ARTS, SCIENCES, AND MISCELLANEOUS LITERATURE;

ENLARGED AND IMPROVED.

THE SIXTH EDITION.

Illustrated with nearly six hundred Engravings.

VOL. IV.

INDOCTI DISCANT; AMEN MEMINISSE PERITI.

EDINBURGH:
PRINTED FOR ARCHIBALD CONSTABLE AND COMPANY;
AND HURST, ROBINSON, AND COMPANY, 90, CHEAPSIDE,
LONDON.

1828.
BOOK-BINDING is the art of gathering together and sewing the sheets of a book, and covering it with a back, &c. It is performed thus: The leaves are first folded with a folding-stick, and laid over each other in the order of the signature; then beaten on a stone with a hammer, to make them smooth and open well; and afterwards pressed. They are sewed upon bands, which are pieces of cord or packthread; six bands to a folio book; five to a quarto, octavo, &c.; which is done by drawing a thread through the middle of each sheet, and giving it a turn round each band, beginning with the first and proceeding to the last. After this the books are glued, and the bands opened and scraped, for the better fixing the pasteboards; the back is turned with a hammer, and the book fixed in a press between two boards, in order to make a groove for fixing the pasteboards; these being applied, holes are made for fixing them to the book, which is pressed a third time. Then the book is laid put to the cutting press, between two boards; the one lying even with the press, for the knife to run upon; the other above it, for the knife to run against; after which the pasteboards are squared.

BOOK-KEEPING

Is the art of recording mercantile transactions in a regular and systematic manner.

1. A merchant's books should contain every particular which relates to the affairs of the owner. They should exhibit the state of all the branches of his business, the connection of the different parts, the amount and success of the whole. They should be so full and so well arranged, as to afford a ready information in every point for which they may be consulted.

The matter which the books should contain is comprehended under the three following heads: First, The debts which are owing to the owner, and the debts which he owes to others. Secondly, The goods and other articles of property which belonged to him; the quantity and value sold, or otherwise disposed on; and the quantity and value which still remain in his possession. Thirdly, The amount of his stock when the books were opened; the profits he has obtained, and the losses he has suffered, since; and the amount of his stock at present.

That method of book-keeping which answers these purposes most clearly and concisely, is the best. The Italian method, by double entry, is generally preferred; at least, it is founded upon the most universal principles, and is the most convenient in extensive and complicated business; and the accountant who understands it, will find little difficulty in following, or even in inventing, other methods that are better accommodated to any particular purpose.

The Italian method requires three principal books; the Waste-Book, Journal, and Leger.

Sect. I. Of the Waste-Book.

1. The waste-book, or day-book, contains an exact register of all occurrences in business in the same order as
BOOK-KEEPING.

as they take place. It begins with an inventory of every thing belonging to the owner, a list of the debts due to him, and of the debts he owes to others: It is carried on with a full relation of all the money he receives or pays; of all the goods he buys or sells; and of every other occurrence in his business. Each article should be entered as soon as the transaction takes place, and should be clearly expressed in the plainest language. It should require no supply from the accountant's memory, but should be fully intelligible to any person, however unacquainted with the business; at the same time, it should be written with all convenient brevity; and, therefore, sometimes refers to invoices and other accounts, for particulars. The accountant's first care should be to have nothing defective or ambiguous; his second, to have nothing superfluous.

3. The date is written in text on the top of each page. The articles are separated from each other by a line: and the transactions of one day are separated from those of another by a double line, in the middle of which there is left a blank space for inserting the number of the day of the month. This book must be kept with greater care, as it contains the materials from which the other books are composed; and any error or defect will occasion a like one in the others. Besides, it is the book whose authority is trusted to, and which must be exhibited to judges, or arbitrators, when an account is disputed. As the journal is filled up from the waste-book, the authority of the former is esteemed more authentic, unless there be an obvious mistake through hurry; and either of these books is depended on rather than the leger, which, from its form, is more liable to error, and may be more easily vitiated by a fraudulent design.

4. As the waste-book contains the whole substance of the business, it may be applied so as to afford any information that can be wanted: but the labour of consulting it would be very great. For instance, if it were required to know how much any person owes us, we must look over the book from the beginning, and mark down every article in which we have dealt with him; or, if it were required to know what quantity of goods we should have on hand, we must look over the whole book, and mark down every article bought or sold. This operation would not only be found very tedious, but much exposed to the risk of omission. To prevent these inconveniences, another book is used, in which the articles are arranged in a methodical order. This book is called the Leger, and we shall consider it next; because the journal, though it comes before it in the order of writing, cannot be well understood, till the nature of the leger be explained.

SECT. II. Of the Leger.

5. In the leger, articles of the same kind are collected together; and, for that purpose, it is divided into many accounts, under which the different branches of business are arranged. Each account is introduced by a proper title, to explain the nature of the articles it contains; and articles of opposite kinds, which belong to the same account, are placed on the opposite pages of the same folio: for instance, money received on the one side, and money paid on the other; or goods bought on the one side, and goods sold on the other. The left-hand page is called the Debtor or Dr. side of the account, and the right-hand page the Creditor or Cr. side. The difference between the sums of the Dr. and Cr. sides is called the Balance.

Accounts in the leger are of three kinds, which answer to the three purposes of book-keeping mentioned § 1.

6. First, Personal Accounts. It is necessary to open an account for every person or company with whom there are any dealings on credit. At opening the books, if they be indebted to the owner, the debt is entered on the Dr.; but if he be indebted to them, it is entered on the Cr. During the course of the business, goods sold on trust, money paid, and every thing for which they are accountable to him, is entered on the Dr.; but goods bought on trust, money received, and every thing for which he is accountable to them, is entered on the Cr. The balance should be written as they owe them, when the Dr. side is greatest; and how much he owes them, when the Cr. side is greater.

7. Secondly, Real Accounts. By this we understand accounts of property, of whatever kind, such as ready money, goods, houses, lands, ships, shares in public companies, and the like.

The account of ready money is entitled Cash. On the Dr. side, the money on hand at opening the books is entered, and afterwards every article of money received. On the Cr. side there is entered every article of money paid out; and the balance shows how much ought to be on hand. The sum of the Dr. side of this account is always greater than that of the Cr. side.

8. Accounts of goods are generally ruled with inner columns for entering the quantities. When the books are opened, the goods on hand are entered on the Dr. side of the respective accounts; the quantities being placed in the inner, and the values in the outer column. Goods bought are entered in the same manner, and goods sold are entered on the Cr. side; the quantities and values being placed in the proper columns. Charges laid out on goods are entered on the Dr. side; and, when an incidental advantage arises from them, such as public bounty, it is entered on the Cr.

If the sums of the inner columns on the opposite sides be equal, it shows that the goods are all sold, and then the balance of the money-column shows the gain or loss. If the Cr. side be greater, it is gain: if the Dr. side be greater, it is loss. If the sum of the inner column be greater on the Dr. side, it shows that part of the goods are on hand; and their value must be added to the sum of the Cr. side, in order to determine the gain or loss.

9. If there be two or more kinds of the same sort of goods, they may be entered in the same account, allowing as many inner columns as there are kinds, and entering the quantities of each kind in the inner column reserved for it. This method exhibits the gain or loss on the whole goods; but does not show how much of it arises from each kind.

Or,
BOOK-KEEPING.

Or, a separate account may be opened for each kind, distinguishing the titles by the qualities, or by some other mark. Thus, one account may be kept for fine linen, another for coarse linen; one for port-wine crop 1787, another for port-wine crop 1788; one for rum from Jamaica, another for rum from Barbadoes. This method shows the gain or loss on each kind.

When there are more kinds than can be conveniently introduced in the same account, they may be divided into several classes, each class being placed in a separate account: and the particular kinds distinguished in inner columns. Thus the account of fine linen may be divided into several columns, for different kinds, distinguished by the number of threads in the breadth, or by any other convenient character.

10. Accounts of ships contain on the Dr. the value of the ship when the books are opened, and all expenses laid out thereon; on the Cr. all freights received. In like manner, accounts of houses or lands have the value of the subject, and all repairs or other charges, entered on the Dr. and all rents or other profits received on the Cr. If the subject be sold in whole or in part, the sale is entered on the Cr. And the balance after valuing the subject (if any) on hand, shows the gain or loss.

Accounts of property in the public funds, or shares in companies, public or private, contain the value, or money paid in, on the Dr. and the dividends received on the Cr. and are balanced as other real accounts.

Some persons open accounts for household furniture, plate, jewels, books, or the like. The entries on these accounts are made in the same manner.

In general, real accounts contain the value of the property, and all charges, on the Dr. and the sales and other returns on the Cr. When the account is to be balanced, if any property remains, the value thereof is placed on the Cr.; and then the balance shows the loss or gain, according as the Dr. or Cr. side is greatest.

11. Thirdly, Accounts of Stock, Profit and Loss, and its subsidiary accounts, which are sometimes called fictitious accounts.

The stock account contains on the Dr. the amount of the debts which the owner owes when the books are opened; and on the Cr. the amount of ready money, goods, debts, and property of every kind belonging to him: therefore the balance shows what his nett stock is; or, in case of bankruptcy, how much his debts exceed his effects. There is nothing further entered on this account till the books are balanced: and then, if the business has yielded profit, the nett gain is entered on the Cr.; if it has been unsuccessful, the nett loss is entered on the Dr.: after which, the balance shows the nett stock at the time the books are closed.

12. The Profit and Loss account contains every article of gain on the Cr. and every article of loss on the Dr. The balance shows the nett gain or loss, and is transferred to the proper side of the stock-account, as mentioned above. This account is partly composed of articles that occur while the books are running. For example; legacies received are entered on the Cr. goods destroyed on the Dr. The rest of the articles are those of gain and loss, arising from the real accounts, which are collected when the books are balanced.

13. It has been found convenient to open several subsidiary accounts, in order to shorten and methodize that of profit and loss. These contain certain articles of gain or loss, which may be reduced under distinct heads. They are in effect so many parts of the profit and loss account, and their balances are entered on the proper side of that account when the books are closed. The chief of these accounts are the following.

Interest account, Which contains on the Dr. sums paid or incurred for interest; and on the Cr. sums received, or become due for the same.

Commission account, Which contains on the Cr. articles of gain received or owing us for our trouble in transacting business for others. There are seldom any entries on the Dr.

Charges merchandise, Which contains on the Dr. all charges paid or incurred on the business, which do not belong to any particular account, as shop-rent, public burdens for trade, clerks wages, postage, and the like. If any of these should afterwards be charged to some other account, the sum so charged is entered on the Cr.

Proper expenses, Which contains on the Dr. money or any thing else, withdrawn from the trade for our private use. There are seldom any entries on the Cr.

The amount of this account, as well as the former, is not properly loss; but as it has the same effect in diminishing the stock, it is placed in the same manner to the Dr. of profit and loss.

Loss by bad debts, Which contains on the Dr. such debts as we reckon desperate; and on the Cr. any of these which may happen to be unexpectedly recovered.

Account of abatements, Which contains on the Dr. discounts allowed by us on payments received; on the Cr. discounts (if any) allowed to us on payments made. It is particularly useful in retail business, where discounts are often given, to show how much they amount to.

Insurance account, Which contains on the Cr. premiums received for making insurances; and, on the Dr. losses sustained on the same. There may be several accounts of this kind, such as insurance against sea-hazard, which is the most common; insurance against fire; insurance of lives; and insurance of debts. The balance shows the gain or loss which arises from being concerned in insurance.

More or fewer of these accounts may be used, according as the articles are frequent; and others may be invented to suit the purposes of the business which the books are kept for.

14. Every simple transaction in business belongs to two accounts, and must be entered on the Dr. of the one and on the Cr. of the other. Thus, when a person becomes indebted to us, the article he owes must be entered on the Dr. of his account; and, if it be for money paid him, it is also entered on the Cr. of cash; if for goods sold, it is entered on the Cr. of the account of goods; if for any thing delivered him by another person at our desire, it is entered on the Cr. of the deliverer's account; if for any wager or bargain, by which we are gainers, it is entered on the Cr. of profit and loss.
BOOK-KEEPING.

Leger. Thus, in whatever way the debt arises, it is entered on the Cr. of some other account, as well as on the Dr. of the person’s account who owes it.

In like manner, when we become indebted to any person, the article we owe must be entered on the Cr. of his account. If it be for money received, it is also entered on the Dr. of cash; if for goods bought, it is entered on the Dr. of the account of goods; if for any thing delivered to another person at our desire, it is entered on the Dr. of the receiver’s account; and if it be in consequence of a losing bargain, it is entered on the Dr. of profit and loss.

Again, when goods are received, the transaction is entered on the Dr. of the account of goods. If they be bought for ready money, it is also entered on the Cr. of cash; if on trust, it is entered on the Cr. of the seller; if they be exchanged for other goods, it is entered on the Cr. of the goods delivered; if they be obtained by some profitable business, without any return, it is entered on the Cr. of profit and loss.

When goods are delivered, the transaction is entered on the Cr. of the account of goods; and, if they be sold for ready money, it is also entered on the Dr. of cash; if on credit, it is entered on the Dr. of the purchaser; if exchanged for other goods, it is entered on the Dr. of the goods received; and, if they be given gratis, or destroyed, it is entered on the Dr. of profit and loss.

Lastly, when any article of loss occurs, the transaction is entered on the Dr. of profit and loss; and as we must either pay it in money or goods, or remain indebted to some person for it, it must be entered on the Cr. of cash, or of goods delivered, or of the person entitled to receive it. And, when an article of gain occurs, it is entered on the Cr. of profit and loss, and also on the Dr. of cash or goods, if money or goods be received; and on the Dr. of the person accountable for it, if not immediately paid.

Thus, every article in any account, whether personal or real, or belonging to profit and loss, corresponds to some other article on the opposite of a different account. The same sum is entered on the Dr. of one account and on the Cr. of the other; and it follows from this, that, if all the accounts in the leger be added, the amount of the same of the Dr. will be equal to those of the Cr.

SECT. III. Of the Journal.

15. The journal is a fair record of all the transactions compiled from the waste-book, in the same order as they stand there; but expressed in a technical style, that it may be transferred to the leger with more ease.

When we are to enter any article in the journal, we must consider which accounts in the leger it will require to be placed to, both on the Dr. and Cr. and write [the former account] Dr. to [the latter account]; then we annex an explanation of the article, and place the sum in the money-column.

Example.

Waste-book.)  Sold for ready money, 30 yards linen, at 32. L.4.10 — Journal.)  Cash Dr. to Linen, Sold 30 yards, at 32. L.4.10 —

Here we consider, that the article must be entered on the Dr. of cash, because money is received; and on the Cr. of linen, because linen is delivered: Therefore we write Cash Dr. to Linen, to which we annex the nature of the transaction. The article thus entered is called a journal-post; Cash is called the Dr.; Linen the Cr.; the words “Cash Dr. to Linen,” the Entry, and the following words the Narration.

The purpose of expressing the article in this form, is to point out the accounts in the leger, to which it will require to be posted, and thereby enable the accountant to write the leger with more ease than he could do if it were filled up immediately from the waste-book.

The learner will be able, from this example, to enter any simple article in the journal, providing he knows the accounts to which it should be posted on the Dr. and Cr. of the leger. This must be collected from the description of the leger accounts already given § 6—13. and the nature and tendency of the article.

I. Every thing received, or person accountable to us, is Dr.

II. Every thing delivered, or person to whom we are accountable, is Cr.

17. As the whole art of writing the journal depends on a proper choice of the Drs. and Crs. we shall give some particular rules for the most common cases, and a few examples for the illustration and practice of each.

Rule I. The person to whom any thing is delivered is Dr. to the thing delivered, when nothing is received in return.

Therefore when money is paid, the receiver is Dr. to cash.

When goods or other property is sold on credit, the purchaser is Dr. to the thing sold. Thus,

Waste-book.)  Paid John Bell in full L.52 — Journal.)  John Bell Dr. to Cash, paid him in full 52 —

Waste-book.)  Sold 50 yards cloth to J. Hill, at 12s. L.30 — Journal.)  J. Hill Dr. to Cloth, sold him 50 yards, at 12s. 30 —

18. Rule II. A thing received is Dr. to the person from whom it is received, when nothing is delivered in return.

Therefore, when money is received, Cash is Dr. to the payer: when goods are bought, the goods are Dr. to the seller. Thus,

Waste-book.)  Received from Thomas Gay in full L.72 — Journal.)  Cash Dr. to Thomas Gay, received in full 72 —

Waste-book.)
BOOK-KEEPING.

Waste-book. Bought from J. Hawley 60lb. wool, at 9d. L. 2 5
Journal. Wool Dr. to J. Hawley, bought 60lb. at 9d. 2 5

19. Rule III. A thing received is Dr. to the thing given for it.

Therefore goods bought for ready money are Dr. to cash.

When goods are sold for ready money, Cash is Dr. to the goods.

When goods are bartered, the goods received are Dr. to the goods delivered. Thus,

Journal. Wine Dr. to Cash, bought 10 hds. at 15l. 150
Waste-book. Sold for ready money 100 gallons rum, at 9d. 45
Journal. Cash Dr. to Rum, sold 100 gallons, at 9d. 45
Waste-book. Bartered 3 hds. wine, at 15l. for 100 gallons rum at 9d. 45
Journal. Rum Dr. to Wine, received 100 gallons at 9d. in barter for 3 hds. at 15l. 45

20. Rule IV. Goods and other real accounts are Dr. for all charges laid out on them. If money be laid out, they are Dr. to Cash; if any thing else be delivered, they are Dr. to the thing delivered: if the charge be taken in trust, they are Dr. to the person to whom it is due. Thus,

Waste-book. Paid for repairs to ship Traffic 18
Journal. Ship Traffic Dr. to Cash, paid for repairs 18
Waste-book. Delivered wood from my timber yard for repairing the Angel-tavern 15
Journal. Angel Tavern Dr. to Wood, delivered for repairing the same 15
Waste-book. Due to William Carpenter for repairs to the Angel-tavern 12
Journal. Angel-tavern Dr. to William Carpenter, due him for repairs 12

21. Rule V. When rents of houses or lands, freights of ships, bounties on goods, or any other profits from real accounts, are received, Cash is Dr. to the account from which the profit arises: if any thing besides money be received, the article received is Dr.: if they remain unpaid, the person who owes them is Dr. Thus,

Waste-book. Received freight of the ship Traffic for a voyage to London 35
Journal. Ship Traffic Dr. to Cash, received freight to London 35
Waste-book. Received 100 barrels salmon, being the rent of Inver fishery, at 52s. 260
Journal. Salmon Dr. to Inver fishery, received the rent, being 100 barrels, at 52s. 260

Waste-book. John Public owes me a year's rent of the Angel-tavern 52
Journal. John Public Dr. to Angel-tavern, for a year's rent due by him 52

22. Rule VI. When an article of loss occurs, Profit and Loss, or some subsidiary account, is Dr. If the loss be paid in ready money, it is Dr. to Cash: if it be paid in any thing else, it is Dr. to the thing delivered. If it remain unpaid, it is Dr. to the person to whom it is owing. Thus,

Waste-book. Given my daughter at her marriage 500
Journal. Profit and Loss Dr. to Cash, given my daughter at her marriage 500
Waste-book. Taken for family use from my granary 3 hails meal, at 13s. 4d. 2
Journal. Profit and Loss [or Proper expenses] Dr. to Meal, taken for family use, 3 hails, at 13s. 4d. 2
Waste-book. Due James Rich for a year's interest on 1000l. at 4 per cent. 40
Journal. Profit and Loss [or Interest account] Dr. to James Rich, due him a year's interest on 1000l. at 4 per cent. 40

23. Rule VII. When an article of gain occurs, that is not immediately connected with any real account, Cash, the article received, or the person accountable for it, is Dr. to Profit and Loss, or to some subsidiary account. Thus,

Waste-book. Received in a gift from my father 100
Journal. Cash Dr. to Profit and Loss, received from my father 100
Waste-book. Received in like manner at opening shop, 100 yards cloth at 12s. 60
Journal. Cloth Dr. to Profit and Loss, received from my father at opening shop, 100 yards, at 12s. 60
Waste-book. James Barbour owes me a year's interest of 1000l. 50
Journal. James Barbour Dr. to Profit and Loss [or Interest account] due by him for a year's interest of 1000l. 50

24. Rule VIII. When one person pays money, or delivers any thing else to another on our account, the person who receives it is Dr. to the person who pays it. Thus,

Waste-book. James Goldsmith has paid the Bank of Scotland on my account, L. 100
Journal. Bank of Scotland Dr. to James Goldsmith, paid them by him 100
Waste-book. Arthur Young has delivered James Baker 100 qrs. wheat for which I am to account to him, at 30s. 350
Journal. James Baker, Dr. to Arthur Young, for 100 qrs. of wheat delivered him on my account, at 30s. 350

Payments of this kind are often transacted by bills of exchange.

25. These
BOOK-KEEPING.

25. These examples will make the learner acquainted with the form of the journal, and the rules extend to the greatest part of the simple transactions that occur in domestic trade. We may observe, that the technical sense of the words Dr. and Cr. has an analogy to their meaning in common language, but is not precisely the same. Thus in Ex. 1. Rule VIII. the journal entry is, Bank of Scotland Dr. to James Goldsmith; by which we are not to understand that the bank is indebted to James Goldsmith; for a debt between them has no connection with our business, and therefore ought not to be entered in our books; the meaning of the entry is, that the bank becomes indebted to us by the transactions narrated; and that we become indebted to James Goldsmith by the same.

26. An article which contains more Drs. or more Crs. than one, is called a complex post. The form of these will appear from the following examples.

Ex. 1.] Sold William Drapier,
25 pieces cloth, at 15l. per piece L.375 —
130 stones wool, at 5s. 6d. per stone 35 15 — L.410 15 —

If the two articles sold to William Drapier were entered separately in the Waste-book, and transferred to the Journal by Rule I. they would stand thus:

William Drapier Dr. to Cloth, sold him
25 pieces, at 15l. L.375 —
William Drapier Dr. to Wool, sold him
130 stones, at 5s. 6d. 35 15 — L.410 15 —

And if these were posted to the leger, there would be two articles placed to the Dr. of William Drapier, one to the Cr. of Cloth, and one to the Cr. of Wool. But the sales may be entered in the form of one complex journal post, as follows.

William Drapier Dr. to Sundries,
To Cloth, for 25 pieces, at 15l. L.375 — To Wool, for 130 stones, at 5s. 6d. 35 15 — L.410 15 —

And then there is only one article on the Dr. of William Drapier in the leger.

Ex. 2.] Sold 10 pieces of cloth to W. Drapier, at 15l. L.150 — 12 ditto to J. Mercer, at 18s. 180 — — — — — — — — L.330 — — — — — — — — 22

This example also falls under Rule I. But whereas there was one Dr. and two Crs. in the former example; there are two Drs. and one Cr. in this: William Drapier and John Mercer, the purchasers, are Drs. for their respective quantities; and cloth, which is the only thing delivered, is Cr. for the whole quantity. The journal post is,

Sundries Drs. to Cloths,
W. Drapier, for 10 pieces, at 15l. L.150 —
J. Mercer, for 12 ditto at 15l. 180 — — — — L.330 — 22

Ex. 3.] Bought from H. Hood,
5 puncheons rum, at 42l. L.210 — 3 hds. claret, at 33s. 99 —
2 pipes madeira, at 56s. 112 — — — — — — — — — L.421 —

This example falls under Rule II. The articles received, rum, claret, and madeira, are Drs.; and the person from whom they are received is the only Cr.

Sundries Dr. to Henry Hood,
Rum, for 5 puncheons, at 42l. L.210 —
Claret, for 3 hds. at 33s. 99 —
Madeira, for 2 pipes, at 56s. 112 — — — — — — — L.421 —

Ex. 4.] Bt. 50 qrns. wheat from J.
Tull, at 35s. L.870 10 —
12 from S. Ellis, 36s. 21 12 — — — — — — — — — L.109 2 — 62

This example also falls under Rule II. There is only one Dr. wheat being the only thing received; and two Crs. because it is received from different persons.

Wheat Dr. to Sundries,
To J. Tull, for 50 qrns. at 35s. L.870 10 —
To E. Ellis, for 12 qrns. at 36s. 21 12 — — — — — — — — — L.109 2 — 62

In like manner, examples might be given of complex posts under every rule, which contained either several Drs. or several Crs.; but as it is unnecessary to enlarge so far, we shall only add a few examples of cases, in which the different parts of the complex article fall under different rules.

Ex. 5.] Sold 150 qrns. beans to A. Arnott, at 13s. 4d. L.100 —
75 ditto to S. Berry, at 13s. 4d. 50 —
18 ditto for ready money, 13s. 2d. 11 17 —
243 — — — — — — — — — — — L.161 17 —

Here beans are delivered, some to different purchasers on trust, and some for ready money. The purchasers are Drs. for the quantity sold to each, by Rule I.; Cash is Cr. for the quantity sold for ready money, by Rule III.; and beans are Cr. for the whole.

Sundries Dr. to Beans,
A. Arnott, for 150 qrns. at 13s. 4d. L.100 —
S. Berry, for 75 13s. 4d. 50 —
Cash, for 18 13s. 2d. 11 17 — — — L.161 17 —

Ex.
BOOK-KEEPING.

Ex. 6. Bought from David Young
8 cwt. 3 qrs. copper, at 121.
per cwt. 1.105 —
Paid in part.
Balance 1.50 —
11.105 —
Here the article received, copper, is the only Dr.; but as it is bought partly for ready money, and partly on credit, it is Dr. to cash for the value of the former, by Rule III; and to the seller for the value of the latter, by Rule II.

Copper Dr. to Sundries.
For 8 cwt. 3 qrs. at 121. per cwt.
1.105 —
To Cash in part.
1.50 —
To D. Young, for balance due him, 55 —
11.105 —
Ex. 7. James Wilson being bankrupt, I have accepted a composition on the debt due by him to me of 150l. and discharged the same.
The composition received, at 15s. per L. is.
1.112 10 —
And the balance lost 37 10 —
1.150 —
Here the whole debt of 150l. due by James Wilson, is cancelled; and he must therefore be stated as Creditor, for that sum. Cash is Dr. for the sum received, by Rule II.; and Profit and Loss, or Loss by bad debts, for the rest, by Rule VI.

Sundries Dr. to James Wilson,
Cash, for compt. on 150l.
at 15s. per L.
1.112 10 —
Profit and Loss, for balance lost 37 10 —
1.150 —
Ex. 8. Shipped for William Smith, per the Bonadventure, Forbes, from Leith to London,
1000 yards linen, at 1s. 2d.
1.58 6 8
600 lb. leather, bought
from J. Currier, at 1s.
30 —
Paid charges at shipping
13 4 —
1.89 —
Here William Smith is Dr. for the amount of the cargo; he is debtor to linen for the quantity delivered, as by Rule I. and to J. Currier for the leather delivered by him, by Rule VIII. and to cash for the charges paid by us, by Rule I.

William Smith Dr. to Sundries,
To Linen, for 1000 yards
at 1s. 2d.
1.58 6 8
To J. Currier, for 600 lb.
leather at 1s.
30 —
To Cash, for charges at shipping
13 4 —
1.89 —
27. The learner may be assisted in understanding these and other complex posts, by resolving them into simple ones. Most of them might have been stated in that manner; and the complex form is only preferred for abridging the leger. In some articles the different classes are so connected, that they cannot be separated with propriety.

The narration is sometimes equally diffused through the post, after the Drs. and Crs. as in the five first examples. Sometimes the chief circumstances are narrated before the Drs. or Crs. be specified, as in Ex. 6.; sometimes after the first, as in Ex. 7.; and sometimes at the end, as in Ex. 8.

28. In some articles, there are both more Drs. and more Crs. than one. These may be entered in one journal-post, Sundries Dr. to Sundries, specifying first the Drs. and then the Crs. But, as this method is somewhat confused, we would recommend it as a better way to divide the transaction into two journal-posts; so that the first may contain only one Dr. and the second only one Cr.

Ex. Bartered with James Fotheringal
100 pieces osnaburghs, at 12s.
100 lb. thread, at 3s. 6d.
17 10 —
For 10 bds. lintseed, at 50s.
500 yds. linen, at 1s. 6d.
37 10 —
And received the balance in money
15 —
1.77 10 —

JOURNAL. Sundries Dr. to Sundries.
Lintseed, for 10 bds. at 50s.
1.25 —
Linen, for 500 yds. at 1s. 6d.
37 10 —
Received in barter from J. Fotheringal
Cash, for balance
15 —

1.77 10 —
To Osnaburghs, for 100 pieces,
at 12s.
1.60 —
To Thread, for 100 lb. at 3s. 6d.
17 10 —
Delivered him in barter,
1.77 10 —
Or rather,
Sundries Dr. to James Fotheringal.
Lintseed, for 10 bds. at 50s.
1.25 —
Linen, for 500 yds. at 1s. 6d.
37 10 —
Received in barter
Cash, received balance
15 —
1.77 10 —

James Fotheringal Dr. to Sundries.
To Osnaburghs, for 100 pieces,
at 12s.
1.60 —
To Thread, for 100 lb. at 3s. 6d.
17 10 —
Delivered in barter
1.77 10 —
29. It is neither practicable nor necessary to enumerate all kinds of complex posts that may occur in business. We shall here only mention the entries which occur at opening the books.
The first journal post contains the substance of the inventory. The entry is Sundries Dr. to Stock; the particular Drs. are Cash, the different kinds of goods and other property belonging to us, and the persons indebted to us.

The
BOOK-KEEPING.

The second journal-post contains the debts due by us.

The entry is, Stock Dr. to Sundries; the particular CRA. are the persons to whom we are indebted.

The form of these entries is more fully exhibited at the beginning of the following sets.

30. The journal should be written by one person, in a fair hand and at leisure hours. The articles are separated, and the titles and dates marked in the same manner as in the waste-book, § 3. The entries are written in half-text for ornament and distinction. In the inventory, the designation (or the business, station, and place of residence) of every person is mentioned; and the same is done the first time that any name occurs in journal-entry. At other times it is sufficient to enter the name without the designation, unless we have dealings with two persons of the same name; in which case, it is always necessary to annex the designation, in order to distinguish them, The narration should be complete, without referring to the waste-book; and so clear, that every person, acquainted with the style of the journal, may understand it with ease. When the post is written, we mark a dash / against the article, on the margin of the waste-book, to show how far the writing of the journal is advanced.

SECT. IV. Of Posting and Balancing the Leger.

31. The first thing to be done in the leger, is to allot a proper space for each account. The accounts may be either opened in the same order that they occur in the journal; or accounts of the same kind may be placed together, the personal accounts in one part of the leger, and the real accounts in another. The accounts of Stock and Profit and Loss are generally placed at the beginning. The room which each will require cannot be exactly known, but it must be conjectured from the number of transactions that are likely to follow.

The number of the folio is marked in strong text at each corner of the top-line; and the titles of the accounts are written in fair text through both folios, if necessary. The designations of the personal accounts may be written in half text, or Italian hand: and some write the titles in Saxon hand for ornament. The word Dr. is prefixed to the title on the left-hand page; and Contra Cr. annexed to it on the right-hand page.

32. Next, An Index must be provided for pointing out the folios where the accounts are opened. The titles of the accounts are entered alphabetically in the index, and the number of the folio annexed. Personal accounts are entered by the first letter of the surname; companies, by the first letter of the surname of the first partner; and all other accounts by the first letter of the first word. The most convenient kind of index is a long narrow book, of 24 leaves, one for each letter of the alphabet. A is marked on the top of the first leaf, and the paper pared away below it; B is marked on the second leaf under A; and the other letters on the following leaves, in the same manner; by means of which we can turn at once to any letter required.

33. In posting the leger, proceed by the following directions. First, look for the Dr. of the journal-post in the index, under the proper letter, and this directs you to the folio of the leger where the account is, if it be already opened; if not, you must allot a space for it, write the title, and enter it in the index. Then enter the article on the left-hand page of the account under the title of the former article, by writing the date on the margin, and the name of the creditor on the line, with the word To prefixed, and a short narration of the transaction annexed, and inserting the sum in the money column, and the quantity, if it be an account of goods, in the inner column. Then turn to the account of the Cr. of the journal-post, and enter the article in the right-hand page, prefixing the word By to the name of the Dr.

34. This being done, turn to the journal, and mark on the margin the number of the folios to which the article is posted. The figures which point out the reference to the Dr. and Cr. folios should be separated by a line: for example, if the Dr. entry be on the third folio, and the Cr. entry on the fifth, the reference is marked . These figures show how far the posting is advanced, and are useful in comparing the books.

The figures for dates or references should be written in a lighter hand than the figures in the columns for money or quantity.

35. There is often a reference-column ruled in the leger, for pointing out the other entry, corresponding to any article. In this column, the folio of the Cr. entry is marked against the Dr. article, and the folio of the Dr. entry against the Cr. article.

Sometimes the accounts are numbered according to their order in the leger; and the references, both in the journal and leger, point out the number of the account instead of the folio.

36. In complex posts turn to the several Drs. or Crs. in their order, and enter the articles according to the foregoing directions; placing the sums belonging to each in the money-column against their respective entries.

37. An article in the leger is generally comprehended in one line. The narration should be as full as can be contained in that bounds. If it cannot be narrated completely, the journal is referred to for further particulars, by writing per Journal, (or p. J.), either after an incomplete narration, or immediately after the Dr. or Cr. when there is no room for a proper narration. In complex posts there can seldom be any narration annexed to the single Dr. or the single Cr. The entry is generally to To Sundries per J. or By Sundries per J. If the sense of the whole article can be narrated, it should be done; but it is improper to narrate the first or any other part of the article, and omit the others.

38. When the space allotted for an account in the leger is filled up, the account must be transported to another folio. For this purpose add the columns on both sides, and write against the sum, Transferred to folio , inserting the number of the folio where the new account is opened, in the reference column, or on the line, if no reference-column be used. Then, after titling the new account, and entering the number of the folio in the index, write on the Dr. To amount brought from folio , inserting the number of the folio
BOOK-KEEPING.

When either side of an account is full, both sides should be transported, and diagonal lines drawn, to fill up the vacant space of the side which requires it. The books should be written up as frequently as can be done conveniently; so that the journal may keep pace nearly with the waste-book, and the leger with the journal. Each book should be carefully revised, and compared with the book from which it is posted. In comparing the leger, observe the following directions:

Begin with the first journal post, and turn to the folio of the leger where the Dr. is entered, which you are directed to by the marginal reference, and compare the date, entry, and sum. If you find them to correspond, it is well; if not, the leger must be altered till it correspond with the journal. Then place a dot before the reference-figure in the journal, and a mark \( \times \) before the sum in the leger.

Proceed in the same manner to compare the Cr. of the journal post, and all the following posts in their order. The dots in the journal show how far the comparison is advanced, and the marks in the leger show what articles are compared. The sums of accounts transported should be left blank till the books be compared; as an error in any article will occasion an alteration in the sum.

Some accountants correct all errors in the leger, without erasing anything, by the following methods: 1st, If the sum be entered too small, they make a second entry for the deficiency. 2d, If it be entered too large, they make an entry on the opposite side for the excess. 3d, If it be entered on the wrong side of the account, they enter it twice on the other; once, to counterbalance the error, and a second time for the true entry. 4th, If it be entered on a wrong account, they charge the wrong account Dr. to, or Cr. by, the right one.

We do not much approve of these methods, as they give the books a confused appearance; and would rather recommend the following rules: 1st, If an article be omitted, do not attempt to interline at the place where it should have been; but insert it under the last article when you discover the omission, and make a cross \( \times \) against it on the margin, and another at the place where it should have been. 2d, If you discover a mistake immediately when committed, correct it, without cancelling anything, as in this example. To Cash, say, To James Spiers received to account. 3d, If you have written a line entirely wrong, or in a wrong place, write the word Error at the end, prefix a cross, and omit or cancel the sum. 4th, Cancel errors, by drawing a line lightly through them, so that the old writing may still be legible; by which it will be evident, that the book has not been vitiated for a fraudulent purpose. The same method should be followed in correcting errors in the journal.

When the comparison of the books is finished, glance over the leger, to observe if the mark of comparison be affixed to every article. If not, you must turn to the journal, and observe if the articles be right which had been marked.

Because the whole sum of the Dr. side of the leger should be equal to the whole sum of the Cr. § 14. it is proper to try if they correspond. For this purpose, you may add the Dr. of every account, except such as are already balanced, placing the sums in an inner column, and extending them at the end of one or more folios, as you find most convenient, to the outer column; and as you go along add the Cr. in the same manner. If the sum total of both sides be equal, it gives a presumption that the books are right; if they differ, there is certainly some mistake. This is called the Trial-balance. The labour bestowed upon it is not lost, as the sums may be reserved for assisting us to collect the balances: the method of which will be explained afterwards.

If the sums of the trial balance do not correspond, the books must be examined again. For this purpose, begin with the first article on the Dr. side of the first account, and turn to the account where the corresponding entry is, which you will find by the figure in the reference-column. If the articles agree, mark them with a dot. Proceed in like manner with the other articles on the Dr. of the first account; then with the articles on the Cr. of the same; and then with the following accounts in their order, till the error or errors be discovered. In complex entries, observe if the amount of the sums on one side be equal to the sum on the other. When you come to a dotted article, you may pass it by, because it has been examined already.

If the errors be not discovered at the first revision, you must repeat the same operation again, till you bring the books to balance. Marks different from the former ones, or differently placed, may be used, to signify that an article has been examined a second or third time. As the detection of errors is the most tedious and disagreeable part of book-keeping, the accountant will be induced to guard against them with all possible care, when he has once experienced the trouble which they occasion.

Before we explain the method of balancing the books, it will be proper to direct the learner how to balance particular accounts. When we settle accounts with any person, and ascertain how much is owing at either hand, it is necessary to balance his account in the leger, and open a new one, beginning with the sum that was due according to the settlement; and when we clear accounts again, we must go back to that article, and no farther.

If any articles be charged on either side, at the time of settling, they must be immediately entered on the waste-book; from which they will pass in course to the journal and leger; and a remark must be entered in the waste-book, that the account was settled, and the balance transferred to the proper side of the new account. This remark is transcribed in the journal; and the leger account is balanced, when it occurs, in the course of posting.

If the balance be due to you, write on the Cr. By balance due to him to Dr. new account, and insert the sum due you; after which, the amount of both sides will be equal. Add the account, placing the sums opposite to each other; and, if the sides be unequal, draw a diagonal line through the vacant space of the shorter side, and close the old account by drawing lines under the sums. Then open the new account immedi-
BOOK-KEEPING.

Post in and Balancing the Leger.

45. Sometimes when an account is balanced, one or more articles are left out on purpose: for example, goods lately bought on credit, may be left out, and the settlement may only relate to articles of longer standing. When this is the case, if the articles omitted be on the Dr. of the leger, we write on the Cr. thus, "By articles sold him since 1st January replaced:" and when we have balanced the account, and opened a new one, we write on the Dr. "To articles replaced at settling, furnished since 1st January:" or, if the articles were left out for any other reason, we explain the same in the narration. If the omitted articles be on the Cr. the like entries are made on the opposite sides. It should be noticed in the waste-book and journal when this operation is necessary.

47. When we post any common article from the journal, we enter the sum on the Dr. of one account, and on the Cr. of another: when we balance an account, we place the balance on the sum of the old account, and on the Cr. of the new one, or contrariwise: and when we replace an article, as above directed, to the Dr. or Cr. of the old account, we place it after balancing to the Cr. or Dr. of the new one. Thus, in those entries, as well as in common posts, there are like sums entered on the Dr. and Cr. of the leger, and the general equality of the sides is still preserved.

48. Merchants generally balance their books once a-year. The design of this operation is, to collect the various branches of their business, diffused through the books, into a concise abstract; to ascertain their gain or loss since the last balance; and exhibit the present state of their funds. If the business be of such a kind, that most of the branches naturally come to an issue at a certain time of year; that time is the proper one for making the balance. Otherwise the end of the year, or the least busy time, may be chosen.

49. It is proper, before balancing, to settle as many personal accounts as possible; to clear all arrears and small charges; to take an exact inventory of the goods on hand, as far as can be done; and affix a moderate value to each article, according to the current prices at the time; such a value as you would be willing at present to buy for. It is more proper to value the goods on hand in conformity to the current prices, than at prime cost; for the design of affixing any value is to point out the gain or loss, and the gain is in reality obtained so soon as the prices rise, or the loss suffered so soon as they fall; therefore it is impossible to make up a just state of the affairs, unless the present prices be attended to.

50. These things being done, proceed to make the balance as follows: Prepare two sheets of paper, ruled with money-columns: in the form of Dr. and Cr. write Profit and Loss as the title of the first, and Balance as the title of the second.

Prepare also some paper for computing the balances, and mark down the folios, titles, and sums of each account in the leger, in a regular order. If a trial-balance was made, the sums may be transcribed from it, and Balance Pass by such accounts as are already closed; also the accounts of Stock and Profit and Loss, which are always the last of being balanced. Then subtract the lesser sum from the greater, and enter the difference on either of the sheets that the nature of the article points out, and on the side of that sheet which corresponds to the greater sum of the account. More particularly,

In personal accounts, enter the difference, which is the debt owing to you, or by you, on the proper side of the balance-sheet.

In the cash account, enter the difference, which is the money in hand, on the Dr. side of the balance-sheet.

In accounts of goods or other property, if there be nothing remaining on hand, enter the difference, which is the gain or loss, on the proper side of the profit and loss sheet.

If the whole be still on hand, enter the present value on the Dr. of the balance-sheet; and if this be different from the prime cost, charges included, enter the difference in the proper side of the profit and loss sheet.

If part be sold, and part on hand, place the value of the quantity on hand under the sum of the Cr. and add them. The sum is the whole return that will be obtained, if the rest of the goods be sold at the estimated value; and this, being compared with the sum of the Dr. which is the whole expense, shows the gain or loss. Enter the same in the proper side of the profit and loss sheet, and enter the quantity and value on hand on the Dr. of the balance-sheet.

Observe if the quantities in the inner columns be equal on both sides, when the goods are all sold; or, if the difference, when only part is sold, be equal to the quantity on hand. If they correspond, you have a just account of the goods. If the Dr. be greater, there is something amiss, which you must enter on the Dr. of the balance-sheet, and mark the cause of the deficiency, as intake, waste, or the like. If the Cr. be greater, there is an excess, which you must enter on the Cr. of the balance-sheet, together with the occasion of it, as difference of measure, or the like.

In accounts subsidiary to profit and loss, enter the difference on the proper side of the profit and loss sheet.

When there is nothing written on one side of an account, enter the sum of the article or articles on that sheet which the kind of the account points out.

51. When you have collected all the balances, sum up both sheets, and add to the profit and loss sheet the sums of the profit and loss account in the leger: then subtract the lesser sum from the greater.

This being done, mark the sums of the stock-account on your computation paper, and add thereto the balance of the profit and loss sheet on the side which corresponds with the greater sum of that account: then subtract the lesser sum from the greater. The remainder will be equal to the difference of the sides of the balance-sheet, if the books be right, and the balances exactly collected.

52. We shall prove that this equality must always hold,
BOOK-KEEPING.

Posting and Balancing the Leger.

hold, from the nature of the articles collected. The Dr. of the balance-sheet contains every kind of property belonging to you, and every debt owing to you; and the Cr. contains every debt owing by you: therefore the difference of the sides shows what your nett estate amounts to. The profit and loss sheets, when the articles from the leger are included, contain every thing you have gained on the Cr. and every thing you have lost on the Dr.; and the difference of the sides is your nett gain or loss. The stock-account contained your effects and debts at the time the books were opened; and therefore, when the gain or loss is added to the proper side, it must show the extent of your nett estate at present. Thus the stock-account and the balance-sheet both point out how much you are worth at present; the one from your former stock, allowance being made for your gains or losses; the other from a view of your present effects and debts; and they will correspond, because both must be agreeable to the truth, if the books be correct.

53. Though the books must balance, if free from error, yet it is sometimes difficult to adjust them exactly, especially when the business is extensive, and the errors trifling. If there be still a difference, which we do not think it worth while to make further search for, we may close the books, by making Profit and Loss Dr. or Cr. for the same. This introduces an article on one side of the leger, which has none corresponding to it on the other, but is balanced by some undiscovered error.

54. The balance being struck, your next work is to close the books. Every article in the leger should be posted from the journal; therefore, the most regular way of finishing both is by inserting the following articles in the journal, and posting them in the common manner to the leger.

1st, Profit and Loss Dr. to Sundries, for loss, on the following accounts. The particulars are taken from the Dr. of the Profit and Loss sheet.

2d, Sundries Dr. to Profit and Loss, for gain, on the following accounts. The particulars are taken from the Cr. of the Profit and Loss sheet.

3d, Balance-account Dr. to Sundries, for debts and property belonging to me.

4th, Sundries Dr. to balance-account, for debts due by me. The particulars of this and the former are taken from the respective sides of the balance-sheet.

5th, Profit and Loss Dr. to Stock for nett gain; or Stock Dr. to Profit and Loss, for nett loss.

6th, Balance-account Dr. to Stock for nett stock.

55. When the four first of these articles are posted in the leger, all the personal, real, and subsidiary accounts will balance, and you may add them as you go along. In accounts of goods, if there be any deficiency, you must enter it on the Cr. in the inner columns; and, if there be any outcome, you must enter it on the Dr. before you add the account. Then the sums of every account and every column on the opposite side will be equal.

The only accounts that remain open are, Profit and Loss, Stock and Balance. The fifth post balances the profit and loss account, and the sixth balances the stock-account. It was noticed, § 14, that the whole sums of Dr. and Cr. of the leger are equal; and therefore, if the sides of every account, except one, be balanced, that one will balance of its own accord. The balance account alone remains open, and, upon trial, you will find that the sides are equal. This affords an additional proof; or, at least, a different view of what was demonstrated, with respect to the balance of the books, in § 52.

The lines above and under the sums, at a general balance, may be drawn with red ink; and, at the balancing of particular accounts, with black ink, for distinction.

56. Some choose to insert the particulars of the profit and loss balance sheets in the respective accounts of the leger. If this be done, it is unnecessary to emergerate them also in the journal.—Some choose to balance the accounts of goods, whenever the quantity is sold off; and we approve of this method, as it lessens the work at the general balance, which is always sufficiently laborious.

57. Thus is the state of a person's affairs brought together, in a short compass, under his view; and the articles of the balance-sheet supply materials for a new inventory. It is convenient, however, to alter the order, and arrange the real accounts together, and the personal ones together.

58. It is not necessary to begin new books, nor open the accounts anew, unless the old folio be full. The accounts may be continued in the former folios; but it is best to begin a new leger, if the old one be not likely to hold all the business of the next year. When one comes to have several sets of books, it is common to distinguish them by the letters of the alphabet. The first waste-book, journal, and leger, are marked A, the second B; and so on.

In the following specimen, the waste-book and journal are placed on opposite pages, that the learner may easily compare them; and the rules are referred to by their numbers.

Vol. IV. Part I. D The
Subsidiary Books used by Merchants.

Though all merchants accounts may be kept by the Waste-book, Journal, and Leger, alone; yet men of great business find it convenient, either for abridging these, or for other ends, to use some others, generally called Subsidiary or Subservient Books; the most common of which are the nine following, viz.

1. Cash-Book. This book is kept in a folio form, like the leger, and serves to abridge the cash-account thereon. On the left-hand page, or Dr. side, Cash is charged Dr. for all the sums received; and on the right-hand page Cash is made creditor for all the sums paid. Once a week, or, which is more ordinary, once a month, this book is posted to the leger; or, if you please, first to the journal, by two entries, viz. Cash Dr. to Sundries, for all the receipts, and Sundries, Dr. to Cash, for all the payments. By this means the cash account in the leger will be so far contracted as to consist of 12 lines, viz. one for each month in the year.

2. Book of Charges of Merchandise. This book is only pagod, and designed to abbreviate the cash-book. It contains particular charges on goods and voyages; such as carriage, custom, freight, crangerage, wharfage, &c.: as also other expenses that affect trade in general; such as, warehouse-rent, shop-rent, account's wages, postage of letters, and the like. At the end of each month the money-columns of this book are added up, and the sum carried to the credit side of the cash-book.

3. Book of House-expense. This book is also pagod, and designed likewise to ease the cash-book. It contains all disbursements for family provisions, servants wages, house-rent, apparel, utensils, &c. The money-columns of this book are also added up at the end of each month, and the sum transferred to the credit side of the cash-book.

4. Invoice-book. This book, which is used chiefly by factors, is pagod, and contains doubles or copies of the invoices of goods sent to sea, or of goods received from abroad.

