied with the ordinary influence attending their situation, were about to fortify themselves in the possession of power in such a way as might gradually enable them to become independent both of him and his people. The moment seemed therefore to have arrived at which temporizing measures must prove ineffectual, and a stand be made for the support of the royal prerogative. Such at least appear to have been the feelings under which his majesty acted upon this

occasion. On the 11th of December he had a conference with Earl Temple, in which he confessed himself completely convinced of the correctness of the views of opposition. It was now late, however, for his majesty to oppose a measure after it had been brought forward by the ministers of the crown, and carried through the house of commons apparently under the sanction of the royal authority. A resolution was, nevertheless, adopted, to endeavour to prevent its farther progress by means of the house of lords, many of the members of which were in habits of personal intimacy with the sovereign, bound, by offices which they held, to attend his person, and might be supposed ready to gratify his wishes, could a sufficient pledge be given, that he had taken a decided part against his own ministers. What personal interviews passed between him and these noblemen is not known; but a card was circulated, understood to be sent by Earl Temple, in consequence of written authority from his majesty, in which it was stated, that "his majesty allowed Earl Temple to say, that whoever voted for the India bill was not only not his friend, but would be considered by him as his enemy. And if these words were not strong enough, Earl Temple might use whatever words he might deem stronger or more to the purpose."

Britain.

734
Earl Temple intimates his majesty's disapprobation of the bill.

The consequence of this interposition was, that, on the 15th of December, upon a question of adjournment in the house of lords, the ministers were left in a minority of 79 to 87. On the same day Mr Baker brought forward, in the house of commons, a motion to declare, that, to report any opinion of his majesty, upon proceedings depending in parliament, with a view to influence the votes of the members, is a high crime and misdemeanour, and a breach of the fundamental privileges of parliament. The motion was seconded by Lord Maitland, and supported by references to the journals, and by this principle, that advice ought only to be given to the king by his ministers, who are responsible for all the measures of government. Mr William Pitt opposed the motion, as proceeding upon unauthenticated rumours; and asserted that the precedents alluded to in the journals, which had been selected from the *glorious times* of King Charles I. were not applicable to the present case. Mr Pitt concluded with reproaching ministers for basely retaining their offices after it appeared, from their own statement, that they had lost the confidence of the prince. The motion, however, was carried by 153 against 80. As it was feared that a dissolution of parliament would instantly take place, the house resolved, upon the motion of the honourable Thomas Erskine, That they would consider any person as an enemy to his country, who should advise his majesty, in any manner, to interrupt their discharging the important duty of providing a remedy for the abuses which prevailed in the East Indies. They also resolved to form themselves into a committee on the state of the nation on Monday the 22d. In the mean while, on Wednesday the 17th of December, Mr Fox's India bill was rejected in the house of lords, on a division of 95 to 76, and, at 12 o'clock on the night of the 18th, a message was delivered to the secretaries of state, requiring them to transmit to his majesty the seals of their offices, by the under secretaries, as a personal

736
Change of ministry.

Britain

sonal interview would be disagreeable. Early the next morning, letters of dismissal, signed Temple, were sent to the other members of the cabinet, and a general resignation of offices took place.

A new administration was immediately formed, in which Mr William Pitt was appointed first lord of the treasury and chancellor of the exchequer. The marquis of Caermarthen, and Mr Townshend, who had been created Lord Sidney, were made secretaries of state; Lord Thurlow became lord high-chancellor; the privy-seal was transferred to the duke of Rutland; Earl Gower became president of the council; the duke of Richmond was made master of the ordnance, and Lord Howe first lord of the admiralty; Mr Grenville and Lord Mulgrave were appointed joint-paymasters of the forces, and Mr Henry Dundas, treasurer of the navy. The office of lord advocate of Scotland, which this gentleman had formerly held, was now transferred from the honourable Henry Erskine to Mr Ilay Campbell.

737
Contest between the crown and the house of commons.

A spectacle was now about to be exhibited, which had long been unknown in Britain, that of an administration appointed by the crown, in direct opposition to the house of commons. This, however, was no longer that house of commons which had subdued the royal prerogative, and contended with success against our ablest and most ambitious monarchs. The late coalition had produced throughout the nation a general distrust of the character of those who formed the majority of its members; and it was soon found, that a representative body possesses little power or influence, and may safely be disregarded, when it ceases to render itself the organ of the sentiments of the public. It was expected that an immediate dissolution of parliament would take place; but the change of the highest officers of the crown having been hastily made, it is probable that the new ministry dreaded entering instantly upon the business of an election against the powerful parties coalesced in opposition to them; perhaps also they might wish to observe the effect of the late measures upon the public mind, and act as circumstances should direct. The majority, however, of the house of commons, feared a dissolution; and, on Monday the 22d of December, voted an address to the king, stating the inconveniences to the public credit and the affairs of India, which would attend a prorogation or dissolution of parliament. His majesty returned an answer on the 24th, acquiescing, in general terms, in the sentiments contained in the address, and assuring the house, that after a short adjournment, their meeting would not be interrupted by any prorogation or dissolution. This answer was regarded as ambiguous; and a dissolution was expected to take place immediately after the usual adjournment at Christmas.

When the house met on the 12th of January, Mr Fox attempted to introduce, previous to any other business, the discussion of certain resolutions, which had been prepared by the opposition; while the new ministers endeavoured to be heard first, by means of a stratagem, which consisted of a declaration of Mr Pitt, that he had a message to deliver from the king. After some tumult, Mr Fox was allowed to proceed. He called upon Mr Pitt to give the house satisfactory assurances that no dissolution would take place: but this last gentleman having declined to comply with

this requisition, Mr Fox moved, that the house should resolve itself into a committee on the state of the nation. The motion was carried, on a division of 232 to 193. Various resolutions were then carried: 1. That to issue public money after a prorogation or dissolution of parliament, unless an act shall have previously passed, appropriating the supplies to specific services, will be a high crime and misdemeanour; a breach of public trust, derogatory to the privileges of parliament and to the constitution of the country. Accounts of money already issued were ordered, and the farther issuing of any money was prohibited till three days after this account should be presented. It was farther resolved, on the motion of the earl of Surrey, that, in the present state of his majesty's dominions, an administration was necessary that should have the confidence of that house and the public, and that the recent appointments did not engage the confidence of the house. It was lastly resolved, on the motion of Mr Fox, that the second reading of the mutiny bill should be deferred to the 23d of February.

Britain.

738
Resolutions of the house of commons against administration.

Warm debates took place upon these resolutions, in which the most pointed personalities were cast out and retorted from both sides of the house. The coalition was branded, as a corrupt confederacy of two desperate factions to seize upon the government of the country; and the India bill was represented as having been an experiment made by the late secretary of state, with a view, if not to place the crown on his own head, at least to raise himself to a degree of power superior to that of the sovereign. On the other hand, the party composing the new administration was described as a coalition, not indeed of parties, but of the shreds and remnants, of the dregs and outcasts of parties; as a body collected for the purpose of fighting the battles of secret and unconstitutional influence, of trampling on the power and dignity of the house of commons, of establishing a government of cabal, intrigue, and favoritism, and of destroying the very principles of laudable ambition and honourable service in the state.

739
Debates on the resolutions.

On the 14th of January, Mr Pitt obtained leave to bring in a bill for the better government and management of the affairs of the East India Company. By this bill, commissioners were appointed by his majesty, authorized to superintend and controul all operations of the courts of directors and proprietors of the East India Company, relative to the civil and military government or revenues of the territories and possessions of the company. This board of controul was to have access to all papers belonging to the company; and the court of directors was on no pretence to send out orders to India, without the previous approbation of the board, which was also authorized to alter and amend the orders of the directors. His majesty was authorized to name the commanders in chief in India, and to remove any governor, general, or member of the councils, of any British settlement in India; and all nominations by the court of directors to these offices, were declared to be subject to the approbation of his majesty; nor was the court of proprietors allowed, for the future, to revoke any proceeding of the court of directors which had been approved of by his majesty. It was chiefly objected to this bill, that it disfranchised the East India Company or violated their charter no less than Mr Fox's bill.

bill had done. A meeting of the court of proprietors, however, had passed a vote in favour of the regulations contained in it; but at the second reading of the bill, on the 22d of January, the bill was negatived upon a division of 222 against 214.

The discussion of this bill did not prevent the house of commons, in the mean time, from endeavouring to shake the determination of the court, and to intimidate the new administration. A resolution was moved by Lord Charles Spencer, and carried by a majority of 205 against 184, which declared, in pointed terms, the disapprobation of the house, of the appointment and continuance in office of the present ministers, which they considered as unconstitutional. On various occasions, Mr Pitt was called upon to explain upon what principle he ventured to remain in office after the house of commons had declared him unworthy of their confidence. He answered, that though novel and extraordinary, his conduct was by no means unconstitutional: That the immediate appointment or removal of a minister did not rest with that house. That he neither could nor ought to remain long in such a situation, he was ready to confess; but he was bound to use his own discretion to prevent the consequences that might attend an instant resignation, which might leave the country without an executive government.

In the mean time, the public at large began to be greatly interested in the dispute which had occurred between the king and the house of commons. The common council of London voted an address of thanks to his majesty for the dismissal of his late ministers; expressed their approbation of the conduct of the house of lords; and declared their resolution always to support the constitutional exercise of prerogative. This address was almost immediately followed by similar addresses from the merchants and trades of the city of London, and from the city of Norwich. The contagion gradually extended itself from one part of the kingdom to another; addresses poured in from every side, and filled every day's gazette; coming from corporations, from cities, from manufacturing towns, and from counties. Every address served to inspire perseverance and energy into the successful party, and to hasten and render irresistible the event of this extraordinary contest. The coalition made some attempts in the county of Middlesex, in Westminster, and in the great county of York, to turn the tide of addresses in their own favour; but in these instances, if they avoided a defeat, they gained no victory.

In the meanwhile, as if the recent coalition of parties deserved to be considered rather as an example worthy of imitation than as an error to be avoided, a number of independent members of the house of commons attempted to heal the whole of the present breaches, by proposing a new coalition of parties, and the formation of an administration upon a still broader basis than formerly. On the 26th of January, nearly 70 members of the house of commons met at the St Alban's tavern, and signed an address, to be presented by a committee of their body, to the duke of Portland and Mr Pitt, requesting them to communicate with each other, on the arduous state of public affairs, and trusting, that by a liberal intercourse, every impediment might be removed to a cordial co-operation of men of respectable characters, acting on the same pub-

lic principles. In answer to this address, both parties expressed themselves desirous to comply with the wishes of so respectable a meeting. But the duke of Portland declined any interview with Mr Pitt, for the purpose of union, while that gentleman should continue prime minister in defiance of the resolutions of the house of commons. On the other hand, Mr Pitt declined resigning as a preliminary to negotiation.

To co-operate with the St Alban's meeting, one of its members moved, and carried unanimously in the house of commons, a resolution, that the present critical state of public affairs required an efficient, extended, and united administration, entitled to the confidence of the people. A second resolution was carried on a division of 223 against 204, that the continuance of the present ministers in office was an obstacle to forming an efficient, extended, and united administration. On the following day these resolutions were ordered, by a majority of 24, to be laid before his majesty. The meeting at the St Alban's tavern next came to a resolution, which was read to the house of commons, in which they declared, that an administration formed on the total exclusion of the members of the last or present administration would be inadequate to the exigencies of public affairs. Mr Fox declared his wishes for an union, but insisted on the resignation of the chancellor of the exchequer in compliance with the resolutions of the house of commons, as an indispensable preliminary step. Mr Pitt, on the contrary, adhered to his office, and declared, that the house might address the crown for his dismissal; but till, in consequence of such a measure, the king should think proper to remove him from his situation, he held it neither illegal nor unconstitutional to retain it, and would not recede from his former determination. He at the same time suggested, that there might be persons on the opposite side of the house with whom he could not act. Lord North understanding himself to be alluded to, declared his readiness to relinquish his pretensions to an official situation, if they should be deemed an obstacle to an union. This self-denying declaration was received with great applause; and Mr Marsham, Mr Powis, and other members of the St Alban's association, in vain called upon Mr Pitt to yield to the pressing exigencies of his country. These gentlemen still continued their efforts; and to remove the difficulty arising from Mr Pitt's refusal to resign in compliance with the resolutions and addresses of the house of commons, or to save the honour of the house upon that subject, they procured the royal interference for the purpose of requesting, that a negotiation should be set on foot between the duke of Portland and Mr Pitt. A message was accordingly sent by Mr Pitt, acquainting the duke, that he was commanded to signify to him his majesty's earnest desire that his grace should have a personal conference with Mr Pitt for the purpose of forming a new administration, on a wide basis and on fair and equal terms. The duke requested an explanation of the message with regard to the words *equal terms*, but Mr Pitt declined any preliminary discussion. The duke of Portland likewise proposed that he should be permitted to understand that the message implied a virtual resignation by Mr Pitt, or that he himself should receive his majesty's commands personally relative to the conference. Both of these

were

Britain. were refused, and here terminated the efforts of the St Alban's association.

746
Mr Pitt
persists a-
gainst the
house of
commons
in refusing
to resign.

On the 18th of February the chancellor of the exchequer was required in his place in the house of commons, to say, previous to the consideration of the question of supply to the ordnance department, whether any communication was to be expected relative to the resolutions of the house which had recently been laid before the king. He replied that his majesty, after considering all the circumstances of the country, had not thought fit to dismiss his ministers, and that his ministers had not resigned. This produced a warm debate, in which it was observed by Mr Fox, that it was the first instance since the revolution, of a direct denial on the part of the crown, to comply with the wishes of the house of commons, and he threw out a hint that it might be necessary for the house to protect its own authority by refusing to vote the supplies. To allow his majesty's ministers time, however, to consider well their situation, he proposed to defer the report of the ordnance estimate only for two days. The refusal of the supplies was treated by the friends of the new administration as a threat which the utmost madness of faction would not seriously attempt to execute, and which could never be justified by his majesty's refusal to dismiss ministers who had been condemned without a trial. On a division, there appeared for postponing the supplies 208; against it 196. On the 20th of February a new address to the throne for the removal of the ministers was carried by a majority of 21. On the 27th, his majesty's answer was reported by the speaker, in which it was stated that no charge or complaint was suggested against the ministers, nor was any one of them specifically objected to; and, on the other hand, that numbers of his subjects had expressed to his majesty the utmost satisfaction on the change of his councils. This answer was abundantly artful, as it tended to divide the people at large from the house of commons; and, at the same time, to perplex the coalition, who could not accuse the prime minister of any political crime, as he was a young man who had never enjoyed the chief direction of any important affair. A second address to the throne was moved in the house of commons on the 1st of March, and agreed to by a majority of 12, remonstrating against the answer to the former address. His majesty replied in civil terms, but persevered in his resolution to retain his ministers. The opposition now made their last effort. Mr Fox declared that he would not propose what is called an address to the throne, because he wished for no answer; but a humble representation, to which it is not customary to make an answer. This representation consisted of a long remonstrance against what was termed the unconstitutional appointment of an administration in opposition to the wishes of the house of commons. It concluded by stating that the house had done its duty by pointing out the evil, and that the blame and responsibility must henceforth lie wholly upon those who had presumed to advise his majesty to act in contradiction to the uniform maxims which had hitherto governed his own conduct, as well as that of every other prince of his illustrious house. The motion for this representation was carried by a majority of only one vote, that is, by a division of 191 to 190. Here the coalition appear to have felt themselves defeated, and to have finally

yielded to their destiny, as they suffered the mutiny bill, which had been their last security against a premature dissolution, to pass in the usual terms.

Britain.

While these contests had been going on in the house of commons, the house of lords was little attended to, and its strength seems to have been as it were exhausted by the extraordinary effort made by it in rejecting Mr Fox's India bill. As its silence during so critical a time was neither calculated to support its own dignity, nor the interest of the minister, an effort was made on the 14th of February to bring it into action. The earl of Effingham moved a resolution expressive of the firm reliance of the house in his majesty's wisdom in the exercise of the prerogative of appointing his own ministers. This, which was meant as a counter resolution to the votes of the commons, passed by a considerable majority after a short debate; and here the house of lords, conscious of the secondary place in point of importance which they held, if not in the constitution, at least in the estimation of the public, appear to have relapsed into their former taciturnity.

749
Conduct of
the house of
lords.

On the 25th of March, parliament was dissolved. In the elections which immediately took place, the new administration were extremely successful. The East India Company and their servants were uncommonly zealous; and the dissenters, a powerful body in England, of a conscientious character and great activity, having regarded with indignation the late coalition as the result of a total disregard of all principle, cast their whole weight into the same scale with the influence of the crown. Upwards of 160 members of the late house of commons lost their seats; and of these, almost the whole number were the friends of the late administration. Thus the defeat of what was looked upon as a most powerful and dangerous combination was completely accomplished, and its leaders were rendered of little importance in the legislature of the empire.

750
Dissolution
of parlia-
ment.

751
Elections.

752
Total de-
feat of the
coalition.

Thus terminated the strength of the celebrated coalition, the fate and effects of which ought never to be forgotten. That fatal measure may be said to have absolutely ruined the fortunes of the honourable Charles Fox, undoubtedly one of the most accomplished statesmen that the British nation ever produced. From that period, he was generally regarded as unfit to be trusted with power; his eloquence ceased to persuade, and his counsels, even when full of wisdom, were regarded with distrust, because his odious coalition with Lord North constantly rose up in remembrance against him, and suggested the strongest suspicions of his integrity, a circumstance which has probably proved on some occasions not less unfortunate to his country than to himself. The same coalition undoubtedly had a tendency to diminish the attachment of the nation to the house of commons, and its confidence in that branch of the constitution. It appeared that a majority of that house might be nothing more than a combination of factious men, aspiring to personal aggrandizement or emolument, and that in certain circumstances it might be necessary for the people at large to arrange themselves behind the throne, to obtain protection against what is undoubtedly one of the worst and most oppressive of all governments, that of a corrupted aristocracy.

the speech from the throne, his majesty assured both houses of his satisfaction in meeting them, after recurring in so important a moment to the sense of his people, and of his reliance that they were animated by the same sentiments of loyalty and attachment to the constitution, which had been so fully manifested throughout the kingdom: He directed their attention towards the affairs of the East India Company; but warned them against adopting any measures which might affect the constitution at home; and concluded with expressing his inclination to maintain in their just balance the privileges and rights of every branch in the legislature.

757
East India
Company's
affairs.

The affairs of the East India Company were speedily brought before parliament. On the 24th of June, a bill was introduced by the chancellor of the exchequer, to allow the company to divide four per cent. on their capital for the half year concluding at midsummer 1784. The necessity of the case was urged to justify this bill to support the credit of the company; and it was alleged, that notwithstanding their present distresses, which were admitted to be great, there existed a sufficient probability that their affairs upon the whole might warrant such a dividend. The bill passed through both houses, and received the royal assent. On the 2d of July, Mr Pitt brought forward another bill, which had for its object to allow the company a respite of duties due to the exchequer, to enable them to accept of bills beyond the amount prescribed by former statutes, and to establish the regularity of their future dividends. This act gave rise to various debates, particularly, in consequence of a question put by Mr Philip Francis, how far the honour of parliament would be pledged by this act to enable the East India Company to make payment of the bills accepted by them, in case the funds of the company should prove deficient. Mr Eden also endeavoured to expose the bill, by contrasting the two distinct propositions contained in it; the one for respiting the duties due by the company, and the other for allowing the company to divide eight per cent. He alleged that these propositions could only be justified by being argued separately, and by contending in support of the first, that the company was so poor, that it required every possible assistance, and in support of the other that their affairs were so flourishing that they could well afford to make an enormous dividend. On the contrary, Mr Pitt contended that the company had suffered like the rest of the British empire by the late war, and therefore wanted a temporary relief; but that they were still in the proper sense of the word actually solvent; that the best hope existed of their future prosperity, which rendered the regular payment of their dividends a rational measure, especially as government had just received intelligence of peace being concluded in the East with Tippoo the son of Hyder Ally. This act also passed into a law; and Mr Pitt, still farther to support the East India Company, brought forward a bill to diminish the duty upon tea for the sake of preventing smuggling, and in lieu thereof, to substitute what has been called the commutation tax, or a tax upon windows. The amount of the revenue raised from tea was between 700,000l. and 800,000l. and the object of this new act was to proportion it in such a way as to raise upon that article in future no

759
Commuta-
tion tax.

more than 169,000l. which it was supposed would enable the company to sell 13 millions of pounds of tea, instead of five millions and a half. Upon this and the former bills, by which such extensive favours were conferred upon the East India Company, Mr Fox animadverted at different times with great severity; he asserted, that considering the tenor of these bills and the conduct of administration during the whole session, it was palpable that they were wholly under the direction of the East India Company, and that the company were making rapid strides, after having despoiled and enslaved many millions of men in a distant quarter of the globe, to reduce the inhabitants of this island under their sway. The acts passed, however, and received the royal assent. In themselves they were subordinate to the bill for regulating the general management of the affairs of the company. This act, though framed upon the same model with that proposed by Mr Pitt in the last parliament, yet differed from it in several points. The powers of the board of controul were enlarged. In cases of urgency and secrecy, the board were authorized to transmit their own orders to India, without their being subject to the revision of the court of directors. It also vested in the governor-general and council of Bengal, an absolute power over the other presidencies in transactions with the country powers, and in all applications of the revenues and forces in time of war. The receiving of presents was declared to be extortion and disobedience of orders, and all corrupt bargains to be misdemeanours, and punishable as such. The company's servants were required, on their return to England, to lodge in the exchequer a statement upon oath of their whole property. For the effectual punishment of crimes committed in the East Indies, a new court of justice was constituted, consisting of three judges appointed by the three courts, four peers taken by lot from a list of twenty-six, chosen at the commencement of every session of parliament, and six commoners out of a list of forty members chosen in like manner.

Mr Francis opposed in strong terms the general principle of this bill. He said, that by the confession of all parties, the court of directors were too weak to enforce their own orders. To remedy this weakness a clashing power was created, nominal on the part of the directors, real on the part of administration. This he reprobated as injudicious, declaring that mere forms were of no use, and ought not to subsist when a constitution was essentially altered. Mr Fox affirmed, as formerly, that this proposed board of controul violated the privileges of the India Company, no less than the enactment of his bills had done, while it increased in a greater degree the dangerous influence of the crown. He treated with great contempt the new court of judicature, which he said might fairly be called a *bed* of justice, as justice would sleep upon it, and thereby embitter the calamities of India, by removing all fear of punishment. Upon the question whether the bill should be referred to a committee of the whole house, the minister was supported by 276 voices, against 61.

When the bill came to be discussed in the committee, Mr Pitt acted in a manner, which afterwards on many occasions served to distinguish his mode of transacting the national business from that adopted by former ministers.

Britain.

Britain.

ministers. Instead of coming forward like the leader of a party, with a measure complete in all its parts, which was to receive the firm support of his adherents, Mr Pitt not only of himself, proposed some essential alterations, but adopted those suggested by others, whether his friends or his antagonists. In the committee, the power of issuing orders, in the first instance, was limited to the case of the court of directors neglecting to transmit dispatches to the board, after fourteen days notice, upon any subject the board might think it necessary to take up. The directors were also empowered to elect a secret committee of three members, to communicate with the board concerning such orders as the board might of its own authority transmit to India. The appointment of the commander in chief of the army was withdrawn from his majesty, and left with the company, together with the negative upon nominations in general. Mr Dempster and Mr Eden strongly reprobated the inquisitorial spirit of that provision of the bill, by which persons returning from India were required to give an account of their fortunes upon oath. Mr Samuel Smith suggested that merchants in particular should be exempted from this inquisition, and Mr Dundas and Mr Pitt expressed their willingness to admit the alteration; but Lord North having contended that this would make the matter worse, by pointing out to the public a certain class of individuals as subjects of suspicion, Mr Pitt relinquished the whole clause. Mr Pitt himself, also, brought forward some amendments of the constitution of the new tribunal. As the clauses originally stood, the right of accusation rested solely with the attorney-general or the company. Instead of this limitation, authority was given to any other person or persons to move the court of king's bench for an information. This court was also authorized to issue commissions to the courts in India, for the purpose of taking depositions. The directors of the company, and persons returning from India, were now excluded from the judicature that was to be erected. When the various amendments were reported to the house, Mr Sheridan treated the alterations that the bill had undergone with a degree of ridicule, which proved extremely offensive to the minister. He remarked that 21 new clauses were added, which were distinguished by the letters of the alphabet; and he requested some gentleman to suggest three more, to complete the horn-book of the ministry. He said the whole bill was a contention of two parties, the crown and the company, to outrun each other. The company remonstrated against the bill as it originally stood, because orders were to be transmitted to India without their consent. To please them, they were to have a secret committee of three directors; but the company were not a whit nearer their object, for their committee were sworn to secrecy. They might be present at a court of directors, and see measures carrying on diametrically opposite to what they knew had been adopted by the board of controul, without being able to apply any other remedy than a nod, or a wink, or a shake of the head, to intimate that they knew something they dared not to divulge. Mr Fox, again, affirmed with great acrimony that the tendency of the present measures was to sacrifice to the East India Company all that was dear to us, for the corrupt influence and under-hand support of the pre-

sent administration, and to establish an Indian government of the island of Great Britain. The bill finally passed the house of commons on the 28th of July. In the house of lords it was opposed by Lord Viscount Stormont and the earl of Carlisle, upon principles similar to those upon which it had been resisted in the house of commons; but the minority there was extremely feeble in point of numbers, and the bill passed on the 9th of August, though it was protested against by a few noblemen, as ineffectual in its provisions, unjust in its inquisitorial spirit, and unconstitutional, as abolishing in certain instances the trial by jury.

All this while Mr Pitt's bill was little noticed by the public at large. The popularity of his name was extremely high. The coalition had become so odious, that the ministry by whom it had been superseded, were regarded by the nation with the most implicit confidence, and it was taken for granted that every thing must be safe in their hands. Neither could the most distinguished talents rescue the leaders of opposition from general neglect. This was in a remarkable degree the case with Mr Burke, whose rich, various, and exuberant eloquence, in competition with which all that remains of antiquity falls short, could not now procure from the house of commons even the appearance of attention. Early in July, the chancellor of the exchequer informed the house of commons, that Sir Elijah Impey, chief judge of the supreme court of justice at Bengal, had arrived in England, in consequence of being recalled by his majesty, pursuant to an address of that house. The acute sensibility, or powerful imagination of Mr Burke, had induced him to interest himself greatly in the sufferings of the natives of India under the British government. He now in vain called on the ministry to enforce the resolutions of the house, respecting Sir Elijah Impey, by bringing him to trial. He repeatedly endeavoured to introduce as the subject of deliberation the reports of the committees of the former parliament respecting Indian affairs; but he was either defeated with little reply, by a motion for the order for the day, or overpowered and silenced by the loud and continual clamour of the house.

761
Mr Pitt's bill little noticed by the public.

During the present session it was found necessary to have recourse to a loan of six millions, to settle the remaining expences of the American war. The naval establishment was at the same time fixed on a higher scale than in former years of peace. The number of seamen and marines was 26,000; but the military force was not large, as it did not exceed 17,500 men for guards and garrisons. Some new taxes were imposed upon linen and cotton manufactures, hats, paper, candles, bricks, postage of letters, horses, hackney-coaches, persons dealing in excisable commodities, and persons engaging in the amusement of shooting game or hunting. These taxes in general met with little opposition.

762
Finance.

The session closed with a motion, brought forward by Mr Dundas, for the restoration of the estates forfeited in Scotland, in the rebellion of 1745, to the descendants or other heirs of the rebels. As this measure had for its object the relief of individuals, whose unequivocal attachment and loyalty to his present majesty, and his family, could not be supposed, even in a less liberal and less enlightened age than the present, to

763
Restoration of Scottish forfeited estates.

Britain. be tainted or affected by the crimes of their ancestors; it met with the perfect approbation of the commons. In the house of lords, however, it was opposed by the lord chancellor Thurlow, both on the ground of its impolicy and partiality. It was impolitic, he said, as far as it rendered nugatory the settled maxim of the British constitution, that treason was a crime of so deep a dye, that nothing was adequate to its punishment but the total eradication of the person, the name, and the family, out of the society which he had attempted to hurt. This was the wisdom, he said, of former times. But if a more enlightened age chose to relax from the established severity, he thought it ought to be done with gravity and deliberation. It was, he said, partial, because the estates forfeited in 1715, and which were forfeited upon the same grounds and principles as those in 1745, were passed over in silence, whilst even a person who had forfeited in 1690, was included in the provision. The bill, however, passed the lords, and received the royal assent.

764
The public amused by aerostatic exhibitions.

At this time the British nation enjoyed peace in all quarters of the world. The public attention being no longer excited by national efforts, or the enterprises of any political faction, was easily directed to objects of less importance. Of this nature was a French invention, that of air-balloons or the art of aerostation, which has hitherto proved of more curiosity than utility, but which at this period served greatly to amuse the world. In France, two brothers of the name of Montgolfier, manufacturers of paper, conceived the idea of sending up a bag or balloon full of heated air, and in repeated trials it ascended to a considerable height. M. de Rosier appears to have been the first who, in November 1783, undertook to fly through the air, without having the balloon secured by ropes, in company with the marquis d'Arlandes. Inflammable air, procured from the decomposition of water by means of sulphuric acid and iron filings, or zinc, was next used to fill a balloon made of varnished silk, with which Messrs Charles and Robert ascended, to the astonishment of the people. Vincenzo Lunardi, an Italian, was the first who ventured to gratify the British populace with a similar spectacle. He ascended repeatedly into the atmosphere, from London, Edinburgh, and other places, and on each occasion was carried to considerable distances in the direction of the wind. Various other persons imitated this example, and on the 16th of October of this year, Mr Blanchard, accompanied by Dr Jefferies, ascended, by the aid of a balloon, from Dover, and having soared over the Channel, arrived safely in France. This art, together with the intrepidity of the individuals who practised it, excited much admiration at the time; but the impossibility of giving to the balloon that direction in its progress which the traveller might wish, together with the extraordinary danger attending it, speedily brought it into neglect.

765
Meeting of parliament. Parliament again assembled on the 25th of Jan. 1784. In the speech from the throne, the object particularly recommended to the attention of both houses, was the final adjustment of the commercial intercourse between Great Britain and Ireland. Farther measures to prevent smuggling were recommended, together with attention to the regulation of the public offices of the kingdom. The first business that was taken up, and

which was discussed with great warmth, related to the choice of two members of parliament for Westminster, at the late general election. On that occasion Lord Hood, Mr Fox, and Sir Cecil Wray had offered themselves as candidates. Lord Hood easily carried his election, but between the other candidates the contest was carried on with unexampled obstinacy. The engaging manners of Mr Fox, who had for some time represented the city of Westminster in parliament, enabled him at the present period, notwithstanding the general unpopularity of the coalition, to engage with ultimate success in this contest. After the election had continued upwards of six weeks, it was concluded on the 17th May 1784, leaving a majority of 235 votes in favour of Mr Fox. The high bailiff at this time (being the very day previous to the return of the writ for the election) granted, at the request of Sir Cecil Wray, a scrutiny into the votes which he had taken. This mode of proceeding was protested against by Mr Fox and several of the electors. Immediately on the meeting of the new parliament, the conduct of the high bailiff, in granting a scrutiny under the above circumstances, was vehemently attacked by opposition, and no less vehemently defended by administration. The subject was repeatedly brought before the house, by petitions from the parties, and by motions of Mr Fox and his friends; for that gentleman, in the mean time, sat in the house as a member, having been elected under the influence of Sir Thomas Dundas, for a district of boroughs in the north of Scotland. But on a motion of Lord Mulgrave, it was resolved by a considerable majority, "that the high bailiff of Westminster do proceed in the scrutiny with all practicable dispatch." In the beginning of February in the present year, the business was resumed in the house of commons. The scrutiny had continued eight months, and two parishes out of seven had only been scrutinized, so that it was admitted that probably more than two years longer would be necessary to finish the scrutiny. In the mean time, of the votes for Mr Fox 71 had been objected to in the first parish, and the objections had been sustained only against 25; whereas, in the same parish, out of 32 votes for Sir Cecil Wray that had been objected to, 27 were declared illegal. In the second parish, the scrutiny of which was not finished, Mr Fox had lost 80 voters, and Sir Cecil Wray 60. On the 8th of February, Mr Welbore Ellis moved that a return of the election be immediately made by the high bailiff of Westminster. This motion, together with others which followed it, gave rise to a variety of debates of little importance to general history. At last, on the 3d of March, the motion having been repeated by Mr Sawbridge, it was carried on a division of 162 against 124, and Lord Hood and Mr Fox were returned as members for Westminster.

On the 18th of February, the attention of the house of commons was called by a motion of Mr Fox to the payment of the debts of the nabob of Arcot. The statute which Mr Pitt had brought forward during the preceding summer, authorized in general terms the court of directors to establish in concert with the nabob, funds for the payment of such of his debts as should appear to be justly due. The court of directors accordingly ordered the council at Madras to investigate these debts; but the board of controul, with

Britain. some trifling limitation, ordered the whole debts to be paid out of the revenues of the Carnatic. Mr Dundas undertook in the house of commons the defence of the board of controul. He treated with ridicule a declaration made by Mr Francis during the debate, that rumours were abroad, of a collusion between the board of controul and the creditors of 1777. He said it was not the first time that his conduct had been misrepresented. It had been said, just with the same degree of truth, that he had received a very large sum of money from an honourable baronet (Sir Thomas Rumbold) on a particular occasion. He had slept perfectly quiet and serene under the former charge, and he trusted he should preserve his temper equally unruffled under the present accusation. He justified the whole of the nabob of Arcot's debts. One set of debts incurred in 1767 consisted, he said, of money borrowed by the nabob at the rate of from 30 to 36 per cent. interest, to pay off a sum due by the nabob to the company, which was at that time in the utmost distress, and the interest had afterwards been reduced to 10 per cent. The second branch of the nabob's debts had arisen from sums borrowed to pay off his own cavalry, which the company had ordered him to reduce, but which he was unable to dismiss from want of money to pay their arrears. He borrowed this money, and the company engaged its credit for the loan. A third class of debts, incurred or consolidated in 1777, were acknowledged by the nabob to be valid, and were only approved of by the board of controul, subject to his objections, or to objections by the company or the rest of the creditors.

768
Nature of the nabob of Arcot's debts.

769
Mr Burke's objections to the nabob's debts.

Mr Burke, in a speech containing a full investigation of the subject, stated, that, at the establishment of the British power in India, Madras and its dependencies formed one of the most flourishing territories in Asia; but since that time it had so declined, by the annual drain to England of nearly a million sterling, made by private gentlemen, that, in the year 1779, not one merchant of eminence was to be found in the country. Besides this annual accumulation of wealth, transmitted to Europe, it appeared that the nabob had contracted a debt with the company's servants, to the amount of 888,000l. sterling, which, in the year 1767, was settled at an interest of 10 per cent. About the same time the court of directors were further informed, that one million sterling had been lent by British subjects to the merchants of Canton in China; and that this sum bore an interest of 24 per cent. In the year 1777, a second debt of the nabob of Arcot, amounting to 2,400,000l. was settled at 12 per cent. interest; to this was added another debt, called the *Cavalry debt*, of 160,000l. at the same interest. The whole of these four capitals, amounting to 4,440,000l. produced at their several rates, annuities amounting to 623,000l. a-year, more than half of which stood chargeable on the public revenues of the Carnatic. These annuities, equal to the revenues of a kingdom, were possessed by a small number of individuals of no consequence, situation, or profession. Mr Burke admitted that the loan of 1767 was the fairest, as he could convict it of nothing worse than the most enormous usury. The interest at 36 per cent. was first paid, then 25, then 20, and lastly the interest was reduced to 10 per cent.; but that all along the interest had been added to the principal, so that of 888,000l. Mr Burke doubted whether the

nabob ever saw 100,000l. in real money. With regard to the cavalry debt, Mr Burke stated the facts to be the following. Instead of ready money, the English money-jobbers engaged to pay the nabob's cavalry in bills payable in four months, for which they were to receive immediately at least one per cent. per month, but probably two, that being the rate generally paid by the nabob; and the receipt of a territorial revenue for that purpose was assigned to them. Instead of four months, it was upwards of two years before the arrears of the cavalry were discharged; and, being during all this time in the constant receipt of the assigned revenue, it is not improbable but that they paid off the nabob's troops with his own money. With respect to the debt of 1777, Mr Burke observed that in different accounts the principal sum rose from 1,300,000l. to 2,400,000l. and that the creditors had never appeared the same in any two lists. In the year 1781, they were satisfied to have 25 per cent. at once struck off from the capital, yet, they were now to obtain payment of the whole. With regard to all these claims, Mr Burke asserted that the nabob and his creditors were not adversaries but collusive parties; that in fact when the nabob of Arcot gave an acknowledgment of debt to an European, he received no money, and did nothing more than endeavour to support his own influence over the servants of the company by receiving them into his pay. Mr Fox's motion for an inquiry into the conduct of the board of controul on this occasion, in supporting these debts, was negatived on a division by 164 against 69. The same motion was made on the same day, with similar success, by the earl of Carlisle, in the house of lords.

Britain.

Mr Pitt had come into office with the singular good fortune of being highly approved of by the nation at large, while, at the same time, he was selected to support the royal prerogative and authority, against the majority of the house of commons, then possessed by the coalition. It is always difficult for the human mind to set popular approbation at defiance, and the love of it seldom fails to gain strength in the character of those persons by whom it has once been enjoyed. Accordingly it became one of the features of Mr Pitt's conduct, to attempt at all times, if possible, to reconcile the services expected from him by the crown with the pursuit, or at least with the apparent pursuit, of whatever measure happened for the time to be the object of popular applause. The attempt to procure a reform of the representation of the people in the house of commons, was one of these objects. He had formerly engaged in it while acting in opposition; and now, after he had become the first minister of the crown, he still undertook to stand forward as its advocate. Every candid writer of history must be sensible of the defective nature of the details which he is able to give of the causes which produce or regulate the most important occurrences. These are sometimes brought to light in a future age, but on many occasions they remain perpetually unknown. In what way, or in consequence of what explanations, Mr Pitt contrived to retain the confidence of his master, while at the same time he stood forward as the champion of a reform, which nobody imagined acceptable at court, we do not know. It is certain, however, that after Mr Pitt attained

770

Mr Pitt patronizes a parliamentary reform.

Britain. attained to the chief place in the present administration, he still continued to correspond with the leading advocates for parliamentary reform, whose meetings he had been accustomed to attend. In a circular letter to Mr Wyvil, president of a committee of Yorkshire gentlemen, who had embarked in this cause, it was stated that Mr Pitt had given authority to declare "that he would bring forward the subject of a parliamentary reform, as early as possible in the session; that he would support his intended propositions to the utmost of his strength; and that he would exert his whole power and credit, as a man and as a minister, honestly and boldly to carry such a system as should place the constitution on a footing of permanent security." Accordingly, at the commencement of the session, in the debates on the speech from the throne, when the subject was alluded to, Mr Pitt took the opportunity to declare that on this business he laboured incessantly. It was that which of all others was nearest his heart, but at that early period of the session to state his plan specifically was impossible. Much remained to be done, and his ideas were not matured. A reform in parliament comprehended, he said, a great variety of considerations. It related to the essentials and the vitals of the constitution. In this path he was determined to tread, but he knew with what tenderness and circumspection it became him to proceed; and he would request the house to come to the subject, uninfluenced by any of the schemes and hypotheses that had hitherto been suggested.

It was not till the 18th of April, that Mr Pitt called the attention of the house to this important subject. He declared himself aware of the pertinacity he must expect to encounter, in proposing a plan of reform; but he entertained more sanguine hopes of success than formerly, because there never was a moment when the minds of men were more enlightened on this interesting topic, or more prepared for its discussion. He was assiduous to remove the objection of innovation. Anciently, he said, great fluctuations existed in the franchise of election. The number of members had varied, and even the representation of the counties was not uniform. As one borough decayed, and another flourished, the first was abolished, and the second invested with the right. This arose from a maxim, the application of which was entrusted to the crown, that the principal places, and not the decayed boroughs, should be called upon to exercise the right of election. King James I. in his first proclamation for calling a parliament, directed the sheriffs, not to call upon such boroughs to send members, as were so utterly ruined as to be unentitled to contribute their share to the representation of the county. He added, that it was by the treaty of union the number of the members of the house of commons was fixed, and that only from the date of that act was the discretion of the crown upon this point at an end. He said, he was no advocate for a revival of this discretionary power, but that the maxim upon which it was founded ought now to be carried into effect. The outline of his plan was this: To transfer the right of choosing representatives from 36 of such boroughs, as had already fallen, or were falling into decay, to the counties, and to such chief towns and cities as were at present unrepresented: That a fund should be provided, for the purpose of giving to the owners and

holders of such boroughs, disfranchised, an appreciated compensation for their property. That the taking this compensation should be a voluntary act of the proprietor, and if not taken at present, should be placed out at compound interest, until it became an irresistible bait to such proprietors. He also meant to extend the right of voting for knights of the shire, to copyholders as well as freeholders. He considered one million as a sufficient fund to be established for purchasing the decayed boroughs. Besides the original 36, he intended to purchase the franchise of other boroughs, and to transfer the right of returning members to unrepresented large towns, that should petition parliament for this privilege. Thus, he said, 100 members would be given to the popular interest of the kingdom, and the right of election extended to 100,000 additional persons. It might be said, he observed, that it did not become that house, for chimerical speculations, to involve their constituents in additional burdens; but he trusted, that in a matter so dear and important to Englishmen, they would not be intimidated by the circumstance of the cost. He conceived the purchase to be above all price. It was a thing for which the people of England could not pay too dear. Alluding to the American war, he asked if the nation would have suffered the calamities to which it had lately been exposed, if there had always been a house of commons, the faithful stewards of the interest of their country, the diligent checks on the administration of the finances, the constitutional advisers of the executive branch of the legislature, and the steady and uninfluenced friends of the people of England? Mr Pitt was aware that there was a sort of squeamishness and coyness in that house, in talking of what might be the proper consideration for the purchase of a franchise. Out of doors it was pretty well understood, that men had no great objection to negotiate the sale and the purchase of seats. But he would ask, was it, after all, such an insult to an Englishman, to ask him to sell his invaluable franchise? was there any immorality in receiving a pecuniary consideration for the cession of a valuable benefit to our country?

Mr Fox disapproved of purchasing from a majority of the electors of a borough, the property of the whole, and of holding out pecuniary temptations to an Englishman to relinquish his franchise, though he declared himself a friend to the general principle of a more equitable representation. Mr Wilberforce supported Mr Pitt's proposal, for this reason in particular, that by putting an end to the representation of the decayed boroughs, future dangerous aristocratical coalitions would be prevented. Mr Pitt's proposal was warmly opposed by Mr Powis, who alleged that the people of England had not called for a reform, as there were only eight petitions upon the table; that the business, therefore, in which Mr Pitt had unfortunately engaged himself, was a volunteer crusade, or a piece of political knight-errantry. He denied that the American war was to be imputed to the representatives of boroughs; and made the important remark, that it was only in consequence of the existence of the elective franchise in a few decayed boroughs, that men of talents, like Mr Pitt himself, had an opportunity of being introduced into the service of their country. Lord North likewise opposed all change, as the people were actually contented, happy, and in full possession of their liberties,

771
Mr Pitt's
plan of re-
form.

Britain. berties, which rendered it, in his opinion, unnecessary to inquire minutely how they came to enjoy these advantages. Leave to bring in the bill was refused, by a majority of 248 against 174.

772
Finances.

As the sole object, on account of which the English monarchs anciently assembled their parliaments, was to obtain money from their subjects, so the adjustment of the public expences, and levying adequate supplies, always continue to occupy a large portion of the time of every session of parliament. The prodigal expenditure that had taken place during the late war, still required additional taxes. For this purpose new demands were made upon hawkers and pedlars, and for gloves and other articles. Attornies were taxed, and the duties on male servants and post horses were enlarged. A tax was likewise imposed upon retail shops. This last tax encountered very persevering opposition in parliament, as well as much unpopularity in the nation. It was represented as extremely unfair, because it fell upon a small number of persons of an industrious character. Being levied in proportion to the shop rent, it fell almost exclusively upon the inhabitants of the metropolis; and it was observed, that, unlike other taxes, the members of parliament who imposed it, were in no hazard themselves of paying any part of it. Of all the taxes, however, which were proposed by the minister, none encountered such sarcastic animadversion as that upon maid servants. Mr Pitt was generally understood to be not very remarkable for his attachment to the other sex, and accordingly Mr Sheridan accused him, upon this occasion, of holding out a bounty to bachelors, and a penalty upon propagation. Sir James Johnston and the earl of Surrey expressed themselves with much humanity on the subject, on account of the unprotected situation of that portion of our fellow creatures against whom this tax was directed; and Mr Fox suggested the propriety of avoiding to tax persons employed in works of domestic economy and industry, and of substituting a tax upon bachelors, which was accordingly adopted.

773
Duke of Richmond's fortifications.

But the business that excited more attention than any other department of supply, was that of the ordinance. As early as the year 1782, the duke of Richmond had planned a very expensive system of fortifications, for the purpose of protecting the different dock-yards of the kingdom. The idea had originated from the alarms occasioned by the combined fleet during the late war. The works had been for some time carried on, and the sum of 50,000*l.* annually voted, without much attention being given to the subject. At last, during the present session, Mr Holdsworth, member for Dartmouth, moved, that an account should be laid before the house, of the expences already incurred on fortifications, at Plymouth, Portsmouth, Gosport, Chatham, Dover, and Sheerness, together with a report of the probable expence of completing the fortifications of Portsmouth and Plymouth; and afterwards on the 14th of March, the annual supply of 50,000*l.* for fortifications was opposed. On this occasion, Captain James Luttrell of the navy defended the duke of Richmond's project, asserting, that such fortifications were necessary to protect not the kingdom at large, for that was not in view, but the principal dock-yards and naval stores, against any sudden invasion. He observed, that veteran troops only

could be opposed to veteran troops in the open field; but within forts militia, seamen, and almost any stout, spirited fellow, might be as useful as the most experienced soldier. The possession, for 24 hours, of a situation from which the dock, stores, and shipping, might be assailed with red-hot shot and shells, would be a fatal blow to the navy, and ought to be guarded against, by fortifying the situations in which it might occur. Thus also the navy would not be under the necessity of remaining always at home for the defence of our own ports, but would be enabled to leave them for the purpose of carrying on offensive war. Mr Courteney opposed the projected system of fortification, together with Captain M'Bride, General Burgoyne, and Colonel Barré. This last gentleman contended, that the superiority of our navy, which ought always to be supported, rendered it unnecessary for us to have recourse to fortification. He made a general attack upon the duke of Richmond, as inexperienced in war, and as lavishing away money upon an absurd system of fortifications, while he oppressed, by an ill-judged economy, the corps of engineers and artillery, which were the only parts of the army founded in science and professionally learned. He concluded, by proposing, that a council of officers should be consulted on the subject. Mr Pitt defended the duke of Richmond's character, but agreed to this last proposal, of taking the opinion of a council of officers; which put an end to the debate.

Britain.

A bill passed for better regulating the office of the treasurer of the navy, without any sort of opposition. ⁷⁷⁴ Another bill, to which little objection was made, passed, for the better examining the public accounts; but another bill brought forward by Mr Pitt, for the general reform of public offices, met with strenuous opposition. Mr Sheridan asserted, that it was unnecessary, as the treasury possessed full power to make the reforms. He said, that the bill had no important object in view, that it was a mere rat-catching bill, instituted for the purpose of prying into vermin abuses, and Mr Burke following out this argument, contrasted, in strong terms, the trifling economy which was here proposed, with the prodigality of the ministers in their proceedings respecting the revenues of the Carnatic, in the sanction they had given to the pretended debts due by the nabob of Arcot. The bill, however, was supported by Mr Powis and other independent members; and having passed through both houses, received the royal assent. During the first nine years of Mr Pitt's administration, his mode of management in the treasury ⁷⁷⁵ department, at the head of which he was placed, appears to have been this: He investigated, with as much accuracy as possible, the emoluments of all the servants of government, in the various departments of office throughout the country; and wherever it was possible to do so, he retrenched the allowances of the inferior servants of the state, with considerable severity, leaving, in general, the higher and more conspicuous officers, in the possession of their usual emoluments. He introduced a variety of regulations to prevent smuggling, which he successfully repressed; and he also collected the revenue with remarkable attention and accuracy. In former times, the custom with British ministers usually had been, to impose a considerable number of taxes, and to levy these taxes mildly.

774
Acts for regulating certain public offices.

775
Manner in which the revenue was now collected.

^{Britain.} mildly. If the revenue fell short, it was augmented by more taxes levied in the same negligent way. Thus individuals were never severely treated; and the collection of the revenue bore a character of extreme lenity, for which the minister of the day often suffered, in consequence of the popular odium which he was under the necessity of encountering, by proposing new taxes. But under Mr Pitt's administration, the revenue was collected in every department with greater strictness; and thus he was enabled to obtain large sums of money, without the necessity of imposing many new taxes.

⁷⁷⁶
Irish propo-
sitions.

One of the most important efforts of legislation that were made during the present session of parliament, consisted of an attempt by Mr Pitt to establish a plan of commercial union between the two kingdoms of Great Britain and Ireland. This plan was proposed to the Irish house of commons on the 7th of February by Mr Ord. It consisted of ten articles, usually styled the *Irish propositions*. They passed with little debate, and an address of approbation was voted to his majesty. On the 22d of the same month, Mr Pitt introduced the subject to the British house of commons. He stated the false and oppressive policy which had long been exercised by government, in regard to Ireland, the object of which was to render her completely subservient to the interest and opulence of this country. She had been shut out from every species of commerce, and restrained from sending the produce of her own soil to foreign markets. This policy had been gradually relaxed during the present century: but the system had not been completely reversed till within a few years preceding. Yet, although the foreign commerce of Ireland had been placed on a better footing, the intercourse between the two countries had never been established upon equal and reciprocal principles. Mr Pitt proposed to allow the produce of the colonies to be imported into Britain through Ireland, and to equalize the duties on the produce and manufactures of both countries. In return for this concession, he wished to stipulate, that the parliament of Ireland should permanently and irrevocably secure an aid towards defraying the expence of protecting the general commerce of the empire in time of peace. After some debates upon the subject, petitions from Liverpool, Paisley, Glasgow, Manchester, and other places, were presented against the measure, to the amount of 60 in number, the consequence of which was, that from the 16th of March to the 12th of May, the house of commons were almost incessantly employed in hearing counsel and examining witnesses. Certain exceptions were now introduced to the general rule of admitting an equal commerce between the countries, Corn, meal, flour, and beer, were made exceptions in favour of British agriculture. Various regulations were also introduced, to secure an effectual equality of duties upon every particular object of trade, in both countries. The plan, after all its amendments, produced a great variety of debates, in the course of which Lord North expressed his wish for a complete incorporating union of the two kingdoms, in preference to a partial settlement, which might prove the source of perpetual discord. In the house of lords, the resolutions were warmly opposed by the earl of Carlisle, Lord Stormont, Lord Loughborough, Lord

⁷⁷⁷
Lord North
recom-
mends an
union with
Ireland.

Sackville, and the earl of Derby. They were successful, however, in both houses; but by this time a great part of the Irish parliament had become dissatisfied with the plan. A majority of 127 voted in its favour in the house of commons against 108. But against such an opposition administration did not think fit to press its adoption.

^{Britain.}

The American war, in some measure, withdrew the inclinations of the British nation, for a time, from ideas of conquest and military splendour. Commercial pursuits were now chiefly valued, and formed a great object of pursuit both with the government and the people. To follow these with complete success, it was necessary that a good understanding should be preserved with the neighbouring powers. This was accordingly done, though with some difficulty, in consequence of certain foreign occurrences, not unworthy of attention.

⁷⁷⁸
Projected
exchange of
Bavaria,
&c.

Joseph II. was at this time at the head of the house of Austria and of the Germanic body. Among the various projects which marked his restless career, he formed one of no small importance, which, had it been attended with success, would scarcely have failed to affect the future condition of the Germanic body. He entered secretly into a negotiation with the elector of Bavaria, then an infirm old man, for an exchange of that electorate for the provinces of the Austrian Netherlands. The Netherlands were to be converted into a kingdom, and the future title was to be that of Austrasia, according to some, and of Burgundy, according to others. It appears, that Count Romanzow, the Russian minister to the diet of Frankfort, informed the duke of Deuxponte, the nephew and heir of the elector of Bavaria, of the substance of this treaty; and, at the same time assured him, that the treaty would be carried into execution, whether he consented to the exchange or not. The duke gave notice of this alarming measure in the month of January of this year, to the celebrated Frederick II. king of Prussia, who regarded it as a most dangerous project to his own independence, as well as to that of the other German states. He endeavoured instantly to spread an alarm through Europe. He alleged, that the proposed exchange was in the highest degree iniquitous and unfair. The population on both sides was indeed nearly equal; but the extent of territory on the side of Bavaria, more than doubled that of the low countries, and their respective revenues were equally disproportioned. In Bavaria, agriculture, commerce, and finance, were notoriously neglected; while in the Austrian Netherlands these resources were extended to their utmost pitch; so that, while the territory which the emperor hoped to acquire was capable of the most considerable improvements, that which he gave away might rather be expected to decline in political resources. These circumstances, however, were of little importance, compared with the political consequences which must result from such a measure. The Netherlands being situated at a distance from the great body of the Austrian dominions, had always proved rather a source of weakness than of strength to that power. A considerable revenue was indeed derived from these provinces; but it was often dearly bought, in consequence of the wars occasioned by the vicinity of France. Great political efforts

Britain. forts had of late years been made by the court of Vienna, to avoid all future grounds of quarrel with the French monarchy. This had been accomplished, by the marriage of an Austrian princess, to the dauphin, now king of France; and the relinquishment of the Netherlands would have gone far towards completing the project. The possession of Bavaria, at the same time, from its vicinity to the rest of the Austrian dominions, would have secured to the emperor a chain of territory from the banks of the Rhine along a great part of the course of the Danube; and would have bestowed upon him such a preponderancy, as would have overturned all shadow of power in Germany that could have resisted the head of the empire. This mighty country, might thus, at no remote period, have been consolidated into one mass, and Austria would probably have instantly ranked in every sense as the first power in Europe.

Thus Frederick II. reasoned. Succeeding events may, perhaps, lead us to suspect, that this acquisition of strength by the house of Austria, might have proved of considerable utility to Europe; but at the time when the plan was proposed, it excited very general apprehensions. The treaty for the exchange had been concluded under the auspices of Russia and France, and to them the king of Prussia addressed his remonstrances. The emperor of Germany and the elector of Bavaria, however, soon found their plan so strongly disapproved of by other powers, that they absolutely disavowed it. The elector, in the Munich gazette, and the emperor by his ambassadors, asserted, that they had never entertained any design of making such an exchange. But the court of France, instead of denying the negotiation, contented itself with replying to the remonstrance of the king of Prussia, that the exchange had been proposed, as depending upon the voluntary arrangement of the parties; and, as the duke of Deuxponts had refused his consent, the proposition of course became fruitless. The empress of Russia, was so far from concealing her accession to the measure, that she defended it as highly equitable.

779
League to
protect the
Germanic
constitu-
tion.

Frederick, in the mean time, exerted himself with great assiduity in negotiating a league with the electors of Hanover and Saxony, for the preservation of the Germanic constitution, and to prevent such cessions and exchanges of territory as might prove injurious to the balance of power in the empire. A treaty to this purpose was concluded on the 23d of July, and various German princes acceded to it, among whom have been enumerated the elector of Mentz, the landgrave of Hesse Cassel, the dukes of Brunswick, Namur, Saxegotha, and the prince of Anhalt. The elector of Hanover appears to have entered with much readiness into the transaction, and from that period a very intimate connexion commenced between the courts of London and Berlin. By some British politicians, however, it was supposed, that the opposition made to the imperial project was unwise, as it tended to excite a spirit of hostility against us on the part of the house of Austria, which, of all the powers of the continent, was considered as one of our most natural allies, in consequence of the ancient hostility which had existed between that power and France, and which was thought likely to break out anew at some future period, notwithstanding the efforts at present made for

its extinction. It was probably in consequence of a jealousy of Britain produced by this transaction, that the emperor published an edict totally prohibiting the importation of British manufactures into any part of the Austrian dominions. In the course of the summer a French edict had also restricted the sale of various articles of British manufacture, particularly saddlery, hosiery, woollen cloths, and hard-ware, unless upon payment of duties, the amount of which was equivalent to a prohibition. To counteract these proceedings, by which the commerce of this country must eventually have been narrowed, commercial treaties were negotiated with the courts of Petersburg and Versailles. The latter of these was undertaken in pursuance of a provision in the definitive treaty of peace, and the negotiator appointed on the part of Great Britain on the 9th of December was Mr William Eden. The acceptance of this appointment was represented by the persons who opposed the present administration as a signal example of political apostasy, as it was said that Mr Eden had not only been the original projector of the celebrated coalition in 1783, but a principal supporter of the resolutions made by the house of commons against the administration of Mr Pitt at the commencement of the year 1784.

Britain.
780
Commer-
cial treaties
negotiated.

Parliament met on the 24th of January 1786. In the speech from the throne some notice was taken of the continental dispute already mentioned, which it was said, had terminated in such a way as to threaten no interruption to the tranquillity of Europe. This excited some debate, in which Mr Pitt declined entering into any defence of the Germanic league, as he and his colleagues in office had not interfered in the formation of it. He said, that accident alone had placed the sovereignty of Hanover and of this country in the same hands, and he desired to have it understood that Great Britain was by no means bound by any leagues entered into by the elector of Hanover. He thought the only way for Great Britain to avoid embroiling herself in the quarrels of Hanover, was for our administration to remain as much as possible unconnected with Hanoverian politics. Hence, unless in some singular cases, he did not account it incumbent upon the minister of this country to lay before parliament arrangements made by the advice of the ministers of that electorate.

781
Meeting of
parliament.
782
Relation of
Britain and
Hanover
debated.

Mr Fox, on the contrary, denied that the affairs of Hanover could be separated from those of Britain. He stated the supposition, that it should hereafter appear an essential act of policy for Great Britain to join the court of Vienna against the league of the Germanic princes, and that the elector of Hanover should appear as one of those princes at the head of his own troops. Mr Fox put the question, Whether a British army could be directed to act hostilely against troops led by their sovereign in the character of elector of Hanover? He remarked, that when George I. purchased Bremen and Verden from Denmark, the minister at that time, General Stanhope, used precisely the same language, and told the house of commons, that they had nothing to do with his majesty's conduct respecting his electoral dominions. The consequence, however, was, that the resentment of the Swedish monarch Charles XII. on account of this transaction, threatened Great Britain with a most dangerous invasion: and the very next

year

Britain. year. General Stanhope was under the necessity of demanding additional supplies, to enable his majesty to defray the expences to which he was exposed in consequence of his purchase.

783
Duke of
Richmond's
fortifica-
tions.

The first object that came before parliament, to which any great degree of public attention was directed, related to the duke of Richmond's plan of fortifications. In consequence of the debate which had formerly taken place upon the subject in the house of commons, the plan was remitted to the consideration of a board of officers on the 13th of April 1785. The duke of Richmond was appointed president of the board; in consequence of which General Conway, Lord Amherst, and Lord Viscount Townshend, declined to act, because he was their junior as an officer. Those who actually assisted were Lieutenant-generals Earl Percy, Earl Cornwallis, Sir Guy Carleton, Sir William Howe, Sir David Lindsay, Sir Charles Grey, Lord George Lenuox, and John Burgoyne, together with six major-generals. The naval officers were Vice-admirals Barrington and Milbank, Rear-admirals Graves and Lord Hood, together with Captains Hotham, Macbride, Bowyer, Luttrell, Sir John Jervis, and Sir Andrew Snape Hammond. On the 10th of February, Mr Pitt stated to the house of commons, that the board had reported to his majesty their approbation of the plans as perfectly adequate to the defence intended, and as being at the same time the least expensive in the construction, and requiring a smaller force to man them, than any other that could be proposed. He stated, however, that it would be imprudent for him to lay before the public a matter of so serious and delicate a nature as the report of the naval and military officers respecting so important a subject as the defence of our dock-yards; but he presented an estimate of the expence necessary to construct the fortifications which had been prepared by the board of engineers. The adversaries of the measure were not satisfied with the withholding entirely the report of the board of officers. Mr Sheridan contended that Mr Pitt might very possibly have misunderstood the report, which might be liable to different constructions; and in this remark he was supported by General Burgoyne, who proposed, that the minister should lay before the house as much of the report as could be published without danger to the state. He alleged, that, for the sake of obtaining a report in favour of his plan, the duke of Richmond had proposed hypothetical questions, which could not fail to be answered in the affirmative. General Burgoyne said, he would not be guilty of a breach of confidence, by mentioning the hypothetical cases that had been stated to the board, but that some of them were as extravagant as if it were asked, "Suppose by some strange convulsion of nature that the straits between Dover and Calais should be no more, and that the coasts should meet and unite, would it not be a politic expedient, and absolutely necessary, to fortify the isthmus or neck of land between France and England?" It appeared during the debate, that at the meetings of the board of officers the plan had been opposed by Earl Percy and Captain Macbride. This last gentleman pointedly condemned the whole system, asserting the utter inutility of all kinds of fortification for the national defence; and he

assured the house, that his opinion was supported by the sanction of Admiral Barrington. Britain.

The decision of the house of commons respecting the whole affair was delayed till the end of February, and in the mean time administration consented to produce the greater part of the papers demanded. The subject was again brought forward by Mr Pitt, who proposed the following resolution, "That it appeared to the house, that to provide effectually for securing the dock yards of Portsmouth and Plymouth by a permanent system of fortification founded upon the most economical principles, and requiring the smallest numbers of troops possible to answer the purpose of such security, was an essential object for the safety of the state, intimately connected with the general defence of the kingdom, and necessary to enable the fleet to act with full vigour and effect for the protection of commerce, the support of our distant possessions, and the prosecution of offensive operations, in any war in which the nation might hereafter be engaged." Mr Pitt supported the measure chiefly on this footing, that the protection of our dock-yards was apt to occupy a part of the navy in time of war, and thereby to reduce us to the necessity of merely defensive operations; whereas, by fortifying the dock-yards, the navy might with more safety be sent to a distance, which was with difficulty accomplished in the late war, when it was necessary to make a powerful effort for the relief of Gibraltar. He asserted, that the fortifications proposed would afford a cheaper defence to the dock-yards than could be obtained by building an additional number of ships of war. He remarked, that such ships could not be indefinitely increased, as in the nature of things there must exist a limit beyond which Great Britain can neither build nor man any additional vessels.

The opposition to the fortifications was opened by the country gentlemen. Mr Bastard contended, that the strongholds now proposed to be built would become seminaries for pretorian bands. He reprobated the idea of tearing the ensign of British glory from the mast-head, and fixing it on the ramparts of a military garrison. The measure was further opposed by Sir William Lenox, General Burgoyne, Mr Marsham, Mr Windham, Mr Courteney, Lord North, and Mr Fox. But it was defended by Viscount Mahon, Lord Hood, Sir Charles Middleton, Captains Barclay, Bowyer, and Luttrell, Mr Hawkins Brown, and Mr Dundas. Captain Macbride asserted, that the report was improperly obtained; that the duke of Richmond rather guided and dictated the decision than merely presided in the assembly; that it was the first board of officers in which both question and answer came from the president and senior members: in every other case the junior officer gave his opinion first, but that this established mode of proceeding had been completely reversed. Mr Sheridan discussed the subject at great length. He contended, that the whole project was utterly unconstitutional: that there was a great and important distinction between troops separated from their fellow-citizens in garrisons and forts, and men living scattered and entangled in all the common duties and connexions of their countrymen. He asserted, that the strong military holds now proposed, if maintained, as they must be in peace, by full and disciplined garrisons,

Britain. sons, would produce tenfold the means of curbing and subduing the country that could arise from doubling the present establishment; with this aggravation, that the naval stores and magazines, the sources of future navies, the preservation of which was the pretence for these unassailable fortresses, would become a pledge and hostage in the hands of the crown to ensure the unconditional submission of the nation. He asserted that the system would not stop with Portsmouth and Plymouth: that the same board of officers, going a circuit round the coasts of the kingdom, would easily find abundance of places necessary to be defended in like manner: that at various places between Chatham and Sheerness extensive lines had actually been begun under the auspices of the duke of Richmond, which must necessarily be provided for according to the new system.

The result of the debate was, that upon a vote the house divided equally, 169 being upon each side. The speaker gave his casting vote in opposition to the measure. The same question, however, was revived on the 17th of May by Mr Pitt, who proposed, that the plan of fortification should still be carried on at Portsmouth and Plymouth, though upon a more limited scale, amounting in all to 400,000l. Mr Pitt's motion was opposed with much severity of language, and at length withdrawn. On the 7th of June, the sum of 59,780l. was, in consequence of a new estimate, voted for the entire completion of the works already begun.

785
Militia
laws.

The attention of parliament was for some time engaged during this session with a proposal, first brought forward by Mr Charles Marsham, for reducing the laws relative to the militia into one act of parliament, and providing for their being annually called out and disciplined. Mr Pitt opposed the calling out of the militia annually; but afterwards, finding a different opinion to prevail, he consented, on condition that though the whole number of men should be balloted for and enrolled, only two-thirds should be actually employed, which would produce a saving of 40,000l. The measure in general of regularly calling out the militia did not pass without opposition. Mr Rolle observed, that it had been found prejudicial to the morals of the people, gave them habits of debauchery and idleness, and always rendered them worse members of society than they were before. The militia bill, after it had passed the commons, did not pass without debate in the house of lords. Lord Viscount Townshend had been the original mover of the establishment in the house of commons, in consequence of the disgust expressed by the nation, when, in the year 1757, a body of Hanoverians and Hessians were brought into the kingdom for its internal security. That nobleman now enlarged considerably upon the subject. He mentioned the militia of France, of Spain, of Prussia, and of the emperor; and showed how much inferior Great Britain was to any of those powers in this important establishment. He treated with contempt the penuriousness of administration with regard to this invaluable establishment, while the buildings at Somerset-house, the admiralty, and for the ordnance, engrossed so much of the public expenditure. Earl Stanhope (lately Viscount Mahon) proposed the following amendment upon the act, without making

VOL. IV. Part II.

any addition to the national expence: Ballot, said he, 21,000 militia, and instead of five, let the term of their service be six years. At the end of three years ballot 21,000 more; of this number call out, train, and exercise, only 7000 every year. Let this be done in rotation till the whole amount of 42,000 men has been disciplined, being double the number contained in the act. The proposal was only objected to because it was too late in the session to debate the principle of the bill, and that if it were altered in that house it might be totally lost.

Britain.

The subject which the minister probably wished ⁷⁸⁶ Mr Pitt's should make a principal figure during this session of parliament, was the proposal of a sinking fund to be applied towards discharging the public debt. He had occasionally mentioned it, during the preceding session, as a great and important national measure which he intended to bring forward. Accordingly, early in the present session, Mr Pitt moved that certain papers should be laid upon the table of the house of commons, to enable them to form an estimate of the annual amount of the national revenue, as well as the amount of the public expenditure, from which they might judge of the existing disposable surplus, and of the sum it would be farther necessary to provide to raise the total to the amount requisite to form the basis of the intended sinking fund. On the 7th of March, Mr Pitt proposed the appointment by ballot of a select committee of nine persons to examine these papers, and to report the result to the house. He stated his intention to be, to take every possible step to give complete satisfaction to the nation in a matter of such general concern; and he conceived that the solemnity of a committee, and the formality of a report, would answer this purpose better than a set of unconnected papers or the affirmation of a minister. The members elected into the committee were, the marquis of Graham, Mr William Grenville, Mr Edward Elliot, Mr Rose, Mr Wilberforce, Mr Beaufoy, Mr John Call, Mr Smith, and Mr Addington, the two last of whom had been the mover and seconder of the address upon the speech from the throne. After this committee had made its report, Mr Pitt, on the 29th March, proposed his plan to the commons in a committee of the whole house. He congratulated parliament upon the prospects of the nation, in a style of animated eloquence. He remarked that the country had been engaged in a most unfortunate war, which added such accumulation to our immense debts, that surrounding nations, and many among ourselves, believed that our powers must necessarily fail, and we must sink under the burden; but that the day was at length arrived when despondency might be disregarded, and our prospects brightened on every side, when the nation could look its situation in the face, and establish a spirited and permanent plan for relieving itself of its incumbrances. Mr Pitt stated the revenue for the current year, as reported by the committee, to amount to 15,397,000l. The interest of the national debt was 9,275,769l. and the civil list 900,000l. which, together with the whole other expenditure for the army and navy, and other establishments, amounted to 14,478,000l.; of consequence, there remained a surplus of the annual income, above the expenditure, of 900,000l. One million he stated to be the sum annually to be contributed to the sinking fund, and to make up the sum of 100,000l.

4 G

wanted

^{Britain.} wanted to complete this amount, he proposed small additional taxes upon spirits, timber, and hair powder and perfumery. He proposed that the sum of 1,000,000l. thus made up, should be placed in the hands of commissioners appointed for that purpose, in quarterly payments of 250,000l. each, to begin on the 5th of the following July. He wished that the commissioners should consist of persons of rank and distinction; the speaker of the house of commons, the chancellor of the exchequer, the master of the rolls, the governor and deputy-governor of the bank of England, and the accountant-general of the high court of chancery. Mr Pitt said, that, by taking care to lay out the sinking fund regularly at compound interest, the million to be applied would rise to a very great amount, in a period that is not very long in the life of an individual, and is but an hour in the existence of a nation: It would diminish the debt of this country so much, as to prevent the exigencies of war from ever raising it to the enormous height they had hitherto done. In the period of 28 years, the sum of a million annually improved, would produce an income of 4,000,000l. per annum. By placing the sum in the hands of commissioners, to be applied by them quarterly to the purchase of stock, no sum would ever lie within the grasp of a minister great enough to tempt him to infringe upon this national revenue. It could not be done by stealth, and a minister would not have the confidence to come to that house expressly to demand the repeal of so necessary a law.

⁷⁸⁷ Debates on the sinking fund. Mr Fox approved in general of the institution of a sinking fund, but thought 28 years too long a period to which to look forward for the effect of this plan. Before that term was arrived, it was not improbable we might have another war; and a variety of circumstances might occur, which would operate as a temptation to a future chancellor of the exchequer, and a future house of commons, to repeal the act, annul the institution, and divert the appropriation of its stock to the immediate services of the year. He stated two specific objections to the plan. The first was that the sum appropriated ought not to have been made unalienable in time of war. The second objection was, that by the institution, parliament being bound to nobody but itself, the whole plan was liable to be annihilated by a future parliament. Hence he recommended a plan formerly proposed, of paying off portions of the national debt by the subscription of individuals, to whom the faith of parliament should be engaged to redeem or repay the sums advanced at certain stated periods. At a future stage of the business, Mr Fox repeated his objections, and at last, in consequence of the acquiescence of Mr Pitt, he introduced an amendment into the plan, of the following nature: That whenever a new loan should hereafter be made, the minister should not only propose taxes sufficient to pay the interest of the loan, but also sufficient to make good whatever it should be found expedient to take from the sinking fund to supply the necessities of the nation. He meant, that if, when a new loan of six millions was proposed, there should be one million in the hands of the commissioners; in such case, the commissioners should take a million of the loan, and the *bonus* or *douceur* of that million should be received by

them for the public; so that, in fact, the public would only have five millions to borrow. ^{Britain.}

In the house of lords, the other objection stated by Mr Fox to the constitution of the sinking fund, was urged with some variation by Earl Stanhope. He pointed out in strong terms the danger which would occur, in future wars, of diverting the fund from its proper destination. He remarked that four millions of free revenue, to which the sinking fund was finally to accumulate, would enable a minister to obtain eighty millions by way of loan. He proposed therefore, that books should be opened at the bank to receive the names of such holders of stock bearing three per cent. interest as should consent to accept of 90l. for every 100l. of their present capital, whenever the public should be desirous of redeeming the said capital at that price, and that all holders of this new stock should be entitled to be paid off before any part of the other public debts should be redeemed; reserving, always, however, for a time, to the commissioners of the sinking fund, the power of purchasing stock at the market price. In recommendation of his scheme, Lord Stanhope produced the letters of several eminent brokers, bankers, and merchants, and also of Dr Richard Price. Lord Camelford (formerly Mr Thomas Pitt), objected to this proposal, that the plan of paying off the national debt by purchasing it at the market price, was more advantageous for the public, because it made a period of war the time in which it would be most easy to discharge the debt. The bill was therefore without any alteration passed into a law.

This establishment of a sinking fund appears to ⁷⁸⁸ Remains have been the most favourite of Mr Pitt's plans of ^{on the} finance, and that which produced to him the greatest degree of popularity. In consequence of his having remained in power during the long and expensive war which succeeded its establishment, it continued regularly and fully to be carried into effect. When a new loan was made, the minister not only proposed taxes sufficient to pay the annual interest of the new debt, but also sufficient to afford a surplus or sinking fund of one per cent. per annum, to be applied by the commissioners towards the extinction of the debt.

With regard to the value of this, or of any other plan for paying off the public debts of a nation, it is perhaps still somewhat difficult to form a correct estimate. It has been found by experience that the existence of a great public debt has the most powerful influence in giving stability to a government, by attaching to its existence a numerous body of public creditors, who must always dread the consequences of any important revolution in the constitution of the state. This will always be a fortunate or an unfortunate circumstance to a nation, according to the nature of its political constitution. It is good, however, in so far, as it alienates the minds of men from rash and hasty projects of change, which must always be dangerous. With regard to the direct effects of such a fund in diminishing the public debt, it may be remarked, that, from what has hitherto occurred, it does not appear that in the present state of the European nations, eager as they are to engage in frequent wars, any sinking fund can actually extinguish the debts of a nation. The only effect of such a fund, when well con-
trolled

Britain. trived and steadily adhered to, seems to be that it enables a nation to maintain its credit in very difficult circumstances, and thereby to carry on the accumulation of public debt to the highest possible amount, and thereby to make trial in the completest manner, of all the moral and political consequences of the funding system. But whatever may be the ultimate effect of the particular sinking fund established in 1786, Mr Pitt had only the merit of adopting it and putting it in force; as it is now generally understood, that the project was not of his own contrivance, but only formed one, and that too not the most efficient, of three plans presented to him by Dr Price.

789 Wine duties: During the present session, Mr Pitt considerably improved the revenue by subjecting to the excise laws the duties levied upon wines. His chief object was to prevent the fraudulent manufacture of wine at home, which was afterwards sold as foreign wine. This he said would be accomplished by excise officers visiting the cellars of dealers in wines. The proposal met with considerable opposition, from the general aversion to the extension of the excise laws, but it was nevertheless carried into effect. When the estimates for the navy were voted, some observations were suggested by Captain Macbride, which are worthy of being recorded on account of their relation to the progressive improvement of the chief defence of the British isles.

790 Best size of ships of war. He censured extremely the voting very large sums of money for the repair of 60 and 64 gun ships, and observed that our having so many vessels of this sort was a principal reason of the many defeats we had suffered in the last war. The French had not now more than three or four 64 gun ships, and they took care not to build any new ones upon that construction. Another thing against our navy, was that the French 74 gun ships were of 2000 tons burden, while our 74's had been reduced to 1600 tons. Captain Macbride said, he verily believed, that if the number of our ships were reduced by one-third, the navy of England would prove one-third the stronger. He was still more severe in his condemnation of the system of suffering the ships to remain in their copper bottoms during a time of peace. He contended, that if we persisted in this idea, there would be no occasion to argue whether ships of one size or another should be built, for we should soon have no navy in our possession. The French had discovered the folly of the practice, and for some time had left off the mode of sheathing their ships. We ought therefore to do the same, or at least to take off the copper when the ships were to lie long in still water. The copper corroded and ate more into their bolts than either worms or time. The consequence would be, that the instant the ships which had been long laid by were sent to sea, their bottoms would drop out, and thousands of brave seamen would perish in the ocean. The ideas of Captain Macbride were confirmed by Sir John Jervis; and, so far as related to the sheathing with copper, by Captain Luttrell.

791 General state of the empire. At this time the British nation, recovered from the effects of the late war, was proceeding in a train of considerable prosperity. The administration of justice was proceeding at home in the ordinary train sanctioned by the constitution, and produced its usual and natural effects of tranquillity and general satisfaction. The

sovereign, in consequence of his domestic virtues and regular life, was personally popular. The members of administration had obtained their offices under circumstances which originally secured the good will of the nation; and no public events had occurred to expose their characters to any severe trial, or to produce an alteration in the public opinion with regard to them. Still, however, the most distinguished members of the late coalition continued to hold seats in parliament, and naturally wished to attract the public notice, and to rescue themselves from the neglect into which of late they had fallen. For this purpose, they appear to have looked towards our Indian empire, for materials upon which to exert their talents, and to demonstrate their public spirit. Their principal effort consisted of an attempt, which was commenced during the present session, by Mr Burke, to bring to trial and punishment Warren Hastings, Esq. late governor-general of Bengal, for crimes alleged to have been committed in that country.

792 The acquisition of foreign territories inconvenient to free states. There is something in the nature of the British constitution, or rather, perhaps, of the constitution of every free state, which renders the conquest, or even the acquisition in any form, of foreign territories, not a little inconvenient. In the case of the British American territories, a constitution, less or more resembling that of Great Britain, had been established in every separate colony or province. These separate constitutions produced abundance of internal prosperity to the colonies; but the whole formed a disjointed empire, slightly bound together by a limited executive power, and destitute of a common legislature. An attempt, made by the legislature of the parent state to make laws for the whole of the subordinate communities, gave rise to a war which ended in the dismemberment of the empire. The remaining foreign possessions, such as Ireland and the West India islands, might be supposed to remain in union with the metropolis of the empire, chiefly in consequence of their weakness, which rendered its protection necessary to their safety, or made them incapable of erecting themselves into separate governments in opposition to its will. The territories which had been acquired by the British nation in India, were, in this respect, in a very peculiar situation. It might, perhaps, have been possible, by an incorporating union, and by extending the privilege of representation, to combine into one firm and consolidated government the whole British islands, together with the American colonies: but this must forever be impossible with regard to the territory of Hindostan. That great and fertile country being inhabited by men of a feebler race, and of a different language and character, is incapable of being united to the British nation upon principles of equal political freedom. It had been originally acquired, not by a conquest made under the direct authority of the executive government of Britain; but by a company of merchants, who, in a manner new in the history of the world, by uniting the military superiority of Europeans with the arts of commercial men, contrived gradually to subjugate one of the fairest portions of the habitable globe, containing a population many times greater than that of their native country. The progress of such a power towards empire, was necessarily attended with the most cruel hardships to the natives of the

Britain. subjugated country. When the mercantile invaders possessed abundance of European troops, they employed them in making direct conquests of additional territory. When these troops were exhausted by war or by the climate, or, having enriched themselves, had returned to Europe loaded with the spoils of the east, and left their former employers in that quarter in a state of considerable weakness, the servants of the company, who remained there, exerted their ingenuity to excite divisions among the native princes. When they could no longer act as principals, they appeared as seconds in every quarrel, and obtained new territories as the reward of their aid. With such views they formed and broke alliances with little delicacy; and, on receiving supplies of troops from Europe, like other conquerors, they were never at a loss for pretences, upon which to extend their dominion.

All this was the natural result of the situation of the British East India Company, with regard to the natives of Hindostan. At the same time, as the jealousy of the neighbouring states of Europe, together with their equal progress in the art of war, had long put an end to the extension of conquests, and produced much political moderation in the transactions of nations, many of the people of the island of Great Britain learned with astonishment, that their countrymen were conducting themselves in Hindostan, in a manner which in Europe would be regarded with the utmost abhorrence. Such feelings, however, were in general lost in the sentiment of national aggrandizement. Efforts, however, had been made to ameliorate as much as possible the future government of India, by subjecting it, by means of the acts of parliament already noticed, in a considerable degree, to the direct authority of the executive government of this country, instead of suffering it to remain totally vested in a company of merchants. Here the present administration appears to have wished that the affair should be suffered to rest, and that whatever was past should be overlooked and forgotten. This, however, did not suit the present views of opposition. Mr Burke, in particular, had been led by an ardent imagination to interest himself deeply in the calamities which had been suffered by the natives of India, in consequence of the conduct of our countrymen. His feelings and the policy of his party at this time coincided; and, accordingly, he endeavoured with much eagerness to bring to trial and punishment the most distinguished person who had of late years acted upon the great theatre of Indian affairs.

794
Mr Burke wishes to bring Mr Hastings to trial.

795
Difficulties in his way.

Great obstacles stood in the way of Mr Burke's proposed attempt to procure a parliamentary conviction of Mr Hastings. He had to overcome a long series of unpopularity, the personal indifference that had been shown to him by the house of commons, and their indisposition so much as to give him a hearing, together with a great degree of coldness which the nation at large had gradually acquired with regard to all complaints of East India delinquency. All these, however, he surmounted by efforts of the most obstinate perseverance, and of great eloquence, upon the fertile subject of cruelty, oppression, and treachery, committed under the authority of the British government in the east. The public attention was gradually attracted to the subject; and at last it formed the great subject of con-

versation, and of political remark, in all parts of the Britain island. To produce this change in the sentiments of the nation, the whole efforts of Mr Fox and the other members of opposition were necessary, in addition to the invectives of Mr Burke.

Mr Hastings had arrived in England on the 16th of June 1785, and on the 20th of that month, Mr Burke had given notice of his intention to move for an inquiry into the conduct of the late governor. On the day of the meeting of parliament, in January of this year, Major Scott, the particular friend of Mr Hastings, publicly reminded Mr Burke of the menace he had thrown out, and requested Mr Burke speedily to decide upon the part he was to take. Accordingly, about the middle of February, this gentleman having resolved to proceed against Mr Hastings, by moving the house of commons to impeach him at the bar of the house of lords, endeavoured to prepare to substantiate the charges which were to be made, by proposing, that the house should order production of various papers; and motions to this effect were renewed by him at different periods. These motions gave rise to a variety of debates, in which Mr Dundas, who now acted as minister for India affairs (being president of the board of controul), together with Sir Lloyd Kenyon, master of the rolls, chiefly opposed Mr Burke, and placed considerable difficulties in his way. Mr Pitt appeared also favourable to Mr Hastings; but, upon the whole, he thought fit to assume the character of acting as a candid and impartial judge upon the occasion, without affording protection to the accused party, or favour to the accuser. These debates excited much attention at the time, but are not of sufficient importance to require to be stated in detail in a concise history of the period. At last, in the month of April, Mr Burke presented to the house his charges against Mr Hastings, which amounted to 21 in number, to which an additional article was afterwards added. The charges were of various degrees of importance; and some of them were of such weight as to excite a considerable degree of public interest. Mr Hastings was accused of driving a whole people, the Rohillas, from their territory, without any pretence of justice; of arbitrarily confiscating the property of the native princes, and of imprisoning them and their servants for the purposes of extortion; of entering into war with the Mahrattas without necessity; and of treacherously delivering the Mogul into their hands on making peace; together with a variety of other charges of less importance. On the 26th of April, Mr Hastings presented a petition, requesting a copy of the articles, and to be heard in his defence against them before any witnesses should be examined. This request was granted; and that gentleman having appeared at the bar, and stated in ample terms the great efforts which he had successfully made for the aggrandizement of the British power in the east, he entered into a particular defence of his conduct, in the particular points upon which he had been accused. He asserted, that the Rohillas were a tribe of adventurers, in driving of whom from an usurped territory, he had only assisted; and the princes or princesses, whose property he was accused of having seized for the use of the conquerors, had deserved their misfortunes

by.

Britain. by their treacherous intrigues or rebellion; that the war with the Mahrattas had not been commenced by him, and that the terms of the pacification were almost universally considered as advantageous; that the Mogul had thrown himself into their hands, and was entitled to no protection from the British government. Upon every other point, he asserted, in a similar manner, not merely the innocence, but the meritorious nature of his conduct, resting his defence chiefly upon such arguments as conquering princes use to justify their encroachments upon their weaker neighbours.

On the 1st of June, Mr Burke brought forward, in the house of commons, his first charge, which related to the expulsion of the Rohillas from their country, to the number of 60,000 men, women, and children. On this occasion Mr Burke exerted all his eloquence. He asserted the purity of his motives in his prosecution; and represented it as not merely a question respecting the character of an individual, or brought forward for the mere purpose of inflicting a hardship upon him, but as a measure necessary for the establishment of the principle of responsibility, with regard to the future governors of our distant possessions, and therefore as a national and imperial question, decisive of the good or ill government of millions now existing or yet unborn. He lamented the difficulty of giving full effect to the charges, in consequence of the immense power and influence which the accused governor had enjoyed, which still afforded him protection, and suppressed information. The remoteness of the country, and the little interest which the British nation might take in the destiny of an unknown people, augmented every other difficulty. However, from the honour and humanity of the house he trusted to surmount all obstacles. He described, in interesting terms, the character of the Rohillas, the simplicity of their manners, the prosperity of their country, and their zeal for agriculture and commerce; and denied that there existed any plausible ground to justify the assistance which Mr Hastings had given to one of their rapacious neighbours to expel them from their territory. After a debate, however, the house decided by a voice of 119 against 67, that the charge did not contain sufficient matter of impeachment against Mr Hastings.

The next article of crimination against Mr Hastings, was founded upon his oppressive conduct towards Cheit Sing, the rajah of Benares, from whom he first arbitrarily demanded payment of a sum of money, in addition to his ordinary tribute, and, on delay of payment, imposed upon him an enormous fine, of half a million sterling; insulted him by an ignominious arrest, and thereafter drove him from his dominions. This charge was opened by Mr Fox. He was opposed by Major Scott and Mr Grenville, who inveighed against the rajah, as having been unwilling to support the British power in a dangerous contest in which it was at that time engaged, and as having favoured the views of its enemy. By this time, however, the repeated discussions of the subject, which had occurred during the present session of parliament, had gradually begun to interest the public at large. Pamphlets were published, in which Mr Hastings's character was very violently attacked, and as eagerly defended. His con-

duct as a governor in India, appeared, to the majority of the people, so totally inconsistent with those ideas of equity, which regulate the opinions of men in this country, that a violent degree of popular indignation was excited against him. Hitherto he had been supported in the house of commons by those who usually adhered to administration, though Mr Pitt himself had on all occasions declared his wish to act candidly as a judge, and to avoid treating the matter as a question to be supported by a particular party. Upon this article of charge, concerning the rajah of Benares, he entered into the views of Mr Fox, and declared himself satisfied, that Mr Hastings had in this case acted unjustifiably. On a division, it was determined by a majority of 119 against 79, that this accusation contained matter of impeachment against the late governor-general of Bengal.

During this session of parliament some farther legislative provisions were made for regulating the government of India. On the 7th of March a motion was made by Mr Francis, and seconded by Mr Windham, for leave to bring in a bill to explain and amend the regulating act, which had been brought forward and carried through by Mr Pitt, upon the subject of India affairs. Mr Francis censured strongly three parts of Mr Pitt's act: 1st, That which establishes a double government of India at home, by two boards, the court of directors, and the board of controul. 2dly, He strongly condemned the excessive power, by means of a constant casting voice in his council, which was bestowed upon the governor-general of Bengal. He said that a governor-general understood nothing of his situation, if he thought that any power, directly vested in his hands, would carry half the authority with it that would accompany the united acts of a governor and council. If he trusted to his own exclusive judgment, he would find himself surrounded by some of the most artful men that existed; by natives, who, without our general knowledge, were infinitely sagacious, who observed us attentively, and understood us perfectly; and by some Europeans, who, in every thing but their habit and complexion, were perfect Asiatics. No single unassisted English judgment was a match for such men, and for such peculiar faculties as would collect about him from the moment of his arrival. If he relied on his exclusive power, for want of clear and accurate knowledge he would rarely venture to exert it. Every man who approached him would tell him a different story, or give him a different opinion. He would often doubt, and no vigorous determination could exist in a good mind, that was not preceded by conviction. Even when he exerted his power, it would be feeble and ineffectual against the universal combination and clamour of all ranks and interests, that would be formed to counteract him in every measure that tended to correct abuse or reduce exorbitant emoluments. Lastly, Mr Francis severely reprobated the institution, in Mr Pitt's bill, of a special court of justice for the trial of Indian delinquents, which deprived such persons of the privilege of a jury. He alluded, upon this subject, to the petitions which were understood to be on their way from India against this part of the act.

Mr Dundas justified, upon the opinion of Lord Macartney,

Britain.

797
Mr Pitt joins the accusers of Mr Hastings.

798
Proposal to amend Mr Pitt's India bill.

Britain. Macartney, the powers conferred upon the governor-general of Bengal. He asserted the necessity of a new court of judicature, from the voluminous nature of the evidence in the cases of Sir Thomas Rumbold and Mr Hastings, which could not be gone through by the ordinary form of a trial by jury. At the same time he stated his own intention to bring speedily forward a bill for amending, in certain respects, the regulating act of 1784. Mr Francis's motion was rejected, and Mr Dundas, on the 16th of March, brought forward his new bill for the regulation of India. It conferred still farther powers upon the governor-general, authorizing him to act in opposition to the sense of his council when he thought fit to take the responsibility upon himself. The offices of commander in chief and governor-general were also united, and the board of controul was alone authorized to inquire into the fortunes of persons serving in India. The service there was also divided into branches; and it was declared, that the servants of the company should rise by gradation only in those branches of service for which they had been prepared by their former habits. After a variety of debates in both houses, the bill was passed.

799
Mr Dundas's amending act.

800
Increase of the India Company's capital.

In consequence of the commutation-act, by which the duties upon tea were so greatly diminished, the East India Company had now increased their annual sales of that commodity from six to fourteen millions of pounds. To enable them to carry on this great additional trade, they petitioned the house of commons to permit an augmentation of their capital. A bill for that purpose accordingly passed through both houses in June, authorizing them to receive new subscriptions to the amount of 1,000,211l.; and to raise an additional sum of 800,000l. by the sale of an annuity due to them by government.

801
Margaret Nicholson's attempt against the king's life.
The session of parliament terminated on the 11th of July, and during the remainder of the year the British empire enjoyed complete tranquillity. An incident, however, occurred, of a singular nature, which called forth very universal demonstrations of attachment to the person of the king from all orders of men. On alighting from his carriage on the 2d of August, a woman approached his majesty, under the appearance of offering a petition, but at the same time aimed a thrust at him with a knife, which, however, did no harm. Her name was Margaret Nicholson. Being instantly seized and examined by some members of the privy council, with the assistance of several medical gentlemen, she was found to be insane, and ordered to be confined for life in Bethlehem hospital. A public thanksgiving was ordered for his majesty's safety, and addresses of congratulation were sent to court from all parts of the country. These were the more sincere, because the prince of Wales was understood to have attached himself by habits of friendship and intimacy to some of the leading members of the late coalition. The life of the reigning monarch was therefore at this time considered as extremely valuable, on account of the support which it gave to a popular administration, and because it prevented the government from falling into the hands of a young man who was not yet supposed to have risen above the inexperience and follies of youth.

Britain. 802
French commercial treaty.
One of the most important measures of Mr Pitt's administration was carried into effect during the autumn of this year. It consisted of a commercial treaty, which, we have already remarked, Mr Eden was sent to negotiate, and which was concluded on the 26th of September of this year. This treaty stipulated, in general terms, that there should be a perfect liberty of navigation and commerce between the subjects of the two kings in all their European dominions, with a view of giving fair encouragement to the produce and manufactures of both countries, by a discontinuance of prohibitory duties, and by putting an end to illicit trade. A particular tariff was adjusted with regard to a great number of commodities, and all articles which it did not include were to be reciprocally imported on the terms allowed to the most favoured nations. It was agreed, that French wine should be subject to no higher duties on importation than those which were paid on the wine of Portugal: that the duty on brandy should not exceed 7s. per gallon: that 30 per cent. *ad valorem* should be levied upon beer: that the highest duties on works of iron and copper, on cabinet ware and turnery, should not go beyond 10 per cent. *ad valorem*: that for saddlery, 15 per cent. should be paid; for glass and earthen ware, also for cotton and woollen articles, (with a prohibition of goods mixed with silk) 12 per cent.; for gauze 10; for millinery 12 per cent. On cambric and lawn the duty was to be 5s. for about eight yards. Linen manufactured in either country was not to be burthened with a higher duty than was at this time paid for Dutch or Flemish linen imported into Britain; and for linen made in Ireland or in France, no greater sum was to be demanded, in the way of duty, than was now paid on the receipt of Dutch linen in the Irish ports. Each of the monarchs reserved the right of countervailing, by additional taxes on certain commodities, the internal duties imposed on the manufactures, or the import charges paid on the raw material. It was also declared, that if either of the princes should be at war, every thing should be deemed free which might be found in the ships of the respective nations (with the exception of goods usually deemed contraband), even though the whole or a part of the lading should belong to the enemies of the other state.

This treaty appears, upon the whole, to have been acceptable to a considerable majority of the nation. When parliament assembled on the 23d of January 1787, it was announced in the speech from the throne, and formed the first subject of deliberation. Mr Fox 803
Debate on the commercial treaty, 1787.
remarked, when the usual address to the throne was moved, that the treaty in question ought to be examined with much jealousy, on account of its introducing an innovation into the established system of our policy. He said, that all the wars of Great Britain had been wars of necessity, and that the jealousy of the power of France, which we must now be called upon to lay aside, has been founded upon the fullest experience of her ambitious character. He deprecated the imputation of being governed by vulgar prejudices; but, at the same time, he declared it to be his opinion, that the external circumstances of the two nations create a rivalry, and, in some degree, an enmity,

Britain. mity, between them, which it is impossible to prevent by any measure which human speculation can devise. Nay, he would not hesitate to pronounce, that were such an event possible, it was not to be wished for by any lover of this country. If, as he sincerely wished, this was a mere commercial treaty, the framers of it had only to prove, that the new channel of trade which it opened would not obstruct, or would be more beneficial than all the other ancient channels which this kingdom had long been in possession of, and which had been found to be the sources of her commercial wealth and prosperity. But if, on the other hand, ministers avowed, that the treaty was intended as a political measure, and that they had in view some more close and intimate connexion with France, such as should render it in future more difficult for the two countries to go to war than heretofore; they then would have to show strong and satisfactory reasons for having pursued and concluded a measure so new in the history of these kingdoms, and of such infinite magnitude and importance. He said he might venture, however, to prophesy, that such an attempt, admitting it to be safe and prudent, would prove vain and abortive. However volatile and inconstant the French nation may be accounted, the French cabinet, he remarked, had for centuries been the most steady in Europe. To raise that monarchy to unlimited power had been its unvarying aim; and he asserted, that there existed no reason to suppose she had abandoned her purpose. He observed, indeed, as worthy of serious consideration, that the army of France was formerly the first in Europe. It was now but the fourth, being inferior to those of Russia, Prussia, and the emperor. On the other hand, her navy was daily increasing, and to that object her whole attention was directed. Was this a favourable symptom of her friendly disposition towards this country? Did it indicate any extraordinary partiality towards Great Britain? Did it not clearly prove, that her confidence was placed upon her continental allies, and that she was looking forward to, and preparing for, some favourable opportunity of indulging her inveterate animosity against her ancient enemies?

804
Mr Pitt's
defence of
the com-
mercial
treaty.

Mr Pitt, in reply, opposed the principles stated by Mr Fox, which went, he said, to prove the necessity and policy of a constant animosity with France. He contended, that such a doctrine militates in the most direct manner both against humanity and common sense. He asserted, that if war is the greatest of all evils, and commerce the greatest blessing that a country can enjoy, it must be the duty of those to whom public affairs are intrusted, to endeavour as much as possible to render the one permanent, and to remove the prospect and dangers of the other. This, he said, was the object of the present treaty. The advantages likely to arise from it would not only strongly operate upon every succeeding administration in both countries, so as to induce them to avoid a war as long as it could be avoided with honour and prudence, but would also strengthen the resources of the country towards carrying on a war whenever it should become indispensably necessary to engage in one. This was, he said, the true method of making peace a blessing, that while it was the parent of immediate wealth and happiness, it

Britain. should also be the nurse of future strength and security. The quarrels between France and Britain had too long continued to harass not only those two great and respectable nations themselves, but had frequently embroiled the peace of Europe; nay, had disturbed the tranquillity of the most remote parts of the world. They had, by their past conduct, acted as if they were intended by nature for the destruction of each other; but he hoped the time was now come when they should justify the order of the universe, and show that they were better calculated for the more amiable purposes of friendly intercourse and benevolence.

On some future occasions, Mr Fox unsuccessfully endeavoured to prevail with the house of commons, previous to coming to any decision upon the French treaty, to enter into an inquiry into the nature of our connexion, and the state of our negotiations, with Portugal, our old ally, in consequence of what is called the *Methuen treaty*, which had long proved a sure source of commercial advantage. Some disputes were at that time depending with Portugal, respecting complaints made by British merchants; and Mr Fox asserted, that the proper period of treating with Portugal would have been before the conclusion of the treaty with France. This would have demonstrated to the world, that, whilst we were seeking new connexions, we had no intention of sacrificing the old. Mr Pitt, on the contrary, contended, that we had acted wisely, in shewing Portugal beforehand, that we could do without her, when about to open negotiations for the remedy of complaints.

On the 12th of February, the house resolved itself into a committee for the purpose of considering the new commercial treaty with France. In a speech of three hours in length, Mr Pitt entered into a full explanation and defence of the treaty. As the subject is of great commercial importance, and may, at some future period of the British history, again become a subject of consideration, we shall here state the nature of his argument. He first gave a general explanation of the treaty, and afterwards endeavoured to refute the arguments against it, contained in a petition which had been presented in opposition to it, by Mr Alderman Newnham, from certain manufacturers assembled in the chamber of commerce.

He considered the treaty in three points of view; as affecting our manufactures, our revenues, and our political situation. With respect to the first, he undertook to prove, that though the treaty had been formed upon principles of strict reciprocity, yet that this country must, from the nature of the case, unavoidably have the advantage. To understand this, he said, it would be necessary for the committee to consider the relative state of the two kingdoms. It is a fact generally admitted, that France has the advantage in soil and climate, and consequently in her natural produce; while it is equally true, that Great Britain is decidedly superior in her manufactures and artificial productions. The wines, brandies, oils, and vinegars of France, are articles which we have nothing to put in competition with, except our beer. But it is equally clear, that we in our turn possess some manufactures, exclusively our own, and that in others we have so eminently the advantage of our neighbours, as to put competition at defiance.

805
Defence of
the treaty
as affecting
our manu-
factures.

Britain.

finance. Such, said he, is the relative condition, and such is the precise ground, on which it is reasonable to suppose that a valuable correspondence and connection between the two nations might be established. Having each its own distinct staple, having each that which the other wants, and not clashing in the great and leading lines of their respective riches, they resemble two opulent traders in different branches, who might enter into a traffic mutually beneficial. But nothing, he said, could be more evident, than that trade was more or less advantageous to any nation, in proportion to the degree of labour, industry, and capital, employed in bringing its commodities to market, and to the excess in value of the perfect manufactures above the raw materials: and this principle gave a decided advantage to us over the French. For, granting that large quantities of their natural produce would be brought into this country, would any man say that we should not send more cottons by the direct course now settled, than by the circuitous passage formerly used? more of our woollens, than while restricted to particular ports, and burdened with heavy duties? Would not more of our earthen ware, and other articles, which under all the disadvantages they formerly suffered, still, from their intrinsic superiority, forced their way regularly into France, now be sent thither? And would not the aggregate of our manufactures be essentially benefited in going to this market, loaded only with duties from 12 to 10, and in one instance only five per cent.? The article charged highest in the traffic, viz. sadlery, gave no sort of alarm. The traders in this article, though charged with a duty of 15 per cent. were so conscious of their superiority, that they cheerfully embraced the condition, and conceived that a free competition would be highly advantageous to them.

On the other hand, we had agreed by this treaty, to take from France, on small duties, the luxuries of her soil, which our refinements had already converted into necessaries. Was it in the power of high duties to prevent the introduction of them at our tables? Was it then a serious evil, to admit their wines on easier terms? With respect to brandy, the reduction of the duties would chiefly affect the contraband trade. Mr Pitt asserted it to be an undoubted fact, that the legal importation bore no proportion to the clandestine; for while the former amounted to no more than 600,000 gallons, the latter, by the best founded calculations, did not amount to less than between three and four millions of gallons. As this article, then, so completely possessed the taste of the nation, it could not surely be deemed wrong, to give to the state a greater advantage from it than heretofore, and, by crushing the illicit, to promote the legal traffic in it. The oils and vinegars of France were comparatively small objects; but, like the former, they were luxuries which had taken the shape of necessaries, and, by receiving them on easy terms, we could lose nothing.

In the next place, it was necessary to inquire whether in addition to the above, which were the natural produce of France, that kingdom had any manufactures peculiar to itself, or in which it so greatly excelled, as to give us just cause of alarm, on account of the treaty, when viewed in that aspect? Cambric was the first that presented itself; but in this article, it was notorious, that our competition with France had ceased,

and there could be no injury in granting an easy importation to that which we were determined at any rate to have. In every other article, there was nothing formidable in the rivalry of France. Glass would not be imported to any amount. In particular kinds of lace, indeed, they had probably the advantage, but none which they did not enjoy independently of the treaty. The clamours about millinery he thought vague and unmeaning. Viewing the relative circumstances of the two countries in this way, our superiority in the tariff was manifest. The excellence of our manufactures was unrivalled, and, in the operation, must give the balance to England. Another circumstance comparatively favourable to this country above France in the treaty, was the state of population in both kingdoms. We had a market opened to us in a country containing above 20 millions of inhabitants, whilst we admitted France to trade with a nation, that was supposed to contain not above eight millions.

With regard to the effect of the treaty upon the revenue, he remarked, that although a considerable reduction must undoubtedly take place on the duties upon French wines, and even upon Portugal wines, should the provisions of the Methven treaty be still kept in force, yet this would be balanced by the increased consumption, and by putting an end to the fraudulent manufacture of home-made wine, which was brought to market as foreign wine, a practice which no regulations of excise had hitherto been able to suppress. If any loss, however, should occur, the article of cambric would alone go a great way towards indemnifying the revenue. He farther remarked, that our most ingenious and laborious manufactures, in steel and other metals, together with various productions of art, being henceforth entitled to admission to France, on payment of a moderate duty, millions of persons would be employed in the preparation of these objects; the taxes paid by whom would greatly augment the revenue. The high price of labour in England, said he, arises chiefly from the amount of the excise, and three fifths of the price of labour are supposed to come into the exchequer.

Upon the political tendency of the treaty, he recur- red to his former remarks. It was objected to, said, in as much as it went to compose those jealousies and destroy that rivalry, which had so long subsisted between the two countries, and which, it was stated, was of the most salutary consequence to Great Britain; and it was further insinuated, that there was no dependence to be placed on the faith of the other contracting party. The first of these objections had, he said, unfortunately gained some degree of consideration from the uniform practice of the two countries for centuries past; and he was scarcely surprised to hear, even from such enlightened men as he had heard speak upon the subject, that France and England were naturally and necessarily enemies. The fact, he was persuaded, was directly the reverse; for however ambition might have embroiled them with each other, still there had always been, in the individuals of both countries, a disposition towards a friendly intercourse, and the people of France and Britain had each of them virtues and good qualities, which the other had liberality enough to acknowledge and admire. To suppose that any two states were necessarily enemies, was

^{Britain.} an opinion founded neither in the experience of nations, nor in the history of man. It was a libel on the constitution of political societies, and supposed the existence of diabolical malice in the original frame of man. But, after all, what reason was there to imagine that the treaty was not only to extinguish all jealousy from our bosoms, but also completely to annihilate our means of defence? Was it to be supposed that the interval of peace between the two countries, would be so totally unemployed by us, as to disable us from meeting France in war with our accustomed strength? Did it not rather, by opening new sources of wealth, speak this forcible language, that the interval of peace, by enriching the nation, would be the means of enabling her to combat her enemy with more effect when the day of hostility should come? It quieted no well-founded jealousy, it slackened no necessary exertions, it retarded no provident preparation; but simply tended, while it increased our ability for war, to postpone the period of its approach. That we should not be taken unprepared for war, depended in no degree on this treaty, but simply and totally on the ability and vigilance of the administration for the time being.

³⁰⁸
Objections
of the ma-
nufacturers
answered.

The objections of the manufacturers to this treaty, were chiefly these: that the proposed intimate connection with France would afford opportunities of enticing away our workmen, and conveying the tools and raw materials of our manufactures out of the kingdom. To this it was answered: that the law upon these subjects would remain as formerly, and afford the same protection as at present to our manufacturers, by restraining the interference of foreigners upon the points alluded to. It was also objected in general to the treaty, that the commodities in which France traded, being the produce of her soil, which could not suffer in their quantities or quality by any lapse of time, whereas, our commodities being principally manufactures, which owe all their value to skilful and ingenious labour, it was to be feared, that the French might by degrees become as industrious and skilful as ourselves, and thereby enter into a successful competition with us, in every branch of our present trade; while our soil and climate rendered it impossible for us to equal them in the articles of their produce. To this objection it was replied, in general, that the different nature of the objects of British and French commerce was favourable to Britain, on account of the superior population employed in bringing our manufactures to market, and, at all events, that the threatened change could not occur in twelve years, which was the whole duration of the treaty. The ministry might also, with justice, have added, that the surest mode of preventing a neighbouring nation from becoming the rivals of any branch of our manufactures, is to supply them with these manufactures cheaply and in abundance, which must have the effect of inducing them to divert their capital and their industry into some more profitable channel. The most likely channel, with regard to France, would be the production of wine, a branch of trade in which Britain never can have reason to regard them with jealousy. Mr Pitt concluded his speech, by moving a resolution, the object of which was, to carry the treaty into effect.

The members of opposition objected to the treaty
VOL. IV. Part II. †

chiefly upon political considerations. Mr Fox contended that the only situation in which Great Britain could stand, in the general system of Europe, with honour, dignity, or safety, was as a counterpoise to the power of France: This had been our invariable quality, in all the most flourishing periods of our history; and it was this circumstance, operating upon the restless ambition of France, not any inward antipathy of mind, nor the memory of Cressy and Agincourt, that made the two nations natural enemies. To prove that no assurances of the friendship of France were to be trusted, when a hope existed of diminishing the power of Britain, he mentioned the correspondence between the French ministers and Lord Stormont, during the first years of the American war, in which they most pointedly disavowed any intention of interference. He observed that, when it was further considered who the monarch was that then sat on the throne of France, a monarch of the most mild and benevolent character, and celebrated for his love of justice; and that the minister who directed his councils was far advanced in the last stage of life, of a feeble and timid disposition, and therefore unlikely to be led away by any new and visionary projects of ambition; not a doubt could be left in any one's mind, but that the French nation was actuated by a regular, fixed, and systematic enmity to this country. France had, indeed, found that Great Britain could not be subdued by direct efforts. Mr Fox, therefore, thought it reasonable to suppose, that she had altered her policy; that instead of force, she intended to employ stratagem, to prevent our cultivating other alliances, to lessen the dependence of foreign states upon us, to turn all our views to commercial profits, to entangle our capital in that country, and to make it the private interest of individuals in Britain, rather to acquiesce in any future project of ambition, in which France might engage, than come to a rupture with her.

^{Britain.}
³⁰⁹
Political
objections,
stated a-
gainst the
treaty.

Mr Francis farther enlarged upon these ideas of Mr Fox, and reproached Mr Pitt with a desertion of the principles of his father Lord Chatham, the most prominent feature of whose political character was *Antigallican*. Mr Flood, Mr Sheridan, and others, supported the same sentiments. Mr Powis and Mr Alderman Watson opposed the treaty, as bringing the British commerce unnecessarily into hazard at a time when it was extremely prosperous. The treaty was defended by Mr Grenville, Mr Wilberforce, and Mr Dundas. This last gentleman said that he had heard much excellent political speculation, which, in his apprehension, had little relation to the subject in question: that the treaty had nothing political in its nature, but was merely a measure calculated to put it in the power of Britain to enable her artists to circulate her manufactures in a much greater degree than could ever formerly be done, by opening to them one of the most extensive markets in the world. He contended it was wise to take advantage of a period of peace to extend our commerce, reduce our debts, and enrich the nation. The resolution proposed by Mr Pitt was carried by a division of 248 against 118.

³¹⁰
Commer-
cial treaty
approved
of by the
commons.

In the house of lords, the commercial treaty was opposed with much warmth by Dr Watson, bishop of Llandaff. He contended that we ought not to abandon a commercial system, by which we had risen to

4 H our

Britain. our present prosperity, and far less to adopt a system which our ancestors had reprobated as detrimental to the welfare and greatness of the nation. The marquis of Lansdowne (formerly Lord Shelburne), defended the treaty with much ability. He said that commerce, like other sciences, had simplified itself, and that the old system, with all its monopolies, prohibitions, protecting duties, and balances of trade, was justly exploded; that it was a proud day for the manufacturers of this country, to see them come down in a body from these strongholds. He denied that the French nation entertained a systematic enmity against Britain, and said, that if commerce was to be free, there existed no reason for making an exception with regard to France. Their wines, brandy, vinegar and oil, are luxuries which we can get elsewhere; whereas they cannot procure, with equal advantage, coals, lead, and tin. He concluded with declaring his opinion, that if this country should decline, it would not be on account of this treaty, but for other obvious causes. If we went on sacrificing the army, the church, and the state, to the paltry purpose of procuring majorities in the two houses of parliament, we could never expect to be prosperous or powerful.

811 and by the lords. On the part of administration the defence of the treaty in all its stages appears to have been chiefly entrusted to Lord Hawkesbury, (formerly Mr Jenkinson). He was opposed by lords Loughborough, Stormont, and Porchester; but it was carried by a majority of 81 against 35.

812 Act to consolidate certain taxes. During the present session, a plan for consolidating into one act of parliament the whole duties imposed by the statutes of customs and excise, was brought forward by Mr Pitt, that it might be no longer necessary either for merchants, or for revenue officers, to turn over the whole statute book in search of the amount of the duties upon particular commodities. The plan received the universal approbation of the house of commons. The duties imposed upon French merchandise, in pursuance of the late commercial treaty, were also included in the same act, although that part of the measure was resisted by opposition.

813 Motion to repeal the corporation and test acts. On the 28th of March, Mr Beaufoy, member for Great Yarmouth, at the request of the deputies of the dissenting congregations about London, made a motion for the repeal of the corporation and test acts. He observed that the test act was originally levelled against the Roman Catholics, and the corporation act against those sectaries who had agitated the kingdom in the times of Charles I. and during the usurpation, with whose character the dissenters of the present age have nothing in common. Mr Beaufoy contended that, as every man has an undoubted right to judge for himself in matters of religion, he ought not on account of the exercise of that right to incur any punishment, or to be branded with what is undoubtedly a mark of infamy, an exclusion from military service and civil trust. He referred to the examples of Scotland, Holland, Russia, Prussia, and the dominions of the emperor, in none of which he said religious opinions were now made the ground of civil disqualification.

Lord North, who had now lost his sight, opposed the proposed repeal, chiefly on the footing of the hazard attending innovation. He denied that a man is sub-

jected to any punishment, because he does not choose to receive the sacrament of the Lord's Supper, according to the usage of the church of England. He only deprives himself of a privilege which he might otherwise enjoy, and which the law, for the safety of the church, had limited to persons of particular opinions. Mr Pitt supported the same side of the question, from the danger to the established church, which would result from intrusting official situations to dissenters. Mr Fox supported the motion in favour of the dissenters; remarking, however, upon this occasion, that from their conduct in a late political revolution, he could not be suspected of being biassed by an improper partiality towards them. The motion was lost on a division of 177 against 100.

814 Prince of Wales's debts. On the 20th of April, Mr Alderman Newnham brought under the view of the house of commons, the pecuniary situation of the prince of Wales, whose affairs had, by this time, fallen into a state of embarrassment. It appears that, previous to this period, a considerable degree of coldness had been known to subsist between the king and the prince. A judicious historian will scarcely account it worth his while to inquire after any other cause for such a circumstance, than merely that which is to be found in the overpowering influence that the passion of ambition possesses over the human mind, which so seldom permits any monarch to regard with complacency the person who has the prospect of his succession. In 1783, when the prince came of age, Mr Fox and his colleagues, who were then in office, wished to grant him an annual income of 100,000l. but his majesty insisted that he should only be allowed one half of that sum. In the year 1786 the prince was found to have contracted a debt of 100,000l. exclusive of 50,000l. expended on Carleton-house. He applied to his majesty to obtain relief from this incumbrance. On receiving a refusal, he instantly dismissed the officers of his court, ordered his horses to be sold, the works at Carleton-house to be stopped, and reduced his household to that of a private gentleman. From these savings an annual sum of 40,000l. was vested in trustees for the payment of his debts. This decisive and spirited conduct was represented at court as disrespectful to the king; and from this period his majesty's dissatisfaction with the prince appears to have been no longer concealed. On occasion of the assault made upon the king's person by Margaret Nicholson, it was remarked that no notice of the accident was sent by the court to the prince of Wales; and when, upon receiving the intelligence, he instantly went to Windsor, he was received there by the queen, but the king did not see him. At this time a French prince, the duke of Orleans, then the richest individual in Europe, was in England, and was said to have made a proposal to relieve the prince from all his pecuniary embarrassments; but this dangerous offer was declined. In these circumstances the prince permitted his situation to be brought before the house of commons, with a view of submitting his conduct to the judgment of the public. Accordingly, on the day already mentioned, Mr Newnham demanded of the chancellor of the exchequer, whether ministers intended to bring forward any proposition for the relief of the prince of Wales; asserting, that it would be disgraceful to the nation to suffer him to remain longer

longer in his present reduced circumstances. Mr Pitt replied, that he had received no command from his majesty upon the subject; without which it was not his duty to bring forward an affair of such a nature. Upon this Mr Newnham intimated his intention of bringing forward a motion upon the subject on the 4th of May. On the 24th of April, Mr Pitt requested to know the nature of the intended motion, declaring his wish to avoid a discussion of the subject. He added, that if it was persisted in, he would be under the necessity of bringing before the public some circumstances of extreme delicacy. At the same time, Mr Rolle, an adherent of the ministry, declared, that the question involved matter, which he threatened to bring into view, by which the constitution both in church and state might be essentially affected. This menace was known to allude to an intimate connection which was supposed to subsist between the prince and Mrs Fitzherbert, a lady of a respectable Roman Catholic family, with whom the scandal of the times alleged he had undergone the ceremony of marriage both by Catholic and Protestant clergymen, which, however, if true, could have no legal effects, in consequence of the provisions of the royal marriage act. Mr Newnham said, that his intended motion would be for an address to his majesty to relieve the prince of Wales from his present difficulties. When some members expressed their wish that the affair might be privately accommodated in some other manner: Mr Sheridan declared, that after the insinuations and threats which had been made, the prince could not recede with honour. Mr Pitt said, that his remarks had no reference to the character of the prince, but merely to a correspondence which had taken place relative to his pecuniary affairs.

On the 30th of April, when the subject was again mentioned, Mr Fox, who had been absent during the former debate, stated that he had authority from the prince to say, that there was no part of his conduct which he was unwilling to submit to public investigation. The allusions made to something full of danger to the church and state, he treated as a tale fit to be imposed only on the lowest of the vulgar; and said, that his highness was ready, in the other house, as a peer of parliament, to give his majesty, or his ministers, any assurances or satisfaction on the subject they might require. Mr Fox, at the same time directly assured the house, that the whole story alluded to was untrue. The result was, that an accommodation took place. The prince was allowed an annual addition to his income of 10,000*l.* and 181,000*l.* was granted by parliament for payment of his debts.

816
Privileges
of the Sco-
tish peer-
age.

During this session some discussions occurred relative to the privileges of the Scottish peerage. In the house of lords, after considerable debate upon a motion of Lord Hopetoun, a resolution was adopted to enforce an ancient resolution of the house, of January 1708-9, which declared, that Scottish peers, created British peers by patent since the union, have no right to vote at the elections of the sixteen who represent the body of the peers of Scotland in the British parliament. In the house of commons also, on the 23d of May, a question concerning the same body was agitated. It arose in consequence of the succession of the earl of Wemyss to that earldom, whose eldest son, Francis Charteris, who thus became Lord Elcho, represented

the boroughs of Lauder, &c. in Scotland. By the ancient law of Scotland, the eldest sons of peers could not sit in parliament, which consisted of one house only. By the treaty of union it is declared, that the two kingdoms should participate in the rights and immunities of each other. Sir John Sinclair moved, that a new writ should be issued for electing a member in the room of Francis Charteris, Esq. now become the eldest son of a peer in Scotland, and therefore incapable of representing the boroughs of Lauder, &c. In support of the motion some very early precedents were alluded to; and, after some debate, the motion was carried.

But the subject which, above all others, still continued during the present session to occupy the attention of parliament, was the accusation of Mr Hastings. After examining Mr Middleton and Sir Elijah Impey as witnesses, in the beginning of February, Mr Sheridan, on the 7th of that month, opened the third charge against Mr Hastings, which asserted, that without justice, or any excuse of political necessity, he had seized the lands, and confiscated the treasures, of the begums or princesses of Oude, the mother and grandmother of the reigning nabob, whom he had even compelled to become the instrument of this robbery. On this occasion the hall of the house of commons was uncommonly crowded. Mr Sheridan's speech lasted five hours and a half. The subject of the charge was well fitted for displaying all the powers of pathetic eloquence, in consequence of the rank and the sex of the parties whom, on this occasion, Mr Hastings was accused of having treated with the most barbarous rapacity, treachery, and cruelty. Every advantage was taken of these circumstances, and Mr Sheridan's discourse was considered as a model of splendid and impressive pleading. When he sat down, the whole house, which was filled with members, peers, and strangers, instantly joined in a loud and long-continued tumult of applause, expressing their approbation in the irregular mode of repeatedly clapping with their hands. Mr Burke declared it to be the most astonishing effort of eloquence, argument, and wit united, of which there is any record or tradition. Mr Fox said, that all that he had ever heard, or read, when compared with it, vanished like vapour before the sun; and Mr Pitt asserted, that it surpassed all the eloquence of ancient or modern times, and possessed every resource which genius or art could furnish to controul and agitate the human mind. After a suspension of debate, some of Mr Hastings's friends attempted to speak in reply, but found it impossible to procure themselves to be listened to with any appearance of favour. At last some members proposed, that for the sake of decorum, the debate should be adjourned. This proposal was carried; and on the following day Mr Francis resumed the charge, which was opposed by Mr Burgess, Major Scott, Mr Nichols, Mr Vansittart, and Mr Alderman le Mesurier. After having heard the arguments on both sides, Mr Pitt rose, and after having stated the sense he entertained of the high importance of the whole procedure against Mr Hastings, asserted, that he himself had endeavoured to give every fact stated in each particular charge, the fullest investigation, and to perform his duty honestly, impartially, and conscientiously. On the present occasion, he declared

Britain.

clared himself fully satisfied, that criminality was brought home to Mr Hastings, though not perhaps to the full extent alleged by the accusers. The motion for accusation was carried, upon a division of 175 against 68.

At future periods of the session other charges were brought forward, and opened by Mr Thomas Pelham, Sir James Erskine, Mr Windham, and Mr Francis. Mr Pitt adopted the cause of the accusers, and on some occasions, though in a mild manner, Mr Dundas did the same. At one period of the accusation, Lord Hood stood forward in a very solemn manner, and requested the attention of the house to the consequences of proceeding, with too scrupulous a nicety, to canvass the conduct of those who had filled stations abroad of high difficulty and important trust. Certain actions, which appeared to those at a distance in a very criminal light, were yet, he alleged, on a nearer investigation, perfectly justifiable on the grounds of absolute and indispensable necessity: should the fear of an impeachment by parliament be hung out to every commander in whose hands was placed the defence of our national possessions, it must necessarily operate as a dangerous restraint to their exertions, when it was considered that no general or admiral had scarcely ever been fortunate enough to conduct himself in the performance of his duty, without occasionally falling into circumstances, in which the public service compelled him to do things in themselves not pleasing to his feelings, nor strictly legal, but, from the indispensable necessities of their situation, perfectly justifiable. The example set by the house of commons in the present instance, would, he said, for ever stand before our future commanders, and create a great and dangerous clog to the public service. This, he was confident, would be the effect of punishing any harsh and severe, but perhaps necessary and indispensable, acts of power, which the saviour of India had, for the public good, been found to commit. Mr Pitt opposed the application of these sentiments to the case of Mr Hastings, asserting, that no adequate political necessity had been pointed out which could justify his conduct.

In the course of the proceedings, it appeared that several members were disposed to consider the merits of Mr Hastings as compensating his crimes, and thus, though they voted his conduct criminal on particular occasions, they had an intention of voting in his favour, when the general question should come to be proposed, about the propriety of proceeding to impeachment. Upon this subject, Major Scott took an opportunity to declare, that Mr Hastings and his friends wished to decline such a mode of defence; and he read to the house as a part of his own speech, a paper signed by Mr Hastings, in which he requested, that if a general vote of criminality should pass against him, by that house, they should farther proceed instantly to an impeachment, that he might have an opportunity of defending himself judicially.

820
Committee
appointed
to prepare
articles of
impeachment.

A committee was at last appointed, to prepare articles of impeachment against Mr Hastings. It consisted of the following persons, whose names we shall recite, as exhibiting a list of the most active leaders of opposition at this period. Mr Burke, Mr Fox, Mr Sheridan, Sir James Erskine, the right honourable Thomas Pelham, the right honourable William Wyndham, the honour-

able St Andrew St John, John Anstruther, Esq. William Adam, Esq. M. A. Taylor, Esq. Welbore Ellis, Esq. the right honourable Frederick Montague, Sir Grey Cooper, Sir Gilbert Elliot, Dudley Long, Esq. Lord Maitland, the honourable George Augustus North, General Burgoyne, and Mr Grey. An attempt was made, by Mr Burke, to procure the appointment of Philip Francis, Esq. as a member of this committee, but without success. He was rejected by a majority of 96 to 44, on account of his being considered as the personal enemy of Mr Hastings, whose measures he had opposed, and with whom he had fought a duel, in India. On the 25th of April, Mr Burke presented the articles of impeachment. They were read, and ordered to be printed and considered, on the 9th of May. Upon that day Lord Hood repeated his former arguments against them, and was supported by Mr Smith, and the celebrated Mr John Wilkes. This last gentleman insisted strongly on the silence of the natives of India, upon the subject of the dreadful oppression said to have been practised against them, and attributed the greatest part of what appeared criminal in the conduct of Mr Hastings, to the craving and avaricious policy of this country, whose demands had, in some instances, driven Mr Hastings to the use of means not strictly justifiable. The amount of the charges, he said, supposing the facts true, was this, that Mr Hastings, by oppression, by injustice, and corruption, had obtained for the East India Company, nine millions and a half sterling. Mr Wilkes thought the acts complained of politic and just; he could not honestly vote for the impeachment of Mr Hastings, while he benefited by his misdeeds. He added, that it appeared incomprehensible to him, how gentlemen who condemned his actions, suffered a day to pass without proposing retribution to the sufferers.

The lord advocate for Scotland (Hay Campbell, Esq.) supported this last idea. He considered the necessities of the company, and the dangerous crisis of their affairs, as grounds of justification for the strong measures pursued by Mr Hastings, in order to extricate them. The company having actually reaped the benefit of them, and so far approved of them as never to have signified any intention of restitution; he could not, he said, conceive with what propriety Mr Hastings could be impeached for them. He further observed, that Mr Hastings had been most unjustly blamed for various acts of administration, in which he had only concurred with others; that the order of dates, as well as the state of the council at different periods, ought to have been more distinctly attended to in the charges. Mr Hastings had enjoyed the casting voice in the council, only for a very short time, and even then, Mr Barwell was equally responsible with him. Afterwards Mr Wheeler, Sir John M'Pherson, Sir Eyre Coote, and Mr Stables, came gradually into the council. At one period, a coalition took place between Mr Hastings and Mr Francis. How do the prosecutors account for this? And is Mr Hastings alone to be made accountable, during that period? He concluded with observing, that in suggesting what had occurred to him, in favour of Mr Hastings, he had avoided saying any thing upon the topic of his extraordinary services in general, being doubtful

By Hay Campbell, Esq.

Britain. ful whether upon the supposition of guilt, in any specific article, a *set-off*, as it is called, or balancing of accounts between merits and demerits, would relevantly be admitted; at the same time, it was a mode of defence not altogether new. The proceedings in Lord Clive's case left no room to doubt, that he owed his safety to it; and there was still a more illustrious example of it in history, the case of Epaminondas the Theban general, who, when tried for his life before the tribunal of his country, for having kept the command four months after he should have laid it down, acknowledged the crime, but enumerated the glorious actions which he had performed; and said he would die with pleasure, if the sole merit of these were ascribed to him. This speech procured his acquittal. The lord advocate thought Mr Hastings well entitled to make use of similar language to the British nation, when accused of having acted illegally in India.—Mr Alderman Townshend justified Mr Hastings on the ground of state necessity; and said that he deserved the highest applause, for not having stood upon so paltry a punctilio, as considering whether a measure was rigidly correct and legal, when the immediate necessity of the company's affairs, and the salvation of India, were concerned.

823
Mr Pitt's
reply.

Mr Pitt reprobated the idea of a *set-off* in very strong terms. He acknowledged that many measures during the administration of Mr Hastings were uncommonly brilliant, and that, in these, his merits were unquestionable. But he trusted that no man, who seriously regarded the honour of the house of commons, would expect that the justice of the country could admit of any compromise whatever. He was sorry his honourable friend, the lord advocate of Scotland, should conceive the honour of the representatives of the British nation not interested in rescuing the British character from that degree of infamy and degradation to which it had been reduced. The accusations which had been preferred against Mr Hastings were now not only the cause of the house, but, in his opinion, involved the honour of every member individually. Nor had he less hesitation, from the importance of the subject, to say it affected the government of the whole empire. It was a question which shook the basis of the constitution, for it was literally a question of responsibility. The policy and interest of the country required, that an example should be made of the delinquent. The necessity of this, he urged particularly from the disposition he perceived in the abettors of Mr Hastings to justify him on the principles of expediency and necessity. The question of impeachment was carried by a majority of 175 against 89. And on the 10th of May, at the bar of the house of lords, Mr Burke, in the name of the house of commons, and of all the commons of Great Britain, impeached Warren Hastings, Esq. late governor-general of Bengal, of high crimes and misdemeanors; and informed the lords that the commons would with all convenient speed exhibit and make good articles against him. On the 21st of the same month, upon the motion of Mr Burke, Mr Hastings was taken into the custody of the serjeant at arms of the house. He was immediately admitted to bail by the house of lords. He was bound in the sum of 20,000*l.* and two sureties in 10,000*l.* each. As the session of parliament was prorogued on

the 30th of May, the trial was necessarily postponed to another session, and by various delays it was ultimately protracted to an extraordinary length.

Britain.
825
Reflections
on the ac-
cusation of
Mr Ha-
stings.

The accusation of Mr Hastings, from the attention which it excited, and the talents which were exerted in it, is undoubtedly an event of considerable importance in British history. It ended in the acquittal of the party accused, but at the same time the immense expence which he incurred, and the uneasiness which he must have suffered from the high degree of odium which in the minds of many persons was excited against him, must undoubtedly have amounted to a very severe punishment. A British house of commons held him guilty of inhumanity, rapacity, perfidy, and tyranny, towards a numerous and a civilized people that had been subject to his power. These sentiments were so widely diffused throughout Great Britain, that the minister of the day, always studious of popularity, thought it necessary to join the general current of opinion; and this will probably be regarded as one of the instances in which Mr Pitt must have exerted some kind of singular dexterity in preserving the confidence of the court, while he seemed to favour a prosecution that was not generally considered as acceptable there.

The period is perhaps scarcely yet arrived when a British historian can so far elevate his mind above temporary and national prejudices as to enable him to appreciate correctly the merits of Mr Hastings, or the reasonableness of the accusations that were brought against him. In making the attempt, it is necessary to consider correctly the situation in which that gentleman stood. He was invested by the British East India Company with absolute power over the people and the soil of a large portion of Hindostan, for the purpose of governing that country for the profit of the company, and to acquire more extensive territories for them if possible. To fulfil the service in which he was employed, it was necessary that he should procure a large revenue for the company, and at the same time that he should enable the young men of rank, whom they sent out in their service, speedily to return to Britain with great wealth; these being the only objects on account of which the East India Company, or the British nation, had made great efforts for the conquest of the east. But these objects evidently imply not that Hindostan was intended to be mildly and generously governed, but that it was to be plundered to the utmost extent that it could bear without ruin. Accordingly, in 1782, Mr Hastings, in one of his letters, complained strongly of the cruelty of his situation, and of the expensive establishments and offices which he was under the necessity of constituting in India, to gratify the avarice of his employers, declaring that he had at that time about him 250 persons, the younger sons of the first families in Britain, all looking up to him for patronage, and expecting to be put in possession of sudden riches. These riches, it is evident, could not be drawn from the natives of Hindostan without much oppression; and when this oppression produced rebellion, or combinations of the native princes against the British power, it became necessary to be guilty of farther oppression, or more grievous extortion, to collect means whereby to subdue the resistance of the vanquished people.

It:

Britain.

It is admitted on all hands, that Mr Hastings was almost unboundedly successful in the service of his employers. He annually sent home great numbers of men loaded with the plunder of the east, while at the same time, by great activity and intrepidity, he collected resources wherewith to maintain and extend the British power, and was enabled to support it in all quarters against the most extensive combinations of the princes of that country.

There are two systems of morality, according to which the character of such a man as Mr Hastings may be tried. The one is founded upon the principle of national attachment or patriotism, and the other upon the great law of humanity. According to the first of these, that conduct is most worthy of applause, which tends in the highest degree to promote the aggrandizement of our native country. Considered in this point of view, the merits of Warren Hastings have seldom been surpassed; and he may justly be ranked among those men whose actions the historians of Greece and Rome, and indeed of almost all nations, have recorded with boundless admiration, and he may well stand a comparison with the first heroes of antiquity. Such difficulties as perplexed Alexander of Macedon, at the head of a great and well-disciplined army, repeatedly yielded to the energy of his talents, which often enabled him, with the most trifling force, and by the mere ascendancy of his personal character, to exercise a despotic authority over an immense country, and to extend the territories of his employers. It is true, that he plundered the provinces of the East, but it was to aggrandize and enrich his country that he did so. He accounted their persons and fortunes as of little consideration, because he was the devoted servant of Britain. Accordingly, the most patriotic people in Europe, the French, whose public enemy he had been, regarded him with admiration, and uniformly extolled his actions as more than human.

In opposition to all this, if we are to weigh the conduct of Mr Hastings by those maxims of morality, which consider the great interests and law of humanity as the rule by which human actions ought to be regulated, there can be no doubt that he must be condemned. He can only be regarded as one of those robbers of nations, to whose crimes historians and poets have given a fatal celebrity. He was guilty of plundering and oppressing a pacific race of men at the extremities of the earth, in whose affairs neither he nor his country had any right to interfere. But the great criminals in this case were the British East India Company, the British legislature, and the British nation, that sent him upon such a service. Mr Hastings was only the guilty servant of a guilty people; and it surely ill became the British house of commons, that had authorized the acquisition of conquests, that is, the exercise of murder and oppression in the East, and whose constituents had become rich by the plunder or the profits of such enterprises, to accuse as a criminal the most successful servant of the state. We therefore apprehend, upon the whole, that Mr Wilkes and the lord advocate for Scotland rested Mr Hastings's defence upon an unanswerable footing, when they considered his crimes as services, which he was employed by his country to perform for its aggrandizement, for the moral rectitude of which he could not be responsible to that power, from

which he derived his commission, and which thought fit to reap the fruit of his labours. Britain.

During the year 1787, the state of amity into which Britain and France might be regarded as brought, in consequence of the commercial treaty, seemed likely to be disturbed, in consequence of the affairs of Holland. 825
Affairs of
Holland. The grounds of difference were speedily adjusted; but the events from which they rose are worthy of notice, on account of their tendency to explain some future occurrences in the history of Europe. The state of the Dutch republic, or, as it was usually called, the United Provinces, was always regarded as of much importance by Great Britain. That country, being situated upon the mouths of the navigable rivers which communicate with some of the most important parts of the European continent, is the great passage by which our manufactures reach their place of ultimate sale and consumption. In our most important efforts for reducing the power of France, the Dutch had acted along with the British nation. Their stadtholder, who had at all times dreaded the power of the French, was disposed to look for protection towards Britain, and was not understood to have concurred zealously, during the late war, in supporting the cause of France and America. The present stadtholder had united himself by affinity to the court of Prussia, with which that of Great Britain had of late begun to be upon terms of great cordiality.

In the history of the United Provinces, during two 827
Parties in
the Dutch
republic. centuries, two parties are always found struggling for superiority. The first, was that of the house of Orange, which had been first raised to power in consequence of the talents of its chiefs, united with their rank and property, which had induced the states to intrust to them the direction of their armies; first, against the Spanish monarchy, from which the provinces had originally revolted, and afterwards against the power of France. By their great public services, the princes of the house of Orange had established, in their own favour, a kind of hereditary claim to the offices which they held in the republic, of stadtholder, captain-general of the forces, and admiral. Thus there existed, in their persons, in succession, a kind of limited monarchy, by which the Dutch republic was influenced and led, rather than formally governed.

The second party in the Dutch republic consisted of a kind of aristocracy, composed of the senates or town-councils of different cities, which possessed the power of nominating to the vacancies in their own order, that is, of electing their own successors in office. This party was usually denominated the *party of the states*, or the *republican party*. Its members were, in point of form, the sovereigns of the country, and were the wealthiest individuals in it. The chief constitutional controul which the stadtholder possessed over them, consisted of a regulation violently established by William III. prince of Orange, in 1674, whereby he enjoyed a negative over the elections to town governments, and a power, in certain cases, of introducing members into them. It is to be observed, however, that the mass of the people at large, who always find greater safety under the dominion of one great superior, than of a multitude of petty local chiefs, were always decidedly attached to the house of Orange, or to the power of the stadtholder, in opposition to that

Britain. of the town senates or republican party. The ancient nobles also, together with the clergy of the established church, and the officers of the army and navy, adhered to the same family, and thereby enabled it on ordinary occasions to support its power.

828
Dutch vo-
lunteers.

During the participation of the United Provinces in the late war against Great Britain, a proposal had been made to enrol bodies of volunteers in the different towns, for the purpose of internal defence. The senates of the towns, that is, the aristocratical, or, as they called themselves, the *republican party*, encouraged the formation of these armed bodies of burghers (over whom at their first enrolment they had complete influence), as affording them a kind of counterpoise against the military power, which, though paid by them, was commanded by the stadtholder. These bodies of citizens, as soon as they were trained to the use of arms, began to be sensible of their own importance. The opinions propagated in North America, during the war, were known all over Europe. They were received with considerable avidity by the Dutch volunteers, and produced in that country a kind of third or democratic party, whose object was to procure for the citizens at large of the towns, a share in the nomination of the magistrates. As the volunteer associations were originally the creatures of the senates or aristocracy, for the purpose of counteracting the power of the stadtholder, they appear, in their first movements, to have been directed by that faction. One of their first movements was at Utrecht. The armed burghers, amounting to 2243, presented a petition to the states of the province of Utrecht, requesting them to abolish the regulation of 1674, whereby the stadtholder was enabled to influence the nomination of the magistracy. They presented an address of a similar nature to the town senate of Utrecht, and to the prince of Orange. As might have been expected, the answer of the prince was unfavourable; but the magistrates of Utrecht, in compliance with the wish of the armed burghers, proceeded to fill up a vacancy in their own number, without consulting the prince. This event occurred in January 1784; but it appears, that in the course of the same year, either from the intrigues of the stadtholder's court, or from a dread of betaking themselves to the assistance of the new and dangerous democratic party, the states of the province and town senate of Utrecht, deserted the cause of the armed burghers, whom they themselves had instigated to action, and recalled or annulled the steps towards innovation which they had taken. The senate and the armed burghers continued alternately to intimidate each other. By degrees, a spirit of political reform, or innovation, diffused itself from Utrecht to the different towns in the provinces where bodies of volunteers or armed burghers had been established. The armed burghers of Utrecht elected a representative body to watch over the management of public affairs; and various other towns did the same. These representative bodies soon quarrelled with the old senates; and the prince of Orange appears to have had it in his power to select which of the parties he might think fit as his adherents. His ancient enemies were the aristocracy or town senates. At the same time, as he could not, without the dangerous measure of a total alteration of the constitution of the United Provinces, derive a re-

gular and legal support from the bodies of armed burghers, he resolved to support the ancient magistracies, and to rest his power upon its ancient footing of influence over these magistracies, though he knew them to be his rivals in political importance. Hence he supported the magistrates of Utrecht and other places against the armed burghers. It would seem, that the aristocracy of the province of Holland, who had always been the most decided enemies of the family of Orange, were not satisfied with the disposition of the prince to support the ancient constitution, and resolved to attempt to undermine or overthrow his power, even at the hazard of a popular or democratic revolution, which must be equally fatal to their own. This aristocratical body, however, was not of an enterprising character, and rather waited than attempted to direct the course of political events. In consequence of the support given by the stadtholder to the senates of Utrecht and other places against the armed burghers, these last, through the whole United Provinces, became disposed to act in opposition to him. In the meanwhile, the populace of the Hague retained their usual attachment to his person and family. On the 4th of September 1785, twelve volunteers of the corps of the town of Leyden, appeared at the Hague in uniform. The populace, offended by this appearance of defiance to the prince at the place of his residence, attacked and drove them into a neighbouring house, the windows of which they broke. A part of the garrison, without interfering with the populace, took the volunteers into custody, and sent them home privately by night. This riot served as a pretext to the states of Holland to supersede the prince of Orange in the command of the garrison at the Hague, which they intrusted to the deputies of Haerlem, a town that had been zealous in opposition to the stadtholder. As this prince had been engaged in endless controversies with the states of Holland, in which the strength of the aristocratical party was concentrated, this affront drove him to the resolution of leaving the Hague, which he did on the 14th September 1785. He applied for protection to Great Britain, whose cause he had supported in opposing the resolution to give any assistance to the Americans in the late war, and to the king of Prussia, the uncle of his wife. The aristocratical party, on the contrary, made application to the court of Versailles, which it had supported by entering into the confederacy against Great Britain, and from which it had always received encouragement. At the same time, it endeavoured to derive assistance, from uniting its cause extensively with that of the armed burghers.

529
Inter-
ence of
neighbour-
ing states
in the af-
fairs of
Holland.

In the mean time, the celebrated Frederick, king of Prussia, died, and was succeeded by his nephew, Frederick William, the brother-in-law of the stadtholder. The French court appeared to espouse with vigour the united aristocratical and democratical parties in the United Provinces. The new king of Prussia seems to have hesitated to engage in a dispute with France; and there is little doubt, that had the French court, on this occasion, appeared ready to act with vigour in support of their party in Holland, the stadtholder must have fallen before his enemies; neither is it probable, that Britain would, at this time, have engaged in a new war on his account. But the French monarchy,

Britain. monarchy, under a benevolent and well-meaning but weak prince, was, at this period, rapidly sinking into a state of great feebleness, in consequence of the extreme embarrassment of its finances. A negotiation was at first proposed between the courts of France and Berlin, for the purpose of adjusting, in some friendly manner, the differences between the stadtholder and his enemies. The weakness of France, however, becoming gradually more obvious, Prussia and Great Britain were soon induced to act a more decisive part in the affairs of Holland, chiefly, it is believed, in consequence of the suggestions of the British ambassador at the Hague, Sir James Harris. The stadtholder had established himself towards the eastern part of the Dutch territory at Nimeguen. Though himself a man of little activity or enterprise, his princess was of a different character. She ventured to undertake a journey to the Hague, unaccompanied by her husband, probably with a view to what actually happened. On the 28th of June 1787, she was arrested by some troops of the opposite party; and this circumstance afforded an excuse to the king of Prussia for interfering in the internal affairs of the United Provinces, to demand a reparation for the insult offered to his sister. A Prussian army, commanded by the duke of Brunswick, the brother-in-law of the king of Great Britain, immediately prepared to invade Holland. To secure additional aid to the prince of Orange, a treaty was concluded between Great Britain and the landgrave of Hesse Cassel, for the assistance of 12,000 troops. In the mean time, the United Provinces remained in a state of great internal distraction. The defects of their political constitution had originally occasioned the appointment of a stadtholder; and no simple system was yet substituted in its stead, which, by doing away the distinctions of states and provinces, might unite the force of the country, for the purpose of enabling it to resist such powerful aggression as that with which it was now threatened. The promised aid from France did not arrive; troops had been levied by the states of Holland, and the chief command of them was intrusted to the rhringrave of Salm, to whose character little confidence appears to have been due. The duke of Brunswick, at the head of a powerful army, entered the country. The reputation of the Prussian armies in Europe was at this time extremely great; and the frontier towns of Holland, which were capable of resisting severe sieges, were now taken with facility, and without a struggle. It is unnecessary to detail the progress of the Prussian troops, which was extremely rapid, and in little more than a fortnight, the republican party found itself confined to the city of Amsterdam. This city was besieged on the 1st of October. After much negotiation, and a variety of attacks, this city, which had so often given laws to other states, admitted a foreign garrison to the possession of its gates. The influence of France was thus totally annihilated in Holland. The power of the stadtholder was restored; but it was restored by the power of Prussia and of Britain. The consequence was, that a decided enmity to these two countries, from that period, took possession of the minds of a great portion of the inhabitants of the Dutch territories. At the same time, the people of that country appear, from this period, to have fallen into a kind of despair, with regard to their na-

tional independence. Their ancestors had derived importance from the relative weakness of the neighbouring states; but from the experience of the event which now occurred, the people of Holland were made sensible of their own weakness, amidst the powerful nations by which they were now surrounded.

When the British parliament met on the 27th of November 1787, the most remarkable circumstance alluded to in the king's speech was the affairs of Holland. He said, that the disputes which subsisted in the republic of the United Provinces had become so critical, as to endanger their constitution and independence, and were thereby likely in their consequences to affect the interests of his dominions: That upon this account, he had endeavoured, by his good offices, to maintain the lawful government in those countries, and had thought it necessary to explain his intention of counteracting all forcible interference on the part of France: That in conformity to this principle, when his most Christian majesty, in consequence of an application for assistance against the king of Prussia, made by the party which had usurped the government of Holland, had notified to him his intention of granting their request, he had declared, that he should not remain a quiet spectator, and had given immediate orders for augmenting his forces both by sea and land: That in the course of these transactions, he had thought proper to conclude a subsidiary treaty with the landgrave of Hesse Cassel: That the rapid success of the Prussian troops, having soon after enabled the provinces to re-establish their lawful government, and all subjects of contest being thus removed, an amicable explanation took place between him and the most Christian king; and both parties had engaged to disarm, and to place their naval establishments on the same footing as at the beginning of the year.

When the address to the throne was moved as usual, Mr Fox took an opportunity of expressing the fullest approbation of the measures that had been lately pursued, and took credit to himself, as one of those who had invariably been of opinion, that this country is at all times deeply interested in the situation of affairs upon the continent, and ought, whenever occasion required, to take an active and vigorous part in preserving the balance of power in Europe. He reminded the house, how frequently he had warned them of the ambition of France when the commercial treaty was under discussion in the last session. He had been thought too severe and uncandid, from the distrust he had then expressed of its friendly professions, but within one year from the conclusion of that treaty, our new friend, this faithful commercial ally, had engaged to support, in Holland, a party in opposition to us, usurpers of the lawful government of their country. He approved of the principle of the subsidiary treaty with Hesse Cassel, as enabling us to reduce our military establishments at home, and to apply the public treasure to the increase of our naval strength, the natural force of Great Britain.

In the house of lords, the bishop of Llandaff, after expressing his satisfaction in seeing the republic of the United Provinces again united in its views with Great Britain, stated a difficulty which occurred to him, with regard to the principle in the law of nature and nations, which could authorize Great Britain and Prussia

Britain. to interfere by force, in settling the internal disputes of an independent state. Was it a right which every individual possesses, of assisting those whom he sees oppressed by unjust force? No: that would be to take the question for granted; since the opponents of the stadtholder will not allow that he was oppressed by unjust force. Was it the right of assisting the majority of a country, to recover their ancient civil constitution from the encroachments and usurpation of a faction? He hoped the fact would bear out such a justification; but he was not well enough acquainted with the wishes of the majority of the Dutch nation upon that head. Upon what other ground did he approve of our late interference? It was on the ground of self-preservation; for if France had gained Holland, we had been undone. When it is said that Holland, and the other states of Europe, are independent states, the proposition is true only to a certain degree; for they all depend one upon another, like the links of a chain; and it is the business of each to watch every other, lest any one become so weighty and powerful, as to endanger the security or political importance of every other.

834
Naval promotions.

During the late interference of Great Britain and Prussia in the affairs of Holland, while a dread was entertained, that the discontented party in the provinces might receive assistance from France, and preparations were made on that account for fitting out a fleet, the lords of the admiralty had promoted 16 captains of the navy to the rank of admirals. In making this promotion, a selection had been made, in consequence of which upwards of 40 senior captains had been passed over, a circumstance which gave rise to various debates in parliament. To understand the subject, it is necessary to remark, that in 1718 an order of council directed the lords of the admiralty, in promoting officers to the rank of admirals in the navy, to prefer the senior captains, providing only they were duly qualified for the rank to which they were to be promoted. By a subsequent order of 1747, the lords of the admiralty were authorized to place such captains, as should be found incapable by age or infirmity of serving as admirals, upon the list of superannuated admirals, which had usually received the appellation of the list of the yellow admirals. In the promotion lately made, the board of admiralty had offered to place upon this list of yellow or superannuated admirals, most of the captains who were passed over; but conceiving themselves, from their capacity of future service, entitled to the rank of acting admirals, they had refused the retreat that was offered them, and a general disgust prevailed among the officers in the navy, on finding that their hopes of reward for the most active services, must at all times depend on their interest with the first lord of the admiralty. On the 20th of February 1788, Lord Rawdon, in the house of lords, stated their case, and proposed an address to his majesty upon the subject. The first lord of the admiralty, Lord Howe, justified the exertion of a discretionary power, by the board, in promoting navy captains to the rank of acting admirals, as a man might be fit to command a single ship, who ought not to be intrusted with the care of a fleet. Lord Sandwich asserted the impropriety of interfering with the executive government in an affair of this nature, and Lord Rawdon's proposal of an address was rejected.

835
Debates on the naval promotion.

VOL. IV. Part II.

The same subject was brought before the house of commons, in various forms, during the month of April, by Mr Bastard. He stated the merits of some of the individual captains who had been passed over as very great, and their services conspicuous, and asserted, that the most notorious partiality had been exerted in the promotion. He was supported by almost all the navy officers who had seats in the house, particularly Sir George Collier and Captain Macbride, who declared, that nothing short of ruin to the service must follow, if such a system of promotion was to continue. Mr Pitt defended the admiralty, by asserting, that no sufficient degree of misconduct had been stated, as could authorize the interference of parliament with the exercise of its powers. The board was protected, by a small majority of 150 against 134.

Britain.

During the present session some debates were occasioned, by certain plans of the duke of Richmond. His project of fortifying certain places in Great Britain had been negatived by the house of commons; but a part of the same plan, consisting of erecting fortifications for the defence of the West India islands, was still persevered in, and required an additional land force in that quarter, of 3064 men. He also wished to purchase certain powder mills at Waltham abbey, upon a project that government should manufacture gunpowder there, for its own use. He farther proposed, to raise a corps of artificers for the ordnance department, to be divided into companies, and subjected to martial law. This last plan met with considerable opposition, but was carried by administration, along with the other projects.

836

Duke of Richmond's plan of fortifying the West India islands.

A bill was at this time brought into parliament, subjecting to higher penalties than formerly, all persons who should export wool from the country, intending thereby to confirm the monopoly enjoyed by our own manufacturers in that article. The manufacturers asserted, that 13,000 packs of British wool were annually smuggled into France, which tended to raise the price of the commodity against our own manufacturers. Several country gentlemen opposed the bill, as an unjust hardship upon the profits of land in this country, which ought to have the world open, as a market for its productions. But the minister, who was aware of the importance of enjoying popularity with the commercial, that is, with the most active part of the British nation, gave full countenance to the bill, in consequence of which it passed into a law.

837

Act against exporting wool.

In stating the situation of the revenue, Mr Pitt made some remarks, descriptive of the improving state of the country, which are not unworthy of being here noticed. He said, that the receipt of the permanent taxes, in the year 1787, exclusive of the land and malt tax, had been 13,000,000l. The receipt of the taxes in the year 1783, had been 10,184,000l. Thus, there was an increase of revenue of three millions, of which not more than one million and a half accrued from new taxes. In the trade, the navigation, and the fisheries, the progressive improvement bore an exact proportion to the increased revenue.

838

Flourishing state of the revenue.

In the year 1772 our imports were	L. 14,500,000
Our exports	16,000,000
In 1787 the imports were about	15,800,000
But the exports were	16,600,000

4 I

In

Britain.

In like manner our navigation had increased.

The Newfoundland fishery in 1773 produced	516,000	Quintals.
In 1786 it produced	732,000	
In 1773 the tonnage in the Greenland fishery	27,000	Tons.
was	27,000	
In 1786 it was	53,000	

The southern whale fishery, a new and very valuable branch of trade, which we only took up at the beginning of the last war, had also equally prospered.

In this fishery, in 1785, there were employed 18 ships, producing 29,000l. In 1787, there were employed 38 ships, producing 107,000l.

839
Compensation to the American loyalists.

On the 8th of June the chancellor of the exchequer, Mr Pitt, called the attention of the house to the compensation which was intended to be made to the American loyalists, on account of the losses sustained by them in consequence of their adherence to this country during the American war. He divided the loyalists who had made claims of compensation into four classes. In the first class he ranked those who had resided in America at the commencement of the war, and who had been obliged to abandon their estates and property, which were seized and confiscated by the Americans. He proposed that such loyalists of this class as had not lost more than 10,000l. should receive full compensation; for losses above that sum, and below 35,000l. he proposed to grant 90 per cent. on the excess of losses above 10,000l.; where the losses were above 35,000l. and not above 50,000l. 85 per cent. was proposed to be allowed on the excess of losses above 10,000l. and where the loss was above 50,000l. 80 per cent. was to be allowed on all above 10,000l. The next class of claimants consisted of those who had lost property in America, but who had resided in England during the war. To the amount of 10,000l. Mr Pitt proposed to indemnify these also in full; but that from all whose claims amounted from 10,000l. to 30,000l. a deduction should be made of 20 per cent. and a farther additional deduction of 20 per cent. in progression upon every additional 50,000l. claimed. The third class of claimants consisted of loyalists, who enjoyed places, and exercised professions in America, and by adhering to this country, had lost their incomes. He proposed to put upon half pay those whose incomes amounted to no more than 400l. per annum, and to grant 40 per cent. upon any excess of income above 400l. per annum, unless the income should exceed 1500l. per annum, in which case, 30 per cent. only should be allowed upon the excess of income above 400l. per annum. Lastly, It was proposed to pay the full amount of their claims to persons connected with West Florida; because, by the treaty of peace, that country had been ceded by Britain to a foreign power. Mr Pitt concluded by moving, that, to satisfy these claims, 1,228,239l. should be voted to the several American claimants for losses, &c. and 113,952l. 14s. 4d. to the Florida claimants. The motion was unanimously agreed to. The liberality with which the British nation acted upon this occasion, merits approbation, as an instance of the wisest policy, from its tendency in future discontents, or insurrections in the subordinate parts of the empire, to secure the attachment of persons of property to the cause of the metro-

polis. As the claims of the American loyalists were stated by themselves, and not scrutinized with extreme severity, it was generally understood that these persons were in very few instances ultimate losers by the part which they had taken, a circumstance of which the public did not disapprove.

The trade carried on by Great Britain and other European nations upon the coast of Africa, for the purpose of purchasing negro slaves to be employed in the cultivation of the West India islands, and certain parts of the continent of America, does not appear, till of late years, to have been considered with that general attention, which a practice, so abhorrent in its nature to the mild principles of modern policy and manners, might have been expected to excite. This may probably have been owing, partly to the distance of the object, which tended both to conceal the sufferings, and to lessen the sympathy of the public for the unfortunate sufferers; partly to the connivance of politicians, unwilling to examine too severely into the necessity of the means by which distant colonies were enabled to pour luxury and wealth into the mother countries. The first public attempt, we believe, that was made to put a stop to this traffic, was by the Quakers of the southern provinces of America, who, soon after the establishment of their independence, not only presented, for this purpose, a strong and pathetic address to their several legislative assemblies; but actually proceeded, as it was said, in many instances, to emancipate the slaves that were in their possession. In Great Britain the same sect appears also to have taken the lead; and, after the example of their American brethren, presented, in 1787, a similar petition to the parliament of this kingdom. The cause soon after became extremely popular, and was taken up with great zeal and earnestness by various descriptions of people. A society was formed, and a considerable sum of money subscribed, for the purpose of collecting information and supporting the expence of an application to parliament. A great number of pamphlets were published upon the subject; several eminent divines recommended it from the pulpit, and in printed discourses; and in the present session, petitions against the African slave-trade were presented from the two English universities, and from several of the most considerable towns and corporations in the kingdom.

By a sort of general consent, Mr Wilberforce had been intrusted with the care of bringing the business into the house of commons; but he being prevented by bad health, Mr Pitt, on the 9th of May, having mentioned this circumstance, proposed that the house should enter into a resolution, to take into consideration the circumstances of the slave trade early in the next session. He added, that the privy-council had appointed a committee to inquire into the matter; and, that next session, the result would probably be laid before the house to facilitate their investigations. Mr Fox and Mr Burke expressed their regret on account of the proposed delay. They lamented, that the privy-council, who had received no petitions from the people, should have instituted an inquiry; and, that the house of commons, whose table was loaded with petitions from every part of the kingdom, should not have instituted an inquiry at all. If they suffered the business of the house to be done by the privy-council, they

⁸⁴¹ Britain. they were abdicating their trust, and making way for an entire abolition of their functions. Sir William Dolben called the attention of the house to the condition of the slaves in one point, which he alleged called for an immediate remedy. He said he neither alluded to their sufferings at home from the hands of their cruel countrymen, nor to their sufferings from their unfeeling masters, the planters in the West India islands; but to that intermediate state of tenfold misery which they suffered in their transportation from the coast of Africa to the West Indies. He entered into a short detail of the horrors of that dreadful passage, which he said was scarcely less fatal in its effects upon the British sailors, than upon the wretched slaves themselves; and he declared himself ready to call evidence to the bar to prove the fact. This, he said, called aloud for a remedy, and that remedy ought to be applied immediately. If parliament did not apply some remedy, without delay, between the present session and the beginning of the next, 10,000 lives would be lost. He wished, therefore, that this grievance should be taken into consideration, independent of the general question; and that some regulation, such as restraining the captains from taking above a certain number of slaves on board, according to the size of their vessels, obliging them to let in fresh air, and provide better accommodation for the slaves during their passage, and such other regulations as should suggest themselves to the house, should be adopted. This proposal met with general approbation; and, accordingly, a bill was brought forward, and passed into a law, for regulating the transportation of the natives of Africa to the British colonies in the West Indies. It met with some unsuccessful opposition from the merchants of Liverpool, who petitioned, and were heard by counsel, against it.

⁸⁴² Indian affairs. In the present session, the affairs of India still continued to occupy the attention of the legislature and of the public. During the apprehensions of a rupture with France, on account of the affairs of Holland, government had resolved to send out four additional regiments to India, on board the company's ships, for the protection of our possessions in that quarter; and the proposal had been received with approbation by the court of directors. After the danger was past, government still adhered to their resolution of sending out four regiments, with a view to form a permanent establishment of the king's troops in that quarter. In consequence of this circumstance, a question arose with the court of directors of the East India Company, about the expence of sending out, and hereafter paying, these troops. By an act passed in 1781, the company were declared liable for the expence attending such troops only as should be sent out upon their own requisition. But administration now contended, that the act brought forward by Mr Pitt in 1784, which gave to the board of controul a power of counteracting the orders of the court of directors, and of directing the application of the company's revenues, ought to be understood to authorize that board to carry into effect the proposed measure. The court of directors, however, obtained the opinion of some eminent lawyers in their favour; and, accordingly, refused to take the troops on board the ships that were about this time to sail for India. For this reason, on the 25th of February, Mr Pitt proposed, in the house of commons,

that all difficulties should be removed by a declaratory act, asserting the intention of the legislature, in the act of 1784, to have been agreeable to the construction put upon it by the board of controul. This mode of proceeding was strongly opposed. It was said, that the claims of government upon the company ought to be tried in a court of law, instead of being brought before the house of commons, where administration possessed an undue influence. It was contended, that the measure was in itself ill-judged, as it would have been more economical to have suffered the company to have raised four regiments, which would have enabled them to provide for many of their own officers, 600 of whom were living in India in very distressed situations, in consequence of having been reduced at the peace; or the mode might have been adopted, with better advantage to the company, of sending out recruits to complete the king's regiments at that time in India, which would have enabled them to avoid the additional burden of all the officers of four new regiments. The measure was farther condemned, as tending to produce confusion in India, by putting the power of the sword into two hands, and giving disgust to the officers in the company's service. It was added, that the power now claimed by the board of controul, of keeping an army of the king's forces in India, to any amount they thought fit, and of paying it out of the revenues of the company, was unconstitutional, as it enabled the king, contrary to the bill of rights, to keep a standing army in time of peace.

But the point of view in which this declaratory act was chiefly resisted, referred to its tendency to deprive the East India Company of the whole management of its own affairs, and the patronage arising from its revenues, which at the time that Mr Pitt's bill was passed, had never been understood to be the intention of the legislature or of government. Mr Pulteney and some other members, who usually voted with Mr Pitt, now declared that they supported his bill in 1784, only because it appeared to preserve uninjured the rights of the East India Company; that the construction attempted to be put upon it in the declaratory bill, made it equally obnoxious with the celebrated bill rejected by the lords in 1783, with only this difference, that what the one had for its professed object openly and without disguise, the other was attempting to effect by fraud and dissimulation. Mr Powis argued, from the various amendments which the act had received in its passage through the house, that no such ideas of its extent, as were now endeavoured to be established, were then entertained of it, much less expressed; and that if they had, it must have been rejected. Mr Baring, one of the directors of the East India Company, declared, that Mr Pitt's bill was generally understood at the time, by that board, to be utterly incapable of the unlimited construction now put upon it; and Colonel Barré declared that having asked one of the directors, why they had suffered the bill to pass unresisted and with the sanction of their concurrence, the director had admitted with him, that the bill darkly and tacitly conveyed powers to the board of controul, as hostile to the rights of the company as Mr Fox's bill; but that they had a confidence in the administration which introduced it, and had no doubt of their exercising these powers with gentleness and moderation.

Britain.

These sentiments excited great triumph on the side of Mr Fox and his friends, who loudly congratulated themselves upon the complete justification which his India bill had now, they said, obtained, by the tacit confession of his adversaries themselves.

In support of the declaratory act, Mr Pitt contended, that the express object of the institution of the board of controul, was to take the entire management of the territorial possessions and the political government of India out of the hands of the company, leaving them only the direction of their commercial concerns. The board of controul was in future to be responsible to the public for the prosperity and safety of our Indian possessions, and was therefore to be invested with all the powers necessary for the due discharge of its important duties. He denied that administration, in 1784, had held any other language with regard to its nature or the authority it was to possess.

With regard to the economy and policy of the present measure, he admitted, that there ought not to be two armies in India; but said, that the army which existed there, ought undoubtedly to be the king's; and solemnly protested that his conduct was in no degree influenced by the prospect of additional patronage to be acquired by the crown. He added, that it was the intention of government to divide equally the new commissions with the East India Company. Upon the constitutional question of a standing army being kept in India by means of the company's revenues, he stated, that all the existing laws relative to standing armies, were, in his apprehension, extremely inaccurate. If any danger was apprehended from the present act, he had no objection to receive any clauses that might be offered, from whatever part of the house they might come. On the 5th of March, the bill was carried by a majority of 182 to 125. In the house of lords, the marquis of Lansdowne expressed the utmost astonishment, that any one who recollected what had passed in that house in the years 1783 and 1784, could contend for a moment, that the principles of the present bill were contained in that of 1784. Their lordships had refused to suffer the bill of 1783 to be sent to a committee, because it was bad in its principle; and yet the act which they afterwards passed in 1784, as now intended to be explained, manifestly holds one and the same principle. The preference of the latter to the former, could not have been given on account of its particular provisions. He, at least, should have preferred that which gave the government of India to parliamentary commissioners for four years. It would now have expired. But if the power proposed should once be given to the crown, what time and exertion would not be required to recover it, or to keep within due bounds the influence of the crown, when all the patronage of India was added to the influence it already possessed? If it was capable of erecting a fourth state, and overturning the constitution in fourth hands, how much more capable of mischief would it be when united in one of the three estates, and that the crown, there being eleven millions sterling per annum to administer?

844.
General
remarks.

Upon the whole of this subject, it is, perhaps, no unfair remark, that, if the augmentation of the power of the crown was at this period indeed a misfortune, it was a misfortune which the conquest of India ap-

pears to have rendered inevitable. The East India Company, by whom the conquest had been made, was admitted, by all parties, to have shewn itself unfit to govern that great country. The management of it, therefore, naturally devolved upon the executive branch of the British constitution, unless the constitution itself was to be endangered, by intrusting the exercise of new and unusual powers to some of the other branches of the legislature, for whose due exercise of such powers the laws had made no provision; or, unless a new kind of authority or power was to be created, as attempted by Mr Fox's India bill, the result of which, as a political experiment upon the constitution, or mode of administering a part of the affairs of the empire, was necessarily hazardous, because heretofore entirely without example.

Britain.

The attention of the nation still continued to be occupied in no small degree by the prosecution of Mr Hastings. The members of the committee, which during the preceding session had prepared the articles of impeachment, were now appointed to act as managers for the house of commons in conducting the trial. On the 13th of February, the trial commenced with extraordinary solemnity in Westminster-hall, which had been fitted up for the purpose. About 11 o'clock the house of commons, preceded by the managers, came from their own house into the hall, Mr Burke leading the procession. Thereafter, the house of peers came in procession, preceded by the clerks of parliament, the masters of chancery, the serjeants at law, and the judges. The inferior peers came first, and the lord chancellor last. The procession closed with the royal family, including the queen; the prince of Wales advancing last. In passing to their seats, they bowed to the throne. That and the following day were consumed in reading the articles of impeachment, and the answers of Mr Hastings. On the 15th of February, Mr Burke began an oration, which he continued during that and four following days, and in which his talents were exerted with great splendour, and his eloquence listened to with admiration. After an appeal to the justice of the court, on the part of the people of India, who came, he said, in the name of the commons of Great Britain, but in their own right, to the seat of the imperial justice of the kingdom, from whence they originally derived all the powers under which they had suffered, he entered into a detail of the history of Hindostan from the earliest times. He gave a luminous view of the revolutions that had occurred in it; of the civil and religious institutions, together with the arts, customs, and manners, of the various classes of its inhabitants. He traced the progress of British intrusion, and minutely described the establishments made by our countrymen. He gave an animated account of the blessings which India might have derived from a communication with the most enlightened nation in Europe; but lamented, that, instead of acting as friends or instructors of the natives, our countrymen had marked their way by treachery and rapine, and taught vice rather than virtue. He expatiated on their usurpations of power, and their frequent enormities. He specified the acts of Mr Hastings, representing them as beyond all bounds arbitrary and rapacious, and endeavoured to hold him up to execration as a monster of tyranny. The governor-general had attempted to justify his oppressions.

Mr Burke's
oration of
five days.

Britain. prections, by asserting that the Asiatic governments were all despotic; that he did not make the people slaves, but found them such; that the sovereignty he was called to exercise was an arbitrary sovereignty, and that he had exercised it in no other way than was done by the other sovereigns of Asia, or the native princes of the country, who at all times made every order of their subjects, and all the property of the countries they governed, subservient to their policy or their extravagance. Mr Burke now reprobated this geographical morality, or these claims to absolute power. He denied that the East India Company, or that the British government, had it to bestow. He asserted, that no such arbitrary government was attempted to be justified in the east: That every Mahometan government must be a government regulated by law, that is, by the laws of the Koran; and that the Gentoo laws proscribe every idea of arbitrary will in magistrates. He contended that the conduct of tyrants and usurpers, or the corrupt practices of mankind, were no principles upon which to regulate the duty of a British governor, who is bound to act, and ought to be judged by his country, upon British principles. These principles Mr Hastings was now accused of having violated, not merely in his own personal conduct, but by employing under him, persons whom he knew to be the most worthless of human beings, and for whose enormous cruelties he was responsible. These cruelties the accuser described with such warmth of colouring, that many of his hearers were convulsed with horror. Mr Burke concluded his speech, or rather his course of orations, with declaring, that with confidence he impeached Mr Hastings in the name of the commons of Great Britain, whose parliamentary trust he had betrayed, and whose national character he had dishonoured. That he impeached him in the name of the people of India, whose laws, rights, and liberties he had subverted; whose properties he had destroyed, and whose country he had made desolate. Lastly, he impeached him in the name of human nature, which he had cruelly outraged in both sexes, in every age, rank, and condition of life.

347
Mode of
procedure
disputed.

The managers of the impeachment next proposed, for regulating the future conduct of the impeachment, that they should proceed to a conclusion on both sides, upon each article separately, before they opened another; but the counsel for Mr Hastings insisted, that the house of commons should first proceed to a conclusion upon the whole charges, before any part of the defence should be demanded. The house of lords deliberated upon this point. The lord chancellor Thurlow and others, who usually voted with administration, supported the demand made by the counsel for Mr Hastings; while Lord Loughborough, and others in opposition, contended that it was impossible to do substantial justice in this way. The managers for the commons acquiesced in the decision, and thereafter entered upon the particular articles of charge. Two charges employed the house of lords during the remainder of the session; as it was necessary to occupy much time in hearing evidence upon each.

348
Sir Elijah
Impey ac-
cused.

During the investigations occasioned by the trial of Mr Hastings, and the discussion of India affairs, the opposition party were led to bring forward an accusation against Sir Elijah Impey, the friend of Mr Hast-

ings, and lately chief justice of the supreme court of Bengal. Soon after the commencement of the present session, Sir Gilbert Elliot presented to the house of commons six articles, containing charges against the late judge, of various high crimes and misdemeanours. The substance of these charges amounted to an assertion, that the chief justice had in a variety of instances rendered himself the agent and tool of Mr Hastings, particularly in the decision of a considerable number of important causes. On this occasion, Sir Gilbert Elliot addressed the house with much ability, in a speech of considerable length. He began by exculpating himself from the imputations which usually attach to the office of an accuser, that he is actuated by a natural malignity of temper, by personal resentments or interests, or by the spirit and passions of party.

With regard to the last, he stated that Sir Elijah Impey had been declared criminal, by the voice of parliament, before the parties into which it was at present divided, had any existence, and that the proceedings, out of which this accusation originated, had been carried on by persons of all descriptions and connexions, and were countenanced by every one of the administrations, which had succeeded each other during the last six years. He next congratulated the house, upon the proofs they had given, that the grievances of India were not only fit objects of their inquiries, but that their redress was the best object of their power. He adverted to certain principles, which for obvious ends had been industriously disseminated abroad, and had even been maintained in that house, that India was indeed oppressed, but that it was accustomed to oppression; and that it must be oppressed or abandoned. These scandalous positions Sir Gilbert warmly controverted, and laid down in opposition to them, what he thought nature and experience warranted him to affirm, that India must be redressed or lost.

Sir Gilbert Elliot then laid down a second principle; viz. that the only means left of reforming Indian abuse, was the punishment, in some great and signal instances, of Indian delinquency. This proposition he endeavoured to establish with great ingenuity, by comparing the different force and efficacy of laws, as arising from their penal sanctions, when applied in our own internal administration, and in the government of distant possessions. At home, where government had in sight, and was in contact with, the governed, their execution was easy and certain; but in our remote dominions, we had to labour with all the difficulties that absence, distance, and ignorance could oppose. Against this evil, no perfect remedy could be found, as experience had fully proved. Every resource of legislative regulation had been exhausted in vain: no device had been left untried, except the simple expedient of distributing reward to merit, and pains to guilt; the exemplary punishment of detected crimes was the only means left of convincing our distant subjects, that though distance might delay, it could not finally avert, the cognizance and penalties of justice.

Of the particular charges which Sir Gilbert Elliot brought forward against Sir Elijah Impey, that respecting the fate of the rajah Nundcomar, a Hindoo-prince of the sacred cast of the Bramins, was the most remarkable. He had the weakness, or imprudence, to become an informer or accuser, to the East India Company, against

Britain. against their principal servant, Mr Hastings; the consequence of which was, that the governor-general was alleged to have procured an accusation to be brought against him, in the court where Sir Elijah Impey presided; and there, on a charge of forgery, he was tried, condemned, and hanged, upon the authority of an English statute; whereby all complaints against the company's servants were said to be for ever stifled, and the grievances of the east to have received a complete remedy. In the course of the session, witnesses were examined against Sir Elijah Impey. His defence was undertaken by the chancellor of the exchequer, with the solicitor and attorney-general. The first charge was rejected on the 9th of May, by a division of 73 against 55. On the 27th of May, the house voted a delay of procedure, during three months, and no impeachment resulted from the inquiry.

During the period which succeeded the prorogation of parliament, in the present year, the only occurrence worthy of notice arose out of the contests of the northern nations. At this period, the relative state of the European powers had rapidly undergone a most important alteration. During a century and a half, the power of the monarchy of France had been formidable to all Europe, and, at different periods, the most extensive combinations were found necessary to resist its ambition. That monarchy, however, since the close of the American war, had evidently lost its importance among the surrounding nations. Its influence over Holland had ever been one of its favourite objects of pursuit, but during the last year, it suffered that influence to be overturned, without a struggle; and with regard to every external effort, France, at this time, appeared to have fallen into a state of complete imbecility. The powers whose ambition was now dangerous to the repose of Europe, were Austria and Russia; the latter, in particular, was extremely restless and enterprising. The empress Catharine II. had contrived to engage in her views the emperor of Germany, Joseph II. and to prevail with him to engage in a sanguinary war on the eastern frontiers of Europe, with a view to the partition of the provinces of the declining empire of the Turks; while France, the ancient ally of that power, was unable to give it any countenance or aid.

In the mean time, the same empress held in a state of extreme dependence upon herself, the two kingdoms, on her western boundary, Sweden and Denmark. After the fatal reign of Charles XII. by whose extravagant military enterprises, the strength of the kingdom had been exhausted, Sweden had sunk into a state of political weakness. The nobles in all parts of the country had resumed, in a great degree, the independence of the feudal times, together with the anarchy to which that form of government was so remarkably subject. The crown and the people were equally insignificant, and the mutual animosities of the nobles subjected the state to the intrigues of neighbouring nations. The king of Prussia had remarked, that there was, in their diet, a French party, and a Russian party, but there was not an individual among them that supported the party of Sweden. The present monarch, Gustavus III. however, was now in the vigour of his age, and a man of a most enthusiastic and enterprising character. By attaching to himself the pea-

santry of the country, and their deputies in their diet, he had, in 1772, obtained his power to be declared absolute; but the nobles had gradually recovered a portion of their authority, and, by the intrigues of Russia, they were now become very dangerous to the throne. These intrigues rendered the situation of the Swedish monarch extremely unhappy, and excited an impatient desire of shaking off his dependence upon Russia. He resolved, therefore, to take advantage of the present war, in which she had engaged with the Turks, to make an attack upon this mighty power, on its north-western frontier. To accomplish this object with tolerable safety, however, it was absolutely necessary that Sweden should be safe on the side of Denmark. But the court of Denmark having always governed Norway in a harsh unfeeling manner, it is said, that in the year 1772, Gustavus III. gave great countenance and encouragement to the malcontents of Norway. This last circumstance has been alleged, by the Danes, as an excuse for a treaty into which their government secretly entered at that time with Russia, whereby it was agreed, that, if Russia should be attacked, Denmark should assist her with 12,000 auxiliary troops, and six ships of the line.

But whatever may have been the conduct of the king of Sweden in 1772, there is no doubt that ever after that period he endeavoured, in the most anxious manner, to conciliate the good will of the court of Denmark. At the close of the year 1787, he paid an unexpected visit to the Danish court, at Copenhagen, in a manner totally destitute of all ceremony, and there endeavoured to prevail with the prince regent and his council, who governed the kingdom during the incapacity of the king, to enter into his views with regard to Russia. He pointed out in the strongest terms, the haughty spirit with which that ambitious power annoyed all her neighbours; that if her present design succeeded, of partitioning the Ottoman empire, her strength would become so vast, that Sweden and Denmark could afterwards only hope to subsist as miserable dependents on her clemency. The court of Denmark, however, could not be prevailed upon to enter into these views, and appears still to have concealed its own secret engagements with Russia, or the part it meant to take in case of a war between Russia and Sweden.

In the month of July, the king of Sweden commenced offensive operations against Russia on the side of Finland. Here, however, the discontents which Sweden had been fostered by Russia among the Swedish nobles speedily came to view: Several officers declared, that the king had no right to make war without the consent of the states of the kingdom. The mutiny became general, and the troops refused to advance. When the king was in this embarrassed state, a Danish army suddenly advanced against Sweden under Prince Charles of Hesse Cassel, accompanied by the prince of Denmark, as a volunteer. To give this force the appearance of an auxiliary army, the prince of Hesse had been created a field marshal in the Russian service. The king of Sweden's affairs were now extremely desperate. The senate at Stockholm, during his absence, had assumed extraordinary powers, and had summoned a meeting of the states of the kingdom. The king, however, unexpectedly arrived at Stockholm from Finland,

He instantly sent off the whole regular troops from the capital; and having assembled the citizens, he declared, in a speech of great eloquence, that he intrusted to their fidelity the defence of his capital, and the protection of the queen and royal family. His audience were instantly seized with military enthusiasm; the citizens armed and embodied themselves, and performed the whole duty of the garrison. Such of the officers as had returned from the army in Finland, were insulted as traitors, and compelled to conceal themselves.

853
Efforts of the king of Sweden.

854
Danger of Gottenburg and the king of Sweden.

855
The British envoy, Mr Elliot, saves the Swedish king.

The king next hastened to the province of Dalecarlia, inhabited by a fierce and ignorant, but honest people, celebrated for the share which they took in the memorable revolution by which Gustavus Vasa rescued his country from the despotism and unequalled cruelty of Denmark, which had massacred the citizens of Stockholm, and almost exterminated the nobility of the kingdom. The loyalty of these people was kindled to enthusiasm by this second visit of a king to their mines and forests, and 4000 of them instantly came forth as volunteers. In the mean time, the Danish army was advancing along the sea coast, which had been left undefended. A body of Swedes were taken prisoners, and the army advanced towards Gottenburg. The governor of this place, which is mostly built of timber, and therefore liable to instant destruction by bombardment, summoned a meeting of the inhabitants, and recommended submission to the invaders; to which they agreed. A Danish officer was, in the mean time, on his way to propose terms for capitulation. Thus was the rich mart and great emporium of the foreign commerce of Sweden, the only port of any value which she possessed on the ocean, at the very point of being lost; nothing more being wanted to seal her destiny, than the arrival of the Danish officer to conclude the capitulation. By unusual personal exertion, however, the king, at this critical period, passed unnoticed through the enemies parties, and entered the city. He assembled the people, and having exerted his usual powers of persuasion, the inhabitants unanimously resolved to encounter every hazard in defence of the city. The place was thus saved for a moment; but its situation, as well as that of the king himself, was still extremely perilous. He had no adequate force within reach, wherewith to resist the Danish army; and the desperate obstinacy of his courage was such, that nobody doubted his determination to perish in the ruins sooner than relinquish the place, while the native spirit of his subjects would scarcely permit those present to avoid becoming partakers of the ruin. On this occasion, however, the city and the king, and perhaps the monarchy of Sweden, owed their safety to the interference of a British subject.

It so happened that at this important period there was no titled ambassador in Sweden from any of the courts of London, Berlin, or Versailles. Their place, however, was well supplied by Mr Hugh Elliot, the British envoy at Copenhagen. This gentleman, from the first notice of hostilities, discerned the interests of his country and of Europe. He passed over into Sweden, and offered his welcome mediation to the king. He next threatened the Danes with an immediate invasion by a Prussian army, supported by a British and Dutch fleet. He continued his threats with

such urgency and authority, that the Danish commander was intimidated, and delayed his threatened hostilities. A Prussian envoy soon arrived, and countenanced all the threats of Mr Elliot; the consequence of which was, that after much skilful negotiation, in which Mr Elliot was not a little perplexed by the impatient temper of the Swedish monarch, a suspension of hostilities was first concluded, and afterwards, in the month of November, the Danish troops totally evacuated the territory of Sweden.

Britain.

Before taking our leave of foreign affairs for this year, it may be observed, that on the 25th of April, a treaty of defensive alliance was concluded between Great Britain and the states general of the United Provinces, whereby his Britannic majesty guaranteed the hereditary stadtholdership in the house of Orange; and on the 13th of August, another treaty of defensive alliance was concluded with Prussia.

856
Treaties with Holland and Prussia.

At the end of autumn of this year a domestic occurrence took place of a singular nature, and new in the British history. The health of the sovereign had suffered a gradual decline; a circumstance that was not ascribed to the freedom of indulgence, and the softness of luxury, but, on the contrary, to too severe a regimen, too laborious exercise, too rigid abstemiousness, and too short intervals of rest. As a remedy for the symptoms that discovered themselves, the king determined to visit the medicinal waters of Cheltenham, and accordingly travelled into that part of the kingdom immediately after the prorogation of parliament, and did not return to the metropolis till the 18th of August. No benefit answerable to the expectations that had been formed resulted from this excursion. His health was in a precarious state, and on the 22d of October symptoms were observed by one of the royal physicians, of that alienation of mind which was afterwards the occasion of so many important and interesting transactions. For some time it was thought proper to observe as much secrecy as possible respecting the nature of the king's indisposition. The retreat of the sovereign at Windsor was favourable to this purpose; and for several days an opinion was entertained by the people in general, that his indisposition was a fever, and that it had risen to so alarming a height as to threaten a speedy dissolution. The real nature of the case, however, could not long be suppressed. By the structure and practice of the English constitution almost every species of public business is, in some manner, implicated with the royal prerogatives. The administration of political government, in particular, was by the present event virtually suspended from its functions; and, notwithstanding the critical situation of Europe, and the very active share we had lately taken in its concerns, it was now deemed impracticable to return any sort of answer to the dispatches of foreign courts, or of our own ambassadors. In this situation the most natural expedient was to suffer the two houses of parliament, which stood prorogued to the 20th of November, to meet at that time, and either adjourn for a short interval, or immediately proceed to discuss the measures it would be proper to adopt at the present crisis. Circular letters were accordingly addressed to the members of the legislature on the 14th, signifying to them, that the indisposition of the sovereign rendered it doubtful whether there would be a possibility of receiving

857
The king's illness.

⁸⁵⁸ ^{Britain.} receiving his commands for the farther prorogation of parliament. In that case, the two houses must of necessity assemble, and the attendance of the different members was earnestly requested.

⁸⁵⁹ Parliament assembled.

Parliament being assembled, the lord chancellor observed in the house of lords, that the reason of their being thus unusually called together without the ordinary notice, for the dispatch of business, arose from the severity of the king's indisposition, which had rendered it impossible for him to approach the royal person in order to receive his commands. Lord Camden remarked, that the customary practice of giving 40 days notice previously to the meeting of parliament, was not in his opinion absolutely necessary. There was an express act of parliament, that limited the notice, in case of treason or rebellion, to 14 days; he therefore recommended an adjournment for that term; and at the same time moved, that the chancellor, by order of the house, should address an official letter to every individual peer. Mr Pitt stated to the house of commons, that every authority had been consulted respecting the present singular situation of affairs; but they did not point out either the possibility of directing a new prorogation, or enable ministers to open the session of parliament in any regular way. Under these circumstances it would be highly improper for the house to proceed to the discussion of any public business; and it was absolutely necessary to adjourn. He therefore recommended the interval of a fortnight, when, if the king's illness should unhappily continue, it would be indispensably incumbent upon them to enter upon the immediate consideration of the state of public affairs. Mr Pitt farther moved a call of the house for the 4th of December, and that the speaker be directed to send circular letters, requiring the attendance of every member on that day.

⁸⁵⁹ Prospect of a change of ministry.

The tenour of the precedents afforded by the history of England were regarded, upon the whole, as in favour of a protectorate or regency, under which the whole, or a considerable part of the political power, should be confided to the next heir to the crown, or to the adult of the royal family most nearly related to the king. A circumstance that rendered this consideration more material upon the present occasion was, that the prince of Wales was understood to entertain an avowed partiality for the political connexion that had lately been instrumental in obtaining for him the discharge of his debts, and an increase of his annual income, as well as some personal resentment to the ministers now in possession of office. Accordingly, soon after the indisposition of the king had been ascertained, the prince despatched an express to Mr Fox, who was at that time in Italy, requesting his immediate presence to assist him in forming an administration. The ministers were aware of the intentions of the prince of Wales, and wished, if possible, to keep themselves in office. As the duration of the king's illness was necessarily uncertain, and he might speedily be able to resume the government, it was obviously their interest to procrastinate, as much as possible, any new establishment which might be thought necessary on account of the present exigency. They were enabled to do so partly in consequence of the profound tranquillity enjoyed by the nation, which did not render the exercise of the executive power of such immediate ne-

cessity as in times of war or public alarm. ^{It is not} ^{Britain} possible also to avoid remarking, upon this occasion, the effect of reputation in supporting any political measure. Mr Pitt, and his colleagues in office, were in possession of the public favour in a degree in which perhaps no ministers in the British annals ever enjoyed it for so long a period of time. Upon Mr Fox and his associates remained a part of that odium which the coalition and the India bill had originally excited. The prince of Wales himself was still less popular. The sobriety of his father's life was thought to form a contrast to his youthful indiscretions; and the rumour of his marriage with Mrs Fitzherbert was still propagated, and met with some credit. In this state of affairs the king's ministers, who had ceased to be any thing more than a kind of ministers by courtesy, had every advantage from the countenance of the public in their project of delaying as long as possible the relinquishment of their official situations, by placing the exercise of the royal authority in new hands. On this occasion Mr Pitt conducted himself with great dexterity in contriving subjects of discussion in the house of commons, while his antagonists seem not to have been aware of his purpose, or, that while they were contending against him for victory in debate upon speculative political questions, they were in fact fighting his battle, by delaying the period of their own entrance into power.

Upon the re-assembling of parliament, on the 4th of ¹⁶⁰ December, a report of the board of privy council, containing an examination of the royal physicians, was ^{Report of} ^{privy} ^{council} presented to the two houses by Lord Camden and Mr Pitt; and it was suggested, that when the delicacy of the subject, and the dignity of the person in question were considered, parliament would probably perceive the propriety of acting upon this report, rather than of demanding that more direct and ample information to which, in strictness, they were entitled. This suggestion was undoubtedly reasonable, as it could not readily be supposed that the ministers of the crown could possibly have acted so directly in opposition to their own interests, as to have falsely represented their master as incapable of supporting them in their offices. Mr Fox, Mr Burke, and others, however, would not take their word upon this point, but insisted upon the solemnity of an inquiry by a committee of the two houses. The report of the committee was laid upon ¹⁶¹ the table of the house of commons, on the 10th; when a farther proposition was moved by Mr Pitt, for the ^{Report of} ^{committee} ^{of the commons} appointment of a committee to inquire into precedents of cases in which the personal exercise of the royal authority had been prevented or interrupted by infancy, sickness, infirmity, or any other cause. Mr Fox observed, that though he had no objection to the appointment of a committee for the purpose proposed, yet as it was notorious, that no precedent existed, which could be applied to the present case, he took this opportunity of stating the following general principle; that in the consequence of its being ascertained, that the king ¹⁶² was at present incapable of holding the executive ^{Report of} ^{privy} ^{council} government, the prince of Wales had as clear and express a right to assume the reins and exercise the power ^{of the crown} of sovereignty during the continuance of the present ^{incapacity} incapacity, as if his father was actually dead. He added, however, that though the prince's right was perfect

fect and entire, the two houses of parliament, as the organs of the nation, were alone qualified to pronounce when he ought to take possession of his right. In reply to this remark, Mr Pitt said, he did not hesitate to affirm, that for any man to assert such a right in the prince of Wales, otherwise than as it was voluntarily conferred upon him by the two houses of parliament, was little less than treason to the constitution of his country; adding, that unless by their election, he had no more right, speaking of strict right, to assume the government than any other individual subject in England. He desired, that every man in that house, and every man in the nation, would consider, that on their proceedings depended, as well the existence of the constitution, as the interest and honour of a sovereign, who was deservedly the idol of his people.

On the following day, the opinion which had been stated by Mr Fox, was, in the house of lords, attacked by Lord Camden, and defended by Lord Loughborough and Lord Stormont. Ministers had now got an abstract question as a subject for debate, of which they resolved not to lose sight, especially as their side of the question was likely to prove most popular, being an assertion of the powers of parliament in opposition to an assertion of hereditary right. Mr Pitt accordingly, when the subject was next mentioned, said, that the question that had been started respecting the rights of parliament was of much greater magnitude and importance than those which related to the present exigency; and he hoped there would be an unanimous concurrence of opinion, that it was impossible to dismiss the question of right without its being fully discussed and decided. On the 16th of December, in a committee upon the state of the nation, he entered at large upon the subject, and endeavoured to prove, that, by ancient precedent, the powers vested in a regent had always been inferior to those of the king, and that parliament had interfered in cases of royal infancy in appointing councils of regency, or a single regent or protector. At the same time Mr Pitt admitted, that it would be expedient to intrust to the prince of Wales, whatever powers should be thought necessary. Mr Fox, on the contrary, contended, that his doctrine was supported by the very nature of a hereditary monarchy. He said, that upon Mr Pitt's principles, if a man were questioned, whether the monarchy is hereditary or not, the answer must be, "I cannot tell; ask his majesty's physicians. When the king of England is in health the monarchy is hereditary, but when he is ill and incapable of exercising the sovereign authority, it is then elective." Mr Fox ridiculed the subtlety of Mr Pitt's assertion, that the prince of Wales had no more right than he had, at the same time that he confessed that parliament was not at liberty to think of any other regent. Mr Pitt's motion upon the question of right was carried, upon a division of 268 against 204.

On the 22d of December, Mr Pitt proposed in the house of commons, a resolution, the object of which was, to declare, that it was necessary for the purpose of supplying the present defect, and maintaining the entire constitutional authority of the king, that the two houses should determine on the means by which the royal assent might be given to the bill, which they might adopt for constituting a regency. The object

Vol. IV. Part II.

of this proposition was obvious; administration had resolved not to confide the regency to the prince of Wales unless under restrictions; but without the royal assent, an act of parliament, fixing these restrictions, could not be passed. They wished, therefore, to devise a solemnity which, in this case, should be held equivalent to the royal assent. Mr Pitt proposed, that the great seal should be affixed by the lord chancellor to the act of parliament, and that this should be held equivalent to the royal assent. Mr Fox, on the contrary, pressed an immediate address to the prince of Wales to take upon himself the regency. Long debates occurred upon the point in both houses of parliament, in which administration continued to be supported by the majority.

On the 2d of January 1780, a new cause of delay occurred in consequence of the death of Mr Cornwall, the speaker of the house of commons. Mr Grenville was elected, in opposition to Sir Gilbert Elliot, upon a division of 215 against 144. On the 6th of January, when the house of commons were about to consider Mr Pitt's proposed regency bill, Mr Loveden moved for the appointment of a new committee to inquire into the state of the king's health. The proposal, after a debate, was carried by administration.

In the mean while Mr Pitt, in the name of the rest of the cabinet, explained to the prince of Wales, in a letter, the restrictions which were meant to be inserted in the regency bill. These were, that the care of the king's person, and the disposition of his household, should be committed to the queen; and that the power to be exercised by the prince should not extend to the personal property of his father; to the granting any office, reversion, or pension, except where the law absolutely required it, as in the case of the judges, for any other term than during the king's pleasure; nor to the conferring any peerage, unless upon such persons of the royal issue as should have attained the age of 21 years. Mr Pitt added, that the ideas he had suggested were founded upon the supposition, that the royal malady was only temporary, and might be of short duration. It would be difficult to fix at present the precise period for which these provisions ought to endure; but it would be open hereafter to the wisdom of parliament to reconsider them whenever circumstances might appear to render it eligible. In his answer, which was dated on the 2d of January 1780, the prince declared, that it was with deep regret he perceived, in the propositions of administration, a project for introducing weakness, disorder, and insecurity, into every branch of political business; a project for dividing the royal family from each other, for separating the court from the state, and depriving government of its natural and accustomed support; a scheme for disconnecting the authority to command service from the power of animating it by reward, and for allotting to him all the invidious duties of the kingly station, without the means of softening them to the public by any one act of grace, favour, or benignity. He stated it to be a principle of the British constitution, that the powers and prerogatives of the crown were held as a trust for the benefit of the people, and were sacred, as they conduced to preserve that balance of the constitution, which was the true security of the liberty of the subject; and he objected to

Britain. making trial, in his person, of an experiment to ascertain with how small a portion of kingly power the executive government of the country could be conducted. He asserted his conviction, that no event could be more repugnant to the feelings of his royal father on his recovery, than to know that the government of his son and representative had exhibited the sovereign power in a state of degradation and diminished energy, a state injurious in its practice to the prosperity of the people, and mischievous in its precedent to the security of the monarch and the rights of his family. The prince declared himself resolved, however, to undertake, under every disadvantage, the office of regent, to avoid the evils which might otherwise arise.

We may here remark, that the most singular part of the project for the government of the kingdom appears to have been, that for confiding to the queen the power to remove, nominate, and appoint the officers of the royal household; assisted by a permanent council, to be selected by parliament, and to consist, in some measure, of the members of the present administration. The annual income of the royal household was computed to amount to 300,000*l.* and the number of officers of which it consisted to 400, an influence, that would certainly have been sufficiently formidable to a government in other respects restricted and limited. The lords of the bed-chamber had been made use of to defeat Mr Fox's projected India bill, and might, under a separate establishment, have proved embarrassing to the existing government. It may also be remarked, that during the whole of the present reign, the queen had never previously appeared to act beyond her domestic sphere, a circumstance which tended not a little to increase the personal respectability of her husband, as his conjugal fidelity and attachment had always been remarkable. In consequence, however, of her name being obtained at this time to the ministerial project, an idea came to be very generally entertained, that her influence or interference in political transactions was by no means inconsiderable.

It is worthy of remark, that on this occasion administration were, no doubt, greatly encouraged in their pursuit of the plan they had formed for restricting the prince's power, by the addresses that were presented to them from various parts of the kingdom, expressive of the gratitude of the persons by whom they were sent, for the assertion which had been made by the house of commons of their right of providing for the present deficiency.

On the 16th of January, Mr Pitt proposed his regency bill, resting it, in some measure, upon the decisive opinion of Dr Willis, who expressed great hopes of the king's recovery. After long debates, the limitations were supported by a considerable majority. In the house of lords, similar debates occurred, but there also administration were victorious.

368
Session of parliament opened in form by the lord-chancellor.

On the 31st of January, Lord Camden moved in the house of lords, that the lord-chancellor be directed, by authority of the two houses of parliament, to issue a commission in the name of the sovereign, for the purpose of immediately opening the session of parliament. The resolution was carried, the house of commons concurred in it, and the session was opened in the proposed form, on the 3d of February.

Though the principles of the regency bill had been previously discussed, yet its various clauses gave rise to

new debates and votes, in which administration still maintained their superiority. The last clause provided, that when it should appear to the queen, and the majority of her council, that the king was restored to health, they should be authorized to signify it under their hands to the lord president of the privy-council, who should cause it to be recorded in full council, and having so done, should send a copy of it to the lord mayor of London, and cause it to be printed in the gazette. The king was then authorized to summon nine privy counsellors, not members of the council to the queen, by the advice of any six of whom, he should be authorized to issue a proclamation, countersigned by the six privy-counsellors, declaring his intention to resume the regal functions, and upon these formalities, the functions of the regent should immediately cease. It was farther provided, that, after this proclamation, parliament should forthwith assemble for the transaction of business. The bill passed the house of commons on the 12th of Feb. and was presented to the house of lords on the following day. It was discussed on the 17th and 18th, and a few amendments were introduced into it.

Here, however, the whole of these proceedings terminated. On the 12th of February, the king had been declared by his physicians to be in a state of progressive amendment. An adjournment of the house of lords was therefore proposed on the 19th. On the 25th, the king was declared by his physicians free from complaint, and on the 10th of March, the lord-chancellor, by the king's authority, addressed both houses of parliament in a speech, and the ordinary business of the session commenced. The experiment was thus left untried, of the effects which the diminished authority of a regent might have produced, at the period in question, upon the practice of the British government.

In the meanwhile, the administration of Mr Pitt had been less fortunate in the kingdom of Ireland than in his own country. The unexampled popularity that reconciled the people of Great Britain to all his measures, and the odium and suspicion that had fallen upon his opponents, had not hitherto, in any very eminent degree, communicated themselves to the neighbouring island. The prospect of his departure from office, therefore, in that country, excited little regret, and its parliament made haste to worship what they accounted the rising sun. It had stood adjourned, previous to the royal incapacity, to the 20th January 1789, and the marquis of Buckingham, then lord-lieutenant, with consent of the privy-council of Ireland, ventured to defer its meeting to the 5th of Feb. On the 11th of that month, two motions were offered to the consideration of the house of commons. The first of them by Mr Grattan, the member most distinguished for his talents; and the second by Mr Conolly, the richest of the Irish commoners. By the first, the royal incapacity was declared; and by the second, it was proposed to present the address to the prince of Wales, requesting him to take upon himself the government, with its various powers, jurisdictions, and prerogatives. In support of these motions, it was argued by Mr Grattan, that there were two modes of proceeding, familiar to the several branches of the legislature; the one legislation, and the other address. The former of these proceeded upon the supposition of a third estate, and required the concurrence of that estate, in order to give it validity; the latter was a function, exclusively the property of the

^{Britain,} the two houses, and which was in itself complete and final. The plan he recommended, advised the creation of a third estate, in order to legislate; not the legislating, in order to create a third estate. To fill up the existing deficiency, was the only act the situation made indispensable. Limiting, therefore, their operation to the demand of the necessity, they parted with their extraordinary power, the very moment it was brought completely into exercise. This Mr Grattan considered as the first thing necessary to be done; but as the addresses of parliament, though competent to supply the deficiency, did not, and could not with propriety, annex to their act the forms of law, he thought it advisable, after the acceptance of the regency, that there should be an act passed, for the purpose of recognizing and giving the established form, to the measures which had preceded. The powers he recommended to be conferred upon the regent, were precisely those exercised by the king; and the reason of this, he said, was to be found in the very nature of the prerogative, which was given, not for the sake of the king, but of the people, for whose use both kings, and regents, and prerogatives, were created and constituted. He knew of no political reason, why the prerogatives in question should be destroyed, nor any personal reason why they should be suspended. He thought it unnecessary, to copy minutely the proceedings of England. The two nations concurred in the same general object, the choice of a regent, which was a common concern, the particular modification of which must be governed by the particular circumstances of the different countries.

⁸⁷⁴
Opposed.

The attorney-general, Mr Fitzgibbon, was the principal champion of administration. He contended, that the Irish parliament ought to wait, till the prince of Wales was invested with the authority of regent in England. He would then have the command of the great seal of that country, the affixing of which was requisite to give authenticity to every legislative act in Ireland. Upon this last solemnity he laid great stress; asserting that the moment a regent was appointed for Great Britain, supposing him to be a different person from the Irish regent, he might send a commission under the great seal of England, appointing a lord lieutenant of Ireland; and to that commission, their regent, at the peril of his head, would be obliged to pay obedience. He asserted, that the government of Ireland, under its present constitution, could never go on, unless they followed Great Britain implicitly in all regulations of imperial policy. Mr Fitzgibbon predicted, that the unadvised rashness of those who disregarded this rule, must ultimately lead to a legislative union with England, a measure which he deprecated, but which was more surely prepared by such violence, than if all the sluices of corruption were prepared together, and poured in one overwhelming torrent upon the country's representatives.

Mr Hutchinson, the secretary of state, who at this time joined opposition, contended, that the regent of England could not, as such, give the royal assent to an Irish bill, and Mr Curran enlarged upon the evils which attended elective monarchy. He contended, that, without overturning the constitution, neither Britain nor Ireland could exert any choice upon the subject, but must receive into the royal office the heir of the monarchy.

The propositions of Mr Grattan and Mr Copolly

were voted by the majority; and on the following day, an address to the prince of Wales was also voted, and sent to the house of lords for their concurrence. It was adopted by the house of lords by a great majority. The address was carried to the lord lieutenant on the 19th of February, who, however, refused to transmit it to England; upon which, the two houses appointed six commissioners, to present the address immediately to the prince. These measures, however, were scarcely carried through parliament, when the king's recovery rendered them ineffectual; the consequence of which was, that the majority of the Irish parliament, who were very far from having intended to engage in a contest with the British government, found themselves in an awkward situation. They maintained for a short time an appearance of firmness; but as the British administration avoided displaying any resentment, on account of the part they had acted, the legislature of that country speedily resumed its usual character of obsequiousness to the British government.

^{Britain.}
⁸⁷⁵
Address carried.

The subject of the slave trade, which had been suggested to the consideration of parliament during the preceding session, was not regularly resumed till the 12th of May. In the interval, various petitions had been presented against the abolition of the trade, by persons interested in it, in London, Liverpool, Bristol, and other places. The report of the committee of privy council, of which Mr Pitt had given notice during the preceding session, was in the mean time presented to the house of commons; and it is to be remarked that, during the preceding year, the enemies of the trade had been extremely active throughout the country, in endeavouring to excite the general indignation of the public against this odious traffic. Innumerable pamphlets were distributed, either gratuitously, or at a low price, giving an account of the calamities endured by the unhappy natives of Africa, in consequence of it. The wars, in which their petty princes were tempted to engage, with a view to the capture of prisoners, whom they might sell to European traders, were fully explained; the wretched manner in which these slaves were transported to the West India colonies, fettered and crowded together in such a way, as to occasion the destruction of multitudes of them by disease, was represented by prints, which were distributed along with the popular publications upon the subject; and, lastly, instances of the cruelty of the masters in the West Indies were published, which had a tendency to render the whole white inhabitants there extremely odious. In consequence of all these exertions, the public at large were induced to interest themselves with very great zeal, for the purpose of procuring, if not an abolition of the state of slavery which exists in the West India islands, at least a complete prohibition of the importation of additional slaves from Africa. To this last object, the abolition of the trade for slaves to the coast of Africa, the attention of the legislature was at this time confined.

⁸⁷⁶
Slave-trade.

Mr Wilberforce opened the business, by stating the effects of the trade upon Africa, as forming the principal motives of the wars in that country. He next noticed the mode of transportation, the most wretched part of the whole subject, in which, he said, so much misery, condensed in so little room, was more than the human imagination had ever before conceived. Different

⁸⁷⁷
Mr Wilberforce's speech against the slave-trade.

Britain

ferent accounts of this matter were indeed given, he said, by witnesses, according to their prejudices and interests; but he observed, that death was a witness that could not deceive, and the proportion of deaths would not only confirm, but, if possible, even aggravate our suspicion of the misery of the transit. It would be found, upon an average of all the ships upon which evidence had been given, that, exclusive of such as perished before they sailed, not less than 12½ per cent. died in the passage. Besides these, the Jamaica report stated, that four and a half per cent. expired upon shore before the day of sale, which was only a week or two from the time of their landing; one-third more died in the seasoning; and this, in a climate exactly similar to their own, and where, as some of the witnesses pretended, they were healthy and happy. The diseases, however, that they contracted on ship-board, the astringents and washes that were employed to hide their wounds, and make them up, as it was called, for sale, were a principal cause of this mortality. The negroes, it should be remembered, were not purchased at first, except in perfect health; and the sum of the different casualties, taken together, produced a mortality of above 50 per cent. Mr Wilberforce added, that, as soon as he had advanced thus far in his investigation, he felt the wickedness of the slave-trade to be so enormous, so dreadful, and irremediable, that he could stop at no alternative short of its abolition. A trade founded on iniquity, and carried on with such circumstances of horror, must be abolished, let the policy be what it might; and he had from this time determined, whatever were the consequences, that he would never rest till he had effected that abolition. The principle upon which he founded the necessity of the abolition, was not policy, but justice: but though justice were the principle of the measure, yet he trusted, he should distinctly prove it to be reconcilable with our truest political interest. In the first place, he asserted, that the number of negroes in the West Indies might be kept up without the introduction of recruits from Africa; and, to prove this, he enumerated the various sources of the present mortality. The first was, the disproportion of the sexes, an evil, which, when the slave-trade was abolished, must, in the course of nature, cure itself. The second was, the disorders contracted in the transportation, and the consequences of the washes and mercurial ointments, by which they were made up for sale. A third was excessive labour joined with improper food; and a fourth, the extreme dissoluteness of their manners. These would all of them be counteracted by the impossibility of procuring further supplies. It was the interest, they were told, of the masters to treat their slaves with kindness and humanity: but it was immediate and present, not future and distant interest, that was the great spring of action in the affairs of mankind.

Mr Wilberforce moved twelve propositions, upon which, however, he observed, that he did not mean to urge them to an immediate vote. They stated the number of slaves annually carried from Africa, imported into the British West Indies, and entered into the customhouse accounts; the number in the first of these articles amounting to 38,000. They entered into the probable demerits of the persons sold to slavery; the consequences produced upon the inhabitants of Africa,

and the valuable and important commerce to that country which might be substituted in the room of the slave-trade. They stated the injury sustained by the British seamen, and the fatal circumstances that attended the transportation to the slaves. They detailed the causes of the mortality of the negroes, and enumerated the different items of calculation respecting the increase of population in Jamaica and Barbadoes; and they concluded with declaring, that it appeared that no considerable or permanent inconvenience would result from discontinuing the farther importation.

Britain

Upon this occasion, Mr Pitt supported that side of the question which had previously received, in a very remarkable degree, the sanction of popular applause. He declared himself satisfied, that no argument compatible with any idea of justice, could be assigned for the continuation of the slave-trade. He trusted, that the project now recommended, would not prove the means of inviting foreign powers to supply our islands by a clandestine trade. Should such an illicit proceeding be attempted, the only language which it became us to adopt was, that Great Britain had resources to enable her to protect her islands, and to prevent that trade from being clandestinely carried on with them, which she had thought fit, from a regard to her character and her honour, to abandon. It was highly becoming in Great Britain to take the lead of all other countries in a business of so great magnitude; and he could not but have confidence that foreign nations would be inclined to share the honour, and contented to follow us as their patterns in so excellent a work. Mr Fox highly approved of what Mr Pitt had said respecting the language it became us to hold to foreign powers. A trade in human flesh he considered as so scandalous, that it was in the last degree infamous to suffer it to be openly carried on by the authority of the government of any country. A regulation of the trade had been proposed by some persons; but his detestation of its existence led him, he said, naturally to remark, that he knew of no such thing as a regulation of robbery and restriction of murder. There was no medium. The legislature must either abolish the trade, or plead guilty to all the iniquity with which it was attended. Mr Burke observed, that, whatever were the present situation of Africa, it could never be meliorated under the present system. While we continued to purchase the natives, they must for ever remain in a state of savage barbarity. It was impossible to civilize a slave: it was contrary to the system of human nature. There was no country that continued under such disadvantageous circumstances, into which the shadow of improvement had ever been introduced.

59

Mr Pitt &c. oppose the slave-trade.

On the other hand, Mr Wilberforce's propositions met with considerable opposition. Mr Savage and Mr Newnham, on the part of the city of London, said, that the measure, if carried into effect, would render the metropolis one scene of bankruptcy. Mr Dempster said, that Mr Wilberforce's first proposal ought to be, to make good out of the public purse, the losses which individuals would sustain from the abolition of the trade. Lord Penrhys asserted, that there were mortgages in the West India islands, to the amount of 70 millions sterling; and that Mr Wilberforce's project would bind the country in equity, for the repayment of this sum. Mr Henniker opposed

59

supported by various members.

the

Britain the abolition, on account of the unalterable depravity of the Africans, which rendered them incapable of being civilized. And the same side of the question was farther supported, upon various grounds, by Lord Maitland, Mr Marsham, Mr Hussey, Mr Rolle, Mr Drake, and Mr Alderman Watson. The merchants who opposed the abolition, requested leave to examine witnesses on their side of the question. Mr Pitt observed, that, in his opinion, all farther inquiry was unnecessary, and could only tend to waste the time of the house. Afterwards, however, he appeared to relax in this respect, and the examination of witnesses was permitted, which consumed so much time, that the business could not be brought to a conclusion during the session. The transactions of the house under this head, were concluded by the renewal of Sir William Dolben's act, to regulate, for a limited time, the mode of conveying slaves in British vessels from the coast of Africa.

ing to the success of the same measure, in increasing the revenue upon wine.

Britain.

As the excise laws authorize the revenue officers to search the houses of the dealers, and as they supersede the favourite system of administering justice by a trial by jury, their extension had formerly been extremely unpopular, and had nearly occasioned the ruin of different ministers, by whom it had been attempted; but, in consequence of the popularity of Mr Pitt's administration, or in consequence of the long enjoyment of national prosperity under the reigning family, without any very remarkable political struggles, Mr Pitt's projects for the purpose of extending the excise, if not positively approved, were at least contemplated with indifference. Petitions were, however, presented against the proposed alteration by the persons about to fall under the new system, and they were permitted to be heard by counsel. They asserted, that the introduction of the excise would lead to the disclosure of their art, and to the consequent ruin of their manufacture; and, that the operations of excise, such as gauging and weighing, were inapplicable to their commodity. Mr Fox, who was absent during the first stages of the business, afterwards came forward. When the bill was under the consideration of a committee, he declared, that he had come down to the house, not so much from any hope of successfully opposing the bill, as with a view to enter his general protest against a scheme which he completely disapproved. He had opposed, and would oppose, every extension of the excise laws, because he was convinced they were a system of laws under which no freeman ought to live, and were utterly incompatible with the principles of just and equal government. He was aware, that in some men, any new increase of revenue outweighed every other consideration. His own opinion was different, and if the excise on tobacco would produce half a million a-year, he would still oppose it. It was the infringement of our liberties and constitution, hitherto regarded as inestimable, that he resisted, and which he foresaw would fall a sacrifice to considerations of revenue. He remarked, that the measure seemed little to interest the public in general; and, if parliament would not attend to their duty, and the nation abandoned it, he saw no prospect of stemming the tide. It seemed as if liberty and a free constitution were merely talked of, and not felt; as if they were words only fit to decorate a speech in parliament; a beautiful theory, but no longer compatible with practice or fit for enjoyment. Standing as we did, the first country for literature, for science, and all which could improve and adorn mankind, it must mortify every man who admired the freedom of our constitution and the equity of our laws, that the sources of our eminence should be so completely and irremediably forgotten. On the contrary, Mr Grenville remarked, that, by the excise laws, six millions of annual revenue were collected; that these laws had been promoted in the best periods of our history; that only 3000 more people were now proposed to be put under them; that the constitution had not hitherto been injured by these laws, and that their extension was absolutely necessary, to enable the honest trader, in the article in question, to carry on his business with success. The bill was carried by a large majority. It

883
Debate on
the subject.

The annual business of the budget was not brought forward, in the present year, till the 10th of June; and immediately previous to this discussion, the office of speaker of the house of commons was vacated, by the promotion of Mr Grenville to the situation of one of the principal secretaries of state, on the resignation of Lord Sydney. Upon this occasion, the marquis of Graham and Mr Grosvenor moved, that Mr Henry Addington, who was the personal friend of Mr Pitt, and the son of Dr Stephen Addington, physician to Mr Pitt's family, should be appointed to the chair. The name of Sir Gilbert Elliot was proposed on the part of opposition, by the same persons who had brought it forward upon a former occasion; and Mr Fox and Mr Burke, in support of this amendment, took notice of the youth and inexperience of his competitor. At length the house divided, and the numbers appeared in favour of Mr Addington 215, and of Sir Gilbert Elliot 142.

New taxes.

In consequence of the expence incurred by the late armament, the allowance to the American loyalists, and other circumstances, it was found necessary to have recourse to a loan of one million, to defray the interest of which, additional taxes were imposed upon newspapers, advertisements, cards and dice, probates of wills, legacies to collateral relations, and carriages and horses.

As one of Mr Pitt's modes of extending the revenue consisted of exerting great vigilance in the suppression of smuggling, he had formerly transferred the management of the revenue upon wine from the customs to the board of excise. He now extended the same plan to the article tobacco. He opened the subject in the house of commons on the 16th of June, by observing, that tobacco was now to be considered as the smuggler's staple, in the same manner as he had formerly dealt in tea, wine, and spirits. The quantity of tobacco consumed in this kingdom, was found to bear a tolerably near proportion to the quantity of tea, and at least one-half of this quantity was the exclusive commodity of the smuggler. The consumption amounted to 14 millions of pounds, and the loss to the revenue, upon the half of this consumption, was three or four hundred thousand pounds per annum. Under these circumstances, Mr Pitt thought it necessary to have recourse to the system of excise, by which the stock of the dealer is taxed instead of the duty being collected on importation. He supported his proposal, by allud-

tax.

met with similar resistance in the house of lords from Lord Stormont, but with a similar issue.

Mr Fox had annually brought forward a motion for the repeal of the shop-tax, which had proved extremely unpopular in the capital. During the present session, Mr Pitt consented that the tax should be abolished. Mr Beaufoy again introduced a motion for the repeal of the corporation and test acts. It was supported by Mr Fox, but opposed by Lord North and Mr Pitt, and rejected by a division of 122 against 102.

penal sta-
tutes.

A bill was introduced into the house of lords by Earl Stanhope, for relieving the members of the church of England from various penalties and disabilities under which they laboured, and for extending freedom in matters of religion to persons of all denominations, Papists excepted. The laws it chiefly intended to repeal, were laws imposing penalties upon persons who did not frequent the established worship, and prohibiting men from speaking or writing in derogation of the doctrine of the book of Common Prayer. It also repealed the laws enjoining the eating fish on certain days, authorizing the imprisonment of persons excommunicated, prohibiting the exportation of women, and declaring all persons who should go to court, without having previously made a certain declaration, which probably had been made by no person now living, to be in the eye of the law Popish recusant convicts, which was a species of outlawry. Lord Stanhope also mentioned certain canons, of which, however, he did not propose the repeal, because he conceived them to be at present void of the force of law. By these canons, among other things, it was declared, that a person who should bring against another a charge of impiety, should not be allowed to be complained against, as having acted out of malice, or from any other motive than from the discharge of his conscience; and that no clergyman should, without license from the bishop, attempt, upon any pretence whatsoever, to cast out any devil or devils. Lord Stanhope deprecated the objection, that the laws he wished to repeal were obsolete, and never carried into execution; and undertook to produce above 30 cases within the last 26 years, some of them within 10, and some within one year, in which men had been persecuted under these laws; and, in some instances, the tables, chairs, dishes, and beds of poor people, had been sold by public auction to pay the penalties of not going to church. Lord Stanhope's bill was opposed by Dr Moore, archbishop of Canterbury, who insisted, that if a man were unfortunate enough to disbelieve the existence of a God, he ought not to be at liberty to disseminate so dangerous a doctrine. Dr Warren, bishop of Bangor, and Dr Halifax, bishop of St Asaph, observed, that Lord Stanhope was mistaken in imagining, that the canons to which he alluded had not the force of law, and asserted, that the clergy were still bound by them, though the laity were exempted. These bishops opposed all innovations upon such a subject as dangerous. Dr Horsley, bishop of St David's admitted that some of the old laws alluded to ought to be repealed; but he objected to Lord Stanhope's bill, as rudely tearing away the foundation of the church of England, and thereby weakening the English constitution. The bill was rejected; and the same nobleman immediately produced another bill, to prevent suits for the recove-

ry of tithes from being instituted in the ecclesiastical courts, whose proceedings, he alleged, were severe, especially against Quakers, who, by their religious principles, were restrained from the voluntary payment of tithes. This bill also was rejected.

On the first of July, the East India Company petitioned the house of commons for permission to add an additional sum of one million to their capital, the whole to be subscribed by the present proprietors of East India stock. The request was granted with little difficulty. On the same day, Mr Dundas, as minister for India, or president of the board of controul, brought forward a statement of the revenues of India, which, after every article of expenditure in that country was deducted, he calculated at 1,820,000l. Mr Francis objected to some particulars of the statement; and Major Scott, the friend and supporter of Mr Hastings, took this opportunity of remarking, that when now, for the first time, an India budget had been opened, Mr Francis had omitted to say one word as to the state of the government of that country, or to reprobate, as he had been accustomed to do, the system under which it was administered. The system he affirmed to be the same which had been introduced by Mr Hastings, adopted by Lord Cornwallis, and sanctioned by the king's ministers. Thus the house of commons appeared, as he observed, to be alternately engaged in condemning and reprobating the system when they acted in one capacity, and bestowing upon it the highest applause when they acted in another.

During the present session, the trial of Mr Hastings still went on before the house of lords. The third charge brought forward, respecting presents received by Mr Hastings during his government of Bengal, was opened by Mr Burke. In the course of his speech upon this occasion, Mr Burke alluded to the trial and execution of Nundcomar, and asserted that Mr Hastings had murdered that man by the hands of Sir Elijah Impey. The transaction respecting Nundcomar made no specific part of the charges which had been made against Mr Hastings by the house of commons; and the question, so far as Sir Elijah was implicated in it, had been examined and rejected during the preceding session. Mr Hastings, therefore, thought proper to present a petition to the house, in which he entreated them, either to cause the additional allegations that were urged against him to be brought forward, and prosecuted in specific articles, or to afford him such other redress as they might judge suitable and proper. In his petition he mentioned certain other accusations that had been brought against him in the course of the trial, which were not specified in the articles of impeachment. Mr Pitt supported the petition; asserting that the murder of Nundcomar was no part of the crime of peculation, and every rule of evidence was against its being alleged. It had been charged in order to discredit the character of the accused; but it was a rule in the courts of law, that no fact could be given in evidence to discredit even a witness. If then the murder of Nundcomar was not admissible as evidence, it could only be urged as matter of aggravation; but it was impossible to allow this. The common sense of the house, and of all mankind, would not permit the crime of murder to be urged to aggravate a crime of peculation. Mr Fox, on the contrary, quoted the case of a captain

Britain. of a ship, against whom murder was charged in having thrown his cargo of slaves overboard, in order to prove that he had by sinister means endeavoured to defraud the underwriters of the amount of the insurance. The present case, Mr Fox said, was exactly correspondent to this. It was impossible to relate the corrupt transactions of Mr Hastings, without relating the crimes that had accompanied them, or to relate the crimes without mentioning the names of the persons by whom they had been committed. A resolution, however, was moved by the marquis of Graham, one of the lords of the treasury, and carried, by which it was declared, that no authority had been given by the house of commons, for making any allegation against Mr Hastings, respecting the death of Nundcomar; and that the words of Mr Burke, complained of in the petition, ought not to have been spoken.

to the
French re-
volution.

The session of parliament was concluded on the 11th of August, by a speech delivered by the lord-chancellor, in the name of the king. The summer passed away in Great Britain, without producing any memorable event, and parliament assembled again on the 1st of January 1790. They were met by the king in person, who, in his speech from the throne, remarked, that he had received continued assurances of pacific dispositions, from the different powers in Europe, and congratulated the nation on the happiness it enjoyed, from the increasing advantages of peace.

During the preceding summer, the eventful career of the French revolution had commenced. To remedy the state of extreme weakness, into which the government of France had fallen, in consequence of the public debts, and the embarrassment of the finances, the king had called together the states of the kingdom, who had assumed the title of the national assembly. Their debates, which were held in public, diffused extensively a love of innovation, for the purpose of reforming their ancient government, and establishing a free constitution. When the court became alarmed by the violence of their proceedings, and attempted to set bounds to their projects, the populace of the capital rose in arms, and the military refused to act against them. The national assembly proceeded in the daily discussion of new plans of change. They seized the ecclesiastical property and tithes, resolving to limit the clergy for the future to stated salaries. They put an end to the monastic institutions. They abolished the whole order of nobility, and limited the power of the crown. These, and other proceedings, which we shall state in their proper place, could not fail to excite attention in Britain, and accordingly allusions to them became not unfrequent in the British parliament during the present session, and general questions were debated with more animation, and excited a higher degree of interest, than they had done during many years.

The supplies for the navy and army, having been stated to the house of commons at the same amount as in the preceding session; this circumstance produced, with regard to the army, some animadversions from Mr Marsham and Mr Pulteney, who alleged, that from the state of Europe, our military establishment might safely be reduced. Mr Fox observed, that if ever there could be a moment, in which he could be less jealous than usual of an increase of the army, the present was that precise moment. The example of a

neighbouring nation had proved, that the former imputations upon standing armies were unfounded and calumnious, and it was now universally known through all Europe, that a man, by becoming a soldier, did not cease to be a citizen. He thought the new form the government of France was likely to assume, would render her a better neighbour, than when she was subject to the intrigues of ambitious and interested statesmen. Mr Pitt acknowledged, that the tumultuous situation of France afforded a prospect of tranquillity; but he thought, that the opportunity ought to be seized, to raise our army into such a state of respectability, as would leave no hopes to future hostility. The present convulsions of France, he observed, must sooner or later terminate in general harmony and regular order; but he confessed there was a probability, that while the fortunate arrangements of such a situation might render her more formidable, they would also convert her into a less restless neighbour. He hoped, he should do nothing wrong as an Englishman, while, as a man, he wished the restoration of the tranquillity of France, though that event appeared to him considerably distant. Whenever it arrived, and her inhabitants became truly free, they must be in possession of a freedom resulting from order and good government; they would then stand forward as one of the most brilliant powers in Europe, nor could he regard with envious eyes, an approximation towards those sentiments which were characteristic of every British subject. While Mr Pitt, who had commenced his own political career as the champion of political reform, and who, notwithstanding his official situation, had, upon important occasions, represented himself as not relinquishing his attachment to his first popular notions, was thus applauding the first revolutionary movements of the French; his friends accounted themselves at liberty to adopt sentiments of a different nature, upon the same subject. Viscount Valletort, who had moved the address to the king on the first day of the session, expressed great compassion on account of the unhappy state of the king of France, almost a prisoner in his own palace, and of the families of distinction who had found it necessary to fly to foreign countries, to avoid the unexampled barbarities which were committed with impunity at home. Colonel Phipps asserted, that the praise bestowed by Mr Fox, upon the conduct of the French military, was a poor compliment to the profession in general, and that if he had wanted a subject for panegyric, he ought rather to have adverted to the conduct of the English army, during the riots of 1780, when they were not led by false feelings to put themselves at the head of schemes of anarchy and cruelty.

On the 9th of February, when the vote of supply for the army came a second time under consideration, Mr Burke revived the subject of the French revolution. He declared himself, in decided terms, an enemy to the measures that had lately taken place in that country. He conceived it would be the greatest of all calamities for Britain, if any set of men among us should represent the late transactions in France as a fit object for our imitation. On account of the weakness of France, however, he condemned the greatness of our military establishment. He declared, that on looking over the geography of this quarter of the world, he saw a great gap, a vast blank, the space hitherto

Britain.

Britain to occupied by France, and which was no longer of any importance.

*Jacet ingens litore truncus,
Avulsunq;e humeris caput, et sine nomine corpus.*

France, he said, had at different periods been as dangerous to us by her example, as by her hostility. In the last age, we had been in danger of being entangled, by her example, in the net of a relentless despotism. Our present danger, from the model of a people, whose character knew no medium, was that of being led, through an admiration of successful fraud and violence, to imitate the excesses of an irrational, unprincipled, proscribing, confiscating, plundering, ferocious, bloody, and tyrannical democracy. They had a good political constitution the day their states general assembled in separate orders; but this they had destroyed. They had now no other system, than a determination to destroy all order, subvert all arrangement, and reduce every description of men to one level. He was sorry, that a proceeding like this should be compared to the revolution in England, which neither impaired the monarchy nor the church; but merely drove away a legal monarch, who was attempting arbitrary power.

895
Fox and
Sheridan
defend the
French re-
volution.

Mr Fox expressed great concern on account of his differing in opinion from Mr Burke, for whom he avowed the highest reverence and esteem. He repeated his former opinion on the subject of French affairs, but declared himself an enemy of all absolute forms of government, whether monarchy, aristocracy, or democracy. Mr Sheridan, in more unqualified terms, stated his disapprobation of Mr Burke's sentiments. He expressed his surprise, that any man who valued the British government, should feel such abhorrence of the patriotic proceedings in France. He declared himself as ready as Mr Burke to detest the cruelties which had been committed; but what, said he, is the striking lesson, the awful moral, that these outrages teach? A deeper abhorrence of that system of despotic government, that had so deformed and corrupted human nature, and that by its extortions, dungeons, and torture, prepared beforehand a day of sanguinary vengeance, when the irritated populace should possess themselves of power. He complimented individually, the Marquis de la Fayette, M. Bailly, and others of the French patriots. He avowed the hope, that the despotism of France would never be restored; but observed, that he ought not, on that account, to be considered as approving a wanton persecution of the nobility, or an insult upon royalty. Mr Burke answered Mr Sheridan with indignation. He denied that he was the advocate of despotism, but said that Mr Sheridan had sacrificed his friendship for the applause of clubs and associations.

896
Conduct of
Mr Pitt.

It is probable, that by this time Mr Pitt was aware of the difficulty of his situation, with regard to the French revolution. It was at that period generally regarded with approbation in Britain, as an imitation of that spirit by which our ancestors had raised their country to a career of unexampled prosperity and happiness. At the same time, Mr Pitt must have known, that the court regarded it in a different light, and that, at no remote period, his ambition and his love of popularity might upon this question come to have very different interests. On the occasion now mentioned,

he undoubtedly saw with satisfaction, a division likely to occur among those who had hitherto been his competitors for popularity. With that happy dexterity in debate, for which he appears to have been at all times remarkable, he instantly endeavoured to widen the breach, and to attach to himself a man of so much popular eloquence as Mr Burke. He declared, that he agreed with him, in almost every point that he had urged, respecting the late commotions in France. He drew a comparison, between the happy and genuine freedom enjoyed by Englishmen, and the unqualified nominal liberty of France, which was in fact, at the present moment, the most absolute, direct, and intolerable slavery. He said, he might differ from Mr Burke, in regard to some particulars, but he trusted they did not differ in fundamental principles. He felt himself bound to acknowledge, that the sentiments Mr Burke had that day professed, respecting the British constitution, filled him with the sincerest satisfaction; and the manner in which he had pledged himself, to maintain it for ever inviolate, entitled him to the gratitude of his fellow citizens at present, and of the latest posterity.

A new effort was made on the 2d of March, to procure a repeal of the corporation and test acts. The efforts of debate were more animated on this occasion than formerly. The dissenters had prevailed with Mr Fox to introduce the motion; and the clergy of the church of England, alarmed no doubt by the downfall of the church of France, were anxious to diffuse a spirit of opposition to the intended attack upon their privileges. Mr Fox represented his whole argument as resting upon this principle, that no government has a right to animadvert upon the speculative opinions of its subjects, till these opinions produce a conduct subversive of the public tranquillity. It was said, he remarked, that certain errors in religion tended to disturb the public tranquillity; but surely political errors must have this tendency in a greater degree: yet such was the absurdity of our present test laws, that a man who favoured arbitrary power in his sentiments, who should consider the abolition of trial by jury as no violation of liberty, and the invasion of the freedom and law of parliament as no infraction of the constitution, might easily pave his way to the first situations in the state. There was no political test to bind him; the obligation of all such tests had been justly exploded by the practice of the country, and what had been the consequence of this? A religious test was imposed for a political purpose. The object of this test had originally been, to exclude antimonarchical men from civil offices. But, he said, he would ever reprobate such a procedure; it was acting under false pretences; its tendency led to hypocrisy, and served as a restraint only upon the conscientious and the honest.

Mr Pitt supported, as he had formerly done, the privileges of the established church, asserting that though opinions might not be a warrantable ground for criminal accusation, yet they might afford a good reason for excluding particular individuals from the public service, and that to discover dangerous opinions a test might be highly expedient.

Mr Burke said, that he had absented himself from two former discussions of the subject, because his mind had not come to any decision concerning it. He was

now

Britain. now completely hostile to the measure. Mr Fox had stated the principles of toleration and persecution, but abstract principles Mr Burke declared himself to have always disliked. Of all abstract principles, however, those of natural right, upon which dissenters rested as their strong hold, were, in his opinion, the most idle and the most dangerous. They superseded society, and snapped asunder all those bonds which had for ages constituted the happiness of mankind. Mr Burke quoted certain passages from the writings of Dr Price, Dr Priestley, and other eminent dissenters, from which it appeared, that they were the avowed enemies of the church of England. He adjured the house of commons to suffer the fatal incidents which had attended the church of France, plundered and demolished in so disgraceful a manner, to awaken their zeal for our present happy and excellent establishment. Mr Fox, in reply, declared himself filled with grief and shame, on account of the sentiments which Mr Burke had on this occasion avowed, but asserted that all the principles he had stated had formerly received the sanction of his friend. He thought Mr Burke, at present, misled by his exquisite sensibility; his feelings had been shocked and irritated by a mistaken idea of the transactions in France, which were, in reality, nothing more than the calamities, to which every country was unavoidably subject, at the period of a revolution in its government, however beneficent and salutary. The proposed repeal of the test and corporation laws was rejected, on a division of 294 against 105.

898
Mr Flood's motion for a reform of parliament.

A few days thereafter, Mr Flood brought forward a motion for the reform of the representation of the people in parliament. Mr Flood proposed to add 100 members to the house of commons, to be elected by the resident householders in every county. Mr Windham opposed the motion, because the country had prospered under the representation as it stood, and because innovations were become extremely dangerous. Where, said he, is the man that would repair his house in the hurricane season? Mr Fox, on the contrary, declared himself as much persuaded as ever, of the necessity of reform: but he thought the majority of the nation ought to be withdrawn. Were not this the case, he would consider the motion as extremely seasonable, because no period could be more proper to begin a repair, than when a hurricane was near, and might possibly burst forth. Mr Pitt considered the proposal as brought forward at an improper time, and said he wished to wait for a more seasonable opportunity, when he would certainly again submit his ideas upon the subject to the consideration of the house: By these remarks Mr Flood was induced to withdraw his proposition.

899
Dispute with Spain about Nootka Sound.

On the 5th of May, a message from the king informed both houses of parliament of certain acts of hostility committed by the Spaniards, by seizing three British vessels, that had attempted to establish a foreign trade, between China and Nootka Sound, on the west coast of North America. The Spaniards conceived the whole of that part of the American coast to be their property, and were the first to give information of what they had done, and required that steps should be taken by the British government to prevent future encroachments upon that coast. The British navy was instantly augmented, and as a war with Spain, unas-

Britain. sisted by France, could not be formidable, the public seemed to regard the approach of hostilities with little aversion. But these same circumstances, induced the Spaniards, on this occasion, very readily to come to an accommodation.

During the present session, little progress appears to have been made in the trial of Mr Hastings. Both parties accused each other, as the authors of the delays that took place. In the mean time, the subject began to be in some measure neglected and forgotten by the public.

On the 10th of June, the king put an end to the session, by a speech from the throne, and this parliament was dissolved.

At this period, the Austrian Netherlands were in a state of great agitation. The people of these provinces had, at all times, been governed by a feudal constitution, in which great privileges were enjoyed by the clergy, the nobles, and certain classes of citizens, but more especially by the first of these orders. Joseph II. had invaded the privileges of these bodies, and seized upon the greater part of the property belonging to the monasteries. Whoever had opposed his innovations was driven from the country, and at last, about the end of the year 1789, the exiles having contrived to unite, on the frontiers of their country, entered it, and being joined by others, formed a considerable army, which rapidly overran the whole of Austrian Flanders. The emperor was at this time engaged in a war with the Turks, which prevented his sending any considerable force against them. In December, the states of Brabant had assembled, and appointed an administration, at the head of which was Henry Vander Noot, a popular advocate. In January 1790, the outlines of a federal constitution were formed, whereby each of the Belgic provinces was to retain its peculiar constitution, but the general defence of the republic was to be intrusted to a congress. Considerable numbers of foreigners went into the service of this new republic. It soon appeared, however, that the Belgic revolution would produce no valuable or lasting effects. The old aristocratical government, uncontrolled by the authority of a prince, was everywhere adopted. The power of the clergy was even increased. The first step of the Belgic congress, was a public declaration of religious intolerance. The liberty of the press was prohibited, and state licensers appointed. The consequence was, that discontents speedily arose. At this period, the emperor Joseph died, and was succeeded by Leopold, archduke of Tuscany. One of the first efforts of this prince, was to issue a proclamation, inviting the revolted provinces to return to their allegiance, and promising to restore their ancient political constitutions. Not trusting to peaceable measures alone, he sent an army against them, which was speedily successful, and at the termination of this year the house of Austria had recovered its authority in the Netherlands.

The new parliament assembled on the 25th of November 1790. As no uncommon efforts had taken place at the preceding elections, nearly the same members as formerly were returned to the house of commons. Mr Addington was chosen speaker, with the marked and unanimous approbation of the whole house of commons. On the following day, the session was opened by a speech from the throne, in which his majesty

Britain.

jesty informed parliament, that the differences which had arisen with the court of Spain, were brought to an amicable termination: That a separate peace had been made between Russia and Sweden, in which the Turks were not included, but that, in conjunction with his allies, his majesty had employed his mediation to negotiate a treaty between Russia and the Porte: That in like manner he was endeavouring to assist in putting an end, by negotiation, to the dissensions in the Netherlands. It was added, that the peace of India had been interrupted by a war with Tippoo Sultan, son of the late Hyder Ally; and the speech concluded with recommending to parliament a particular attention to the state of the province of Quebec.

Various debates occurred, which are of little importance in a historical point of view, upon the negotiations with Spain, concerning the fur trade at Nootka on the west coast of North America, and the expensive naval armament which had been fitted out to enforce the claims of Britain.

904
Division among the members in opposition.

In the beginning of March 1791, a bill was brought into parliament by Mr Pitt, for regulating the government of the provinces of Canada in North America. This circumstance is chiefly worthy of notice, on account of an alteration to which it gave rise between Mr Burke and Mr Fox. In the last session of the former parliament, Mr Burke had declared his disapprobation of the French revolution, while Mr Sheridan and Mr Fox had expressed very opposite sentiments. Mr Pitt laid hold of the opportunity to excite disunion among his antagonists, and declared himself highly satisfied with Mr Burke's attachment to the British constitution. Mr Burke had long been engaged in a career of fruitless opposition to the existing government. During the king's illness, in the end of the year 1788, he at all times expressed such a degree of indecent impatience when any expectation was expressed in the house of commons of his majesty's speedy recovery, as sufficiently demonstrated how eager he was to obtain possession of the emoluments of office. It is probable that the approbation expressed by Mr Pitt, of Mr Burke's fears from the French revolution, suggested a decisive opposition to the character of that revolution, as a mode of ingratiating himself with administration, and that this idea, concurring with his former sentiments, stimulated his eager mind to devote his principal attention to this subject. In November 1790, he published a treatise, in which he endeavoured to vilify the French national assembly, and to hold out the revolution as a subject of alarm and of detestation to all Europe. The style of copious and popular eloquence in which the book was written, together with the sentiments it contained, produced a great sale of it among the higher orders of society. Replies were made to it by Dr Priestley and others; but that which was most successful in gaining the attention of the public was, a pamphlet published at this time by Thomas Paine, who had formerly, in North America, published a pamphlet entitled "Common Sense," which was extremely prejudicial to the royal cause throughout the colonies. His present work contained a statement of the facts connected with the French revolution, together with much satirical remark upon what he accounted imperfections in the British constitution. He was not equal to his learned antagonist in copiousness of diction, but

905
Burke and Paine's pamphlets.

in shrewdness of remark and concise energy of style he was far superior. Mr Burke's love of literary fame was very great. It had been highly gratified by the attention paid to his book. He now saw his reputation rudely assaulted by a dangerous rival. His temper was ruffled, and at the same time he appears to have wished to find an opportunity of separating himself from his former political associates. On the 6th of May, when the clauses of the Quebec bill were about to be read in a committee of the whole house, paragraph by paragraph, Mr Burke rose, he said, to speak to the general principle of the bill. He enlarged upon the importance of the act which they were about to perform, that of appointing a legislature for a distant people. He thought the first consideration ought to be the competency of the house to such an act. He said, that by what was called the rights of man, a body of principles lately imported from France, "All men are by nature free, and equal in respect to rights." If this code were admitted, the power of the British legislature would extend no farther than to call together the inhabitants of Canada to choose a constitution for themselves: rejecting this code, however, which was never preached without mischief, he would assume the principle, that this country had acquired the right of legislating for Canada by right of conquest. The next question was, what model was to be followed in instituting a government for Canada; whether that of America, of France, or of Great Britain, which were the three great modern examples. Hence he took an opportunity to pronounce a vehement invective against the principles and enactments adopted by the French national assembly, in attempting to form a new constitution. He was called to order by some of his former friends, and an altercation ensued, during which he asserted, that a design was formed in this country by certain persons against the constitution. Mr Fox accused Mr Burke of leaving the question before the house to seek a difference with him, and to fortify misrepresentations of something which he had said in a former debate concerning the French revolution. He adhered to his former sentiments in approving the revolution, though not the new constitution of France. Mr Burke repeated his attack upon the French revolution. He declared that his friendship with Mr Fox was dissolved by that accursed event. Mr Fox, with much apparent agitation, endeavoured to soften the asperity of Mr Burke, but without effect. That gentleman had evidently resolved upon the part he was to act; and this may be considered as the first occasion upon which any member of the British legislature represented his own conduct as seriously influenced, to the extent of being led to desert his former political views and associates, in consequence of an alarm originating in the example of the French revolution.

During this session, the question of the slave-trade was again brought forward by Mr Wilberforce, on the 18th of April, in a very copious speech, which he concluded by moving for leave to bring in a bill to prevent the farther importation of African negroes into the British colonies. He was supported by Mr Pitt and Mr Fox. His motion, however, was negatived by a majority of 75. The zeal of the nation upon the subject, however, had at this time become very great. The evidence which had been led before the house of commons,

Britain.

907

Britain.

commons, had represented this trade as the source of multitudes of crimes, and of an immense mass of misery. Considerable numbers of persons became not a little scrupulous, even about the use of sugar, a commodity said to be produced by means of so much wretchedness and injustice. In consequence of subscriptions to a large amount, a company was established with the view of civilizing the natives of Africa, and of cultivating, by the hands of freemen, the West India productions in that country. A bill for granting to this company a charter was introduced on the 28th of March. They fixed their settlement at Sierra Leone, on the western coast of the central region of Africa; but the ultimate object of the undertaking has hitherto made little progress.

908

909
Dispute
with Rus-
sia about
Oczakow.

On the 28th of March, a message from his majesty announced, that his endeavours, in conjunction with his allies, to effect a pacification between Russia and the Turks, not having proved successful, he judged it necessary to add weight to his representations, by making some farther augmentation of his naval force. The question in dispute was this: The empress of Russia had gradually been making progress in her attempts for the subjugation of the Turkish provinces in her neighbourhood. After many efforts she had taken Oczakow, a town situated upon the Black sea, at the mouth of the river Dnieper, and considered as a situation, which at a future period might enable her to carry war into the very heart of the Ottoman empire. The Turks, being greatly exhausted, were reduced to the necessity of purchasing tranquillity at almost any price; but Prussia, being alarmed on account of the growing greatness of Russia, had, in conjunction with Britain and Holland, offered to mediate a peace, with a view to procure the restoration of Oczakow to its former masters. Russia refused the offer of mediation. She also refused to renew any commercial treaty with Britain, though she made one with France, and another with Spain. She even entered into a quadruple alliance with these two countries, and with Austria, for the obvious purpose of restraining the influence of Prussia, Britain, and Holland. Mr Pitt, in the usual form, moved an address to his majesty in consequence of the message. He said, that having entered into defensive alliances, which were admitted to be wise and politic, we ought to adhere to them, and if possible to prevent any changes in the general state of affairs, which might render them nugatory. Prussia was our ally; any event therefore which might affect that power, and diminish its influence on the continent, would be injurious to ourselves, as far as our mutual interests were united. The progress of the Russian arms against the Porte gave sufficient cause for alarm; for should success still attend them, and the power of the Porte be farther humbled by its aspiring rival, Prussia would instantly feel it; and not Prussia alone, but all Europe, which might prove in danger of being shaken to its very foundation.

910
Debate on
the Russian
armament.

Mr Fox expressed his conviction, on the contrary, that Prussia could not be endangered by any progress which the Russian arms might make in Turkey. An alliance with Russia appeared to him the most natural and most advantageous which we could possibly form. The address was carried by a majority of 228 against 135. Opposition finding themselves upon this occasion

supported by greater numbers than usual, and that a war with Russia was unpopular throughout the nation, brought forward the question repeatedly for discussion. The result was, that administration, finding the current of public opinion to run against them, deserted their pretensions, and refused to support Prussia in attempting to set bounds to the ambition of the Russians.

Britain.

On considering the state of Europe at the time, we apprehend that administration were guided, in their jealousy of Russia, by the maxims which influenced the politics of Great Britain during the best periods of its history. The Spanish monarchy had long been in a state of such debility as rendered it of little weight or importance on the continent of Europe. France likewise, during a considerable number of years, had suffered her armies to decline, and had fallen by a sort of family compact under the influence of Austria. In consequence of the revolution, or rather of the weakness which preceded it, her capacity of interfering in foreign affairs had been utterly lost. In the mean time, Austria and Russia, relinquishing all rivalry, had of late years entered into a close combination, and acted in subserviency to each others ambition. To preserve against these two great military empires some tolerable balance of power on the continent of Europe, it became absolutely necessary that Great Britain and Holland should join their whole strength to that of Prussia and Sweden, and that these should protect the Turks, merely for the purpose of preventing the further aggrandisement of the two great and warlike powers of Russia and Austria. Prussia at this time had farther endeavoured to fortify herself against Russia, by encouraging an attempt made by the king, and some of the patriotic nobles of Poland, to reform the government of that ill-fated country, by abolishing the feudal anarchy, rendering the throne hereditary, and establishing a constitution formed in imitation of that of Great Britain. The British ministry, however, finding a war with Russia unlikely to prove popular, and that it was disliked by many of their friends in parliament, consented that Great Britain should relinquish, on this occasion, the proud office of holding the balance of the continent, for which she had on former occasions so lavishly sacrificed her blood and her wealth. The consequences of this desertion speedily appeared. Prussia was under the necessity of joining Russia and Austria in their schemes of aggrandisement, at the expense of the weaker powers, that she might strengthen herself by a share of the spoil. How far the British administration acted with magnanimity in deserting what they accounted their duty, in compliance with the apparent wish of the nation, is a question which was never discussed; because the consequences of Great Britain deserting its usual political station at this time were soon overlooked and forgotten, amidst the great events which speedily occurred to alter the relative force of the states of Europe. But the impartial voice of history will probably hereafter record the event now alluded to in a manner little to the credit either of the people, or of the political parties, of Great Britain. During the preceding year, the public had no objection to a Spanish war, because plunder was to be won, while no danger was to be apprehended. They now disliked a war with Russia, in which nothing could be gained, while trade might be interrupted. From the

rope.

⁹¹² Britain. love of popularity, and the habit of resisting all the projects of administration, opposition at this time encouraged the pusillanimity of their countrymen, which soon cost Europe and Britain very dear; while the members of administration, from the fear of losing their places, suffered their country to be degraded from its rank and influence in the scale of Europe, and prepared the way for the partition of Poland, the projected partition of France, the war of the revolution by which that project was resisted, and the immeasurable aggrandisement of that power which soon proved so dangerous to Europe and to Britain.

⁹¹² Motion to repeal the test act in favour of the Scotch.

An unsuccessful effort was made during this session of parliament by Sir Gilbert Elliot, to procure for the members of the church of Scotland, an exemption from the test act. The general arguments employed in favour of the application were nearly the same with those formerly stated in support of a repeal of that statute; and it was added, that by the treaty of union, the subjects of both countries were to have a free communication of right throughout the whole united empire, which the members of the Scottish presbyterian church could not enjoy while the English test act remained in force. To this it was replied, that it was certainly known to the Scotch, previous to the treaty of union, that the test act existed, as appears by their own debates on the subject. This being the case, being fully aware of it, and voluntarily agreeing to the union notwithstanding its existence, any attempt to get rid of it at present was a kind of chicane which would never be countenanced in private conduct. The motion was rejected by a majority of 87.

⁹¹³ Relief of protesting Catholics.

A part of the body of the Roman Catholics in England were more fortunate, during the present session, in obtaining relief from certain penal statutes. As the Romish church was the great object both of political and religious terror in the first stages of the reformation in Europe, the English statute book was loaded with the most rigorous edicts against the professors of that obnoxious faith. Though, in the year 1780, some of these were removed; yet in the year 1791, in a well-known book, Burn's Ecclesiastical Law, not less than 70 pages were to be found occupied with the enumeration of the penal statutes in force against the Roman Catholics. Among these were some of the most sanguinary nature. It was high treason and death to make a convert to the Roman Catholic faith; severe penalties were enacted against Papists for hearing mass by some statutes, and by others they were compelled to attend the established worship, however contrary to their consciences. A reform in the penal statutes was now more obviously reasonable, since, in the year 1790, a body of Catholic dissenters had formally protested against the temporal power of the pope, and against his assumed authority to release men from their civil obligations, or to dispense with the sacredness of oaths. Mr Millford brought forward a bill to relieve these protesting Catholics from the penalties and disabilities to which persons professing the Popish religion were by law subject. The bill passed unanimously, excepting that Mr Fox wished to extend it not merely to protesting, but to all Roman Catholics, upon this principle, that in his apprehension the state has no right to inquire into the opinions of the people either political or religious, but only to take cognizance of their actions.

This sentiment was opposed by Mr Burke, who said ^{Britain.} that opinions might influence the human passions, and that the passions govern the man; that it was therefore the duty of the state to watch over the opinions of the people; but in this case, he observed, there was no danger from the pope; it was not by him that the Americans were absolved from their allegiance, nor had his interference produced any of the late revolutions in Europe.

The war which was now carrying on in India was ⁹¹⁴ War in the cause of some debates during the present session, India. Like all other wars in that quarter of the globe, it was undertaken, on our part, for the purpose of aggrandisement, and on the part of our antagonist, from a jealousy of the British power. The ostensible cause of ⁹¹⁵ its ostensible cause. the war, however, was this. The Dutch had long been in possession of two forts, called *Cranganore* and *Jaccotab*, upon the frontier of Hyder Ally's kingdom of Mysore. In the year 1780, Hyder seized and garrisoned these forts, under the pretence that they belonged to a vassal of his. Having speedily thereafter joined the Dutch and French against the British, the forts were given up to the Dutch; but in 1789 Tippoo again claimed the forts. The Dutch, dreading his power, sold the forts to the rajah of Travancore, a vassal or ally of the British. Tippoo, resenting this mode of evading his claim, made war upon Travancore; but as the rajah had made his purchase under secret instructions from the British government in India, he was defended by them. Thus the war was said, on our part, to have been made in defence of the just rights of our ally, the rajah of Travancore; while on the other hand, it was contended that this was nothing more than an attempt made to subdue the monarch of Mysore, and extend our eastern empire, at a time when the power of France was annihilated, and our own forces in great strength in that quarter.

In the trial of Mr Hastings little progress was made ⁹¹⁶ Trial of Mr Hastings during the present session. As parliament had been dissolved during the dependence of the trial, a question occurred, whether that circumstance did not put an end to the impeachment. The friends of Mr Hastings adopted the affirmative side of the question. They were supported by Mr Erskine and the attorney and solicitor general, M'Donald and Scott; while Mr Pitt, Mr Burke, and Mr Fox, contended, that a dissolution had no effect upon an impeachment. The argument, from expediency, seemed to be upon their side; as, if the house of commons were not to be held a permanent body, every judicial proceeding of this kind would be subject to interruption from the prerogative of the crown. It was carried in the house of commons, that the impeachment was still depending, or, in the language of the lawyers, that it did not *abate* by a dissolution of parliament. The same decision was adopted by a majority of the house of lords, on the 16th day of May; and the session of parliament was concluded on the 10th of June.

As the avowed purpose of the first leaders of the ⁹¹⁷ Early period of the establishment of a system of political freedom, or the French revolution, of a representative government, with a hereditary monarch at its head, and as one of the consequences which they expected to follow from the establishment of

Britain. of the new system, was the complete abolition of wars, which, unmindful of the general temper and violent passions of men, they ascribed entirely to the ambition of kings, the progress of the revolution was regarded with much favour by persons of a speculative character in Great Britain. The reform of the Roman Catholic church, though it alarmed the English clergy, was favourably regarded by the English dissenters, and the abolition of titles of honour was not disliked in a country where they are only enjoyed by a few individuals, and are chiefly valued, not for themselves, but on account of the privilege of hereditary legislation, by which they are accompanied. The English also had at all times been accustomed to boast of their own political freedom, and of their superiority in this respect over their French neighbours. When the populace of Paris rose in arms, when the military refused to act against them, and the state prison or fortress of the Bastile was taken and demolished, persons fond of political speculation in Great Britain regarded with applause, as an imitation of the efforts of our own ancestors, the attempts made by the French to shake off their ancient despotic government, and to renovate the order of society. Though the British public at large had not yet given much attention to the subject, yet of the curious and the idle, a sufficient number had done so to form parties who commemorated the 14th of July, the day on which the Bastile was taken, by convivial meetings in taverns in many of the most considerable towns throughout the island. These meetings were, on the whole, understood to be rather unfavourably regarded by that description of persons who are most attached to the monarchical part of our constitution, but no public expression of disapprobation had hitherto appeared. One of these festive meetings was to have been held at Birmingham on Thursday the 14th of July 1791; but on the preceding Monday, some copies were left in a public house, by a person unknown, of a hand-bill, of a most inflammatory nature, which represented the late transactions in France as proper to be imitated in England. The contents of this hand-bill, having been generally circulated, produced much conversation in the town, and the magistrates offered a reward of 100 guineas for discovering the author, printer, or publisher of it. In the mean time, the friends of the intended meeting thought it necessary to disclaim the sentiments contained in the seditious hand-bill; but finding their views misrepresented, they at one time resolved that the meeting should not take place. Another determination was afterwards adopted, and the company assembled to the amount of 80 in number. The house was soon surrounded by a tumultuous mob, who expressed their disapprobation by hisses and groans, and by the shout of "church and king," which became the watchword on this occasion; upon which the meeting immediately dispersed. In the evening of the same day, the mob attacked and burned an unitarian meeting-house belonging to the congregation of the celebrated Dr Joseph Priestley, a man, who, at that time, as an experimental philosopher, and a voluminous but most ingenious and original writer upon a great variety of speculative subjects, might be considered as at the head of English literature. Dr Priestley himself had not been present at the convivial assembly above men-

918
Riots at
Birmingham.

tioned; at half-past nine at night, however, he was under the necessity of suddenly escaping with his family from his own house, which was attacked by the mob. The whole of his library, his valuable philosophical apparatus, and his manuscripts and papers, were destroyed. The magistrates were accused of having at first favoured and given encouragement to the mob, whose fury they afterwards found it impossible to resist. During three succeeding days they destroyed some other meeting-houses, together with the dwelling-houses of several eminent dissenters in the neighbourhood. It was not till Sunday night that some parties of light dragoons arrived in Birmingham; and the first days of the week were spent in scouring the country, to clear it of the parties of rioters, who, in different directions, attacked the houses of dissenters. Five of the rioters were tried at Worcester, and one was convicted and executed. At Warwick twelve were tried, and four were convicted of burning and destroying houses; three were executed, and one was reprieved upon the application of the magistrates, as it appeared that his interference in the riot was accidental, and that he had only made an opening into a house to let out a body of smoke by which a party of the rioters were about to be suffocated from fire of their own raising.

Britain.

At this time a foundation was laid on the European continent for the most important political changes. The various nations of Europe had for some centuries owed their independence to the mutual jealousies which they entertained. Many petty states were altogether unable to contend in war against their powerful neighbours; but they were safe, because these neighbours were held in check by other great powers, who would not permit their aggrandisement. When any one nation became dangerous by its ambition, the combination of a number of other states repressed its progress. In this way the Spanish, and afterwards the French monarchies were retained within bounds. During the late century a new power, that of Russia, had become formidable in Europe, and its rulers contrived rather to undermine than to overthrow that balance of strength to which the lesser states of Europe had owed their safety. A former Russian empress had entered into close ties of amity with the empress queen of Hungary, or head of the house of Austria. This union had nearly proved fatal to the Prussian monarchy, notwithstanding the talents of the great Frederick. The house of Austria, finding the advantage of such an alliance, attempted, at the same time, to attach itself to France, its ancient hereditary enemy, by the marriage of the archduchess Maria Antonietta to the dauphin. This marriage had fully produced its intended political effects. The French court, relinquishing its former policy of humbling Austria, suffered its armies to decay, and allowed itself to be led on all occasions by this more active power. The French revolution, which so essentially altered the whole government of the state and order of society, by subverting every existing establishment, and exciting jealousies and discontent in every quarter; brought the nation, in the eyes of foreign powers, into a state of utter debility. The king and royal family had been exposed to endless insults and humiliations, and compelled to submit to a new constitution, which placed the royal authority on a very

919
Remarks
on the state
of Europe.

⁹¹⁹ Britain. very precarious footing. The principal nobility had emigrated. The king himself had attempted to do the same, but was seized, and brought back as a fugitive, and reluctantly placed at the head of a form of government of which he disapproved.

In this state of affairs the two great military powers, Russia and Austria, acting in conjunction, saw nothing to resist their ambition. They had recently wished to divide the best provinces of the Turkish empire between them. The Austrians had met with unexpected resistance, and desisted from the attempt. The Russians, on their side, were more successful. The king of Prussia, with the aid of Britain and Holland, had attempted to restrain the progress of Russia; but being deserted by Britain, he now found it necessary to be upon good terms with that power, and with Austria; and for that purpose, as well as to avoid being left behind in the career of usurpation and aggrandisement, to enter into all their ambitious schemes.

⁹²⁰ Project for dividing Poland and France.

Poland and France were, at this time, two of the weakest states in Europe. We have said, that for the sake of erecting a barrier to his own states, the Prussian monarch had encouraged the king and the leading nobles of Poland to form for their country a new political constitution, by which its government might be strengthened; but Russia and Austria had cast their eyes upon this country, with a view (in imitation of what they had done in 1772), to seize its best provinces, and the king of Prussia now found it necessary to acquiesce in this project. The state of France at this period held out great temptations to the formation of a similar project with regard to it. Leopold, emperor of Germany, in consequence of the ties of affinity, had a fair excuse for interfering in French affairs, to rescue the king from the state of thralldom into which he had evidently been brought by his subjects. At the same time, the other princes of Europe were become jealous of the examples set by France, of limiting the authority of a monarch, of destroying the privileges of the nobility, and reducing to a level all classes of persons in the state. It therefore now formed a part of the plan of the united powers of the north to restore the French king and his nobles; but at the same time it was determined to divide among themselves or their allies a part of the provinces of France. These points were adjusted towards the close of the summer 1791, at a meeting which took place at Pilnitz in Saxony between the emperor Leopold and the king of Prussia. The treaty was intended to be kept secret; but it speedily transpired, and was afterwards, by the jealousy which it excited in the French nation, the cause of some important events. Its general object is understood to have been the partition of Poland, and of a part of France. Poland was to be divided among the three great military powers in different proportions. With regard to France, the emperor was to obtain Bavaria; in exchange for which he was to conquer the French Netherlands, and give them, along with the Austrian Netherlands, to the elector of Bavaria. The archduke Charles was to obtain the duchy of Lorraine. Strasburg and Alsace were to be restored to the empire. The king of Sardinia was to receive Dauphiny, if he acceded to the coalition. Spain was to receive, on the same condition, the French part of the island of St Domingo, with Corsica and Roussillon, and

⁹²¹ Treaty of Pilnitz.

Bearn. The Swiss cantons, if they acceded to the coalition, were likewise to receive certain territories. ⁹²² Britain. This treaty was publicly disavowed; but at the same time, it was universally talked of and believed throughout Europe, under the appellation of the *Concert of Princes*.

The British parliament assembled on the 31st of January 1792. A variety of uninteresting debates occurred, the principal of which related to the armament which had taken place on account of the dispute with Russia concerning Oczakow. As ministry had adopted mild measures, opposition endeavoured to triumph over them, in consequence of their own successful resistance to the intended interference in continental affairs. Administration chiefly rested their defence upon the importance of preserving the balance of power on the continent. As France had now totally sunk into insignificance, they contended, that the only power now to be dreaded was Russia, which had showed a hostile spirit against Great Britain, and could only be resisted by adhering to Prussia, and protecting the Turkish empire.

During the preceding autumn, the second son of ⁹²³ the king, the duke of York, had married a daughter of the king of Prussia. This prince was known to be a favourite son; and as the marriage was understood to have been contracted, not as a political engine like the usual marriages of princes, but from the private choice of the parties, it gave much satisfaction to the public in Britain. The dowry of the princess amounted to 22,000*l.* a sum which, in the wealthy nation of Great Britain, was considered as unworthy of notice in the solemn treaty entered into between the British and Prussian monarchs on this occasion. A provision of 37,000*l.* per annum was readily made by parliament for the parties.

On the 17th of February, Mr Pitt brought forward a statement of the public revenue, from which ⁹²⁴ it appeared, that about 400,000*l.* might be applied towards the extinction of taxes, or the payment of the national debt. He proposed, therefore, to remove an additional tax which had recently been imposed upon malt, together with the taxes on female servants, on carts and waggons, and on houses under seven windows, and part of the duty on candles. The repeal of these taxes would, he said, diminish the revenue to the extent of 222,000*l.* and the other 200,000*l.* he proposed to apply to the reduction of the national debt. Mr Pitt concluded by giving a most flattering statement of the prosperity and happy prospects of the country, declaring, however, that these prospects were connected with peace abroad and tranquillity at home, of any interruption to which he appeared to entertain no doubt.

On the 2d of April, the question of the African ⁹²⁵ slave-trade was again brought under the consideration of the house of commons by Mr Wilberforce. He disclaimed any project of immediately emancipating the negroes, whom he admitted to be in a state unfit to receive the enjoyment of freedom; but he contended that, by the immediate abolition of the importation of new slaves, the state of those in the West Indies would be improved, by the necessity under which the planters would be brought of treating them well, that they might produce families to support the population

Britain.

of the islands. From the evidence which had been led before the house of commons, Mr Wilberforce stated various instances of extreme barbarity on the part of the traders in slaves, together with the loss of seamen as well as of negroes, occasioned by the unhealthy state into which the latter fall in consequence of their captivity and expatriation. The slave-trade on this occasion was defended by Colonel Tarleton and Mr Jenkinson, on the general principle of its having received the sanction of parliament, and that an immense yearly loss would fall on the manufacturers and shipbuilders of this country in consequence of its abolition. Mr Wilberforce was supported by Mr Montague, Mr Whitbread, and Mr Milbank. Mr Dundas professed himself a friend to the abolition of the slave-trade, and that he only entertained doubts with respect to the mode of effecting it. He thought the African trade not founded in policy, and agreed, that the continuation of it was not essential to the West India islands, where he thought, that without it, the human race might not only be maintained but increased; but he doubted of the propriety of a direct abolition of the trade. He proposed to accomplish the object by regulations tending to promote the increase of the negroes in the West Indies, and gradually to put an end to hereditary slavery. Mr Addington agreed in opinion with Mr Dundas. He thought the trade ought to exist for some years longer, and therefore could not vote for an immediate abolition; but he proposed certain regulations for giving grants of land or money to those who should rear a certain number of children, to institute premiums for the invention of instruments of agriculture; and that the importation of males should be subject to a heavier duty than that of females, to promote the population of the islands, to which he thought the trade still necessary.

Mr Fox deprecated, upon this subject, in strong terms every kind of deception or delusion upon the country. He said he neither felt, nor wished to feel, any thing like moderation on the question. Regulations would be as disgraceful as they would be impotent. He reprobated, in particular, Mr Addington's proposed premium for the transportation, that is, for the kidnapping, of females. He said, he should like to see the clause by which this inhuman measure was to be presented to the parliament of England, or the man capable of conceiving words in which it should be framed. Last session, said Mr. Fox, we were cajoled, and taught to believe, that something would be early brought forward. Have we not passed a year, and nothing has been done? Are we still to be deluded and betrayed? Why were we not at an earlier period entertained by the proposition for a gradual abolition? Mr Dundas having moved, as an amendment of Mr Wilberforce's motion, that the trade should be abolished "gradually," Mr Pitt declared his disapprobation of the amendment. He lamented the state of barbarism in which the wretched Africans were plunged in consequence of the trade; and repeated certain calculations which he had produced in the former session, to show, that the population of the islands might be supported without any supply from Africa. The motion for a gradual abolition was carried by a majority of 68.

226
A gradual abolition voted.

Britain.

On the 23d of April, Mr Dundas stated the regulations which he meant to propose, towards accomplishing the abolition of the trade; these consisted chiefly of increasing the duties upon the age of the negroes imported; of abolishing the trade, so far as not intended for the supply of our own islands; of limiting the tonnage to be employed in it; and, of punishing British subjects, guilty of crimes in the conduct of it. He proposed, that the importation of negroes into the British colonies, should cease on the 1st of January 1800. Mr Wilberforce disclaimed all acquiescence in these propositions; and Mr Fox ridiculed them, by asking where was the baptismal register kept on the coast of Africa, to ascertain the age of those who were to be exported. Lord Mornington moved, that the abolition should take place on the 1st of January 1793, expressing his satisfaction, that the great blow to the slave-trade was struck, but alleging, that it admitted of no modification, as we could not modify injustice, and could not carry on a trade which we had condemned as inhuman. Lord Mornington's amendment, however, was rejected by a majority of 49. On a future day, he altered the period of abolition to the 1st of January 1795, and at last consented that it should be fixed for the 1st of January 1796, and this amendment was carried by a majority of 40. On the 1st of May, a series of resolutions, similar on the whole to those proposed by Mr Dundas, were presented to the house of commons by Mr Pitt. In the upper house, the advocates for the abolition were less successful; and they were not a little provoked, on finding one of the younger branches of the royal family, the duke of Clarence, declaring himself decidedly hostile to their wishes, in what they accounted a question of humanity. On the 8th of May, the subject came forward upon a question of form, regarding the expediency of hearing evidence at the bar of the house, or before a committee. The friends of the abolition, Lord Grenville, the bishop of London, Lord Porchester, Earl Stanhope, and Lord Rawdon, desired despatch, and therefore urged the necessity of a committee; but the duke of Clarence, the lord-chancellor, Lord Stormont, Lord Hawkesbury, and the bishop of St David's pleaded with success for hearing evidence at the bar. Evidence was accordingly ordered to be heard at the bar, which necessarily produced delay, and little progress was made during the session.

On the 18th of April, Mr Sheridan moved for an ⁹²⁷ inquiry into the grievances, of which the royal bo-^{Scotch}roughs of Scotland had complained by petition. Of ^{reform.} 66 royal boroughs, 50 concurred in the complaint, which Mr Sheridan now supported. The petitions complained of the mismanagement of the revenues of the boroughs by their magistrates, who were self-elected, that is, elected their own successors, and, at the same time, could not be called to account before any court of law. The remedy proposed by Mr Sheridan for the abuses, consisted of abolishing the self-electing power of the magistrates, and of extending the right of election. Alluding to the subject of the French revolution, he said, that by assuring us of tranquillity abroad, it afforded leisure to look into abuses at home, and that the lesson which that event ought to afford, was this, that rational and sober reformation of abuses, in a season of tranquillity, was the best way of avoiding the

⁹²⁸ Britain. the evils of a reform accomplished by violence. The motion was resisted by Mr Anstruther, Mr Dundas, and Sir J. St Clair Erskine, upon the general ground that no serious grievance existed, and the inquiry was refused by a majority of 69 against 27.

Excepting some debates relative to the French revolution, nothing farther of importance occurred during the present session: and that we may not afterwards have occasion to interrupt our detail of the transactions connected with this interesting event, we shall here take notice of the war which had for some time been going on in India, and which was now brought to a fortunate termination. The western side of the peninsula of Hindostan consists of a level country for about 70 miles inwards. At the back of this level tract of territory, and parallel to the ocean, runs a chain of lofty mountains, whose front is abruptly broken towards the west, forming tremendous precipices, but which on the other side consist of an extensive plain, gradually descending eastward to the bay of Bengal, and forming the territory of the Mahrattas, Mysore, Madras, the Carnatic, and other states included within that great peninsula. Tippoo possessed territory on both sides of these mountains, which are denominated *Ghauts* (passes), from the narrow paths or passes, by which they are ascended. The British Carnatic army, under General Meadows, was directed to attack the territories of Tippoo from the east; while the Bombay army, under General Abercromby, was to reduce the country to the westward of the Ghauts. The Mahrattas, and the nizam of the Decan, agreed to attack Tippoo's country from the north and north-east, where it touched their own territories; and Seringapatam his capital was fixed upon, as the point towards which the whole of the hostile armies were to direct their efforts.

On the 15th of June 1790, General Meadows entered Tippoo's country. The grand army on this occasion amounted to 14,000 effective men, a body of European troops which no power in India could encounter in the field, on account of the superiority possessed by men of the race of Europe, over the timid and superstitious natives of that enfeebling climate. A variety of operations occurred, which are uninteresting in detail, on account of the want of equality between the contending parties. Little, however, appears to have been accomplished towards the subjugation of the enemy (excepting the capture of the country to the westward of the Ghauts by General Abercromby) till the end of February 1791, when Lord Cornwallis, having assumed the command in person, proceeded against Bangalore, which he reached on the 5th of March. A breach being made in the walls by means of four batteries, the fort was stormed on the 21st, with little loss to the British. Of the garrison not less than 1000 were massacred with the bayonet, and a small number were taken. Earl Cornwallis being joined by above 14,000 of the nizam's troops, and 700 Europeans, with 4580 troops under Colonel Oldham, proceeded against Seringapatam, in the neighbourhood of which he arrived on the 13th of May, after a difficult march in bad weather over a hilly and barren country. Tippoo now stood an engagement, in which, though he was beaten, he suffered little loss; but he was under the necessity of retiring into his

⁹²⁹ Tippoo retreats into his capital.

capital, which being defended by a river, which at this season was swelled with rains, afforded him protection. Lord Cornwallis finding himself destitute of provisions to support his army during a protracted siege, and General Abercromby not having been able to join him from the west, he judged it prudent to return to Bangalore, after destroying his battering artillery. On his retreat he was joined by the Mahrattas, to the number of 30,000. General Abercromby, in the mean time, retired across the Ghauts to the westward, with a fatigued and dispirited army, and thus for the present Tippoo escaped the necessity of standing a siege in his capital.

After his retreat, Lord Cornwallis employed himself for some time in reducing various smaller forts in the neighbourhood of Bangalore. Some of these are described as of such prodigious natural strength, as would render them, in any other hands than those of the feeble natives of that country, absolutely impregnable. Nundydroog is described as built on the summit of a mountain 1700 feet in height, three-fourths of which are absolutely inaccessible. After a siege, from the 22d of September to the 18th of October, a breach was made, and the place was assaulted at midnight, and taken, though not by surprise. In consequence of the efforts of Captain Robertson, little blood was shed upon this occasion. The fortress of Saverdroog, 18 miles to the west of Bangalore, is described as still more strongly situated. It stands on the summit of a vast mountain or rock, which rises half a mile in perpendicular height, from a table or base of eight or ten miles in circumference. At its summit it is divided into two hills, which have each their peculiar defences, and are capable of being maintained independent of the lower works. The whole mountain is surrounded by a strong wall, and in every accessible part cross walls and barriers are erected; yet this stupendous fortress was taken in ten days.