5. Sales-book. This book too is chiefly used by factors; and into it are posted, from the waste-book, the particular sales of every consigned cargo; by which means the several articles of a sale, that lie scattered in the waste-book, are brought together, and represented under one view, and that in a manner more full and minute than they are collected in the leger account. This book exhibits the sales of every consigned separately and by themselves: to which are subjoined the respective charges, such as freight, custom, the factor's commission, as also abatements allowed to buyers, &c. whose sum subtracted from the gross amount of sales gives the nett proceeds. From this book, when a cargo is sold off, an account of sales is drawn out, in order to be transmitted to the employer.

6. Bill-book. The design of this Bill-book, or Month-book, is to furnish a merchant with a ready way of knowing the time when bills or other debts become payable to or by him. It consists of 12 folios, one for each month in the year. The left-hand page contains the debts that fall due to the merchant in the month on the top, and the right-hand page contains the debts payable by him to others in the same month.

7. Receipt-book. In this book a merchant takes receipts of the payments he makes. The receipt should contain the date; the sum received, expressed in words at large, and also in figures in the money-columns; the reason why; and whether in full or in part; and must be signed by the person receiving. But there is no occasion to mention the merchant's name; for the book being his own, sufficiently implies that.

8. Letter-book. It is very imprudent in any person to send away a letter of business, without keeping a double of it to himself; and therefore to prevent the bad consequence of such a careless practice, merchants are provided with a large book in folio, into which is copied every letter of business before it is sent off. So that this book, together with the letters received (which must also be carefully kept in files or boxes), makes a complete history of all the dealings that pass between a merchant and his correspondents, which may be very useful and necessary on many occasions.

9. Pocket-book. This is a small book, of a portable size, which a merchant carries in his pocket when business calls him abroad to a tavern, a fair, the country, or other places. In this he sets down the bargains he makes, the expenses he incurs, or sums he receives, with every other part of business he transacts while abroad; as also any occurrence or piece of news he thinks worth while to record. When he comes home to his counting house or shop, he transfers the things contained in this book, each to their proper places in the waste-book, or book subsidiary.

Factors of great business sometimes keep another small book called the Memorandum-book. Into this book is copied, from letters as they come to hand, short notes of the several commissions for buying goods contained in them; and as the commissions are effected, the notes are crossed, or have some mark affixed to them. This is more convenient in doing business, than to be continually running to the letters themselves.

The above are the subsidiary books most in use; but a merchant is not tied down or restricted to them; he may keep some, and neglect others, or invent more as the nature of his business requires, and he finds convenient.

New Method of Book-keeping by Mr. Jones.

A new method of keeping books, entitled the English System of Book-keeping, has been proposed by Mr. Edward Thomas Jones of Bristol, for which a patent was granted in January 1796.

Three books are required in the English System of book-keeping, viz. a Day-book or Journal, an Alphabet, and a leger. The day-book must have three columns on each page, one of which to receive the amount of debits
BOOK-KEEPING.

A new Mo. debits and credits; one column to receive the debits only; and one column to receive the credits only; or it may be ruled with only two columns on each page, one of which to receive the amount of the debits, and the other to receive the amount of the credits. On each page of the day-book, there must also be four other columns ruled, two on the left side next the amount of the debits, and two on the right side next the amount of the credits. These columns are intended for receiving the letter or mark of posting, and the page of the leger to which each amount is to be posted. It is not necessary that the alphabet be ruled, but it must contain the name of every account in the leger, the letter annexed to it as a mark of posting, and the page of the leger. The leger is to be ruled with three, four, five, or seven columns on each page, as may be most agreeable, for receiving the amounts of the transactions which are entered in the day-book. The plan of making up books of accounts, according to this system, is the following:

When a person begins trade, either as an individual or in company, he must open an account with himself in the leger. He must first enter in the day-book, and then to the credit of his account in the leger, the amount of the property which he has advanced into the trade. His name only may be placed at the head of the account, or it may be called stock-account.

When goods are purchased, give the person credit of whom they are bought; when goods are sold, debit the person to whom they are sold. When you pay money, debit the person to whom it is paid, not only for the amount you pay, but also for any discount or rebate that may be allowed, and give the cashier credit for the next amount paid. When money is received, credit the person of whom it is received, not only for what he pays, but also for any discount you have allowed, and debit the cashier for the next sum received. In these entries a plain narrative of the fact should only be introduced. Technical phrases, excepting the terms debit and credit, should be avoided. These are the only terms applicable to every transaction, and may be affixed to every entry.

In the hurry of business, entries may be made to the debit instead of the credit of an account in the day-book, and vice versa. To obviate this evil, Mr. Jones proposes to have only one column for receiving the amount of every transaction, whether debit or credit, at the time of making the entry; and that the debits may be conveniently separated from the credits, previous to posting, which is necessary to prevent confusion, he has two other columns in the same page; the column on the left side receives the amount of every debit, and the column on the right side receives the amount of every credit. These columns must be cast up once a month. The column of debits and credits of itself forms one amount; the column of debits forms a second amount; and the column of credits a third amount. The second and third amounts, when added together, it is plain, must agree with the first amount, which includes both the debits and credits; otherwise there must be some error, either in making the entry or in the addition.

In this manner the accountant may obtain an accurate statement of the transactions recorded in his books for every month, which will show how much be owes for that month, and how much is owing to him; and by subtracting the amount of the credit from the whole amount of the debits for any given time, with the value of the stock of goods on hand, the profits of the trade for that period will at once appear.

The next part of the operation in this system is that of posting. An account is opened in the leger with every person to whose debit or credit an entry has been made in the day-book; and to each account a letter is affixed, which is to be used as a mark of posting. The name of the person, his place of abode, and the folio of the leger, must then be entered in the alphabet, with the same letter prefixed to each name, as is affixed to the account in the leger. The next step of the process is to affix to each amount in the day-book in the column for that purpose, the page of the leger on which each account is opened. This will be seen in the alphabet. The date and amount of each debit are then to be posted in the proper columns in the leger, on the left or debit side of that account to which it relates; taking care to enter as a mark of posting in the day-book, against each amount, the same letter that is affixed to the account in the leger to which said amount may be posted. The debits of January, February, March, &c. it is to be observed, must be posted into the column for those months in the leger, and the credits must also be posted in like manner, each account being filled up in the centre, at the expiration of every month, with the whole amount of the month's transactions. Thus may the whole statement of each person's account for the year be included in a small space. The columns to the right and left contain the separate amount of each transaction. The column in the centre exhibits a monthly statement.

Having shewn in what manner the entries are to be made and carried through the different books, according to this system; the next thing is to describe the method of examining them, so as to ascertain with certainty their accuracy; and not only to discover if each transaction has been correctly posted, with regard to its amount, but also that it has been rightly entered to the debit or credit of its proper account. The mode of examination proposed by this system is different from those which have been hitherto practised, both in expedience and accuracy. All that is necessary is to add together the different sums in the debit and credit columns, through the leger: and the amount of these columns, if right, must agree with the columns in the day-book for the same period. This examination should take place once every month; and if the amounts do not agree, the posting must be called over, and when the time allotted to each column of the leger, whether it be for one or more months, has expired, the amount of each column should be put at the bottom of the first page, and carried forward to the bottom of the next, and so on to the end of the accounts. The amount in the day-book for each month's transactions, must be brought into one gross amount for the same time.

But this process, although it proves that the leger contains the whole contents of the day-book, is not to be considered as complete without some mode of ascertaining if each entry be posted to the right account. To discover this the following method is adopted. It is to be admitted as a rule, that a letter, which may be used...
BOOK-KEEPING.

A new Merc. used alphabetically in any form or shape, is to be affixed to each account in the leger, and the same letter prefixed to the names in the alphabet. These letters are to be used as marks in posting, and affixed to each account in the day-book as it is posted. It is therefore only necessary to compare and see that the letter affixed to each entry in the day-book is the same as that which is prefixed to the same name in the alphabet. If there be no difference, it must be right, otherwise there must be some error.

When the accounts are to be balanced at the end of the year, or at any other time, if the profits of the trade are to be stated in the books, the value of the stock of goods on hand at prime cost, either in one sum, or by specifying the amount of every article, may be entered in the day-book, and an account opened for it in the leger, to the debit of which it is to be posted. The casting up of the leger is then to be completed; and when it is found to agree with the day-book, and the amount placed at the bottom of each column, subtract the credits from the debits, and the difference will show the profit of the trade; but if the credits be the greater amount, then a loss has followed.

To avoid error in taking off the balances of the leger, one rule must be observed. First, find out the difference between the whole amounts of the credits and debits on each page for the year, with which the differences of the outstanding balances of the several accounts on each page must exactly agree, otherwise the balances have not been taken right. Proceeding in this way every page will be proved, and the balances of any number of legers, according to this plan, cannot be taken off wrong without being observed.

BOOKSELLER, one who trades in books, whether he prints them himself, or gives them to be printed by others.

BOOKSELLERS, among us, are the same with the bibliopolae of the ancients, whose office was distinct from that of librarius. Petty dealers, or venders of small ware, were distinguished by the diminutive appellation libelliones. At Rome, the Argiletum was the mart of books, as Paul's Church-yard, or Fleet-street, and Paternoster-row, have been in London: whence that of Martial.

Argiletanis mavis habitare tabernas,
Cum tibi, parve liber, scripta nostra vocant.

BOOKSELLERS in many places are ranked among the members of universities, and entitled to the privileges of students: as at Tubingen, Salzburg, and Paris, where they have always been distinguished from the vulgar and mechanical traders, and exempted from divers taxes and impositions laid on other companies.

Formerly, the offices of booksellers and printers were united in the same persons. Labbe gives a list of learned booksellers; most of whom were also authors. Of late, booksellers have drawn their business into less compass, and leaving the labour of composing books to one set of persons, and that of printing them to another, content themselves with the gainful part; thus ministering to the republic of letters not with the head or the hand, but the purse only. In this view, they have been very important and useful agents between authors and the public; and have contributed, in a small degree, to the encouragement of genius and literary industry, and the spread of science. There are few authors, who have undertaken the printing and publishing of any work likely to be transmitted to posterity, without being connected with some bookseller, or booksellers, eminent in their profession.

The fairs of Frankfort and Leipsic are famous for the resort of booksellers, not only from all parts of the empire, but Holland, Flanders, &c. They have each their shop or warehouse, over which is inscribed the

name of some celebrated bookseller of former times; Bookseller,
Officina Etscheviana, Frobeniana, Morelliana, Jansoni-
ana, &c.

An acquaintance with the booksellers' marks or signs frequently expressed on the title-page of their books, is of some use; because many books, especially in the last century, have no other designation either of printer, bookseller, or even city. The anchor is the mark of Raphaelengius at Leyden; and the same with a dolphin twisted round it, of the Manutii at Venice and Rome; the Arion denotes a book printed by Opurinius at Basil; the caduceus, or Pegasus, by the Wecheliusse at Paris and Frankfort; the cranes, by Cranioy; the compass, by Plantin at Antwerp; the fountain, by Vascossan at Paris; the sphere in a balance, by Janson or Blaeu, at Amsterdam; the lily, by the Junias at Venice, Florence, Lyons, and Rome; the mulberry-tree, by Morel at Paris; the olive-tree, by the Stephensse at Paris and Geneva, and the Elziervier at Amster-
dam and Leyden; the bird between two serpents, by the Frobeniuses at Basill; the Truth, by the Comelius at Heidelberg and Paris; the Saturn by Colineus; the printing-press, by Badius Ascensius, &c.

The traffic of books was anciently very inconsiderable, insomuch that the book-merchants of England, France, Spain, and other countries, were distinguished by the appellation of stationers, as having no shops, but only stalls and stands in the streets. During this state, the civil magistrates took little notice of the booksellers, leaving the government of them to the universities, to whom they were supposed more immediate retainers; who accordingly gave them laws and regulations, fixed prices on their books, examined their correctness, and punished them at discretion. But when, by the invention of printing, books and booksellers began to multiply, it became a matter of more consequence; and the sovereigns took the direction of them into their own hands, giving them new statutes, appointing officers to fix prices, and granting licenses, privileges, &c.

BOOM, in the sea-language, a long piece of timber with
with which the clew of the studding-sail is spread out; and sometimes the boom is used to spread or boom out the clew of the main-sail.

BOOM, denotes also a cable stretched athwart the mouth of a river or harbour; with yards, top-masts, battling or spars of wood lashed to it, to prevent an enemy's coming in.

BOOMING, among sailors, denotes the application of a boom to the sails. A ship is said to come booming forwards, when she comes with all the sail she can make.

BOONEN, ARNOLD, portrait painter, was born at Dort in 1669, and at first was a disciple of Arnold Verbius, a painter of history and portrait. Afterwards he placed himself with Godfrey Schalken, and continued with that artist for six years. The sweetness of his colouring, and the neatness of his touch, with a striking likeness in his portraits, procured him a number of admirers. He painted in the manner of his master, particularly subjects by candle-light, which were very delicate, and very natural; and much more of his work was requested by the lovers of the art than it was possible for him to undertake. He had the honour to paint the portraits of the czar of Muscovy; of Frederick I. king of Prussia; of the victorious duke of Marlborough, as well as many of the princes of Germany; and most of the noblemen who attended the czar. His style of colouring was extremely good, and he had an elegant manner of disposing the attitudes of his figures; his handling was neat, and the whole had so much harmony that he was justly ranked among the ablest artists of his time. The small pictures of Boonen are in the taste of his master Schalken; but his excessive application, to answer the multitude of his engagements, impaired his health, and destroyed while it enriched him. He died in 1729.

BOPHTHALMUS, a kind of agate with large circles in it, bearing some resemblance to an ox's eye, from whence it has got this name.

BOOPS, in Zoology, the trivial name of a species of balena. See BALENA, CETOGY Index.

BOOSSHATTER, formerly the city of Utica, famous for the retreat and death of Cato, lies about seven miles inland from PORTO FARINA in the bay of Tunis. Nothing remains of its ancient grandeur except part of a large aqueduct, some cisterns, and other magnificent ruins, which cover a large extent of ground, and show it to have been a very considerable place. The sea, it is known, came up anciently to this city, though now seven miles distant.

BOOT, a leathern cover or defence for the leg, used on horseback, both to keep the body more firm, and defend the part from the injuries of the weather. Boots seem to have taken their name from the resemblance they bear to a sort of jacks or leathern bottles formerly in use, and called bottes, in the old French bouts. Borel derives the name from the old French word bot, a stump, by reason the boot gives the leg this appearance. The Chinese have a kind of boots made of silk or fine stuff, lined with cotton, a full inch thick, which they always wear at home. These people are always bootied; and when a visit is made them, if they happen to be without their boots, their guest must wait till they put them on. They never stir out of doors without their boots on; and their scrupulousness in this respect is the more remarkable, as they are always carried in their chairs.

The boot was much used by the ancients, by the foot as well as by the horsemen. It was called by the ancient Romans ocra; in middle-age writers, querę, gambria, baisberga, bembarga or bembarg. The boot is said to have been the invention of the Carians. It was at first made of leather, afterwards of brass or iron, and was proof both against cuts and thrusts. It was from this that Homer called the Greeks brason-booted. The boot only covered half the leg; some say the right leg, which was more advanced than the left, it being advanced forwards in an attack with the sword; but in reality it appears to have been used on either leg, and sometimes on both. Those who fought with darts or other missile weapons, advanced the left leg foremost, so that this only was booted.

Fishing-Boots, are a thick strong sort used in dragging ponds and the like. Hunting-boots, a thinner kind used by sportsmen. Jack-boots, a kind of very strong boots used by the troopers.

BOOT, is likewise a kind of torture for criminals; to extort a confession, by means of a boot, stocking, or buskin of parchment; which being put on the leg moist, and brought near the fire, in shrinking squeezes the leg violently, and occasions intolerable pain.

There is also another kind of boot; consisting of four thick strong boards round with cords: two of these are put between the criminal's legs, and the other on the other; then squeezing the legs against the boards by the cords, the criminal's bones are severely pinched, or even broken, &c.

The boot is now disused in England and Scotland; but it subsists still in some other countries.

Boot-Tree, or Boot-last, an instrument used by shoemakers to widen the leg of a boot. It is a wooden cylinder slit into two parts, between which, when it is put into the boot, they drive by main force a wedge or quoin.

BOOTES, a constellation of the northern hemisphere, consisting of 23 stars according to Ptolemy's catalogue, of 18 in Tycho's, of 34 in Bayer's, of 52 in Hevelius's, and of 54 in Mr Flamstead's catalogue.

BOOTH, BARTON, a famous English actor, born in Lancashire in 1681, and educated in Westminster school under the celebrated Dr Bushby, where his access in the Latin plays customarily performed by the scholars gave him an inclination for the stage. He was intended for the church; but running away from school to Dublin, he there commenced actor. His first appearance was in the part of Oronoko, in which he came off with every testimonial of approbation from the audience. From this time he continued daily improving; and after two successful campaigns in that kingdom, conceived thoughts of returning to his native country, and making a trial of his abilities on the English stage. To this end, he first, by letter, reconciled himself to his friends; and then, as a farther step towards insuring his success, obtained a recommendation from Lord Fitzhardinge (one of the lords of the bed-chamber to Prince George of Denmark) to Mr Betterton, who with great candour and good nature took him under his care, and gave him all the assistance in
The first part Mr. Booth appeared in at London was that of Maximus in Lord Rochester's Valentinian, his reception in which exceeded even his most sanguine expectations; and very soon after his performance of Artaban, in Rowe's Ambitious Stepmother, which was a new tragedy, established his reputation as second at least to his great instructor. Pyrrhus, in the Distressed Mother, was another part in which he shone without a rival. But he was indebted to a happy coincidence of merit and chance, for that height of fame which he at length attained in the character of Cato, as drawn by Mr. Addison, in 1712. For this play being considered as a party one, the Whigs, in favour of those principles it was apparently written, thought it their duty strongly to support it, while at the same time the Tories, who had too much sense to appear to consider it as a reflection on their administration, were still more vehement in their approbation of it, which they carried to such a height, as even to make a collection of 50 guineas in the boxes during the performance, and present them to Mr. Booth, with this compliment, "That it was a slight acknowledgment for his honest opposition to a perpetual dictator, and his dying so bravely in the cause of liberty." Besides this, he had a present of an equal sum from the managers, in consideration of the great success of the play, which they attributed in a good measure to his extraordinary merit in the performance; and certain it is, that no one since that time has ever equalled, or even nearly approached, his excellence in that character.—

But these were not the only advantages which were to accrue to Mr. Booth from his success in this part; for Lord Bolingbroke, then one of the principal secretaries of state, in a little time after, procured a special license from Queen Anne, recalling all the former ones, and nominating Mr. Booth as joint manager with Wilkes, Giber, and Drogg; none of whom were pleased at it; but the last especially took such disgust as to withdraw himself from any further share in the management. In 1704, Mr. Booth had married a daughter of Sir William Barkham, Bart. who died in 1710, without issue. Being now established in the management, he once more turned his thoughts towards matrimony; and in the year 1719 united himself to the celebrated Miss Hester Santlow, a woman of a most amiable disposition, whose great merit as an actress, added to the utmost discretion and prudential economy, had enabled her to save up a considerable fortune. During the 20 years in which Mr. Booth continued a manager, the theatre was in the greatest credit; and his illness and death, which happened on the 10th of May 1733, contributed not a little to its decline.

Mr. Booth wrote a dramatic entertainment called Dido and Æneas; but his masterpiece was a Latin inscription to the memory of Mr. William Smith, a celebrated actor, who died while he was young. As an actor, his excellency lay wholly in tragedy, not being able to endure such parts as had not strong passion to inspire him. And even in this walk, dignity, rather than complacency, rage rather than tenderness, seemed to be his taste. For a particular idea of his abilities, we must refer to the description Mr. Cibber has given of him in his Apology; and the admirable character drawn of him by that excellent judge of dramatic perfection, Aaron Hill, Esq., in a political paper published by him called the Prompter, which may be seen at length in Theop. Gibber's Lives of the Poets, and Chetwood's History of the Stage. His character as a man was adorned with many amiable qualities, among which a goodness of heart, the basis of every virtue, was remarkably conspicuous; and so particularly was he distinguished and caressed, and his company sought by the great, that, as Chetwood relates of him, not one nobleman in the kingdom had so many sets of horses at command as he had.

BOOTY, whatever is taken from an enemy in time of war. Among the Greeks, the booty was divided in common among the army, the general only claiming a larger share. By the military discipline of the Romans, spoils taken from the enemy belonged to the republic, particular persons having no right to them. The generals who piqued themselves on their probity carried it wholly to the public treasury. Sometimes indeed they divided it among the soldiery, to animate them, and serve in lieu of a reward. But this distribution depended on the generals, who were to conduct themselves herein with great equity and moderation; otherwise it became a crime of peculation to lay hands on the pillage, as regularly belonging only to the state. The consuls Romulus and Vartius were condemned for having sold the booty taken from the Equi. Among the Jews, the booty was divided equally between the army and the people, though under the kings a different kind of distribution obtained. Among the Mahometans, two thirds of the spoils are allowed to the army: the other third to God, to Mahomet and his relations, and to the orphans, the poor, and the pilgrims. — Among us, formerly, the booty was divided among the soldiery. If the general be in the field, every body takes what he can lay hold on: if the general be absent, the booty is distributed among the soldiery, two parts being allowed to the cavalry and one to the infantry. A captain is allowed ten shillings, a lieutenant six, and a cornet four.
BORD Service, the tenure of bord-lands, by which some lands are held of the bishop of London, and the tenants pay sixpence per acre, in lieu of sending provision annually for their lord's table.

BORDA, JOHN CHARLES, an eminent French mathematician. See Supplement.

BORDAT, in commerce, a small narrow stuff, which is manufactured in some parts of Egypt, particularly at Cairo, at Alexandria, and Damietta.

BORDE, ANDREW, a physician, was born at Pevensey in Sussex, early in the 16th century, and supposed to have been educated at Westminster school. In his Introduction to Knowledge, he says, that he was a student of Oxford; but of what college he does not mention. He left the university without a degree, and entered himself a brother of a Chartusian convent in or near London; but not liking the severe discipline of that order, he returned to Oxford, and applied himself to the study of physic. Some time after, he embarked for the continent; and, as himself expresses it, "travelled through and round about Christendom, and out of Christendom into some parts of Africa." In the years 1541 and 1542, he resided at Montpellier in France, where he was made doctor of physic, and after his return to England was incorporated into the same degree at Oxford. From the preface to his introduction above mentioned, it appears that he had been in Scotland, which probably was soon after his return from France. Having now satisfied his inclination for travelling, he settled first at Pevensey where he was born, afterwards at Winchester, and finally in London, where he is said to have become a fellow of the college of physicians, and first physician to King Henry VIII. But notwithstanding his eminence in his profession, he had the misfortune to spend the latter part of his life in the Fleet prison, where he died in the year 1549. As to his character, Wood says that "he was esteemed a noted poet, a witty and ingenious person, and an excellent physician." Pits calls him a man of sufficient learning, but too volatile and inconstant. Bale and some others, on the contrary, abuse him grossly. His writings are, 1. A book of the introduction of knowledge, the whys and which teach man to speak part of all manner of languages, &c. Lond. 1542, 4to; dedicated, from Montpellier, to the Lady Mary daughter to Henry VIII. It is written partly in verse, and partly in prose, containing 39 chapters, before each of which is a wooden print of a man. 2. The brevity of health, wherein are remedies for all manner of sicknesses and diseases, &c. Lond. 1547, &c. 4to. 3. Dietary of health, Lond. 1576, 8vo. 4. The merry tales of the madmen of Gotham. Printed, says Wood, in the time of Henry VIII. in whose reign, and after, it was accounted a book full of wit and mirth by scholars and gentlemen. Afterwards being often printed, it is now only sold on the stalls of ballad-singers. 5. A right pleasant and merry history of the mynher of Abington, with his wife and his fair daughter, and of two poor scholars of Cambridge. Lond. printed by Richard Jones, 4to. 6. A book of every region, country, and province; which shows the miles and leagues distant from city to city, and from town to town, with the noted things in the said cities and towns. Wood says that the author lent the manuscript of this book.
book to his friend Thomas Cromwell, who lost it, to
the great grief of the author, who would otherwise
have published it. In this instance, however, the an-
tiquary was misinformed; for it has since been published
by Hearne at the end of Benedictus abbis Peteb. de
vita Henrici II. Oxif. 1735, 8vo. 7. The principles
of astronomy, the which diligently prosecuted is in a
manner a prognostication to the world. Lond. printed
by Robert Copland, 12mo. The author says that he
wrote this little book in four days, with one old pen
without mending.

BOERIO, in Gardening, is made to enclose par-
ters, that they may not be injured by walking in
them. Borders are made either circular, straight, or in
cants; and are turned into knots, scrolls, volutes, and
other compartments. They are rendered very orna-
tmental by the flowers, shrubs, yews, &c. that are raised in
them. They are always laid with a sharp rising in the
middle; because, if they are flat, they are noways
agreeable to the eye: and as for their breadth, the largest
are allowed five or six feet, and the smallest
commonly four.

BORDUNI, or BORDONE, Paris, an excellent
Italian painter, was born at Venice about the year
1512; and, being of a noble family, had a polite ed-
cation. He was the disciple of Titian; but has been
admired more for the delicacy of his pencil than for the
truth of his outlines. He was at the court of France
in the reign of Francis I. who had a great esteem for
him, and for whom he drew not only abundance of
history-pieces, but the portraits of several court-ladies,
in so fine a manner, that original nature was hardly more
charming. He at length returned to Venice, laden
with riches and honour; and having gained great
reputation in all parts of Italy, died in 1587, aged
75.

BORDURE, in Heraldry. See there, No. 10.

BORE, among engineers, denotes the diameter of
the barrel of a gun or cannon, or rather its whole
cavity.

BOreas, a Greek name, now in common use for
the north wind. Fezenor observes, that anciently Bo-
reas signified the north-east wind blowing at the time
of the summer solstice. The Greeks erected an altar
to Boreas. He is represented on the temple at At-
thens with his robe before his mouth, as if he felt the
cold of the climate over which he presides, agreeably
to the description of Ovid, who calls him gelidus tyrann-
sus, "the shivering tyrant," Met. vi. ver. 711. But
he is usually described by the Roman poets as violent
and impetuous; ibid. ver. 686—ver. 707. In paint-
ing, he is generally represented like an old man with
a horrible look, his hair and beard covered with snow
or hoar frost, with the feet and tail of a dragon. M.
Spierlingius has a treatise in praise of Boreas, wherein
he shows the honours paid to him by antiquity. Bo-
reas, according to this author, purifies the air, renders
it calm and salubrious, preserves buildings from de-
cay, drives away the plague and other noxious dis-
eases, and expels locusts and other vermin hurtful to the
grounds.

BOREL, Peter, a learned physician, was the son
of James Borel who published several poems, and was
born at Castres in 1620. He applied himself to the
study of physic, of which he was created doctor, and
practised with great success in the city of Castres. To-
wards the end of the year 1653, he went to Paris, and
was soon after made physician in ordinary to the king.
In 1674, he was received into the academy of sciences,
and distinguished himself by writing a great number of
works. The most esteemed are, 1. Historiarum et
observationum medico-physicarum centuria quinque. 2.
Bibliotheca chimica, duodecimo. 3. De vero telescopii
inventore, cum brevi omnim conspicuorum historia.
He died in 1678.

BORELLO, JOHN ALPHONSO, a famous philoso-
pher and mathematician, born at Naples on the 28th of
January 1608. He was professor of philosophy and
mathematics in some of the most celebrated universi-
ties of Italy, particularly at Florence and Pisa, where
he became highly in favour with the princes of the
house of Medici; but having been engaged in the re-
volt of Messina, he was obliged to retire to Rome,
where he spent the remainder of his life under the
protection of Christina queen of Sweden, who ho-
noured him with her friendship, and by her liberality
himself softened the rigour of his hard fortune.
He continued two years in the convent of the regu-
lar clergy of St Pantaleon, called the pious scholas,
where he instructed the youth in mathematical stud-
ies. He died there of a pleurisy, the 31st of De-
ember 1679, in the 72d year of his age. He wrote
in Latin, 1. Euclid restored. 2. The theory of the
influence of the planets in medicine, deduced from
physical causes. 3. Of percussive force. 4. Of natu-
ral motions depending upon gravity. 5. An historical
and meteorological account of the burning of Mount
Etna, in the year 1660. 6. Of the motion of ani-
mal; and several other works, some of which are in
Italian.

BOGIA, CESAR, natural son of Pope Alexan-
der VI. was a brave general, but a most abandoned vil-
lain. See (History of) ITALY.—It is incredible what
numbers he caused to be taken off by poison, or by the
sword; and it is notorious that swarms of assassins were
constantly kept in pay by him at Rome, for the sake
of removing all who were either obnoxious or inconve-
nient to him. He experienced various turns of for-
tune; and was sometimes very prosperous, sometimes
the reverse. He was very narrowly escaped dying by poi-
son in 1503; for having concerted with the pope a
design of poisoning nine newly created cardinals at
once, for the sake of possessing their effects, the poison-
ed wine, destined for the purpose, was by mistake
brought to and drank by themselves. The pope died
of it; but Caesar, by the vigour of his youth, and the
force of antidotes, after many struggles, recovered. He
only recovered to outlive his fortune and grandeur, to
see himself depressed, and his enemies exulted; for he
was soon after divested of all his acquisitions, and sent
a prisoner to Spain, in order to free Italy from an in-
cendiary, and the Italian princes from those dangers which
the turbulent and restless spirit of Caesar made them
fear, even though he was unarmed. He escaped from
there; and got safe to Navarre to King John his bro-
ther-in-law, who was then at war with his subjects.
Cesar served as a volunteer in that war, and was killed
in 1507.

BORGO,
BORGO, a town of Russia, seated on the gulf of Finland, in the province of Kyneneved. E. Long. 26. N. Lat. 60. 34.

Borago de St Sepulcro, a town of Tuscany, in Italy, situated in E. Long. 13. 0. N. Lat. 43. 30.

Borago de Val de Ferro, a town of Italy, in the duchy of Parma, in E. Long. 10. 36. N. Lat. 44. 35.

Borago Forte, a town of Mantua in Italy, situated at the confluence of the rivers Po and Menzo. E. Long. 11. 0. N. Lat. 44. 50.

Borago San Domino, a town of Italy, in the duchy of Parma, with a bishop's see. E. Long. 10. 31. N. Lat. 41. 53.

BORGOGNONE, a celebrated painter, whose true name was Giacomo Corteisi; but he is commonly called Borgognone, from the country where he was born, about the year 1605. He was much admired and highly applauded for his admirable gusto and grand manner of painting battles. He had for several years been conversant in military affairs, was an officer of considerable rank in the army, made the camp his school, and formed all his ideas from what he had seen performed in the field. His style is roughly noble, full of fire and spirit, and there are a few prints etched by his own hand. Towards the close of his life he retired to the Jesuits convent at Rome, where he is said to have taken sanctuary to rid his hands of an ill bargain he had got of a wife; but happily surviving her, he lived in great esteem and honour till after the year 1675.

BORIA, a small town of Spain, in the kingdom of Arragon. W. Long. 2. 2. N. Lat. 41. 50.

BORING, in a general sense, the art of perforating, or making a hole through any solid body.

Boring of Water-pipes. The method of boring water-pipes is as follows. The poles of alder, which is a very useful wood in making pumps, water-pipes, &c. being laid on horses or trusses of a foot height, to rest the auger upon while they are boring, they set up a lathe to turn the least end of the poles, to fit them to the cavities of the great end of the others. They turn the small ends of the poles about five or six inches in length, to the size they intend to bore the bigger ends about the same depth, viz. five or six inches. This is designed to make a joint to shut each pair of poles together, the concave part being the female part, and the other the male part. In turning the male part, they turn the channel in it, or a small groove at a certain distance from the end; and in the female part they bore a small hole to fit over this channel. This being done, they bore the poles through; and to prevent them from boring out at the side, they stick great nails at each end to be a guide in boring. It is usual, however, to bore them at both ends; so that a crooked pole can be bored through and not spoil it. See Boring, Supplement.

Boring, in Farriery, a cruel and absurd method of treating a wrenched shoulder. See Farriery Index.

Boring, in Mineralogy, a method of piercing the earth with scooping irons, which being drawn back at proper times, bring up with them samples of the different strata through which they have passed; by the examination of which the skilful mineralogist will be able to guess whereabouts a vein of ore or a stratum of coal may lie, or whether it will be worth while to open a mine for the purpose of working it.

BORIQUEN, one of the Caribbees islands in North America, near that of Porto Rico. The English formerly had a settlement there, but were driven away by the Spaniards. It is at present without inhabitants, though agreeable and fertile; the air being wholesome, and the water good. There are a great number of land-crabs, whence some have called it Crab Island. W. Long. 64. 35. N. Lat. 18. 0.

BORISTHENSE, in Ancient Geography, the largest river of Sarmatia Europaeus, thus described by Media, who copies verbatim from Herodotus: "It runs through a cognominall people, is the most pleasant of all the rivers in Scythia, and calmer than all of them in its course, and very agreeable to drink: it feeds very rich pastures, and produces large fish of the best flavour, and without bones; it comes a great way, rising from springs unknown; its course is a distance of 40 days, and so far is it navigable." It is now called the Donner or Nieper.

BORKELA, a strong town in the United Provinces, in the county of Zutphen, seated on the river Borkel, in E. Long. 6. 30. N. Lat. 52. 15.

BORLASE, Dr EDMUND, an eminent physician and English writer in the 17th century, was the son of Sir John Borlase, master of the ordnance, and one of the lords justices of Ireland in 1643. He studied in Dublin college, and afterwards at the university of Leyden, at which last place he took the degree of doctor of physic. He afterwards practised physic with great success in the city of Chester, and was incorporated doctor of the faculty in the university at Oxford. Among the books which he wrote and published are the following. 1. Latham Spaw in Lancashire, with some remarkable cases and cures performed by it. 2. The reduction of Ireland to the crown of England. 3. The History of the Irish rebellion. 4. Brief reflections on the earl of Castlehaven's memoirs, &c. He died after the year 1682.

BORLASE, William, a very ingenious and learned writer, was of an ancient family in Cornwall, and born at Pendeen, in the parish of St Just, Feb. 2. 1655-6. He was put early to school at Penzance, and in 1720 removed to Plymouth. March 17, 1753, he was entered of Exeter College, Oxford; and, June 1719, took a master of arts degree. In 1720, he was ordained a priest; and, in 1722, instituted to the rectory of Ludgvan in Cornwall. In 1732, lord-chancellor King presented him to the vicarage of St Just, his native parish; and this, with the rectory aforesaid, were all the preferments he ever had. In the parish of Ludgvan were rich copper works, which abound with mineral and metallic fossils: and these, being a man of a active and inquisitive turn, he collected from time to time, and thence was led to study at large the natural history of his native county. He was struck at the same time with the numerous monuments of remote antiquity that are to be met with in Cornwall; and enlarging therefore his plan, he determined to gain as accurate an acquaintance as possible with the Druid learning, and with the religion and customs of the ancient Britons, before their conversion to Christianity. In 1750 he was admitted a fellow of the Royal Society; and, in 1753, published
in folio at Oxford his "Antiquities of Cornwall"; a second edition of which was published, in the same form, at London, 1769, with this title, "Antiquities, historical and monumental, of the county of Cornwall; consisting of several essays on the ancient inhabitants, Druid superstition, customs and remains of the most remote antiquity in Britain and the British isles, exemplified and proved by monuments now extant in Cornwall and the Scilly islands; with a vocabulary of the Cornu-British language. Revised, with several additions, by the author. To which is added a map of Cornwall, and two new plates." His next publication was, "Observations on the ancient and present state of the islands of Scilly, and their importance to the trade of Great Britain; Oxf. 1765," 4to. This was the extension of a paper which had been read before the Royal Society in 1753. In 1758 came out his "Natural history of Cornwall; Oxf." 1 fol. After these publications, he sent a variety of fossils and remains of antiquity which he had described in his works, to be repositioned in the Ashmolean museum: for which, and other benefactions of the same kind, he received the thanks of the university, in a letter from the vice-chancellor, Nov. 18. 1758; and March 1766, the degree of doctor of laws. He died in 1772, aged 77 years, leaving two sons out of six, whom he had by a lady he married in 1724. Besides his literary connections with many ingenious and learned men, he had a particular correspondence with Mr Pope; and there is still existing a large collection of letters written by that poet to Dr Borlase. He furnished Pope with many of the materials which formed his grotto at Twickenham, consisting of curious fossils; and there may at present be seen Dr Borlase's name in capitals, composed of crystals, in the grotto. On which occasion Pope says to Borlase in a letter, "I am much obliged to you for your valuable collection of Cornish diamonds: I have placed them where they may best represent yourself, in a shade, but shining; alluding to the obscurity of the doctor's situation, and the brilliancy of his talents. Besides the above works, he sent many curious papers to the Philosophical Transactions, and had in contemplation several other works.

BORPIO, a county depending on Switzerland, formerly on the republic of the Grisons, but now subject to Austria, and included in the district called the Valteine. It is 15 miles over both ways; and is divided into five communities, viz. the town of Bormio, the valley of Forbia, the Interior Valley, the Lower Valley, and the Valley of Lavino. Bormio, which is the only town in this district, contains about 1000 inhabitants, and is neatly built, but stands in a delightful country. It is seated at the confluence of the rivers Adda and Isalaca, in E. Long. 10. 10. N. Lat. 46. 25.

BORN, IGNATIUS, BARON VON, a late German mineralogist. See Supplement.

BORNEO, an island of Asia, in the East Indies, and one of the three great Sunda islands. It is thought to be the largest island in the world, next to New Holland; being 800 miles long, and 700 broad. It is seated under the equator, that line cutting it almost through the middle. It is almost of a circular figure: abound with gold; and the finest diamonds in the Indies are found in its rivers, being probably washed down from the hills by torrents. Here are also mines of iron and tin, and leadstones. Birds nests are to be had in this island, which are eatable, and reckoned a great delicacy. The beasts are, oxen, buffaloes, deer, goats, elephants, tigers, and monkeys. This island has fine rivers, especially towards the west and south. In their monsoon, from April to September, the wind is westerly; and they have continual heavy rains, attended with violent storms of thunder and lightning. The rainy season continues for eight months of the year; and as during that time all the flat country near the coast is overflowed, the air is rendered very unhealthy, and the inhabitants are forced to build their houses on floats, which they make fast to trees. The houses have but one floor, with partitions made with cane; and the roofs are covered with palmetto leaves, the waves of which rest with about five feet of the bottom. The west and north-east sides of the island are almost desert, and the east is but little known. The inland parts are very mountainous; and the south-east, for many leagues together, is a stinking morass, which, being overflowed in the wet season, is very unhealthy.

The Portuguese, who first discovered Borneo, had arrived in the Indies above 30 years before they knew any thing of it more than the name, and its situation, by reason of their frequently passing by its coast. At last one Captain Edward Corril had orders to examine it more narrowly; and being once acquainted with the worth of the country, they made frequent voyages thither. They found the coasts inhabited by the Malay Moors, who had certainly established themselves there by conquest; but the original inhabitants still remain in the mountains, and are styled Benjus, which in the Malay language signifies a wild man. The most authentic account of these people is the following, which was extracted from the papers of Father Antonio Venticinque, an Italian missionary. He was sent to Borneo from Macao, on board a Portuguese ship, and converted great numbers to Christianity, and died on the island about the year 1604. The Benjus have no kings, but many little chiefs. Some are subject to the Moorish kings, and pay them tribute; but such as live far up the country are altogether independent, and live according to their own customs. They are generally very superstitious, and much addicted to aury. They do not adore idols; but their sacrifices of sweet wood and perfumes are offered to one God, who, they believe, rewards the just in heaven, and punishes the wicked in hell. They marry but one wife; and look upon any breach of conjugal faith, either in the man or woman, as a capital offence. The Benjus are naturally honest and industrious, and have a brotherly affection for one another. They have a notion of property, which yet does not render them covetous. They sow and cultivate their lands; but in the time of harvest, each reaps as much as will serve his family, and the rest belongs to the tribe in common; by which means they prevent necessity or disputes. With the Moors on the coasts the Portuguese for some time carried on a considerable trade, and at their request settled a factory there; which, however, was afterwards surprised and plundered by the Moors, who put most of
the people to the sword. The chief town, also called Bornoe, is on the north-west side of the island. See Borneo, Supplement.

BORNHOLM, an island in the Baltic sea, to the south-east of the province of Schonen in Sweden. It is twenty-one miles in length, and above thirteen in breadth. It has three considerable towns, Rettum, Sandwich, and Nexia; with a great number of villages; and is fertile and populous. It was conquered by the Swedes in 1658: but the inhabitants, under the conduct of Jens Roefolds, voluntarily surrendered it to the king of Denmark, on account of the bad usage they received from the former. In 1678, a body of 5000 Swedish troops, in their passage from Pomerania to Sweden, being shipwrecked on this island, such of them as remained were made prisoners of war. The inhabitants defend the island by their own militia, without any expense to the crown. It was a short time in the hands of the British, who took it from the Danes in 1809. E. Long. 14. 36. N. Lat. 55. 15.

BORNOU, a kingdom or province of Zara in Africa, extending from 12 to 22 degrees of east longitude, and from 17 to 21 degrees of north latitude. The northern part is poor, and the rest of the provinces of Zara; but the rest is well watered by springs and rivers that tumble down with a dreadful noise from the mountains; rendering the country prolific in corn, grass, and fruits, and giving it a pleasing aspect. The eastern and western frontiers are divided into mountains and valleys, the latter being all covered with flocks of cattle, fields of rice and millet, and many of the mountains with wood, fruit-trees, and cotton. On the north-west stands the mountain of Tarton, having plenty of good iron mines; and on the south flows the river Niger, which, it is said, after running a great many leagues under a long chain of mountains, rears up its head again, and minglest its streams with the waters of the lake Bornou in its course, from whence it washes the walls of the capital of this kingdom. The compilers of the Universal History, however, are of opinion, that in these mountains the river Niger hath its source, because no river hath been traced to the eastward, except the Nile, which runs in a different course from north to south, and the White river, on the western frontiers of Abyssinia, which is a branch of the Nile. The eastern and western parts of Bornou are inhabited by a people of a roving disposition, who live in tents, and have their women, children, and every thing else, in common: the word property, or any idea equivalent to it, being utterly unknown among them. They have neither religion, laws, government, nor any degree of subordination; and hence they have been supposed by Cluverius to be the lineal descendants of the ancient Garamantes, and this to have been the residence of that people. In these parts, the natives are almost to a man, shepherds and husbandmen. In summer they go naked, except a short apron before; but in winter they are warmly clothed with the softest sheep-skins, of which they also form their bedclothes; and indeed this is a scarce a sufficient defence against the inclemency of the weather at certain seasons of the year, when a cold piercing wind blows from the northern mountains, that chills the blood in proportion as the pores of the body have been opened by the scorching heats of summer.

Baudrand and Draper affirm, that the natives are scarce superior in their understanding to brutes; not even having any names whereby to distinguish each other, except what they take from some personal defect or singularity; such as lean, fat, squatting, hump-backed, &c. In the towns, however, it is acknowledged that they are something more civilized and polite, being many of them merchants; but of these towns, or indeed of the kingdom in general, very little is known.

BORODINO, a village in Russia, near the river Moskwa, about 90 miles west of Moscow; remarkable for the great battle fought there on the 7th September 1812, between the French and Russians. The Russian army, of 120,000 men, occupied a position of no great strength. The firing began at six o'clock in the morning, and soon became general in the centre and Russian left. The Russians had extended their line too much; and the French, after making an impression with their artillery and musketry, pushed forward, regardless of loss, and carried several batteries, about eight o'clock. The Russians resisted obstinately till noon, and even till two o'clock; and during the following night retired from the field. The loss on each side was believed to be about 50,000 men.

BOROMÆUS. See BOROMÆUS.

BORONDON, an island in the Atlantic ocean, mentioned by some writers, particularly Linschottin, in their description of the Canary islands, as something supernatural. It is said to be about 100 leagues distant from Ferro, probably west, though no writer has pretended to lay down its exact situation. Here it is affirmed several ships have touched by accident, and all agree in their relations of the state of the inhabitants and island. They affirm, that it is perpetually clothed with a great variety of wood, chiefly fruit-trees: that the valleys are in a perpetual state of verdure. It is said to be peopled by Christians, who have a language of their own, apparently combined of a variety of modern languages. It is remarkable that no ships, expressly sent upon this discovery, were ever fortunate enough to fall in with the island of St Borondon, though the Spaniards have several times attempted it from the Canaries. Hence it has been called the marvellous island; and hence indeed we may conclude, either that it exists wholly in imagination, or at least that it is surrounded with such currents as insensibly carry ships out of their course, and prevent their meeting with it.

BOROUGH, Burrough, Borow, or Burgh, is frequently used for a town or corporation which is not a city.

BOROUGH, in its original Saxon borge, or borgh, is by some supposed to have been primarily meant of a tithing or company consisting of ten families, who were bound and combined together as each others pledge. Afterwards, as Verstegan informs us, borough came to signify a town that had something of a wall or inclosure about it: so that all places which among our ancestors, had the denomination borough, were one way or other fenced or fortified. But, in latter times, the same appellation was also bestowed on several of the villæ insigniores, or country towns of more than ordinary note, though not walled.

The ancient Saxons, according to Spelman, gave the name burgh to those called, in other countries, cities. But divers canons being made for removing the
BOROUGH [36]

episcopal sees from villages and small towns to the chief cities, the name city became attributed to episcopal towns, and that of borough retained to all the rest; though these too had the appearance of cities, as being governed by their mayors, and having laws of their own, making, and sending representatives to parliament, and being fortified with a wall and castle, and the like.

BOROUGH, or Burgh, is now particularly appropriated to such towns and villages as send burgesses or representatives to parliament. Boroughs are equally such, whether they be incorporate or not; there being great numbers of our English boroughs not incorporated; and, on the contrary, several corporations that are not boroughs; e. gr. Kingston, Deal, Kendal, &c.

BOROUGHS, in Scotland. See LAW.

Royal Boroughs, in Scotland, are corporations made for the advantage of trade, by charters granted by several of their kings; having the privilege of sending commissioners to represent them in parliament, besides other peculiar privileges. The royal boroughs are not only so many distinct corporations, but do also constitute one entire body, governed by, and accountable to, one general court, anciently called the court of four boroughs, held yearly to treat and determine concerning matters relating to the common advantage of all boroughs. The four boroughs which composed this court were, Edinburgh, Stirling, Roxburgh, and Berwick; which two last falling into the hands of the English, Linlithgow and Lanark were put in their places; with a saving to the former whenever they should return to their allegiance. But this court not being sufficient to answer the necessities of the royal boroughs, they were all empowered under James III. in 1487, to send commissioners to a yearly convention of their own, which was then appointed to be held at Inverkeithing, but is now held at Edinburgh, under the denomination of the convention of boroughs, vested with great power, and having for their object the benefit of trade, and the general interest of the boroughs.

Borough-Courts, are certain courts held in boroughs, by prescription, charter, or act of parliament: such are the sheriff’s court, and court of hustings, in London.

Borough-English, a customary descent of lands or tenements, in some ancient boroughs and copyhold manors, by which the younger son, and not the eldest succeeds to the burgage tenement on the death of his father. For which Littleton gives this reason; because the younger son, by reason of his tender age, is not so capable as the rest of his brethren to help himself. Other authors have indeed given a much stranger reason for this custom; as if the lord of the fee had anciently a right to break the seventh commandment with his tenant’s wife on her wedding night; and that therefore the tenement descended, not to the eldest, but to the youngest son, who was more certain the offspring of the tenant. But it cannot be proved that this custom ever prevailed in England, though it certainly did in Scotland, (under the name of merceta, or marcheta), till abolished by Malcolm III. But perhaps a more rational account than either may be brought from the practice of the Tartars; among whom, according to Father Dubalde, this custom of
descent to the youngest son also prevails. That nation is composed totally of shepherds and herdsmen; and the elder sons, as soon as they are capable of leading a pastoral life, migrate from their father with a certain allotment of cattle, and go to seek a new habitation. The youngest son, therefore, who continues with his father, is naturally the heir of his house, the rest being already provided for. And thus we find, that among many other northern nations it was the custom for all the sons but one to migrate from the father, which one became his heir. So that possibly this custom, wherever it prevails, may be the remnant of that pastoral state of the ancient Britons and Germans which Caesar and Tacitus describe.

Borough-Head, or Head-Borough, called also borough-holder, or burghholder, the chief man of the decennies, or hundred, chosen to speak and act in behalf of the rest.

Head-borough also signifies a kind of head constable, where there are several chosen as his assistants, to serve warrants, &c. See Constable.

Boroughbridge, a town in the north riding of Yorkshire in England, seated on the river Your, over which there is a handsome stone bridge. The town is not large, but commodious, and sends two members to parliament. W. Long. 1. 15. N. Lat. 54° 10'.

Borozail, or the zeal of the Ethiopians, a disease epidemic in the countries about the river Senegal. It principally affects the pudenda, but it is different from the lues veneris. It owes its rise to excessive venery: in the men this distemper is called saak, in women assobatus.

Borracho. See Caoutchouc.

Borrage. See Borous, Botany Index.

Borrelists, in church-history, a Christian sect in Holland, so denominatated from their founder Borrel, a person of great learning in the Hebrew, Greek, and Latin tongues. They reject the use of the sacraments, public prayer, and all other external acts of worship. They assert, that all the Christian churches of the world have degenerated from the pure apostolical doctrines, because they have suffered the word of God, which is infallible, to be expounded, or rather corrupted, by doctors who are not infallible.

Borrichus, one of the most learned men of his age, the son of a Lutheran minister in Denmark, was born in 1626. He applied himself to physic in the university of Copenhagen, and began to practise during a most terrible plague that made great havoc in that city. He travelled: but before his departure, in 1652, he was appointed professor in poetry, botany, and chemistry; and at his return discharged his duties with great assiduity, of which the works he published afford full proof. He was raised to the office of counsellor in the supreme council of justice, in 1686; to that of counsellor of the royal chancery, in 1693; and died of the operation for the stone, in 1690. He published, 1. Lingua pharmacoedorum. 2. Dissertations de poeticae Graecia et Latiniae. 3. De ortu et progressu chemica; and several other works.

Borromean Islands, certain islands in the lake Maggiore in Italy, celebrated for their picturesque beauty. See Supplement.

Borromeus, St Charles, cardinal, and archbishop.
Borromeus, bishop of Milan; a personage of great note in the Roman calendar, and whose sincere piety, simplicity of manners, and zeal for reformation, render him indeed a character equally interesting and instructive to the members of any church. He was the son of Gilbert Borromeus count of Arona and of Mary of Medicis, and was born at the castle of Arona upon Lake Maggiore in Milanese, in October 1538. When he was about 12 years old, Julius Caesar Borromeus resigned an abbacy to him of a considerable revenue, which was considered as an hereditary inheritance of the family; which Charles accepted, but applied the revenue wholly in charity to the poor. Having acquired a sufficient knowledge of the languages at Milan, he studied the civil and canon law at Pavia, where he lived like another Lot in Sodom, preserving his innocence among a thousand snares by which it was endangered. He received great advantage from the company and conversation of Francis Alciat, one of the most learned men of the age, for whom he afterwards procured a position. He would accept no new benefices, but on condition that he should be at liberty to apply the revenue to public uses. In the year 1554, Charles, being then 16 years old, his father died, an event which brought him back to the castle of Arona; where, though he had an elder brother, Count Frederick, he was requested by the family to take upon him the management of the domestic affairs, to which at length he consented.

After some time he returned again to his studies, which, in the year 1559, being then just 21, he finished by a solemn act, and took his doctor's degree. The promotion of his uncle to the pontificate, by the name of Pius IV., which happened the year following, seemed to have very little effect upon him; but he was very soon made prothonotary, and entrusted both with the public and private seal of the ecclesiastical state; he was also, at the same time, created cardinal deacon, and soon after archbishop of Milan. In obedience to the will of his uncle the pope, he lived in great simplicity, having raised a large revenue and a great number of domesticos; yet his own temperance and humility were never brought into question. In order to render even his amusements useful, he established an academy of select and learned persons, as well ecclesiastics as laics, from among his household and dependants, who were employed in some exercise which tended to inspire a love of virtue, and to form a just taste. Each of them was to write on some chosen subject, either in verse or in prose, and to communicate to each other in frequent conferences the fruits of their studies. The works produced by this society have been published in many volumes, under the title of Notae Vaticanae, because these useful assemblies were held at the Vatican, and at night, after the business of the day was over. About this time Charles also formed a design of founding a college at Pavia, which should at the same time be a school of science and an asylum from the vices and vanities of the world. In prosecution of this design, he raised a large edifice and the foundations of several houses which belonged to the family of Borromeus in that city; he obtained from the pope several benefices, which he attached to his buildings; he provided it with all things necessary for the young scholars out of his own revenue; and he dedicated his college to Justina virgin and martyr. Upon the death of his only brother Frederick, his relations, his friends, and even the pope himself, advised him to change his state, to quit the church, and marry, that his family might not become extinct. Charles, however, contrary to this advice and the expectations of the world, received the priesthood, and addressed the pope in these terms: "Do not complain of me, Holy Father, for I have taken a spouse whom I love, and on whom my wishes have been long fixed." From this time he became more fervent in exercises of piety and ecclesiastical knowledge: He perceived that some literati who had departed from the faith had also corrupted the writings of some holy doctors of the church, and he thought he should render religion good service if he could restore the genuine reading. He therefore employed Achilles Statius, a Portuguese of great learning, in this work, whom for that purpose he retained at Rome. To his zeal and attention also is owing the congregation of cardinals and others, to resolve doubts and obviate difficulties which should arise in explanations of the council of Trent.

There was a very intimate friendship between Borromeus, and Don Bartholemy des Martyrs, archbishop of Prague, and author of a work entitled Stimulus Pastorum. This work falling into Borromeus's hands gave him an earnest desire to become a preacher, as he was now convinced that preaching was one of the principal duties of a prelate. An almost inconceivable multiplicity of business, ill health, a feeble voice, and a difficult pronunciation, were no inconsiderable obstacles to his design, yet he surmounted them all; and although his beginnings were weak, yet perseverance crowned them with success.

Having obtained permission to visit his church, which the pope had hitherto refused, as he found his presence necessary at Rome, he prepared to set out for Milan. He had before sent thither his grand vicar Permanus, whose labours at first had not been without success, but who soon found opposition so pernicious and obstinate as to put an end to his hopes: Borromeus therefore saw the necessity of going in person, and he was received with the most distinguished honours. He was, however, soon recalled to Rome, where many things made his presence necessary: the pope was gradually dying; and Charles arrived just time enough to administer to him the last sacraments.

Pius IV. died on the 7th of January 1566, and 28 days afterwards Cardinal Alexandrine mounted the papal chair, and assumed the name of Pius V. the skill and diligence of Borromeus having contributed not a little to prevent the cabals of the conclave.

As soon as this event had taken place, and all was quiet at Rome, Borromeus gave himself wholly up to the reformation of his diocese, where the most flagitious irregularities were openly practised, having first made another reform in his own family. He began by making pastoral visits in his metropolis, where the canons were not distinguished for the purity of their manners. He soon restored proper decency and dignity to divine service, by a variety of wise and necessary regulations: In conformity to the decrees of the council of Trent, he cleared the cathedral of many pompous
Pompous tombs, rich ornaments, banners, arms, and in general of all the trophies with which the vanity of man had disfigured the house of God; and in order to give a sanction to his zeal by his example, he spared not the monuments of his nearest relations. Nor did his zeal stop here: he divided the nave of the church through its whole length into two parts, by strong thick planks, that the two sexes, being separated, might perform their devotions without any attention to each other, and with a modesty and recollection more suitable to the place.

This pastoral care extended from the cathedral to the collegiate churches, and even to the fraternities or societies of penitents, particularly that of St John the Baptist. The duty of this society was to attend criminals to the place of punishment, to assist, comfort, and prepare them for death; but the spirit of the institution was now forgotten, and the wretches who were condemned to death were commonly dragged to execution like beasts, without any spiritual assistance or consolation. But the archbishop revived the original fervour of this order, in the exercise of their peculiar duty, and persuaded many of the nobility and principal persons of the city to become members of a society appropriating to themselves the care of Christian charity. The reformation of the monasteries followed that of the churches, and the vigilance of the pastor soon extended itself from the city to the country round it, which abounded with irregularities that required his correction. The great abuses and irregularities which had overrun the church at this time arose principally from the gross ignorance of the clergy; in order therefore to attack these evils at the root, Charles established seminaries, colleges, and communities, for the education of young persons intended for holy orders. He met with many difficulties, and much opposition in his endeavours to bring about a reformation of manners; but he prevailed against every obstacle by an inflexible constancy, tempered with great sweetness of manners.

The governors of the province, and many of the senators, were apprehensive that the cardinal's ordinances and proceedings would enroach upon the civil jurisdiction, and become inconsistent with the rights of his Catholic monarchy, to whom the duchy of Milan was then in subjection. And this was a fruitful source of remonstrances, representations, and complaints, which long troubled the courts of Rome and Madrid, and which the king of Spain, Philip II., referred entirely to the decision of the pope. But Borromeus had a more formidable opposition to struggle with, that of several religious orders, particularly the Brothers of Humility. Three provosts of the society entered into a conspiracy to cut him off; and one of their confederates, called Jerom Donat, whose surname was Fa-rina, took upon him to carry the design into execution. For this purpose he mixed with the crowd that went into the archiepiscopal chapel, where the cardinal spent an hour every evening in prayer with his domestics and other pious persons; and having watched his opportunity, he fired a harquebus at him, which was loaded with a ball suited to the bore of the piece, and with a considerable charge of leaden shot. It is said that the ball struck him on the spinal bone, but fell down at his feet without doing any other damage than soli-

ing his rochet, and that one of the shot penetrated his clothes to the skin, and there stopped, without im-

printing any wound, which was considered as a mir-

acle, especially as another shot tore away part of a

wall, and went quite through a table.

In the year 1576, the city and diocese of Milan were visited by the plague, which swept away incredible numbers; and the behaviour of Borromeus, on this occasion, was truly Christian and heroic: He not only continued on the spot, but he went about giving di-

rections for accommodating the sick, and burying the dead, with a zeal and attention that were at once ar-
dent and deliberate, minute and comprehensive; and his example stimulated others to join in the good work.

He avoided no danger, and he spared no expense; nor did he content himself with establishing proper accommoda-
tions in the city, but went out into all the neighbour-

ing parishes where the contagion raged, distributing money to the poor, ordering proper accommodate-
tions for the sick, and punishing those, especially the clergy, who were remiss in the duties of their calling.

Charles, notwithstanding the fatigue and perplexity which he suffered by thus executing his pastoral charge, endured nothing of the usual luxury of his life, nor omitted any of his stated devotions; for, whatever ap-

proached to luxury or magnificence, he considered as incompatible with the propriety of his character. It happened, that being once on a visit to the archbishop of Sienna at his palace, a very sumptuous entertain-

ment was provided for him. Borromeus, though he had been used to content himself with bread and wa-
ter, yet sat down at the table, where however he ate but little, and gave sufficient intimation that he was much displeased with such ostentation prodigality; but what was his surprise when he saw the table again covered with a dessert, consisting of whatever was most rare, exquisite, and costly! He immediately rose hastily from his seat, as if he had suddenly recollected some pressing business, and gave orders for his departure, notwithstanding the rain, and the most earnest entreaties of the archbishop. "My lord," said the cardinal, "if I should tarry here to-night, you would give me another such treat as that I have just seen, and the poor will then suffer another loss, great numbers of whom might have been fed with the superfluities that have been now set before me."

The continual labours and austerities of Borromeus naturally shortened his life; he went to Verceil to put an end, if possible, to the divisions which threatened the most fatal consequences; and, when he was there, he received a message from the duke of Savoy, requesting his presence at Turin. From Turin he retired to a place called the Sepulchre, on the mountain Varais, where he was seized with an intermittent fever, which scarce permitted him to return alive to Milan, where he arrived on the 3d of November 1584, and died the next day. He was lamented by the city and the whole province with such marks of sincere sorrow as are rarely seen; and he was immediately worshipped as a saint, without waiting for the pope's approbation.

The pope, however, when he was told of it by Cardi-

nal Baronius, gave directions that the devotion of the people should not be restrained, though Borromeus was not canonized till the 1st of November 1610, in the pontificate of Leo XI. Since that time many churches
BORROWING, churches and chapels have been erected in honour of Borromæus, this saint, and many religious societies instituted and put under his protection.

The foregoing particulars are extracted from an account of the life of Borromæus, written some years ago by Father Anthony Touron. Upon a comparison of this life with that written by Ribandëreia, a Spanish Jesuit above a century ago, it appears that the improvement of knowledge has made a very striking difference in this kind of biography. Ribandëreia, who lived in the midst of ignorance and superstition, did not suspect that the time was at hand when the incredible and ridiculous fables he recites could not be believed: his life of this saint, therefore, abounds with particulars which Touron has justly omitted. We are told that a miraculous light was seen over the chamber of Borromæus's mother when she was in labour: That Borromæus, seeing two persons carried violently down a rapid river on their horses, and just ready to perish, caused their horses slowly to leap with them out of the water that gave them his benediction: That Octavian Varona, a gentleman of Milan, who was confined to his bed by sickness, when Borromæus died, became instantly well, by recommending himself to the saint's intercession. That a daughter of Julius Bona- cina was instantly cured of a disorder in her eye, which had taken away the sight of it, by performing an act of devotion in honour of this saint: That a count of Ferrara was instantly seized with a violent disease upon speaking irreverently of Borromæus's picture, but was cured upon confessing his fault. It would certainly be a work of infinite service to the Romish church, to new-write the lives of her saints in such a manner as can now be believed, since the lives already written might by that means be gradually superceded, which are a better antidote against Popery than the arguments of the best reasoner in the world.

BORROWING and HIRING, in Law, are contracts, by which a qualified property may be transferred to the hirer or borrower; in which there is only this difference, that hiring is always for a price or stipend, or additional recompense; borrowing is merely gratuitous. But the law in both cases is the same. They are both contracts, whereby the possession and transient property is transferred for a particular time or use, on condition and agreement to restore the goods so hired or borrowed, as soon as the time is expired or the use performed, together with the price or stipend (in case of hiring) either expressly agreed upon by the parties, or left to be implied by law, according to the value of the service. By this mutual contract, the hirer or borrower gains a temporary property in the thing hired, accompanied with an implied condition to use it with moderation, and not to abuse it; and the owner or lender retains a reversionary interest in the same, and acquires a new property in the price or reward. Thus if a man hires or borrows a horse for a month, he has the possession and a qualified property therein during that period; on the expiration of which his qualified property determines, and the owner becomes (in case of hiring) entitled also to the premium or price for which the horse was hired.

There is one species of this price or reward the most usual of any, but concerning which many good and learned men have in former times very much perplexed themselves and other people, by raising doubts about its legality in furo conscientia. That is, when money is lent on a contract to receive not only the principal sum again, but also an increase by way of compensation for the use, which is generally called interest by those who think it lawful, and usury by those who do not so. But as to this, see the article INTEREST.

BORROWSTOWNNESS. See BURROWSTOWNNESS.

BORSEHOLDER, among the Anglo-Saxons, one of the lowest magistrates, whose authority extended only over one free burg, tithing, or decennary, consisting of ten families. Every freeman who wished to enjoy the protection of the laws, and not to be treated as a vagabond, was under the necessity of being admitted a member of the tithing where he and his family resided; and in order to obtain this admission, it was as necessary for him to maintain a good reputation; because all the members of each tithing being mutual pledges and sureties for each other, and the whole tithing sureties to the king for the good behaviour of all its members, they were very cautious of admitting any into their society who were of bad or doubtful characters. Each tithing formed a little state or commonwealth within itself, and chose one of its most respectable members for its head, who was sometimes called the alderman of such a tithing or free-burg, on account of his age and experience, but most commonly borseholder, from the Saxon words bors, a "sentry," and alder, a "head or chief." This magistrate had authority to call together the members of his tithing, to preside in their meetings, and to put their sentences in execution. The members of each tithing, with their tithing-man or borseholder at their head, constituted a court of justice, in which all the little controversies arising within the tithing were determined. If any dispute of great difficulty or importance happened, or if either of the parties was not willing to submit to a sentence given in the tithing-court, the cause was referred or appealed to the next superior court, or court of the hundred.

BORSET, or BORSSET, celebrated for its baths, a place about half a league from Aix-la-Chapelle in Germany. The abbey here is a very magnificent pile of building. It was formerly a monastery; but serves for a nunnery, whose abbess is a princess of the empire, and lady of Borsæt. The waters are warm, and of the nature of those of Aix-la-Chapelle; but they are only used as baths for the diseases in which the waters last mentioned are recommended, and also in tropical and oedematous cases. The waters are distinguished into the upper and lower springs. The former were found by Dr. Simmons to raise the thermometer to 158°, the latter to only 127°. All the baths are supplied by the first. Dr. Simmons observed, that these waters were much less sulphureous than those of Aix-la-Chapelle, probably on account of their greater heat. He likewise found that they abounded much with selenites, which inculent the pipe through which the water passes, and likewise the sides of the bath.

BORYSTHENES. See BORYSTHENES.

BOS, JOHN BAPTIST DU, a celebrated author and member of the French academy, was born at Brusais in 1690, and finished his studies at the Sorbonne. In 1695, he was made one of the committee for foreign affairs.
affairs under Mr. Torez; and was afterwards charged with some important transactions in England, Germany, Holland, and Italy. At his return to Paris, he was handsomely preferred, made an abbé, and chosen perpetual secretary of the French academy. He was the author of several excellent works; the principal of which are, 1. Critical reflections upon poetry and painting, 3 vols 12mo. 2. The History of the four Gordians, confirmed and illustrated by medals. 3. A critical History of the establishment of the French Monarchy among the Gauls, 2 vols 4to, 4 vols 12mo. He died at Paris on the 23rd of March 1742.

Bos, Lewis Jansen, an esteemed painter, was born at Bois-le-Duc. Having been carefully instructed in the art of painting by the artists of his native city, he applied himself entirely to study nature and rendered himself very eminent for the truth of his colouring and the neatness of his handling. His favourite subjects were flowers, and curious plants, which he usually represented as grouped, in glasses, or vases of crystal, half filled with water; and gave them so lively a look of nature, that it seemed scarce possible to express them with greater truth or delicacy. It was frequent with this master to represent the drops of dew on the leaves of his objects, which he executed with an uncommon transparency; and embellished his subjects with butterflies, bees, wasps, and other insects, which Sandart says, were superior to any thing of that kind performed by his contemporaries. He likewise painted portraits with very great success; and showed as much merit in that style as he did in his compositions of still life. He died in 1507.

Bos. See Mammalia Index.

Bos, in antiquity, was peculiarly used for an ancient Greek silver coin which was didrachm, or equivalent to two drachms. It was so called as having on it the impression of an ox, and chiefly obtained among the Athenians and Delians; being sometimes also struck of gold. From this arose the phrase Bos in lingua, applied to those who had taken bribes to hold their tongue.

BOSIA, a maritime town in the western part of the island of Sardinia, with a castle, a good port, and a bishop's see. It is seated on the river Bosia, to the north-east of an island of the same name; and has good salt pits. E. Long. 8. 30. N. Lat. 40. 19.

BOSCAGE, the same with a grove or thicket.

Boscage, in a law sense, is that food which trees yield to cattle; as mast, &c. But Manhood says, to be quit of boscage is to be discharged of paying any duty for windfall wood in the forest.

Boscage, among painters, denotes a landscape representing much wood and trees.

BOSCAN, John, a Spanish poet of the 16th century, born at Barcelona. He was the friend of Garcia de Vega, another Spanish poet. These two were the first who made any great improvement in the poetry of their nation, and their pieces were printed together. Boscan, who died about the year 1542, principally succeeded in sonnets.

BOSCAWEN, Edward, a brave British admiral, was the second son of Hugh late lord viscount Falmouth. Having early entered into the navy, he was, in 1740, captain of the Shoreham; and behaved with great intrepidity as a volunteer under Admiral Vernon, at the taking of Porto Bello. At the siege of Carthagena, in March 1740-1, he had the command of a party of seamen who resolutely attacked and took a batter of 15 twenty-four pounders, though exposed to the fire of another fort of five guns. Lord Aubrey Beaucler being killed at the attack of Boca-Chica, Captain Boscawen succeeded him in the command of the Prince Frederic of 70 guns. In May 1742, he returned to England, and married Frances daughter of William Glanville, Esq. and the same year was elected representative for Truro in Cornwall. In 1744, he was made captain of the Dreadnought of 60 guns; and soon after he took the Medea, a French man of war commanded by M. Hoquart, the first king's ship taken in that war. May 3. 1747, he signalled himself under the admirals Anson and Warren, in an engagement with the French fleet off Cape Finisterre, and was wounded in the shoulder with a musket ball. Here M. Hoquart, who then commanded the Diamond of 56 guns, again became his prisoner; and all the French ships of war, which were ten in number, were taken. On the 15th of July he was made rear-admiral of the blue, and commander in chief of the land and sea forces employed on an expedition to the East Indies; and, on the 4th of November, sailed from St Helen's, with six ships of the line, five frigates, and 2000 soldiers. On the 20th of July 1748, he arrived at St David's, and soon after laid siege to Pondicherry; but the men growing sickly, and the monsoons being expected, the siege was raised, and Mr Boscawen showed himself as much the general as the admiral in his retreat. Soon after he had news of the peace, and Madras was delivered up to him by the French. In April 1750, he arrived at St Helen's in the Exeter, and found that in his absence he had been appointed rear-admiral of the white. He was the next year made one of the lords commissioners of the admiralty, and chosen an elder brother of the Trinity-house. In February 1755, he was appointed vice-admiral of the blue. On the 19th of April, sailing in order to intercept a French squadron bound to North America, he fell in with the Alcide and Leys of 64 guns each, which were both taken: on this occasion M. Hoquart became his prisoner a third time, and he returned to Spithead with his prizes and 1500 prisoners. In 1756, he was appointed vice-admiral of the white; and in 1758, admiral of the blue, and commander in chief of the expedition to Cape Breton; when, in conjunction with General Amherst, and a body of troops from New England, the important fortress of Louisbourg and the whole island of Cape Breton were taken, for which he afterwards received the thanks of the house of commons. In 1759, being appointed to command in the Mediterranean, he arrived at Gibraltar, where hearing that the Toulon fleet, under M. de la Clue, had passed the Straits, in order to join that at Brest, he got under sail, and on the 18th of August saw, pursued, and engaged the enemy. His ship, the Namur of 90 guns, losing her main-mast, he shifted his flag to the Newark; and, after a sharp engagement, took three large ships, and burnt two in Lagos bay, and the same year arrived at Spithead with his prizes and 2000 prisoners. On December 8. 1760, he was appointed general
BOSCH, Jacob Vanden, a painter of still life, was born at Amsterdam, in 1636, and painted summer fruits, of various kinds, peaches, pears, apples, plums, nectarines, and cherries, with extraordinary neatness of pencil. He painted all his objects after nature, and imitated every sort of fruit with so great truth and delicacy, with such natural and transparent colour, that they appeared delicious and almost real. He died in 1676.

BOSCHAERTS, Thomas Willeborts, a celebrated painter, was born at Bergen-op-Zoom; and, like the great painters who flourished at that time, began to draw when very young, in the books that were intended for other studies. Preferring his pencil to every thing else, he drew his own picture, by his resemblance in a looking-glass, so like, that those who saw it were astonished. This he did before he had the least instruction from any one, and when he was only 12 years of age. Upon this his parents sent him to a master, that he might follow the best of his genius; but he drew after being only an indifferent painter, and incapable of satisfying his earnest desire of learning, he left him, and engaged himself with Gerard Segers; under whom, after four years practice, he proved a most accomplished artist. Antwerp being at that time the seat of arts, where there was a confux of the most eminent painters, he thought it the fittest place for his improvement; and there executed such a number of noble pieces as added greatly to the splendour of that wealthy city. In 1642, Henry Frederic prince of Orange, and his son Prince William, employed him in their service; in which he continued several years, and made those excellent pieces that are to be seen in that prince's palace at the Hague and other parts of Holland, and painted portraits for most of the persons of quality that were then living. He died in the flower of his age, in 1670.

BOSCO, or Bosch, a town of Italy, in the Milanese, seated on the river Orbe. E. Long 9. 44. N. Lat. 14. 4. 8.

BOCCIO, or Bocci, in ecclesiastical history, denotes a species or tribe of monks in Palestine, who fed on grass like the beasts of the fields. The word is Greek, βοσκε, q. d. “grazers,” formed from βόσκε, pascō, “I feed.” The Bocci are ranked among the number of Adamites, not so much on account of their habit, as food. They took no care about provision; but when eating time came, or any of them was hungry, went into the fields, with each his knife in his hand, and gathered and ate what he could find.

BOSCOVICH, Roger Joseph, the founder of an original and sublime theory of natural philosophy, deserves to be particularly noticed in a work of this nature; but we have to regret that the materials from which our biographical memoir must be compiled, are insufficient to satisfy the curiosity concerning the literary habits, and the characteristic features, of this very illustrious man.

His rank, indeed, as a philosopher, we are enabled to appreciate by perusing some of the immortal works which he has bequeathed us; but, for a knowledge of his moral character, disposition, and temporal con-

VOL. IV. Part I.

cerns, we can only have recourse to the eulogies of his friends. These are certainly entitled to much of our confidence; and when the names of M. de la Lande, M. Fabroni, Stay, and Zamagna are mentioned, we may be thought fastidious, in implying the least distrust of their testimony. It is our respect for the public and for truth, and it is our knowledge of the nature of eulogies, which have made us so.

We have, therefore, endeavoured, rather to relate the incidents in the life of Boscovich, than to give a transcript of friendly effusion; and yet perhaps it may be discovered, that our report is luminous with eulogy, whilst its outlines are poorly defined.

Boscovich was born on the 11th of May 1711, at Ragusa, a sea-port on the coast of the Adriatic, and capital of a small republic of the same name, under the protection of the Turks and the Venetians. We know so little of his parents, that we can only conjecture at their circumstances and capacity, from the education which they gave to their son being liberal and judicious.

It does not appear that our author gave any tokens of superior genius, till he was sent to learn grammar and philosophy in the school of the Jesuits, who were at that time the principal teachers in Ragusa and throughout Italy. Amongst them his docility and obedience could not pass unnoticed, but were sufficient to mark him as a likely subject for future eminence, and consequently to procure to him particular attention. In his 15th year, after he had gone through the ordinary course of education, and when it was necessary to determine his farther pursuits, application was made to admit him into the order; and for the reasons we have mentioned, it was readily complied with. This was agreeable to his own inclination, and proved the source of that distinction in learning to which he afterwards attained.

The Jesuits, it is well known, had much interest and authority to promote in the city of Rome; whither it was customary in them to send those members whom they knew to be qualified for that purpose, and those youths of whom they had great expectations, for more instruction. As Boscovich was sent there in the year 1725, we may reasonably imagine he had profited much by his teachers, and was signalized for his abilities. This zeal in the cultivation of youth, which the Jesuits ever preserved, and which perhaps tended more to the preservation of their power than all their religious artifices, was attended with consequences the most beneficial to humanity; and when we recollect how many and how great the geniuses were which it discovered, and fostered and brought to maturity, we are almost induced to believe that it counterbalanced all the ill effects of their order. Had this education been confined to some limited sphere; had it embraced the prattling doctrines of casuistry and the unwieldy mass of cloistered theology alone; unfortunate and melancholy for the world would have been this zeal: no refuge for the venial penitent, no security against boisterous sectarism would have remained; an unnaturally lethargy would have debased the mind, and the moral and the intellectual world would have sunk to a dread chaos of confusion. But the Jesuits knew well the benignant influence of literature, and the salutary elevation of science; they saw that wealth, and power, and ho-
BOS [ 42 ] BOS

Boscovich, a man of profound and exact knowledge; and that philosophy had driven him to the consideration of the order of their duties and the importance of their order in the public disputations, by anticipating obstacles, overcoming and removing them, the Boscovich he entertained some of those original notions which were destined to grow up into system, and one day to astonish the whole world of science. These, as they grew, were strengthened by solid arguments in the public disputations, by producing obstacles, overcoming and removing them, by his efforts in extending and applying them to the most remote and discrete actions of the universe. The animating spirit of discovery and invention led him to consider every portion of physical science; and indeed so versatile and so vigorous was his mind, we would be at a loss to specify one portion, which, within a few years, it did not comprehend, elucidate, and advance. In confirmation of this we beg to present our readers with an enumeration of the principal subjects to which he turned his attention, and concerning which he published dissertations whilst he continued in the professorship. The transit of Mercury over the sun; the spots in the sun; the aurora borealis; the construction of spherical trigonometry; the figure of the earth; a new telescope to determine celestial objects; the motion of tides; the law of gravitation; the orbit of the planets; the law of natural philosophy, which alone will render his name immortal.

About this time a taste for philosophical poetry was much prevalent amongst the learned, and some of our author's acquaintance had laboured in it with success. Of these we may mention Father Noci, who wrote on the rainbow and the aurora borealis, and the justly celebrated Benedict Stay, whose poems on the philosophy of Descartes, and on the more modern philosophy, are excellent examples of fine Latin composition and scientific investigation. Boscovich published their works with annotations and supplements, in which a splendid fund of information and learning is displayed.

By such undertakings, the fame of our author was widely diffused, and he became an object of general admiration. The learned societies of many countries in Europe conferred on him unsolicited honours, and several foreign princes invited him to their courts. His opinions on various subjects of civil architecture, topography, and hydrodynamics, were asked and entertained by Pope Benedict XIV, John V, of Portugal, and others. These necessarily required his presence in different states, where he never failed to increase his reputation, and often terminated disputes which might otherwise have gone on to open warfare.

He was employed to correct the maps of the papal dominions, and to measure a degree of the meridian passing...
Boscovich. passing through them. In this he was assisted by an English Jesuit, Christopher Maire. An account of their expedition was printed at Rome and Paris, and is interspersed with some curious anecdotes, concerning the opinions which the peasants of the Apennines formed of them, and the operations which they had to perform; but it is valuable on account of the accurate detail which is given of their observations.

In the year 1757, he was sent to Vienna by the republic of Lucca, to reconcile some differences concerning the draining of a lake, in which the grand duke of Tuscany, the emperor Francis I, and that republic, were concerned. It was after he had succeeded in the object of his visit to that city, that he published there his Théorie Philosophic Naturelle in 1758; and that he gained the esteem of the empress-queen.

Another occasion for his mediating powers soon presented itself, and which more nearly interested him, as his native city of Ragusa required them. It had been suspected by the British government, that some ships of war were fitted out at that port for the service of the French, thereby infringing the neutrality. Such a suspicion having no just foundation, alarmed the senate of Ragusa, and required speedy removal, as the consequences of it might be extremely prejudicial to their commerce. Boscovich, who had often been successful in similar circumstances for other powers, appeared to them the most proper person for this purpose, and was accordingly entrusted with it. He repaired to London, and there also effected the object of his mission with honour to himself. He visited the Royal Society, which received him with distinguishing marks of respect, and which he soon afterwards complimented with an excellent Latin poem on the solar and lunar eclipses. This was in the year 1762, when Dr Johnson was in London. Mr Murphy speaks of an interview which took place between our author and Johnson; but in order to magnify the unruly powers of the tremendous companion, he rather unhandsomely tells us of the easy cant with which a priest might travel through Italy and France. We are unwilling to mention what effects on some minds may have been produced by the formidable society of a Johnson; but if they are a contempt of elegant simplicity and ingenious ease, and an affected devotion to repulsive pomp and authoritative ostentation, be our lot far from his influence, amid the peace and liberty of social life.

Boscovich was invited by the Royal Society to be of the party of their members sent to America, to observe the transit of Venus over the sun's disk, which happened in the year 1762. The nature of his embassy, and the necessity of returning home, however, prevented his acceptance of the invitation. Soon after his return, and when his embassy was fulfilled, he was appointed by the senate of Milan to the mathematical chair in the university of Pavia, and to superintend the observatory of the royal college of Brera. He continued in this situation for six years, when he was made professor of astronomy and optics in the Palatine schools of Milan by the empress-queen; who also requested him to continue his attention to the observatory. This he expected to be the most agreeable part of his life. Admired by the learned; beloved by his friends; having an adequate income, and a constitution sound and vigorous; he promised to himself, happy, because useful days, in the tranquil cultivation of the sciences; but a cloud long impending now burst over his head, and these bright days never came.

The mysterious regulation in the political constitution of the Jesuits, though it had attracted the keen curiosity of the world, had, for very substantial reasons, never been explored; nay, such was the influence of the order over the minds of the most enlightened statesmen, that this impenetrable mystery was held sacred by the civil power in many countries, as if no danger could exist in what was not understood. But the rapid progress of science, and the gradual decay of superstition, required some evidence of security, and some proof that it was ever necessary to conceal good intentions, and to cover virtuous principles with any other garb than what truth could bestow. These, it is well known, the Jesuits either could not, or were unwilling to give; and they, therefore, justly incurred the suspicion of men. The most trivial circumstances would augment this suspicion, and the least deviation from rectitude in any of the order would serve to justify it: these were not wanting, and soon became invincible: the interest of the Jesuits rapidly declined for many years, and at last, in 1773, their order was totally abolished.

No exemption from the edict for its downfall could be procured: all who held offices were dismissed; and Boscovich sought refuge in the city of Paris. Thither indeed he was invited by the minister (we believe Targot), by whose means he was made one of the directors of optics for the sea service, and received a pension: but it does not seem that his situation was agreeable to him; for it is well known that the peculiar nature of his circumstances was the sole cause of his long residence in Paris.

Whether his dislike arose from the envy of some of the French, his own irritability of temper, or the incongruity of the prevailing manners with his own, we cannot determine: but it is reasonable to imagine, that the ruin of his order, and the subsidence of his own importance, would leave some indelible mark in his mind; and perhaps when he contemplated the apparent levity and the real scepticism of the age, he might be brought to fear that the degradation or the downfall of the world was concomitant. Sentiments very opposite to those of the French would thence naturally arise; morosity and discontent would invade him, and he wished to revisit the scenes of his youth. Be all this, however, as it may, certain it is, he applied for leave of absence for two years, after he had resided in Paris for ten years: this he easily procured, and accordingly set out for Bassano in the republic of Venice.

At this place he published, in five vols. quarto, a collection of the works which he had finished in Paris. This forms a body of optical and astronomical knowledge, well worthy the attention of the philosophical and mechanical cultivators of the sciences. It may be worth mentioning, that by proceeding on the principles contained in one of the dissertations in this collection, an amiable philosopher of our own country (Dr Robison) believed it possible to ascertain the motions of the earth, though the observer should be confined in a cellar; in prosecuting the subject, however, he
Boscovich found that an error into which Boscovich had fallen, concerning the aberration of light, undermined the principles on which he had erected such a wonderful but legitimate problem. The candid and very interesting acknowledgment of the error, and his extreme disappointment in the discovery of it, which the doctor made in the 3rd vol. of the Edinburgh Transactions, is at once an evidence of his own liberality, and an undeniable testimony to Boscovich's genius.

We beg to recommend to our readers the perusal of the work of which we have now mentioned; they would tend to form the mind to the true mode of investigating the phenomena of nature, and will satisfactorily show that this mode is always rewarded by discovery. The following is a pretty just account of their contents: A new instrument for determining the refracting and diverging forces of diaphanous bodies; a demonstration of the falsehood of the Newtonian analogy between light and sound; the algebraic formulæ regarding the focusses of lenses, and their applications for calculating the sphericity of those which are to be used in achromatic telescopes; the corrections to be made in octant lenses, and the error of the sphericity of certain glasses; the causes which hinder the exact union of the solar rays by means of the great burning glasses, and the determination of the loss arising from it; the method of determining the different velocities of light passing through different mediums by means of two dioptrical telescopes, one common, the other of a new kind, containing water between the objective glass and the place of the image: a new kind of objective microscopes; the defects and inutility of a dioptrical telescope proposed and made at Paris, which gives but two images of the same object, the one direct, the other inverse, with two contrary motions of moveable masses; masses floating in the atmosphere, as hail of an extraordinary size, seen on the sun with the telescope, and resembling spots; the astronomical refractions, and various methods for determining them; various methods for determining the orbits of comets and of the new planet, with copious applications of these doctrines to other astronomical subjects, and still more generally to geometry and to the science of calculation; the errors, the rectifications, and the use of quadrants, of sextants, of astronomical sectors, of the meridian line, of telescopes called the instruments of transits, of the meridian, and of the parallactic machine; the trigonometrical differential formulæ, which are of so much use in astronomy; the use of the micrometrical rhombus, extended to whatever oblique position; the error arising from refractions in using the astronomical ring for a sundial, and the correction to be made; the appearing and the disappearing of Saturn's ring; the methods of determining the rotation of the sun by means of the spots, proposed formerly by the author, and now perfected; the greatest exactness possible in determining the length of a pendulum oscillating every second of middle time by the comparison of terrestrial and celestial gravity; a compend of astronomy for the use of the marine, containing the elements of the heavenly motions, and of the astronomical instruments, to be explained to a prince in the course of one month; a method for determining the altitudes of the poles with the greatest exactness, by means of a gnomon alone, where other instruments are not to be had; the determination of the illuminated edge of the moon to be observed on the meridian; a method of using the retrograde return of a star to the same longitude, for determining the less certain elements of her orbit; a method for correcting the elements of a comet, of which the longitude of the node is given; and the inclination of the orbit has been found nearly; another method for the same purpose, and for finding the elliptical orbit, when the parabolic one does not agree with the observations; a method for correcting the elements of a planet by three observations; the projection of an orbit inclined in the plane of the ecliptic; the projection of an orbit inclined in any other plane; the calculation of the aberration of the stars, arising from the successive propagation of light; some beautiful theorems belonging to triangles, which are of great use in astronomy, reduced to the most simple demonstrations.

After the publication of these works, our author left Bassano, and went to Rome to visit the companions of his youth. From Rome, he proceeded to Milan, where he revised some of his own works, and prepared for publication the two last volumes of Stay's poems.

In such occupations, and amid friends whom equal misfortune and temporary separation had still more endeared, he had remained happy, and might perhaps have been still further useful to the world; but his leave of absence was now nearly expired, and his dislike to a residence in Paris was augmented by the contrast which his present abode afforded. He was too delicate to apply for more leave of absence; and though he was sensible of the gratitude which he owed to France, he could not reconcile it with the destruction of his own repose. About this time also he had several attacks of gout, but he would admit no medical aid. Under these distresses, and others which we have before mentioned, our illustrious author at last sunk: a melancholy despondency seized on and subjugated his mind, so that for five months he remained perfectly faithful; and an imposthume having burst in his breast, terminated his existence on the 13th of February 1787, in the 76th year of his age.

The following inscription was composed by Benedict Stay, and engraved on marble by order of the senate of Ragusa, in memory of their useful citizen the illustrious Boscovich.

Rogerio Nicolai F. Boscovich, summi ingenii, viri philosophi, et mathematici, praestatissimae scriptori operum egregiorum, rerum physicae, geometricae, astronomicae, plurimis inveni, suis auctarum continentium celebritarum Europae, academiarum socii. Qui in societate Jesu cum esset ac Romae, matheum, praefecturus Benedicto XIV. mandante. Multo.
Besides the works which we have mentioned, he wrote other works on various subjects, as, on the project of turning the navigation to Rome from Fiumicino to Maccarese; a third on two torrents in the territory of Perugia; a fourth on the bulwarks on the river Pounaro; a fifth on the river Sidone in the territory of Placentia; a sixth on the entrance into the sea of the Adige. He wrote other works on the bulwarks of the Po; on the harbours of Ancona, of Rimini, of Magna Vacca, and Savona, besides others, almost all which were printed. He had likewise received a commission from Clement XIII. to visit the Pomptin lakes, on the draining of which he drew up his opinion in writing, to which he added further elucidations at the desire of Pius VI.

We have spoken of Boscovich as the founder of a new system of natural philosophy, which has occupied much of the attention of the learned, and which alone will render the name of its author immortal. It becomes us therefore to give such a synopsis of it, as may satisfy the general reader, or induce the student to search for more information in the work from which we ourselves have derived it.

In a subject so abstruse and remote from observation, as many of the principles which we have to consider in this theory, much difficulty in investigation is to be expected, and perhaps the metaphorical language which we are constrained to employ, will tend not a little to embarrass and mislead us. We are also aware of the many obstacles which a theory of such magnitude has to encounter in the improved mode of philosophising of the present day; we are aware that at the bare mention of a new theory in natural philosophy, some of our readers will revolt from our page, affect a contempt of our labours, and call to their aid the authority of Bacon. But we would ask such, from whence does their spirit arise? have they found it in those who never studied a page of Bacon; and we have known it accompanied by indolence, and by a supine indifference to aught that dignifies and elevates humanity. It is surely no hard matter to condemn a theory, merely because it is a theory; nor is it at all demonstrable that such condemnation requires any great effort of genius or understanding. Now the spirit of Bacon is a spirit of zeal, and labour, and perseverance, and above all, of investigation. Not then from his writings has this contempt arisen, but from a total ignorance of them; not from his doctrine, but from an imaginary inspiration of his principles.
We have reason to believe that the theory of Boscovich would have received the sanction of the illustrious Bacon: because the foundation on which it is erected is consecrated by irradiation from his works. Be this, however, as it may, we are convinced that such an example of true genius will be acceptable to every friend of humanity, and to every cultivator of science.

That we may do justice to our author in giving a synopsis of his theory, we shall follow the order in which he himself has adopted; and shall subjoin some general observations and remarks which have occurred to us in the course of the work.

Boscovich's Theoria Philosophiae Naturalis is divided into three parts; of which the first contains the explanation of the theory, its analytic deduction, and its vindication.

The second contains the application of the theory to mechanics, and

The third the application of the theory to physics. Of these in order, and first of the explanation of the theory.

This theory has something in common with the Leibnitzian and the Newtonian.

With the former it admits that the elements of matter are simple and unextended; but it differs from it, in denying the continued extension of the elements, and in asserting that the elements are perfectly homogeneous,

Like the Newtonian, it allows the existence of mutual powers or forces, which vary according to the distance by certain laws; but it goes further, in that it asserts these powers are both repulsive and attractive, and that when either of these terminates the other begins; but it differs from the Newtonian in explaining by one principle phenomena to which the latter applies three.

This one principle may be expressed by an algebraic formula, or by one continued geometrical curve; and it is the law by which the powers of repulsion and attraction act. As continued extent of bodies is rejected from this theory, it is obvious, that as on the one hand a repulsive power must render it impossible, so on the other an attractive power must give rise to the apparent examples of it, to the phenomena of cohesion: this accordingly is one essential characteristic of the theory.

From these few remarks we may deduce the principles of the theory.

The first elements or atoms of matter are indivisible, inextended, but simple, homogeneous, and finite in number. They are dispersed in an immense space, in such a manner as that any two or more may be distant from each other at any assignable interval. This interval may be indefinitely augmented or diminished, but cannot entirely vanish. Actual contact of the atoms is therefore impossible, seeing that the repulsive power which prevents the entire vanishing of the interval, must be sufficient to destroy the greatest velocities by which the atoms tend to unite. The repulsive power must encircle every atom, must be equal at equal distances from the atoms, and moreover, must increase as the distance from the atoms diminishes. On the contrary, if the distance from the atoms increases, the repulsive power will diminish, and at last become equal to nothing, or vanish; then, and not till then, an attractive power commences, increases, diminishes, v. Boscovich's system of Philosophy.

Such a process as we have now mentioned may seem a very complicated and confused; but the curve line which will express it is so simple, that we are assured, our readers, though unacquainted with geometry, will comprehend the whole theory, and hence will be able to understand the principles of the theory itself.

We shall now proceed therefore to exhibit this curve, and to shew in what manner it elucidates the principles of the theory.

The axis CAC has an asymptote of a curve in the point A, viz. the indefinite right line AB; on each side of which are placed two equal and similar branches of a curve, viz. DFEFG, &c. and DEFGHIKL MNOPQRSTV; the latter of these having the asymptotical arch ED, though indefinitely produced towards the right line AB, will never touch it; but it accedes to the axis CAC, and touches it in some point E. From this point it recedes on the opposite side of the axis to some point F; bends again to the axis CAC, and cuts it in the point G; from this it recedes in a similar manner, on the side of the axis from whence it originated, and arrives at the point H. From the point H it bends to the axis CAC, and cuts it in the point I; and so on in alternate sets of accesion and recession till it has completed the remaining arches IKL, LMN, NOP, QRS, TST; after which it becomes asymptotical, forming the arch TPSV, which approaches the axis CAC on the side opposite that from which it originated, in such a manner as that the distances from the axis shall be in the reciprocal duplicate ratios of the distances from the asymptote BA.

Now, if we raise and let fall perpendiculars on the axis CAC in the points a, b, d, &c. the segments of the axis so formed, viz. A a, A b, A d, &c. are abscissae, and will represent the distances between any two atoms or points of matter; and the perpendiculars so constructed, viz. a g, b r, d a, are ordinates, and will represent the intensity of the repulsive or attractive powers, according to their situation with respect to the axis CAC; for, if on the same side with the asymptote AB, as a g, b r, they represent the former; and if on the side opposite to the asymptote, as d a, the latter power.

From what we have said, it is manifest, that the ordinate a g may be increased beyond any assignable limit, provided the corresponding abscissa A a be diminished beyond any assignable limit; seeing that the limb of the curve ED is asymptotical which terminates the ordinate a g, and consequently never touches the right line AB; but that, if the abscissa be increased as to A b, then the ordinate will be diminished to b r; and that by perpetually increasing the abscissa to the point E, the ordinate will be perpetually diminished till at the point E it will totally vanish.

Moreover, if we shall increase the abscissa to A d, we shall find that on the opposite side of the axis CAC, there will appear the ordinate d a, which, by continuing
If these conditions be answered, it must be evident, that by this curve we can express any intensity of any force, in any direction we please; and of consequence, that by one law of the forces, every thing in the universe, connected in any manner with motion, may be explained.

We come now to consider the analytic deduction of the theory, in which we shall follow closely the steps of Boscovich.

Boscovich sets out, by examining the nature of the law of continuity, and the principles on which it is founded. In the year 1745 he published a dissertation De Viribus virtutum, in which he was led to consider the phenomenon of the collision of bodies, and in consequence, the dilemma into which former philosophers had fallen by their mode of investigating it, and the breach of the law of continuity which some had allowed to extricate themselves from the dilemma.

Maclaurin, of whom Boscovich speaks in terms of the highest respect, “Summus nostri aevi geometra et philosophus,” was the principal advocate for the breach of the law of continuity in the collision of bodies, and spoke with some indignation of those who asserted, that this law was universal. He of course believed in the production of motion by impulse, and in the immediate contact of bodies. Now Boscovich, as we have before mentioned, rejects both of these suppositions, and consequently explains the phenomenon in a very different manner from Maclaurin, and endeavours to prove that the law of continuity is universal, and that no instance of a breach of it is ever observable or possible.

Before proceeding to his reasoning on this subject, we shall explain what is meant by the law of continuity, and give one example of it, to which all others are referable.

The law of continuity (says Boscovich) consists in the this, that any quantity whilst passing from one magnitude to another, must pass through all the intermediate magnitudes of the same kind: or, according to the law of continuity, all changes in nature are produced by insensible and infinitely small degrees; so that no body can, in any case pass from motion to rest, or from rest to motion, without passing through all possible intermediate degrees of motion. Maclaurin’s Newton, b. i. c. 4.

Let there be a right line AB (fig. 2.), to which another line CDE is related; let AB represent the time, and from any points of it, F, H, let there be erected the perpendiculars FG, HI, which (ordinates) may represent any quantities continually variable, and will correspond to the moments of time F, H; but to the intermediate moments K, M, other magnitudes KL, MN, will correspond; and if from the point G to the point I there goes a continued and finite part of the line CDE, it is evident that there is no intermediate point of the line AB, as K, to which some ordinate KL does not correspond; and conversely there is no ordinate of magnitude intermediate between FG, HI which does not correspond to some point intermediate between F, H. Now the variable quantity expressed by this variable ordinate, changes according to the law of continuity because from the magnitude FG, which it has in the moment of time F, to the magnitude HI, which it has in the moment of time H, it passes.
This then may be sufficient to explain the nature of
the law of continuity, about which, we may remark,
there can be no ambiguity; for the terms which ex-
press it are precise, it is a matter of fact, and one ex-
ample of it is enough to give us an adequate idea of it.
We proceed, therefore, to consider on what its uni-
versality is founded; and here two questions naturally
occur: Have we discovered the universality of this law
by a laborious induction? or does it necessarily result
from the nature of continuity? Boscovich answers both
of these questions in the affirmative.