In December, General Abercromby once more crossed the Ghauts, and proceeded eastward towards the Mysore country, while Lord Cornwallis, in the beginning of February 1792, advanced from Bangalore. He arrived on the 5th within sight of Seringapatam, under the walls of which Tippoo Sultan was posted to receive him. On the 6th of February, at eight o'clock in the evening, the British made an attack on Tippoo's camp. After an engagement in different points, some parties of the British crossed the river, and posted themselves upon the island on which the city of Seringapatam stands. Being thus pressed by the invaders in every quarter, his palace and beautiful gardens in their possession, and his power reduced within the narrow limits of a fortress, Tippoo found it necessary to endeavour to purchase peace upon almost any terms. With this view he released two prisoners, lieutenants Chalmers and Nash, and requested the former of these gentlemen to present a letter from him to Lord Cornwallis. The operations of the siege, however, still continued to go on; and, on the 19th of February, the trenches were opened, while the Bombay army, under General Abercromby, invested the western side of the capital. But a cessation of hostilities was agreed upon on the 23d of February. By the treaty of peace, concluded on this occasion, it was stipulated, 1st, That Tippoo was to cede one half of

Britain. of his dominions to the allied British and Indian powers; 2dly, That he was to pay three crores and 30 lacks of rupees: 3dly, That all prisoners were to be restored; 4thly, That two of the sultan's three eldest sons were to become hostages for the due performance of the treaty. On the 26th, the two princes, each mounted on an elephant, richly caparisoned, proceeded from the fort to Lord Cornwallis's camp, where they were received by his lordship with his staff. The eldest, Abdul Kallich, was about ten, the youngest Mooza-ud-deen, about eight years of age. The princes were dressed in long white muslin gowns, with red turbans richly adorned with pearls. Educated from infancy with the utmost care, the spectators were astonished to behold in these children all the reserve, the politeness, and attention, of maturer years. The kindness with which they were received by the British commander, appeared to afford them visible satisfaction. Some presents were exchanged on both sides; and the scene is described by an eye witness, Major Dirom, as highly interesting. It was the 19th of March before the definitive treaty was finally adjusted, and delivered by the young princes into the hands of Lord Cornwallis.

934
Causes of impending changes in Europe.

935
Ambition of the great powers.

936
The French revolution.

In the meanwhile the nations of Europe were hastening fast into scenes of unparalleled importance and activity. These arose from two causes, the ambition of the great military powers of Europe, and the French revolution. When, by a corruption of that policy which had once produced a vigilant attention to what was called the balance of power, Russia and Austria had formed, as already mentioned, the new project of extending their dominions, not by contending in arms, as had been the custom of former ages, against nations of equal strength, but by amicably dividing the weaker states; and Prussia, not to be left behind in the career of aggrandisement, found it necessary to concur in their policy; it became evident that the situation of Europe must speedily undergo great changes: and there was reason to fear that the mildness of government, which in some measure had arisen from the facility of emigration, and of obtaining protection in neighbouring states, might come to an end. The French revolution, which had speedily reduced that once potent monarchy to a state of complete debility, seemed to afford an opportunity to the remaining great powers to extend their system of ambition, by enabling them to regard its ample and fertile territories as a farther subject of partition.

In another point of view, however, this revolution had now begun to appear an object of no small jealousy and alarm. The distinguished place which France holds among the nations of Europe, rendered the late change of her government an object of universal attention; and it now began to be seriously feared as an object of imitation. The public discussions which took place in her national assemblies, and in printed publications, were conveyed, through the medium of a language almost universally understood, to the most obscure corners of Europe; and kings, nobles, and priests, became apprehensive, that the contagion of innovation might not terminate in the country in which it had begun. Hence a general wish existed among these ruling classes of society, that an effort should be made to overwhelm, before it should be too late,

VOL. IV. Part II.

that country, from which so much danger to established governments seemed to originate. It is still perhaps too early, even for the most enlightened and unimpassioned mind, so far to elevate itself above the current of events, as to be enabled to take a clear view of the philosophical history of modern Europe; and more especially of that great convulsion, which now began to be the hinge of all the changes that occurred in this, and even in other parts of the globe. It is to be remarked, however, that, during six centuries, the condition of the human race had, in Europe, been in a state of rapid and obvious amelioration. This quarter of the globe was at one time governed by a barbarous military aristocracy, that held agriculture and every useful art in contempt; or by a wealthy and numerous, but illiterate and licentious priesthood; while the body of the people remained in an enslaved condition. By the efforts of various princes the nobles were gradually subdued. The dominion of law and of order was established; and the body of the people were protected, and, by means of industry, enabled to rise to the possession of wealth. Literature was encouraged among all ranks of persons; and the human character assumed a more respectable and a happier aspect. This fortunate progress was indeed early disturbed. The new intelligence which they had acquired, enabled mankind to discern the vices which existed in their priesthood, which formed one of the principal orders, possessing a very large proportion of the wealth of every European community. This class of men had been rendered voluptuous by riches, and indolent by long possession of power; and the ignorance into which they had fallen, with the superstitious which they still encouraged, were now beheld with contempt and indignation by a populace that were acquiring industry, riches, and knowledge. Princes and people in many countries shared the same sentiments. Some reforms were attempted; but the clergy having resisted such changes as the temper of mankind now rendered necessary, a zeal for their destruction was excited, which rapidly diffused itself from mind to mind, and from one country to another, till it embraced the extremities of the Christian world. Men were, however, divided in their sentiments; and many princes dreaded that the love of change might not stop short with the extirpation of one great order of the state. Destructive wars, therefore, took place, embittered by religious zeal, in which one half of Europe contended with ferocity against the other. This sanguinary rage, which divided not only states but private families, gradually subsided. It was at last found, that the clergy might be reformed, while the prince and his nobles retained their power. Nations once more made war from views of policy, and religious quarrels were forgotten.

937
Progressive improvement of Europe.

In the mean time, the nations of Europe still continued their progress in improvement; and, as soon as tranquillity had been restored by the peace of 1763, this benevolent spirit started into action in every quarter. As the kings of Europe had originally, by the elevation of their own power, and of the importance and prosperity of the people, upon the ruins of the feudal anarchy, been the prime movers of the improvement of the human character in Europe, so at this time they continued to take the lead in the same honourable

4 M

nourable

Britain.

nourable career. The value of the most important of all arts, that of agriculture, had gradually been seen. The reasonings and experiments of philosophers were employed upon it; and in Prussia, Russia, and other countries, it was cherished by royal bounty. Poland was still behind the other nations of Europe. There the authority of the crown was little more than nominal. A feudal aristocracy governed the country, and the cultivators of the soil were in a state of slavery. Even there, however, it became a sort of fashion among the more enlightened nobles to give freedom to their peasants.

The mercantile interest advanced still more rapidly into importance in Europe. The pre-eminence which commerce had given to Great Britain, stimulated all who had the means and the opportunity, to foster and increase it by every artificial aid among their own subjects. Manufactories were established and supported by many of the crowned heads on the continent; and trading companies were erected, vested with ample immunities, and sometimes assisted with great loans. The pride of the military nobility was passing away. They found successful rivals for the efficient offices of state in the professors of the law. The establishment of standing armies rendered them of little importance in war; and their wealth, as the great landholders of Europe, was daily more and more eclipsed by the opulence of the industrious classes; and though titles of honour still remained, the estimation in which they were held was much diminished, in consequence of the attention universally paid to men of letters. Still, however, considerable abuses remained. In those states that had resisted in former times the innovations produced by religious zeal, a wealthy priesthood and monastic orders still existed. The privileges of the nobles and of the clergy rendered taxation unequal; and commerce was embarrassed by restrictive laws, and the privileges of old incorporations. There was therefore much to reform among the continental states of Europe; but everywhere princes were seen taking pride in helping forward this work of reformation. In particular, the late emperor of Germany was extremely eager to distinguish himself in this career. He abolished monastic establishments, emancipated the peasants, abolished the privileges of the nobles to a very great degree, and extended the protection of the law, and the privileges enjoyed by other subjects, to that unfortunate people, the Jews, who had long been objects of religious hatred and persecution. This prince, however, urged his projects with a degree of restlessness and impatience, which in many instances defeated the purpose for which they were undertaken, by not giving leisure to the sentiments of the people to go along with him in his innovations.

938
Character
of the royal
family of
France.

Though the house of Bourbon had supported in France the Roman Catholic system of superstition, yet, upon the whole, they were of a more liberal spirit than any other royal family in Europe, and had given greater encouragement to letters, and to every kind of improvement. It is not wonderful, therefore, that in France, the Roman Catholic superstition had become contemptible, and that the desire for improving the condition of mankind, and simplifying the arrangements of society, which was everywhere pursued by the princes of Europe, should here have become extreme-

ly prevalent. Unfortunately, however, though the benevolent character of the reigning monarch led him to encourage such projects, yet his undecided and inactive spirit, together with the embarrassed state of the finances, prevented him from taking the lead in these changes, or from repressing them when inordinately pursued by others. In the mean time, the example of prosperity enjoyed under the free constitution of Great Britain, together with the pride of having recently contributed to the establishment of a republican government in North America, fixed the character of any changes of a political nature, which at this period might originate in France, from the men of letters, the army, or the people at large.

There is a passion of the human mind, to which philosophers have not hitherto given a name, which at times remains dormant for ages, but which, when kindled into action, seldom fails to alter the whole face of society. This is the passion or rage for reforming the world, or for propagating that which, under the influence of this sentiment appears good for the human race, or just and right with regard to society at large. In the regions of Asia, under the Arabian prophet, it assumed the form of a zeal for religious truth, or a passion to destroy every form of idolatry, and to bring mankind to the worship of one God. Supported by the energy which this passion inspired, and the contagious frenzy which it communicated, the Mahometan faith was conveyed from the Arabic gulf to the banks of the Ganges, the deserts of Tartary and of Africa. At one time it seemed to embrace all Europe, invading Germany from the east, and advancing from the south through Spain into the centre of France, where its career was with difficulty arrested by Charles Martel, after a sanguinary conflict of many days. The same passion has, in Europe, at different times, assumed the form of a zeal for freedom and of religious enthusiasm. At the time of the reformation from Popery, it chiefly appeared under the aspect of a desire to accomplish religious reform. In those countries which, like England, were vigorously governed, and where the prince and the people concurred in the same object, the zeal of the multitude was restrained, and the reformation was not carried to extremes; but where the populace led the way, as in Scotland, Geneva, and other places, the reformation was destructive to all ancient religious institutions. When the passion for reform, after two centuries of internal tranquillity, was communicated to the French nation, by the example of the princes of Europe and of the citizens of America, it assumed the shape of a zeal for freedom, and religion was treated with contempt. The passion, however, was the same that had formerly induced the European states to engage in sanguinary wars for the support or the overthrow of their religious establishments. In both cases, the followers of the new sect were filled with enthusiastic notions of their own powers and their own worth, with visionary schemes of impracticable improvement, and with complete impatience of opposition, accompanied with an eager zeal for making proselytes. Like other social passions, its contagion rapidly flew from city to city, and in a less or greater degree it extended to the utmost limits of Europe. It more particularly seized the minds of men of letters, who regarded the French revolution, in its commencement,

939
Passion for
reform, its
history and
character.

Britain. commencement, as their own work, and as the fruit of the war which they had long waged against monastic institutions, and the exemptions from taxes, or the public burdens of the state, which were enjoyed by the privileged orders. On the other hand, princes and the clergy, together with persons of high rank and great opulence, were seriously alarmed by the example which France had given of diminishing the power of the throne and of the altar, and destroying all privileges enjoyed by particular orders of men; and they feared that this system of innovation might proceed, as some of its wild votaries hoped, to overturn the safety of private property, while, at the same time, no European nation might be free from its contagion. It is not wonderful, therefore, that the princes of Europe combined against France on this occasion, or that they were supported by their clergy and their nobles. It remained to be seen, however, what part Great Britain would act in this important scene. Her church and her aristocracy were already reformed, and the first French reformers began their career by the avowed imitation of her example.

940
Defect of
the new
French
constitu-
tion.

In forming a political constitution, the vanity of the French, which induced them to avoid the appearance of servile imitation, had unhappily led them to differ in one essential point from the British constitution. Their legislature consisted only of a king and a single house of representatives; whereas in Britain, by means of a third estate, that of the peerage, who are naturally jealous of popular innovation, laws injurious to the royal prerogative are prevented from being enacted, without the king being involved in any personal dispute with the commons. But, in France, the king himself was laid under the necessity, in such cases, of preventing the passing of the law, by personally exercising a negative voice; that is, he was placed in the unpopular and absurd situation of opposing his single judgment to the united will of a nation, and that too in the present perilous and critical times, when he could not fail to be suspected of disliking a constitution, by which his despotic power was taken away. Still, however, the representative government of Britain had radically been the model on which the French had proceeded; and there is no doubt, that they expected, during any contest in which they might be involved with the powers of the continent, that they would enjoy, if not the support, at least the neutrality and favourable countenance, of the British nation.

On the other hand, however, the passion for innovation which had seized the French nation, had, in many instances, proceeded to very extravagant lengths; and there was reason to fear, on the part of the court of London, that this passion might communicate itself in an inconvenient degree to Britain, where, though political abuses were comparatively trifling, and the passion would consequently find less food for its exertion, yet enough might exist to kindle disturbances and produce anxiety.

941
Society of
friends of
the people.

In the month of April 1792, a society was instituted in London, at the head of which appeared Mr Grey, Mr Baker, Mr Whitbread, Mr Sheridan, Mr Lambton, Mr Erskine, and several other members of parliament, for the express purpose of obtaining a reform in the representation of the people. The association assumed the popular title of *the Friends of the People*; and it was speedily joined by some very respecta-

ble characters in the commercial and literary world. Similar societies had, at former periods, existed in Great Britain; and the duke of Richmond, Mr Pitt, and others, while they were zealous advocates for the reform of parliament, had attended meetings, not merely of persons acting in their individual capacity, but, what was undoubtedly more dangerous, of persons appearing as delegates of other societies. At the present period, however, government, not without reason, appear to have regarded any association of this kind, as unusually dangerous. The society had resolved, that, early in the next session, a motion should be brought forward in the house of commons, for the reform of parliament, and that the conduct of the business should be committed to Mr Grey and Mr Erskine. In conformity with the intentions of the association, on the 30th of April, Mr Grey gave notice in the house, of a motion, which next session he intended to submit to their consideration, for a reform in the representation of the people. Its necessity, he said, had been admitted both by Mr Pitt and Mr Fox. The times were indeed critical, and the minds of the people agitated, but his object was to tranquilize them, by removing every cause of complaint. He requested gentlemen to consider the question in the interval, and hoped, that by the time the motion was brought forward, the sentiments of the people on the subject would be fully ascertained.

Britain.

942
Mr Grey
announces
a motion for
a reform of
parliament.

Mr Pitt rose with unusual vehemence. He said, he felt no difficulty in saying, in most decisive terms, that he objected both to the time and the mode in which this business was brought forward. He retained his opinion of the propriety of a reform in parliament, if it could be obtained by a general concurrence; but he feared at this moment, that if agreed on by that house, the security of all the blessings we enjoyed would be shaken to the foundation. The present, he alleged, was not a time to make hazardous experiments. Could we forget what lessons had been given to the world in a few years! or could men be supposed to regard the situation of this country as in any respect unfortunate when contrasted with that of others? He took notice of the new association, and the advertisements in newspapers, by which they invited the public to join the standard of reform. He said, he saw with concern the gentlemen to whom he alluded, united with others, who professed not reform only, but direct hostility to the very form of our government, who threatened an extinction to monarchy and every thing which promoted order and subordination in a state.

943
Opposed by
Mr Pitt.

Mr Fox declared himself satisfied concerning the necessity of a reform in the representation, but that he never entertained very sanguine hope of its accomplishment. He would repeat however what he had said almost the first time he addressed that house, that the greatest innovation which could be introduced into the constitution of England was to come to a vote that there should be no innovation in it. His name did not indeed appear in the list of the society for reform, because, though he saw great abuses, he did not see the remedy. Had his honourable friend consulted him, he should have hesitated in recommending the part he had taken; but having taken it, he could not see why the period was improper for the discussion. He professed strong attachment to the British constitution, but

Britain.

did not regard this as the only free country in the world. He noticed particularly the American states as in the enjoyment of practical freedom, and approved of the new constitution of Poland. After a tumultuous debate in which Mr Burke and Mr Windham opposed Mr Sheridan and Mr Erskine, the subject was dropt.

944
Paine's re-
solutions of
the Rights
of Man.

945
Royal pro-
clamation,
against se-
ditions pub-
lications.

In the mean time, a variety of political pamphlets were daily published, the most remarkable of which was a publication by Thomas Paine, entitled "The Rights of Man, part second." This was a direct and most inflammatory attack upon the whole principles and practice of the British constitution. Administration thought fit, on the 21st of May, to issue a royal proclamation against the publishing and dispersing of seditious writings; exhorting the magistrates to vigilance in attempting to discover the authors of such writings, and to preserve the peace and tranquillity of the kingdom; and exhorting the people to guard against all attempts which aimed at the subversion of regular government.

It is not easy to perceive what precise purpose government intended to serve by this proclamation. The authors of the seditious publications alluded to did not conceal themselves, and the publications were openly sold without any attempt to suppress them by prosecutions. Perhaps it was intended to prepare the minds of men for these future measures of direct hostility against France, on which government had already resolved. Perhaps it was only meant to rouse and countenance, in the friends of government, a spirit of opposition to the proposals of innovation which were now afloat, or it might be intended in this way to try the general feelings of parliament and of the public upon the subject; but whatever object administration might have in view by this proclamation, its first effect was to excite a general spirit of political curiosity, and to serve as a public advertisement to the dangerous writings of Thomas Paine and others. In all parts of the island multitudes of persons, who had not hitherto interrupted their ordinary occupations to attend to the transactions of the continent, or the speculative discussions which the present state of France had excited, were now seen crowding to the shops of booksellers, inquiring for the treatises, the names or titles of which they knew not, against which the king's proclamation had issued. Every printing press in the kingdom was occupied, and copies could scarcely be supplied in sufficient abundance to satisfy the demand.

On the 25th of May, an address to his majesty being moved by the master of the rolls, in consequence of the proclamation, he intimated that the object of the proclamation was Mr Paine's works. He read an extract from one of his pamphlets, importing that all kings were tyrants, and their subjects slaves, and complained of the circulation of such publications. Mr Grey asserted, that the minister, apprehensive of the effects of the association of the friends of the people, had concerted this measure with an insidious view of separating those who had been long connected. He pretended that such sinister practices were delighted in by a gentleman, whose whole political life was a tissue of inconsistency, and who never proposed a measure without intending to delude his hearers. He said, that mode of proceeding against seditious writings was inefficient, irregular, and mischievous. If improper writ-

ings were published, his majesty's ministers ought to have prosecuted the authors or printers. Upwards of twelve months had elapsed since the publications now complained of made their appearance. What could they now say for themselves, or what could the public think of the conduct of the ministers of the crown, who had suffered these publications, which were said to be the bane of the public tranquillity, to poison the public mind for a whole year? He wished to know what could be the motives that brought forward at this time this sudden show of ardour to subdue disorder. Had it always manifested itself in the conduct of ministers? Was there any remarkable activity displayed in preserving order in the affair of Birmingham, where there had been actual outrage and violence to the laws, to liberty, and order? Mr Fox disapproved of the proclamation, because it was insidious and ambiguous, tending to propagate vague and unnecessary alarm. Mr Pitt said he was far from imputing any ill design to the new association; but observed that it might be taken advantage of by ill-disposed persons, who under the shelter of a respectable body might push their own sinister designs. The plan of the persons to whom he alluded, was evidently to destroy the monarchy, and convert the kingdom into a republic. The address to the throne was agreed to without a division; and in the house of lords on the 31st of May a similar address was voted after some debate. Parliament was prorogued in a short time thereafter.

The eyes of all Europe were now turned towards France; and the combination which the kings of Europe were known to have formed against that country was expected speedily to proceed to action. The king of Sweden, who was fond of war, and had greatly distinguished himself in his late contest with Russia, having now settled all disputes with that state, offered to lead in person the armies of the combined powers, to destroy in France those new institutions and opinions which threatened to subvert the whole ancient system of public order in Europe. He still, however, continued in a state of extreme hostility with his disaffected nobles; and on the 16th of March he was assassinated at a masquerade by an enthusiast, a nobleman of the name of Ankerstroom, who boasted, when he was apprehended, that he had liberated his country from a tyrant. In the mean time, Leopold emperor of Germany had also died, and was succeeded by his son Francis II. Leopold had chosen to temporize with France, but his successor thought it unnecessary to observe any measures of caution. On some remonstrances being made by the French government against his permitting troops to assemble on the frontiers, he avowed the concert of princes against the constitution of France; and he stated it to be one of the conditions necessary to the preservation of peace, "That the neighbouring powers should have no reason for the apprehensions which arise from the present weakness of the internal government of France." This acknowledged intention to interfere in the internal affairs of the French nation, produced a proposal on the part of the French king to the national assembly, which was readily acceded to, for declaring war against the king of Hungary and Bohemia, and in a short time war was in like manner declared against Prussia and Sardinia.

In the mean while, though the combined princes had

⁹⁴⁷ ^{Britain.} had not probably as yet completely adjusted the shares they were to receive of the spoils of France and Poland; yet that the latter might be retained in a state of weakness, and that all traces of the new principles which were at this time alarming the world, might as far as possible be obliterated, the empress of Russia gave notice to the king of Poland of her determination to invade that state with an army of 150,000 men, for the purpose of overturning the new constitution, which had been framed in imitation of that of Great Britain. No provision had been made by the king, who appears to have been a well-intentioned but a weak man, to resist such a force. An attempt was however made by Kosciuszko, a Polish nobleman, who had served under General Washington in America, to defend the independence of the country. Some battles were fought, but the Russians continued to make progress; and on the 23d of July, the king, despairing of the result of the contest, submitted without reserve to Russia, and consented to the restoration of the old constitution with all its weakness and anarchy. When this event took place, considerable numbers of persons in Britain were promoting a subscription of sums of money to assist the Poles to maintain their independence. The population of Poland was sufficient to have enabled it to resist the power of Russia; but the people at large were still the property of the nobles, and consequently illiterate, and incapable of exerting themselves with that union which is necessary to a great national effort.

While the combined princes were thus successful in the north, a very different train of events awaited them in France. The French king and his ministry directed the Austrian Netherlands to be invaded, but the object was accomplished in an unskilful manner. Four distinct detachments, under Fayette and other generals, were directed to enter that country at different points. They made some progress; but their raw troops were speedily repulsed by the disciplined armies of Austria, which afterwards advanced with considerable force. At length Prussia and Austria, who had undertaken the extinction of the revolution in France, had completed their preparations, and the duke of Brunswick was appointed commander of the combined armies which were to enter that country. In a long manifesto issued by the emperor and the king of Prussia, they thought it necessary to disclaim all views of aggrandisement, or interference in the internal administration of France; but declared themselves resolved to re-establish in that country public security, with the ancient order of things, and to protect the persons and property of all loyal subjects. They threatened to punish in a striking manner, and to give up the city of Paris to most dreadful and terrible justice, if the least insult should be offered to the king, the queen, or the royal family. ⁹⁴⁸ The duke of Brunswick also issued a manifesto, in his own name, on the 27th of July, at Coblenz his head quarters, in which he declared that the two allied courts had no intention to make conquests from France; that they meant merely to deliver the king and royal family from captivity, and to restore his authority. The duke promised protection to all who should submit to the king. He required the national guards to protect the public safety till farther orders, and threatened to treat such of them as should resist him in arms as rebels to their king. He required, in

like manner, the officers and soldiers of the French regular troops to submit to their legitimate sovereign: He declared the French magistrates responsible, on pain of losing their heads and estates, for every disorder which they should not have attempted to prevent. He threatened with death the inhabitants of towns and villages, who should dare to defend themselves against his troops, but promised protection to those who should submit. He called upon the city of Paris to submit instantly to the king, making personally responsible, on the pain of losing their heads, pursuant to military trials, all the members of the national assembly, and the magistrates and national guards of Paris; threatening on the word of the emperor and king, that if the palace of the Tuilleries should be forced or insulted, or the least outrage offered to the king, queen, and royal family of France, or if they were not immediately placed in safety and set at liberty, to inflict the most exemplary and ever memorable avenging punishments, by giving up the city of Paris to military execution, and exposing it to total destruction: Lastly, It was declared that no other laws could be acknowledged in France, excepting those derived from the king when at full liberty; he was therefore invited to come to some frontier town, where he might provide for the restoration of order, and the regular administration of his kingdom.

This fatal manifesto was no sooner published, than all France was in commotion. The insolent language held in it by two foreign powers, one of which, Austria, had for ages been regarded with hereditary hostility, wounded the national pride and patriotic spirit of every Frenchman. Many who were the enemies of the revolution, could not brook an attack upon the national independence; and the zeal of those who had been enthusiastic promoters of freedom was kindled into frenzy. From all quarters of the country, multitudes hastened to the frontiers, to share the danger of protecting the independence of their country. Unhappily for the monarch, Louis XVI. the enemies of the nation had loudly declared themselves to be his friends, and the restoration of his absolute power was made the excuse for a hostile invasion. The king, therefore, and all who were attached to him, became objects of public jealousy. A very small republican party had previously existed; every hour now procured to it an accession of strength, as it appeared dangerous to intrust the national defence in the hands of the king. He was, therefore, dethroned on the 10th of August. A republic was proclaimed, and the capital soon became the scene of a sanguinary massacre of those persons who had been imprisoned on suspicion of adhering to his cause.

The duke of Brunswick was, in the mean time, advancing into the country at the head of the combined armies. Verdun and Longwy surrendered to his arms in the end of August, and he gradually advanced to the neighbourhood of Chalons. He had been opposed, however, at every step of his progress; the people of the country removed all kinds of provisions from the course of his march, while the French army under Dumourier was well supplied. At last, as the French daily acquired discipline, General Kellerman was able to sustain, with 16,000 men, an attack of 14 hours by a superior force. The combined army suffered by disease, while their adversaries were rapidly augmenting

Conduct of
Prussia.

in numbers and in courage, so that it became not a little dangerous to attempt to advance to the capital.

The king of Prussia was personally present with the combined army. We have already noticed the policy of that prince, or of his cabinet. He had resisted the combination of Russia and Austria to accomplish their own aggrandisement by dividing the territories of the Turks, and he had given countenance to the new Polish constitution, to form a barrier against Russia. Being deserted in his views by Britain upon the question concerning Oczakow, and finding France unable to give him any support, he had found it necessary to enter into the views of the two imperial courts; but he appears by no means to have regretted the discovery which he now made, that France was by no means in the prostrate state to which it had been supposed to be reduced; that she was capable of resisting an invasion, and was likely soon to resume her place among the European powers, and consequently, according to her ancient policy, to give countenance and protection to Prussia, and to repress the ambition of the court of Vienna. It may be farther remarked, that in consequence of Prussia being a Protestant state, and of the philosophical notions that had been diffused by the former monarch, Frederick II. many of the Prussian courtiers and military officers were not unfavourable to some of the principles of the French revolution, particularly to the overthrow of the Roman Catholic church. Neither was Prussia very jealous of political reforms, as it had countenanced the establishment of a free constitution in Poland, to assist her in resisting the restless ambition of Russia.

952
Duke of
Brunswick's re-
treat.

A retreat was begun by the combined armies, without any very desperate attempt being made to force the French to a general engagement, or to penetrate farther into their country; so that some suspicions were at this time entertained, by discerning men, that France would not have much to dread from the obstinate hostility of the king of Prussia. He probably wished to allow the new republic another winter within which to establish a government for themselves. If they succeeded in their object, he would be safe against the future ambition of Russia and Austria. If they failed to acquire sufficient energy to defend themselves, he could return during the following summer, to take his share of their spoils. After his retreat, the French, with wonderful activity, commenced offensive operations. General Custine took Mentz in October. In the same month Dumourier invaded the Netherlands, and on the 4th of November, fought the celebrated battle of Jemappe, in which the Austrians were beaten; and, as the late emperor Joseph II. trusting to his alliance with the royal family of France, had demolished the fortifications of the towns in the Netherlands, excepting Luxembourg and the citadel of Antwerp, the whole of that country, to the frontiers of Holland, now suddenly fell into the hands of the French.

953
Battle of
Jemappe.
Invention
of flying
artillery.

At the battle of Jemappe, a new invention in the art of war, that of flying-artillery, is said to have been first put in practice by the French army. Like all other contrivances in the art of war, it derived much weight from its novelty; and as success in this terrible art depends greatly upon influencing the passions of mankind, by striking terror by what is unknown, or inspiring hope and confidence in conse-

quence of any new device, this invention, at the period alluded to, made much noise in Europe. The French boasted greatly of the superiority which they derived from the use of it, and this boast was no doubt of some use to their enterprises. The invention itself is understood to have been made a short time before the battle of Jemappe, by the late Mr John Anderson, professor of natural philosophy in the university of Glasgow. He is said to have informed his friends in Scotland, that he offered the contrivance originally to the British government, at least to some persons connected with administration for the time, but that it was neglected by them. Being a man of an irritable temper, he was greatly enraged by this neglect, and instantly went over to France, where he communicated his contrivance to M. de la Fayette. Here he met with a very different reception. His experiments having been repeated by a committee of French engineers, the importance of the invention was instantly discerned; he was caressed by the most distinguished persons in the French capital, and considered as one of the most ingenious men of his age. He was seen looking from a window with Madame de la Fayette, on the day that the king was brought back to Paris after his unfortunate flight to the frontiers. His vanity appears to have been much gratified by the attention which, on this and other occasions, he received; and he remained during life an admirer and friend of the French revolutionary leaders. In the mean time, that people enjoyed the benefit of his invention, which on some occasions proved very fatal to their enemies; and the use of it is believed to have been only borrowed from them by the British army at a future period.

After the victory of Jemappe, the government of the new French republic, to conciliate the inhabitants of the Austrian Netherlands, published a resolution to open the navigation of the river Scheldt (which for some centuries had been kept shut up by the jealousy of the Dutch), and thereby to revive the trade of Antwerp, anciently one of the first commercial cities in Europe. At the same time to counteract, if possible, the combination of princes which had been formed against them, and which was now rapidly extending itself to every court in Europe, the new French convention (or representative body which had been elected after the deposition of the king) eagerly endeavoured to represent their own cause as the cause of mankind, or of the people at large in every country, in opposition to that of their princes or hereditary rulers, whom they denominated despots and tyrants. On the 10th of November the convention passed a decree, declaring, that they would give assistance, by their armies, to every people that should attempt to establish a free government for themselves. The same convention, two months thereafter, by a majority of votes, ordered their imprisoned monarch to be put to death on an accusation that he had betrayed the cause of the nation.

The important transactions which were taking place on the continent could not fail to produce a powerful effect upon the British nation, where the minds of men, as already remarked, had been directed in so particular a manner, to political questions by the late royal proclamation. According to the different sentiments of men, they perused with terror, or with satisfaction, the duke of Brunswick's manifesto. Men of a patriotic

otic character, however, whatever their political opinions might be, were in general not dissatisfied to see a nation capable, amidst the utmost public confusion, of repelling an invasion by the best disciplined armies, conducted by the most experienced commanders, in Europe. The horrid massacres, however, which took place in September, together with the treatment of the royal family, excited very different sentiments, as exhibiting an instance of unparalleled barbarity and useless bloodshed. In consequence of the political publications which, by the months of August and September, had been universally read, the whole British nation was in a most agitated state. In all companies, political questions on the comparative merits of monarchical and republican government, together with the propriety of a reform in the British house of commons, formed the sole subjects of conversation. Persons of every rank and sex entered into these discussions with singular eagerness. In general, at the commencement of the dispute, very few had any idea that a republican government would be found practicable in France. With regard to Britain, which enjoyed a sound administration of justice, and much internal prosperity, no change seemed necessary. In proportion, however, as the French gained victories, a republican government seemed less impracticable in such a country; and, in proportion, as the subject of political abuses was canvassed, new ideas concerning the state of government in Britain began to be entertained.—The disgraceful scenes of tumult and notorious corruption which had occurred in borough elections, the inattention of parliament during late years to the petitions presented for the abolition of the slave-trade, or motions made upon other popular topics, and last of all, the memory of the coalition, and the reproach under which the house of commons ever since that time had fallen, induced many persons to think a reform in the representation of the people absolutely necessary. As it is the nature of the human mind, when its attention is completely occupied on any subject, to proceed to extremes, new notions were daily broached at home, or imported from the volcanic region of France; one notion, in particular, was extremely prevalent, that of the boundless perfectibility of the human mind, which is so true in theory, but so false in fact; which, in the hands of providence, seems to be gradually and surely going forward, but which has never failed to cover with confusion all those who have hitherto attempted to act upon it as a present and existing reality. At the period alluded to, however, when so many novelties were afloat, this notion gained singular favour. Men of science or benevolence, who judged of others from the rectitude of their own intentions; men of ardent imaginations, who believed every thing practicable to their unbounded zeal; together with the young and inexperienced, who were unacquainted with the imperfections of the human character,—all imagined, that the period was arrived when mankind, become rational and just, were no longer to engage in sanguinary wars of ambition; when good sense alone was to rule the world; and when the public business of society, reduced to the narrow limits of administering justice and constructing high roads and harbours, might be conducted with little trouble, and without the establishment of king and nobles, and different ranks and orders of men, or the display of military force for the

preservation of public tranquillity. As these notions were extremely favourable to the common people, they entered into them with much eagerness, and thus contributed to give them a greater appearance of practicability. A sort of general delirium upon political subjects prevailed, and mankind were led to believe that the greatest changes in the order of society might be accomplished with facility and safety.

Besides the society called the *Friends of the People*, other associations of less distinguished persons, called the *Constitutional and Corresponding Societies*, were established in London; and during the harvest, societies assuming the name of that of Friends of the People, were established in all towns and villages throughout the country, for the avowed purpose of accomplishing a reform of parliament. In proportion, however, as the character of the French people began to display itself, in the sanguinary nature of their revolution, and the extravagant projects and sentiments which they published, persons of rank and property, as well as those of a mild and moderate disposition in Britain, became greatly alarmed lest something similar should occur in this country. In the month of November an association was instituted at the Crown and Anchor tavern in London, by Mr Reeves, the chief justice of Newfoundland, and other gentlemen connected with administration; the avowed purpose of which was the protection of liberty and property, against the attempts of republicans and levellers. Similar associations for the support of government were instituted in other parts of the metropolis, and throughout the country. These last included, in the course of the winter and succeeding spring, almost all persons of property in the island, besides great numbers of others who, from a spirit of timidity, or the desire of appearing the friends of the existing government, thought fit to join them, so that in point both of number or wealth it appeared, that, comparatively, very few had formed a resolution to avow a desire of innovation at this period. In Scotland, where the literature generally diffused among the common people enabled them to obtain a full knowledge of the new notions then afloat, which their rank and situation in society induced them to regard with favour, it was found very easy to quiet the general ferment; because the same literature enabled them, by the perusal of newspapers and pamphlets, to see the universal combination of persons of rank and property that was formed against the opinions which had recently gone abroad.

Parliament was assembled on the 13th of December 1792. The speech from the throne intimated, that his majesty had judged it necessary to embody a part of the militia, and to assemble parliament previous to the time fixed for that purpose. It stated, as the cause of these measures, the seditious practices which had been discovered, and the spirit of tumult and disorder shown in acts of riot and insurrection, which required the interposition of a military force in support of the civil magistrate. The industry, it added, employed to excite discontent on various pretexts, and in different parts of the kingdom, appeared to proceed from a design to attempt the destruction of our happy constitution, and the subversion of all order and government, and that this design had evidently been pursued in connection and concert with persons in foreign countries.

Speech

^{Britain.} countries. His majesty asserted, that he had carefully observed a strict neutrality in the present war on the continent, and had uniformly abstained from any interference with respect to the internal affairs of France; but that it was impossible for him to see, without the most serious uneasiness, the strong and increasing indications which had appeared there of an intention to excite disturbances in other countries, to disregard the rights of neutral nations, and to pursue views of conquest and aggrandisement, as well as to adopt towards his allies, the states general, measures which were neither conformable to the law of nations, nor to the positive stipulations of existing treaties. Under all these circumstances he felt it his indispensable duty to have recourse to those means of prevention and internal defence with which, he was intrusted by law; and thought it right to take some steps for making some augmentation of his naval and military force, being persuaded, that these exertions were necessary in the present state of affairs, and were best calculated both to maintain internal tranquillity, and to preserve the blessings of peace.

⁹⁶⁰
Debate on
the king's
speech.

An address, in consequence of the speech from the throne, having been moved, as usual, in the house of commons, Lord Wycombe opposed it. He said the speech calumniated the people of England; that no insurrection existed; that the kingdom was on the contrary overflowing with loyalty; that speculative political opinions had always been agitated under the free constitution of Britain: and that the persons thought most disaffected, wished to reform that constitution. He apprehended we had no just cause of war at present; for he considered the opening of the Scheldt, or even the protection of the stadtholder's privileges, as no sufficient justification of such a measure. Mr Fox said, that the present was the most momentous crisis, not only that he had ever known, but that he had ever read of, in the history of this country; and that on the conduct of parliament, depended not merely the fate of the British constitution, but of doctrines which go to the happiness and well-being of all human kind. He alleged, that there was not one fact asserted in his majesty's speech, which was not false. He denied the existence of an insurrection; remarking that though the sailors at Shields, Yarmouth, and other places, had entered into riots for an increase of wages, nobody had alleged that they had any political object in view. He justified the joy which many persons had expressed, on account of the retreat of the duke of Brunswick; and asserted, that this did not imply, in the minds of such persons, the existence of a dislike to the British constitution. One extreme, said he, naturally leads to another; those who dread republicanism, fly for shelter to the crown; those who desire reform, and are calumniated, are driven by despair to republicanism, and this, said he, is the evil that I dread; these are the extremes into which these violent agitations hurry the people, to the gradual decrease of that middle order of men, who dread as much republicanism on the one hand, as they do despotism on the other. He described the calling out of the militia, as a fraud, intended to induce the people to believe, that great cause of alarm existed, and thereby to bring them more completely under the influence of government. He treated the opening of the Scheldt, as no just cause of

war, and said, he did not believe that it would ever be the real cause, though it might be the pretext. He said, that such a war would undoubtedly aid the object of republicans and levellers; and recommended the removal of acknowledged grievances, as the certain means of appeasing discontents among the people. He, therefore, moved an amendment to the address, which simply pledged the house, to make inquiry into the facts stated in his majesty's speech.

Mr Windham now deserted the opposition, and joined administration, in contending that great danger to the constitution existed. He declared his approbation of the march of the combined armies into France, because he believed their motives to be good. Mr Dundas asserted, that under the pretext for reform, the example of France had been held out for imitation to the people of this country; that the object of the French evidently was the aggrandisement of their dominions. He said the interests and honour of this country, required that we should protect Holland, in the right of keeping the Scheldt shut, and thereby convince it, that it was happier to be connected with Great Britain, than with France. He took notice of the invasion of Poland, that had been alluded to in the debate; and said, that if there had not been such a division in that house, on the subject of the Russian war, Poland would have escaped her present fate. Mr Sheridan denied the existence of any just cause of alarm, and said, that he should vote that English minister to be impeached who should enter into a war, for the purpose of re-establishing the former despotism in France, or should dare, in such a cause, to spend one guinea, or shed one drop of blood.

⁹⁶¹
Great
division
opposition

From the commencement of Mr Pitt's administration, a considerable number of members of parliament, the remnant of the coalition, had remained in opposition to his measures. At this time, however, in consequence of the alarm which had diffused itself among persons of high rank, and perhaps also in consequence of a plausible excuse being found for deserting a fruitless and unprofitable opposition, of which they were weary, a great number of the members of the party hitherto hostile to administration, now joined in supporting those measures which they perceived to be agreeable to the executive power. On a division there appeared for the address 270; for the amendment 50. On the following day, when the address was reported by the committee appointed to prepare it, Mr Fox moved an amendment, the object of which was to prevent a war. He remarked, that some gentlemen had said, that ministers ought sooner to have taken the alarm, and sooner interposed to guard against the ambitious designs of France. He also thought, that they ought to have armed sooner, but not for the purpose of joining the general confederacy against France, but of counteracting it. They should have armed, the instant they heard that the two great military powers of Germany had confederated, and resolved to enter France; they should have opposed any such invasion, because it must have been productive of great injury to Britain, and to the other states of Europe, had it been attended with success. He said, he was an enemy to the aggrandisement of France; but in opposing it, he would take care to have justice on his side. Had he been minister when Prussia and Austria resolved to invade that

^{Britain.} that country, he would have told those powers they had no right to enter France. Had this been done, the English must have acquired such an influence in the councils of that nation, as would have completely prevented any attack upon Holland. He contended, that, in case of a war, the mutual jealousies of Austria and Prussia would render them unsteady allies; nor was Holland to be trusted, on account of the existence of a strong party, hostile to the stadtholder. Mr Burke compared the new French republic to the system of Mahomet, who, with the Koran in one hand, and a sword in the other, held out the former to the acceptance of mankind, which the latter compelled them to adopt as their creed; and asserted, that the two states of France and Britain might already be considered as actually in a state of war. Mr Dundas defended administration for not having mediated on the invasion of France by Austria and Prussia. He admitted, that the successes of the French had been incredibly great; but he noticed the emptiness of Dumourier's military chest, and the expences daily increasing; comparing them with the situation of this country, and pronouncing confidently that the war must be successful and glorious. Mr Fox's amendment was negatived without a division.

In the house of lords, similar debates took place upon the address, and opposition experienced a similar desertion of a part of its members. The duke of Norfolk, the marquis of Lansdowne, Lord Rawdon (since earl of Moira), and Earl Stanhope, declared themselves averse to war; while Lord Grenville, Lord Stormont, the marquis of Townshend, and others, supported the sentiments expressed in the king's speech.

⁹⁶²
Mr Fox's
motion to
treat with
the French.

After the French king had been dethroned, Earl Gower the British ambassador was recalled; but the French ambassador, M. Chauvelin, still continued to reside in London. On the 15th of December, Mr Fox moved, that a minister should be sent to Paris, to treat with the provisional executive government of France. He declared, that by this motion, he meant not to approve of the conduct of the French government, but simply to record it as his opinion, that it was the true policy of every nation to treat with the existing government of every other nation, with which it had relative interests, without regarding how that government was constituted. He said, we could have no stronger objection to the existing government of France, than to the government of Algiers and Morocco, where we have consuls. This motion gave rise to a very animated debate, in which the present opposition were accused of wishing to encourage discontent and sedition, and were defended by Mr Taylor, Mr Grey, and Colonel Tarleton. Mr Jenkinson enlarged on the flourishing state of our finances, while the French were involved in enormous expence; that the period for going to war was favourable; that the disaffected party in this country was very small; and, in the mean time, that the ambition of the French nation was daily increasing, and the ambition of a nation was more dangerous than that of a king. He considered the protection of the Dutch, in their claims to prevent the navigation of the Scheldt, as a just cause for going to war; and said, that by sending an ambassador to Paris, we should offend those who were to be our allies, the king of Prussia and the emperor. Mr Fox's motion was negatived.

VOL. IV. Part II.

On the 19th, Lord Grenville introduced into the house of lords, what has been called the alien bill, which authorized government to dismiss from the kingdom such foreigners as they might think fit. It passed after some opposition from the earl of Lauderdale and the marquis of Lansdowne. During its dependence, the latter nobleman ineffectually proposed an address to his majesty, to enter into a negotiation with the existing government of France, for the purpose of averting the fate of Louis XVI.

⁹⁶³
The alien
bill.

On the 28th of December, Mr Secretary Dundas urged the house of commons to pass the alien bill, on account of the extraordinary influx of foreigners into the country, and on account of the dissatisfaction of persons at home. Sir Gilbert Elliot supported the bill, and declared his regret on account of being under the necessity of differing from his former political associates. Mr Burke, as usual upon the subject of French affairs, spoke with great violence. He said, he would give the bill his most cordial support, as being calculated to keep out of England those murderous atheists, who would pull down the state and church, religion and God, morality and happiness. The bill, he said, was intended to drive from this country murderers and assassins. At one part of his speech, he drew a dagger from under his coat, and with much vehemence of action, cast it on the floor. This, said he, pointing to the dagger, is what you are to gain by an alliance with France; wherever their principles are introduced, their practice must also follow: you must guard against their principles; you must proscribe their persons. I vote, said he, for the present bill, because I consider it as the means of saving my life, and all our lives, from the hands of assassins. When they smile, a see blood trickling down their face, I see their insidious purposes; I see, that the object of all their cajoling is blood. I now warn my country to beware of those execrable philosophers, whose only object is to destroy every thing that is good here, and establish immorality and murder by precept and example.

Hic niger est, hunc tu Romane caveto.

While the alien bill was still under consideration, another measure allied to it in principle was introduced. This was a bill to prevent the circulation of assignats and other paper money, under the authority of France. The object of the bill was to make payments made in this way illegal, even when accepted. During the month of December, an order of council was also issued for preventing the exportation of corn to France, and some ships which had grain on board were compelled to unload. On the 26th of December, an act of indemnity passed upon the subject.

964
Lord Gren-
ville and
M. Chau-
velin's cor-
respon-
dence.
Affairs were now hastening to an open rupture with France. On the 17th of December, M. Chauvelin transmitted a note to Lord Grenville, one of the secretaries of state, in which, in the name of the executive council of the French republic, he demanded to know whether his Britannic majesty ought to be considered as a neutral or a hostile power. He said, that no wish existed on the part of France, to entertain any doubt upon the subject. That they even wished to answer previously all those reproaches which might be thrown out against them. Notice was taken of the decree of the French convention of November 19th, which it

4 N

was

^{Britain.} was alleged had been misinterpreted; that the French republic did not intend to favour insurrections in neutral or friendly states, and that the decree applied only to those people, who, after having acquired their liberty, might request the assistance of the French republic, by a solemn and unequivocal expression of the general will. A promise was made that the neutrality of Holland should be respected, while that power confined itself on its part within the bounds of strict neutrality. With regard to the question of opening the Scheldt, it was a question irrevocably decided by reason and justice, of little importance in itself, in the opinion both of England and Holland, and which could not seriously become a cause of war. It was added, however, that on the fatal supposition of a war being resolved on, while the intentions of France were thus peaceful and conciliatory, the whole weight and responsibility of it would sooner or later fall on those who had provoked it.

Lord Grenville's answer to this note, which bears date 31st December 1792, disclaims considering M. Chauvelin in any other public character than that of minister from his most Christian majesty. His lordship denied, that the decree of 19th November was satisfactorily explained, as the promoters of sedition, in every country, might still have in view the cases in which they might count beforehand on the support of France. The neutrality of Holland was said to be already violated by a French officer, who had navigated the Scheldt, to attack Antwerp; that the unimportance of the Scheldt would only render the opening of its navigation a clearer proof that an intention existed to insult the allies of England, by violating the rights which were guarded by the faith of treaties.

An official note of the executive power of France was transmitted through M. Chauvelin in reply to Lord Grenville's answer, in which an attempt was made to justify their former explanation, or to explain farther the obnoxious decree of November 19th. All intention of making a conquest of the Netherlands was disclaimed; and it was added, that if the Belgians, through any motive whatever, should consent to deprive themselves of the navigation of the Scheldt, France would not oppose it. In an answer to this note by Lord Grenville, these explanations were declared unsatisfactory. On the 17th of January, M. Chauvelin sent to Lord Grenville his letters of credence, as an ambassador from the French republic. On the 20th of the same month, Lord Grenville sent him a letter, refusing to receive his credentials, or to consider him in any other character than that of one among the general mass of foreigners resident in England. On the 24th of January, Lord Grenville sent to M. Chauvelin a passport for himself and his suite, declaring that, after the fatal death of his most Christian majesty, he could no longer be considered as holding any public character in Britain.

⁹⁶⁵
The king's message announcing war.

In consequence of this correspondence, the French convention declared war against England and Holland on the 1st of Feb.; and in the mean time, on the 28th of January, Mr Secretary Dundas presented to the house of commons a message from the king, stating that copies of the papers now mentioned, were laid before the house. It was added, that his majesty thought it necessary to make a farther augmentation of his forces by sea and land, and, that he relied upon the zeal of the

house of commons to enable him to take the most effectual measures for maintaining the security of his own dominions, for supporting his allies, and for opposing the ambition of France, at all times dangerous, and peculiarly so, when connected with the propagation of principles utterly subversive of the peace and order of all civil society.

Thus Britain became a party in the most sanguinary ⁹⁶⁶ The French and eventful war that Europe ever saw. We may here attempt to remark, that, in the month of April, the French government made an attempt to enter into a new negotiation. The minister (Le Brun), transmitted to England by a private gentleman letters to Lord Grenville, to be delivered by Mr John Salter a notary in London, in which he requested passports for M. Maret to come to Britain to negotiate peace; but no public notice was taken of the application.

In the quarrels of nations, the real sources of hostility are often very different from those that are ostensibly held out to the world. It was for some time customary to dispute in Great Britain, with much eagerness, the question concerning who were the aggressors in this war. In such disputes the friends of administration were under great difficulties, in consequence of the narrow ground upon which government had thought fit to rest the grounds or causes of hostility. The French government had been willing to explain away the offensive decree of the 19th November, and the question about the Scheldt they were willing to give up. It would seem, that their total ignorance of the nature of the British constitution, and of the elements which influence it in practice, prevented them from entertaining any idea that they were likely to encounter hostility from this country in consequence of their revolution. Hence they not only neglected their navy, but they had already, in some measure, ruined it, by sending their seamen to the frontiers in the character of soldiers. But though the French had originally no hostile designs against this country, and though the ostensible causes of war on the part of Great Britain were weak, it by no means follows, that the motives which actually influenced the conduct of the British government, on this occasion, were of the same nature. France had been the ancient and the dangerous enemy of England. She had suddenly fallen into a state of anarchy and consequent debility. All Europe was now leagued against her. Within she was divided by faction, and without she was assailed by immense hosts of the best disciplined soldiers in Europe, conducted by the most skilful leaders, to whom she had nothing to oppose but an undisciplined multitude, led on by low-born and inexperienced chiefs. In this state of things, it seemed a very safe measure to make war against her. To do so, was only to retaliate the conduct she herself had recently observed, when she accomplished the dismemberment of the British empire, by assisting our revolted colonies. It now seemed practicable, by dismembering France, to render her for ever incapable of being dangerous to Britain.

But the most powerful incitements to this war undoubtedly arose from the example of political innovation, which it was so much the interest of every government in which there existed any mixture of hereditary authority, completely to defeat and overwhelm.

To

Britain. To comprehend the full force of this motive for going to war, it is necessary to have lived in these times, to recollect the ferment which universally prevailed in the minds of men, and to imagine the situation and the feelings of a prince, who, though still safe himself, yet saw, in his immediate vicinity, the first of European monarchs, of the most ancient race, and at the head of the mightiest kingdom, hurled from his throne to a prison, and from that prison to a scaffold; his power assumed by the meanest of his subjects, who justified their own conduct as the triumph of reason and of freedom; their minds inflamed by furious zeal, devoting to destruction whatever resisted their career; while, at the same time, the contagion of their sentiments extended itself into neighbouring kingdoms, and from the license of speech and of publication allowed in Britain, produced a vehemence of discussion, which threatened to break out into actions not less violent than those of the primary revolutionists of France. In this state of things, and under the influence of such sentiments, a war against France seemed to be a war in defence of the whole arrangements of society, whether civil or religious; and princes and nobles considered themselves as engaged in the protection, not merely of their rank and riches, but of their personal safety. By engaging in war, the hands of government would be strengthened, in consequence of the patronage produced by the expenditure of public money, and of placing the patriotic sentiments of the people, or the wish to defend their own country, in opposition to the feelings of sympathy, with which they were disposed to regard the efforts of the French leaders in establishing a republican constitution, and defending their national independence.

nary and desperate contest, such as this was likely to prove, armies led on by princes, brought into power by the casualty of birth, might prove no match for French enthusiasm in the first instance, and far less ultimately for the superior tactics and enterprize which must speedily be introduced, by men rising to command in consequence of the admiration produced by their talents and their success. Last of all, we have already remarked the opinion suggested by Mr Fox, that Great Britain ought, on this occasion, to have actively protected the independence of France, which would have given such an ascendancy over her councils, as would have enabled us to protect Holland, perhaps to preserve the life, and even the sovereignty, of Louis XVI.; and, at all events, would have enabled us speedily to terminate the war, without any important changes being suffered to take place in the relative strength of the continental states of Europe.

Britain.

It is to be observed, that at the close of the year 1792, Mr Pitt did not attend parliament when it first assembled; nor did he make his appearance in the house of commons till the alien bill was going through its last stages in January, after the first debates were ended, and the relative strength of parties had appeared. The ostensible cause of his absence was, that having obtained, on the death of Earl Guildford (Lord North), the place of warden of the cinqueports, and thereby vacated his seat as a member of the house of commons, he had gone to Cambridge to secure his re-election. The length of his absence, however, suggested to some persons a suspicion, that he was hesitating about engaging to support the court in going into the war. Mr Dundas, in the mean while, who, during Mr Pitt's administration, had usually left the entire management of every debate to the premier, though he had acted otherwise when supporting Lord North's ministry, stood forth in the house of commons, as the leading servant of the crown, in support of the proposal for engaging in the war. Mr Pitt, however, on his return, resumed his station in the debates of the house, and supported the present measure with the utmost ardour. In the mean time, it is to be remarked, that, at this period, Lord Thurlow was removed from the office of lord-high-chancellor, and was succeeded by Lord Loughborough, who had originally owed his preferment to the support given by him to Lord North's administration and measures, and who had hitherto adhered to opposition, but in the late debates had defended the plans of administration.

⁹⁶⁹ Mr Pitt absent from parliament for a time.

⁹⁶⁸ Doubts of the necessity of the war.

Still, however, there were not wanting at that time some individuals, who thought the war altogether unnecessary to the support of the British constitution and government. The great amount of the national debt, together with the patronage of the crown, and the general happiness and integrity of character which the admirable jurisprudence of England produces in the people at large, gave powerful assurances of stability to government, and safety to property. Even before the war commenced, the crimes committed by the French revolutionists had greatly diminished the popularity of their cause; while the associations on the side of government that were forming throughout the kingdom, demonstrated the superiority of its adherents in wealth and numbers. It was therefore thought by a few persons to be completely practicable to weather the storm, without having recourse to war, especially as the body of the people of Great Britain were at this time entire strangers to the military art, and completely destitute of arms, while a considerable standing army was in the hands of the crown. The example of the American government, which, though weak in itself, and totally destitute of a standing army, while the people, as individuals, were all possessed of arms, and though greatly disturbed at this time by the admirers of the French revolution, yet, under the virtuous administration of George Washington, contrived to preserve its neutrality, affords some countenance to this idea. There were even some who doubted the prudence of the war, notwithstanding the strength of the combination formed against France, and who suspected, that in a sanguin-

On occasion of the message from his majesty announcing the actual declaration of war by France, Mr Pitt stated, that his majesty had always declined taking any part with regard to the internal government of France; and, during the summer, while France had been engaged in war with Austria and Prussia, his majesty had in no form departed from his neutrality; but as the French seemed now determined to subjugate other nations to their principles, he was under the necessity of interfering for the protection of his own allies, the Dutch, who had not indeed made any formal requisition for assistance, but to whose government the French had at all times been notoriously hostile. Mr Pitt also represented the language of the men in power in France, as intolerably menacing towards the government

⁹⁷⁰ Debates on the French declaration of war.

Britain. verment of Britain, and, as dangerous, from its tendency to introduce anarchy. He read an extract from a letter, written by one of the French executive council, and addressed to all the friends of liberty in the French sea-ports: "The king of England and his parliament mean to make war against us. Will the English republicans suffer it? Already these free men show their discontent, and the repugnance which they have to bear arms against their brothers the French. Well, we will fly to their succour; we will make a descent on the island; we will lodge there 50,000 caps of liberty; we will plant there the sacred tree, and we will stretch out our arms to our republican brethren: the tyranny of their government will soon be destroyed." Mr Pitt also adverted, in strong terms, to the death of the French king as a calamitous event; an act of outrage to every principle of religion, justice, and humanity; an act, which, in this country and the whole of Europe, had excited but one general sentiment of indignation and abhorrence, and could not fail to produce the same sentiments in every civilized nation. He compared it, and other late proceedings, to the massacre of St Bartholomew. It was, he said, in all its circumstances, so full of grief and horror, that it must be a wish, in which all united, to tear it, if possible, from their memories; to expunge it from the page of history; and remove it for ever from the observations and comments of mankind.

*Excidat ille dies ævo, neu postera credant
Secula? Nos certe taceamus, et obruta multa
Nocte tegi nostræ patiamur crimina gentis.*

All the members who remained in opposition, concurred in reprobating the conduct of the French revolutionists. Mr Fox, however, asserted, that the general maxim of policy was, that the crimes committed in one independent state could not be cognizable by another. He alleged, that the topics adverted to by Mr Pitt, were introduced into the debate to blind the judgment, by exciting the passions; and he contended, that the opening of the Scheldt, and the decree of the 19th of November, which were stated as the causes of the war, could never justify such a measure. He censured our past neutrality as unfair. While the French were invaded, we were quiet spectators; but, on their becoming invaders in their turn, we said Europe was in danger, and interfered against them. With respect to the general situation of Europe, he said, we had been scandalously inattentive. We had seen the entire conquest of Poland, and the invasion of France, with such marked indifference, that it was evident the professed causes were not the real grounds for going to war. He asserted, that the real cause, always disavowed by our government, but ever kept in mind, was the internal government of France. The destruction of that government was the avowed object of the combined powers. We were about to join them; but we were ashamed to own that Britain was engaging to aid the restoration of despotism; and therefore the Scheldt and Holland were collusively had recourse to as pretexts.

In the house of lords, when the same subject was discussed, the marquis of Lansdowne contended, that, by sending an able and experienced minister to Paris, our government might have saved the life of Louia

XVI. He said, the war would be a wanton war on our part, without provocation on the part of France; and he highly disapproved of the insulting manner in which M. Chauvelin was dismissed. Various debates afterwards occurred, in which both parties eagerly disputed the question, whether the French or the British were the aggressors in the war.

Though from the expensive nature of modern wars, ⁹⁷¹ Great com- a great commercial nation, in consequence of its wealth ^{mercial} and credit, is enabled to engage in them with consi- ^{failures.} derable advantage; yet, on every such occasion, it makes an immense sacrifice of individual happiness. The derangement of great branches of trade, and the disappointment of commercial speculations, never fails to reduce to instant ruin vast numbers of manufacturers and merchants, while many thousands of their dependent labourers, suddenly deprived of bread, are under the necessity of enlisting as soldiers; a circumstance, which is indeed attended with conveniency to government, but is productive of much wretchedness, for a time, to the families of such persons. At the period of which we are now treating, the British commerce had become extremely extensive, and, in consequence of the commercial treaty, the British and French merchants had become closely connected. From the sudden stagnation of trade, which the war now produced, added to the alarms which had been excited upon political subjects, a general paralysis appeared to seize the country, and the number of bankruptcies exceeded all that had ever happened in the most calamitous times. A general stoppage of commercial credit took place. No bank would venture to advance money to merchants or manufacturers; the consequence of which was, that many of them, with large quantities of goods in their possession, were unable to make effectual the smallest payment. To apply a remedy to this alarming evil, several of the principal traders and merchants waited upon Mr Pitt, and requested the interference of government; which was granted. A select committee of the house of commons was appointed to investigate the subject. After consulting with a variety of bankers, manufacturers, and merchants, the committee, on the 29th of April, gave a report favourable to the solicitations of the merchants for relief. ⁹⁷² A bill was accordingly introduced, on the 1st of May, ^{Loan to} authorizing government to issue five millions by ex- ^{the mer-} chequer bills, in loans to such merchants and manu- ^{chants.} facturers, as should deposit goods in security for the sum advanced. The measure proved extremely salutary. When it was found that the traders could obtain money from government, the bankers, and all other persons, immediately became willing to advance them money, or give credit to their bills; the consequence of which was, that not one half of the exchequer bills was ever issued. Trade gradually revived, and new channels were by degrees found out, for the disposal of the productions of British industry.

On the 27th of March, Mr Pitt, in a committee of ⁹⁷³ Loan to the house of commons, stated that he had borrowed ^{govern-} for the service of the present year 4,500,000l. The terms of the loan were, that for every 72l. advanced to the public, the lenders should be entitled to 100l. stock, bearing an interest of 3 per cent. which would make a capital of 6,210,000l. the interest of which, to be paid by the public, would amount to 186,000l.

Britain. a year. He said, there was another charge attending the loan; for, by the act for appropriating the million surplus to a sinking fund, it was provided, that whenever a new loan should be made, a fund equal to one per cent. on the whole of it must be provided, and applied to the liquidation of it. This would require an annual charge of 62,100*l.* making in the whole, including the interest, 248,400*l.* per annum.

them the parchments, then propose a candidate, and afterwards collect these parchments, and declare his lord's friend duly elected for the borough. These elections Lord Thurlow called a mockery." Mr Grey, after asserting that a considerable part of the representation of England was in this defective state, and urging the necessity of a reform, concluded, with moving that the petition should be referred to a committee. A very animated debate ensued, which was adjourned, and renewed on the following day. The proposal of reform was chiefly opposed on account of the hazard attending it, which appeared from the example of France, and on account of the length, universal suffrage, to which its more ardent partizans out of doors wished it to be carried. Mr Pitt, in a speech of considerable length explained his former motives for being friendly to a parliamentary reform, and his objections against it at the present moment. If this principle of individual suffrage (pointed at in several of the petitions) was to be carried to its utmost extent, it went, he said, to subvert the peerage and to depose the king, and, in fine, to extinguish every hereditary distinction, and every privileged order, and to establish that system of equalizing anarchy, announced in the code of French legislation, and attested in the blood shed in the massacres at Paris. "The question then," added Mr Pitt, "is, whether you will abide by your constitution, or hazard a change, with all that dreadful chain of consequences with which we have seen it attended in a neighbouring kingdom."

Britain.

974
Traitorous
correspon-
dence bill.

On the 15th of March, the attorney-general brought forward a bill for preventing traitorous correspondence with the king's enemies. It was the intention of this bill to prohibit the sale to the French government, or the French armies, of arms, military stores, provisions, or clothes, under the penalty of high treason. The purchase of lands in France was also prohibited. No person was allowed to go from this country into France, without a license under his majesty's great seal, under the penalty of being accounted guilty of a misdemeanour. Persons, though subjects of this country, coming from France, were prohibited to enter the kingdom without a passport, or, at least without presenting to the master of the vessel, a declaration to be transmitted to the secretary of state, and that, in the mean time, they should not quit the place where they had landed, without the permission of a justice of peace, or finding security for their good behaviour. Lastly, The insurance of vessels, either coming from France or going to France, was prohibited. The bill was opposed as unnecessary, because the ancient English treason laws prohibit the supplying of the king's enemies with naval or military stores, and because there was little danger of British money being conveyed to France, in the present distracted state of that country. It passed through both houses, supported by great majorities.

Mr Fox, on the contrary, represented in strong terms, the inconsistency of Mr Pitt's present conduct with his former professions. As to the time of attempting a reform, he said, it had been proposed at all periods, in war and in peace; but they had all been represented as improper. The present, he contended, was not a more dangerous period than the year 1782, when Mr Pitt himself had brought forward a similar proposal. Mr Fox said, he had always disliked universal representation as much as the chancellor of the exchequer, but that dislike was no reason for charging it with more mischief than was fairly imputable to it. He denied that it had been the cause of all the evils which had occurred in France. These he ascribed to the councils, generally unwise, and often wicked, by which that country had recently been governed. Mr Grey's motion was rejected, upon a division of 282 against 41.

975
Petitions
for parlia-
mentary
reform.

During the present session, a very great number of petitions were presented to the house of commons, from different parts of the country, praying for a reform in the representation. On the 6th of May, Mr Grey brought forward the question, after presenting a petition, which had been framed by the association called the Friends of the People in London, and which had a very numerous subscription annexed. He asserted, that the number of petitions now brought forward, demonstrated, that the house of commons were not the real representatives of the people. He gave a detailed statement of the various defects in the representation; and, as a specimen of the mode of argument now maintained upon the subject, it may be remarked, that when Mr Grey came to take notice of burgage tenures, and the splitting of messuages and hereditaments, for the purpose of multiplying voters, contrary to an act of King William for preventing such practices; he quoted an opinion given judicially by Lord Thurlow, when sitting as chancellor in the house of lords, in an appeal cause from Scotland, respecting the right of voters at elections. His lordship said, "If the right of election could be tried by law, in a court of law in England, he was convinced that an English court of law would not be satisfied with such a mode of election as this, that a nobleman's steward should go down to a borough with ten or twelve pieces of parchment in his hand, containing each the qualification for a vote, and having assembled a sufficient number of his master's tenants round a table, should distribute among

We have already remarked, that during some preceding years, the people at large took a very considerable interest in the question concerning the abolition of the African slave-trade, and that great numbers of petitions had been presented to the house of commons, during every session, praying that it should be prohibited. During the present session, however, no such petitions were brought forward. In consequence of the French revolution, and of the dread of innovation at home, the greater number of the original enemies of this traffic had been deterred from opposing it, lest they should give countenance to the discussion of a popular question, by which a dangerous enthusiasm might at this critical time be excited. The remaining enemies of the trade, being also zealous advocates for a reform of the parliamentary representation, had resolved to drop all inferior questions, and

976
Question
about the
slave-trade
dropped by
the public.

Britain.

to concentrate their strength upon that single point, assuring themselves, that if the house of commons should once be elected in a manner in any degree approaching towards universal suffrage, every popular question would thereafter be easily carried. The subject being thus in some measure deserted by the people at large, Mr Dundas did not account it necessary to revive the propositions, by which, on the part of the government, during the former session, he had endeavoured to moderate the views of the opponents of the trade.

On the 14th of May, however, Mr Wilberforce moved for leave to bring in a bill, for abolishing the trade carried on by English merchants, for supplying foreign territories with slaves. The motion was carried by majority of 7; but as it was not to take effect for some years, according to the resolution of the house in the preceding session, Mr Wilberforce moved, that leave be given to bring in a bill, for limiting and regulating the importation of slaves into the British West India colonies, for a time to be fixed in the act. This motion was also carried by a majority of 35 against 25. The bill proceeded through a first and second reading, but was rejected on the 12th of June, by a majority of 31 against 29.

977
Board of
Agriculture
instituted.

During the present session, certain popular measures were adopted. On the recommendation of Sir John Sinclair, a gentleman who of late years had been extremely active in calling forth a spirit of attention to the improvement of the domestic productions of the island, 3000*l.* per annum was voted by the house of commons, for the establishment of a board of agriculture. This institution has been the means of collecting and conveying to the public much useful information respecting that most valuable of all arts. At the same time, the institution is believed to have suffered from the unpropitious effect of political influence, which is so apt to injure the utility of every British establishment; and after the removal from its head of its original proposer, which happened in a few years, in consequence of his opposition to Mr Pitt's measures, it lost much of its utility. As it possesses little patronage, and has no special business allotted to it, there seems to be danger that it may sink into insignificance.

978
Relief of
Scottish
Catholics

In consequence of a motion of the lord advocate of Scotland, Robert Dundas, Esq. a bill was in the month of April brought into parliament, for the relief of the Roman Catholics of Scotland. The persons of that proscribed sect were still incapacitated by law from holding or transmitting landed property, and were liable to other very severe restrictions. These were now removed by a bill which passed without opposition. The passing of this bill was at the present period a popular measure, although a dozen of years had scarcely elapsed, since the people of Scotland had almost universally, and with the utmost violence, combined to oppose any relaxation of the penal laws against the Catholics. But one of the favourite notions of all political reformers at this time, was that religion ought to have no influence on government; that religion, or our duty to God, is a subject about which men are only interested as individuals, and concerning which society has no right to interfere. On the other hand, the opposers of every kind of innovation, were disposed to regard the Catholics with a favourable eye,

as the adherents of an ancient system, which reprobated all novelties, and tended to inspire the utmost reverence for established authority.

Britain.

The inhabitants of the north of Scotland were successful, by the assistance of Mr Dundas, in obtaining a repeal of the duty on coals carried coast-ways, as far as respected that part of Great Britain: but the cities of London and Westminster were less fortunate in a similar attempt, to procure a repeal of the taxes paid by them on the same article; as the minister would not agree, at the commencement of a war, to relinquish a tax which amounted in this case to a considerable sum.

979

Tax on

coals car-

ried north-

ward coast-

ways re-

pealed.

At this period the exclusive charter of the East India Company being within a year of expiring, that body presented a petition for a renewal of it. On the 23d of April the subject was considered in the house of commons. Mr Dundas introduced the business by observing, that the proposal he was about to make of a renewal of the charter was undoubtedly attended with considerable difficulties. "No writer upon political economy, (said he), has as yet supposed that an extensive empire can be administered by a commercial association, and no writer on commerce has thought that trade ought to be shackled with an exclusive privilege. In deviating from these principles, which have been admitted and admired, I am sensible that my opinions have popular prejudices against them: but I am supported by successful experience; and when the house adverts to the peculiarities of the subject before them, they will at once see that I am not attempting to overturn theories, though I am unwilling to recede from old and established practice. It would be idle, and a proof of ignorance, to maintain, that all the advantages that Great Britain possesses from its connexion with India, arise out of the present exclusive privilege of the company; but it would be impossible to say what might be the political or commercial effects of a variation from the present system." Mr Dundas then stated, that the shipping employed by the East India Company amounted to 81,000 tons; that the seamen navigating those ships were about 7000 men, who had constant employment; that the raw materials imported from India for the use of home manufactures amounted annually to about 700,000*l.*; that the annual exports of British produce and manufacture to India and China in the Company's ships, amounted to upwards of a million and a half sterling. He stated, that great difficulties would attend any alteration of the present system of government in India, especially from the effects which the innovation might have on the minds of the natives. He therefore proposed a variety of resolutions, the most material of which was; "That it appears to be fit and proper to continue to the East India Company their exclusive trade, within the limits now enjoyed by them, for a farther term of 20 years, to be computed from the 1st of March 1794, liable to be discontinued at the end of such a period, if three years notice shall previously be given by parliament; subject, nevertheless, to the regulations herein after specified for promoting the export of goods, wares, and merchandise, of the growth, produce, or manufacture of Great Britain or Ireland, and for encouraging individuals to carry on trade to and from the East Indies." The regulations

pany's

charter re-

newed.

referred

⁹⁸¹ Britain. referred to, permitted the export and import of certain commodities in the company's ships, at a stated freight. The resolutions proposed by Mr Dundas having been carried, a bill was brought forward, and passed through both houses, with little opposition, for renewing the East India Company's charter.

⁹⁸¹ Trial of Hastings. The trial of Mr Hastings still proceeded, though very slowly, and was now totally disregarded by the public. A petition was presented to the house of lords on the 18th of April, from Mr Hastings, complaining of "the enormity of the delays which have attended his long protracted trial," and earnestly entreating, that their lordships would adopt such means as might seem best calculated to accomplish the end which the petitioner so anxiously solicited, viz. a close of the trial during the present session of parliament. Mr Hastings had addressed the court on the 27th of February, to the same effect, but the business was not at this time brought to any conclusion.

⁹⁸² Barracks. During this year, government endeavoured to strengthen itself by erecting barracks in the neighbourhood of all the great towns in the island: that, by residing there, the soldiers might be removed from the hazard of receiving the contagion of popular opinions. A considerable degree of political fermentation still prevailed in the minds of the people, which, however, was rapidly subsiding. In England a bookseller was prosecuted, and punished with imprisonment for selling the second part of Paine's Rights of Man; and one or two individuals, of low rank, were committed for seditious words. In Scotland, the public attention was much excited by the prosecution of two gentlemen, Mr Thomas Muir, a member of the faculty of advocates, and Mr Fysche Palmer, a member of the university of Cambridge, who acted as a unitarian minister at Dundee. Mr Muir had been extremely active during the autumn of the preceding year, when the political agitation was at its height, in promoting associations about Glasgow and its neighbourhood, for the avowed purpose of procuring a popular reform of the representation in the house of commons. His talents as a man of letters were only moderate, but he possessed the faculty of unpremeditated elocution in a surprising degree; and he appeared to be influenced in a great measure by the vanity of haranguing without end, which the daily meetings of these societies afforded him an opportunity of doing. In other respects he was no way formidable, possessing little knowledge of the world, and still less discernment of the human character. He injured the cause he meant to promote, by constantly collecting numerous assemblages of common people, first at Glasgow and afterwards at Edinburgh, which gave an appearance of disorder and turbulence to the state of society, that was extremely alarming, not merely to government, but to persons who, in other respects, might have been disposed to favour the political sentiments which he avowed, but who were intimidated by the events which were passing on the continent of Europe, and by the unsettled appearance which affairs were thus made to assume at home.—Mr Palmer was a man of more literary talents. He attended political societies, but without making any remarkable efforts in them. He was tried before the circuit court of justiciary, on the 17th of September, some months after Mr Muir's trial

⁹⁸³ Political trials. at Edinburgh, and found guilty of publishing a political libel, which had been written by some other person, but which he had corrected, and ordered to be printed. Both of these gentlemen were condemned to transportation, Mr Muir for fourteen and Mr Palmer for seven years, to such place beyond seas as his majesty should think fit to appoint; and they were accordingly sent to Botany Bay. The severity of these sentences excited considerable discussion. The crime with which they, the condemned parties, were charged was, that of sedition or leasing-making, or public libel; the express punishment for which is prescribed by the law of Scotland, to be fine, imprisonment, or banishment. As it is a rule in law, that penal statutes are to be strictly interpreted, it was doubted how far the punishment of transportation could be inflicted under a statute which points out, in general terms, banishment as the punishment of the offence. The ancient practice of the Scottish courts was undoubtedly favourable to the extensive and more severe interpretation now adopted.

⁹⁸⁴ British convention. Not intimidated by these trials, a few persons of no public or political importance whatever, met at Edinburgh in the month of November, and thought fit to call themselves a British convention. They mimicked the proceedings of the French national convention as closely as possible, saluting each other with the title of *citizen*, holding public sittings, admitting strangers to the honours of the sittings, &c. and mingling the solemn with the ridiculous in a most singular style. At any other period their conduct would have excited nothing but ridicule. At this time, however, it was considered in another light, as some of the members were brought to trial, and punished with the same severity that had been exercised towards Muir and Palmer.

⁹⁸⁵ Foreign treaties. To promote the success of the war, a convention had been signed in the spring between our court and that of Petersburg, stipulating for the prosecution of hostilities till the French should relinquish all their conquests. A treaty was soon after concluded with the landgrave of Hesse Cassel, for a subsidiary body of 8000 men; a number which, by a subsequent agreement, was extended to 12,000. The king of Sardinia engaged (for 200,000*l.* per annum) to keep up an army of 50,000 men, to be employed in the particular defence of his dominions, and in general service against the enemy. A compact of alliance was adjusted with Spain, one with Naples, and others with Prussia, Austria, and Portugal. Besides the stipulations of vigorous hostility, it was agreed, that the conduct of other powers should be watched with extraordinary circumspection in this case of common concern to every civilized state, lest they should abuse their professed neutrality by protecting the commerce or property of the French.

⁹⁸⁶ The war. We reserve the particular detail of the military transactions of this most eventful contest for the article FRANCE, to which we refer the reader. We may here observe, however, that during the present campaign the independence of France seemed at one time to be brought into considerable hazard. The faction that overturned the monarchy, assembled a convention of national representatives, and was endeavouring to establish a republican form of government, soon divided

986
The war.

⁹⁸⁷ **Defection of Dumourier.** ed itself into two parties. The leading party at the first establishment of the republic consisted chiefly of men of letters, who were led by their speculations to expect a wonderful amelioration of the human character, and of the state of society, from the changes they were producing. They wished to avoid sanguinary measures at home, and to restore tranquillity to their country as speedily as possible. These men, however, appear to have been deficient in activity, as well as in knowledge of the character of their countrymen. They were opposed by a turbulent and ferocious minority, led by Robespierre, Danton, and other men of a most unprincipled and sanguinary temper. The moderate and ruling party were deceived by many of those whom they employed; and at last their chief commander, Dumourier, having been repulsed in the Netherlands by the united forces of Austria, Prussia, and England, entered into a negotiation with these powers for the restoration of monarchy in France. The negotiation was rendered abortive by the fidelity of his army, almost the whole of which deserted their general, and refused to bring the independence of their country into hazard by allowing foreign armies to interfere in the arrangement of its internal government.

⁹⁸⁸ **Favourable opportunity of making peace lost.** The defection of Dumourier, together with the repulse of their armies, brought the moderate party, which still ruled in the French convention, into great difficulties; and it is perhaps a most unfortunate circumstance, that the British government did not seize that opportunity of making peace with them. The hazard of innovation was now over in Britain. One of the maxims of the first French republicans was the love of peace and hatred of war. The unsuccessful issue of the attempt which they had made to penetrate into other countries might have remained long upon their minds, and added force to this sentiment. The tranquillity of Europe might thus have been insured during a considerable period. A mild party would have been preserved in power, an influence obtained by Great Britain over their councils, and the sanguinary scenes would have been avoided which afterwards occurred in the interior of France, and upon the frontiers. This opportunity of making peace, however, was unhappily disregarded, and nothing less was expected from its distraction within, and the immense combination of force assailing it from without, than the complete subjugation of that country. The want of success in their military operations at last encouraged the antagonists of the more moderate French republicans to attempt their overthrow by an insurrection of the common people of Paris. The national representatives were in this way subdued. Ninety members of the convention were imprisoned, and the minority were enabled to convert themselves into an apparent majority. By this event all France was thrown into confusion. The authority of the convention, thus mutilated, was rejected by the whole of the south of France, and the royal or national harbour of Toulon, with its fleet and stores, surrendered, by negotiation, to the British admiral, Lord Hood, as trustee for the next heir of the monarchy. In the western parts of France, the standard of royalty was reared, and joined by immense multitudes, who adhered to it with the most obstinate bravery, and were not subdued till after a greater expence

of blood than was found necessary for the repulse of the combined armies of Europe. ⁹⁸⁹ **Britain.**

On the part of Britain the general plan of a war ⁹⁸⁹ **General plan of the war de-** of such magnitude and supposed importance does not seem to have been well contrived, or properly carried into effect. A great part of the western coast of France was in full possession of the royalists, while, at the same time, the British navy commanded the ocean. It was therefore an easy enterprise, at a time when Britain had an opportunity of taking into pay so many foreign troops, to have landed a great army on the French coast, to have assisted the royalists, and advanced along with them through an open country, destitute of fortified towns, to the capital, against a convention whose authority was scarcely acknowledged by one-third of the nation. Instead of this mode of proceeding, the combined armies advanced against the French Netherlands, and wasted the summer, as well as their own strength, in the siege of a few of the powerful fortresses which defended that frontier. Thus the attack upon France was actually made upon its strongest side, that is to say, in the most injudicious manner possible. Leisure was given to the convention to establish its authority at home, and to call forth immense levies for the defence of the country, so that before the close of the year the tide of success was turned in their favour. Toulon was retaken, and the Spaniards beaten in the south; while on the northern frontier, the British army was repulsed before Dunkirk, and the commander in chief of the allies, the prince of Cobourg, before Maubeuge. The duke of Brunswick and Prince Wurmsers were driven across the Upper Rhine near Mentz, within the last fortnight of the year, after a succession of sanguinary conflicts, in which the French, by fighting every day in succession, and daily bringing forward fresh troops, who had been allowed to repose on the preceding days, at last succeeded with their raw levies, in wearing down the strength and the courage of their veteran enemies.

The British parliament assembled on the 1st of January 1794. ⁹⁹⁰ **King's speech.** In the speech from the throne his majesty called the attention of the two houses to the issue of the war, "on which," he observed, "depended the support of our constitution, laws, and religion, and the security of all civil society;" to the advantages that had attended our arms both by land and sea; and the expectation of ultimate success, as the operations of our enemies were alone derived from an arbitrary system, which enabled them unjustly to dispose of the lives and properties of the people, which must necessarily introduce internal discontent and confusion. His majesty proceeded to state the impossibility of making peace upon the only grounds on which it ought to be concluded, the permanent safety of the country, and the tranquillity of all other nations. He noticed the treaties and conventions into which he had entered for this object with foreign powers; and mentioned the general loyalty which prevailed amongst all ranks, notwithstanding the continued efforts to mislead and seduce the people. He lamented the necessity of additional burdens upon the people, but noticed the favourable state of the revenue.

As usual, the topics mentioned in the king's speech became the subject of debate, both in the house of lords

Britain. lords and in the house of commons, but they excited little attention throughout the nation. Men of property, in general, had been so much alarmed by the events which occurred in France, that they accounted it absolutely necessary to repose implicit confidence in government; and as administration seemed resolved not yet to despair of success in the war, they received full support from the approbation of the public. A minority, indeed, existed throughout the country, by whom the war was openly disapproved of; but as they consisted in general of persons of little influence, they could in no way embarrass the measures of administration. By this minority, the debates in parliament were as little regarded as by the supporters of government. They had no confidence in that assembly, in consequence of the inconsiderable number of the members that remained in opposition; and the memory of the coalition between Lord North and Mr Fox, together with the moderate and correctly constitutional nature of the principles supported by Mr Fox, deprived this statesman of the confidence of the more ardent lovers of political innovation, and rendered his eloquence of little value in their estimation. Indeed there was something in the form which the parliamentary debates generally assumed during the present war, which tended to render them uninteresting. It was understood by the public, that the war was undertaken for the purpose of subduing the political principles adopted by the French leaders; but these principles, notwithstanding the extravagant length to which they had been carried, and the absurdities and the crimes which had been committed under pretence of them by the ruling factions of France, still, at bottom, bore such a resemblance to some fundamental maxims of the British constitution, and to the principles for which our ancestors so earnestly contended, that the members of administration seem to have accounted it imprudent to avow in their public speeches, that the war originated in the purpose which their friends out of doors considered as its radical object. They were unwilling to say, that they wished to encroach upon the independence of a neighbouring state, or to prevent its establishing a representative government; and chose rather to allege that the war was occasioned by the direct aggression and ambition of the French, in attempting to establish their dominion over other nations, and that our object in it was merely to obtain indemnity for the past, and security against such aggression for the future. As opposition possessed considerable advantages from this equivocating mode of defending the war, every debate was apt to turn into this channel, and the same arguments were continually repeated without any person being convinced.

991
Debates on
the address. On occasion of the king's speech, Lord Wycombe moved an amendment to the usual address of thanks, recommending pacific measures. Lord Mornington, on the other hand, who was one of the principal supporters of the address, contended that the alternative of war and peace did not at present exist. Before we could relinquish the principles on which the war commenced, proof was necessary, either that the opinions which we had conceived of the views of France were erroneous; that the war was become desperate and impracticable; or that, from some improvement in the system and prin-

VOL. IV. Part II.

Britain. ciples of the French, the justice and necessity which prompted us to commence the war no longer existed. His lordship ascribed to France unlimited views of aggrandizement; ambition connected with principles subversive of all regular government. In support of his opinion, he adduced the act of fraternity, the assumption of sovereignty in Savoy and the Netherlands, the opening of the Scheldt, and the apparent designs of hostility against Holland. That such were the motives his lordship contended from a pamphlet written by M. Brissot, the conduct of the French residents in America and Constantinople, and the scheme of emancipating and arming the negroes in the West Indies. From all these proofs, his lordship declared himself fully convinced of the original justice and necessity of the war. He was so pleased, notwithstanding the late reverse, with the general result of the campaign, that he entertained confident hopes of ultimate success. He considered the foundations of the French power as so unsound, and the new government as so weak, that the effect of the confederate arms would soon be triumphantly striking. He acknowledged, that the enemy had displayed extraordinary vigour and energy; but he was convinced that power obtained by a system of terror would not be permanent. He opposed a negotiation as unlikely to be effectual in the present circumstances, and advised the continuance of the most resolute exertions of hostility.

Mr Sheridan, in reply to Lord Mornington, asserted that Great Britain had acted with no less disregard of the independence of neutral states than the French; that we had endeavoured to compel Genoa, Switzerland, and Tuscany, to join the confederacy against France, by the most insulting menaces; and that, as far as prudence would permit, we had assumed the same language towards Sweden and Denmark. He said, that if the French system of fraternizing with other nations that wished to overturn their own internal government was a just cause of war, their dereliction of that system ought to be a reason for making peace. He denied that the French were the original aggressors. "I am astonished," said he, "that the minister who sits near the noble lord, does not himself feel it necessary to his own dignity to oppose this paltry argument of the act of aggression having come from them, instead of leaving that task to us, to whom comparatively the fact is indifferent. When he hears this called a war of necessity and defence, I wonder he does not feel ashamed of the meanness which it spreads over the whole of his cause, and the contradiction which it throws among the greater part of his arguments. Will he meet the matter fairly? Will he answer this one question distinctly? If France had abstained from any act of aggression against Great Britain, and her ally Holland, should we have remained inactive spectators of the last campaign, idle, apart, and listening to the fray; and left the contest to Austria and Prussia, and whatever allies they could themselves have obtained? Does he then mean to say that he would have sat still; that Great Britain would have sat still with arms folded; and reclining with luxurious ease on her commercial couch, have remained an unconcerned spectator of this mighty conflict, and have left the cause of civil order, government, morality, and religion, and its God, to take care of itself, or to owe its preservation to

Britain. the mercenary exertions of German and Hungarian barbarians; provided only that France had not implicated Great Britain by a special offence, and forced us into this cause of divine and universal interest by the petty motive of a personal provocation? He will not tell us so: or if he does, to answer the purpose of the hour, will he hold the same language to our allies? Will he speak thus to the emperor? Will he speak thus to the king of Prussia? Will he tell them that we are not volunteers in this cause; that we have no merit in having entered into it; that we are in confederacy with them only to resent a separate insult offered to ourselves; which redressed, our zeal in the cause at least, if not our engagement to continue in the alliance, must cease? Or if he would hold this language to these powers, will he repeat it to those lesser states, whom we are hourly dragging into this perilous contest, upon the only plea by which such an act of tyrannical compulsion can be attempted to be palliated, namely, that a personal ground of complaint against the French is not necessary to their enmity; but that as the league against that people is the cause of human nature itself, every country where human feelings exist, has already received its provocation in the atrocities of this common enemy of human kind? But it is unnecessary to ask whether he would hold this language to the greater powers. The king of Prussia, Sir, at this moment, tells you, even with a menacing tone, that it is your own war; he has demanded from you a subsidy and a loan; you have endeavoured to evade his demand, by pleading the tenor of your treaty of defensive alliance with him, and that as the party attacked, you are entitled to the whole of his exertions; he denies that you are the party attacked, though he applauds the principles upon which you are the aggressor; and is there another power in Europe, to whom our government will venture to refer the decision of this question? If what I now state is not the fact, let me see the minister stand up and contradict me. If he cannot, let us no longer bear that a fallacy should be attempted to be imposed on the people of this country, which would be treated with scorn and indignation in every other corner of Europe. From this hour, let him either abandon the narrow ground of this being a war of necessity entered into for self-defence, or give up the lofty pretence of its being a war of principle, undertaken for the cause of human nature." Mr Sheridan admitted, that enormities had been committed in France, which disgusted and sickened the soul. This was most true; but what relation had these to England? And if they had, what did it prove? What but that eternal and unalterable truth, that a long-established despotism so far degraded and debased human nature, as to render its subjects, on the first recovery of their rights, unfit for the exercise of them? But, he said, he should always meet with reprobation the inference from this truth, that those who had long been slaves ought ever to continue so. That we and all the powers of Europe had reason to dread the madness of the French, Mr Sheridan agreed; but was this difficult to be accounted for? Wild and unsettled as they must necessarily be from the possession of such power, the surrounding states had goaded them into a paroxysm of madness, fury, and desperation. We called them monsters, and hunted them as monsters. The conspiracy of Pillnitz, and the brutal threats of

Britain. the abettors of that plot, had to answer for all the additional horrors that had since disengaged humanity. We had covenanted for their extermination, and now complained that they turned upon us with the fury that we had inspired. The same speaker asserted, that no reasonable hope of success existed upon which we ought to be led. "What," said he, "was the state of our allies when we entered into the confederacy? The force of Austria unbroken, though compelled to abandon Brabant, and the power of the veteran troops of Prussia absolutely untried, though the seasons and disease had induced them to retire from Champagne. What is their state now? Defeat has thinned their ranks, and disgrace has broken their spirit. They have been driven across the Rhine by French recruits, like sheep before a lion's whelp, and that not after the mishap of a single great action lost, but after a succession of bloody contests of unprecedented fury and obstinacy. Where now is the scientific confidence with which we were taught to regard the efforts of discipline and experience, when opposed to an untrained multitude and unpractised generals? The jargon of professional pedantry is mute, and the plain sense of man is left to its own course." Mr Sheridan asserted that the efforts of the inferior states, the Dutch, the Portuguese, the Italians, whom we had compelled to enter into the war, had been of no importance, and he alleged that government had conducted the contest with little vigour or ability.

Mr Windham combated the opinion, that the enormities committed in France were the effects of the war. It was, he said, the duty of every government to interfere, for France was making war against all government, all religion, and all principle. How was it possible to preserve peace with a nation which formed a ground for quarrel with every government that dared to suspect the purity of their intentions? Whatever might be understood as the binding law upon nations carrying on offensive war, with respect to interfering in the internal affairs of other countries, he conceived that such opinions could not affect a nation sustaining a defensive war. "Standing (said Mr Windham) as we do, the defenders of the present and the future world, ought we meanly to crouch in cowardice, and sink in despair."

Mr Dundas defended the management of the war and the activity which had been employed by government in it. Our seamen in the beginning of the year were only 15,000; in the course of the war 54,000 men had been added. At the commencement of the war, we had only 13 ships of the line and 30 frigates fit for service; at the present time we had 80 ships of the line and 100 frigates in actual employ, which, with the armed vessels now in the service of the public, made the whole above 300 sail. In augmenting the army, the most effectual and economical system had been pursued; besides the militia, 30,000 men had been added to the army. He concluded, that more had been done in the first year of this, than of any former war; and added, that upon the issue of this struggle, every thing that was valuable to us, either as individuals or a nation, depended.

Mr Fox repeated in a variety of forms the assertion that we were the aggressors in the war. He contended, that every state had a full right to regulate its internal government;

Britain. government; and asserted, that the manifesto of the duke of Brunswick had occasioned all the excesses of the French. Upon the subject of acts of aggression previous to the war, he thought, that this difference between the conduct of the parties subsisted; France was always ready to negotiate, while the British government invariably refused. The former expressed the strongest dislike to war, and took every step to avoid it. The latter not only showed an inclination for war, but endeavoured to inflame and provoke hostilities. He contended, that the nature of the conduct of the French government towards this country, afforded no good reason for a continuance of hostilities, and no rational objection against the permanency of any treaty that might be concluded with them. We negotiated with Louis XIV. though his pretensions were no less dangerous to this country, than those of the present French leaders. That monarch was a declared enemy to our revolution. He corresponded with the jacobites of England. He endeavoured to overturn our establishment in church and state. He invaded Holland, and confined not his projects of conquest to the banks of the Rhine. Mr Fox said, we ought to be satisfied with the best security for peace, that the nature of the circumstances in which it was made would permit, taking care that the power with whom it was made should have no temptation to break it. He denied, that the prodigal manner in which the French government conducted their affairs, and the confusion and ruin into which their finances were hastening, afforded any prospect of success to the allied powers. He said, he remembered, that during the American war, there was much talk of a vagrant congress, which was nowhere to be found, of their miserable resources, and their wretched paper money at 300 per cent. discount, of which, with any few halfpence you had in your pocket, you might purchase to the amount of 100 dollars. The Americans were represented, as exercising on each other the most intolerable tyranny, on the royalists the most unheard-of cruelty; and it was then said, that if such principles were suffered to exist, if the cause of America was ultimately successful, there was an end of all civilized government; England must be trodden in the dust. "Yet then (said this statesman), I recommended negotiation, and lived to see Great Britain treat with that very congress so often vilified and abused, and the monarchy remain in sufficient vigour. God grant that I may not see her treat with the present government of France in circumstances less favourable for making peace than the present." He reprobated the conduct of administration, in endeavouring to compel the weaker states to join them in the war, while, at the same time, they were inveighing against the French, as invaders of the rights of nations. He concluded with a most splendid panegyric upon the superior dignity which appeared in these times in the character and conduct of the illustrious General Washington, who, for the preservation of his authority, as first magistrate of a free people, had not recourse to tricks of policy or arts of alarm, but depended upon his own wisdom, moderation, and firmness; which enabled him to preserve the neutrality of America, without fear of the contagion of the French revolution, or of the threats of British hostility.

Mr Pitt recapitulated the arguments formerly used,

to prove that the aggression had certainly taken place on the part of France. He mentioned the system adopted by the French as subversive of all regular government, their usurpation of foreign territory, their hostile intentions against Holland, and their unprecedented views of aggrandisement and ambition. Unless it could be proved that we had mistaken these principles, we were bound, he said, to continue the war; and supposing that difficulty and disappointment had occurred in the prosecution of it, these ought to inspire us with additional vigour, and stimulate us to new exertions. Had there been any misconduct, of which he was not sensible, in conducting the war, yet that could not affect the general question. If the difficulties we had experienced, arose from the want of abilities in those to whom the management was entrusted, let us resort to other men. If the difficulty arose from the nature of the contest, then the argument against ministers would be much weakened. He stated the objects of the war to be, to procure a secure and permanent peace, and an indemnity for the expences incurred. To accomplish these ends, he asserted the necessity of interfering in the internal affairs of France, and he vindicated this measure upon the ground of securing our own safety. He conceived there was not the least probability of the continuance of the present government of France. The efforts of the people had been merely the result of terror. They were supported by the most desperate resources, which could not possibly continue. He said, that peace with the present French government was less desirable to him than war, under any disasters which he could possibly imagine. He admitted, that a safe and advantageous peace ought to be concluded, as soon as it could possibly be obtained; but he affirmed, that the security and benefits of peace with France must depend upon the establishment of a government essentially different from the present. He asserted, that had Louis XIV. succeeded in his projects, what we should have suffered from him would have been a deliverance, compared with the consequence of success attending the present French system. He said he did not attach the same degree of importance to the restoration of monarchy in France, as to the destruction of the present system. He attached importance to the former, only as a form of government in which the greater part of the people would be disposed to concur, and which would afford the best security for the permanence of peace. He noticed, as precluding all negotiation, a late decree of the French convention declaring the unity and indivisibility of their republic, in the enumeration of the territories of which they included their late conquests. He concluded with saying, that there could be no question but to resist, till such time as, by the blessing of providence upon our endeavours, we might secure the independence of this country, and the general interests of Europe. The address was carried by a majority of 277 against 59.

In the house of lords, a similar debate took place upon the same occasion. Lord Stair moved the address, and the motion was seconded by Lord Auckland, with speeches which recited in strong terms the atrocities committed by the French factions upon each other, together with the successes of the British troops under the duke of York and elsewhere. These noblemen were supported by the duke of Portland, Earl Spencer,

4 O 2

Lord

Britain. Lord Coventry, the earl of Mansfield, the earl of Hardwicke, the earl of Carlisle, Lord Grenville, and others. They were opposed by the earl of Guildford, who proposed an amendment to the address, recommending negotiation, and by the duke of Norfolk, the earl of Derby, the earl of Lauderdale, Earl Stanhope, and the marquis of Lansdowne. Earl Mansfield asserted, that the war was begun by the unprovoked aggression of France; and continued on our part, not from the motives of ambition and conquest, but to restore the blessings of order and good government to that country, to resist and defeat the wild attempts of those, who had declared it to be their purpose to disorganize Europe, and who were the enemies of the whole human race. He said that a lasting peace with France would be impossible. No alliance could be made with anarchy. The government of France was continually fluctuating, and the leaders of the present faction were not likely to respect any engagements formed by their predecessors.—Other noblemen supported the necessity of persevering in the war, to avoid breaking faith with foreign powers, and as the only means of preserving the independence and the constitution of this country; while, on the other hand, the marquis of Lansdowne contended, that the speech from the throne had discovered an important secret, that this was a war for nothing, or which had no specific object in view. He ridiculed, with much success, the difficulty of treating with the French, because they had no government, or were in a state of anarchy. Let the ministers, said his lordship, ask General Wurmser if there is no existing government in France. Let them ask the duke of Brunswick and the king of Prussia. Let them ask Lord Hood and Sir Gilbert Elliot, the royalist army of La Vendee, the unfortunate Lyonese, the Spaniards retiring before their arms. He feared it would not be long, before the prince of Saxe-Cobourg and the duke of York must allow that there was a government in France. The horrid outrages perpetrated in France, he considered as chiefly owing to the delusive hopes entertained by the royalists, of assistance from this country. The earl of Lauderdale regretted the consequences, which, by the management of ministers, the war was made to produce upon the situation of the people of this country. He asserted, that the alarm spread by ministers had been made the ground for a system of persecution. The revolutionary tribunal had been regarded with horror and disgust; but what had been the conduct of the courts of justice in this and a neighbouring country? What their sentences? Who could venerate a constitution, which must be protected by the friend becoming a spy on the actions of his neighbour, and the house of domestic conviviality being subjected to a state inquisition? His lordship discussed at some length the severities exercised in Scotland, and ascribed the revolution in France to the severity of punishments and the oppression of the poor. "Does the minister then (said his lordship), take the way to prevent the introduction of French principles, when he embarks in a war which weighs down the people with taxation; and introduces a system of severity, which must make them detest, not admire, the constitution of Great Britain." The address was carried in the house of lords, by a majority of 97 against 12.

Several debates of a similar nature occurred during

the course of the session; but as the issue of the whole was the same, and the arguments employed did not differ essentially from those now mentioned, it is unnecessary to state them in detail. Britain

It is one of the remarkable characteristics of the British nation, to be at all times easily thrown into a state of great anxiety and alarm, by any object which government for the time thinks fit to represent as dangerous. The two greatest objects of political terror to Englishmen, have at all times been the fear of a foreign invasion, and the dread of secret conspiracies, asserted to be entered into by a disaffected party. It is true, that during many ages Britain has not been successfully invaded, and that, since the time of the Spanish armada, no such attempt has been made by any of those governments with which Britain has engaged in hostility; but this very circumstance, which leads reflecting persons to regard such a project as extremely unlikely to occur at any particular period, seems to produce a contrary effect upon the people at large. The evils attending invasion having never been felt, lay hold of their imaginations in the wildest and most exaggerated forms; and from the terror thus produced, they are prevented from reflecting upon the difficulties attending such a project, which deterred Louis XIV. from attempting it while in the height of his power, and possessing the advantage of a disputed succession to the crown. Such is the credulity of the British nation upon this head, that administration can at any time throw them into a state of the utmost consternation, by expressing an apprehension of a French invasion. From this alarm, ministers usually derive considerable advantages. The voice of faction is silenced for a time by patriotic terror, and all parties are under the necessity of arranging themselves under the banners of government for the defence of their country.

The dread of plots and conspiracies produces effects somewhat similar. It is true that no conspiracy of Englishmen was ever productive of danger to the government, while it remained even tolerably popular; but this never prevents the nation from being thrown into the utmost consternation, by intimations, on the part of government, that some desperate conspiracy is secretly carrying on, and is ready to burst forth, to the utter destruction of the public tranquillity. 995

During the war of which we are now treating, Mr Pitt's administration derived incredible strength from these two sources of terror; the fear of invasion, and the dread of conspiracies by disaffected persons. Neither did he want skill to profit by them. At the commencement of the war, it had been believed by most persons, and perhaps by government, that it would be of short duration, as the state of anarchy which succeeded the overthrow of the monarchy in France, seemed to render that country an easy prey to the powerful armies by which it was invaded. When any doubt of success was expressed, it was said, that after making trial of the war for a year, we might desist, in case we were unsuccessful. But the original state of affairs was now considerably altered, by the successes of the French at the end of the late campaign. The British government still resolved to persist in the war; which, however, was now becoming less popular, as less likely to be attended with success. On the other hand, the French leaders were greatly irritated by the persevering

Britain. persevering hostility of the British ministry, and amidst the pride of victory, menaced England with invasion. It is evident, that they had still too much business upon their hands on the continent, to be able to make the slightest attempt to carry their threats into execution: but the British administration, taking advantage of the threat, expressed their fears that it might be successful; and proposed the arming of associations of volunteers, both cavalry and infantry, throughout the island, for the defence of the nation, both against foreign invasion, and also against the efforts of disaffected persons at home. They also encouraged the raising of subscriptions to defray the expence of these armed associations; and although the measure was disapproved by the minority in parliament, as an unconstitutional mode of raising money, it was supported by the majority. An act was passed, authorizing the embodying and training of volunteers, and the measure was carried to a considerable extent throughout the country. In like manner, though the political ferment occasioned by the French revolution had now considerably subsided, and the alarm occasioned by it was gradually passing away, administration, aware of the strength they derived from keeping the country in a state of anxiety upon political subjects, announced to parliament, by a message from the king on the 12th of May, that seditious practices had been carried on by certain societies in London, with a view to overturn the constitution, and introduce the system of anarchy that prevailed in France; that their papers had been seized, and were submitted to the consideration of the house. On the same day, Thomas Hardie, a shoemaker in Piccadilly, who had acted as secretary to the London Corresponding Society, and Daniel Adams the secretary to the Society for Constitutional Information, were apprehended for treasonable practices, upon a warrant from Mr Dundas. Mr Horne Tooke, well known for his ingenious philological writings, as well as for the political part he formerly acted in the turbulent days of John Wilkes, with the reverend Mr Jeremiah Joyce, Holcroft a dramatic writer, Mr Kyd a barrister, and John Thelwall, who had for some time entertained the town in the character of a political lecturer, were in a few days arrested and committed to the Tower on a charge of high treason.

996
Secret committee.

A secret committee of the house of commons was chosen by ballot, for the sake of giving solemnity to the inquiries made into this conspiracy. The members of the committee were the friends of the minister. The report of the committee, concerning the alleged conspiracy, amounted to little more than a recital of a number of advertisements from societies, or accounts of their debates, that had previously appeared in the public newspapers. It served, however, as a reason for suspending the operation of the habeas corpus act, and thereby enabling ministers to prevent any political movement, or avowed disapprobation of their measures, from being rashly exhibited out of parliament.

In the mean while, the fear of invasion, added to the political alarm, which, previous to the commencement of the war, had diffused itself through the country, and which was thus artfully maintained, conferred upon ministers a degree of strength, which for a century or two no British administration had possessed. Almost all men of property were their adherents. Their antago-

nists sunk into utter discredit, and suffered a very severe degree of persecution in every department of society; so that it became dangerous to a man's prospects in the world, and in ordinary business, to express the slightest doubt of the propriety of any measure approved of by government.

Britain.

In the early part of his administration, Mr Pitt had endeavoured to rest his reputation, in a considerable degree, upon the improvement of the finances, and the hope which he held out of paying off the national debt. He now deserted all such views; and taking advantage of the uncontrolled power he possessed at home, and the pliability of parliament, he engaged in a career of unexampled expediture, in corrupting successive parties in France, or in the management of the war. No opposition was made to a demand of 85,000 men for the maritime service; but the increase of the army to 60,000 men was resisted by opposition, though the majority allowed that number. The whole supply of the year exceeded 20,228,000*l.* As a loan was negotiated for 11,000,000*l.*; spirituous liquors, glass, bricks, paper, and other articles were subjected to new duties; and an additional revenue was drawn from attornneys.

997
Finance.

From its first rise to eminence as an European power, the Prussian court considered France as its protector against the ambition of Austria. We have remarked, that, at the period of which we are treating, Prussia had entered with reluctance into the ambitious views of Austria and Russia for the partition of Poland and France. Having found it necessary to do so, however, for the sake of sharing in their acquisitions, the Prussian court appears to have conducted itself with singular prudence and dexterity. During the present year, in spite of the resistance of a party in Poland, headed by the brave Kosciusko, that country was partitioned, and Prussia obtained an ample share of its territory. The partition of France was an object from which Prussia had every thing to fear, as it would destroy that power, by which Austria, the inveterate enemy of Prussia, had at all times been kept in awe. When the Prussian monarch found it necessary in conjunction with his new allies to invade France in 1792, he retired upon the first appearance of a tolerably firm opposition, and gave the new republic a respite of another winter, during which to arrange its strength, and call into action its resources. In the year 1793, the Prussians remained extremely inactive till towards the close of the campaign, when, at last, in consequence of repeated remonstrances from their allies, they advanced against Alsace. Being there repulsed, and the republic beginning to exhibit on all sides a respectable military front, the king of Prussia declared, that the expences of the war were more than his finances could sustain, and required the other German states to supply him with money, threatening in case of a refusal entirely to desert the common cause. Upon their declining to comply with his demands, he actually began to withdraw his troops. By this time, however, the British ministry had engaged in the war with a degree of eagerness, which induced them to make every sacrifice to obtain success in their object. On this occasion, therefore, to avoid losing the assistance of Prussia towards the common cause, they offered a subsidy, which was finally adjusted upon the following terms: His Prussian.

998
Prussian politics.

Britain. Prussian majesty agreed to furnish 62,000 troops, which was 30,000 beyond his contingent; for which his Britannic majesty agreed to pay him 50,000*l.* a month, 100,000*l.* a month for forage, 400,000*l.* to put the army in motion, and 100,000*l.* on their return; in all for the remaining nine months of the present year, 1,350,000*l.* The whole year would amount to 1,800,000*l.* out of which the states general were to pay 400,000*l.* The forces thus subsidized, were to be commanded by an officer to be named by the king of Prussia.

By this treaty the king of Prussia was enabled to keep his army upon the war establishment with little additional expence to himself, and would have it in his power to claim a share of whatever conquests were made from France; while at the same time, by stipulating that he himself should appoint the general of the subsidized army, he retained a complete command over it, and could prevent his troops from being worn out by active service, and restrain them from doing greater injury to the French republic than he himself might judge prudent.

999
Maritime
success of
Britain.

All Europe looked forward with great anxiety to the approaching campaign, as decisive of the mighty contest in which its whole powers, excepting Russia, Sweden, and Denmark, were actively engaged. At sea, where her strength could be most effectually exerted, Great Britain was eminently successful. An expedition, under Sir Charles Grey and Sir John Jervis, was sent to the West Indies, where Martinique, St Lucia, and other islands were taken. In the Mediterranean, the French were driven from the island of Corsica, and the inhabitants acknowledged the king of Great Britain as their sovereign. But the most signal victory, was that which was gained by Lord Howe, over the French fleet, on the 1st of June, near Brest. During the first years of the revolution, France had suffered much distress from a scarcity of grain; and such was the inveteracy with which the present war was conducted, that the British government had formed a plan of subduing that nation by famine, by preventing their obtaining supplies of provisions from any foreign country. In their distress, the French rulers applied for assistance to the United States of America. The states still owed a considerable debt to France, which they had contracted to the monarchy in the war with Great Britain, by which their own revolution had been accomplished. The French now offered to accept payment of this debt, not in money but in corn, a commodity abounding in America. The Americans, accordingly, delivered the grain in their own ports, and 160 sail of vessels laden with grain set sail for France. Lord Howe was sent out to intercept, if possible, this valuable convoy; while, on the other side, the French admiral, Villaret Joyeuse, sailed from Brest to hazard an engagement with the British fleet, for the sake of preserving the convoy. The force of the hostile fleets was nearly equal, the British having 26, and the French 25 sail of the line; but the French line was broken, and at the end of an obstinate engagement, six of their ships were found to be taken, and two sunk. Their admiral, however, had before the battle, detached a considerable force for the protection of the convoy, which was thus enabled

2

with safety to reach its destined port. This victory produced very great exultation in the British nation, in consequence of the fear of invasion, which had been previously excited, the danger of which, this proof of naval superiority seemed to place at a distance.

On the part of the French, however, these colonial and naval losses were greatly overbalanced by the general result of the campaign. The allies still concentrated their principal force against the Netherlands, and with that view, besieged and took Landrecies at the commencement of the campaign; but the fortune of the war was speedily turned. General Pichegru advanced into maritime Flanders, and in a variety of engagements, defeated General Clairfait, an Austrian officer of great activity, who speedily ruined his own army, by daily and sanguinary efforts to drive back a superior enemy. An attempt made by the grand army to cut off the retreat of Pichegru was unsuccessful. He, in return, afterwards made an attempt, on his part, to cut off the communication between the imperialists and their stores at Ghent. He was repulsed; but the obstinate conflict which he maintained, and the steady fire of his troops, during a succession of battles, which lasted from daybreak till the setting of the sun, convinced the allied armies, that the invasion of France had become a hopeless project. At last, the French advanced, under General Jourdan, from the eastward, and at Fleurus gained a victory in which 15,000 of the Austrian troops perished. Mutual disgust, as well as discouragement, now prevailed among the allies. The Austrians retreated, leaving the duke of York, at the head of the British and Hanoverian forces, in considerable peril. He made good his retreat, however, with the assistance of Earl Moira. This nobleman (formerly Lord Rawdon) had distinguished himself in the American war. In the house of lords, he had opposed the present war, but he had been sent by administration with a feeble armament, where the greatest efforts of Britain ought to have been directed, that is, to assist the royalists on the western coast of France. Finding himself too weak to effect any important measure in that quarter, he had brought back his troops. He was afterwards sent with them to defend Ostend. Learning the difficult nature of the duke of York's situation, and perceiving that Ostend could not long be protected, and could indeed be of no value after the rest of Flanders was deserted, he marched across the country, and in the face of much danger, and great hardships, effected a junction with the principal British army, to which this reinforcement afforded seasonable aid.

The French were no less successful upon the upper Rhine, on the frontiers of Italy, and of Spain. At the end of the campaign, an intense frost having set in, they reinforced their armies, and Pichegru invaded Holland. After a variety of engagements, the British and Hanoverians, together with some Austrian auxiliaries, whom Britain had subsidized, were repulsed, and found it necessary to leave Holland to its fate. Many Dutch families sought refuge in Britain. When Utrecht had submitted to the enemy, the stadtholder knowing that Amsterdam would not be defended, left his country, and escaped to England in a fishing-boat. He and his family became immediate objects

Britain. jects of royal liberality, and were treated with the respect due to their rank and misfortunes.

The Dutch, who had viewed the English with a very unfriendly eye, since the revolution of the year 1787, appeared to be highly pleased with this change in their affairs. They had for some time treated our military countrymen with contempt and illiberality, and were not disposed to alleviate by kindness, or compassion, the sufferings of the wounded, or the distress of the fugitives, who at length effected their retreat to Bremen, after a long and severe exercise of their patience and fortitude.

The united provinces were now revolutionized on the French model. Liberty, equality, and the rights of man, were proclaimed; representatives of the people were chosen, and the regenerated state was named the *Batavian Republic*. But the pretended friends of the Hollanders, in rescuing them from what they termed a disgraceful yoke, did not suffer them to enjoy real freedom or independence.

1002
Prussia de-
serts the
allies.

The result of these successes was, that the king of Prussia, now perceiving France restored to more than her ancient energy, and become capable of endeavouring to humble his enemy, and her ancient rival, the house of Austria, deserted the coalition against her, refused to accept of any farther subsidy from Great Britain, and took under his protection, as neutral states, the whole princes of the north-west of Germany; thereby becoming the ostensible head and guardian of a large division of the empire, which was thus enabled to recover its tranquillity, and to become a quiet spectator of the prolonged contest, which the rest of the empire under Austria continued to carry on against France. Spain was under the necessity of imitating the example of Prussia, though upon less favourable terms, being constrained to relinquish, as the price of peace, her half of the island of St Domingo. The duke of Tuscany also deserted a contest, into which he had been constrained to enter.

1003
Trials for
treason.

In the mean while, administration at home pursued their system of alarming the friends of internal tranquillity, by the dread of conspiracies, and attempts against the constitution. The persons who, in the month of May, had been imprisoned on a charge of high treason, were brought to trial in the end of October. The first that was tried, was Thomas Hardie. His indictment stated nine overt acts of high treason. 1st, That with others, he had formed an intention of exciting rebellion and insurrection; to carry which into effect, he and they had conspired to subvert the government, and depose the king. 2dly, That he and they had written diverse books, pamphlets, letters, and addresses, recommending delegates to a convention. 3dly, That they consulted on the means of forming such a convention. 4thly, That they agreed to form themselves into a society for the purposes aforesaid. 5thly, That they caused arms to be made to subvert the government, and depose the king. 6thly, That they conspired to levy war within the realm. 7thly, That they conspired to aid the king's enemies. 8thly, That they composed and published certain books, pamphlets, letters, exhortations, and addresses, for the purposes aforesaid. Lastly, That they procured arms, for the purpose of levying war against the king, and to excite rebellion, &c. The written evidence consisted chiefly of advertisements, and addresses, published in the news-

papers, many of which were expressed in a very intemperate style, with regard to ministers; and the proceedings of the societies, which were all public, were of a similar nature. With regard to any intended armament of the people by these societies, it appeared to rest upon no solid foundation. The accusation and defence, therefore, rested chiefly upon the question of the intention of the party accused, and his associates. He was ably defended by Mr Thomas Erskine, and Mr Gibbs, and the prosecution was conducted by the attorney and solicitor-general. When the proceedings had continued to the eighth day, the jury after some deliberation, brought in a verdict of not guilty. The next trial was that of Mr Tooke, who endeavoured to prove, that he had merely followed the example of Mr Pitt, in recommending a plan of parliamentary reform. The minister was examined on the occasion, chiefly with regard to the proceedings of the popular party (before the close of the American war) for the attainment of that object; but he evaded most of the questions by alleging a want of recollection. The acquittal of Mr Tooke, being followed by that of Mr Thelwall, a despair of convicting any one of the supposed traitors produced a dereliction of the indictment.

Britain.

As the war was becoming unpopular, the acquittal of these persons, which tended to discredit the alarms kept up by the friends of administration, was felt by them as an additional misfortune. Had the indictments been laid only for sedition, the prosecutions would probably have proved successful; but ministers were led to carry matters the length of an accusation of treason, by their success in a similar charge at Edinburgh, in the preceding month of September, against two persons named Robert Watt and David Downie. Watt had been a spy, employed by government to attend political societies, and discover the designs of the leaders. As he was a needy person, and had been unable to communicate intelligence of much importance, he had received little pay. To earn more money, he had thought fit to contrive a plot, which he communicated to Downie, and some others, for seizing the castle and public offices at Edinburgh, with a view no doubt of afterwards holding out his associates to government as criminals. Neither he nor they had any means of carrying such a plan into effect. Watt, however, had procured some pikes, which he deposited in a cellar in his own house. These being accidentally discovered, he was apprehended; and the persons to whom he had communicated his plan, having come forward as witnesses against him and Downie, they were both found guilty of high treason; but Downie, who had done little more than appear to approve of Watt's plan, was recommended to mercy, and afterwards pardoned; but Watt was executed.

1004
Trial of
Watt and
Downie.

Another cause of encouragement to administration to proceed with measures of severity, arose at the same time from a plot brought to light by some informers, which by way of ridicule was afterwards termed the *pop-gun plot*. The persons implicated in this charge, were John Peter Le Maitre, a native of Jersey, and apprentice to a watch-case-maker in Denmark-street, St Giles's; William Higgins, apprentice to a chemist in Fleet-market; and a man of the name of Smith, who kept a book stall in the neighbourhood of Lincoln's-inn.

1005
Pop-gun.

Britain.

coln's-inn. Their accuser was one Upton an apprentice or journeyman to a watch-maker. Le Maitre, Higgins, and Smith, were apprehended on Saturday the 27th of September, by a warrant from the duke of Portland, as secretary of state, and were examined on Sunday the 28th before the privy-council, the lords of which were summoned again to attend on Tuesday on the same important business. The charge supported by the testimony of Upton, was to the following effect: An instrument was to have been constructed by the informer Upton in the form of a walking stick, in which was to have been inserted a brass tube of two feet long; through this tube a poisoned dart or arrow was to have been blown by the breath of the conspirator Le Maitre at his majesty, either on the terrace at Windsor, or in the playhouse. The poison was to have been of so subtle a nature, that if the point but glanced upon the king, it was to have produced instantaneous death. Nothing short of the most consummate ignorance of the state of human science could on any ordinary occasion have procured attention to such a ridiculous story as this. Such, however, is the well-known credulity of the English nation, with regard to political dangers, that administration and their friends appear to have regarded this plot as an affair of some importance, as tending to keep men's minds in a state of anxiety.

1006
Meeting of
parliament.

Parliament assembled on the 30th of December. In the speech from the throne, his majesty urged the necessity of persisting in the war, however unfortunate it had been, and noticed the rapid decay of the resources of the enemy. The Dutch had, he observed, from a sense of present difficulties, entered into a negotiation for peace with the prevailing party in France; but no established government could derive security from such a negotiation. The most effectual means had therefore been employed for the farther augmentation of the forces; on whose valour, as well as on the public spirit of the people, his majesty professed he had the utmost reliance. The speech ended with mentioning the accession of the sovereignty of Corsica to the British dominions; a treaty of amity and commerce with America; the conclusion of a treaty of marriage between the prince of Wales and the princess Caroline of Brunswick, in making suitable provisions for whom his majesty doubted not of the concurrence and support of both houses.

1007
Changes in
the cabinet.

When an address to his majesty in the same terms with the speech was moved in common form, very animated debates took place in both houses of parliament. The war was attacked and defended upon the usual topics, with this additional circumstance, that the events of the late campaign gave considerable countenance to the assertions of opposition, that all hope of ultimate success was irrational. Administration, however, were no less powerful than formerly. On the last day of the preceding session, they had received into official situations some of those supporters of the war, who in former years had opposed their measure. Earl Fitzwilliam had been appointed president of the council. The duke of Portland became one of the secretaries of state. Earl Spencer was declared keeper of the privy seal, and Mr Windham secretary at war. Notwithstanding these official changes, Mr Pitt with the aid of his personal friend Mr Dundas, and his relation

Lord Grenville, was understood to retain the efficient power of the state. Mr Dundas had still retained the management of the war with France; and as a kind of third secretary of state, he performed a considerable part of the business which would otherwise have devolved upon the duke of Portland, while at the same time he continued as president of the board of control to superintend the affairs of India, and to hold the office of treasurer of the navy. Earl Fitzwilliam was soon got quit of, without any disadvantage to administration. He was sent to Ireland as lord-lieutenant, under an agreement, as he alleged, that he was to have full power to promote the recal of the penal statutes against the Catholics, and to concede certain privileges which had been withheld in 1793. Afterwards, however, ministers in England having altered their sentiments about some of these points, prohibited him to proceed, and as he insisted upon the terms on which he accepted his situation, he was recalled and dismissed from office. By joining ministers for a time, he was prevented from acting along with opposition in reproaching the war, and thus he was left insulated and separated from both parties.

Among the debates of the present session, one of the most remarkable was that which occurred upon the motion of Mr Grey in the house of commons on the 26th of January 1795, "That the existence of the present government of France ought not to be considered as precluding at this time a negotiation for peace." He said, that after two years of war, which had drained this country of its blood and treasures, we did not appear to be one point nearer to the object for which it was undertaken. From certain words of the minister on a former occasion, Mr Grey inferred, that this was a war *usque ad internecionem*, or a mortal strife to be carried on till one of the parties should be destroyed. He wished, by the present motion, to put the question to issue, whether this opinion was countenanced by the house of commons. He said that the public at large, and even the enemy with whom we were contending, had a right to know the length to which the contest was to be carried, and the terms upon which peace was to be obtained. He endeavoured to show that there existed no prospect or chance of success in overturning by force of arms the republican government of France, and that a war persisted in with that view must necessarily be absurd. He contended, that the people of France were too firmly attached to their new arrangements to be likely to give them up, however they might change their leaders. A dependance upon a decay of their finances was, he alleged, equally ill founded. Both in the American war, and the present, the affairs of the British nation were unfortunately entrusted to persons unable to distinguish between the fallacy of imperfect calculations, and the energy of a people struggling for independence. He said that the French government were admitted to possess a landed estate far exceeding in value the most exaggerated account of their debts. With this, was to be considered the addition of the money of Holland, the population of France, which was equal to that of one-sixth of the whole of Europe, and the distracted and impoverished state of our allies. Our own resources were, he doubted not, equal to every thing to which they ought to be applied, but not equal to the conquest of France,

Britain. or to a war of aggression. For the exhausted state of the emperor's finances, he appealed to a memorial he had recently addressed to the circles of the Upper Rhine. Was it then from him, from the Italian states, the kings of Sardinia, Naples, and Spain, or from our disgraceful alliance with the empress of Russia, that we expected assistance? Or was it from our good German ally, who had taken 1,200,000*l.* of our money, who had not brought into the field the 62,000 men for which he stipulated, who had denied our right to command any of the Prussian troops, and contended that they ought not to march against the French, but to remain to defend Germany. The strongest reason which a great nation could have for war, was the defence of its honour; this, he contended, we had so fully vindicated, as to secure us from future insult. The decree of the convention, November 19. 1792, was now no bar to a negotiation, as that declaration had been repealed, and followed by a contrary declaration. It had been stated, that there had been periods at which a negotiation could commence. It was a proper period at the time the misunderstanding commenced with this country; and at several times when we had been successful since, negotiation might have been begun. This, Mr Grey remarked, had been repeatedly advised from his side of the house; and thus much misery might have been prevented. While we possessed great power and great resources was the time for negotiation. Should the French proceed in their rapid career of conquest, it would not be easy. Were even the house willing to trust ministers with the prosecution of the war, would the minister declare he could trust the allies? This, therefore, was a time for negotiation; and should our attempts of that nature prove fruitless, the house and the people would cheerfully concur in a vigorous prosecution of the war; and we should then resemble France in the only point in which she was to be envied, the unanimity of the people with their government. As additional reasons, Mr Grey noticed the capture of Holland, and the debates in the diet at Ratisbon, in which all parties agreed for overtures to the enemy, except the elector of Hanover, and the landgrave of Hesse.

1009
Mr Pitt's amendment of Mr Grey's motion.

Mr Pitt, in reply, asserted, that the motion was utterly inconsistent with the sentiments formerly expressed by his majesty and by parliament. He therefore proposed an amendment, importing, that "it was the determination of the house to prosecute the war, as the only means of procuring a permanent and secure peace; relying on the intention of his majesty, vigorously to employ the force of this country in support of its interest, and on his desire uniformly manifested of effecting a pacification with France, under any government capable of maintaining the relations of peace and amity." Mr Pitt contended, that no nation at war with another, ought to treat for peace with a government that could not give security. This last he asserted to be the great object by which alone the war could be terminated. "What did we naturally look to in the state of any country, but to the manner in which they performed their engagements; to their stability, their apparent authority, and the reliance that might be placed on their pacific dispositions? Nothing but a series of revolutions had been generated under the sy-

stem and principles now prevalent in France." He represented the agriculture and commerce of France as in the most disastrous situation, and justice as almost unknown. With respect to their religion, he demanded, whether the house would willingly treat with a nation of atheists. He would not, however, say, that they might not improve. When they should come into such a state, as would give, with regard to their government, that stability and authority, which afforded a probability that we might treat with security, then we might negotiate: but we ought, in prudence, to wait the return of such circumstances as would afford a chance of treating with success. He considered the French as having begun the war, upon the principle, that their own was the only lawful existing government, and that they had a right to destroy all others as usurpations; a principle from which they had not yet ceased to act. In April 1793, the French had enacted the penalty of death, upon any person who should propose peace with any country, which did not acknowledge the French republic one and indivisible, founded on the principles of equality. The admission of these principles amounted to a confession of the usurpation and injustice of every other government. In treating for peace with France, one preparatory step was, the acknowledgment of what the house had hitherto denied. They must acknowledge those principles which condemned the usurpation of all other governments, and denied the very power they were exercising. Were peace to be obtained, he thought the country in the utmost danger from French emissaries; and if a peace should be so insecure as to require us to remain in a state of vigilant jealousy and never-ceasing suspicion, we would be under the necessity of retaining an establishment, which would prove burdensome to peace, and ineffectual to war. With respect to the comparative resources of this country and France, the latter had, as he stated, expended 260,000,000*l.* sterling, during the last two years. Assignats, he said, were at 15 per cent.; and every thing proclaimed a rapid decay of the French resources. Ministers, he declared, had never looked to the conquest of France. Peace was not obstructed by any form of government, but by the internal circumstances of France. An attempt to treat, instead of accelerating peace, would only be productive of danger; it would encourage the enemy, and sink the spirits of the people of this country.

Mr Fox accused ministers of tergiversation. He said, he approved of the amendment, so far as it stated, that there existed nothing in the present form of government of France to prevent negotiation; but he complained, that during two successive years, opposition had moved a similar amendment; and for doing so, they had been called the advocates of France, jacobins, republicans, enemies of their king and country, &c. though it was now pretended that all this time they were speaking the sentiments of ministers. He contended, that the minister had, in fact, found it necessary to alter his conduct; and that the impolitic speech he had put into the mouth of his majesty, at the opening of the session, had made a serious impression upon the public, which must be done away. What, he asked, would have been the feelings of

Britain. Englishmen, if the convention had determined never to treat with them till there was a reform in the English government? We must do away all our arrogant expressions against France, and then, even though we should not obtain peace, yet we should take from them the cause of their enthusiasm, that which roused every national feeling, and had carried them to unparalleled exertions. They would not then feel that they were to fight to extremity, for daring to give to their own country the government they liked. He wished us not to diminish our force; but surely we could fight just as well, if necessary, after declaring we had no intention to reduce a people to slavery. He ridiculed the idea of danger from the influx of French principles, and observed, that the constitution of this country had been endeared to us, from the fatal experiments made in France. He called the recollection of Mr Pitt the declaration of his father, "that they should die in the last breach before they granted the independence of America;" yet the first act of his political life had been to sign the very independence which his father had deprecated. Necessity dictated that act; and he must now, on the same account, retract his declaration respecting France.

The motion was opposed by Mr Dundas, on the ground that it would fetter the executive government in their negotiations for peace; and he thought we had the utmost reason to expect success from the prosecution of the war: at least, it was a fair presumption, that our situation would not be worse if we continued the war. Mr Grey's motion was negatived by a majority of 183, and Mr Pitt's amendment afterwards adopted, by a majority of 164.

1810
Duke of
Bedford's
motion for
peace.

On the following day, the duke of Bedford brought forward, in the house of lords, a motion, similar to that which Mr Grey had supported in the house of commons. This patriotic nobleman, who enjoyed great popularity, because he expended his princely revenue in promoting and giving countenance to the agriculture of his country, urged the necessity of an explicit declaration of the real object of the war. Ministers said, negotiation was dishonourable, as the French were the aggressors. Admitting this, what scenes of blood must Europe have exhibited, had it been adopted as a general principle, that no party should manifest a wish for peace, which had not been the aggressor in the war. That the French, however, were not the aggressors, his grace contended, from the retraction of the offensive declaration; from the explanation offered by the minister; from different speeches in the convention, and the decree afterwards passed that they would not interfere with the government of other countries. As to a permanent peace, no such thing could be found in the absolute sense of the word. An equitable peace was the only one likely to prove permanent. He contended, that we ought no longer to trust to the efforts of our continental allies. He did not believe the finances of France exhausted; but admitting they were nearly so, could we hope to ruin them? certainly not. While there was property in the country, the government would find means to obtain it; and, while the people were convinced it was a war of extermination or unconditional submission, they would sacrifice their property. Still less was the

probability of outnumbering them. Attempts had been made to excite the passions of men, by calling this a war in the cause of humanity and of God. Whatever it might have been during the life of the king, whose death he thought accelerated by our interference, it could no longer be called so. It had, as allowed by ministers, produced the system of terror in France; and could the death of 50,000 British subjects, and of hundreds of thousands of innocent soldiers on all sides, be called a circumstance favourable to humanity? It was admitted, he said, that the present government of France was infinitely milder than what it had been; but, instead of assisting her rulers in the work of reformation, our ministers declared, they should not restore order and justice but by our means, and that we would not be satisfied without carrying war to their frontiers, and famine to their interior. By this course, we should never conquer the armies or the opinions of France, but might regenerate the system of terror. The adoption of his motion would, his grace observed, unite the people of this country, if the war continued, and disunite the people of France.

Lord Grenville moved an amendment, precisely similar to that which had been introduced by Mr Pitt in the house of commons the preceding evening. He thought the present was not a moment convenient or proper for forwarding a negotiation. It never, he said, had been his opinion, that this country should not make peace with another, merely on account of their form of government; but, in such a negotiation, especial care should be taken to provide for that most important of all concerns, security. His lordship declared his belief, that a majority of the French were favourers of royalty; and the re-establishment of monarchy presented the most probable hopes of peace. Ministers had, he said, never declared that they would not treat with any government capable of maintaining the accustomed relations of peace and amity. He denied, however, that any probability existed of the permanency of the present French government. He entered into a detail of the shocking impieties of the French; and insisted upon the failure of their resources, and the disaffection of a considerable number of the people towards the present ruling party, who had prematurely refused to the lawful heirs the restoration of that wealth, of which their fathers had been unjustly deprived. He allowed, that, by the new system in France, we were in a situation less remote from that in which we might treat with a rational prospect of security. Till that period, however, arrived, which he thought far distant, he conceived, that a vigorous prosecution of the war was far preferable to any attempt to negotiate.

The bishop of Llandaff urged the importance of an immediate negotiation to promote union at home, and to shew to the French, that, if refused by them, the war was continued in consequence of the ambition and oppression of their rulers. He was aware, that some might object to negotiation, on the ground of evincing an unworthy want of firmness; but, in that respect, firmness was out of the question. When circumstances rendered it prudent to alter a course, to persist was not firmness, but obstinacy. It was a mistaken notion

Britain. of firmness that lost America. It might be asked, if those who had been guilty of such atrocities ought to go unpunished? To this he would answer, that though the atrocities of the French disgraced human nature, we were not the avengers; they ought to be left to the wisdom and justice of God; or, if any thing more was to be said, let their lordships pray to God for pardon to the guilty. He asserted, that even could we place upon the throne of his ancestors, the son of the last French monarch, he could grant us no indemnity for our past expenditure; his own subjects, and even our own continental allies, would not suffer him to do so. With respect to the charge of atheism against the French, as a reason for continuing the war, his lordship added: "Presumptuous idea! Miserable beings as we are, do we imagine that the arm of flesh is wanting to assist and enforce the will of the Almighty? Not one of the tribe of modern philosophers can affect or injure Christianity. The abuse of religion has been mistaken for religion itself. Hence, France in the eagerness of her enthusiasm for reform of religious abuses, overlooked religion itself, and fell into atheism. But the mist of infidelity will soon be dispersed, and Christianity appear in a purer state."

The duke of Norfolk, the marquis of Lansdowne, the earl of Lauderdale, the duke of Leeds, and the earl of Guildford, farther supported the motion; while the amendment was defended by the earl of Darley, Lord Hawkesbury, Earl Spencer, Lord Hawke, the marquis of Abercorn, the lord-chancellor, Lord Auckland, and others. On a division, a great majority voted in favour of the amendment. The victories of the French, during the late campaign, and the despair of ultimate success in the war, which now began to be entertained throughout the country, encouraged opposition, to renew the subject, under a variety of forms, and to urge ministers to enter into a negotiation; but, on every occasion, the motions made by them were negatived by a similar superiority of numbers.

The number of seamen and marines voted during the present session, amounted to 100,000; while 119,380 men were voted to form the guards and garrisons. To procure the requisite number of seamen, the parliament required the merchants to give up a part of the crews of their shipping, in proportion to the tonnage; and ordered every parish to furnish one man for the service. A loan of 18,000,000l. was found necessary, together with a large issue of exchequer bills, as the supplies voted amounted to no less than 29,307,000l. The new taxes were made payable on wines, spirits, tea, coffee, stamps on deeds, &c. insurance on ships and cargoes, timber, and on persons wearing hair-powder.

Mr Wilberforce again brought forward the question of the slave-trade. He was supported by Mr Fox and Mr Pitt; but the proposed abolition of it was rejected in the house of commons, by a majority of 17.

During the present session, the long trial of Mr Hastings was at length brought to a conclusion. The subject was discussed in a committee of the house of lords. The lord-chancellor, and the earl of Carnarvon, considered Mr Hastings as criminal; but he was defended very elaborately and ably by Lord Thurlow, who was supported by the marquis of Lansdowne, the bishop of Rochester, and others. When every part of

the accusation had been disallowed by the committee, the report was reviewed by the house; and after some debates on the mode of proceeding, it was resolved, that the question should be separately put on 16 points. The greatest number of peers, who voted the defendant guilty in any one respect, did not exceed six. The votes of innocence on some of the charges, were 26; in others 23; in one 19. The lord chancellor then intimated the decision of the court to Mr Hastings, who received it in silence, bowed, and retired from the bar. The war in which we were now engaged, had rendered men more eagerly desirous of the aggrandizement of their country than they were when this trial commenced, and also less scrupulous about the means by which that aggrandizement was promoted. The services of Mr Hastings were now therefore more highly appreciated; and the public regarded, with satisfaction, the acquittal of one, who had so eminently promoted the interest of his employers, secured their authority, and extended and established their dominion.

At this time, the debts of the prince of Wales ¹⁰¹⁴ amounted to 630,000l. It had been adjusted at court, ^{Debt of the prince of Wales.} that these debts should be paid, and that the prince should marry his cousin, the daughter of the duke of Brunswick. After some discussion in the house of commons, the prince's establishment was fixed at 125,000l. out of which he was required to pay 65,000l. every year, till his debts should be liquidated. The rents of the duchy of Cornwall, amounting to 13,000l. were also set apart for the extinction of the debts. Farther sums were also voted to defray the expences of the marriage, and the repairs and decorations of Carlton house. Parliament was prorogued on the 27th of June, by a speech from the throne, in which ministers thought it prudent to hold out to the public, some prospect of negotiation. "It is impossible (said his majesty) to contemplate the internal situation of the enemy, with whom we are contending, without indulging a hope, that the present circumstances of France, may, in their effects, hasten the return of such a state of order and regular government, as may be capable of maintaining the accustomed relations of amity and peace with other powers. The issue, however, of these extraordinary transactions, is out of the reach of human foresight."

The incidents of the war, during the year 1795, ¹⁰¹⁵ were less memorable than those of the former years. Lord Bridport, with an inferior force, attacked a French fleet, near Port l'Orient, and took three of their ships. Vice-admiral Hotham pursued to the Genoese coast, a fleet which had sailed from Toulon, to attempt the recovery of Corsica, and which had captured one of his detached ships. He brought the enemy to a partial engagement, and took two sail of the line; but he afterwards lost one of his own ships, in consequence of damage received in the conflict. On their own western coast, the French, with 13 sail of the line and 14 frigates, avoided coming to an engagement with Vice-admiral Cornwallis, who had only eight ships, including frigates. These events occurred early in the summer. Notwithstanding the vigilance of the British navy, the French captured, in the month of July, 30 sail of a valuable convoy returning from the Mediterranean. They also made prize

of part of a Jamaica fleet. On the other hand, their own commerce had sunk so low, as to present few objects for our cruizers and privateers.

1016
War with
Holland.

As the Dutch, though nominally the allies of the French, had, in fact, become subject to them; letters of marque were issued against them by Great Britain, and directions given to seize their colonial territories, under the professed intention, however, of restoring them when the stadtholder's government should be re-established. The Cape of Good Hope was taken, together with Trincomalé and the other Asiatic settlements of the Dutch, excepting Batavia. Their territories in the West Indies were not attacked during the present year, on account of the difficulties which the British experienced in that quarter, in keeping in subjection the islands captured from the French, where various insurrections were incited by their ancient masters. The island of Jamaica was also kept in a state of great alarm, by a small tribe of independent negroes, called *Maroons*, which had long existed in the mountainous parts of the island. These people, in consequence of a quarrel with the white inhabitants, committed many cruel ravages, and were not subdued till Spanish hunters and blood-hounds were procured from the island of Cuba, and employed against them, which induced them at last to submit to deportation from the island.

1017
Expedition
to Quiberon.

When it was too late, the British ministry resolved to give assistance to the royalists in the western parts of France. An expedition, planned, it was said, by Mr Windham, and guided by French emigrant officers, with troops, many of whom consisted of prisoners of war, relieved from confinement on condition of bearing arms against their country, set sail for the French coast, and landed upon the extremity of the narrow peninsula of Quiberon. Here they fortified themselves; but many of the troops, as might have been expected, proving unfaithful, they were speedily overpowered by the republicans, who, according to their custom, put to death such of their countrymen as they found in arms fighting against them. By this feeble and ill-timed invasion of the French territory, nearly 10,000 men were lost, that is, were killed or taken prisoners.

1018
Campaign
in Germany.

The continental campaign on the side of Germany was of little importance during this year, and was upon the whole unfavourable to the French. The convention had shaken off the government of that sanguinary faction, which, under Robespierre and his associates, had deluged the interior of France with blood, but which had possessed the merit of calling forth with astonishing energy, the powers of that country for the support of its independence. The present leaders possessed less activity, and affected a milder train of conduct. The military operations languished. The French army remained inactive till autumn, when it crossed the Rhine near Mentz, under General Pichegru, but was speedily repulsed, and an armistice was concluded for the winter. The convention, however, established a new form of government, consisting of an executive directory of five persons, elected by two representative bodies, to which the powers of legislation were intrusted; and it was naturally expected, that if the war should continue, the new executive power

would endeavour to distinguish itself by some important operations.

Britain.
1019
Meeting of
parliament.

The British parliament was again assembled at a very early period, the 29th of October. The state of public affairs bore at this period an unfavourable aspect. The French armies had been inactive during the summer, but they had lost nothing; the new republic retained possession of the territory extending from the Pyrenees to North Holland, and consequently of an immense length of coast opposite to Great Britain. In the meanwhile, a dearth of provisions began to prevail at home. The winter, which had set in with extreme severity at the close of the year 1794, and enabled the French to conquer Holland with little difficulty, was followed by an ungenial summer, during which the crop failed in consequence of almost incessant rains. This state of affairs was productive of discontent in many among the lower orders of the people, and the war was blamed as tending to aggravate the distress which they suffered. Previous to the meeting of parliament, some meetings were held by the London Corresponding Society, for the avowed purpose of petitioning the king in parliament in favour of peace and a parliamentary reform. As the meetings were held in the open fields, they were very numerously attended, but the persons composing them dispersed without disturbance. At the opening of parliament, some riots took place; and though it did not appear, that the persons guilty of these riots belonged to the society above mentioned, yet it seems probable, that its meetings had tended, along with the general state of public affairs, to rouse the attention of the multitude to political subjects.

1020
Riots at
the meeting
of parliament.

His majesty proceeded from the palace to open the session of parliament at the usual hour, between two and three o'clock; and the crowd in St James's park, which is always considerable on these occasions, was certainly greater than usual, though it was thought to have been overrated, when estimated at 150,000 persons. A fine day, and a rumour which had been circulated, with what view it is impossible to ascertain, that a riot was likely to take place, contributed greatly to increase the multitude of the spectators. As the royal carriage passed along the park, the predominant exclamations were "Peace! peace! Give us bread! No Pitt! No famine! No war!" A few voices were heard to exclaim, "Down with George," or words to that effect. In the park, and in the streets adjacent to Westminster hall, some stones and other articles were thrown, nine of which, it is asserted, struck the state-coach! and one of them, which was suspected to have proceeded from a window in Margaret-street, near the abbey, perforated one of the windows by a small circular aperture: and from these circumstances, it was supposed by some to have been a bullet discharged from an air-gun, or from some similar engine of destruction: but no bullet was found; and whatever it was, it neither touched the king nor the noblemen who attended him. As his majesty returned from the house through the park, though the gates of the Horse-guards were shut to exclude the mob, yet even this precaution was not sufficient to prevent a renewal of the outrages, and another stone was thrown at the carriage as it passed opposite to Spring-garden terrace.

After

^{Britain.} After the king had alighted at St James's, the populace attacked the state-carriage, and in its way through Pall-mall to the Mews, it was almost demolished.

¹⁰²¹
^{The king's}
^{speech.} The speech from the throne stated his majesty's satisfaction, that the general situation of affairs, notwithstanding many events unfavourable to the common cause, was materially improved. The French had, in Italy, been driven back, and were checked on the side of Germany. Their successes, and the treaties of peace they had entered into, were far from compensating the evils they had suffered from the continuance of war; and the unparalleled embarrassment and distress of their internal situation appeared to have produced an impression that their only relief must result from peace, and a settled government. The crisis in which they now were must probably produce consequences important to the interests of Europe. If this crisis terminated in any thing affording a reasonable expectation of security in any treaty, the appearance of a disposition to treat for peace, on just and suitable terms, would, his majesty added, be met on his part with an earnest desire to give it the speediest effect. The acceleration of this desirable end required, however, that we should prove our ability to prosecute the war till we could conclude it in a peace suited to the justice of our cause, and the situation of the enemy.

¹⁰²²
^{New penal}
^{statutes.} In the speeches for and against the usual addresses little novelty occurred; the same subject, that is, the propriety of the war, having been so repeatedly discussed. Administration took advantage of the attack upon his majesty's person, to issue a proclamation connecting the meetings of the Corresponding Society with the insults offered to his majesty, and to bring forward two penal statutes. The first was introduced into the house of lords by Lord Grenville, under the title of "an act for the safety and preservation of his majesty's person and government against treasonable and seditious practices and attempts." One clause ordained the capital punishment of every one who should express, utter, or declare by the publication of writings, or by any overt-act, such imaginations, devices, or intentions, as were calculated to injure the king, impair his authority or that of the parliament, or promote an invasion of his dominions. Another provision was, that all declarations tending to excite hatred or contempt of the king should be considered as high misdemeanours; and it was decreed, that a second offence of this kind might be punished, either in the ordinary mode, or by banishment from the realm, for a term not exceeding seven years. The other bill was introduced by Mr Pitt in the house of commons. It enacted, that no meeting of any description of persons, exceeding the number of 50, except such as might be called by sheriffs, or other officers or magistrates, should be holden for political purposes, unless public notice should have been given by seven housekeepers: that if such a body should assemble without notice, and twelve, or more, individuals should continue, together (even quietly) for one hour after a legal order for their departure, they should be punished as felons, without benefit of clergy: and that the same rigour might be exercised, if any person, after due notice of the meeting, should use seditious language, or propose the irregular alteration of any thing by law established. With regard to the delivery of lectures or discourses,

or the exercise of debate, on topics connected with the laws and government of the country, a license was declared to be necessary for such meetings.

¹⁰²³
^{Petitions}
^{for and a-}
^{were going on,} Very animated discussions upon these bills took place in both houses of parliament. While the discussions against the bills. On the other hand, various corporations and public bodies petitioned for their enactment. The result of the whole was useful to ministers; as the disputes which thus arose, tended to revive in the minds of persons of property that political alarm which was now passing away, and to remove a portion of that dislike to the war, which naturally arose from the want of success with which it had been attended. The two bills were enacted into laws by the votes of great majorities. Still, however, administration were sensible that it would become necessary, for the sake of preserving their popularity, to assume an appearance of willingness to put an end to the war. Accordingly, while the two bills were still under discussion, each house received a message from the king, in which, ¹⁰²⁴ including the new constitution, and the directorial ^{Pacific mes-} sage from ^{the king.} government of France, he said, that such an order of things had arisen as would induce him to meet any desire of negotiating on the part of the enemy with a full readiness to give it the speediest effect. When an address of thanks for this communication was moved, Mr Sheridan suggested an amendment, tending to produce an immediate negotiation, and to remove, by a renunciation of the principles on which the war had been conducted, all obstacles to the attainment of peace. Mr Fox also wished, that the first offer should proceed from our court: but Mr Pitt and Mr Dundas thought it advisable to wait till the enemy should manifest a disposition to negotiate. Similar observations were made in the house of peers. At a future ^{An. 1796.} period, Mr Grey moved, that his majesty should be requested to intimate to the executive government of France, his readiness to enter into a negotiation for the re-establishment of peace on reasonable terms. He said, he was sorry to observe, that the court appeared to be more intent on warlike preparation than eager to promote peace: overtures from this country, he thought, could not be degrading; and he flattered himself with the hope, that they would be successful. Mr Pitt wished that this affair might be left to the discretion of ministry. It was proper, he said, that the allies of Great Britain should be consulted, as a close concert with them would give greater dignity and effect to a negotiation. Steps had been already taken to ascertain the disposition of the enemy; and if there should be a prospect of an honourable peace, the opportunity would be embraced with pleasure. Mr Fox said, that a better season for treating than the present might not occur for a long period; and he hoped, that, as the French had renounced the decree of fraternity, every idea of interference in their interior concerns would, on our part, be disclaimed. This would be a good preparative to negotiation; and a subsequent offer of moderate terms would expedite the accomplishment of the desirable object. Only 50 members supported the motion, while 189 voted against it.

¹⁰²⁵
^{Attempts to} On the 8th of March 1796, Mr Wickham, his majesty's minister to the Swiss cantons, transmitted a note to negotiate. ^{M.}

Britain.

M. Barthelemi, the French ambassador at Berne, stating, that he himself was not authorized to enter into any negotiation, but requesting information in writing on the part of his court about three points. First, Whether France was disposed to send ministers to a congress to negotiate a general peace with his Britannic majesty and his allies. 2dly, Whether the French government would be willing to state the general grounds upon which they would consent to conclude a treaty; and, 3dly, Whether the French government would think fit to propose any other mode of arriving at a general pacification. M. Barthelemi returned an answer, on the 26th of the same month, stating, that the executive directory doubted the sincerity of these overtures of peace, from the proposal of a general congress, which would lead to endless negotiations, and from Mr Wickham having received no powers to negotiate. He asserted, however, the willingness of France to make peace; but declared, that the executive directory had no power to relinquish any of the territories which the constitutional act had declared to form an integral part of the republic. With regard to other territories occupied by the French armies, these, he said, might become objects of negotiation.—As the Netherlands, and the island of St Domingo, had been declared by the new French constitution, to form a part of the territory of the republic, the British government immediately published a note declaring these pretensions on the part of France totally inadmissible; and that while they were persisted in, nothing was left but to prosecute a war equally just and necessary. This first attempt towards negotiation for peace gave rise to various debates in the British parliament, in all of which administration were supported by their usual majorities.

1026
Finances,
&c.

Supplies were voted during this session to the amount of 37,588,000l. and upwards of twenty-five millions and a half were borrowed. As no prospect existed that British armies could be employed on the continent, the guards and garrisons were reduced to 49,000 men. The forces in the colonies were increased to 77,000; the sailors and marines were 110,000. Taxes were imposed on legacies to collateral relations, and on horses, and dogs, and hats. The assessed taxes were increased, and also the duties on wine, tobacco, salt, and sugar. Parliament was dissolved on the 20th of May, and new elections immediately took place.

1027
Campaign
on the con-
tinent.

An extremely active campaign was now opened by the French upon the continent. Their generals, Moreau and Jourdan, advanced into Germany. They were ultimately repulsed by the archduke Charles, but not till they had reached the vicinity of Ratisbon. The retreat of Moreau, amidst hostile armies, formed one of the most celebrated events of the war. On the side of Italy the French obtained greater ultimate success. Their new general in that quarter, Bonaparte, compelled the king of Sardinia to desert the allies, and to purchase peace at the expence of a considerable portion of his territory. He next descended into the Milanese; obliged the Italian states to surrender their finest paintings, statues, and other curiosities, together with large sums of money, as the price of peace; and after a multitude of sanguinary conflicts, he succeeded in subduing, by famine, Mantua, the only fortress that remained to the Austrians in Italy.

Few maritime events of much importance occurred. The Dutch lost their whole tropical possessions, with the exception of the unhealthy but rich settlement of Batavia in the island of Java; and they also lost a squadron, which they sent out to attempt the re-capture of the Cape of Good Hope, but which was itself made prize of by the British admiral, Sir George Elphinston. On the other hand, the British were under the necessity of abandoning Corsica, in consequence of the conquests of Bonaparte in Italy, and the mutinous spirit of his countrymen, the Corsicans.

British,
1028
Maritime
events.

The result of the campaign was, that the British ministry, to avoid quarrelling with the nation, found it necessary to send Lord Malmesbury to Paris to negotiate a peace. It was afterwards admitted by Mr Pitt, that, at this period, they had no wish to conclude a treaty, and that the measure now mentioned was adopted merely in compliance with the obvious wishes of the public. Accordingly, as the French still refused to relinquish the Netherlands, this was adopted as a sufficient reason for persevering in the war.

1029
Negotia-
tion by
Lord Mal-
mesbury.

The early part of the session of parliament, which met on the 6th of October, passed away with few debates, on account of the intention to attempt an immediate negotiation, which had been announced in the king's speech, and afterwards on account of the expectation of its issue. At the close of the year, the French directory, in consequence of an invitation from a disaffected party in Ireland (see IRELAND), sent to invade that country, an expedition of 17 ships of the line and many smaller vessels, bearing an army of 18,000 men under General Hoche. The violence of the winds prevented the rendezvous of this armament at Bantry bay, in consequence of no landing was attempted, and the fleet returned home with the loss of two ships of the line and two frigates, which perished in a tempest, and one frigate taken by the English. Shortly thereafter the French disembarked on the coast of Pembrokeshire 1250 criminals, whom they had sent as soldiers upon the Irish expedition, but whom they did not now know how to employ.

1797.
1030
Stoppage of
payment
by the
bank.

At this period the first instance of serious difficulty occurred in the management of the British funding systems. The large sums of money sent abroad as subsidies to foreign princes by government, had diminished the quantity of gold and silver in Great Britain. At the same time, administration, through the medium of the bank of England's paper, had issued immense sums for the public expences, and in payment of the additional interest of the national debt. The alarm occasioned by the Irish invasion coming in addition to these circumstances, produced a greater demand than usual upon the bank to exchange its paper for specie. Thus their coffers were soon drained, and to replenish them they were under the necessity of giving for bullion a premium, or high price, which they paid with their paper. This made matters worse, for certain persons secretly melted down the guineas which the bank had procured to be coined, and, for the sake of the premium, sold this gold back to the bank as bullion. A ruinous traffic was thus carried on by the bank, which purchased bullion at a high rate, while they gave out their guineas at the usual price. The directors of the bank were under the necessity of laying their case before the privy council, which issued

Britain. an order against the issue of cash by the bank. Considerable alarm was occasioned by this step. Committees of the two houses of parliament were appointed to inquire into the state of the bank's affairs, both of which reported them to be prosperous, yet each recommended a continuation of the late prohibition. An act was therefore passed for confirming the restriction, and to render it less inconvenient, bank-notes for one and two pounds were put into circulation. At the same time private persons were not compelled to accept of the bank of England's notes in their transactions with each other. As the bank of England is the office through which the British government issues all payments, and as these payments are made in the bank's paper, which administration might influence the directors to augment indefinitely, many persons feared and predicted, that this paper would speedily sink in value when compared with gold and silver, as the French assignats and the American paper currency had done, when rendered not convertible at pleasure, into specie. The stability, however, of the British funding system speedily displayed itself. The credit of the bank of England's paper remained unshaken, because government received it in payment of all taxes, and these taxes fully equalled the interest of the whole sums borrowed by the public.

¹⁰³¹
Supplices.

During the preceding year the emperor had received a subsidy, under the appellation of a loan, from the British government, and a new subsidy was now given him under a similar appellation. To supply this and the rest of the national expences, early in the session 27,647,000*l.* were voted, and afterwards above 15 millions additional were thought necessary, and voted. Two loans were negotiated by government, one for 16 millions and a half in the usual way, from money-brokers, and another of 18 millions, called the *loyalty loan*, from the nobility and gentry being requested to fill it up, which they did with eagerness. The troops voted consisted of 120,000 seamen; 60,765 soldiers for guards and garrisons, that is, for European service, and above 64,000 for the dependencies of Great Britain. As the fear of invasion was now revived, a large supplementary body of militia was levied, together with a considerable force consisting of cavalry. The interest of the two loans was provided for by taxes upon houses, stage-coaches, horses, auctions, stamps on agreements and newspapers, ornamental plate, spirits, tea, coffee, &c. Towards the close of the session, opposition unsuccessfully brought forward motions to address the king to dismiss his ministers, resume the negotiation with France, and to repeal the two acts introduced in the preceding session, by Lord Grenville and Mr Pitt, for extending the treason laws, and imposing restrictions upon popular meetings for political purposes. They were encouraged in some measure to these motions by a variety of addresses which at this time were presented from different parts of the country, to his majesty, advising him to dismiss the present ministry.

¹⁰³²
Loyalty
loan, &c.

¹⁰³³
War with
Spain.

The French had now acquired such an ascendancy over the Spanish monarchy, as to induce the government of that country to declare war against Britain. Their fleet, amounting to 27 sail of the line, attempted to join a French armament; but were attacked by

Sir John Jervis, on the 14th of February, near Cape St Vincent, with only 15 sail of the line; and four of their ships, from 74 to 112 guns, were made prizes by the British fleet. The island of Trinidad was also taken from them; and there also they lost four ships of the line and a frigate.

Britain.

At the commencement of the summer an event occurred, which had the French been prepared to attempt an invasion of this country, might have been productive of serious evils. This was a mutiny in the fleet. It appears that very gross impositions had for some time been practised upon the seamen with regard to their provisions, both as to the quantity and quality allowed them. They made an anonymous application for redress to Earl Howe, by a letter. The application was disregarded, because the strictness of discipline prevented the open avowal or public appearance of discontent, which his lordship, therefore, inconsiderately supposed did not exist, and that the letter must be an imposition. The seamen resolved to enforce redress. When orders were given to prepare for putting to sea, the crew of the Queen Charlotte, and other ships lying at Spithead, refused to act; and treating with contempt the remonstrances of the officers, made choice of delegates, who, after a formal consultation, drew up petitions to the board of admiralty, and the house of commons. Earl Spencer, the naval minister, that is, the first lord of the admiralty, dreading a dangerous mutiny, and not thinking the demands unreasonable, promised compliance; and the king readily offered full pardon to all who should immediately return to their duty. The seamen, however, would not declare their satisfaction before the parliament had confirmed the promises of the lords of the admiralty; and, as some delay was thus produced, the irritation of their minds led to a contest with Vice-admiral Colpoys, in which some lives were lost. An act was passed for the gratification of the seamen both in point of pay and provisions; and subordination was restored at Spithead and Plymouth.

¹⁰³⁴
Mutiny in
the fleet.

The grant of these claims encouraged the seamen at the Nore to insist on a more punctual discharge of arrears, a more equal distribution of prize-money, and a general abatement of the severity of discipline. A council of delegates was elected, at the head of whom was a seaman named Richard Parker, who took the command of the fleet. He prevailed upon the men to reject repeated offers of pardon. He robbed two merchant-ships of provisions, and obstructed trade by the detention of others; and he fired on some ships of war that refused to accede to the mutinous combination. An act of parliament was passed in the beginning of June, denouncing capital punishment against all who should hold intercourse with the rebellious ships, or voluntarily continue on board. As the public strongly disapproved of this last mutiny, for which no excuse could be offered, the seamen gradually returned to their duty. Parker was apprehended, and with several other mutineers was punished with death. A considerable number were condemned after trial, but the greater number were pardoned.

During the summer the port of Cadiz was blocked up by the British fleet under Earl St Vincent (formerly Sir John Jervis). An attempt was made against the Spanish

¹⁰³⁵
Maritime
operations.

Britain.
1036
Duncan's
victory.

Spanish island of Teneriffe, but without success. In the meanwhile another fleet, under Admiral Duncan, lay before the Texel. When he retired for a short time, the Dutch admiral De Winter sailed out. Intelligence of this event was immediately brought to Admiral Duncan at Yarmouth, who instantly put to sea, encountered the Dutch fleet near their own coast; and out of 21 vessels of different descriptions, captured seven sail of the line and two frigates. This event excited, as usual in such cases, the most lively joy in the British nation, from its tendency to put an end to all fears of invasion.

1037
The emperor
forced to
make
peace.

While their allies, or rather subjects, were suffering these disasters by sea, the French armies triumphed on the continent. Bonaparte advanced from Italy against the centre of the Austrian dominions. After several sanguinary conflicts, he crossed the Alps, where they approach the frontiers of Hungary, and forced the emperor to conclude a preliminary treaty on the 18th of April, at Leoben. This was followed by a definitive treaty, signed at Campo Formio, near Udine, in Italy, on the 17th of October. The emperor acquired the city of Venice; but he relinquished the Milanese and the Netherlands, and, by secret articles, consented that the Rhine should be the boundary of France.

1038
Britain ne-
gotiates.

Britain was now left alone in that contest into which she had originally entered as a sort of auxiliary to Austria and Prussia. The British government, therefore, again entered into a negotiation towards the close of the summer. Both the French and British nations now eagerly wished for a termination to this sanguinary contest, and it is probable, that administration at last seriously wished to conclude a treaty; but by this time a violent party, headed by the director Barras, had gained the ascendancy in France, and resolved to continue the war. A demand was therefore insolently made, that Britain should renounce every conquest as a preliminary to farther negotiation, while France reserved a right to make demands. On a refusal of compliance, the British ambassador, Lord Malmesbury, was dismissed from Lisle, where the negotiations had been held.

1039
Meeting of
parliament.

Parliament assembled on the 2d of November. In the speech from the throne, his majesty expressed his concern, that his endeavours to restore peace had been rendered ineffectual. But he expressed the fullest reliance in the magnanimity and courage of a free people contending for their best interests, in a war in which they were compelled, by necessity, to persevere. During this session of parliament, few or none of the members of opposition attended. At the close of the preceding session the members of opposition had declared this to be their intention, and they justified their conduct in the following terms: "In times when every man who censures the conduct of administration is regarded as in league with the enemy, for what end should we incur so black a censure? If we declare our sentiments, we are proclaimed as the enemies of our king; if we tacitly acquiesce in the measures of the minister, we voluntarily take upon us a share of the responsibility. We have done our utmost to prevent the war; we have urged repeatedly the necessity of bringing it to a speedy termination: we have not persuaded our opponents. Events must

1040
Retreat of
opposition.

now take their natural course: we cannot aid with counsel; it shall not be said, that we embarrass by opposition." This retirement of opposition, however, was much resented, and spoken of with great bitterness, by the friends of administration, as it had a tendency to suggest to the nation, the idea that government was conducted by the power of the crown alone, unchecked by the discussion of its measures by men of talents in the two legislative assemblies.

The inability of the bank of England to pay upon demand its notes in specie, according to ancient custom, and to the terms of the obligation contained in these notes, appears now to have suggested to Mr Pitt some fear with regard to the funding system, and an apprehension, that from the immense sums annually borrowed, and the corresponding quantity of paper-money necessarily issued to pay the interest of the loans, the system might be carried too far, so as to discredit this paper-money issued in the name of the bank of England. This apprehension was strengthened by a fact, of which all persons were daily becoming sensible, that the money price of all kinds of property in Great Britain had rapidly risen during the war; and this rise of price was very justly ascribed to a gradual sinking in the value of money, (that is, of paper, the only money used in Britain) in consequence of its too great abundance. Mr Pitt therefore proposed, instead of borrowing the whole sum necessary to defray the expence of the war, and imposing no more taxes than were requisite to pay the interest of the loan, that heavier taxes should be imposed, to defray, by means of them, a portion of the extraordinary expenditure. Accordingly an act was passed with the view of raising seven millions within the year. This was to be done by augmenting, in a threefold proportion, and, in some cases, by raising to five times their former amount, the assessed taxes, that is, the taxes on houses, windows, male-servants, horses, and carriages; but so as not to compel any individual to pay more than one-tenth of his income. The leading members of opposition attended to oppose this extraordinary measure, but without effect.

As the French were now disencumbered from all other hostility, it was naturally expected that they would turn their arms in a more direct manner than formerly against the British empire. The result of the late combination of the states of Europe, for the partition of France, had been extremely disastrous, and had left the new republic in possession of an extent of territory which the ablest and most ambitious of the ancient French monarchs had in vain aspired to possess. The command which they had now obtained of Holland rendered France more dangerous than formerly, by the superior means of invasion which an additional extent of coast, and the possession of a large quantity of shipping, might afford; and had the French navy been less weak, or the French rulers possessed of greater ability, a dangerous crisis in the history of Great Britain might at this period have occurred.

It never was the interest of any British administration to conceal from the public at large, the possibility of a foreign invasion. As the French government at this time boasted of their intention to make such an attempt, and ordered a considerable army to advance

Britain. to the sea coast, it seemed in some measure the duty of ministers in Great Britain, to make preparations to resist any such effort. Accordingly they readily came forward in parliament, to propose measures of defence; and the danger into which the nation considered itself as brought, obliged all men, in some measure, still to adhere to an administration, which, in other respects, might have lost all their popularity from the ill success of their late measures.

1798.
1044
Defence
act.

On the 8th of February 1798, Mr Dundas moved in the house of commons for the introduction of a bill, to enable the king to incorporate in the regular militia a portion of the supplementary militia. The bill was passed with little debate. On the 27th of March, the same minister moved for leave to bring in a bill, to enable his majesty to take measures for the more effectual security and defence of these realms, and to indemnify persons who might suffer injury in their property by the operation of such measures. He stated, that the bill had several objects. Already some counties had expressed a wish to adopt measures in their nature similar; for instance, Dorsetshire. Propositions were made by the men of property, which induced the sheriff to hold several meetings; but, as from the nature of his office, he could only call out the *posse comitatus*, in cases limited by circumstances of mere local exigency, these meetings had no other effect, than that of giving a collected expression to the patriotism of that county. In other counties, the lord-lieutenants had done more; but it was doubtful whether they could go beyond certain bounds. It was, he said, the object of this bill to provide for every possible emergency, by giving a power to his majesty to discover who were the persons prepared to appear in arms to embody for their own defence. Another provision of the bill was to see what number of the inhabitants of certain districts would be able to act as pioneers, or in other laborious situations. Mr Dundas also remarked, that, in the crisis of real danger, some persons might be influenced by motives of personal safety, or the natural wish of preserving their property, which might lead individuals to withdraw from their country; the present bill, however, would provide, that should the property of individuals be destroyed by a marching army, or fall into the enemy's hands, or be taken for the service of the country, indemnification should be rendered according to its value. The other provisions were, that in the event of its being necessary to employ persons as pioneers to remove stock, or assist in facilitating the carriage of military stores, proper compensation would be made. The bill, he observed, was intended to give a power of embodying also a portion of the regular militia, and employing them in the defence of the country. Upon these broad principles of justice, he was confident, the spirit of the country could be exerted; and he believed that there was nothing that could better infuse confidence into a people, and make them feel that their security depended on the measures taken for their defence, than to enable them to unite to defend themselves.

The bill was enacted into a law after some unimportant debates. The principal members of opposition not usually attending, the persons who chiefly now appeared to oppose the measures of administration, were Mr Tierney, Mr Nichols, Sir William Pulteney, General Tarleton, and others, who had former-

VOL. IV. Part II.

ly been considered as occupying a less important place in the discussions of the legislature.

Britain.

As it was supposed, that the war, on the part of Britain, would occasion greater expence than when all Europe had been engaged in it along with her, the supplies were augmented to 35,000,000l. ; and, with a view to draw supplies from distant parts of the country, instead of raising large loans for the public service, which were negotiated in London alone, Mr Pitt brought forward a scheme, by which proprietors of land were enabled to redeem the land-tax; in other words, that the owner of land, and failing him, that any other person, should be permitted to purchase this tax, by a transfer of stock, which produced a dividend greater than the amount of the impost. The measure was enacted into a law, but produced little immediate effect.

1045
Redemp-
tion of the
land-tax
act.

On the 25th of May, Mr Pitt brought forward a bill in the house of commons, intended to increase the navy, with a view to resist, with greater success, the threatened invasion. On this occasion, an event occurred, which seemed to indicate, that by the long possession of power, and the uncommon support he had received from the nation, Mr Pitt had suffered to grow upon him a certain haughtiness of manner and impatience of contradiction, which, in former times, would have proved extremely inconvenient to a British minister. On the subject of his proposed bill, he said, that the object he had in view, was to suspend, for a limited time, the protections which various descriptions of persons enjoyed, to prevent them from being impressed into the service of the navy. It was his wish, he said, that the bill should this day pass through its different stages, with a suitable pause at each, if required, and that it should be sent to the lords for their concurrence. Mr Pitt concluded, by moving for leave to bring in a bill for the more speedy and effectual manning of the navy.

1046
Navy-bill.

Mr Tierney said, the very extraordinary manner in which the right honourable gentleman called upon the house to adopt this measure, could not fail to create great alarm. He had imagined, that the augmentation of the navy was to be provided for in the usual way; or, if any very uncommon mode was to be resorted to for the attainment of that object, notice should have been given to the house. For his part, he had heard no arguments that proved its propriety; and even if he had, some time ought to have been allowed him to weigh the force of such arguments, before he proceeded to give three or four votes on a measure, of which no notice of any kind had been given. If the honourable gentleman persisted in hurrying the bill through the house in the manner proposed, he must give it his decided negative. Indeed, from what he had already seen, he must view all the measures of the ministers as hostile to the liberties of the subjects of this country.

The chancellor of the exchequer replied, that if every measure adopted against the designs of France was to be considered as hostile to the liberty of this country, then indeed his idea of liberty differed widely from that of the honourable gentleman. He observed, that he had given notice before of the present motion; and that, were it not passed in a day, those whom it concerned might elude its effects. But

4 Q

if

^{Britain.} if the measure was necessary, and that a notice of it would enable its effects to be eluded, how could the honourable gentleman's opposition be accounted for, but from a desire to obstruct the defence of the country?

Mr Tierney called the right honourable gentleman to order.

The speaker observed, that whatever had a tendency to throw suspicion on the sentiments of a member, if conveyed in language that clearly marked that intention, was certainly irregular. This the house would judge of; but they would wait to hear the right honourable gentleman's explanation.

1047
A duel
fought by
Mr Pitt.

The chancellor of the exchequer replied, that if the house waited for his explanation, he feared it must wait a long time. He knew very well, that it was unparliamentary to state the motives that actuated the opinions of gentlemen; but it was impossible to go into arguments in favour of a question, without sometimes hinting at the motives that induced an opposition to it. He submitted to the judgment of the house the propriety of what he argued; and he would not depart from any thing he had advanced, by either retracting or explaining them.

The result of this altercation was a duel on the following Sunday, between Mr Pitt and Mr Tierney. They went to Putney Heath, attended by seconds; and, standing at the distance of 12 paces, each of them fired twice; but Mr Pitt fired his second pistol in the air. The seconds interfered; and thus the affair terminated.

1048
Rebellion
in Ireland.

During the summer of this year, a rebellion broke out in Ireland, the particulars of which will be stated in their proper place (see IRELAND). We shall only remark here, that Ireland has, at all times, been in a very unhappy state. Two-thirds of the population are Roman Catholics, possessing, till lately, no political rights; excluded by penal statutes from all employments in the army, and from every incorporation; while, at the same time, they are under the necessity of paying tithes to the Protestant Episcopal clergy. The Protestants, who form the remainder of the people, have long been divided among themselves; one part being Presbyterians, while the remainder are attached to the Episcopal church. These divisions never fail to produce great unhappiness; and such was the miserable policy followed by England, that, instead of incorporating Ireland with itself with a view to form an united empire, with a single legislature, as King James I. had proposed, and as was attempted during the usurpation, the British government usually chose rather to hold Ireland in a state of constant dependence, by governing it through the organ of a faction, and by rather encouraging than attempting to do away the divisions that existed among its inhabitants. The enthusiasm which the French revolution had kindled in so many quarters of Europe, extended itself to Ireland. Some men there, of ardent imaginations, chiefly Protestant dissenters, persuaded themselves that they could regenerate their country, cast off the dominion of Great Britain, heal the unhappy divisions among the inhabitants of Ireland, and convert it into an independent republic. As early as the year 1793, these persons formed themselves into a society, under the name of the *United Irishmen*, and were gradually joined by a very

great proportion of the population of the country. ^{Britain.} They at first sought aid from France; and it was in consequence of their invitation, that the unsuccessful expedition under General Hoche was undertaken. From that period, the country remained in a state of the greatest alarm. On one side rigorous laws were enacted, and every effort was made, by severity of punishment, to repress all appearance of opposition to the existing government; while, on the other hand, the common people busied themselves in the fabrication and concealment of pikes, or broke into the houses of country gentlemen, to seize whatever fire-arms they could discover. The schemes of the disaffected party were greatly disconcerted, by the discovery and apprehension of their principal leaders. A rebellion, however, actually broke out; and, though attended with considerable destruction of human lives and of property, it was of a partial nature, and speedily repressed. During its existence, some circumstances occurred, which completely demonstrated of how visionary a nature the schemes of those persons had been, who hoped to establish, in Ireland, an independent government, upon any basis that could afford a tolerable hope of national prosperity. The disaffected party among the Protestants were too weak to be able of themselves either to shake off the dominion of Great Britain, or to assume the ascendancy in Ireland. They were therefore under the necessity of calling in the aid of the Roman Catholics, of whom the great mass of Irish population consists. They were the more readily induced to do so, in consequence of the notion, which of late years had very generally gained ground in Europe, that religious sentiments form no proper source of distinction in civil society; and from perceiving the facility with which the Catholics of France had set at defiance the religion of their fathers, when placed in competition with what they accounted the interests of freedom, or the means of aggrandizement to their country. But it speedily appeared, that these new maxims of conduct could not be adopted by the superstitious and illiterate peasantry of Ireland. The Catholics were no sooner in arms, than their chief animosity came to be directed, not against the dominion of Britain or against any form of civil government, but against their own countrymen of the Protestant faith, who must thus ultimately have fallen a sacrifice to the success of their own schemes. In short, it became evident to all persons of reflection, that Ireland could not possibly exist in tranquillity, or with safety to the Protestant part of its inhabitants, independent of the supremacy of Great Britain.

Upon the continent, the world was amused with a ¹⁰⁴⁹ negotiation which was carried on at Rastadt, ^{between} the French directory and the German empire. ^{the} The negotiation was conducted with much slowness, and ultimately became ineffectual. ¹⁰⁵⁰ While it was going on, the French government contrived to quarrel with the Swiss cantons, invaded and seized their country, and converted it into a new republic, under their own influence. ^{land} Austria, however, had been so much humbled by recent losses, that she did not venture, on this occasion, to assert the independence of Switzerland, although it must have been evident to all discerning persons, that her own independence was ultimately connected with that object. ^{by the}

1052
Importance
of Switzer-
land in
European
politics.

Switzerland consists of a vast assemblage of lofty and precipitous mountains, situated in such a manner as to divide the most important countries of Europe from each other. On one side, these mountains look down upon the fertile country of Italy, to the north they command the very centre of Germany, and to the west they are bounded by France. For ages they have been inhabited by a virtuous and fearless race of people, divided into petty communities, who contented themselves with maintaining their own independence; and though, as individuals, they entered into the military service of the neighbouring princes, yet, as a people, they had long ceased to take any part in the wars of Europe. For some centuries, the independence of Switzerland proved the chief basis of the independence of the neighbouring nations. All parties respected and avoided any dispute with the Swiss, in a war against whom much might be lost, but nothing could be won. Accordingly, when the French attacked the Austrians, and when the Austrians attacked the French, the assailing party was under the necessity of sending its armies to a great distance from the centre of its own power. If defeated, the march homewards was long and difficult; while, even if tolerably successful, the attack was never seriously dangerous, in consequence of the weakness with which it was made in a remote quarter. Hence when, in 1796, the French generals, Moreau and Jourdan, marched through Swabia and Franconia to invade Austria, the length of their march afforded many opportunities of attacking them with success; and the invaded country had full leisure to call forth its whole resources against them. The result was, that, when Jourdan was defeated, the retreat of the other army became almost impracticable; and hence arose the unbounded reputation acquired by Moreau, in consequence of accomplishing it with success. Had the French, at that period, occupied Switzerland, the retreat of Moreau would have been attended with no difficulty; because, by retiring into that rugged country, he could easily have made a stand against a very superior force, for a considerable time, till he could receive reinforcements from home. For the future, therefore, by commencing a war of invasion against Austria, not upon the frontiers of France, but at the eastern extremity of the Swiss mountains, the French, if successful, might reach the gates of Vienna in a few weeks. The independence of Switzerland, by placing these nations at a distance from each other, had hitherto prevented such an enterprise from being carried into effect; and the present removal of that barrier by the French directory, during a period of peace with Austria, displayed, on their part, a correct knowledge of the cause which had, at all times, set bounds to the ambition of France; and, at the same time, a determined spirit of hostility against the independence of the surrounding states.

In the meanwhile, the weakness of the French navy rendered it impossible for them to engage in any serious attack against the European part of the British empire. The French government, however, with the double view of attacking the rich empire which Britain had acquired in Asia, and of removing a popular military officer, whose ambition was already accounted

dangerous, formed a scheme of sending Bonaparte, with an army, to seize and colonize Egypt. To accomplish the scheme with the greater safety, the threats of invading England were loudly renewed. The troops upon the coast were denominated the *army of England*. Bonaparte was appointed their commander, and visited them in person: But he suddenly departed, and embarked at Toulon with a great army, before his intentions were suspected in Great Britain. Malta was surrendered to him on his passage. Departing thence, he landed in safety in the vicinity of Alexandria, and soon was master of all Egypt. Here, however, his successes terminated. He was closely pursued by a British fleet, under Admiral Nelson; and the French admiral, instead of putting to sea, having injudiciously remained at anchor near the shore, gave an opportunity to some of the British ships of war to run between a part of his vessels and the coast, while others attacked the same vessels from the sea; and thus, by putting them in succession between two fires, captured or destroyed the whole, excepting two ships of the line, which put to sea and escaped.

From the time of the battle of Actium, by which the sovereignty of the Roman empire was decided, no naval victory was ever attended with consequences so immediately and obviously important as this. The French directory had concealed their intended enterprise from the Ottoman Porte, which lays claim to the sovereignty of Egypt, but has never been able to make its claim fully effectual. The Grand Signior, however, considered the present attempt as an act of hostility against himself; and the maritime victory above mentioned, encouraged him to declare war, in the name of all Mussulmans, against that host of infidels which had invaded the land, from which the sacred territory of Mecca is supplied with bread. In Europe, similar consequences took place. The irresistible career of Bonaparte had compelled Austria to submit to peace upon terms which left France in a state of most dangerous aggrandizement. But the terrible Bonaparte, with the best part of his victorious army, was now held under blockade by the British fleet in a distant country. The hopes of Austria began to revive, and there seemed reason to expect, that by renewing the contest, her ancient rank in Europe might be recovered. The king of Naples entered into these views with great eagerness, and rashly went to war with France, without having patience to wait, and to follow the movements of the greater powers.

The empress of Russia was now dead, and was succeeded by her son Paul. She had never contributed more than her good wishes towards the war, which the other powers of Europe had waged against France. But her son, a man of a furious and passionate character, was unable to follow the same cautious policy, or to remain a quiet spectator of the issue of a contest against the French republic, in which he considered all princes as deeply interested. He was encouraged by the naval victory gained at the mouth of the Nile, which seemed to insure the absence of Bonaparte and his army, to declare his willingness, so far as his finances would permit, to join in a new combination against France.

¹⁰⁵⁶ ^{Britain.} was enabled to procure allies, willing to send abundance of troops against her enemy, providing she would defray the necessary expence. In the mean time, the acquisitions and the losses of Britain, were nearly equally balanced in other quarters. An armament sailed towards the island of Minorca, and a descent was made near the creek of Addaya. A body of Spaniards threatened to surround the first division of the invading army; but they were soon repelled, and our troops gained a position, from which they might have attacked the enemy with advantage, if the latter had not retired in the evening. The army seized the post Mescaldal, and a detachment took the town of Mahon and Fort Charles. The chief defence was expected at Civadella, where new works were added to the old fortifications. The approach of the English drove the Spaniards within the walls of that town, and General Stuart summoned the governor to surrender it without delay. To enforce compliance, two batteries were erected; but, as the invaders had few of the requisites of a siege, their adversaries might, with a small share of spirit, have made a considerable resistance. Intimidated, however, by the movements of the troops, and the appearance of the squadron, the garrison capitulated; and thus the whole island was reduced without the loss of a single man.

¹⁰⁵⁷ ^{St Domingo} ^{abandoned.} Towards the end of the same year, however, the British troops, which during a considerable length of time had occupied a great number of positions upon the coast of the island of St Domingo, found it necessary to abandon the whole. The power of the French government had nearly been annihilated there, by a negro commander (Toussaint), to whom the British surrendered Port au Prince and St Marc. The losses incurred in consequence of the unfortunate attempt made by the British government to subjugate that island, were immense; 15 millions of money were expended, and, it is said, that upwards of 20,000 men were lost, chiefly by the ravages of the yellow fever, added to the natural malignity of that climate to European constitutions.

¹⁰⁵⁸ ^{Meeting of} ^{parliament.} Parliament assembled on the 20th of November. It was said, in the speech from the throne, "that the success which had attended our arms, during the course of the present year, had been productive of the happiest consequences, and promoted the prosperity of the country. Our naval triumphs had received fresh splendour, from the memorable action in which Lord Nelson had attacked a superior enemy, and turned an extravagant enterprise to the confusion of its authors: the blow thus given to the power and influence of France had afforded an opening, which might lead to the general deliverance of Europe.

"The magnanimity of the emperor of Russia, and the vigour of the Ottoman Porte, had shown, that these powers were impressed with a just sense of the present crisis; and their example would be an encouragement to other states to adopt that spirited line of conduct, which was alone consistent with security and honour. Our preparations at home, and the zeal of all ranks of people, had deterred the enemy from attempting to invade our coasts. In Ireland, the rebellion had been suppressed: the views of ill-minded people, who had planned the subversion of our constitu-

tion, had been fully detected and exposed; those whom they had misled, must now be awakened to their duty; and the miseries which those traitorous designs had produced, impressed the necessity of repelling every attack on the established government of their country.

"Under the pressure of protracted war, it was a great satisfaction to observe, that the produce of the public revenue had been fully adequate to the increase of our permanent expenditure; the national credit had been improved, and commerce had flourished in a degree unknown."

The debates which occurred in the house of commons upon this occasion, were not remarkably interesting, as the leading members of the old opposition were usually absent. Administration was chiefly opposed by Mr Tierney, Sir Francis Burdett, Sir John Sinclair, and Sir William Pulteney. In the house of lords, Earl Darnley moved the usual address to the throne, and was seconded by Lord Craven. This last nobleman discussed, in terms of great triumph, the situation and prospects of Britain. He remarked, that, after being deserted by the allies, whose cause we had espoused, it was gratifying to see the noble stand we had made, and the success we had obtained by our single exertions. The navy of the French republic was annihilated; her boasted army of England lost its title; not only our coasts at home, but our most valuable possessions abroad, were secured. There was only one branch of commerce which we did not before almost exclusively possess, namely, that of the Levant; and of that trade France would now be totally deprived, and we should reap all those advantages which had heretofore maintained her navy. The situation of Bonaparte was also in our favour; cut off from all means of retreat, and beset on every side with obstacles. These successes had given spirit and alacrity to several of the foreign powers, who had unequivocally determined to join against the common enemy. Russia and the Ottoman Porte had declared themselves; and Austria, though unwilling, would find it her interest to unite in the exertions which our example had recommended to all Europe, and without which it would be in vain to look either for security or peace.

The marquis of Lansdowne remarked, that the greatest conquests were but fleeting objects unless well used, and however fascinating by their splendour, would pass away without solid cause of joy, unless made the means of obtaining the most desirable good, so often recommended by himself in that house, a safe and honourable peace. The real patriot would think his service best repaid, by knowing it had tended to procure the cessation of arms, and the return of tranquillity. He had no doubt, but that Lord Nelson would highly prefer this satisfaction to any personal compliment which could be paid him; and the marquis acknowledged his regret in observing, that the victory of the Nile, which might have led to peace, was employed as a reason for new exertions, and a continuance of the war. And in what manner? By again combining with the European powers, by every one of whom we had already been abandoned. His lordship reprobated the conduct of the French; but, asserted, that the proposed means for diminishing their power, were inadequate to the object.

Britain. in view. We now were told of the vigour manifested by Russia and the Porte, a monstrous alliance between the Turks and Russians. We all knew, that their mutual distrusts exceeded those of other nations: it was hereditary, it was implanted in their nature, and strengthened by their education. The family upon the throne of the Russians had uniformly, cherished the notion that Constantinople was to be a part of their inheritance. It was with this view they named the second son of the present emperor Constantine II.; and it was from a coalition of this sort, that we were to derive hopes of vigorous operations against France. If Russia were in earnest, why did we not hear of the other northern powers coming forward and joining in the league. As to the Grand Signior, what was the Ottoman Porte? Turkey was the most helpless of all countries upon earth, incapable not only of external operations, but of domestic defence, and in a state of universal insubordination. Defeated in more than 30 attacks upon one rebellious pacha, unable to resist the rebellion of a subject, was it from such a country that we were to expect a vigorous co-operation; upon such a league that we could place our confidence? His lordship, therefore, urged the propriety of assuming the moment of victory, as the proper period, in which, without humiliation, we might safely testify a wish for peace.

Lord Holland supported the same sentiment. He said, that the speech from the throne held forth the probable success of a powerful confederacy against France. We had heard such language before; but we had only seen, in consequence of these confederacies, devastation extended over the surface of the globe, with less and less prospect of procuring tranquillity. The former confederacy of princes was the chief cause of the calamities produced by the French revolution. Experience might teach us, that it was impossible to derive any advantage to this country from them. We might recollect, that we never had an alliance with any of them, who had not deserted us. Austria, the most considerable, was only a drain upon us, and a temptation for the conquests of the enemy.

The late glorious victory ought to induce us to show a disposition for peace. It would not be humiliation, but magnanimity; nor would the people of this country fancy it was a degradation, if his majesty's ministers, in their name, would evince a pacific spirit. The people of England had no wishes inconsistent with the glory of their country; and he heartily regretted, that they had not their due weight in the government. Of the diminution of expence he saw but little probability; having observed, that in the years when we had the strongest assurances of retrenchment, our expenditure had increased the more.

On the contrary, Lord Mulgrave was surprised, that any Englishman should think that this was a moment for proposing peace, especially to such an enemy as we had to contend with. Reference to the fate of the former attempts, had little to do with the present. He demanded, whether the relative situation of the two countries were the same as at the beginning of the war either in point of glory, in point of finance, or in point of the popularity of the two governments. When the contest first began, the parties started as great rivals upon equal terms; at present, however, every thing which could constitute advantage was in our favour.

Britain. In such a position of things, would it be wise to trust the moderation which the noble lord had so highly extolled? Ought we to rest our security upon the pacific disposition of the present rulers of France? Was it sound policy, at a moment when a prospect had arisen of securing the independence of Europe, to throw away our advantages, and seek, by crouching at the feet of France, a precarious, hollow, and fallacious peace, without endeavouring to turn the glory we had earned into a universal benefit to the world?

In support of the same sentiments, Lord Grenville stated, that the powers of the continent were at present willing to embrace a train of conduct suited to the protection of their independency; and was this a moment for England to show, that she was guided by little selfish politics? Instead of leaving Europe to its fate, and abandoning the victims of French dominion to their misery, it ought to be the business of Great Britain to animate their efforts, and contribute to their deliverance. It was the duty of ministers to promulgate this glorious purpose, to conciliate differences, to allay jealousies, and not, by reviving them, to prevent that co-operation which was so necessary to the general safety, and connected with the true interests of the country.

As a prospect was now opened of reviving, upon a ¹⁰⁶⁰ New most extensive scale, the continental war against France, ¹⁰⁶¹ it became necessary to provide great pecuniary re- ¹⁰⁶¹ sources to subsidize the armies which were to be brought forward, especially by the Russians, the poverty of whose country could ill afford to sustain the expence of supporting armies in Italy or the banks of the Rhine. The same difficulties, however, or rather doubts concerning the prudence of carrying to its utmost length the British practice of borrowing money to defray the extraordinary expence incurred during each year of war, which had led to an augmentation of what are called the *assessed taxes*, still induced the minister to attempt to raise a proportion of the extraordinary or war expenditure within the year, not by a loan, but by taxes to the requisite amount. With this view, what was accounted ¹⁰⁶¹ a very bold measure was brought forward. This was ¹⁰⁶¹ a proposal for imposing a general tax upon the income of every individual throughout the nation. Mr Pitt stated, in the house of commons, his plan to be, that no one whose income was less than 60l. per annum should be obliged to contribute more than the taxes he already paid; but that every one who had an income of, or beyond, that amount, should be additionally burthened, some in the proportion of ten per cent. others at a lower rate. All who had 200l. a year, would be required to sign a declaration of their willingness to pay a certain sum, not less than a tenth part of their income, without particularizing the modes in which it accrued; and a scale of easy computation would be adjusted for the rest. If doubts of the fairness of a statement should arise, the commissioners might summon an individual before them, and demand upon oath a minute specification of income; and if, on a continuance of suspicion, full proof of accuracy should not be adduced, they might fix the amount of contribution. If they should require more than a tenth, no relief would be allowed, unless the books of the tradesmen, or the ordinary accounts kept by others, should be submitted to inspection.

Having:

^{Britain.} Having stated the outlines of his plan, Mr Pitt mentioned the data upon which he formed an estimate of its produce. He was of opinion, that the annual rent of all the land in England and Wales, amounted to twenty-five millions of pounds sterling; a sum which, by the allowance of a fifth part for the exceptions under 6*l.* and the modifications under 20*l.* a year, would be reduced to twenty millions. Six millions he thought might be assumed as the clear income of the land to tenants, the tithes might be valued at four millions, the produce of mines, canals, &c. at three, the rent of houses at five, and the profits of the liberal professions at two: on all these heads, it might be sufficient to allow an eighth part for Scotland, which would be five millions. Income drawn from possessions beyond seas might be stated at five; annuities from the public funds, at twelve; those of internal trade, mechanical skill, and industry, at twenty-eight millions. These calculations formed an aggregate of an hundred and two millions; and from this source about ten millions of supply were expected to arise.

¹⁰⁶² Defects of the income tax. The whole of this measure was opposed, without success, by Mr Tierney, Sir John Sinclair, Mr Pulteney, and others. Its chief defects were two: it was unequal in its principle, and, when carried into practice, occasioned much falsehood, with a view to evade it. Its inequality in point of principle is extremely obvious; because, under the tax upon income, a man without capital who earned 20*l.* per annum, by his industry, paid the same tax to government, with a man living in idleness, and enjoying a revenue of the same amount upon a land estate; though it is obvious that the wealth of two such persons, as well as the degrees in which they deserve public encouragement, are very different. In its collection this tax presented to merchants, and all other persons whose income depends upon their own industry, a powerful temptation to represent its amount as extremely low. It was expected, indeed, that the vanity of appearing wealthy and prosperous, would counteract this tendency; but it was soon found that, in a commercial community, the love of gain is not easily subdued by any other passion: and as a general understanding soon prevailed among men, with regard to each others feelings upon this subject, nobody regarded his neighbour as unprosperous, merely because he had reported his own income, to government, at a low rate.

¹⁰⁶³ Union with Ireland proposed. The fear of a French invasion, had in a former age induced the English nation so far to vanquish their own prejudices, as to consent to an incorporating union with Scotland. The late rebellion in Ireland, together with the dread, that by means of French aid, Ireland might be dismembered from the British empire, as the American colonies had been, now produced a sense of the necessity of doing what ought to have been done three centuries before this date, that is, of uniting Ireland to Britain, by incorporating into one the heretofore distinct legislatures of the two islands. The measure was at this period very practicable, because Ireland was, in fact, under the dominion of 40,000 troops, who had been collected to crush the rebellion, and protect the island against the French; and because the friends of govern-

ment were too much intimidated by the confusion, and the scenes of bloodshed, which had recently occurred there, to venture to oppose vigorously, a measure which promised to preserve for the future the tranquillity of the country inviolate. ^{Britain.}

On the 31st of January, Mr Pitt proposed the measure in the British house of commons. He said, that a permanent connexion between Britain and Ireland, was essential to the true interests of both countries; and that unless the existing connexion should be improved, there was great risk of a separation, he had strong reasons to believe. The settlement of the year 1782, he said, was so imperfect, that it substituted nothing for that system which it demolished, and it was not considered as final even by the ministers of the time. It left the two realms with independent legislatures, connected only by the identity of the executive power, a very insufficient tie, either in time of peace or of war, inadequate to the consolidation of strength, or the mutual participation of political and commercial benefits. The case of the regency exhibited a striking instance of the weakness of the connexion; and if the two parliaments had differed on the subject of the war, the danger of a disjunction would have been seriously alarming. The entire dissociation of the kingdom was one of the greatest aims of our enemies; and, as their eventual success on Ireland would expose Britain to extreme peril, the establishment of an incorporative union, by which their views might be effectually baffled, was a necessary act of policy. Great Britain had always felt a common interest in the safety of Ireland; but that interest was never so obvious and urgent, as when the enemy attacked the former realm through the medium of the latter. The French had shown by their conduct, that they deemed Ireland the most vulnerable part of the empire: and this consideration alone ought to enforce the adoption of a measure, which would tend to strengthen and secure that country. It ought to be noticed, that the hostile divisions of its sects, the animosities existing between the posterity of the original inhabitants and the descendants of the colonists, the rudeness and ignorance of the people, and the prevalence of jacobinical principles among them, had produced a state of distress, for which there was no cure, but in the formation of a general imperial legislature, free alike from terror and resentment, removed from the danger and agitation, uninfluenced by the prejudices and unflamed by the passions, of that distracted country.

Among the advantages which would accrue to Ireland, from an incorporation with Britain, he mentioned the protection which she would secure to herself in the hour of danger; the most effectual means of increasing her commerce, and improving her agriculture; the command of English capital, the infusion of English manners, and English industry, necessarily tending to meliorate her condition: adding, that she would see the avenue to honours, to distinctions, and exalted situations in the general seat of empire, opened to all those whose abilities and talents enable them to indulge an honourable and laudable ambition. He farther remarked, that the question was not what Ireland would gain, but what she would preserve; not merely how she might best improve her situation, but how she might avert

Britain. avert a pressing and immediate danger; in this point of view, her gain would be the preservation of all the blessings arising from the British constitution.

After some commercial statements, tending to show the benefits derivable to Ireland from an union, he asserted the competency of the legislature, not by argument or demonstration, but by allegations of the danger of controverting such right. A denial of parliamentary competence, he said, would amount to a denial of the validity of the Scotch union, and of the authority under which the existing parliament now deliberated; and it would even shake every principle of legislation. That a competency for any new, or very important measure, could only arise from the express directions or consent of the electors, or the great body of the nation, was a jacobinical idea, connected with the dangerous doctrine of the sovereignty of the people.

As the supposed loss of national independence formed, in the minds of many, a strong objection to the scheme, he argued, that the dreaded loss would be a real benefit; that the Irish would rather gain than lose in point of political freedom and civil happiness; and that though a nation possessing all the means of dignity and prosperity, might justly object to an association with a more numerous people, Ireland being deficient in the means of protection and civil welfare, could not be injured or degraded by such an union, with a neighbouring and kindred state, as would connect both realms by an equality of law, and an identity of interest. Her people would not less be members of an independent state, as to any valuable or useful purpose, or less free in the enjoyment of the benefits of society and civilization.

Mr Sheridan opposed an union, as particularly unseasonable, amidst the irritation which prevailed at this period in Ireland; and deprecated the accomplishment of the object by means of force or corruption. The measure, however, was approved of by a majority of 145. In the house of lords, the same subject was afterwards discussed with a similar result. In the Irish parliament, however, the proposal was resisted with such vehemence, that administration, finding themselves supported only by a small majority, thought fit to avoid pressing the matter at the present period.

Before the rising of parliament, money was voted to the amount of 30,947,000*l.* to provide for the expences of the war.

During the present year, the British power in India was greatly augmented, and its territory extended, by the fall of Tippoo Sultan, the son and successor of Hyder Ally. From the time that this prince had been compelled, in 1792, to surrender one half of his dominions, in consequence of the invasion by Lord Cornwallis, it was understood, that sooner or later, he would make an attempt to recover what he had lost. It would seem that he had entertained hopes of aid from the French, and that with this view he had privately sent envoys to the isle of France, to attempt to form a connection with the present French rulers. When intelligence reached India of the expedition to Egypt, and the victory at the Nile, the British governor-general demanded from Tippoo Sultan, an explanation of his views, and after some fruit-

less negotiation, on the 11th of February a British army, under General Harris, invaded the territory of the Mysore, which they found in a bad state of preparation for war. After some slight engagements, the British army, on the 6th of April, encamped before Seringapatam. It was not till the 2d of May, however, that the besieging batteries began to make a breach. On the 4th, during the heat of the day, the place was stormed, and Tippoo himself perished fighting at one of the gates of the fort. His dominions were seized by the British, who bestowed a portion of them upon the Mahrattas, and the nizam their ally. A part was reserved under the direct sovereignty of the East India Company; and the remainder was nominally bestowed upon a prince of that family which had lost its power by Hyder's usurpation. The substantial authority, however, over this last-mentioned portion of Tippoo's dominions, was in truth retained by the British government. As the nizam himself soon became entirely dependent upon the British power, the whole peninsula of Indostan might now be considered, by the death of Tippoo, as brought under our government, with the single exception of the territory of the Mahrattas, which evidently could not long remain unsubdued.

In Europe the present campaign was extremely eventful. The French directory had been more anxious to establish its own power at home, than careful to preserve the army upon the frontiers, and in the conquered countries, in a proper state of force and discipline. A French army, under General Jourdan, advanced into Swabia, in the month of March; but was encountered and beaten by a superior force, under the archduke Charles. The importance of the possession of Switzerland instantly displayed itself. The vanquished French army crossed the Rhine into Switzerland, and in that mountainous country, contrived to make a stand during the greater part of the summer. The Austrians advanced the length of Zurich, of which they obtained possession; but before they could proceed farther, the French armies were reinforced towards the end of the season, and were enabled in their turn to act offensively.

In Italy the French acted unskilfully at the opening of the campaign. Instead of concentrating their forces, they attempted to retain possession of the whole of that country, and were thus in various engagements beaten in all quarters. The combined armies of Austrians and Russians were commanded by the Russian general Suwarrow, who pressed upon the French with incredible activity, carrying on a multiplicity of sieges at the same instant, bringing his troops together with wonderful celerity, when his enemy attempted to take advantage of the manner in which his forces were scattered. The result of the whole was, that before the campaign terminated, he had driven the French out of the whole of Italy, with the exception of Savoy and the Genoese territory. But this was not accomplished without a great loss of men in sieges and sanguinary conflicts. In these last the hardy warriors of the north suffered very severely. Their leaders depended more for success upon the intrepidity of their troops, and the promptitude with which they rushed into action, than upon the skilful dispositions with which they arranged their force, or harassed their enemy.

Suwarrow's campaign.

^{Britain.} Hence, it happened that amidst all Suwarrow's victories, no instance occurred of any column of French troops being compelled to surrender without fighting, nor was any advantage gained but by the efforts of superior force exerted in open battle. Such a warfare, carried on against a single enemy by combined armies, could not be long successful. The Austrian officers complained loudly of their northern allies as men destitute of military skill, who wasted armies without a proportioned return of conquest; while, on the other hand, the Russians censured their associates as destitute of proper spirit, and as protracting the war by an ill-timed caution.

¹⁰⁶⁷
Attempt to drive the French from Switzerland.

The advantage derived by the French from the possession of Switzerland, had by this time begun to be understood. A resolution was therefore adopted of closing the campaign, not by sending Suwarrow from Italy into the south of France, but by directing him to turn his arms northward against the Alps. The archduke Charles had spent the summer in pressing upon the French in that quarter, but had been unable to advance beyond Zurich; he now departed with a division of his army towards Manheim and Philipburgh, leaving considerable bodies of Austrians and Russians at Zurich. To assume the command of these troops Suwarrow advanced from Italy at the head of 18,000 men. His views however were anticipated by the French general Massena, who finding the archduke Charles and Suwarrow at the distance of more than a day's march on his left and right, instantly attacked the troops stationed near Zurich. The Austrians perceived the hazardous nature of their own situation, and retreated out of Switzerland with only a moderate degree of loss. But the Russians, from an ill-judged contempt of their enemy, from their own ignorance of the country, and want of skill in the art of conducting war in it, maintained their ground till they were hemmed in on all sides. They attempted to resist the French, as they had often resisted the Turks, by forming a hollow square of great strength; but neither this nor their own courage afforded any safety against the flying artillery of their enemy, in the face of which an iron front of bayonets was in vain presented. Their order was at last broken, and their retreat was extremely disastrous; Suwarrow was in the same instant advancing rapidly to their relief; but a victorious enemy turned quickly upon him, and attempted to encompass him on all sides. By great activity he effected his escape with about 5000 of his troops, in want of every thing, and retaining only the musquets in their hands.

¹⁰⁶⁸
The Russians defeated.

Thus terminated on the eastern side of France this very active campaign. The allies remained masters of Italy; but France was still enabled to menace that country, as well as Germany, by retaining possession of Switzerland. In the meanwhile, the British attempted with the aid of Russian auxiliaries to drive the French out of Holland. On the 27th of August, a landing was effected under Sir Ralph Abercromby at the mouth of the Texel. The Zuyder sea was immediately entered by a British fleet, under Admiral Mitchell. The Dutch admiral, Story, surrendered the fleet under his command, alleging that his men refused to fight. The ships were 12 in number, and eight of them mount-

¹⁰⁶⁹

ed from 54 to 74 guns. Here, however, the effectual success of the expedition terminated. The duke of York afterwards assumed the command, and forces amounting to 35,000 men were sent over. But it was soon discovered that the invasion had been ill concerted. To have afforded a prospect of success, the invading army ought to have landed in the vicinity of Rotterdam, which is full of Scotchmen, and where the supporters of the stadtholder were numerous; and to have advanced rapidly into the centre of the country, to encourage the numerous enemies of the French to stand forward in their favour. Instead of this, the army was set ashore at the extremity of a long and narrow neck of land, having the sea on both sides, where the French and Dutch found it no difficult matter to obstruct their progress with a handful of troops during a great length of time. Their difficulties were increased by the unusual wetness of the season, which greatly injured the roads. The British commander was at length under the necessity of withdrawing his troops to the point at which they originally landed; and a convention was entered into, by which it was stipulated on the one hand, that he should not injure the country, and that a number of French prisoners in England should be released; while on the other hand, it was agreed that the duke of York should be permitted to retreat unmolested.

^{Britain.}

At the end of this campaign, the French government underwent a new change at home. Bonaparte after the conquest of Egypt, had invaded Syria; but found his career stopt at Acre by the Turkish governor of that town, assisted by the British under Sir Sidney Smith. Having returned into Egypt, and destroyed a Turkish army, Bonaparte ventured upon a step which is without example in the history of modern Europe. He had heard of the great reverses which the French armies had suffered in the early part of the campaign, and of the general discontent which prevailed throughout the nation in consequence of these misfortunes, and he resolved to try his fortune amidst the present troubled state of public affairs. With this view, along with a party of select friends, he secretly stole away from his army in a small vessel, leaving his troops blockaded by a British fleet in a barbarous country. The unexpected arrival in France of an officer who had never fought in Europe without success, was welcomed by the public at large as a most happy event; and in the first moment of joy, little inquiry was made about the manner in which he had forsaken his army, which in any other circumstances would have been regarded by a military people as one of the greatest of crimes. Finding a party willing to second his views, Bonaparte took advantage of the satisfaction occasioned by his arrival, together with the discontents arising from the corruption and mismanagement of the directorial administration, to usurp the government, and to dissolve the representative legislature.

¹⁰⁷⁰
Usurpation of Bonaparte.

The British parliament was assembled so early as the 24th of September, for the sake of providing for the expences and augmentation of force, thought necessary to give effect to the invasion of Holland, of the success of which sanguine hopes were at that time entertained. The speech from the throne began with recommending the propriety of permitting to a very considerable

¹⁰⁷¹
Parliament assembled.

Britain. considerable extent, the acceptance of the voluntary service of the militia to augment our force abroad. It stated that our prospects under providence had been improved beyond the most sanguine expectation; the deliverance of Italy might now be considered as secured by a campaign, equal in splendour and success to the most brilliant recorded in history.

The kingdom of Naples had been rescued from the French yoke, and restored to the dominion of its lawful sovereign.

The French expedition to Egypt had been productive of calamity and disgrace, whilst its ultimate views against our eastern possessions had been utterly confounded; the desperate attempts which our enemies had made to extricate themselves, had been defeated by the courage of the Turkish forces, directed by the skill, and animated by the heroism, of a British officer; and the overthrow of that restless and perfidious power had placed the British interests in a state of permanent security.

There was every reason to expect that our present efforts for the deliverance of the United Provinces would prove successful. We had rescued already the principal port and naval arsenal of the Dutch republic from the enemy; and might hope that the skill of our generals, and the intrepidity of our troops, would soon with the assistance of our allies surmount every obstacle, and that the fleet destined under the usurped dominion of France to invade these islands, would, under its ancient standard, restore the religion, liberty, and independence of provinces so long in alliance with this country.

To our good and faithful ally the emperor of Russia, whose wisdom and magnanimity directed the force of his extensive empire to so many quarters of Europe, we were in a great measure indebted for the favourable change in the general posture of affairs. In pursuance of the recommendation of the British parliament, his majesty had communicated their sentiments to both houses of parliament in Ireland, respecting an union with that kingdom, which would add so much to the security and happiness of his Irish subjects, and consolidate the strength and prosperity of the empire.

In consequence of the recommendation from the throne, an act was passed, authorising his majesty to receive into the army volunteers from the militia regiments; and some measures of finance were adopted: but government having received intelligence of the failure of the expedition against Holland, parliament was suddenly adjourned for some time. In the mean while, affairs on the continent began to assume an unpropitious aspect. The emperor of Russia, from his extreme vehemence of character, was led to entertain a very violent degree of discontent, on account of the defeats sustained by his troops in all quarters towards the close of the campaign. He became dissatisfied with his allies, and there was reason to dread that his irascible and unreasonable temper might lead him not merely to desert but to quarrel with them. In the mean while, Bonaparte, under the title he had assumed of *Chief or First Consul of the French republic*, resolved to signalize his acquisition of power, by what was now become a very popular measure in France, an attempt to procure peace. He thought fit, with this view, to address a letter, signed by himself, to the king of Great Britain. In this

VOL. IV. Part II.

letter he announced his own appointment to the office of first magistrate of the republic. He asked, "Is the war which for eight years has ravaged the four quarters of the world to be eternal? Are there no means of coming to an understanding? How can the most enlightened nations of Europe, powerful and strong beyond what their safety and independence require, sacrifice to ideas of vain grandeur, commerce, prosperity, and peace? How is it that they do not feel that peace is of the first importance, as well as the highest glory?"

"These sentiments cannot be foreign to the heart of your majesty, who reigns over a free nation, with the sole view of rendering it happy. Your majesty will see in this overture my sincere wish to contribute efficaciously for the second time to a general pacification, by a step speedy, entirely of confidence, and disengaged from those forms which, perhaps necessary to disguise the dependence of weak states, prove in those that are strong only the desire of deceiving each other.

"France and England, by the abuse of their strength, may still for a long time, for the misfortune of all nations, retard the period of their being exhausted; but, I will venture to say, the fate of all civilized nations is attached to the termination of a war which involves the whole world." This letter was transmitted through the medium of an agent of the French government, who resided at London for the sake of managing the exchanges and other affairs relative to prisoners of war. Lord Grenville, as secretary of state for the foreign department, informed the agent who had transmitted Bonaparte's letter, that his majesty could not depart from the usual forms of transacting business, and therefore, that the only answer to be returned, would be an official note from himself. In this note, his lordship stated, that the king wished for nothing more than to restore tranquillity to Europe; that he had only made war in defence of his people, against an unprovoked attack; but that it would be in vain to negotiate while the same system continued to prevail in France which had ravaged Holland, Switzerland, Germany, and Italy. "While such a system therefore prevails, (continued his lordship); and while the blood and treasures of a powerful nation can be lavished in its support, experience has shown, that no defence but that of open and steady hostility can be availing. The most solemn treaties have only prepared the way to fresh aggression; and it is by determined resistance alone, that whatever remains in Europe of stability, for property, for personal safety, for social order, or the exercise of religion, can be preserved. For the security, therefore, of these essential objects, his majesty cannot place reliance on the mere renewal of general professions of pacific dispositions. Such professions have been repeatedly held out by all who have successively directed the resources of France to the destruction of Europe, and whom the present rulers have declared all to have been incapable of maintaining the relations of amity. Greatly will his majesty rejoice whenever it shall appear, that the danger to which his own dominions and those of his allies have been so long exposed, has really ceased; whenever he shall be satisfied that the necessity of resistance shall be at an end, and after so many years of crimes and miseries, better principles have prevailed, and the gigantic projects of ambition, endangering the

Lord Grenville's answer.

Britain. very existence of civil society, have at length been relinquished. But the conviction of such a change can result only from the evidence of facts.

"The best pledge of its reality and permanence would be the restoration of that line of princes which, for so many centuries, maintained the French nation in prosperity at home and consideration abroad. Such an event would at once remove all obstacles in the way of negotiation for peace. It would confirm in France the unmolested enjoyment of its ancient territory, and give to all other nations, that tranquillity, that security, which they are now compelled to seek by other means.

"But it is not to this mode that his majesty limits the possibility of solid pacification; he makes no claim to prescribe to France what shall be the form of her government, or in whose hands she shall vest the authority necessary for conducting the affairs of a great and powerful nation.

"His majesty only looks to the security of his own dominions, of his allies, and of Europe. Whenever he shall judge it can be in any manner attained, he will eagerly embrace the opportunity, to concert with his allies the means of an immediate and general peace.

"Unhappily at present no such security exists; no sufficient evidence of the principles by which the new government will be directed, no reasonable ground of its stability, appears. In this situation, therefore, it remains for his majesty to pursue, in conjunction with other powers, those exertions of a just and defensive war, which a regard to the happiness of his subjects will never permit him to continue beyond the necessity in which they originated, or to terminate on any other foundation than such as would contribute to the secure enjoyment of their tranquillity, their constitution, and their independence."

1074
Talley-
rand's note.

As one of the principal objects, on account of which Bonaparte commenced this negotiation, undoubtedly was to cast upon Great Britain the odium of the continuance of the war; he persevered in this purpose with considerable dexterity: He appeared not to be disconcerted by the first rejection of his offers, and continued the correspondence through the medium of Talleyrand, his minister for foreign affairs, who, in a note in answer to that of Lord Grenville, began with a recrimination respecting the origin of the war; in which he presented a picture of a design and colouring totally different from that which his lordship had pourtrayed in his letter. The charge of aggression, of which the French nation were accused, was haughtily repulsed, and retorted on the coalesced powers, and particularly on the British government. After expatiating on this subject, the French minister observed, that a sincere desire for peace ought to lead the parties to the discovery of the means of terminating the war, rather than apologies or recriminations respecting its commencement; that no doubt was entertained but that the right of the French nation to choose its own government, was a point which would not be contested, asserting that the British crown was held on no other tenure; that at a time when the republic presented neither the solidity nor the force which it now possessed, negotiations had been twice solicited by the British cabinet, and carried into effect: that the reasons

for discontinuing the war were become not less urgent; on the contrary, the calamities into which the renovation of the war must infallibly plunge the whole of Europe, were motives which had induced the first consul to propose a suspension of arms, which might likewise influence the other belligerent powers. The minister concluded with pressing this object so far as to propose the town of Dunkirk, or any other, for the meeting of plenipotentiaries, in order to accelerate the re-establishment of peace and amity between the French republic and England.

In the answer of the British minister to this note, the recrimination of aggression was as contemptuously repulsed as it had been haughtily urged: Referring to his former note, the minister observed, that the obstacles which had been presented, rendered hopeless for the moment any advantages which might be expected from a negotiation; that all the representations made with so much confidence by the French minister, the personal dispositions of those in power, the solidity and consistence of the new government, were points which could not be admitted as motives for opening a negotiation, since these considerations remained yet to be proved, and of which the only evidence must be that already explained by his majesty, namely, the result of experience, and the evidence of facts.

On the 22d of January, copies of this correspondence were presented to the British parliament, along with a message from his majesty, announcing that he relied on the support of his parliament, and the zeal and perseverance of his subjects, in such measures as would best confirm the signal advantages obtained in the last campaign, and conduct the contest to an honourable conclusion. On the 28th of the same month, the subject was discussed in the house of lords upon a motion made by Lord Grenville for an address of thanks to his majesty for the consequence of the message. Lord Grenville contended, that nothing in the state of Europe admitted a rational hope, that there was any security but in the war; that peace with a nation at enmity with order, religion, and morality, would rather be an acquiescence in wrong than a suspension of arms in ordinary warfare. In these times, when the differences that agitated states were of no common origin; when indeed they were the offspring of a mad and maddening system of innovation; the work of peace should be entered upon with caution, and pursued with jealousy. To negotiate with established governments was formerly not merely easy, but safe; but to negotiate now with the government of France, would incur all the risks of an uncertain truce, without one of the benefits of a temporary peace. He entered into a comment upon the note of the French minister, and disputed all its positions. He said that the love of peace, on the part of France, had been displayed in a war of eight years with every nation in Europe excepting Sweden and Denmark; that her disinclination of conquest had been ascertained by the invasion of the Netherlands, of Italy, of Switzerland, and even of Asia. He contended, that no honourable or permanent peace could be made with the present rulers of France. Every power with which she had treated could furnish melancholy instances of the perfidy, injustice, and cruelty of the republic. If she agreed to a suspension of arms, it was in order to be

Britain. he admitted into the state of the negotiating prince, that she might then undermine his throne by corrupting the principles of his subjects. The duke of Tuscany was among the early sufferers by a treaty. He strove to conform his conduct in every respect to the views of France; but at the moment when she pledged her honour for the security of his state, he saw the troops of his ally enter his capital, the governor of that city imprisoned, his subjects in a state of rebellion, and himself about to be exiled from his dominions. It was to this prince, however, that the republic repeated her assurances of attachment. That very republic, which sought not conquest, which declared she would not interfere with the government of other states, deposed the sovereign and gave democracy to the Florentines. A similar conduct had been observed towards the king of Sardinia, the king of Naples, and the republics of Venice, Genoa, and Switzerland. He repeated the assertion, in which he had always persevered, that France had been the original aggressor in the war. His lordship next proceeded to investigate the character of the present ruler of the French nation.

He remarked, that General Bonaparte, in the third year of the republic, imposed upon the French, by the mouth of the cannon, that very constitution which he had now destroyed by the point of the bayonet. If a treaty was concluded and broken with Sardinia, it was concluded and broken by Bonaparte; if peace was established and violated with Tuscany, it was established and violated by Bonaparte; if armistices were ratified and annulled with Modena, and the other petty states of Italy, they were ratified and annulled by Bonaparte; if that ancient republic, Venice, was first drawn into a war, and compelled afterwards to conclude a treaty, it was that Bonaparte might more easily overthrow her constitution, and annihilate the political system by which she had existed with glory and security for ages past; if the government of Rome was subverted, it was subverted by Bonaparte; if Genoa was reduced to the same humiliating situation, her wealth and independence were sacrificed to Bonaparte; if Switzerland, deluded by offers of peace, was induced to surrender up her rights and liberties, she was deprived of them by Bonaparte. But to examine that part of his conduct which is diplomatic, and passing over his rapacities, and the cruel massacres which were perpetrated by his orders, let us review his professions to the Porte: he solemnly declared, that he had no intention of taking possession of Egypt; whilst he declared to his own generals that this was his intention, and to the people of Egypt that it was with the consent of the Porte. He had multiplied violations of all moral and religious ties; he had repeated acts of perfidy; his hypocrisies were innumerable, and in that country where he had affirmed the French to be true Mussulmans, he had given us a correct idea of his sincerity and his principles.

Being thus provided with so many unquestionable pledges of his future integrity, was it illiberal or impolitic to suspect a man, who, having overturned the government of his own country, as he had done that of others, now came forward with offers of pacification. If the interest of Bonaparte were deeply concerned he might be sincere, and there was no doubt but it was his

Britain. interest to consolidate his power; but it ought not to be forgotten, that whenever any acts of atrocity were to be accomplished by the French, they had been usually effected by a suspension of arms. The proposed negotiation would relieve her from the present pressure of alarming difficulties, and could not relieve England from any; the ports of France, which were now blockaded by our fleet and cruisers, would be thrown open to introduce naval stores, and a variety of necessary articles, of which the country was in want; fleets would be sent to bring back the troops which were now deprived of all intercourse with the republic, and which might then be employed in augmenting the numbers of the French armies. To us a suspension of arms could not be productive of any benefit whatever; our ports were not blocked up, our commerce was not interrupted; and it also should be considered, that there would be no security for the maintenance of such a suspension. Was Bonaparte now prepared to sign a general peace? If he were not, he could not be sincere in his offers. It was necessary for him to keep an army of 60,000 men to preserve tranquillity in the interior of France; every act of his government was supported by force; and if he even were sincere, it was hazarding too much to hazard all on his single life. What reliance could be placed on the unanimity of the French people? Were we destitute of hope from the change which had recently taken place in the persons employed in public offices? Men of the blackest characters had been appointed to situations of the greatest trust; men infamous for professed principles of anarchy, had been raised to places of confidence and power; and those who were judges in the sanguinary tribunals of Robespierre, were now exalted to a distinguished rank in the republic: whilst, therefore, the jacobin system prevailed in France, there was no security for England but by a vigorous prosecution of hostilities.

His lordship concluded by disclaiming, on the part of administration, any wish to consider the restoration of the French monarchy as the object of the war; he considered the restoration of monarchy as the best, the surest and speediest, but not as the only means of restoring peace: his majesty, he said, would not hesitate to treat with any form of government capable of preserving the customary relations of amity; but to commence a negotiation which would not be likely to terminate in peace, would be dishonest and fruitless.

The duke of Bedford opposed the secretary's motion for the address. He contended, that all the objections against negotiation might have been urged against the negotiations which the ministers themselves had formerly opened at Lisle. He considered the conduct of the British government, on the present occasion, as unwise; because provoking and unconciliatory. He thought, that, in a correspondence with the present French government, all discussion about the original commencement of the war ought to have been avoided. Whether England or France were the first aggressor, was a question to be reserved to posterity; it was natural for each country to throw the imputation off their own shoulders, and avoid not only the execration of the present age, but the curse of posterity. The wild scheme of restoring the French monarchy, was the *quo*

qua non, if not of peace, of negotiation; for notwithstanding the noble secretary had denied the charge, whilst he pointed out the impossibility of treating with the French government during all its stages to the present, and insisted upon vigorous hostilities being the only means of our security, there was no inference to be drawn, but that the war must be continued till monarchy was established. What prospect remained of such an event taking place, his grace said he would not pretend to determine; but this fact was certain, that, in the same proportion as this country oppressed France, in the same proportion did she become violent; our attempts to destroy Jacobinism promoted, and if we persevered, would establish it. If the restoration of monarchy was not the object, what was it? Were ministers contending that we ought to wait for a more favourable opportunity of entering into negotiation? Was it to be obtained by railing at Bonaparte? There were no terms sufficiently strong to censure the littleness which attacked his character, in order to ruin him in the estimation of the French nation, as if, by so doing, we could negotiate with more effect, or gain a fairer prospect of peace.

The duke of Bedford next contended, that no confidence was to be reposed in our present continental allies; and as a severe scarcity at this period prevailed in the country, this circumstance was made use of, as an additional argument against persevering in the war. We had been taught to believe, said his grace, that this country was able to starve France; now, if we took a view of our internal situation, we should find it alarming in an extreme degree. If we repaired to the woods, we should everywhere discover traces of those miserable wretches, whose poverty left them no resources but depredation; if we contemplated the villages, we should hear only the unavailing cries of children, calling for that food which their parents had not to give them. Numerous were the instances, of strong and healthy country men, appealing from parish officers, who had denied them assistance on the ground of their being able to work: it was true, that they had ability, but no employment; and left without it, they were perpetually distressed with the clamours of their families pining at their miserable homes in wretchedness and want. The beneficence of individuals had indeed much alleviated these evils; but the necessity of affording relief to the laborious parts of the community by charity, was a proof of the weakness of the country. Six months ago, our army had been recruited by unconstitutional measures; the fundamental principle, on which the force of the kingdom was formed, had been violated for the purpose of conducting us to victory; that same army, which we had beheld marching with an assurance of success, had been obliged to purchase its retreat from the enemies territory with disgrace. Such were the means we had of obtaining a more favourable opportunity to negotiate. Ought ministers to be suffered to persist, were they to have another secret expedition, to drain the country of its provisions, in order to fill the magazines of the enemy, and to stamp the British character with dishonour? Surely it ought first to be well ascertained, that we had some rational hope of success. The chief consul, doubtless, sought to make a peace advantageous to himself, and the nation

over which he presided. Like all other statesmen, his motives might not be influenced by humanity. It was to be supposed his aim would be to satisfy the French people, and consolidate his own power. As to the abuse which ministers threw upon his character, it was their habit to abuse every ruling power in France. But, whenever they had been driven by the voice of the people to negotiate, their former ill language had never been any impediment. It was unfortunately the interest of ministers to procrastinate the war; they retained their places by its continuance, and when it was ended, the people would inquire for what they had been spending their blood and treasures, and reflect on the heavy calamities they endured, without having reaped the least advantage by the contest. The duke of Bedford concluded his speech with a motion for an address, recommending a negotiation for peace.

Lord Borington said, he would not pretend to determine what might be the real disposition of the first consul relative to general pacification: but it was remarkable, that though his majesty, with that good faith so well becoming his character as well as that of the nation, expressly stated his intentions of acting only in concert with his allies, not one word should be said respecting peace with them; he argued, therefore, that even if we had acceded to the French propositions, it was probable we might have left in existence the continental war; we might have enabled France to have strengthened and recruited her forces, basely have allowed her to bring them out against the powers now in alliance with us, and have put into the hands of the successors of Bonaparte a power more formidable than that now enjoyed by himself; more formidable from the principles of those who might direct it, and, above all, from the abject state in which it would most assuredly find this country, under such circumstances. It was impossible to conceive means more calculated to damp the ardour, and check the enterprise of our fleets, to destroy the discipline and spirit of our armies, and diffuse distrust and despondency into the public mind, than the hasty conclusion of a temporary peace.

Lord Holland reprobated the conduct of ministers throughout the contest. At one time they asserted, that the ambition of France was so insatiable, that she would listen to no terms; they were now driven from that pretext, and they urged that a peace would be insecure. As to the ambition of the enemy, it was a consideration of weight in the arrangement of terms, not a preliminary objection preclusive of treaty. What proof could be given of the abandonment of dangerous views, but a negotiation in which moderation could be displayed. It was urged, that Bonaparte might be insincere; but if he was not, he could only have done precisely what he had done. Was it reasonable to suppose that he would admit, that the guilt of the aggression lay with France? This was a point which ought not to have been discussed. The object was to treat on actual circumstances, and the real grounds of dispute. It was not Talleyrand who began the subject; he did not, like our ministers, throw out severe reproach and pointed insult; he merely stated, that the possibility of arrangement, not the original offence, was now the question. Suppose that Bonaparte, desirous to attain peace by any means, should sit down to consider how

Britain. he could succeed. What does the note allow him to do. He would find that the restoration of the hereditary line of kings was the only case in which a speedy peace would be admitted as possible; in fact, therefore, this restoration was the *sine qua non*, in which immediate negotiation was admissible with ministers. Now let us examine this condition of peace in two points of view. Was it desirable in itself? Would it remove the objections urged to negotiation? Surely if the ambition of the republic was so formidable, we could not forget this ground of apprehension, when we talked of restoring the house of Bourbon. Had we forgotten their proverbial ambition, and was their restoration the remedy for evils arising from such a source? We had now taken up the principle, so much objected to jacobins, of distinguishing between the people and their government; but what was the conduct of the French? Bonaparte distinctly renounces this principle in the letter to the king, and acknowledges the title and the character of his majesty's government. The note of our ministers was a manifesto to the royalists, and formed for that purpose. It spoke of the miseries of France; but the miseries of France were not the causes of the war: they might interest our humanity, but were not to be urged as motives in diplomatic papers. As little had we to do with the internal miseries of the republic, as Talleyrand would have to retaliate, by reproaching us with the test act, the want of parliamentary reform, assessed taxes, or any other of our grievances.

Lord Holland asserted, that the people at large disapproved of the abrupt rejection of Bonaparte's overtures; and if it afterwards should appear, that he was sincere, how would their lordships reconcile it to their consciences, to have prolonged by their sanction the calamities of war, without any motive of honour, interest, or security? He therefore gave his decided support to the amendment.

The earl of Carnarvon said, he would not consider the answer of our ministers as a refusal to treat for peace, or a declaration of eternal war; it was, as the secretary of state had termed it, a call upon the house and the country, to pause before they rashly suffered themselves to enter into a negotiation with an unsettled government. He did not expect any extraordinary faith to be manifested by Bonaparte, more than by any other chief or chiefs: but although he should be best pleased with the restoration of monarchy in France; in all times, in monarchies as well as republics, aristocracies, and every other species of government, good faith in treaties was preserved, and exemplified, only so long as it was the interest of the parties to maintain it. So little integrity had history left on record, that at the very time they were signed, a secret intention was often indulged to violate them at a particular period. The address, as moved by Lord Grenville, was carried by a majority of 79 against 6.

1077
Debate in
the house
of commons
on the cor-
respond-
ence.

In the house of commons, Mr Dundas moved a similar address, which gave rise to a similar debate. Mr Dundas said, that the leading feature of the French revolution was a disregard of all treaties, and a contempt for the rights of other powers; in proof of this assertion, he considered it as necessary, merely to recite the names of Spain, Naples, Sardinia, Tus-

cany, Genoa, Geneva, Modena, Austria, Prussia, Eng-
land, and Egypt, with Denmark and Sweden, *at all times neutral states. He considered, and desired*
had not at this time any resources *to suppose*
that a change of principles had taken place. The ja-
cobinical form of government was at an end; but,
but, in substance and essence, all the qualities of the
revolutionary government were in as full force at this
moment as they were in the days of Robespierre. All
power was now consolidated and concentrated in the
hands of Bonaparte; and the nation stood with a mili-
tary despot at its head, invested with unlimited au-
thority to revive the practice of forced loans and re-
quisitions, to wield the force of the state as he pleased,
and resort to all the resources of the revolutionary go-
vernment.

Under these circumstances, overtures are made for
peace. This proposition ministers have thought pro-
per to reject, assigning as the cause, that, as all the
former attempts had proved abortive, or, if successful,
were followed by violation, nothing yet presented it-
self which ascertained security. In the first place, we
were not assured of the sincerity of the offer, and in
the second, of its permanency. There were certain
circumstances which inspired confidence in states, as
the character of the king of a country, the conduct of
his ministers, the general laws of the government; but
was there one of these criteria to be found in the
present case? If there were none of them to be found,
it rested solely on the assertion of the party himself
declaring he was of a pacific disposition, accredited by
his minister Talleyrand; for to him he had referred to
vouch for his character. It was not, however, the
business of this country, to judge the private charac-
ter of Bonaparte; at the same time, he must confess,
that he had an old prejudice hanging about him, so as
to induce him to regard the blasphemer of his God, as
not the person with whom he would wish to treat.
But, waving these objections, he was to be considered
in the character in which he forced himself upon the
house, namely, as professing a pacific disposition, and
proposing a negotiation with us. Here Mr Dundas
particularized, with much severity, the conduct of
Bonaparte, in the various kingdoms and states which
he had before named; and concluded with observing,
there was not a single one with which he had not vio-
lated his faith; and affirmed these to be strong reasons
for withholding confidence, and rejecting treaty. Mr
Dundas contended, that a negotiation at this period
would be equivalent to a desertion of our allies, and
would surrender the continent of Europe to France;
that we should uphold the usurpation of Bonaparte,
while at the same time, we could have so little con-
fidence in his good faith, that even, were the negotia-
tion to terminate successfully, Great Britain could not
venture to disarm.

Mr Whitbread asserted, that, had it not been for the
interference and ambition of the other powers of Eu-
rope, the French revolution would have assumed a very
different character from that which it now possessed.
He remarked, that other powers had treated neutral
states no less unjustly than had been done by the French;
Lord Harvey and Lord Hood had ordered the French
ministers to be dismissed from Florence, and by threats
we had compelled Genoa to dismiss her French inhabi-
tants.

Britain.

tants. He compared Bonaparte with Suwarrow, and the invasion of Egypt by France, with that of Poland by Austria, Russia, and Prussia, whose friendship we had frequently courted.

Mr Thomas Erskine entered at great length into the question, upon which he himself had previously published a pamphlet, whether France or Great Britain had been guilty of the original aggression in the war. He contended that the British government had unnecessarily engaged in it, and persisted without necessity; and strenuously resisted the propriety of giving any approbation to the part which administration had acted in the late correspondence.

Mr Pitt on the other hand asserted, that the French leaders had themselves begun the war, on the principle that it was necessary to consolidate the revolution. With regard to the proposal to negotiate with their present leader, he said that it was impossible to discuss fairly its propriety, without taking into consideration his personal character and conduct. Some gentlemen indeed had represented this as irritating and invidious; but no minister could discharge his duty, without stating the principles and dispositions of the person with whom we were to treat, since the stability of the treaty must depend on these circumstances. Mr Pitt here expatiated on the conduct of Bonaparte at Campoformio, in the Milanese, Genoa, Modena, Tuscany, Rome, Venice, Switzerland, and Egypt: his arts of perfidy, he said, were commensurate with his number of treaties; and if we traced the history of the men in this revolution whose conduct had been marked by the most atrocious cruelty, the name of Bonaparte would be found allied to more of them than that of any other within these ten eventful and disastrous years.

From those facts the house might judge what reliance might reasonably be placed on this conqueror, and what degree of credit might be given to his professions. It had been observed, indeed, that whatever had been his character, he had now an interest in making and preserving peace. This was to him a doubtful proposition; that it was his interest to negotiate he readily would acknowledge, and to negotiate with this country separately, in order to dissolve the whole system of the confederacy on the continent; to palsy at once the arms of Russia, of Austria, or of any other country which might look to us for support; and then either to break off his separate treaty; or if he should have concluded it, to apply the lesson taught in his school of policy in Egypt, and to revive at his pleasure those claims of indemnification, which may have been reserved to some happier period.

Under all these circumstances of his personal character, and his newly acquired power, what security had he for retaining that power but the sword? His hold upon France was the sword, and he had no other. Was he connected with the soil or with the habits, the affections or the prejudices of the country? No: he was a stranger, a foreigner, and a usurper. He united in his own person every thing that a pure republican must detest; every thing which an enraged jacobin had abjured; every thing which a faithful royalist must feel an insult. If he was opposed in his career, he appealed to his army. Placing then his whole dependence on military support, could he afford to permit his military renown to pass away, his laurels to wither, and

his trophies to sink in obscurity? Was it certain that with his army confined within France, and restrained from inroads upon her neighbours, he could maintain at his devotion a force sufficiently numerous to uphold his power? Having no object but dominion, no passion but glory, was it probable that he could feel such an interest in permanent peace as would justify our laying down our arms, reducing our expence, and relinquishing our means of security, on the faith of his engagements?

But was the inference to be drawn from these considerations, that we ought in no case to treat with Bonaparte? No: but we ought to wait for the evidence of facts. If there should be an appearance that France was governed by other maxims of policy from those which had hitherto prevailed; when there were signs of a stable government, which were not now to be traced; if the danger of the contest should increase, whilst the hope of ultimate success should be diminished, all these would have their due weight: but at present there was nothing from which we could presage a favourable disposition to change in the French conduct. There was the greatest reason to rely on powerful cooperation from our allies; the strongest marks in the interior of France of a disposition to resist this new tyranny; and every reason to believe, that if we were disappointed of complete success, the continuance of the contest, instead of making our situation comparatively worse, would have made it comparatively better.

It might be necessary, Mr Pitt remarked, to take notice of the negotiation at Lisle in 1797, to which allusion had been frequently made by the opponents of administration. The jacobin system of prodigality and bloodshed, by which the efforts of France had been supported, had at that period driven us to exertions which had exhausted the ordinary means of defraying our immense expenditure, and led many who were convinced of the necessity of the war to doubt the possibility of persisting in it. There seemed too much reason to believe, that without some new measure to check the accumulation of debt, we could no longer trust to the funding system, by which the nation had supported the different wars in which we had been engaged during the present century. The general and decided concurrence of public opinion was necessary in order to prosecute our plans with vigour. Under this impression we negotiated, not from the sanguine hope that its result would be permanent security; but from the persuasion, that the danger arising from peace in these circumstances would be less than the continuance of war with inadequate means. Those negotiations have fully proved, that the enemy would be satisfied with nothing less than the sacrifice of the honour of our country; and from this conviction a spirit and enthusiasm was excited in the nation which produced the subsequent happy change in our situation.

Mr Fox asserted, that France undoubtedly at the commencement of the war was the defending party: the aggressions of Austria and Prussia could not be denied by any impartial person; nothing could be more decidedly hostile than their proceedings; they scrupled not to declare to France, that it was her internal concerns, not her outward actions, which provoked them to confederate against her: they did not pretend

Britain. pretend to fear her ambition, her conquests, her troubling her neighbours; but they accused her of new-modelling her own government. In all this he was not seeking to justify the French, either in their internal or external policy; on the contrary, he thought their successive rulers had been as execrable, in various instances, as any of the most despotic and unprincipled governments which the world had ever seen; and it was impossible that it should have been otherwise: men bred in the school of the house of Bourbon, once engaged in foreign wars, would naturally endeavour to spread destruction, and form plans of aggrandisement on every side; they could not have lived so long under their ancient masters, without imbibing the insatiable ambition and restless spirit, the perfidy and the despotism, inherent in the race; they had imitated their great prototype; and through their whole career of crimes, had done no more than trace the steps of their own Louis XIV. Are we for ever, continued Mr Fox, to deprive ourselves of the benefits of peace, because France has perpetrated acts of injustice? With the knowledge of these acts, we had treated with them twice; and ought not now to refuse to do so; much less ought we to regard any improper language which the French leaders have used. Bonaparte had declared the two governments of Great Britain and France could not exist together, and deputed Berthier and Monge to make known this sentiment to the directory after the treaty at Campoformio. And had not Mr Pitt declared the same thing in that house. If we were to bring up all the idle speeches of the French, and they were to repeat ours, there would be no end to these reciprocations of animosity. Much, Mr Fox remarked, had been said of the short-lived nature of military despotism; yet such was the government erected by Augustus Cæsar, which endured 600 years. Indeed it was too likely to be durable wherever it was established. Nor was it true that it depended on the life of the first usurper; half of the Roman emperors were murdered, yet the tyranny continued; and this, it was to be feared, would be the case in France. Neither would it make any difference in our relation with that country if Bonaparte were removed, because the purchasers of confiscated property, amounting, it was said, to one million and a half of persons, must prove an insurmountable obstacle to the restoration of the ancient monarchy and the nobility. Mr Fox concluded by remarking, that if administration wished to include the allies of Britain in the proposed negotiation, they should have said so to Bonaparte, and not have insisted upon keeping him some time longer at war, as a state of probation; but the fact appeared to be, that contrary to the wishes of administration, the people of England were friends to peace, and hence ministers were apprehensive that Bonaparte might agree to their proposal, and thereby deprive them of all pretext for the continuance of hostilities. The address was carried upon a division of 260 against 64.

1078
Union with
Ireland ef-
fectcd.

The great measure of a legislative union with Ireland was carried into effect during the present session of parliament. Administration had found it necessary to delay this interesting affair, in consequence of the strength of the opposition to it in the Irish parliament; but during the recess they had obtained a more ample

majority. The British parliament, upon Mr Pitt's motion, had passed resolutions in favour of the union. The business was formally introduced to the Irish parliament on the 5th of February 1800, by a message from the lord-lieutenant, in which his excellency stated, that he had it in command from his majesty, to lay before the houses of legislature, the resolutions of the British parliament; and to express his majesty's wish, that they would take the same into their most serious consideration, &c. After a long and spirited debate, the ministry prevailed, by a majority of 43, for taking his majesty's message into consideration on the Wednesday following. The distinguished abilities of Mr Grattan, which had been voluntarily cast into obscurity, were once more brought before the public on this interesting occasion. In a debate, which took place on the 17th of February, on proposing the first article of the union, he opposed the measure with such a degree of vehemence, that the chancellor of the exchequer accused him of associating with traitors, and of disaffection to the government. The reply of Mr Grattan was so pointed and severe, that the chancellor conceived himself under the necessity of resenting it by a challenge: five shots were exchanged, and the chancellor (Mr Corry) was wounded in the arm. The question, however, was carried by a majority of 161 against 115, and as the discussion proceeded, the numbers of opposition appeared to diminish. The last struggle, as it may be deemed, was made on the 13th of March, when Sir John Parnell moved to petition his majesty to call a new parliament, in order that the sense of their constituents might be more fully ascertained; but this motion was overruled by a majority of 46. In the mean time, the business proceeded with little opposition in the house of lords, and on the 24th of March that house adopted the whole of the articles of union with a few alterations. On the Friday following both houses waited on his excellency with a joint address to that effect, which was afterwards transmitted to Great Britain; and no time was lost by the ministers in submitting the measure anew to the British parliament.

Britain.

1079
Debate in
Ireland a-
bout their
union.

On the 2d of April, a message from his majesty was presented to each of the houses of the British parliament, communicating the resolutions of the Irish parliament in favour of an entire union between the two kingdoms, and recommending the speedy execution of a work so interesting to the security and prosperity of the British empire.

In the house of lords the measure was opposed by Lord Holland, chiefly for this reason, that an union at the present period was not the spontaneous offer of the parliament of Ireland, uninfluenced by corruption or menace. The whole articles of the union were afterwards moved, and carried, in a committee of the house, after some debates of no great importance.

1080
Debates in
Britain on
the Irish
union.

In the house of commons similar debates occurred. Mr Pitt stated, that the principal article in the treaty, that of the share of representation which Ireland was to have in the united parliament, was founded upon a comparative statement of the population of both kingdoms, as well as the revenue of both. The number of members, fixed for the counties and two principal cities, was 68; and those for the most considerable

^{Britain.} considerable cities, towns, and boroughs, were regulated at 31, who would be selected without partiality. Having adverted to the article respecting the number of representatives for the commons of Ireland, on the ground that they could afford no cause of suspicion as to any increase of the influence of the crown, he next adverted to the arrangements respecting the house of peers, and the members to be returned; and said, as the members for the commons of Ireland were nearly double in number to those of Scotland, the same rules would be observed with the peerage, which therefore was to consist of 32 members. It was also understood, that such peers of Ireland as might not be among the 28 temporal peers, should be allowed to sit in the united parliament until elected. Such a measure, in his opinion, could not be thought unconstitutional. He remarked, that the only article, consisting of minute details, related to apportioning the shares of the revenue of each country respectively. He said, it was a circumstance much to be wished, that the finances of both countries were so nearly alike, that the system of both could be identified; but, as from the different proportions of debt, and the different stages of civilization and commerce, and the different wealth of the countries, that desirable object was rendered impracticable, he contended, however, that the advantage of an union ought not to be deferred, because it could not at once be carried to its full extent.

Mr Grey opposed the union in the present state of affairs. He said, that it had been asserted, in a speech of the lord-lieutenant to the Irish parliament, that five-sevenths of the country, and all the principal commercial towns, except Dublin, had petitioned in favour of the union. He said, this only meant, that 19 counties had presented petitions, and that these counties constitute five-sevenths of the surface of Ireland. He admitted the petitions in favour of the union; but by what means were they obtained? The lord-lieutenant who, besides being the chief civil magistrate, is commander of a disciplined army of 170,000 men, who is able to proclaim martial law when he pleases, and to establish the military trial of a court-martial, in his progress through the kingdom, procured these petitions, which, he said, were signed by few names, and those by no means the most respectable. Fortunately, said Mr Grey, there were many petitions on the other side, which were not obtained by solicitation and at illegal meetings, but at public assemblies, of which legal notice had been given. Twenty-seven counties had petitioned against the measure. The petition from the county of Downe was signed by 17,000 respectable independent men; and all others were in a similar proportion. Upon this Mr Grey spoke at some length, and begged the attention of the committee, while he adverted to some of the favourite arguments of unionists. Their grand source of argument, he said, was the experience of the benefits derived from the union with Scotland. He had attended to that point, and he could see, after the most mature deliberation, no analogy between the circumstances of the Scotch union and those which called for an union with Ireland, nor could he apprehend that the same consequences would follow from them. In the union between Scotland and England, there was no physical impediment; the relative situation of the two countries was such, that

the king himself could administer the executive government in both: there was no occasion for a separate establishment being kept in each. The great difference, said Mr Grey, between Scotland and England, was not between people and people, but between parliament and parliament. The Scots had prohibited the importation of English goods into Scotland; they had established a trading company, which interfered with the colonial arrangements of England, and nearly embroiled her with Spain; they had refused to limit the succession of the crown, and even enacted, that it should not descend to the same person with the crown of England. An act was about to have been brought into the English parliament, to render all Scotsmen aliens, and another to fit out a fleet to attack all Scots vessels they should fall in with. Here, Mr Grey observed, there was no alternative but union or war. If the union should, in this case, be carried into effect notwithstanding the general disapprobation of the people, he wished that it might tend to strengthen the connection between the two countries, as much as he believed in his conscience, that it threatened the only solid bond of connection, that of affection and kindness, and that it must prove injurious to the real power of the state. Mr Grey concluded, by moving an address to his majesty, requesting a suspension of all proceedings relative to the union, till the sentiments of the people of Ireland could be ascertained.

Mr Sheridan represented the measure as an act of tyranny towards the people of Ireland, which must become the fatal source of new discontents and future rebellions. Mr Grey's motion was rejected, on a division of 236 against 30.

Early in the present session of parliament, mention had been made by opposition of the unfortunate invasion of Holland by the British forces; but ministers declined entering upon the subject, as the whole expedition had been carried on under the superintendance of Mr Secretary Dundas; and that gentleman, speedily after the meeting of parliament, had gone down to Scotland in the depth of winter, without any ostensible business; a circumstance which gave rise to suspicions, that some dissatisfactions existed at court, on account of the result of the Dutch invasion, or the manner in which the duke of York had been supported in it by administration at home.

On the 10th of February, the subject was introduced into the house of commons, by Mr Sheridan, who moved for an inquiry into the causes of its failure. He treated the capture of the Dutch navy as of little value, or rather as pernicious, on account of the example of mutiny, which it exhibited on the part of the seamen, whom we had received into our service. He admitted, that the restoration of the stadtholder was, in some measure, a justifiable motive for our interference; but contended, that Britain had treated the people of Holland ill, by obliging them to enter into the present war, and by avoiding to promise a restoration of their colonies, in case of a successful invasion. In these circumstances, he thought the British government had acted imprudently in expecting any assistance from Dutchmen. He asserted, that the expedition itself was ill arranged, as the army, after its landing, had no means of moving forward, on account of the want of necessaries. The result was, that instead

Britain. of delivering the Dutch, the British army was under the necessity of entering into capitulation for its escape, and of holding out as an inducement to enter into this capitulation, a threat, in case of its being refused by the enemy, to destroy for ever the means of commerce of that very people whom we embarked to save. He contended, that to vindicate the honour of the British army it was necessary to inquire into the cause of its misfortunes upon this occasion.

1032
Able defence by Mr Dundas of the expedition to Holland.

Mr Dundas defended the expedition against Holland with great ability. He stated its object to be threefold: 1st, To rescue the United Provinces from the tyranny of the French; 2dly, To add to the efficient force of this country, and diminish that of the enemy, by gaining possession of the Dutch fleet; and, lastly, By hostile operations in Holland, to oblige the French to weaken their armies in other quarters. Mr Dundas contended, that at the commencement of the expedition, a great probability existed of the success of all these objects; two of them did actually succeed, and only one failed.

Mr Dundas remarked, that it was a maxim adopted by the wisest politicians, from the earliest period of our connexion with Holland, to protect its independence both against France and Spain. Queen Elizabeth gave them assistance for this purpose. King William followed the same policy, and it had been uniformly observed under the house of Brunswick. It could not surely be more criminal in us to attempt to rescue the same provinces from the French republic, which we had protected against the house of Bourbon.

With regard to the capture of the fleet, Mr Dundas declared himself astonished, that a doubt should exist about the value of such an acquisition. That fleet had been absolutely destined for the invasion of our dominions; along with it we took nearly 7000 seamen, all of whom were liable to be employed in the French fleet, and 40,000 tons of shipping, which might have annoyed our commerce.

By the invasion of Holland, Mr Dundas asserted, that the French were compelled to weaken their other armies, which gave success to Suwarrow, in driving them from Italy, and to the archduke on the upper Rhine and Switzerland. They had indeed succeeded in defending Holland; but, as the price of this success, they had been severely pressed in every other quarter. Had the French followed the plan formerly adopted by them, they could not have prevented our recovering Holland. At the moment our enterprise was undertaken, it was a doubt whether they would place their reinforcements there, or in other parts of the continent. They poured their prodigious reinforcements into Holland, by which means we were unable to rescue it from their yoke; but another part of the result was, that they lost every other point which they contested, in the whole campaign, in every other place. Mr Dundas asserted, that administration were highly justifiable in undertaking the expedition, in consequence of their knowledge of the inclinations of the people of Holland; but he declined making known upon this subject the secrets of government. Never, said he, was a commencement more prosperous than that of the late expedition. Sir Ralph Abercromby sailed for the Helder the 13th of August, and every thing promised the most rapid success. On the 14th came on the most

Vol. IV. Part II.

Britain. extraordinary hurricane that ever blew from the heavens; it was impossible to land a single soldier on any part of the coast of Holland; and this continued till the 27th: the consequence was, that the enemy knew where our fleet must land, and the troops came in shoals to oppose us; 7000 men were collected; and as they were superior in number, Sir Ralph could not land his men to advantage. The ardour of the soldiers and the gallantry of the commander were never excelled on any occasion. Without any thing but their muskets and bayonets, (for they had not the power of bringing with them a single field-piece) against cavalry and artillery, they made their landing good, and by it they secured the Dutch fleet. He stated these things, to show how easy it was to censure both soldiers and their generals unjustly upon an event depending on the temper of the elements. It was alleged, that the troops had no means to draw their waggons; but they had no waggons, and could not possibly have landed them had they been there. Instantly on their landing they could not want them; for all they immediately had to do, was to secure a landing place, and a post of communication. Sir Ralph had to consider what position he should take till the 1st of September, when reinforcements should arrive. He judged wisely for the dispositions of the army; and the delay arose from causes which no human wisdom could foresee, and therefore could not prevent. Had he been able to land when he expected, he would according to all probability have commanded complete success to all the objects of his expedition. The same wind prevented the Russian troops from arriving to reinforce ours; they did not come till the 18th. The duke of York offered the Russian general, D'Hermann, to delay the attack, if he thought his men were not sufficiently recovered from the fatigues of the voyage; but the general requested that the attack should be made, with a promptitude and alacrity which reflected the highest honour upon him. But this ardour led him to the field full two hours sooner than the time appointed. The army, however, was gloriously successful till a late hour in the day. General D'Hermann and his troops were in possession of the village of Berghen, and crowned with victory, till his zeal led him beyond a given point and turned the fate of it. When the attack was made, the French amounted to 7000, and the Dutch to 12,000 men; yet, notwithstanding this superiority of force, our troops fought and conquered them with a spirit which immortalized the battle; but the French continually pouring in reinforcements, the duke was advised by General Abercromby, and all the other officers, to accede to the terms of an armistice, which was by that time mutually wished. The duke yielded to this advice, and, by so doing, consulted the dictates of reason and humanity.

Mr Dundas contended, that our army returned with as much honour as they entered Holland. The duke of York, indeed, agreed to give up 8000 French prisoners on condition that his retreat should be unmolested; but he could not be wrong in doing so, because our prisons were overloaded with them, and he did not recede from any one article in which national dignity was concerned: he resisted with firmness and indignation every proposition for restoring the fleet. An attempt had been made to magnify the loss of lives, and the expence attending the expedition: the

Britain. one had been stated as equivalent to the income tax; six or seven millions: the other at the loss of 10,000 men. There was no occasion to leave this point to conjecture; the expenditure actually amounted to 1,142,000*l.* and computing by Dr. and Cr. there would in commercial consideration be no objection to it. We had a right to consider the ships which were taken, and to state the reduction for the maintenance of a fleet in the north seas to check a Dutch fleet: If we calculated the value of the former, the decrease of expence in the latter, and the saving in the pay of 10,000 seamen voted less the last year, the balance was greatly in our favour. We gave up the 8000 prisoners, who were annually fed at a great expence, and gained 6000 Dutch seamen to man our fleets. The objects gained by the expedition were the ships, the reduction of the expence, and the great diversion in the French forces which facilitated the victories of the combined armies. Without making it a topic of eloquence, he believed he felt as much as any man for the brave soldiers who composed our army; but in war no important objects would be obtained without the loss of many dear and valuable connexions: those calamities arose inevitably from the situation of a great nation fighting for great objects; for an independent empire, and for existence itself. To remove the impression of our having lost 10,000 men, he would state in detail the returns made during the whole of the campaign.

Sick and wounded admitted into the hospitals,	4080
Sent home out of these hospitals,	2993
The amount of those who died,	185
And the whole of those who were slain,	846

Mr Tierney supported the proposal for an inquiry; he disputed the advantages said to result from it by weakening the French forces in other quarters, as they had actually been everywhere successful at the close of the campaign. He contended, that at least to a secret committee, or in some other form, ministers ought to account for their conduct, and exonerate themselves from suspicions too strong to be removed without proof, by producing the documents (if any such exist) on which this ill-fated expedition had been planned. It was unconstitutional, it was an insult on the house, to say this could not be done consistently with the preservation of secrecy. General Abercromby landed on the 22d of August with 10,000 men; he got possession of the Helder; he was reinforced by General Don on the 27th: Was it not strange, that 15,000, headed by an able general, and going by invitation, should think it imprudent to advance? Had the Dutch been well affected, why did they not declare themselves? No French troops were then in Holland to keep them in awe. Why did not the duke of York sail at the same time with General Don? Why were all our forces sent to one place, and 43,000 men cooped up in a narrow peninsula where but few could act at a time? It was strange that ministers, who were so fond of making diversions, did not think of making a diversion in some other quarter. This was a point which only military men could determine; and the house was bound to examine officers, that the truth might be known. Whether his royal highness concluded the capitulation from instructions, or from his own judgment, he should

(in his opinion) have demanded an inquiry; and this was the only way the disgrace could be transferred from himself and the gallant officers who served under him. He had no reason to apologize for the liberties he used with the name of his royal highness, although he might one day become his sovereign; for he would not think the worse of that Englishman who was most solicitous for the honours of the British army. We gave up 8000 seamen, who it seems were mere lumber: had his royal highness been of the same opinion, he would not have hesitated in complying with this requisition of General Brune, but instantly have made the surrender of the prisoners. The capitulation had inflicted an indelible blot on the national character: A king's son, commanding 40,000 men, capitulated to a French general who had only 35,000.

Mr Addington observed, that having maturely and dispassionately considered the nature of the proposed inquiry, it appeared to him to rest upon two grounds: first, the propriety of judging any measure by its event; and, secondly, that in consequence of a failure, there should be a necessity for investigation. It ought to be recollected, that the worst concerted plans had often produced the most brilliant success, and the best terminated in disaster. No human being could command success, and no existing government controul the elements. He concluded with an eulogy on the skill of our generals, and the intrepidity of our army. The proposed inquiry was rejected by a majority of 216 against 45.

The supplies during the present year were estimated at 39 millions and a half, to which a million and a half was afterwards added: loans were negotiated to the amount of 20 millions and a half, and the income tax was mortgaged to a considerable amount.

During the present year the war was extremely eventful. The army which Bonaparte had left in Egypt under General Kleber could not fail to be disgusted by the desertion of the first leader of the expedition. Accordingly a negotiation was entered into by Kleber with the Turkish grand vizier, and Sir Sidney Smith; the result of which was, that the French agreed to abandon the whole of Egypt, on condition of being permitted to return unmolested to France. The agreement was concluded on the 24th of January, and the return home of this disheartened army might have proved dangerous, if not fatal, to the newly established power of the first consul: but here the fortune of Bonaparte interposed. The British government, suspecting that some proposals of this kind might be made, sent secret orders to Vice-admiral Lord Keith not to consent to any proposals which might leave such an army at liberty to act in Europe, or which should not include the surrender of all the ships in the port of Alexandria. The consequence was, that Lord Keith refused to fulfil the treaty called the *treaty of El Arish*, which Sir Sidney Smith and the Turkish grand vizier had concluded, and detained as prisoners General Dessaix, and a number of troops that had been sent from Egypt. The French general, Kleber, immediately intimated to the Turks a determination to resume hostilities. He attacked and totally routed their army consisting of 40,000 men, in the neighbourhood of Grand Cairo: multitudes perished in the desert and by slaughter, and the French remained masters of the country.

Britain. country. When it was too late, an order arrived from Britain to permit General Dessaix and his troops along with him to land in France, and to fulfil every part of Sir Sidney Smith's treaty; but the state of affairs had altered, Kleber had been assassinated, and his successor, Menou, refused to evacuate Egypt; in consequence of which it became necessary at a future period to send an army from Britain, to drive the French out of that country.

1085
Campaign
on the con-
tinent.

The Austrian armies in Germany were commanded by General Kray, and in Italy by General Melas. The campaign was conducted on the part of the French government with great ability and decision. It was publicly announced in all the French newspapers, that the armies were to be reinforced as powerfully as possible, and that an army of reserve was to be formed in a central position between Germany and Italy, from which the armies might be supplied with fresh troops according to the events of the war. Dijon was mentioned as the station of this army of reserve, and that it already amounted to 50,000 men. Nobody suspected that any important plan of operations or military stratagem was concealed by the affected notoriety of this arrangement. Accordingly the Austrians commenced the campaign by an attack upon Massena in the Genoese territory. After a succession of obstinate battles the French were driven into Genoa, where they sustained a siege, till they were compelled to surrender on account of the want of provisions. While Melas besieged Genoa, and even pushed forward his parties through Nice into the ancient French territory, Bonaparte in person suddenly joined at Dijon an immense army, to the assembling of which, as already remarked, Europe at large had paid little attention, on account of the appellation which it had received of an army of reserve. He immediately advanced across the Alps over the mountain of St Bernard; and, as it had been accounted impracticable to transport an army over the rugged mountains and precipices which on that quarter form the barrier of Italy, he descended into the Milanese with little opposition. At the same time powerful reinforcements joined him from Switzerland, of which the French troops continued to hold possession. Bonaparte thus placed himself in the rear of the Austrian general, and hazarded himself and his army upon the fortune of a single battle. He was attacked on the plain of Marengo near Alessandria; and, as the Austrians were greatly superior in cavalry and artillery, they were victorious during the greatest part of the day. The French wings were turned, the centre division broken, and scarcely 6000 of them stood firm at any one point, when General Dessaix, towards the evening, arrived with a reinforcement of 6000 cavalry. By this time Bonaparte was personally engaged, and on the eve of being killed or taken: but Dessaix, by sacrificing himself with the greater part of his cavalry, broke the Austrian line, and retrieved the fortune of the day; the French army once more rallied, and the Austrians relinquished the field of battle. On the following day Melas proposed to negotiate, and, as the price of an unmolested passage to the interior territory of Austria, agreed to abandon all Piedmont, thus surrendering in an instant twelve of the strongest fortresses in Europe.

1086
Battle of
Marengo.

On the side of Germany, the French under Moreau exerted equal dexterity. They passed the Rhine with some troops in the neighbourhood of Strasburg, where they were opposed by the Austrians: but this was only a feigned attack. They speedily retreated, and the main body of their army at the same instant descended from the mountains of Switzerland, and crossed the Rhine in the rear of the Austrian army near Schaffhausen. After a desperate engagement, the Austrians were defeated with the loss of 10,000 men, of whom 4000 were made prisoners. As the mode of attack had been unforeseen, and was consequently unprovided for, the loss of magazines and baggage was immense. In another, and harder fought battle, at Moskirch, the Austrians lost upwards of 8000 men. Other battles with a similar issue were fought at Biberach, Augsburg, and Hochstet; the result of which was, that the Austrians were under the necessity of crossing the Danube, leaving the French masters of the electorate of Bavaria, and enabled to invest Ulm. A general suspension of hostilities was immediately agreed to, by which both parties retained possession of their present positions. A negotiation for peace was entered into between the French and Austrians, which produced an attempt to negotiate on the part of Great Britain; but as the French demanded a naval armistice, which could have no other tendency than to enable them to accumulate naval stores, the negotiation was dropt. After considerable delays, during which the Austrian minister at Paris concluded a treaty, which his court afterwards disowned, preparations were made for opening the campaign anew. But the French consented to renew the armistice with the Austrians, on receiving delivery of the important fortresses of Ulm, Ingoldstadt, and Phillipsburg. These armistices and unsuccessful negotiations were of great service to the French. The consent to a truce in the midst of an unexampled career of victory, gave an appearance of moderation to the new consular government; the conclusion of a treaty at Paris, to which the Austrian government afterwards refused to adhere, induced neutral nations to consider Bonaparte as extremely anxious for the attainment of peace. Hence the wonderful success which attended his arms, during the early part of the campaign, was so far from rousing the jealousy of the other states of Europe, that he was considered as a well-meaning and by no means dangerous neighbour, and that the Austrians had imposed upon his credibility. The northern nations eagerly courted his alliance; the emperor Paul of Russia, led by the natural instability of his temper, and his admiration of military success, entered into a close alliance with Bonaparte, and seized the British vessels in his ports; while the Danes, Swedes, and Prussians, began to form a confederacy for the purpose of enabling each other to evade the right, claimed in war by maritime states, of preventing their enemy from being supplied with naval stores by means of neutral vessels. The present weakness of the French at sea rendered such a combination directly hostile to Great Britain, and favourable to them.

Britain.

1087
Continental
truce.

In the meanwhile, Great Britain was greatly distressed at home by a scarcity of provisions; riots broke out in London and some provincial towns. On this account parliament assembled on the 11th of November,

1088
Scarcity in
Britain.

Britain. member, and the principal discussions which occurred, in it related to the severe dearth which prevailed throughout the country, and which involved in very great difficulties the middle and lower classes of society. The members of opposition asserted, that the war and the scarcity were closely connected; whereas Mr Pitt and his colleagues contended, that a more obvious cause might be found in the deficiency of the two preceding crops, in consequence of cold rainy seasons. A royal proclamation was issued in the beginning of December, which exhorted all masters of families to reduce the consumption of bread by at least one-third of the quantity consumed in ordinary times; and in no case to suffer the same to exceed one quarter loaf for each person in each week; to abstain from the use of flour in pastry; and restrict the consumption of oats and other grain by horses. Acts of parliament were at the same time passed, prohibiting the exportation, and offering bounties upon the importation of grain. After all, it was thought by many, that these measures operated doubtfully. By increasing the alarm of scarcity to the highest possible pitch, they induced wealthy persons to buy up grain, and to withhold it from the markets, unless tempted by very exorbitant prices. The prohibition of exportation of provisions was unnecessary, when a better price could be obtained in Britain than anywhere else; and the same high prices afforded a sufficient bounty for importation, though, perhaps, as an exception to this last rule, it was necessary to offer a bounty for grain imported from America, or other distant quarters of the world, to afford the merchant a certainty of profit notwithstanding a change of price before the arrival of his grain.

1089
War with
the north-
ern powers.

1090
Treaty of
Luneville.

1091
Change of
ministry.

At the commencement of the succeeding year government imposed an embargo on all Russian, Danish, and Swedish ships in British ports, so that Great Britain was now at war with the greatest part of Europe. Our ally, Austria, ventured indeed to renew the war; but the French general, Moreau, speedily gained a signal victory at Hohenlinden, and drove back the Austrian army upon their capital, while at the same time great defeats were sustained by them in Italy and Franconia. From the necessity of their affairs the Austrians were thus suddenly compelled to sue for peace, which was concluded at Luneville. The Netherlands and the Milanese were resigned. The emperor consented, that France should extend its limits to the Rhine; that Tuscany should be relinquished by the grand duke; but that he should receive an indemnification in Germany: while, on the other hand, the city of Venice and a portion of its ancient territory were relinquished to Austria. The German princes who suffered by the treaty, were to receive an indemnification out of the ecclesiastical states of the empire; thereby weakening still farther the influence of the house of Austria, which had always been the head of the Catholic interest in Germany. This treaty left the French masters of Europe to the southward of the Rhine and of the Adige.

The commencement of the year 1801 was marked in Great Britain by a most important event, the termination of Mr Pitt's administration. When this event was announced to the public, it created no small degree

of astonishment in the minds of men. Since Mr Pitt had come into office, a new generation had sprung up, and a succession of the most extraordinary public transactions had occurred, amidst all which, he and his kinsman Lord Grenville, and his friend Mr Dundas, had remained firmly established in power. The authority and influence of these men had in some measure interwoven itself, in the opinion of most people, with the very existence of the British constitution. They were surrounded by an immense train of powerful dependents and adherents, raised by their patronage; while, at the same time, Mr Pitt himself retained such a degree of popularity, that his dismissal appeared a very bold measure in the present difficult state of public affairs.

The ostensible cause assigned for Mr Pitt's dismissal, obtained little credit. He was represented, as having promised to the Irish Catholics, a full equalization of their privileges with those of their fellow subjects, on condition that they should acquiesce in the treaty of union; but that his majesty had been persuaded to oppose the measure, as contrary to his own coronation oath. In this state of affairs, it was said that the ministry could no longer honourably remain in office.

Concerning the true cause of this change, little is publicly known. It does not seem necessary, however, to search for a secret history of such a transaction, as it may be sufficiently accounted for from those principles which, in the constitution of our nature, generally regulate the conduct of men. The influence acquired by Lord North, in consequence of the patronage he enjoyed during the expensive period of the American war, enabled him, by combining with others, to establish a formidable interest in the legislature. But the power enjoyed by Lord North was trifling when compared with that which Mr Pitt and his friends possessed. The war which Mr Pitt had conducted, had been expensive in a degree altogether unexampled in preceding times. The circumstances under which it was commenced had united, as a party under him, almost all the persons of property in the kingdom. During his long administration, also, the crown possessed, in a more direct manner than formerly, the increasing patronage of India. In every respect, therefore, the leading members of this administration must have been regarded, as having attained to a degree of power and influence, which might not easily be shaken; and which, therefore, might prove inconvenient, when held by any combination of subjects in a free country. In such circumstances, it was natural for an experienced prince to wish for a change. Mr Pitt had been originally received into office, as the agent of the crown in the house of commons, and to support the royal prerogative there, against a combination of powerful and accomplished men. He had enjoyed great popularity, and was considered as the man best qualified to conduct the dangerous war of the French revolution. He must have felt the important rank which he held in the public estimation: and it is not improbable, that, as in his dispute with Mr Tierney, he treated the house of commons with little deference, so in the cabinet he may have presumed upon the indispensable importance of his own services; and accounting himself absolutely necessary to the administration of the empire, he may have assumed a considerable degree of independence. Such

Britain. a sentiment might at least be readily imputed to the minister and his friends; and the result of it would be, that the period when they would no longer be wanted, would begin to be expected with some eagerness. This period occurred as soon as the success of the French arms became such, that it was no longer possible to overturn their new government by war. Accordingly there appears reason to suppose, that, on dismissing this administration, a resolution was at the same time adopted by the British court, seriously and earnestly to endeavour to obtain peace upon any tolerable terms.

Britain. in the war, or of relinquishing his power. If the war is to be considered as advised and conducted by him, he will be responsible for the greatest misfortune which during several centuries Europe has encountered, that of the enormous aggrandisement of France, and the subjugation of the weaker states. Had Britain originally stood aloof, or rather, had she negotiated in favour of the independence of France, brought into hazard as it was by the combination of the great military powers; France would have continued to be confined within her ancient boundary. Italy, Switzerland, and Holland, would have retained their independence; and the strength of Austria would have continued unbroken. Or had Britain withdrawn her force with the earliest opportunity, and avoided urging and subsidizing the continental powers till they were successively vanquished, the same result might have occurred.

1093
Remarks
on Mr Pitt's
administra-
tion.

With regard to the general merits of this administration, it must be left to remoter times, to form a correct judgment, as we are probably still too much involved in the passions and prejudices occasioned by late occurrences, to be able to appreciate them with sufficient candour and intelligence. Mr Pitt derived great advantage from the copious and splendid eloquence which he at all times displayed in the house of commons; and certainly no man ever possessed so completely the art of managing the people of England, and of retaining their affections in an astonishing degree, while at the same time he continued to possess the confidence of his sovereign. When it is considered that he obtained the government of the British empire when a very young man, the prudence of his conduct, as well as the magnitude of many of his plans, entitle him to a great share of estimation. His sinking fund, though not contrived by himself, was a great and important measure, which he brought forward with ability, and carried into effect with a degree of perseverance, which has undoubtedly rendered it one of the firmest pillars of that great political experiment, the funding system. His commercial treaty with France was a measure recommended by the soundest wisdom. Had it been permitted to continue in force during a few years longer, it would in all probability have connected so closely, by the ties of reciprocal interest, the British and French nations, that it would even have prevented the sanguinary contest by which it was dissolved.

On the other hand, if the war is to be considered as undertaken to overturn the principles of the French, it was undoubtedly successful to a certain extent, as it compelled them to abandon these principles, and to have recourse to a military usurpation; but it ought to be remembered, that to Britain, as a nation, the political principles of the French were of no importance whatever; whereas, their permanent aggrandisement may bring into hazard our very existence as a people.

The most ambiguous circumstances in Mr Pitt's public conduct, were those which related to parliamentary reform, to the trial of Mr Hastings, and to the slave trade, in which he adopted the popular side in the debates of the house of commons, while the court was considered as hostile to his avowed sentiments; and these sentiments were never successful. Those who admire the dexterous and skillful management of the humours and passions of men, and those who admire disinterested magnanimity of conduct, will perhaps judge differently upon these points. To persons of candour, it may be sufficient to remark, that the passion of ambition was fostered at a very early period of life in the mind of this minister, that it is the most powerful of all human passions, and has been considered as affording an excuse for many efforts towards its gratification.

Mr Pitt and his friends called forth the resources of the country for the support of the war in an astonishing degree. Immense treasures were lavished away upon it in supporting our allies, and on the increase of our navy. By this last measure, if the French acquired the continent of Europe, Britain might be said to have acquired all the rest of the world, as no communication between distant regions could exist without her permission. It is to be remarked, however, that the acquiescence of the public in the war was preserved, by keeping the minds of men in a state of constant alarm, from the fear of danger to the constitution, in consequence of the alleged disaffection of a body of the people. In this manner, a constant spirit of persecution was maintained throughout the country, which thus seemed to be ruled rather by a jealous faction than by a legitimate government. The concluding great measure of Mr Pitt's administration, the union with Ireland, is entitled to much praise. It was suggested by the course of events, and tended to remedy a great defect in the constitution of the British empire, the want of consolidation into one united political body.

The most difficult question, with regard to the merits of Mr Pitt's administration, relates undoubtedly to the war with France. Though, by the forms of the British constitution, Mr Pitt was responsible for engaging in this war, and for continuing in it; yet, as he was not actually the head of the state, it is possible that the interference of Britain in it might not originate with him, and that he had only the alternative of engaging

Of the associates of Mr Pitt, his relation Lord Grenville, who acted as minister in the house of lords, was the chief in England, and Mr Dundas in Scotland, and perhaps also in the rest of the empire. This last gentleman possessed the greatest share of power ever intrusted to any Scotsman since the union, excepting for a short time to Lord Bute. During a considerable length of time he appears to have conducted almost the whole of the public business of that vast assemblage of nations, in all climates of the globe, which constitutes the British empire. Under his patronage, and that of his friend Mr Pitt, a numerous train of dependents rose to the possession of opulence; while they themselves, engrossed by other pursuits, were understood to have made only a very trifling provision for their future distinction.

Britism.

stinction or independence, upon a retreat from the emoluments of office.

In doing justice to the merits of these men, the next generation, and even future historians, ought to be upon their guard, not to trust rashly to the unfavourable representations of their actions and intentions, which will be extremely apt to pass down to posterity, in consequence of one part of their conduct. During the last ten years of their administration, they gave great offence to men of letters, at least at a distance from the capital, by their disregard of literary talents in exercising the patronage of the crown, and by placing persons of little reputation or ability in situations in which distinguished learning and liberal accomplishments are expected to be found. It is dangerous to offend those who possess the power of dispensing renown, or of fixing permanent reproach upon a name; and men of letters, an irritable race, are extremely apt to regard their own quarrel as that of mankind. Any errors of the kind alluded to, which were committed by Mr Pitt's administration, in their nomination to offices, may in a great measure be ascribed to the tempestuous spirit of the times, which compelled, or at least induced, administration, to countenance an ardent political zeal, and to consider fidelity to their party as superior to every other endowment. It was only when a man of talents accidentally possessed this merit, that he could expect to meet with any countenance, or that the servants of the crown did not otherwise account themselves at liberty to acknowledge his worth. Mr Pitt and Mr Dundas carried into retirement so much of the public regret, that considerable sums of money were contributed to erect statues to their memory.