1. It is discovered by induction. Here we beg to
transcribe the words of our author, as much more sa-
tisfactory than anything we can give: “Quin immo
omnes in lineis continuis sunt quasvis abruptis.
Plurimos ejusmodi motus videmus. Planetae et co-
metae in lineis continuis currus peragunt suum, et
omnia retrogradationes sunt paulatim, ac in stationibus
sempervigilant quidem motus, sed tamen habetur sem-
per, atque hinc etiam dies paulatim ad auras ven-
it, per vespertinum crepusculum abit, solis diametr
non per saltum, sed continuo motu supra horizontem
ascendit, vel descendit. Gravitas itidem obliqué pro-
jecta in lineis itidem pariter continuis motus exercet
suos, imiritum in parabolis seclusa aere resistentia, vel
ea considerata, in orbibus ad hyperbolas potius acced-
dentibus, et quidem semper cum aliquia exigua obliqui-
tate projiciuntur, cum infinitissimis impropriabi-
tatis habebat motus accuratís verticalis inter infinitas
infinitas inclinationes, licet exiguis, et sub sensum non
cadentes, fortuito obveniens, qui quidem motus in
hypothesi tellarum mota a parabolis plurimam distant,
et curvam continuam exhibent etiam pro casu projec-
tionis accuratís verticalis, quo quisque usus tellure,
et nulla ventorum vi deflectente motum, habebatur,
ascescunt rectilineus, vel descensus. Immo omnes ali-
imus a gravitate pendentes, omnes ab elasticitate, a
viamagnetica, continuitatem itidem servat, cum eam
servent vires ille ipsa, quibus gignuntur. Nam gra-
vitatis, cum decreasat in ratione reciproca duplicata dis-
tantiarum, et distantiae per saltum mutari non possint,
motur per omnes intermedias magnitudines. Vide-
mus pariter vim magneticae a distantia pendere lege
continua; vim elasticam ab inflexione, uti in laminis,
vel a distanti, ut in particularis aeris compressi. In ipsis,
et omnibus ejusmodi viribus, et motibus, quos gign-
untur, continuitas habetur semper, tam in lineis, quae
descirribunt, quam in velocitatibus, quae pariter per
omnes intermedias magnitudines mutatur, ubi videre
est in pendulis, in ascensione corporum gravium, et in
alii mille ejusmodi, in quibus mutationes velocitat
sunt gradatim, nec retro cursus reflectitur, nisi immi-
nuta velocitate per omnes gradus. Ego diligenter
continuam servat omnia. Hinc vacatis usque in natura-
libus motibus habebatur angulus, sed semper mutatio di-
rectionis fit paulatim, nec voto anguli exacti habebatur
in corporibus ipsis, in quibus utcunque videatur tenuis
acies, vel cuspis, microscopii saltem ope videri solet
curvatura, quam etiam habent alvei fluidorum semper,
habent arborum folia, et frondes, ac rami, habent la-
pides quinquaque, nisi forte alicubi cuspides continu
occurrent, vel primi generis, quis natura videtur affec-
tare in sinis, vel secundi generis, quis videtur affec-
tare in avium unguibus, et rostro, in quibus tamen mag-
nente in ipso cuspide unica tangente continuitatem ser-
vari videbimus infra. Infinitum esset singula persequi,
in quibus continuatas in natura observatur. Satis est
generatius provocare ad exhibendum casum in natura,
in quo continuitas non servetur, qui omnino exhiberi
non poterit.” (Theoria, p. 18.)

From these and other examples, in which the law of
continuity is manifestly held, Boscovich infers, that it
is universal; and that in so far as induction supports
us, we are at liberty to apply it in the explanation of
phenomena. Nay, we are by the same principle com-
pelled to admit it in cases where observation fails us;
because to imagine that in such cases this law is broken,
and some other is adopted, is to transgress one of the
fundamental principles of true philosophy: it is to
multiply causes unnecessarily; it is to limit the power
of the Creator by the imperfection of our own senses;
and it will plunge us into difficulties which no effort
of human reason will remove. Beside this, it is very es-
yasy to conceive that the law is permanent; and as no
absurdity, therefore, accompanies the supposition, and
no fact can be brought to overthrow it, whereas the
contrary is unsupported by any fact, but is plainly rep-
ugnant to all, it is surely rational to make use of it,
and to hold it as the general principle, till some higher
one be discovered on which it depends.

From induction alone, therefore, we may infer the un-
iversality of the law; but Boscovich has other argu-
ments, which he calls positive evidence, by which he
leads us to the second question. Does this universal-
ity necessarily arise from the nature of continuity?
The limit which joins the precedent and consequent of
anything is common to both, and is therefore indivi-
sible. Thus a superficies separating two solids, wants
thickness, and is that in which a transition from the
one to the other occurs; a line dividing two parts of a
continued superficies wants breadth; a point discrimi-
nating two segments of a continued line wants every
dimension. So it is with regard to time, for the limit
of two conjunct portions is common to both, and indivi-
sible; and, as every change of a variable quantity
from one magnitude to another must be made in time,
so every change must be influenced by the continuity of
time. But to every moment of time, a certain magni-
tude of the variable quantity corresponds, and the li-
mit of two moments of time is common and indivisible;
therefore, the limit of two magnitudes corresponding
to these two moments must be common and indivisible.
Moreover, it is impossible for any quantity to
have two magnitudes at the same time, and when con-
tinually varying, that it shall have the same magnitude
at different times; much more impossible, therefore,
that in the limit of two moments of time, it should have
two magnitudes, the one corresponding to the pre-
ceding, and the other to the consequent moment, or
shall not have gone through the intermediate magni-
tudes in the intermediate moments of time. For the
same reason, a body cannot have two velocities at
the same time, and therefore cannot have two velocities
in the limit common to two moments of time; and when
continually changing its velocity, cannot have the
same
transitions from one power to another, we are referred to the phenomena of effervescence, fermentation, cohesion, &c.; the consideration of which belongs to the third part of our subject.

To prove the homogeneity of the atoms, Boscovich makes use of the same reasons which have been employed by other philosophers; and he removes the objections made to it by Leibnitz, on the principle of the sufficient reason, and the visible diversity of bodies: the former he contends to be safe, being founded on that doctrine of necessity which Leibnitz maintained; and with respect to the latter, he describes a beautiful and striking analogy, which we cannot refrain from transcribing.

"Fieri possent nigrantiae literae, non ductu atra-menti continuo, sed punctulis rotundis nigrantibus, et ita parum a se invicem remotis, ut intervalla non nisi opie microscopicis discerni possent, et quidem ipsae literarum formae pro typis fieri possent ex eja-umodi rotundis sibi proximis cupidibus constantes. Concipiatur ingens quaedam bibliotheca, cujus omnibus libris constarent litterae impressae, ac sit incredibilis ex multitudine libros comprehenderet linguas varias, in quibus quidem singulis omnibus ejusdem idiomatici voces repercurrent, quae quidem numero admodum paucis essent, discrimine illo ingenti totam variari illorum rotundatum adducere illasque adesse tales, et habuerit in eadem cum ipsa litterae convenientia. At inquisitione promotae, facile adverteret, omnes illae tam variis voces constare ex tantummodo diversis literis, discrimine aliquod inter se habentibus in ductu linearum, quibus formantur, quorum 'combinatio diversa pararet omnes illas voces tam varias, ut eorum combinatio libros efformaret usque adeo magis a se invicem discrepantem. Et ille quidem si aliud quoque sine microscopicis examinibus institueret, nullum aliquod inveniat magis adhuc similis elementorum genus, ex quibus diversae rationes combinatoriae orientur ipsae litterae; at microscopicum arrepto, intueretur utique illam ipsam literarum compositionem in punctis illis rotundis prorsus homogeneam, quorum sola diversa posito se distributio literarum exhiberet. Hec mihi quidem imago videtur esse eorum quae cernimus in natura. Tam multi, tam varii, illi libri corpora sunt, et quae ad diversa pertinent regnas, sunt quam diversa conscripta linguas. Horum omnium chemica analysis principiis quaedam invenit minus inter se disimilis, quam sint libri, nimium voces. Hec tamen ipsae inter se habent discrimeriam aliquod, ut tam multas oceanus, terrarum, salium species eruditum chemica analysis diversus corporibus. Ultrior analysis horum veluti vocum literarum minus adhuc inter se differt, uit et ultima juxta theologiam meam deveniet ad homogenea punctula, que ut illi circuli nigris literas, ita ipsa diversae diversorum corporum particularia se solam dispositionem diversam efformarent: usque adeo analogia.
Some have asserted that the atoms of this theory do not differ from spirits, because they have not extension, which is the characteristic of matter. Does then extension constitute matter, and the want of it spirit? We apprehend not. The discrimination of matter and spirit consists in these two circumstances: the former is perceptible by our senses, and is incapable of thought and volition; whereas, the latter does not affect our senses, but can both think and will. But the perceptibility of matter arises from its impenetrability, not from continued extension. Besides this, the atoms have repulsive and attractive powers, though they do not therefore resemble spirit. For were we to admit the existence of a kind of being possessed of these active powers, conjoined with inertia, and having at the same time cognition and volition; it would neither be matter nor spirit, but _tertium quid_, distinguished from the former by cognition and volition, and from the latter by inertia, and by powers which induce impenetrability.

Boscovich treats the other metaphysical objections to his theory in a similar manner; but we think it very unnecessary to dwell longer on them, and shall therefore proceed to the second part of our subject.

II. We are obliged to be concise in our account of the application of the theory to mechanics, because, though very valuable in itself, it can hardly be abridged;

and would prove interesting to those only who are versed in mechanical science. There remains, however, some farther circumstances of the curve to be considered, which are essential to the fully understanding the theory itself, and the manner in which it is to be applied either to mechanics or to physics. We propose to deliver them in this place in conformity with our author's plan, though they are equally suitable to any of the three parts.

The circumstances we mean are of three kinds. First, The arches of the curve. Secondly, The areas comarks on the prehended betwixt the axis, and the arches which the curve ordinates generate by continually flowing. Thirdly, The points in which the curve cuts the axis.

1. The arches are either repulsive or attractive, according as they are situated on the same side of the axis with the asymptotic limb ED, or on the side opposite, and terminate the ordinates exhibiting the repulsive or the attractive powers. The arches may bend towards the axis, and turn again from it without touching or cutting it, as in the arch Pef; this bending may be repeated, and may occur on either side of the axis, and it may admit of many varieties in figure and size, so as to express every possible action and mode of action.

2. The areas may be of any magnitude, however great or small, or they may be infinite, according as the arches depart more or less from the axis, or become asymptotic with respect to it. The abscisces represent the distances betwixt the atoms, and the ordinates the present force by which they are acting: the areas which the ordinates run through, express the increment or the decrement of the squares of the velocities which are generated. From these principles it is easy to see in what manner the doctrine of dynamics may be applied in the theory. And from this very circumstance it is clear that this theory does not interfere with principles in mechanics which are deduced from reasoning abstractedly.
The remarks which we have now made, together with the former explanation of the curve, are sufficient to acquaint our readers with the general principles of the theory, and will serve to exhibit the manner in which it may be applied to mechanics and to physics.

Of the former, we have already mentioned, it is difficult to give even an abridgment; we propose then to employ the remainder of this part in enumerating the particular subjects in mechanics to which our author has applied his theory, and in giving our opinion of the degree of success with which his application is attended.

He commences by showing in what manner masses may be combined with the powers of repulsion and attraction and first of the combination of two atoms, then of three, and so to the most complicated bodies. He proves that the masses so formed will be possessed of different properties, in consequence of the disposition of the powers which in certain cases will always attract, in others always repel, and in others again will do neither; i.e., will be neutral. From these differences will necessarily result peculiarities in the mode of the action of different masses, and these so endless and diversified, as to include every possible phenomenon in nature. It is easy to conceive that the varieties in figure will readily result from the position of the atoms, and the influence of the powers in respect to each other. Thus a pyramid may be formed of four atoms, and a cube of eight; these smaller or primary masses may be combined to form secondary, and so on to any order. Regular and irregular bodies will hence be formed; and yet it may be shown that the most irregular and complicated may be reduced to the primary or original forms, from whence they were constructed.

The crystallization of salts, for example, may in this manner be accounted for, and the reduction of them into the primitive forms be explained on the principles of the theory. These phenomena imply composition and equilibrium of forces, which strictly belong to mechanics; our author therefore proceeds to consider these and other subjects connected with them: as the centre of gravity; the equality of action and reaction; the collision of bodies; the centre of equilibrium; the centre of percussion. In all these he causeth the laws of the forces is strictly applicable, that by it some very difficult problems are solved, and some intricate phenomena explained, with an accuracy and precision highly creditable to Boscovich, and strongly presumptive of the value of his theory. The formulæ which his investigations afford are certainly curious and interesting to the speculative, and may be useful to the practical mechanic. He adds a few remarks on the pressure and velocity of fluids, which are equally clear, and in our opinion satisfactory.

III. We have already anticipated some of the principles which more properly belong to this part, in the physics which we consider his application of the theory to physics. This necessarily comprehends all the general properties of matter, some of which have already engaged our attention when treating of the analytic deduction and vindication of the theory, but still require some particular observations.

The inscrutability of the atoms is a necessary consequence of the interior repulsive power increasing as ability.
Bosovich’s theory; but as we have already spoken of its limits and their varieties, we need not enlarge on it. We have to consider certain other properties of bodies, which from not being general have been called secondary. Of these the principal are solidity and fluidity.

Fluidity.—Bosovich imagines that the particles of fluid bodies are spherical, and that their forces are more directed to their centres than to their surfaces; by which motion is allowed freely when any force is applied to them from without; and that when at rest all the particles are in equilibrium in respect of each other, but that the pressure of incumbent bodies, and containing vessels, always causes some deviation from it. He says, there are three kinds of fluids: one in which the particles or masses have no mutual power; one in which they have repulsive power, and the other in which they have an attractive power. Of the first we have examples in sand and fine powders; of the second are the elastic fluids, as air; and of the third, all liquors, as water, mercury, &c. Now these three kinds are produced by the original differences in the primary particles which compose them; and we are able on the principles of the theory to specify the causes of the diversity in the phenomena which they exhibit.

Solidity is the consequence of the irregular figure of the particles and their great deviation from sphericity, by which free motion among them is prevented, and their cohesion better secured. Now the diversity in solids arises from the various degrees of strength in the limits of cohesion; and the same principles will give rise to a class of bodies intermediate between solids and fluids, viz. the viscous, whose particles attract each other more strongly than the fluids, and not so strongly as the solids.

If we imagine the particles to be so formed as to attract on some sides, and to repel on others, and to attract certain particles similarly constructed, and to repel others, we may conceive in what manner the regular bodies denominated organized are compounded; and for these the varieties admitted in the limits of cohesion, situation, and combination of atoms, will abundantly suffice. Humidity is only relative, seeing that water, e.g. adheres to our fingers, and may be easily spread out on glass, wood, &c. whereas it does not affect oleaginous and resinous bodies: now this is in consequence of the partial arrangement of the powers in different bodies, and the varieties in the combination, &c. of the particles.

Of the chemical operations Bosovich remarks in Chemical general, that they may be all traced to the same principle, the law of the forces, and the differences in the particles which thence arise; and that were they subjected to the observation of our senses, a general reason for them would be discovered; but for this there are required an intimate knowledge of the texture of all the particles, and a power of geometry and analysis which far exceeds the human mind. He explains some of them in the following manner: And first of solution. The particles of some solids have a less attraction for each other than for the particles of some fluids, and consequently when these are applied to each other, the particles of the former will separate and combine with those of the latter, so as to form a mixture in which the two bodies are suspended in combination.

But
We profess not to understand Boscovich's notions of fire; but lest our readers may require it, we beg to transcribe his own words: "Ignem ego arbitror esse quoddam fermentationis genus, quod acquirat vel potissimum, vel etiam sola, sulphurea substantia, cum qua fermentat materia lucis vehementissime, si in Fic. satis magna copia collecta sit. Ignem autem voco eum, qui non tantum rarificat motu suo, sed et calcinat, et lucet; quae omnia habentur, quando materia illa sulphurea satis fermentescit." And he observes in another place, that if fire be excited only by a fermentation of sulphureous substance, there is none of this substance there is no danger of fire.

Boscovich retains the Newtonian opinion concerning Light, viz. that it is an effluvium or emission from the sun, propagated with immense celerity, and retained in certain bodies, from which it may be extricated by certain means. He holds the atoms of light to be immense, but still finite in number, and endeavours on the principles of his theory to account for the wonderful properties with which light is endowed. In doing so, he makes extensive use of the repulsive power, the varieties in the limits of cohesion, and, we may add, with much plausibility and success. Sir Isaac Newton, in explaining the reflection of light, found it necessary to admit the existence of a repulsive power, for which, however, he had made no provision in his system. The late experiments in optics by Mr. Brougham serve to confirm the supposition of the existence of a repulsive power in regard of light at least. Boscovich refers his reader to his dissertation De Lumine for more information concerning the reflection, refraction, &c. of light and colours, and for the application of the principles of his theory to them.

He proceeds to explain many of our sensations; but we must confess there is very little praiseworthy in his remarks concerning them: indeed we can see no reason why they should be introduced at all into a system of natural philosophy, erected on such or any other foundation which concerns the external world only. In the small example of the order of systematic arrangement and application of physical phenomena to the intellectual world, which Boscovich has given us, we observe a striking coincidence with the doctrine of Hartley; but our opinion of that doctrine is not in the least modified by such coincidence. It is a doctrine which affects to teach more than it is given to man to know; a doctrine by which we are induced to depart from the humble but secure path of observation, and to wander in the boundless incomprehensible field of transcendentals, and which, however barren its consequences may be, as it augments the vanity of man, prevents the employment of his faculties in the inquiry into familiar truths.

Boscovich adopts Franklin's hypothesis of electricity; and we must refer our readers to the work itself, for his reasoning on electricity and magnetism. We would only remark, that as our knowledge of these curious phenomena is much augmented since the time of Boscovich, his theory was applied to them with disadvantage; but perhaps these very phenomena afford the best proofs of the truth of some of its principles.

We have now followed Boscovich through the conclusion of his theory, and we flatter ourselves that remarks.
Bosovich's in so doing, we have given such an exhibition of its peculiar principles as will at least excite the curiosity of our readers, though it may not gratify it; and indeed, little more could be expected from us in detailing a system of such magnitude, and affecting to comprehend so much. We have, however, engaged ourselves to give such observations and remarks as may have been suggested to us in the course of the work. In conformity with this, we beg the retrospection of our readers to those circumstances in the theory which are most peculiar to it, and which serve to fix it on the characteristic feature of originality. Of these the rejection of contact, as it is the most conspicuous, so it requires the most particular attention, as on it rests the greatest part of the reasoning and fabric of the system.

We have seen that Bosovich supports this principle on the universality of the law of continuity, and on the existence of the interior repulsive power. Of the former we have to observe, that the mode of proving it by induction is strictly philosophical, just, and convincing; but that the metaphysical or positive arguments used for the same purpose are by no means so. We do not mean to assert, that these arguments have no weight, but only that they are not so far removed from a considerable source of error and misconception as to prevent all suspicion of their accuracy, and to entitle them to an unqualified application to the subject we consider. It is true, indeed, that no appeal to observation can directly determine the question, and therefore, it may be said, we must have recourse to some other authority. But, to us at least, it seems as true, that the proof by induction is the only satisfactory one we can have; and that if we are careful to keep in view that precept of philosophy which teaches us not to multiply causes unnecessarily, and to reason from analogy on the simplicity and steady uniformity of nature, there will be no occasion to have recourse to other authority.

We are disposed to believe, that the metaphysical arguments which Bosovich employs may be retorted on the theory itself. Does not the theory seem to admit a breach in the law of continuity, when it denies the continued extension of bodies? Or, as it rejects the divisibility and extension of atoms, must we not imagine, and believe, on the faith of the law of continuity, that these atoms are mere nuclei of repulsive powers? Or shall we admit that the law of continuity depends on some higher principle not yet discovered, a principle in which extension or duration are concerned; that where there is neither extension nor duration, the law does not hold; that consequently, in the case of the atoms and their mode of union, this law suffers a breach; i.e. that the metaphysical arguments do not prove its universality, or that a breach of it is impossible? Such are the mysteries in which we are enveloped, when we wander from that path which is assigned to human reason.

As to the existence of the interior repulsive power, it may be observed, that if it be proved or evinced to us, the impossibility of contact must be admitted. Now we are of opinion, that a power of repulsion does exist in the nearest vicinity of many bodies; but we pretend not to know the law by which it operates, or even that it increases to infinity on the diminution of the distance. We are satisfied that it occasions many very curious phenomena, some of which have been explained by it; Bosovich's and we sincerely believe that the investigation of its laws and the extent of its influence will fabricate a crown as an underlying as that of Newton. But we are convinced that were the theory of Bosovich concerning it tacitly confined in, such a crown could never be obtained. Nay we insist further, that though by reasoning it could be determined that such a power does exist, it would be useless to us, till the most laborious induction be practised, to discover how far it influences observable phenomena, and how far it may be subject to human artifice and ingenuity.

The phenomena which give evidence of the existence of a power of repulsion are chiefly optical; but it belongs not to this article to explain them. We may however just mention that we allude to the experiments of the object-glasses of long telescopes, the brilliancy of dew drops while supported on leaves or rolling on the surface of water, in which it is demonstrable that a certain space intervenes betwixt bodies which are apparently in contact, and that this space can be caused by repulsive power alone. Sir Isaac Newton himself virtually admitted the existence of such a power, as appears from the last question of his Optics; indeed it is very certain that the attractive power alone will not produce many of the phenomena of which he speaks.

Concerning the other principles of the theory we have little to remark, seeing that most of them result from those we have now considered. The transition of the powers are in our opinion to be ascertained only by observation, and this it must be confessed is no easy matter: the phenomena of fermentation, effervescence, &c. to which we are referred for proofs of the existence of these transitions, seem to be easily explained on such a supposition; but it is nevertheless probable that the supposition was prior to the observation of the laws by which these phenomena are regulated. It may be worth while remarking, that if we are able to conceive these transitions as existing, we can also conceive how motion may be produced at a distance, which was held up as an absurdity in the schools. It must be very evident to our readers that the theory of Bosovich supposes this production of motion, and that any other mode is impossible, seeing that contact is so. But we are not therefore to believe that the repulsive or attractive powers are efficient causes; though they certainly are physical ones, i.e. they are higher principles than the phenomena which succeed them, and may for ought we know depend on some one more general principle which this theory does not comprehend. We do not therefore foresee any dangerous consequences of the supposition of matter acting on matter at a distance; nor can we believe that these two expressions are equivalent or consecutive, viz. if matter act where it is not, it may act when it is not. The one is a reference to space, the other to time, and betwixt these we know no mean of comparison.

We see then that the theory of Bosovich is intimately connected with the most abstruse metaphysical inquiries and disquisitions that can employ the mind of man; in particular, that which attempts to discover the mode in which our perception of the material world is carried on. For such, we confess, we have not talents of investigation, and indeed we are convinced that no investigation has yet been, or ever will be, successful;
BOS

Boscovich's ful, but we are also convinced, that if the theory of Boscovich be established, many preposterous dogmas will be overturned: as such we prefer it to any that has hitherto been offered to the world. But it is to be considered as valid, in so far only as induction satisfies us of its principles; that it can be satisfactorily applied to the solution of any phenomena where other theories fail us; that it does not in anywise inform us of the nature, or supersede inquiry into the laws, of matter. We are of opinion that it was his very intimate knowledge of these laws, and his diligent inquiry into matters of fact, that led Boscovich to the discovery of the law of continuity and of the forces, and made him see the propriety of erecting some new system in which these might bear a part. The merit of Boscovich consists not in having discovered the cause of motion, or on what it depends. He attempted a more humble strain: he investigated familiar operations, and acquainted himself with vulgar things. No mysterious analogy indeed conducted him either to the harmony or to the beauty of the spheres; but then, no stupendous vacuum intercepted his path, and no unruly vortices whirled him from rectitude. That he stopped not where prudence might have directed, and beyond which his guide could go no farther, was the failing of genius elevated by success, the lot of the resplendent few who are dazzled by their own lustre. But it would ill become his followers to attempt continuing to the end on that path which he pointed out; moderate minds should accompany him as their friend, only so long as they perceive he is directed by a friend which is greater than him: let them remember that it is his observations alone which are valuable, the simple arrangement of them which they should esteem; it is the plain narrative of the honest traveller which will assist them, not the pompous fabric of the self-deluded novice.

The only theory with which we can properly compare this of Boscovich, is the Newtonian, and in so doing its superiority will appear; but for very obvious reasons we enter not minutely into the comparison, and will only add that in the Newtonian, we must have recourse to the three principles of gravity, cohesion, and fermentation, for the explanation of phenomena; and even these are insufficient in the modern chemistry; but we learn from the former that these are only portions of a more general principle, that they result from one fundamental law, and that to this law may be referred as well the formation of a dew drop, as the rolling of the spheres (A).

Some of the admirers of Boscovich may be surprised that we affirm, his theory gives no information of any one efficient cause in nature, and that all the discovery he has made is, that of some events which precede the Newtonian gravity. We have already borne ample testimony to the merits of Boscovich, and we think we are secure from any suspicion that we endeavour to deprecate the value of his theory; such indeed is far from our thoughts, but we must say it is farther from our thoughts to consider it as the ultimatum in natural philosophy, or that it discloses to us the most supreme process in nature. We will venture farther; for we will maintain, that though all the principles of the theory were established on a firm and invariable foundation, as they are not, it would be impossible for any one to determine what shall be the consequences resulting from them, prior to experience of the regularity and the constancy of the conjunction of events; and that of consequence the same, may greater, labour of induction and observation is required in the phenomena of the material world; greater, because the objects are increased in number by the discovery which Boscovich has made. But this assertion concerns the laws of nature alone, not the laws of human thought, of which, in our opinion, Boscovich has made too free use. He tells us that one consequence of the interior repulsive power is, the impossibility of contact, and that another is the impenetrability of the atoms. Now it requires no great exertion of understanding to perceive that he is displaying a law of human thought, for these consequences of which he speaks are parts of the same conception, and that no reasoning a priori is employed to determine their connexion; for we cannot possibly imagine, that contact or penetrability of the atoms should

(A) It may be a satisfaction to our readers to know that Sir Isaac Newton entertained notions very similar to those of Boscovich concerning the causes of motion at sensible distances, though it is to be regretted that he had made no provision for them in his system. The last question in his Optics plainly indicates that he himself was convinced that no law by which an attractive force might be supposed to act would be sufficiently for the explanation of certain phenomena which take place in the immediate vicinity of the atoms of matter. "And if all these things are so, then all nature will be very simple, and consistent with itself, effecting all the great motions of the heavenly bodies by the attraction of gravity, which is mutual between all those bodies, and almost all the less motions of its particles by another certain attractive and repulsive force, which is mutual between those particles. Now it seems that these elementary particles not only have in themselves the vis ineretion, and those passive laws of motion which necessarily arise from that force, but that they likewise perpetually receive a motion from certain active principles; such as gravity, and the cause of fermentation, and of the cohesion of bodies. And I consider these principles, not as occult qualities, which are feigned to flow from the specific forms of things, but as universal laws of nature, by which the things themselves were formed. For that truly such principles exist, the phenomena of nature shew, although what may be their causes has not as yet been explained. To affirm that every species of things is ended with specific occult qualities, by which they have a certain power, is indeed to say nothing; but to deduce two or three general principles of motion from the phenomena of nature, and then to explain how the properties and actions of all corporeal things follow from those principles, this truly would be to have made a great advancement in philosophy, although the causes of those principles were not as yet known. Wherefore I do not hesitate to maintain the above said principles of motion, seeing they extend widely through all nature." Newton's Optics.
serve differences in their positions and magnitudes, in consequence of such variations. Our astronomical readers will perceive that we allude to the apparent approach of our sun to the constellation Hercules in the northern hemisphere, the gradual widening of the stars in that quarter of the heavens, and the consequence of it. But without any such confirmation it must be acknowledged, that our supposition is much more probable, and gives a more elevated notion of the great Artificer's skill than that of Boscovich, and we are the more anxious to retain it, that one of the principles in the theory may not be broken, that the transitions of the powers occur in the insensible distances. We request the attention of our readers to Boscovich's provident supposition on another account. Does it not indicate one of the modes by which the theory was formed? Does it not plainly shew us how far genius will be exerted when observation fails? Does it not satisfactorily demonstrate that part of this splendid theory is the offspring of an imagination heated by systematic love, and animated by a reconciling enthusiasm? Indeed when the imagination is the provider, the reason can be well satisfied; for what is wanting can be readily supplied, what is displeasing can be easily rejected, what is unshapely can be fashioned to conformity, and all can be decorated and adorned, till at last there arises some fine fabric to please and to delight. But we require more than pleasing ornament, and yet we expect perfection; we know that every theory of natural philosophy has failed hitherto, not from a deficiency but rather from a luxuriy in grandeur, which, surpassing, has eclipsed the minute gems that glitter below; no one has failed in explaining the stupendous structure and the mighty rollings of worlds, which no eye ever comprehended and no hand ever approached; but take it from its god-like work to the mean purposes and the trivial uses of man, and behold the airy phantom shrink from our view! It is in explaining familiar circumstances, or, so to speak, the events of our neighbourhood, that every one has failed; but it is consoling to mankind to know, that in every succeeding one, there is a greater approximation to perfection, a greater extent and more facility of application; and we will acknowledge that this of Boscovich, though not totally invulnerable, certainly leaves the least uncovered.

The observations which we have now made seem to us very proper to introduce those we have to offer on the application of the theory to physics. We are of opinion that Boscovich, in his account of solidity and fluidity, has rather given a description, and related some properties, than proposed an explanation or deduction on the principles of his theory: but in a system of such extent, and promising so much, we require more than this, and it is our opinion that more may be given. Without pretending that we have complete success in our attempt, or wishing to preclude others, we offer the following as at least a probable one.

We can imagine, that any number of atoms shall come into the limits of cohesion of each other in such a manner as that a mass of some determined form shall be produced; and that the powers on each side of these limits are so strong, as to withstand considerable dantile force from without. Now in a mass so 

---

Boscovich's System of Natural Philosophy.

The most ignorant of the sons of men are as well qualified to understand this as the greatest philosophers who have adorned humanity; and if it be entitled to the name of discovery, it is one in which all mankind have shared: but for having expressed it in words, and incorporated it with others which some kindred genius alone could have made, all are indebted to Boscovich, and must acknowledge that in his hands it has served to fabricate a lasting monument of genius, industry, and sagacity. We are not therefore to consider that these are instances wherein any consequences have been determined a priori; and they do not affect our assertion, that prior to the experience of the regularity and constancy of the conjunction of events, it would be impossible for any one to determine a priori what shall be the consequences resulting from the principles of the theory. To illustrate our meaning in the assertion, we shall suppose that the transitions of the powers have been discovered to exist in the constitution of matter; and we then ask, if, prior to the knowledge of the phenomena of fermentation, &c. it could have been determined that these phenomena should necessarily result from them: we apprehend it could not, and our reason is, that we cannot find any mode of connexion between any transitions of any forces and these phenomena; for we can conceive the former to exist without the latter, and this might have been the case, for aught we know to the contrary; and we think we are authorized in saying, that these transitions are only rules or methods observed in the production of such phenomena, that they are events prior to fermentation, &c. and remain themselves to be accounted for. We may say the same of the repulsive and attractive powers, and of all the other principles in the theory which are not laws of human thought. Causation is inscrutable, the labours of every age serve only to add to its mystery, seeing that they conduct us nearer to the boundaries of human observation, and discover to us the delusive glare of every weak meteor which promised permanent and enlightening lustre.

We have seen that the general properties of matter may be well explained by the theory; and so far therefore we must admit that the theory is applicable to the objects of investigation, and may be useful to connect together some general principles. There remains to us to make one remark concerning one of these, viz. Newtonian gravity. The supposition that it terminates beyond the comets of our system, and is succeeded by repulsion, appears to us very unnecessary, not to say unlikely, though highly worthy the accommodating genius of Boscovich. We are of opinion, that the objections urged against Sir Isaac Newton on this subject, may be much better and more simply olivated by a supposition which the modern improvements in astronomy have nearly confirmed, viz. that there are systems of suns and revolving planets, similar to, and reaching to the limits of our own; and that those are sufficient to counteract the necessary effects of universal gravity or attraction. If such be the case, inequalities in our systematic motions, relative to others, may arise from the varying situations of the other system; and, if we consider the fixed stars as forming these, we may observe differences in their positions and magnitudes, in consequence of such variations. Our astronomical readers will perceive that we allude to the apparent approach of our sun to the constellation Hercules in the northern hemisphere, the gradual widening of the stars in that quarter of the heavens, and the consequence of it. But without any such confirmation, it must be acknowledged, that our supposition is much more probable, and gives a more elevated notion of the great Artificer's skill than that of Boscovich, and we are the more anxious to retain it, that one of the principles in the theory may not be broken, that the transitions of the powers occur in the insensible distances. We request the attention of our readers to Boscovich's provident supposition on another account. Does it not indicate one of the modes by which the theory was formed? Does it not plainly shew us how far genius will be exerted when observation fails? Does it not satisfactorily demonstrate that part of this splendid theory is the offspring of an imagination heated by systematic love, and animated by a reconciling enthusiasm? Indeed when the imagination is the provider, the reason can be well satisfied; for what is wanting can be readily supplied, what is displeasing can be easily rejected, what is unshapely can be fashioned to conformity, and all can be decorated and adorned, till at last there arises some fine fabric to please and to delight. But we require more than pleasing ornament, and yet we expect perfection; we know that every theory of natural philosophy has failed hitherto, not from a deficiency but rather from a luxuriant in grandeur, which, surpassing, has eclipsed the minute gems that glitter below; no one has failed in explaining the stupendous structure and the mighty rollings of worlds, which no eye ever comprehended and no hand ever approached; but take it from its god-like work to the mean purposes and the trivial uses of man, and behold the airy phantom shrink from our view! It is in explaining familiar circumstances, or, so to speak, the events of our neighbourhood, that every one has failed; but it is consoling to mankind to know, that in every succeeding one, there is a greater approximation to perfection, a greater extent and more facility of application; and we will acknowledge that this of Boscovich, though not totally invulnerable, certainly leaves the least uncovered.

The observations which we have now made seem to us very proper to introduce those we have to offer on the application of the theory to physics. We are of opinion that Boscovich, in his account of solidity and fluidity, has rather given a description, and related some properties, than proposed an explanation or deduction on the principles of his theory: but in a system of such extent, and promising so much, we require more than this, and it is our opinion that more may be given. Without pretending that we have complete success in our attempt, or wishing to preclude others, we offer the following as at least a probable one.

We can imagine, that any number of atoms shall come into the limits of cohesion of each other in such a manner as that a mass of some determined form shall be produced; and that the powers on each side of these limits are so strong, as to withstand considerable dantile force from without. Now in a mass so
unphilosophical one; for in a similar manner, and in a similar manner, and, we venture to say, with as much truth, if matter or its System of Natural Philosophy. 

Boscovich's System of Natural Philosophy.

Boscovich's system of every atom is retained in its situation by powers of the same kind, acting by the same laws, and which cannot be increased or diminished by any other means than varying the distance between these atoms. The powers so influenced are those only which belong to the particular atoms whose respective distances are changed; for the powers of the atoms whose distances are not changed remain the same; therefore a portion of the mass may be separated, or the whole mass may be moved, without causing any relative motion among the atoms: for, in the former case, a few only, in the latter, none, of the limits of cohesion are disturbed. This then is the structure which the atoms of matter would form, did such laws as we have considered exist; and it appears to us that it is the natural structure; for we ourselves cannot conceive how a fluid body should be composed by such laws independent of composition of the solid. But admitting composition, we would explain fluidity in the following manner: As in a mass, such as we have described, there are spaces between all the atoms; it is possible that other atoms may be introduced within it, or that in the vacant intervening space the powers of other atoms may operate. Now, it is easy to conceive, that in the former case very various effects will result in consequence of the differences in the proximity of the atoms; for some will quit the limits of cohesion in which they were prior to the introduction of the adventitious atoms, and will enter into new ones, and will vibrate from one to another, if there be a constant addition of atoms made, or if any of those which have been introduced be removed; and that in the latter case, in consequence of the composition of forces, very different effects will result, according as the composition is of similar or different powers acting in the same or different directions, and of different intensities: in either case relative motion among the particles will occur, and the mass will yield to the least extrinsic force; as equilibrium will sometimes be destroyed by the bodies with which the smallest force can combine, and be destroyed very readily in different ways, as by the addition or subtraction of the adventitious atoms, and by the application of forces to the mass. We might specify some of the particular circumstances which would tend to the production of different fluids, did our limits permit; but as this would be prolix, we shall only mention some of the consequences which may be deduced from the principles we have stated, and granting that they are well founded, we shall consider how far they coincide with the phenomena we observe. Every fluid must be a compound body. This will be pretty generally admitted by modern chemists; for though they well know that the composition of several fluids is not yet discovered, they will allow that the rational presumption from analogy is, that when our analytical powers are augmented, we shall be able to discover the composition of all of them; nor is it any objection to the rationality of the presumption that matter of the same kind is not capable of being divided into simple or elementary parts; for it must be remembered, that all of them are combined with caloric or the matter of heat. Nay caloric itself, which we hold to be a substance, may, for ought we know to the contrary, be a solid body: it is indeed almost universally believed to be a fluid, and essentially so; but, for this belief we can find no other reason than that it causes fluidity, and surely that is a very Vol. IV. Part I.  

We do not deny that when it combines in sufficient quantity with bodies it causes fluidity; but we beg to remind our readers that there are cases of fluids being generated by the trituration of solids together, and surely they will acknowledge, that what is true in the one case, is at least possible in the other; but we will even admit, that caloric is the principal cause of fluidity (though we are aware that in admitting it, we depart from true philosophy), and yet we do not perceive, that the least objection to our supposition will thence arise. May not caloric be composed of the very smallest, or the primary atoms of matter, and consequently be more easily disseminated between the atoms of other bodies which are composed of the aggregates of these primary atoms? Do we not find that it corresponds pretty accurately with the description of these atoms which Boscovich has given? Does it not seem in the least distances to repel its own particles, and at greater distances to be attracted by the particles or atoms of other bodies?

The constant addition of adventitious atoms to the interstices in a solid body, as we have before mentioned, will cause vibrations, and will at last, by totally separating the atoms from the limits of cohesion and the sphere of the attractive power, render them susceptible of the influence of surrounding bodies, so that they leave each other, and combine with those which surround them. When caloric is the body added, the most general effect which results from its repeated and constant addition is evaporation. Now the particles of an evaporated fluid will recombine if the superabundant caloric holds them asunder be withdrawn, but will separate the bodies with which they unite to attract them more powerfully than they do each other. But it is possible that such an addition will in certain cases strengthen the combination of a solid, i.e. that fluidity will not always be the consequence of insinuating atoms into the vacant spaces, for it is possible to specify circumstances, in which a body, already fluid, may be rendered solid by interposing amongst its particles, the particles of another fluid.

When the adventitious atoms are removed, one of two consequences will occur, either the atoms of a solid which has been rendered fluid by such insinuation, will be left within their spheres of attraction, and consequently will enter into limits of cohesion, and form a solid again, or they may be left beyond these spheres, so as not to enter into limits of cohesion, but to form a loose uncombined pulvulent substance. It may happen that, in the latter case, the particles being separated from each other beyond their spheres of attraction, will form into combinations of simple or elementary bodies, of whose influence they are now susceptible. We have instances of both of these in the fusion of metals: sometimes on cooling these form again into solids; others, having their atoms too far separated from each other, cannot so unite, but combine with other bodies (generally oxygen), and form powders which retain no characteristics of metals; and some combine with other metals, constituting alloys.
We recommend the prosecution of this subject to the philosophical chemist; and though we encounter the charge of vanity, we cannot help flattering ourselves with having pointed out a mode by which, though nothing should be discovered, yet to resolve some apparently unconnected phenomena into one general principle, and hence to abridge the labour of acquiring the science of chemistry, and to facilitate the application of it to the practical purposes of life. We are of opinion that the facts in chemistry are now so numerous, as to acquire a generalizing spirit to reduce them into some kind of order, to shew their connection in the chain of nature, and to derive from them by induction, certain principles which may be employed in the synthetic process. Indeed, without such it will soon be found that no ordinary memory can retain what may be useful, but certainly is elegant in the art, and that a great body of evidence is insufficient to enforce conviction, if it be huddled together in chaotic confusion: pillars and porticoes may be collected, and may astonish us by their grandeur; but unless they be methodized, connected, and combined, our astonishment will resemble that which we feel, when we contemplate the precipitous structure of some mountain monster, whose limbs are individually elegant, but serve by their elegance to magnify the error of their position. We do not wish to depreciate the merits of modern chemists, but we must confess, they appear to us more scrupulous about ascertaining the few grains of earth in the cockle-shell, than anxious to erect a temple to their science; and are themselves too much elevated by the discovery of a semi-metal, to be concerned about the deities which preside. What we have said may be thought mere declamation, if we do not accompany it with some example of the employment of such a generalizing spirit; we know not how far it may become us to do so, but as the consideration of the theory of Boscovich, in which we have been engaged, has naturally led us to those phenomena which seem best qualified to admit of its application, and as therefore, in some sort resulting from, or connected with our subject, we shall attempt to give a small specimen of it. It is well known to chemists, that although certain individual or single bodies of the saline class be very soluble in water, the compounds formed of them are very insoluble in that fluid, i.e. that though alkalies or acids be singly very soluble in water, the neutral salts formed by them are very insoluble; and that many varieties in the degrees of solubility are to be met with in the compound bodies or neutral salts, which are contrary to what we should expect from reasoning on the varieties of these degrees, in the simple or elementary bodies which compose them.

For example, the sulphuric acid is very soluble in water, and so is the vegetable alkali or potash; but the sulphate of potash, which is a compound of these, is so difficult of solution, that 16 times its own weight of water, at the temperature of 60°, is required to effect it. The acetate of potash affords another example, though not so remarkable, requiring only about 10 times its own weight of water at the same temperature. Indeed, there are many instances of a compound or neutral salt being less soluble than either the alkali or the acid—which enter into its composition; but in those we have mentioned, the difference is so great as to have merited much attention, though, as far as we know, Boscovich's there has not been assigned a reason for it. Now we apprehend the reason to be, that as both the simple bodies have an attraction for water, or that as there is an attraction between water and these two bodies, the degree of attraction will be equal to the difference only of the separate attractions between water and the bodies individually; or, in other words, the attraction between water and one of the bodies will be lessened by the attraction between water and the other body, so that the difference only of these two will influence. Now, in certain cases, this difference will be equal to nothing, when the attractions are equal; but in every case, it is evident, it will be less than the greater of the attractions, and, of consequence, the solubility of the compound will be less than that of the simple bodies which compose it. Now this consequence is not affected by the absolute solubility of the simple bodies, but by their solubility in respect to each other, i.e. relative alone; therefore, the compound of simple bodies, which themselves are highly soluble, may be no more soluble than the compound of simple bodies, which themselves are very little soluble.

The principle is universal. Other consequences will result, which are not only curious, but in our opinion important; and we do not in the least hesitate to assert, that the principle may be applied to determine a priori the degrees of solubility of neutral salts, provided we are sufficiently acquainted with the relative solubility of the simple bodies which compose them. One consequence will be, that a compound formed of a very soluble and a very insoluble simple body will be nearly, or quite, as soluble as the former, seeing that the attraction between it and water will be little or not at all diminished by the attraction between the other very insoluble body and water. As a proof of this, we may take the instance of the sulphate of magnesia, which is soluble in its own weight of water at temperature 60°: Now, in this case, the magnesia is soluble to a very small amount only; but the acid, it is well known, is so to a great degree; even the small solubility of the magnesia, however, does in a certain degree impair the solubility of the compound. The same is true of the nitrat and muriat of magnesia; and, did, our limits permit, we might adduce very many examples of the same: we might shew, that the compounds of very soluble acids with the metallic oxides are soluble, if these oxides are not so; but if they are, the solubility of the compound is impaired: and we might also apply the principle to bodies soluble in alcohol and other menstrua, where it will be found to hold. But we leave the prosecution of the subject to our chemical readers, confessing, however, that we have found exceptions to its universality, which as yet we have not been able to reconcile. Perhaps, a principle still more general, and higher in the order of events, may influence or modify this which we have specified; it may be connected with some of these varieties in the composition of forces, which must take place in the insensible distances, changing the limits of cohesion, and modifying the position and the action of the atoms of matter. We have ventured far in the exposition we have given; did we persevere, there might be imputed to us temerity.

We have attempted to apply Boscovich's theory to several
ed, according to Dr Sparrman, from their dwelling in woody or mountainous places. They are sworn ene-
emies to a pastoral life. Some of their maxims are, to live on hunting and plunder, and never to keep any
animal alive for the space of one night. By this means they render themselves odious to the rest of the inhabi-
tants of the Cape; and are pursued and exterminated like the wild beasts, whose manners they have assumed.
Others of them again are kept alive, and made slaves of. Their weapons are poisoned arrows, which shot
out of a small bow will fly to the distance of 200 paces, and will hit a mark with a tolerable degree of certainty
at the distance of 50 or even 100 paces. From this
distance they can by stealth, as it were, convey death
to the game they hunt for food, as well as to their foes, and even to so large and tremendous a beast as
the lion; this noble animal thus falling by a weapon
which perhaps it despised, or even did not take notice of.
The Hottentot, in the mean time, concealed and
safe in his ambush, is absolutely certain of the opera-
tion of his poison, which he seeks in the cuticle of the most
virulent kind; and it is said he has only to wait a few
minutes in order to see the wild beast languish and die.
The dwellings of these foes to a pastoral life are gen-
really not more agreeable than their maxims and man-
ners. Like the wild beasts, bushes and cliffs in rocks
by turns serve them instead of houses; and some of
them are said to be so far worse than beasts, that their
soil has been found close by their habitations. A great
many of them are entirely naked; but such as have
been able to procure the skin of any sort of animal,
great or small, cover their bodies with it from the
shoulders downwards as far as it will reach, wearing it
till it falls off their back in rags. As ignorant of a
griculture as apes and monkeys, like them they are ob-
liged to wander about over hills and dales after cer-
tain wild roots, berries, and plants (which they eat raw), in order to sustain a life that this miserable food
would soon extinguish and destroy, were they used to
better fare. Their table, however, is sometimes com-
posed of several other dishes, among which may be
reckoned the larvae of insects of that kind of cater-
pillars from which butterflies are generated, and in
like manner a sort of white ants (the termes), grass-
oppers, snakes, and some sorts of spiders. With all these
changes of diet, the Boshies-man is nevertheless fre-
cently in want, and famished to such a degree as to
waste almost to a shadow. “It was with no small a
stonishment (says Dr Sparrman), that I for the first
time saw in Lange Kloof a lad belonging to this race
of men, with his face, arms, legs, and body, so mon-
strously small and withered, that I could not be
induced to suppose but that he had been brought to
that state by the fever that was epidemic in those parts,
bad I not seen him at the same time run like a lapwing.
It required but a few weeks to bring one of these
starvelings to a thriving state, and even to make him fat; their stomachs being strong enough to digest the
great quantity of food with which they are crammed,
to they may rather be said to boil than eat. It some-
times happens indeed that they cannot long retain what
they have taken in; but this circumstance, it is said,
does not hinder them from beginning again upon a new
score.”

The capture of slaves from among this race of men

DEx.

BOSHIES-MEN, a species of Hottentots, so cal-

Bosovich's system of elec-
is by no means difficult; and is effected (Dr Sparman informs us) in the following manner. "Several farmers that are in want of servants join together and take a journey to that part of the country where the Boshies-men live. They themselves, as well as their Lugo-Hottentots, or else such Boshies-men as have been caught some time before, and have been trained up to fidelity in their service, endeavour to spy out where the wild Boshies-men have their haunts. This is best discovered by the smoke of their fires. They are often found in societies from 10 to 100, reckoning great and small together. Notwithstanding this, the farmers will venture in a dark night to set upon them with six or eight people, which they contrive to do by previously stationing themselves at some distance round about the crail. They then give the alarm by firing a gun or two. By this means there is such a consternation spread over the whole body of these savages, that it is only the most bold and intelligent among them that have the courage to break through the circle and steal off. These the captors are glad enough to get rid of at so easy a rate; being better pleased with those that are stupid, timorous, and struck with amazement, and who consequently allow themselves to be taken and carried into bondage. They are, however, at first treated by gentle methods; that is, the victors intermix the fairest promises with their threats, and endeavour, if possible, to shoot some of the larger kinds of game for their prisoners, such as buffaloes, sea-cows, and the like. Such agreeable baits, together with a little tobacco, soon induces them, consciously or insensibly, to pass the greater part of the time in the smoking of tobacco; a state which excites in them sensations of a agreeable nature as the frenzy produced by spirituous liquors and opium seems to afford to many others, who are never at ease but when they can procure to themselves this delicious pleasure. And yet, though they thus agreeably pass away the otherwise tedious hours of their lives in smoking and sleep, they nevertheless generally run away. The colonies wonder at this, as a procedure entirely devoid of reason; without perceiving, that in so doing they suppose the Hottentots not endued with a desire, which has its immediate foundation in nature, and which is common to the human race, and even to most brute animals, viz. an earnest longing after their birthplace and families, and especially after their liberty.