1094
Royal in-
disposition.

At the time when the change of ministry was made, the king became affected with a severe illness, supposed to result from the anxiety and agitation of mind which accompanied that important measure. In making choice of a new prime minister, he avoided admitting into power the party that had opposed the war; and selected Mr Addington, whom we have mentioned as originally patronized by Mr Pitt, and who, in the station of speaker of the house of commons, had gained the approbation of all parties by his good temper, prudence, industry, and conciliating manners. This gentleman appears to have obtained from his predecessors in office a promise of support in parliament; and he was industriously represented throughout the country as nothing more than a nominal minister, holding a temporal situation, which, with the first opportunity, he was to relinquish in favour of Mr Pitt and his friends. This account of the state of affairs derived plausibility from the actual support in the parliamentary debates which the new minister received from these gentlemen, and from the influence which they evidently retained in the nomination of all inferior offices. Mr Addington's appointment as first lord of the treasury and chancellor of the exchequer, was followed by the nomination of Lord Eldon to the office of lord high chancellor, Lord St Vincent to that of first lord of the admiralty, Lord Hawkesbury as secretary of state for the foreign—Lord Pelham for the home department, and Colonel Yorke as secretary at war. Lord Eldon was succeeded by Sir Michael Pepper Arden, who was created Lord Alvanley, as chief justice of the common pleas; and Mr Addington by Sir John Miltford, as

speaker of the house of commons. Sir William Grant was made master of the rolls, and Mr Law and Mr Percival attorney and solicitor general.

On the 2d of February, the parliament of Great Britain and Ireland was opened; but, as the king's illness immediately succeeded that event, the new administration could not receive formal possession of their offices till the month of March, and during that time the old ministers continued to hold their former rank. At the opening of the imperial parliament, as it was now called, the speech from the throne expressed his majesty's great satisfaction in being now able to avail himself of the advice of the united parliament of Great Britain and Ireland. This memorable era, distinguished by a measure calculated to consolidate the strength of the empire, he hoped would be equally marked by that energy and firmness which our present situation so peculiarly required. The court of Petersburg had treated our representations of the outrages committed against our ships and property, and against Englishmen, with the utmost disrespect; indeed acts of injustice and violence had aggravated the first aggressions.

Under these circumstances, a convention had been concluded between Petersburg, Copenhagen, and Stockholm, the avowed object of which was to renew their former engagements, for establishing a new code of maritime law, inconsistent with the rights, and hostile to the interests of this country.

The earliest measures had been taken to repel this confederacy, and to support those principles essential to the maintenance of our naval strength; in which firm determination there was no doubt of the vigorous assistance of the united parliament.

The speech concluded with recommending an inquiry into the high price of provisions, and promises of terminating the present contest whenever it could be done consistently with security and honour.

When the usual address was moved, some debate occurred in both houses, with regard to the present state of affairs, more particularly as connected with the combination of the northern powers against Britain. In the house of commons, Mr Grey deplored the prospect of a war with all Europe. Russia, he said, had evidently been guilty of the grossest violence and injustice towards this country, in the confiscation of the property of our merchants, and the treatment of our sailors; but the emperor accused the British government of violating a convention by which he was to receive the island of Malta, as the reward of his co-operation against France; and the truth of this assertion ought to be investigated. Concerning the northern confederacy, Mr Grey remarked, that the principles on which it was founded were of no recent origin. The king of Prussia, in 1740, disputed the pretensions of this country, and contended strenuously for the principle, that free vessels make free goods. In 1762, the Dutch resisted the claim of a right to search ships under convoy. In the year 1780, the assertion of the rights of neutral states assumed a greater degree of consistency and concert; the subscribers, that is, all the powers of Europe entered into the armed confederacy, officially announced its principles, and claimed the rights enumerated in that celebrated document, as agreeable to the law of nations. Hence, Mr Grey contended, that to avoid encountering the inveterate animosity

Britain. mosity of other states, the subject ought to be cautiously investigated; and, unless it appeared absolutely necessary to our safety, Britain ought from prudence to relinquish her claim. In his opinion, France, while without seamen or skill, would derive little benefit from the importation of naval stores in neutral vessels.

Britain. shameful retreat through Holland, the evacuation of Toulon, the abandonment of Corsica, and the expedition to Quiberon, all were fatal proofs of ill-concerted schemes. Mr Grey adverted to the late expedition against Holland as more disgraceful than the rest, because it terminated in a capitulation to an inferior force. He asserted, that administration had acted with such imprudence, that our whole allies were converted into enemies. The Swedes and other neutral nations had complained, that their trade was molested, their ships detained, and justice refused them in our courts, or so long delayed that it was useless. These he considered as points which undoubtedly deserved investigation; nor did the internal state of the country less require consideration. The sum already mentioned of 270,000,000l. had been added to the national debt, exclusive of imperial and other loans, and the reduction by the sinking fund; and yet we were assured by the ex-ministers that they left the country in a flourishing condition. And did not every Englishman, from diminished comfort, or from positive distress, feel this declaration to be an insult? Ask the ruined manufacturers of Yorkshire, Manchester, and Birmingham: ask the starving inhabitants of London and Westminster. In some parts of Yorkshire, formerly the most opulent, the poor rates had increased from 522l. to 6000l. a-year, though the whole rack rent of the parish did not exceed 5600l. In Birmingham there were near 11,000 who received parochial relief, where the number of inhabitants is 80,000, and this of a town accounted one of the most flourishing in England. The situation of the sister kingdom was alarming in the extreme. Since the recall of Earl Fitzwilliam, Ireland had been the scene of transactions shocking to humanity. Was it now tranquil? A few days ago a bill passed the house, which, we were told, was necessary for its safety; though rebellion had been crushed in the field, it was said to lurk in secrecy; the mass of population was disaffected; and nothing prevented the separation of Ireland from us but the inability of France to send a force to assist the rebels. Whatever any one might assert, he could not persuade himself, that there was any innate depravity in the Irish nation. He must believe, that, if they were well governed, they would be sober, industrious, and orderly. Hence Mr Grey called for an inquiry into the present state of affairs, and demanded the support of the new administration, as a testimony of their disapprobation of the measures of their predecessors.

Mr Dundas defended the management of the war. ¹⁰⁹³ The principle which he laid down, as one which never defends the conduct of the war. ought to be departed from, was that war ought to be directed to the destruction of the commerce and colonial possessions of the enemy; in this he included their maritime power, which must entirely depend upon their commerce. But this was not the only reason: it was hardly possible for England to be long at war with France, without being involved in disputes on the continent, which might deprive us of many of the markets which we had for our goods, and therefore it was peculiarly our interest to gain these colonies, that they might remain open for our commodities. In order then to judge how far this war, conducted on this principle, had been disastrous and disgraceful,

1097
Motion on
the state of
the nation.

Mr Pitt, who still acted as chancellor of the exchequer, asserted, that with every one of the three northern powers, independent of the law of nations, we had on our side the strict letter of engagements, by which they were bound to us. In the convention signed between Great Britain and Russia, the latter bound herself to use her efforts to prevent neutral powers from protecting the commerce of France on the seas, or in the ports of France. Denmark and Sweden had expressed their readiness to agree on that very point, which they were now disposed to contend. We did not indeed know the precise terms of their new convention; but as its existence and general object were acknowledged, we must necessarily act upon the supposition of their hostility. Mr Pitt asserted the question now to be, Ought we to permit the navy of our enemy to be supplied and recruited; to suffer blockaded forts to be furnished with warlike stores and provisions; and permit neutral nations, by hoisting a flag on a fishing boat, to convey the treasures of America to the harbours of Spain, and the naval stores of the Baltic to Brest and Toulon? If the commerce of France had not been destroyed, if the fraudulent system of neutrals had not been prevented, her navy would have been now in a very different situation.

In the month of March, a debate occurred in the house of commons, which is worthy of notice on account of the recapitulation which it produced of some important circumstances connected with the state of the nation, and the history of the war. Mr Grey moved for an inquiry into the state of the nation. He said, that we were now in the ninth year of a war with France, and threatened with a war against all the maritime states of Europe, if not actually involved in it; we had added 270,000,000l. to the capital of our national debt, and above 17,000,000l. to our annual taxes; we found ourselves opposed to France, which was now extended in territory beyond the hopes of her most sanguine friends, increased in population, and supported by all the states of the north. We were opposed to her with diminished means, exhausted strength, and stripped of every ally. Was it not then incumbent on the representatives of the people, to enter into a serious inquiry into the means most likely to restore to us security and happiness. Mr Grey represented the conquests we had made during the war, as not compensating our disasters, or the acquisitions made by France. Her frontier now reached to the Rhine, to the Alps, and to the ocean. All these possessions we had consented to abandon as the price of peace; for peace, which our ministers might have made with France confined within her ancient limits, while our own country was prosperous and happy. Thus all our losses were irretrievable, and our triumphs empty. It had been said with truth, that there was no shore, from the Texel to the Adriatic, which had not witnessed the defeat of our forces, and the disgrace of our arms. The unfortunate attempt upon Dunkirk, the

graceful, he would state its progress and success. Hostilities commenced against France, in February 1793; in that year Tobago, St Pierre, Miquelon, Pondicherry, part of St Domingo, and the fleet at Toulon, were taken, besides the possessions of the Newfoundland fishery. In the year 1794, we took Martinique, Guadeloupe, St Lucia, the Saints, Corsica, and Mariagalante; in 1795, Trincomalé, and the Cape of Good Hope; in 1796, Amboyna, Berbice, and Demerara; in 1797, Trinidad, with four ships of the line either taken or destroyed; in 1798, Minorca; in 1799, Surinam; in 1800, Goree, Malta, and Curaçoa. Such had been our successes. Mr Dundas defended the expedition against Holland, upon the same principles as formerly; observing that an expedition could not be regarded as completely unsuccessful, which terminated in the capture of ten sail of the line, and 13 frigates, which would otherways have been now employed in augmenting the force of the northern confederacy.

Concerning the navy, Mr Dundas stated, that without enumerating its triumphs, he would briefly mention, that since the commencement of the present war, we had taken or destroyed 80 sail of the line belonging to the enemy, 181 frigates, 224 smaller ships of war, 743 French privateers, 15 Dutch, and 76 Spanish ships. The losses we had sustained were, three sail of the line, one of which we had retaken; one 50 gun ship, which also we got again; and of the frigates captured by the enemy, only the Ambuscade remained in their possession. One of the great advantages to be derived from the colonial possessions of the enemy, was the procuring markets for our manufactures. In the year 1793, the manufactures sent from this country to the West Indies, amounted to above 1,800,000l. sterling. Before the war, our exports to the East Indies did not exceed one million, and in the last year exceeded 1,600,000l. a proof that we had not lost the markets of Europe, and that his principle had been sound policy, to destroy the commerce of the enemy, and direct all our forces to this end, excepting such a part of them as might be necessary for the defence of Great Britain and Ireland; and when 400,000 men were applied to this purpose, which is actually the case, he left it to the house to judge, whether ministers had paid sufficient attention to the security of the country.

Mr Dundas remarked, that the failure of an expedition was now considered as a decisive proof of misconduct in ministers; but in that glorious seven years war, which was in every body's recollection, there were expeditions attempted which completely failed, though the failure was not considered as a proof of incapacity or neglect in Lord Chatham. The conquests which we then made, were Senegal, Louisburg, St Lucia, Duquesne, Guadeloupe, Martinique, the Havannah, Montreal, Pondicherry, Grenada, Belleisle, besides destroying the fortifications of Cherbourg; we took or destroyed 32 sail of the line, and 58 frigates, besides a proportionable number of smaller vessels. We were now in possession of every place taken in that war, excepting Guadeloupe, the Havannah, and Belleisle; but on the other hand we had gained the Cape of Good Hope, Ceylon, Demerara, Berbice, and all the

Dutch possessions in the East and West Indies; added to Minorca and Malta. We had also destroyed the confederacy formed against us in the East Indies, and acquired a great increase of power and territory there.

Lord Temple expressed concern at being obliged, by a sense of duty, to differ from those with whom he had uniformly acted since he had entered into parliament. He professed the greatest respect for the new chancellor of the exchequer; but he acknowledged, he much wished this gentleman had still continued to fill the chair of the house, which he had done so long with honour to himself and to his country. But he felt it incumbent on him, to support the present motion, because he conceived us to be in a state of difficulty and danger. To such an object, it was worthy the character of the house, to devote the most serious attention; and it was called upon in justice to investigate it. The king, in the exercise of his undoubted prerogative, had appointed a new administration, to direct the affairs of the country, in this important juncture; he meant not to speak harshly of it, though it appeared a thing made up of shreds and patches, of men unknown and inexperienced, in whom he could place no confidence, because he had had no trial; who, whatever might be their talents, whatever their capacity for governing a great nation, had not hitherto been in circumstances to evince them: and this was not a moment to make experiments. But to return to the motion; that suspicion was a sufficient ground for inquiry, he conceived to be an excellent principle for a British house of commons to act upon.

Mr Pitt, after expressing his respect for the new administration, observed, that no point had been more disputed than that of confidence in ministers. By some people it was held, that no person was entitled to it, till he had given proofs of having merited it. Here it never could be carried in substance to the letter; for whoever entered into any employment, must at first be new to it; there could be no experience without trial, but when persons had been tried in one situation, and had acquitted themselves well in it, it was a rule to give them credit when they entered into another, till proof of their incapacity or misconduct appeared. The present ministers were called, indeed, to a new situation, but they were not new to the house and to the public, or to the love and esteem of both.

Mr Pitt then bestowed the most ample praises on the merits of Mr Addington, Lord Hawkesbury, and Earl St Vincent. He asked the gentlemen of the opposition, if they knew any one among themselves superior to Lord Hawkesbury, excepting one (Mr Fox) whose transcendent talents made him an exception to almost any rule, but whose conduct also ought to be an exception, having withdrawn his attendance from the house, and whose counsels, had they been followed, must have been injurious to the country. Of the other individuals composing the new administration, much might be said, but he was unwilling to trespass on their patience. He would only add, therefore, upon this subject, that it showed little reflection or consideration, to affirm that the present ministers were unentitled to confidence, by which he meant, of course, no more than a constitutional confidence; and the house was bound by the best principles of sound policy, to wait

Mr Pitt's
account of
the change
of ministry.

wait to see the conduct of the servants of the crown, before they withheld it.

Upon the subject of the retirement or dismissal of the late administration, Mr Pitt contended, that his majesty had a right to part with his servants, and his servants to retire, without any explanations to the public. Concerning the affairs of the Irish Catholics, and their connexion with the dismissal of administration, which had given rise to many reports, he said, that a memorandum had been sent, in the name of a noble lord, at the head of the executive government of Ireland, who thought it essential to communicate the grounds of our change of administration, to persons more immediately amongst the Catholics. Mr Pitt said, it had been at his express desire this communication had been made, and the motives explained to them which led to the change, to prevent any misrepresentation of that subject. Emancipation of the Catholics was a term he disclaimed. He never understood the situation of the Catholics was such as to need what deserved to be called *emancipation*; but he thought the few benefits which they had not yet anticipated, might easily have been added to those so bountifully conferred on them in the present reign; not as a matter of right, but of liberality and political expedience, and, in this sense, of wisdom. Had such measures preceded the union, indeed, they would have been rash and destructive; and even now, if any attempt was made to push it so as to endanger the public tranquillity, or to pervert the affections of any of his majesty's subjects, the late ministers would be firm in resisting them. But he hoped the day would come when such a measure might be revived, and carried in the only way he wished to see it carried, which was conformably to the general tranquillity of the empire. He acknowledged, that it had appeared to him of such importance, that being unable to bring it forward as a measure of government, he did not conceive it possible for him, with honour, to remain in the same situation; and, at the same time, he wished it to be understood, that whenever the same obstacles did not exist, he would do every thing in his power to promote its success. He denied, however, that any of those who had retired from office, had so pledged themselves to the Catholics, as to be under the necessity of resigning their offices, because they could not perform their promise; and said, he was authorized to deny, that ever the Catholics supposed they had received such a pledge. An expostulation was natural, but a pledge was never given.

Mr Pitt concluded, that the British government had justice on its side, or rather was supported by the law of nations, in the claims which it now maintained, to search neutral vessels for military stores on their way to the enemy, and to declare particular French or other ports under blockade, to the effect of thereafter having a right to arrest neutral vessels attempting to enter them.

Mr Fox said, that it was undoubtedly a doctrine recognized by the law of nations, that free bottoms did not make free goods; but doubted the propriety of discussing it at this critical juncture. He thought our claims, upon this subject, were extended too far, when they were made to reach to naval stores, as these

VOL. IV. Part II.

had not been at former periods considered as contraband. He considered the subject as resolving into three branches: convoys, search, and contraband goods. If one state was to convey the trade of another, it was a new doctrine, and a fit subject for representation, by which it might have been settled. As to *search*, if we were not content with the papers, and had ground of suspicion, we should search and do the same with a convoy, in which we were fully justified. Suppose Spain, which was always at war with the Algerines, should demand the search of every British vessel passing through the strait, merely under pretext of her being at war with Algiers, would we submit to it? surely not; and yet we had demanded it of others. Respecting *contraband goods*, it was curious to talk of ships, and timber and naval stores, not being foreseen as implements of war in 1694. Great maritime powers were then in existence; and it was idle to compare them with the articles of gunpowder, guns, and cannons. Naval stores were not in the number of modern inventions; and if it had been thought proper to have called them contraband of war, they would have been enumerated.

Mr Fox adverted to the successes of the war, which had been enumerated by Mr Dundas. To the navy he gave much praise; and also to the late first lord of the admiralty, assigning his merit as the reason for the constant and brilliant triumphs of the navy; whilst our military expeditions, though our troops were as brave as our seamen, had generally failed. In naval tactics almost every thing depended on the talents of the officers; whereas, in military movements, much depended on the original design. The boasted capture of islands was not the object of the war: our object was to protect Europe against France. How had we succeeded? Which of the two nations had been most aggrandised in the course of it? We are told, that only 160,000,000*l.* was added to the debt; so 56,000,000*l.* is cut off, besides that for which the income tax is mortgaged; and a debt to be paid by installments was to be considered as no debt at all. It now cost us 38,000,000*l.* a-year in taxes, 10,000,000*l.* for poor rates; and the whole land-rent of the country was but 25,000,000*l.* A country paying double its land rent was in a state demanding inquiry. The war secretary had talked much about the diversion of war, and shown us its nature on his principles. He had sent his royal highness, and an army of 30,000 men, to the only neck of land perhaps in the world, where a fifth part of their own numbers was equal to cope with them. Of the armistice of Hohenlinden, and the negotiation which followed it, Mr Fox spoke with indignation, reprobating the conduct of the minister, which had so fatally proved that eloquence was distinct from wisdom. Time had now evinced, that all the great objects of the war were defeated, and our allies had deserted: and when no prospect of success remained, we might resort to negotiation. The same men who had rejected the proposals of Bonaparte with insolence, must approach with respect, suing for favour, to avoid participating in the disgrace.

With regard to the Irish Catholics, Mr Fox said, that, in his opinion, no man ought to be deprived of his rights, because he worshipped God according to the

4 T

dictates

Britain. dictates of his own conscience; that it was a reflection upon parliament to say, as Mr Pitt had said, that he could not there propose a measure which he approved. Mr Fox declared his belief, that no such difficulty existed; but that the late minister might wish to retire for a season, till overtures of peace were made, which he could not make, without mortification, to the man he had insulted. Mr Fox spoke of the change of administration as a fortunate occurrence. Some indeed might suspect, from the panegyric of Mr Pitt, that the new ministers were the less gaudy puppets, directed by those who had quitted their stations; and if they adopted the system of their predecessors, with the additional blame of being hostile to the Catholic claims, acting in this point from their own motives, they would be unworthy of confidence.

The new chancellor of the exchequer, Mr Addington, said, that the degree of confidence which the house of commons ought to extend to the present ministers, it was not for him to conjecture; they only asked for that portion of it which should be constitutionally reposed in persons duly appointed by his majesty, unless it was precluded by antecedent character and conduct. Of himself he should say no more, than that he should be grieved at its being supposed, that he had been induced, by ambition or interest, to exchange the situation he had filled for 12 years, for the present, in which, in obedience to the king's command, he was placed. A sense of duty and allegiance alone had directed his conduct; and to this he had sacrificed every other consideration. He commented on all the leading points in dispute between us and the northern powers; and after ably stating the grounds of the principle asserted by this country, and referring to the exception made by existing treaties, gave it as his decided opinion, that the right for which we contended was vital and fundamental, and could neither be abandoned nor compromised; and, at the same time, expressing an earnest wish, that it should be asserted temperately and firmly. The naval pre-eminence which it was the object of the present confederacy to subvert, had protected the commerce of Europe, during the present war, from piracy. Respecting Catholic emancipation, he deprecated whatever might have the appearance of intolerance and proscription. No restraint ought to be imposed on any who dissented from the established church, but what was absolutely necessary for its security and permanence; and he anxiously hoped, that the dissenters of all descriptions would feel assured, that they were regarded in no other light by government, than as truly valuable members of the community.

He felt it incumbent on him, lastly, to declare, that it was the determination of his majesty's servants, to take such steps, as appeared to them best calculated for the restoration of peace; that no form of government in France would obstruct negotiation; and if there was a corresponding disposition on the part of the enemy, the grand object would be accomplished. He concluded, with professing, that he occupied no party ground, and wished no confidence that was not constitutional. The motion for inquiry was rejected, by a majority of 291 against 105.

Notwithstanding the change of ministry, Mr Pitt

brought forward the business of the supplies in the house of commons. Their amount was 35,587,462*l.*; of which sum, 15,800,000*l.* was for the navy; 15,902,000*l.* for the army; and for the ordnance 1,938,000*l.* The income tax was now stated as amounting only to 6,000,000*l.* As some deficiencies of former estimates required now to be provided for, Mr Pitt stated, that the whole charge of the two countries, for the service of the year, would amount to 42,197,000*l.* which would be divided between the two countries thus: Great Britain for its fifteen-sevenths of the joint expence, and those charges which belonged separately to her, would have to defray, in round numbers, 37,870,000*l.*; and the charges falling upon Ireland, would be 4,324,000*l.* The sum of 25,000,000*l.* was raised by way of loan, and new taxes were imposed upon paper, tea, houses, lead, the post-office, and various other articles. The income tax was also farther mortgaged; so that the debt, for which it was pledged, amounted to 76,000,000*l.*

As the progress of the funding system of Great Britain will in all probability be regarded, in future times, as a most important fact in the political history of nations, it may be here remarked, that the extent of the national debt was so great, and it arose out of such a variety of transactions and engagements, that British statesmen had begun to differ among themselves about its actual amount. Mr Tierney had of late presented to the house of commons, annually, a statement of the debt and of the expenditure for the current year. His statements of the amount of the debt had been combated by the minister. We shall here insert an abstract of a considerable number of resolutions, which he moved upon the subject, on the 7th of June; together with counter resolutions moved by Mr Addington, on the 22d of the same month.

Mr Tierney stated, that the total amount of the public funded debt, including the Irish and imperial loans, and deducting the stock purchased by the commissioners, and 16,083,802*l.* transferred to them on account of the land tax redeemed, was, in February 1801,

	L.484,365,464
That the life and short annuities were about 540,000 <i>l.</i> per annum, worth at 6½ years purchase,	3,375,000
That the long annuities were 1,007,000 <i>l.</i> per annum, worth at 5 per cent.	21,978,132
	509,718,596
Deduct the Irish loans,	19,708,750
	L.490,009,846

On the contrary, the resolutions which were moved by Mr Addington and carried, stated, that the total amount of the public debt, after deducting the sum of 52,281,656*l.* redeemed, and the annuities fallen in to the commissioners, and 16,083,802*l.* transferred to them on account of the land tax redeemed, was, on the 1st of February 1801, together with short annuities to the amount of 545,333*l.* and long annuities to the amount

Britain.	of 1,007,613l. after deducting the annuities provided for by Ireland,	L.400,709,832
	That the life and short annuities were	
	545,333l. per annum, worth	3,408,331
	That the long annuities were 1,007,613l. per annum, worth at 5 per cent.	21,989,703
	Whole debt was	L.426,107,866

Both Mr Addington and Mr Tierney concurred in estimating the total sum to be raised in Great Britain in the year 1801, at 68,923,970l.; and they calculated the amount of a future peace establishment, exclusive of sums to be paid on winding up the expences of the war, at 28,979,563l.

1101
Attack upon Copenhagen, &c.

In the mean while, to prevent the active co-operation of Denmark with the designs of Russia, an armament was fitted out in the British ports, consisting of 17 sail of the line, three frigates, and about 20 bomb ketches, gun brigs, &c. under the command of Sir Hyde Parker, and Lord Nelson. This fleet sailed from Yarmouth on the 12th of March, and triumphantly passing the Sound, which was deemed impossible, reached the capital of Denmark. The approaches to Copenhagen were fortified with skill; batteries of cannon and mortars were erected on every part of the shore, where they were likely to be efficacious; the Crown islands, and that of Amak, were strengthened by a variety of works; the mouth of the harbour was protected by a chain, and by a fort built on piles; and a line of shipping added to the strength of the place. The admiral having ordered an attack from the southward, Lord Nelson advanced with 12 sail of the line, four frigates, some sloops, fireships, and bomb vessels; but, from the intricacy of the navigation, two of the largest ships ran aground, and another was obliged to cast anchor far from her intended station. Captain Murray in the *Edgar*, led the van with great intrepidity. The *Monarch* sustained the most destructive fire, and her commander (Moss) lost his life with above 50 of his men. Captain Riou was also killed while he was attacking the ships at the entrance of the harbour. The battle raged for four hours with great slaughter on both sides. The number of killed on the part of the English, exceeded 250; on the side of the Danes above 500. Almost 700 men in the ships of the aggressors, and about 1500 of the opposite party, were wounded. Some of our ships were severely damaged, while 17 Danish vessels, floating batteries included, were sunk, burnt, or captured.

After the victory had been decided, Lord Nelson threatened to burn all the floating batteries which he had taken, without saving the troops who were on board, if the enemy should continue the least firing. This menace produced a cessation of hostilities. Lord Nelson landed, and conferred with the prince of Denmark; and a convention was signed for a regular armistice.

On the 19th of April the British fleet appeared off the entrance of Carlscrona, and the admiral acquainted the governor, that the court of Denmark having concluded an armistice by which the unfortunate dispute with the court of St James's had been accommodated, he was directed to require an explicit answer from his Swedish majesty, relative to his intention of adhering

to, or abandoning the hostile measures he had taken in conjunction with Russia. An official answer to this demand was communicated from the king of Sweden to Sir Hyde Parker, intimating, that his Swedish majesty would not fail to fulfil the engagements entered into with his allies; but that he would not refuse to listen to equitable proposals made by deputies, furnished with proper authority to regulate the matters in dispute.

Britain.

The termination of the contest is, however, not to be attributed, either to the battle of Copenhagen, or to the victorious progress of the British fleet, but to an event which had just before taken place, to the astonishment of Europe, and which produced an almost instantaneous revolution in the politics of the north. On the 23d of March, the emperor Paul, who had performed so versatile and extraordinary a part on the political stage, from the period when he ascended the Russian throne, expired suddenly. His capricious tyranny, which was at last about to be directed against the members of his own family, proved fatal to him. His son and successor, Alexander, immediately disclaimed the hostility against Great Britain, and made reparation for the damage suffered by our merchants, in consequence of the embargo imposed upon our vessels. A convention was adjusted with Russia in the month of June, which put an end to the dispute with the northern states, as Sweden and Denmark could not of themselves hope to resist the power of Great Britain. By the third article of the agreement, it was stipulated, that effects embarked in neutral vessels should be free, with the exception of contraband stores of war, and the property of an enemy; that the latter designation should not include merchandise of the produce, growth, or manufacture of the countries at war, acquired by the subjects of the neutral state, and transported on their account; that the commodities prohibited should be such only as were declared contraband by the treaty of commerce concluded between Great Britain and Russia in 1797; that a port should be considered as under blockade, when the ships of a belligerent power should be so stationed, as to render it evidently dangerous to enter; that the neutral vessels should not be stopped, except upon strong grounds, and that the proceeding should be uniform, prompt, and legal. The next article provided, that the right of searching mercantile ships, sailing under convoy of a ship of war, should only be exercised by the ships of the government, not by those of private adventurers. Thus the chief points in dispute were settled in our favour.

1102
Death of the emperor of Russia.

1103
A Convention with Russia.

The war between France and Great Britain was now in Europe reduced to operations merely maritime, and these were of the most trifling nature. One of the most important of these, was that which occurred upon the coast of Spain, between Sir James Saumarez and a squadron of French and Spanish ships of war. On the morning of the 6th of July, the British admiral stood through the straits of Gibraltar, with the intention of attacking three French line of battle ships and a frigate, which were at anchor off Algesiras. On opening Cabrita Point, he found the ships lay at a considerable distance from the enemy's batteries, and having a leading wind up to them, he conceived he had every reasonable hope of success. He had previously directed Captain Hood in the *Venerable* to lead the squadron; but, though it was not intended, the captain found

1104
Naval engagement on the Spanish coast.

Britain.

found himself under the necessity of casting anchor from the wind failing. Captain Stirling in the Pompee, at the same time, anchored opposite to the inner ships of the enemy, and the action commenced. In the ardour for engaging, the Hannibal unfortunately ran aground. Every effort was made by the admiral to cover her from the enemy; but being only three cables length from one of the batteries on shore, he was obliged to retire, and to leave her in their hands. The loss on board the English squadron was 375. The admiral was scarcely in harbour, before he was apprised, that the French line of battle ships disabled in the action of the 6th, were on the 8th reinforced by a squadron of five Spanish ships of the line, under the command of Don Juan de Mozen, and a French ship of 74 guns. He learned further, that they were all under sail on the morning of the 12th of July, together with his majesty's late ship Hannibal. "I had almost despaired (says Admiral Saumarez) of having a sufficient force in readiness to oppose such numbers." But by great exertion he was able to warp out of the Mole with all the ships under his command, the Pompee excepted, which had not time to get in her masts. The object of the British admiral, was to obstruct the passage of this powerful force to Cadiz. Late in the evening, he observed the enemies ships to have cleared Cabrita Point, and at eight he bore up to stand after them. At eleven the Superb was up with them, and opened her fire on the enemies ships at not more than three cables length. At this critical period a fatal mistake of the enemy decided the battle. The Spanish ships, in the darkness and confusion, fired upon each other; the Real Carlos took fire and blew up, and the Hermenegildo, still mistaking her for an enemy ran on board her, and shared her melancholy fate. The San Antonia of 74 guns and 730 men, commanded by Le Rey chief of division, being thus left unsupported, struck to the Superb. The remaining ships of the enemy now crowded all the sail they could carry, and stood out of the straits. At daybreak, only one French ship appeared in sight, which was standing to the shoals of Cavil. At this juncture the wind failed her, and the Venerable was able to bring her to action, and had nearly silenced her, when the loss of the mainmast obliged the captain of the Venerable to desist, and this ship, which was an 84, escaped along with the rest.

1105
Attack of
Boulogne.

As the French now resumed their usual threat of invasion, and assumed the appearance of collecting a force in the harbour of Boulogne, an attempt was made by Lord Nelson to obstruct their preparations. He succeeded in doing some damage, which appears to have encouraged him to make a more serious effort. Boats intended for boarding the French vessels, were sent off in the night in four divisions, under the respective conduct of the captains Somerville, Parker, Cotgrave, and Jones; and some boats furnished with howitzers, were detached under Captain Cowan, to join in the enterprise. Parker's division first approached the enemy, and commenced a fierce attack. He made strenuous efforts, with undaunted courage, and with sanguine hopes of success; but an unforeseen obstacle baffled all his exertions. This was a very strong netting traced up to the lower yards of the French vessels, which were also fastened by chains to the ground, and

to each other. So effectual was the resistance of the foe, thus guarded, that about two thirds of the crew of the boat in which he acted, were repelled in their attempts to board a large brig, by a furious discharge of cannon and musquetry. Many of the assailants lost their lives, many were wounded and maimed. The captain received a shot which carried off his leg and part of his thigh, and his boat would have been seized by the enemy, had not a cutter seasonably towed her off. Somerville in the mean time silenced the fire of a brig near the pier head; but far from being able to bring her off, he found difficulty in securing the retreat of his own boats. Cotgrave, after a spirited attack, was deprived of the services of many of his men by a fire from the flotilla and the shore. Jones felt so strongly the obstructions of the tide, that he could not approach before the break of day, when the other captains were returning; he, therefore, retired without making any hostile attempts. Captain Parker died of his wounds after the return of the fleet to the Downs. The number of British seamen killed and wounded, amounted to 172.

In consequence of the unfortunate refusal of the late administration to ratify the treaty called the capitulation of El Arish, negotiated with General Kleber by Sir Sidney Smith, the French still retained possession of Egypt. To remedy the error, a considerable force had been dispatched from Great Britain, under the conduct of an experienced and gallant officer, Sir Ralph Abercromby. The British forces under Lord Keith and General Abercromby, after unexpected delays on the coast of Asia Minor, arrived off Alexandria on the 1st of March. The following day the fleet made sail for the bay of Aboukir, and anchored there. Till the 8th, the sea ran high, and no disembarkation could be effected; but on that day, the first division made good their landing at ten o'clock in the morning, in the face of a body of French, who were evidently aware of their intention, and were posted in force, with considerable advantage of position. The front of the disembarkation was narrow, and a hill which commanded the whole, appeared almost inaccessible: yet the British troops ascended the hill, under the fire of grape shot, with the most perfect intrepidity, and forced the French to retire, leaving behind them seven pieces of artillery, and a number of horses. The disembarkation was continued during that and the following day. The troops which landed on the 8th advanced three miles the same day; and on the 12th, the whole army moved forward, and came within sight of the French, who were formed advantageously on a ridge, with their left to the canal of Alexandria, and their right towards the sea.

It was determined to commence the attack on the 13th, and, with this view, the British army marched in two lines by the left, with an intention of turning the right flank of the enemy. The attack was in some measure anticipated by the French, and they descended from the heights on which they were formed, and attacked the leading brigades of both lines. The British troops were therefore compelled to change their position, which was done with the greatest precision, and the rest of the army immediately followed their example. After a severe conflict, victory declared in favour of the English, though not without considerable loss.

The

Belain.

Britain.

The French commander in chief in Egypt, Menou, appears to have acted upon this occasion with little judgment. Instead of bringing down nearly his whole force to the coast, which would have enabled him greatly to outnumber, and consequently, in all probability, to defeat the invaders, who were less acquainted with the country than his own officers; he thought fit to hazard an engagement, on the 21st of March, with only half his force. It commenced before day light in the morning, by a false attack on the left of the English under Major-General Craddock, in which the French were repulsed. But the most vigorous efforts of the enemy were directed to the right of the English army, which they endeavoured, by every possible means, to turn. The attack on that point was begun with great impetuosity by the French infantry, sustained by a strong body of cavalry, who charged in column. The contest was unusually obstinate. The French were twice repulsed, and their cavalry were repeatedly mixed with the English infantry, but at length gave way altogether. While this was passing on the right, the French attempted to penetrate the centre of the British army with a column of infantry, who were also repulsed and obliged to retreat. A corps of light troops, however, was advanced, supported by infantry and cavalry, to keep in check the left of the English, which was certainly the weakest of the whole line; but all their efforts were fruitless, and the British remained masters of the field. The loss on our side was great, being in killed, wounded, and missing, upwards of 1500. The loss of the French was calculated in the English accounts at 3000. One of the French generals, Roiz, was killed, and generals Lanusse and Bodet died of their wounds. A French regiment, which had been styled *invincible*, was destroyed in this battle, and their colours fell into the hands of a Scottish regiment, the 42d. This battle decided the fate of Egypt. The invaders having the command of the sea, received reinforcements, so that they speedily became decidedly superior to the remaining French force. In this battle, however, the British army was justly considered as having suffered a great calamity in the loss of its general. This officer was at once beloved and esteemed by the soldiers whom he commanded; he preserved the most strict military discipline, while, at the same time, he secured the attachment of his troops by his obvious anxiety for their welfare. Early in the late war, he was employed on the continent. He commanded the advanced guard in the action on the heights of Cateau, and conducted the march of the guards from Deventer to Oldensaal in the retreat of the British troops in 1794. In the following years, till 1797, he was engaged as commander in chief in most of the successful enterprises of the British in the West Indies. On his return to Europe, he was invested with the rank of lieutenant-general, and appointed to the command of the forces in Ireland. In this station he made great efforts at once to protect the people, and restore discipline to the army, both of which the violence of faction had induced the rulers of that country to neglect. Though he was a man of modest manners, yet, being of a most independent character, he did not hesitate to express, in public orders, the indignation which he felt on observing the disorder and consequent misery which had been introduced into

Ireland, by encouraging the licentious insolence of the troops against persons accounted disaffected to the government. He freely informed the army in that country, that they "were become formidable to every one but the enemy." In the expedition to Holland, he displayed great military talents, which excited the admiration at once of his own army and of the hostile generals.

After the death of Sir Ralph Abercromby, the command devolved upon General Hutchinson. He lost no time in proceeding towards Alexandria, where the principal force of the enemy was yet concentrated. In the mean time, the town and castle of Rosetta were taken by a division of the British army under Colonel Spencer, aided by a body of Turks. The French garrison, amounting to 800 men, made but a feeble resistance, and retired to the right bank of the Nile, leaving a few men killed and prisoners.

While such was the state of affairs in the neighbourhood of Alexandria, Admiral Blanket, with a considerable force from the East Indies, effected a landing at Suez. The admiral was separated from the rest of his squadron in the dangerous and difficult passage of the Red sea; but before the end of April was joined by a large reinforcement under the command of General Baird, Colonels Wellesley, Murray, &c.

As the capture of Grand Cairo, next to Alexandria, was an important object with the allies, a force was detached early in May for its reduction. On the 9th of the month General Hutchinson, with 4000 British and an equal number of Turks, attacked the French near Rhamanieh; the French were driven in, and in the night retreated towards Cairo, leaving a small garrison at Rhamanieh, which on the following day surrendered to the victors. The loss of the English on this occasion did not exceed 30 men. About the same time a body of French and Copts, who had moved forward from Cairo to attack the Turks, were defeated by the grand vizier, who was essentially assisted by Colonel Murray, and other British officers. The French are said to have lost 50 men and the Turks about 30 in this action. The whole number of French, &c. engaged was said to amount to 4600, and the Turkish army to 9000.

It was the middle of June before the British army under General Hutchinson reached the vicinity of Cairo. He found the works very much extended, though the garrison did not exceed 4000 or 5000 in number. The captain pacha at the same time invested Gizeh (which may be regarded as a suburb of Cairo) on the left bank of the Nile, and the grand vizier took a position within cannon-shot of the city. Thus invested on every side, the garrison, on the 22d, sent a flag of truce to the English general, offering to treat for the evacuation of Cairo upon certain conditions. After a negotiation of several days, the surrender was finally agreed upon in a convention of 21 articles; the substance of which was, that the French army at Cairo and its dependencies should be conveyed in ships of the allied powers, and at their expence, together with their baggage, arms, ammunition, and other effects, to the nearest French ports in the Mediterranean; and of this convention General Menou was to be at liberty to avail himself.

The port of Alexandria was all that now remained

in possession of the French; it was attacked by sea and land, and at length surrendered by capitulation on the 2d of September. At the time when the news of this event reached England, the views of men were turned to a new state of things. Administration had seriously entered into negotiations for peace. These were conducted by Lord Hawkesbury on the part of Great Britain, and M. Otto, who resided at London as agent for the French prisoners of war, and who was now intrusted, on the part of the French, with this important business. The whole was managed with such secrecy, that not even the persons who were in official situations, except those immediately concerned, were acquainted with the state of the negotiation; and the lord-mayor of London was the first person out of the cabinet to whom the result was communicated. Thus no unfair advantage could be taken; and this treaty stands almost singular on our records, since, at a period when the practice of gambling in the public funds was from the wide extension of public credit more predominant than at any previous crisis, not a single instance occurred of any sinister practice.

1111
Prelimina-
ries of
peace.

By the preliminary articles, which were signed at London on the 1st of October, by M. Otto on the part of the French republic, and Lord Hawkesbury on the part of his Britannic majesty, Great Britain agreed to the restoration of all her conquests, the island of Trinidad and the Dutch possessions of Ceylon excepted. The Cape of Good Hope was to remain a free port to all the contracting parties, who were to enjoy the same advantages. The island of Malta was to be evacuated by the British troops, and restored to the order of St John of Jerusalem. Egypt was restored to the Ottoman Porte. The territory of Portugal was to be maintained in its integrity; and the French troops were to evacuate the territory of Rome and Naples. The republic of the Seven Islands was recognised by France. The fishery at Newfoundland was established on its former footing; and, finally, plenipotentiaries were to be named by the contracting parties, to repair to Amiens, to proceed with the formation of a definitive treaty, in concert with the allies of the contracting parties.

During the war negotiations for peace had so repeatedly proved unsuccessful, that a general incredulity had come to prevail with regard to the possibility of such an event; accordingly all merchants conducted their speculations upon the supposition, that there existed no probability of an immediate termination to the war. The state of the present negotiation had been so carefully concealed, that, when the official intelligence of its issue was transmitted throughout the country, it everywhere excited the utmost astonishment. It produced, however, almost instantaneously, the most unbounded expressions of joy among all orders of persons. The zealous adherents, indeed, of the late administration were upon the whole rather dissatisfied; but their voice was overwhelmed in the general exclamations which took place, and which far surpassed the expressions of joy which had occurred at the termination of any former war. As an abundant harvest was reaped at the same time, the prospect of plenty greatly added to the public joy.

1112
Rejoicings
for the
peace.

1113
Meeting of
parliament.

Parliament assembled on the 29th of October. By this time the new administration had obtained, by the

mildness of their conduct, and by their successful negotiations for peace, a powerful hold over the affections of the public. When they first came into office, they appeared to have obtained a promise of support from their predecessors; but as might naturally have been expected, this kind of gratuitous support could not be very consistent or uniform. Mr Pitt himself continued to give countenance to the minister; but others of his friends avowed their dissatisfaction on account of the treaty with France.

The speech from the throne announced the favourable conclusion of the negotiations begun in the last session of parliament. It expressed much satisfaction, that the differences with the northern powers had been adjusted by a convention with the emperor of Russia, to which the kings of Denmark and Sweden had made known their readiness to accede.

That the preliminaries of peace had been ratified between us and the French republic; and while this arrangement manifested the justice and moderation of our views, it would also be found conducive to the interests of this country and the honour of the British character. As the provision for defraying the expences which must unavoidably be continued for some time, and maintaining an adequate peace establishment, could not be made without large additional supplies, all possible attention should be paid to such economical arrangements as might be consistent with the great object of security to his majesty's dominions.

The speech concluded with applauding the naval and military operations of the last campaign, and the glorious issue of our expedition to Egypt; and with a fervent prayer that the people might experience the reward they so well merited in a full enjoyment of the blessings of peace; and above all, in the undisturbed possession of their religion, their liberties, and laws.

In the house of lords, the motion for the usual address passed unanimously. In the house of commons, both Mr Fox and Mr Pitt declared, that they joined in the general joy which the peace had produced, and gave it their approbation. On the other hand, Mr Windham had the misfortune, he said, to differ on the cause of the general joy and exultation; he did not approve of the preliminaries of peace signed with France, nor could he approve the address, if it implied approbation of them; but as he did not consider the support of the one as inseparably connected with the other, he should not withhold his vote.

It behoved him to give his reasons for dissenting so materially in a material point. To stand as a solitary mourner in the midst of public rejoicings, to wear a countenance clouded with sadness, whilst all others were lighted up with pleasure, appeared ungracious. But were the circumstances of this peace such as justified our exultations on former occasions? To him they appeared in a quite contrary view; and when he was desired to illuminate, he should first endeavour to learn whether it was to light him to a feast or a sepulchre. It was his firm persuasion, that in signing this peace his honourable friends had put their signatures to the death-warrant of the country. He knew the inconsistency of human affairs, nor was he profane enough to set bounds to the dispensations of providence; but neither could he foresee what changes might be wrought

Britain. wrought in the disposition of the people of England by intrigues from without or convulsions from within; but upon no rational view could he see his way out of the evils it would entail upon this country.

The only thing which was necessary to enable France to divide with us the empire of the seas was a participation of our commerce. This she would effectually secure by the present peace; while, by the surrender of our conquests, we had thrown out of our hands the only means to prevent it, the extension of our colonial system.

The motives which induced ministers to conclude these preliminaries, Mr Windham said, he knew not: some of them he had heard, but was not convinced; on the contrary, they appeared wholly insufficient. If we were forced to accept this peace through inability of resorting to alternatives, their conduct was the more excusable; and we had to thank them, not for what they had acquired, but saved for their country. If they can prove, that, by ceding foreign colonies, they had preserved objects nearer and dearer to us, as Portsmouth, Plymouth, and Ireland, and the soil of England, from ravage and desolation, they were entitled to gratitude instead of censure; and had established, not an apology, but a claim to thanks. Such a plea, however, he did not recognize; and how far they were actuated by necessity, would be a matter for future discussion.

Mr Addington said, that the observations of Mr Windham were premature, as the articles of the treaty were not before the house. Without referring to the terms of the peace (for that he could not do at this time without transgressing order) he would aver, that all we had given up would have afforded us no sort of security against the dangers apprehended by Mr Windham. The best counterpoise to the power of France was in the preservation of our constitution, in our industry and skill, in the right direction of our resources, (and happily much remained of these resources) which he considered, under providence, as the security of the blessings of peace.

Respecting the hint thrown out, that some unknown necessity might have been the cause of ministers having advised his majesty to sign the preliminaries, he totally disclaimed the plea; he did not seek his own justification, nor would any of his colleagues seek it, in such a way. If the enemy had not acceded to the terms agreed upon, we should have continued the contest, and been able to have carried it on, proving to the world, that we still had resources to maintain the honour and secure the liberties of the British empire.

Mr Sheridan said, that notwithstanding the unanimity with which the address was consented to, he believed, that if men sincerely delivered their opinions, there never was a period of less real unanimity. Mr Pitt had spoken of the peace in terms to which he could not agree, calling it glorious and honourable; still more did he dissent from those who maintained it was inexpedient to make peace at all. It was a peace of which every Englishman might be glad, but no one proud; it was a peace, involving a degradation of national dignity, such as the war might lead us to expect, the worst in which this country had ever been engaged; and the peace perhaps as good as any

minister could make in the circumstances in which we **Britain.** were placed.

In consequence of a message from his majesty, communicating the preliminary treaty with the French republic, an address of thanks was moved on the 3d of November. Earl Spencer expressed regret, in manifesting a difference of sentiment from the ministers, of all of whom he entertained a very favourable opinion, and with some of whom it was his pride to have coincided in principles, and co-operated in conduct. The great object of Britain, in former wars with France, was the preservation of the balance of power, that the relative strength of France should not exceed that of other countries, and thereby endanger our security. This was the point which had been considered, from King William's confederacy against Louis XIV. to the present age. To ensure this balance, it was not only necessary that Britain should not be left by the peace in a worse political situation than in the beginning of the war, but that her strength, possessions, or acquisitions, should continue in proportion as high as those of France. In the present war, the acquisitions of France had been infinitely beyond all former conception; she had, by her arts or her arms, subdued the Netherlands, Holland, the left bank of the Rhine, and a great part of Italy: her power, compared with that of Great Britain, exceeded what she had been allowed to retain at any former treaty of pacification; nor could we be secure, when such immense acquisitions had been left to France, without any thing like an equivalent left to this country. This general principle his lordship illustrated at some length, and strongly condemned the conditions of the peace now concluded. It was a peace of very great inequality, whether we viewed the relative state of France and the continent, or of France and England. It was also a peace with a republic which was still under the influence of a revolutionary government, with a usurper who could make a rupture whenever his spleen or caprice prompted a violation of the contract, and consequently a peace which could never be considered permanent. France, overgrown and gigantic, would easily be roused to a new war, whenever the first consul could gratify his inordinate ambition. In such a contest there would be great inequality, and thence would arise danger to this country, which, notwithstanding the valour of our arms by sea and land, would have a powerful and terrible enemy to combat.

Lord Pelham took a retrospect of the several negotiations, especially those in which the ex-ministers had been concerned. He said there was very little difference between the present peace, and that under the consideration of the late ministry. He stated the nature and progress of the negotiation after Lord Malmesbury went to France; and insisted that this was as proper a time to conclude it as any. Although nothing was mentioned in the preliminaries of the prince of Orange, he hoped something might be obtained for him by the noble marquis intrusted with the definitive treaty. The terms of peace were the best that could be procured, even in favour of our allies, such as scarcely could have been expected, as already stated in the preliminaries. Portugal was safe, whatever might be asserted

treaty in
the house
of lords.

Britain. asserted to the contrary, and the Roman and Neapolitan territories had been released from the French yoke. One of the greatest triumphs of the war was the expulsion of the French from Egypt, by which our Ottoman ally had been saved, and the British name raised to the pinnacle of glory. With regard to Malta, of which surrender so many complaints had been made, it was his lordship's opinion, that its retention would have been more injurious than beneficial to England. A powerful garrison would have been requisite for its protection, which would have distracted our fleets and armies, without any object equal to the vigilance and activity of our men. In the East and West Indies, we had been triumphant by sea and land; our possessions in the east, so valuable to this country, had received very important additions, by the conquests we had made there. As to the security of the peace, we surely had every security which could be expected in this critical juncture of affairs. Besides, it was the policy and interest of France to preserve it, and in this view he believed it would be preserved, and consequently voted in favour of the motion.

Lord Grenville contended, that, as Britain was in a prosperous state, we ought to have obtained more honourable terms of peace, because we were in a condition to demand them. He said, it was far from his intention to undervalue the acquisitions of France; on the contrary, he thought them more important than was generally esteemed: she had made the Rhine the boundary of her empire, she had acquired Savoy, &c. and not only extended her territories beyond the ambition of her monarchs, but she had her frontiers protected by dependent republics and tributary kings. On our side, we had triumphs no less brilliant and striking; we had multiplied our colonies, and our navy sailed invincible. We had rescued Egypt, captured Malta, possessed ourselves of Minorca, and shut up the Mediterranean from the ships of France and Spain. The Cape of Good Hope was ours, if not the only, at least an important key of the east. In the East Indies, we had every thing except Batavia, which we might also have possessed, had we thought it worth the cost of an expedition. In the West Indies, we had Martinico, Trinidad, &c. Upon the continent of South America, we had an absolute empire, in extent almost equal to that power to which we restored it. He meant Surinam, Demerara, &c. Such were the colonial possessions acquired by the war. It, indeed, was not undertaken for the purpose of colonial conquests; yet the force of the country had wisely been directed to that object: for whenever we were at war with France, it was essential to cripple her marine, which could never be better done, than by contracting her commerce, and depriving her of her colonial possessions; and these should have been held as pledges of indemnity, and still more as pledges of security. If Europe could not have been restored to her pristine state, these ought to have been retained as a counterpoise to the power of France.

Lord Grenville denied the fairness of comparing the present treaty with that proposed at Lisle. We now gave up Surinam, Malta, and Minorca. At no time, during the contest, was the spirit of the country

so depressed, as the negotiation at Lisle. If it were ^{Britain} asked, why did we choose such a period to negotiate? the answer was, It was not chosen; but ministers were convinced, that the war could not be carried on, unless the people of England clearly found, that the rulers of France, at that time, would not grant us peace on any terms of moderation. A variety of causes combined to produce that despondency; the stoppage of the bank, the defection of our allies, and, above all, the mutiny in the fleet. If such were our situation, the measure was defensible on necessity; but this was not the case at present. Under all the disadvantages under which the negotiation at Lisle was undertaken, we demanded on that occasion the Cape of Good Hope, and Pondicherry and Cochin in the East Indies. The result was, in his opinion, that we had given to the French the only thing they wanted, the means of creating a navy, and of rivalling us in our commerce; while we had obtained nothing in return.

The earl of Moira said, that though the terms of the treaty were inadequate, they were unavoidable. The noble lord who condemned them, ought to recollect, that he had left the country in jeopardy, with a slender chance of recovery, and it was impossible afterwards to conclude an advantageous peace.—Lord Nelson made some remarks respecting Malta. He said, that when he was sent down the Mediterranean, this island was in the hands of the French; and on his return from Aboukir, it was his first object to blockade, because he deemed it an invaluable service to rescue it out of their possession. In any other view, it was of no consequence, being at too great a distance from Toulon to watch the French fleet from that port; and in time of peace, it would have required a garrison of 7000 men, in war as many more, without being of any real utility to us. The Cape would be equally detrimental if retained by us; and though it certainly ought not to be given up to them, this cession would be better than to keep it. Though the war had been long, he believed his majesty seized the first opportunity of making peace, and he believed it would prove the best that existing circumstances admitted. The address was carried by a great majority.

When the same subject was discussed in the house of ^{Debate} commons, Lord Hawkesbury ascribed the origin of ^{the present} war to the interference of France in the affairs of ^{of ministers} other nations; but said, that the state of that country ^{the house} was now considerably amended, and that it was impossible to look at the present state of France, without being convinced, that we had at least effected this change. View the manners and opinions of their people in 1793 and 1801! After this comparison he would not hesitate to give his opinion respecting the moral evils of the peace, and that they certainly were less at this moment than at any former period. With regard to the continuance of hostilities, there were two considerations by which we were to be regulated; the first was, Did we possess the power of forming another coalition against France? and the second, If we continued the war, what injury could France do to us, or we to France? The first coalition had failed, the second had equally failed. What encouragement had we to hope that the third would be more fortunate, and to hazard so dangerous an experiment?

Britain.

It was impossible, he contended, to find in Europe the elements of such a combination of force, directed to the attainment of one grand end; and if no coalition could be formed, what object could we possibly have in the farther prosecution of hostilities? As to any injury which France could do to us, or we to France, it did not require much argument to prove there was none. Where, and in what manner, was it possible for us, with our immense superiority by sea, to effect a fatal blow; or for the republic to invade an island, not only defended by its navy, but fortified by the hearts of the people? The fact was, neither power could affect the other; and to continue hostilities, would be a barbarous effusion of blood, for no end but slaughter. His lordship then expatiated on the advantages we had gained, and the good faith we had maintained with our allies, releasing them from express stipulations when they were exposed to danger by continuing faithful to their engagements. To Portugal every protection had been given, consistent with our strength and her interests. Naples was required to exclude our shipping from her ports. She went farther, and joined in an alliance, which would have justified a declaration of war on our part; when, with a magnanimity peculiar to the spirit of Britain, we interfered in her favour; obtained the restoration of her dominions, and the re-establishment of her independence. To the Ottoman Porte, who of all our allies remained faithful to the last, we evinced proofs of inviolable attachment and gratitude; for we procured for her not only the restitution of her territories, but the renunciation of France to acquisitions which threatened her existence. To the stadtholder and the king of Sardinia, to whom we were not bound by obligation, every thing had been performed which this country was able to perform. An arrangement concerning the former had been carried on at Berlin; and though from various reasons it had been withdrawn, the stadtholder was satisfied with our measures. But it had been contended, that we had given up, by treaty, an island of great importance to our foreign concerns and commercial prosperity, Minorca, which he did not consider as an acquisition worth retaining. In war, we had always acquired that island whenever we pleased, and always lost it at the conclusion of peace to avoid the expence. Of Malta, he spoke with less confidence, which, from its impregnable state, was certainly of political consequence in the Mediterranean: but Malta was no source of trade and opulence; and, connected with the prosperity of the Levant, its consequence was considerably diminished. The Levant trade might, like many other topics of commercial speculation, be highly valued; but as far as it related to England, was next to nothing. The whole of our manufactures, exported thither during the war, had not exceeded the sum of 112,000*l.*; and this was to be taken out of the aggregate exports of 24 millions. The trade of Great Britain was inconsiderable, compared with that of other countries, to the Levant. It was chiefly supplied by the south of Europe, and must remain with these places, from the nature of its articles and the facility of its intercourse. Respecting the north of Europe, it had principally been in the possession of the Dutch. Here it might be asked, why the Dutch, who had no settlement in the Mediterra-

VOL. IV. Part II.

nean, had succeeded in cultivating this branch of commerce? Because their policy was wiser than ours. We prevented ships, with forged bills of health, from entering our ports; made all vessels, sailing from the Mediterranean, perform quarantine; and prohibited the landing both of sound and bad goods. The Dutch, on the contrary, gave them an airing within their ports, separated the good from the bad merchandise, and allowed the immediate importation of the former. Thus they occupied almost the whole of the northern trade to the Levant, which was so strongly felt by us, that two years ago, it was deemed expedient to repeal these laws, to encourage a system of trade, which the Dutch converted wholly to their own profit, without possessing a port in the Levant.

Lord Hawkesbury added, that of Trinidad and Ceylon he could not say too much, when he called them the two great naval stations of the parts of the world to which they belonged. Ceylon contained ports so capacious and secure, that the whole of the navy and commerce of Great Britain might ride with ease and safety in them. It held out a position to which our Indian army might retire, if necessary, and defy the attempts of the united force of the world. Trinidad was also of considerable naval importance, and so healthy and productive, as to induce us to select it in preference to every other possession in that quarter. Thus, considering the results of the war, if the term glory be not taken into account, we have at least made an honourable peace; we had been engaged in a tremendous contest, and come out of it, considering the circumstances, with advantage. The situation of Europe and of Great Britain might appear critical; but, in a sound system of policy, consisting of firmness and moderation, would be found a counterpoise for every danger, and a remedy for every evil.

Earl Temple considered those who had signed the peace, as having signed the ruin of their country. Amongst other ill consequences, he lamented the encouragement hereby given to republican principles; and one of its effects was to revive the hopes of the disaffected. He recapitulated the various ostensible objects of the war, not one of which had been accomplished. The only adequate plea for such a peace, was dire necessity.—Mr Pitt said, that, upon a subject of such importance, it was his misfortune to differ from those with whom it had been his happiness to live in habits of strictest friendship.

He remarked, that it was undoubtedly the duty of government, in negotiations, to obtain the best possible terms; but it was difficult to know how far insisting on some lesser points might endanger the whole treaty; and, for his own part, he had no hesitation in declaring, that he would rather close with an enemy on any terms, not inconsistent with the honour of his country, than continue a war for any particular possession. When he had the honour of a seat in his majesty's councils, if it had come to a question of terms, and if the pacific disposition of the enemy had corresponded with ours, he knew that he himself should have acted on that principle; and knowing this, it was but candid to apply it to another administration. He did not pretend to state, that this peace fully answered all his wishes; but the government had obtained the best terms they could, and the terms for which

4 U

we

Britain. we contended would not have justified ministers for protracting the war.

Our grand object was to give additional vigour to our maritime strength, and security to our colonial possessions. In thus considering the subject, it was necessary to look to the leading quarters of the world in which we were to seek this security. Our acquisitions were all in the Mediterranean, in the East and in the West Indies; and if, on examination of this treaty, it should appear, that in two out of the three quarters mentioned, viz. in the East and West Indies, we had retained such possessions as effectually preserved our ancient territories, we had done much. He meant not to undervalue the conquests in the Mediterranean, especially Malta; but certainly it was of secondary consideration, when compared with the Indies. The Levant trade he accounted unimportant, in comparison with the trade with Ireland, America, and the tropical regions. He accounted it sound policy to place Malta under the protection of a third power, to avoid attracting the jealousy of France. Mr Pitt declared, that he regarded the Cape of Good Hope as far inferior to Ceylon, which, of all places upon the face of the globe, would add most security to our East India possessions; as Trinidad was of the greatest importance in the West, being a post from which we might direct our future operations against Spain in South America. When it came to be a question of terms between England and France, it was necessary for us to retain one of the greatest naval stations in the West Indies, because our chief want in that quarter was a naval post. The four were, Guadaloupe, Martinique, St Lucia, and Trinidad; and of those Trinidad and Martinique were the best, and Trinidad the better of the two.

Mr Pitt justified our conduct towards our allies, who themselves had forsaken us, or requested to be relieved from their engagements towards us. Even were we to take upon ourselves the granting a remuneration to the Prince of Orange, Mr Pitt thought it ought not to stand in the way of a great national arrangement. But it had been affirmed, that we had signed the death-warrant of our country in this peace, and given to France an augmentation of maritime strength, whilst we had gained nothing to balance her power. Now, in the first place, if we had retained all our conquests, it would not have made any difference to us in point of security: not that he meant to imply that he would not have kept them all if he could: but they were not important, except, as they would give us a little more or less of colonial strength, and only tended to promote our security, by increasing our finances. The acquisition of all these islands would not have enabled us to counterbalance the power of France on the continent; they would only have added a little more wealth, which would have been ill purchased by a little more war.

Mr Pitt said, that our resources were greater than the French, or even the English themselves, fully understood: but they ought not to be lavished away; as, by a continuance of the war, we might come to sit down in a worse relative situation than at present. He said, that the former administration had wished to see the restoration of the French monarchy, but did not insist upon that point. If it became impossible to

attain this, policy required that we should remain satisfied with the next best. Britain.

Mr Fox declared himself satisfied with the terms of the treaty, and asserted, that no perseverance in the war would have enabled us to make peace upon better conditions. There were persons, he said, who lamented the peace as glorious for France. If it were so, and not inglorious to England, it gave him no concern. The opinions of men depended in a great degree upon their conceptions of the causes of the war; if one of its objects was the restoration of the accursed despotism of France, to him it was another recommendation of the peace, that it had been obtained without the accomplishment of such an object. If the coalition to restore the Bourbons had succeeded, the consequences would have been, amongst all the kings of Europe, a perpetual guarantee against all people who might be opposed by any of them, in any part of the world. All countries therefore must be benefited by the failure of such a project, but no one more so than Great Britain. Had the coalition in the reign of Charles I. established such a guarantee, would the liberties of the people have been preserved against the house of Stuart? Had such a guarantee existed in latter times, would the revolution of 1688 have been able to maintain itself?

In the terms and tone of the present treaty, he perfectly coincided. He approved the terms, and thought the noble secretary had wisely tempered firmness of conduct with moderation of tone; but further than this he could not go: he would by no means agree respecting the time in which the treaty was made: it came many, many years too late.

He said, he would put it to the house, whether at the time the opposition was most railed against, for advising pacific measures, we could not have made peace on terms equally advantageous with the present. Would not France, on the breaking out of the war, have acceded to any? Would she not then have relinquished Holland, and perhaps abandoned her designs on the Netherlands? But since that eventful period could we not have negotiated better very often, for instance, after the surrender of Valenciennes? Again, at Lisle, when we only failed from the extravagant pretensions of administration? In January 1800, the chief consul made a direct overture, and we returned answer, that the most effectual mode of facilitating peace would be to restore the Bourbons, not indeed as the only means, but it was left to the French to suggest any other: Did we hint then at the possession of Ceylon or Trinidad? Would not Bonaparte have added these? Yes, and the Cape into the bargain. We then might have had Egypt by the convention of El Arish. The gallant Abercromby, indeed, would not have fallen covered with laurels in the lap of victory, nor would our brave army have acquired immortal honour; but we should have gained Egypt without the loss of blood or treasure. The chief consul might not perhaps have relinquished the Netherlands, or the left bank of the Rhine; but in Italy he had only the Genoese territory, and we had nothing then to resist to the south-eastward of the Alps, and our allies were victorious to the frontiers of France. At that time, the instability of the government operated with us; but neither its stability nor instability were of any real consequence. None of

Britain. of the convulsions and changes of the French revolution produced any material difference in her relation with foreign powers. She had at the beginning made peace with Prussia, and sedulously preserved it during the stormy times succeeding its ratification. We were told by the ministers to pause, and we did pause from January 1800 to October 1801, and added 73 millions to our national debt, since we returned that impertinent answer to the overtures of Bonaparte. This pause cost five times as much as all the duke of Marlborough's campaigns.

1113
Definitive treaty negotiated.

To negotiate the definitive treaty of peace, the marquis Cornwallis went to Paris towards the close of the year, and from thence to Amiens, where the negotiations went on very slowly, and were not concluded till the 27th of March 1802. The chief difficulty occurred with regard to Malta. It was at last agreed that it should be restored to the knights of the order of St John, under the protection and sovereignty of the king of Naples; and that it should be under the guarantee of France, England, Russia, Spain, Austria, and Prussia; that if the order should not have sufficient troops to defend the island, the guaranteeing powers should each contribute an equal portion of troops, the officers to be appointed by the grand master. It was settled that Malta should be a neutral port, that one half of the garrison should be Maltese, and that there should be no French or English body of knights, or tongue as it is called. The king of Naples, however, was to be invited to garrison the island with 2000 men for one year, from the restitution of the knights; which was to take place in three months after the exchange of the ratifications of the treaty. In other respects, the definitive treaty differed little from the preliminaries formerly agreed to.

1119
Suspicious conduct of Bonaparte.

During the dependence of the negotiation, the French first consul, Bonaparte, had taken some steps which indicated little moderation, or rather an arbitrary presumptuousness of character, which demonstrated that it would be extremely difficult to remain upon terms of amity with him, and that the desire of extensive dominion, which at present governed his council, was of too restless a character to allow much hope of tranquillity to the world. Without waiting till a definitive treaty of peace should be concluded, he sent an immense army to St Domingo, which obliged Britain to send to the West Indies a powerful fleet to watch its motions. On the continent his measures were much more arbitrary. A considerable portion of Lombardy, with Milan as its capital, had been erected into what was called the Italian republic, containing some millions of people. This was now united to France, by the form of nominating Bonaparte to the supreme office of president over it. This last measure would at any other period have involved all Europe in war; but at present no state ventured to interpose; and the British ministers finding no power in Europe disposed to resist this step towards the permanent aggrandisement of France, and being themselves truly anxious, as it would seem, to restore peace, did not interrupt the negotiations on this account.

1120
Definitive treaty.

On Thursday the 29th of April, Lord Pelham by his majesty's command, laid before the house of lords, a copy of the definitive treaty of peace between his

Britain. Britannic majesty and the French republic, his Catholic majesty, and the Batavian republic, signed at Amiens on the 27th of March. Several debates occurred in that house upon the subject; and, at length, on the 15th of May, Lord Grenville moved the order of the day, for the house to take into consideration the definitive treaty. He remarked, that it might be asked of what use was discussion, now that peace was concluded? Was it to abrogate, could it correct the treaty? To this question he was the first to answer that this unfortunate treaty had been ratified by his majesty, and was therefore irrevocable; to its terms, however injurious, we were bound to accede. By evasion we should but add to disaster disgrace, and, with the loss of national honour, fill up the measure of national calamity. He wished not to impede the execution of the treaty, but to demonstrate to that house its dangerous tendency; to ascertain the situation in which it left the country; to point out the perils which impended, and the safety which yet remained. His objections to the preliminary treaty he had already stated; but to the definitive treaty there were objections yet more formidable. His lordship observed, that the two bases of negotiation, the *status ante bellum*, which signified the actual situation of the parties previous to hostilities, and the *uti possidetis*, which referred to their position during the pacification, had both been applied in the most prejudicial manner to this country. With regard to herself, England had adopted the *status ante bellum*; with regard to her rival, the *uti possidetis*. England had ceded her own conquests, and confirmed to France her new acquisitions. France possessed dominion on the continent; we had to oppose that dominion, the colonies of France and Spain. It would have been just that France should purchase our colonial by her continental sacrifices. His lordship contrasted the definitive treaty with that of 1763. It had, he said, been an invariable principle with Lord Chatham, to make the preliminary as much as possible the definitive treaty. Our negotiators had treated with France during a naval armistice. Immediately subsequent to the preliminary treaty, France had sent an armament to the West Indies, and obliged England to destine for the West Indies also, a naval force more than double to any squadrons which had been sent during the war. The necessity of keeping in the West Indies 35 sail of the line was the first fruits of the peace. His lordship contended, that it was incumbent on our negotiators to have insisted that the French fleet should not sail till the preliminary articles were definitively ratified, and till the first consul had afforded proof that he meditated not the accession of power he had since made in Italy. It was obvious, that the definitive treaty contained concessions more important than the preliminary articles; and it was palpably the object of the French government to exclude the commerce of this country from the continent of Europe. With respect to the situation in which Portugal and the prince of Orange were left by the treaty, the house had been told that it was a pity, and that the articles were read with regret. The proposed indemnity to the prince of Orange was evidently at the option of France; for the Cape of Good Hope, no effort had been made to ensure its independence; and Malta, whose independence had been expressly

1121
Debates on the definitive treaty.

Britain. expressly stipulated, with the provision that it should be guaranteed by one of the powers of Europe, competent to its protection, was finally placed under the guarantee of six powers who never could be brought to agree on the subject of it. Its restoration to the order was nominal and futile. He had estimated the whole Maltese revenue at 34,000*l.* of which, however, 8000*l.* only came to the knights; he was now competent to state that the expenditure of Malta amounted, on the average of ten years, to 130,000*l.* per annum. The dominions in France and Spain had been confiscated; the langues of Italy had produced about 20,000*l.* or 25,000*l.* from their property in Piedmont, which was also confiscated; the langues of Naples and Portugal, with a revenue of 20,000*l.* remained to support the establishment of 130,000*l.* The order of Malta was virtually extinct; it would be subject to the nomination, the influence, and the dominion of France. His lordship objected to the treaty, that certain pecuniary claims, which Britain had for supporting the French prisoners during the war, had been relinquished. He contended that, by the circumstance of this treaty not containing a clause as usual renewing former treaties, and in particular by the non-renewal of the treaty of Utrecht, this country had ceded its claims of equal participation with France in the privileges of commerce in Spanish America. In like manner, we had confirmed the cession of Goree and Senegal, without renewing the clause which stipulated for us the liberty of carrying on the gum trade; whilst France had manifested her hostility to our commerce, by prohibiting the right of trading on that part of the coast of Africa. His lordship proceeded to take a retrospective view of the situation of this country at the commencement of the negotiation. With a colonial territory of an immense extent, we had, in the very conquests achieved by our arms, the means of perpetuating our victories. From the West Indies, the produce of which amounted to two millions annually, a considerable revenue had arisen, which was now lost. By our naval superiority, we had controuled the movement of the French fleet; they were now at liberty to steer for the West Indies, and we were under the necessity of sending fleets to watch them. We were in possession of resources adequate to the prosecution of the war, and held in our hands the means of extorting a just and reasonable peace. Instead of improving these advantages, we had resigned to the French the preponderance of power on the continent, established her sway in Italy, and annexed to her important possessions in India. Even our right of sovereignty in India was no longer recognized. It had been suggested that this right was guaranteed by the silence of the definitive treaty; a mode of argument which appeared equally strange and singular. His lordship affirmed, that the sovereignty of the Cape was necessary to the safety of our territories in India. He instanced the war with Tippoo Sultan, when a corvette had been sent to the Cape, from whence fresh troops were immediately dispatched, who landed, marched, and co-operated at the siege of Seringapatam. By ceding the Cape to Holland, we had ceded it to France. The town and port of Cochin had also been surrendered to Holland, and virtually to France. In the West Indies we had restored to France Martinique

and Tobago, and facilitated the recovery of St Domingo. France was also mistress of Louisiana, and in reality of Florida, which could not from its vicinity to Louisiana remain subject to Spain. France possessed the key of Mexico, which she might enter at any period. If we returned to the Mediterranean, his lordship said, it would be impossible to send there a single ship, without the permission of France. We were stripped of Majorca, Minorca, and even of the island of Elba; we were excluded from Leghorn, and deprived of the means of maintaining a fleet in that sea. The king of Sardinia could no longer open to us his ports. His lordship observed, that the victory obtained by Lord Nelson at Aboukir was to be attributed to the assistance rendered by the king of Naples. In return for these services, the British government had stipulated that the French republic should evacuate his dominions, without stipulating that they should not return to them. His lordship added, that whatever the valour of the British navy had won, the incapacity of a British ministry had lost. He would ask whether the advantages of such a peace preponderated over the disadvantages of the war? It had diminished our commerce, and rendered it absolutely necessary, for the sake of safety, to maintain a great naval and military force in constant discipline.

The duke of Norfolk expressed his hope, that now the sword was restored to its scabbard, it would not again be unsheathed for the acquisition of a station in the Mediterranean. Lord Auckland, in reply to Lord Grenville, discussed a point of some importance in the law of nations. He stated, that, from an attentive perusal of the works of the publicists, he had corrected, in his own mind, an error still prevalent; that all treaties between nations are annulled by war, and, to be reinforced, must be specially renewed on the return of peace. It was true, that treaties, in the nature of compacts and concessions, the enjoyment of which has been interrupted by the war, are thereby rendered null: but compacts which were not impeded by the course and effect of hostilities, such as the rights of a fishery on the coasts of either of the belligerent powers, the stipulated right of cutting logwood in a particular district; compacts of this nature were certainly not affected by war. There were also circumstances which might authorize the dissolution of treaties, without any rupture between the two parties. In the late revolution in Holland, the antecedent treaties subsisting between us would have been dissolved, although no hostilities had ensued, by her incapacity to maintain the relations to which those treaties were meant to apply. It had therefore been well observed by Vattel and other writers, that treaties cease whenever an essential alteration in either of the contracting parties takes place. He applied this doctrine to Savoy, Switzerland, and other countries, the temporary victims of the French revolution. His lordship admitted, that the definitive treaty contained not a single provision, direct or indirect, for the renewal of treaties, which had subsisted previous to the war; but it was not true, that by the non-renewal of our treaties with Holland, the vessels of that republic would be exonerated from the ancient practice of striking their flag to British ships of war in the British seas; that

Britain. that practice had existed independent of the treaty of 1782, or even of the treaty of Breda in 1767, which were only recognitions of a pre-admitted claim. The same remark was applicable to the sixth article of the treaty of 1764, by which the States-general promised not to obstruct the navigation of British subjects in the eastern seas. That article was no new grant, but an acknowledgment of a right, and a notification to merchants that they would not be disturbed in the exercise of that right. With respect to France, his lordship acknowledged, that the commercial treaty of 1786 had expired, but not till it had reached the natural era of decay; nor should he feel solicitude for its resuscitation, unless our negotiator at Amiens could have proved, that the French manufacturers were able, in 1802, to resume the competition to which they were unequal in 1786, under the existing tariff; unless we also would have sacrificed the additional wine duties, which produced above a million sterling. He had the deepest conviction of the importance of commercial treaties; and he appealed to the recollection of the manufacturers of Birmingham, Staffordshire, Lincolnshire, Yorkshire, and Paisley, who, during six years, had experienced the benefits of the commercial treaties. His lordship was ready to admit, that the great and venerable mass of treaties, which had long constituted the title-deeds of nations, was utterly gone; but this event was independent of omission in the definitive articles; it was caused by the fate of war and the tide of revolutions, which had swept away the old order of things in Europe. He thought the French plenipotentiaries right in objecting to the renewal of treaties, irreconcilable with the present state of Europe. With regard to our sovereignty in India, it had been confirmed and extended by various treaties, recognized by all the powers of Europe and India, who had accepted privileges from us; and finally established by the undisturbed possession of 40 years: that France was bound by the law of nations, in India and elsewhere, and by that law was pledged to resume the situation she had maintained previous to the war.

On the contrary, Lord Carnarvon represented the treaty as pregnant with danger to the country. With the highest respect for the virtues of those who composed the present administration, his lordship confessed, that he had never confided in their talents or experience. The moment they had taken the helm, they had pressed into their service a noble lord, beloved indeed, but ill fitted for the invidious task of coping with men old in craft, adepts in duplicity, regardless of principle, and unpractised in virtue. Under negotiators so unequal, some disadvantages were inevitable; yet the preliminary articles, which disappointed even the least sanguine, and which were approved by none, were welcomed by all. It had been hoped, that some articles relative to our allies, and involving our own national honour, would be altered: but the definitive treaty, instead of realizing, had annihilated these hopes; concession was heaped on concession, disgrace added to disgrace. By omitting to renew former treaties, ministers had unadjusted all former adjusted disputes, and without the customary acknowledgment of our rights, had left us to the honour and justice of France. So mysterious, his lordship observed, had

been this part of their conduct, that it was difficult to understand whether they sought this omission, or were betrayed into it. The country was entitled to know the truth, and his lordship challenged the ministry to avow it. It was palpable, that a deliberate refusal to renew a treaty, admitted but of one construction, that the treaty was abrogated; if the refusal had come from France, the stability of the peace was on a different footing: all former disputes were let loose.

Lord Ellenborough expressed much surprise, that the non-renewal of treaties should have been urged as a serious objection to the definitive treaty. To what purpose was solemn nonsense to be revived? Were not these treaties replete with articles wholly inapplicable to the present political state of Europe? For himself, he could as well think of the revival of the condition of mankind, in some very remote period, as of the ancient treaties which had become inapplicable and obsolete. Our sovereignty in India, his lordship said, rested on the rights of conquest in legitimate war, upon the repeated recognition of all the powers of Europe, and on the best rights of all, possession. His lordship, in a rapid epitome of our history in India, observed, that the acceptance of the Dewannee was a foolish thing, though he honoured the gallantry and ability of Lord Clive. He approved of the arrangement respecting Malta; and thought the cession of the Cape of Good Hope a subject of felicitation rather than of regret. He stated, that the charge at which it must have been retained was enormous; that England could not send thither a single chaldron of coals, without the expence of 26l. 10s.; and it was notorious, that when the Dutch were remitting to this country, in the season of scarcity, a scanty supply of grain, the English government had to procure rice and other provisions from India; and was even obliged to send home for a supply of biscuit, not for our troops, but for the Dutch themselves. Much had been said of the free navigation of the Indian seas. Had a British ship been stopped in those seas? For the paltry prerogative of lowering the Dutch flag, he thought there was little magnanimity in exacting of the weaker, more than was required of the stronger powers; and he added, that Portugal was grateful for the services rendered her by the definitive treaty.

The same subject, after being repeatedly alluded to, ¹¹²² was finally discussed in the house of commons on the 13th of May. Mr Windham attacked the treaty in several of its prominent parts. With regard to Malta, ^{of commons} he contended, that it must ultimately fall into the hands of the French. ^{on the definitive} The little order of Malta, ^{treaty.} which contained in itself the great characteristic and distinctive qualities which the French revolution had subverted, was now destroyed. The little phial which contained the essence of the old principles, had been diluted by ministers, not even with common water, but with water from the puddle. The German knights had already refused to serve in a body so degraded and debased; the Neapolitan soldiers would form no security for the independence of the island; the state of Malta was a virtual surrender, and our position in the Mediterranean untenable. The Cape of Good Hope was ceded, in full sovereignty, to the Dutch, who were thus at liberty to resign it to France. It had been said, that the Cape was but a tavern; and ^{surely}

Britain. ting each man at 60l. the sum of 18 millions would be necessary to provide for the island the ordinary complement of black inhabitants. Was it probable, that France should possess the capital to make this purchase, without which, the island would be of little value? His lordship concluded with recommending a vigorous establishment, adequate to the protection of our rights, independence, and honour.

Mr Addington said, that he desired not that the treaty should be praised. He had never regarded it with sentiments of exultation; never lavished on it panegyric: he was content, that the honour of the country was unsullied by the measure he had adopted. If he were asked, why, after the transactions at Lyons, no remonstrance had been made to France? he must answer, that it was wrong to put questions, which his duty as minister forbade him to resolve. This he would say, that, had the negotiation failed, it was the intention of his majesty's ministers, to have laid every document concerning it before the house. He acknowledged, that the territorial acquisitions of France could not be viewed without regret; but there were events which we could not controul, and dispensations in which we must acquiesce; he should rejoice to see the resources of this country economized by peace. He trusted, that peace would be preserved; or, should the war be renewed, hateful as was that supposition, it would be a satisfaction to every man in that house to reflect, that nothing had been neglected for the preservation of peace. He would even say, that we were pursuing the best course for war, by husbanding our resources, at a period we had the liberty of doing so; or, what was better, of preventing a war, by being prepared to meet it.

Mr Sheridan treated the subject with some gaiety. He said, he supported the peace, because he was convinced that ministers could obtain no better; their predecessors had left them to chuse between an expensive, bloody, fruitless war, and a hollow perilous peace. He attacked the new oppositionists, who had been supporters of the former administration, and demanded for what did we go to war? Why, to prevent French aggrandisement. Have we done that? No. Then we are to rescue Holland: Is that accomplished? No. Brabant is the *sine qua non*: Is it gained? No. Then come security and indemnity. Are they obtained? No. The late minister told us, that the example of a jacobin government in Europe, founded on the ruins of a holy altar, and the tomb of a martyred monarch, was a spectacle so dreadful and infectious to christendom, that we could never be safe while it existed, and could do nothing short of our last effort for its destruction. For these fine words, continued Mr Sheridan, which had at last given way to security and indemnity, we had laid out near 200,000 lives, and nearly 300 millions of money, and had gained Ceylon and Trinidad. But one grand consolation remained. Bonaparte was to be the extirpator of jacobinism; the champion of jacobinism was to become a parricide; the child of sin was to destroy his mother; he had begged pardon of God and man, piously restored bishops with the salaries of curates, and penitently extorted of them a solemn oath to turn spies and informers in his favour. It had been said, that France must have colonies to be afraid of

war; that is the way to make Bonaparte love peace. Britain. He has had, to be sure, a rough military education; but if you put him behind the counter a little, he will mend exceedingly. When he was reading the treaty, he thought all the names of foreign places, Pondicherry, Chandernagore, Cochin, Martinico, all ceasions. No such thing; they are so many traps or holes to catch this silly fellow in, and make a merchant of him. Mr Sheridan said, that at present in Britain, nobody knew who was minister, as the present ministers continued to identify themselves with the former. That when the ex-minister quitted his office, almost all the subordinate ministers kept their places. Of the late minister he said, that none more admired his splendid talents than he did. If ever man was formed to give lustre to his country, he was that man. He had no low, little, mean, petty vices; he had too much good sense, taste, and talents, to set his mind upon ribbonds, stars, and titles; he was not of a nature to be the tool and creature of any court: but great as were his talents, he had misapplied them in the politics of this country, he had augmented our national debt, and diminished our population. He had done more to abridge our privileges, to strengthen the crown at the expence of the constitution, than any minister he could mention. Mr Sheridan concluded with moving, as an amendment to Lord Hawkesbury's address, that it was the opinion of that house, that the omission of various opportunities of negotiating peace with advantage to this country, more especially the rejection of the overtures made by the first consul of France in January 1800, appeared to that house to have led to that state of affairs, which rendered peace so necessary, as to justify the painful sacrifices which his majesty had been advised to make for the attainment thereof. The address proposed by Lord Hawkesbury was carried by a very great majority.

During this session of parliament, the most important operation of finance, consisted of the repeal of the tax upon income, which gave great satisfaction. Indeed, in their whole conduct, administration conducted themselves with a degree of moderation and prudence, which greatly conciliated towards them the minds of the public. They defended on all occasions the former ministry, against the attacks of the old opposition; and in return, they were supported by a considerable number of the members of that administration, including Mr Pitt. At the same time, they did not appear unwilling to enter into political connections with the members of the old opposition. Parliament was prorogued on the 28th of June, and dissolved on the following day. The elections which immediately succeeded, exhibited the singular spectacle of an administration, that avoided interfering in the choice of the members of parliament. The members and friends, however, of the old administration, together with their opponents, were abundantly active.

The effect of the change of ministry had by this time been very sensibly felt over the whole island. During the preceding ten years, the minds of men had, in a less or greater degree, been kept in a state of constant alarm from the fear of plots and conspiracies against the government; and from the apprehension, that a most dangerous disaffected party was at all times ready to burst forth into action; and that the British constitution

Britain. constitution was only preserved in consequence of the suspension of the habeas corpus act and other legislative restraints, aided by the extreme vigilance of administration, and of their friends, in repressing disaffected persons. Hence society existed under a sort of general apprehension and distrust; and persons originally unfriendly to the war, suffered, in all departments of business, and in every quarter of the country, a considerable degree of political persecution. All this had now passed away; the new ministers suffered the penal and restraining laws quietly to expire, and the constitution to depend for support upon its own strength and the ancient provisions of the law; they gave themselves no trouble about the general sentiments of the people with regard to speculative subjects, and seemed willing to conciliate the good will of all orders of the state. The consequence was, that all the fears and anxiety which formerly existed about the safety of the constitution, seemed to pass away like a dream, and an universal attachment to the institutions of the country appeared to exist, without any jealousy that danger to their safety was to be apprehended from any quarter; and political animosities, being no longer fed by alarms excited by government, were, as if by a sort of enchantment, appeased and forgotten.

1125
Effects of
peace.

With regard to the effects of peace upon the British and French nations, they promised at first to be extremely favourable to the general interests of humanity. The French had successfully defended their own independence, and in their turn had assailed those by whom it had been menaced, with such a persevering energy as secured to them a portion of respect from the British nation; while on the other hand the maritime triumphs of Britain had been so splendid during the whole war, and the valour of her troops in Egypt had been so distinguished, as to secure to this country a high degree of consideration in the eyes of the French. The people of the two countries accordingly seemed eager to unite into habits of great intimacy with each other. Very considerable numbers of Frenchmen came over into Britain; while at the same time multitudes of persons of all ranks hastened from Britain, to visit a country that had of late years excited in so remarkable a degree the attention of all the nations of Europe, and been the scene of such extraordinary transactions. Upon this tendency of the two nations, thus reciprocally to abandon their mutual animosities, a system of commercial intercourse might have been reared, of a nature much more perfect and simple than that created by Mr Pitt's commercial treaty. There is no reason to believe, that any disposition existed on the part of the British government to stand aloof from France, or to avoid, for any political reason, the extension of our commerce into that country. There can be no doubt that such an intercourse would have proved favourable to France in every point of view. It would have enabled her people to derive considerable aid from the great capital of British merchants, which would have been rapidly and liberally advanced towards promoting the culture of their wines and other valuable productions. Even in a political point of view, France would have derived aggrandisement from such a connexion. What she wanted was a navy to enable her to defend her colonies, or even contend with any chance of success against Britain in the event

VOL. IV. Part II.

of a future war. This she could only obtain by means of commerce, and commerce could in no way be better encouraged than by engaging continually in trade with the first commercial nation upon earth.

Britain.

But it was now to be demonstrated to mankind, that a man may be qualified to lead armies successfully to battle, to overrun provinces, and to attain the envied title of a conqueror, who at the same time possesses only a very moderate portion of magnanimity, of self-command, or knowledge of the rules of sound policy or the best interests of nations. The French government, instead of seizing the opportunity of encouraging their people to become commercial, and thus gradually acquire wealth, and form a maritime power, by laying open their ports, and holding out to Britain a commercial treaty upon the most liberal principles, shut their own ports more closely than during the most violent period of the war. They vainly fancied, in this way, that they would enable their own manufacturers to rival those of Britain, while in fact they only excluded their wines from the British market; and by thus losing the only sure and ready mode of attracting riches into their country, they prevented the acquisition by enterprising individuals of a large capital gained by trade, without which no manufactures can ever greatly prosper. They idly thought they were in this way limiting the trade of Britain, which having all the rest of the world open to its efforts, could not thus be injured, and thus in truth they only injured themselves.

1126
Conduct of
the French
government.

With similar ill policy, or at least with a restless spirit of ambition, the French government could not abstain from pursuing aggrandisement by those efforts of violence which are only tolerable in the midst of war, but which in peace justly excite the jealousy and indignation of mankind.

One of the first enterprises of Bonaparte, in consequence of the peace, was to reduce under his power the island of St Domingo. That great and fertile island had suffered the most severe calamities in consequence of the revolution. These had terminated in the emancipation of the negroes from slavery; and they had formed themselves into a regular and sufficiently orderly government, at the head of which was one of their own race, Toussaint, a man of humanity, and, it is said, of considerable talents. Reports were circulated in Europe, that he wished to render St Domingo independent of France; but of this there is no proof: and it is probable that his chief offence consisted of the general estimation and personal consequence to which he had attained; and that the despotic spirit of Bonaparte could endure no appearance of elevation of character, or of independence, in any part of the French territory. Nor was it unnatural that under a military government force should have been employed in preference to any methods of conciliation. At the end of the year 1801, an army of 25,000 men was sent out to St Domingo; and as single ships and small squadrons continued to sail during the winter, loaded with troops, it is believed that near 40,000 men were employed in what might be called the first division of the expedition. We have very defective accounts of their proceedings, but they appear to have been extremely disgraceful on the part of the French. The negro chiefs having refused unconditional submission,

1127
French ex-
pedition
against St
Domingo.

4 X

they

^{Britain.} they were attacked, and having been defeated in several battles, disunion among themselves took place, and Toussaint was at last induced to enter into a negotiation. The terms of the treaty were concealed; but, as he was still at the head of a respectable force, it is believed that the possession not only of his personal freedom, but the undisturbed enjoyment of his property, was secured to him, and his followers were promised a full indemnity. This took place in the beginning of May 1801.

The French general, Le Clerc, the brother-in-law of the chief consul, no sooner perceived the negro chief in his power, and the tranquillity of the colony apparently re-established, than he immediately accomplished one of the basest acts of treachery that ever disgraced a government. The abdicated general was accused of a conspiracy, though it was evident there was not time from his submission to his seizure even to meditate, much less to organize, such a measure. On the 12th of May, Toussaint, with his whole family, was put on board a frigate, and, contrary to the most solemn treaty, shipped off for France. There he soon perished, in consequence of harsh usage in prison. The negroes of St Domingo soon perceived themselves to be betrayed and deceived. An attempt was made to reduce them back into a state of slavery after they had now enjoyed freedom for several years, and they were publicly sold as formerly. The chiefs who had been prevailed with to desert Toussaint, and whose desertion had led to his surrender, now justly learning that they were destined to partake in the miserable fate of their deluded colleague, betook themselves to flight. The whole island revolted. The climate came in aid of these avengers of tyranny and falsehood. The miserable instrument of the first consul's cruelty fell himself the victim of the climate. After a series of horrors and atrocities, even worse than those which blacken the memory of Robespierre, Marat, and Carrier, and which will, to future ages, remain a lasting stain on the French character; the republic had to regret the loss of 60,000 of her best troops, in a vain attempt to subdue a colony, which might, with temper and humanity, have been conciliated.

¹¹²⁸ In Europe the conduct of the French government was not less arbitrary. The whole fortresses of Piedmont were dismantled, and that country ultimately annexed to France. The same was done with regard to the duchy of Parma and Placentia. The Swiss, in the mean time, whose form of government had been altered in imitation of that of France, wished to restore the ancient constitutions of the cantons, under which their ancestors had prospered during so many ages. Their present leaders, however, who had risen to power by the protection of France, solicited the interference of Bonaparte in their favour. He accordingly sent a numerous army against Switzerland, and in spite of the remonstrances of the British court, placed the sovereignty in the hands of his own dependents or adherents.

¹¹²⁹ After all their struggles for freedom, the French nation now submitted to a confirmed military despotism. When Bonaparte first assumed the appellation of chief consul, it was under the declaration, that his office would only endure, in terms of the constitution then promulgated, for ten years. But this constitution was

now altered, and the assent of the people was demanded to a new constitution, by which Bonaparte was to remain consul for life, and even to possess the power of nominating his own successor. Suffrages to this measure were obtained to the number of 3,577,259. The event was celebrated with the highest magnificence in Paris; and addresses of congratulation were presented from the different courts of the continent of Europe, and even from the emperor of Germany.

¹¹³⁰ These transactions could not fail to be noticed in Britain, and to be the subject of remark in the public newspapers. In these the unprincipled ambition of Bonaparte, and the degraded character and state of the French nation, became topics of frequent discussion. It appears that Bonaparte very early became jealous upon this head. The English had long boasted, in consequence of their political freedom, of their superiority as a people over their enslaved neighbours of France; and the first consul, no doubt, dreaded lest the vanity of his subjects should be wounded by representations coming, from the free press of England, of the state into which they had fallen. A great degree of irritation was thus produced in the French government against England; and the chief consul even went so far as not only to prohibit the importation of English newspapers in France, but to demand from our government, that the best bulwark of British freedom should be done away, by imposing restrictions upon the liberty of the press. He was weak enough, though the medium of the French official journal, to commence a contest of argument and of eloquence against the writers of English newspapers. In such a warfare he could not fail to be beaten; because they had nothing else to do but to write, and because the obscurity of their situation, as individuals, enabled them to inflict wounds without fear of reprisals. Such writers also had much to gain by such a contest, as they could wish for nothing more favourable to their employment, than to be enabled, during a dull and monotonous period of peace, to render their lucubrations interesting, and to amuse their readers, by engaging in a paper war with the great Bonaparte. These circumstances, however, added to the restless ambition of this personage, and his obvious want of discernment of the true interests of France, or want of patience to pursue them, left little reason to hope that the peace so recently concluded would be of long duration.

¹¹³¹ The new parliament assembled on the 16th of November. Mr Abbot was chosen speaker of the house of commons; and on the 22d of the same month his majesty, in a speech from the throne, congratulated the country on having experienced the bounty of divine providence in the produce of an abundant harvest. He remarked, that the state of the manufactures, commerce, and revenues of the united kingdom was flourishing beyond example; and that the loyalty and attachment which were manifested to the king's person and government, afforded the strongest indication of the just sense that was entertained of the numerous blessings enjoyed under the protection of our happy constitution. "In my intercourse with foreign powers, (continued his majesty), I have been actuated by a sincere disposition for the maintenance of peace. It is nevertheless impossible for me to lose sight of that established and wise system of policy by which the interests

Britain. terests of the other states are connected with our own. I cannot therefore be indifferent to any material change in their relative condition and strength. My conduct will be invariably regulated by a due consideration of the actual situation of Europe, and by a watchful solicitude for the permanent welfare of my people."

1132
Execution
for high
treason.

In both houses, the usual address was agreed to un-animously and without debate.

About this time, Colonel Despard, and six persons of low rank, were executed for high treason. Their criminal engagements with each other were fully proved. Their execution was attended with no particular consequences.

1133
Difficulties
in execut-
ing the
treaty of
Amiens.

In the mean while, some difficulties occurred in the execution of the treaty of Amiens. The British ministry had avoided engaging in a quarrel with Bonaparte, on account of his continental usurpation, because they found no power willing to join with them in resisting him; but his restless ambition induced him to endeavour to lay hold of the island of Malta; and his impatient spirit prevented his conducting the plan with such slowness as might enable him to avoid suspicion, and ensure success. That island was destined, by the treaty, to be intrusted to the order of St John. Without waiting till the British should abandon it, Bonaparte instantly set on foot negotiations with the different countries to which the knights of the order belonged, to procure the abolition of the order, the confiscation of its revenues, and the prohibition of the future enrolment of knights, or their departure to Malta. Having accomplished these objects, he required the British government to deliver up the island to a grand master, appointed, at his instigation, by the pope; or to the king of Naples, who was to receive possession, in the first instance, for behoof of the knights. As, strictly speaking, there was thus no longer any order of Malta to defend the island, and as the king of Naples was at all times at the mercy of France; the evacuation of Malta by the British troops, in the present state of affairs, would have been equivalent to transferring it to this last power. The British ministry had submitted to the late continental acquisitions of France, from want of means to oppose them; but they resolved to oppose the seizure of an island, because the superiority of the British fleet enabled them successfully to do so. This determination appears to have greatly perplexed the vehement and irritable mind of Bonaparte. No successful resistance had hitherto been made to any of his continental enterprises; and as the attempt now made, to refuse delivery of the island of Malta to the king of Naples, and the nominal grand master of the order of St John, could only be justified by accusing him of having acted fraudulently against the spirit of the treaty; so an acquiescence on his part in the retention of the island, contrary to the express stipulations of the treaty of Amiens, would have been equal to a confession of guilt. In this situation he found himself detected in a deceit, which he was unwilling to acknowledge; while, at the same time, he suffered the additional mortification of having sacrificed his reputation, without any profit in return, because the irresistible power of the British navy rendered it impossible for him to seize

Malta by force. While he remained under this dilemma, a conversation occurred between him and the British ambassador, Lord Whitworth. As the fortunes of Bonaparte have been too extraordinary, not to render him for ages a prominent object in history, it may be worth while, for the sake of throwing all possible light upon his character and actions, to record the conversation alluded to, in the terms in which it was reported to the British court. Lord Whitworth in a letter of the 21st of February, to Lord Hawkesbury, says:

Britain.

"I received a note from M. Talleyrand (minister for foreign affairs), informing me, the first consul desired to converse with me, and that I would come to him at the Thuilleries, at nine o'clock. He received me in his cabinet, with tolerable cordiality; and after talking on different subjects, for a few minutes, he desired me to sit down, as he himself did, on the other side of the table, and began. He told me, that he felt it necessary, after what had passed between me and M. de Talleyrand, that he should in the most clear and authentic manner make known his sentiments to me, in order to their being communicated to his majesty, and he conceived, this would be more effectually done by himself, than through any medium whatever. He said, that it was a matter of infinite disappointment to him, that the treaty of Amiens, instead of being followed by conciliation and friendship, the natural effects of peace, had been productive only of continual and increasing jealousy and mistrust; and that this mistrust was now avowed in such a manner, as must bring the point to an issue. He now enumerated the several provocations which he pretended to have received from England. He placed in the first line, our not evacuating Malta and Alexandria, as we were bound to do by treaty. In this, he said, that no consideration on earth would make him acquiesce, and of the two, he had rather see us in possession of the Fauxbourg St Antoine, than Malta. He then adverted to the abuse thrown out against him, in the English public prints: but this, he said, he did not so much regard as that which appeared in French papers published in London. This he considered as much more mischievous, since it meant to excite this country against him and his government. He complained of the protection given to Georges, and others of his description, who, instead of being sent to Canada, as had been repeatedly promised, were permitted to remain in England, handsomely pensioned, and were constantly committing all sorts of crimes on the coasts of France, as well as in the interior. In confirmation of this, he told me, that two men had within these few days been apprehended in Normandy, and were now on their way to Paris, who were hired assassins, and employed by the bishop of Arras, by Georges, and by Dutheil, as would be fully proved in a court of justice, and made known to the world. He acknowledged, that the irritation he felt against England increased daily, because every wind (I make use as much as I can of his own ideas and expressions) which blew from England, brought nothing but enmity and hatred against him.

1134
Bona-
parte's
conversa-
tion with
Lord
Whit-
worth.

"He then expatiated much on the natural force of the two countries. France with an army of 480,000 men, for to this amount it is, he said, to be immedi-

Britain. ately completed, all ready for the most desperate enterprises; and England with a fleet that made her mistress of the seas, and which he did not think he should be able to equal in less than ten years. Two such countries, by a proper understanding, might govern the world, but by their strifes might overturn it. He said, that if he had not felt the enmity of the British government on every occasion since the treaty of Amiens, there would have been nothing that he would not have done, to prove his desire to conciliate; participation in indemnities as well as in influence on the continent, treaties of commerce, in short, any thing that could have given satisfaction, and have testified his friendship. Nothing had, however, been able to conquer the hatred of the British government, and, therefore, it was now come to the point, whether we should have peace or war? To preserve peace, the treaty of Amiens must be fulfilled; the abuse in the public prints, if not totally suppressed, at least kept within bounds, and confined to the English papers; and the protection so openly given to his bitterest enemies, (alluding to Georges, and persons of that description), must be withdrawn. If war, it was necessary only to say so, and to refuse to fulfil the treaty."

1135
King's
message on
the danger
of hostilities.

The result of this conversation, and of some suspicious circumstances in the conduct of the French, was that on the 8th of March, a message was addressed by the king to the house of commons, acquainting the house, that as very considerable military preparations are carrying on in the ports of France and Holland, he had judged it expedient to adopt additional measures of precaution for the security of his dominions. Upon the motion of Mr Addington, the house voted an address, agreeing unanimously to support the crown in the measures proposed. It speedily appeared, that the preparations which had been alluded to in the king's message were extremely trifling. Bonaparte had obliged the Spaniards to cede to him the sovereignty of Louisiana, in North America, that is to say, the great country to the south-west of the river Mississippi, which lies between the United States and the Spanish province of Mexico; and an armament, with about 4000 troops, was now preparing to leave the ports of Holland, to take possession of the territory thus acquired. The government of the United States opposed this measure; and the state of Kentucky sent notice to the president, that 10,000 volunteers had enrolled themselves, and were resolved, with or without the aid of the union, to resist the settlement of the French in their neighbourhood. Bonaparte, who probably had no serious intention of effecting such a settlement, sold Louisiana for a sum of money to the United States of North America.

1136
Transference of
Louisiana.

In the mean time the negotiations with France proceeded. Bonaparte still insisted upon the literal fulfilment of the treaty of Amiens. He appears to have flattered himself, that the British ministry would not venture to renew the war on account of Malta. Their pacific dispositions were well known: they had suffered him to make great encroachments upon the continent, without engaging in hostilities. But the good temper and forbearance of administration, had the effect of rousing, in a very great degree, the spirit of the British nation, and of inducing a great proportion of the people to wish to engage in a war, against a man whom they

now detested as an odious usurper. Thus encouraged, administration rose in their demands of the price to be paid by France for the continuance of peace. On the 12th of May, Lord Whitworth presented the ultimatum of the British government, which was in these terms;

1137
Ultimatum
of the British
court.

"1. The French government shall engage to make no opposition to the cession of the island of Lampedosa to his majesty, by the king of the two Sicilies.

"2. In consequence of the present state of the island of Lampedosa, his majesty shall remain in possession of the island of Malta, until such arrangements shall be made by him, as may enable his majesty to occupy Lampedosa as a naval station; after which period, the island of Malta shall be given up to the inhabitants, and acknowledged as an independent state.

"3. The territories of the Batavian republic shall be evacuated by the French forces, within one month after the conclusion of a convention founded on the principles of this project.

"4. The king of Etruria, and the Italian and Ligurian republics, shall be acknowledged by his majesty;

"5. Switzerland shall be evacuated by the French forces.

"6. A suitable territorial provision shall be assigned to the king of Sardinia in Italy.

"Secret article.—His majesty shall not be required by the French government to evacuate the island of Malta, until after the expiration of ten years.

"Articles 4, 5, 6. may be entirely omitted, or must all be inserted."

This proposal having been rejected, war was announced on the 16th of May, by a message from the king to the two houses of parliament. On the 21st of May a declaration, justifying this measure, was inserted in the London gazette. It begins with contrasting the liberal and friendly conduct displayed towards the subjects of France, immediately after the peace of Amiens, with the severity and injustice practised towards the English; connected with which is mentioned the circumstance of persons being sent from France to reside in the British and Irish seaports, in the character of consuls, when no commercial treaty existed, and whose conduct gave reason to suspect purposes of a dangerous kind. The manifestations of an encroaching spirit by the French government since the peace were next adverted to; of which examples were given, in the keeping up of a French army in Holland, contrary to the remonstrances of the Batavian government; the violation of the independence of Switzerland; the annexation to France of Piedmont, Parma, Placentia, and the isle of Elba. With regard to Malta, it was contended that the conduct of the governments of France and Spain, in destroying the independence of the order, had been the cause of the non-execution of that article which stipulates the evacuation of Malta by the British. Besides, the French government had themselves given indications of a design to violate those articles which stipulate for the integrity and independence of Turkey and the Ionian isles, and this would justify the retention of Malta. The paper concludes by declaring, that his majesty was still ready to concur in any arrangement by which satisfaction should be given him for the indignities offered to his crown.

1138

War re-
newed.

Britain. crown and people, and security against farther encroachments on the part of France.

Mr Tierney, Mr Sheridan, and a part of the usual opposition members, supported the measures of ministers in relation to the renewal of hostilities. Mr Fox, however, was in favour of farther negotiation; and on the 27th May 1803, moved an address to his majesty, advising his acceptance of the proffered mediation of Russia. This motion, after some debate, he consented to withdraw; on a declaration from Lord Hawkesbury, that the government was ready to accept of this mediation, but that they could not suspend the requisite preparations for war. Posterity will probably be inclined to sanction Mr Fox's judgment on this question. There can be no doubt that the conduct of France afforded sufficient grounds to justify a war on our part, if that war held out any reasonable prospect of correcting the evils which gave occasion for it; but the aggressions of France upon other powers which tamely yielded up their independence, did not lay us under an imperative obligation to take up arms against her, unless by so doing we were likely to better the condition of the parties injured: we believe ministers themselves scarcely anticipated this. And there was no national insult of such a kind as to compel us to arm from a feeling of national honour, without calculating the consequences. In a word, we had sufficient reasons for making war, if war promised to be advantageous; but none to force us into it, if it were otherwise. The war thus entered on, if not unnecessarily, at least without any urgent cause, has been productive of greater calamities to the country than all that had preceded it put together. Experience has now shewn us that the transient prosperity which appeared at its commencement was fictitious; that the expenditure it occasioned was drawn out of the very vitals of the country, and has left us in such a state of weakness as to render it doubtful whether the nation will not finally sink under its burdens, or escape destruction only by a dangerous crisis.

1139
Preparations for war.

As it was not doubted that Napoleon, from his inability to assail us in any other way, would attempt an invasion, a bill was passed for raising a new species of force, denominated an army of reserve. It consisted of 50,000 men, who were raised by ballot to serve in the British isles, and in Jersey or Guernsey. A bill was also passed enabling his majesty to call out the population of the kingdom *en masse*, in case of invasion. And the volunteer associations were revived, and speedily extended over the whole country.

1140
Murder of Lord Kilwarden.

The act of union with Ireland had been accomplished by means not very creditable to the British government, and had left much angry feeling in the breasts of the Irish, which broke out into open insurrection in July 1803. A simultaneous rising had been organized in the counties of Wicklow, Wexford, and Kildare, as well as in remoter districts; and it was prevented only by the neglect or misunderstanding of the signals or instructions. In Dublin, however, a number of country people collected from Kildare, furnished with pikes and fire-arms, and after murdering Lord Kilwarden and his nephew Mr Wolfe, whom they met in a carriage, they overpowered a small military post; but being attacked in their turn by a larger party of military, they were soon dispersed; and the insurrection was at once

extinguished. Mr Robert Emmet, the leader of the insurrection, a young man of good family, great abilities, and an amiable character, was found guilty of high treason and executed; as were some of the others who had been most active. Bills were passed in parliament for trying rebels by martial law, and for suspending the habeas corpus act.

Britain.

Immediately after the declaration of war by England, the French government seized all the English between the ages of 18 and 60, and subjected them to the same treatment as prisoners of war. This act was done in retaliation for the capture of certain French ships by the English previous to the declaration of hostilities, a practice disgraceful, no doubt, to the British government, but which certainly did not justify this cruel outrage upon peaceable individuals who relied upon experiencing from the French government the treatment which foreigners usually receive in such circumstances. Many of these individuals were ruined by their detention, and not a few sunk into the grave from dejection and melancholy.

1141
Seizure of English subjects in France.

The first warlike proceedings of the French were the occupation of Hanover, and of the strong towns in the eastern part of Naples. In the West Indies, however, the last feeble remains of the French force in St Domingo were compelled to yield to the efforts of the Blacks and the British.

On the 12th May 1804, the weak administration of Mr Addington was dissolved, and a new one organized under Mr Pitt. As the state of things on which the old party divisions had been founded was greatly changed, it was expected that the leaders of the Whigs would have been included in the cabinet; and considerable disappointment was felt when the new arrangements were announced. Lord Grenville, much to his honour, declined to form a part of the new administration on this account.

1142
Accession of Mr Pitt to the administration.

The seizure of four large Spanish frigates on the 5th October 1804, having a great quantity of specie on board, by a British naval force, hastened a rupture with Spain, and war was declared by that power about the end of the year. Though it is extremely probable, as was alleged, that the treasure conveyed by the frigates would have gone secretly to France; this can furnish no justification of so flagrant a violation of the principles of national justice.

In April 1805, the publication of the tenth report of the commissioners of naval inquiry drew the public attention to certain facts indicating peculation to a great extent on the part of Lord Melville, then first lord of admiralty, and Mr Trotter, the paymaster to the navy. The subject was brought forward in the house of commons by Mr Whitbread, who moved various resolutions accusing Lord Melville of conniving at the peculations of Mr Trotter, and of being a participator therein. On a division, there appeared 216 on each side, and the resolutions were carried by the casting-vote of the speaker. Immediately after Mr Trotter was dismissed, and Lord Melville resigned his office, and was excluded from the privy council. First a criminal prosecution was resolved upon, but afterwards his lordship's friends found reason to prefer an impeachment, and an impeachment was accordingly carried up to the peers on the 26th June. The trial was opened in Westminster hall in April 1806, and was closed by his.

1143
Impeachment of Lord Melville.

Britsin.

his lordship's acquittal from all the charges on the 12th June. On four of the charges, however, the majority in his favour was not great.

Napoleon had assumed the title of emperor, in 1804, to which that of king of Italy was added in May 1805. Genoa was at the same time annexed to France; and Holland, to accommodate herself to the new imperial system, received a new constitution, by which a chief magistrate was created with the title of Pensionary. A great parade of preparation for invasion was kept up at Boulogne, where 100,000 troops were at one period collected; but no attempt was actually made.

1144
Treaty of
Presburg.

A new coalition was in the meantime organized by Mr Pitt, of which Britain and Russia were at first the only members, but after the annexation of Genoa it was joined by Austria. After some fruitless negotiations, Bonaparte rapidly collecting his forces, burst into Bavaria, and by a bold manœuvre nearly annihilated the army of General Mack. He entered Vienna on the 13th November, and on the 2d December completed the humiliation of the Austrian monarchy, by the defeat of the combined army at Austerlitz. This was followed by the peace of Presburg, which stripped Austria of all her possessions in Italy, and of the Tirol and Vorarlberg.

1145
Victory of
Trafalgar.

While the French emperor was thus bearing down all resistance on land, he was doomed to experience a mortifying reverse on the ocean. On the 21st October 1805, the combined French and Spanish fleets of 33 sail of the line, were attacked by Lord Nelson with 27 sail, near Cape Trafalgar, and utterly defeated, 19 ships of the line being taken, only four of which, however, could be brought home, owing to the stormy weather. But the death of the great commander damped the triumph of the victors, and was mourned by the country as a great national loss.

1146
Whig ad-
ministra-
tion.

On the death of Mr Pitt on the 23d January 1806, a new ministry was formed of the Whigs, with Lord Grenville and Mr Fox at their head, Lord Erskine being raised to the office of high chancellor. Accidental circumstances having made an opening for a negotiation, Lord Lauderdale was sent to Paris, but the demands of the French government were found to be inadmissible, and the British negotiator left Paris without accomplishing any thing.

1147
Defeat of
the Prus-
sians at
Jena.

Prussia, who had received multiplied provocations from France, imprudently ventured to expose herself to a contest with the latter single-handed. Russia was indeed to support her, but before this support could arrive, Napoleon had annihilated the Prussian armies at the battle of Jena, on the 14th October 1806. So entirely ruinous did this single battle prove to Prussia, that nearly the whole kingdom was immediately occupied by the French, and it was held in a state of dependence till 1813. This same year a British force under Sir David Baird reduced the Cape of Good Hope, after experiencing a very feeble opposition. From this conquest a small part of the force proceeded to Buenos Ayres, of which possession was obtained almost by surprise on the 27th June. Shortly after, however, the British were overpowered by an insurrection within the city, aided by a force from the country, and made prisoners.

The death of Mr Fox, on the 7th September, was a

severe blow to the new ministry, who were understood not to possess the private favour of the court. A dissolution took place, and a new parliament was called a short time afterwards. The ministers, notwithstanding the dangers that menaced them, brought forward two measures which were believed not to be very acceptable to the sovereign. The first of these, the abolition of the slave-trade, was carried by a majority so triumphant, that men were at a loss to understand by what mysterious power, a measure so popular had been so long withstood. The bill received the royal assent on the 25th March 1807. On the 5th of the same month Lord Howick introduced a bill for securing to all his majesty's subjects the privilege of serving in the army or navy, upon their taking an oath prescribed, and for leaving them as far as practicable the free exercise of their religious opinions. As this was a matter which was believed to touch the conscientious scruples of the king, pains had been taken to explain the nature of the measure to him before it was introduced; and it was understood to be proposed with his entire approbation. In the interval, however, between the first and second reading, some of those secret counsellors who infest the courts of princes, found means to act upon the royal mind; and the ministers soon discovered, that the king had become hostile to the measure, and to them as its authors. A cry of danger to the church, was at the same time raised out of doors, by the exertions of Mr Percival and other members of parliament then in opposition. The result was, that the measure was defeated, and the Whigs dismissed from office. It is remarkable, that their successors, the pre-¹¹⁴⁸sent ministers, brought in a measure of exactly the same import in 1818, which passed through both houses ^{of the} almost totally unobserved. Nor ought their conduct to be too severely arraigned for this apparent inconsistency; for perhaps no political party ever existed which has not made insincere professions at times to serve its own interest, and which has not at some period cried down measures which it afterwards adopted. The Whigs had behaved but indifferently while in office; but it is certain, that the mode of their dismissal, which exhibited them as martyrs to their principles, somewhat raised their character in the estimation of the country. The new ministry was appointed on the 25th March, and in May parliament was again dissolved.

Russia was still in arms against France, engaged in fruitless efforts to support the sinking fortunes of Prussia. The bloody but indecisive battle of Eylau was followed by the loss of Dantzic; and the defeat of Friedland, in June 1807, led to the conclusion of a peace between Russia, Prussia, and France, at Tilsit, on the 7th July. By this peace Prussia was stripped of half her territories, and forced to receive French garrisons into her fortresses. An unsuccessful attempt was made by a British squadron to overawe the Turks in their capital; and a small body of troops under General Fraser occupied Alexandria in Egypt for a short time, but abandoned it on the approach of a large Turkish force. Monte Video, in South America, was taken by storm in January; but an attempt made by General White Locke, some months after, on Buenos Ayres, completely failed, and this led to the withdrawing of the British troops altogether from La Plata. ¹¹⁴⁹
Better

Britain. Better success attended the British arms in the unexpected attack made on Copenhagen, by which the Danes, then at peace with us, were compelled to give up their fleet of 18 ships of the line and 15 frigates. The act, however, was severely censured by the opposition in parliament, and was loudly exclaimed against by all Europe, as a flagrant violation of justice and good faith.

Britain. Castlereagh on other grounds with corrupt proceedings, in influencing elections, was also negated. The plea set up in justification of the ministers, was undoubtedly valid and reasonable. To have charged as a special crime against one or two individuals what was commonly practised by a great proportion of those who obtain seats, would have been a piece of hypocritical grimace.

1150
Spanish war.

The year 1808 was rendered memorable by the beginning of the Spanish revolution. Napoleon having allured Charles IV. and his son Ferdinand to Bayonne, compelled them by threats to make a renunciation of the Spanish crown in his favour on the 5th May. The crown was then bestowed on Joseph Bonaparte, who was succeeded as king of Naples by Joachim Murat. Napoleon had previously marched a large body of troops into the country, and he convoked a junta of the Spanish nobles at Bayonne, who accepted the new constitution, and swore obedience to the new king. The mass of the people, however, were roused by the indignity offered to the nation, and flew to arms. A large body of troops under General Dupont were compelled to surrender to the patriots, and this sudden success raised high their hopes. Peace was immediately concluded with Britain, who made instant exertions to support the new cause, and the Portuguese rose in arms at the same time; and their country was soon delivered from the French power by the battle of Vimiera, which was followed by the convention of Cintra.

After the defeat of Dupont, Bonaparte poured in troops into Spain, and overpowered the regular armies of the Spaniards, though a desultory warfare was still maintained by the Guerillas. The British, under Sir John Moore, made a disastrous retreat to Corunna, where they embarked for England after defeating their enemy. Austria, however, encouraged by the embarrassments occasioned to Napoleon by the Spanish war, once more took up arms. The French, now aided by their vassal allies, advanced through Bavaria, and on the 20th and 22d April 1809, defeated the Austrians in two well-fought actions. The latter retired beyond Vienna. The bloody battle of Aspern seemed to suspend the fate of Austria for a little; but the defeats she sustained at Raab and Wagram, at length compelled her to submit to the conqueror. At the peace, which was concluded on the 15th October, Austria gave up the northern shores of the Adriatic, with various other districts, and acceded to the continental system of Napoleon, by prohibiting the importation of British goods.

1152
Hostilities between France and Austria.

1151
Charges against the duke of York.

Early in 1809 a subject was brought before parliament which excited an extraordinary interest throughout the nation. On the 27th January, Mr Wardle, a colonel of militia, directly charged the duke of York with having suffered himself to be swayed by a mistress named Clarke, who had carried on a traffic in commissions, and with partaking in the corrupt gains made by Mrs Clarke in this traffic. The inquiry, which was conducted in a committee of the whole house, occupied the greatest part of two months. That Mrs Clarke had received money for her interest in obtaining commissions and promotion, was proved beyond a doubt; but the duke's knowledge of her transactions, and participation in her gains, were circumstances, the proof of which depended chiefly on Mrs Clarke herself. Ultimately the duke was acquitted of all personal corruption, or connivance at corruption, by a pretty large majority; but this decision proved so little satisfactory to the country, that, a short time after, it was judged expedient for the duke to resign his office as commander in chief, which, however, he resumed when the inquiry was forgotten.

With the view of destroying the naval resources which Bonaparte had been preparing at a great expence in the Scheldt, an expedition, consisting of 40,000 troops, sailed from England on the 28th July 1809, and after a fortnight's bombardment reduced Flushing. But during this period, the French had assembled such a force at Antwerp, and put the town in such a posture of defence, that it was not deemed advisable to attack it. The sickly season too brought disease into the British camp; and after incurring an enormous expence, and losing a vast number of men, this ill-planned expedition returned to England without having accomplished any thing except the demolition of the fortifications of Flushing.

1153
Expedition to the Scheldt.

This piece of ill success was followed by dissensions among the ministers. Mr Canning having endeavoured to effect the removal of Lord Castlereagh from his office on the ground of incapacity, the Irish minister hotly resented this impeachment of his abilities, and a duel took place between the parties (22d Sept. 1809), in which Mr Canning was wounded. Both of them having previously resigned their situations, an offer was made to receive the leaders of the Whigs into office along with Mr Percival. On their refusal to join with that individual, the marquis of Wellesley was recalled from Spain and appointed secretary for foreign affairs. The utmost efforts of the ministers could not prevent the house from instituting an inquiry into the Walcheren expedition; but after some investigation the conduct of ministers was approved of by a small majority.

An investigation conducted by a committee of the house of commons, brought to light many corrupt practices in the disposal of East India appointments. Among others, it was discovered that Lord Castlereagh had endeavoured to procure a seat in parliament for Lord Clancarty, in exchange for a writership which had been given to the former when president of the board of control. Lord Castlereagh's conduct was defended on the ground of the notoriety and universality of such practices; and the resolutions moved against him by Lord A. Hamilton were negated by a majority of 216 to 167. A similar motion brought forward by Mr Maddocks, charging Mr Percival and Lord

A Mr Gale Jones having made some free remarks on the conduct of the house of commons, in excluding strangers during the Walcheren investigation, was committed to Newgate by warrant of the speaker. Sir Francis Burdett, in a letter addressed to his constituents, animadverted on this proceeding in very strong terms,

Britain. terms, denying the right of the house of commons to imprison any individual on its own authority. For this letter, he was himself committed to the Tower on the 7th April 1810, from which he was not released till the prorogation of parliament on the 21st June. A very strong sensation was produced in the country by his arrest. Numerous addresses were voted to him from all quarters of the country; and very violent remonstrances were presented by public bodies on his behalf to parliament.

1154
Insanity of
the king.

The king having been attacked towards the end of 1810 by the mental malady under which he had formerly laboured, ministers, after several prorogations of parliament, found it necessary to bring in a bill for appointing a regency. The ministers proposed to fetter the regent by very rigorous restrictions, while the opposition held that he should be allowed to step into the full exercise of the royal authority. The restrictions proposed by the ministers were ultimately agreed to by both houses, though only by small majorities. The prince of Wales in various ways expressed his dissatisfaction at the conditions on which the government was confided to him.

The rigorous exclusion of British manufactured goods from the continent by the extension of Bonaparte's system, now began to make itself felt in the state of trade. Numerous failures took place, and the commercial distress became so general, that parliament in March 1811, authorized six millions of Exchequer bills to be issued in loans on security. The measure was not found so beneficial as had been expected. The depreciation of bank paper in this and the following year became too obvious to be longer disputed. Notes were purchased with gold at the rate of fourteen or fifteen shillings per pound, and though an act was passed making this traffic illegal, it was still carried on to a great extent.

In the East Indies an expedition fitted out from Madras, under the command of Sir Samuel Achmuty, and accompanied by the governor general Lord Minto, conquered the rich Dutch settlement of Java in August 1811.

Early in 1812 the Prince regent who had now become reconciled to the Tory ministers, invited his old friends the Whigs to take a part in the administration. This, however, they declined, chiefly on the ground that they could not act with Mr Percival, as he held opinions on the Catholic claims directly hostile to those measures which they considered indispensable to the safety of the empire. A very short time afterwards, on the 11th May, Mr Percival was shot in the lobby of the house of commons, by a person of the name of Bellingham, who conceived he had been ill used by the government, and who from commercial losses had fallen into a state of partial derangement. The negotiations with the Whigs were now renewed in consequence of a motion of Mr Stuart Wortley, in the house of commons on the 21st May, but were again unsuccessful. It was evident from the terms proposed that the prince had now become alienated from "his early friends," and was anxious to construct the cabinet so that they should in no case have a preponderating influence. The Whigs, on their part, showed that they ascribed the change in the prince's views to secret in-

1155
Assassina-
tion of Mr
Percival.

fluence, and they stipulated with a jealous caution that certain officers of the household should be removed. **Britain.** Notwithstanding the difficulties which these circumstances raised, the negotiation would probably have terminated successfully, had it not been for the indiscretion of Lord Moira who latterly conducted it.

As the military transactions in the peninsula will be given more in detail under the article Spain, we shall confine ourselves here to a very brief narrative. The diversion which the Austrian war occasioned in 1809, enabled the Spaniards to reorganize their forces and recover a part of the country. The British commander advanced into the heart of the kingdom, and defeated the French at Talavera. But after the successful termination of the Austrian campaign, French troops poured into Spain; the Spanish armies being defeated and dispersed, the Cortes (which first met in 1810) was cooped up within Cadiz; and Lord Wellington found it necessary to retire into Portugal. Thither he was followed by Massena, who was defeated in an attempt to carry a British position at Busaco; and after advancing as far as Santarem, and remaining some weeks in front of the British lines at Torres Vedras, he was compelled to make a disastrous retreat into Spain. The battles of Fuentes d'Honor, Albuera, and Barrosa, gained by the British and Portuguese in 1811, were followed by the reduction of Ciudad Rodrigo and Badajoz, and by the splendid victory of Salamanca in 1812. These various losses compelled the French to raise the blockade of Cadiz, and withdraw their troops from Madrid. The arrival of fresh supplies however, again enabled them to advance, and Lord Wellington found it necessary to make a retreat into Portugal, which he did not accomplish without much loss.

The war in Spain had now lasted four years, and the persevering resistance made by the people there had embarrassed Bonaparte more than any contest he had previously been engaged in. The defeats he had sustained from the British, had at the same time lessened the reputation of his arms; and altogether the war had shaken the basis of his power. Incapable however of receding from his purpose, he still maintained the contest; and, to add to his difficulties, plunged causelessly into a war with Russia. Whether his object was to reestablish his influence by associating his name with fresh victories in the north of Europe; whether he thought the maintenance of the continental system of such importance as a means of ruining Britain, that it was to be upheld at whatever cost; or whether he believed it essential to the preservation of his power, that the first attempt on the part of any state to act independently of him, should be punished with exemplary severity; whatever was his motive, it is certain that the demands of Russia were moderate, and that the war was forced upon her by the overbearing insolence of the French government. A shew was made of negotiation, but most probably without any serious pacific view on either part. At length Napoleon, having collected a force of above 300,000 men in Prussia, consisting of French, Bavarians, Saxons, Italians, and Prussians, advanced into Poland in June 1812. The Russians, whose force was much inferior, retired slowly before him, wasting the country; and the successive battles of Smolensko, on the 17th August, and of Borodino,

115
Invasion
of Russia
by the
French.

^{Britain.} rodino, on the 17th September, conducted the conqueror to Moscow. His object was now to dictate a peace from the advantageous position he occupied, while the terror inspired by his victories lasted. The voluntary destruction of the city by the Russians, which should have shewn him the fallacy of such an expectation, made no impression on him; and after protracting his residence in Moscow to the 19th October, in the vain hope of operating upon the mind of the Russian emperor, he left the city, and commenced the most dreadful and disastrous retreat recorded in history. To add to the horror of his situation, the winter is said to have set in a fortnight earlier than usual. Famine, cold, and the sword, pursued his footsteps with such destructive fury, that not one seventh part of the fine army that entered Russia returned to Poland. The Prussians, whom terror only had attached to him, now turned their swords against him. His power however was too deep seated to be easily overthrown. He raised within a few months 300,000 men; and with this new force he defeated the Russians and Prussians at Lutzen and at Bautzen in May 1813. An armistice, agreed to under the mediation of Austria, only gave the allied powers a clearer view of the advantage of following up their present successes, and time to arrange their plans of operation. The negotiation terminated, and Austria joined the allies on the 11th August. The vassal powers who formed the confederation of the Rhine, deserted the cause of their master one by one. Victory however seemed to smile once more upon his arms in the battle of Dresden; but this was but the prelude to his fall. The battle of Leipsic, fought on the 16th, 17th, and 18th October 1813, destroyed the great military force on which his hopes rested, and shook the foundations of his power. Terror, confusion, and disorder, attended the flight of his shattered force to the Rhine. The allies prosecuted their advantages with vigour; and, notwithstanding a very able and active opposition on his part, they got possession of Paris on the 31st May 1814, and put an end to the power and the government of the man who had so long held them in terror and subjection.

1157
Capture of
Paris.

The British army in Spain had powerfully co-operated in bringing about this great change. Lord Wellington having received some reinforcements, advanced from Portugal in May 1813, pursued the French who were now withdrawing from Spain altogether, defeated them with immense loss at Vittoria on the 20th of May, and drove them within their own frontier. Some time was spent in reducing St Sebastian, Pampelona, and other strong places. A pause followed during the winter rains; but early in February the British army set forward, forced several strong positions, occupied Bourdeaux on the 12th March, and defeated the French at Toulouse on the 10th April. The day after this last battle intelligence arrived of the deposition of Bonaparte, and put a period to the hostilities.

1158
War with
America.

We must now go back a little to notice the war between Britain and America. The chief subjects of complaint on the part of the United States, were the impressment of their seamen by British commanders, and the seizure of their ships trading to French ports under the orders in council. The right of searching American ships, and seizing those seamen found in them whom the naval officers considered to be British

subjects, had been long exercised, and whether right or wrong, was not likely to be abandoned at the moment when our naval superiority left us without a rival on the ocean. The other grievance was maintained to be merely a retaliatory measure on our part, and such as the Americans had no title to complain of, so long as they submitted to the Berlin decrees of France which had given birth to it. Negotiations had long been carried on between the parties, without making the smallest progress towards the adjustment of these differences. At length the repeal of the orders in council, which after a laborious investigation by parliament, were proved unequivocally to have been extremely injurious to our own trade, seemed to have removed the greatest obstacle to an accommodation. This took place on the 18th June 1812, but on the 8th of the same month war had been declared against Britain by the American government. The detail of the events of this war will be found under the article AMERICA. Here we shall only observe, that the Americans were foiled in their great object, the conquest of Canada; and the British on the other hand failed equally in their attempts to make any impression on the northern frontier of the United States. The marauding expedition to Washington, in which we burned bridges, libraries, and other buildings unconnected with the purposes of war, was justly censured as discreditable to the national character, and it was productive of no advantage, as it exasperated the enemy without weakening him. By sea the Americans proved much more formidable enemies than had been anticipated; and though the absolute loss to the British navy was too trifling to be mentioned, the injury to our naval reputation in the eyes of Europe, when our ships were beat by vessels of the same class, and by a naval power yet in its infancy, was by no means of small moment. Peace was concluded on the 24th December 1814; but three weeks after the signature of the treaty, though before it was known in America, the battle of New Orleans, the most considerable action which occurred in the course of the war, was fought, and occasioned a loss of 2,500 men to the British army.

1159
Battle of
Waterloo.

The government of the Bourbons, after their restoration by the allied powers, had produced much dissatisfaction in France. Priests and emigrants had got a decided ascendancy in the administration, and conducted matters with so much violence, that the holders of church lands and confiscated property began to feel alarm. A spirit of hostility to the government spread rapidly; and Napoleon, apprized of the state of the national feeling, quitted his retreat at Elba unperceived with 600 men, and landed in the south of France on the 1st March 1815. Wherever he presented himself the military declared for him; and after a triumphant and pacific procession through two-thirds of the kingdom, he arrived in Paris on the 21st. From this period to the middle of June, he was incessantly employed in organizing his military force. The ever memorable victory of Waterloo, gained by the British and Prussians on the 18th June, hurled him again from the seat of power, and re-established the government of the Bourbons. Great Britain thus, after immense sacrifices and extraordinary perseverance, saw the objects for which she had first taken up arms, fully accomplished; and though it must be admitted that chance, and errors on the part of the enemy, which

Britain. could not be foreseen, contributed greatly to bring the contest to this fortunate conclusion; yet it cannot be denied that the power of the united empire, the magnitude of its resources, the valour of its troops, and the skill of its commanders, were never before so conspicuously displayed; that the war, though barren of other advantages to Britain herself, has been fertile in glory; and that she never before occupied so commanding a position among the nations of Europe.

From the re-establishment of the Bourbons to the death of George III. on the 29th January 1820, the

attention of government has been chiefly occupied with the financial difficulties occasioned by the war, the general distress resulting from the pressure of our enormous load of taxes, and the growing discontent of the people. The country is in fact now suffering from the effects of the exhausting efforts it continued for so long a period; and when its sufferings and distractions are likely to have an end it would be difficult to conjecture. For a fuller detail of the recent events in the history of Britain, the reader is referred to the article GREAT BRITAIN, in the SUPPLEMENT.

B R I

New BRITAIN, a large country of North America, called also *Terra Labrador*, has Hudson's bay and strait on the north and west, Canada and the river St Lawrence on the south, and the Atlantic ocean on the east. It is subject to Great Britain, but yields only skins and furs. The following is the best description of this country that hath yet appeared. It was drawn up by the commander of the Otter sloop, and communicated to the Royal Society, by the honourable Daines Barrington in 1774.

Phil. Trans. "There is no part of the British dominions so little known as the immense country of Labrador. So few have visited the northern parts of this vast country, that almost from the straits of Belleisle until you come to the entrance of Hudson's bay, for more than ten degrees of latitude, no chart which can give any tolerable idea of the coast hath been hitherto formed. The barrenness of the country explains why it has been so seldom frequented. Here avarice has but little to feed on.

"Perhaps, without an immoderate share of vanity, I may venture to presume, that, as far as I have been, which is to the latitude of 59. 10. the draught which I have been able to form is by much the best of any that has hitherto been made.

"Others have gone before me, blest with abilities superior to mine, and to whom I hope to be thought equal only in assiduity. But I had advantages of which they were destitute: with a small vessel, and having an Indian with me, who knew every rock and shoal upon the coast, I was enabled to be accurate in my observations; and these are the reasons why I deem my own sketch preferable to all others.

"As this country is one of the most barren in the whole world, so its sea coast is the most remarkable. Bordered by innumerable islands, and many of them being a considerable distance from the main land, a ship of burden would sail a great way along the coast without being able to form any notion of its true situation.

"Hence it is that all the charts of it have been so extremely erroneous; and hence arose those opinions that some of the inlets extended a vast distance into the country, if not quite into the sea of Hudson's bay.

"Davis's inlet, which has been so much talked of, is not 20 leagues from the entrance of it to its extremity.

B R I

"The navigation here is extremely hazardous. Towards the land, the sea is covered with large bodies and broken pieces of ice; and the farther you go northward, the greater is the quantity you meet with.

"Some of those masses, which the seamen call *islands of ice*, are of a prodigious magnitude; and they are generally supposed to swim two-thirds under water. You will frequently see them more than 100 feet above the surface; and to ships in a storm, or in thick weather, nothing can be more terrible.

"Those prodigious pieces of ice come from the north, and are supposed to be formed by the freezing of cataracts upon the lands about East Greenland and the pole. As soon as the severity of the winter begins to abate, their immense weight breaks them from the shore, and they are driven to the southward. To the miserable inhabitants of Labrador, their appearance upon the coast serves as a token of the approach of summer.

"This vast tract of land is extremely barren, and altogether incapable of cultivation. The surface is everywhere uneven, and covered with large stones, some of which are of amazing dimensions. There are few springs; yet throughout the country there are prodigious chains of lakes or ponds, which are produced by the rains and the melting of the snow. These ponds abound in trout, but they are very small.

"There is no such thing as level land. It is a country formed of frightful mountains, and unfruitful valleys. The mountains are almost devoid of every sort of herbage. A blighted shrub and little moss is sometimes to be seen upon them, but in general the bare rock is all you behold. The valleys are full of crooked low trees, such as the different pines, spruce, birch, and a species of cedar. Up some of the deep bays, and not far from the water, it is said, however, there are a few sticks of no inconsiderable size. In a word, the whole country is nothing more than a prodigious heap of barren rocks.

"The climate is extremely rigorous. There is but little appearance of summer before the middle of July; and in September the approach of winter is very evident. It has been remarked, that the winters within these few years have been less severe than they have been known heretofore. The cause of such an alteration it would be difficult to discover.

"All along the coast there are many rivers that empty

Britain
||
Brittany.

empty themselves into the sea, and yet there are few of any consideration; and you must not imagine that the largest are any thing like what is generally understood by a river. Custom has taught us to give them this appellation; but the greatest part of them are nothing more than broad brooks or rivulets. As they are only drains from the ponds, in dry weather they are everywhere fordable; for running upon a solid rock, they become broad without having a bed of any depth below the surface of the banks.

"The superficial appearance of this country is extremely unfavourable. What may be hidden in its bowels, we cannot pretend to suggest: probably it may produce some copper; the rocks in many places being impregnated with an ore of that resemblance. Something of a horny substance, which is extremely transparent, and which will scale out into a number of small sheets, is often found amongst the stones; there are both black and white of this sort, but the black is the most rare. It has been tried in fire, but seems to be nowise affected by heat.

"The species of wood here are not very various: excepting a few shrubs which have as yet received no name from the Europeans, the principal produce of the country are the different sorts of spruce and pine. Of these, even in the more southern parts, there is not abundance; as you advance northwards they gradually diminish; and by the time you arrive at the 60th degree of latitude, the eye is not delighted with any sort of herbage. Here the wretched residents build their miserable habitations with the bones of whales. If ever they cheer their aching limbs with a fire, they gather a few sticks from the sea-shore, which have probably been washed from Norway or Lapland. Here a vast quantity of snow remains upon the land throughout the year.

"Although the winter here is so excessively rigid, in summer the heat is sometimes disagreeable; and in that season the weather is very moderate, and remarkably serene. It is but seldom foggy, speaking comparatively between this and Newfoundland; nor are you so frequently liable to those destructive gales of wind which visit many other parts of the globe.

"It is in general high land, and sometimes you meet with mountains of an astonishing height; you are also frequently presented with prospects that are really awful, and extremely romantic.

"The inhabitants of New Britain are called *Eskimaux*." See GREENLAND and *Hudson's Bay*.

BRITANNICUS, son of the emperor Claudius by Messalina, was excluded from the empire after his father had married Agrippina: who put her son Nero on the throne, and cause Britannicus to be poisoned A. D. 55.

BRITANNICUS, or **BRITANNICO**, *John*, an eminent Italian scholar of the 15th century, was born in the Brescian territory, of a family originally from Britain. He published notes on Persius, Juvenal, Terence, Statius, and Ovid, with annotations on Pliny's Natural History, which last were published after his death. He died in 1510.

BRITE, or **BRIGHT**, in *Husbandry*. Wheat, barley, or any other grain, is said to *brite*, when it grows over ripe and shatters.

BRITTANY, or **BRETAGNE**, a considerable pro-

vince of France, which is 150 miles in length and 112 in breadth. It is a peninsula, surrounded on all sides by the ocean except on the east, where it joins to Anjou, Maine, Normandy, and Poitou. It is divided into the upper and lower; and therein are large forests. It carries on a great trade, by reason of the many harbours on its coasts. It was united to the crown of France in 1532. Rennes is the capital town. According to the new division of France, Brittany is divided into several departments.

BRITTLENESS, that quality of bodies on account of which they are denominated *brittle*, or which subjects them to be easily broken by pressure or percussion.

Brittle bodies are extremely hard; a very small percussion exerts a force on them equivalent to the greatest pressure, and thus may easily break them. This effect is particularly remarkable in glass suddenly cooled, the brittleness of which is thereby much increased. Tin, though in itself tough, gives a brittleness to all the other metals when mixed therewith. The brittleness of glass has been said to arise from the heterogeneity of the parts whereof it is composed, as salt and sand can never bind sufficiently together: but this cannot be the case; for the pure calces of metals, or any other simple substances, when vitrified, become brittle also. In timbers, brittleness seems to be connected with durability; the more brittle any sort of wood is, the more durable it is found. Thus oak is of very long duration: while beech and birch, as being tough, presently rot, and are of little service in building.

BRITTON, **THOMAS**, the famous musical small-coal man, was born at Higham-Ferrers in Northamptonshire. He served his time in London, where he set up in a stable, next door to the little gate of St John of Jerusalem, on Clerkenwell-green, which he converted into a house. Here getting acquainted with Dr Garenriers, his near neighbour, he became an excellent chemist, constructing a moveable laboratory which was much admired by all who saw it. His skill in music was nowise inferior to that in chemistry, either in the theory or practice; he had for many years a well-frequented musical club, meeting at his own little cell; and was as well respected as known by persons of the first quality; being, above all, a valuable man in his moral character. In Ward's account of clubs, we are told that "Britton's was first begun, or at least confirmed, by Sir Roger L'Estrange, a very musical gentleman; and that the attachment of Sir Roger and other ingenious gentlemen, lovers of the muses, to Britton, arose from the profound regard he had in general to all manner of literature. It is observable, that this meeting was the first of the kind, and the undoubted parent of some of the most celebrated concerts in London. Ward, who was his contemporary, says, that at the first institution of it, his concert was performed in his own house, which is thus described. "On the ground floor was a repository for small coal: over that was the concert room, which was very long and narrow, and had a ceiling so low, that a tall man could but just stand upright in it. The stairs to this room were on the outside of the house, and could scarce be ascended without crawling. The house itself was very old and low built, and in every respect so mean as to be a fit ha-

Gallard.

bitation only for a very poor man." But this mansion, despicable as it was, attracted to it as polite an audience as ever the opera did. At those concerts Dr Pepusch, Mr Handel, Mr Bannister, Mr Henry Needler, and other capital masters, were performers. At the first institution of this club, it is certain Britton would receive no gratuity whatever from his guests, and was offended whenever any was offered him. According to some, however, he departed from this; and the rules were, Britton found the instruments, the subscription was 10s. a-year, and they had coffee at a penny a dish. The singularity of his character, the course of his studies, and the collections he made, induced suspicions that Britton was not the man he seemed to be. Among other groundless conjectures, his musical assembly was thought by some to be only a cover for seditious meetings; by others for magical purposes: and Britton himself was taken for an atheist, a presbyterian, Jesuit, &c. The circumstances of this man's death are not less remarkable than those of his life. There lived at that time one Samuel Honeyman, a blacksmith by trade, who became very famous for a faculty which he possessed of speaking as if his voice proceeded from some distant part of the house where he stood; in short, he was one of those men called *Ventriloquist**, i. e. those who speak from their bellies. One Robe, an acquaintance of Britton's, was foolish enough to introduce this man, unknown to Britton, for the sole purpose of terrifying him; and he succeeded in it. Honeyman, without moving his lips, or seeming to speak, announced, as from afar off, the death of Britton within a few hours; with an intimation that the only way to avert his doom was for him to fall on his knees immediately and say the Lord's prayer: the poor man did as he was bid, went home and took to his bed, and in a few days died, leaving his friend Mr Robe to enjoy the fruits of his mirth. This happened in September 1714. Britton left behind him a large collection of books, music, and musical instruments. Of the former Sir Hans Sloane was a considerable purchaser. His collection of music, mostly pricked by himself, and very neatly, sold for near 100l. In the British Museum there is a painting of him taken from the life. A mezzotinto print was taken from this picture, for which Mr Hughes (author of the *Siege of Damascus*, and a frequent performer at Britton's concerts) wrote the following lines:

Tho' mean thy rank, yet in thy humble cell
Did gentle peace and arts unpurchas'd dwell;
Well pleas'd, Apollo thither led his train,
And music warbled in her sweetest strain.
Cyllenius, so, as fables tell, and Jove,
Came willing guests to poor Philemon's grove.
Let useless pomp behold, and blush to find
So low a station, such a lib'ral mind.

BRIVA ISARÆ, in *Ancient Geography*, a town of Gallia Belgica, on the river Isara or Oyse; now *Pont-oysc*.

BRIVATES, in *Ancient Geography*, a port of Gallia Celtica, now *Brest*, in Brittany.

BRIVES-LA-GALLARD, a town of France, in lower Limosin, now the department of Correze. It stands in a fruitful plain, opposite to an island formed by the river Correze, over which there are two handsome

bridges. Silk and cotton manufactures are established here. It is 220 miles south by west of Paris. E. Long. 1. 45. N. Lat. 45. 15.

BRIXELLUM, in *Ancient Geography*, a town of Gallia Cispadana; remarkable for being the place where Otho killed himself after the battle of Bedriacum: now *Bersello* or *Bresello*, in the territory of Rhegio.

BRIXEN, THE BISHOPRIC OF, is seated in Tirol, in Germany, near the frontiers of Friuli and Carinthia, towards the east. The bishop has a vote and seat in the diet of the empire, and furnishes his contingent when any tax is laid on Tirol. The principal places are Brixen, Sertzingen, Brenneck, and Leintz.

BRIXEN, the capital of the bishopric of the same name, and where the bishop commonly resides, is seated on the river Eisache, at some distance from the mountain Brenner. It is surrounded with mountains, where there are plenty of vineyards, which yield good red wine. It is a populous town; and the houses are well built, with piazzas, and are painted on the outside. The public buildings are very handsome, and there are several spacious squares. It is much frequented, on account of the mineral waters that are near it. E. Long. 11. 50. N. Lat. 46. 35.

BRIXIA, in *Ancient Geography*, a town of the Cenomani in the Regio Transpadana: now *Brescia*, capital of the Bresciano.

BRIZA, QUAKING-GRASS. See *BOTANY Index*.

BRIZE, in *Husbandry*, denotes ground that has lain long untilled.

BRIZE Vents, shelters used by gardeners who have not walls on the north side, to keep cold winds from damaging their beds of melons. They are inclosures about six or seven feet high, and an inch or more thick; made of straw, supported by stakes fixed into the ground, and props across on both inside and outside; and fastened together with willow-twigs, or iron wire.

BROACH, BROCHA (from the French *broche*), denotes an awl or bodkin; also a large packing-needle. A spit, in some parts of England, is called a *broach*; and from this word comes to pierce or broach a barrel. In Scotland, *broach*, *broche*, or *brotche*, is the name of an utensil which the Highlanders used, like the *fibula* of the Romans, to fasten their vest. It is usually made of silver, of a round figure, with a tongue crossing its diameter, to fasten the folds of the garment; sometimes with two tongues, one on each side of a cross-bar in the middle. There are preserved, in several families, ancient broches of very elegant workmanship, and richly ornamented. Some of them are inscribed with names, to which particular virtues used to be attributed; others are furnished with receptacles for relics, supposed to preserve from harm. So that these broches seem to have been worn not only for use but as amulets. One or two of this sort are figured and described by Mr Pennant, *Tour in Scotland*, i. 90. iii. 14. edit. 3d.

BROADCAST, as opposed to the drill-husbandry, denotes the method of cultivating corn, turnips, pulse, clover, the foreign grasses, and most other field plants, that are not transplanted, by sowing them with the hand; in which method they are scattered over the ground at large, and thence said to be sown in broadcast.

* See *Ventriloquism*.

Broadest
||
Brocade.

cast. This is called the *old husbandry*, to distinguish it from the drill, horse-hoeing, or new husbandry. See AGRICULTURE Index.

BROAD-Piece, a denomination given to certain gold pieces broader than a guinea; particularly Caroluses and Jacobuses.

BROAD-Side, in the sea-language, a discharge of all the guns on one side of a ship at the same time. A broad-side is a kind of volley of cannonade, and ought never to be given at a distance from the enemy above musket-shot at point-blank.

BROCADE, or **BROCADO**, a stuff of gold, silver, or silk, raised and enriched with flowers, foliages, and other ornaments, according to the fancy of the merchants or manufacturers.

Formerly the word signified only a stuff wove all of gold, both in the warp and in the woof, or all of silver, or of both mixed together; thence it passed to those stuffs in which there was silk mixed, to raise and terminate the gold or silver flowers: but at present all stuffs, even those of silk alone, whether they be programs of Tours or of Naples, satins, and even taffeties or lustrings, if they be but adorned and worked with some flowers or other figures, are called *brocades*.

In manufacturing brocades, the flatted gilt wire is spun on threads of yellow silk approaching as near as may be to the colour of gold itself. The wire, winding off from a bobbin, twists about the thread as it spins round; and, by means of curious machinery, too complex to be described here, a number of threads are thus twisted at once by the turning of one wheel. The principal art consists in so regulating the motion, that the several circumvolutions of the flatted wire on each side may just touch one another, and form, as it were, one continued covering. It is said, that at Milan there is made a sort of flatted wire, gilt only on one side, which is wound upon the thread so that only the gilt side appears; and that the preparation of this wire is kept a secret, and has been attempted in other places with little success. There is also a gilt copper wire, made in the same manner as the gilt silver: Savary observes, that this kind of wire, called *false gold*, is prepared chiefly at Nuremberg; and that the ordinances of France require it to be spun, for its distinction from the gilt silver, on flaxen or hempen threads. One of our writers takes notice, that the Chinese, instead of flatted gilt wire, use slips of gilt paper, which they both interweave in their stuffs and twist upon silk threads: this practice he inconsiderately proposes as a hint to the British weaver. But, whatever be the pretended beauty of stuffs of this kind of manufacture, it is obvious that they must want durability. The Chinese themselves, according to Du Halde's account, sensible of this imperfection, scarcely use them any otherwise than in tapestries, and such other ornaments as are not intended to be much worn, or exposed to moisture.

The Venetians have carried on a large trade to the Levant in a kind of brocade called *domasquette*, which, though it has only about half the quantity of gold or silver as that made among us, looks far more beautiful. The flatted wire is neither wound close together on the silk threads, nor the threads stuck close in the weaving; yet by passing the stuff betwixt rolls, the disposition and management of which is kept a secret, the

Brocade.

tissue or flower is made to appear one entire brilliant plate of gold or silver. The French ministry, ever vigilant for the advancement of arts and commerce, judged this manufacture important enough to deserve their attention; and accordingly, for contriving the machinery, they engaged the ingenious M. Vaucanson, known throughout Europe for his curious pieces of mechanism, who, in the memoirs of the academy for the year 1757, lately printed, gives an account of his success, and of the establishment of such a manufacture at Lyons.

The lower roll is made of wood, 32 inches in length and 14 in diameter; the upper one of copper, 36 inches long and 8 in diameter: this last is hollow, and open at one end, for introducing iron heaters. For making the rolls cylindrical, he has a particular kind of lathe, wherein the cutting tool, which the most dexterous hand could not guide in a straight line through such a length as 36 inches, is made to slide by means of a screw, on two large steel-rulers, perfectly straight, and capable of being moved at pleasure, nearer, and always exactly parallel, to the axis of the roll.

He first disposed the rolls nearly as in the common flattening mill. In this disposition, ten men were scarcely sufficient for turning them with force enough to duly extend the gilding: and the collars, in which the axes of the rolls turned at each end, wore or galled so fast, that the pressure continually diminished, insomuch that a piece of stuff of ten ells had the gilding sensibly less extended on the last part than on the first. He endeavoured to obviate this inconvenience by screwing the rolls closer and closer in proportion as the stuff passed through, or as the wearing of the collars occasioned more play between them; but this method produced an imperfection in the stuff, every turn of the screw making a sensible bar across it. To lessen the attrition, each end of the axis, instead of a collar, was made to turn between three iron cylinders called *friction wheels*: but even this did not answer fully, for now another source of unequal pressure was discovered. The wooden roll, being compressible, had its diameter sensibly diminished: it likewise lost its roundness, so that the pressure varied in different points of its revolution. On trying different kinds both of European and Indian woods, all the hard ones split, the soft ones warped without splitting, and of more than 20 rolls, there was not one which continued round for 24 hours even without being worked in the machine.

These failures put him upon contriving another method of pressing the rolls together, so that the force should always accommodate itself to whatever inequalities might happen. The axis of the copper roll being made to turn between friction wheels as before, that of the wooden one is pressed upwards by a lever at each end furnished with a half collar for receiving the end of the axis. Each lever has the end of its short arm supported on the frame of the machine, and the long arm is drawn upwards by an iron rod communicating with the end of the short arm of another lever placed horizontally: to the long arm of this lever is hung a weight, and the levers are so proportioned, that a weight of 30 pounds presses the rolls together with a force equivalent to 17,536 pounds, which was found to be the proper force for the sufficient ex-

ension.

of Arts.

Brocade,
Brocatel.

tension of the gilding. By this contrivance four men can turn the rolls with more ease than ten can turn those which are kept together by screws; and the same weight acting uniformly in every part, the pressure continues always equal, though the wooden roll should even become oval, and though the stuff be of unequal thickness.

A piece of cloth, of about two ells, is sewed to the beginning and end of the stuff, to keep it out to its width when it enters and parts from the rolls, which could not be done by the hands for fear of burning or bruising them; as it would take too much time to sew these cloths to every small piece of an ell or two, a number of these is sewed together. The stuff is rolled upon a cylinder, which is placed behind the machine, and its axis pressed down by springs to keep the stuff tight as it comes off. Four iron bars, made red hot, are introduced into the copper roll, which in half an hour acquires the proper degree of heat, or nearly such a one as is used for the ironing of linen: the wooden roll is then laid in its place, and the machine set to work. If more than 30 ells are to be passed at once, the wooden roll must be changed for another, for it will not bear a long continuance of the heat without danger of splitting: and therefore the manufacturer should be provided with several of these rolls, that when one is removed, another may be ready to supply its room: as soon as taken off from the machine, it should be wrapt in a cloth and laid in a moist place.

The principal inconvenience attending the use of this machine, is that the heat necessary for extending the gilding, though it improves the brightness of white and yellow silks, is injurious to some colours, as crimson and green. A double pressure will not supply the place of heat; and the only method of preventing this injury, or rendering it as light as possible, appeared to be, to pass the stuff through with great celerity.

Method of clearing BROCADE when sullied. For this purpose neither alkalies nor soap must be used; because the former, while they clean the gold, corrode the silk, and change or discharge its colour; and the latter also alters the shade, and even the species, of certain colours. But spirit of wine may be used without any danger of its injuring either the colour or quality of the subject; and in many cases proves as effectual for restoring the lustre of the gold as the most corrosive detergents. A rich brocade flowered with a variety of colours, after being disagreeably tarnished, had the lustre of the gold perfectly restored by washing it with a soft brush dipped in warm spirit of wine, and some of the colours of the silk which were likewise soiled became at the same time remarkably bright and lively. Spirit of wine seems to be the only material adapted to this intention, and probably the boasted secret of certain artists is no other than this spirit disguised. As to powders, however fine, and however cautiously used, they scratch and wear the gold, which here is only superficial and of extreme tenuity.

BROCADE-Shell, the English name of a species of LIMAX.

BROCADEL, or **BROCADEL**, a kind of coarse brocade; chiefly used for tapestry.

BROCCOLI, a kind of cabbage cultivated for the use of the table. See BRASSICA.

BROCHE, or **BROACH**. See BROACH.

BROCK, among sportsmen, a term used to denote a badger.—A hart, too, of the third year, is called a *brock*, or *brocket*; and a hind of the same year, is called a *brocket's sister*.

BROCKLESBY, **RICHARD**, an eminent English physician. See SUPPLEMENT.

BROD, a town of Hungary, in the county of Possega in Sclavonia, seated on the river Save. It was once more considerable than at present; and is memorable for a victory obtained over the Turks in 1668. E. Long. 18. 36. N. Lat. 45. 20.

BRODEAU, **JOHN**, in Latin *Brodeus*, a great critic, on whom Lipsius, Scaliger, Grotius, and all the learned, have bestowed great encomiums, was descended from a noble family in France, and born at Tours in 1500. He was liberally educated, and placed under Alciat to study the civil law; but soon forsaking that, he gave himself up wholly to languages and the belles lettres. He travelled into Italy, where he became acquainted with Sadolet, Bembo, and other famous wits: and here (says Thuanus) he applied himself to the study of mathematics, philosophy, and the sacred languages, in which he made no small proficiency. Then, returning to his own country, he led a retired, but not an idle, life, as his many learned lucubrations abundantly testify. He was a man free from all ambition and vain glory, and suffered his works to be published rather under the sanction and authority of others than under his own. His chief works are, 1. A commentary on the *Anthologia*. 2. Ten books of miscellanies. 3. Notes on Oppian, Euripides, &c. He died in 1563, aged 63.

BRODERA, or **BRODRA**, a town of Asia, in the empire of the Great Mogul. It stands in a large sandy plain, on the little river Wasset; and is fortified, after the old way, with pretty good walls and towers. It is inhabited by Banians and callico-weavers. The country about it produces plenty of gum-lac and indigo. E. Long. 72. 30. N. Lat. 22. 10.

BROGLING FOR EELS; the same with SNIGLING.

BROGLIO, a town of Piedmont in Italy, and capital of a county of the same name, situated near the frontiers of Provence, in E. Long. 6. 42. N. Lat. 44. 12.

BROKE, **SIR ROBERT**, lord chief justice of the common pleas, was the son of Thomas Broke, Esq. of Claverly in Shropshire, and educated at Oxford; from whence he removed to the middle temple, and soon became a very eminent lawyer. In the year 1542, he was chosen summer reader, and double reader in 1550. In 1552, he was made serjeant at law; and in the year following (first Queen Mary), lord chief justice of the common pleas; about which time he received the honour of knighthood. Stow says he was recorder of London and speaker of the house of commons; which is confirmed by a manuscript in the Ashmolean library. He died and was buried at Claverly in Shropshire, the place of his nativity, in 1558. Wood gives him the character of a great lawyer and an upright judge. His works are, 1. An abridgement containing an abstract of

Brokers.

Brokers.

of the year-books till the time of Queen Mary. 2. Certain cases adjudged in the reign of Henry VIII. Edward VI. and Queen Mary. 3. Reading on the statute of limitations, 32 Hen. VIII. c. 2.

BROKEN WIND, among farriers. See **FARRIERY Index**.

BROKER. The origin of the word is contested; some derive it from the French *broier*, "to grind;" others from *brocarder*, "to cavil, or triggler;" others deduce broker from a trader broken, and that from the Saxon *broc*, "misfortune," which is often the true reason of a man's breaking. In which view, a broker is a broken trader by misfortune; and it is said none but such were formerly admitted to that employment.

BROKERS are of three kinds; exchange-brokers, stock-brokers, and pawn-brokers.

Exchange-BROKERS, are a sort of negotiators, who contrive, make, and conclude bargains between merchants and tradesmen, in matters of money or merchandise, for which they have a fee or premium. These, in old English law-books, are called *broggers*, and in Scotland, *broccarii*, i. e. according to Skene, mediators or intercessors in any contract, &c.

They make it their business to know the alteration of the course of exchange, to inform merchants how it goes, and to notify to those who have money to receive or pay beyond sea, who are proper persons for negotiating the exchange with; and when the matter is accomplished, that is, when the money is paid, they have for brokerage 2s. per 100l. sterling. These, by the statute of 8 and 9 William III. are to be licensed in London by the lord mayor, who gives them an oath, and takes bond for the faithful execution of their offices. If any person shall act as a broker without being thus licensed and admitted, he shall forfeit the sum of 500l.: and persons employing him, 5l.; and brokers are to register contracts, &c. under the like penalty: also brokers shall not deal for themselves, on pain of forfeiting 200l. They are to carry about with them a silver medal, having the king's arms and the arms of the city, and pay 40s. a-year to the chamber of the city.

In France, till the middle of the 17th century, their exchange brokers were called *courtiers de change*; but by an arret of council in 1639, the name was changed for that more creditable one of *agent de change, banque, et finance*; and in the beginning of the 18th century, to render the office still more honourable, the title of *king's counsellors* was added.

At Grand Cairo, and several places of the Levant, the Arabs, who do the office of exchange-brokers, are called *consuls*; the manner of whose negotiating with the European merchants has something in it so very particular, that we have referred it to a distinct article. See **CONSUL**.

The exchange-brokers at Amsterdam, called *makel-ders*, are of two kinds: the one, like the English, called *sworn-brokers*, because of the oath they take before the burgomasters; but the others negotiate without any commission, and are called *walking-brokers*. The first are in number 395; whereof 375 are Christians, and 20 Jews: the others are near double that number; so that in Amsterdam there are near 1000 exchange-brokers.—The difference between the two consists in this: The books and persons of the former are allowed

as evidence in the courts of justice; whereas, in case of dispute, the latter are disowned, and their bargains disannulled.

The fee of the sworn exchange-brokers of Amsterdam is fixed by two regulations, of 1613 and 1623, with regard to matters of exchange, to 18 sols for 100 livres de gros, or 600 florins; i. e. three sols for 100 florins; payable, half by the drawer and half by the person who pays the money. But custom has made considerable alterations herein.

The Jews, Armenians, and Banians, are the chief brokers throughout most parts of the Levant and the Indies. In Persia all affairs are transacted by a sort of brokers whom they call *delal*, i. e. great talkers. Their manner in making their markets is very singular: after the brokers have launched out into long, and usually impertinent discourses, coming towards a conclusion, they only converse with their fingers. The buyer's and seller's broker each takes the other by the right hand, which they cover with their coat or a handkerchief: the finger stretched out stands for six; bent for five; the tip of the finger for one; the whole hand for 100: and the hand clinched for 1000. They will express even pounds, shillings, and pence, by their hands. During all this mystic commerce, the two brokers appear as cold and composed as if there were nothing passing between them.

The French distinguish two kinds of brokers; one for the service of merchants, the other of manufacturers, artificers, and workmen. The business of the former is to facilitate the sale of goods in the wholesale and mercantile way; that of the other, to procure the goods wanted for manufacturers, artificers, &c. or to sell their goods when made. At Paris there is scarce a company of tradesmen, or even mechanics, but have their brokers, who are usually taken out of their body, and make it their sole business to negotiate in the particular kinds of goods to which such company is by statutes restrained. There are brokers for drapery, brokers for grocery, brokers for mercery, &c. There are even brokers for tanners, curriers, cutlers, and the like.

Stock-BROKERS, are those who are employed to buy and sell shares in the joint stock of a company or corporation, and also in the public funds. As the practice of stock-jobbing has been carried to such an excess as became not only ruinous to a great number of private families, but even affected, or at least might soon affect, the public credit of the nation, the legislature thought fit to put a stop to it, or at least to bring it within certain bounds, and under some regulation. The negotiations, &c. of these brokers are regulated by stat. 6 Geo. I. cap. 18. and 7 and 10 Geo. II. cap. 8. which, among other things, enacted, that contracts in the nature of wagers, &c. incur a penalty of 500l. and by the sale of stock, of which the seller is not possessed, a forfeit of 100l. and that brokers keep a book, in which all contracts, with their dates, and the names of the parties concerned, shall be entered, on pain of 50l.

Pawn-BROKERS, persons who keep shops, and lend money upon pledges to necessitous persons, and most commonly at an exorbitant interest. They are more properly styled *pawn-takers*, or *tallymen*; sometimes *fripers*, or *friperers*. These are meant in 1 Jac. I. cap.

Brokers,
Brome.

xxi. sect. 5. where it is declared, that the sale of goods wrongfully taken to any broker, or pawn-broker, in London, Westminster, Southwark, or within two miles of London, does not alter the property. And (sect. 7.) if a broker, having received such goods, shall not, upon request of the owner, discover them, how and when he came by them, and to whom they are conveyed, he shall forfeit the double value thereof. See BROKER, SUPPLEMENT.

In the cities of Italy, there are companies established by authority for the letting out money on pawns, called *mounts of piety*; a title little becoming such institutions. In some parts of Italy, they have also mounts of piety of another kind, wherein they only receive ready money, and return it again with interest, at a certain sum per annum. At Bologna, they have several such mounts, which are distinguished into *frank* and *perpetual*: the interest of the former is only four per cent.; that of the latter, seven.

BROKERS are also those who sell old household furniture, and wearing apparel, &c.

BROME, ALEXANDER, a poet, and attorney in the lord mayor's court in the reign of Charles II. was the author of the greatest part of those songs and epigrams which were published in favour of the royalists, and against the *rump*, as well in Oliver Cromwell's time as during the rebellion. These, together with his Epistles and Epigrams translated from different authors, were all printed in one volume 8vo after the Restoration. He also published a version of Horace, by himself and others, which is very far from being a bad one. He left behind him a comedy entitled *The Cunning Lovers*: and the world is indebted to him for two volumes of Richard Brome's plays in octavo; many of which, but for his care in preserving and publishing them, would in all probability have been entirely lost. He died in 1666.

BROME, Richard, a dramatic writer who lived in the reign of King Charles I. and was contemporary with Decker, Ford, Shirley, &c. His extraction was mean, he having been originally no better than a menial servant to the celebrated Ben Johnson. He wrote himself, however, into high reputation, as is testified, not only by various commendatory verses written by his contemporaries and prefixed to many of his plays, but also by some lines which his quondam master addressed to him on account of his comedy called *The Northern Lass*. Brome, in imitation of his master, laid it down as his first great point, to apply closely to the study of men and manners. His genius was entirely turned to comedy; and therefore his proper province was observation more than reading. His plots are all his own, and are far from being ill conducted; and his characters, which for the most part are strongly marked, were the offspring of his own judgment and experience, and his close attention to the foibles of the human heart. In a word, his plays in general are good ones; met with great applause when first acted; and as Langbain informs us, were thought by the players worthy to be revived, to their own profit and the author's honour, in that critical age which he himself lived in. Nay, we have had a proof, even in our own time, of the merit of one of his comedies, which with a very little alteration has lately been revived, and with great success, viz. *The Jovial Crew*, which for no less

than three seasons running brought crowded audiences to the theatre-royal in Covent Garden at all the frequent repetitions of its performance. The comedies which the author left behind him are 15 in number; ten of which are collected together, as above mentioned, in two volumes octavo. He joined also with Thomas Heywood in a play called *The Lancashire Witches*.

BROMELIA, the PINE-APPLE: for the classification see BOTANY *Index*. In the natural method it ranks under the 10th order, *Coronariae*.

As the pine apple, on account of its highly flavoured fruit, is a desirable object to those who can afford the expence of raising it, we shall here enter somewhat into the detail of the most approved method of cultivation.—The plants are propagated by planting the crowns which grow on the fruit, or the suckers which are produced either from the sides of the plants or under the fruit: both which are found to be equally good; although by some persons the crown is thought preferable to the suckers, as supposing it will produce fruit sooner than the suckers, which is certainly a mistake. The suckers and crowns must be laid to dry in a warm place for four or five days, or more (according to the moisture of the part which adhered to the old plant or fruit); for if they are immediately planted, they will rot. The certain rule of judging when they are fit to plant, is by observing if the bottom is healed over and become hard; for if the suckers are drawn off carefully from the old plants, they will have a hard skin over the lower part, so need not lie so long as the crowns of those whose bottoms are moist. But whenever a crown is taken from the fruit, or the suckers from old plants, they should be immediately divested of their bottom-leaves, so high as to allow depth for their planting; so that they may be thoroughly dry and healed in every part, lest when they receive heat and moisture they should perish, which often happens when this method is not observed. If these suckers or crowns are taken off late in the autumn, or during the winter, or early in the spring, they should be laid in a dry place in the stove for a fortnight or three weeks before they are planted; but in the summer season, they will be fit for planting in a week at farthest.

These should be planted in a rich good kitchen-garden mould, not too heavy so as to detain the moisture too long, nor over light and sandy; but where this is wanting, you should procure some fresh earth from a good pasture, which should be mixed with about a third part of rotten neats dung, or the dung of an old melon or cucumber bed which is well consumed. These should be mixed six or eight months before they are used, but if it be a year it will be the better; and should be often turned, that their parts may be the better united, as also the clods well broken. This earth should not be screened very fine; for if you only clear it of the great stones, it will be better for the plants than when it is made too fine. You should always avoid mixing any sand with the earth, unless it be extremely stiff, and then it will be necessary to have it mixed at least six months or a year before it is used; and it must be frequently turned, that the sand may be incorporated in the earth so as to divide its parts: but you should not put more than a sixth part

of

Bromelia.

of sand; for too much sand is very injurious to these plants. In the summer season, these plants must be frequently watered; but you should not give them large quantities at a time: you must also be very careful that the moisture is not detained in the pots by the holes being stopped, for that will soon destroy them. If the season is warm, they should be watered twice a-week; but in a cool season, once a-week will be often enough: and during the summer season you should once a-week water them gently all over their leaves; which will wash the filth from off them, and thereby greatly promote the growth of the plants.

There are some persons who frequently shift these plants from pot to pot. But this is by no means to be practised by those who propose to have large well-flavoured fruit: for unless the pots be filled with the roots, by the time the plants begin to show their fruit, they commonly produce small fruit, which have generally large crowns on them; therefore the plants will not require to be new potted oftener than twice in a season. The first time should be about the end of April, when the suckers and crowns of the former year's fruit (which remained all the winter in those pots in which they were first planted) should be shifted into larger pots; i. e. those which were in halfpenny or three-farthing pots, should be put into penny or at most three halfpenny pots, according to the size of the plants; for you must be very careful not to over-pot them, nothing being more prejudicial to these plants. The second time for shifting of them is in the beginning of August; when you should shift those which are of a proper size for fruiting the following spring into twopenny pots, which are full large enough for any of these plants. At each of these times of shifting the plants, the bark-bed should be stirred up, and some new bark added, to raise the bed up to the height it was at first made: and when the pots are plunged again into the bark-bed, the plants should be watered gently all over their leaves, to wash off the filth, and to settle the earth to the roots of the plants. If the bark-bed be well stirred, and a quantity of good fresh bark added to the bed, at this latter shifting, it will be of great service to the plants; for they may remain in the same tan until the beginning of November, or some time latter, according to the mildness of the season, and will require but little fire before that time. During the winter, they will not require to be watered oftener than once a-week, according as you find the earth in the pots too dry: nor should you give them too much at each time; for it is much better to give them a little water often, than to over-water them.

You must observe never to shift those plants which show their fruit into other pots; for if they are removed after the fruit appears, it will stop the growth, and thereby cause the fruit to be smaller, and retard its ripening, so that many times it will be October or November before the fruit is ripe: therefore you should be very careful to keep the plants in a vigorous growing state from the first appearance of the fruit, because upon this depends the goodness and the size of the fruit; for if they receive a check after this, the fruit is generally small and ill-tasted.—When you have cut off the fruit from the plant whose kind you are desirous to propagate, you should trim the leaves, and

VOL. IV. Part II.

plunge the pots again into a moderate hot-bed, observing to refresh them frequently with water, which will cause them to put out suckers in plenty; so that a person may be soon supplied with plants enough of any of the kinds, who will but observe to keep the plants in health.

The most dangerous thing that can happen to these plants is their being attacked by small white insects, which appear at first like a white mildew, but soon after have the appearance of lice; these attack both root and leaves at the same time; and if they are not soon destroyed, will spread over a whole stove in a short time, and in a few weeks entirely stop the growth of the plants by sucking out the nutritious juice, so that the leaves will appear yellow and sickly, and have generally a great number of yellow transparent spots all over them. These insects, after they are full grown, appear like bugs, adhering so closely to the leaves as not to be easily washed off, and seem to have no local motion. They were originally brought from America upon the plants which were imported from thence; and are probably the same insects which have destroyed the sugar-canes of late in some of the Leeward islands, for upon some sugar-canes which were sent Mr Miller from Barbadoes he observed great numbers of these insects. Since they have been in England, they have spread greatly in such stoves where there has not been more than ordinary care taken to destroy them. They have also attacked the orange-trees in many gardens near London, and have done them incredible damage; but they do not endure the cold of our climate in winter, so that they are never found on such plants as live in the open air. The only method yet discovered for destroying these insects, is by frequently washing the leaves, branches, and stems, of such plants as they attack, with water in which there has been a strong infusion of tobacco stalks. But this method cannot be practised on the ananas plants, because the insects will fasten themselves so low between the leaves, that it is impossible to come at them with a sponge to wash them off; so that if all those which appear to sight are cleared off; they will soon be succeeded by a fresh supply from below, and the roots will be also equally infested at the same time. Therefore, whenever these insects appear on the plants, the safest method will be to take the plants out of the pots, and clear the earth from the roots; then prepare a large tub, which should be filled with water in which there has been a strong infusion of tobacco stalks; into this tub you should put the plants, placing some sticks across the tub to keep them immersed in water. In this water they should remain 24 hours; then take them out, and with a sponge wash off all the insects from the leaves and roots, and dip the plants into a tub of fair water, washing them therein, which is the most effectual way to clear them from the insects. After which, you should pot them in fresh earth; and, having stirred up the bark-bed, and added some new tan to give a fresh heat to the bed, the pots should be plunged again, observing to water them all over the leaves, and this should be repeated once a-week during the summer season; for these insects always multiply much faster where the plants are kept dry, than where they are sometimes sprinkled over with water, and kept in a growing state. As these insects are frequently brought

Bromelia.

Eromelia. over from America on the ananas plants which come from thence, those persons who procure their plants from thence should look carefully over them when they receive them, to see they have none of these insects on them; for if they have, they will soon be propagated over all the plants in the stove where they are placed; therefore, whenever they are observed, the plants should be soaked (as before directed) before they are planted into pots.

Such are the directions generally given with regard to the culture of the pine-apple in this country. Of late, however, some very considerable improvements have been made in that article. The leaves of the oak have been substituted to the more expensive bark; and by treating the pines with them, they are found to thrive as well, and to produce as good fruit, as in the other method. Of the proper way of managing these leaves for the rearing of exotic plants, an account is given under the article *OAK-LEAVES*. But the most considerable improvement is that mentioned in the 67th volume of the Philosophical Transactions, where a method is shown by William Bastard, Esq. of Devonshire, of raising these fruits in Water. His account of this method is as follows.

“Before I enter into the particulars of raising pine-apples in water, it will be necessary to tell you that my hot-house is covered with the best crown-glass, which I apprehend gives more heat than the common sort of green glass generally used for hot-houses. In the front part of the house, and indeed anywhere in the lowest parts of it, the pine-apple plants will not thrive well in water. The way in which I treat them is as follows. I place a shelf near the highest part of the back wall, so that the pine-plants may stand without absolutely touching the glass, but as near it as can be; on this shelf I place pans full of water, about seven or eight inches deep; and in these pans I put the pine-apple plants, growing in the same-pots of earth as they are generally planted in to be plunged into the bark-bed in the common way; that is, I put the pot of earth, with the pine-plant in it, in the pan full of water, and as the water decreases I constantly fill up the pan. I place either plants in fruit, or young plants as soon as they are well rooted, in these pans of water, and find they thrive equally well: the fruit reared this way is always much larger, as well as better flavoured, than when ripened in the bark-bed. I have more than once put only the plants themselves without any earth, I mean after they had roots, into these pans of water, with only water sufficient to keep the roots always covered, and found them flourish beyond expectation. In my house, the shelf I mention is supported by irons from the top, and there is an intervening space of about ten inches between the back wall and the shelf. A neighbour of mine has placed a leaden cistern upon the top of the back flue (in which, as it is in contact with the flue, the water is always warm when there is a fire in the house), and finds his fruit excellent and large. My shelf does not touch the back flue, but is about a foot above it; and consequently the water is only warmed by the air in the house. Both these methods do well. The way I account for this success is, that the warm air always ascending to the part where this shelf is placed, as being the highest part of the house, keeps it much hot-

ter than in any other part. The temperature at that place is, I believe, seldom less than what is indicated by the 73d degree of Fahrenheit's thermometer, and when the sun shines it is often at above 100: the water the plants grow in seems to enable them to bear the greatest heat, if sufficient air be allowed; and I often see the roots of the plants growing out of the holes in the bottom of the pot of earth, and shooting vigorously in the water.

“My hot-house (the dimensions of which it may be proper to know) is 60 feet long and 11 feet wide, the flues included; six feet high in the front, and 11 feet at the back of the inside of the house. It is warmed by two fires. A leaden trough or cistern on the top of the back flue is preferable to my shelf, as in it the pine plants grow much faster in the winter, the water being always warmed by the flue: of this I have seen the great benefit these last two months in my neighbourhood. It is not foreign to this purpose to mention, that as a person was moving a large pine-plant from the hot-bed in my house last-summer, which plant was just showing fruit, by some accident he broke off the plant just above the earth in which it grew, and there was no root whatever left to it: by way of experiment I took the plant, and fixed it upright in a pan of water (without any earth whatever) on the shelf; it there soon threw out roots, and bore a pine-apple that weighed upwards of two pounds.”

BROMLEY, a town of Kent in England, situated on the river Ravensburn, and containing 3000 inhabitants. E. Long. 0. 5. N. Lat. 51. 23.

BROMSGROVE, a town of Worcestershire in England, seated on the river Salwarp. It is well inhabited by clothiers; and the market is large for corn, cattle, and provisions. Population 3000 in 1811. W. Long. 2. 5. N. Lat. 52. 26.

BROMUS, BROOM-GRASS. See *BOTANY Index*.

BROMYARD, a town of Herefordshire in England, seated on a rising ground, and containing 1101 inhabitants in 1811. W. Long. 2. 46. N. Lat. 52. 20.

BRON, a town of Italy, in the duchy of Milan, where the imperialists gained an advantage over the French in 1703. E. Long. 10. 0. N. Lat. 44. 50.

BRONCHIA, in *Anatomy*, the ramifications of the trachea. See *ANATOMY Index*.

BRONCHOCELE, a tumour rising in the anterior part of the neck. See *MEDICINE Index*.

BRONCHOTOMY, in *Surgery*, an incision made in the aspera arteria, or wind-pipe, which is necessary in many cases, and especially in a violent quinsy, to prevent suffocation from the great inflammation or tumor of the parts. It is also called *laryngotomy* and *tracheotomy*. See *SURGERY Index*.

BRONKHORST, JOHN VAN, an eminent painter who flourished about the middle of the last century. He was born at Utrecht: and after having studied under several masters, entered the school of Cornelius Poelemborg, whose style of painting he imitated with great success. He painted both history and landscapes; and his pictures, which are very highly finished, are held in great estimation. He amused himself with the point; and some landscapes from Poelemborg, together with other subjects from his own compositions, are attributed to him.

BRONTLÆ, or THUNDER-STONES, in *Natural History*.

Brontium
||
Bronze.

story. These were supposed, according to the opinion of many philosophers, to have only an imaginary existence. But of late years the attention of naturalists has been much directed to stones that have fallen from the clouds. The fact seems to be sufficiently established; but whether the stones are formed in the atmosphere during the thunder storm which generally accompanies their fall, are ejected from a volcano, or projected, as some suppose, from the moon, there is great difference of opinion.

BRONTIUM, in Grecian antiquity, a place underneath the floor of the theatres, in which were kept brazen vessels full of stones and other materials, with which they imitated the noise of thunder.

BRONTOLOGY, denotes the doctrine of thunder, or an explanation of its causes, phenomena, &c. together with the presages drawn from it. See **ELECTRICITY**.

BRONZE, a compound of copper and tin, to which sometimes other metallic substances, particularly zinc, are added. This metal is brittle, hard, and sonorous. It is employed for various uses, as for making of bells, cannon, and statues; and the proportions of the component metals are varied to suit the several purposes to which it is applied. This compound, like some others, is specifically heavier than either of the metals taken separately. A metallic mass, composed of four-fifths of copper and one-fifth part of tin, weighs in water $7\frac{1}{10}$ grains more than the same quantities of these two metals would together weigh in water, if not alloyed. This proves, that in the union of copper and tin there is a penetration of parts, the one metal entering into the pores of the other; and this is further confirmed by an observation of Mr Tillet, member of the royal academy of sciences. In his memoir concerning the ductility of metals, he takes notice, that when the mixture of copper and tin is made in the proportions above mentioned, the colour of the copper is entirely annulled and covered by that of the tin, although the quantity of the first be four times greater; and this singular effect cannot be understood without admitting a total change in the size and disposition of the pores of the compound metal.

Tin being less subject to rust than copper, bronze is also found to be less liable to be covered with verdigrise than pure copper is; and this is one reason why it is used for cannons, statues, and works exposed to the air and weather. The greater fusibility of bronze than copper is also an advantageous property, and much facilitates the casting of large works. The operation for casting bronze is sufficiently simple. For this purpose a brick furnace is used, nearly of the shape of an oven for baking bread. The floor of this furnace is concave, and consists of a composition of sand and clay. In this hollow floor the metals to be fused are put.—The furnace has three openings. The first is a lateral mouth, at which enters the flame of the wood placed in a second furnace, on one side of the first: the second opening is a chimney placed on a side opposite to the mouth, by means of which the flame is drawn over the metal. The third is a hole which is opened and shut at pleasure; through which the inner part of the furnace may be occasionally inspected, that the state of the metal may be observed. When the metal is in the state required, a fourth opening is then unclosed, communi-

cating with the hollow floor, and through which the melted metal flows by channels into the moulds prepared to receive it. See **BRONZING**, SUPPLEMENT.

BRONZE, also denotes a colour prepared by the colourmen of Paris, wherewith to imitate bronze.—There are two sorts, the red bronze, and the yellow or golden. The latter is made solely of copper-dust, the finest and brightest that can be got: the former is made of the same, with the addition of a little quantity of red ochre well pulverized. They are both applied with varnish. To prevent their turning greenish, the work must be dried over a chafing-dish as soon as bronzed.

BRONZES, a name given by antiquarians to figures either of men or beasts, to urns, and in general to every piece of sculpture which the ancients made of that metal. We likewise give the name of *bronzes* to statues or busts cast of bronze, whether these pieces be copies of antiques or original subjects.—Among medallists, all copper medals bear the name of *bronzes*.

BRONZING, the art or act of imitating bronze, which is done by means of copper-dust or leaf, fastened on the outside, as gold leaves are in gilding.

BROOD, the young of fish, fowls, &c.

BROODING, the act of a hen in hatching her eggs. See **HATCHING**.

BROOK, a little river or small current of water.—A brook is distinguished from a river, insomuch as a river flows at all times, whereas a brook flows at some particular seasons only.

Brook-Lime. See **VERONICA**, **BOTANY Index**.

BROOKE, MRS, daughter of a clergyman of the name of Moore, was a lady as remarkable for her virtue and suavity of manners as for her great literary accomplishments. Her first performance, which introduced her to the notice and consequent esteem of the public, was *Julia Mandeville*; a work concerning which there were various opinions, but which every body read with eagerness. It has been often wished that she had made the catastrophe less melancholy; and we believe that she afterwards was of the same opinion, but she thought it beneath her character to alter it. She soon afterwards went to Canada with her husband, who was chaplain to the garrison at Quebec; and here she saw and loved those romantic characters and scenes which gave birth to *Emily Montague*, a work most deservedly in universal esteem, which has passed through several editions, and which is now not easily met with. On her return to England, accident introduced her, and congenial sentiments attracted her, to Mrs Yates; and an intimacy was formed which terminated only with the life of that lady. Mrs Brooke, in consequence of this connexion, formed an acquaintance with Mr Garrick, and wrote some pieces for the stage. She had, however, great reason to be dissatisfied with his behaviour as a manager; and she made *The Excursion*, a novel which she wrote at this time, the vehicle by which she exhibited to the public her complaints and anger against the king of Drury. Her anger, we believe, was just, but the retribution was too severe. She herself afterwards thought so, for she lamented and retracted it. Her first dramatic performance was the tragedy of *Virginia*, 1756. Her next effort in that line was, *The Siege of Synope*, a tragedy, introduced by Mr Harris, and written principally with a view of placing Mrs

Brooke.

Brooke.
||
Broome.

Yates in a conspicuous character. This did not altogether fail, but it did not become popular; it wanted energy, and it had not much originality; there was little to disapprove, but there was nothing to admire. Her next and most popular production was *Rosina*, which, in a most liberal manner, she presented to Mr Harris. Few modern pieces have been equally successful. Her last musical piece, entitled *Marian*, which was introduced by Shield, continued for some time to be occasionally exhibited. Mrs Brooke was also the translator of various books from the French. She was esteemed by Dr Johnson, valued by Miss Seward, and her company courted by all the first characters of her time. She died in January 1789, two days after her husband. Her husband enjoyed the rectory of Colney in Norfolk, to which he had been preferred after his arrival from America.

BROOM. See GENISTA, BOTANY Index.

Butcher's BROOM. See RUSCUS, BOTANY Index.

Spanish BROOM. See SPARTIUM, BOTANY Index.

BROOM also denotes a well-known household besom or implement wherewith to sweep away dirt, dust, and the like. We say, a *birch-broom*, a *hair-broom*, a *rush-broom*, a *heath-broom*. The primitive kind of brooms, from whence the denomination is given to all the rest, was made of the genista or wild broom growing on commons.

Broom-flower gives the denomination to an order of knights instituted by St Louis of France, on occasion of his marriage. The motto was, *Exaltat humiles*, and the collar of the order made up of broom flowers and husks, enamelled and intermixed with *fleurs de lys* of gold, set in open lozenges, enamelled white, chained together; and at it hung a cross florence of gold. This answers to what the French called *Ordre de la Geneste*, from the name of a species of broom so called; different from the common broom, as being lower, the stalk smaller, and leaf narrow; the flower is yellow, and bears a long husk. Some also speak of another order of the *Geneste* or *Broom* established by Charles Martel, or rather Charles VI.

Broom-Gall, in *Natural History*, a name given by authors to a remarkable species of galls found on the *genista vulgaris* or common broom. This is occasioned, like all other galls, by the puncture and eating of an insect; and, when opened, is found to contain a small oblong worm, of a red colour, but whose size requires the use of a glass in order to see it distinctly.

Broom-Rape. See OROBANCHE, BOTANY Index.

BROOME, WILLIAM, the coadjutor of Pope in translating the *Odyssey*, was born in Cheshire, as is said, of very mean parents. He was educated upon the foundation at Eton, and was captain of the school a whole year, without any vacancy by which he might have obtained a scholarship at King's college. Being by this delay, such as is said to have happened very rarely, superannuated, he was sent to St John's college by the contribution of his friends, where he obtained a small exhibition. At this college he lived for some time in the same chamber with the well-known Ford, by whom Dr Johnson heard him described as a contracted scholar and a mere versifier, unacquainted with life, and unskilful in conversation. His addic-

tion to metre was then such, that his companions familiarly called him *Poet*. When he had opportunities of mingling with mankind, he cleared himself, as Ford likewise owned, from great part of his scholastic rust. He appeared early in the world as a translator of the *Iliads* into prose, in conjunction with Ozell and Oldisworth. How their several parts were distributed is not known. This is the translation of which Ozell boasted as superior, in Toland's opinion, to that of Pope: It has long since vanished (Dr Johnson observes), and is now in no danger from the critics. He was introduced to Mr Pope, who was then visiting Sir John Cotton at Madingley, near Cambridge; and gained so much of his esteem, that he was employed to make extracts from Eustathius for the notes to the translation of the *Iliad*; and in the volumes of poetry published by Lintot, commonly called *Pope's Miscellanies*, many of his early pieces were inserted.

Pope and Broome were to be yet more closely connected. When the success of the *Iliad* gave encouragement to a version of the *Odyssey*, Pope, weary of the toil, called Fenton and Broome to his assistance; and taking only half the work upon himself, divided the other half between his partners, giving four books to Fenton and eight to Broome. Fenton's books are enumerated in Dr Johnson's life of him. To the lot of Broome fell the second, sixth, eighth, eleventh, twelfth, sixteenth, eighteenth, and twenty-third, together with the burden of writing all the notes. The price at which Pope purchased this assistance was 300l. paid to Fenton, and 500l. to Broome, with as many copies as he wanted for his friends, which amounted to 100l. more. The payment made to Fenton is known only by hearsay; Broome's is very distinctly told by Pope in the notes to the *Dunciad*. It is evident, that, according to Pope's own estimate, Broome was unkindly treated. If four books could merit 300l. eight, and all the notes, equivalent at least to four, had certainly a right to more than 600l. Broome probably considered himself as injured, and there was for some time more than coldness between him and his employer. He always spoke of Pope as too much a lover of money, and Pope pursued him with avowed hostility; for he not only named him disrespectfully in the *Dunciad*, but quoted him more than once in the *Bathos*, as a proficient in the art of sinking; and in his enumeration of the different kinds of poets distinguished for the profound, he reckons Broome among "the parrots who repeat another's words in such a hoarse odd tone as makes them seem their own." It has been said that they were afterwards reconciled; but their peace was probably without friendship. He afterwards published a *Miscellany of Poems*, and never rose to very high dignity in the church. He was some time rector of Sturston in Suffolk, where he married a wealthy widow; and afterwards, when the king visited Cambridge 1728, became doctor of laws. He was in 1733 presented by the crown to the rectory of Pulham in Norfolk, which he held with Oakley Magna in Suffolk, given him by the lord Cornwallis, to whom he was chaplain, and who added the vicarage of Eye in Suffolk; he then resigned Pulham, and retained the other two. Towards the close of his life he grew again poetical, and amused himself with translating Odes of Anacreon, which

Broome
Brother.

which he published in the Gentleman's Magazine under the name of *Chester*. He died at Bath in 1745.

BROOMING, or *BREANING* of a Ship, the washing and burning off all the filth she has contracted on her sides, with weeds, straw, broom, &c. when she is on the career, or on the ground. See **CAREENING**.

BROSSARD; **SEBASTIAN DE**, an eminent French musician. In the former part of his life he had been prebendary and chapel-master of the cathedral church of Strasburg; but afterwards became grand-chaplain, and also *maitre de chapelle* in the cathedral of Meaux. There is extant of his a work entitled *Prodromus Musicalis*. He was author also of a very useful book, entitled *Distionaire de Musique*, printed at Amsterdam, in folio, 1703; and afterwards at the same place in octavo, without a date. At the end of this book is a catalogue of authors ancient and modern, to the amount of 900, who have written on music, divided into classes; wherein are interspersed many curious observations of the author relating to the history of music. By Mr Boivin's *Catlogue General des Livres de Musique* for the year 1729, it appears that Brossard was the author of two sets of motets, as also of nine *Leçons de Tenebres* therein mentioned. It seems that these several publications were at a time when the author was far advanced in years; for Walther takes notice that in the *Mercur Galante*, he is mentioned as an abbé and composer, so early as the year 1678.

BROSSES, **CHARLES DE**, a miscellaneous French writer. See **SUPPLEMENT**.

BROTHEL-HOUSES, lewd places, being the common habitations of prostitutes. King Henry VIII. by proclamation, in the 37th year of his reign, suppressed all the stews or brothel-houses which had long continued on the bank-side in Southwark, contrary to the law of God and of the land*. A brothelman was a loose idle fellow; and a *femme bordelier*, or *brothelier*, a common whore. And *borelman* is a contraction for *brothelman*. See **BAWDY-HOUSE**.

BROTHER, *Frater*, a term of relation between two male children, sprung from the same father, or mother, or both. Scaliger and Vossius derive *frater* from *φρατρει*, for *φρατρι*, which properly signifies a person who draws water in the same well; *φρατρει*, in Greek, signifying *well*, and *φρατρι*, a company of people who have a right to draw water out of the same well. The word, it is said, came originally from the city Argos, where there were only a few wells distributed in certain quarters of the city, to which those of the same neighbourhood alone repaired.

By the civil law, brothers and sisters stand in the second degree of consanguinity; by the canon law, they are in the first degree.—By the Mosaic law, the brother of a man who died without issue was obliged to marry the widow of the deceased. Deuter. xxv. 7.

The ancients applied the term brother indifferently to almost all who stood related in the collateral line, as uncles and nephews, cousin Germans, &c.—This we learn not only from a great many passages in the Old Testament, but also from profane authors: Cicero, in his *Philippics*, says, "Antonia was both wife and sister of Mark Antony; because she was daughter of his brother C. Antonius." And as to cousins, Tullus Hostilius, in *Dionysius Halicarnassensis*, calls the Hora-

tii and Curiatii, brothers; because they were sisters' children. Brother.

The language of the Jews, Bishop Pearson observes, included in the name of brethren not only the strict relation of fraternity, but also the larger of consanguinity. We are brethren, says Abraham to Lot, Gen. xiii. 8. whereas Lot was only his nephew.—So Jacob told Rachel that he was her father's brother, Gen. xxix. 12. where he was only her father's nephew.—This consideration has been urged with good advantage against the Antidicomarianites, who, from the mention made of the brethren of Jesus, John ii. 12. Matth. xii. 46. have impugned the perpetual virginity of the mother of Christ.

Among us, it is customary for kings to give the title brother to each other; the unction in coronation being esteemed to create a kind of brotherhood. Nor is the custom modern: Menander mentions a letter of Cosroes king of Persia to the emperor Justinian, beginning thus: Cosroes, king of kings, &c. to the emperor Justinian my brother.—Kings now also give the same appellation to the electors of the empire; and the like was given by the king of France to the late king of Sardinia, while only duke of Savoy.

In the civil law, brothers, *fratres*, in the plural, sometimes comprehends sisters: as *Lucius et Titia, fratres; tres fratres, Titius, Mævius, et Scia*.

Foster-BROTHERS, those who sucked the same nurse. The French call them *fratres du lait*, or brothers by milk; which is most properly used in respect of a person who sucked a nurse at the same time with the nurse's own child.

BROTHERS-German, *Fratres Germani*. See **GERMAN**.

BROTHER was also used, in middle-age writers, for a *comes*, or governor of a province.

BROTHER is applied, in a less proper sense, to denote a person of the same profession. In which sense, judges, bishops, priests, &c. call each other brothers.

BROTHER is also a customary term for priests of the same persuasion to address one another by: But it is more particularly used to denote the relation between monks of the same convent; as Brother Zachary: in English, we more usually say, Friar Zachary, from the French word, *frere*, brother.—Preachers also call their hearers, *my brethren*, or *my dear brethren*. This appellation is borrowed from the primitive Christians, who all called each other *brothers*. But it is now principally used for such of the religious as are not priests; those in orders are generally honoured with the title of *father*, whereas the rest are only simply brothers.

BROTHER is also an appellation more peculiarly given to certain orders of religious: Thus, the

BROTHERS of St Alexis, in the low countries, were an order of persons who attended on those who lay dying, and took care of the burial of the dead. See also *Brethren of CHARITY, of DEATH, &c.*

POOR BROTHERS, in the charity-house, a denomination given to decayed gentlemen, to the number of 80, who are subsisted with diet, clothing, and lodging, on the establishment. The poor brothers are to be gentlemen by descent, come to poverty; or decayed merchants, soldiers, or officers of the king's household. The conditions of admission are, that they have no estate.

Brother
Broughton

estate for life worth 200*l.* nor coming in *viis et modis*, 2*q**l.* per annum; and that they be 50 years old, unless they have been maimed in the the public service; in which case, the age of 40 suffices. They wear a livery gown within doors.

BROTHERS of Arms, an appellation given those who contract a kind of fraternity in war, obliging themselves to the mutual service and assistance of each other. In the military orders, the knights are also called *brothers*.—In the order of Malta, there is a particular class, who are called *serving brothers*; consisting of such as cannot give proof of their nobility. In Latin they are denominated *fratres clientes*.

BROTHERS of the rosy cross. See ROSYCRUCIANS.

BROUAGE, a maritime town of Saintonge in France. It consists of five or six streets which terminate in a great square. It is famous for its salt-works, which are the finest in the kingdom. W. Long. 1. 0. N. Lat. 45. 50.

BROURSHAVEN, a port-town of the United Provinces, in the island of Schonen in Zealand, seated on the north side of the island, in a bay of the sea, in E. Long. 3. 35. N. Lat. 51. 50.

BROUGH, a town in Westmoreland in England, seated under Stanmore-hill. W. Long. 2. 50. L. Lat. 54. 40. It was formerly a place of great note, being a Roman fortress; but is now much decayed. Population in 1811, 758.

BROUGHTON, THOMAS, a learned divine, and one of the original writers of the *Biographia Britannica*, was born at London, July 5. 1704, in the parish of St Andrew, Holborn; of which parish his father was minister. At an early age he was sent to Eton school, where he soon distinguished himself by the acuteness of his genius, and the studiousness of his disposition. Being superannuated on this foundation, he removed about 1722 to the university of Cambridge; and, for the sake of scholarship, entered himself of Gonville and Caius college. Here two of the principal objects of his attention were, the acquisition of the knowledge of the modern languages, and the study of the mathematics, under the famous Professor Sanderson. May 28. 1727, Mr Broughton, after taking the degree of bachelor of arts, was admitted to deacon's orders. In the succeeding year, September 22d, he was ordained priest, and proceeded to the degree of M. A. At this time he removed from the university, to the curacy of Offley, in Hertfordshire. In 1739, he was instituted to the rectory of Stepington, otherwise Stibington, in the county of Huntingdon, on the presentation of John duke of Bedford, and was appointed one of that nobleman's chaplains. Soon after he was chosen reader to the Temple, by which means he became known to Bishop Sherlock, then master of it, and who conceived so high an opinion of our author's merit, that in 1744, this eminent prelate presented Mr Broughton to the valuable vicarage of Bedminster, near Bristol, together with the chapels of St Mary Redcliff, St Thomas, and Abbot's Leigh, annexed. Some short time after, he was collated, by the same patron, to the prebend of Bedminster and Redcliff, in the cathedral of Salisbury. Upon receiving this preferment, he removed from London to Bristol, where he married the daughter of Thomas Harris, clerk of that city, by whom he had

seven children, six of whom survived him. He resided on his living till his death, which happened December 21. 1774, in the 71st year of his age. He was interred in the church of St Mary Redcliff.

From the time of Mr Broughton's quitting the university, till he was considerably advanced in life, he was engaged in a variety of publications, of which a list is given in the *Biographia Britannica*, 2d edition. Some little time before his death, he composed "A short view of the principles upon which Christian churches require, of their respective clergy, subscription to established articles of religion;" but this work never appeared in print. He possessed, likewise, so inconsiderable talent for poetry, as is evident from many little fugitive pieces in manuscript, found among his papers; and particularly from two unfinished tragedies, both written at the age of 17. When he was at Eton school, Mr Broughton was of the same year with Dr Ewer, late bishop of Bangor; Dr Sumner, late provost of King's college, Cambridge; and Dr Sleesh, late provost of Eton; and during his residence in London, he enjoyed the esteem and friendship of most of the literary men of his time. He was a great lover of music, particularly the ancient; which introduced him to the knowledge and acquaintance of Mr Handel; whom he furnished with the words for many of his compositions. In his public character, Mr Broughton was distinguished by an active zeal for the Christian cause, joined with a moderation of mind. In private life, he was devoted to the interests and happiness of his family; and was of a mild, cheerful, and liberal temper. This disposition, which is not always united with eminent literary abilities, attended him to his grave. In 1778, a posthumous "volume of sermons, on select subjects," was published by his son, the Rev. Thomas Broughton, M. A. of Wadham college, Oxford, and vicar of Tiverton, near Bath.

BROUKHUSIUS, JONUS, or **JOHN BROEKHUIZEN**, a distinguished scholar in Holland, was born November 20. 1649, at Amsterdam, where his father was a clerk in the admiralty. He learned the Latin tongue under Hadrian Junius, and made a prodigious progress in polite literature; but, his father dying when he was very young, he was taken from literary pursuits, and placed with an apothecary at Amsterdam, with whom he lived some years. Not liking this, he went into the army, where his behaviour raised him to the rank of lieutenant-captain; and, in 1674, was sent with his regiment to America in the fleet under Admiral de Ruyter, but returned to Holland the same year. In 1678, he was sent to the garrison at Utrecht, where he contracted a friendship with the celebrated Grævius; and here, though a person of an excellent temper, he had the misfortune to be so deeply engaged in a duel, that, according to the laws of Holland, his life was forfeited: but Grævius wrote immediately to Nicholas Heinsius, who obtained his pardon from the stadtholder. Not long after, he became a captain of one of the companies then at Amsterdam; which post placed him in an easy situation, and gave him leisure to pursue his studies. His company being disbanded in 1697, a pension was granted him, upon which he retired to a country-house near Amsterdam, where he saw but little company, and spent his time among books. He died December 15. 1707.

A1

Broukhu-
sius
||
Brown.

As a classical editor, he is distinguished by his labours upon Tibullus and Propertius; the latter was published in 1702, the former in 1708. He was an excellent Latin poet himself; a volume of his poems was published at Utrecht, 1684, in 12mo; but a very noble edition of them was given by Van Hoogstraten at Amsterdam, 1711, in 4to. His "Dutch poems" were also published at Amsterdam, 1712, in 8vo, by the same person, who prefixed his life, extracted from Peter Burman's funeral oration upon him. Broukhusius was also an editor of Saanazarius's and Palearius's Latin works. With regard to his Latin poems, the authors of the "Journal de Trevoux" have delivered themselves thus (and what they have said may be applied to the bulk of modern Latin poems): "His verses are written in good enough Latin; but they want fire. The author was a poet by art, not by nature."

BROUNCKER, or **BROUNKER**, **WILLIAM**, lord viscount of Castle-Lyons, in Ireland, and the first president of the Royal Society, was the son of Sir William Brounker, knt. and born about the year 1620. He was distinguished by his knowledge of the mathematics, and by the considerable posts of honour and profit he enjoyed after the Restoration; for he had at the same time the office of chancellor to the queen, and the keeping of her great seal, that of one of the commissioners of the navy, and master of St Catharine's hospital near the Tower of London. He wrote, 1. Experiments of the recoiling of guns. 2. An algebraical paper upon the squaring of the hyperbola; and several letters to Dr Usher, archbishop of Armagh. He died in 1684.

BROUSSONET, **P. M. A.** an eminent French naturalist. See SUPPLEMENT.

BROWER, **ADRIAN**, a famous Dutch painter, born either at Oudenard or Haerlem, in 1608, of poor parentage. He became the disciple of Francis Hals, under whom he proved an inimitable artist. His subjects were taken from low life, always copied from nature; as droll conversations, drunken brawls, boors at cards, or surgeons dressing the wounded. Brower was apprehended at Antwerp as a spy; where being discovered by Rubens, he procured his liberty, took him home, clothed him, and endeavoured to acquaint the public with his merit; but the levity of his temper made him quit his benefactor; and he died not long after, in 1640, destroyed by a dissolute course of life.

BROW, or **EYE-BROW**, a hairy arch extended over the orbit of each eye. See ANATOMY *Index*.

Brow-Post, among builders, denotes a beam which goes across a building.

Brow-Antler, among sportsmen, that branch of a deer's horn next the tail.

BROWALLIA. See BOTANY *Index*.

BROWN, **ROBERT**, a schismatic divine, the founder of the Brownists, a numerous sect of dissenters in the reign of Queen Elizabeth. He was the son of Mr Anthony Brown of Tolthorp in Rutlandshire; whose father obtained the singular privilege of wearing his cap in the king's presence, by a charter of Henry VIII. Robert was educated at Cambridge, in Corpus Christi, or, according to Collier, in Bennet college, and was afterwards a schoolmaster in Southwark. A-

bout the year 1580, he began to promulgate his principles of dissepion from the established church; and the following year preached at Norwich, where he soon accumulated a numerous congregation. He was violent in his abuse of the church of England; pretended to divine inspiration, and that he alone was the sure guide to heaven. This new sect daily increasing, Dr Freake bishop of Norwich, with other ecclesiastical commissioners, called our apostle before them. He was insolent to the court, and they committed him to the custody of the sheriff's officer; but he was released at the intercession of lord treasurer Burleigh, to whom it seems he was related. Brown now left the kingdom; and with permission of the states, settled at Middleburg in Zealand; where he formed a church after his own plan, and preached without molestation; but here persecution, the *sine qua non* of fanaticism, was wanting. In 1585, we find him again in England: for in that year he was cited to appear before Archbishop Whitgift; and seeming to comply with the established church, was, by Lord Burleigh, sent home to his father: but relapsing into his former obstinacy, his aged parent was obliged to turn him out of his house. He now wandered about for some time, and in the course of his mission endured great hardships. At last he fixed at Northampton; where, labouring with too much indiscretion to increase his sect, he was cited by the bishop of Peterborough, and, refusing to appear, was finally excommunicated for contempt. The solemnity of this censure, we are told, immediately effected his reformation. He moved for absolution, which he obtained, and from that time became a dutiful member of the church of England. This happened about the year 1590; and, in a short time after, Brown was preferred to a rectory in Northamptonshire, where he kept a curate to do his duty, and where he might probably have died in peace: but having some dispute with the constable of his parish, he proceeded to blows; and was afterwards so insolent to the justice, that he committed him to Northampton jail, where he died in 1630, aged 80. Thus ended the life of the famous Robert Brown; the greatest part of which was a series of opposition and persecution. He boasted on his death-bed, that he had been confined in no less than 32 different prisons. He wrote "A treatise of reformation without tarrying for any, and of the wickedness of those teachers which will not reform themselves and their charge, because they will tarry till the magistrate command and compel them, by me Robert Brown;" and two others, making together a thin quarto; published at Middleburg, 1582.

BROWN, *Ulysses Maximilian*, a celebrated general of the 18th century, was son of Ulysses, Baron Brown and Camus, colonel of a regiment of cuirassiers in the emperor's service, and descended from one of the most ancient and noble families in Ireland. He was born at Basil in 1705; and having finished his first studies at Limeris in Ireland, was, in 1715, sent for into Hungary, by Count George Brown, his uncle, member of the aulic council of war, and colonel of a regiment of infantry. He was present at the famous battle of Belgrade, in 1717. Next year he followed his uncle into Italy, who made him continue his studies, in the Clementine college at Rome, till the year 1721, when he was sent to Prague in order to learn the civil law.

Brown.

Brown. law. At the end of the year 1723, he became captain in his uncle's regiment; and in 1725, lieutenant-colonel: in 1730, he went into Corsica with a battalion of his regiment; and contributed greatly to the taking of Callansara, where he received a considerable wound in his thigh. In 1732, the emperor made him chamberlain: He was raised to the rank of colonel in 1734; and distinguished himself so much in the war of Italy, especially at the battles of Parma and Guastalla, and in burning in the presence of the French army the bridge which the marshal de Noailles had caused to be thrown over the Adige, that he was made general in 1736. The following year he favoured the retreat of the army, after the unhappy battle of Banjuluca in Bosnia, by an excellent manœuvre, and saved all the baggage. His admirable conduct upon this occasion was rewarded by his obtaining a second regiment of infantry, vacant by the death of Count Francis de Wallis.

At his return to Vienna, in 1739, the emperor Charles VI. raised him to the rank of general field-marshal-lieutenant, and made him counsellor in the aulic council of war. After the death of that prince, the king of Prussia entering Silesia, Count Brown, with a small body of troops, disputed the country with him inch by inch. He signalized himself on several other occasions: and, in 1743, the queen of Hungary made him a privy-counsellor, at her coronation in Bohemia. He at length passed into Bavaria, where he commanded the van-guard of the Austrian army; seized Deckendorf, with a great quantity of baggage; and obliged the French to abandon the banks of the Danube, which the Austrian army passed in full security. The same year, viz. in 1743, the queen of Hungary sent him to Worms, in quality of her plenipotentiary to the treaty of alliance between the courts of Vienna, London, and Turin. In 1744, he followed Prince Lobkowitz into Italy; took the city of Veletri, on the 4th of August, in spite of the superior numbers of the enemy; entered their camp, overthrew several regiments, and took many prisoners. The following year he was recalled into Bavaria, where he took the town of Wilshosen by assault, and received a dangerous shot in the thigh. The same year he was made general of the artillery; and in January 1746, marched for Italy, at the head of a body of 18,000 men. He then drove the Spaniards out of the Milanese; and having joined the forces under Prince de Lichtenstein, commanded the left wing of the Austrian army at the battle of Placentia on the 15th of June 1746, and defeated the right wing of the enemy's forces commanded by Marshal de Maillebois. After this victory, he commanded in chief the army against the Genoese; seized the pass of Bosetta or Bochetta, though defended by above 4000 men; and took the city of Genoa. Count Brown at length joined the king of Sardinia's troops; and took, in conjunction with him, Mont-Alban, and the county of Nice. On the 30th of November he passed the Var, in spite of the French troops; entered Provence; took the isles of St Margaret and St Honorat; and thought to have rendered himself master of a much greater part of Provence, when the revolution which happened in Genoa, and Marshal Belleisle's advancing with his army, obliged him to make that fine re-

Brown. treat which procured him the admiration and esteem of all persons skilled in war. He employed the rest of the year 1747 in defending the states of the house of Austria in Italy; and after the peace in 1748, he was sent to Nice to regulate there, in conjunction with the duke of Belleisle and the marquis de la Minas, the differences that had arisen with respect to the execution of some of the articles of the definitive treaty of Aix-la-Chapelle.

The empress queen, to reward these signal services, especially his glorious campaign in Italy, in 1749 made him governor of Transylvania, where he rendered himself generally admired for his probity and disinterestedness. In 1752, he obtained the government of the city of Prague, with the chief command of the troops in that kingdom; in 1753, the king of Poland, elector of Saxony, honoured him with the collar of the order of the White Eagle; and the next year he was declared field-marshal.

The king of Prussia entering Saxony in 1756, and attacking Bohemia, Count Brown marched against him; and repulsed that prince at the battle of Lobowitz, on the 1st of October, though he had only 27,000 men, and the king of Prussia had at least 40,000. Seven days after this battle, he undertook the famous march into Saxony, to deliver the Saxon troops shut up between Pirna and Konigstein; an action worthy of the greatest captains, ancient or modern. He at length obliged the Prussians to retire from Bohemia; for which he was rewarded, by being made a knight of the Golden Fleece. Soon after, Count Brown hastily assembled an army in Bohemia, to oppose the king of Prussia, who had again penetrated into that kingdom at the head of all his forces; and on the 6th of May fought the famous battle of Prague; in which, while he was employed in giving his orders for maintaining the advantages he had gained over the Prussians, he was so dangerously wounded, that he was obliged to be carried to Prague, where he died of his wounds, on the 26th of June 1757, at 52 years of age. There is reason to believe, that, had he not been wounded, he would have gained the victory, as he had broken the Prussians, and the brave Count Schwerin, one of their greatest generals, was slain.

BROWN, Sir Thomas, an eminent physician and celebrated writer, was born at London, October 19th 1605. Having studied at Winchester college, and afterwards at Oxford, he travelled through France and Italy; and returning by the way of Holland, took his degree of doctor of physic at Leyden. In 1636, he settled at Norwich; and the year following was incorporated as doctor of physic at Oxford. His *Religio Medici* made a great noise; and being translated into Latin, instantly spread throughout Europe, and gained him a prodigious reputation: it was then translated into almost every language in Europe. This book has been heavily censured by some, as tending to infidelity, and even atheism: while others, with much more reason, have applauded the piety, as well as the parts and learning, of the author. The reverend Mr Granger observes, that among other peculiarities in this book, he speaks of the ultimate act of love as a folly beneath a philosopher; and says, that he could be content that we might procreate, like trees, without conjunction; but, after the writing of it, he descended

Brown. scended from his philosophic dignity, and married an agreeable woman. It was said, that his reason for marrying was, because he could discover no better method of procreation. His Treatise on Vulgar Errors was read with equal avidity; he also published *Hydriotaphia*, or a Discourse of Sepulchral Urns lately found in Norfolk. His reputation in his profession was equal to his fame for learning in other respects; and therefore the college of physicians were pleased to take him into their number as an honorary member; and King Charles II. coming to Norwich in his progress, in 1671, was pleased to knight him, with singular marks of favour and respect. He died on his birthday, in 1681, leaving several manuscripts behind him, which were published under the title of *The posthumous works of the learned Sir Thomas Brown, Knt. M. D.*

BROWN, Edward, the son of the former, physician to King Charles II. and president of the royal college at London. He was born in the year 1642; and studied at Cambridge, and afterwards at Merton college, Oxford. He then travelled; and at his return published a brief account of some travels in Hungary, Servia, Bulgaria, Macedonia, Thessaly, Austria, Styria, Carinthia, Carniola, Friuli, &c.: he also published an account of several travels through great part of Germany; and joined his name to those of many other eminent men, in a translation of Plutarch's Lives. He was acquainted with Hebrew, was a critic in Greek, and no man of his age wrote better Latin. High Dutch, Italian, French, &c. he spoke and wrote with as much ease as his mother-tongue. King Charles said of him, that "he was as learned as any of the college, and as well bred as any at court." He died August 27th, 1708.

BROWN, William, an English poet of the 17th century, was descended from a good family, and born at Tavistock in Devonshire in the year 1590. After he had passed through the grammar school, he was sent to Exeter college in the university of Oxford, in the beginning of the reign of James I. and became tutor to Robert Dormer, who was afterwards earl of Carnarvon, and killed at Newbury battle, September 20. 1643. He is styled in the public register of the university, "a man well skilled in all kinds of polite literature and useful arts;" *vir omni humana literatura et bonorum artium cognitione instructus*. After he had left the college with his pupil, he was taken into the family of William earl of Pembroke, who had a great respect for him; and he made his fortune so well, that he purchased an estate. His poetical works procured him a very great reputation. They are as follow: 1. *Britannia's pastorals*. The first part was published at London, 1613, in folio; and ushered into the world with several copies of verses made by his ingenious and learned friends John Selden, Michael Drayton, Christopher Cook, &c. The second part was printed at London in 1616, and recommended by various copies of verses written by John Glanville, who afterwards became eminent in the profession of the law, and others. These two parts were reprinted in two vols. 8vo. 1625. 2. *The Shepherd's Pipe*, in seven eclogues; London, 1614, in 8vo. 3. An elegy on the never-enough bewailed death of Prince Henry, eldest son of King James I. Mr Wood tells us, that it

VOL. IV. Part II.

is probable our author wrote several other poems which he had not seen. It is uncertain when he died.

BROWN, Thomas, "of facetious memory," as he is styled by Addison, was the son of a farmer in Shropshire; and entered in Christ-church college, Oxford, where he soon distinguished himself by his uncommon attainments in literature. But the irregularities of his life not suffering him to continue long there, he, instead of returning to his father, went to London to seek his fortune: his companions, however, being more delighted with his humour than ready to relieve his necessities, he had recourse to the usual refuge of half-starved wits, scribbling for bread; and published a great variety of poems, letters, dialogues, &c. full of humour and erudition, but often indelicate. Though a good-natured man, he had one pernicious quality, which was, rather to lose his friend than his joke.

Towards the latter end of Tom Brown's life, we are informed by Mr Jacob, that he was in favour with the earl of Dorset, who invited him to dinner on a Christmas day, with Mr Dryden and some other gentlemen celebrated for their ingenuity, (as his lordship's custom was); when Mr Brown to his agreeable surprise found a bank note of 50l. under his plate, and Mr Dryden at the same time was presented with another of 100l. Mr Brown died in the year 1704; and was interred in the cloyster of Westminster abbey, near the remains of Mrs Behn, with whom he was intimate in his lifetime. His works have been printed both in 8vo and 12mo, making 4 vols.

BROWN, Dr John, a clergyman of the church of England, and an ingenious writer, was born at Rothbury in Northumberland in November 1715. His father, John Brown, was a native of Scotland; of the Browns of Colstown near Haddington; and at the time of his son's birth was curate to Dr Tomlinson, rector of Rothbury. He was afterwards collated to the vicarage of Wigton in Cumberland; to which place he carried his son, who received the first part of his education there. Thence he was removed in 1732 to the university of Cambridge, and entered of St John's college, under the tuition of Dr Tunstall. After taking the degree of bachelor of arts with great reputation (being among the list of wranglers, and his name at the head of the list), he returned to Wigton, and received both deacon's and priest's orders from Sir George Fleming bishop of Carlisle. Here he was appointed by the dean and chapter a minor canon and lecturer of the cathedral church. For some years he lived here in obscurity; and nothing farther is known concerning him, than that in 1739 he went to Cambridge to take his degree of master of arts. In 1745 he distinguished himself as a volunteer in the king's service, and behaved with great intrepidity at the siege of Carlisle. After the defeat of the rebels, when several of them were tried at the assises held at Carlisle in the summer of 1746, he preached at the cathedral church of that city two excellent discourses, on the mutual connexion between religious truth and civil freedom; and between superstition, tyranny, irreligion, and licentiousness.

Mr Brown's attachment to the royal cause and to the Whig party procured him the friendship of Dr Osbaldeston, who was the only person that continued to

Brown.

be his friend through life; the peculiarities of Mr Brown's temper, or some other cause, having produced quarrels with every one else. When Dr Osbaldeston was advanced to the see of Carlisle, he appointed Mr Brown to be one of his chaplains.

It was probably in the early part of his life, and during his residence at Carlisle, that Mr Brown wrote his poem entitled *Honour*, inscribed to the lord viscount Lonsdale. Our author's next poetical production was his *Essay on Satire*; and which was of considerable advantage to him both in point of fame and fortune. It was addressed to Dr Warburton; to whom it was so acceptable, that he took Mr Brown into his friendship, and introduced him to Ralph Allen, Esq. of Prior Park, near Bath, who behaved to him with great generosity, and at whose house he resided for some time.

In 1751 Mr Brown published his "Essays on the Characteristics of Lord Shaftesbury, &c." dedicated to Ralph Allen, Esq. This was received with a high degree of applause, though several persons attempted to answer it. In 1754 our author was promoted by the earl of Hardwicke to the living of Great Horkesey in Essex.

In 1755, our author took the degree of doctor of divinity at Cambridge. This year he published his tragedy of *Barbarossa*; which, under the management of Mr Garrick, was acted with considerable applause; but when it came to be published, was exposed to a variety of strictures and censures. This tragedy introduced our author to the acquaintance of that eminent actor; by whose favour he had a second tragedy, named *Athelstan*, represented at Drury-Lane playhouse. This was also well received by the public; but did not become so popular as *Barbarossa*, nor did it preserve so long the possession of the stage.

In 1757 appeared his famous "Estimate of the Manners and Principles of the Times." The reception which this work met with from the public was very flattering to his vanity; no fewer than seven editions of it having been printed in little more than a year. The chief design of this performance was to show, that a vain, luxurious, and selfish effeminacy in the higher ranks of life, marked the character of the age; and to point out the effects and sources of this effeminacy. Several antagonists appeared, some of whom were neither destitute of learning nor ingenuity; though Dr Brown himself asserted that Mr Wallace, a clergyman of Edinburgh, was the only candid and decent adversary that appeared against him. The testimony given by M. de Voltaire to the effect which the Estimate had on the conduct of the nation, is very honourable to Dr Brown. "When Marshal Richelieu, in 1756, (says that celebrated writer), laid siege to Port Mahon, the capital of Minorca, the British sent out Admiral Byng with a strong naval force, to drive the French fleet off the island, and raise the siege. At this time there appeared a book, entitled *An Estimate of the Manners of the Times*; of which there were no less than five editions printed off in London in the space of three months. In this treatise the author proves that the English nation was entirely degenerated;—that it was near its ruin;—that its inhabitants were no longer so robust and hardy as in former times; and that its soldiers had lost their courage.—

Brown.

This work roused the sensibility of the English nation, and produced the following consequences. They attacked, almost at one and the same time, all the sea coasts of France, and her possessions in Asia, Africa, and America." In 1758, our author published the second volume of his *Estimate of the Manners and Principles of the Times*; containing additional remarks on the ruling manners and principles, and on the public effects of those manners and principles. The design of this volume was, to retract such mistakes as he thought he had committed; to prove such points as were affirmed and not proved; to illustrate those particulars which were hinted, but not explained; to reply to such capital objections as had been made to his general system by preceding writers on the same subject; and to display the consequences which might be fairly deduced from his principles, and through a designed brevity were omitted in the first volume. But it unfortunately happened that the doctor's self-opinion, which gave so much offence in his first volume, broke out in the second with still greater violence. The consequence of this was, that he exposed himself to general censure and dislike; and the prejudices against him occasioned the real excellencies of the work to be very much overlooked. The periodical critics, whom he had gone needlessly out of his way to abuse, treated him with uncommon severity; and such a multitude of antagonists rose against him, so many objections were urged upon him, by friends as well as enemies, that he seems to have been deeply impressed, and to have retired for a while into the country. From the country it was that he wrote, in a series of letters to a noble friend, "An Explanatory Defence of the Estimate of the Manners and Principles of the Times; being an appendix to that work, occasioned by the clamours lately raised against it among certain ranks of men."

But while Dr Brown thus distinguished himself as a political writer, he was advanced to no higher dignity in the church: nay, on some disgust, it is supposed, he resigned his living in Essex: however, in recompense, Dr Osbaldeston, procured him the rectory of St Nicholas in Newcastle on Tyne. He would probably have received further favours from this prelate, had not the latter died soon after his promotion to the see of London.

In 1760 our author published an *Additional Dialogue of the Dead*, between Pericles and Aristides; being a sequel to a dialogue of Lord Lyttleton's between Pericles and Cosmo. One design of this additional dialogue was to vindicate the measures of Mr Pitt, against whose administration Lord Lyttleton had been supposed to have thrown out some hints. Our author's next publication, in 1763, was "The cure of Saul," a sacred ode; which was followed in the same year by "A Dissertation on the Rise, Union, and Power, the Progressions, Separations, and Corruptions of Poetry and Music." This is one of the most pleasing of Dr Brown's performances, and abounds with a variety of critical discussions. A number of strictures on this piece were published; and the doctor defended himself in a treatise entitled "Remarks on some Observations on Dr Brown's Dissertation on Poetry and Music." In 1764 our author published, in octavo, "The History of the Rise and Progress of Poetry through its several Species;" which is

Brown. no more than the substance given in the dissertation above mentioned. The same year Dr Brown published a volume of sermons, dedicated to his patron Dr Osbaldeston bishop of London; but most, if not all, of these, had been separately published, excepting the first three, which were on the subject of education. In the beginning of the year 1765, the doctor again returned to politics, and published "Thoughts on Civil Liberty, Licentiousness, and Faction." At the conclusion of this work the author prescribed a code of education, upon which Dr Priestley made remarks at the end of his "Essay on the Course of a liberal Education for civil and active Life." The same year he published a sermon "On the Female Character and Education," preached on the 16th of May 1766, before the guardians of the asylum for deserted female orphans. His last publication was in 1766, "A Letter to the Rev. Dr Lowth, occasioned by his late Letter to the Right Rev. Author of the Divine Legation of Moses." This was occasioned by Dr Lowth's having *clearly*, though *indirectly*, pointed at Dr Brown as one of the extravagant adulators and defenders of Bishop Warburton. Besides these works, Dr Brown published a poem on Liberty, and two or three anonymous pamphlets. At the end of several of his latter writings, he advertised his design of publishing, "Christian Principles of Legislation," but was prevented from executing it by his death; though the work appears to have been completed.

We come now to the concluding events of our author's life; concerning which the following is the most authentic intelligence that can be procured. Whilst Dr Dumaresq resided in Russia in the year 1765, to which he had been invited in the preceding year to give his advice and assistance for the establishment and regulation of several schools which her imperial majesty intended to erect, he received a letter from a lady of distinguished character in England, recommending to him Dr Brown as a proper correspondent on this occasion. Dr Dumaresq then wrote a letter to Dr Brown, telling him the occasion of his application, and the difficulties that occurred. He had imagined that nothing more would be wanted of him than what concerned classical learning, and a general foundation for the sciences; as that had been the common introduction to every kind of useful knowledge in the western parts of Europe. But on his arrival he found that a much more extensive scheme was required; and such as extended not only to learning properly so called, but also to matters military and naval, civil and commercial. But having stated his difficulties in executing this plan to Dr Brown, the latter proposed a scheme still more extensive; and which was no less than a general plan of civilization throughout the whole Russian empire. In this plan, however, though it showed very enlarged ideas and great strength of mind, there were several defects which rendered it, as Dr Brown himself was afterwards convinced, impracticable. He had laid greater stress upon the support, energy, and efficacy of absolute power in princes, when exerted in a good cause, than experience would warrant; and he was ready to imagine that the bulk of the Russian nation, just emerging out of barbarism, was like a *tabula rasa*, upon which any characters might be written. At last the doctor's letter was laid before the empress,

who was so pleased with it that she immediately invited him to Russia. He accepted the invitation, and procured his majesty's leave to go: 1000l. were ordered for his expence, and he actually received 200l. But when he was on the point of setting out, an attack of the gout and rheumatism, to which he had been all his lifetime subject, so impaired his health, that his friends dissuaded, and at last succeeded in preventing him from going. The money was returned excepting 97l. 6s. which had been expended in necessities for the intended journey. But though he thus declined the journey, a long letter which he afterwards wrote to the empress, and which does honour to his abilities, shows that he had not abandoned his intention of being serviceable. The affair, however, taken in all its circumstances, did no doubt greatly agitate his mind; and his being obliged at length to give up the journey, must have been no small disappointment to a man of his sanguine expectations. This disappointment concurring with the general state of his health, and perhaps the recollection of some other failures that had happened, was followed by a dejection of spirits; in consequence of which he put an end to his life on the 23d of September 1766, in the 51st year of his age. On the morning of that day his servant came into his bed-chamber, and asked him what sort of a night he had had? to which he replied, "A pretty good one." The servant having quitted the bedside for a few minutes, heard a noise in the doctor's throat, which he imagined to be owing to some obstruction occasioned by phlegm. Going to assist his master, he found him speechless, and bleeding profusely, having cut the jugular vein with a razor; and this he had done so effectually, that death speedily ensued. Such was the unhappy end of this ingenious writer; but the manner of it, when some previous circumstances of his life are understood, will cast no stain on his character. He had a tendency to insanity in his constitution; and, from his early life, had been subject at times to some disorder in his brain; at least to melancholy in its excess. Mrs Gilpin of Carlisle, soon after Dr Brown's decease, wrote in the following terms, in a letter to a friend. "His distemper was a frenzy, to which he had by fits been long subject; to my own knowledge above 30 years. Had it not been for Mr Farish frequently, and once for myself, the same event would have happened to him long ago. It was no premeditated purpose in him; for he abhorred the thought of self-murder; and in bitterness of soul expressed his fears to me, that one time or another some ready mischief might present itself to him, at a time when he was wholly deprived of his reason."

BROWN, Simon, a dissenting minister, whose uncommon talents and singular misfortunes entitle him justly to a place in this work, was born at Shepton Mallet in Somersetshire, 1680. Grounded and excelling in grammatical learning, he early became qualified for the ministry, and actually began to preach before he was twenty. He was first called to be a pastor at Portsmouth, and afterwards removed to the Old Jewry, where he was admired and esteemed for a number of years. But the death of his wife and only son, which happened in 1723, affected him so as to deprive him of his reason; and he became from that time lost to himself, to his family, and to the world: his congregation

Brown.

at the old Jewry, in expectation of his recovery, delayed for some time to fill his post; yet at length all hopes were over, and Mr Samuel Chandler was appointed to succeed him in 1725. This double misfortune affected him at first in a manner little different from distraction, but afterwards sunk him into a settled melancholy. He quitted the duties of his function, and would not be persuaded to join in any act of worship, public or private. Being urged by his friends for a reason of this extraordinary change, at which they expressed the utmost grief and astonishment, he told them, after much importunity, that "he had fallen under the sensible displeasure of God, who had caused his rational soul gradually to perish, and left him only an animal life in common with brutes: that, though he retained the human shape, and the faculty of speaking in a manner that appeared to others rational, he had all the while no more notion of what he said than a parrot; that it was therefore profane in him to pray, and incongruous to be present at the prayers of others:" and, very consistently with this, he considered himself no longer as a moral agent, or subject of either reward or punishment. In this way of thinking and talking he unalterably and obstinately persisted to the end of his life; though he afterwards suffered, and even requested prayers to be made for him. Some time after his secession from the Old Jewry, he retired to Shepton Mallet, his native place; and though in his retirement he was perpetually contending that his powers of reason and imagination were gone, yet he was as constantly exerting both with much activity and vigour. He amused himself sometimes with translating parts of the ancient Greek and Latin poets into English verse: he

composed little pieces for the use of children; An English Grammar and Spelling Book; An Abstract of the Scripture-History, and A Collection of Fables, both in metre; and with much learning he brought together in a short compass all the *Themata* of the Greek and Latin tongues, and also compiled a Dictionary to each of those works, in order to render the learning of both these languages more easy and compendious. Of these performances none have been made public. But what showed the strength and vigour of his understanding, while he was daily bemoaning the loss of it, were two works composed during the two last years of his life, in defence of Christianity, against Woolston and Tindal. He wrote an answer to Woolston's fifth Discourse on the Miracles of our Saviour, entitled, A fit Rebuke for a ludicrous Infidel; with a preface concerning the prosecution of such writers by the civil power. The preface contains a vigorous plea for liberty, and is strongly against prosecutions in matters of religion; and in the Answer, Woolston is as well managed as he was by any of his refuters, and more in his own way too. His book against Tindal was called, A Defence of the Religion of Nature and the Christian Revelation, against the defective account of the one and the exceptions against the other, in a book entitled, Christianity as old as the Creation: and it is allowed to be as good a one as that controversy produced. He intended to dedicate it to Queen Caroline; but as the unhappy state of his mind appeared in the dedication, some of his friends very wisely suppressed it, as sure to defeat the use and intent of his work. The copy however was preserved, and is subjoined in the note (A), as much too great a curiosity

Brown.

(A) Madam, Of all the extraordinary things that have been rendered to your royal hands since your first happy arrival in Britain, it may be boldly said, what now bespeaks your majesty's acceptance is the chief. Not in itself indeed: it is a trifle unworthy your exalted rank, and what will hardly prove an entertaining amusement to one of your majesty's deep penetration, exact judgment, and fine taste; but on account of the author, who is the first being of the kind, and yet without a name. He was once a man, and of some little name; but of no worth, as his present unparalleled case makes but too manifest: for, by the immediate hand of an avenging God, his very thinking substance has for more than seven years been continually wasting away, till it is wholly perished out of him, if it be not utterly come to nothing. None, no, not the least remembrance of its very ruins remains; not the shadow of an idea is left; nor any sense, so much as one single one, perfect or imperfect, whole or diminished, ever did appear to a mind within him, or was perceived by it. Such a present from such a thing, however worthless in itself, may not be wholly unacceptable to your majesty, the author being such as history cannot parallel; and if the fact, which is real, and no fiction or wrong conceit, obtains credit, it must be recorded as the most memorable, and indeed astonishing, even in the reign of George II. that a tract composed by such a thing, was presented to the illustrious Caroline; his royal consort needs not be added; fame, if I am not misinformed, will tell that with pleasure to all succeeding times. He has been informed, that your majesty's piety is as genuine and eminent as your excellent qualities are great and conspicuous. This can indeed be truly known to the great Searcher of hearts only. He alone, who can look into them, can discern if they are sincere, and the main intention corresponds with the appearance; and your majesty cannot take it amiss if such an author hints, that his secret approbation is of infinitely greater value than the commendation of men, who may be easily mistaken, and are too apt to flatter their superiors. But, if he has been told the truth, such a case as his will certainly strike your majesty with astonishment; and may raise that commiseration in your royal breast, which he has in vain endeavoured to excite in those of his friends: who, by the most unreasonable and ill-founded conceit in the world, have imagined, that a thinking being could for seven years together live a stranger to its own powers, exercises, operations, and state; and to what the great God has been doing in it and to it. If your majesty, in your most retired address to the King of kings, should think of so singular a case, you may perhaps make it your devout request, that the reign of your beloved sovereign and consort may be renowned to all posterity by the recovery of a soul now in the utmost ruin, the restoration of one utterly lost, at present amongst men. And should this case affect your royal breast, you will recommend it to the piety and prayers of all the truly devout who have the honour to be known

Brown.

osity to be suppressed. The above pieces were published by Mr, afterwards Dr W. Harris, who, in an advertisement to the reader, recommends the afflicted case of the author, under a deep and peculiar melancholy, to the compassion and prayers of all his friends, and every serious Christian. Mr Brown survived the publication of this last work a very short time. A complication of distempers, contracted by his sedentary life (for he could not be prevailed on to refresh himself with air and exercise), brought on a mortification, which put a period to his labours and sorrows about the latter end of 1732. He was unquestionably a man of uncommon abilities and learning: his management of Woolston showed him to have also vivacity and wit: and, notwithstanding that strange conceit which possessed him, it is remarkable that he never appeared feeble or absurd, except when the object of his frenzy was before him. Besides the two pieces above mentioned, and before he was ill, he had published some single Sermons, together with a Collection of Hymns and Spiritual Songs. He left several daughters.

BROWN, *Isaac Hawkins*, an ingenious English poet, was born at Burton upon Trent, in Staffordshire, January 21. 1705-6; of which place his father was the minister. He received his grammatical institution first at Litchfield, then at Westminster; whence, at sixteen years of age, he was removed to Trinity College, Cambridge, of which his father had been fellow. He remained there till he had taken a master of arts degree; and about 1727 settled himself in Lincoln's-inn, where he seems to have devoted more of his time to the Muses than to the law. Soon after his arrival there, he wrote a poem on Design and Beauty, which he addressed to Mr Highmore the painter, for whom he had a great friendship. Several other poetical pieces were written here, and particularly his Pipe of Tobacco. This is in imitation of Cibber, Ambrose Phillips, Thomson, Young, Pope, and Swift, who were then all living; and is reckoned one of the most pleasing and popular of his performances. In 1743-4, he married the daughter of Dr Trimmell, archdeacon of Leicester. He was chosen twice to serve in parliament, first in 1744, and afterwards in 1748; both times for the borough of Wenlock in Shropshire, near which place he possessed a considerable estate, which came from his maternal grandfather, Isaac Hawkins, Esq. In 1754, he published what has been deemed his capital work, *De Animi Immortalitate*, in two books; in which, besides a most judicious choice of matter and arrangement, he is thought to have shewn himself not a servile but happy imitator of Lucretius and Virgil. The universal applause and popularity of this poem produced several English translations of it in a very short time; the best of which is that by Soame Jenyns, Esq. printed in his Miscellanies. Mr Brown intended to have added a third part, but went no farther than to leave a

fragment. This excellent person died, after a lingering illness, in 1760, aged 55. In 1768, the present Hawkins Brown, Esq. obliged the public with an elegant edition of his father's poems, in large octavo; to which is prefixed a print of the author, from a painting of Mr Highmore, engraved by Ravenet.

BROWN, *Sir William*, a noted physician and multifarious writer, was settled originally at Lynn in Norfolk, where he published a translation of Dr Gregory's Elements of Catoptrics and Dioptrics; to which he added, 1. A method for finding the Foci of all Specula, as well as Lenses universally; as also magnifying or lessening a given object by a given Speculum or Lens, in any assigned Proportion. 2. A Solution of those Problems which Dr Gregory has left undemonstrated. 3. A particular Account of Microscopes and Telescopes, from Mr Huygens; with the discoveries made by Catoptrics and Dioptrics. Having acquired a competence by his profession, he removed to Queen's Square, Ormond Street, London, where he resided till his death. By his lady, who died in 1763, he had one daughter, grandmother to the present Sir Martin Browne Folkes, Bart. A great number of lively essays, both in prose and verse, the production of his pen, were printed and circulated among his friends. The active part taken by Sir William Brown in the contest with the licentiates, 1768, occasioned his being introduced by Mr Foote in his Devil upon Two Sticks. Upon Foote's exact representation of him, with his identical wig and coat, tall figure, and glass stiffly applied to his eye, he sent him a card complimenting him on having so happily represented him; but as he had forgotten his muff, he had sent him his own. This good-natured method of resenting disarmed Foote. He used to frequent the annual ball at the ladies boarding-school, Queen Square, merely as a neighbour, a good-natured man, and fond of the company of sprightly young folks. A dignitary of the church being there one day to see his daughter dance, and finding this upright figure stationed there, told him he believed he was Hermippus *redivivus*, who lived *anhelitu puellarum*. When he lived at Lynn, a pamphlet was written against him: he nailed it up against his house door. At the age of 80, on St Luke's day, 1771, he came to Batson's coffee-house in his laced coat and band, and fringed white gloves, to show himself to Mr Crosby, then lord mayor. A gentleman present observing that he looked very well, he replied, *he had neither wife nor debts*. He died in 1774, at the age of 82; and by his will he left two prize medals to be annually contended for by the Cambridge poets.

BROWN, *John*, M. D. the founder of a modern theory of physic, was born about the year 1735 or 1736 in the parish of Buncle, in Berwickshire, Scotland. His parents being in an inferior rank of life, while he was very young, he was put an apprentice to a weaver, the

Brown.

known to your majesty: many such doubtless there are, though courts are not usually the places where the devout resort, or where devotion reigns. And it is not improbable, that multitudes of the pious throughout the land may take a case to heart, that under your majesty's patronage comes thus recommended. Could such a favour as this restoration be obtained from heaven by the prayers of your majesty, with what transport of gratitude would the recovered being throw himself at your majesty's feet, and, adoring the divine power and grace, profess himself, Madam, your majesty's most obliged and dutiful servant,

SIMON BROWN.

Brown.

the drudgery of which having either disliked, or discovering abilities which would by cultivation raise him to a more conspicuous station, his destination was changed, and he was placed at the grammar school of Dunse. Here he soon distinguished himself, and gave abundant proofs, by his ardour and success in the studies which occupied his attention, that he was worthy of being encouraged in literary pursuits. His parents belonged to that body of dissenters, in Scotland called Seceders. Flattered with the rapid and successful progress which their son had begun to make in the acquisition of the Latin language, they destined him to the ministerial office among their own sect. With this view his education was for some time directed. But an accident it is said made him at once renounce this plan and the sect, the tenets of which, as will appear from this circumstance, are extremely rigid. So early as his 13th year, while at the grammar school, he was prevailed upon, though not without showing considerable reluctance, to attend a meeting of synod, one of the church courts of Scotland, which was held in the church of Dunse. This, in the estimation of the party to which he belonged, was a transgression which could not be passed over without notice. Young Brown was called upon to appear before the church-court, and he must either submit to ecclesiastical censure, or suffer a sentence of expulsion. Too proud or indignant to yield to the one, or to wait for the other, he anticipated or prevented the effects of both, by declaring that he was no longer a member of the sect, and joining himself to the established church. From this time, it would appear, his religious ardour was much abated, and his rigid principles were greatly relaxed.

After this period, Brown was for some time engaged as a private tutor in a gentleman's family in the country; and here, and as an assistant in the grammar school of Dunse, he remained till about his 20th year, when he went to Edinburgh, and having passed through the previous necessary studies in the classes of philosophy, entered himself as a student of divinity in the university. His classical knowledge was now of real advantage to him; for while he resided in Edinburgh, pursuing the plan of his studies, he was able to support himself by private teaching. In this situation he continued for some time, after which he resumed his former labours as assistant in the grammar school of Dunse for a year, and returned to Edinburgh about the year 1759, when he finally renounced the study of theology, and commenced that of physic.

During his medical studies, he supported himself by his own exertions. He was employed in giving private instructions to students who wished to acquire the habit of expressing themselves with facility and correctness in the Latin language, and thus to be prepared for the examinations which are conducted in that language, for medical degrees in the university. For this employment, as well as for translating inaugural dissertations into the same language, the previous studies and acquirements of Brown peculiarly fitted him. Thus occupied, he soon recommended himself to the notice of several of the professors, and particularly to that of Dr Cullen, whose patronage and friendship he obtained in an eminent degree. The doctor not only employed him as a private tutor in his own family, but was extremely assiduous in recommending him to others.

Brown.

This situation afforded him an excellent opportunity of improving in medical studies by the conversation of the celebrated professor, and by the permission which was granted him of delivering lectures or illustrations of the doctor's public lectures to private pupils. In this way Mr Brown began to have full employment, and prosperity seemed to smile upon him. It was about this time that he married the daughter of a respectable tradesman in Edinburgh, and opened a house for boarding students. His house was soon filled with boarders, who were attracted by the hope of great benefit from his instructions and conversation. But here it soon appeared that he was unfit for the management of such concerns. By want of economy or misconduct his affairs were soon greatly embarrassed, and at last terminated in total bankruptcy. Soured and irritated by this misfortune, and still more so, it is probable, by being disappointed of one of the medical chairs in the university, which he supposed had been occasioned by the interference of Dr Cullen, he quarrelled with his friend and patron, and from that moment set himself up as a keen opponent of his doctrines. His application to be admitted a member of the philosophical society was about the same time rejected; and this, which he imagined arose from the same influence, tended not a little to foment the quarrel.

This seems to have been the origin of the celebrated theory which divided the medical world, which excited so much interest in those who espoused or opposed it, and inspired such a degree of enthusiasm in the debates and writings, especially of the pupils of the seminary which gave it birth, that it not unfrequently burst forth with all the violence of religious frenzy. This indeed is little to be wondered at, when we consider that half-educated young men, as is the case with the great proportion of medical students, unaccustomed to patient investigation, and fond of novelty, are the most apt to embrace such speculations, as could be supported and defended by ingenious and subtle reasonings, rather than by accurate and extensive observation; and think themselves regarded by their friends and admirers as distinguished philosophers, in proportion to their ability in starting objections to received opinions, and overthrowing established doctrines. At the same time, it is but justice to observe, that those who adhered to his opinions, were also often treated with suspicion and similar violence. This opposition of sentiment and struggle of opinions had a natural tendency to unite more closely those who were on the same side, and this probably in the end was the cause of poor Brown's future misfortunes. Besides, on account of the convivial talents which he possessed, his company was earnestly courted by the gay and the dissipated, and this led him to frequent meetings and clubs in taverns, where the dictates of prudence and the rules of temperance were rarely observed. Indulging the same spirit, he was principally concerned in the institution of a lodge of free masons, in which the business was conducted in the Latin language. His views in promoting this institution, were, it is said, to attract students to attend his lectures, or to become proselytes to his doctrines.

It was about the year 1780, that the first edition of his *Elementa Medicinæ* appeared. This work is a compendium of his opinions, which he continued for several years to illustrate by a course of public lectures.

And

Brown.

And as he now proposed to prosecute the profession of medicine by private practice and public instruction, it was found necessary to have a medical degree, as a testimony to the world of his qualifications. Having opposed and quarrelled with all the professors in the university of Edinburgh, there was little hope of his succeeding there; and therefore, in consequence of an application to the university of St Andrews, he was admitted to medical honours.

But the terms on which Dr Brown lived with his medical brethren, and the unfortunate habits which were daily gathering strength, precluded him from all rational hopes of success, either as a private practitioner or a public teacher. He therefore turned his thoughts to London, and removed to that metropolis in the year 1786. Previous to 1788, he had delivered one course of lectures; for in October of this year, he was cut off by a fit of apoplexy, on the day after he had delivered his introductory lecture to a second course. He died in the 53d year of his age.

Dr Brown possessed great vigour of mind, and seems to have been capable of considerable application. His talents, had they been directed to more practical and more useful objects, would have probably raised him to more eminent distinction, and rendered him a more valuable member of society. The style of his *Elementa* is harsh and unpolished. His meaning is often dark and ambiguous. But perhaps this want of perspicuity is as much owing to the subjects which he treated, the principles of which are far from being settled, as to the obscurity of his expression. He attempted an unbeaten path; it is not wonderful that he was often bewildered and lost.

To the sketch which we have now given of the life of Dr Brown, it will be expected, by some of our readers, that we add some account of the leading features of his theory. The following, extracted from the observations prefixed to an edition of the *Elements of Medicine*, published by Dr Beddoes, will perhaps be as correct and satisfactory as any thing we can give.

"The varied structure of organized beings, it is the business of anatomy to explain. Consciousness, assisted by common observation, will distinguish animated from inanimate bodies with precision more than sufficient for all the ends of medicine. The cause of gravitation has been left unexplored by all prudent philosophers; and Brown, avoiding all useless disquisition concerning the cause of vitality, confines himself to the phenomena which this great moving principle in nature may be observed to produce. His most general propositions are easy of comprehension.

"1. To every animated being is allotted a certain portion only of the quality or principle on which the phenomena of life depend. This principle is denominated *excitability*.

"2. The excitability varies in different animals, and in the same animal at different times. As it is more intense, the animal is more vivacious or more susceptible of the action of exciting powers.

"3. Exciting powers may be referred to two classes. 1. External; as heat, food, wine, poisons, contagions, the blood, secreted fluids, and air. 2. Internal; as the functions of the body itself, muscular exertion, thinking, emotion and passion.

"4. Life is a forced state; if the exciting powers are withdrawn, death ensues as certainly as when the excitability is gone.

"5. The excitement may be too great, too small, or in just measure.

"6. By too great excitement, weakness is induced, because the excitability becomes defective; this is *indirect debility*: when the exciting powers of stimulants are withheld, weakness is induced; and this is *direct debility*. Here the excitability is in excess.

"7. Every power that acts on the living frame is stimulant, or produces excitement by expending excitability. Thus, although a person, accustomed to animal food, may grow weak if he lives upon vegetables, still the vegetable diet can only be considered as producing an effect, the same in kind with animals, though inferior in degree. Whatever powers, therefore, we imagine, and however they vary from such as are habitually applied to produce due excitement, they can only weaken the system by urging it into too much motion, or suffering it to sink into languor.

"8. Excitability is seated in the medullary portion of the nerves, and in the muscles. As soon as it is anywhere affected, it is immediately affected everywhere; nor is the excitement ever increased in a part, while it is generally diminished in the system; in other words, different parts can never be in opposite states of excitement.

"I have already spoken of an illustration, drawn up by Mr Christie from a familiar operation, to facilitate the conception of Brown's fundamental positions. I introduce it here as more likely to answer its purpose than if separately placed at the end of my preliminary observations. 'Suppose a fire to be made in a grate, filled with a kind of fuel not very combustible, and which could only be kept burning by means of a machine containing several tubes, placed before it, and constantly pouring streams of air into it. Suppose also a pipe to be fixed in the back of the chimney, through which a constant supply of fresh fuel was gradually let down into the grate, to repair the waste occasioned by the flame, kept up by the air machine.

'The grate will represent the human frame; the fuel in it, the matter of life—the excitability of Dr Brown, and the sensorial power of Dr Darwin; the tube behind, supplying fresh fuel, will denote the power of all living systems, constantly to regenerate or reproduce excitability; while the air machine, of several tubes, denotes the various stimuli applied to the excitability of the body; and the flame drawn forth in consequence of that application represents life, the product of the exciting powers acting upon the excitability.

'As Dr Brown has defined life to be a *forced state*, it is fitly represented by a flame forcibly drawn forth from fuel little disposed to combustion, by the constant application of streams of air poured into it from the different tubes of a machine. If some of these tubes are disposed to convey pure or dephlogisticated air, they will denote the highest class of exciting powers, opium, musk, camphor, spirits, wine, tobacco, &c. the diffusible stimuli of Dr Brown, which bring forth for a time a greater quantity of life than usual, as the blowing in of pure air into a fire will temporarily draw forth an uncommon quantity of flame. If others of the tubes

be

Brown.

Brown.

be supposed to convey common or atmospheric air, they will represent the ordinary exciting powers or stimuli applied to the human frame, such as heat, light, air, food, drink, &c. while such as convey impure and inflammable air may be used to denote what have formerly been termed sedative powers, such as poisons, contagious miasmata, foul air, &c.

'The reader will now probably be at no loss to understand the seeming paradox of the Brunonian system; that food, drink, and all the powers applied to the body, though they support life, yet consume it; for he will see, that the application of these powers, though it brings forth life, yet at the same time it wastes the excitability or matter of life, just as the air blown into the fire brings forth more flame, but wastes the fuel or matter of fire. This is conformable to the common saying, "the more a spark is blown, the brighter it burns, and the sooner it is spent." A Roman poet has given us, without intending it, an excellent illustration of the Brunonian system, when he says,

"*Balnea, vina, venus, consumunt corpora nostra ;
Sed vitam faciunt balnea, vina, venus.*"

"Wine, warmth, and love, our vigour drain ;
Yet wine, warmth, love, our life sustain."

Or to translate it more literally,

"Baths, women, wine, exhaust our frame ;
But life itself is drawn from them."

'Equally easy will it be to illustrate the two kinds of debility, termed *direct* and *indirect*, which, according to Brown, are the cause of all diseases. If the quantity of stimulus, or exciting power, is proportioned to the quantity of excitability, that is, if no more excitement is drawn forth than is equal to the quantity of excitability produced, the human frame will be in a state of health; just as the fire will be in a vigorous state when no more air is blown in than is sufficient to consume the fresh supply of fuel constantly poured down by the tube behind. If a sufficient quantity of stimulus is not applied, or air not blown in, the excitability in the man, and the fuel in the fire, will accumulate, producing direct debility; for the man will become weak, and the fire low. Carried to a certain degree, they will occasion death to the first, and extinction to the last. If, again, an over proportion of stimulus be applied, or too much air blown in, the excitability will soon be wasted, and the matter of fuel almost spent. Hence will arise indirect debility, producing the same weakness in the man, and lowness in the fire, as before, and equally terminating, when carried to a certain degree, in death and extinction.

'As all the diseases of the body, according to Dr Brown, are occasioned by direct or indirect debility, in consequence of too much or too little stimuli, so all the defects of the fire must arise from direct or indirect lowness, in consequence of too much or too little air blown into it. As Brown taught that one debility was never to be cured by another, but both by the more judicious application of stimuli, so will be found the case in treating the defects of the fire. If the fire has become low, or the man weak, by the want of the needful quantity of stimulus, more must be applied, but very gently at first, and increased by degrees, lest a strong stimulus

applied to the accumulated excitability should produce death; as in the case of a limb benumbed with cold (that is, weakened by the accumulation of its excitability in consequence of the abstraction of the usual stimulus of heat), and suddenly held to the fire, which we know from experience is in danger of mortification; or as in the case of the fire becoming very low by the accumulation of the matter of fuel, when the feeble flame, assailed by a sudden and strong blast of air, would be overpowered and put out, instead of being nourished and increased. Again, if the man or the fire have been rendered indirectly weak, by the application of too much stimulus, we are not suddenly to withdraw the whole, or even a great quantity of the exciting powers or air, for then the weakened life and diminished flame might sink entirely; but we are by little and little to diminish the overplus of stimulus, so as to enable the excitability, or matter of fuel, gradually to recover its proper proportion. Thus a man who has injured his constitution by the abuse of spirituous liquors is not suddenly to be reduced to water alone, as is the practice of some physicians, but he is to be treated as the judicious Dr Pitcairn of Edinburgh is said to have treated a Highland chieftain, who applied to him for advice in this situation. The doctor gave him no medicines, and only exacted a promise of him, that he would every day put as much wax into the wooden *queich*, out of which he drank his whisky, as would receive the impression of his arms. The wax thus gradually accumulating, diminished daily the quantity of the whisky, till the whole *queich* was filled with wax; and the chieftain was thus gradually, and without injury to his constitution, cured of the habit of drinking spirits.

'These analogies might be pursued farther; but my object is solely to furnish some general ideas, to prepare the reader for entering more easily into the Brunonian theory, which I think he will be enabled to do after perusing what I have said. The great excellence of the theory, as applied, not only to the practice of physic, but to the general conduct of the health, is, that it impresses on the mind a sense of the impropriety and danger of going from one extreme to another. The human frame is capable of enduring great varieties, if time be given it to accommodate itself to different states. All the mischief is done in the transition from one state to another. In a state of low excitement we are not rashly to induce a state of high excitement, nor when elevated to the latter, are we suddenly to descend to the former, but step by step, and as one who from the top of a high tower descends to the ground. From hasty and violent changes, the human frame always suffers; its particles are torn asunder, its organs injured, the vital principle impaired, and disease, often death, is the inevitable consequence.

'I have only to add, that though in this illustration of the Brunonian system (written several years ago), I have spoken of a tube constantly pouring in fresh fuel, because I could not otherwise convey to the reader a familiar idea of the power possessed by all living systems, to renew their excitability when exhausted; yet it may be proper to inform the student, that Dr Brown supposed every living system to have received at the beginning its determinate portion of excitability; and, therefore, although he spoke of the exhaustion, augmentation,

Brown.

Brown **Brownists.** tion, and even renewal, of excitability, I do not think it was his intention to induce his pupils to think of it as a kind of fluid substance existing in the animal, and subject to the law by which substances are governed. According to him, excitability was an unknown *somewhat*, subject to peculiar laws of its own, and whose different states we are obliged to describe (though inaccurately) by terms borrowed from the qualities of material substances.

“The Brunonian system has frequently been charged with promoting intemperance. The objection is serious; but the view already given of its principles shows it to be groundless. No writer had insisted so much upon the dependence of life on external causes, or so strongly stated the inevitable consequences of excess. And there are no means of promoting morality upon which we can rely, except the knowledge of the true relations between man and other beings or bodies. For by this knowledge we are directly led to shun what is hurtful, and pursue what is salutary: and in what else does moral conduct, as far as it regards the individual, consist? It may be said that the author’s life disproves the justness of this representation: his life, however, only shows the superior power of other causes, and of bad habits in particular; and I am ready to acknowledge the little efficacy of instruction when bad habits are formed. Its great use consists in preventing their formation; for which reason popular instruction in medicine would contribute more to the happiness of the human species, than the complete knowledge of every thing which is attempted to be taught in education, as it is conducted at present. But though the principles of the system in question did not correct the propensities of its inventor, it does not follow that they tend to produce the same propensities in others.”

BROWN, among dyers, painters, &c. a dusky colour inclining towards redness. Of this colour there are various shades or degrees, distinguished by different appellations; for instance, Spanish-brown, a sad-brown, a tawny-brown, the London brown, a clove-brown, &c.

Spanish-brown is a dark dull red, or a horse-flesh colour. It is an earth; and is of great use among painters, being generally used as the first and priming colour that they lay upon any kind of timber-work in house-painting. That which is of the deepest colour, and freest from stones, is the best. Though this is of a dirty brown colour, yet it is much used, not to colour any garment, unless it be an old man’s gown; but to shadow vermilion, or to lay upon any dark ground behind a picture, or to shadow yellow berries in the darkest places, when you want lake, &c. It is best and brightest when burnt in the fire till it be red hot; although, if you would colour any hare, horse, dog, or the like, it should not be burnt; but, for other uses, it is best when it is burnt; as for colouring wood, posts, bodies of trees, or any thing else of wood, or any dark ground of a picture.

BROWNSIA. See *BOTANY Index*.

BROWNISTS, a religious sect, which sprung out of the Puritans, towards the close of the 16th century. Their leader, Robert Brown, wrote divers books in their behalf, was a man of good parts, and some learning. He was born of a good family in Rutland-

Vol. IV. Part II.

shire, and related to the lord-treasurer Burleigh. He had been educated at Cambridge; but first published his notions, and began to inveigh openly against the discipline and ceremonies of the church, at Norwich, in the year 1580; from which time he underwent divers prosecutions from the bishops; insomuch that he boasted he had been committed to no less than 32 prisons, in some of which he could not see his hand at noon-day. At length, with his congregation, he left the kingdom, and settled at Middleburgh in Zealand; where they obtained leave of the states to worship God in their own way, and form a church according to their own model; which they had not long done, before this handful of men, just delivered from the severities of the bishops, began to differ among themselves and crumble into so many parties, that Brown their pastor grew weary of his office; and, returning to England in 1589, renounced his principles of separation, and was preferred to the rectory of a church in Northamptonshire, and died, after leading a very idle and dissolute life, in 1630.

The revolt of Brown was attended with the dissolution of the church at Middleburgh; but the seeds of Brownism, which he had sown in England, were so far from being destroyed, that Sir Walter Raleigh, in a speech in 1592, computes no less than 20,000 followers of it. The occasion of their separation was not any fault they found with the faith, but only with the discipline and form of government, of the other churches in England. They equally charged corruption on the Episcopal form, and on that of the Presbyterians, by consistories, classes, and synods: nor would they join with any other reformed church, because they were not assured of the sanctity and regeneration of the members that composed it; on account of the toleration of sinners, with whom they maintained it an impiety to communicate. They condemned the solemn celebration of marriages in the church; maintaining that matrimony being a political contract, the confirmation thereof ought to come from the civil magistrate. They would not allow any children to be baptized of such as were not members of the church, or of such as did not take sufficient care of those baptized before. They rejected all forms of prayer; and held that the Lord’s prayer was not to be recited as a prayer, being only given for a rule or model whereon all our prayers are to be formed. The form of church-government which they established was democratical. When a church was to be gathered, such as desired to be members of it made a confession of it, and signed a covenant, by which they obliged themselves to walk together in the order of the gospel. The whole power of admitting and excluding members, with the decision of all controversies, was lodged in the brotherhood. The church officers were chosen from among themselves, for preaching the word, and taking care of the poor, and separated to their several offices by fasting, prayer, and imposition of hands of some of the brethren. But they did not allow the priesthood to be any distinct order, or to give any indelible character. As the vote of the brotherhood made a man a minister, and gave him authority to preach the word and administer the sacraments among them, so the same power could discharge him from his office, and reduce him to a mere layman again. And as they

Brownists.

Brownists, Brownrigg. maintained the bounds of a church to be no greater than what could meet together in one place and join in one communion, so the power of these officers was prescribed within the same limits. The minister or pastor of one church could not administer the Lord's supper to another, nor baptize the children of any but those of his own society. Any lay-brother was allowed the liberty of prophesying, or of giving a word of exhortation to the people; and it was usual for some of them, after sermon, to ask questions, and reason upon the doctrines that had been preached. In a word, every church on the Brownists model is a body corporate, having full power to do every thing which the good of the society requires, without being accountable to any classis, synod, convocation, or other jurisdiction whatever. Most of their discipline has been adopted by the Independents, a party which afterwards arose from among the Brownists. The laws were executed with great severity on the Brownists; their books were prohibited by Queen Elizabeth, and their persons imprisoned, and many of them were hanged. The ecclesiastical commission and the star-chamber, in fine, distressed them to such a degree, that they resolved to quit their country. Accordingly, many families retired and settled at Amsterdam, where they formed a church, and chose Mr Johnson their pastor; and after him Mr Ainsworth, author of the learned commentary on the Pentateuch. Their church flourished near 100 years. See INDEPENDENTS.

BROWNRIGG, WILLIAM, M. D. F. R. S. was a native of Cumberland, and born about the year 1712. Of the early part of the life of this philosopher we have had no opportunity of obtaining information. Being destined for the medical profession, after the previous studies in his own country, he repaired to Leyden to finish his education. This university was then in its highest splendour; Albinus in anatomy, Euler in mathematics, and the chair of medicine and chemistry was occupied by the all-accomplished Boerhaave. Having made at Leyden a long and happy residence, and taken his degree, he returned to his native country, and, in Whitehaven, married a lady of singular good sense, and possessing an address so versatile and superior as never failed to charm in whatever circle it was exerted. He was author of an inaugural dissertation *De Praxi medica ineunda*, 4to, Lugd. Bat. 1737; of a treatise "On the Art of making Common Salt," printed at London, in 1748, in 8vo; which procured for him the addition of F. R. S.; a book now long out of print, but not out of recollection. He also published "An Enquiry concerning the mineral Elastic Spirit contained in the water of Spa in Germany;" and, lastly, a treatise, published in 1771, "On the Means of preventing the Communication of Pestilential Contagion." A trip to the Spas of Germany suggested to him the idea of analyzing the properties of the Pymont springs, and of some others, and actually led him to that train of disquisition, which terminated in the de-elementizing one of our elements, and fixing its invisible fluid form in a palpable and visible substance. That Dr Brownrigg was the legitimate father of these discoveries was not only known at the time to his intimate and domestic circle, but also to the then president of the Royal Society, Sir John Pringle; who, when called upon to bestow upon Dr Priestley the gold

medal for his paper of "Discoveries of the Nature, and Properties of Air," thus observed; "And it is no disparagement to the learned Dr Priestley, that the vein of these discoveries was hit upon, and its course successfully followed up, some years ago, by my very learned, very penetrating, very industrious, but modest, friend, Dr Brownrigg." To habits of too much diffidence, and to his scrupulosity of taste, the world has to attribute the fewness of his publications, and the difficulties which always impeded his road to the press. The writer of this article has grounds for saying, that a general history of the county of Cumberland was one of the doctor's literary projects, and that he had made several arrangements subservient to such an undertaking, particularly in the department of natural history. As a medical practitioner, his works were more numerous, and, if not equally celebrated, they were of a character more endearing within the sphere of their utility. His system of treating disease formed an epoch in the annals of medical practice. The poor and the rich had everywhere somewhat for which they thanked him; and health seemed only one of the blessings which he had to dispense. By these means the doctor passed into the summit of professional honour without rival or competitor, without controversy or detraction, but not without applications and requests from fellow students and followers from distant parts, from academies, societies, and universities, foreign and domestic, entreating permission to enrol his name among their respective communities. In his younger days, though the classics of Greece, Rome, and Britain, were present to his fancy, and enlivened and enriched his conversation, yet the Sacred Scriptures were the topics of his delight, and the objects of his veneration: and as his quotations of Virgil and Milton bore testimony to the elegance of his taste, and the fervour of his genius; so, when Job and Isaiah were brought forward, he shewed what his imagination would aspire at, in the ranges of sublimity. In the ordinary occurrence of good things, he never failed to give God the praise; and in the more solemn dispensations, he closed his observations or repressed his feelings, by a purpose of resignation to God's will. To his seat at Ormethwaite, near Keswick, he had retired about 20 years before his death, withdrawing himself as much from the practice of physic as his numerous connexions, his high character, and his friendly disposition would permit: and purposing to divide his time and his taste between the romantic scenery of this delicious spot, and his researches in natural philosophy. In this retirement he died at the venerable age of 88, lamented by the poor, to whom he was always a beneficent friend, and regretted by all. (*Month. Mag.*)

BROWNY, the name of a serviceable kind of sprite, who, according to a superstitious notion formerly prevalent in the Hebrides and Highlands of Scotland (as well as among the country people in England, where he had the name of *Robin Goodfellow*), was wont to clean the houses, helped to churn, thrashed the corn, and would labour all that pretended to make a jest of him. He was represented as stout and blooming, had fine long flowing hair, and went about with a wand in his hand. He was the very counterpart of Milton's *Lubber Fiend*, who

Tells how the drudging goblin swet,
To earn his cream-bowl duly set,

When

Brown
Bruce.

When in one night, ere glimpse of morn,
His shadowy flail hath thrash'd the corn
That ten day-lab'ers could not end;
Then lays him down the Lubber Fiend,
And stretch'd along the chimney's length,
Basks at the fire his hairy strength.

BROWSE, the tops of the branches of trees, whereon beasts feed. This is sometimes also called *brouce* and *bruttle*; probably from the French *broust*, which signifies the same thing.

BROWSE more properly denotes the food which deer find in young copses, continually sprouting anew.

BRUCE, ROBERT, son of the earl of Carrick, being competitor with Baliol for the crown of Scotland, lost it by the arbitration of Edward I. of England, for generously refusing to hold the crown of Scotland as depending on him, which his ancestors had left him independent. But Baliol having afterwards broke his agreement with Edward, Bruce was easily persuaded by that king to side with him against Baliol, upon promise that he would settle him on the throne. Having contributed much to the breaking of Baliol's party, he demanded the accomplishment of King Edward's promise, who is said to have given him this answer: "What! have I nothing else to do but to conquer kingdoms for you?" However, he recovered his crown, defeated the English in several battles, raised the glory of the Scots, and extended their dominions. See *History of SCOTLAND*.

BRUCE, James, F. R. S. the celebrated traveller, was born at Kinnaird-house in the county of Stirling, Scotland, in the year 1729. The Bruces of Kinnaird are a very ancient family. They were descended from a younger son of Robert de Bruce, and have been in possession of that estate for three centuries, connected during this period with some of the most distinguished houses of the kingdom.

Mr Bruce was instructed in grammatical learning at the school of Harrow on the Hill in Middlesex, where he acquired a considerable share of classical knowledge. Returning to Scotland, he applied to the study of the laws of his country; but soon contracting a dislike to his situation, he determined to push his fortune in the East Indies, and for that purpose went to London. Being disappointed in his views of procuring an appointment in the company's service, he engaged in trade, and entered into partnership with a wine merchant in London of the name of Allen, whose daughter he married. That lady falling into a bad state of health, Mr Bruce took her abroad, in hopes that travelling would be attended with beneficial effects, but in these he was disappointed, as she died within a year after her marriage. He was induced, in order to dispel his grief, to continue his travels, during which his father dying (at Edinburgh 4th May 1758), the inheritance of his ancestors devolved upon him, and he returned to Britain. Some of his subsequent transactions shall now be related in his own words:

"Every one will remember that period, so glorious to Britain, the latter end of the ministry of the late Earl of Chatham. I was then returned from a tour through the greatest part of Europe, particularly through the whole of Spain and Portugal, between whom there was then the appearance of an approaching war.

"I was about to retire to a small patrimony I had

received from my ancestors, in order to embrace a life of study and reflexion, nothing more active appearing within my power, when chance threw me unexpectedly into a very short and very desultory conversation with Lord Chatham.

"It was a few days after this, that Mr Wood, then under secretary of state, my zealous and sincere friend, informed me that Lord Chatham intended to employ me upon a particular service; that, however, I might go down for a few weeks to my own country to settle my affairs, but, by all means, to be ready upon a call. Nothing could be more flattering to me than such an offer, when so young; to be thought worthy by Lord Chatham of any employment, was doubly a preference. No time was lost on my side; but just after receiving orders to return to London, his Lordship had gone to Bath, and resigned his office.

"This disappointment, which was the more sensible to me that it was the first I had met with in public life, was promised to be made up to me by Lord Egremont and Mr George Grenville. The former had been long my friend; but unhappily he was then far gone in a lethargic indisposition, which threatened, and did very soon put a period to his existence. With Lord Egremont's death my expectations vanished. Further particulars are unnecessary; but I hope that, at least in part, they remain in that breast where they naturally ought to be, and where I shall ever think, not to be long forgotten is to be rewarded.

"Seven or eight months were passed in an expensive and fruitless attendance in London, when Lord Halifax was pleased, not only to propose but to plan for me, a journey of considerable importance, and which was to take up several years. His lordship said, that nothing could be more ignoble than, at such a time of life, at the height of my reading, health, and activity, I should as it were, turn peasant, and voluntarily bury myself in obscurity and idleness; but though war was now drawing fast to an end, full as honourable a competition remained among men of spirit, which should acquit themselves in the dangerous line of useful adventure and discovery.

"He observed, that the coast of Barbary, which might be said to be just at our door, was yet but partially explored by Dr Shaw, who had only illustrated (very judiciously indeed) the geographical labours of Sanson; that neither Dr Shaw nor Sanson had been, or pretended to be, capable of giving the public any detail of the large and magnificent remains of ruined architecture, which they both vouch to have seen in great quantities, and of exquisite elegance and perfection, all over the country. Such had not been their study, yet such was really the taste that was required in the present times. He wished, therefore, that I should be the first, in the reign just now beginning, to set an example of making large additions to the royal collection; and he pledged himself to be my support and patron, and to make good to me, upon this additional merit, the promises which had been held forth to me by former ministers for other services.

"The discovery of the source of the Nile was also a subject of these conversations; but it was always mentioned to me with a kind of diffidence, as if to be expected from a more experienced traveller. Whether this was but another way of exciting me to the attempt,

Bruce.

tempt, I shall not say; but my heart, in that instant, did me justice to suggest, that this too was either to be achieved by me, or to remain as it had done for these last two thousand years, a defiance to all travellers, and an opprobrium to geography.

"Fortune seemed to enter into this scheme. At the very instant, Mr Aspinwall, very cruelly and ignominiously treated by the dey of Algiers, had resigned his consulship, and Mr Ford, a merchant, formerly the dey's acquaintance, was named in his place. Mr Ford was appointed, and, dying a few days after, the consulship became vacant. Lord Halifax pressed me to accept of this, as containing all sorts of conveniences for making the proposed expedition.

"This favourable event finally determined me. I had all my life applied unweariedly, perhaps with more love than talent, to drawing, the practice of mathematics, and especially that part necessary to astronomy. The transit of Venus was at hand. It was certainly known, that it would be visible once at Algiers, and there was great reason to expect it might be twice. I had furnished myself with a large apparatus of instruments, the completest of their kind, for the observation. In the choice of these, I had been assisted by my friend Admiral Campbell, and Mr Russel, secretary to the Turkey company: every other necessary had been provided in proportion. It was a pleasure now to know, that it was not from a rock or wood, but from my own house at Algiers, I could deliberately take measures to place myself in the list of men of science of all nations who were then preparing for the same scientific purpose.

"Thus prepared, I set out for Italy, through France; and though it was in time of war, and some strong objections had been made to particular passports, solicited by our government from the French secretary of state, Monsieur de Choiseul most obligingly waved all such exceptions with regard to me, and most politely assured me, in a letter accompanying my passport, that those difficulties did not in any shape regard me, but that I was perfectly at liberty to pass through or remain in France, with those that accompanied me, without limiting their number, as short or as long a time as should be agreeable to me.

"On my arrival at Rome, I received orders to proceed to Naples, there to wait his majesty's further commands. Sir Charles Saunders, then with a fleet before Cadiz, had orders to visit Malta before he returned to England. It was said, that the grand master of that order had behaved so improperly to Mr Hervey (afterwards Lord Bristol) in the beginning of the war, and so partially and unjustly between the two nations in the course of it, that an explanation on our part was become necessary. The grand master no sooner heard of my arrival at Naples, than, guessing the errand, he sent off Chevalier Mazzini to London, where he at once made his peace and his compliments to his majesty upon his accession to the throne.