"I must confess (continues our author), that the Boshies-men in some husbandmen's service are treated in the gentlest manner, and perhaps even without ever having a harsh word given them; live very well with regard to provisions; are well clad, relatively to their condition in life; and are very comfortably lodged, in comparison of what others are, in their own straw cottages. The chief of their business perhaps consists in tending a herd of cattle or flock of sheep during the heat of the day, when they have an opportunity of getting into a gentle state of intoxication by smoking tobacco; a state which excites in them sensations of a agreeable nature as the frenzy produced by spirituous liquors and opium seems to afford to many others, who are never at ease but when they can procure to themselves this delicious pleasure. And yet, though they thus agreeably pass away the otherwise tedious hours of their lives in smoking and sleep, they nevertheless generally run away. The colonies wonder at this, as a procedure entirely devoid of reason; without perceiving, that in so doing they suppose the Hottentots not endued with a desire, which has its immediate foundation in nature, and which is common to the human race, and even to most brute animals, viz. an earnest longing after their birthplace and families, and especially after their liberty.

"The slave business, that violent outrage to the natural rights of mankind, always in itself a crime, and which leads to all manner of misdemeanors and wickedness, is exercised by the colonists in general with a cruelty towards the nation of Boshies-men which merits the abhorrence of every one; though I have been told that they pique themselves upon it: and not only is the capture of those Hottentots considered by them merely as a party of pleasure, but in cold blood they destroy the bands which nature has knit between the bands and their wives and children. Not content, for instance, with having torn an unhappy woman from the embraces of her husband, her only protection and comfort, they endanger all they can, and that chiefly at night, to deprive her likewise of her infants; for it has been observed, that the mothers can seldom persuade themselves to flee from their tender offspring. The amiable tenderness of the mother, which perhaps glows with a more lively flame in the breast of this poor heathen than in those of her Christian tyrants, is the very circumstance laid hold on by their persecutors in order to rivet the chains of this wretched female so much the faster. There are some mothers, however, that set themselves free, when they have lost all
all hopes of saving their children. After having made
their escape, they sometimes keep secretly about the
neighbourhood, in hopes of finding some opportunity of
recovering their infants again.

BOSNA SERAGO, a large and strong town of Tur-
key in Europe, and capital of the province of Bosna.
E. Long. 18. 57. N. Lat. 44. 40.

BOSNIA, a province of Turkey in Europe, seated
between Scelonia and Dalmatia. It belongs entirely to
the Turks; but they were on the point of being
expelled from it by the Christians, when the Spaniards
invaded Sicily, and obliged the emperor to conclude
the peace of Passarowicz in 1718, by which he gave up
Bosnia to the Turks. It is 200 miles in length, and
75 in breadth. It is a barren country, and but little
cultivated: the principal revenue arising chiefly from
the silver mines. Among the game there are falcons,
which are held in great esteem.

BOSPHORUS, or Bosphorus, in Geography, a
long and narrow sea, which it is supposed a bullock
may swim over. In a more general sense, it is a long
narrow sea running in between two lands, or separating
two continents, and by which two seas, or a gulf and
a sea, are made to communicate with each other: In
which sense, bosphorus amounts to the same with what
we otherwise call an arm of the sea, channel, or strait;
the Italians, faro; the Latins, freum; and the French
pas, manche. The word is Greek, Bosphoros, formed
from βόσκω, “bullock,” and πορσος, “passage.”

The name bosphorus is chiefly confined to two
strait in the Mediterranean sea, viz. the bosphorus of
Thrace, commonly called the strait of Constantinople,
or channel of the Black Sea; and the Cimmerian or
Scythian bosphorus, so called, it seems, from its resem-
blance to the Thracian; nor more commonly the
strait of Kapha, or Kiderleri, from two cities standing
on it.

The origin of the name is better agreed on than the
reason why it was first given to the Thracian bospho-
rus. Nymphius tells us, on the authority of Accari-
on, that the Phrygians, desiring to pass the Thracian
strait, built a vessel, on whose prow was the figure of
a bullock; and which was hence called βοσς, “bul-
lock;” and served them for a ferry-boat. Dionysius
Valerius, Flaccus, Callimachus, Apollodorus, Marcel-
linus, &c. say, that Io, being transformed into a cow
by Juno, passed this strait swimming, which hence
was called bosphorus. Arrian tells us, that the Phrygians
were enjoined by the oracle, to follow the route which
a bullock should mark out to them; and that, upon
stirring one up, it jumped into the sea to avoid their
pursuit, and swam over this strait. Others say, that
an ox, tormented by a gale, flew itself in, and
swam over: and others, that anciently the inhabitants
of these coasts, when they would pass over, joined lit-
tle boats together, and had them drawn over by bul-
locks, &c.

BOSquets, in Gardening, groves so called from
boschetto, an Italian word which signifies a little wood.
They are compartments in gardens formed by branches
of trees disposed either regularly in rows, or wildly and
irregularly, according to the fancy of the owner. A
bosquet is either a plot of ground enclosed with pali-
sades of hornbeam, the middle of it being filled with
tall trees, as elm or the like, the tops of which make
a tuft or plume; or it consists of only high trees, as
horse-chesnut, elm, &c. The ground should be kept
very smooth and rolled, or else covered with grass, after
the manner of green plots. In planting bosquets, care
should be taken to mix the trees which produce their
leaves of different shapes, and various shades of green
and hoary or mealy leaves, so as to afford an agreeable
prospect. Bosquets are only proper for spacious gar-

dens, and require a great expense to keep them up.

BOSSAGE, in Architecture, a term used for any
stone that has a projecture, and is laid rough in a build-
ing, to be afterwards carved into mouldings, capitals,
coats of arms, &c. Bosage is also that which is other-
wise called rustic-work; and consists of stones which
advance beyond the naked or level of the building, by
reason of indentures or channels left in the jointings.
These are chiefly used in the corners of edifices, and
hence called rustic quoins. The cavities or indentures
are sometimes round, sometimes chain-framed, or bevel-
lled, sometimes in a diamond form, sometimes enclosed
with a cavetto, and sometimes with a listel.

BOSS, ABRAHAM, an able engraver, born at
Tours, was well skilled in perspective and architecture.
He wrote two treatises, which are esteemed; the one
on the manner of designing, and the other upon en-
graving.

BOSSINEY, or BOSS-CASTRE, a town of Cornwall,
in England, which sends two members to parliament.
W. Long. 5°. N. Lat. 50°. 40.

BOSSU, RENE LE, born at Paris in 1631, was
admitted a canon regular in the abbey of St Genevieve,
in 1649; and after a year’s probation, took the habit.
He taught polite literature with great success in several
religious houses for 12 years, when he gave up the task
for retirement. He then published a parallel between
the principles of Aristotle’s natural philosophy and
those of Descartes, with a view to reconcile them,
which was but indifferently received. His next trea-
tise was one epic poetry; which Boileau declared one
of the best compositions on that subject in the French
language, and which produced a great friendship be-
tween them. He died in 1680, and left a great num-
ber of MSS, which are kept in the abbey of St John
of Chartres.

BOSSUET, JAMES BENVIGNY, bishop of Meaux,
was born at Dijon, on the 27th of September, 1627.
He distinguished himself by his preaching, and the
zeal he discovered in his endeavours to bring over the
Protestants of France to the Roman church; by his
opposition to quietism; and by his numerous writings
both in French and Latin, which have been collected
and printed at Paris in 17 vols 4to. This
famous divine died at Paris, in 1704, aged 77.

BOSSUPT, a town in the kingdom of the Nether-
lands, in the province of Brabant. E. Long. 4°. 30.
N, Lat. 52.

BOSSUS, MATTHEW, distinguished by his virtue
and his learning, was born in 1427. He devoted him-
self to the ecclesiastical state in 1451, in the congrega-
tion of regular canons of Lateran, and afterwards
ought divinity at Padua. His orations, his sermons,
and his letters, have been often printed. He also
wrote a sort of an apology for Phalaris, and other
works. He died at Padua in 1502, aged 75.

BOST, a very strong town of Persia, and capital of
the.
BOSTON, a corporation town of Lincolnshire in England, which sends two members to parliament. It is commodiously seated on both sides the river Witham, over which it has a handsome high wooden bridge; and, being near the sea, enjoys a good trade. It has a spacious market place, and the largest parish church without cross aisles in Europe, the steeple of which serves for a land-mark to sailors. Boston is a barony in the Ibrv family. The population in 1811 was 8,113. E. Long. 0. 15. N. Lat. 53. 3.

BOSTON, the capital of the state of Massachusetts, and of New England, in North America, built in 1630, in a peninsula of about four miles in circumference, at the bottom of Massachusetts bay, in a very convenient situation for trade. The town stands in W. Long. 71. 5. N. Lat. 42. 24. about nine miles from the mouth of the bay. At the entrance of this bay are several small rocks which appear above water, and a number of small islands, some of which are inhabited. There is but one safe channel to approach the harbour, and that so narrow, that two ships can hardly sail through abreast; but within the harbour there is room for 500 sail to lie at anchor in a good depth of water. On one of the islands stands a fort. At the bottom of the bay is a noble pier near 2000 feet in length; along which on the north side extends a row of warehouses for the merchants; and to this pier ships of the greatest burden may come and unload without the help of boats. The greatest part of the town lies round the harbour in the form of a half-moon, the country beyond, rising gradually, and affording a delightful prospect. The neck of land which joins the peninsula to the continent is but 40 yards over. Boston contained about 40,000 inhabitants in 1817; and the tonnage of the vessels belonging to it in 1815, amounted to 137,000 tons, which is greater than that of any other American port, except New York. The merchants are remarkably active and enterprising, and the inhabitants in general bear the character of being well informed, sober, and industrious, but sharp and overreaching. The austerity of the old Puritans is less relaxed here than in any of the other large towns in America. Boston is the headquarters of federalism, or rather of aristocracy, in politics, and of unitarianism in religion. Though professing republicanism, they are ridiculously vain of those titles which are still retained. The Independents are the prevailing religious sect, and have twelve churches here. There are besides three Baptist churches, two Episcopalians, one Quaker, one Universalist, one Catholic, and two Methodist. Besides the churches, the principal buildings are the state house, courthouse, two theatres, concert-hall, jail, almshouse, workhouse, and bridewell. The town is well paved, and has excellent flagged front walks. The streets, though generally narrow, are for the most part clean, and in good order. Boston is connected with the minor towns of Cambridge and Charlestown, by two handsome wooden bridges, the one 1503 feet in length, the other 3483 feet. Boston has frequently suffered by fire, but the houses that were thus destroyed have always been rebuilt to advantage. The late American war began here by the attack on Bunkers-hill, when many brave men lost their lives.

BOSWORTH, a town of Leicestershire in England, containing 791 inhabitants in 1811. It has a lofty situation on a hill, and the country about it is fertile in corn and grass. It is memorable for the decisive battle fought near it between Richard III. and the earl of Richmond, afterwards Henry VII. wherein the former lost his crown and life. W. Long. 1. 24. N. Lat. 52. 25.

BOTALLUS, LEONARD, physician to the duke of Alençon, and to Henry III. was born at Amst in Piedmont. He introduced at Paris the practice of frequent letting of blood; which was condemned by the faculty; but soon after his death it came into practice with all the physicians. He published several books in physic and surgery; and the best edition of his works is that of Leyden, in 1662, octavo.

BOTANY

I8 that science which arranges, distinguishes, and names all plants and vegetables, to enable us to study their properties and uses.

Vegetables consist of an innumerable succession of individuals which it is impossible to examine, and would be useless if it were possible. It is therefore necessary to diminish the labour by forming them into groups or classes, that the same name may apply to a great number of individuals. Now certain individual plants have so close a resemblance to others in their flower, fruit, leaves, and general appearance, that almost every man at first sight would give them the same name. Thus every man who has seen the common daisy once, and knows its name, will probably apply the same name without mistake to every other individual of the same species. This forms the first step in botany, or what is called arranging and naming plants according to their species. Nor is it only the first, but the easiest step in botany. It is also the most important; for all the individuals of the same species must in similar circumstances possess the same qualities. For example, we have no reason to doubt that each individual plant of common hemlock, or of foxglove, possesses the same medical qualities, though from their place of growth these qualities may differ in degree. It is therefore the individuals of the species alone that are useful; and the whole value of any arrangement consists in enabling the botanist to distinguish and name the individuals, with the greatest ease and accuracy. If the number of species were small, definitions or descriptions
BOTANY.

Elements. Descriptions of them would alone be sufficient; but as they amount perhaps to 40,000 or 50,000 or more, to search for every single species amid such a multitude would be a task for which neither human patience nor human life would be sufficient.

To shorten the labour, it has been found very expedient to arrange plants into various divisions; first into some very general divisions which may reduce them into a small compass, then to subdivide these general divisions into others less comprehensive, and these into others, till we arrive at the particular species which we are in search of. Thus the arrangement descends from a general division of all plants to every particular species.

Many plans of this kind have been attempted by various botanists, but the arrangement of the celebrated Linnaeus is incomparably the most ingenious, most accurate, as well as the simplest and easiest. That illustrious botanist divided all plants into classes, the classes into orders, the orders into genera, and the genera into species. The orders, too, and the species, when numerous, be frequently subdivided into sections.

Objections have been made to the arrangement of Linnaeus, because it admits divisions which do not appear natural. But such persons, though distinguished botanists, seem to us to have misunderstood the use and intention of that arrangement. It is not, and ought not to be, its object to give what has been called a natural arrangement; for nature does not class her productions. She places before us innumerable individuals, and leaves us to classify them according to the purpose which we have in view. If nature had formed plants into classes, orders, and genera, the botanist would have nothing to do but to study these. But in none of her works has nature done this. Classification is the work of man; and it is necessary for man merely on account of the limited nature of the faculties of his mind. Classification enables us to accomplish by several steps or operations what we cannot accomplish by one. But were our faculties much more exalted, were our penetration much more acute, and our memories perfectly retentive; could we at once survey all the qualities of objects, discern their relations to one another, and retain the remembrance of these accurately, we should have no occasion to generalize at all. As generalization or classification is necessary to aid our limited faculties, the best classification is that which leads us without error, and by the easiest process, to the particular object which we have occasion to investigate.

The arrangement of Linnaeus is therefore the best: it is, however, not so perfect in some of its parts as it may yet be rendered. This is the case in some of the genera which are distinguished by marks that are too minute. But when we consider the indefatigable mind of that illustrious man, the chaos in which he found botany, and the beautiful arrangement which he gave to it, we may justly enroll the name of Linnaeus in the same list with Bacon, and Newton, and Locke.

A botanical system is a dictionary by which a person who has studied the rudiments of the science may find out the name of every plant which he meets with. This dictionary has been much enlarged by the labours of the great many eminent botanists of the present time. We shall therefore point out the method of consulting it, after giving a very concise view of the principles upon which it is founded. We will give a concise view, because we think most or perhaps all the elementary books of this science tend to confound and disgust beginners by physiological definitions, and by the multiplicity of terms which they require to be studied at the very first outset. Their plan is just as if a teacher of Latin was to require his pupils first to make themselves masters of a Latin dictionary before he allowed them to translate. Our plan is to require of a beginner no more elementary knowledge than what is sufficient to enable him to consult the system as he would do a dictionary. The meaning of the rest of the botanical terms we think can best be learned by having recourse to an explanation in an alphabetical form, as they occur in the investigation. This we intend to add to the present article. And we wish sincerely that every man who publishes a system of botany would do the same; for we have strong reasons to believe that different writers use the same words in different senses from one another. Linnaeus, indeed, has defined his botanical terms; but in his two works, Delineatio Plantarum et Philosophia Botanica, he sometimes defines the same word differently. Now we ought to know which of his definitions succeeding botanists have adopted. Besides almost every botanist introduces terms of his own, which we shall look for in vain in the definitions of Linnaeus.

ELEMENTS OF BOTANY.

The parts of a plant which it is necessary for the young botanist first to know are the flower and fruit. These include seven: the calyx, corolla, stamen, pistil, pericarp or seed-vessel, seed, and receptacle. We will describe these in the order which will make them most easily distinguished.

1. The corolla, which in common language is called the flower, and in fruit-trees the blossom, is the part which is most beautifully coloured, which is of the finest texture, and is often odorous. It is to be found of every colour, except green, a hue which it very seldom assumes. It is white, as in the blossoms of the cherry; yellow, as in the primrose and ranunculus or butter-cup; red, as in the rose; blue, as in the violet. It is sometimes of one piece, and sometimes divided into distinct pieces, called petals. When the corolla consists of one petal, the outer or upper part, which is broad, is named the limb or border; and the lower part, which is narrow and hollow, by which it is fixed, is called the tube. When the corolla consists of more than one petal, the lower part is called a claw, and the upper lamina.

In the corolla it is necessary to attend to its form, its divisions, the number of its petals, its colour and the part to which it is attached. See Plate XCV. Fig. 11. a corolla of one petal; a, the tube; b, the laminas. Fig. 12. a corolla of more than one petal: d, the claw; b b, the laminas.

2. The
It is called common when many flowers are attached to it, as in the common daisies, dandelion. See Plate XCV. Fig. 13. c, a proper receptacle. Fig. 9. 10, a common receptacle.

Attention to the receptacle is most necessary chiefly in classes 11th, 13th, and 19th.

Besides these seven, which are called the parts of fructification, because when they exist together, they are supposed necessary for producing proper fruit, there is another part which Linnaeus calls the nectary, that requires attention, as it is the foundation of some genera. It is difficult for beginners to distinguish it, as it varies much in its appearance, and is not very discernible in a great many species. It is sometimes the name of a small gland; sometimes of a scale or a number of scales; sometimes of a cup; sometimes of a horn or spur on the corolla, as in larkspur and violet; sometimes of a groove or excavation. In short, it appears to be a name for any singular or irregular appearance of any of the parts of the flower. In all accurate and peripatetic systems, it is so well described that it can be easily found out. If this be done the name may be admitted, but if not it must lead to ambiguity and want of precision.

OF THE CLASSES.

The descriptions now given are sufficient to enable the young botanist to understand the classes and orders.

All plants are arranged into 24 divisions, called classes. In 23 of these classes, the flowers, or the pistils and stamens, or at least the stigmas and anthers, are evident. The 24th class comprehends all plants in which the flowers are invisible to the naked eye, as mosses, ferns, mushrooms.

The principles upon which the classes are formed are few, simple, and beautiful. All plants which have only one stamen, are of the first class; those that have only two, are of the second; those that have only three, are of the third; and so on, the number of stamens being the same with the number of the class in the first ten classes. See Plate XCIV. fig. 1, 3, 4, 5, 6, 7, 8, 9, 10.

In the next three classes, the place to which the stamens are fixed must be attended to as well as the number of the stamens. Thus the 11th contains those plants which have from 12 to 15 stamens inclusive, fixed to the receptacle. The 12th those that have 20 stamens fixed to the inside of the calyx. In this class the place of insertion is more to be relied on than the number of the stamens, for they are sometimes less than 20, often more. The 13th class comprehends those that have more than 20 stamens attached to the receptacle. See Plate XCIV. fig. 11, 12, 13.

For an example of the 12th class a rose may be examined, and for an example of the 13th a poppy, or a ranunculus.

The 14th and 15th classes depend upon the number and proportion of the stamens. When there are four stamens in a flower, of which two are longer, it belongs to the 14th class. When there are six stamens, of which four are longer, it belongs to the 15th class.

For an example of the 14th class the flowers of the dead nettle, mist, thyme, or foxglove, may be examined;
BOTANY.

Elements mined, and for a specimen of the 15th class, inspect the flowers of shepherds purse, or mustard. See also Plate XCIV. fig. 14. and 15.

The 16th, 17th, 18th, and 19th classes depend upon the manner in which the stamens are connected, whether they be joined by their filaments into one set, or two sets, or more than two; or be united by the anthers into a cylinder.

In the 16th class the stamens are united by their filaments into one set, forming a case round the lower part of the pistil, but separating at the top. A geranium forms a specimen of this class. In the 17th the corollas are papilionaceous, like the blossom of a bean; the stamens are connected by their filaments, but divided into two sets or parcels, one of which is thicker and forms a case round the pistil; the other is smaller and leans towards the pistil. Specimens of these may be found in the flowers of peas and beans. In the 18th class, the stamens are united by their filaments into more than two sets, or parcels. See Plate XCIV. fig. 18.

The 19th class is difficult to a beginner. It consists of compound flowers, as the common daisy, dandelion. They are called compound, because each single flower consists of a collection of little flowers or florets, attached to the same broad receptacle, and contained within one calyx. Each floret consists of a corolla, or little corolla, five stamens united by their anthers into a hollow or tubular cylinder, and a pistil which passes up through the tube of the cylinder. See Plate XCIV. fig. 19, and examine a dandelion, or thistle, or common groundsel, or a sunflower. See also the beginning of the 19th class in the system, where a fuller account will be given of this class.

In the 20th class, the stamens are attached to the pistil. An orchis will afford a specimen of this. See also Plate XCIV. fig. 20.

In the three next classes, the pistils and stamens are situated on separate flowers, or distinct plants, or on plants which bear flowers with pistils and stamens, others with stamens or with pistils, or flowers of both kinds.

The 21st class contains those plants which have flowers of different kinds on the same plant, some bearing pistils, and others bearing stamens only. The flowers with pistils we shall call pistillar or stigmatic, and those with stamens staminal or anthered. The birch affords an example of this class. See also fig. 21.

The 22d class consists of those species which have stamens on one plant and pistils on another. Instances of this may be found in the willow, poplar, and juniper. See fig. 22.

The 23d class comprehends those plants which have at least two and sometimes three kinds of flowers. 1. Some anther-stigmatic, or with pistils and stamens on the same flower. 2. Others have pistils only, or stamens only. 3. Or having flowers with pistils only, or flowers with stamens only. This may be expressed more concisely. Some having flowers anther-stigmatic, some stigmatic, some anthered, or having both anthered flowers and stigmatic flowers. The common ash tree may be examined for a specimen of this class. See also fig. 23.

The names of the classes are formed from Greek words, and express the characteristic of each class. The first ten classes are named from the Greek numerals and the word andria, which the botanist must consider as synonymous with stamens.

1. Mono -andria.
2. Di -andria.
3. Tri -andria.
4. Tetra -andria.
5. Penta -andria.
6. Hexa -andria.
10. Dec -andria.
11. Dodeca -andria, 12 stamens.
13. Poly -andria.
15. Tetra -dynamia, 4 powers.
16. Mon -adelphus, one brotherhood.
17. Di -adelphus, two brotherhoods.
18. Poly -adelphus, many brotherhoods.
19. Syn -genesis mean origin or production together, so called from the stamens being united by the anthers.
20. Gyn -andria, pistils and stamens together.
21. Mon -oea, one house.
22. Di -oea, two houses.
23. Poly-gamia, many kinds of flowers. The etymology here would throw no light upon the class to a beginner; nor does it throw any on the next class.
24. Crypto-gamia, therefore, is to be understood to mean invisible flowers.

OF THE ORDERS.

The formation of the orders is as ingenious and simple as that of the classes. In the first thirteen classes, the names and characters are taken from the number of pistils or styles; when these are wanting, from the number of stigmas. Thus:

Mono -gynia, 1 style.
Di -gynia, 2 styles.
Tri -gynia, 3 styles.
Tetra -gynia, 4 styles.
Penta -gynia, 5 styles.
Hexa -gynia, 6 styles.
Hepta -gynia, 7 styles.
Octa -gynia, 8 styles.
Dodeca -gynia, 12 styles.
Poly -gynia, many styles.

In the 14th class Didynamia there are only two orders, which depend on the presence or absence of the pericarp or seed-vessel.

1. Gymnosperma. Four naked seeds in the bottom of the calyx; as in mint, dead-nettle, thyme.

In the 15th class, Tetradynamia, there are also two orders, which are taken from the form of the pericarp.

1. Siliculosa. Seeds enclosed in a silicle, or roundish seed-vessel, consisting of two pieces called valves, and the seeds fixed to both edges or sutures, as in shepherds purse, scarry-grass.
2. Siliquosa.
In the 16th, 17th, and 18th classes, the names and characters of the orders are taken from the number of stamens. In the 19th class there are six orders, which it is difficult at first to distinguish accurately.

1. Polygama Æqualis. Florets anther-stigmatic, or having both stamens and pistils in the same floret; as in dandelion, thistle, sow-thistle, artichoke.

2. Polygama Superflua. When the flower is composed of two parts, a disk or central part, and rays projecting outwards; as in corn-marigold, tansy, daisy, golden-rod, groundsel, chamo-mile, milfoil. The florets of the disk are another-stigmatic; those of the ray stigmatic.

3. Polygama Frustanea. Florets of the disk anther-stigmatic; those of the rays with styles but no stigmas; as blue-bottle, knapweed.

4. Polygama Necessaria. Florets of the disk anther-styled, without stigmas; those of the rays stigmatic. Garden marigold will afford a specimen.

5. Polygama Segregata. When each of the florets has a calyx, besides the common or general calyx of the flower. Specimens of this can only be found in botanic gardens.

6. Monogamia. When the flower is not compound but single, and the andros united. This order ought to be transferred to the class Pentandria, as it is most independent, and has been seen in those with only one flower systems. Examples of it may be found in the common garden flowers.

In the classes Gynandra, Monocha, and Dioecia, the orders are formed from the number of stamens, with three of a different kind, monadelphous, syngenesia, and gynandra, in the classes Monocca and Dioecia.

1. Monocha. When the flowers are anther-stigmatic and anthered; or anther-stigmatic and stigmatic, on the same individual plant.

2. Dioecia. When the flowers are anther-stigmatic and anthered, or anther-stigmatic and stigmatic, on two different individual plants.

3. Trioeia. When the flowers of one individual plant of the same species are anther-stigmatic; upon a second individual plant, anthered; and upon a third individual plant, stigmatic.

The orders into which the 24th class, Cryptogamia, is divided, will be explained in the introduction to that class.

OF THE SECTIONS.

The orders are generally subdivided into what may be called sections. These may vary in number, according as the system is partial or universal; but they are almost as well established as the classes and orders. Sections are not employed in the 11th, 12th, 16th, 18th, 19th, 20th, 21st, 22d, 23d classes. The principles on which they are formed are few and very simple.

In the first ten classes they depend upon the following circumstances: on the flower being superior or inferior or naked, complete or incomplete, calyced, enclosed in a spathe or glume, aggregate, united, involucrated; on the number of petals, the seeds being united or enclosed; on the number of seeds, and the number of cells in the capsule or seed-vessel, or number of berries.

The flower is said to be superior when the receptacle of the flower is above the germen, and inferior when the receptacle is below the germen. A flower is said to be naked when the calyx is absent; it is called complete when it has both a calyx and corolla, and incomplete when either of these is wanting. It is said to be calyced when the calyx has a small calyx or calyx at the base. An aggregate flower, is a flower composed of florets standing on footstalks, attached to a broad receptacle.

An umbelliferous plant, is one which sends out towards the top, from the same point or centre, a number of branches like the spokes of a wheel, and bearing flowers on the top. All the spokes, with their flowers, form an umbel. On the top of each spike arises an umbel, or partial umbel. At the base of the spikes of the umbel form partial involucres; and at the base of the spikes of the umbel form partial involucres. This will suffice for explaining the sections of the first ten classes. The sections of the 13th depend on the number of petals.

In the 14th class, Didynamia, the sections depend upon the calyx, which is said to be clavate when it is cut or divided into so many parts, and two-lipped when its mouth has a resemblance to two lips.

In the 15th class, the sections depend on the silicle and calyx. The silicle in one section is notched at the point, and in another unnotched or entire. In the first section of the order siligosa, the calyx is closed by its own leaflets. In the second it is not closed, and the leaflets are separated at the upper end.

In the 16th class, Diadelphia, and the order decandria, there are six sections. 1. The first comprehends those flowers which have the stamens all united as in the class Monadelphous, and therefore forms an exception to the regularity of the class. 2. In the second, the stigma is pubescent or hairy. The stamens are not. 3. The seed-vessel or legume, has two cells, without the connected marks of the former sections. 4. The legume contains only one seed, without the marks of the former three sections. 5. The legume is somewhat jointed, without the marks of the former. 6. The legume has only one apartment, but many seeds, without the marks already mentioned.

The only remaining class, whose orders are divided into sections, is the 16th, Syngenesia. 1. In the first section of the first order, the corollas are ligulate, that is, flat towards the exterior or upper end, and tubular only at the base. 2. Capitate or beheaded, when the flowers grow in globular forms; as the thistle. 3. Discoid, when the corollas are all tubular, not ligulate. In the order polygama superflua are two sections. 1. Discoid corollas. 2. Rayed or radiate, when all the corollas are ligulate.
I. Monadelphia, 1 stamen.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.

II. Diandra, 2 stamens.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Trigynia, 3 styles.

III. Triandra, 3 stamens.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Trigynia, 3 styles.

IV. Tetandra, 4 stamens. If the two nearest stamens be shorter, the plant belongs to class 14th.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Tetragynia, 4 styles.

V. Pentandra, 5 stamens.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Trigynia, 3 styles.
   4. Tetragynia, 4 styles.
   5. Pentagynia, 5 styles.

VI. Hexandra, 6 stamens. If the two opposite stamens be shorter, the plant is of the 15th class.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Tetragynia, 4 styles.
   4. Polygynia, more than 4.

VII. Heptandra, 7 stamens.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Tetragynia, 4 styles.
   4. Heptagynia, 7 styles.

VIII. Octandra, 8 stamens.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Trigynia, 3 styles.
   4. Tetragynia, 4 styles.

IX. Enneandra, 9 stamens.
   1. Monogynia, 1 style.
   2. Trigynia, 3 styles.
   3. Hexagynia, 6 styles.

X. Decandra, 10 stamens.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Trigynia, 3 styles.
   4. Pentagynia, 5 styles.
   5. Decagynia, 10 styles.

XI. Dodecandra, 12 or 13 stamens, inserted in the receptacle.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Trigynia, 3 styles.
   4. Pentagynia, 5 styles.
   5. Dodecagynia, 12 styles.

XII. Icosandra, 20 stamens or more fastened to the receptacle.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Trigynia, 3 styles.
   4. Pentagynia, 5 styles.
   5. Polygynia, more than 5 styles.

XIII. Polyandra, more than 20 stamens fastened to the receptacle.
   1. Monogynia, 1 style.
   2. Digynia, 2 styles.
   3. Trigynia, 3 styles.
   4. Tetragynia, 4 styles.
   5. Pentagynia, 5 styles.
   6. Hexagynia, 6 styles.
   7. Polygynia, more than 6 styles.

XIV. Didynamia, 4 stamens, 2 longer than the rest.
   1. Gymnospernia, 4 naked seeds in the bottom of the calyx.
   2. Angiospernia, seeds enclosed in a seed-vessel.

XV. Tetradynamia, 6 stamens, 4 longer than the rest.
   1. Siliculussa, seeds contained in a siliquae or roundish seed-vessel.
   2. Siliquos, seeds contained in a siliquae or long seed-vessel.

XVI. Monadelphia, stamens united by their filaments into one set or body.
   1. Triandra, 3 stamens.
   2. Pentandra, 5 stamens.
   3. Octandra, 8 stamens.
   4. Enneandra, 9 stamens.
   5. Decandra, 10 stamens.
   7. Dodecandra, 12 stamens.
   8. Polyandra, more than 12 stamens.

XVII. Diadelphia, stamens united by their filaments into two bodies.
   1. Pentandra, 5 stamens.
   2. Hexandra, 6 stamens.
   3. Octandra, 8 stamens.
   4. Decandra, 10 stamens.

XVIII. Polyadelphia, filaments united and divided into more than two sets.
   1. Pentandra, 5 stamens.
   2. Icosandra, 20 stamens.

XIX. Syngenesia, anthers united into a cylinder.
   1. Polygynia equalis, florets all anther-stigmatic.
   2. Polygynia superbus, florets of the disk anther-stigmatic; florets of the ray stigmatic.
   3. Polygynia frustrana, florets of the disk anther-stigmatic; florets of the ray styled, but not stigmatic.
   4. Polygynia necessaria, florets of the disk anther-styled; florets of the ray anther-stigmatic.
   5. Polygynia aggregata, several calyces in one calyx.

   6. Monogynia, florets single, not compound, with anthers united.

I a

XX.
BOTANY.

XX. GYMNANDRIA, stamens fastened to the pistils.
1. Diandra, 1 stamen.
2. Triandria, 3 stamens.
3. Tetrandria, 4 stamens.
4. Pentandria, 5 stamens.
5. Hexandria, 6 stamens.
6. Decandria, 10 stamens.
7. Dodecandria, 12 stamens.
8. Polyandria, more than 12 stamens.

XXI. MONOECIA, stamens and pistils not in the same flower, but in the same plant.
1. Monandria, 1 stamen.
2. Diandra, 2 stamens.
3. Triandria, 3 stamens.
4. Tetrandria, 4 stamens.
5. Pentandria, 5 stamens.
6. Hexandria, 6 stamens.
7. Heptandria, 7 stamens.
8. Polyandria, more than 7.
9. Monadelphica, filaments united.
10. Syngenesia, anthers united.
11. Gymnandria, stamens fixed to pistils.

XXII. Dioecia, stamens and pistils on different plants.
1. Monandria, 1 stamen.
2. Diandra, 2 stamens.
3. Triandria.
4. Tetrandria.
5. Pentandria.
6. Hexandria.
7. Octandria.
8. Enneandria.
10. Dodecandria.
11. Polyandria.
12. Monadelphica.
13. Syngenesia.

XXIII. POLYGAMIA.
1. Monoeccia, anther-stigmatic and stigmatic, or anther-stigmatic in the same plant.
2. Dioecia, anther-stigmatic and stigmatic, or anther-stigmatic in two plants.
3. Tricecia, anther-stigmatic in one plant, stigmatic in a second, and anther-stigmatic in a third.

XXIV. CRYPTOAGAMIA.
1. Dioecia, or forms.
3. Algae, or sea-weeds.
4. Fungi.

OF THE GENERA.

Having now shown how plants are arranged into classes, orders, and sections, we come to the next division, called genera. The characteristic marks of the genera are derived from the flower and fruit. A genus consists of a certain number of species, which resemble one another in some part of the flower or of the fruit, or both. By way of illustrating the principles on which the formation and distinction of genera are founded, we shall run over the British genera in each class.

I. In the first class, Order I sect. 1. the calyx is one-leaved or indistinct, corolla absent. Sect. 2. the berry contains many seeds, the apodex contains many flowers, and the capsule is one-seeded. Order II. genus 5. calyx wanting, two petals present; seeds four, not enclosed in a seed-vessel.

II. In the 2d class, DIANDRIA. Order I. the genera depend upon the figure of the corolla, which is divided, wheel-shaped, ringent, furnished with a spur, or two-petalled; on the calyx being cleft or being two-leaved; on the number of seeds which the berry contains; on the shape of the capsule, and the number of seeds enclosed in it; on the stamens being distant, or standing on a footstalk.

In the 2d order, the only genus is a grass, the calyx and corolla of which are called glumes.

III. In the 3d class, TRIANDRIA. Order I. sect. 1. the division of the genera depends on the number of divisions of the calyx and singularities of the stigmas. In sect. 2. the genera are distinguished by the peculiarities of the glumes and seeds.

In the 2d order, Digynia, sect. 1, 2, 3, and 4. the genera are distinguished.
1. By the number of valves or pieces of which the glumes or corolla and calyx consist.
2. By the peculiarities of these valves.
3. By the number of flowers contained in the calyx.
4. By the peculiarities of the stamens and seed.
5. By the form of the spikelets, and
6. By the peculiarities of the spine or thread, or form of the receptacle.

In the 3d order, Trigynia, the genera are distinguished.
1. By the number of leaves of which the calyx is composed.
2. By the number of petals.
3. By the number of the capsule, the number of valves composing it, and seeds contained in it.

IV. In the 6th class, TETRANDRIA, Order I. the genera are determined.

Sect. 1.
1. By the peculiarities of the common and partial calyx, or of the calyx and calyculate.
2. By the corolla being superior.

Sect. 2. and 3.
1. By the form of the corolla.
2. By the peculiarities of the fruit.

Sect. 4.
1. By the number and the peculiarities of the nectaries.
2. By their absence.
3. By the nature of the seed-vessel; by its situation, and the number of cells or seeds it contains.

Sect. 5.
1. By the peculiarities of the calyx and seed.

Digynia and Trigynia, Order I and II.
1. By the number of petals, and by their absence.
2. By the nature of the pericarp, and by the number of its valves and cells, and seeds.

V. In the 5th class, PENTANDRIA, Order I. the genera are distinguished,
BOTANY.

Order II. Angiosperma.
1. By the number of cells and directions of the partitions of the capsule or seed-vessel.
2. By the form and number of the seeds.
3. And by other marks of the calyx and corolla, which require no explanation.

XV. Tetradynama.
I. Silicula, the genera are distinguished,
1. By the silicle or short roundish seed-vessel, by the shape and position of its valves or pieces, by its being entire or notched, and the number of seeds it contains.
II. Siliquosa. The genera are distinguished,
1. By the shape of the silique or long seed-vessel, which is composed of two valves or pieces, with the seeds fastened to both sutures, or joinings of the valves; by the manner in which the siliques open.
2. By peculiar glands.
3. By the calyx being open or spreading.
4. By the position of the petals.
5. By the stigma being notched or entire.

XVI. In the 16th class, Monadelphia, the genera are distinguished,
1. By the number of styles.
2. By the divisions of the outer calyx.
3. By the position of the capsules and number of seeds contained in each.
4. By the seeds being beaked spirally or backwards.

XVII. Diadelphia. Here it is necessary to describe the corolla, which is called papilionaceous, or pea-blossomed, and usually consists of four petals. The lower petal, shaped like a boat, is called the keel; the upper petal, which spreads and rises upwards, is called the standard, and the two side petals are called the wings. The seed-vessel is called a legume, and consists of two pieces or valves, and the seeds are fixed to one of the sutures or joinings.

In the order Decandria, the genera are distinguished,
1. By the form and divisions of the calyx.
2. By the form and roughness of the style and stigma.
3. By the peculiarities of the standard, keel, and wings.
4. By the legume; its form, length, and the number of seeds it contains.

XIX. In the 19th class, Syngenesia, the genera are distinguished,
1. By the nature and form of the receptacle, by its smoothness or roughness, its being dotted, or like a honeycomb.
2. By the nature of the pappus, which is the featherly, or flying, or winged crown of the seed by which it flies.
3. By the peculiarities of the calyx, its resembling tiles, being double, accompanied with scales, &c.
4. By the number of florets in the ray.

XX. Gynandra, Diandra, the genera are distinguished,
By the form of the nectary, which is in the lower lip of the corolla.

XXI. In the 21st class, Monoecea, the genera are distinguished,
any.

as there is in separating plants that have a close resemblance into different genera. Who would have supposed that the botanist who has separated the Erica vulgaris or common heath, from the genus to which it has hitherto belonged, would have thought it improper to arrange so extensive a genus into subdivisions. We can only account for it, by supposing that an eminent botanist may sometimes forget the principles of the Linnean classification, to seek after a natural classification; a thing which we suspect is like the government of Utopia, that exists only in the mind of the inventor.

of varieties.

Every part of a plant is subject to variation from climate, soil, cultivation, and diseases, or injuries produced by insects, winds, &c. The corolla and leaves are most liable to change. Variations arising from such accidents are not permanent; they may indeed be propagated by slips, but vanish in those plants which are raised from seeds. It is by rearing plants from seeds that we can determine whether a plant be a variety or a distinct species.

rules for directing the young botanist in investigating a plant.

After the young botanist understands the principles upon which the classification is formed, he ought immediately to proceed to the examination of plants.

1. The botanist ought to select flowers in different states, some expanded, some unopened, and if possible, some that are ripened into fruit.

2. If the flower contain both stamens and pistils, it belongs to some one of the first 20 classes. If either the pistils or stamens be wanting, it belongs to the 21st, 22d, or 23d. To this rule there are a few exceptions, which if the young botanist cannot overcome, he may pass them over till he has made some progress in the art of investigation.

3. He must next examine whether the stamens be connected or separate, and whether two of them be uniformly shorter than the rest. If the stamens be not connected, and two of them be not uniformly shorter, the plant belongs to one of the first 13 classes. If the stamens do not amount to 12, the number of the stamens and number of the class is the same. If the stamens be 12 or more, then, besides counting them, it is necessary to observe whether they be fixed at the lower end to the calyx or receptacle. This may be best known by tearing off the calyx; if the stamens do not come away with the calyx, the plant belongs to the class dodecandria. If the stamens be about 20, less or more, and fixed to the calyx, the plant belongs to icosandria. If 20 or more, and attached to the calyx, the class is polyandria.

In all these classes the orders may be known by examining the pistils.

4. If the stamens be four or six, and two shorter than the rest, the plant belongs to didynamia or tetradynamia. The corolla in didynamous plants is one petal divided into two lips; and the corolla in tetradynamous plants consists always of four petals, placed somewhat in the form of a cross: hence called cruciiform.

The orders of the class didynamia may be known by observing whether the seeds be enclosed in a seed.
Elements, vessel, be four-in number, and naked at the bottom of the calyx.

In tetradynamis, the orders are distinguished by the form of the seed-vessel. If long, the order is silicous; if roundish it is siliculosa.

5. If the stamens be connected by the filaments into one set round the pistil, but separated at the top, and the petals five, the class is monadelphia. If the stamens be formed into two sets, and the corolla like the blossoms of a pea or bean, the class is diadelphia; and if formed into more than two sets, the class is polyadelphia. The orders depend upon the number of the stamens.

6. If the flower be compound, that is, if one calyx contain a great many corollas, each of which has five stamens united to a cylinder at the anthers, the flower belongs to the class syngenesia.

The orders are to be determined by examining the florets, that is, the corollas of the disk and ray, in order to know whether they both contain pistils and stamens, or anthers and stigmas, or otherwise. 1. If all the florets contain stamens and a pistil, the order is polygama equisalis. 2. If the disk or central part have florets with a pistil and stamens, but the rays contain only a pistil, the order is polygama superflua. 3. If the florets of the disk have stamens and pistils, or both anther-stigmas, but those of the rays have only a style, the order is polygama frustranea. 4. If the florets of the disk have stamens and styles, but no stigmas, and those of the rays a pistil only, the order is polygama necessaria. 5. When each of the florets has a small calyx, the order is the polygama segregata. 6. And when the flower is not compound, but single with anthers united, the order is monogama. But such plants are commonly now added to the class pentandria.

7. If the stamens be fixed to the pistil, the class is gynandria. The flower has something of a monstrous or irregular appearance. The petals are five, the style grows from the inner petal of the lower lip of the corolla, so as scarcely to be distinguishable.

The orders are determined by the number of the stamens.

8. When the flowers are imperfect, that is, when some in the same individual plant have only pistils and some only stamens, the plant belongs to the class monoeza. When the pistils are in one plant, and the stamens on another, the class is dioecia; and when perfect and imperfect flowers occur on the same plant, or on two or three different plants, the class is polygama.

The orders of monoeza and dioecia, are known by the number of stamens; and in polygama, if imperfect and perfect flowers, that is, anther-stigmate, and stigmatic or anthered, be found on the same plant, the order is monoeza; if on two plants, the order is dioecia; and if anther-stigmatic flowers be on one plant, stigmatic on another, and anthered on a third, the order is tricoecia.

9. Different flowers should be examined, and especially those that are unopened, if the number of stamens and pistils should vary. And if after this examination, different unopened or unexpanded flowers should vary, a preference should be given to the flowers that terminate the stalk. We ought always, therefore, to compare different flowers before we inquire after the class or orders.

II. 1. After determining the class and order, the botanist ought to compare with the flower which he is investigating the different sections of the order when it is divided into sections. He may then proceed to examine the genus.

2. In the beginning of each class he will find all the genera arranged as they agree and differ in some essential characters of the flower and fruit. But they are numbered in that order which brings those that have the closest resemblance next to one another. After the section is determined, then the flower must be compared with each of the genera of that section, or of the order when it is not divided into sections.

3. If none of the essential characters agree with the flower and fruit of the plant which is examined, then the plants which are named at the end of the orders are to be sought for and examined.

In this system we have first given the essential marks of all the genera at the beginning of each class in Latin, and also in English.

4. After determining the genus, the plant may be compared with the description of the species. In foreign plants we have in general given only the essential character of the species. But in some British plants we have added also, from Dr Smith's Flora Britannica, a minute and fuller account, as an example of botanical description.

We have not referred to those books which give plates of the species, because they are accessible but to very few, and because we do not think that a man will ever be a botanist whose knowledge is indebted to plates. It is much better to consult an experienced botanist than a book of plates. Those, however, who wish to consult plates may do so from this system as well as from any other, after ascertaining the class and order.

As to the language which is employed in the following system, we need say very little. We have endeavoured to make it as much English as possible. We have always preferred words of English origin when we thought them sufficiently accurate; but when we had reason to believe that such words were so vague that they might lead into error, we thought it better to adopt the Linnean terms, and to give them an English termination. In a few cases we have retained the Linnean terms unaltered, as corolla, bracteae, stipule, because we thought any such change would be unpleasant to the ear, as corol, bracte, stipule. Besides, it would be no disadvantage to the harmony of our language to have more words ending with vowels.

We once intended to have given English names to many of the genera, and to all the species, and had done so through the first four or five classes; but it was objected, that this would increase the synonyms, which are already too numerous; and consequently would often tend to mislead than to be useful. It would certainly be much better that plants were known in all nations by the same name.

Of the Method of forming an Herbarium or Hortus Siccus.

Every man who wishes to be a complete botanist will find it necessary to preserve and to form into a collection the plants which he has examined.

The
The best method of preserving them is by drying them: specimens ought to be collected when dry, and carried home in a tin box. Plants may be dried by pressing, in a box of sand, or with a hot smoothing iron. Each of these has its advantages.

1. If pressure be employed, a botanical press may be procured. The press is made of two smooth boards of hard wood, 18 inches long, 12 broad, and two thick. Screws must be fixed to each corner with nuts. If a press cannot easily be had, books may be employed.

Next, some squares of unprinted blossom blotting paper must be provided. The specimens, when taken out of the tin box, must be carefully spread on a piece of pasteboard covered with a single sheet of the blossom paper quite dry; then place three or four sheets of the same paper above the plant, to imbibe the moisture as it is pressed out; it is then to be put into the press. As many plants as the press will hold may be piled up in this manner. At first they ought to be pressed gently.

After being pressed for twenty-four hours or so, the plants ought to be examined, that any leaves or petals which have been folded may be spread out, and dry sheets of paper laid over them. They may now be replaced in the press, and a greater degree of pressure applied. The press ought to stand near a fire, or in the sunshine. After remaining two days in this situation, they should be again examined, and dry sheets of paper be laid over them. The pressure then ought to be considerably increased. After remaining three days longer in the press, the plants may be taken out, and such as are sufficiently dry may be put in a dry sheet of writing paper. These plants which are succulent may require more pressure, and the blossom paper again renewed.

Plants which dry very quickly, ought to be pressed with considerable force when first put into the press; and if delicate, the blossom paper should be changed every day. When the stem is woody it may be trimmed with a knife, and if the flower be thick or globular, as the thistle, one side of it may be cut away; as all that is necessary, in a specimen, is to preserve the character of the class, order, genus and species.

2. Plants may be dried in a box of sand in a more expeditious manner, and this method preserves the colour of some plants better. The specimens, after being pressed for ten or twelve hours, must be laid within a sheet of blossom paper. The box must contain an inch deep of fine dry sand, on which the sheet is to be placed, and then covered with sand an inch thick; another sheet may then be deposited in the same manner, and so on, till the box be full. The box must be placed near a fire for two or three days. Then the sand must be carefully removed, and the plants examined. If not sufficiently dried, they may again be replaced in the same manner for a day or two.

3. In drying plants with a hot smoothing iron, they must be placed within several sheets of blotting paper, and ironed till they become sufficiently dry. This method answers best for drying succulent and mucilaginous plants.

4. When properly dried, the specimens should be placed in sheets of writing paper, and may be slightly fastened by making the top and bottom of the stalk pass through a slip of the paper, cut neatly for the purpose. Then the name of the genus and species should be written down, the place where it was found, nature of the soil, and the season of the year. These specimens may be collected into genera, orders, and classes, and titled and preserved in a portfolio or cabinet. The method of preserving many of the cryptogamous plants is more difficult, on account of the greater quantity of moisture which they contain, and the greater delicacy of their texture.