"Nothing remained now but to take possession of my consulship. I returned, without loss of time, to Rome, and from thence to Leghorn, where having embarked on board the Montreal man of war, I proceeded to Algiers.

"After a year spent at Algiers, constant conversation with the natives while abroad, and with my manu-

scripts within doors, had qualified me to appear in any part of the continent without the help of an interpreter. Ludolf had assured his readers, that the knowledge of any oriental language would soon enable them to acquire the Ethiopic; and I needed only the same number of books to have made my knowledge of that language go hand in hand with my attainments in the Arabic. My immediate project of setting out on my journey to the inland parts of Africa, had made me double my diligence; night and day there was no relaxation from these studies, although the acquiring any single language had never been with me either an object of time or difficulty."

At Algiers Mr Bruce was detained longer than he expected, in consequence of a dispute with the dey concerning Mediterranean passes. This being adjusted, he proceeded to Mahon, and from Mahon to Carthage. He next visited Tunis and Tripoli, and travelled over the interior parts of these states. At Bengazi, a small town on the Mediterranean, he suffered shipwreck, and with extreme difficulty saved his life, though with the loss of all his baggage. He afterwards sailed to the isles of Rhodes and Cyprus, and proceeding to Asia Minor, travelled through a considerable part of Syria and Palestine, visiting Hassia, Latakea, Aleppo, and Tripoli, near which last city he was again in imminent danger of perishing in a river. The ruins of Palmyra and Baalbec were next carefully surveyed and sketched by him; and his drawings of these places are deposited in the king's library at Kew: "the most magnificent present, in that line," to use his own words, "ever made by a subject to his sovereign."

It is much to be regretted, that Mr Bruce published no particular account of these various journeys; from the nature of the places visited, and the abilities of the man, much curious and useful information might have been expected. Some manuscript accounts of different parts of them are said to have been left by him, but whether in such a state as to be fit for publication is very uncertain.

In these various travels some years were passed; and Mr Bruce now prepared for the grand expedition, the accomplishment of which had ever been nearest his heart, the discovery of the sources of the Nile. In the prosecution of that dangerous object, he left Sidon on the 15th of June 1768, and arrived at Alexandria on the 20th of that month. He proceeded from thence to Cairo, where he continued to the 12th of December following, when he embarked on the Nile, and sailed up the river as far as Syene, visiting in the course of the voyage the ruins of Thebes. Leaving Kenné on the Nile, 16th February 1769, he crossed the desert of the Thebaid to Cosseir on the Red sea, and arrived at Jidda on the 3d of May. In Arabia Felix he remained, not without making several excursions, till the 3d of September, when he sailed from Lohcia, and arrived on the 19th at Masuah, where he was detained near two months by the treachery and avarice of the naybe of that place. It was not till the 15th of November that he was allowed to quit Arkeeko, near Masuah; and he arrived on the 15th of February 1770 at Gondar, the capital of Abyssinia, where he ingratiated himself with the most considerable persons of both sexes belonging to the court. Several months were

Bruce. were employed in attendance on the king; and in an unsuccessful expedition round the lake of Dembea. Towards the end of October, Mr Bruce set out for the sources of the Nile, at which long-desired spot he arrived on the 14th of November, and his feelings on the accomplishment of his wishes cannot better be expressed than in his own words:

“It is easier to guess than to describe the situation of my mind at that moment; standing in that spot which had baffled the genius, industry, and inquiry, of ancients and moderns for the course of near 3000 years. Kings had attempted this discovery at the head of armies; and each expedition was distinguished from the last only by the difference of the numbers which had perished, and agreed alone in the disappointment which had uniformly, and without exception, followed them all. Fame, riches, and honour, had been held out for a series of ages to every individual of those myriads those princes commanded, without having produced one man capable of gratifying the curiosity of his sovereign, or wiping off this stain upon the enterprise and abilities of mankind, or adding this desideratum for the encouragement of geography. Though a mere private Briton, I triumphed here in my own mind over kings and their armies; and every comparison was leading nearer and nearer to the presumption, when the place itself where I stood, the object of my vain-glory, suggested what depressed my short-lived triumphs. I was but a few minutes arrived at the source of the Nile, through numberless dangers and sufferings, the least of which would have overwhelmed me, but for the continual goodness and protection of providence; I was, however, but then half through my journey, and all those dangers which I had already passed awaited me again on my return. I found a despondency gaining ground fast upon me, and blasting the crown of laurels I had too rashly woven for myself.”

When he returned to rest the night of that discovery, repose was sought for in vain. “Melancholy reflections upon my present state, the doubtfulness of my return in safety, were I permitted to make the attempt, and the fears that even this would be refused, according to the rule observed in Abyssinia with all travellers who have once entered the kingdom; the consciousness of the pain that I was then occasioning to many worthy individuals, expecting daily that information concerning my situation which it was not in my power to give them; some other thoughts, perhaps, still nearer the heart than those, crowded upon my mind, and forbade all approach of sleep.

“I was, at that very moment, in possession of what had for many years been the principal object of my ambition and wishes; indifference, which, from the usual infirmity of human nature, follows, at least for a time, complete enjoyment, had taken place of it. The marsh, and the fountains, upon comparison with the rise of many of our rivers, became now a trifling object in my sight. I remembered that magnificent scene in my own native country, where the Tweed, Clyde, and Annan, rise in one hill; three rivers I now thought not inferior to the Nile in beauty, preferable to it in the cultivation of those countries through which they flow; superior, vastly superior to it in the virtues and qualities of the inhabitants, and in the beauty of its flocks, crowding its pastures in peace, without fear of violence

from man or beast. I had seen the rise of the Rhine and Rhone, and the more magnificent sources of the Saone; I began, in my sorrow, to treat the inquiry about the source of the Nile as a violent effort of a dis-tempered fancy:

‘What’s Hecuba to him, or he to Hecuba,
‘That he should weep for her?’

Grief and despondency now rolling upon me like a torrent, relaxed, not refreshed, by unquiet and imperfect sleep, I started from my bed in the utmost agony. I went to the door of my tent. Every thing was still; the Nile, at whose head I stood, was not capable either to promote or to interrupt my slumbers, but the coolness and serenity of the night braced my nerves, and chased away those phantoms that while in bed had oppressed and tormented me.

“It was true, that numerous dangers, hardships, and sorrows, had beset me through this half of my excursion; but it was still as true, that another Guide, more powerful than my own courage, health, or understanding, if any of them can be called man’s own, had uniformly protected me in all that tedious half. I found my confidence not abated, that still the same Guide was able to conduct me to my wished-for home. I immediately resumed my former fortitude, considered the Nile as indeed no more than rising from springs as all other rivers do, but widely differing in this, that it was the palm for 3000 years held out to all the nations of the world as a *detur dignissimo*, which in my cool hours I had thought was worth the attempting at the risk of my life, which I had long either resolved to lose, or lay this discovery a trophy in which I could have no competitor, for the honour of my country, at the feet of my sovereign, whose servant I was.”

The object of Mr Bruce’s wishes being now gratified, he bent his thoughts on his return to his native country. He arrived at Gondar 19th November 1770; but found, after repeated solicitations, that it was by no means an easy task to obtain permission to quit Abyssinia. A civil war in the mean time breaking out, several engagements took place between the king’s forces and the troops of the rebels, particularly three actions at a place called Serbraxos on the 19th, 20th, and 23d of May 1771. In each of them Mr Bruce acted a considerable part, and for his valiant conduct in the second received, as a reward from the king, a chain of gold, of 184 links, each link weighing $3\frac{1}{8}$ dwts. or somewhat more than 2 $\frac{1}{4}$ lbs. troy in all. At Gondar, after these engagements, he again preferred the most earnest entreaties to be allowed to return home, entreaties which were long resisted; but his health at last giving way, from the anxiety of his mind, the king consented to his departure, on condition of his engaging by oath to return to him in the event of his recovery, with as many of his kindred as he could engage to accompany him.

After a residence of nearly two years in that wretched country, Mr Bruce left Gondar on the 16th of December 1771, taking the dangerous way of the desert of Nubia, in place of the more easy road of Masuah, by which he entered Abyssinia. He was induced to take this rout, from his knowledge and former experience of the cruel and savage temper of the naybe of Masuah. Arriving at Teawa the 21st March 1772,

Mr

Bruce.

Mr Bruce had the misfortune to find the shekh Fidele at Atbara, the counterpart of the naybe of Masuah, in every bad quality; by his intrepidity and prudence, however, and by making good use of his foreknowledge of an eclipse of the moon, which happened on the 17th of April, he was permitted to depart next day, and he arrived at Sennaar on the 29th of the same month.

Mr Bruce was detained upwards of four months at that miserable and inhospitable place; the inhabitants of which he describes in these expressive words: "War and treason seem to be the only employment of these horrid people, whom heaven has separated by almost impassable deserts from the rest of mankind, confining them to an accursed spot, seemingly to give them an earnest in time of the only other worse which he has reserved to them for an eternal hereafter." This delay was occasioned by the villany of those who had undertaken to supply him with money; but at last, by disposing of 178 links of his gold chain, the well-earned trophy of Serbraxos, he was enabled to make preparation for his dangerous journey through the deserts of Nubia.

He left Sennaar on the 5th of September, and arrived on the 3d of October at Chendi, which he quitted on the 20th, and travelled through the desert of Gooz, to which village he came on the 26th of October. On the 9th of November he left Gooz, and entered upon the most dreadful and dangerous part of his journey; the perils attending which he has related with a power of pencil not unworthy of the greatest masters. All his camels having perished, Mr Bruce was under the necessity of abandoning his baggage in the desert, and with the greatest difficulty reached Assouan upon the Nile on the 29th of November.

After some days rest, having procured fresh camels, he returned into the desert, and recovered his baggage, among which is particularly to be remarked a quadrant (of three feet radius) supplied by Louis XV. from the military academy at Marseilles; by means of which noble instrument, now deposited in the museum at Kinnaird, Mr Bruce was enabled with precision and accuracy to fix the relative situations of the several remote places he visited.

On the 10th of January 1773, after more than four years absence, he arrived at Cairo, where, by his manly and generous behaviour, he so won the heart of Mahomet Bey, that he obtained a firman, permitting the commanders of English vessels belonging to Bombay and Bengal to bring their ships and merchandise to Suez, a place far preferable in all respects to Jidda, to which they were formerly confined. Of this permission, which no European nation could ever before acquire, many English vessels have since availed themselves; and it has proved peculiarly useful both in public and private dispatches. Such was the worthy conclusion of his memorable journey through the desert; a journey which, after many hardships and dangers, terminated in obtaining this great national benefit.

At Cairo Mr Bruce's earthly career had nearly been concluded by a disorder in his leg, occasioned by a worm in the flesh. This accident kept him five weeks in extreme agony, and his health was not re-established till a twelvemonth afterwards, at the baths of Porretta in Italy. On his return to Europe, Mr Bruce

was received with all the admiration due to so exalted a character. After passing some considerable time in France, particularly at Montbard, with his friend the comte de Buffon, by whom he was received with much hospitality, and is mentioned with great applause, he at last revisited his native country, from which he had been upwards of twelve years absent.

It was now expected that he would take the earliest opportunity of giving to the world a narrative of his travels, in which the public curiosity could not but be deeply interested. But several circumstances contributed to delay the publication; and what these were will be best related in his own words:

"My friends at home gave me up for dead; and as my death must have happened in circumstances difficult to have been proved, my property became as it were a *hereditas jacens*, without an owner, abandoned in common to those whose original title extended no further than temporary possession.

"A number of law-suits were the inevitable consequence of this upon my return. To these disagreeable avocations, which took up much time, were added others still more unfortunate. The relentless ague, caught at Bengazi, maintained its ground, at times, for a space of more than 16 years, though every remedy had been used, but in vain; and what was worst of all, a lingering distemper had seriously threatened the life of a most near relation (his second wife), which, after nine years constant alarm, where every duty bound me to attention and attendance, conducted her at last, in very early life, to her grave."

Amidst the anxiety and the distress thus occasioned, Mr Bruce was by no means neglectful of his private affairs. He considerably improved his landed property, inclosing and cultivating the waste grounds; and he highly embellished his paternal seat, making many additions to the house, one in particular of a noble museum, filled with the most precious stores of oriental literature, large collections of drawings made, and curious articles obtained, during his far-extended peregrinations.

The termination of some law-suits, and of other business, which had occupied much of his time, having at length afforded leisure to Mr Bruce to put his materials in order, his greatly desired and long expected work made its appearance in 1790, in five large quarto volumes embellished with plates and charts. It is unnecessary to enter into any critic or analysis of this celebrated work. It is universally allowed to be replete with curious and useful information; and to abound in narratives which at once excite our admiration and interest our feelings. The very singular and extraordinary picture which it gives of Abyssinian manners, startled the belief of some; but these manners, though strange in the sight of an European, are little more than might be expected in such a barbarous country.

A more serious objection to the truth of Mr Bruce's narrative was started by an anonymous critic, in an Edinburgh newspaper, soon after the publication, from the account of two astronomical phenomena, which it is asserted *could not possibly have happened* as Mr Bruce asserts. The first of these is the appearance of the new moon at Furshout, during Mr Bruce's stay in that place, which he mentions to have been from 25th Dec. 1768, to the 7th of Jan. 1769; and on a particular day in that interval

Bruce. interval asserts, that the new moon was seen by a fakir, and was found by the ephemerides to be three days old; whereas it is certain that the moon changed on the 8th of January 1767. The other phenomenon appears equally impossible. At Teawa Mr Bruce says he terrified the shekh by foretelling that an eclipse of the moon was to take place at four o'clock afternoon of the 17th of April 1772; that accordingly, soon after that hour, he saw the eclipse was begun; and when the shadow was half over, told the shekh that in a little time the moon would be totally darkened. Now, by calculation, it is certain, that at Teawa this eclipse must have begun at 36 minutes past four, and the moon have been totally covered at 33 minutes past five; while the sun set there a few minutes past six, before which time the moon, then in opposition, could not have risen: so that as the moon rose totally eclipsed, Mr Bruce could not see the shadow half over the disk, nor point it out to the shekh. To these objections, which appear unsurmountable, Mr Bruce made no reply, though in conversation he said he would do it in the second edition of his book.

The language of the work is in general harsh and unpolished, though sometimes animated. Too great a display of vanity runs through the whole, and the apparent facility with which the traveller gained the most familiar access to the courts, and even to the harems, of the sovereigns of the countries through which he passed, is apt to create in readers some doubts of the accuracy of the narration. Yet there appears upon the whole such an air of manly veracity, and circumstances are mentioned with a minuteness so unlike deceit, that these doubts are overcome by the general impression of truth, which the whole detail irresistibly fastens upon the mind. This first impression being almost wholly disposed of within a short time, Mr Bruce had stipulated for a second edition, which was preparing for the press, when death removed the author from this transitory stage.

That event happened on the 26th of April 1794. In the evening of that day, when some company were departing, Mr Bruce attended them down stairs; on the steps his foot slipped, and he fell down headlong. He was taken up speechless, and remained in a state of insensibility for eight or nine hours, when he expired, on the 27th of April 1794, in the 65th year of his age.

He married, for his second wife, at Carronhall, 20th May 1776, Mary, eldest daughter of Thomas Dundas of Fingask. Mrs Bruce died, after a long and lingering indisposition, during which she was attended with the most affectionate assiduity by her husband, in 1784, having had issue two sons and one daughter.

There never, perhaps, existed a man better qualified for the hazardous enterprise he undertook, than Mr Bruce. His person was of the largest size, his height exceeding six feet, and the bulk as well as the strength of his body was proportionally great. He excelled in all corporeal accomplishments, being a hardy, practised, and indefatigable swimmer, trained to exercise and fatigue of every kind, and his long residence among the Arabs had given him a more than ordinary facility in managing the horse. In the use of fire arms he was so unerring, that in innumerable instances he never failed to hit the mark; and his dexterity in handling the

spear and lance on horseback was also uncommonly great. He was master of most languages, understanding the Greek perfectly; and was so well skilled in oriental literature, that he revised the New Testament in the Ethiopic, Samaritan, Hebrew, and Syriac, making many useful notes and remarks on difficult passages. He had applied from early youth to mathematics, drawing, and astronomy; and had acquired some knowledge of physic and surgery. His memory was astonishingly retentive, his judgment sound and vigorous. He was dexterous in negotiation, a master of public business, animated with the warmest zeal for the glory of his king and country, a physician in the camp or city, a soldier and horseman in the field, while, at the same time, his breast was a stranger to fear, though he took every precaution to avoid danger. Such, at least, is *his own* representation of his character; and though an impartial judge would probably make considerable abatement for the natural bias of a man drawing his own portrait, yet it cannot be denied, that in personal accomplishments, Mr Bruce equalled, if not exceeded, most of his cotemporaries; was uncommonly distinguished for vigour of understanding, as well as great literary attainments; and in active persevering intrepidity may be classed with the most eminent characters in any age or country.

Thus accomplished, Mr Bruce could not but be eminently fitted for an attempt so full of difficulty and danger as the discovery of the sources of the Nile: no one who peruses his account of the expedition, can fail to pay an unfeigned tribute of admiration to his intrepidity, manliness, and uncommon dexterity in extricating himself out of situations the most dangerous and alarming, in the course of his long and hazardous journey. Not to mention his conduct during his residence in Abyssinia, his behaviour at Masuah, Teawa, and Sennaar, evinces the uncommon vigour of his mind; but it was chiefly during his passage through the Nubian desert that his fortitude, courage, and prudence, appeared to the greatest advantage. Of his learning and sagacity, his delineation of the course of Solomon's fleet from Tarshish to Ophir, his account of the cause of the inundations of the Nile, and his comprehensive view of the Abyssinian history, afford ample proofs. He expresses throughout all his works a deep and lively sense of the care of a superintending Providence, without whose influence, he was convinced of the futility of all human ability and foresight to preserve from danger. He appears to have been a serious believer of the truth of Christianity; and his illustrations of some parts of the sacred writings are original and valuable. (*Edin. Mag.*)

BRUCHSAL, a town of Germany, in the palatinate of the Rhine, and bishopric of Spire, situated on the river Satz, in E. Long. 8. 30. N. Lat. 49. 15.

BRUCHUS. See ENTOMOLOGY *Index*.

BRUCKER, JAMES, a German theologian and historian. See SUPPLEMENT.

BRUEGHEL. See BREUGHEL.

BRUGES, a city of the Netherlands, is seated in a plain eight miles from the sea; and has a great number of canals, one of which leads to Ghent, another to Ostend, and others to Sluys, to Newport, to Furnes, to Ypres, and to Dunkirk. All the waters about Bruges are without any current; but they may be

Bruce
||
Bruges.

Bruges. be changed in half an hour's time, by opening the sluices, and letting the water run into the sea. There are several bridges about the city, and that which was built in 1739 of freestone is very stately.

Bruges was in a very flourishing condition upwards of 200 years ago, and every nation had a consul here for the maintenance of their rights and privileges; but since the enlargement of Amsterdam and Antwerp, the trade is diminished. The population in 1816 was 45,000. There are many rich merchants, and a chamber for trade. There are several fine churches; in the first rank of which is the cathedral, whose rich ornaments and treasure deserve notice. The finest square in the city is the great market, in which stand the halls, with public galleries, and a large court in the middle, and on one of its sides a high steeple supported only with four pillars. It is full of bells, with the most harmonious chimes in all the country. On the side of the great square there is a structure which serves for a public magazine to lay cloth in. It is built on a canal, and supported by pillars in such a manner, that small vessels can pass under it, to cross the city from the canal of Ostend to that of Ghent.

The square where the Wednesday's market is kept is very fine; for it contains several walks between two rows of trees, and a new guard-house in the middle. The Burg is a large square, in which is the town-house, built in the Gothic manner, and adorned with a variety of figures of the ancient counts and countesses of Flanders. In the same square there are several other public buildings. The church dedicated to the Virgin Mary is very fine, with a high steeple, which serves as a sea-mark for the ships that come to Ostend; in the inside are two tombs of copper gilt, of an extraordinary magnificence. Besides the cathedral and two collegiate churches, there are five parish churches, fourteen chapels, and twelve convents for men and women. There are a great many alms-houses and hospitals, one of which is called the *school of Bogards*, where there are about 180 boys, some of which are brought up to learning, others to trades, according to their genius. Their habit is cloth, and half of them wear blue and half red, with a black bonnet. There is also a school for poor girls, to the number of 120, clothed with red or blue. In short, there is no place in the Low Countries where they take more care of widows and orphans.

It is remarkable that the knights of the Golden Fleece were instituted in this city in 1430, when the marriage of Philip the Good was celebrated with Elizabeth princess of Portugal. The parts about the city, which belong to it, are called *Franc of Bruges*, and contain 37 villages, and enjoy perfect liberty, according to the tenor of their freedom. The fortifications of Bruges are but trifling, insomuch that in the time of war they always yield to the strongest party. It is eight miles east of Ostend, 24 north-east of Ghent, and 46 west of Antwerp. E. Long. 3. 5. N. Lat. 51. 11.

BRUGES, *John of*, (real name, *John van Eick*), a celebrated Flemish painter, and the first who discovered the method of painting in oil, flourished in the 15th century. He found in the course of his chemical experiments (to which science he also applied himself),

that, by grinding colours with linseed or nut oil, he could form them into a solid body which would resist the water, and not need the varnish used in painting the water colours or in fresco. He presented the first picture painted in this manner to Alphonsus I. king of Naples, who was much pleased with it.

BRUIN, JOHN DE, professor of natural philosophy and mathematics at Utrecht, was born at Gorcum in 1620. He had uncommon skill in dissecting animals, and was a great lover of experiments. He made also observations in astronomy. He published dissertations *De vi altrice*; *De corporum gravitate et levitate*; *De cognitione Dei naturali*; *De lucis causa et origine*, &c. He had a dispute with Isaac Vossius, to whom he wrote a letter printed at Amsterdam in 1693; wherein he criticises Vossius's book *De natura et proprietate lucis*; and strenuously maintains the hypothesis of Descartes. He died in 1675, after he had been professor 23 years; and his funeral oration was pronounced four days after by M. Grævis.

BRUISE, in *Surgery*, the same with CONUSION.

BRUMALES PLANTÆ, in *Botany* (from *bruma*, winter); plants which flower in our winter; such are plants from southern tropical regions, which retain in some measure their former habits, and observe the same period of flowering, the summer in those regions being at the same time of the year with our winter.

BRUMALIA, in Roman antiquity, festivals of Bacchus celebrated twice a-year; the first on the 12th of the kalends of March, and the other on the 18th of the kalends of November. They were instituted by Romulus, who during these feasts used to entertain the senate. Among other heathen festivals which the primitive Christians were much inclined to observe, Tertullian mentions the *brumæ* or *brumalia*.

BRUMOY, PETER, a learned Jesuit, born at Rouen in 1668, distinguished himself in his youth by his talents for the belles lettres; and during his whole life was beloved for his probity, his virtue, and the goodness of his heart. He wrote many works, the most considerable of which is his *Theatre of the Greeks*. He died at Paris in 1742.

BRUN, ANTHONY LE, an ambassador of Spain, famous for his skill in negotiating, was of an ancient and noble family, and born at Dole in the year 1600. He was attorney-general in the parliament of Dole; during which time he had a hand in all the state negotiations which concerned the provinces. He was sent afterwards by Philip IV. to the diet of Ratisbon, and from thence to the court of the emperor Ferdinand III. He was one of the plenipotentiaries of his Catholic majesty, at the conferences of Munster held in 1643; where, though all the other plenipotentiaries took place of him, yet it is said that he far exceeded them all in capacity. The king of Spain was particularly beholden to him for the peace which the Dutch made at Munster, exclusively of France; and the intriguing turn which he showed upon this occasion made him dreaded ever after by French ambassadors. He was a man of letters as well as of politics; and therefore employed his pen as well as tongue in the service of his master. He died at the Hague, during his embassy, in the year 1654.

BRUN, *Charles le*, was descended of a family of distinction

Brus. distinction in Scotland, and born in the year 1619. His father was a statuary by profession. He discovered, it is said, such an early inclination for painting, that at three years of age he used to take coals, and design on the hearth and sides of the chimney, only by the light of the fire; and at 12 he drew the picture of his uncle so well, that it still passes for a fine piece. His father being employed in the gardens at Sequier, and having brought his son along with him, the chancellor of that name took a liking to him, and placed him with Simon Vouet, an eminent painter. He was afterwards sent to Fountainbleau, to take off some of Raphael's pieces. He sent him next to Italy, and supported him there for six years. Le Brun, in his return, met with the celebrated Poussin, by whose conversation he greatly improved himself in his art, and contracted a friendship with him which lasted as long as their lives. A painting of St Stephen, which he finished in 1651, raised his reputation to the highest pitch. Soon after this, the king, upon the representation of M. Colbert, made him his first painter, and conferred on him the order of St Michael. His majesty employed two hours every day to see him work while he was painting the family of Darius at Fountainbleau. About the year 1662, he began his five large pieces of the history of Alexander the Great, in which he is said to have set the actions of that famous conqueror in a more glorious light than Quintus Curtius has done in his history. He procured several advantages for the royal academy of painting and sculpture at Paris, and formed the plan of another for the students of his own nation at Rome. There was scarcely any thing done for the advancement of the fine arts in which he was not consulted. It was through the interest of M. Colbert that the king gave him the direction of all his works, particularly of his royal manufactory at the Gobelins, where he had a handsome house with a genteel salary assigned to him. He was also made director and chancellor of the royal academy, and showed the greatest zeal to encourage the fine arts in France. He was endowed with a vast inventive genius, which extended itself to arts of every kind. He was well acquainted with the manners and history of all nations. Besides his extraordinary talents, his manners were so polished and his address so pleasing, that he attracted the regard and affection of the whole court of France, where, by the places and pensions conferred on him by the king's liberality, he made a very considerable figure. Le Brun was the author of two treatises; one on physiognomy, and the other on the different characters of the passions. He died at Paris in 1690.

The talent of this painter, except for landscapes, was universal. He was not indeed admired for his colouring, or for his skill in the distribution of his lights and shadows: but for a good gusto of design, an excellent choice of attitudes, an agreeable management of his draperies, a beautiful and just expression, and a strict observance of decorum. In fine, his compositions demand the attention and admiration of the nicest judges. The pieces that gained him greatest reputation were, besides what we have already mentioned, those which he finished at Fontainebleau, the great staircase at Versailles, but especially the grand gallery there, which was the last of his works, and is said to have taken him up 14 years.

VOL. IV. Part II.

BRUNDISIUM, or **BRUNDISIUM**, in *Ancient Geography*, a town of Calabria, with the best harbour in Italy. It was a very ancient town, and belonged originally to the Salentines; but was taken by the Romans about 256 years before Christ. Now *Brindisi*; which see.

BRUNIA. See *BOTANY Index*.

BRUNO, JORDANO, an atheistical writer, was born at Nola in the kingdom of Naples; and about the year 1582 began to call in question some of the tenets of the Romish church, which occasioned his retiring to Geneva: but after two years stay there, he expressed his aversion to Calvinism in such a manner that he was expelled the city. After having staid some time at Lyons, Thoulouse, and Paris, he came to London, and continued two years in the house of M. Castlneau the French ambassador. He was very well received by Queen Elizabeth, and the politer part of the court. His principal friends were Sir Philip Sidney and Sir Fulk Greville. With these and some others of their club, Bruno held assemblies; but as they treated of subjects of a very delicate nature, which could not suit the taste or capacity of every body, they kept the door always shut, and none but select persons were admitted into their company. At Sir Philip's request, he composed his *Spaccio della Bestia Trionfante*, which was printed in 8vo, 1584, and dedicated to that gentleman. This work, which is remarkable for nothing but its impiety, we are told in one of the *Spectators* (N^o 389.), sold at an auction in London for 30l. From England he went to Wittemberg, and from thence to Prague, where he printed some tracts, in which he openly avowed his atheistical principles. After visiting some other towns in Germany, he made a tour to Venice. Here he was apprehended by order of the inquisition; tried; condemned; and refusing to retract, was burnt at the stake, February 9th 1600.

BRUNSBUTTLE, a sea-port town of Germany, in the circle of Lower Saxony, and duchy of Holstein, seated at the mouth of the river Elbe, in E. Long. 8. 42. N. Lat. 44. 30. It is a subject to Denmark.

BRUNSFELSIA. See *BOTANY Index*.

BRUNSWICK, a city of Germany, in the circle of Lower Saxony, and capital of the duchy of the same name. It is composed of five towns, viz. the Old Town, the New Town, the Hagen or Burg, the Old Wieck, and the Sack, which makes it a large place, but the house are almost all built of wood. There are several churches, one of which is an ancient Gothic building, but the appearance of its antiquity is almost absorbed by the repairs it has undergone. Brunswick is a fortified place, and would require a numerous army to besiege, and not a few men to defend it. It is of a square form, divided in the middle by the river Ocker. It is about two miles in circumference, and is strongly fortified. On the ramparts is a mortar piece of brass, ten feet six inches long, and nine feet two inches in circumference, weighing 1800 quintals, and has 93 quintals of iron in its carriages. It will carry a ball of 730 pounds weight to the distance of 33,000 paces, and throw a bomb of a thousand weight; but it requires 52 pounds of powder for a charge. This city is the residence of the prince whom we style the *duke of Brunswick-Wolfenbuttle*. The inhabitants

†

5 C

of

Brunswick of the city and parts adjacent carry on a considerable trade with Bohemia. Brunswick rum is well known in England; a small sort of which is the common drink of the inhabitants of the city. The religion here is the Lutheran, and they observe it very strictly. The peasants are sober and laborious, but clownish and heavy; however, as they are robust and strong, they make good soldiers. The elector of Hanover is styled *duke of Brunswick*, though he has no property in, nor dominion over, this city, which belongs to the duke of Brunswick-Wolfenbüttele. The number of inhabitants is about 30,000; and the whole income of the duke is estimated at 170,000*l*. The academy of Brunswick, Dr Moore informs us, has been new-modelled, and the plan of education improved, by the attention, and under the patronage of the hereditary prince. Students now resort to this academy from many parts of Germany; and there are generally some young gentlemen from Britain who are sent to be educated here. Such of them as are intended for a military life, will not find so many advantages united at any other place on the continent as at the academy of Brunswick. They will here be under the protection of a family partial to the British nation;—every branch of science is taught by masters of known abilities;—the young students will see garrison duty regularly performed, and may by the interest of the prince obtain liberty to attend the reviews of the Prussian troops at Magdeburg and Berlin. They will have few temptations to expence, in a town where they can see no examples of extravagance;—have few opportunities of dissipation, and none of gross debauchery.

The fortifications at Brunswick were sometimes of great utility, and on one occasion they saved the town from being pillaged, and afforded Prince Frederick, who is now in the Prussian service, an opportunity of performing an action, which it is imagined gave him more joy than twenty victories. This happened in the year 1761, soon after the battle of Kirch-Denkern, when Duke Ferdinand protected Hanover, not by conducting his army into that country, and defending it directly, as the enemy seemed to expect, and probably wished; but by diversion, attacking with strong detachments, commanded by the hereditary prince, their magazines in Hesse, and thus drawing their attention from Hanover to that quarter. While the duke lay encamped at Willhemstall, watching the motions of Broglio's army, the mareschal being greatly superior in numbers, sent a body of 20,000 men, under Prince Xavier of Saxony, who took possession of Wolfenbüttele, and soon after invested Brunswick. Prince Ferdinand, anxious to save his native city, ventured to detach 5000 of his army, small as it was, under his nephew Frederick, assisted by General Luckner, with orders to harass the enemy, and endeavour to raise the siege. The young prince, while on his march, sent a soldier with a letter to the governor, which was wrapped round a bullet, and which the soldier was to swallow in case of his being taken by the enemy.—He had the good fortune to get safe into the town. The letter apprised the commander of the garrison of the prince's approach, and particularised the night and hour when he expected to be at a certain place near the town, requiring him to favour his entrance.

In the middle of the night appointed, the prince fell

suddenly on the enemy's cavalry, who, unsuspecting of his approach, were encamped carelessly within a mile of the town. They were immediately dispersed, and spread such an alarm among the infantry, that they also retreated with considerable loss. Early in the morning the young prince entered Brunswick, amidst the acclamations of his fellow-citizens, whom he had relieved from the horrors of a siege. The hereditary prince having destroyed the French magazines in Hesse, had been recalled by his uncle, and ordered to attempt the relief of Brunswick. While he was advancing with all possible speed, and had got within a few leagues of the town, he received the news of the siege being raised. On his arrival at his father's palace, he found his brother Frederick at table, entertaining the French officers, who had been taken prisoners the preceding night.

BRUNSWICK, the duchy of, is a country of Germany, bounded on the north by the duchy of Lunenburg; on the west, by the circle of Westphalia, from which it is separated by the river Weser; on the south by Hesse, and the little territory of Piechfield; and on the east by Thuringia, with the principalities of Anhalt and Halberstadt, and the duchy of Magdeburg. The rivers are, the Weser, the Ocker, and the Lyne; and it is fertile both in corn and pastures. It is divided into three principalities, Wolfenbüttele, Grubenhagen, and Calenberg, which also comprehends the duchy of Gottingen. The principality of Wolfenbüttele has its own dukes, and constitutes what is now called the duchy of Brunswick; but the other two belong to the elector of Hanover. The territories of the house of Brunswick occupy a space of 1540 square English miles, and had a population of 209,000 souls in 1816. At the new arrangements made in 1815 by the congress of Vienna, Brunswick was left in possession of its independence.

BRUNSWICK, the family of. The illustrious and ancient house of Brunswick owes its origin to Azo IV. of the family of Este, son of Hugo III. marquis of Ferrara in Italy. Azo, who died in 1055, left by his wife Cunegonde, daughter and heiress to Gueif III. duke of Bavaria, a son who was Gueif IV. great-grandfather to Henry the Lion. His son, Gueif V. surnamed the Valiant, was created duke of Bavaria by the emperor Henry II. His son, Gueif VI. married Matilda, the richest heiress in Europe; but having no issue, his brother Henry the Black succeeded to his dominions. He died in 1125, having married Wulfhild, daughter of Magnus, last duke of Saxony of the Bulling family, by whom he had Henry the Proud, who succeeded to Bavaria in 1137; and he having married a daughter of the emperor Lotharius, his father-in-law granted him investiture of Saxony, and meant him for his successor in the empire; but this last he was disappointed of. Dying in 1139, both Saxony and Bavaria devolved on his son Henry V. surnamed the Lion. He married Maude, eldest daughter of King Henry II. of England, and is always looked upon as the founder of the Brunswick family: it is therefore extremely remarkable, that his present majesty should be descended from one of our worthiest monarchs, in whom were united the royal Anglo-Saxon and Norman blood. The dominions possessed by Henry the Lion were the most extensive of any prince of his time; but having refused to assist the emperor Frederick

Brunswick
||
Bruschius.

Frederick Barbarossa in a war against Pope Alexander III. this drew the emperor's resentment on him; and being already jealous of his power and abilities, all his former services were forgotten; and in the diet of Wurtzburg in 1179 or 1180, he was proscribed. The duchy of Bavaria was given to Otho Count Whittlepatch, from whom is descended the present electoral family of Bavaria; the duchy of Saxony to Bernard Ascanius, founder of the house of Anhalt; and all his other territories disposed of to different persons. On this he retired to England; and by his father's intercession, Brunswick and Lunenburg were restored to him. His wife Maude died in 1189, and he in 1195. He left three sons: but the two oldest not leaving any male issue, William, the third son, carried on the line of the family; and his son Otho was created duke of Brunswick and Lunenburg in 1235, by the emperor Ferdinand II. From him all the succeeding dukes of this family have descended; and no family can boast of a line of princes who have more distinguished themselves, both by their political abilities and martial achievements; and they are allied to all the principal families in Europe. The house of Brunswick has divided into several branches. The late duke of Brunswick had a command in the Prussian army, and fell in the attack made by the French on the 16th June, two days before the battle of Waterloo.

BRUNTISLAND, a parliament town of Fifeshire in Scotland, situated on the frith of Forth, eight miles north of Edinburgh, in W. Long. 3. 5. N. Lat. 56. 12. It has the best harbour on the coast, which is formed by a rocky isle eked out with piers, for there are none on this side the country entirely natural. This is dry at low water. The church is square, with a steeple rising in the centre. The old castle, built by the *Durries*, commanded both town and harbour. The place has a natural strength, which, with the conveniency of a port opposite to the capital, made it, during the troubles of 1560, a most desirable post. The French, allies of the queen regent, fortified it strongly. In 1715, it was surprised and possessed by the rebels, who here formed the bold design of passing over a body of troops to the opposite shore, which was in part executed under the command of Brigadier Macintosh, notwithstanding all the efforts of the men of war to prevent it. Population 1934 in 1811.

BRUSCHIUS, **GASPAR**, a Latin historian and poet, was born at Egra in Bohemia, in 1518. He was devoted to books from his childhood, and especially to poetry, in which he gained so much reputation, that he attained to the poetical crown, to the dignity of poet laureat, and of count palatine. He wrote with prodigious facility; and his verses are extremely flowing, easy, and natural. He published Latin poems on a great variety of subjects; the history of the bishops and bishoprics of Germany; history of German monasteries, and a great number of other works, of which a catalogue is given in Gesner's *Bibliothèque*. Bruschius was far from being rich, or rather he was very poor, subsisting almost entirely by the benefactions of his poetical patrons, and by presents from the abbots and abbesses whose monasteries he described. The liberalities of some abbots, while he was with Oporin at Basil, enabled him to buy a new suit of clothes; but when he found that appearing well dressed in the

streets procured him many marks of respect from the vulgar, he tore his new finery to pieces, "as slaves that had usurped their master's honours." Bruschius seems to have been too great a philosopher for the age he lived in, or indeed for any age. He was murdered in the forest of Scalingenbach, between Rottemberg on the Tauber and Winsheim: and it was believed that this assassination was concerted and carried into execution by some gentleman against whom Bruschius was about to write something.

BRUSH, an assemblage of hairs and hogs bristles, fastened in the holes of a wooden handle or board, pierced for that purpose, serving to cleanse divers bodies by rubbing therewith. The manner of making brushes is by folding the hair or bristle in two; and bringing it by means of a packthread, which is engaged in the fold, through the holes with which the wood is pierced all over, being afterwards fastened therein with glue. When the holes are thus filled, the ends of the hair are cut to make the surface even.

Shearmen's BRUSH, is made of wild boar's bristles; and serves to lay the wool or nap of cloth, after shearing it for the last time.

BRUSH, among painters, a larger and coarser kind of pencil, made of hogs bristles, wherewith to lay the colours on their large pieces. The Chinese painters brush consists of the stalk of a plant; whose fibres being fretted at both ends, and tied again, serve for a brush.

Wire-BRUSHES, are used by silversmiths and gilders, for scrubbing silver, copper, or brass pieces, in order to the gilding of them. There is a method of dyeing or colouring leather, performed by only rubbing the colour on the skin with a brush. This the French leather-gilders call *broussure*; being the lowest of all the sorts of dye allowed by their statutes.

BRUSH of a Fox, among sportsmen, signifies his drag or tail, the tip or end of which is called the *chape*.

BRUSH is also used in speaking of a small thicket or coppice. In this sense the word is formed from the middle-age Latin *bruscia*, *bruscius*, which signifies the same.

BRUSH-Wood denotes small slender wood or spray. See **BROWSE**.

BRUSH, in *Electricity*, denotes the luminous appearance of the electric matter issuing in a parcel of diverging rays from a point. Beccaria ascribes this appearance to the force with which the electric fluid, going out of a point, divides the contiguous air, and passes through it to that which is more remote.

BRUSHING. Among jockies, a brushing gallop denotes a brisk one: a horse should have his brushing gallop in a morning before watering.

BRUSSELS, the chief town of Brabant, and now the capital of the kingdom of the Netherlands, is situated on the small river Senne, which runs through it. It is a rich and handsome city; and among the public structures, the ducal palace where the governor resides, the town-house, and the arsenal, are most superb. No city in Europe, except Naples and Genoa, makes a finer appearance at a distance: but, like them, when in the town, it is all up and down hill. It is encompassed with a double brick wall, and has seven gates; but being seven miles in compass, is too large to hold out a long siege. In Brussels are seven

Bruschius
||
Brussels.

Brussels
Erute.

fine squares or market-places; that of the great market is one of the most beautiful in the world. The town-house takes up one quarter of it; and has a very high steeple, on the top of which is a brazen statue of St Michael, 15 feet high. In one of the apartments, which is handsomely adorned, the states of Brabant meet. In three other rooms there is the history of the resignation of Charles V. wrought in tapestry; which is so well done, that it may be mistaken for painting. In the other parts of the square are the halls of the different trades. There are here several palaces of the nobility. The opera-house is built after the Italian manner, with rows of boxes, in which are chimneys. One is covered over with looking-glass, so that they can sit by the fire, drink a bottle, and see what is doing. There are 20 public fountains, adorned with statues, at the corners of the most public streets; and in the middle of the town-house is one with Neptune, the tritons, and the horses spouting out water from their nostrils. The hospitals are well endowed, some of which are for the maintenance of strangers for three days. There is also a foundling hospital, and one for penitent courtezans. Among the churches, that of St Gudula is very magnificent. It stands on the top of a hill, near the gate of Louvain, and is surrounded with iron ballustrades. It is an old Gothic structure, with two large steeples at the east end, and is finely adorned within. The Jesuits have a fine church as well as a library. There are several monasteries and nunneries, two of which last are English. The nunnery, called the *Beguinaige*, is like a little town, being surrounded by a wall and ditch, and has little streets, where each nun has an apartment. Six or seven hundred girls are educated here.

In 1695, Brussels was bombarded by Marshal Villeroy, who demolished four thousand houses, the stadthouse, and several churches. In 1708, it was besieged again by the elector of Bavaria; but the duke of Marlborough soon came to its assistance, and obliged him to raise the siege with precipitation. Marshal Saxe, the French general, took it in 1746; but it was restored by the treaty of Aix-la-Chapelle. The population of Brussels, which had been long on the decline, has begun to increase since 1814. By a census in 1816, the inhabitants amounted to 80,000. It has a considerable trade in lace, camblets, tapestry, &c. E. Long. 4. 8. N. Lat. 50. 51.

BRUSSELS, the quarter or district of, is one of the four parts of the duchy of Brabant. This quarter is bounded on the east by that of Louvain; on the north by that of Antwerp; on the west by Flanders; and on the south by Hainault. Brussels is the capital city of this quarter, and of all Brabant.

BRUTE, a general name for all animals except mankind.

Among brutes, the monkey kind bear the nearest resemblance to man, both in the external shape and internal structure, but more in the former than in the latter. In the monkey kind, the highest and the nearest approach to the likeness of man is the ouran outang, or *Homo Sylvestris**.—The structure and economy of brutes make the objects of what is called *Comparative ANATOMY*. See *ANATOMY Index*.

Philosophers have been much puzzled about the essential characteristics of brutes, by which they may

be distinguished from man. Some define a brute to be an *animal not risible, or a living creature incapable of laughter*; others call them *mute animals*. The Peripatetics allowed them a sensitive power, but denied them a rational one. The Platonists allowed them reason and understanding, though in a degree less pure and refined than that of men. Lactantius allows every thing to brutes which men have, except a sense of religion; and even this has been ascribed to them by some sceptics. Descartes maintained, that brutes are mere inanimate machines, absolutely destitute not only of reason, but of all thought and perception, and that all their actions are only consequences of the exquisite mechanism of their bodies. This system, however, is much older than Descartes; it was borrowed by him from Gomez Pereira, a Spanish physician, who employed 30 years in composing a treatise which he entitled *Antoniana Margarita*, from the Christian names of his father and mother. It was published in 1554: but his opinion had not the honour of gaining partizans, or even of being refuted; so that it died with him. Even Pereira seems not to have been the inventor of this notion; something like it having been held by some of the ancients, as we find from Plutarch and St Augustin. Others, who rejected the Cartesian hypothesis, have maintained that brutes are endowed with a soul essentially inferior to that of men; and to this soul some have allowed immortality, others not. And, lastly, in a treatise published by one Bougeant a Jesuit, entitled, *A Philosophical Amusement on the Language of Beasts*, he affirms that they are animated by evil spirits or devils.

The opinion of Descartes was probably invented, or at least adopted by him, to defeat two great objections: one against the immortality of the souls of brutes, if they were allowed to have any; the other against the goodness of God, in suffering creatures who had never sinned to be subjected to so many miseries. The arguments in favour of it may be stated as follow: 1. It is certain, that a number of human actions are merely mechanical; because they are done imperceptibly to the agent, and without any direction from the will; which are to be ascribed to the impression of objects and the primordial disposition of the machine, wherein the influence of the soul has no share; of which number are all habits of the body acquired from the reiteration of certain actions. In all such circumstances, human beings are no better than automata. 2. There are some natural movements so involuntary, that we cannot restrain them; for example, that admirable mechanism ever on the watch to preserve an equilibrium, when we stoop, bend, or incline our bodies in any way, and when we walk upon a narrow plank. 3. The natural liking for, and antipathy against, certain objects, which in children precede the power of knowing and discriminating them, and which sometimes in grown persons triumph over all the efforts of reason, are all phenomena to be accounted for from the wonderful mechanism of the body, and are so many cogent proofs of that irresistible influence which objects have on the human frame. 4. Every one knows how much our passions depend on the degree of motion into which the blood is put, and the reciprocal impressions caused by the animal spirits between the heart and brain, that are so closely connected

* See *Simia*.

Brute.

connected by their nerves; and if such effects may be produced by such simple mechanical means as the mere increase of motion in the blood, without any direction of the will, we are not to wonder at the actions of brutes being the effects only of a refined mechanism, without thought or perception. 5. A farther proof will arise from a consideration of the many wonderful effects which even the ingenuity of men has contrived to bring about by mechanical means; the androide, for instance, of Mr Kempel, which plays at chess. Now, it is not to be questioned, but that the mechanism of the body of the meanest animal infinitely surpasses that of Mr Kempel's machine; and what can be the consequence of this, but that the actions of that animal must be proportionably more surprising than those of the wooden chess-player? See ANDROIDES and AUTOMATON.

The above is a short abstract of all the arguments that are brought in favour of the Cartesian system: but they are evidently very far from being conclusive. They are deficient, in the first place, because, though we allow them in the utmost extent the Cartesians themselves can desire, they prove only the possibility of brutes being inanimate, and that the power of God actually could produce such and such actions from inanimate machines; but that he actually hath done so, they have not the least tendency to prove. In the second place, the Cartesian argument is insufficient, because it hath no limits, and knows not where to stop; as, by the same method of arguing, every man might prove his neighbour to be an inanimate machine: for though every individual be conscious of his own thoughts, he is not so of those of his neighbours; and it no more exceeds the power of God to cause an inanimate machine perform the actions of a man than those of a beast. Neither are the two objections which the hypothesis is calculated to answer, to be at all admitted as arguments in its favour. They are, 1. That if we allow brutes to have souls, they must be immaterial, and consequently immortal: and, 2. It seems a contradiction to the goodness of God to think that he should subject innocent creatures to such a multitude of evils as we see the brute creation endure in this world. The first of these is productive of no bad consequences to us, though it should be granted; and if it is supposed that the brute creatures are really immortal, the second objection vanishes; because, in the enjoyment of endless felicity, all temporary afflictions, how severe soever, must be swallowed up as though they had never been.

As to a positive proof on the other side, viz. that brutes are really endowed with sensation and consciousness, there is undoubtedly the same evidence for the sensibility of brutes that there is for that of mankind. We see brutes avoid pain as much as we do; and we likewise see them seek for pleasure, and express their happiness in the enjoyment of certain things by signs not at all equivocal. Therefore, though we grant the possibility of all this being the effect of mere mechanism; yet, as we are conscious that in ourselves similar effects are produced by a sentient principle, we have all the reason in the world to conclude that in brutes they are likewise derived from a principle of sensation; especially seeing we know of no kind of mechanism in any other part of nature that produces

any thing like the effects just mentioned: and until we see that a mechanism of this kind does take place in some part of nature, we have no reason to suppose it in any. As to those actions of the human body in which it seems to move spontaneously, like an automaton, without the direction of the mind or will, it is almost superfluous to observe, that they were not performed in this manner originally, but required very great exertions of the will and intellectual faculty before the body could be brought to perform them easily; so that from this nothing can be inferred. Add to this, that divine revelation sets forth to us in many places the brute creation as objects of mercy; which could not be done without the highest absurdity, if they were not really capable of feeling pleasure and pain as well as we.

The most rational opposers of the Cartesian scheme maintain, that brutes are endowed with a principle of sensation as well as we; though of an inferior nature to ours. Great disputes, however, have arisen on this subject; some maintaining, that the soul of brutes is merely sensitive, and that they are altogether destitute of reflection and understanding; others, that they not only reason, but make a better use of it than men do. That the brutes are endowed only with sensation, and totally destitute of all power of reflection, or even reasoning, is what can by no means be maintained on good grounds: neither can it be asserted that they act entirely from instinct, or a blind propensity to certain things, without knowing why or wherefore. In numberless instances, needless to be mentioned here, but which will readily occur to every reader, it is evident, that education will get the better of many of the natural instincts of brutes; which could never be the case were they absolutely incapable of reasoning. On the other hand, it is equally certain, that they are by no means capable of education in the same degree that men are; neither are the rational exertions of beasts at all to be compared even with those of the meanest savages. One remarkable instance of this is in the use of the element of fire. The most savage nations have known how to make this element subservient to their purposes; or if some have been found who have been entirely ignorant of its existence, they have quickly learned its uses on seeing it made use of by others; but though many of the brute creatures are delighted with warmth, and have opportunities every day of seeing how fire is supplied with fuel, and by that means preserved, it never was known that one of them attempted to preserve a fire by this means. This shows a strange defect of rationality, unaccountable upon any other supposition than that the soul or sentient principle of brutes is somehow or other inferior in its nature to that of man; but still it is a sentient principle, capable of perceptions as quick, and in many instances much more so than our own.

Father Bougeant supports his opinion of the spirits of brute creatures being devils in the following manner: Having proved at large that beasts naturally have understanding, "Reason (says he) naturally inclines us to believe that beasts have a spiritual soul; and the only thing that opposes this sentiment is, the consequences that might be inferred from it. If brutes have a soul, that soul must be either matter or spirit; it must

Brute.

Brute.

be one of the two, and yet you dare affirm neither. You dare not say it is matter, because you must then necessarily suppose matter to be capable of thinking; nor will you say that it is spirit, this opinion bringing with it consequences contrary to the principles of religion; and this, among others, that man would differ from beasts only by the degrees of plus and minus; which would demolish the very foundation of all religion. Therefore, if I can elude all these consequences; if I can assign to beasts a spiritual soul, without striking at the doctrines of religion; it is evident, that my system, being moreover the most agreeable to reason, is the only warrantable hypothesis. Now I shall, and can do it, with the greatest ease imaginable. I even have means, by the same method, to explain many very obscure passages in the Holy Scripture, and to resolve some very great difficulties which are not well confuted. This we shall unfold in a more particular manner.

“Religion teaches us, that the devils, from the very moment they had sinned, were reprobate, and that they were doomed to burn for ever in hell; but the church has not yet determined whether they do actually endure the torments to which they are condemned. It may then be thought that they do not yet suffer them, and that the execution of the verdict brought against them is reserved for the day of the final judgment.—Now what I pretend to infer from hence is, that, till doomsday comes, God, in order not to suffer so many legions of reprobate spirits to be of no use, has distributed them through the several spaces of the world, to serve the designs of his providence, and make his omnipotence to appear. Some, continuing in their natural state, busy themselves in tempting men, in seducing and tormenting them; either immediately, as Job's devil, and those that lay hold of human bodies; or by the ministry of sorcerers or phantoms. These wicked spirits are those whom the Scripture calls the *powers of darkness*, or the *powers of the air*. God, with the others, makes millions of beasts of all kinds, which serve for the uses of men, which fill the universe, and cause the wisdom and omnipotence of the Creator to be admired. By that means I can easily conceive, on the one hand, how the devils can tempt us; and on the other, how beasts can think, know, have sentiments, and a spiritual soul, without any way striking at the doctrines of religion. I am no longer surprised to see them have forecast, memory, and judgment. I should rather have occasion to wonder at their having no more, since their soul very likely is more perfect than ours. But I discover the reason of this; it is because, in beasts as well as in ourselves, the operations of the mind are dependent on the material organs of the machine to which it is united; and those organs being grosser and less perfect than in us, it follows, that the knowledge, the thoughts, and the other spiritual operations of the beasts, must of course be less perfect than ours: And if these proud spirits know their own dismal state, what a humiliation must it be to them thus to see themselves reduced to the condition of beasts! But, whether they know it or not, so shameful a degradation is still, with regard to them, the primary effect of the divine vengeance, I just mentioned; it is an anticipated hell.”

Brute.

Having mentioned the prejudices against this hypothesis, such particularly as the pleasure which people of sense and religion take in beasts and birds, especially all sorts of domestic animals: he proceeds, “Do we love beasts for their own sakes? No. As they are altogether strangers to human society, they can have no other appointment than that of being useful and amusing. And what care we whether it be a devil or any other creature that amuses us? The thought of it, far from shocking, pleases me mightily. I with gratitude admire the goodness of the Creator, who gave me so many little devils to serve and to amuse me. If I am told that these poor devils are doomed to suffer eternal tortures, I admire God's decrees, but I have no manner of share in that dreadful sentence; I leave the execution of it to the sovereign Judge: and, notwithstanding this, I live with my little devils as I do with a multitude of people, of whom religion informs me that a great number shall be damned. But the core of a prejudice is not to be effected in a moment: it is done by time and reflection: give me leave then lightly to touch upon this difficulty, in order to observe a very important thing to you.

“Persuaded as we are that beasts have intelligence, have we not all of us a thousand times pitied them for the excessive evils which the majority of them are exposed to, and in reality suffer? How unhappy is the condition of horses! we are apt to say upon seeing a horse whom an unmerciful carman is murdering with blows. How miserable is the dog whom they are breaking for hunting! How dismal is the fate of beasts living in woods! they are perpetually exposed to the injuries of the weather; always seized with apprehensions of becoming the prey of hunters, or of some wilder animal; for ever obliged, after long fatigue, to look out for some poor insipid food; often suffering cruel hunger; and subject, moreover, to illness and death! If men are subject to a multitude of miseries that overwhelm them, religion acquaints us with the reason of it; viz. the being born sinners. But what crimes can beasts have committed by birth to be subject to evils so very cruel? What are we, then, to think of the horrible excesses of miseries undergone by beasts? miseries, indeed, far greater than those endured by men. This is, in any other system, an incomprehensible mystery; whereas nothing is more easy to be conceived from the system I propose. The rebellious spirits deserve a punishment still more rigorous, and happy it is for them that their punishment is deferred. In a word, God's goodness is vindicated, man himself is justified: for what right can we have, without necessity, and often in the way of mere diversion, to take away the lives of millions of beasts, if God had not authorised us so to do? And beasts being as sensible as ourselves of pain and death, how could a just and merciful God have given man that privilege, if they were not so many guilty victims of the divine vengeance?

“But hear still something more convincing, and of greater consequence: beasts, by nature, are extremely vicious. We know well that they never sin, because they are not free; but this is the only condition wanting to make them sinners. The voracious birds and beasts of prey are cruel. Many insects of one and the same species devour one another. Cats

are

Brute are perfidious and ungrateful; monkeys are mischievous; and dogs envious. All beasts in general are jealous and revengeful to excess; not to mention many other vices we observe in them: and at the same time that they are by nature so very vicious, they have, say we, neither the liberty, nor any helps to resist the bias that hurries them into so many bad actions. They are, according to the schools, necessitated to do evil, to disconcert the general order, to commit whatever is most contrary to the notion we have of natural justice and to the principles of virtue. What monsters are these in a world originally created for order and justice to reign in? This is, in good part, what formerly persuaded the Manicheans, that there were of necessity two orders of things, one good, and the other bad; and that the beasts were not the work of the good principle: a monstrous error! But how then shall we believe that beasts came out of the hands of their Creator with qualities so very strange! If man is so very wicked and corrupt, it is because he has himself through sin perverted the happy nature that God had given him at his creation. Of two things, then, we must say one: either that God has taken delight in making beasts so vicious as they are, and of giving us in them models of what is most shameful in the world; or that they have, like man, original sin, which has perverted their primitive nature.

“The first of these propositions finds very difficult access to the mind, and is an express contradiction to the holy scriptures; which say, that whatever came out of God’s hands, at the time of the creation of the world, was good, yea very good. What good can there be in a monkey’s being so very mischievous, a dog so full of envy, a cat so malicious? But then many authors have pretended, that beasts, before man’s fall, were different from what they are now; and that it was in order to punish man that they became so wicked. But this opinion is a mere supposition, of which there is not the least footstep in holy Scripture. It is a pitiful subterfuge to elude a real difficulty: this at most might be said of the beasts with whom man has a sort of correspondence; but not at all of the birds, fishes, and insects which have no manner of relation to him. We must then have recourse to the second proposition, That the nature of beasts has, like that of man, been corrupted by some original sin: Another hypothesis, void of foundation, and equally inconsistent with reason and religion, in all the systems which have been hitherto espoused concerning the souls of beasts. What party are we to take? Why, admit of my system, and all is explained. The souls of beasts are refractory spirits which have made themselves guilty towards God. The sin in beasts is no original sin; it is a personal crime, which has corrupted and perverted their nature in its whole substance; hence all the vices and corruption we observe in them, though they can be no longer criminal, because God, by irrevocably reprobating them, has at the same time divested them of their liberty.”

These quotations contain the strength of Father Bougeant’s hypothesis, which also hath had its followers; but the reply to it is obvious. Beasts, though remarkably mischievous, are not completely so; they are in many instances capable of gratitude and love, which devils cannot possibly be. The very same passions that

are in the brutes exist in the human nature; and if we choose to argue from the existence of those passions, and the ascendancy they have over mankind at some times, we may say with as great justice, that the souls of men are devils, as that the souls of brutes are. All that can be reasonably inferred from the greater prevalence of the malignant passions among the brutes than among men, is, that the former have less rationality than men: and accordingly it is found, that among savages, who exercise their reason less than other men, every species of barbarity is practised, without being deemed a crime.

On the present subject there is a very ingenious treatise in German, published by the late Professor Bergman, under the title (as translated) of “Researches designed to show what the Brute animals certainly are not, and also what they probably are.”—That they are not machines, he proves with more detail than seemed necessary for refuting a hypothesis which would equally tend to make us all machines. It is certain, that the *half-reasoning* elephant cannot be deemed a machine, by us, from any other consideration, than that *he* goes upon four feet, while *we* go upon two; and he might as well take us for mere machines because *we* go upon two feet, while *he* goes upon four.

But if animals are not mere machines, what are they? Manifestly sensitive beings, with an immaterial principle; and thinking or reasoning beings, to a certain degree. In certain classes of animals this appears evident to our author, who seems to have observed with great sagacity and attention their various operations and proceedings, their ways and means, &c. He thinks it impossible to deduce this variety of action, in any animals (if we except those of the lowest classes in the gradation of intelligence), from a general and uniform instinct. For they accommodate their operations to times and circumstances. They combine; they choose the favourable moment; they avail themselves of the occasion, and seem to receive instruction by experience. Many of their operations announce reflection: the birds repair a shattered nest, instead of constructing instinctively a new one: the hen, who has been robbed of her eggs, changes her place, in order to lay the remainder with more security: the cat discovers both care and artifice in concealing her kittens. Again, it is evident, that, on many occasions, animals know their faults and mistakes, and correct them; they sometimes contrive the most ingenious methods of obtaining their ends, and when one method fails have recourse to another; and they have, without doubt, a kind of language for the mutual communication of their ideas. How is all this to be accounted for (says our author), unless we suppose them endowed with the powers of perceiving, thinking, remembering, comparing, and judging? They have these powers, indeed, in a degree inferior to that in which they are possessed by the human species, and form classes below them in the graduated scale of intelligent beings. But still it seems to our author unreasonable to exclude them from the place which the principles of sound philosophy, and facts ascertained by constant observation, assign to them in the great and diversified sphere of life, sensation, and intelligence;—he does not, however, consider them as beings whose actions

Brute.

Brute. actions are directed to moral ends, nor consequently as accountable and proper subjects for *reward* or *punishment* in a future world.

That brute animals possess reflection and sentiment, and are susceptible of the kindly as well as the irascible passions, independently of sexual attachment and natural affection, is evident from the numerous instances of affection and gratitude daily observable in different animals, particularly the dog. Of these and other sentiments, such as pride, and even a sense of glory, the elephant exhibits proofs equally surprising and indubitable, as the reader may see under the article **ELEPHAS**.

*White's
Natural
History,
&c. of Sel-
borna.*

As to the natural affection of brutes, says an ingenious writer, "the more I reflect on it, the more I am astonished at its effects. Nor is the violence of this affection more wonderful than the shortness of its duration. Thus every hen is in her turn the virago of the yard, in proportion to the helplessness of her brood; and will fly in the face of a dog or a sow in defence of those chickens which in a few weeks she will drive before her with relentless cruelty. This affection sublimes the passions, quickens the invention, and sharpens the sagacity of the brute creation. Thus a hen, just become a mother, is no longer that placid bird she used to be, but with feathers standing on end, wings hovering, and clogging note, she runs about like one possessed. Dams will throw themselves in the way of the greatest danger, in order to avert it from their progeny. Thus a partridge will tumble along before a sportsman, in order to draw away the dogs from her helpless covey. In the time of nidification the most feeble birds will assault the most rapacious. All the hirundines of a village are up in arms at the sight of a hawk, whom they will persecute till he leaves that district. A very exact observer has often remarked, that a pair of ravens nestling in the rock of Gibraltar would suffer no vulture or eagle to rest near their station, but would drive them from the hill with amazing fury: even the blue thrush at the season of breeding would dart out from the clefts of the rocks to chase away the kestrel or the sparrow-hawk. If you stand near the nest of a bird that has young, she will not be induced to betray them by an inadvertent fondness, but will wait about at a distance with meat in her mouth for an hour together. The flycatcher builds every year in the vines that grow on the walls of my house. A pair of these little birds had one year inadvertently placed their nest on a naked bough, perhaps in a shady time, not being aware of the inconvenience that followed; but a hot sunny season coming on before the brood was half fledged, the reflection of the wall became insupportable, and must inevitably have destroyed the tender young, had not affection suggested an expedient, and prompted the parent-birds to hover over the nest all the hotter hours, while with wings expanded and mouths gaping for breath they screened off the heat from their suffering offspring. A farther instance I once saw of notable sagacity in a willow-wren, which had built in a bank in my fields. This bird, a friend and myself had observed as she sat in her nest; but were particularly careful not to disturb her, though we saw she eyed us with some degree of jealousy. Some days after, as we passed that way, we were desirous of remarking how this brood went on,

but no nest could be found, till I happened to take up a large bundle of long green moss, as it were carelessly thrown over the nest, in order to dodge the eye of any impertinent intruder."

A wonderful spirit of sociality in the brute creation, independent of sexual attachment, has been frequently remarked. Many horses, though quiet with company, will not stay one minute in a field by themselves: the strongest fences cannot restrain them. A horse has been known to leap out at a stable window, through which dung was thrown, after company; and yet in other respects is remarkably quiet. Oxen and cows will not fatten by themselves; but will neglect the finest pasture that is not recommended by society. It would be needless to instance in sheep, which constantly flock together. But this propensity seems not to be confined to animals of the same species. In the work last quoted, we are told of "a doe still alive, that was brought up from a little fawn with a dairy of cows; with them it goes a-field, and with them it returns to the yard. The dogs of the house take no notice of this deer, being used to her; but if strange dogs come by, a chase ensues; while the master smiles to see his favourite securely leading her pursuers over hedge, or gate, or stile, till she returns to the cows, who with fierce lowings and menacing horns drive the assailants quite out of the pasture."

Even great disparity of kind and size does not always prevent social advances and mutual fellowship. Of this the following remarkable instance is given in the same work: "A very intelligent and observant person has assured me, that in the former part of his life, keeping but one horse, he happened also on a time to have but one solitary hen. These two incongruous animals spent much of their time together in a lonely orchard, where they saw no creature but each other. By degrees an apparent regard began to take place between these two sequestered individuals. The fowl would approach the quadruped with notes of complacency, rubbing herself gently against his legs; while the horse would look down with satisfaction, and move with the greatest caution and circumspection, lest he should trample on his diminutive companion. Thus by mutual good offices each seemed to console the vacant hours of the other; so that Milton, when he puts the following sentiment in the mouth of Adam, seems to be somewhat mistaken:

Much less can bird with beast, or fish with fowl,
So well converse, nor with the ox the ape.

In the Gentleman's Magazine for March 1788 we have the following anecdotes of a raven, communicated by a correspondent who does not sign his name, but who says it is at the service of the doubtful. The raven alluded to "lives, or did live three years since, at the Red Lion at Hungerford; his name, I think, is *Rafe*. You must know then, that coming into that inn, my chaise run over or bruised the leg of my Newfoundland dog; and while we were examining the injury done to the dog's foot, *Rafe* was evidently a concerned spectator; for the minute the dog was tied up under the manger with my horse, *Rafe* not only visited but fetched him bones, and attended upon him with particular and repeated marks of kindness. The bird's notice of the dog was so marked, that I observed it to the hostler;

Brute. hostler; for I had not heard a word before of the history of this benevolent creature. John then told me, that he had been bred from his pin-feather in intimacy with a dog; that the affection between them was mutual; and that all the neighbourhood had often been witnesses of the innumerable acts of kindness they had conferred upon each other. Rafe's poor dog, after a while, unfortunately broke his leg; and during the long time he was confined, Rafe waited upon him constantly, carried him his provisions daily, and never scarce left him alone! One night by accident the hostler had shut the stable door, and Rafe was deprived of the company of his friend the whole night; but the hostler found in the morning the bottom of the door so pecked away, that had it not been opened, Rafe would in another hour have made his own entrance-port. I then inquired of my landlady (a sensible woman), and heard what I have related confirmed by her, with several other singular traits of the kindnesses this bird shows to all dogs in general, but particularly to maimed or wounded ones. I hope, and believe, however, the bird is still living; and the traveller will find I have not over-rated this wonderful bird's merit."

To these instances of attachment between incongruous animals from a spirit of sociality or the feelings of sympathy, may be added the following instance of fondness from a different motive, recounted by Mr White, in the work already so frequently quoted. "My friend had a little helpless leveret brought to him, which the servants fed with milk in a spoon; and about the same time his cat kittened, and the young were dispatched and buried. The hare was soon lost, and supposed to be gone the way of most foundlings, or to be killed by some dog or cat. However, in about a fortnight, as the master was sitting in his garden in the dusk of the evening, he observed his cat, with tail erect, trotting towards him, and calling with little short inward notes of complacency, such as they use towards their kittens, and something gambling after, which proved to be the leveret, which the cat had supported with her milk, and continued to support with great affection. Thus was a graminivorous animal nurtured by a carnivorous and predaceous one!

"Why so cruel and sanguinary a beast as a cat, of the ferocious genus of *Felis*, the *marium leo*, as Linnæus calls it, should be affected with any tenderness towards an animal which is its natural prey, is not so easy to determine. This strange affection probably was occasioned by that desiderium, those tender maternal feelings, which the loss of her kittens had awakened in her breast; and by the complacency and ease she derived to herself from the procuring her teats to be drawn, which were too much distended with milk, till from habit she became as much delighted with this foundling as if it had been her real offspring.

"This incident is no bad solution of that strange circumstance, which grave historians as well as the poets assert, of exposed children being sometimes nurtured by female wild beasts that probably had lost their young. For it is not one whit more marvellous that Romulus and Remus, in their infant state, should be nursed by a she-wolf, than that a poor little sucking leveret should be fostered and cherished by a bloody grimalkin.

Brute. *Viridi fatam Mavortis in antro
Procubuisse lupam: geminos huic ubera circum
Ludere pendentes pueros, et lambere matrem
Impavidos: illam tereti cervice reflexam
Mulcere alternos, et corpora fingere lingua."*

But besides the different qualities enumerated, besides reflection and sagacity often in an astonishing degree, and besides the sentiments and actions prompted by social or natural attachments, certain brutes seem on many occasions inspired with a superior faculty, a kind of presentiment or second-sight as it were, with regard to events and designs altogether unforeseen by the rational beings whom they concern. Of the faculty alluded to various instances will probably consist with the knowledge or the recollection of most of our readers: We shall therefore only recite the following, on account of its unquestionable authenticity. At the seat of the late earl of Lichfield, three miles from Blenheim, there is a portrait in the dining-room of Sir Henry Lee, by Johnston, with that of a mastiff dog which saved his life. It seems a servant had formed the design of assassinating his master and robbing the house; but the night he had fixed on, the dog, which had never been much noticed by Sir Henry, for the first time followed him up stairs, got under his bed, and could not be got from thence by either master or man: in the dead of night, the same servant entered the room to execute his horrid design; but was instantly seized by the dog, and being secured confessed his intentions. There are ten quaint lines in one corner of the picture, which conclude thus:

But in my dog, whereof I made no store,
I find more love than those I trusted more.

Upon what hypothesis can we account for a degree of foresight and penetration such as this? Or will it be suggested, as a solution of the difficulty, that a dog may possibly become capable in great measure of understanding human discourse, and of reasoning and acting accordingly; and that, in the present instance, the villain had either uttered his design in soliloquy, or imparted it to an accomplice, in the hearing of the animal?

It has been much disputed whether the brutes have any language whereby they can express their minds to each other; or whether all the noise they make consists only of cries inarticulate, and unintelligible even to themselves. We are, however, too little acquainted with the intellectual faculties of these creatures to be able to determine this point. Certain it is, that their passions, when excited, are generally productive of some peculiar cry; but whether this be designed as an expression of the passion to others, or only a mechanical motion of the muscles of the larynx occasioned by the passion, is what we have no means of knowing. We may indeed, from analogy, conclude, with great reason, that some of the cries of beasts are really expressions of their sentiments; but whether one beast is capable of forming a design, and communicating that design by any kind of language to others, is what we submit to the judgment of the reader, after giving the following instance, which among others is brought as a proof of it by Father Bougeant. "A sparrow finding a nest that a martin had just built, standing very conveniently

Brute
|
Brutus.

veniently for him, possessed himself of it. The martin, seeing the usurper in her house, called for help to expel him. A thousand martins came full speed, and attacked the sparrow; but the latter being covered on every side, and presenting only his large beak at the entrance of the nest, was invulnerable, and made the boldest of them who durst approach him repent of their temerity. After a quarter of an hour's combat, all the martins disappeared. The sparrow thought he had got the better, and the spectators judged that the martins had abandoned their undertaking. Not in the least. Immediately they returned to the charge; and each of them having procured a little of that tempered earth with which they make their nests, they all at once fell upon the sparrow, and inclosed him in the nest to perish there, though they could not drive him thence. Can it be imagined that the martins could have been able to hatch and concert this design, all of them together, without speaking to each other, or without some medium of communication equivalent to language?"

BRUTII, in *Ancient Geography*, one of the two peninsulas of Italy, the ancient Calabria being the other; stretching to the south towards Sicily; bounded by the sea on every side except by the isthmus, between the river Laus and the Thurii, where it is terminated by Lucania; inhabited by the Bruttii, for whose country the ancient Romans had no peculiar name, calling both the people and the country indiscriminately *Bruttii*. This, and a part of Lucania, was the ancient Italia, (Stephanus). It was called *Bruttia*, which in Greek signifies *pitch*, from the great quantity of it produced there, (Bochart). It is divided into two coasts by the Apennines; that on the Tuscan and that on the Ionian sea. Now called *Calabria Ultra*. Different from the ancient Calabria or Messapia to the east, on the Adriatic or Ionian sea, and which formed the other peninsula or heel of the leg, now called *Calabria Citra*, the Bruttii forming the foot.

BRUTTON, a town of Somersetshire in England. It is situated on the river Brew; and is a good place and well inhabited. It is adorned with a very beautiful church; has a free school, founded by Edward I.; and the alms-house or hospital is so good, that it has the appearance of a college. They have a woollen manufactory of cloth and serges, and they are likewise noted for their malt. Population 1536 in 1811. W. Long. 2. 30. N. Lat. 51. 15.

BRUTUS, or **BRUTE**, according to the old exploded history of this country by Geoffroy of Monmouth, was the first king of Britain. He is said to have been the son of Sylvius, and he of Ascanius the son of Æneas, and born in Italy: killing his father by chance, he fled into Greece, where he took King Padrosus prisoner, who kept the Trojans in slavery, whom he released on condition of providing ships, &c. for the Trojans to forsake the land. Being advised by the oracle to sail west beyond Gaul, he, after some adventures, landed at Totness in Devonshire. Albion was then inhabited by a remnant of giants, whom Brutus destroyed; and called the island after his own name, *Britain*. He built a city called *New Troy*, since London; and having reigned here 24 years, at his death parcelled the island among his three sons: *Loocrine* had

the middle, called *Loegria*; *Camber* had Wales, and *Albanact* Scotland.

BRUTUS, *Lucius Junius*, the avenger of the rape of Lucretia, and founder of the Roman republic, flourished 500 years before Christ. See (*History of*) **ROME**.

BRUTUS, *Marcus*, the passionate lover of his country, and chief conspirator against Cæsar, slew himself on losing the battle of Philippi, 42 years before Christ. See (*History of*) **ROME**.

BRUTUS, *John Michael*, a man of learning, and a polite writer, in the 16th century. He was a native of Venice; and, having studied at Padua, spent great part of his life in travelling, and became historiographer to his imperial majesty. He wrote, 1. A history of Hungary. 2. A history of Florence. 3. Notes on Horace, Cæsar, Cicero, &c.; and other works. He was living in the year 1590.

BRUTUS, *Stephen Junius*, the disguised author of a political work, entitled *Vindicia contra tyrannos*. See **LANGUET**.

BRUYERE, **JOHN DE LA**, a celebrated French author, was born at Dourdan in the year 1664. He wrote characters, describing the manners of his age, in imitation of Theophrastus: which characters were not always imaginary or general, but descriptive, as was well known, of persons of considerable rank. In the year 1693, he was by an order of the king chosen a member of the French Academy; and died in the year 1696.—“The characters of Bruyere (says Voltaire), may justly be ranked among the extraordinary productions of this age. Antiquity furnishes no examples of such a work. A style rapid, concise, and nervous; expression animated and picturesque; an use of language altogether new, without offending against its established rules, struck the public at first; and the allusions, which are crowded in almost every page, completed its success. When La Bruyere showed his work in manuscript to Malesieux, this last told him, that the book would have many readers, and its author many enemies. It somewhat sunk in the opinion of men, when that whole generation whose follies it attacked were passed away; yet as it contains many things applicable to all times and places, it is more than probable that it will never be forgotten.”

BRUYIERS, a town of Lorrain, in Vosque, with a provostship. E. Long. 6. 45. N. Lat. 48. 15.

BRYANS BRIDGE, a town of Ireland in the county of Clare and province of Connaught, seated on the river Shannon, eight miles north of Limerick. W. Long. 8. 30. N. Lat. 52. 31.

BRYANT, **SIR FRANCIS**, a soldier, statesman, and a poet of no inconsiderable fame in his time, was born of a genteel family, educated at Oxford, and afterwards spent some time in travelling abroad. In the year 1522, the 14th of Henry VIII. he attended in a military capacity the earl of Surrey in his expedition to the coast of Brittany; and commanded the troops in the attack of the town of Morlaix, which he took and burnt. For this service he was knighted on the spot by the earl. In 1528, he was in Spain; but on what service is doubtful. In 1529, he was sent ambassador to France; and the year following to Rome, on account of the king's divorce. He had also been there in 1522, in the same capacity, when Cardinal Wolsey's election to the

holy

Bryant
Bryennius

holly see was in agitation. He was gentleman of the privy chamber to King Henry VIII. and to his successor Edward VI. in the beginning of whose reign he marched with the protector against the Scots; and after the battle of Musselburgh, in which he commanded the light horse, was made banneret. In 1548, he was appointed chief governor of Ireland, where he married the countess of Ormond. He died soon after, and was buried at Waterford. He wrote, 1. Songs and Sonnets; some of which were printed with those of the earl of Surrey and Sir Thomas Wyatt. Lond. 1565. 2. Letters written from Rome concerning the king's divorce; manuscript. 3. Various letters of state; which Ant. Wood says he had seen. 4. A dispraise of the life of a courtier, &c. Lond. 1548, 8vo, from the French.

BRYANT, *Jacob*, a distinguished scholar and mythologist. See SUPPLEMENT.

BRYE, JOHN THEODORE DE, an excellent engraver, was a native of Liege; but he resided chiefly at Franckfort, where he carried on a considerable commerce in prints. It does not appear when he was born, nor to what master he owed his instructions in the art of designing and engraving. He worked almost entirely with the graver, and seldom called in the assistance of the point. He acquired a neat free style of engraving, excellently well adapted to small subjects, in which many figures were to be represented; as funeral parades, processions, and the like, which he executed in a charming manner. He also drew very correctly. His heads in general are spirited and expressive, and the other extremity of his figures well marked. His back-grounds, though frequently very slight, are touched with a masterly hand. He died, as his sons inform us in the third part of Boissard's collection of portraits, on March 27th, 1598; the two first parts of which collection were engraved by himself, assisted by his sons, who afterwards continued it.

BRYENNIUS, MANUEL, a Greek writer on music, is supposed to have flourished under the elder Paleologus, viz. about the year of Christ 1120. He wrote three books of Harmonics; the first whereof is a kind of commentary on Euclid, as the second and third are on Ptolemy. He professes to have studied perspicuity for the sake of young men. Meibomius had given the public expectations of a translation of this work: but not living to complete it, Dr Wallis undertook it; and it now makes a part of the third volume of his works, published at Oxford in three volumes folio, 1699.

BRYENNIUS, *Nicophorus*, a prince distinguished by his courage, probity, and learning, was born at Orestia in Macedonia; where his father by rebellion provoked the emperor to send his general Alexis Comnenus against him, who ordered his eyes to be pulled out; but being charmed with his son Bryennius, he married him to Anne Comnena his daughter, so famous by her writings. When Alexis came to the throne, he gave Bryennius the title of *Cæsar*; but would not declare him his successor, though solicited to it by the empress Irene; and was therefore succeeded by his son John Comnenus, to whom Bryennius behaved with the utmost fidelity. Being sent, about the year 1137, to besiege Antioch, he fell sick; and, returning, died at Constantinople. This prince wrote

the History of Alexis Comnenus, which he composed at the request of his mother-in-law the empress Irene.

BRYGMUS, among physicians, a grating noise made by the gnashing of the teeth.

BRYONIA, BRYONY. See BOTANY *Index*.

Black-BRYONY. See TAMUS, BOTANY *Index*.

BRYUM. See BOTANY *Index*.

BUA, an island of the gulf of Venice, on the coast of Dalmatia, near the town of Trau; called likewise the *Partridge-island*, because frequented by those birds. It is called *Bubus* by Pliny. In the times of the decay of the empire it was called *Boas*; and several illustrious men that fell under disgrace at court were banished to this island; among whom were Florentius, master of the offices of the emperor Julian, Immentius de Valenti, and the heretic Jovinian. The emperors of Constantinople either were not much acquainted with this pretended Siberia, or were willing to treat the banished with great clemency. It is certain that the climate of this island is exceedingly mild; the air perfectly good; the oil, grapes, and fruit excellent; and the sea around it abounds in fish, and the port is large and secure. Neither is it so small that a man has not room to walk and ride about as much as he pleases; for it is ten miles in length, and about 25 in circuit; nor can it be said to be rugged, though rather high and mountainous.

BUANES, a town of France, in Gascony, and in the diocese of Aire, seated on the river Bahus, in E. Long. 0. 5. N. Lat. 43. 47.

BUAT-NANCAÿ, L. G. COUNT DU, a French writer on politics and history. See SUPPLEMENT.

BUBALIS, in *Zoology*, the trivial name of the buffalo, a species of the bos. See Bos.

BUBASTIS, in the Egyptian mythology, one of the names of Isis or the moon. The Egyptians bestowed different names on the sun, either to characterize his effects or his relations with respect to the earth; they followed the same method respecting the moon. Chæremon, a sacred writer of Egypt, leaves no doubt on this subject. "Every thing which is published of Osiris and Isis, all the sacerdotal fables, allude to the phases of the moon, and the course of the sun." Bubastis was one of the principal attributes of Isis. Theology having personified her, formed of her a divinity, in whose honour a city of that name was built, as described by Herodotus, and where the people collected from all parts of Egypt, at a certain period of the year. A cat was the symbol of this deity. The priests fed it with sacred food; and when it died, they embalmed its body, and carried it in pomp to the tomb prepared for it. The ancients have explained this worship variously. The Greeks pretend that when Typhon declared war against the gods, Apollo transformed himself into a vulture, Mercury into an ibis, and Bubastis into a cat, and that the veneration of the people for the latter animal took rise from that fable; but they ascribe their own ideas to the Egyptians, who thought very differently. However that may be, the cat was greatly honoured in Egypt, and a Roman soldier having imprudently killed one, was immediately put to death by the populace.

Bubastis, in the language of the priests, was deemed the daughter of Isis, and even represented her in cer-

Bryennius
Bubastis.

Eubastis,
Bubble.

tain circumstances. It is for this reason that the Greeks, who honoured the moon by the name of *Diana*, bestowed it also on this Egyptian divinity. Bubastis, says Herodotus, is called *Diana* by the Greeks. The Egyptians attributed to her the virtue of assisting pregnant women. The Greeks and Latins, disciples of the Egyptians, ascribed the same power to Diana; and Horace does not think it unworthy of his pen to address the following strophe to her:

*Montium custos nemorumque, Virgo,
Quæ laborantes utero puellas
Ter vocata audis, adimisque letho,
Diva Triformis.*

The philosopher will seek for the origin of this ancient worship in the laws imposed by nature on women, and which in some measure follow the lunar revolutions. The natural philosophers and the poets buried it under allegories unintelligible to the people.

A perfect resemblance, however, does not exist between the two deities we have been speaking of. The Greeks constituted Diana goddess of the chase and of the forests; an attribute the Egyptians did not acknowledge in Bubastis. The former added, that she was the daughter of Jupiter and Latona, and Bubastis was produced by Osiris and Isis.

A barbarous custom was introduced at the festivals celebrated in honour of Bubastis, called by the Greeks also *Ilithyia*, or *Lucina*, to mark her presiding over childbirth. The Egyptians adored her under this name in the city of *Ilithyia*, situated near *Latopolis*.

It remains to resolve a question which naturally arises here: How could Bubastis be called the daughter of Isis, since she also was a symbol of the moon? The Egyptian theology easily explains these apparent contradictions. Isis was the general appellation of the moon, Bubastis a particular attribute. The sun, in conjunction with the star of the night, formed the celestial marriage of Osiris and Isis; the crescent which appears three days after was allegorically called their daughter. It is in this sense that the Hebrews called this same phenomenon *the birth of the moon*, and that Horace says,

*Cælo supinas si tuleris manus,
Nascente lund rustica Phidyle, &c. &c.*

These observations inform us, why in the city of *Ilithyia*, where Bubastis was adored, the third day of the lunar month was consecrated by a particular worship. In fact, it is three days after the conjunction, that the moon, disengaged from the rays of the sun, appears as a crescent, and is visible to us. The Egyptians celebrated therefore a solemnity in honour of Bubastis, which in their tongue signified *new moon*. The crescent with which her head was crowned, expresses palpably the intention of the priest in creating this symbolical divinity.

BUBBLE, in *Philosophy*, a small drop or vesicle of any fluid filled with air; and formed either on its surface by an addition of more of the fluid, as in raining, &c.; or in its substance, by an intestine motion of its component particles. Bubbles are dilatible or compressible, i. e. they take up more or less room as the included air is more or less heated, or more or less pres-

sed from without; and are round, because the included air acts equally from within all around.

BUBBLE, in commerce, a cant term given to a kind of project for raising money on imaginary grounds, much practised in France and England in the years 1719, 1720, and 1721.

The pretence of those schemes was the raising a capital for retrieving, setting on foot, or carrying on, some promising and useful branch of trade, manufacture, machinery, or the like. To this end proposals were made out, showing the advantages to be derived from the undertaking, and inviting persons to be engaged in it. The sum necessary to manage the affair, together with the profits expected from it, were divided into shares or subscriptions, to be purchased by any disposed to adventure therein.

Bubbles, by which the public have been tricked, are of two kinds, viz. 1. Those which we may properly enough term *trading bubbles*; and, 2. Stock or fund bubbles. The former have been of various kinds; and the latter at different times, as in 1719 and 1720.

BUBO, in *Ornithology*, the trivial name of a species of strix. See **STRIX**, **ORNITHOLOGY Index**.

BUBO, or *Buboe*, in *Surgery*, a tumour which arises with inflammation, only in certain or particular parts to which they are proper, as in the arm-pits and in the groins. See **MEDICINE Index**.

BUBON, **MACEDONIAN PARSLEY**. See **BOTANY Index**.

BUBONOCELF, or **HERNIA INGUINALIS**, in *Surgery*, a tumour in the inguen, formed by a prolapsus of the intestines, omentum, or both, through the process of the peritoneum and rings of the abdominal muscles. See **SURGERY Index**.

BUBONIUM, in *Botany*, a synonyme of the **INULA**.

BUC, **GEORGE**, a learned English antiquarian, flourished in the beginning of the 17th century. In the reign of King James I. he was made one of the gentlemen of his majesty's privy-chamber, and knighted: he was also constituted master of the revels. What he mostly distinguished himself by was his writing, 1. The history of the reign of Richard III.; in which he takes great pains to wipe off the bloody stains that have blotted his character, and represents the person and actions of that prince in a much less odious light than other historians have done. He also wrote, 2. A Treatise of the Art of Revels; and, 3. A work entitled *The Third Universitie of England*.

BUCANEER, one who dries and smokes flesh or fish after the manner of the Indians. The name was particularly given to the first French settlers on the island of *St Domingo*, whose sole employment consisted in hunting bulls or wild boars, in order to sell their hides and flesh. The name has also been applied to those famous piratical adventurers, chiefly English and French, who joined together to make depredations on the Spaniards of America. Of both these we shall give an account.

I. *The Buccaneers of St Domingo*. The Spaniards had not been long in the possession of the West Indies and the continent of America, when other nations, especially the English and French, began to follow them there. But though the Spaniards were unable to peo-

Bubb
|
Bucan

Bucaneer. ple such extensive countries themselves, they were resolved that no others should do it for them; and therefore made a most cruel war on all those of any other nation who attempted to settle in any of the Antilles or Caribbee islands. The French, however, were at last lucky enough to acquire some footing in the island of St Christopher's: but by the time they began to subside into a regular form of government, the Spaniards found means to dislodge them. Upon this the wretched fugitives, considering at how great a distance they were from their mother-country, and how near to the island of Hispaniola or St Domingo, the northern parts of which were then uninhabited and full of swine and black cattle, immediately resolved to take possession of that country, in conjunction with several other adventurers of their own and the English nation; especially as the Dutch, who now began to appear in these seas, promised to supply them plentifully with all kinds of necessaries they might require, in exchange for the hides and tallow they should procure by hunting.

These new settlers obtained the name of *bucaneers*, from their custom of bucaning their beef and pork in order to keep it for sale, or for their own consumption, the method of which will be presently described. But some of them soon grew tired of this new way of life, and took to planting; while many more chose to turn pirates, trusting to find among those who remained on shore a quick sale for all the plunder they could make at sea. This new body of adventurers were called *freebooters*, from their making free prey or booty of whatever came in their way.

The colony now began to thrive at a great rate, by the cheap and easy manner in which the freebooters acquired the greatest riches, and the profusion with which they distributed them among their old companions, the bucaners and planters, for the merest trifles. This brought numbers of settlers from Old France in quality of indented servants, though they toiled rather like slaves during the three years for which they generally bound themselves. One of these men presuming to represent to his master, who always fixed upon a Sunday for sending him with skins to the port, that God had forbidden such a practice, when he had declared, "Six days shalt thou labour, and on the seventh day shalt thou rest:" "And I (replied the brutish bucaner) say to thee, Six days shalt thou kill bulls, and strip them of their skins, and on the seventh day shalt thou carry their hides to the sea-shore." This command was followed by blows, which sometimes enforce obedience, sometimes disobedience, to the laws of God.

Thus the colony consisted of four classes: bucaners; freebooters; planters; and indented servants, who generally remained with the bucaners or planters. And these four orders composed what they now began to call the *body of adventurers*. These people lived together in a perfect harmony under a kind of democracy: every freeman had a despotic authority over his own family; and every captain was a sovereign in his own ship, though liable to be discarded at the discretion of the crew.

The planters settled chiefly in the little island of Tortuga on the northern coast of Hispaniola: but it was not long before some of them going to the great island to hunt with the bucaners, the rest were sur-

prised by the Spaniards; and all, even those who had **Bucaneer.** surrendered at discretion in hopes of mercy, were put to the sword or hanged.

The next care of the Spaniards was to rid the great island of the bucaners; and for this reason they assembled a body of 500 lance-men, who, by their seldom going fewer than 50 in a company, obtained the name of *the Fifties* from their enemies, whose manners and customs we shall now enter upon.

The bucaners lived in little huts built on some spots of cleared ground, just large enough to dry their skins on, and contain their bucaning houses. These spots they called *Boucans*, and the huts they dwelt in *Ajoupas*, a word which they borrowed from the Spaniards, and the Spaniards from the natives. Though these ajoupas lay open on all sides, they were very agreeable to the hardy inhabitants, in a climate where wind and air are so very desirable things. As the bucaners had neither wife nor child, they associated by pairs, and mutually rendered each other all the services a master could reasonably expect from a servant, living together in so perfect a community, that the survivor always succeeded his deceased partner. This kind of union or fellowship they called *s'emateloter* [insailing], and each other *matelot* [sailor], whence is derived the custom of giving, at least in some parts of the French Antilles, the name *matelotage* [sailorage], to any kind of society formed by private persons for their mutual advantage. They behaved to each other with the greatest justice and openness of heart: it would have been a crime to keep any thing under lock and key; but, on the other hand, the least pilfering was unpardonable, and punished with expulsion from the community. And indeed there could be no great temptation to steal, when it was reckoned a point of honour, never to refuse a neighbour what he wanted; and where there was so little property, it was impossible there should be many disputes. If any happened, the common friends of the parties at variance interposed, and soon put an end to the difference.

As to laws, the bucaners acknowledged none but an odd jumble of conventions made between themselves, which, however, they regarded as the sovereign rule. They silenced all objections by coolly answering, that it was not the custom of the coast; and grounded their right of acting in this manner, on their baptism under the tropic, which freed them, in their opinion, from all obligations antecedent to that marine ceremony. The governor of Tortuga, when that island was again settled, though appointed by the French court, had very little authority over them; they contented themselves with rendering him from time to time some slight homage. They had in a manner entirely shaken off the yoke of religion, and thought they did a great deal in not wholly forgetting the God of their fathers. We are surprised to meet with nations, among whom it is a difficult matter to discover any trace of a religious worship: and yet it is certain, that had the bucaners of St Domingo been perpetuated on the same footing they subsisted at the time we are speaking of, the third or fourth generation of them would have had as little religion as the Caffres and Hottentots of Africa, or the Topinambous and Cannibals of America.

They even laid aside their surnames, and assumed nick-names, or martial names, most of which have con-

tinued.

Bucaneer. continued in their families to this day. Many, however, on their marrying, which seldom happened till they turned planters, took care to have their real surnames inserted in the French contract; and this practice gave occasion to a proverb, still current in the French Antilles, *a man is not to be known till he takes a wife.*

Their dress consisted of a filthy greasy shirt, dyed with the blood of the animals they killed; a pair of trowsers still more nasty; a thong of leather by way of belt, to which they hung a case containing some Dutch knives, and a kind of very short sabre called *manchette*; a hat without any brim, except a little flap on the front to take hold of it by; and shoes of hogskin all of a piece. Their guns were four feet and a half in the barrel, and of a bore to carry balls of an ounce. Every man had his contract servants, more or fewer according to his abilities; besides a pack of 20 or 30 dogs, among which there was always a couple of beagles. Their chief employment at first was ox-hunting; and, if at any time they chased a wild hog, it was rather for pastime, or to make provision for a feast, than for any other advantage. But in process of time, some of them betook themselves entirely to hunting of hogs, whose flesh they buccaned in the following manner: First, they cut the flesh into long pieces, an inch and a half thick, and sprinkled them with salt, which they rubbed off after 24 hours. Then they dried these pieces in stoves over a fire made of the skin and bones of the beast, till they grew as hard as a board, and assumed a deep brown colour. Pork prepared in this manner will keep in casks a twelvemonth and longer; and when steeped but a little while in lukewarm water, becomes plump and rosy, and yields moreover a most grateful smell, either broiled or boiled, or otherwise dressed, enough to tempt the most languid appetite and please the most delicate palate. Those who hunt the wild boar, have of late been called simply *hunters*.

In hunting, they set out at day-break, preceded by the beagles, and followed by their servants with the rest of the dogs; and as they made it a point never to balk their beagles, they were often led by them over the most frightful precipices, and through places which any other mortal would have deemed absolutely impassable. As soon as the beagles had roused the game, the rest of the dogs struck up and surrounded the beast, stopping it, and keeping a constant barking till the buccaneer could get near enough to shoot it; in doing this, he commonly aimed at the pit of the breast; when the beast fell, he hamstringed it, to prevent its rising again. But it has sometimes happened that the creature, not wounded enough to tumble to the ground, has run furiously at his pursuer, and ripped him open. But, in general, the buccaneer seldom missed his aim; and when he did, was nimble enough to get up the tree behind which he had the precaution to place himself. What is more; some of them have been seen to overtake the beast in chase, and hamstring it without any further ceremony.

As soon as the prey was half-skinned, the master cut out a large bone, and sucked the marrow for breakfast. The rest he left to his servants, one of whom always remained behind to finish the skinning, and bring the skin with a choice piece of meat for the huntsman's dinner. They then continued the chase till they had killed as many beasts as there were heads in the company. The

master was the last to return to the boucan, loaded like the rest with a skin and a piece of meat. Here the buccaneers found their tables ready: for every one had his separate table; which was the first thing, any way fit for the purpose, that came in their way, a stone, the trunk of a tree, and the like. No table-cloth, no napkin, no bread or wine, graced their board; not even potatoes or bananas, unless they found them ready to their hand. When this did not happen, the fat and lean of the game, taken alternately, served to supply the place. A little pimento, and the squeeze of an orange, their only sauce; contentment, peace of mind, a good appetite, and abundance of mirth, made every thing agreeable. Thus they lived and spent their time, till they had completed the number of hides for which they had agreed with the merchants; which done, they carried them to Tortuga, or some port of the great island.

As the buccaneers used much exercise, and fed only on flesh meat, they generally enjoyed a good state of health. They were indeed subject to fevers, but either such as lasted only a day, and left no sensible impression the day following; or little slow fevers, which did not hinder them from action, and were of course so little regarded, that it was usual with the patient, when asked how he did, to answer "Very well, nothing ails me but the fever." It was impossible, however, they should not suffer considerably by such fatigues, under a climate to the heat of which few of them had been early enough inured. Hence the most considerate among them, after they had got money enough for that purpose, turned planters. The rest soon spent the fruits of their labour in taverns and tipping-houses; and many had so habituated themselves to this kind of life, as to become incapable of any other. Nay, there have been instances of young men, who having early embarked through necessity in this painful and dangerous profession, persisted in it afterwards, merely through a principle of libertinism, rather than return to France and take possession of the most plentiful fortunes.

Such were the buccaneers of St Domingo, and such their situation, when the Spaniards undertook to extirpate them. And at first they met with great success; for as the buccaneers hunted separately, every one attended by his servants, they were easily surprised. Hence the Spaniards killed numbers, and took many more, whom they condemned to a most cruel slavery. But whenever the buccaneers had time to put themselves into a state of defence, they fought like lions, to avoid falling into the hands of a nation from whom they were sure to receive no quarter; and by this means they often escaped: nay, there are many instances of single men fighting their way through numbers. These dangers, however, and the success of the Spaniards in discovering their boucans, where they used to surprise and cut the throats of them and their servants in their sleep, engaged them to cobabit in greater numbers, and even to act offensively, in hopes that by so doing they might at last induce the Spaniards to let them live in peace. But the fury with which they behaved whenever they met any Spaniards, served only to make their enemies more intent on their destruction; and assistance coming to both parties, the whole island was turned into a slaughter-house, and so much blood spilt on both sides, that many places, on account of the carnage of which

Bucaneer. which they had been the theatres, were entitled, *of the massacre*: such as *the hill of the massacre*; *the plain of the massacre*; *the valley of the massacre*; which names they retain to this day.

At length the Spaniards grew tired of this way of proceeding, and had recourse to their old method of surprise, which, against enemies of more courage than vigilance, was like to succeed better. This put the bucaneeers under a necessity of never hunting but in large parties, and fixing the boucans in the little islands on the coast, where they retired every evening. This expedient succeeded; and the boucans, by being more fixed, soon acquired the air and consistency of little towns.

When the bucaneeers had once fixed themselves, as related, each boucan ordered scouts every morning to the highest part of the island, in order to reconnoitre the coast, and see if any Spanish parties were abroad. If no enemy appeared, they appointed a place and hour of rendezvous in the evening, and were never absent if not killed or prisoners. When therefore any one of the company was missing, it was not lawful for the rest to hunt again till they had got intelligence of him if taken, or avenged his death if killed.

Things continued in this situation for a long time, till the Spaniards made a general hunt over the whole island; and, by destroying their game, put the bucaneeers under a necessity of betaking themselves to another course of life. Some of them turned planters; and thereby increased some of the French settlements on the coast, and formed others. The rest, not relishing so confined and regular a life, entered among the freebooters, who thereby became a very powerful body.

France, who had hitherto disclaimed for her subjects these ruffians whose successes were only temporary, acknowledged them, however, as soon as they formed themselves into settlements; and took proper measures for their government and defence. See the article **ST DOMINGO**.

The hunting both of the bull and boar is at this day carried on, and proves of considerable importance. That of the former furnishes France with the finest hides brought from America. The bucaneeers put the hides in packs which they call loads, mixing together hides of full grown bulls, of young bullocks, and of cows. Each of these loads is composed of two bull-hides, or of an equivalent; that is to say, either of two real bull hides, or of one bull-hide and two cow-hides, or of four cow-hides, or of three young bullocks hides; three bullocks hides being reckoned equivalent to two full-grown bulls hides, and two cows hides equivalent to one bull's hide. These bulls they commonly call *oxen* in France, though they be not gelt. Each load is commonly sold for six pieces of eight rials, which is a Spanish coin, the French coin being but little current, or not at all, in the island of St Domingo.

The boar meat bucanued in the manner above mentioned is sold by the bundle or pack, weighing commonly 60 pounds, at the rate of six pieces of eight per pack. The palmetto leaves serve to pack it up in; but their weight is deducted, so that there must be in each pack 60 pounds of net flesh. These bucaneeers have also a great trade of the lard of boars, which they melt, and gather in large pots called *potiches*. This lard,

which is called *mantegua*, is also sold for about eight pieces of eight per pot. There is a great trade, and a great consumption of each of these merchandises in the French settlements of the island of St Domingo, and in those of Tortuga: besides which, they used to send great quantities of them to the Antilles, and even into the continent of French America. There is also a great deal of it sold for the support of the crews of the ships that come from France for trading, or which the privateers of Tortuga fit out for cruising against the Spaniards.

The Spaniards, who have large settlements in the island of St Domingo, have also their bucaneeers there, whom they call *matadores* or *monteros*. Their chase has something noble, which savours of the Spanish pride: the huntsman being on horseback uses the lance to strike the bull, thinking it beneath his courage to shoot him at a distance. When the servants who are on foot, have discovered the beast, and with their dogs have driven it into some savannah or meadow, in which the master waits for them on horseback, armed with two lances, the matadore goes and hamstringing it with the first lance, the head of which is made like a crescent or half-moon, and extremely sharp, and kills it afterwards with the other lance, which is a common one. The chase is very agreeable; the huntsman making commonly, in order to attack the bull, the same turns and the same ceremonies which are practised in those festivals so famous in Spain, wherein the greatest lords expose themselves sometimes to the view of the people, to make them admire their dexterity and intrepidity in attacking those furious animals: but then it is a very dangerous chase; those bulls, in their fury, often running directly against the huntsman, who may think himself very happy if he comes off only with the loss of his horse, and if he himself is not mortally wounded.

The Spaniards dress their hides like the French, who have learned it from them; and these hides being carried to the Havannah, a famous harbour in the island of Cuba, are a part of the trade of that celebrated town. The flota and the galleons scarce ever fail touching there, on their return from Vera Cruz and Porto Bello, and load there those hides which they carry into Spain, where they are sold for Havannah hides, the most esteemed of any that are brought from America into Europe.

II. BUCANEERS, the Pirates. Before the English had made any settlement at Jamaica, and the French at St Domingo, some pirates of both nations, who have since been so much distinguished by the name of *Bucaneers*, had driven the Spaniards out of the small island of Tortuga; and, fortifying themselves there, had with an amazing intrepidity made excursions against the common enemy. They formed themselves into small companies, consisting of 50, 100, or 150 men each. A boat, of a greater or smaller size, was their only armament. Here they were exposed night and day to all the inclemencies of the weather; having scarce room enough to lie down. A love of absolute independence, the greatest blessing to those who are not proprietors of land, rendered them averse from those mutual restraints which the members of society impose upon themselves for the common good; some of them chose to sing, while others were desirous of going to sleep. As the authority they had conferred on their captain was confined

Bucaneer.

Bucaneer. to his giving orders in battle, they lived in the greatest confusion. Like the savages, having no apprehension of want, nor any care to preserve the necessaries of life, they were constantly exposed to the severest extremities of hunger and thirst. But deriving, even from their very distresses, a courage superior to every danger, the sight of a ship transported them even to a degree of frenzy. They never deliberated on the attack, but it was their custom to board the ship as soon as possible. The smallness of their vessels, and the skill they showed in the management of them, screened them from the fire of the greater ships; and they presented only the forepart of their little vessels filled with fusileers; who fired at the port-holes with so much exactness, that it entirely confounded the most experienced gunners. As soon as they threw out the grappling, the largest vessel seldom escaped them.

In cases of extreme necessity, they attacked the people of every nation, but fell upon the Spaniards at all times. They thought that the cruelties the latter had exercised on the inhabitants of the new world justified the implacable aversion they had sworn against them. But this was heightened by a personal pique, from the mortification they felt in seeing themselves debarred from the privileges of hunting and fishing, which they considered as natural rights. Such were their principles of justice and religion, that, whenever they embarked on any expedition, they used to pray to heaven for the success of it; and they never came back from the plunder, but they constantly returned thanks to God for their victory.

The ships that sailed from Europe to America seldom tempted their avidity. The merchandise they contained would not easily have been sold, nor been very profitable to those barbarians in these early times. They always waited for them on their return, when they were certain they were laden with gold, silver, jewels, and all the valuable productions of the new world. If they met with a single ship, they never failed to attack her. As to the fleets, they followed them till they sailed out of the gulf of Bahama; and as soon as any one of the vessels was separated by accident from the rest, it was taken. The Spaniards, who trembled at the approach of the bucaneeers, whom they called *devils*, immediately surrendered. Quarter was granted, if the cargo proved to be a rich one; if not, all the prisoners were thrown into the sea.

The bucaneeers, when they had got a considerable booty, at first held their rendezvous at the island of Tortuga, in order to divide the spoil; but afterwards the French went to St Domingo, and the English to Jamaica. Each person, holding up his hand, solemnly protested that he had secreted nothing of what he had taken. If any one among them was convicted of a perjury, a case that seldom happened, he was left, as soon as an opportunity offered, upon some desert island, as a traitor unworthy to live in society. Such brave men among them as had been maimed in any of their expeditions, were first provided for. If they had lost a hand, an arm, a leg, or a foot, they received 26l. An eye, a finger, or a toe, lost in fight, was valued only at half the above sum. The wounded were allowed 2s. 6d. per day for two months, to enable them to have their wounds taken care of. If they had not money enough to answer these several demands, the whole

company were obliged to engage in some fresh expedition, and to continue it till they had acquired a sufficient stock to enable them to satisfy such honourable contracts.

After this act of justice and humanity, the remainder of the booty was divided into as many shares as there were bucaneeers. The commander could only lay claim to a single share with the rest; but they complimented him with two or three, in proportion as he had acquitted himself to their satisfaction. Favour never had any influence in the division of the booty; for every share was determined by lot. Instances of such rigid justice as this are not easily met with; and they extended even to the dead. Their share was given to the man who was known to be their companion when alive, and therefore their heir. If the person who had been killed had no intimate, his part was sent to his relations when they were known. If there were no friends or relations, it was distributed in charity to the poor and to the churches, which were to pray for the person in whose name these benefactions were given.

When these duties had been complied with, they then indulged themselves in all kinds of profusion. Unbounded licentiousness in gaming, wine, women, every kind of debauchery, was carried to the utmost pitch of excess, and was stopt only by the want which such profusion brought on. Those men who were enriched with several millions, were in an instant totally ruined, and destitute of clothes and provisions. They returned to sea; and the new supplies they acquired were soon lavished in the same manner.

The Spanish colonies, flattering themselves with the hopes of seeing an end to their miseries, and reduced almost to despair in finding themselves a perpetual prey to these ruffians, grew weary of navigation. They gave up all the power, conveniences, and fortune, which their connections procured them, and formed themselves almost into so many distinct and separate states. They were sensible of the inconveniences arising from such a conduct, and avowed them; but the dread of falling into the hands of rapacious and savage men, had greater influence over them than the dictates of honour, interest, and policy. This was the rise of that spirit of inactivity which continues to this time.

This despondency served only to increase the boldness of the bucaneeers. As yet they had only appeared in the Spanish settlements, in order to carry off some provisions when they were in want of them. They no sooner found their captures begin to diminish, than they determined to recover by land what they had lost at sea. The richest and most populous countries of the continent were plundered and laid waste. The culture of lands was equally neglected with navigation; and the Spaniards dared no more appear in their public roads, than sail in the latitudes which belonged to them.

Among the bucaneeers who signalized themselves in this new species of excursions, Montbar, a gentleman of Languedoc, particularly distinguished himself. Having by chance, in his infancy, met with a circumstantial account of the cruelties practised in the conquest of the new world, he conceived an aversion which he carried to a degree of frenzy against that nation which

Bucaneer. which had committed such enormities. The enthusiasm this spirit of humanity worked him up to, was turned into a rage more cruel than that of the religious fanaticism, to which so many victims had been sacrificed. The manes of these unhappy sufferers seemed to rouse him, and call upon him for vengeance. He had heard some account of the bucaneeers, who were said to be the most inveterate enemies to the Spanish name: he therefore embarked on board a ship, in order to join them.

In the passage they met with a Spanish vessel; attacked it; and, as it was usual in those times, immediately boarded it. Montbar, with a sabre in his hand, fell upon the enemy; broke through them; and, hurrying twice from one end of the ship to the other, levelled every thing that opposed him. When he had compelled the enemy to surrender, leaving to his companions the happiness of dividing so rich a booty, he contented himself with the savage pleasure of contemplating the dead bodies of the Spaniards, lying in heaps together, against whom he had sworn a constant and deadly hatred.

Fresh opportunities soon occurred, that enabled him to exert this spirit of revenge, without extinguishing it. The ship he was in arrived at the coast of St Domingo; where the bucaneeers on land immediately applied to barter some provisions for brandy. As the articles they offered were of little value, they alleged in excuse, that their enemies had overrun the country, laid waste their settlements, and carried off all they could. "Why (replied Montbar) do you tamely suffer such insults?" "Neither do we (answered they in the same tone); the Spaniards have experienced what kind of men we are, and have therefore taken advantage of the time when we were engaged in hunting. But we were going to join some of our companions, who have been still worse treated than we: and then we shall have warm work." "If you approve of it (answered Montbar), I will head you, not as your commander, but as the foremost to expose myself to danger." The bucaneeers perceiving from his appearance that he was such a man as they wanted, cheerfully accepted his offer. The same day they overtook the enemy, and Montbar attacked them with an impetuosity that astonished the bravest. Scarce one Spaniard escaped the effects of his fury. The remaining part of his life was equally distinguished as on this day. The Spaniards suffered so much from him, both by sea and land, that he acquired the name of the *Exterminator*.

His savage disposition, as well as that of the other bucaneeers who attended him, having obliged the Spaniards to confine themselves within their settlements, these freebooters resolved to attack them there. This new method of carrying on the war required superior forces; and their associations in consequence became more numerous. The first that was considerable was formed by L'Olonois, who derived his name from the sands of Olones the place of his birth. From the abject state of a bondsman, he had gradually raised himself to the command of two canoes, with 22 men. With these he was so successful as to take a Spanish frigate on the coast of Cuba. He then repaired to Port-au-Prince, in which were four ships, fitted out purposely to sail in pursuit of him. He took them, and threw all the crews into the sea, except one man, whom he saved,

VOL. IV. Part II.

in order to send him with a letter to the governor of the Havannah, acquainting him with what he had done, and assuring him that he would treat in the same manner all the Spaniards that should fall into his hands, not excepting the governor himself, if he should be so fortunate as to take him. After this expedition, he ran his canoes and prize-ships aground, and sailed with his frigate only to the island of Tortuga.

Here he met with Michael de Basco, who had distinguished himself by having taken, even under the cannon of Porto-Bello, a Spanish ship, estimated at 218,500*l.* and by other actions equally brave and daring. These two gave out, that they were going to embark together on an expedition equally glorious and profitable; in consequence of which they soon collected together 440 men. This body of men, the most numerous the bucaneeers had yet been able to muster, sailed to the bay of Venezuela, which runs up into the country for the space of 50 leagues. The fort that was built at the entrance of it for its defence was taken; the cannon were nailed up; and the whole garrison, consisting of 250 men, put to death. They then reembarked, and came to Maracaybo, built on the western coast of the lake of the same name, at the distance of ten leagues from its mouth. This city, which had become flourishing and rich by its trade in skins, tobacco, and cocoa, was deserted. The inhabitants had retired with their effects to the other side of the bay. If the bucaneeers had not lost a fortnight in riot and debauch, they would have found at Gibraltar, near the extremity of the lake, every thing that the inhabitants had secreted to secure it from being plundered. On the contrary, they met with fortifications lately erected, which they had the useless satisfaction of making themselves masters of, at the expence of a great deal of blood; for the inhabitants had already removed to a distance the most valuable part of their property. Exasperated at this disappointment, they set fire to Gibraltar. Maracaybo would have shared the same fate, had it not been ransomed. Besides the sum they received for its ransom, they also carried off with them all the crosses, pictures, and bells of the churches; intending, as they said, to build a chapel in the island of Tortuga, and to consecrate this part of their spoils to sacred purposes. Such was the religion of these barbarous people, who could make no other offering to heaven than that which arose from their robberies and plunder.

While they were idly dissipating the spoils they had made on the coast of Venezuela, Morgan, the most renowned of the English bucaneeers, sailed from Jamaica to attack Porto-Bello. His plan of operations was so well contrived, that he surprised the city, and took it without opposition.

The conquest of Panama was an object of much greater importance. To secure this, Morgan thought it necessary to sail in the latitudes of Costa-Ricca, to procure some guides in the island of St Catharine's, where the Spaniards confined their malefactors. This place was so strongly fortified, that it ought to have held out for ten years against a considerable army. Notwithstanding this, the governor, on the first appearance of the pirates, sent privately to concert measures how he might surrender himself without incurring the imputation of cowardice. The result of this consultation was, that Morgan, in the nighttime, should

5 E

attack

Bucaneer. attack a fort at some distance, and the governor should sally out of the citadel to defend a post of so much consequence; that the assailants should then attack him in the rear, and take him prisoner, which would consequently occasion a surrender of the place. It was agreed that a smart firing should be kept on both sides, without doing mischief to either. This faroe was admirably carried on. The Spaniards, without being exposed to any danger, appeared to have done their duty; and the bucaners, after having totally demolished the fortifications, and put on board their vessels a prodigious quantity of warlike ammunition which they found at St Catharine's, steered their course towards the river Chagre, the only channel that was open to them to arrive at the place which was the object of their utmost wishes.

At the entrance of this considerable river, a fort was built upon a steep rock, which the waves of the sea constantly beat against. This bulwark, very difficult of access, was defended by an officer whose extraordinary abilities were equal to his courage, and by a garrison that deserved such a commander. The bucaners, for the first time, here met with a resistance that could only be equalled by their perseverance; it was a doubtful point, whether they would succeed or be obliged to raise the siege, when a lucky accident happened that proved favourable to their glory and their fortune. The commander was killed, and the fort accidentally took fire; the besiegers then taking advantage of this double calamity, made themselves masters of the place.

Morgan left his vessels at anchor, with a sufficient number of men to guard them; and sailed up the river in his sloops for 33 miles, till he came to Cruces, where it ceases to be navigable. He then proceeded by land to Panama, which was only five leagues distant. Upon a large and extensive plain that was before the city, he met with a considerable body of troops, whom he put to flight with the greatest ease, and entered into the city, which was now abandoned. Here were found prodigious treasures concealed in the wells and caves. Some valuable commodities were also taken upon the boats that were left aground at low water; and in the neighbouring forests were also found several rich deposits.

Having burnt the city, they set sail with a great number of prisoners, who were ransomed a few days after, and came to the mouth of the Chagre with a prodigious booty.

In 1603, an expedition of the greatest consequence was formed by Van Horn, a native of Ostend, but who had served all his life among the French. His intrepidity would never let him suffer the least signs of cowardice among those who associated with him. In the heat of an engagement, he went about his ship; successively observed his men; and immediately killed those who shrank at the sudden report of a pistol, gun, or cannon. This extraordinary discipline had made him become the terror of the coward and the idol of the brave. In other respects, he readily shared with the men of spirit and bravery the immense riches that were acquired by so truly warlike a disposition. When he went upon these expeditions, he generally sailed in his frigate, which was his own property. But these new designs requiring greater numbers to carry them in-

to execution, he took to his assistance Cramont, Becasse Godfrey, and Jonqué, three Frenchmen distinguished by their exploits; and Lawrence de Graff, a Dutchman, who had signalized himself still more than they. Twelve hundred bucaners joined themselves to these famous commanders, and sailed in six vessels for Vera Cruz.

The darkness of the night favoured their landing, which was effected at three leagues from the place, where they arrived without being discovered. The governor, the fort, the barracks, and the posts of the greatest consequence, every thing, in short, that could occasion any resistance, was taken by the break of day. All the citizens, men, women, and children, were shut up in the churches, whither they had fled for shelter. At the door of each church were placed barrels of gunpowder to blow up the building. A bucaner, with a lighted match, was to set fire to it upon the least appearance of an insurrection.

While the city was kept in such terror, it was easily pillaged; and after the bucaners had carried off what was most valuable, they made a proposal to the citizens who were kept prisoners in the churches to ransom their lives and liberties by a contribution of 437,500l. These unfortunate people, who had neither ate nor drank for three days, cheerfully accepted the terms that were offered them. Half of the money was paid the same day: the other part was expected from the internal parts of the country; when there appeared on an eminence a considerable body of troops advancing, and near the port a fleet of 17 ships from Europe. At the sight of this armament, the bucaners, without any marks of surprise, retired quietly, with 1500 slaves they had carried off with them as a trifling indemnification for the rest of the money they expected, the settling of which they referred to a more favourable opportunity.

Their retreat was equally daring. They boldly sailed through the midst of the Spanish fleet; which let them pass without firing a single gun, and were in fact rather afraid of being attacked and beaten. The Spaniards would not probably have escaped so easily and with no other inconvenience but what arose from their fear, if the vessels of the pirates had not been laden with silver, or if the Spanish fleet had been freighted with any other effects but such merchandise as was little valued by these pirates.

A year had scarce elapsed since their return from Mexico, when, on a sudden, they were all seized with the rage of going to plunder the country of Peru. It is probable that the hopes of finding greater treasures upon a sea little frequented, than on one long exposed to piracies of this kind, was the cause of this expedition. But it is somewhat remarkable, that both the English and French, and the particular associations of these two nations, had projected this plan at the same time, without any communication, intercourse, or design of acting in concert with each other. About 4000 men were employed in this expedition. Some of them came by Terra Firma, others by the straits of Magellan, to the place that was the object of their wishes. If the intrepidity of these barbarians had been directed, under the influence of a skilful and respectable commander, to one single uniform end, it is certain that they would have deprived the Spaniards of this important

Bucaneer. tant colony. But their natural character was an invincible obstacle to so rare an union; for they always formed themselves into several distinct bodies, sometimes even so few in number as ten or twelve, who acted together, or separated, as the most trifling caprice directed. Grogner, Lecuyer, Picard, and Le Sage, were the most distinguished officers among the French; David Samms, Peter Wilner, and Towley, among the English.

Such of these adventurers as had got into the South sea by the straits of Darien, seized upon the first vessel they found upon the coast. Their associates, who had sailed in their own vessels, were not much better provided. Weak, however, as they were, they beat several times the squadrons that were fitted out against them. But these victories were prejudicial to them, as they interrupted their navigation. When there were no more ships to be taken, they were continually obliged to make descents upon the coasts to get provisions, or to go by land in order to plunder those cities where the booty was secured. They successively attacked Seppa, Puebla-Nuevo, Leon, Realejo, Puebla-Viejo, Chiriquita, Lesparso, Granada, Villia, Nicoy, Tecoa-teca, Mucmeluna, Chiloteca, New-Segovia, and Guayaquil, the most considerable of all these places.

Many of them were taken by surprise; and most of them deserted by their inhabitants, who fled at the sight of the enemy. As soon as they took a town, it was directly set on fire, unless a sum proportioned to its value was given to save it. The prisoners taken in battle were massacred without mercy, if they were not ransomed by the governor or some of the inhabitants: gold, pearls, or precious stones, were the only things accepted of for the payment of their ransom. Silver being too common, and too weighty for its current value, would have been troublesome to them. The chances of fortune, that seldom leave guilt unpunished, nor adversity without a compensation for its suffering, atoned for the crimes committed in the conquest of the new world, and the Indians were amply revenged of the Spaniards.

While such piracies were committed on the southern ocean, the northern was threatened with the same by Gramont. He was a native of Paris, by birth a gentleman, and had distinguished himself in a military capacity in Europe; but his passion for wine, gaming, and women, had obliged him to join the pirates. He was, however, affable, polite, generous, and eloquent; he was endued with a sound judgment, and was a person of approved valour; which soon made him be considered as the chief of the French bucaneeers. As soon as it was known that he had taken up arms, he was immediately joined by a number of brave men. The governor of St Domingo, who had at length prevailed upon his master to approve of the project, equally wise and just, of fixing the pirates to some place, and inducing them to become cultivators, was desirous of preventing the concerted expedition, and forbade it in the king's name. Gramont, who had a greater share of sense than his associates, was not on that account more inclined to comply, and sternly repelled: "How can Louis disapprove of a design he is unacquainted with, and which has been planned only a few days ago?" This answer highly pleased all the

bucaneers; who directly embarked, in 1685, to attack **Bucaneer.** Campeachy.

They landed without opposition. But at some distance from the coast, they were attacked by 800 Spaniards, who were beaten and pursued to the town; where both the parties entered at the same time. The cannon they found there was immediately levelled against the citadel. As it had very little effect, they were contriving some stratagem to enable them to become masters of the place, when intelligence was brought that it was abandoned. There remained in it only a gunner, an Englishman; and an officer of such signal courage, that he chose rather to expose himself to the greatest extremities, than basely to fly from the place with the rest. The commander of the bucaneeers received him with marks of distinction, generously released him, gave him up all his effects, and besides complimented him with some valuable presents: such influence have courage and fidelity even on the minds of those who seem to violate all the rights of society.

The conquerors of Campeachy spent two months in searching all the environs of the city, for 12 or 15 leagues, carrying off every thing that the inhabitants, in their flight, thought they had preserved. When all the treasure they had collected from every quarter was deposited in the ships, a proposal was made to the governor of the province, who still kept the field with 900 men, to ransom his capital city. His refusal determined them to burn it, and demolish the citadel. The French, on the festival of St Louis, were celebrating the anniversary of their king; and in the transports of their patriotism, intoxication, and national love of their prince, they burnt to the value of a million of logwood; a part, and a very considerable one too, of the spoil they had made. After this singular and extravagant instance of folly, of which Frenchmen only could boast, they returned to St Domingo.

In 1697, 1200 bucaneeers were induced to join a squadron of seven ships that sailed from Europe under the command of Pointis, to attack the famous city of Carthagena. This was the most difficult enterprise that could be attempted in the new world. The situation of the port, the strength of the place, the badness of the climate, were so many obstacles that seemed insurmountable to any but such men as the bucaneeers were. But every obstacle yielded to their valour and good fortune: the city was taken, and booty gained to the amount of 1,750,000l. Their rapacious commander, however, deprived them of the advantages resulting from their success. He scrupled not, as soon as they set sail, to offer 5250l. for the share of those who had been the chief instruments in procuring him so considerable a spoil.

The bucaneeers, exasperated at this treatment, resolved immediately to board the vessel called the *Sceptre*, where Pointis himself was, and which at that time was too far distant from the rest of the ships to expect to be assisted by them. This avaricious commander was upon the point of being massacred, when one of the malecontents cried out: "Brethren, why should we attack this rascal? he has carried off nothing that belongs to us. He has left our share at Carthagena, and there we must go to recover it." This proposal was

Bucaneer received with general applause. A savage joy at once succeeded that gloomy melancholy which had seized them; and without further deliberation all their ships sailed towards the city.

As soon as they had entered the city without meeting with any resistance, they shut up all the men in the great church; and exacted payment of 218,750*l.* the amount of their share of booty which they had been defrauded of; promising to retreat immediately upon their compliance, but threatening the most dreadful vengeance if they refused. Upon this, the most venerable priest in the city mounted the pulpit, and made use of all the influence his character, his authority, and his eloquence gave to him, to persuade his hearers to yield up without reserve all the gold, silver, and jewels they had. The collection which was made after the sermon, not furnishing the sum required, the city was ordered to be plundered.

At length, after amassing all they could, these adventurers set sail; when unfortunately they met with a fleet of Dutch and English ships, both which nations were then in alliance with Spain. Several of the pirates were either taken or sunk, with all the cargo they had on board their ships; the rest escaped to St Domingo.

Such was the last memorable event in the history of the bucaners. The separation of the English and French, when the war, on account of the prince of Orange, divided the two nations; the successful means they both made use of to promote the cultivation of land among their colonies, by the assistance of these enterprising men; and the prudence they showed in fixing the most distinguished among them, and entrusting them with civil and military employments; the protection they were both under the necessity of affording to the Spanish settlements, which till then had been a general object of plunder: all these circumstances, and various others, besides the impossibility there was of supplying the place of these remarkable men, who were continually dropping off, concurred to put an end to a society as extraordinary as ever existed. Without any regular system, without laws, without any degree of subordination, and even without any fixed revenue, they became the astonishment of that age in which they lived, as they will be also of posterity.

BUCCELLARII, an order of soldiery under the Greek emperors, appointed to guard and distribute the ammunition bread; though authors are somewhat divided as to their office and quality. Among the Visigoths buccellarius was a general name for a client or vassal who lived at the expence of his lord. Some give the denomination to parasites in the courts of princes, some make them the body-guards of emperors, and some fancy they were only such as emperors employed in putting persons to death privately.

BUCCELLATUM, among ancient military writers, denotes camp-bread, or biscuit baked hard and dry, both for lightness and keeping. Soldiers always carried with them enough for a fortnight, and sometimes much longer, during the time that military discipline was kept up.

BUCCINA, an ancient musical and military instrument. It is usually taken for a kind of trumpet; which

opinion is confirmed by Festus, by his defining it a crooked horn, played on like a trumpet. Vegetius observes, that the buccina was bent in a semicircle, in which respect it differed from the tuba or trumpet. It is very hard to distinguish it from the cornu or horn, unless it was something less, and not quite so crooked; yet it certainly was of a different species, because we never read of the cornu in use with the watch, but only the buccina. Besides, the sound of the buccina was sharper, and to be heard much farther than either the cornu or the tuba. In Scripture, the like instrument, used both in war and in the temple, was called *rams-horns*, *kiren jobel*, and *sepheroth hagijobelim*.

This instrument was in use among the Jews to proclaim their feast-days, new-moons, jubilees, sabbatic years, and the like. At Lacedæmon, notice was given by the buccina when it was supper time; and the like was done at Rome, where the grandes had a buccina blown both before and after they sat down to table. The sound of the buccina was called *buccinus*, or *bucinus*; and the musician who played on it was called *buccinator*.

BUCINUM, or **WHELK**. See **CONCHOLOGY Index**. One of the species, the *Buccinum lapillus*, or *massy whelk*, which is a British shell, produces a purple dye, analogous to the *purpura*, or celebrated Tyrian purple of the ancients. By some, it is supposed to be the same.

BUCCLEUGH, a village in the county of Selkirk in Scotland, from which the noble family of Scott have the title of duke.

BUCCO, the **BARBET**. See **ORNITHOLOGY Index**.

BUCENTAUR, a galeas or large galley of the doge of Venice, adorned with fine pillars on both sides, and gilt over from the prow to the stern. This vessel is covered over head with a kind of tent, made of purple silk. In it the doge receives the great lords and persons of quality that go to Venice, accompanied with the ambassadors and counsellors of state, and all the senators seated on benches by him. The same vessel serves also in the magnificent ceremony of Ascension day, on which the doge of Venice throws a ring into the sea to espouse it, and to denote his dominion over the gulf of Venice.

BUCENTAUR is also the name of a ship, as great and as magnificent as that of the Venetians, built by order of the elector of Bavaria, and launched on a lake which is six leagues in length.

BUCÉPHALA, or **BUCEPHALOS**, in *Ancient Geography*, a town built by Alexander, on the west side of the Hydaspis, a river of the Hither India, in memory of his horse Bucephalus, which was killed in the action with Porus, after crossing that river. Others say, this horse died of age, 30 years old; and not in the battle, but some time after. His being branded or marked on the buttock with the head of an ox, gave rise to his name (Hesychius).—This generous animal, who had so long shared the toils and dangers of his master, had formerly received signal marks of royal regard. Having disappeared in the country of the Uxii, Alexander issued a proclamation, commanding his horse to be restored, otherwise he would ravage the whole country with fire and sword. This command was

Bucephalus was immediately obeyed, "So dear," says Arrian, "was Bucephalus to Alexander, and so terrible was Alexander to the Barbarians."

Buchanan.

BUCER, MARTIN, one of the first authors of the reformation at Strasburg, was born in 1491, in Alsace; and took the religious habit of St Dominic, at seven years of age: but meeting afterward with the writings of Martin Luther, and comparing them with the Scriptures, he began to entertain doubts concerning several things in the Romish religion. After some conferences with Luther at Heidelberg in 1521, he adopted most of his sentiments; but in 1532, he gave the preference to those of Zuinglius. He assisted in many conferences concerning religion; and in 1548 was sent for to Augsburg to sign the agreement between the Papists and Protestants, called the *interim*. His warm opposition to this project exposed him to many difficulties and hardships; the news of which reaching England, where his fame had already arrived, Cranmer archbishop of Canterbury gave him an invitation to come over, which he readily accepted. In 1549, a handsome apartment was assigned him in the university of Cambridge, and a salary to teach theology. King Edward VI. had the greatest regard for him. Being told that he was very sensible of the cold of the climate, and suffered much for want of a German stove, he sent him 100 crowns to purchase one. He died of a complication of disorders in 1551; and was buried at Cambridge with great funeral pomp. Five years after, in the reign of Queen Mary, his body was dug up, and publicly burnt, and his tomb demolished; but it was afterwards set up by order of Queen Elizabeth. He composed many works, among which are commentaries on the evangelists and gospels.

BUCEROS. See *ORNITHOLOGY Indem.*

BUCHAN, a district of Scotland, lying partly in the shire of Aberdeen and partly in that of Banff: it gives the title of earl to the noble and ancient family of Erskine.

BUCHANAN, GEORGE, the best Latin poet of his time, perhaps inferior to none since the Augustan age, was born in February 1506. This accomplished scholar and distinguished wit was not descended of a family remarkable for its rank. He had no occasion for the splendour of ancestry. He wanted not a reflected greatness, the equivocal, and too often the only ornament of the rich and noble. The village of Kilmearn, in Stirlingshire, Scotland, was the place of his nativity; and the abject poverty in which his father died might have confined him to toil at the lowest employments of life, if the generosity of an uncle had not assisted him in his education, and enabled him to pursue for two years his studies at Paris. But that short space was scarcely elapsed, when the death of his benefactor made it necessary that he should return to his own country, and forsake, for a time, the paths of science.

He was yet under his 20th year, and surrounded with the horrors of indigence. In this extremity, he enlisted as a common soldier under John duke of Albany, who commanded the troops which France had sent to assist Scotland in the war it waged, at this period, against England. But nature had not destined him to be a hero. He was disgusted with the fatigues

of one campaign; and, fortunately, John Major, then professor of philosophy at St Andrew's, hearing of his necessity and his merit, afforded him a temporary relief. He now became the pupil of John Mair, a celebrated teacher in the same university, under whom he studied the subtilities of logic: and contracting an attachment to his master, he followed him to Paris. There, after having encountered many difficulties, he was invited to teach grammar in the college of St Barbe. In this slavish occupation he was found by the earl of Cassilis; with whom having remained five years at Paris, he returned to Scotland. He next acted as preceptor to the famous earl of Murray, the natural son of James V. But while he was forming this nobleman for public affairs, he found that his life was in danger; and from enemies, whose vindictive rage could suffer no abatement, and who would not scruple the most dishonourable means of gratifying it.

The scandalous lives of the clergy had, it seems, excited his indignation; and, more than reasoning or argument, had estranged him from the errors of Popery. The Franciscan monks, in return to the beautiful but poignant satires he had written against them, branded him with the appellation of *atheist*; a term which the religious of all denominations are too apt indiscriminately to lavish where they have conceived a prejudice; and, not satisfied with the outrage of abuse and calumny, they conspired his destruction. Cardinal Beaton gave orders to apprehend him, and bribed King James with a very considerable sum to permit his execution. He was seized upon accordingly; and the first genius of his age was about to perish by the halter, or by fire, to satisfy a malignant resentment, when, escaping the vigilance of his guards, he fled into England. Henry VIII. at all times the slave of caprice and passion, was then burning, on the same day, and at the same stake, the Lutheran and the Papist. His court did not suit a philosopher or a satirist. After a short stay, Buchanan crossed the sea to France; and, to his extreme disappointment, found at Paris, Cardinal Beaton, as ambassador from Scotland. He retired privately to Bourdeaux, dreading, perhaps, new misfortunes, and concerned that he could not prosecute his studies in obscurity and silence. Here he met Andrew Govea, a Portuguese of great learning and worth, with whom he had formerly been acquainted during his travels, and who was now employed in teaching a public school. He disdained not to act as the assistant of his friend; and during the three years he resided at this place, he composed the tragedies which do him so much honour. It was here, also, that he wrote some of the most pleasant of those poems, in which he has rallied the muses, and threatened to forsake them, as not being able to maintain their votary. About this time, too, he presented a copy of verses to the emperor Charles V. who happened to pass through Bourdeaux.

His enemies, meanwhile, were not inactive. Cardinal Beaton, wrote about him to the archbishop of Bourdeaux; and by every motive which a cunning and a wicked heart can invent, he invited him to punish the most pestilential of all heretics. The archbishop, however, was not so violent as the cardinal. On inquiring into the matter, he was convinced that the poet had committed a very small impropriety; and allowed

Buchanan. lowed himself to be pacified. But fortune was not long to continue her smiles. Andrew Govea being called by the king of Portugal, his master, to establish an academy at Coimbra, he entreated Buchanan to accompany him. He obtained his request; and had not been a year in his own country, when he died, and left his associate exposed to the malice of his inveterate enemies the monks. They loudly objected to him, that he was a Lutheran; that he had written poems against the Franciscans; and that he had been guilty of the abominable crime of eating flesh in Lent. He was confined to a monastery till he should learn what these men fancied to be religion: and they enjoined him to translate the Psalms of David into Latin verse; a task which every man of taste knows with what admirable skill and genius he performed.

On obtaining his liberty, he had the offer of a speedy promotion from the king of Portugal: the issue of which, his aversion to the clergy did not allow him to wait. He hastened to England; but the perturbed state of affairs during the minority of Edward VI. not giving him the promise of any lasting security, he set out for France. There he had not been long, when he published his *Jephtha*, which his necessities made him dedicate to the marshal de Brisac. This patron did not want generosity, and could judge of merit. He sent him to Piedmont, as preceptor to his son Timoleon de Cossi. In this employ he continued several years; and during the leisure it afforded him, he fully examined the controversies which now agitated Europe; and put the last hand to many of the most admired of his smaller poems.

When his pupil had no longer any use for him, he passed into Scotland, and made an open profession of the reformed faith. But he soon quitted his native country for France; which appears to have been more agreeable to his taste. Queen Mary, however, having determined that he should have the charge of educating her son, recalled him: and till the prince should arrive at a proper age, he was nominated to the principality of St Andrew's. His success as James's preceptor is well known. When it was reproached to him, that he had made his majesty a pedant; "It is a wonder (he replied) that I have made so much of him." Mackenzie relates a story concerning his tutelage of his pedantic majesty, which shows under what authority Buchanan held his pupil, and at the same time the degree of his veneration for royalty. The young king being one day at play with his fellow pupil the master of Erskine, Buchanan, who was then reading, desired them to make less noise. Finding that they disregarded his admonition, he told his majesty, if he did not hold his tongue, he would certainly whip his breech. The king replied, he would be glad to see who would *bell the cat*, alluding to the fable. Buchanan, in a passion, threw the book from him, and gave his majesty a sound flogging. The old countess of Mar, who was in the next apartment, rushed into the room, and taking the king in her arms, asked how he dared to lay his hand on *the Lord's anointed*. Buchanan's answer is too indelicate to be repeated.

On the misfortunes that befel the amiable but imprudent Mary, he went over to the party of the earl of Murray; and at his earnest desire he was prevailed upon to write his "*Detection*;" a work which his

greatest admirers have read with regret. Having been sent with other commissioners to England, against his mistress, he was, on his return, rewarded with the abbacy of Cross Regal; made director to the chancery; and some time after lord privy council and privy seal. He was likewise rewarded by Queen Elizabeth with a pension of 100l. a-year. The last twelve years of his life he employed in composing his *History of Scotland*. After having vied with almost all the more eminent of the Latin poets, he contested with Livy and Sallust the palm of eloquence and political sagacity. But it is to be remembered with pain, that, like the former of these historians, he was not always careful to preserve himself from the charge of partiality. In the year 1582, he expired at Edinburgh, in the 76th year of his age.

Various writers who have mentioned this author, speak of him in very different language, according to their religious and political principles. From his works, however, it is evident, that, both as a Latin poet and prose writer, he hath been rarely equalled since the reign of Augustus; nor is he less deserving of remembrance as a friend to the natural liberties of mankind, in opposition to usurpation and tyranny. "The happy genius of Buchanan (says Dr Robertson), equally formed to excel in prose and verse, more various, more original, and more elegant, than that of almost any other modern who writes in Latin, reflects, with regard to this particular, the greatest lustre on his country." To his memory an obelisk 100 feet high was erected by subscription in 1788, at Killearn the place of his nativity, designed by Mr J. Craig, nephew to the celebrated poet Thomson.

The following is a list of his works. 1. *Rerum Scotticarum, &c.* 2. *Psalmorum Davidis paraphrasis poetica.* 3. *De jure regni apud Scotos Dialogus.* 4. *Psalmus civ. cum judicio Barclaii, &c.* 5. *Psalmus cxx. cum analysi organica Beuzeri.* 6. *Baptistes, sive Calumnia.* 7. *Alcestis, tragædia.* 8. *Tragædiæ sacræ et extera.* 9. *De Caleto recepto carmen, apud Stephan.* 10. *Franciscanus et Fratres, &c.* 11. *Elegiæ, Silvæ, &c.* 12. *Déspera Herbornæ.* 13. *Pœmata.* 14. *Satyra in cardinalem Lotharingium.* 15. *Rudimenta grammatices, Tho. Linacri ex Anglico sermone in Latinum versa.* 16. An admonition to the true lords. 17. *De prosodia.* 18. *Chamæleon, 1572.* 19. *Ad viros sui seculi epistola.* 20. *Literæ reginæ Scotticæ ad com. Bothwellæ.* 21. A detection of the doings of Mary queen of Scots, and of James earl of Bothwell, against Henry Lord Darnly. 22. *Vita ab ipso scripta biennio ante mortem, cum commentario D. Rob. Sibbaldi, M. D.* 23. Life of Mary queen of Scots. These have been severally printed often, and in various countries. An edition of them all collected together was printed at Edinburgh in 1704, in 2 vols folio.

BUCHANNESS, a cape or promontory of Scotland, which is the farthest point of Buchan, not far from Peterhead, and the most eastern of all Scotland. E. Long. 0. 30. N. Lat. 57. 28.

BUCHAW, a town of Germany, seated on the river Tedersee, 22 miles south-west of Ulm. Here is a monastery, whose abbess had formerly a voice in the diets of the empire. The town is subject to Wirtemberg. E. Long. 9. 37. N. Lat. 48. 5.

BUCHAW, a small territory of Germany, in the circle

Buchaw of the Upper Rhine, which comprehends the district of the abbot of Fulda.

BUCHOREST, a pretty large town of Turkey in Europe, seated in the middle of Walachia, and the ordinary residence of a hospodar. The houses are mean and very ill built, except a few that belong to the principal persons. In 1716, a party of Germans sent from Transylvania entered this town, and took the prince prisoner with all his court, and carried them off. This expedition was the more easily performed, as several lords of the country had a secret intelligence with the governor of Transylvania. This prince had no other way to regain his liberty, but by giving up that part of Walachia, which lies between the river Aluth and Transylvania, to the emperor of Germany, by the peace concluded at Passarowitz in 1718. The Germans again entered the capital of his dominions, and levied excessive contributions. But affairs took another turn after the fatal battle of Crotska in 1737; for the emperor was obliged to restore this part of Walachia to the hospodar. Buchorest contains about 60,000 inhabitants. E. Long. 26. 30. N. Lat. 44. 30.

BUCHAM, a small town of Suabia in Germany, seated on the lake of Constance, in E. Long. 9. 20. N. Lat. 47. 41.

BUCIOCHE, in commerce, a sort of woollen cloth manufactured in Provence in France, which the French ships carry to Alexandria and Cairo.

BUCK, in *Zoology*, a male horned beast of venery or chase, whose female is denominated a *doe*. See **CERVUS** and **Buck-HUNTING**.

BUCK, is also applied to the male of the hare and rabbit kind. See **LEPUS**, and **Hare-HUNTING**.

Buck-Bean. See **MENYANTHES**, **BOTANY Index**.

Buck-Thorn. See **RHAMNUS**, **BOTANY Index**.

Buck-Wheat. See **POLYGONUM**, **BOTANY Index**.

BUCKENHAM, **NEW**, a town of Norfolk in England, which formerly had a strong castle, but now demolished. It is seated in a flat, in E. Long. 1. 10. N. Lat. 52. 30. Population 656 in 1811.

BUCKET, a small portable vessel to hold water, often made of leather for its lightness and easy use in cases of fire. It is also the vessel let down into a well, or the sides of ships, to fetch up water.

BUCKING, the first operation in the whitening of linen yarn or cloth.

BUCKINGHAM, the chief town of Buckinghamshire in England, stands in a low ground, on the river Ouse, by which it is almost surrounded, and over which there are three handsome stone-bridges. The town contained 3500 inhabitants in 1811, and sends two members to parliament. It seems, however, to have been but an inconsiderable place at the Conquest; for, according to Doomsday-book, it paid only for one hide, and had but 26 burgesses. Edward the elder fortified it in the year 918 against the incursions of the Danes, with a rampart and turrets. It also had formerly a castle in the middle of the town, of which no vestiges now remain. The shrine of St Rumbald, the patron of fishermen, preserved in the church, was held in great veneration. The county-gaol stands in this town, and here the assizes are sometimes kept. It was formerly a staple for wool, but that advantage it hath now lost. It is governed by a bailiff and 12 burgesses, who are the sole electors of the members. In its neigh-

bourhood are many paper-mills upon the Ouse. W. Long. 0. 58. N. Lat. 51. 30.

BUCKINGHAM-Shire, (supposed to derive its name from the Saxon word *Buc*, denoting a hart or buck) an inland county of England. During the time prior to the landing of the Romans it was included in the division of Catieuchlani; and after their conquest it was included in their third province of Flavia Caesariensis. During the heptarchy it belonged to the kingdom of Mercia, which commenced in 582, and terminated in 827, having had 18 kings; and it is now included in the Norfolk circuit, the diocese of Lincoln, and the province of Canterbury. It is bounded on the north by Northamptonshire; south by Berkshire; east by Bedfordshire, Hertfordshire, and Middlesex; and west by Oxfordshire. It is of an oblong form, whose greatest extent is from north to south. It contains 441,000 acres; has above 111,400 inhabitants, 185 parishes, 73 vicarages; is 49 miles long, 18 broad, and 109 in circumference. It has 15 market-towns, viz. Buckingham and Aylesbury, the county towns, Marlow, Newport-Pagnel, Winslow, Wendover, Beaconsfield, Wiccomb, Chesham, Amersham, Stony Stratford, Colnbrook, Ivingho, Oulney, Risborough; besides the considerable villages of Eaton and Fenny Stratford, and 613 others inferior. It is divided into eight hundreds, provides 560 men for the militia, sends 14 parliament-men, and pays 12 parts of the land-tax. Its rivers are the Thames, Ouse, Coln, Wicham, Amersham, Isis, Tame, and Loddon. Its chief produce is bone-lace, paper, corn, fine wool, and breeding rams. The most noted places are the Chiltern Hills, Vale of Aylesbury, Bernwood Forrest, Wooburn-Heath, and 15 parks. The air is generally good, and the soil mostly chalk or marle. The population of Buckinghamshire amounted to 117,650 in 1811. See **BUCKINGHAMSHIRE**, **SUPPLEMENT**.

BUCKINGHAM, *George Villiers, duke of*. See **VILLIERS**.

BUCKINGHAM, *John Sheffield, duke of*. See **SHEPHERD**.

BUCKLE, a well known utensil, made of divers sorts of metals, as gold, silver, steel, brass, &c.

The fashion or form of buckles is various; but their use, in general, is to make fast certain parts of dress, as the shoes, garters, &c.

BUCKLE, in *Heraldry*. The buckle was so much esteemed in former times, that few persons of repute and honour wore their girdles without it; and it may be considered, in coats of arms, as a token of the surety, the faith, and service of the bearer.

BUCKLER, a piece of defensive armour used by the ancients. It was worn on the left arm, and composed of wickers woven together, or wood of the lightest sort, covered with hides and fortified with plates of brass or other metal. The figure was sometimes round, sometimes oval, and sometimes almost square. Most of the bucklers were curiously adorned with all sorts of figures of birds and beasts, as eagles, lions; nor of these only, but of the gods, of the celestial bodies, and all the works of nature; which custom was derived from the heroic times, and from them communicated to the Grecians, Romans, and Barbarians.

The scutum, or Roman buckler, was of wood, the parts being joined together with little plates of iron, and

Buckingham
Buckler.

Buckler
||
Bucolic.

and the whole covered with a bull's hide. An iron plate went about it without, to keep off blows; and another within, to hinder it from taking any damage by lying on the ground. In the middle was an iron boss or *umbo* jutting out, very serviceable to glance off stones and darts; and sometimes to press violently upon the enemy, and drive all before them. They are to be distinguished from the *clypei*, which were less, and quite round, belonging more properly to other nations, though for some little time used by the Romans. The *scuta* themselves were of two kinds; the *ovata*, and the *imbricata*: the former is a plain oval figure; the other oblong, and bending inward like half a cylinder. Polybius makes the *scuta* four feet long, and Plutarch calls them *κεδνεις*, reaching down to the feet. And it is very probable that they covered almost the whole body, since in Livy we meet with soldiers, who stood on the guard, sometimes sleeping with their head on their shield, having fixed the other part of it in the earth.

Votive BUCKLERS: Those consecrated to the gods and hung up in their temples, either in commemoration of some hero, or as a thanksgiving for a victory obtained over an enemy; whose bucklers, taken in war, were offered as a trophy.

BUCKOR, a province of Asia, subject to the Great Mogul. It is seated on the river Indus, on the banks of which there are corn and cattle; but the west part, which is bounded by Sagestan in Persia, is a desert. The inhabitants are strong, robust, and apt to mutiny; for which reason the Mogul has a garrison at the chief town called *Buckor*, which is seated in an island made by the river Indus. They are all Mahometans, and drive a great trade in cotton cloth and other Indian commodities. E. Long. 70. 5. N. Lat. 28. 20.

BUCKRAM, in commerce, a sort of coarse linen cloth stiffened with glue, used in the making of garments to keep them in the form intended. It is also used in the bodies of women's gowns; and it often serves to make wrappers to cover cloths, serges, and such other merchandises, in order to preserve them, and keep them from the dust, and their colours from fading. Buckrams are sold wholesale by the dozen of small pieces or remnants, each about four ells long, and broad according to the piece from which they are cut. Sometimes they use new pieces of linen cloth to make buckrams, but most commonly old sheets and old pieces of sails.

BUCKSTALL, a toil to take deer, which must not be kept by any body that has not a park of his own, under penalties.

BUCOLIC, in ancient poetry, a kind of poem relating to shepherds and country affairs, which, according to the most generally received opinion, took its rise in Sicily. *Bucolics*, says Vossius, have some conformity with comedy. Like it, they are pictures and imitations of ordinary life; with this difference, however, that comedy represents the manners of the inhabitants of cities, and *bucolics* the occupations of country people. Sometimes, continues he, this last poem is in form of a monologue, and sometimes of a dialogue. Sometimes there is action in it, and sometimes only narration; and sometimes it is composed both of action and narration. The hexameter verse is the most pro-

per for *bucolics* in the Greek and Latin tongues. Moschus, Bion, Theocritus, and Virgil, are the most renowned of the ancient *bucolic* poets.

BUD, in *Botany*. See the article **GEMMA**.

BUDA, the capital city of Hungary, called *Oscra* by the inhabitants, and *Buden* by the Turks. It is large, well fortified, and has a castle that is almost impregnable. The houses are tolerably handsome, being most of them built with square stone. It was a much finer place before the Turks had it in their possession; but they being masters of it 135 years, have suffered the finest buildings to fall to decay. The lower city, or Jews town, extends like suburbs from the upper city to the Danube. The upper town takes up all the declivity of a mountain; and is fortified with good walls, which have towers at certain distances. The castle, which is at the extremity of the hill, on the east side, and commands the greatest part of it, is surrounded with a very deep ditch, and defended by an old fashioned tower, with the addition of new fortifications. There is also a suburb, enclosed with hedges, after the Hungarian manner. The most sumptuous structures now are the caravanseras, the mosques, bridges, and baths. These last are the finest in Europe, for the magnificence of the building, and plenty of water. Some of the springs are used for bathing and drinking; and others are so hot, that they cannot be used without a mixture of cold water. The Danube is about three quarters of a mile in breadth; and there is a bridge of boats between this city and Pest, consisting of 63 large pontoons. The Jews have a synagogue near the castle-gardens. The adjacent country is fruitful and pleasant, producing rich wines; though in some places they have a sulphureous flavour. The population is about 30,000.

This city was the residence of the Hungarian monarchs, till the Turks took it in 1526. Ferdinand archduke of Austria recovered it the next year; but in 1529, the Turks became masters of it again. In 1684 the Christians laid siege to it; but they were obliged to raise it soon after, though they had an army of 80,000 men. Two years after, the Turks lost it again, it being taken by assault in the sight of a very numerous army. The booty that the Christians found there was almost incredible, because the rich inhabitants had lodged their treasures in this city as a place of safety. However, part of these riches was lost in the fire occasioned by the assault. This last siege cost the Christians a great deal of blood, because there were many in the camp who carried on a secret correspondence with the Turks. When the seraskier saw the city on fire, and found he could not relieve it, he beat his head against the ground for anger. In 1687 this city had like to have fallen into the hands of the Turks again by treachery. After this, the Christians augmented the fortifications of this place, to which the pope contributed 100,000 crowns, for this was looked upon as the key of Christendom. It is seated on the Danube, 105 miles south-east of Vienna, 163 north by west of Belgrade, and 563 north-west of Constantinople. E. Long. 19. 22. N. Lat. 47. 20.

BUDA, the *Beglerbeglic* of, was one of the chief governments of the Turks in Europe. It included all the countries of Upper Hungary between the rivers Teisse and Danube, and between Agria and Novigrad;

Bucolic
||
Buda.

Buda
Buddesdale

all Lower Hungary from Gran and Canisca, the eastern part of Slavonia, and almost all Servia: but a good part of this government now belongs to the emperor.

BUDÆUS, WILLIAM, the most learned man in France in the 15th century, was descended of an ancient and illustrious family, and born at Paris in 1467. He was placed young under masters; but barbarism prevailed so much in the schools of Paris, that Budæus took a dislike to them, and spent his whole time in idleness, till his parents sent him to the university of Orleans to study law. Here he passed three years without adding to his knowledge; for his parents sending for him back to Paris, found his ignorance no less than before, and his reluctance to study, and love to gaming and other useless pleasures, much greater. They talked no more to him of learning of any kind; and as he was heir to a large fortune, left him to follow his own inclinations. He was passionately fond of hunting, and took great pleasure in horses, dogs, and hawks. The fire of youth beginning to cool, and his usual pleasures to pall upon his senses, he was seized with an irresistible passion for study. He immediately disposed of all his hunting equipage, and even abstracted himself from all business to apply himself wholly to study; in which he made, without any assistance, a very rapid and amazing progress, particularly in the Latin and Greek languages. The work which gained him greatest reputation was his treatise *de Asse*. His erudition and high birth were not his only advantages; he had an uncommon share of piety, modesty, gentleness, and good-breeding. The French king, Francis I. often sent for him; and at his persuasion, and that of Du Bellay, founded the royal college of France, for teaching the languages and sciences. The king sent him to Rome with the character of his ambassador to Leo X. and in 1522 made him master of requests. The same year he was chosen provost of the merchants. He died at Paris in 1540. His works, making four volumes in folio, were printed at Basil in 1557.

BUDDÆUS, JOHN FRANCIS, a celebrated Lutheran divine, and one of the most learned men Germany has produced, was born in 1667, at Anclam, a town of Pomerania, where his father was minister. He was at first Greek and Latin professor at Colburg; afterwards professor of morality and politics in the university of Hall; and at length, in 1705, professor of divinity at Jena, where he fixed, and where he died, after having acquired a very great reputation. His principal works are, 1. *A large historical German dictionary*. 2. *Historia ecclesiastica Veteris Testamenti*, 2 vols 4to. 3. *Elementa philosophiæ practicæ, instrumentalis, et theoreticæ*, 3 vols 8vo, which has had a great number of editions, because in most of the universities of Germany the professors take this work for the text of their lessons. 4. *Selecta juris naturæ et gentium*. 5. *Miscellanea sacra*, 3 vols 4to. 6. *Isagoge historico-theologica ad theologiam universam, singulasque ejus partes*, 2 vols 4to; which is much valued by the Lutherans. 7. A treatise on atheism and superstition.

BUDDESDALE, or BETTISDALE, a town of Suffolk in England, seated in a dale or valley, and its street takes in a good part of Ricking, all which to—
VOL. IV. Part II. †

gether make up the town; for of itself it is but a hamlet, having a small chapel, and an endowed grammar-school, to which belong certain scholarships, assigned to Bennet or Corpus Christi college in Cambridge, being the gift of Sir Nicholas Bacon, lord keeper of the great seal. E. Long. 1. 8. N. Lat. 52. 25.

BUDDING, in *Gardening*. See *ENGRAFTING*.

BUDDLE, in *Metallurgy*, a large square frame of boards, used in washing metallic ores.

BUDDLEIA. See *BOTANY Index*.

BUDELICH, a town of Germany, in the duchy of the Rhine, belonging to Prussia. It is seated on the little river Traen, in E. Long. 6. 55. N. Lat. 49. 52.

BUDGE-BARRELS, among engineers, small barrels well hooped, with only one head; on the other end is nailed a piece of leather, to draw together upon strings like a purse. Their use is for carrying powder along with a gun or mortar; being less dangerous, and easier carried, than whole barrels. They are likewise used upon a battery of mortars for holding meal powder.

BUDGELL, EUSTACE, Esq. an ingenious and polite writer, was the son of Gilbert Budgell, doctor of divinity; and was born at St Thomas, near Exeter, about the year 1685. He was educated at Christchurch college, Oxford; from which he removed to the Inner Temple, London: but instead of studying the law, for which his father intended him, he applied to polite literature; kept company with the genteel persons in town; and particularly contracted a strict intimacy with the ingenious Mr Addison, who was first cousin to his mother, and who, on his being made secretary to Lord Wharton, lord lieutenant of Ireland, took him with him as one of the clerks of his office. Mr Budgell, who was about 20 years of age, and had read the classics, and the works of the best English, French, and Italian authors, now became concerned with Sir Richard Steele and Mr Addison in writing the *Tatler*, as he had, soon after, a share in writing the *Spectators*, where all the papers written by him are marked with an X; and when that work was completed, he had likewise a hand in the *Guardian*, where his performances are marked with an asterisk. He was afterwards made under secretary to Mr Addison, chief secretary to the lords justices of Ireland, and deputy clerk of the council. Soon after, he was chosen a member of the Irish parliament; and in 1717, Mr Addison, having become principal secretary of state in England, procured him the place of accountant and comptroller general of the revenue in Ireland. But the next year, the duke of Bolton being appointed lord-lieutenant, Mr Budgell wrote a lampoon against Mr Webster, his secretary, in which his grace himself was not spared; and upon all occasions treated that gentleman with the utmost contempt. This imprudent step was the primary cause of his ruin: for the duke of Bolton, in support of his secretary, got him removed from the post of accountant-general; upon which, returning to England, he, contrary to the advice of Mr Addison, published his case in a pamphlet, entitled, "A letter to the lord * * * from Eustace Budgell, Esq. accountant-general," &c. Mr Addison had now resigned the seals, and was retired into the country for the sake of his health: Mr
5 F Budgell

Buddesdale
Budgell.

Budgell
Budoa.

Budgell had also lost several other powerful friends, who had been taken off by death; particularly the lord Halifax and the earl of Sunderland: he, however, made several attempts to succeed at court, but was constantly kept down by the duke of Bolton. In the year 1720 he lost 20,000*l.* by the South-sea scheme, and afterwards spent 5000*l.* more in unsuccessful attempts to get into parliament. This completed his ruin. He at length employed himself in writing pamphlets against the ministry, and wrote many papers in the Craftsman. In 1733, he began a weekly pamphlet, called *The Bee*; which he continued for above 100 numbers, printed in eight volumes 8vo. During the progress of this work, Dr Tindal's death happened, by whose will Mr Budgell had 2000*l.* left him; and the world being surprised at such a gift from a man entirely unrelated to him, to the exclusion of the next heir, a nephew, and the continuator of Rapin's history of England, immediately imputed it to him, making the will himself. Thus the satirist:

Let Budgell charge low Grub-street on my quill,
And write whate'er he please except my will.

It was thought he had some hand in publishing Dr Tindal's Christianity as old as the Creation; for he often talked of another additional volume on the same subject, but never published it. After the cessation of the Bee, Mr Budgell became so involved in law-suits, that he was reduced to a very unhappy situation. He got himself called to the bar, and attended for some time in the courts of law; but finding himself unable to make any progress, and being distressed to the utmost, he determined at length to make away with himself. Accordingly, in the year 1736, he took a boat at Somerset-stairs, after filling his pockets with stones; ordered the waterman to shoot the bridge; and, while the boat was going under, threw himself into the river. He had several days before been visibly distracted in his mind. Upon his bureau was found a slip of paper, on which were these words:

What Cato did, and Addison approv'd,
Cannot be wrong.

Besides the above works, he wrote a Translation of Theophrastus's Characters. He was never married; but left one natural daughter, who afterwards assumed his name, and became an actress in Drury-lane.

BUDINUS, in *Ancient Geography*, a mountain of Sarmatia Europæa, from which the more northern spring of the Borysthenes is said to take its rise, according to Ptolemy. But this is contradicted by later accounts. Now *Podolia*.

BUDNÆANS, in ecclesiastical history, so called from the name of their leader, Simon Budnæus. They not only denied all kind of religious worship to Jesus Christ, but asserted, that he was not begotten by any extraordinary act of divine power; being born, like other men, in a natural way. Budnæus was deposed from his ministerial functions in the year 1584, and publicly excommunicated, with all his disciples; but afterwards abandoning his peculiar sentiments, he was readmitted to the communion of the Socinian sect. Crellius ascribes the origin of the above opinion to Adam Neuser.

BUDO, a maritime town of Dalmatia, with a bishop's see, subject to Austria. It is seated between the gulf of Cattaro and the city of Duligno, on the coast of Albania; and is an important fortress, where the Venetians formerly kept a strong garrison. In 1667, it suffered greatly by an earthquake: and in 1686 was besieged by Soliman, basha of Scutari; but General Cornaro obliged him to raise the siege. E. Long. 19. 22. N. Lat. 42. 12.

BUDRIO, a town of Italy, in the Bolognese. The adjacent fields produce large quantities of fine hemp, which renders the town of more consequence than larger places. E. Long. 11. 35. N. Lat. 44. 27.

BUDUN, is the name of one of the Ceylonese gods: he is supposed to have arrived at supremacy, after successive transmigrations, from the lowest state of an insect, through the various species of living animals. There have been three deities of this name, each of which is supposed to reign as long as a bird removes a hill of sand, half a mile high, and six miles round, by a single grain in a thousand years. See **SAKRADAWENDRA**.

BUDWEIS, a royal city of Bohemia in Germany. It is pretty large and well built, surrounded with strong walls, fortified with a good rampart, and might be made an important place. It was taken by the king of Prussia in 1744, but he did not keep it very long. E. Long. 14. 19. N. Lat. 42. 15.

BUDZIAC TARTARY, lies on the rivers Neister, Bog, and Nieper; having Poland and Russia on the north, Little Tartary on the east, the Black sea on the south, and Bessarabia on the west. The chief town is Oczakow. It is subject to Turkey.

BUENA VISTA, one of the Cape de Verd islands, lying in N. Lat. 15. 56. It is also called *Bonvista* and *Bonnevue*; but the first is the true appellation, the others being only abbreviations and corruptions of the original name, which signifies a *good prospect*, intimating the beautiful appearance it makes to ships at sea. This island is reckoned near 20 leagues in circumference, and is distinguished on the north side by a ridge of white rocks that bound it. The coast that stretches east and north-west is terminated with sundry banks to the sea; but the interior part is chiefly mountainous. From the northern point there is a large ridge of rocks projecting near a whole league into the sea, against which the waves break with incredible fury. Another point of rocks stretches into the sea on the southern point of the island eastward, a league and a half beyond that point; and in that bay is the best road for shipping.

BUENOS AYRES, a country of South America, belonging to the Spaniards. This name, given from the pleasantness of the climate, is extended to all that country lying between Tucuman on the east, Paraguay on the north, and Terra Magellanica on the south, or to the vertex of that triangular point of land which composes South America. The country is watered by the great river La Plata; first discovered in 1515 by Juan Diaz de Solis, who with two of his attendants was massacred by the natives; and partly subdued by Sebastian Gaboto, who gave the great river the appellation of *La Plata*, from the abundance of the precious metals he procured from the inhabitants, imagining them to be the produce of the country, though in fact they

Budo

Ayres
Buffet.

they were brought from Peru.—No country in the world abounds more in horned cattle and horses than Buenos Ayres, where the greatest expence of a horse or cow is in the catching it, and they are frequently to be had at the small price of two or three rials. In such abundance are these useful animals, that the hide alone is deemed of any value, as this constitutes a main article in the trade of the country. All rove wild in the fields; but they are now become more difficult of access, the terrible havock made among them having taught the cautious brutes to keep at a greater distance. All kinds of fish are in the same abundance; the fruits produced by every quarter of the globe grow up here in the utmost perfection; and for the salubrity of the air, a finer country cannot be imagined. The principal cities are Buenos Ayres the capital, Monte Video, Corienteo, and Santa Fe. See BUENOS AYRES, SUPPLEMENT.

BUENOS AYRES, *Neustra Sennora de*, the capital of the country called *Buenos Ayres*, in South America, was founded in the year 1535, under the direction of Don Pedro de Mendoza, at that time governor. It stands on a point called *Cape Blanco*, on the south side of the Plata, fronting a small river, in S. Lat. 34° 34' 38", according to the observations of Father Feville. The situation is in a fine plain, rising by a gentle ascent from the river; and truly paradisaical, whether we regard the temperature of the climate, the fertility of the soil, or that beautiful verdure which overspreads the whole face of the country, of which the inhabitants have a prospect as far as the eye can reach. The city is very considerable in extent, containing according to some 40,000, according to others 60,000 inhabitants. The streets are straight, broad, and pretty equal in the heights and dimensions of the buildings; one very handsome square adorns it, the front being a castle in which the governor holds his court, and presides over a garrison of 3000 soldiers. The city was taken by the British in 1806, but retaken by the inhabitants a few weeks after.

BUFALMACO, **BORAMICO**, an Italian painter; the first who put labels to the mouths of his figures, with sentences; since followed by bad masters, but more frequently in caricature engravings. He died in 1340.

BUFF, in commerce, a sort of leather prepared from the skin of the buffalo; which dressed with oil, after the manner of shummy, makes what we call *buff-skin*. This makes a very considerable article in the French, English, and Dutch commerce at Constantinople, Smyrna, and all along the coast of Africa. The skins of elks, oxen, and other like animals, when prepared after the same manner as that of the buffalo, are likewise called *buffs*.

Of buff-skin, or buff-leather, are made a sort of coats for the horse or *gens d'armes* of France, bandaliers, belts, pouches, and gloves.

In France, there are several manufactories designed for the dressing of those sorts of hides, particularly at Corbeil, near Paris; at Niort, at Lyons, at Rome, at Etanepus, at Cone.

BUFFALO, in *Zoology*. See **Bos**.

BUFFET was anciently a little apartment, separated from the rest of the room by slender wooden columns, for the disposing of china, glass-ware, &c.

Buffet
||
Buffon.

It is now properly a large table in a dining-room, called also a *side-board*, for the plate, glasses, bottles, basons, &c. to be placed on, as well for the service of the table as for magnificence. In houses of persons of distinction in France, the buffet is a detached room, decorated with pictures relative to the subject, with fountains, cisterns, and vases. It is commonly faced with marble or bronze.

BUFFIER, **CLAUDE**, a French writer, born in 1661, became a Jesuit in 1679, and died at Paris in 1737. There are many works of this author, which show deep penetration and accurate judgment; the principal of which is, *Un Cours des Sciences*, &c. that is, "a Course of Sciences upon principles new and simple, in order to form the language, the understanding, and the heart, 1732," in folio. This collection includes an excellent "French grammar upon a new plan; a philosophic and practical treatise upon eloquence; an art of poetry," which, however, is not reckoned the best part of this miscellany; "elements of metaphysics; an examination into vulgar prejudices; a treatise of civil society; and an exposition of the proofs of religion:" all full of reflections, just as well as new. He was the author of other works, in verse and prose, of which no great account is had; and it is remarkable, that his style in both is rather easy than accurate and correct, notwithstanding the precepts in his "Grammar," which is really philosophic.

BUFFON, **GEORGE LOUIS LE CLERC**, COUNT OF, a celebrated naturalist, was born at Montbard, in Burgundy, the 9th of September 1707: his father was a counsellor of the parliament of Dijon, and the son was destined to the same office, if science had not drawn him away from the law. He studied at Dijon; and his eager activity, his acuteness, penetration, and robust constitution, fitted him to pursue business and pleasure with equal ardour. His early passion was for astronomy, and the young Le Clerc was never without Euclid in his pocket. At the age of twenty, he went with an English nobleman and his governeur to Italy; but he overlooked the choicest remains of art, and, amidst the ruins of an elegant and luxurious people, he first felt the charms of natural history, whose zealous and successful admirer he afterwards proved. On his return to France, he fought, on some occasional quarrel, with an Englishman, whom he wounded, and was obliged to retire to Paris. He there translated Newton's Fluxions from the Latin, and Hales's Statics from the English, into the French language. He afterwards came to England, at the age of 25; and this journey concluded his travels: he staid there about three months. At the age of 21, he succeeded to the estate of his mother, which was valued at about 300,000 livres (above 12,000l. sterling); and he was one of those whose easy or affluent circumstances urge on to literary pursuits, and clear the path of some of its thorns. Perhaps this was the period of his retirement to Montbard, where he spent much time, and where his leisure was little interrupted: while in the capital, his office of intendant of the king's garden and cabinet engaged much of his time. He loved much company, and was partial to the fair; but he loved glory more. He spent 14 hours every day in study; and, when we examine the extent of his knowledge, and the number of his works, we wonder at his having executed so

Buffon,
Buffoon.

much even in this time. At five in the morning he retired to a pavilion in his vast gardens, and he was then inaccessible. This was, as Prince Henry of Prussia called it, *the cradle of natural history*; but she was indifferently accommodated. The walls were naked: an old writing-table, with pen, ink, and paper, and an elbow chair of black leather, were the only furniture of his study. His manuscripts were in a cabinet in another building, and he went occasionally from one to the other. The eras of Buffon's works are pretty well known. When each was finished it was put aside, in order that he might forget it, and he then returned to it with the severity of a critic. He was anxious to have it perspicuous; and if those to whom he read his works hesitated a moment, he changed the passage. The works of others he at last read like Magliabechi, the titles, the contents, and the most interesting parts; but he read M. Neckar's *Compte Rendu*, and the Administration of the Finances, at length; and he spoke of them also with no little enthusiasm. His favourite authors were Fenelon, Montesquieu, and Richardson.

M. de Buffon's conversation was unadorned, rarely animated, but sometimes very cheerful. He was exact in his dress, particularly in dressing his hair. He sat long at table, and then seemed at his ease. His conversation was, at this time, unembarrassed, and his guests had frequently occasion to notice some happy turn of phrase, or some deep reflection. His complaisance was very considerable: he loved praise, and even praised himself; but it was with so much frankness, and with so little contempt of others, that it was never disagreeable. Indeed, when we consider the extent of his reputation, the credit of his works, and the attention with which they were always received, we do not wonder that he was sensible of his own value. It would perhaps have displayed a stronger mind to have concealed it. His father lived to 93, and almost adored his son; his grandfather to 87; and the subject of the present article exceeded only 80. He died in April 1788. Fifty-six stones were found in his bladder; but if he had consented to the operation, he might probably have lived longer. He left one son; who near a high tower in the gardens of Montbard has placed a low column, with the following inscription:

Excelsæ Turri
Humilis Columna,
Parenti suo
Fil. Buffon.

This son fell a victim to the tyranny of Robespierre during the late revolution in France.

BUFFOON, a droll, or mimic, who diverts the public by his pleasantries and follies. Menage after Salmasius, derives the word from *buffo*; a name given to those who appeared on the Roman theatre with their cheeks blown up; that, receiving blows thereon, they might make the greater noise, and set the people a laughing. Others, as Rhodiginus, make the origin of buffoonery more venerable; deriving it from a feast instituted in Attica by King Erectheus, called *buphonia*.

Buffoons are the same with what we otherwise find denominated *scurra*, *gelasiani*, *mimilogi*, *ministelli*, *go-*

liardi, *joculatores*, &c. whose chief scene is laid at the tables of great men. Gallienus never sat down to meat without a second table of buffoons by him; Tillemont also renders *pantomimes* by buffoons. In which sense he observes, the shows of the buffoons were taken away by Domitian, restored by Nerva, and finally abolished by Trajan.

BUFONIA, TOAD-GRASS. See **BOTANY** *Index*.

BUFONITA, in *Natural History*, the toad-stone. This has been received not only among the list of native stones by the generality of authors, but even has held a place among the gems, and is still worn in rings by some people; though undoubtedly it is an extraneous fossil. There has been a strong opinion in the world, that it was found in the head of an old toad; and that this animal voided it at the mouth, on being put on a red cloth. The general colour of the bufonitæ is a deep dusky brown; but it varies greatly in this respect in several specimens, some of which are quite black, others of an extremely pale simple brown, a chesnut colour, liver colour, black-gray, or whitish. The bufonitæ are usually found immersed in beds of stone; and so little doubt is there of what they have originally been, viz. the petrified teeth of the *Lupus piscis*, or wolf-fish, that part of the jaw of the fish has sometimes been found with the teeth petrified in it. The bufonitæ are said to be cordial and astringent; many other fanciful virtues are ascribed to them, which the present practice has rejected.

BUG, or **BUGG**. See **CIMEX**, **ENTOMOLOGY** *Index*.

Cheap, easy, and clean mixture for effectually destroying BUGS. Take of the highest rectified spirit of wine, (viz. lamp-spirits) that will burn all away dry, and leave not the least moisture behind it, half a pint; new distilled oil, or spirit, of turpentine, half a pint: mix them together; and break into it, in small bits, half an ounce of camphire, which will dissolve it in a few minutes; shake them well together; and with a piece of sponge, or a brush dipt in some of it, wet very well the bed or furniture wherein these vermin harbour and breed, and it will infallibly kill and destroy both them and their nits, although they swarm never so much. But then the bed and furniture must be well and thoroughly wet with it (the dust upon them being first brushed and shaken off), by which means it will neither soil, stain, nor in the least hurt, the finest silk or damask bed that is. The quantity here ordered of this mixture (that costs but about a shilling) will rid any one bed whatever, though it swarms with bugs. If any bugs should happen to appear after once using it, it will only be for want of well wetting the lacing, &c. of the bed, or the folding of the linens or curtains near the rings, or the joints or holes in and about the bed or head-board, wherein the bugs and nits nestle and breed; and then their being wetted all again with more of the same mixture, which dries in as fast as you use it, pouring some of it into the joints and holes where the brush or sponge cannot reach, will never fail absolutely to destroy them all. Some beds that have much wood-work can hardly be thoroughly cleared without being first taken down; but others that can be drawn out, or that you can get well behind, to be done as it should be, may. The smell this mixture occasions will be all gone in two or three days; which

Buffon
|
Bug

yet

Bug
B
Bugger.

yet is very wholesome, and to many people agreeable. Remember always to shake the mixture together very well whenever you use it, which must be in the daytime, not by candle-light, lest the subtlety of the mixture should catch the flame as you are using it, and occasion damage.

Early in the spring, even in February, the larva of this insect begins to burst from the egg; and it is at this season that attention is so very requisite. The bed ought to be stripped of all its furniture, which should be washed, and even boiled, if linen; if stuff, it should be hot-pressed. The bedstead should be taken to pieces, dusted, and washed with spirit of wine in the joints; for in those parts the females lay their eggs. This done, the joints, crevices, cavities, &c. should be well filled with the best soft soap mixed with verdigris and Scots snuff. On this substance, the larva, if any escape the cleansing, or any, which is common in old houses, creep into the bedstead, will feed at first, and of course be destroyed: this last will effect the purpose in houses where these vermin are not so numerous, by repeating the operation every three months.—

† Travels in America.

Professor Kalm † mentions, that, from repeated trials, he has been convinced, that sulphur, if it be properly employed, entirely destroys bugs, and their eggs in beds or walls, though they were ten times more numerous than the ants on an ant-hill. His translator, Dr Forster, adds, that a still more effectual remedy is, to wash all the infected furniture with a solution of arsenic. See further the article CIMICIFUGA.

BUGEY, a province of France, bounded on the east by Savoy, on the west by Bresse, on the south by Dauphiny, and on the north by the territory of Gex and the Franche Compté. It is about 40 miles long and 25 broad. Though it is a country full of hills and rivers, yet it is fertile in some places, the rivers abound in trouts, and there is plenty of all sorts of game. The chief places are Belley the capital, Seisel, St Rambert, Fort L'Ecluse, and Chateau Neuf.

BUGGERS, (*Bulgarii*) anciently signified a kind of heretics, otherwise called *Paterini*, *Cathari*, and *Albigenses*.

The word is formed of the French *Bougres*, and that from *Bougria* or *Bulgaria*, the country where they chiefly appeared. Among other errors they held that men ought to believe no scripture but the New Testament; that baptism was not necessary to infants; that husbands who conversed with their wives could not be saved; and that an oath was absolutely unlawful. They were strenuously refuted by Fr. Robert, a Dominican, surnamed the *Bugger*, as having formerly made profession of this heresy.

The Buggers are mentioned by Matthew Paris, in the reign of Henry III. under the name of *Bugares*. *Circa dies autem illos invaluit heretica pravitas eorum qui vulgariter dicuntur Paterini et Bugares, de quorum erroribus malo tacere quam loqui.*

BUGGER, or BUGGERER, came afterwards to be used for a sodomite; it being one of the imputations laid, right or wrong, on the Bulgarian heretics, that they taught, or at least practised, this abominable crime.

BUGGER (*Bulgarius*), is also a denomination given to usurers; usury being a vice to which the same heretics are said to have been much addicted.

Buggery
B
Bugloss.

BUGGERY, or SODOMY, is defined by Sir Edward Coke to be a carnal copulation against nature, either by a confusion of species, that is to say, either a man or woman with a brute beast; or sexes, as a man with a man, or a man unnaturally with a woman. It is said this sin against God and nature was first brought into England by the Lombards. As to its punishment, the voice of nature and of reason, and the express law of God †, determines it to be capital. Of † Levit. xx. this we have a signal instance, long before the Jewish dispensation, by the destruction of two cities by fire from heaven; so that this is an universal, not merely a provincial, precept. Our ancient law, in some measure, imitated this punishment, by commanding such miscreants to be burnt to death; though Fleta says, they should be buried alive; either of which punishments was indifferently used for this crime among the ancient Goths. But now the general punishment of all felonies is the same, namely, by hanging: and this offence (being in the times of Popery only subject to ecclesiastical censures) was made felony without benefit of clergy by statute 25 Hen. VIII. c. 6. revived and confirmed by 5 Eliz. c. 17. And the rule of law herein is, that, if both parties are arrived at the years of discretion, *agentes et consentientes pari poena plectantur*, "both are liable to the same punishment."

BUGIA, a province of the kingdom of Algiers in Africa. It is almost surrounded with mountains; and is divided into three parts, Benijubar, Auraz, and Labez. These mountains are peopled with the most ancient Arabs, Moors, or Saracens. The province is very fertile in corn.

BUGIA, by the Africans called *Bugeiah*, a maritime town of Africa, in the kingdom of Algiers, and once the capital of the province of that name. It is supposed to be the *Salda* of Strabo, built by the Romans. It hath a handsome port formed by a narrow neck of land running into the sea: a great part of whose promontory was formerly faced with a wall of hewn stone; where was likewise an aqueduct, which supplied the port with water, discharging it into a capacious basin; all which now lie in ruins. The city itself is built on the ruins of a large one, at the foot of a high mountain that looks towards the north-east; a great part of whose walls run up quite to the top of it; where there is also a castle that commands the whole town, besides two others at the bottom, built for a security to the port. The inhabitants drive a considerable trade in ploughshares, mattocks, and other iron tools, which they manufacture from the neighbouring mines. The town is watered by a large river, supposed to be the *Nasava* of Ptolemy. The place is populous; and hath a considerable market for iron work, oil, and wax, which is carried on with great tranquillity; but is no sooner over than the whole place is in an uproar, so that the day seldom concludes without some flagrant instance of barbarity. F. Long. 4. N. Lat. 35. 30.

BUGIF, a town of Egypt, situated on the western shore of the Red sea almost opposite to Ziden, the port town to Mecca, and about 100 miles west of it. E. Long. 36. N. Lat. 22. 15.

BUGLE. See AJUGA, BOTANY *Index*.

BUGLOSS. See ANCHUSA, BOTANY *Index*.

Vipers BUGLOSS. See ECHINUM, BOTANY *Index*.

BUILDING,

Building
Bukharia.

BUILDING, a fabric erected by art, either for devotion, magnificence, or convenience.

BUILDING is also used for the art of constructing and raising an edifice; in which sense it comprehends as well the expences as the invention and execution of the design. See **ARCHITECTURE**.

The modern buildings are much more commodious, as well as beautiful, than those of former times. Of old they used to dwell in houses, most of them with a blind staircase, low ceilings, and dark windows; the rooms built at random, without any thing of contrivance, and often with steps from one to another; so that one would think the people of former ages were afraid of light and fresh air: whereas the genius of our times is altogether for light staircases, fine sash-windows, and lofty ceilings. And such has been our builders industry in point of compactness and uniformity, that a house after the new way will afford, on the same quantity of ground, almost double the conveniences which could be had from an old one.

By act 11 Geo. I. and 4 Geo. III. for the regulation of building within the weekly bills of mortality, and in other places therein specified, party walls are required to be erected of brick or stone, which shall be two bricks and a half thick in the cellar, two bricks thick upwards to the garret floor, &c. and other limitations are enacted respecting the disposition of the timbers, &c. And every building is to be surveyed; and the person who offends against the statute in any of the particulars recited, is liable to a forfeit of 250l. to be levied by warrant of justices of the peace. The other principal statutes relating to building are 19 Car. II. c. 3. 22 Car. II. c. 11. 5 Eliz. c. 4. 35 Eliz. c. 6. 6 Ann. c. 31. 7 Ann. c. 17. 33 Geo. II. c. 30. and 6 Geo. III. c. 37.

BUILDING of Ships. See *SHIP-BUILDING*.

BUILTH, or **BEALT**, a town of South Wales in Brecknockshire, pleasantly seated on the river Wye, over which there is a wooden bridge that leads into Radnorshire. W. Long. 3. 10. N. Lat. 52. 8.

BUIS, a territory of France, in Dauphiny. It is a small mountainous country, but pretty fertile; and Bois and Nions are the principal places.

BUKARI, a small well-built town of Hungarian Dalmatia, situated on the Golfo di Bikeriza, in E. Long. 20. 53. N. Lat. 45. 20.

BUKHARIA, a general name for all that vast tract of land lying between Karazm and the *great Kobi*, or sandy desert bordering on China. It derives its name of *Bukharia* from the Mogul word *Bukhar*, which signifies a learned man; it being formerly the custom for those who wanted instruction in the languages and sciences to go into Bukharia. Hence this name appears to have been given to it by the Moguls who under Jenghiz Khan conquered the country. It is nearly the same with that called by the Arabs *Mawaralnahr*, which is little other than a translation of the word *Transoxana*, the name formerly given to those provinces.

This region is divided into Great and Little Bukharia.

Great Bukharia (which seems to comprehend the *Sogdiana* and *Bactriana* of the ancient Greeks and Romans, with their dependencies) is situated between the 34th and 46th degrees of north latitude, and between

the 76th and 92d degrees of east longitude. It is bounded on the north by the river *Sir*, which separates it from the dominions of the *Eluths* or *Kalmucs*; the kingdom of *Kashgar* in Little Bukharia, on the east; by the dominions of the great Mogul and Persia on the south; and by the country of *Karazm* on the west: being about 770 miles long from west to east, and 730 miles broad from south to north. It is an exceeding rich and fertile country; the mountains abound with the richest mines; the valleys are of an astonishing fertility in all sorts of fruit and pulse; the fields are covered with grass the height of a man; the rivers abound with excellent fish; and wood, which is scarce over all Grand Tartary, is here in great plenty. But all these benefits are of little use to the Tartar inhabitants, who are naturally so lazy, that they would rather go rob and kill their neighbours than apply themselves to improve the benefits which nature so liberally offers them. This country is divided into three large provinces, viz. Bukharia proper, Samarcand, and Balk; each of which generally has its proper khan. The province of Bukharia proper is the most western of the three; having on the west *Karazm*, on the north a desert called by the Arabs *Gusnah*, on the east the province of Samarcand, and on the south the river *Amu*. It may be about 390 miles long, and 320 broad. The towns are Bokhara, Zam, Wardansi, Karakul, Siunjala, Karshi, Zaruji, Nersem, Karmina, &c.

Little Bukharia is so called, not because it is less in dimensions than the other, for in reality it is larger; but because it is inferior to it as to the number and beauty of its cities, goodness of the soil, &c. It is surrounded by deserts; it has on the west, *Great Bukharia*; on the north, the country of the *Kalmucs*; on the east, that of the *Moguls* subject to China; on the south, *Thibet*, and the north-west corner of *China*. It is situated between the 93d and 118th degrees of east longitude, and between 35° 30' and 45° of north latitude; being in length from east to west about 850 miles, and in breadth from north to south 580: but if its dimensions be taken according to its semicircular course from the south to the north-east, its length will be 1200 miles. It is sufficiently populous and fertile: but the great elevation of its land, joined to the height of the mountains which bound it in several parts, particularly towards the south, renders it much colder than from its situation might naturally be expected. It is very rich in mines of gold and silver; but the inhabitants reap little benefit from them, because neither the *Eluths* nor *Kalmucs*, who are masters of the country, nor the *Bukhars*, care to work in them. Nevertheless, they gather abundance of gold from the beds of the torrents formed by the melting of the snow in the spring; and from hence comes all that gold dust which the *Bukhars* carry into *India*, *China*, and *Siberia*. Much musk is likewise found in this country; and all sorts of precious stones, even diamonds; but the inhabitants have not the art of either cutting or polishing them.

The inhabitants both of Great and Little Bukharia, are generally those people called *Bukhars*. They are commonly sun-burnt and black-haired; although some of them are very fair, handsome, and well made. They do not want politeness, and are addicted to commerce;

Bukharia

Bukharia. merce; which they carry on with China, the Indies, Persia, and Russia: but those who deal with them will be sure of being overreached, if they do not take great care. The habits of the men differ very little from those of the Tartars. Their girdles are like those of the Poles. The garments of the women differ in nothing from those of the men, and are commonly quilted with cotton. They wear bobs in their ears 12 inches long; part and twist their hair in tresses, which they lengthen with black ribbands embroidered with gold or silver, and with great tassels of silk and silver, which hang down to their heels; three other tufts of a smaller size cover their breasts. Both sexes carry about with them prayers written by their priests, which they keep in a small leathern purse by way of relics. The girls, and some of the women, tinge their nails red with the juice of an herb called by them *kena*: they dry and pulverize it; then mixing it with powdered alum, expose it in the air for 24 hours before they use it, and the colour lasts a long time. Both sexes wear close breeches, and boots of Russia leather, very light, and without heels, or leather soles; putting on galloches, or high-headed slippers like the Turks, when they go abroad. They wear also the same sort of bonnets and covering for the head; only the women set off theirs with trinkets, small pieces of money, and Chinese pearls. Wives are distinguished from maids by a long piece of linen worn under their bonnets; which, folding round the neck, they tie in a knot behind, so that one end of it hangs down to the waist.

The Bukhar houses are of stone, and pretty good; but their moveables consist mostly of some China trunks plated with iron. Upon these, in the day-time, they spread the quilts they have made use of at night, and cover them with a cotton carpet of various colours. They have likewise a curtain sprigged with flowers and various figures; also a sort of bedstead half a yard high, and four yards long, which is hidden in the day-time with a carpet. They are very neat about their victuals; which are dressed in the master's chamber by his slaves, whom the Bukhars either take or buy from the Russians, Kalmucs, or other neighbours. For this purpose there are in the chamber, according to the largeness of the family, several iron pots, set in a kind of range near a chimney. Some have little ovens, made, like the rest of the walls, with a stiff clay or bricks. Their utensils consist of some plates and porringers made of cagua wood or of china, and some copper vessels. A piece of coloured calicoe serves them instead of a table-cloth and napkins. They use neither chairs nor tables, knives nor forks; but sit cross-legged on the ground; and the meat being served up, they pull it to pieces with their fingers. Their spoons resemble our wooden ladles. Their usual food is minced meats, of which they make pies of the form of a half moon: these serve for provisions when the Bukhars go long journeys, especially in winter. They carry them in a bag, having first exposed them to the frost; and when boiled in water, they make very good broth. Tea is their common drink, of which they have a black sort prepared with milk, salt, and butter; eating bread with it, when they have any.

As the Bukhars buy their wives, paying for them

more or less according to their handsomeness; so the surest way to be rich is to have many daughters. The persons to be married must not see or speak to each other from the time of their contract to the day of marriage. This is celebrated with three days feasting, as they do great annual festivals. The evening before the wedding, a company of young girls meet at the bride's house and divert themselves till midnight, playing, dancing, and singing. Next morning the guests assemble, and help her to prepare for the ceremony. Then, notice being given to the bridegroom, he arrives soon after, accompanied by ten or twelve of his relations and friends. These are followed by some playing on flutes, and by an *Abus* (a kind of priest), who sings, while he beats two little timbrels. The bridegroom then makes a horse race; which being ended, he distributes the prizes, six, eight, or twelve, in number, according to his ability. They consist of damasks, sables, fox-skins, calico, or the like. The parties do not see each other while the marriage ceremony is performing, but answer at a distance to the questions asked by the priest. As soon as it is over, the bridegroom returns home with his company; and after dinner carries them to the bride's house, and obtains leave to speak to her. This done, he goes back, and returns again in the evening, when he finds her in bed; and in presence of all the women, lays himself down by her in his clothes, but only for a moment. The same farce is acted for three days successively; but the third night he passes with her entirely, and the next day carries her home.

Although the prevailing religion throughout all Little Bukharia is the Mahometan, yet all others enjoy a perfect toleration. The Bukhars say, that God first communicated the Koran to mankind by Moses and the prophets; that afterwards Mahomet explained, and drew a moral from it, which they are obliged to receive and practise. They hold Christ to be a prophet, but have no notion of his sufferings. Yet they believe in the resurrection, but cannot be persuaded that any mortal shall be eternally damned: on the contrary, they believe, that as the daemons led them into sin, so the punishment will fall on them. They believe, moreover, that at the last day every thing but God will be annihilated; and, consequently, that all creatures, the devil, angels, and Christ himself, will die. Likewise, that, after the resurrection, all men, excepting a few of the elect, will be purified or chastised by fire, every one according to his sins, which, will be weighed in the balance. They say there will be eight different paradises for the good; and seven hells, where sinners are to be purified by fire; that those who will suffer most, are liars, cheats, and others of that kind: that the elect who do not feel the fire will be chosen from the good; viz. one out of 100 men, and one out of 1000 women; which little troop will be carried into one of the paradises, where they shall enjoy all manner of felicity, till it shall please God to create a new world. It is a sin, according to them, to say, that God is in heaven. God, say they, is everywhere; and therefore it derogates from his omnipresence to say that he is confined to any particular place. They keep an annual fast of 30 days, from the middle of July to the middle of August, during which time they taste nothing all day; but eat twice in the night, at sunset and midnight;

nor

Bukharia
B
Buliam.

nor do they drink any thing but tea, all strong liquors being forbidden. Whoever transgresses these ordinances is obliged to emancipate his most valuable slave, or to give an entertainment to 60 people: he is likewise to receive 85 strokes on the back with a leather strap called *dura*. The common people, however, do not observe this fast exactly, and workmen are allowed to eat in the day time. The Bukhars say prayers five times a-day; before morning, towards noon, after noon, at sunset, and in the third hour of the night.

Jenghis Khan, who conquered both the Bukharias from the Arabs, left the empire of them to his son Jagatay Khan. He died in the year 1240, and left the government to his son Kara Kulaku, and of Little Bukharia to Amul Khoja Khan. A long succession of khans is enumerated in each of these families, but their history is uninteresting. They are long since extinct, and the Kalmuc Tartars are masters of the country. See BUKHARA, SUPPLEMENT.

BUL, in the ancient Hebrew chronology, the eighth month of the ecclesiastical, and the second of the civil, year: it has since been called *Marshewan*, and answers to our October.

BULAC, a town of Egypt, situated on the eastern shore of the river Nile, about two miles west of Grand Cairo, of which it is the port town, and contains about 4000 families. It is a place of great trade, as all the vessels going up and down the Nile make some stay here. It is also at this place that they cut the banks of the river every year, in order to fill their canals and overflow the neighbouring ground, without which the soil would produce neither grain nor herbage. E. Long. 32. N. Lat. 30.

BULAFU, a musical instrument, consisting of several pipes of wood tied together with thongs of leather, so as to form a small interstice between each pipe. It is used by the negroes of Guinea.

BULAM, or BULAMA, an island on the western coast of Africa, at the mouth of the Rio Grande, in N. Lat. 11° and W. Long. 15°. This island, which is about 18 leagues long, and four broad, forms part of a cluster of islands, which have been known by the name of *Bissagos*, and are supposed to be the Hesperides of the ancients.

This island was purchased in 1792 by a society instituted for similar purposes with those of the Sierra Leone association. The sum of 9000l. was subscribed for the establishment of the colony, and the management of it is intrusted to a committee who sailed from Spithead in April 1792, and having arrived at Bulama, took possession of the new purchase, and left a body of settlers consisting of 49 men, 13 women, and 25 children, under a superintendant, with a supply of stores and provisions necessary for an infant settlement. The following account of the climate, soil, and productions of Bulama, drawn up by Mr Johansen, gives a flattering picture of this island. The climate, says he, on the whole, may be deemed salubrious, and will become more so in proportion to the increase of cultivation. The mornings and evenings are temperate and pleasant; the middle of the day is hot, but the fine sea breeze which then sets in tends greatly to cool and refresh the air. The heat of the sun is not so excessive or intolerable as has been generally supposed; indeed nature has most admirably adapted our mechanical and physi-

cal qualities to the exigencies of different regions; and man, who is the inhabitant of every climate, may, in some measure, render himself indigenuous to every soil. Here the only danger arises from too sudden an exposure to the operation of the vertical rays of the sun, or an excess of labour; both of which the first settlers ought most studiously to avoid.

“ It appears from Mr Beaver’s observations at noon, between the 20th of July 1792, and the 28th of April 1793, that the thermometer, when lowest, was at 74; the medium heat 85; and that it never exceeded 96, except at one time when it rose to 100, during a calm that occurred in the interval between the north-east breeze in the morning and the south-west in the evening of the 19th of February 1793. The difference between the heat of noon and that of the morning and evening is from 20 to 30 degrees. On the 23d of October 1792, hail of the size of a pin’s head fell during two minutes, although not a cloud was to be seen during this phenomenon. The mercury in the thermometer then stood at 85; the wind was at north-east in the morning and south-west in the evening.

“ Immediately after sunset a dew constantly begins to fall, which induces some to light a fire in their houses; they at the same time put on warmer clothing. There is little or no twilight; and night and day are nearly equal: the earth has therefore time to cool during twelve hours absence of the sun.

“ None of these terrible and destructive hurricanes so frequently experienced in the West Indies are to be met with here. The *tornadoes*, which arise chiefly from the eastern point of the compass, are but of short duration, seldom lasting above an hour, and may be readily foreseen some time previously to their commencement. They occur at the beginning and close of the wet season, and are highly beneficial, as they purify the air, and dispel the noxious vapours with which it would otherwise abound.

“ The rains set in about the latter end of May or the beginning of June, and discontinue in October or November. They do not fall every day, for there is often a considerable interval of clear weather, during which the atmosphere is beautifully serene; the showers in the first and last months occur but seldom; and are far from being violent; while, on the other hand, they sometimes resemble torrents, more especially towards the middle of the season. During the whole of this period, Europeans should, if possible, confine themselves to their habitations, as the rains prove injurious to health, more especially, if those exposed to them neglect to wipe their bodies dry, and to change their clothes immediately on their return home. It is deemed prudent also not to dig the earth until the expiration of a month after the return of fair weather, as this is considered to be unhealthy.

“ During the continuance of the dry season, a dew falls during the night, in sufficient quantity to answer all the purposes of vegetation.

“ Every stranger is generally here, as well as in the West Indies, subject to a fever or *seasoning* on his arrival. This is not infectious; it proceeds perhaps from an increased perspiration and a sudden extension of the pores of the human body, in consequence of the heat, by which means it is rendered more liable to inbibite the abundant exhalations that arise from the animal, vegetable,

Bulama. getable, and mineral kingdoms; but even this, alight as it is, might doubtless be avoided by means of a proper regimen, and a short seclusion from the full action of the open air, more especially at noon, and during the evening, till the climate has been rendered familiar.

"Bulama is admirably adapted for all the purposes of an extensive commerce, being not only happily situated at the mouth of the Rio Grande, but in the vicinity of several other navigable rivers; so that a trade with the internal parts of Africa is thereby greatly facilitated. The landing is remarkably easy and safe, there being no surge; the ebb and flow is regular, and there is an increase of 16 feet of water at spring tide. The bay opposite the Great Bulama is adorned with a number of islands, covered with trees, and forms a most excellent harbour, sufficiently capacious to contain the whole navy of Great Britain, which might ride there in safety. The settlement in general is well supplied with water. A number of springs have been lately discovered in different places; and besides a draw-well in the fort which was erected for the defence of the colony, there is a small stream, which runs into E-lewis bay, near the new settlement called *Hesper Elewis*: this is admirably situated for the supply of shipping.

"The island is beautifully surrounded and interspersed with woods: lofty fruit and forest trees, mostly free from underwood and brambles, form a verdant belt, in some places two or three miles broad, which entirely encircles it, in such a manner as to represent a plantation artificially formed around a park. Within this the fields are regularly divided by trees, so as to resemble the hedge-rows in England. The beach has in some places the appearance of gravel walks; it is fringed with mangrove-trees, which forming a line with the high-water mark dip their branches into the sea, and thus afford nourishment to the oysters that often adhere to their extremities.

"The soil is abundantly rich and deep; stones do not here impede the labours of the farmer; and indeed none have hitherto been discovered, but a small sort, resembling pieces of ore, which are to be met with on the shore. There are many *savannahs* or natural meadows, so extensive that the eye can scarcely descry their boundaries. These are admirably adapted for the rearing of stock and feeding of cattle of every kind.

"Cotton, indigo, rice, and coffee, grow spontaneously on this coast; the sugar cane is indigenous to many parts of Africa, and might be cultivated here by the labour of freemen, in equal perfection, and to much greater advantage than in the exhausted islands of the West Indies: All kinds of tropical productions, such as pine-apples, limes, oranges, grapes, plums, cassada, guava, Indian wheat, the papaw, water-melon, musk-melon, the pumkin, tamarind, banana, and numbers of other delicious fruits, also flourish here. The adjoining territories produce many valuable sorts of spices, gums, and materials for dyeing: all of which, it is but fair to suppose, might be readily cultivated in a kindred climate and a congenial soil.

"The neighbouring seas abound with a variety of fish, highly agreeable to the palate. The lion, tyger, jackal, &c. are natives of the continent; but in Bulama no animals have been discovered, the wolf, some

buffaloes, a few elephants, and a species of the deer, excepted.

"The woods abound with doves, guinea fowls, and a variety of birds, celebrated for the beauty of their plumage." The settlement was abandoned a short time after it was formed.

BULARCHUS, a Greek painter; the first who introduced (among the Greeks at least) different colours in the same picture. He flourished in 740 B. C.

BULB, in the anatomy of plants, a kind of large bud, generally produced under the ground, upon or near the root of certain herbaceous plants, hence denominated *bulbous*.

A bulb is defined by Linnæus to be a species of *hybernaculum*, produced upon the descending caudex or root; consisting of stipulæ, petioli, the rudiments of the former leaves, and scales or bark.

To elucidate this definition, it is proper to remark, that every bud contains, in miniature or embryo, a plant, in every respect similar to the parent upon which it is seated. Plants therefore are perpetuated in the buds, as well as in the seeds; and the species may be renewed with equal efficacy in either way.

The tender rudiments of the future vegetable, of which the bud is composed, are inclosed, and during the severities of winter defended from cold and other external injuries, by a hard bark or rind, which generally consists of a number of scales placed over each other like tiles, and fastened together by means of a tenacious, resinous, and frequently odoriferous, substance. Thus defended, the buds remain upon different parts of the mother plant till the ensuing spring; and are, therefore, with great propriety, denominated by Linnæus the *hybernaculum* or winter-quarters of the future vegetable.

With respect to their place, buds are situated either upon the stem and branches, or upon the roots: the former are styled *gemmae*, or buds properly so called; but as they subsist several years by their roots, may be furnished with the other species of *hybernaculum* called bulbs, which, according to the definition, are seated upon the descending *caudex* or root.

Again, trees which are perennial, with a woody and durable stem or trunk, have generally proper buds or *gemmae*, but no bulbs.

In bulbous plants, as the tulip, onion, or lily, what we generally call the *root*, is in fact a bulb or *hybernaculum*, which incloses and secures the embryo or future shoot.

At the lower part of this bulb may be observed a fleshy knob or tubercle, from whence proceed a number of fibres or threads. This knob, with the fibres attached to and hanging from it, is, properly speaking, the true root; the upper part being only the cradle or nursery of the future stem, which after the bulb has repaired a certain number of times, it perishes; but not till it has produced at its sides a number of smaller bulbs or suckers for perpetuating the species.

One part of Linnæus's definition still remains obscure. The bulb, says he, is composed of the remains or rudiments of the former leaves of the plant; *è rudimento foliorum præteritorum*.

It is easy to comprehend that buds contain the rudiments of the future leaves; but how can bulbs be said

Bulb
|
Bulbocastanum.

to contain the rudiments of leaves that, to all appearance, are already perished? To explain this, let it be observed, that, in the opinion of very eminent botanists, the root, in a very great number of perennial herbs, is annually renewed or repaired out of the trunk or stalk itself; in which sense only, roots are properly said to descend.

In the perennials alluded to, the basis of the stalk continually, and by insensible degrees, descends below the surface of the earth, and is thus changed into a true root; which root, by the continuance of the said motion of the stalk, also descends; and thus, according to the durability of its substance, becomes a longer or shorter root; the elder or lower part rotting off in proportion as the upper is generated out of the stalk. Thus, in brownwort, the basis of the stalk, sinking down by degrees till it is hid under the ground, becomes the upper part of the root; and continuing still to sink, the next year becomes the lower part, and the following year rots away.

This is exactly what obtains in bulbous roots, as well as in the far greater number of other herbaceous perennials; as arum, valerian, tansy, samphire, primrose, woodsorrel, iris, and others.

The immediate visible cause of this descent is the string-roots which this kind of trunks frequently puts forth; which descending themselves directly into the ground, serve like so many ropes for pulling the trunk after them. Hence the tuberous roots of iris are sometimes observed to reascend a little upon the rotting or fading away of the string roots which hang at them.

In bulbous roots, where the stalk and former leaves of the plant are sunk below, and formed into what is called the *bulb* or wintering of the future vegetable, the radicles or small fibres that hang from the bulb are to be considered as the root; that is, the part which furnishes nourishment to the plant: the several rinds and shells, whereof chiefly the bulbs consist, successively perish, and shrink up into so many dry skins; betwixt which, and in their centre, are formed other leaves and shells, and thus the bulb is perpetuated.

What has been said of the descent of roots by the sinking of the stalk, is further confirmed by the appearance of certain roots; as of valerian, plantago major, and the devil's bit, in which the lower part appears bitten or chopped off. In these the lower part rotting off as the upper descends, the living remainder becomes stumped, or seems bitten.

All bulbous roots, says the learned Dr Grew in his anatomy of plants, may be considered as hermaphrodite roots, or root and trunk both together: for the radicles or strings only are absolute roots; the bulb actually containing those parts which springing up make the body or leaves of the plant; so that it may be regarded as a large bud under ground.

Bulbous roots are said to be solid, when composed of one uniform lump of matter: tunicated, when formed of multitudes of coats surrounding one another; squamose, when composed of, or covered with, lesser flakes; duplicate, when there are only two to each plant: and aggregate, when there is a congeries of such roots to each plant.

BULGARIA, a small province of Turkey in Europe, bounded on the north by Wallachia, on the east by the Black sea, on the south by Romania and Macedonia, and on the west by Servia. It is very narrow, but 325 miles long on the side of the Danube, from Servia till it falls into the Black sea.

The Bulgarians anciently inhabited the plains of Sarmatia that extended along the banks of the Volga. Thence they migrated, about the middle of the 7th century of the Christian era, in quest of new settlements. A large body of them passed the Danube, and took possession of the country adjacent to the western coast of the Euxine sea. Several attempts were made by the Romans to dispossess and extirpate them: But they defended themselves with equal resolution and success. Constantine III. being defeated and intimidated, concluded an ignominious peace with them (A. D. 78), and purchased their friendship by the payment of an annual tribute. Justinian II. refused to comply with these dishonourable terms, and invaded their territories (A. D. 687); but he was defeated, and constrained to renew the treaty. War was carried on, almost without interruption, between them and the eastern emperors, during the course of several centuries. After a long and doubtful struggle, the Romans prevailed; and the emperor Basil reduced Bulgaria to the form of a province (A. D. 1019). From this time the Bulgarians remained in subjection, and were governed by Roman dukes, until the reign of Isaac Angelus, when they revolted (A. D. 1186).

The history of Bulgaria, in the subsequent period, scarcely merits attention. Stephen IV. king of Hungary, having defeated the Bulgarians, obliged them to acknowledge him as their sovereign. His successors were styled kings of Hungary and Bulgaria; and this title was transmitted, together with the kingdom of Hungary, to the house of Austria.

By the aid of the eastern emperors they threw off the Hungarian yoke; and, in return, they assisted their ally in an attempt to recover Adrianople (A. D. 1369). Provoked by this combination, Amurath invaded their country; and Bajazet, his successor, completed the conquest of it (A. D. 1396).

Bulgaria still remains a province of the Ottoman empire. The inhabitants are Christians; but extremely ignorant, insomuch that they seem to know nothing of Christianity but baptism and fasting. It is divided into four sangiacates; Byden, Sardice, Nicopolis, and Silistria. The chief towns are of the same names, except Sardice, which is now called *Sophia*.

BULGARIAN Language, the same with the **SCLAVONIC.**

BULIMY, a disease in which the patient is affected with an insatiable and perpetual desire of eating; and, unless he is indulged, he often falls into fainting fits. It is also called *james canina*, canine appetite. See **MEDICINE Index.**

der, or in the kidneys and bladder, of an ox. See Bos.

BULK of a SHIP, the whole content in the hold for the stowage of goods.

BULK-HEADS are partitions made athwart the ship with boards, by which one part is divided from the other; as the great cabin, gun-room, bread-room, and several other divisions. The *bulk-head afore* is the partition between the fore-castle and gratings in the head.

BULL, DR JOHN, a celebrated musician, and composer, was born in Somersetshire about the year 1563, and, it is said, was of the Somerset family. He was educated under Blitheman. In 1586, he was admitted at Oxford to the degree of bachelor of music; having practised in that faculty 14 years; and in 1592, was created doctor in the university of Cambridge. In 1591, he was appointed organist of the queen's chapel, in the room of his master, Blitheman.

Bull was the first Gresham professor of music, and was appointed to that station upon the special recommendation of Queen Elizabeth. However skilful he might be in his profession, it seems he was not able to read his lectures in Latin; and therefore, by a special provision in the ordinances respecting the Gresham professors, made anno 1597, it is declared, that because Dr Bull is recommended to the place of music-professor by the queen's most excellent majesty, being not able to speak Latin, his lectures are permitted to be altogether English, so long as he shall continue music-professor there.

In the year 1601, he went abroad for the recovery of his health, which at that time was declining; and during his absence was permitted to substitute, as his deputy, a son of William Bird, named *Thomas*. He travelled incognito into France and Germany; and Wood takes occasion to relate a story of him while abroad, which the reader shall have in his own words.

"Dr Bull hearing of a famous musician belonging to a cathedral in St Omer's, he applied himself, as a novice, to him, to learn something of his faculty, and to see and admire his works. This musician, after some discourse had passed between them, conducted Bull to a vestry or music-school joining to the cathedral, and showed him a lesson or song of 40 parts; and then made a vaunting challenge to any person in the world to add one part more to them, supposing it to be so complete and full, that it was impossible for any mortal man to correct or add to it. Bull thereupon, desiring the use of pen, ink, and ruled paper, such as we call *musical paper*, prayed the musician to lock him up in the said school for two or three hours; which being done, not without great disdain by the musician, Bull, in that time or less, added 40 more parts to the said lesson or song. The musician thereupon being called in, he viewed it, tried it, and retried it; at length he burst out into a great ecstasy, and swore by the great God, that he that added these 40 parts must be either the devil or Dr Bull. Whereupon Bull making himself known, the musician fell down and adored him. Afterwards, continuing there and in those parts for a time, he became so much admired, that he was courted to accept of any place of preferment suitable to his profession, either within the dominions of the emperor, the king of France, or Spain; but the tidings of these transactions coming to the

English court, Queen Elizabeth commanded him home." *Fasti*, anno 1586.

Dr Ward, who has given the life of Dr Bull, in his lives of the Gresham professors, relates, that upon the decease of Queen Elizabeth he became chief organist to King James, and had the honour of entertaining his majesty and Prince Henry at Merchant Taylors hall with his performance on the organ. The same author proceeds to relate, that in 1613 Bull quitted England and went to reside in the Netherlands, where he was admitted into the service of the archduke. He suggests, as the reason of Bull's retirement, that the science began to sink in the reign of King James; which he infers from that want of court-patronage, which it seems, induced the musicians of that day to dedicate their works to one another. But surely Bull had none of these reasons to complain of being slighted that others had. He was in the service of the chapel, and at the head of the prince's musicians; and in the year 1604 his salary for the chapel duty had been augmented. The circumstances of his departure from England may be collected from the following entry now to be seen in the cheque book: "1613, John Bull, doctor of music, went beyond seas without license, and was admitted into the archduke's service, and entered into paie there about Mich. and Peter Hopkins a base from Paul's was sworn into his place the 27th of December following. His wages from Mich. unto the day of the swearing of the said Peter Hopkins was disposed of by the deane of his majesty's chapel." Wood says, that Dr Bull died at Hamburgh; others have said at Lubeck.

The only works of Bull in print are lessons in the "Parthenia, or the maidenhead of the first music that ever was printed for the virginals." An anthem of his, "Deliver me, O God, is to be found in Bernard's collection of church-music. Dr Ward has given a long list of compositions of Dr Bull in manuscript in the collection of the late Dr Pepusch, by which it appears that he was equally excellent in vocal and instrumental harmony. By some of the lessons in the Parthenia it seems that he was possessed of a power of execution on the harpsichord far beyond what is generally conceived of the masters of that time. As to his lessons, they were, in the estimation of Dr Pepusch, not only for the harmony and contrivance, but for air and modulation, so excellent, that he scrupled not to prefer them to those of Couperin, Scarlatti, and others of the modern composers for the harpsichord.

BULL, George, bishop of St David's, was born at Wells, in 1634; and educated at Exeter college, in Oxford. The first benefice he enjoyed was that of St George's, near Bristol, whence he rose successively to be rector of Suddington in Gloucestershire, prebendary of Gloucester, archdeacon of Llandaff, and in 1705 bishop of St David's. This dignity he enjoyed about four years, and died in 1709. During the usurpation of Cromwell, he adhered steadily, though still with great prudence, to the forms of the church of England; and in the reign of James II. preached very strenuously against the errors of Popery. He wrote, 1. A defence of the Nicene faith. 2. Apostolical harmony. 3. Primitive apostolical tradition; and other works.

BULL. See BOS, MAMMALIA *Index*.

Bull.

Wild Bulls. The wild bulls, now so numerous on the continent of America, are said to have sprung from one bull and seven cows, which were carried thither by some of the first conquerors. For the manner of hunting these, see BUCANEERS.

BULL, in *Astronomy*. See ASTRONOMY *Index*.

Bulls Eye, among seamen, a small, obscure, sub-lime cloud, ruddy in the middle, that sometimes appears to mariners, and is the immediate forerunner of a great storm at sea.

Bull-Fighting, a sport or exercise much in vogue among the Spaniards and Portuguese, consisting in a kind of combat of a cavalier or torreadore against a wild bull, either on foot or on horseback, by riding at him with a lance. The Spaniards have bull-fights, i. e. feasts attended with shows, in honour of St John, the Virgin Mary, &c. This sport the Spaniards received from the Moors, among whom it was celebrated with great eclat. Some think that the Moors might have received the custom from the Romans, and they from the Greeks. Dr Plot is of opinion, that the *ταυρομαχίαν* among the Thessalians, who first instituted this game, and of whom Julius Cæsar learned and brought it to Rome, were the origin both of the Spanish and Portuguese bull-fighting, and of the English bull-running. This practice was prohibited by Pope Pius V. under pain of excommunication incurred *ipso facto*. But succeeding popes have granted several mitigations in behalf of the torreadores.

From the following account of a bull-feast in the Coliseum at Rome 1332, extracted from Muratori by Mr Gibbon, the reader may form some idea of the pomp, the ceremonies, and the danger which attended these exhibitions. "A general proclamation as far as Rimini and Ravenna invited the nobles to exercise their skill and courage in this perilous adventure. The Roman ladies were marshalled in three squadrons, and seated in three balconies, which on this day, the third of September, were lined with scarlet cloth. The fair Jacova di Rovere led the matrons from beyond the Tiber, a pure and native race, who still represent the features and character of antiquity. The remainder of the city was divided between the Colonna and Ursini families: the two factions were proud of the number and beauty of their female bands; the charms of Savella Ursini are mentioned with praise; and the Colonna regretted the absence of the youngest of their house, who had sprained her ankle in the garden of Nero's tower. The lots of the champions were drawn by an old and respectable citizen; and they descended into the *arena* or pit, to encounter the wild bulls, on foot as it should seem, with a single spear. Amidst the crowd, our annalist has selected the names, colours, and devices of 20 of the most conspicuous knights. Several of the names are the most illustrious of Rome and the Ecclesiastical State; Malatesta, Polenta, della Valle, Casarello, Savelli, Cappoccio, Conti, Annibaldi, Altieri, Corsi. The colours were adapted to their taste and situation. And the devices are expressive of hope or despair, and breathe the spirit of gallantry and arms. "I am alone, like the youngest of the Horatii," the confidence of an intrepid stranger: "I live disconsolate," a weeping widower: "I burn under the ashes," a discreet lover: "I adore Lavinia or Lucretia," the ambiguous declaration of a modern passion: "My

faith is as pure," the motto of a white livery: "Who is stronger than myself?" of a lion's hide: "If I am drowned in blood, what a pleasant death!" the wish of ferocious courage. The pride or prudence of the Ursini restrained them from the field, which was occupied by three of their hereditary rivals, whose inscriptions denoted the lofty greatness of the Colonna name: "Though sad, I am strong:" "Strong as I am great;" "If I fall (addressing himself to the spectators) you fall with me:"—intimating (says the writer), that while the other families were the subjects of the Vatican, they alone were the supporters of the Capitol. The combats of the amphitheatre were dangerous and bloody. Every champion successively encountered a wild bull; and the victory may be ascribed to the quadrupeds, since no more than eleven were left on the field, with the loss of nine wounded and 18 killed on the side of their adversaries. Some of the noblest families might mourn; but the pomp of the funerals, in the churches of St John Lateran and St Maria Maggiore, afforded a second holiday to the people. Doubtless it was not in such conflicts that the blood of the Romans should have been shed; yet, in blaming their rashness, we are compelled to applaud their gallantry; and the noble volunteers, who display their magnificence and risk their lives under the balconies of the fair, excite a more generous sympathy than the thousands of captives and malefactors who were reluctantly dragged to the scene of slaughter."

A striking relick of barbarity in the Spanish manners of the present day, is the excessive attachment of that nation to bull-fights, a spectacle which shocks the delicacy of every other people in Europe. Many Spaniards consider this practice as the sure means of preserving that energy by which they are characterized, and of habituating them to violent emotions, which are terrible only to timid minds. But it seems difficult to comprehend what relation there is between bravery and a spectacle where the assistants now run no danger; where the actors prove by the few accidents which befall them, that theirs has nothing in it very interesting; and where the unhappy victims meet only with certain death as the reward of their vigour and courage. Another proof that these spectacles have little or no influence on the disposition of the mind is, that children, old men, and people of all ages, stations, and characters, assist at them, and yet their being accustomed to such bloody entertainments appears neither to correct their weakness and timidity, nor alter the mildness of their manners.

The bull-fights are very expensive; but they bring great gain to the undertakers. The worst places cost two or four reals, according as they are in the sun or in the shade. The price of the highest is a dollar. When the price of the horses and bulls, and the wages of the *torreadores*, have been paid out of this money, the rest is generally appropriated to pious foundations; at Madrid it forms one of the principal funds of the hospital. It is only during summer that these combats are exhibited, because the season then permits the spectators to sit in the open air, and because the bulls are then more vigorous. Those which are of the best breed are condemned to this kind of sacrifice; and connoisseurs are so well acquainted with their distinguishing marks, that as soon as a bull appears upon the *arena*,

Bull.

arena, they can mention the place where he was reared. This arena is a kind of circus surrounded by about a dozen of seats, rising one above another; the highest of which only is covered. The boxes occupy the lower part of the edifice. In some cities, Valladolid for example, which have no place particularly set apart for these combats, the principal square is converted into a theatre. The balconies of the houses are widened, so as to project over the streets which end there; and it is really a very interesting sight to see the different classes of people assembled round this square, waiting for the signal when the entertainment is to commence, and exhibiting every external sign of impatience and joy. The spectacle commences by a kind of procession around the square, in which appear, both on horseback and on foot, the combatants who are to attack the fierce animal; after which two *alguazils*, dressed in perukes and black robes, advance with great gravity on horseback; who go and ask from the president of the entertainment an order for it to commence. A signal is immediately given; and the animal, which was before shut up in a kind of hovel with a door opening into the square, soon makes his appearance. The officers of justice, who have nothing to do with the bull, prudently hasten to retire, and their flight is a prelude to the cruel pleasure which the spectators are about to enjoy. The bull, however, is received with loud shouts, and almost stunned by the noisy expressions of their joy. He has to contest first against the *picadores*, combatants on horseback, who, dressed according to the ancient Spanish manner, and as it were fixed to their saddles, wait for him, each being armed with a long lance. This exercise, which requires strength, courage, and dexterity, is not considered as disgraceful. Formerly the greatest lords did not disdain to practise it; even at present some of the *hidalgos* solicit for the honour of fighting the bull on horseback, and they are then previously presented to the people, under the auspices of a patron, who is commonly one of the principal personages at court.

The *picadores*, whoever they may be, open the scene. It often happens that the bull, without being provoked, darts upon them, and every body entertains a favourable opinion of his courage. If, notwithstanding the sharp-pointed weapon which defends his attack, he returns immediately to the charge, their shouts are redoubled, as their joy is converted into enthusiasm; but if the bull, struck with terror, appears pacific, and avoids his persecutors, by walking round the square in a timid manner, he is hooted at and hissed by the whole spectators, and all those near whom he passes load him with blows and reproaches. He seems then to be a common enemy, who has some great crime to expiate; or a victim, in the sacrifice of which all the people are interested. If nothing can awaken his courage, he is judged unworthy of being tormented by men; the cry of *perros*, *perros*, brings forth new enemies against him, and large dogs are let loose upon him, which seize him by the neck and ears in a furious manner. The animal then finds the use of those weapons with which nature has furnished him; he tosses the dogs into the air, who fall down stunned, and sometimes mangled; they however recover, renew the combat, and generally finish by overcoming their ad-

Bull.

versary, who thus perishes ignobly. If, on the other hand, he presents himself with a good grace, he runs a longer and nobler, but a much more painful career. The first act of the tragedy belongs to the combatants on horseback; this is the most animated and bloody of all the scenes, and often the most disgusting. The irritated animal braves the pointed steel which makes deep wounds in his neck, attacks with fury the innocent horse who carries his enemy, rips up his sides, and overturns him together with his rider. The latter, then dismounted and disarmed, would be exposed to imminent danger, did not combatants on foot, called *chubs*, come to divert the bull's attention, and to provoke him, by shaking before him different pieces of cloth of various colours. It is, however, at their own risk that they thus save the dismounted horseman; for the bull sometimes pursues them, and they have then need for all their agility. They often escape from him by letting fall in his way the piece of stuff which was their only arms, and against which the deceived animal expends all his fury. Sometimes he does not accept this substitute, and the combatant has no other resource but to throw himself speedily over a barrier, six feet high, which incloses the interior part of the arena. In some places this barrier is double, and the intermediate space forms a kind of circular gallery, behind which the pursued *torreadore* is in safety. But when the barrier is single, the bull attempts to jump over it, and often succeeds. The reader may easily imagine in what consternation the nearest of the spectators then are; their haste to get out of the way, and to crowd to the upper benches, becomes often more fatal to them than even the fury of the bull, who, stumbling at every step, on account of the narrowness of the place and the inequality of the ground, thinks rather of his own safety than of revenge, and besides soon falls under the blows which are given him from all quarters.

Except in such cases, which are very rare, he immediately returns. His adversary recovered, has had time to get up; he immediately remounts his horse, provided the latter is not killed or rendered unfit for service, and the attack commences; but he is often obliged to change his horse several times. Expressions cannot then be found to celebrate these acts of prowess, which for several days become the favourite topic of conversation. The horses, very affecting models of patience, courage, and docility, may be seen treading under their feet their own bloody entrails, which drop from their sides half torn open, and yet obeying, for some time after, the hand which conducts them to new tortures. Spectators of delicacy are then filled with disgust, which converts their pleasure into pain. A new act is however preparing, which reconciles them to the entertainment. As soon as it is concluded that the bull has been sufficiently tormented by the combatants on horseback, they retire and leave him to be irritated by those on foot. The latter, who are called *banderilleros*, go before the animal; and the moment he darts upon them they plunge into his neck, two by two, a kind of darts called *banderillas*, the points of which are hooked, and which are ornamented with small streamers made of coloured paper. The fury of the bull is now redoubled; he roars, tosses his head, and the vain efforts which he makes serve only to in-

crease.

Bull.

crease the pain of his wounds : this last scene calls forth all the agility of his adversaries. The spectators at first tremble for them, when they behold them braving so near the horns of this formidable animal ; but their hands, well exercised, aim their blows so skilfully, and they avoid the danger so nimbly, that after having seen them a few times, one neither pities nor admires them, and their address and dexterity seem only to be a small episode of the tragedy, which concludes in the following manner : When the vigour of the bull appears to be almost exhausted ; when his blood issuing from twenty wounds, streams along his neck and moistens his robust sides ; and when the people, tired of one object, demand another victim ; the president of the entertainment gives the signal of death, which is announced by the sound of trumpets. The matador then advances, and all the rest quit the arena ; with one hand he holds a long dagger, and with the other a kind of flag, which he waves backwards and forwards before his adversary. They both stop and gaze at one another : and while the agility of the matador deceives the impetuosity of the bull, the pleasure of the spectators, which was for some time suspended, is again awakened into life. Sometimes the bull remains motionless, throws up the earth with his feet, and appears as if meditating revenge.

The bull in this condition, and the matador who calculates his motions and divines his projects, form a group which an able pencil might not disdain to delineate. The assembly in silence behold this dumb scene. The matador at length gives the mortal blow ; and if the animal immediately falls, a thousand voices proclaim with loud shouts the triumph of the conqueror ; but if the blow is not decisive, if the bull survives and seeks still to brave the fatal steel, murmurs succeed to applause, and the matador, whose glory was about to be raised to the skies, is considered only as an unskilful butcher. He endeavours to be soon revenged, and to disarm his judges of their severity. His zeal sometimes degenerates into blind fury, and his partizans tremble for the consequences of his imprudence. He at length directs his blows better. The animal vomits up blood ; he staggers and falls, while his conqueror is intoxicated with the applauses of the people. Three mules, ornamented with bells and streamers, come to terminate the tragedy. A rope is tied around the bull's horns, which have betrayed his valour, and the animal, which but a little before was furious, and proud, is dragged ignominiously from the arena which he has honoured, and leaves only the traces of his blood and the remembrance of his exploits, which are soon effaced on the appearance of his successors. On each of the days set apart for these entertainments, six are thus sacrificed in the morning, and twelve in the afternoon, at least in Madrid. The three last are given exclusively to the matador, who, without the assistance of the picadores, exerts his ingenuity to vary the pleasure of the spectators. Sometimes he causes them to be combated by some intrepid stranger, who attacks them mounted on the back of another bull, and sometimes he matches them with a bear ; this last method is generally destined for the pleasure of the populace. The points of the bull's horns are concealed by something wrapped round them, which breaks their force. The animal, which in this state is called *Em-*

2

Bull.

bolado, has power neither to pierce nor to tear his antagonist. The amateurs then descend in great numbers to torment him, each after his own manner, and often expiate this cruel pleasure by violent contusions ; but the bull always falls at length under the stroke of the matador. The few spectators who are not infected with the general madness of this sport, regret that those wretched animals do not, at least, purchase their lives at the expence of so many torments and so many efforts of courage ; they would willingly assist them to escape from their persecutors. In the minds of such spectators, disgust succeeds compassion, and satiety succeeds disgust. Such a series of uniform scenes makes that interest become languid, which this spectacle, on its commencement, seemed to promise. But to connoisseurs, who have thoroughly studied all the stratagems of the bull, the resources of his address and fury, and the different methods of irritating, tormenting, and deceiving him, none of these scenes resembles another, and they pity those frivolous observers who cannot remark all their varieties.

The Spanish government are very sensible of the moral and political inconveniences arising from this species of frenzy. They have long since perceived, that among a people whom they wish to encourage to labour, it is the cause of much disorder and dissipation ; and that it hurts agriculture, by destroying a great number of robust animals, which might be usefully employed : but they are obliged to manage with caution a taste which it might be dangerous to attempt to abolish precipitately. They are, however, far from encouraging it. The court itself formerly reckoned bull-fights among the number of its festivals, which were given at certain periods. The *Plaza-Mayor* was the theatre of them, and the king and the royal family honoured them with their presence. His guards presided there in good order. His halberdiers formed the interior circle of the scene : and their long weapons, held out in a defensive posture, were the only barrier which they opposed against the dangerous caprices of the bull. These entertainments, which by way of excellence, were called *Fiestas Reales*, are become very rare. Charles III. who endeavoured to polish the nation, and to direct their attention to useful objects, was very desirous of destroying a taste in which he saw nothing but inconveniences ; but he was too wise to employ violent means for that purpose. He, however, confined the number of bull-fights to those, the profits of which were applied to the support of some charitable institution, with an intention of substituting for these other funds afterwards. Bull-fights, by these means being rendered less frequent, will, perhaps, gradually lose their attractions, until more favourable circumstances permit the entire abolition of them.

BULL-Running, denotes a feudal custom obtaining in the honour of Tutbury in Staffordshire ; where, anciently, on the day of the assumption of our Lady, a bull is turned loose by the lord to the minstrels ; who, if they can catch him before he passes the river Dove, are to have him for their own, or, in lieu thereof, to receive each 40 pence ; in consideration of which custom they pay 20 pence yearly to the said lord.

BULL and Boar. By the custom of some places, the parson is obliged to keep a bull and boar for the use

of

Bull. of his parishioners, in consideration of his having tithes of calves and pigs, &c.

BULL-Frog. See RANA, ERPETOLOGY *Index*.

BULL-Head, or Miller's Thumb. See COTTUS, ICHTHYOLOGY *Index*.

BULL, among ecclesiastics, a written letter dispatched, by order of the pope, from the Roman Chancery; and sealed with lead, being written on parchment, by which it is partly distinguished from a brief; see the article BRIEF.—It is a kind of apostolical rescript, or edict; and is chiefly in use in matters of justice or grace. If the former be the intention of the bull, the lead is hung by a hempen cord; if the latter, by a silken thread. It is this pendent lead, or seal, which is, properly speaking, the bull, and which is impressed on one side with the heads of St Peter and St Paul, and on the other with the name of the pope and the year of his pontificate. The bull is written in an old, round, Gothic letter, and is divided into five parts, the narrative of the fact, the conception, the clause, the date, and the salutation, in which the pope styles himself *servus servorum*, i. e. the servant of servants. These instruments, besides the lead hanging to them, have a cross, with some texts of scripture, or religious motto, about it. Bulls are granted for the consecration of bishops, the promotion to benefices, and the celebration of jubilees, &c.

BULL in Cæna Domini, a particular bull read every year, on the day of the Lord's supper or Maundy Thursday, in the pope's presence, containing excommunications and anathemas against heretics, and all who disturb or oppose the jurisdiction of the holy see. After the reading of the bull, the pope throws a burning torch in the public place, to denote the thunder of this anathema.

Golden BULL, an edict, or imperial constitution, made by the emperor Charles IV. reputed to be the magna charta, or the fundamental law of the German empire.

It is called *golden*, because it has a golden seal, in the form of a pope's bull, tied with yellow and red cords of silk: upon one side is the emperor represented sitting on his throne, and on the other the capitol of Rome. It is also called *Caroline*, on Charles IV.'s account. Till the publication of the golden bull, the form and ceremony of the election of an emperor were dubious and undetermined, and the number of the electors not fixed. This solemn edict regulated the functions, rights, privileges, and pre-eminences of the electors. The original, which is in Latin, on vellum, is preserved at Francfort: this ordonnance, containing 30 articles or chapters, was approved of by all the princes of the empire, and remains still in force.

Silver BULLS were not in so frequent use; though we do not want instances of them.

Leaden BULLS were sent by the emperors of Constantinople to despots, patriarchs, and princes; and the like were also used by the grandees of the Imperial court, as well as by the kings of France, Sicily, &c. and by bishops, patriarchs, and popes. It is to be observed, that the leaden bulls of these last had, on one side, the name of the pope or bishop inscribed. Polydore Virgil makes Pope Stephen III. the first who used leaden bulls, about the year 772. But others find instances of them as early as Silvester, Leo I. and

Gregory the great. The latter popes, besides their own names, strike the figures of St Peter and St Paul on their bulls, a practice first introduced by Pope Paschal II. But why, in these bulls, the figure of St Paul is on the right, and that of St Peter on the left side, is a question, which has occasioned many conjectures and disputes.

Waxen BULLS are said to have been first brought into England by the Normans. They were in frequent use among the Greek emperors, who thus sealed letters to their wives, mothers, and sons. Of these there were two sorts, one red, and the other green.

BULLA, or **DIPPER**, in *Conchology*; a genus belonging to the order of vermes testacea. It is an animal of the snail kind: the shell consists of one valve, convoluted, and without any prickles; the aperture is narrowish, oblong, longitudinal, and entire at the base; the columella is smooth and oblique. There are 23 species; four of them found in the British seas; the rest chiefly natives of the Asiatic and Atlantic oceans. See CONCHOLOGY *Index*.

BULLÆ, in antiquity, a kind of ornaments much in use among the ancient Romans. Mr Whittaker ^{* *History of Manchester* vol. i. p. 79.} is of opinion that they were originally formed of leather among all ranks of people; and it is certain that they continued so to the last among the commonalty. He also imagines, that at first the bulla was intended as an amulet rather than an ornament; as a proof of which he tells us that the bullæ were frequently impressed with the figure of the sexual parts. It is universally asserted by the critics, that the bullæ were made hollow for the reception of an amulet; but this Mr Whittaker contradicts from the figure of a golden one lately found at Manchester, which had no aperture whereby an amulet could have been introduced.—Pliny refers the original of the bulla to the elder Tarquin, who gave one with the pretexta to his son, because at the age of 14 he had with his own hand killed an enemy; and in imitation of him it was afterwards assumed by other patricians. Others affirm that the bulla was given by that king to the sons of all the patricians who had borne civil offices. Lastly, others allege, that Romulus first introduced the bulla, and gave it to Tullus Hostilius, the first child born of the rape of the Sabines.—As to the form of the bullæ, Mr Whittaker informs us that they were originally made in the shape of hearts; but they did not always retain the form of a heart, any more than they were always made of leather. As the wealth of the state and the riches of individuals increased, the young patrician distinguished himself by a bulla of gold, while the common people wore the amulet of their ancestors. The figure of the heart then became so generally round, some even having the impression of an heart upon them, that there are not many of the original form to be found in the cabinets of the curious. The form is naturally varied from a complete circle to that of a segment; and this was the shape of the above-mentioned bulla found at Manchester. When the youth arrived at 15 years of age, they hung up their bullæ about the necks of their gods lareæ. We are further informed, that the bullæ were not only hung about the necks of young men, but of horses also. We may add, that bullæ were sometimes allowed to statues; whence the phrase *statuæ bullatæ*.

Bull
Bullæ.

BULLÆ

Bulle
||
Bulleyn.

BULLÆ was also the denomination given to divers other metalline ornaments made after the same form; and in this sense *bullæ* seems to include all gold and silver ornaments of a roundish form, whether worn on the habits of men, the trappings of horses, or the like. Such were those decorations used by the ancients on their doors and belts. The *bullæ* of doors were a kind of large-headed nails fastened on the doors of the rich, and kept bright with great care. The doors of temples were sometimes adorned with golden *bullæ*. Mr Bandelot takes the *bullæ* worn by soldiers on their belts to be something more than mere ornaments. They seem to have been considered as preservations from dangers and diseases, and even means of acquiring glory, and other advantages. The like may perhaps be extended to the *bullæ* on doors, which were probably placed there as a security to them from being broken or violated.

BULLÆ also denotes a table hung up in the public courts, to distinguish which days were fasti, and which nefasti; answering in some measure to our calendar.

BULLET, an iron or leaden ball or shot, wherewith fire arms are loaded. Bullets are cast in iron moulds, consisting of two concave hemispheres, with a handle whereby to hold them; and between them is a hole, called *the gate*, at which to pour in the melted metal. The chaps or hemispheres of bullet-moulds are first punched, being blood-red hot, with a round-ended punch, of the shape and nearly of the size of the intended bullets. To cleanse the insides they make use of a bullet bore, which consists of a steel shank, having a globe at one end, wherewith to bore the inside of a mould clean, and of the intended size.

BULLEYN, WILLIAM, a learned physician and botanist, was born in the isle of Ely, in the former part of the reign of Henry VIII. and educated at Cambridge. Botany being his favourite study, he travelled through various parts of England, Scotland, and Germany, chiefly with an intention to improve his knowledge in that science. In the reign of Edward VI. or of Queen Mary, Mr Bulleyn appears, from his remarks on the natural productions of that country, to have resided at Norwich, or in that neighbourhood, and also to have spent some time at Bloxhall in Suffolk; but he afterwards removed into the north, and settled at Durham, where he practised physic with considerable reputation and success. His great patron at this time was Sir Thomas Hilton, knight, baron of Hilton, who was governor of Tinnmouth castle in the reign of Philip and Mary. In 1560, he came to London, and soon after his arrival, was accused by William Hilton of Bidick of having murdered his brother Sir Thomas, our author's friend and patron. He was arraigned before the duke of Norfolk, and honourably acquitted. This Hilton afterwards hired some villains to assassinate the doctor; but this attempt proving ineffectual, he had him arrested on an action for debt, and he remained for a long time in prison. During this confinement, Dr Bulleyn composed several of those works which raised his reputation as a medical writer. He died in January 1576, and was buried in St Giles's Cripplegate, in the same grave with his brother the divine, who died 13 years before, and in which John Fox the martyrologist was interred 11 years after. Dr Bulleyn appears from

his writings to have been well acquainted with the works of the ancient Greek, Roman, and Arabian physicians. According to the modern practice, his books, were they generally known, would be of little use; but as he was a man of genius and fertile imagination, they are by no means barren of entertainment. He wrote, 1. *The Government of Health*, 1559, 8vo. 2. *A regimen against the Pleurisy*, 8vo, London, 1562. 3. *Bulleyn's Bulwark of Defence against all Sickness, Soreness, and Wounds that dooe daily assault Mankinde*, London, printed by John Kingston, 1562, folio. This includes, *The Government of Health*. 4. A dialogue both pleasant and pietifull, wherein is a goodlie regimen against the fever pestilence, with a consolation and comfort against death, London, 1564, 8vo; 1569, 8vo; very scarce. There is a wooden print of the author prefixed to the first edition of his *Government of Health*; also a small one engraved by Stukeley in 1722.

BULLIALDUS, ISMAEL, an eminent astronomer, was born at Laon in the Isle of France in 1605. He travelled in his youth for the sake of improvement; and afterwards published several works, among which are, 1. *De natura lucis*. 2. *Philolaus*. 3. *Astronomia philolaica, opus novum, in quo motus planetarum per novam et veram hypothesin demonstrantur*. 4. *Astronomiæ philolaicæ fundamenta clarius explicata et asserta adversus Zethi Wardi impugnationem*. He also wrote a piece or two upon geometry and arithmetic. In 1661, he paid Hevelius a visit at Dantzic, for the sake of seeing his optical and astronomical apparatus. Afterwards he became a presbyter at Paris, and died there in 1694.

BULLINGER, HENRY, born at Bremgarten in Switzerland in 1504, was an eminent Zuinglian minister, a great supporter of the reformation, and employed in many ecclesiastical negotiations. He composed many books, one against Luther in particular. He died in 1575.

BULLION, uncoined gold or silver in the mass.

Those metals are called so, either when smelted from the native ore, and not perfectly refined; or when they are perfectly refined, but melted down in bars or ingots, or in any unwrought body, of any degree of fineness.

When gold and silver are in their purity, they are so soft and flexible, that they cannot well be brought into any fashion for use, without being first reduced and hardened with an alloy for some other baser metal.

To prevent these abuses which some might be tempted to commit in the making of such alloys, the legislators of civilized countries have ordained, that there shall be no more than a certain proportion of a baser metal to a particular quantity of pure gold or silver, in order to make them of the fineness of what is called the standard gold or silver of such a country.

According to the laws of England, all sorts of wrought plate in general ought to be made to the legal standard; and the price of our standard gold and silver is the common rule whereby to set a value on their bullion, whether the same be ingots, bars, dust, or foreign specie: whence it is easy to conceive that the value of bullion cannot be exactly known, without being first assayed, that the exact quantity of pure metal therein contained may be determined, and consequently whether it be above or below the standard.

Bulleyn

Bulleyn.

Silver

Bullion
of
Bunting-
ford.

Silver and gold, whether coined or uncoined (though used for a common measure of other things), are no less a commodity than wine, tobacco, or cloth; and may, in many cases, be exported as much to the national advantage as any other commodity.

BULLOCK, the same with an ox, or gelded bull. See **Bos**, **MAMALLIA Index**.

BULTER, a term used to denote the refuse of meal after dressing, or the cloth wherein it is dressed, otherwise called the *butler-cloth*.

BULWARK, in the ancient fortification. See **RAM-PART**.

BUMICILLI, a religious sect of Mahometans in Egypt and Barbary, who pretend to fight with devils, and commonly appear in a fright and covered with wounds and bruises. About the full moon they counterfeit a combat in the presence of all the people, which lasts for two or three hours, and is performed with assagias or javelins, till they fall down quite spent.

BUNDLE, a collection of things wrapped up together. Of baste-ropes, harness-plates, and gloves knives, ten make a bundle; of Hamburg yarn, 20 skeans; of basket-rods, three feet the band.

BUNDECUND, a province in Hindostan. See **SUPPLEMENT**.

BUNEL, PETER, a native of Thoulouse, was one of the most elegant writers of the Latin tongue in the 16th century, but was still more conspicuous for the regularity of his manners. He did not seek either for riches or lucrative employments; but, contented with the bare necessities of life, applied himself wholly to the improvement of his mind. He died at Turin in 1547, aged 47; and has left behind him some Latin epistles, which are written with the utmost purity. The magistrates of Thoulouse have a bust of him in marble, placed in their town-house. The most correct edition of his Letters is that of Henry Stephens in 1581.

BUNGAY, a market town of Suffolk, situated on the river Wavenny, about 32 miles north-east of Bury. E. Long. 1. 35. N. Lat. 52. 35.

BUNIAS, in *Botany*, a genus of the 39th natural order, *Siliquosa*, belonging to the tetradynamia class of plants, for which there is no English name. The silicula is deciduous, four-sided, muricated, or shagreened with unequal pointed angles. There are eight species; all of them annual plants, but none of them possessed of any remarkable property.

BUNIUM, *Pig-nut*, or *Earth-nut*. See **BOTANY Index**.

BUNT of a *SAIL*, the middle part of it, formed designedly into a bag or cavity, that the sail may gather more wind. It is used mostly in topsails, because the courses are generally cut square, or with but small allowance for bunt or compass. The bunt holds much leeward wind; that is, it hangs much to leeward.

BUNT-Lines, are small lines made fast to the bottom of the sails, in the middle part of the bolt-rope, to a cringle, and are so reeved through a small block, seized to the yard. Their use is to trice up the bunt of the sail, for the better furling it up.

BUNTING. See **EMBERIZA**, **ORNITHOLOGY Index**.

BUNTINGFORD, a town of Hertfordshire, with a market on Mondays, and two fairs, on June 29th, and November 30th, for pedlars wares. It is a good

thoroughfare town, distant 31 miles north from London. W. Long. 0. 6. N. Lat. 51. 55.

BUNTZEL, or **BUNTZLAU**, a town of Silesia, in the duchy of Jauer. The greatest part of the houses are built with stone, and there were formerly rich mines in the neighbourhood. It is in the common road to Leipsic; and the trade is in earthen ware, of which great quantities are made. E. Long. 15. 50. N. Lat. 51. 12.

BUNYAN, JOHN, author of the *Pilgrim's Progress*, was born at Elstow, near Bedford, in 1628. He was the son of a tinker; and, in the early part of his life, was a great reprobate, and a soldier in the parliament army: but being at length deeply struck with a sense of his guilt, he laid aside his profligate courses, became remarkable for his sobriety, and applied himself to obtain some degree of learning. About the year 1655, he was admitted a member of a Baptist congregation at Bedford, and was soon after chosen their preacher: but, in 1660, being taken up, and tried for presuming to preach, he was cruelly sentenced to perpetual banishment; and in the mean time committed to jail, where necessity obliged him to learn to make long-tagged thread-laces for his support: to add to his distress, he had a wife and several children, among whom was a daughter who was blind. In this unjust and cruel confinement he was detained twelve years and a half, and during that time wrote many of his tracts; but he was at length discharged by the humane interposition of Dr Barlow. When King James's declaration for liberty of conscience was published, he was chosen pastor of a congregation at Bedford. He at length died of a fever at London, on the 31st of August 1688, aged 60. He also wrote an allegory, called *The Holy War*. His *Pilgrim's Progress* has been translated into most European languages; and his works have been collected together, and printed in two volumes folio.

BUONACARSI, or **PIERINO DEL VAGA**. See **PIERINO**.

BUOY, in sea affairs, a sort of close cask, or block of wood, fastened by a rope to the anchor, to determine the place where the anchor is situated, that the ship may not come too near it, to entangle her cable about the stock or the flukes of it.

BUOYS are of various kinds; as,
Can-Buoys: these are in the form of a cone; and of this construction are all the buoys which are floated over dangerous banks and shallows, as a warning to passing ships, that they may avoid them. They are extremely large that they may be seen at a distance; and are fastened by strong chains to the anchors which are sunk for this purpose at such places.

Nun-Buoys are shaped like the middle frustum of two cones, abutting upon one common base, being casks which are large in the middle, and tapering nearly to a point at each end.

Wooden-Buoys are solid pieces of timber, sometimes in the shape of a cylinder, and sometimes in that of a nun-buoy; they are furnished with one or two holes, in which to fix a short piece of rope, whose two ends, being spliced together, make a sort of circle or ring, called the *strop*.

Cable-Buoys, are common casks employed to buoy up the cables in different places from rocky ground. In

the

Buoy
||
Buphonia.

the harbour of Alexandria in Egypt, every ship is moored with at least three cables, and has three or four of these buoys on each cable for this purpose.

Slings of the Buoy, the ropes which are fastened about it, and by which it is hung: they are curiously spliced around it, something resembling the braces of a drum.

To stream the Buoy, is to let it fall from the ship's side into the water; which is always done before they let go the anchor, that it may not be retarded by the buoy-rope as it sinks to the bottom.

Buoy-Rope, the rope which fastens the buoy to the anchor: it should be little more than equal in length to the depth of the water where the anchor lies, as it is intended to float near, or immediately above, the bed of it, that the pilot may at all times know the situation thereof. See Plate XXXIII. Fig. 1. N^o 3. where *b* is the anchor, *c* the buoy-rope, and *d* the buoy floating on the surface of the water. The buoy-rope is often extremely useful otherwise, in drawing up the anchor when the cable is broke. It should always, therefore, be of sufficient strength for this purpose, or else the anchor may be lost through negligence.

Buoy of the Nore, is a buoy placed at the mouth of the river Thames, to direct mariners how to avoid a dangerous sand.

BUOYANT, something which, by its aptness to float, bears up other more ponderous and weighty things. See **BUOY**.

BUPALUS, a celebrated sculptor, and native of the island of Chios, was son, grandson, and great grandson of sculptors. He had a brother, named *Athenis*, of the same profession. They flourished in the 60th Olympiad: and were contemporary with Hipponax, a poet of an ugly and despicable figure. Our sculptors diverted themselves in representing him under a ridiculous form. But Hipponax wrote so sharp a satire against them, that they hanged themselves, as some say. Pliny, however, does not allow this; but says, on the contrary, that, after Hipponax had taken his revenge, they made several fine statues in several places; particularly a Diana at Chios, which was placed very high, and appeared with a frowning countenance to those that came in, and with a pleasant one to those that went out. There were several statues at Rome made by them; and they worked only in the white marble of the isle of Paros. Pausanias mentions Bupalus as a good architect as well as sculptor; but says nothing of Athenis.

BUPHAGA. See **ORNITHOLOGY Index**.

BUPHONIA (from *Bovs*, ox, and *phona*, slaughter, in antiquity, an Athenian feast or ceremony, denominated from a bullock slain therein, with quaint formalities. From the origin of the buphonia, we are told it was forbidden by the laws of Attica to kill an ox: but it once happened, at the feast of the *dispholia*, that an ox ate the corn, others say the cakes, which had been dressed for the sacrifice. Thaulon the priest, enraged at this, presently killed him, and fled for it. On which the Athenians, fearing the resentment of the gods, and feigning themselves ignorant who had committed the fact, brought the bloody axe before the judges, where it was solemnly arraigned, tried, found guilty, and condemned. And, in memory of this event, a feast was instituted under the denomination of

buphonia; in which it was still customary for the priest to fly, and judgment to be given about the slaughter of the ox.

BUPHTHALMUM, OX-EYE. See **BOTANY Index**.

BUPLEURUM, HARE'S EAR. See **BOTANY Index**.

BUPRESTIS. See **ENTOMOLOGY Index**.

BUQUOI, a town of Artois, in the French Netherlands, situated on the confines of Picardy. E. Long. 2. 40. N. Lat. 50. 12.

BUR, a broad ring of iron, behind the place made for the hand on the spears used formerly in tilting; which bur was brought to rest when the tilter charged his spear.

BURBAS, in commerce, a small coin at Algiers, with the arms of the dey struck on both sides: it is worth half an asper.

BURCHAUSEN, a town of Germany in the Lower Bavaria, situated on the river Saltz. E. Long. 13. 25. N. Lat. 48. 5.

BURDEGALA, or **BURDIGALA**, in *Ancient Geography*, a trading port town of Aquitania, situated on a lake of the sea, formed by the mouth of the Garumna. It was a famous seat of the Muses, as appears by Ansonius's book entitled *Professores*; and birth-place of Ansonius: now Bourdeaux, capital of the Bourdelois, on the river Garonne. W. Long. 0. 40. N. Lat. 44. 54.

BURDEN, or **BURDON**, in *Music*, the drone or base, and the pipe or string which plays it: hence that part of a song that is repeated at the end of every stanza, is called the *burden* of it.—A chord which is to be divided, to perform the intervals of music, when open and undivided, is also called the *burden*.

BURDEN properly signifies a heavy weight or load. Ringelberg recommends the bearing burdens as the best sort of exercise; especially to strengthen men of study. To this end, he had a gown lined with plates of lead, which he could just lift with both his hands. This load he bore six or seven days together, either increasing or diminishing it as he found occasion; by which means he could both write and exercise at the same time.

BURDEN also denotes a fixed quantity of certain commodities. A burden of gad steel is two score, or 120 pounds.

BURDEN of a SHIP is its contents, or number of tons it will carry. The burden of a ship may be determined thus: Multiply the length of the keel taken within board, by the breadth of the ship within board, taken from the midship-beam, from plank to plank; and multiply the product by the depth of the hold, taken from the plank below the keelson, to the under part of the upper deck plank; and divide the last product by 94: the quotient is the content of the tonnage required. See **FREIGHT**.

BURDOCK. See **ARCTIUM** and **XANTHIUM**, **BOTANY Index**.

BURELL, or **CIVITA BURELLA**, a town of Italy in the kingdom of Naples, and in Abruzzo Citra, near the river Sangro. E. Long. 15. 5. N. Lat. 41. 56.

BUREN, a town of the United Provinces, in Guelderland. It gives the title of count de Buren to the prince of Orange. E. Long. 5. 22. N. Lat. 52. 0.

BUREN, a town of Germany, in the circle of Westphalia,

Buphonia
|
Bura

Buren || Burgaudine. phalia, and bishopric of Paderborn. It is seated on the river Alme, five miles south of Paderborn. E. Long. 8. 25. N. Lat. 61. 35.

BURFORD, a town of Oxfordshire, seated on an ascent on the river Windrush, is a handsome place, chiefly noted for the making of saddles. The downs near it, noted for horse-races, are of great advantage to the town. Burford is an earldom in the family of St Albans. It is 23 miles west-north-west of Banbury, and 85 west of London. Population 1342 in 1811. W. Long. 1. 43. N. Lat. 51. 40.

BURG, BURGH, or DUN, in northern topography. See DUN.

BURG, a town of Lincolnshire, seated in a marsh, 12 miles south-east of Boston. Population 709 in 1811. E. Long. 0. 5. N. Lat. 53. 12.

BURG, a town of the Dutch Netherlands, in Zutphen, seated on the Old Issel, 18 miles east of Nimeguen. E. Long. 6. 12. N. Lat. 52. 0.

BURG-Castle, or *Borough-castle*, a fortress on the edge of the county of Suffolk, three miles west of Yarmouth, where the rivers Yare and Waveny meet. It was formerly a delightful place; but now only the ruins of its walls remain, near which Roman coins are often dug up.

BURGAGE, or *Tenure* in *BURGAGE*, is where the king, or other person, is lord of an ancient borough, in which the tenements are held by a rent certain. It is indeed only a kind of town soccage; as common soccage*, by which other lands are holden, is usually of a rural nature. A borough is distinguished from other towns by the right of sending members to parliament; and where the right of election is by burgage-tenure, that alone is a proof of the antiquity of the borough. Tenure in burgage, therefore, or burgage-tenure, is where houses, or lands which were formerly the scite of houses in an ancient borough, are held of some lord in common soccage, by a certain established rent. And they seem to have withstood the shock of the Norman encroachments, principally on account of their insignificance, which made it not worth while to compel them to an alteration of tenure, as 100 of them put together would scarce have amounted to a knight's fee. Besides, the owners of them, being chiefly artificers, and persons engaged in trade, could not with any tolerable propriety be put on such a military establishment as the tenure in chivalry was. The free soccage, therefore, in which these tenements are held, seems to be plainly a remnant of Saxon liberty; which may also account for the great variety of customs affecting many of these tenements so held in ancient burgage; the principal and most remarkable of which is that called *Borough-English*. See the article *Borough-English*.

BURGAU, in *Natural History*, the name of a large species of sea-snail, of the lunar or round-mouthed kind. It is very beautifully lined with a coat, of the nature of the mother-of-pearl; and the artificers take this out, to use under the name of mother-of-pearl, though some call it, after the name of the shell they take it from, *burgaudine*.

BURGAUDINE, the name given by the French artificers to what we call mother-of-pearl. In their works, they do not use the common nacre-shell for this, but the lining of the American burgau. Hence some

call the mother-of-pearl *burgaudine*, and others the *burgaudine* mother-of-pearl.

BURGDORF, a handsome and pretty large town of Switzerland, in the canton of Bern, seated on an eminence. The river Emma is about a pistol-shot from the town; and as it often changes its bed, it frequently does a great deal of mischief. It runs at the foot of a rock of a prodigious height, and there is a stone-bridge over it. Near the town there is a sulphurous spring which supplies their baths with water, which is good against palsies and diseases of the nerves. E. Long. 7. 35. N. Lat. 47. 6.

BURGEON, in *Gardening*, a knot or button put forth by the branch of a tree in the spring. The word is formed from the French *bourgeon*, which signifies the same, formed from the Latin *burrio*, of *burra*. Burgeon amounts to the same with what is otherwise called eye, bud, or germ. Frosts are chiefly dangerous when the burgeons begin to appear. The burgeons have the same skin, same pith, same ligneous body, and the same insertions as the stalk.

BURGER, G. A. a celebrated German poet. See SUPPLEMENT.

BURGESS, an inhabitant of a borough, or walled town, or one who possesses a tenement therein. The word is also applied to the magistrates of some towns; as the bailiff and burgesses of Leominster.

Anciently, burgesses were held in great contempt; being reputed servile, base, and unfit for war; so that the gentry were not allowed to intermarry in their families, or fight with them; but in lieu thereof, were to appoint champions. A burgess's son was reputed of age, when he could distinctly count money, measure cloth, &c.

BURGESS is now ordinarily used for the representative of a borough-town in parliament. Burgesses are supposed to represent the mercantile part, or trading interest of the nation. They were formerly allowed, by a rate established in the reign of Edward III. two shillings a-day as wages. It is much to be regretted, that the members for boroughs bear above a quadruple proportion to those for counties. The right of election of burgesses depends on several local charters and customs: though by 2 Geo. II. c. 24. the right for the future shall be allowed according to the last determination of the house of commons concerning it: and by 3 Geo. III. c. 15. no freeman, except such as claim by birth, servitude, or marriage, shall be entitled to vote, unless he hath been admitted to his freedom twelve months before. No person is eligible as a burgess, who hath not a clear estate of 300l. a-year.

BURGRAVE, properly denotes the hereditary governor of a castle, or fortified town, chiefly in Germany. The word is compounded of *bourg*, town, and *graf* or *grave*, count. The burgraves were originally the same with what we otherwise call *castellans*, or *comites castellani*; but their dignity was considerably advanced under Rodolph of Hapsburgh: before his time they were ranked only as counts, and below the princes, but under him began to be esteemed on a footing with princes. In some parts, the dignity is much degenerated, especially in the palatinate. There were formerly, according to Leti, 15 families who enjoyed the

* See Soccage.

Burggrave
|
Burglary.

the title of burggraves, 13 of which are now extinct. But this is differently represented by others. In Bohemia the title of burggrave is given to the chief officer, or to him that commands in quality of viceroy. In Prussia, the burggrave is one of the four chief officers of the province. In Guelderland, the burggrave of Nimeguen is president of the states of the province.

BURGH. See **BOROUGH.**

BURGH, or DUN. See **DUN.**

BURGH-BOTE signifies contribution towards the building or repairing of castles, or walls, for the defence of a borough or city.

By a law of King Athelstan, the castles and walls of towns were to be repaired, and burgh-bote levied every year within a fortnight after rogation days. No person whatever was exempt from this service; the king himself could not exempt a man from burgh-bote; yet, in after times, exemptions appear to have been frequently granted; inasmuch, that, according to Cowel, the word *burgh-bote* came to be chiefly used to denote not the service, but the liberty or exemption from it.

BURGH-BRECHE, or brech, a fine imposed on the community of a town, or burgh, for the breach of peace among them.

BURGH-MAILS, were yearly payments to the crown of Scotland, introduced by Malcom III. and resembling the *FEE-FARM* rents of burghs in England. See **MAIL.**

BURGH-MASTER, an officer in the tin mines, who directs and lays out the meers for the workmen, &c. otherwise denominated bailiff and bar-master.

BURGHMASTER. See **BURGOMASTER.**

BURGHMOTE, the court of a borough. By the laws of King Edgar, the burghmote was to be held thrice in the year; by those of Henry I. 12 times.

BURGLARY, or NOCTURNAL HOUSE-BREAKING, (burgi latrocinium), which by the ancient English law was called *hamesucken*, a word also used in the law of Scotland, but in a somewhat different sense, has always been looked upon as a very heinous offence: not only because of the abundant terror it carries with it, but also as it is a forcible invasion and disturbance of that right of habitation which every individual might acquire even in a state of nature; an invasion which, in such a state, would be sure to be punished with death, unless the assailant were stronger. But, in civil society, the laws come in to the assistance of the weaker party: and besides that they leave him this natural right of killing the aggressor if he can, they also protect and avenge him in case the assailant is too powerful. And the law has so particular and tender a regard to the immunity of a man's house, that it styles it his *castle*, and will never suffer it to be violated with impunity; agreeing herein with the sentiments of ancient Rome. For this reason no outward doors can in general be broken open to execute any civil process, though in criminal causes the public safety supersedes the private*. Hence also in part arises the animadversion of the law upon eaves-droppers, nusancers, and incendiaries: and to this principle it must be assigned, that a man may assemble people together lawfully (at least if they do not exceed 11), without danger of raising a riot, rout, or unlawful assembly, in order to protect his house; which he is not permitted to do in any other case.

* See the article *Arrest.*

The definition of a burglar, as given us by Sir Ed-

ward Coke, is "he that by night breaketh and entereth in a mansion house, with intent to commit a felony." In this definition there are four things to be considered; the *time*, the *place*, the *manner*, and the *intent*.

Burglary.

1. The *time* must be by night, and not by day; for in the day time there is no burglary; i. e. if there be day-light or crepusculum enough, begun or left, to discern a man's face withal. But this does not extend to moonlight; for then many midnight burglaries would go unpunished: and besides the malignity of the offence does not consist so much in its being done in the dark, as at the dead of night; when all the creation, except beasts of prey, are at rest; when sleep has disarmed the owner, and rendered his castle defenceless.

2. As to the *place*. It must be, according to Sir Edward's Coke's definition, in a mansion-house: for no distant barn, warehouse, or the like, are under the same privileges, nor looked upon as a man's castle of defence; nor is a breaking open of houses wherein no man resides, and which for the time being are not mansion-houses, attended with the same circumstances of midnight terror. A house, however, wherein a man sometimes resides, and which the owner hath left only for a short season, *animo revertendi*, is the object of burglary, though no one be in it at the time of the fact committed. And if the barn, stable, or warehouse, be parcel of the mansion-house, though not under the same roof or contiguous, a burglary may be committed therein; for the capital house protects and privileges all its branches and appurtenances, if within the curtilage or homestall. A chamber in a college, or an inn of court, where each inhabitant hath a distinct property, is, to all other purposes as well as this, the mansion-house of the owner. So also is a room or lodging in any private house the mansion for the time being of the lodger; if the owner doth not himself dwell in the house, or if he and the lodger enter by different outward doors. But if the owner himself lies in the house, and hath but one outward door at which he and his lodgers enter, such lodgers seem only to be inmates, and all their apartments to be parcel of the one dwelling house of the owner.

3. As to the *manner* of committing burglary: there must be both a breaking and an entry to complete it. But they need not be both done at once; for if a hole be broken one night, and the same breakers enter the next night through the same, they are burglars. There must be an actual breaking; as at least, by breaking or taking out the glass of, or otherwise opening, a window; picking a lock, or opening it with a key; nay, by lifting up the latch of a door, or unloosing any other fastening which the owner has provided. But if a person leaves his doors or windows open, it is his own folly and negligence; and if a man enters therein, it is no burglary; yet, if he afterwards unlocks an inner or chamber door, it is so. But to come down a chimney is held a burglarious entry: for that is as much closed as the nature of things will permit. So also, to knock at a door, and, upon opening it, to rush in with a felonious intent; or under pretence of taking lodgings to fall upon the landlord and rob him; or to procure a constable to gain admittance in order to search for traitors, and then to bind the constable and rob the house; all these entries have been adjudged burglarious,

ous,

Burglary
B
Burgos.

ous, though there was no actual breaking: for the law will not suffer itself to be trifled with by such evasions, especially under the cloak of legal process. As for the *entry*, any the least degree of it, with any part of the body, or with an instrument held in the hand, is sufficient: as, to step over the threshold, to put a hand or hook in at a window to draw out goods, or a pistol to demand one's money, are all of them burglarious entries. The entry may be before the breaking, as well as after; for by statute 12 Anne, c. 7. if a person enters into the dwelling-house of another, without breaking in, either by day or by night, with an intent to commit felony, or, being in such house, shall commit any felony; and shall in the night break out of the same; this is declared to be burglary.

4. As to the *intent*; it is clear that such breaking and entry must be with a felonious intent, otherwise it is only a trespass. And it is the same, whether such intention be actually carried into execution, or only demonstrated by some attempt or overt act, of which the jury is to judge.

Burglary is a felony at common law, but within the benefit of clergy. Burglary in any house belonging to the plate-glass company, with intent to steal the stock or utensils, is by statute 13 Geo. III. c. 3. declared to be single felony, and punished with transportation seven years.

BURGOMASTER, BURGHERMASTER, *Bourgermester*, or *Burgmester*, the chief magistrate of the great towns in Flanders, Holland, and Germany. The power and jurisdiction of the burgomaster are not the same in all places, every town having its particular customs and regulations: at Amsterdam there are four chosen by the voices of all those people in the senate who have either been burgomasters or echevins. They dispose of all under offices that fall in their time, keep the key of the bank, and enjoy a salary but of 500 guilders; all feasts, public entertainments, &c. being defrayed out of the common treasury. The word is formed from the two Flemish words, *borger*, *burgess*, or *citizen*; and *mester*, *master*. Some express it in Latin by *consul*, others by *senator*.—Mr Brenau observes, that *burghermaster* in Holland, answers to what is called *alderman* and *sheriff* in England, *attorney* at Compeigne, *capitoul* at Thoulouse, *consul* in Languedoc, &c.

BURGOO, or BURGOUT, a sea-faring dish, made of whole oatmeal, or groats, boiled in water till they burst; then mixed with butter. It is a cheap and strengthening diet. Burgoo, otherwise called *loblolly*, is held by Cockburn very proper to correct that thickness of humours and costiveness to which the other diet of sailors much disposes them. Yet the burgoo victualing is the least liked of all their provisions, because of the scanty allowance of butter to it. The same author thinks it might be worth the consideration of those to whom the care of the seamen is committed, to contrive to render this food more agreeable to them.

BURGOS, a city of Spain, the capital of Old Castile, with an archbishop's see, erected in 1574. It is surrounded with mountains, which render the air very cold nine months in the year, and the other three excessively hot. It is seated on the declivity of a hill, on

the top of which there is a strong castle, and the lower part of the town is watered by the river Alançon. The principal avenue to the city is by a handsome bridge over this river, which leads to a beautiful gate, adorned with the statues of several kings of Spain. The town is large and populous; but the houses are ill built, and the streets are narrow and dirty, except some few, especially that which leads to the cathedral. There are several squares adorned with fountains and statues. The great square in the middle of the city is surrounded with fine houses, with piazzas to each. The cathedral church is a masterpiece of Gothic architecture, and one of the finest in all Spain. The church of the Augustines is remarkable for its beautiful and rich chapel of the holy crucifix. There are several fine convents and nunneries; one of which last contains 150 nuns, who must all be of noble extraction. They have likewise a royal hospital, very richly endowed; and at this place they speak the best Castilian, that is, the purest Spanish, in the kingdom. W. Long. 4. 7. N. Lat. 42. 20.

BURGUNDIONES, a part or branch of the Vin-dili or Wandili. Cluverius places them about the Warta, a river of Poland: though the conjectures on the seat of these people are doubtful; and no wonder, because the Roman expeditions terminated at the Elbe. They afterwards removed to the Cisalpin Germany, and at length to Celtic Gaul, and gave name to the duchy and county of Burgundy.

BURGUNDY, a late province or government of France, which now forms the three departments, of Cote d'Or, Saone and Loire, and Yonne. It contains, besides the government of Burgundy, La Bresse, La Bugey, and the district of Gex; having Champagne on the north, Lyonnais on the south, Franche Comte on the east, and Nivernois and Bourbonnois on the west. Its length from north to south is about 45 leagues, and its breadth from east to west about 30. It is very fertile in corn, wine, fruit, and tobacco; being watered by the Seine, the Debune, which falls into the Saone, the Brebince or Bourbince, the Armançon, the Oucke, and the Tille. There are some noted mineral springs in it, with subterraneous lakes, and plenty of ochre. For a long time it had dukes of its own, subordinate to the crown of France; but at last, Louis XI. upon the failure of the heirs male, seized upon it, and annexed it to his crown. The principal places are Dijon, Auxerre, Autun, Bourbon l'Ancy, &c.

BURIAL, the interment of a deceased person.

The rites of burial are looked upon in all countries, and at all times, as a debt so sacred, that such as neglected to discharge it were thought accursed: hence the Romans called them *justi*, and the Greeks *επιταφια*, *επιταφια*, *επιταφια*, words implying the inviolable obligation which nature has laid upon the living to take care of the obsequies of the dead. Nor are we to wonder that the ancient Greeks and Romans were extremely solicitous about the interment of their deceased friends, since they were strongly persuaded that their souls could not be admitted into the Elysian fields till their bodies were committed to the earth; and if it happened that they never obtained the rites of burial, they were excluded from the happy mansions for the term of 100 years. For this reason it was considered as a duty

Burgos
B
Burial.

Burial.

duty incumbent upon all travellers who should meet with a dead body in their way, to cast dust or mould upon it three times; and of these three handfuls one at least was cast upon the head. The ancients likewise considered it as a great misfortune if they were not laid in the sepulchres of their fathers; for which reason, such as died in foreign countries had usually their ashes brought home, and interred with those of their ancestors. But notwithstanding their great care in the burials of the dead, there were some persons whom they thought unworthy of that last office, and to whom therefore they refused it: such were, 1. Public or private enemies. 2. Such as betrayed or conspired against their country. 3. Tyrants, who were always looked upon as enemies to their country. 4. Villains guilty of sacrilege. 5. Such as died in debt, whose bodies belonged to their creditors. And, 6. Some particular offenders, who suffered capital punishment.

Of those who were allowed the rites of burial, some were distinguished by particular circumstances of disgrace attending their interment: thus persons killed by lightning were buried apart by themselves, being thought odious to the gods; those who wasted their patrimony forfeited the right of being buried in the sepulchres of their fathers; and those who were guilty of self-murder were privately deposited in the ground, without the accustomed solemnities. Among the Jews, the privilege of burial was denied only to self-murderers, who were thrown out to rot upon the ground. In the Christian church, though good men always desired the privilege of interment, yet they were not, like the heathens, so concerned for their bodies, as to think it any detriment to them, if either the barbarity of an enemy, or some other accident, deprived them of this privilege. The primitive Christian church denied the more solemn rites of burial only to unbaptized persons, self-murderers, and excommunicated persons who continued obstinate and impenitent, in a manifest contempt of the church's censures.

The place of burial among the Jews was never particularly determined. We find they had graves in the town and country, upon the highways, in gardens, and upon mountains. Among the Greeks, the temples were made repositories for the dead in the primitive ages; yet the general custom in latter ages, with them, as

well as with the Romans and other heathen nations, was to bury their dead without their cities, and chiefly by the highways. Among the primitive Christians, burying in cities was not allowed for the first 300 years, nor in churches for many ages after, the dead bodies being first deposited in the atrium or churchyard, and porches and porticoes of the church; hereditary burying-places were forbidden till the 12th century. As to the time of burial, with all the ceremonies accompanying it, see the article *FUNERAL Rites*.

BURICK, a town of Germany, in the circle of Westphalia, and duchy of Cleves, subject to the king of Prussia. It was taken by the French in 1672, who demolished the fortifications. It is agreeably seated on the river Rhine, over against Wesel, in E. Long. 6. 8. N. Lat. 51. 38.

BURIDAN, JOHN, a native of Bethune, in Artois, was one of the most celebrated philosophers of the 14th century. He taught in the university of Paris with great reputation; and wrote commentaries on logic, morality, and Aristotle's metaphysics. Aventinus relates, that he was a disciple of Ockam; and that, being expelled Paris by the power of the Realists, which was superior to that of the Nominalists, he went into Germany, where he founded the university of Vienna. From him came the proverb of the *ass of Buridan*, so famous in the schools. Buridan supposed a hungry ass fixed at an exactly equal distance between two bushels of oats: or an ass, as much pressed by thirst as hunger, between a bushel of oats and a pail of water, each of them acting equally on his senses. Having made this supposition, he desired to know what the ass would do? If he was answered that he would remain immovable, then he concluded he would die of hunger between two bushels of oats, or of both hunger and thirst, with corn and water within his reach. This appeared absurd, and brought the laughter on his side; but if it was replied, that the ass would not be so stupid as to die of hunger or thirst in such a situation, Then (said he), the ass has free will, or is it possible that of two equal weights one should outweigh the other? These two consequences appeared equally absurd; and thus Buridan, by this sophism, perplexed the philosophers, and his ass became famous in the schools.

Burial
Buridan