We will now conclude this introduction with particular reference to the plates.

PLATE XCIV. exhibits the 24 CLASSES; fig. 1. representing the first class, or Monandria; fig. 2. the second class, or Diandria; fig. 3. the third class, or Triandria; and so on, according to the enumeration in the table.

PLATE XCV. represents the parts of a plant upon which the investigation of the GENUS depends.

Parts of the Flower.—Fig. 1. Spatho. Fig. 2. Spadix. Fig. 3. Gluma, or glume; b, oriza, or awn. Fig. 4. Umbella and involucrum; a, Umbello universal; or universal umbel; b, partialis, or partial umbel: c, Involucrum universal; universal involucrum; d, partialis, or partial involucrum. Fig. 5. Calyptra, calyptere or veil; a, capitulum; b, operculum; parts of mosses. Fig. 6. Amentum. Fig. 7. Siphobus, strobile. Fig. 8. a, Podus, caps; b, color, c, stipule; parts of fungi or mushrooms. Fig. 9. a, Receptaculum commune nudum, the common receptacle or base of the flower when the stamens, pistillum, capsule, &c. are taken off. Fig. 10. Receptaculum commune paleis inbricateum, or common receptacle imbricated with paleus or membranaceous lamella. Fig. 11. a the tube, b the edge or margin, of a one-petaled corolla. Fig. 12. is a flower laid in a proper position for showing its different parts. a, German, which includes the seeds and capsule in which they are enclosed; b, style, a continuation of the german; c, stigma, or top of the style; d d d d d, filaments, or threads; e e e e e, anthers; f f f f, petals. Fig. 13. a, the claws, b, the laminae or plates, of a many-petaled corolla. Fig. 14. a, Bell-shaped nectary of the narcissus. Fig. 15. Horned nectaries of monkshood. Fig. 16. Horned nectary in the calyx of the tropocoeleum. Fig. 17. a a a a a. The nectaries of the parnassia grass, five in number, each of which has 13 styles, with round buttons on their tops.

Parts of Fruitation.—Fig. 18. a, Pereanth; b, german; c, style; d, stigma; e e, filaments; f f, anthers, some shedding the pollen or dust; g, the appearance of the anther before it sheds the pollen. Fig. 19. a, the filament, and b, the anther, separated from the flower. Fig. 20. a, one grain of the pollen magnified by a microscope; b, an elastic aura supposed to be necessary for impregnating the seeds. Fig. 21. a, German; b, style; c c, stigma. Fig. 22. Follicle: The seeds not adhering to the suture, are enclosed in a particular receptacle. a. Fig. 23. Legume, or a double-valved pericarp, having the seeds fixed only to one of the sutures a a. Fig. 24. Silique, or a double-valved pericarp, with the seeds fixed to both sutures or margins, a b. Fig. 25. Pome, or a fleshy pericarp, containing
LEAVES COMPOUND

LEAVES AS TO DETERMINATION
**Botany**

Elementary. a capsule in which the seeds are enclosed, as in the apple, &c. a, the pericarp; b, the capsule, or seed-case. Fig. 26. a. Drupe, or pericarp containing a nut or stone, and having no valve. b, the nucleus, or stone.

Fig. 27. Bacc a or berry, a pericarp containing naked seeds dispersed through the pulpy part. Fig. 28. A capsule opening at the top to allow the seeds to fall out. Fig. 29. Four capsules included in a common pericarp. a a. The valves; b b. the dissepiment, or partition which separates the different seed-capsules from one another; c. columna, or central column, by which the capsules are connected. Fig. 30. A capsule cut off longitudinally, to show the receptacle of the seeds. Fig. 31. Pappus, or down; a, long-haired; b, feathered; c, seed; d, stipe.

Pedunculi or Footstalks of Flowers.—Fig. 32. Corymb. 33. Raceme. 34. Spike. 35. Verticil. 36. Panicle.

Plates XCVI. XCVI. XCVIII. contain delineations relative to the SPECIES of plants.

1. Leaves as to figure. A, Simple.—Fig. 37. Orbicular, of a circular figure. Fig. 38. Subulate, thread-like or nearly circular. Fig. 39. Oval.

Fig. 40. Oval or elliptical. Fig. 41. Obovate. Fig. 42. Lanceolate. Fig. 43. Linear. Fig. 44. Subulate, or awl-shaped. Fig. 45. Reniform, or kidney-shaped. Fig. 46. Cordate, or heart-shaped. Fig. 47. Lunulate, or crescent form. Fig. 48. Triangular. Fig. 49. Sagittate.

Fig. 50. Cordato-Sagittate, heart-shaped behind, and sharp like the point of an arrow before. Fig. 51. Hastate, or halbert-shaped. Fig. 52. Cleft. Fig. 53. Three-lobed, or having three (55) lobes. Fig. 54. Premorse, fore-bitten. Fig. 55. Lobed. Fig. 56. Quinquangular, or five-angled. Fig. 57. Eroded. Fig. 58. Palmate. Fig. 59. Pinnated. Fig. 60. Laciniate.

Fig. 61. Sinuate. Fig. 62. Dent-sinuate. Fig. 63. Sinuate backwards. Fig. 64. Partite or parted. Fig. 65. Repand, or scolloped. Fig. 66. Dentated, or dent- ed. Fig. 67. Serrated or sawed. Fig. 68. Doubly serrated. Fig. 69. Doubly notched. Fig. 70. Cartilaginous. Fig. 71. Acutely notched. Fig. 72. Obtusely notched. Fig. 73. Plaited. Fig. 74. Crenate, notched. Fig. 75. Curled. Fig. 76. Blunt or obtuse. Fig. 77. Acute. Fig. 78. Acuminated, or awl-pointed. Fig. 79. Obtuse with an acumen, blunt with a sharp point superadded. Fig. 80. Acutely emarginated. Fig. 81. Coniciform emarginate, wedgeform and notched at the end. Fig. 82. Retuse. Fig. 83. Long-haired. Fig. 84. Tomentose, or cottony. Fig. 85. Hirsut, or bristle-haired. Fig. 86. Ciliated. Fig. 87. Rugose or wrinkly. Fig. 88. Veined. Fig. 89. Nerved. Fig. 90. Papillous. Fig. 91. Liniform or tongue-shaped.

Fig. 92. Scimitar-shaped. Fig. 93. Hatched-shaped. Fig. 94. Deltoid. Fig. 95. Three-sided or triquetrous. Fig. 96. Channelled. Fig. 97. Furrowed. Fig. 98. Cylindrical. B. Compound Leaves. Fig. 99. Three-lobed.

Fig. 100. Binate. Fig. 101. Ternate. Fig. 102. Diforate, or fingered. Fig. 103. Pedate. Fig. 104. Pinnate with an odd leaflet. Fig. 105. Abruptly pinnated.

Fig. 106. Pinnated alternately. Fig. 107. Abruptly pinnated. Fig. 108. Pinnated with a cirus. Fig. 109. Pinnated with only two leaflets. Fig. 110. Pinnated decussively. Fig. 111. Pinnated jointly. Fig. 112. Lyre-shaped. Fig. 113. Binate, or duplo-ter-

**EXPLANATION OF SIGNS.**

- ☐ Annual.
- ☐ Biennial.
- ☐ Perennial.
- ☐ Tree or shrub.
- ☐ Flowering.

**CLASSIFICATION.**
CLASSIFICATION.

CLASSIS I.

MONANDRIA.

Ordo I. MONOGYNIA.

Sect. I. SCITAMINAE, Fructu infero uniovulato, triloculari.

1. CANNA. Cal. 3-phylletum. Cor. 6-partita. Nect. 2-partitum. Caps. 3-locularis.
9. MYROSMA. Cal. duplex: exterior 3-phylletum: interior 3-partitum. Cor. 5-partita irregularis.

Sect. II. Fructu infero quadrilociulari.

18. Lopezia. Cal. 4-phylletum. Cor. 5-petala inequalis. Caps. 4-loculi. 4-valvis, polysperma.

Sect. III. Fructu supero.

Class I. MONANDRIA.

Order I. MONOGYNIA.

Sect. I. SCITAMINAE or Spicy Plants. The Germin Inferior, and 1 or 3-celled.

12. K. Cal. indistinct. Cor. 6-parted, the three greater segments open in two-parted stigmas, bilamelated.
13. R. Cal. 1-leaved, bursting. Cor. 3-cleft, unequal. Nect. oblong, one tooth on each side of the base. A berry.
17. H. Cal. 2-cleft. Cor. long, filiform; limb double, the exterior one 3-parted. Nect. tubulosus.
18. A. Cal. 3-dentated, equal. Cor. 3-parted, equal. Nect. 2-lipped, inferior lip spreading.
19. A. Cal. 3-cleft, unequal. Cor. 3-parted, unequal. Nect. 2-lipped, somewhat erect.
20. C. Cal. 3-cleft, gibbous. Cor. 3-parted, ringent. Nect. 2-lipped, inferior lip greatest, and 3-lobed.
21. M. Cal. 3-leaved. Cor. 3-cleft. Nect. 3-parted, third segment on the higher side anther-bearing.
16. C. Cal. 3-leaved. Cor. 6-parted. Nect. 2-parted. Caps. 3-celled.
13. T. Cal. 3-leaved. Cor. 5-petaled, two interior petals less. Nect. lanceolatum, concave. Drupe 1 cell.
21. M. Cal. double; exterior one 3-leaved, interior 3-parted. Cor. 5-parted, irregular.

Sect. II. Germin inferior, and four-celled.

18. L. Cal. 4-leaved. Cor. 5-petals, unequal. Caps. 4 cells, 4 valves, many seeds.

Sect. III. Germin superior.

15. P. Spatha one flower. Cal. none. Cor. 4-petals irregular. Caps. 3 cells, many seeds.

Monandria.

16. **Cucullaria.** Cal. 4-partitus. Cor. 4-petala inaequalis calcarata. Fil. petaliforme. Anth. loculis discretis!
17. **Qualea.** Cal. 4-partitus. Cor. dipetala. **Bacea.**
19. **Ustelia.** Cal. 4-dentatus, lacinia unica relinquis multo majore. Cor. infundibuliformis 4-dentata. Caps. 1-locul. 2-sperma.

† **Mangifera Indica.** *Tradescantia monandra.*

**Sect. IV. Monosperma.**

20. **Boerhaavia.** Cal. superus margo integerrimus. Cor. 1-petala campanulata.

† **Valeriana rubra, angustifolia.** *Calceolus.** Scirpi et Cyperis nonnullae species. *Alchemilla Aphanes, monandra. Polycnemum monandra.*

**Ordo II. DIGYNIA.**

**Sect. I. PLANTS.**

25. **Lacistema.** Cal. amenti squama. Cor. 4-partita. Fil. 3-fid. Bac. pedicellata monosperma.
27. **Callitriche.** Cal. o. Cor. 2-petala. Cap. 2-locularis.
29. **Mniarum.** Cal. 4-partitus superus. Cor. o. Sem. 1.

**Sect. II. GRASSES.**

30. **Cinna.** Cal. gluma 1-flora. Cor. gluma 2-valvis.

† **Leersia Monandra.**

1. **Canna, Flowering Reed.**
Cor. 6-parted, erect. Nect. 2-parted, rolled back. Style lanceolate, adhering to the corolla. Cal. 3-leaved.

**indica.**
1. C. leaves ovate, acuminated ribbed.
**rubra.**
α C. whole flower reddish, leaves ellipse-ovate.
**lutea.**
β C. interior petals erect and yellow, the segments of the nectary rolled back and sprinkled with reddish lines; leaves ovate elliptical.

**sppicosa.**
γ C. interior petals erect, scarlet, the segments of the nectary rolled back, yellow sprinkled with red lines, leaves ovate elliptical.

**patens.**
ζ C. interior petals reflected, scarlet leaves lanceolate oblong. Between the tropics.

2. **C. leaves lanceolate on footstalks, ribbed. Small angustifolia.** *Flowering reed.* America.
3. **C. leaves lanceolat. petiol. glaucescent beneath, with glaucescent out ribs.** Carolina.

2. **Helena.**
Limb of the cor. double, the outer one commonly 3-cleft. Nect. 2-leaved or 2-cleft. Caps. 3-celled, coriaceous, inflated, subglobose. Cal. spathiform, campanulate, 2-cleft.

**K 2**
2. **H.**

ANY.

16. **C. Cal. 4-parted.** Cor. 4-petals unequal, spurred. Fil. petal-shaped.
17. **Q. Cal. 4-parted.** Cor. 2 petals. A berry.
19. **U. Cal. 4-dentated, one segment greater than the rest.** Cor. funnel-shaped, 4-dentate. Caps. 1 cell, 1 seed.

† **Mangifera Indica.** *Tradescantia monandra.*

**Sect. IV. Monosperme, or having one Seed.**

20. **B. Cal. superior, margin very entire.** Cor. 1 petal, campanulate or bell-shaped.
* 23. **H. Cal. superior, margin two-lobed.** Cor. none.
22. **S. Cal. 1-phyllyus, ventricose.** Cor. o.
21. **P. Cal. 1-phyllyus, 5-dentated.** Cor. o. Seed 1, fleshy, scaly, enclosing the germen.
* **C. Cal. o.** Cor. o. Anth. sessilia. Style o. Berry many seeds.
* **Z. Spadix linear, sheathed by the leaves, fruit-bearing.** Cal. o. Cor. o. Seeds solitary alternate.

† **Valeriana rubra, angustifolia.** *Calceolus.** Several species of Scirpus and Cyperus, *Alchemilla Aphanes, monandra. Polycnemum monandra.*
angular...
Monandria.

2. C. leaves lanceolate, ribs lateral and very numerous. 2. India.

12. KEMPFERIA.

Cal. indistinct. Cor. 6-parted, the three greater segments a little expanded, one two-parted. Stigma bilaminellated.

galanga. 1. K. leaves ovate sessile. Galangal. 2. India.
2. K. leaves lanceolate on footstalks. 2. India.

13. THALIA.

Cor. 5-petalled; the two inner petals less. Nect. lanceolate concave. Nect. one cell. Cal. 3-leaved.

cannafors. 2. T. Cor. 5-petalled. Nect. 2-cleft, erect. 2. New Hebrides.

14. PHYRMNII.

15. PHYLLIDERUM.

Spathe one flower. Cal. none. Cor. 4-petalled, irregular. Caps. 3-celled, with many seeds.

16. CUCULLARIA.

Cal. 4-parted. Cor. 4-petalled unequal, with a spur. Fil. petaliform.

excela. 1. C. Guiana. A lofty tree, with leaves opposite, obovate acute veined; racemes terminating, flowers yellow.

17. QAILEA.

Cal. 4-parted. Cor. 2-petalled.

rosa. 1. Q. Guiana.

corsica. 2. Q. petals emarginate, leaves acute. Guiana.

18. LOPESIA.

Cal. 4-leaved. Cor. 5-petalled unequal. Caps. 4-celled, 4-valved, many seeds.

mexicana. 1. L. 2. Mexico. The Lopesia hirsuta of Jacquin is only a variety.

19. USTERIA.

Cal. 5-dentéd, one dent much larger than the rest. Cor. funnel-shaped, 4-dentéd. Caps. one cell, 2 seeds. Seeds arillled.

20. BOERHAVIA.

Cal. margin quite entire. Cor. 1 petal, campanulated plaited. Seed 2, naked, inferior.

erostra. 1. B. stem 4-angled smooth, the internodes viscous, flowers corymbous-panicled. 2. Vera Cruz, and Jamaica. The stamens are two in number.

2. B. leaves oblong-ovate, a little fleshy, flowers ascendens, panicked, fruitstalks with two flowers, stem ascending or rising like an arch. Guinea.

3. B. stem tapering pubescent, flowers capitata diffusa, corymbous. 2. South America. The leaves are whitish beneath. Flowers purple, with one stamen.

4. B. stem a little tapering; hisrate flowers capi. hisrata. 2. Jamaica. The stem is a foot long, the flowers blood-coloured, the stamens two.

The corolla is of a pale rose hue, the stamens three, the fruit top-shaped and striated.

6. B. stem erect, flowers umbellated bistaminatal, scandens. leaves heart-shaped. West Indies. 2. six feet high, erect, smooth. The branches alternate, the umbels green, bearing six flowers, the involucres 5-leaved.

B. stem erect, leaves inferior heart-shaped ovate, excelsa. the highest leaves ovate, flowers umbellated, 3-staminated. 2. The corolla is purple, the stamens three.

Dr Smith. 2. Chancay in Peru.

11. B. leaves linear and acute. augustinol.

12. B. stem creeping, flowers 4-staminated. Society tetrandra. islands.

Several species of Boerhaavia resemble the Valerianas.

21. POLLICHIA.

Cal. 1-leaved, 5-dentéd. Cor. none. Seed 1. Recept. including the fruit within its scales.

1. P. 2. Cape of Good Hope. campestris

22. SALICORNIA, Samphire.

Cal. ventricose, entire. No petals. Stam. 1 or 2. Seed 1, covered with the calyx.

* 1. S. Knees compressed, emarginate, internodes ob- herbacea. conical, spikes on footstalks tapering towards the apex.

Europe.

a S. Europea; small jointed glasswort.

b. S. erecta, leaves short; woody-jointed.

g. S. myosuroides, procumbent shoots very long.

More branched, procumbent, leaves short, purplish. Marsh samphire, jointed glasswort, or saltwort.

Frequent on the sea shore in muddy or sandy places.

0 or 3. Flowers VIII. and IX.

The root is fibrous, small. Stem commonly erect, subdivided at the base, branched above. Branches opposite, simple erect, very succulent, without leaves; knee, knees compressed, dilated at the summit, emarginated. Spikes opposite terminating with a large odd one, on footstalks, tapering gradually towards the summit, somewhat pointed, jointed. Flowers opposite, three commonly on each side.

† Has a more branched stem, spikes longer and thicker.

Note, The genera and species of plants found in Britain are marked with an asterisk.
thicker. A diffuse stem, spikes very long. 2 A stem very much branched, spikes small, purplish. 3 A stem very much branched, firmer, spikes shorter, green.

\textit{fruticosa}. 2. S. knees cylindrical, entire, internodes equal, spikes subcylindrical, distinct. \textit{Shrubby Campsis} or \textit{jointed glasswort}. Is found in sea marshes. 4. Flowers in VIII. and IX. The root is woody and perennial, the stem somewhat shrubby, ascending, very much branched, the branches and branchlets opposite. All the internodes commonly cylindrical. The spikes generally sessile, cylindrical, obtuse, many-flowered, joints very short.

\textit{strobilacea}. 4. S. stem prostrate shrub, genicules trunca ted alternately bearing spikes; spikes naked, very short opposite. \_h. Near the Caspian sea.

\textit{virginica}. 5. S. erect, branches very simple. Virginia.

\textit{arabica}. 6. S. leaves alternate, sheathing, obtuse, deciduous. \_h. Arabia.

\textit{foliata}. 7. S. leaves linear, alternate, stem-clasping, deciduous. Siberia. \_h.

\textit{complexicaulis}. 8. S. leaves heart-shaped, stem-clasping. Tunis. \_h.

23. HIPPIPURIS.

Cal. indistinct, entire. Cor. none. Stigma simple. Seed 1, inferior.

\textit{vulgaris}. * 1. H. with leaves verticillate and linear. In ditches and muddy stagnant pools, but not common. Near Hornsey and Lyne: also in the King's park at Edinburgh. 2. Flowers in V. The root is composed of long verticillate fibres; the stem very simple, erect, often knotted, immersed and leafless to the middle, leafy above. The leaves verticillate, from 8 to 12, spreading, linear, acute, very entire, smooth. Flowers axillary, solitary, sessile.

24. MITHRIDATEA.

Recep. has many flowers, and is 4-cleft. Cal. none. Cor. none. Seeds solitary, immersed in a fleshy receptacle.

\textit{quadrifida}. 1. M. \_h. Madagascar, Mauritius, and Bourbon. It has opposite branches, leaves on footstalks opposite, elliptical obtuse, entire, venous; flowers solitary on footstalks, four-cleft, lateral on the older branches. The fruit is fleshy, and of the size of an apple.

\textit{CHARA}.

\textit{Order II. DIGNYNIA}.

25. LACISTEMA.

Cal. scale of an ament. Cor. 4-petalled. Fil. 2-cleft. Berry on a fruitstalk, 1 seed.

1. L. Jamaica and Surinam. \_h.

26. CONIFERUM. \textit{Tickseed}.

Cal. none. Petals 2. Seed 1, oval, naked.

1. Cor. spikes terminal, leaves linear, ribless, \textit{awned}. \_h. Russia, Tartary, and south of France. \_h. 2. Cor. spikes axillary, squarrose, leaves lanceolate- \textit{accuminated}, pungent, nerved, or ribbed. Banks of the \textit{Wolga} and the deserts of the \textit{Cossack}.

27. CALLITRICHE.

Botany

1. B. little heads spiked, terminal. South of Eur.-capitatum. rope, especially of the Tyrol, Switzerland. 
2. B. little heads scattered and lateral. virgatum.
3. B. chenopodioides, little heads verticilled and juiceless. Tartary, Spain and France. 

29. Mniarum.
Cal. 4-parted, superior. Cor. none. Seed 1.

1. M. New Zealand and Terra del Fuego. 2. biformum.
This genus very much resembles the genus Mniarum in the 3d class.

30. Cinna.
Cal. a glume 2-valved, one flower. Cor. a glume 2-valved.

1. C. Canada. 2. This plant seems to be a spe. arundinac.-cies of agrostis, though evidently distinct from AGROS. cea.

In the class Monandria are

30 Genera; and 84 species, 8 of which are British.

Class II.

Diandria.

Order I. Monogynia.

Sect. I. Flowers inferior.

36. O. Cor. 4-cleft, segments subovate. Drupa x seed.
37. C. Cor. 4-cleft, segments very long. Drupa 1 seed. Nut striated.
35. P. Cor. 4-cleft. Berry 1 seed.
34. L. Cor. 4-cleft. Berry with 4 seeds.
38. S. Cor. 4-cleft. Capsule corticated, 2-celled.
41. E. Cor. 5-cleft, segments obovate, plane.
32. J. Cor. 5-8-cleft. Berry 2-grained. Seeds solitary, arillate.
33. G. Cor. 4-5-cleft. Stamens 4, 2 barren.

Sect. II. Flowers inferior, one-petaled, irregular. Fruit capsularis.

45. P. Cor. 4-cleft, throat bare. Cal. 5-parted. Caps. 2-celled.
46. W. Cor. 4-cleft, throat bearded. Cal. 5-parted. Caps. 2-celled.
44. V. Cor. limb 4-parted, lower segment narrow.

49. Gratiola.
49. **Gratiola.** Cor. 4-fida bilabiata resupinata. Stamina 4: duo sterilia. Caps. 2-local.

50. **Schwenkia.** Cor. subequalis: ore pliato-stellato glanduloso. Stam. 5: 3 sterilia. Caps. 2-local.

47. **Cyrtandra.** Cor. irregularis. Stam. 4: 2 sterilia. Bacca 2-localaria.

53. **Pinguiicula.** Cor. ringens, calcarata. Cal. 5-fidus. Caps. 1-local.

51. **Calceolaria.** Cor. ringens, inflata. Cal. 4-fidus. Caps. 2-local. 4-valvis.

52. **Bae.** Cor. ringens. Cal. 5-partitus. Caps. 2-local. 4-valvis.

54. **Utricularia.** Cor. ringens, calcarata. Cal. 2-phyllyus. Caps. 1-localaria.

55. **Chinia.** Cor. ringens. Cal. 5-aristatus. Nux carnos 4-localia.

66. **Schirius.** Cor. ringens. Stam. 5: 3 sterilia. Caps. 5 coalite.

† Hemimeris sabulosa, diffusa, montana. Bignonia catalpa, longissima.

**Sect. III.** Flores inferi monopetali, irregularares. Fructus gymnospermi.

56. **Verbe.** Cor. subequalis. Cal. lacinia suprema brevior.

57. **Lycopus.** Cor. 4-fida subequalis; lacinia unica emarginata. Stam. distantia.

58. **Amethystea.** Cor. 5-fida subequalis; lacinia inmissa concava. Stam. approximata.

60. **Ziziahora.** Cor. ringens: galea reflexa. Cal. filiformis.

61. **Monarda.** Cor. ringens: galea lineari obvolvente genitalia.

63. **Salyria.** Cor. ringens. Fil. transverso pedicellata.

59. **Cunila.** Cor. ringens, galea plana. Stam. 4: 2 sterilia.

64. **Collinsonia.** Cor. subringens: labio capillari multiido.

**Sect. IV.** Flores inferi polypetali.

42. **Fontanesia.** Cor. 2-petala. Cal. 4-partitus. Caps. 2-local. non dehiscent.

68. **Lithophila.** Cor. 3-petala. Cal. 3-phyllyus. Peric. 2-local.

69. **Linociera.** Cor. 4-petala. Cal. 4-dentatus. Bacca 2-local.

39. **Dialium.** Cor. 5-petala. Cal. nullus.

† Polycenemum sclerospermum.

**Sect. V.** Flores superi.

65. **Morina.** Cal. fructus dentato-aristatus, floris bifidus.

49. **G.** Cor. 4-clefs, bilabiata, resupinata. Stam. 4: 2 barren. Caps. 2-celled.

51. **S.** Cor. subequalis, mouth pliato-stellate glandularis. Stam. 5: 3 barren. Caps. 2-celled.

48. **J.** Cor. irregularis. Caps. 2-celled, bursting, with an elastic claw.

47. **C.** Cor. irregular, 4 stamens, 2 barren. Berry.

53. **P.** Cor. ringent, spurred. Cal. 5-clefs, 1-celled.

51. **C.** Cor. ringent, inflated. Cal. 4-clefs. Caps. 2-celled, 4-valved.

52. **B.** Cor. ringent. Cal. 5-parted. Caps. 2-celled, 4-valved.

56. **G.** Cor. ringent. Cal. 5-awned. Nut fleshy, 4-celled.

66. **S.** Cor. ringent. Stam. 3 barren. Caps. 5, united.

Plants apt to be confounded with those are,

Hemimeris sabulosa, diffusa, montana. Bignonia catalpa, longissima.

**Sect. III.** Flowers inferior, one-petaled, irregular. Seeds naked.

56. **V.** Cor. subequalis. Cal. highest segment shorter.

57. **L.** Cor. subequalis. Stamens distant.

58. **A.** Cor. 5-cleft subequal, longest segment concave cleft. Stamens near.

60. **Z.** Cor. ringent, helmet reflected. Cal. filiform.

61. **M.** Cor. ringent, helmet linear, covering the petals and stamens.

62. **R.** Cor. ringent, helmet arched, 2-cleft. Stam. crooked.

65. **B.** Cor. ringent. Fil. on a transverse foot-stalk, with a dent.

59. **C.** Cor. ringent, helmet plane. 4 Stam. 2 barren.

64. **C.** Cor. subringent, lip capillary many-cleft.

**Sect. IV.** Flowers inferior, many-petaled.

42. **F.** Cor. 2-petaled. Cal. 4-parted. Caps. 2-celled, not dehiscent.

68. **L.** Cor. 3-petaled. Cal. 3-leaved. Peric. 2 cells.

Flower resembling these.
Saccharum Cylindricum Thunbergii.

ORDO III. TRIGYNIA.

Cor. salver-shaped, the segments truncated. Caps. 2-celled, marginate. Seeds solitary.

 Arbor tristis. 1. N. with a stem four-cornered, leaves ovate, sharp-pointed, seed-vessels membranaceous and flattened. h. East Indies.

32. Jasminum, Jasmine.

Cor. salver-shaped, from five to eight-clft. Berry 2-grained. Seeds solitary in a seed-coat.

Sambac. 1. J. with leaves simple, opposite, elliptical ovate, membranaceous and opaque, the branchlets and footstalks pubescent, the segments of the calyx awl-shaped. India. h.

a. With a simple flower.

b. With a multiplied flower, segments oblong acute, shorter than the tube.

c. With full flowers, segments roundish, longer than the tube.

2. J. with leaves ovate, sharp-pointed, a little waved, the branches columnar. Malabar. h.

Hirsutum. 3. J. with leafstalks and footstalks villous. India. h.

Angustifolium. 4. J. with leaves blunt, lanceolate and ovate. India. h.

Vimineum. 5. J. with leaves opposite, ovate, dagger-pointed, footstalks axillary, one-flowered, those terminating three Vol. IV. Part I.

Flowered. h. Java and Malabar. Has a great affinity to the preceding.

6. J. with leaves opposite, ovate, heart-shaped, pubescent on both sides. h. Calcutta.

7. J. with leaves opposite, simple, ovate-oblong, ta-scessis, pering; panicles right-angled; segments of the calyx bristle-shaped, bent back. Bengal.

8. J. with leaves heart-shaped, lanceolate, acute, and elongatum long; branches columnar. Nyctanthes elongata of Linn. Suppl. E. Indies.

10. J. with leaves opposite, simple, ovate, tapering, trinerve, three-nerved; footstalks axillary and commonly one-flowered. Java.

Subdiv. II. Leaves terna.

13. J. with leaves opposite ternate, leaves of curculia-the flower-bearing branchlets simple; the calyxes an-tum-gled, the branches columnar and pubescent. Malabar.

14. J. smooth, with leaves ternate and opposite, stem flexile. climbing, branches columnar. E. Indies.

15. J.
didymum. 15. J. smooth with leaves terete, opposite, leaflets ovate-lanceolate, branches axillary. Society islands.

usoricum. 16. J. with leaves terete, opposite; leaflets ovate and a little heart-shaped waved; branches smooth, columnar, the segments of the calyx equal to the tube. Azores.

humile. 18. J. with leaves terete, alternate acute pinnated, branches angled, the segments of the calyx very short. Obs. Pinnate leaves are seldom found in this species.

odoratissimum. 19. J. with leaves terete, alternate bluntish and pinnated, branches columnar, segments of the calyx very short. Madeira.

Subdiv. III. Leaves pinnated.

officinale. 20. J. with leaves opposite and pinnated, leaflets sharp-pointed, the buds a little erect. India and Switzerland.

grandiflorum. 21. J. with leaves opposite and pinnated, leaflets bluntish, buds horizontal. East Indies.

33. Galipea.

Cal. four or five-corrugated, four or five-toothed. Cor. salver-shaped, four or five parted. Stamens four, two barren.

 trifoliata. 1. G. Guiana. 7 6 feet high, with leaves alternate on footstalks terete; leaflets sessile, lanceolate, sharp-pointed, entire. The flowers small, grow in a cyme.

34. Ligustrum, Privet.

Cor. 4-cleft; berry superior, 2-celled, with four seeds.

vulgare, *1. L. leaves ellipse-lanceolate, obtuse, mucronulated. Privet, Print or Prim print. Grows in woods, thickets, and hedges, especially in a gravelly moist soil. Europe. 7. Flowers in V. and VI. The branches are wand-like. The leaves opposite, subessence, dark green, smooth, lanceolate, sometimes elliptical, entire, pointed like a dagger, but not very sharp, sometimes continuing through the winter; petals terminating and crowded with flowers. Flowers milky, strong smelling. Berries black, very bitter, as are also the leaves and bark. This plant is not injured by the smoke of towns.

japonicum. 2. L. with leaves ovate, sharp-pointed; panicle obtuse-angled. Japan.

35. Phillyrea.

Cor. 4-cleft. Berry one seed.

media. 1. P. with leaves oblong-lanceolate, serrated.

 Angustifolia. 2. P. with leaves linear-lanceolate and very entire.

36. Olea, Olive.

Cor. 4-cleft, segments nearly ovate. Drupe one seed.

1. O. with leaves lanceolate, very entire, racemos European axillary and condensed.

* O. communis, with leaves lanceolate, plane, hoary beneath.

* O. verrucosa, with leaves lanceolate, plane, whitish beneath, branches warty.

* O. longifolia, with leaves linear-lanceolate, plane, silvery beneath.

* O. latifolia, leaves oblong plane, hoary beneath.

* O. ferruginea, leaves lanceolate, rusty beneath.

* O. obliqua, leaves oblong, bending obliquely, pale beneath.

* O. buxifolia, leaves oblong-oval. Common olive.

7. South of Europe, and north of Africa. * Cape of Good Hope.

2. O. with leaves ovate very entire, branches paniculata, obtuse-angled.

* O. coriacea, leaves ovate-oblong, stiff, plane, with red footstalks.

* O. ampelaster, leaves elliptical waved, footstalks green. Cape olive. 7. Cape of Good Hope.

3. O. with leaves lanceolate-elliptical, very entire, americana racemos narrow, all the branches permanent, cuneate and small. Carolina and Florida.

4. O. with leaves oblong lanceolate, very blunt; ra-cemosa, racemes axillary, simple; flowers drooping. Madagascar.

5. O. with leaves elliptical, flowers racemose with many petals. New Zealand.

6. O. with leaves elliptical, acute, bracteas perfoliatus; the lowest cup-shaped, permanent; the higher leafy, large, deciduous. Madeira.

7. O. with leaves lanceolate and serrated, footstalks fragrant, lateral, aggregate, bearing one flower. Cochin-china, China and Japan.

Cor. 4-cleft, segments very long. The kernel of the drupe striated.

1. C. with a panicle terminating 3-cleft, fruit-virginia, stalks bearing three flowers, the leaves acute. North America.

* C. latifolia, with leaves ovate-elliptical.

* C. angustifolia, with leaves lanceolate. Obs. The corolla varies with 4, 5, or 6 segments, and 4 stamens.

2. C. with a panicle terminating trichotomous, foot-cotinisfolia, stalks bearing three flowers, leaves blunt. Ceylon.

3. C.
Diandria.  

3. C. with panicles trichotomous, the last flowers almost head-shaped, the calyxes villous, the leaves lanceolate oblong, the anthers sharp-pointed. Caribbean.  

zylanica. 4. C. the branches of the axillary panicle opposite, flowers almost sessile. h. Ceylon.  

incrassata. 5. C. with panicles axillary, trichotomous, all the flowers separate, and anthers blunt. Guiana and Jamaica.  

38. SYRINGA, Lilac.  

Cor. 4-cleft. Caps. 2-celled.  

a S. carmala, with blue flowers. Blue lilac.  

b S. violacea, with violet flowers. Violet lilac.  

γ S. alba, with white flowers. White lilac.  

chinensis. 2. S. with leaves lanceolate. h. China.  

persica. 3. S. with leaves lanceolate. Persia.  

a with leaves lanceolate entire.  

b S. laciniata, leaves pinnatifid.  

γ S. carmala, with leaves simple, flowers blue.  

δ S. alba; leaves simple, flowers white.  

sussianca. 4. S. with leaves ovate serrated and ternate. Japan.  

39. DIALIUM.  

Cor. 5-petaled. Cal. o. Stam. on the higher side.  

indicum. 1. D. with a panicle simple and nodding. h. India.  

guineensis. 2. D. with a panicle, more than doubly compound, and erect. Guinea.  

40. PIMELEA.  

Cal. none. Cor. 4-cleft. Stam. inserted into the throat. The nut corrugated and 1-celled.  

linifolia. 1. P. with leaves linear lanceolate, broad terminals involucrate; corolla villose on the outside. New Holland.  

gnidia. 2. P. with leaves oblong lanceolate-acute, very smooth; corolla villose on the outside. New Zealand.  

Bankia gnidia of Forster. Passerina gnidia of Lin. Suppl.  

41. ERANTHEMUM.  

Cor. 5-cleft, tube thread-shaped. Anth. without the tube. Stigma simple.  

angustifolium. 2. E. with leaves linear, remote, acute-angled to the stem. Ethiopia.  

parvifolium. 3. E. with leaves ovate-linear, imbricated. Cape of Good Hope.  

salsoloides. 4. E. shrubby, leaves fleshy, somewhat tapering, linear, very smooth; racemes axillary and the calyxes pubescent, tube bowed downwards.  

42. FONTANESIA.  

Cor. 2-petaled. Cal. 4-parted inferior. Caps. membranaceous, not opening; 2-celled; cells contain one seed.  

ANY.  

83  

1. F. Syria.  

43. FRAXINUS, the Ash.  

Cal. none or 4-parted. Cor. none or 4-parted. Caps. superior, 2-celled, leafy above, compressed. Seeds solitary, pendulous. Some of the flowers have pistils only.  

* F. with leaflets serrated, flowers destitute of a calyx excelsior. and corolla. Common Ash Tree. There is a variety with pendulous branches, called weeping ash. h. Flowers in IV. and V. and thrives better in calcareous soils on mountains. It is a very lofty and beautiful tree, its bark is of the colour of wood ashes, its buds are large and black. The flowers grow in loose panicles, pistostaminal, intermixed with pistils sometimes very numerous. The anthers are large, dark-purple. When these fall off, the leaves unfold themselves. This is the latest of all our native trees of coming into leaf. The leaves are pinnate, terminated by an odd one, serrated, sometimes simple, very easily injured by frost in autumn. The capsules soon fall. The seeds are flat.  

44. CIRCEA, Enchanter’s Nightshade.  

Cor. 2-petaled. Cal. 2-leaved, superior. Caps. 2-celled. Seeds single.  

* 1. C. with stem upright, leaves egg-shaped, edged latifolia with small teeth, opaque, pubescent. Common enchanter’s nightshade. Grows in shady moist places. Europe and North America. 2. Flowers in VI. and VII. The root creeps, and can scarcely be eradicated. The stem is erect, not much branched, having commonly but one raceme, which is terminal. The leaves when full grown are egg-shaped, finely green, pubescent, opaque, somewhat repand, edged with small teeth not serrated. The calyx not membranaceous.  

* 2. C. with a stem ascending, leaves heart-shaped, alpina, serrated, and glossy, the calyx membranaceous. Mountain enchanter’s nightshade. Grows in shady moist places on mountains and rocks; in Lancashire, Westmorland, and Cumberland, at the foot of the mountains; about Loch Broom, Ross-shire, and in Hamilton Wood, Scotland; and in the cold countries of Europe. 3. Flowers in VII. and VIII. The root creeps, and the whole plant is less pubescent than the former. The stalk is short, spreading at the base; the joint joints red, the leaves tender, pale-green, glossy, heart-shaped, tooth-serrate, the leaf-stalks edges with a membrane.  

45. VERONICA, Speedwell.  

Cor. 4-cleft, wheel-shaped, the lowest segment least. Caps. superior, 2-celled.  

British species.  

Subdiv. 1. Spiked.  

* 1. V. with a terminating spike; the leaves opposite, site, bluish, notched-serrulate, very entire at the extremity; the stalk ascending, very simple. Spiked Speedwell. Grows in meadows and calcareous soils. On Newmarket heath and Gogmagog hills; on Cavendish heath near Bury; and near Penny-bridge, Lancashire. Flowers in VII. and often continues in flower till IX. The stalk are seven inches high, ascending, simple, I 2 somewhat
somewhat round, leafy, somewhat woody, pubescent. The leaves opposite, commonly blunt, sometimes a little sharp-pointed, crease-serrate, entire at the extremity, hairy. Spike erect, many flowered. The flowers are of a deep blue, the throat of the corolla bearded. This species varies, with leaves linear and almost entire.

**hybrida.**  
*2.* V. with spikes terminating, leaves opposite, elliptical, blunt, unequally crease-serrate, the stalk somewhat erect. **Welsh speedwell.** Grows on the sides of mountains, but is very rare. It is found on Craig Wreiwhin, Montgomeryshire, and at Cartwell Fells, Lancashire.  
*2.* Flowers in VII. Nearly allied to the preceding, but twice as large in every part: the spikes generally numerous; the stalk and leaves more rugged above, and more deeply serrated; the leafstalk in the former is often found winged.

**affinis.**  
*3.* V. with lateral spikes on footstalks, leaves opposite, scabrous, stalk procumbent. **Europe. Male or common speedwell.** Grows commonly in barren sandy pastures. Flowers in V. and VI. The stalk has wide-spreading branches; the leaves pale, a little stiff and roughish; the spikes axillary, solitary, on footstalks, many-flowered, hairy, longer than the stalk; the flowers of a faint blue, with deeper veins.

Subdiv. 2. *Corymb racemous.*

**saxatilis.**  
*4.* V. with a corymb terminating and bearing few flowers, the leaves elliptical, stalks spreading, capsule egg-shaped, 4-valved. **Blue rock speedwell.** Grows on Ben Lawers, Perthshire; and on the Alps.  
*4.* Flowers in VII. The stalks decumbent at the base, somewhat shrubby, branched; the branches ascending, simple, leafy; the leaves opposite, small, elliptical or elliptical-lanceolate, blunt, very entire, sometimes but seldom aborted on the stem, light-green, somewhat fleshy, smooth, crowded at the base of the branches, more distant above; the flowers three or five in a terminating corymb, on footstalks which are three or four times longer than the floral leaf or bracteae, large, beautiful, of a blue-violet hue, the throat red. The calyx 4-cleft, almost equal, blunt, pubescent; the capsule pubescent, egg-shaped, 4-valved. It differs from the fruticisosa in having generally broader leaves, stalks more spreading, in having a larger corolla, which is blue and not flesh-coloured; and is still more distinguished by having longer footstalks, fewer, and in being corymbose, not spine-like.

**fruticisosa.**  
*5.* V. with a corymb terminating many-flowered, spiked, leaves elliptico-lanceolate, stalks erect, capsule egg-shaped, 4-valved. **Flesh-coloured shrubby speedwell.** Grows in Cravan, Argyllshire, and Ben Lawers, Perthshire. Also on the Alps and Pyrenees.  
*5.* Flowers in VII. The stalks are branched at the base, twisted, lying upon the ground, a little shrubby, after withering erect, stiff, and straight, spine-like, inclining long, simple, leafy, round, a little pubescent. The leaves are opposite, elliptico-lanceolate, most commonly entire, sometimes serrated, pale green, hollowish, and a little shaggy on the edge. The corolla is terminating, pubescent, a little spiked, and afterwards extended into a long leafy raceme. The flower-bearing footstalks are of the same length with the bracteas, and those which bear the fruit half as long again. The calyx is four-cleft, almost equal, blunt, shaggy. The corolla of a pale flesh colour, with purple lines less than the preceding. The capsule egg-shaped, shaggy, four-valved.

*6.* V. with a corymb terminating, a little spiked; alpina, leaves oval, smooth, slightly serrated, the calyx ciliate, stem ascending and simple. **Alpine speedwell.** Grows on wet sandy places, on mountains about Garwaymoor, on Ben Nevis, and on the mountains of Badenoch, and on the Alps.  
*6.* Flowers in VII. and VIII. The stalks are a finger long, ascending simple, leafy, rooting at the base. The leaves opposite, elliptic-oval, thin, slightly shaggy, often entire, sometimes notched, commonly three-nerved, pale green, shining. The flowers are small, blue, on a small corymb, which afterwards extends into a short raceme. The bracteas are of the same proportion as in the preceding. The calyx is nearly equal, bluntish, ciliate, and often shaggy. The hairs jointed like the pubescence of the leaves. The capsule elliptical, emarginate, two-valved, pubescent, terminated with a short persistent style.

*7.* V. with a raceme terminating, approaching to a Caryophyllaceae; the leaves oval, a little notched, three-nerved, tilia, smooth; the capsule obcordate, shorter than the style. **Europe and N. America.**

**7. V. Humifusa. Smooth Speedwell, or Paul's Betony.**  
The first variety grows in meadows and pastures; the second on the highest mountains in Scotland, under the snow-covered rocks.  
*2.* Flowers in V. and VI. The plant is shining, somewhat fleshy; in moist places smooth, in mountains rough-haired. The stalks decumbent and taking root, leafy; the branches commonly erect. The leaves on footstalks oval or roundish, more or less crenated, three-nerved. The raceme terminating, long, loose, many-flowered, often pubescent. The bracteas elliptical. The segments of the calyx are ovate-elliptical, smooth, equal. The corolla of a blue or flesh-coloured whitish colour, with violet streaks. The capsule obcordate, double, of the length of the style or a little shorter.

The variety called humifusa, has a procumbent stem with a shorter raceme.

*8.* V. with racemes lateral, leaves elliptical and beccabun-dine, and stalk creeping. **Brooklime.** Europe. Grows in rivulets and ditches containing clear water.  
*8.* Flowers in VI. and VII. The plant is very smooth and glossy. The stalks decumbent or swimming, columnate. The leaves on short footstalks, elliptical, broad pointed, indistinctly serrated, of a beautiful green, somewhat fleshy. The racemes axillary, opposite, on footstalks, many-flowered. The bracteas linear, lanceolate, shorter than the fructiferae. The segments of the calyx sharp-pointed. The corolla blue. The capsule almost smooth.

*9.* V. with racemes lateral and opposite, leaves anagallis lanceolate and serrated, stalks erect. **Water speedwell, or long-leaved brooklime.** Europe and the Levant. Grows in ditches and marshes.  
*9.* Flowers in VII. It is distinguished from the former by leaves lanceolate, longer, a little ovate or elliptical, and an erect stalk. The racemes are longer and more pointed.

*10.* V. with racemes lateral and alternate, fruit-ovulate. stalklets divaricate, leaves linear and denticate. **Narrow-leaved marsh speedwell.** Europe. Grows in marshes and places that have been overflowed with water.
Diandria.  

**B O T A N Y.**  

The stalk is often branchy at the base, erect, seven inches high. The flowers are sessile, issuing from the axils of lanceolate bracteas, which are quite dissimilar to the leaves. For which reason, this species might have been arranged among the Spiked Veronicae; were not for its affinity to the preceding and following species. The segments of the calyx are lanceolate, unequal and acute. The corolla is pale blue. The capsule is sessile, erect, obcordate, flattened. The seeds are elliptical, plane and furrowed in the middle.  

* montana. *  

* 11. V. with racemes lateral, long, thread-shaped, few-flowered; leaves ovate, serrated, on footstalks, the stalk hairy on all sides. **Mountain speedwell,** or **mountain madwort.** Italy, Switzerland, and Germany. Grows in woods, in moist shady places, and beside hedges in a calcareous soil. It is found in Charlton wood, Kent; in the Devil's ditch, Newmarket heath; at Linton, in Gamlingay park and Kingston wood, near Worcester, near Virginia water, about Kirkstall abbey near Leeds, at Shortwood, Pucklechurch, Gloucestershire; and is very common in Yorkshire. Also in the woods at Dunglass, near the river, Berwickshire, and on the banks of the Esk near Roslin, Midlothian.  

* 12. V. with lateral racemes, leaves ovate, sessile, wrinkled, incised, serrated; the stalk hairy on two sides. **Europe.** **Germander speedwell,** or wild germander. Grows in meadows and pastures, and under hedges, and is very common.  

* 13. V. with flowers solitary, leaves ovate, incised, serrated, shorter than the flower-stalk, stalk procumbent, seeds pitcher-shaped. **Procumbent speedwell,** or **germander chickweed.** Grows in cultivated grounds, and among rubbish.  

* 14. V. with flowers solitary, leaves ovate, incised, serrated; flowers lanceolate, longer than the leafstalk, stalk erect. **Europe.** **Wall speedwell,** or **speedwell chickweed.** Grows frequently in dry cultivated grounds, on walls, and among rubbish.  

Subdiv. 3. Flowers solitary.  

Subdiv. 1. Spiked.  

* 18. V. with spikes terminating, leaves in sevens verticilled, stem a little shaggy. **Dauria.**  

* 19. V. with spikes terminating, leaves in fours or **sibirica.**  

* 20. V. with spikes terminating, leaves in fours, **spuria.**  

* 21. V. with spikes terminating, leaves nearly heart-**maritima.**  

* 22. V.
22. V. with spikes terminating, leaves lanceolate, sharp-pointed, serrated. Tartary, Austria, and Sweden.  

23. V. with spikes terminating, leaves opposite, crinated blunt, stem erect, downy. Native of the Ukraine, Samara.  

24. V. with spike terminating, leaves linear, pinnatifid, bunched; segments thread-shaped, forming an obtuse angle. Siberia.  

25. V. with raceme approaching to a spike, and terminating, leaves pinnatifid, jagged. Siberia.  

26. V. with spikes terminating, leaves lanceolate, cut into irregular segments, pinnatifid, smooth. Siberia.  

27. V. with racemes terminating flexuous, stem somewhat shrubby, leaves lanceolate, serrated. New Zealand.  

28. V. with racemes lateral, stem shrubby, leaves elliptical, very entire. New Zealand.  

29. V. with racemes almost terminating erect; leaves lanceolate, very entire, smooth, plain; stem shrubby. New Zealand.  

30. V. with racemes lateral, nodding; leaves lanceolate, very entire; stem shrubby. New Zealand.  

31. V. with racemes almost terminating; leaves linear-lanceolate, very entire, smooth, dagger-pointed; stem shrubby. New Zealand.  

32. V. with spikes lateral, on footstalks; leaves opposite, roundish, glossy, rigid; stalk smooth, creeping. The Alps.  

33. V. with racemes axillary, few-flowered; leaves elliptical, perennial, very entire; stem shrubby. Falkland islands.  

*Subdiv. 2. Corymb racemous.*  

34. V. with a corymb terminating, and naked stem.  

a. V. Kamitchata, rough-haired; raceme three-flowered, long, lateral, and without leaves; leaves ovate, oblong, serrated, rough-haired, hairs jointed. The Alps and north of Asia.  

35. V. with a corymb terminating, stem ascending, two-leaved; leaves obtuse, crinated; calyx shaggy. Pyrenees and Alps of Switzerland.  

36. V. with a corymb terminating, stem ascending; leaves lanceolate, cartilaginous on the edge, the lower leaves conate, sheathing. Cappadocia and Armenia.  

37. V. with a raceme terminating, stem very little branched, leaves heart-ovate, dented, sessile. Var. 1. Pumila, with unbranched stem, terminating with a bunch of flowers; leaves ovate, acute, dented. Native of the Pyrenees, the var. pumila on the top of the Piedmontese Alps.  

38. V. with a corymb terminating; leaves opposite, elliptical, blunt, very entire; calyxes hairy. The Alps.  

40. V. with racemes lateral, and very long; leaves ovate, wrinkly, dented, bluish stalks, procumbent. Obs. This is a doubtful species.  

41. V. with racemes axillary, leaves ovate, blunt, plaited, deeply dented; stalk procumbent, hairy on both sides. Austria. Obs. Dr. Smith suspects that this is only a variety of the latifolia.  

42. V. with racemes lateral, leaves oblong, ovate, prostrate, and serrated, stalks procumbent. Germany, Italy, and Switzerland.  

43. V. with racemes lateral, leafy; leaves oblong, pinnatisecto-cuneate-serrate; stems procumbent. Constantinople.  

44. V. with racemes lateral; leaves pinnatifid, orientalis, smooth, acute, tapering at the base; the calyxes unequal, the footstalks papillate, and longer than the bracteae. Armenia.  

45. V. with racemes lateral, leaves many-parted, multifidae; segments pinnatifid, lobes deciduous, footstalk short, calyx very smooth, stalk villous. Siberia.  

46. V. with racemes lateral; leaves a little hairy, latifoliae, near, pinnatifid, lowest segments longer; the calyxes a little hairy, the footstalks shorter than the bracteae. Austria, Silesia, and Carniola.  

47. V. with racemes lateral; leaves a little hairy, laurica, linear, undivided, and pinnatifid, dentiliculate; footstalks longer than the bracteae, the calyx four-cleft, smooth. Tauria.  

48. V. with racemes lateral; leaves heart-shaped, verticillo-sectile, sharply serrated, sharp-pointed; stem stiff and lute. straight, the leaflets of the calyx in fours. Switzerland, Bithynia, Austria, and Bavaria.  

49. V. with racemes lateral; leaves heart-shaped, latifoliae, sessile, wrinkled, bluntly serrated, stem stiff and straight, leaflets of the calyx in fives. Austria and Switzerland.  

50. V. with racemes lateral and very long; leaves paniculata lanceolate, in threes; serrated; stem ascending. Tartary and Bohemia. Veronica dentata of Schmidt.  

Subdiv. 3. Footstalks bearing one flower.  

51. V. with flowers solitary; leaves heart-lanceolate, biloba, dented; the segments of the calyx equal, ovate, sharp-pointed, three-nerved. Cappadocia.  

52. V. with flowers solitary; leaves heart-shaped, filiformis, crenated, shorter than the fruitstalk, segments of the calyx lanceolate. Levant.  

53. V. with flowers solitary, sessile; all the leaves digitate. finger-parted, stem stiff and straight. Bohemia, Montpellier, and Spain.  

54. V. with flowers on footstalks solitary; leaves asinifolia, ovate, smooth, crenated; stem erect, a little hairy.  

a. V. romana of Allionius and Schmidt. Warm climates of Europe.  

55. V. with flowers sessile and solitary; leaves lan-peregrina, ceolate-linear, smooth, blunt, very entire; stem erect. North of Europe.  

56. V. with flowers solitary, on footstalks; leaves bellardi, linear, very entire, rough-haired, longer than the flower; stalk very little branched, erect. Piedmont.  

57. V. with flowers solitary, sessile, leaves linear, marian-stems with spreading branches. Virginia.  

45. Pedekota.  

Cor. ringent, four-cleft, the throat naked. Cal. 5-parted. Caps. 2-celled.  

1. P. with leaves sharply pointed, helmet of the co-ageries rollas two-cleft. Pedekota rollas of Lin. Suppl. Carniola and Italy.  

2. P. with leaves roundish-ovate, the helmet of the bambaras corollas entire. Alps. 2. Pedekota corollas of Lin. Suppl.
46. Wulfenia. Cor. ringent, upper lip short, entire; the inferior three-parted; throat bearded. Cal. 5-parted. Caps. 2-celled.

biflora. 1. C. with fruitstalks somewhat branched; leaves elliptical, almost quite entire, smooth. Otateite.

cympaea. 2. C. with fruitstalks nearly cymose; leaves ovate, crenated, oblique at the base, pubescent beneath. Tanna.

Subdiv. 1. Calyx simple, opposite. anther one.

fastuosa. 1. J. with thyrses terminating, pointing one way, leaves lance-elliptical. Tranquebar. h.

forsekii. 2. J. with thyrses axillary, terminating; leaves ovate, sharp-pointed. Arabia Felix and India. h. Justicia paniculata of Forskål.

purpurea. 3. J. with spikes axillary, and terminating; bracteas lanceolate, smooth, branches pubescent. China.

verticillaris. 4. J. villous, with flowers axillary, verticilled; exterior calyxes awnless, leaves ovate. Cape of Good Hope.

aristata. 5. J. villous, with flowers axillary and verticilled, exterior calyxes awned, leaves ovate. Cape of Good Hope. 

chinensis. 6. J. with fruitstalks axillary, verticilled, three-leaf; bracteas ovate, dagger pointed, coloured at the base. China and Arabia Felix.

triflora. 7. J. with fruitstalks axillary, long, three-flowered; bracteas linear-lanceolate. Arabia Felix.

Subdiv. 2. Calyx double, anthers two.

salicata. 8. J. with spikes terminating; flowers verticilled, leaves ovate, heart-shaped. Arabia Felix.

bivalvis. 10. J. with fruitstalks axillary, three-leaf, fruitstalklets lateral, two-flowered; bracteas ovate, awned, nerved. Arabia and India. h.

Subdiv. 3. Calyx single; corollas 2-lipped, lips undivided.

sexangulatilis. 13. J. with fruitstalks bearing three flowers, bracteas wedge-shaped, leaves ovate, branches six-angled. Vera Cruz, and Jamaica. o.

ANY. 24. J. with spikes axillary, arched downwards; scorpioides leaves lanceolate-ovate, shaggy, sessile. Vera Cruz. h.

15. J. with racemes terminating, axillary and sim-gangetica. Ail; flowers alternate, pointing one way; bracteas indistinct. India.

16. J. with spikes axillary, terminating, branched; assurgent. flowers alternate, bracteas linear. Jamaica and Santa Cruz.

Subdiv. 4. Calyx single, corollas 2-lipped, lips divided.

One anther.

17. J. stemless, leaves crenate, veins villous beneath. Aculis.

Oaks. It is doubtful whether the var. 1. be not a distinct species.

18. J. with fruitstalks terminating, many-flowered, hispida. segments of the calyx and bracteas linear awl-shaped, ciliolate, leaves oblong-lanceolate, branches hispid-pubescent. Sierra Leone. h.

19. J. with spikes terminating, four-cornered; bracteas ovate, imbricated, ciliolate, darker-pointed; the helmet of the corollas linear, and bent back. Arabia, Malabar, and Ceylon. h. Justicia viridis of Forskål.

20. J. with spikes terminating, four-cornered; bracteas ovate, imbricated, keel-shaped, ciliolate; leaves crenate and smooth. Ceylon. h.

21. J. with spikes terminating; leaves and bracteas coccineas. elliptical, bare on the edge; the helmet of the corollas lanceolate, bent back at the apex. Cayenne. h.

22. J. with spikes terminating and axillary; bracteas puberulous; ovate, imbricated, ciliolate, and awnless; helmet of the corollas lanceolate, erect. South America. h.

25. J. with spikes axillary, opposite, double on each side; bracteas linear, lengthened; seeds globose and spermat. shining. Caribees.

27. J. with spikes axillary, terminating; calyxes of procumb. four segments, ciliolate; bracteas of the length of the bens calyx, leaves lanceolate. Ceylon. h.

28. J. with spikes axillary and terminating; calyxes diffusa. of four segments, smooth; bracteas shorter than the calyx, leaves elliptical. India. h.

29. J. with spikes axillary, opposite, pointing one eclovido. way, ascending, linear, rough with hair. Malabar and Ceylon. h.

30. J. with spikes axillary, double, opposite, pointing longifolia. one way; leaves lanceolate, long. Malae.

31. J. with spikes terminating, a little branched; latifolia. inferior leaves verticilled; leaves ovate, sharp-pointed. East Indies. h.

32. J. with racemes axillary and terminating, flowers pica. verticilled, leaves ovate and colored. Asia. h.

33. J. with racemes terminating, a little branch- nitida. ed, flowers commonly verticilled, leaves lance-elliptical,
cal, tapering. Martin zincio, Santa Cruz, and Guada-loupe. 2.

variegata. 34. J. with spikes terminating, axillary simple, flowers opposite, calyxes hispid, leaves ovate and sessile.

stricta. 35. J. with racemes axillary, two-parted; flowers pointing one way, leaves lance-elliptical, filaments smooth. Malabar.

paniculata. 36. J. with panicles axillary, terminating, dichotomous; flowers pointing one way, filaments hisurate, capsule flattened, leaves lanceolate. East Indies.

mutans. 37. J. with racemes terminating, nodding at the apex, flowers reversed, leaves dentated. Java.

nasuta. 38. J. with fruitstalks axillary and dichotomous, leaves elliptical and very entire. India. 3.

scandens. 39. J. with fruitstalks axillary, trichotomous, obtuse-angled; leaves ovate, sharp-pointed, somewhat repand, the branches villous. Malabar. 7.

ciliaris. 40. J. with flowers axillary, opposite; leaves lanceolate. 2.

Subdiv. 5. Calyx single; corollas two-lipped, the lips divided. Anths two.

secunda. 41. J. with racemes terminating, compound racemose-lets pointing one way; leaves ovate-lanceolate, sharp-pointed. Trinity island.

debilis. 42. J. with spikes axillary and terminating; bracteas ovate, imbricated, and ciliolated. Arabia Felix. 7.

violacea. 43. J. with spikes terminating; bracteas lanceolate, imbricated, ciliolated; leaves lanceolate. Arabia Felix. Dianthera violacea of Vahl. 5.

bracteolata. 44. J. with a raceme axillary, fruitstalks three-flowered, leaves tapering oblong, stem four-corned, edge scabrous. Caraccas. 6.

rohrii. 45. J. with spikes terminating, compound, imbricated, pubescent; bracteas ovate, leaves elliptical, very entire.

polystachia. 46. J. with spikes axillary, opposite, pointing one way; bracteas ovate, hisurate, leaves lanceolate-ovate. Cayenne.

retusa. 47. J. with spikes terminating; bracteas obovate, commonly retuse, imbricated; leaves ovate, sharp-pointed. Santa Cruz.

americana. 49. J. with spikes axillary, flowers crowded, fruitstalks long, alternate, leaves lanceolate. Virginia and Florida.

eustachiana. 51. J. with spikes axillary and terminating; flowers in pairs below, above solitary; bracteas wedge-shaped. St Estatius. 2.

caracassii. 52. J. with spikes axillary and terminating; bracteas sharp-pointed, shorter than the calyx; leaves ovate, sharp-pointed, waved, pubescent. Caraccas. 3.

pectoralis. 53. J. with a panicle terminating, dichotomous. St Domingo and Martinico. 2.

undulata. 55. J. with fruitstalks terminating, umbelled, sim-

ple, three-cleft; leaves lanceolate, undulated. Java and Malabar.

56. J. with umbels axillary, compound, on long footed-stalks; bracteas obovate, rhomboid, blunt, smooth. Ota-beite.

57. J. with fruitstalks axillary, opposite, four-flowered, pubescent, on fruitstalklets; bracteas ovoid, roundish, dagger-pointed, pubescent. Botany island. Dianthera curvica of Forskål.

58. J. with fruitstalks axillary, opposite, bearing three Lavigna flowers on fruitstalklets; bracteas oblong, dagger-pointed, pubescent. Java. 5.

60. J. with fruitstalks axillary, verticillated, bearing litoasperméone flower; bracteas linear-lanceolate; leaves oblong, misfolia, scabrous. 2.

61. J. with fruitstalks axillary, two-flowered; leaves biflora ovate, equal; bracteas awl-shaped. East Indies. 6.

62. J. with flowers axillary, solitary, and sessile; sessilia; leaves ovate and crenated. St Eustatius. 7.

Subdiv. 6. Calyx single, corollas ringent; one anther.

64. J. with spikes terminating; bracteas ovate, sharp-betonicae, pointed, vein-netted, coloured. India. 6.

65. J. with spikes axillary, terminating, and smooth; rene- bracteas dorsal, pointing two ways, membranaceous at the edge. 2. Ceylon.

66. J. with fruitstalks axillary, solitary, bearing one sanguino-flower, alternate; leaves oblong, stalk creeping. Cey-lonia. Obs. The whole plant is of a blood colour.

Subdiv. 7. Calyx single, corollas ringent; two anthers.

67. J. with spikes axillary and terminating, leaves peruviana, ovate and acute. Lima. 2.

68. J. with fruitstalks axillary, alternate, commonis-crinatae, bearing four flowers on fruitstalklets; bracteas lanceolate, ciliolated. Japan. 2. Dianthera Japonica of Thunberg.

69. J. with fruitstalks axillary, usually bearing three frisica flowers, flowers sessile; leaves oblong, blunt. Arabia Felix. 7.

70. J. with fruitstalks axillary, generally bearing lysospermone flower; leaves lanceolate, blunt. Canaries. 2.

71. J. with flowers axillary, solitary, almost sessile; petioli leaves ovate, sharp-pointed. Caraccas. Obs. It is un-felicit. certain whether this be a distinct species or a variety of the peruviana.

72. J. with fruitstalks one-flowered, axillary; leaves orchideidae, lanceolate, rigid, acute. Cape of Good Hope. 3.

73. J. with fruitstalks axillary, one-flowered; leaves madurens-oblong and dentate. Madeira. 2.

74. J. with flowers axillary, solitary, sessile, and leaves cuneata obovate, emarginate. Cape of Good Hope. 7.

Subdiv.
Diandria.

Subdiv. 8. Calyx single, corollas almost equal.

infundibuliformis. 77. J. with spikes terminating; leaves lanceolate-ovate, in fours. India. h.

sinuata. 78. J. with fruitstalks axillary, trifid; leaves linear, sinu-pinnifid. Tanna. h. J. longifolia of Pers. ex Selk.

vineoideae. 79. J. with fruitstalks axillary, generally bearing one flower, leaves ovate, stalk unarm. Madagascar. h.

spinosa. 80. J. with fruitstalks bearing one flower, leaves oblong, spikes axillary. South America. h.

Subdiv. 9. Species indeterminate in the calyx and corolla.

repaidea. 81. J. shrubby, leaves ovate repand, fruitstalks axillary, trifid. Tanna. h.

armata. 82. J. shrubby, prickly; leaves oblong margi marginate, stiff like leather, glossy. Jamaica. h.

aciculina. 83. J. shrubby, branches spreading, thorny, thorns bristle-shaped, flowers on fruitstalks axillary and solitary. Jamaica. h.

parviflora. 84. J. with branches spreading, leaves ovate, entire, spikes pointing one way, bracteate lanceolate, anterior, winged. Calcutta. h.

remora. 85. J. with a stalk herbaceous, four-cornered, a little erect; leaves ovate-lanceolate, spikes ovate. Jamaica and Hispaniola. x.

japonica. 86. J. herbaceous, with leaves ovate and serrated, spikes terminating, bracteate bristle-shaped, stem forming an acute angle. Japan.

lanceolata. 87. J. with flowers verticillate-aggregate; leaves entire, lanceolate. Japan. 6.

pemptas. 88. J. two-anthered, stalk herbaceous creeping, leaves blunt, spike terminating and undivided. St Domingo. 6.

49. Gratiosa.

Cor. irregular, reversed. Stam. two, barren. Caps. two-celled. Calyx of several segments, the two outer segments spreading.

officinalis. 1. G. with leaves lanceolate and serrated, flowers on footstalks. South of Europe. x

a. G. alpina.

manniera. 2. G. with leaves oblong entire, fruitstalks bearing one flower, leaves longer, stem bending. Antilles. 6.

pemps. 3. G. with leaves ovate, stalk creeping, calyx five-leaved, style bifid. Jamaica.

rotundifolia. 4. G. with leaves ovate, three-nerved. Malabar.

lucida. 5. G. with a stalk branched, spreading, taking root; leaves heart-ovate, dentate; fruitstalks axillary, longer than the leaves. Malabar, Amboina, and China.

veronicifolia. 6. G. with a stalk creeping, leaves ovate-lanceolate, acutely serrated, flowers terminating, opposite, calyx 5-leaved. India. 6.

hyssopoideae. 7. G. with leaves lanceolate, somewhat serrated, shorter than the stem joint. Tranquebar. 6.

lobelioideae. 8. G. with stem almost naked, stipulated; leaves oblong, very entire; panicle dichotomous, capsules a little globular. India. 6.

tridentata. 9. G. with leaves linear-lanceolate, in fours, dent-}

BOTANY.

ed at the apex, trifid; capsules hairy. Malabar. 6.

Gratiola chamadranica of Lamark.

10. G. with leaves lanceolate, blunt, a little dent-virginica.

ed. Virginina.

11. G. with flowers almost sessile. Peru. peruviana.

quebrad. Madras, Siam, Malacca.

13. G. with stem ascending, leaves lanceolate, ser-oppositated, fruitstalks opposite to the leaves. Tranque-folia.

14. G. with stem very little branched; leaves pusilla.

ovate, notched, acute; fruitstalks axillary, bearing one flower, longer than the leaves. India. 6.

50. SCHWENKIA.

Cor. nearly equal; throat plaited, glandular. Stamens three, barren. Caps. 2-celled, with many seeds.

1. SCHWENKIA. Berbice. 6

americanana.

51. CALCIOARIA.

Cor. ringent, inflated. Caps. 2-celled, 2-valved. Cal. 4-parted, equal.

1. C. with leaves pinnate.

Var. with pinnas of the leaves fewer and broader. Peru. 6.

2. C. with leaves lanceolate, wrinkled, serrated; integri-flowered panicled and terminating. Peru. lilia.

3. C. with a branched stem, leaves ovate and cre-ovalata.

C. integrofolia of Lin. Suppl.

4. C. with stem perfoliate, leaves sagittate, villous perfoliata.

on both sides. New Granada and Peru.

5. C. with leaves sessile, oblong, acute, crenated; crenata.

flowers cymous, terminating the stalk and branches.

Peru.

6. C. with leaves linear, very entire, bent back at rosmarinus.

the edge, downy below; stem smooth. Peru. folia.

7. C. with leaves batledore-shaped, very entire; othergillii.

fruitstalks scape-like, bearing one flower. Falkland.

islands. 6.

9. C. with scarpe bearing one flower, leaves ovata-mana.

and very entire. Calcio. uniflora of Lamark. S. America near the straits of Magellan. 6.

52. BAEA.

Cor. ringent, tube very short, upper lip plain, 3-dented, the lower lip plane and 2-lobed. Cal. 2-celled, 4-

valved, contorted. Caps. 3-parted, and equal.

1. B. Near the straits of Magellan. 6.

53. PINGUICULA, Butterworth.

Cor. ringent, spur-shaped. Cal. 2-lipped, 5-cleft. Caps.

1-celled.

* r. P. with a blunt nectary shorter than the petal, lusitanica.

Flowers in VI. and VII.

* 2. P. with a cylindrical nectary, acute, and vulgaris.

of the length of the petal, the capsule ovate. Con-
BOT

any.

Diandria.

The base, dented, downy beneath; stalk shrubby. South America. 

5. V. spikes loose; calyxes alternate, prismatic, prismatic truncate, awned; leaves ovate, blunt. Jamaica. 

6. V. spikes loose; calyxes of the fruit turned down; mexicana, wards, round and double, hirsute. Mexico. 

Subdiv. 2. Tetrandrous, or species with four stamens.

8. V. spikes globular, leaves lanceolate, crumpled globiflora, wrinkled, scabrous; stem shrubby. South America. 

11. V. spikes fascicled; leaves lanceolate, stem heteromorphous-clustered. Guiana Ayres. 

12. V. spikes long, sharp-pointed; leaves hastate, hastata. Canada. 

13. V. flowers panicled, leaves in threes, stem shrub. tripillica.

by. Chili. 

14. V. calyxes fruit-bearing, roundish, inflated; kappulaeae, seeds oblongated. Caribbe islands. 

15. V. the calyxes fruit-bearing, roundish, bear forshackii, od, sharp-pointed; seeds rounded, wrinkly. Arabia Felix. 

17. V. spikes panicled; leaves undivided, ovate, uredioflora, serrated, on footstalks. Virginia and Canada. 

18. V. spikes loose, solitary; leaves trifid, inodorous, unsubtis. 

Virginia. 

21. V. spikes thread-shaped, solitary; leaves doubly supina, pinnatifid.

57. LYCOPOD.

Cor. four-cleft, one segment margined. Stamens distant. Seeds four, retuse. 

2. L. leaves pinatifid-serrated at the base. Italy. 

Obs. The stem is about the height of a man.

3. L. with leaves equally but slightly serrated. Vir virginica. 

58. AMETHYSTE.

Cor. five-cleft; lowest segment more spreading. Stamens near. Cal. almost bell-shaped. Seeds four, gibbous.

A. Siberia. 

59. CUNILA.

Cor. ringent, upper lip erect, plane. Filaments two, without anthers. Seeds four.

1. C. with leaves linear, rolled back, downy basiflora, leaves ovate, long at
Diandria.

BOTANY.

2. S. with leaves serrated, sinuate and smooth, verticils two-flowered, segments of the calyx blunt. Cape of Good Hope. h. 5.

Ziziphus.

Cor. ringent, upper lip bent back, entire. Cal. thread-shaped. Seeds four.

capitata. 1. Z. with fascicles terminating, leaves ovate. Syria, Armenia, Siberia. ○.

hispanica. 2. Z. with leaves ovate, flowers raceme-spiked, bracteas obvolute, curved, acute. Spain. ○.

tenuior. 3. Z. with flowers lateral, and leaves lanceolate. ○.

acinoides. 4. Z. with flowers lateral, leaves ovate. Siberia. ○.

61. Monarda.

Cor. unequal, upper lip linear, wrapping the filaments. Seeds four.

eubongata. 2. M. leaves lanceolate, rounded, and tapering at the base, villous, plane. N. America. 2.

cymbia. 3. M. with leaves ovate smooth, heads verticilled, flowers approaching to the diosmum, the stem acute-angular. Pennsylvania and New York. 2.

clinopodia. 5. M. with leaves ovate-lanceolate, rounded at the base, unequal, smooth. Virginia. 2. Obs. This resembles the preceding, but it bears leaves like Clinopodium. Its spike is not red but purple, and its leaves very smooth.

punctata. 6. M. with flowers verticilled, corollas dotted, bracteas coloured. Obs. The corollas are yellow with purple dots.

ciliata. 7. M. with flowers verticilled, corollas longer than the involucre. Virginia.

62. Rosmarinus.

Cor. unequal, upper lip two-parted. Filaments long, curved, simple with a dent.

officinalis.

2. R. with sessile leaves. S. of Europe. h.

chilensis.

2. R. with leaves on footstalks. Chili. h. Obs. This plant has not been properly examined.

Cor. unequal. Filaments two, very short, supporting two others fixed transversely upon them almost by the middle. Seeds four, and naked.

pratensis. 1. S. with leaves heart-shaped oblong and crenated, the highest stem-clasping. The verticils commonly without leaves, the corollas glutinous in the upper lip. Meadow Clary. In dry meadows and under hedges, but rarely. Europe. 2. Flowers in VII. This is a beautiful species, with large corollas of a blue violet colour, arched.

2. S. with leaves serrated, sinuate and smooth, verticils two-flowered, segments of the calyx blunt. Wild English cae. Scary. Grows in meadows and pastures. Europe. 2. Flowers from VI. to X.

3. S. with leaves lanceolate, slightly dentate, flowers egypfoic on footstalks. Melica perennis of Forsk. Egypt and the Canaries. ○. Obs. The flowers are often tetragamous.

4. S. with leaves linear-oblong, dent-pinnatisect, verticils two-flowered, segments of the calyx blunt. Cape of Good Hope. h. 5.

5. S. with leaves lanceolate, flowers with two cretica. pistils, calyces of two segments. Crete. h. Obs. This seems to be a variety of the Salvia officinalis.

6. S. with root-leaves lyrate, dentate, the helmet lyrate of the corollas very short. Var. 2. Horminum virginicum, with leaves wedge-oblong, stem with two leaves. N. America. 2.

8. S. with leaves linear, very entire, pubescent, habits-sessile, flowers verticille-scape, bracteas ovate, awl-ana. pointed. Taures. 2. This is a beautiful plant.

10. S. with leaves heart-oblong, crenated, verticils grandifl-many-flowered, calyces acute. 2.

11. S. downy, leaves on footstalks, very wrinkly, triloba. three-lobed, the middle lobe oblong and extended, the side lobes ovate and blunt. Crete and Syria. h.

13. S. with leaves ovate-oblong, doubly serrated; urticifolia. calyces three-dentéd, highest segment three-dentéd. Virginia and Florida. 2. Obs. The corollas are small, the upper lip short, the pistil longer than the upper lip.

15. S. with leaves heart-shaped, wrinkled, crenated, tiliaefolia. and equally serrated, acute; calyces smoothish, awned. 2.

16. S. with leaves heart-shaped, serrated, soft; flowers serotina. raceme-spiked, corollas scarcely longer than the calyx.

18. S. with leaves obovate, crenated, of the viridis. corollas semicircular, calyces fruit-bearing, turned back. Italy. ○.

19. S. with leaves blunt, crenated, the highest Horminum-bracteas barren and coloured, and larger. Greece. ○.

20. S. with leaves obovate, heart-shaped, wrinkled, virgata. crenated; hairs of the stem and calyx glandular at the apex. Armenia. 2.

21. S. leaves heart-shaped, wrinkled, twice-serrate; stenostis. bracteas coloured, shorter than the flower, awl-pointed; hairs of the stem and calyx simple. Europe. 2.

22. S. with leaves heart-shaped, lanceolate, serrated nemorosa. and plane; bracteas coloured, the lowest lip of the corolla turned back. Austria and Tartary. 2.

ANY.  

Diandria.

spikes four-cornered, imbricated; calyces trifid. O.  
Italy.

47. S. lower leaves lyrate, highest heart-shaped, oblong-campanula, flowers verticillate, the calyxes dagger-pointed and ciliated. Africa. ♀.

48. S. leaves heart-shaped, crenate-dentate; verticillata-campanula almost naked; style of the corolla leaning upon the lower lip. Germany and Switzerland. ♀.

49. S. leaves heart-shaped, crenate-dentate, the lower nectaries one hastate and lyrate; verticils almost naked, upper lip shorter. Italy and France.

50. S. leaves heart-sagittate, serrated, and acute, glabrous. Europe. ♀. Obs. The calyx is three-lobed; the corolla sickle-shaped, yellow, dotted with brown; the middle lobe of the lower lip crenated.  

51. S. leaves unequally dentate, awl-pointed, heart-barbata-shaped, angle-hastate at the base; verticils almost naked. Spain. ♀.

54. S. leaves roundish, serrated, truncated at the africana base and dentate. Cape of Good Hope. ♂.

55. S. leaves roundish and very entire, truncated at the base and dentate. C. of G. Hope. ♀.

56. S. leaves elliptical, almost quite entire, downy; corolla the limb of the calyx membranaceous and coloured. C. of G. Hope. ♀.

57. S. leaves oblong-wedge-shaped, slightly dentate, panicle and naked; stem shrubby. Africa. ♂.

58. S. leaves oblongate and dentate; calyces bell-sha-actataboed, forming an acute angle, hairy; stem shrubby, less. Levant. ♂.

59. S. leaves oblong and repand; calyces thorny; spinae. bracteas heart-shaped, dagger-pointed, hollow. Egypt. ♀.

60. S. leaves heart-shaped, crenate-dentate; calyces tingitanae thorny; bracteas very entire, heart-shaped, dagger-pointed, hollow, ciliated. Africa. ♂. Obs. Smell very fetid.  

61. S. leaves wrinkled, heart-shaped, oblong, vill. scalarea, lous, serrated: floral bractees longer than the calyx, hollow, awl-pointed. Syria and Italy. ♀.

62. S. leaves ovate-lanceolate, serrated; flowers involucrospiked, terminating, the largest bractees coloured. Mexio. ♀. Obs. This is a very beautiful plant in the number and magnitude of its flowers.  

63. S. leaves wrinkled, pinnatifid, woolly; the high-crestest verticils barren. Persia. ♀.  

64. S. leaves oblong, gnawed, woolly; verticils ethiops. woolly; bracteas arched downwards, a little thorny. Var. 2. with laminated leaves. Greece, Africa, and France. ♀. The lower lip coheres on the fore part, and forms a sack.  

65. S. leaves lanceolate, almost entire; stem wool phlomoidly-viscous. Spain.  

66. S. leaves oblong, dent-angled, woolly; highest argentea verticils barren, bracteas hollow. Crete. ♀. This species connects the scalarea and ethiops.  

67. S. leaves pinnaed and very entire, the terminating leaflet greatest. Levant. ♂.  

68. S. leaves pinnaed, pinnas gnawed. Crete and pinnaata. the Levant. ♀.  

69. S.
Diandria. 69. S. leaves pinnated and serrated, stalks procumbent and bifurcate. Levant. C. Obs. The stem is quadrangular; the inferior leaves are pinnated, the superior entire.

rosefolia. 70. S. leaves pinnated, hoary, leaflets serrated, calyces ringent. Armenia. 2.

japonica. 71. S. leaves twice pinnated and smooth. Japan. ©.

cerrato-phylloides. 72. S. leaves pinnatifid, wrinkled, villous; stem pappose, noded, much branched. Sicily and Egypt. ©.

forsskalli. 73. S. leaves lyre-shaped, stem almost leafless, the calyx of the corolla half bistr. The East. 2.

nutans. 74. S. leaves heart-shaped, indistinctly 5-lobed gnawed, stem roundish, racemes nodding. Russia. 2.

hastata. 75. S. leaves hastate-lanceolate, crenated, stalk almost naked, racemes drooping. Supposed a native of Russia.

betonica. 76. S. leaves lanceolate crenated, stem almost naked, racemes drooping. Russia.

64. COLLINSONIA.
Cor. unequal, the lower lip multifid, hair-like. Seed one, perfect.

scabrius-cula. 2. C. leaves ovate, and somewhat heart-shaped, and a little hairy; stem a little hairy and scabrous. Florida. 2.

65. MORINA.
Cor. unequal. Cal. of the fruit 1-leaved, dented. Calyx of the flower bifid. Seed one, crowned with the calyx of the flower.

persica. 1. MORINA. Persia. 2.

66. SCIURIS.
Cor. unequal, upper lip trifid, inferior bifid and shorter. Stamens are five, but three of them are without anthers. Caps. five, united into one body, with one cell and one seed.

aromatica. 1. SCIURIS. Guiana. 7.

67. GLOBBA.

marantina. 1. G. East Indies. 2. The stalk is simple, herbaceous. The leaves alternate on foot-stalks, which are membranaceous, sheathing, the sheaths truncated at the apex.

mutans. 2. G. spike terminating and pendulous, leaves ellipses-lanceolate. East Indies.

japonica. 3. G. raceme terminating and drooping, leaves sword-shaped entire. Japan.

uniflora. 4. G. with a lateral spike. East Indies. 2.

68. LITOPHILA.
Cal. three segments. Cor. 3-petalled. Nectary two segments. Seed-vessel 2-celled.

muscoides. 1. LITH. NAVASA.

69. LINOCIERA.
Cal. four dented. Cor. four-petalled. Anth. connecting the two opposite petals to the base. Berry 2-celled, cells 2-seeded.

ANY.

70. ANCISTRUM.

1. A. stems decumbent; leaflets obovate, equally sanguined, silky, pubescent below; spike globular. New Zealand. 2.

2. A. stalks commonly below water, fruitstalks scape-lucidum, form, spikes ovate; leaflets oblong, very entire, acute, usually fascicled. Falkland Islands. 2.

71. ARUNA.
Cal. 5-parted, segments turned back. Cor. none. Berry 1-celled, with one or two seeds.

1. ARU. Guiana. 7. diericata

ORDER II. DIGYNIA.

72. ANTHOXANTHUM.
Cal. is a glume of two valves, and contains one flower. Cor. a two-valved awned glume. Seed one.

1. A. with a spike ovate oblong, the florets on little odoratum, fruitstalklets longer than the awn. Sweet-scented cereal grass. Grows in meadows and pastures, very common. 2. Flowers in V. Obs. This grass gives the fragrance to hay.

2. A. a linear spike; florets sessile, longer than the indicum awn. India. It approaches nearest to the genus anthoxanthum, though very different in appearance, and the number of stamens do not agree.

3. A. a panicle pressed together, awn very long-crinitum. New Zealand. A tall smooth grass, the corolla glume awned.

4. A. spike pointed one way, calyxes hairy, florenets with a long twisted awn. Malabar. It bas aum every appearance of an oat stalk except the two stamens.

73. CRYPTO.
Cal. a two-valved glume with one flower. Cor. a two-valved awnless glume.

ORDER III. TRIGYNIA.

74. PIPER, Pepper.
Cal. none. Cor. none. Berry one seed.

1. P. leaves ovate, about 7-nerved, smooth fruitstalks nigrum very simple. India. 7.

2. P. leaves ovate oblongish, awl-pointed, 7-nerved, beltc fruitstalks 2-dented. India. 7.

3. P. leaves obliquely ovate or oblong, veined acute, cuneata spike solitary on footstalks, opposite to the leaves, fruits on fruitstalks. Java and Guinea. 7.

4. P.
BOTANY.

P. sub-herbaceous; leaves lanceolate, stem-spicifluous, nerveless, fleshy; stem erect, simple. East Indies.

P. leaves alternate, obovate, commonly 3-nerved, papillose; spikes simple, usually terminating. Society Islands.

P. with leaves obovate and nerveless.

P. leaves obovate and retuse. Cape of Good Hope.

P. sub-herbaceous, with leaves obovate, awl-pointed; globuliferum, stem declinating, taking root, much branched.

P. herbaceous, with leaves obovate, acute; stem ascendens, taking root, simple, ascending.

P. herbaceous, with leaves roundish-acute, plane, serpentinus, of different colours; stem creeping.

P. herbaceous, with leaves inversely heart-shaped, cordifolium, plane-convex, fleshy; stem creeping.

P. herbaceous, with leaves circular, convex-nursallirame, stem threadlike, creeping, taking root.

P. herbaceous, with leaves roundish, plane, rotundata, stem threadlike and creeping.

P. leaves target-shaped ovate, St Domingo.

P. leaves target-shaped, circular heart-shaped, peltatum; blunt-rendip; spikes umbellate. St Domingo.

P. leaves somewhat target-shaped, circular-sub-peltate, heart-shaped, awl-pointed; spikes umbellate. Am. boyena.

P. leaves ovate, awl-pointed, spikes conjugate, distachyon, stem taking root. S. America.

P. leaves circular heart-shaped, awl-pointed, umbellate-veined, spikes umbellate; stem erect, furrowed, pubescent. E. Indies.

P. leaves in three and roundish. America.

P. leaves verticillate in three or four, elliptical, peregrinata-three-nerved, smooth; spike terminating single, stem foliolous, spotted. Venezuela.

P. leaves verticillate, rhomb-ovate, very entire, polystachyon, on footstalks, three-nerved, pubescent. Jamaica.

P. leaves in fours, wedge-shaped, obovate, emarginate, almost sessile; stem erect. S. America.

P. leaves verticillate in fours, elliptical, blunt, verticillatum 3-nerved. Jamaica.

P. leaves verticillate, commonly in fours, oblong, stellatum, awl-pointed, 3-nerved. Jamaica. Obs. This species differs from the verticillatum in having leaves awl-pointed, and spikes three times longer.

P. leaves in fours, rhombous, fleshy, turned back reflexum, and spreading; stem creeping. E. Indies. Cape of Good Hope. Piper tetraphyllum of Forster.

P. leaves in fours, almost sessile oblong, nerve-pulchellus, very entire; spikes terminating. Jamaica.

P. herbaceous, with leaves linear blunt, the filiforme, highest verticillate, the stem threadlike and creeping. Jamaica. Obs. It is remarkable that of the 53 species of Piper here described, 21 species are natives of Jamaica.

In the class Diandria are,

39 Genera, which include 209 Species; 29 species are found in Britain.

CLASSIS
CLASSIS III.

TRIANDRIA.

ORDO I. MONOGYNIA.

Sect. I. **Floras superi.**

- 75. Valeriana. Cor. 5-fida basi gibba. Sem. unicum.
- 84. Melothria. Cor. 5-fida rotata. Bacca trilocularis.
- 95. Antholiza. Cor. 6-fida tubulosa reflexa : laciniae inaequalibus.
- 94. Gladiolus. Cor. 6-partita tubulosa : laciniae subaequalibus, superiores convergentibus.
- * 97. Iris. Cor. 6-partita ; laciniae alternis reflexis. Stig. petaloideum.
- 93. Ixia. Cor. 6-partita patens. Stig. tria simplicia.
- 98. Moraea. Cor. 6-petala ; petalia alternis inaequalibus patentibus.
- 100. Bilatins. Cor. 6-petala biserrata. Fil. tercium reliquis minus. Stigma simplex.

Sect. II. **Floras inferi.**

- 103. Wachendorfia. Cor. 6-petala inaequalis. Cal. o.
- 104. Commelina. Cor. 6-petala : Petala 3 s. 4 cylindricibus. Nect. cruciata pedicellata.
- 76. Oxybaphus. Cor. 5-dentata infundibuliformis. Cal. 3-fid. Nux 5-gona calyce alata !

CLASSIS III.

TRIANDRIA.

ORDO I. MONOGYNIA.

Sect. I. **The Flowers inserted above the Germin.**

- 75. V. Cor. 5-cleft, gibbous at the base. Seed 1.
- 84. M. Cor. 5-cleft, wheel-shaped. Barry 3-celled.
- * 92. C. Cor. 6-parted, equal. Stigma convolute.
- 95. A. Cor. 6-cleft, tubular, arched downwards ; the segments unequal.
- 94. G. Cor. 6-parted and tubular ; the segments nearly equal, the higher segments converging. * 97. I. Cor. 6-parted, petals alternate, turned back. Stigma petalsiform.
- 93. I. Cor. 6-parted and spreading. The stigmas three and simple.
- 96. A. Cor. 6-petalled. Style declining. Stigma funnel-shaped and gaping.
- 98. M. Cor. 6-petalled ; the petals alternate, unequal and spreading.
- 100. D. Cor. 5-petalled and hisrate. The third filament less than the rest. Stigma simple.

Plants resembling those belonging to other classes.

I. Boerhaavia exscapa, repanda charophylloides, phom-bacina. VI. Pontederia lancea.

Sect. II. **The Flowers inserted below the Germin.**

- 99. M. Cor. 6-parted ; the alternate segments half the size of the rest. Stigma petal-shaped, 3-cleft, the segments not divided. Cal. none.
- 103. W. Cor. 6-petalled, unequal. Cal. o.
- H. Cor. 6-petalled, the three interior petals staminiferous above the middle. Stigma obtuse. Caps. inferior and 3-celled.
- 102. X. Cor. 6-petalled, equal. Cal. o.
- 104. C. Cor. 6-petalled ; petals 3 or 4, calyx-form. Nect. cruciform and on the fruitstalklet.
- 76. O. Cor. 5-dentated, funnel-shaped. Cal. 5-cleft. Not 5-angled, winged at the calyx.
- 78. M. Cor. 5-petalled, unequal. Cal. double, the exterior calyx 2-leaved, the interior one 5-dented. A legume.
- 79. R. Cor. 5-petalled, unequal. Cal. 5-parted. Stigmas three, rolled back.
- 89. H. Cor. 5-petalled. Cal. 5-parted. Caps. three, 2-valved.
- 90. Tonella.
B O T A N Y.

87. Loxylingia. Cor. 5-petaled. Cal. 5-phyl1lus. Bacc 1-locular.
83. Williana. Cor. 4-fidus. Cal. 4-fidus. Caps 2-locular.
105. Ciliata. Cor. 3-petaled. Cal. 3-phyl1lus. Caps. 2-locular.
106. Stelata. Cor. 3-petaled. Cal. 3-phyl1lus. Caps. 3-valvis unilocular.
80. Rump1la. Cor. 3-petaled. Cal. 3-fidus. Drup a 1-locular.
91. Fissilasc. Cor. 3-petaled cohaerens: petalis 2, bifidi. Cal. urceolatus integer. Stam. 8; quorum 5 sterilis. Nux 1-sperma.
81. Ceneorum. Cor. 3-petaled. Cal. 3-dentatus. Bacc 3-coccus.
107. Xyris. Cor. 3-petaled. Cal. 2-valvis. Caps. 3-locular.
82. Comocladia. Cor. 4-partita. Cal. 3-partita. Stylus o. Drupae.
85. Rotala. Cor. o. Cal. 3-dentatus. Caps. 3-locul.
88. Polycnemum. Cor. o. Cal. 5-phyl1lus. sub tus 3-phyl1lus. Sem. 1.

Sect. III. Flores graminis; valvulis glume calycina.

110. Mafania. Cor. o. Cal. 6-valvis. Involucro triphyl1lum.
110. Cenchrus. Cor. 2-valvis. Cal. 2-valvis. Involucr. 3 s. 4-florum laciniatum echinatum.
116. Pommerelia. Cor. 3 s. 4-bivalvis arista. Cal. turbinatus bivalvis.

ORDO II. DIGYNIA.

127. Panicum. Cal. 3-valvis; tertio dorsali minori.

Triandria.

90. T. Cor. 5-petaled. Cal. 5-parted. Nect. pitcher-shaped. Berry 1-celled, and 4-seeded.
87. L. Cor. 5-petaled. Cal. 5-leaved. Caps. 1-celled.
83. W. Cor. 4-cleft. Cal. 4-cleft. Caps. 2-celled.
105. C. Cor. 3-petaled. Cal. 3-leaved. Caps. 2-celled.
106. S. Cor. 3-petaled. Cal. 3-leaved. Caps. 3-celled, 3-valved.
80. R. Cor. 3-petaled. Cal. 3-cleft. Drupae with nut. 3-celled.
91. F. Cor. three petals cohering; two petals 2-cleft. Cal. pitcher-shaped, entire. Stam. eight, of which 5 are barren; the nut 1-seeded.
81. C. Cor. 3-petaled. Cal. 3-dent. Berry 3-grained.
107. X. Cor. 2-petaled. Cal. 2-valved. Caps. 3-celled.
82. C. Cor. 3-parted. Cal. 3-parted. Style none. A drupe.
77. O. Cor. 3-cleft. Cal. entire.
85. R. Cor. none. Cal. 3-dented. Caps. 3-celled.
86. O. Cor. none. Cal. 5-leaved. Caps. 1-celled.
88. P. Cor. none. Cal. 5-leaved. Seed one.

Plants of other classes resembling these are thus classed.

† VI. Tradescantia multiflora. V. Hirvela triandria.
IV. Fagura spinosa, acuminata.

Sect. III. Grasses. The glumes of the calyx valved.

* 111. S. Glumes chaffy, crowded, the exterior one barren. Seeds roundish.
* 112. C. Glumes chaffy, tiled in two ranks.
* 113. S. Glumes chaffy, tiled on all sides.
* 115. E. Glumes chaffy, tiled on all sides. Seed surrounded with very long wool.
110. M. Cor. o. Cal. 6-valved. Involucro 3-leaved.
117. N. Cor. a 2-valved glume.
114. M. Cor. 2-valved. Nect. 1-valved, inclucing the germen.
119. C. Cor. 2-valved. Cal. 2-valved. Involucr. 3 s. 4-flowered, laciniated and echinatum.
118. L. Cor. 2-valved. Cal. a spathe. Nut 2-celled.
116. P. Cor. 3 or 4 bivalved, awned. Cal. top-shaped bivalve.
108. F. Cor. 3-valved. Cal. o. Ament. imbricat. the scales awned.

ORDER II. DIGYNIA.

127. P. Cal. 1-valved, the third valve least.

122. Cornucoxia.
Triandria.

120. CORNUCOPIE. Cal. 2-valvis. Cor. 1-valvis. Involute crum commune 1-phyllo multisporum.
146. ARISTIDA. Cal. 2-valvis. Cor. 1-valvis, spicis aristis tribus.
* 120. ALOPECURUS. Cal. 2-valvis. Cor. 1-valvis, spicis simplici.
* 128. PHLEUM. Cal. 2-valvis, truncatus, mucronatis, sessili.
* 125. PHALARIS. Cal. 2-valvis; valvis carinatis sequibus, corollam inclusentibus.
126. PASSALUM. Cal. 2-valvis; valvis subrotundis figura corollae.
* 130. MILLUM. Cal. 2-valvis; valvis ventricosis corolla majoribus, subequalibus.
* 131. AGROSTIS. Cal. 2-valvis; valvis acutis corolla brevioribus.
* 137. DACTYLIS. Cal. 2-valvis; valva majore longiore compressa carinata.
* 141. STIPA. Cal. 2-valvis. Cor. arista terminali inarticulata.
143. LAGUROS. Cal. 2-valvis villosus. Cor. arista 2 terminalibus et 1 dorali.
122. SACCHARUM. Cal. 2-valvis, lanugine extus vestitos. Cor. 2-valvis.
121. MUEHLENBERGIA. Cal. 1-valvis. Cor. 2-valvis.
123. PERSIS. Cal. o. Cor. 2-valvis. lanugine extus vestita.
124. LEERSIA. Cal. o. Cor. 2-valvis clausa.

ANY.

146. A. Cal. 2-valved. Cor. 1-valved, 3 awns at the apex.
* 129. A. Cal. 2-valved. Cor. 1-valved, the apex simple.
* 128. P. Cal. 2-valved, truncated, dagger-pointed and sessile.
* 125. P. Cal. 2-valved; the valves keeled, equal, enclosing the corolla.
126. P. Cal. 2-valved; the valves roundish, of the figure of the corolla.
* 150. M. Cal. 2-valved; the valves ventricose, greater than the corolla, nearly equal.
* 131. A. Cal. 2-valved; valves acute, shorter than the corolla. Stigmas feathered.
* 137. D. Cal. 2-valved, flattened; the greater valve keel-shaped.
* 143. S. Cal. 2-valved. Cor. with terminating awn, jointed at the base.
143. L. Cal. 2-valved, awns villous.
122. S. Cal. 2-valved, covered with down on the outside. Cor. 2-valved.
121. M. Cal. 1-valved. Cor. 2-valved.
123. P. Cal. o. Cor. 1-valved, covered with down on the outside.
124. L. Cal. o. Cor. 2-valved, shut.

Plants belonging to the third Sect. of this order resembling these.

Arundo epigeios, calamagrostis, arenaria.

Sect. II. Flores bifiore, vagi.

* 132. AIRA. Cal. bivalvis. Flosculi absque rudimento tertii.
* 133. MELICA. Cal. 2-valvis. Rudimentum tertii inter flosculos.
HOLLUS. Cal. 2-valvis. Cor. arista tertia.

Sect. III. Flores multifiore, vagi.

136. UNTOLA. Cal. multivalvis, carinatus.
* 135. BRIZA. Cal. 2-valvis. Cor. cordata; valvis ventricosis.
* 134. POA. Cal. 2-valvis. Cor. ovata; valvis acutiusculi.
* 139. FESTUCA. Cal. 2-valvis. Cor. oblonga; valvis mucronatis.
* 140. BROMUS. Cal. 2-valvis. Cor. oblonga; valvis sub spere aristei.
* 142. AVENA. Cal. 2-valvis. Cor. oblonga; valvis dorsi arista contorta.
* 144. ARUNDO. Cal. 2-valvis. Cor. basi lanata, mutica.
145. PAPPORHORUM. Cal. 2-valvis. Cor. 2-valvis multi-aristate.

Vol. IV. Part I.

+ Sect. II. Flowers scattered, 2 in each calyx.

* 132. A. Cal. 2-valved. Florets without the rudiments of a third.
133. M. Cal. 2-valved, commonly 2-flowered, with the rudiments of a third.
H. Cal. 2-valved. Cor. awned.

Plant resembling these.

Tritium hermaphroditum.

Sect. III. Flowers scattered, many in each calyx.

136. U. Cal. many-valved, keeled.
* 135. B. Cal. 2-valved. Cor. bellied, valves heart-shaped, blunt. Seed adhering to the corolla.
* 134. P. Cal. 2-valved. Cor. valves ovate, a little sharp, awnless.
* 139. F. Cal. 2-valved. Spikelet oblong, glumes sharp-pointed.
140. B. Cal. 2-valved. Spikelet oblong, glumes awned under the apex, the inner one ciliated.
* 142. A. Cal. 2-valved. Cor. a glume, roundish, awned on the back. Awn contorted.
* 144. A. Cal. 2-valved. Florets surrounded by permanent wool. Awnless.
145. P. Cal. 2-valved. Cor. 2-valved with many awns.
153. LAPPAGO. Cal. subtrivalvis. Cor. 2-valvis resupinata.

Sect. IV. Spicati, receptaculo subulato.

* 148. ROTTBOELIA. Cal. 1-florus rachi adpresso.
* 150. SECALE. Cal. biflorus.
* 152. TRITICUM. Cal. multiflorus.
* 149. ELYMUS. Involucr. tetraphyllum bisororum. Flos compositus.
* 158. CYNOBULUS. Involucr. monophyllum laterale. Flos compositus.

ORDO III. TRIGYNIA.

Sect. I. Flores inferi.

* 159. Polycarpum. Cor. 5-petala. Cal. 5-phyllos. Caps. 3-valvis.
* 164. Lechea. Cor. 3-petala. Cal. 5-phyllos. Caps. 3-cocca.

Sect. II. Flores superi.

160. Donatia. Cor. polypetala. Cal. 3-phyllos.

ORDIN I. MONOGYNIA.

75. Valeriana, or Valerian.

No calyx. Cor. monopetalous, hence bulging at the base. Superior.

rubra. 1. V. With tailed flowers; leaves spear-shaped, very entire. 2.

2. V. Tailed flowers; leaves very entire, strap-shaped. onagrostis. of Europe. 2.

3. V. Monandrous flowers; leaves with winged clefts. calcitrachis. Portugal and the East. 2.

* 4. V. Flowers staminiferous and pistilliferous on differing plants, with very entire winged leaves. 2.

* 5. V. Triandrous flowers, with leaves winged, and copensia. florets oval-toothed. C. of G. Hope. 6.
6. V. leaves all winged and toothed.—It is this species which is in so much request as a medicine. The root has a strong, but not an agreeable smell. Its taste is warm, bitterish, and subacid. It communicates its properties to wine, water, and spirit; but it is best in substance, and may be taken from half a drachm to two drachms for a dose. There is no doubt of its possessing antispasmodic virtues in an eminent degree. It is often prescribed with advantage in hysterical cases, and instances are not wanting where it appears to have removed some obstinate epilepsies. In habitual constiveness it is an excellent medicine, and frequently loosens the bowels when other stronger purgatives have been tried in vain. Cows eat the leaves. Sheep are not fond of them. Cats are greatly delighted with the roots. Rats are said to be equally fond of them, and that the rat-catchers employ them to draw the rats together.

7. V. with stem-leaves winged, those issuing from the root undivided. Europe. 

8. triptera. V. toothed leaves, those rising from the root undivided; those of the stem in threes, oval-oblong. Alba. 

9. montana. V. leaves oval-oblong, nearly tooth-shaped with an undivided stem. 

celtica. V. leaves oval-oblong, obtuse, very entire. The Alps. 

tuberosa. V. root-leaves spear-shaped, very entire; the rest winged, cleft. South of Europe. 

10. sasatilia. V. leaves nearly toothed; the root-leaves oval; the stem-leaves strap-spear-shaped. S. of Europe. 

11. elongata. V. radical leaves oval; stem-leaves heart-shaped sitting, mift near, halberd-shaped. S. of Europe. 

12. pyrenaica. V. stem-leaves heart-shaped, toothed, having leafstalks; the highest in threes. Pyrenees. 

13. scandens. V. leaves in threes, the stem climbing. 

mixta. V. stem 4-cleft, the lowest leaves double-winged cleft, with a feather down. 

14. supina. V. small involucrums 5-leaved, 3-flowered; the leaves entire. Alp. 

15. atrovirens. V. inferior leaves ear-shaped, the superior leaves toothed, woolly. Japan.

16. Silvestris. V. winged leaves, with a compound spike in whorls. 

17. sibirica. V. winged cleft leaves; seeds connected with an oval chaff. Siberia. 

ruthenica. V. leaves oval, fleshy, winged, cleft, toothed; seeds connected with an oval chaff. Siberia. 

carnosa. V. oval, toothed, fleshy, hoary leaves. 

cornucopia. V. flowers diandrous, leaves oval sitting. S. of Europe. 

echinata. V. toothed leaves, fruit strap-shaped, 3-toothed; the outward larger and bent back. S. of Europe. 

olitoria. V. forked stem; leaves spear-shaped, very entire; fruit naked. Europe. 

dentata. V. forked stem; leaves spear-shaped, entire; fruit 3-toothed; 2 teeth very short. Europe. 

veriserrata. V. stem forked; leaves spear-shaped, toothed; fruit inflated globular. Crete. 

coronata. V. stem forked; leaves spear-shaped, toothed; fruit 6-toothed. Portugal. 

discoida. V. stem forked; leaves spear-shaped, toothed; fruit 12-toothed with hooked teeth.

radiata. V. stem forked, leaves oblong-obtuse, little heads with involucrums.

31. V. forked stem, the lower leaves toothed, the pumila. highest strap-shaped, many-cleft.

As we have already given to our readers an example of the mode in which the different species of plants are discriminated by botanists, and such extreme minuteness might seem inconsistent with the nature of our work, we shall avoid pursuing it, unless where the peculiar nature of any species may appear to require such a degree of attention, either as an object of scientific curiosity, or of general utility. At the commencement of the succeeding class, however, we shall give a further example, taken from the extensive genus Protea, of the manner in which the species of plants ought to be defined. With this exception, however, we shall confine ourselves to the definition of the more important plants. At the same time, that our work may be as complete as its nature will permit, we shall state the names of all the species included under every genus (excepting the almost boundless class of Cryptogramme), taking care to distinguish the foreign from the British plants, by affixing to the latter the usual mark (*). Thus there will be exhibited to the reader, nearly a complete enumeration of the objects contained under this extensive and curious branch of science; together with an account of whatever it contains most interesting or useful.

76. Oxybaphus

Contains one species; viz. viscosus.

77. Olax

One species; viz. zeylanica. Ceylon.

78. Macrolorum

Three species; viz. pinaxatum, hymenoeides, sperospermum.

79. Bohria

One species; viz. petiolifera. Cape, Japan, West Indies.

80. Rumphia

One species; viz. amboinensis. Amboyna.

81. Cnzeorum, Widow-tea.

One species; viz. tricoccum. S. Europe.

82. Comocledia, or Maiden-plant.

Four species; viz. integrifolia, dentata, ilicifolia, angulosa. Jamaica, S. America.

83. Willichia

One species; viz. repens. Mexico.

84. Melothria, Small-creeping Cucumber.

One species; viz. pendula. N. America.

85. Rotala

One species; viz. verticillaris. E. Indies.

86. Orkecia

Two species; viz. hispanica, dichotoma. S. Eur.

87. Loeitia

Two species; viz. hispanica, indica. India, Spain.

88. Polychnemum

Five species; viz. monandrium, sclerospermum, arvense, salsum, oppositifolium. S. Europe.

N 2
89. HIPPOCRATAEA.
Three species; viz. volubilis, indica, comosa. S. Am.

90. TONSELLA.
Two species; viz. scandens, africana. Guiana.

91. FISSILIA.
One species; viz. psittacorum. Isle Bourbon.

92. CROCUS, or Saffron.

89. 47 species; viz. fruticosus, minuta, rosea, chloroleuca, * bulbocodium, cruciata, fragrans, humilis, pilosa, hirta, secunda, villosa, rubrocynanea, pumicea, purpurea, crispa, cinnamomea, corymbosa, heterophylla, anemoniiflora, coelestina, epica, plantaginea, linearis, incarnata, patens, capillaris, flexuosa, angusta, radiata, virgata, longiflora, scillaris, aristata, pendula, bulbifera, leucantha, erecta, maculata, deusta, crocata, squalida, lancea, pentandra, alulia, falcata, excisa. Alps, Africa, China, Magellan.

94. GLADIOLUS, or Corn-flag.
50 species; viz. montanus, parviflorus, flexuosus, recurvus, falcatus, biennis, tenellus, dichotomus, striatus, crispus, cuspipatula, tristis, albus, hyalinus, gracilis, carinatus, galeatus, imbricatus, brevifolius, communis, carneus, hirsutus, watsonii, mevanelli, merianus, laccatus, iridiflorus, re扶actus, alatus, bicolour, aniceps, sessilifolius, silenoides, roseus, junceus, scitolius, marganatas, angustus, undulatus, florus, securigera, tubiflorus, tubatus, floribundus, blandus, plicatus, strictus, microdatus, spathaceae, gramineus. Europe, Africa.

95. ANTHOLOGYA.
Six species; viz. lucidior, athiopica, nervosa, cunia, ringens, plicata. Persia, Africa.

96. ARISTEA.
One species; viz. cyannea. Cape of Good Hope.

97. IRIS
Contains 53 species; viz. the following: ciliata, minuta, pumila, lutescens, cristata, susiana, florentina, flavissima, biflora, aphylla, variegata, squamata, japonica, sambucina, lurida, germanica, pallida, compacta, dichotoma, tripetalata, tricuspid, * xyphium, xiphioideae, * pseud-acorus, * facetia, virginica, versicolor, halophyta, ochroleuca, ephacera, ramosa, sisyrinchium, verna, persica, juncea, augusta, setacea, tenutiloba, ventricosa, graminea, ensata, spuria, orientalis, sibirica, martiniacensis, pavonia, crassis, papilionacea, edulis, tristis, polystachya, viscaria, bituminose, tuberosa. Europe, Barbary, Persia, N. America. Of these the following deserve notice.

1. Every other segment of the cor. or blossom smaller than the summit.—The juice of the fresh fruit of

98. MORAEA.
This genus chiefly inhabits the C. of G. Hope, and has 17 species; viz. melaleuca, spiralis, pusilla, magellanic, gladiata, aphylla, filiformis, spathacea, flexuosa, polyanthus, cerulea, plicata, umbellata, crispa, iroides, iridoides, chinensis. Africa.

99. MARICA
Has one species; viz. marica paludosa. Guiana.

100. DILATIS.
Has three species; viz. corymbosa, viscosa, paniculata. C. of G. Hope.

101. WITSENIA
Has one species; viz. witsenia maura. C. of G. Hope.

102. XIPHIDIUM
Has two species; viz. album, coccineum. Guiana.

103. WACHENDORFIA
Has five species; viz. thyrsiflora, paniculata, hirsuta, tenella, graminea. C. of G. Hope.

104. COMMELINA, or Day-flower.
Has 13 species; viz. comminis of America, africana, benghalensis, erecta, virgínica, longicaulis, mollis, tuberosa, vaginata, nudiflora, coccinea, japonica, spira, chiefly Indian, unless otherwise denoted by the name.

105. CALLISIA
Has one species; viz. callisia repens. S. America.

106. SYENA
Has one species; viz. syena fluvialitis. Guiana.

107. XYRIS
Has four species; viz. indica, pauciflora of Malabar, americana, capensis.

108. FUIRENA
Has one species; viz. fuirena umbellata. Surinam.

109. KYLLINGIA
Has eight species; viz. monococaphalos, brevifolium, trecs, panicae, filiformia, umbellata, cyperina, incomplete. Surinam. E. and W. Indies.
Triandria.

110. Mapania
Has one species; viz. mapania sylvatica. Guiana.

111. Schoenus, or Base Cypress,
Has 39 species; viz. mariscus, junceus, mucronatus, pilosus, biliformis, striatus, capitellum, scariosus, nigricans, ferrugineus, fuscus, tristachyos, cuspidatus, aristatus, compar, flexuosus, capillaceus, ustulatus, picatus, bobartze, stellatus, bulbosus, inanus, cephalotes, cyperoides, cymosus, glomeratus, cladium, effusus, restiodes, surinamensis, thermalis, levii, lanceus, albus, gracilis, setaceus, pusillus, capillaris. Chiefly tropical.

112. Cyperus, or Greater Galangale,
Has 76 species; viz. mimimum, setaceus, arenarius, procerus, effusus, articulatus, marginatus, complanatus, texilis, compactus, monostachyos, distachyos, trilobus, nanus, filiformis, dubyus, capitatus, niveus, pannonicus of Austria, mucronatus, laevigatus, squarrosus, nitens, polytrachyos, conglomerauros, erucius, aristatus, luzulace, coniunctus, viscous, liguicis, glomeratus, imbricatus, maderas-patanus, cantianus, elegans, surinamensis, flavidus, flavescens, fuscos, virescens, disformis, jemenicus, strigosus, tenuis, tuberosus, pumilis, stoloniferus, compressus, pulcher, vegetus, abidus, rotundus, glaber, odoratus, esculentus, tenuiflorus, paneri, denudat, lanceus, longus, fastigiatus, canaliculatus, monti, iria, santonicis, corymbosus, racemosus, haspan, clatus, distans, diphyllos, papyros, flabelliformis, alternifolius, spathac专门. Chiefly Arabian. C. of G. Hope, S. of Europe, and tropical.

113. Scirpus, or Rush grass,
Has 70 species; viz. mutius, spiralis, articulatus, plantaginaceus, nutans, * palustris, genticulatus, caricos, cespitosis, baethron, campestris, capitatus, ovatus, astropurpureus, polytrichoides, * accicularis, * fluitans, * lacustris, glomeratus, arenensis, truncatus, laciniiatus, membranaceus, pilosus, hypotrichos, * holoschoenus, australis, * romanus, nodosus, radiatus, * setaceus, supinus, nutans, vaginatus, tri-tachyos, unciniatus, aristatus, autumnalis, diphyllos, fastigiatus, globulosus, globiferus, capillari, trispicatus, lateralis, * triqueter, mucronatus, dichotomus, echinatus, retrofractus, ferruginosus, spadicos, anomalus, milicceae, * maritimus, grossus, luzulace, * sylvaticus, corymbosus, estivalis, squarrosus, dipscaceus, junciformis, michelianus, ciliarius, hortentotus, araucanici, argentus, menander, cephalotes. S. Europe, E. and W. Indies, America. Of these S. lacustris is worthy of notice. It is thus described: Straw cylindrical, naked; spikes several, egg-shaped, on fruitstails, terminating; calyx fringed, 3-cleft, middle segment awl-shaped. When fodder is exhausted, cattle will live upon this species. Catties are sometimes thatched, and packed-stuffed with it. Bottoms of chairs are very commonly made of this rush. If cut at one year old it makes the fine bottoms. Coarse bottoms are made of it at two years old, and such as are still older, mixed with the leaves of the iris pseudacorus makes the coarsest bottoms of all. Mats are likewise made either of the scirpus lacustris alone, or mixed with the aforesaid leaves. Goats and swine eat it, cows and sheep refuse it.

114. Miegia
Has one species; viz. miegia maritima. Cayenne.

115. Eleocharis, or Cotton Grass,
Has six species; viz. vaginatum, polytrachyos, an-

116. Pomeruellia
Has one species; viz. pomeruellia cornucopiae. India.

117. Nardus, or Matt grass,
Has four species; viz. stricta, aristata, indica, ciliaris. Two first, Europe; two last, India.

118. Lygeum
Has one species; viz. lygeum spartum. Spain.

119. Chenchus, or Hedgehog-grass,
Has ten species, viz. lappaceus, capitatus, echinatus, tribuloides, ciliaris, setosus, genticulatus, hordiciformis, purpureus, frutecens. Generally hot climates.

ORDER II. DIGYNIA.

It is highly worthy of being remarked, that under this second order of the class of triandria in the Linnean system are included a considerable number of the plants that are very valuable in agriculture, especially the grasses. This branch of botany, therefore, deserves the attention of those engaged in the culture of artificial grasses, and even of all persons in any way engaged in the cultivation of the soil. Several advantages result from being able to discriminate the particular grasses that naturally rise upon a field, and the name which they bear. A farmer or other cultivator of lands may, in the first place, be enabled to derive greater benefit from the perusal of publications upon the art on which he is engaged. In the next place, it is to be remarked, that some grasses rising spontaneously upon a soil indicate that it is of bad quality, or that it has been impoverished by severe cropping; whereas there are other grasses, which demonstrate, by their spontaneous growth, that the land is in excellent condition. It is of obvious utility to be able to discriminate such plants. It is also of importance, when artificial grasses have sprung up, to be able to discern the kinds to which they belong, and consequently to know whether the proper sorts of seed have been sown, and which of the sorts may have failed to spring up. For these and other reasons we shall give the botanical description, in as concise terms as possible, of a considerable number of the species of this order.

120. Cornucopiae, or Horn-of-plenty grass,
Includes two species; * cucullatum, with an awnless spike, and a scoloped cone; and * alopecuroideus, with an awned spike received in a hemispherical cone.

121. Muhlenbergia
Has one species, viz. diffusa.

122. Saccharum, or the Sugar Cane,
Contains eleven species, viz. tenniferius, spontaneum, japonica, officinarum, polytrachyos, arundinaceum, benghalense, repens, ravenae, cylindricum, thanbergii. Tropical.

123. Perotis
Has two species; viz. latifolia, and polytrachyos. Tropical.

124. Leersia
Four species; viz. orizoides, virginica, monandra, hexandra. Tropical.
125. Phalaris, or Canary-grass.

Cal. 2; valves heeled, equal in length, including the corolla.

canariensis. 

1. P. an awnless panicle nearly oval; spiked, boat-shaped, entire. Cor. 4-valved; the exterior valves spear-shaped and smooth; the interior woolly. Cultivated for its seeds, with which canary birds are fed. O. aquatica. 

2. P. panicule awnless, cylindrical, spike-formed; chaff boat-shaped, slightly toothed. Cor. 3; valves, the interior woolly, the exterior small, awl-shaped. Egypt and Italy.

capensis. 

4. P. panicule awnless, cylindrical, spike-formed; husks boat-shaped, toothed. Cor. 2; valves smooth; roots bulbous. O. Spain.

nodoso. 

5. P. panicule oblong; leaves rigid.

dentata. 

phlaoideae. 

7. P. panicule awnless, cylindrical, spike-formed; husks heeled, entire, rough like a file. Cor. 2; valves smoothish. O. arenaria. 

8. P. panicule awnless, cylindrical, spike-formed; husks heeled, entire, fringed; stem branched. O. aspera. 

9. P. panicule awnless, cylindrical, spike-formed; husks heeled, bulging above. Cor. 2; valves smooth. O. utriculata. 

10. P. panicule oval, spike-formed; husks boat-shaped, the back dilated; theawn longer than the chaff. O. Italy.

paradoxa. 

11. P. panicule awnless, oblong, spike-formed; husk boat-shaped, one-toothed. Cor. 2; valves smooth, small flowers as if bitten off below. India. O. hispida. 

126. Paspalum.

Fifteen species, viz. dissectum, scrobiculatum, villosum, virgatum, paniculatum, stoloniferum, repens, hispidum, kora, longiflorum, distichum, conjugatum, vagnatum, filiforme, decumbens. S. America, and E. Indies.

127. Panicum, or Panic grass.

Cor. with 3 valves; the third valve very small. It is thus defined by Withering. Cal. 2-valved, 2-flowered.

polyctyon. 

1. P. with tapering spikes, small envelopes of one flower, in fascicles bristly; the straw erect above, branchy. India. O. sericeum. 

2. P. a tapering spike, covering bristly, hairy, single flowers; leaves plain. W. Indies. O. verticillata. 

3. P. spike cylindrical, rough when stroked downwards; partial involucrums with 2 bristles, and 1 floret.

helvolum. 

5. P. spike tapering, small involucrums, double flowers, with hairy fascicles. Seeds with undulated wrinkles. O. viride. 

6. P. spike cylindrical, soft to the touch; partial involucrums, with 3 bristles and 1 floret.

germanicum. 

7. A compressed compound spike, spikele congested, small involucrums bristle-shaped, longer than the flower; spike-stalk shaggy. O. italicum. 

9. P. spikes alternate and in pairs; little spikes sub-crus galli. divided; husks awned and rough strong hairs. Spike stalked, with five angles.

10. P. spikes finger-like, knotty on the inside of sanguinaria. the base; flowers in pairs, without awns; sheath of the leaves dotted.

11. P. spikes fingered, expanding soft hairs on in-ruct. sides of the base, flowers solitary, roots with creeping runners.

To these are to be added the following species; setosum, * lancelatum, stagnum, crus corvi, seierigerum, colonum, fluitans, flavidum, dimidiatum, burmanni, hirtellum, pilosum, molle, fasciculatum, cartaginense, conglomera tam, interruptum, umbrosum, filiforme, crypticum, ciliare, lineare, cimicium, distachyon, squarrosum, hispidulum, compositum, elatis, dichotomum, ramosum, demustum, coleratum, repens, ischinoide, remotum, aristatum, miliacense, antidorsale, notatum, muricatum, capillare, flexuosum, grossatum, acuminatum, rigens, fuscum, laxum, latifolium, flavescens, diffusum, oryzoide, clandestinum, arboreum, curvatum, virgatum, ptens, trigonum, pallens, lanatus, arundinaceum, polygamum, glutinosum, brevilobum, radicans, tricoides, and divaricatum. Chiefly hot climates.

128. Phleum, or Cat's-tail grass.

Cal. 2-valved, sitting, strap shaped, lopped, ending in 2 dagger points, enclosing the cor.

1. P. spike egg-shaped, fringed; straw branched. orcamum. 

2. P. panicule cylindrical, spike-like; husks naked; panicule-straw sometimes branched.

3. P. spike cylindrical, very long; calyx fringed, pratense, and awned; straw upright.—This grass is represented by all travellers in America as the great support of cattle, &c. wherever meadows are found. It is there called timothy-grass. It is best adapted to clayey soils, moist loam, and especially pest. The seeds are to be had very clean dressed, at about one guinea a bushel.

4. P. spike cylindrical; straw ascending; leaves nodosum, slender; root bulbous.

5. P. spike egg-cylindrical.

129. Alopecurus, or Fowstail-grass.

Cal. 2-valved. Cor. 1 valve. Nect. none. Some kinds of this grass are very valuable.

1. P. spiked; straw upright. Cal. hairy. Cor. awn-pratens "ed. This grass (meadow foxtail) has scarcely a superior for the use of the farmer. It is very early, and abides on the farm, when sown, for many years. It produces few seed-stalks. It is difficult to procure the seed in any degree of plenty, on account of an insect that feeds upon it and destroys it.

2. P. spiked; straw upright; calyx not hairy; its agristis. husks united at the base.

3. P. straw upright; spike cylindrical; root bulbous.

4. P. spiked; straw knee-jointed.

Cor. awned. To these may be added the following panicum species, viz. indicus, capensis, and echinatus, being all foreign plants.
Triandria.  

BOTANY:

130. MILIUM, or Millet.
Cal. 2-valved, 1-flowered; valves nearly equal. Cor. very short; summits pencil-shaped.

1. M. panicule spike-like; flowers with awns.
2. M. flowers in panicles scattered; awnless. The foreign species are, capense, punctatum, compressum, digitatum, panicum, confertum, globosum, paradoxum, villosum, and ramosum. Globosum is found in Japan. The rest tropical.

131. AGROSTIS, or Bent-grass.
Cal. 2-valved, 1-flowered, rather smaller than the cor.; outer petal smooth; summits set lengthways, with stiffish hairs.

It is otherwise described thus: Cal. 1-flowered, 2-valved, spear-shaped, acute, generally rough on the heel; longer than the cor. Cor. 2-valved; summits hairy.

Of the British species the following have awns:

spicati. 1. A. cal. husks nearly equal; cor. valves equal; awn twice the length of the cal. fixed just beneath its point.

palustris. 2. A. cal. husks equal. Cor. outer valve twice the length and breadth of the inner awn, shorter than the cor. fixed just beneath its point.

canina. 3. A. cal. husks nearly equal; cor. valves very unequal. Awn twice as long as the cor. fixed just beneath its middle.

virealis. 4. A. cal. husks equal; cor. valves nearly equal; awn as long as the cor. fixed just beneath its middle.

pallida. 5. A. cal. husks unequal; cor. inner valve hair-like, very short; awn rather longer than the cor. fixed beneath its middle.

alpina. 6. A. cal. husks unequal; cor. without hairs at the base; awn twice the length of the blossom, fixed near its base.

littoralis. 7. A. panicule spike-like; cal. awned.

The following British plants have no awns:

alba. 8. A. panicule large spreading; cal. both valves serrated on the heel.

migr. 9. A. panicule scattered, branches bare at the base; florets few; cal. inner valve smooth.

stolonifera. 10. A. panicule compact; branches short, stiff, densely crowded with florets at the base; cal. inner valve smooth; outer one serrated upwards.—This is a water grass, and a very noxious plant. It grows upon poor wet loams and clay. When it is found in meadows or pasture lands, it is proof that the soil is either naturally poor, or has been rendered so by scourging crops.

maritima. 11. A. panicule large, rather spreading; longer branches naked at the base, shorter crowded with florets; cal. inner valve smooth, outer serrated upwards.

vulg. 12. A. panicule spreading; branches bare at the base; florets numerous; cal. inner valve smooth, outer serrated upwards; cor. inner valve but half the size of the outer; deciduous.

minima. 13. A. cal. husks equal, blunt, smooth. To those are to be added the following foreign species; viz. interrupta, spiciformis, and hiruta, panicis, milium, tenuiflorum, bromoides, amidinaea, calamus, serrata, rubra, stricta, ovata, matrella, rupestris, compressa, capillaris, bispida, scabra, anomala, diandra,

sylvestris, pumila, ciliata, capensis, tremula, virginica, pungens, spicata, mexicana, verticillata, coromandeliana, tenax, purpureascens, indica, procera, linearis, lenta, stellata. Chiefly of Japan, India, America, and S. of Europe.

132. AIRA, or Hair-grass.
Cal. 2-valved, 2-flowered, without any intervening substance between the florets.

• 1. A. florets awnless; panicule expanding, smooth, aquatica longer than the calyx; leaves flat.
• 2. A. leaves flat; panicule expanding; petals woolly capito, and awned at the base; aawn straight, short.
• 3. A. leaves like bristles; staws almost naked; flemsona. panicles diverging; fruitstalks zigzag.
• 4. A. leaves like bristles; panicule slender and compact; florets hairy and awned at the base; awn twisted and longer.
• 5. A. leaves like bristles; sheaths rough; flowers in cuneo... a panicule; awn not longer than the cal.
• 6. A. leaves like bristles; sheaths smooth, angular, praecox. winged; panicles spike-like; awn taller than the cal.
• 7. A. leaves like bristles; sheaths smoothish, fur-coryphyl- rowed; panicule wide spreading when ripe; awn taller than the cal.

To these add the species called runcinacea, minuta, involucro, pubescens, of N. of Europe; subspicata and alpina, of the Alps; antarctica of N. Zealand; chinesicus, of China: setacea.

133. MELICA, or Melic, or Rope-grass.
Cal. 2-valved, 2-flowered, with a little substance on a pedicle between the florets; nect. 1 leaf; stamens dilated at the base.

• 1. M. petals not fringed; panicule drooping, undi... vides.
• 2. M. panicule compact; flowers cylindrical; straw cernue with knots.
• 3. M. panicule thin set; cal. with 2 florets, 1 her-auniflora. maphrodite, the other neutral. Add to these ciliata, gigantea, geniculata, decumbens, racemosa, ramosa, capensis, minuta, papilionacea, altissima. Chiefly of Cape of Good Hope.

134. POA, or Meadow-grass.
Cal. 2-valved, many-flowered; spikes egg-shaped; valves shining at the edge, rather acute.

• 1. P. panicules spreading; spikes strap-shaped, 6-... flowered.
• 2. P. panicules with subdivided branches; spikes distans. 5-flowered; florets distant, blunt; cal. valve very unequal.
• 3. P. panicule spreading; spikes 5-flowered, smooth; protensis. straw cylindrical; upright sheath; scale short and blunt. This is an excellent grass, when sown upon rich loams.
• 4. P. panicule spreading, very much branched; spi-alpina. kets 6-flowered, heart-shaped.
• 5. P. panicule spreading; spikes 4-flowered, pubes... cent; straw cylindrical, upright; root-leaves doubled tot.

Together, very slender; sheaths smooth; sheath-scale short, lopped.
• 6. P. little spikes egg-shaped; florets smoothish; bullosa. acute; straw upright, bulbos at bottom.
• 7. P. panicule spreading horizontally; branches in annua... pairs;
B O T A N Y.

Triandria.

2. D. panicule crowded, pointing one way.—This _glomerata_ grass is cultivated to advantage on wet loams on a clayey marl bottom, upon which the finer grasses are apt to give way to the indigenous produce. If subject to rise high, it is very coarse; but, when fed close, is a very valuable sheep-pasture. Women and children are said to make good earnings in gathering the seed at 4s. a bushel. Upon an English acre two bushels may be sown, with ten pounds of common red clover. When the clover wears out, the grass covers the land, and abides well in it. It grows well in winter.

Add the species _cynosuroides_, _cespitosa_, _littoralis_, _ravis_, _villosa_, _serata_, _ciliaris_, _bisida_, _geniculata_, _brevisulata_, _lagopoides_, _pungens_, of _America_, _India_, and _Africa_.

138. _Cynosurus_, or _Dogs-tail Grass_.

Cal. 2-valved, many-flowered, equal; cor. 2-valved; 1 valve concave, longer. Nect. 2-leaved.

1. C. _floral leaves, with winged clefts._—The crested _crisata._

_dogs-tail_ is highly spoken of in the Milanese. The Rev. Arthur Young speaks thus of it:—"To judge from the appearance of the bents of this grass, in poor upland but moist pastures, a man would think it a very unpromising plant; but the rich marshes of _Bridge-water_ and Boston; the famous pastures of _Panion_ in _Devonshire_, and those close to _Mr. Butler's_ castle near _Leskeard_ in _Cornwall_; _Mr. Thorne's_ bullock ground, on _Dunstone_ bottom, near _Tavistock_; _Mrs. Williams's_ at _Little Malvern_ in _Worcestershire_, (which are among the richest pastures in the kingdom) all abound very greatly in this grass; in some of them it is the predominant heritage. Mr. _Marshall_ places it as the most prevailing plant in the best grass meadows of the vale of _Pickering_; some of which will feed a large cow from _Mayday_ to _Michaelmas_. Very fortunately it abounds much with seed; so that I have had many bunches gathered in a season by poor women and children, at 1s. a pound, and laid down many acres of it successfully. Attention should be paid to its being ripe; for I once ordered eight bunches to be sown on eight acres, and it failed from deficiency in ripeness."

2. C. _floral leaves winged, segments awned._

3. C. _floral leaves entire; spike nearly egg-shaped._

The remaining species are the following: _calculus_, of Cape of Good Hope; _crassus_, of Europe; _paniculatus_, of C. G. Hope; _lima_ of Spain; _olurus_, of Europe; _retroflexus_, _sphacelatus_, _uniola_, _filifolis_, _monochyios_, _coronarius_, _floccifolius_, _penicillatus_, _parapaloides_, _egyptius_, _indicus_, _virgatus_, _aureus_.

139. _Festuca_, or _Fescue Grass_.

Cal. 2-valved; spikes oblong, roundish; husks tapering to a point, or terminating in an awn.

1. H. _spikes upright, smooth._ Cal. _valves, one en-bromoides_, the other tapering to an awn-like point.

2. H. _panicle spike-like, drooping._ Cal. _smaller_, _myuros_.

3. H. _panicle compact, awned; straw four-cornered._—It flourishes best in a dry sandy soil. _Cow_, horses, and goats will eat it; but it is the favourite food of sheep: they prefer it before all other grass, and are said soonest to grow fat upon it; for, though small, it is succulent. The _Tartars_, who lead a wandering life, tending their _flocks_.
Triandria.

BOTANY.

flocks and herds, always choose those spots where this grass abounds. Such may be its just character in the uncultivated wilds of nature; and as it prefers a dry soil, its growth is an indubitable indication of the salubrity of such places for flocks of sheep; but in a more rich and cultivated country, it is said to be of little value as a pasture grass, being extremely diminutive; nor will it remain long in the ground if sown, but will soon give place to more luxuriant grasses.

rubra. * 4. Panicle rough; spikelets 6-flowered, awned; floret at the end awnless; straw semi-cylindrical.

durissula. * 5. Panicle oblong; spikelets oblong, smooth; leaves bristle-shaped.—A very excellent grass for the agriculturist, as springing very early, being productive, and grateful to all kinds of cattle, and is found in most good meadows and pastures.

elatior. * 10. Panicle upright; spikelets scarcely awned, the outer ones cylindrical. It makes an excellent pasture, but requires a rich soil. Horses, cows, sheep, and goats eat it.

fusiana. * 11. Panicle branched, upright; spikelets nearly sitting, cylindrical, awnless.—The seeds are small, but very sweet and nourishing. They are collected in several parts of Germany and Poland, under the name of manna seeds; and are esteemed a delicacy in soups and gruels, on account of their nutritious quality and excellent flavour. When ground to meal, they make bread very little inferior to that in common use from wheat. The bran, separated in preparing the meal, is given to horses that have the worms; but they must be kept from water for some hours afterwards. Geese are very fond of the seeds, and well know where to look for them. The plant affords nourishment to the phalena farinata. Horses and swine will run risks to get at it.

joliatea. * 12. F. spikelet; spikelets alternate, sitting, compressed, awnless.

decumbens. * 13. F. panicle upright; spikelets nearly egg-shaped, awnless; cal. larger than the florets; straw lying down.

pinnata. * 14. F. spikelets sitting; straw undivided; awn shorter than the blossoms.

sylvestris. * 15. F. spikelets sitting; straw undivided; awn as long as the blossom. To these add the following species: viz. tenella, pomilla, amethystina, repatria, heterophylla, sciuroides, mioglimus, spadicea, scabra, fusca, pauciflora, cristata, misera, indica, calycina, pungens. Mild climates.

140. Bromus, or Bromegrass.

Cal. 2-valved; spikelets oblong, cylindrical, 2-rowed; awn beneath the point. This genus includes 33 species; viz. secalinus, multiflorus, mollis, pectinatus, lanceolatus, alopecurus, squarrosum, japonicus, bifidus, purgans, cephaticus, inermis, asper, litoraeus, ciliatus, sterilis, arvensis, geniculatus, tectorum, giganteus, rubens, scoparius, rigens, racemosus, triflorus, madritensis, rigidus, ramosus, gracilis, pinnatus, cristata, distachys, stipoides. Chiefly European. The following are thus described.

Votr. IV. Part L

†

B. Panicle expanding; spikelets egg-shaped; awn polymorphic.—Its merit or demerit in an agricultural view seems not to be sufficiently ascertained. It is said to be disliked by farmers, as being in corn fields a troublesome weed, and in pastures and mowing grounds of little value, since it has generally shed its seed by the time of mowing, and produces very few root leaves.

B. Panicle drooping; spikelets egg-shaped; awn squarrostradelling; panicle imbricated.

B. Panicle upright, ending abruptly; spikelets oblong, hairy, awned, about 5 florets in each; straw upright; leaves hard. A coarse grass, disliked by cattle, as are all the bromes. Properly a rescue, but has the habit of a brome.

B. Panicle diffuse, upright but open; spikelets strap-shaped, the middlemost in pairs; pedicels thickest at the top.

B. Panicle drooping, rough; spikelets hairy; awned; asper.

B. Panicule spreading; spikelets oblong; florets two-stemmed; rowed; cal. taper-pointed; awns very long.

B. Panicle drooping; spikelets egg-oblong; arvensis.

B. Panicle drooping; spikelets four-flowered, shorter giganteus; than the awns.

B. Straw undivided; spikelets alternate, nearly sit-pinnatus ting; cylindrical, somewhat awned.

141. Stipa, or Feather-grass.

Cal. 2-valved, 1-flowered. Cor. outer valve ending in an awn; awn jointed at the base. This genus includes 11 species; viz. pennata, juncea, capillata, aristella, pallescens, tenacissima, capensis, spicata, bicolor, avenacea, membranacea. Europe, and Cape of Good Hope. The following is thus described.

S. awns woolly.

142. Avena, or Oats.

Cal. 2-valved, many-flowered. Awn from the back of the cor. twisted. The genus includes 34 species; viz. sibirica, elatior, stipiformis, aristiodae, tristata, paluida, pennsylvanica, loslingiana, brevis, alba, striosa, orientalis, sativa, forskalia, nuda, sativa, elephantina, sequinetta, lutes, tenuis, pubescens, stellati, hispida, pratensis, versicolor, sponta, phyllophila, biliformis, spica, bromoides. Chiefly C. of Good Hope and mild climates. The following are thus described.

A. Panicle; cal. 3-flowered; male floret awned; elatior.

B. Hemaphrodite floret somewhat awnless. Cows, sheep, and goats eat it. The roots are sometimes very troublesome to the farmers in arable lands, producing a kind of squitch. It produces a large crop, but is unpalatable to cattle, especially to horses, as are the avenae in general.

A. Panicle; cal. 3-flowered, shorter than the re-nuda.

B. Acceptable; petals awned upon the back; the third floret awnless. This is nearly as good as the cultivated oat; it will make gruel or oat cake, and feed cattle, as well as that. Ray says it sells in Cornwall at the price of wheat.

A. Panicle; cal. 3-flowered, all the florets awned; sativa.

B. And hairy at the base. Horse, sheep, and goats eat it. The awns are used for hygrometers. Sometimes so prevalent amongst barley as almost entirely to choke it. It may be extinguished by repeated followings, or laying down the land in grass.
**BOTANY**

**Pappaphorum.** Has one species; viz. slopecuruideum.

**Aristida,** or Oat-grass.

**Lolium,** Dorneil or Rye-grass.

**perenne.** L. spike awnless; spikets compressed, many-flowered, longer than the calyx.—It makes an excellent hay upon dry chalk or sandy soils. It is cultivated with advantage along with clover, and springs earlier than the other grasses, thereby supplying food for cattle at a season when it is most difficult to be obtained. Cows, horses, and sheep eat it. Goats are not fond of it. Though it succeeds best upon light soils, it will flourish on any land except stiff clay, and will grow even on that; but upon rich sands and loams it becomes not only a good spring grass, but if properly managed by due mixtures, turns out well as permanent pasture land; always, however, most valuable by being sheep fed, for which it is singularly adapted. It is worthy of remark, however, that there is reason to think that the common cultivated rye-grass has degenerated from its natural qualities; and that it is inferior in many respects, particularly in its duration, to the

**ANY.**

**Triandria.**

rye-grass which grows naturally in the best British meadows and pastures.

L. spikes awned, compressed, many-flowered, not temulenta longer than the calyx; straw rough.—The seeds mixed tum. with bread corn produce but little effect, unless the bread be eaten hot; but if malted with barley, the ale soon occasions drunkenness.

L. spikes awnless, rather shorter than the calyx; arvenses. cal. 2-valved; straw smooth.—It is very injurious to a wheat crop, but may readily be avoided as it is sown along with the seed.

L. panicule univalved, pointing one way; spikets bromide, awned.

**Rotboellia,** or Sea hard-grass.

Cal. of 1 or 2 valves, egg-spear-shaped, flat. Florets alternate, on a zigzag spike-stalk. Cor. 2-valved, awnless. This genus includes 16 species; viz. incurvata, filiformis, cylindrica, thomae, repens, levis, pisosa, compressa, hispata, cymbachne, celeraria, dimidiata, exaltata, coromenda, muricata, sanguinea. Chiefly of Europe and India. The following is thus described.

B. spike cylindrical, awl-shaped; cal. husk awl-incurvata, shaped, contiguous, divided into two.

**Elymus,** or Lime-grass.

Cal. lateral, 2-valved, several together, many-flowered. This genus contains 12 species; viz. arenarius, giganteus, sibiricus, tener, philadelphia, canadensis, calamistrum, virginicus, striatus, europaean, caput medusae, hystrich. Chiefly of Europe and America. The following is thus described:

E. spike upright, compact; cal. woolly, longer than arenarius. the floret.—It resists the spreading of the loose sand on the sea shore. It is not capable of being formed into ropes as the stipa tenacissima is in Spain. Cows, horses, and goats eat it; sheep refuse it.

E. spike compact, leaing; spikets upright without camius. an involucrum, the lowermost in pairs.

E. spike upright; spikets 2 florets in each, as long europaean as the calyx.

**Secale,** or Rye.

Contains four species; viz. cereale, villorum, orientale, creticum.

**Hordeum,** or Barley.

Cal. lateral, 2-valved, 1-flowered; three together. This genus includes ten species; viz. vulgaris, hexastichon, distichon, zeorriton, bulbosum, nodosum, muralim, secalinum, maritimum, jubatum. The following are thus described:

H. lateral florets male, awned, smooth on the heel; murinum. involucrum of the intermediate florets fringed. Sheep and horses eat it. It feeds the brown moth (phaeum granella), and the barley fly (musca frut). H. lateral florets male, awnless; involucrum bristle-protense. shaped, rough. In moist meadows it produces a considerable quantity of hay, but is not to be recommended as one of the best grasses for the farmer.

H. lateral florets male, awnless; middle floret hex-maritimum-maphrodite, with a long awn.

H. all the florets hermaphrodite, awned: cal. grow-ryloaticum ing together at the base, shorter than the awns.

**Triticum,** or Wheat.

Cal. 2-valved, solitary, mostly 3-flowered; floret bluish.
Tetrandria. This genus includes 18 species; viz. setivum, hypericum, compositum, turgidum, polonicum, speletum, monococcus, hispanicum, prostratum, pulvum, juncum, distichum, repens, maritimum, tenellum, unioides, lolium, unilaterale. Of mild climates. The following are thus described:

* T. Cal. 5-flowered, topped; leaves edges rolled in. juncum.
* T. Cal. 4-flowered, awl-shaped, tapering to a point; leaves flat.—It is a most troublesome weed in arable lands, and can only be destroyed by fallowing in a dry summer. At Naples the roots are collected in large quantities, and sold in the market to feed horses; they have a sweet taste, something approaching to that of liquorice; when dried, and ground to meal, they have been made into bread in years of scarcity. The juice of them drunk liberally is recommended by Boerhaave in obstructions of the visera; particularly in cases of scirrhous liver and jaundice. Cattle are frequently found to have scirrhous livers in the winter, and they soon get cured when turned out to grass in the spring. Dogs eat the leaves to excite vomiting; horses eat them when young, but leave them when fully grown; cows, sheep, and goats eat them.

canum. * T. cal. pointed, mostly 4-flowered; awns longer than the cor.; spikets upright.

ticium. * T. spike simple, compressed; spikets egg-shaped, but pointed; cal. many-flowered.

153. Lappago
Has one species, called racemosa. Europe, India, and Arabia.

ORDER III. TRIGYNIA.

154. Ericaulon, or Nett-work,
Has eight species; viz. triangulare, quinquangulare, sexangulare, sectaum, decangulare, repens, fasciculatum, umbellatum. India, and S. America.

CLASSIS IV.

TETRANDRIA.

ORDO I. MONOGYNIA.

Sect. I. Flores monopetalii, monospermii, inferii.

Sect. II. Flores monopetalii, monospermii, superi, aggregate.

CLASSIS IV.

TETRANDRIA.

ORDO I. MONOGYNIA.

Sect. I. Flowers with one petal, 1-seeded, inferior.

G. or Blue Daisy. Cor. 1 petal, irregular; seed without down.

Sect. II. Flowers monopetalous, 1-seeded, incorporated.

* D. or Teasel. Cal. common, leafy. Receptacle conical, chafy. The seeds columnar.
* S. or Scabious. The cal. common. The receptacle elevated, somewhat chafy. The seed crowned, rolled inwards.

174. Allionia.

† Valeriana Sibirica. Boerhaavia tetrandra.

Sect. III. Flores monopetalii, tetraspermii.

188. Mattuschkea. Cor. 4-fida hypocrateriforme. Cal. 4-partitus.

Sect. IV. Flores monopetalii, monocarpi, inferi.

221. Exacum. Cor. subcampanulata. Cal. 4-phyllus. Caps. 2-locularis compressa.

† Justicia pacherrima, lycium tetrandrum, cordia tetrandra.

Sect. V. Flores monopetalii, monocarpi, superi.

204. Cunninghamia. Cor. infundibuliformis. Cal. 4-dentat. Drupa nucis 2-locul.

A. Cal. common, 3-leaved; 3-flowered; the proper superior wanting. Seed naked.

Sect. III. Flowers monopetalous, 4-seeded.

M. Cor. 4-cleft, salver-shaped. Cal. quadrifidus.

Sect. IV. Flowers monopetalous, one fruit-vessel, inferior.

P. Cor. bell-shaped. Cal. 4-toothed. A drupe 8-seeded with nuts.

M. Cor. tubular. Cal. entire. A drupe with a nut, and 4 cells and 4 seeds.

P. Cor. tubular. Cal. 4-toothed. A drupe with a 2-celled nut.

A. Cor. wheel-shaped. Cal. nearly 4-cleft. A berry many-seeded.

R. Cor. bell-shaped. Cal. 4-leaved. A berry 4-angular, many-seeded.

C. or Tonomia. Cor. tubulosa. Cal. 4-cleft. Berry 4-seeded.

W. Cor. tubulosa. Cal. 4-cleft. Berry 1 seed.

W. Cor. nearly bell-shaped. Cal. obscure, 4-toothed. Seed-vessel 2-celled.

A. Cor. salver-shaped. Cal. 4-toothed. Berry 2-celled. Style half-cleft.

C. or Button-wood. Cor. funnel-shaped. Cal. 4-cleft. Caps. 4-celled, not wide.

L. Cor. funnel-shaped, with a woolly mouth. Cal. 5-cleft. Caps. 1-celled, 2-seeded.

S. Cor. wheel-shaped. Cal. 4-parted. Caps. 1-celled, 2-valved.

C. or Base Pimpernel. Cor. wheel-shaped. Cal. 4-cleft. Caps. 1-cell, cut round.

P. or Plantain. Cor. bent back. Cal. 4-cleft. Caps. 2-celled, cut round.

P. or Carolina Flask. Cor. wheel-shaped. Cal. 4-leaved. Caps. 2-cells, notched.

B. Cor. bell-shaped. Cal. 4-cleft. Caps. 2-celled, 2-furrowed.

E. Cor. nearly bell-shaped. Cal. 4-leaved. Caps. 2-celled, compressed.

M. Cor. tubular. Cal. 5-toothed. Caps. 2-celled, many-seeded.

L. Cor. nearly bell-shaped. Cal. 4-leaved. Caps. 4-celled.

P. Cor. bell-shaped. Cal. 2-leaved. Caps. 4-celled, 4-valved.

B. Cor. nearly bell-shaped. Cal. 4-partite. Caps. 4-celled, with open angles.

Sect. V. Flowers monopetalous, 1 seed-vessel, superior.

C. Cor. tubulosa. Cal. 4-cleft. A drupe with a 2-celled nut.

C. Cor. funnel-shaped. Cal. 4-cleft. A drupe with a 2-celled nut.
Tetrandria.

corymbosa. 29. P. with strap-awl-shaped contiguous leaves, and little flat-topped branches in whorls. h C. of G. Hope.
nana. 30. P. with strap-awl-shaped leaves, a terminal knob and coloured calyx. h C. of G. Hope.
lanata. 31. P. with contiguous 3-square leaves, and a woolly terminal knob. h C. of G. Hope.
torta. 32. P. with oblique, strap-shaped, obtuse leaves, h C. of G. Hope.
apa. 33. P. with strap-shaped, silky, cottony leaves. h C. of G. Hope.
australis. 34. P. with strap-battledore-shaped, smooth leaves; flowers in bunches; single calyx, h C. of G. Hope.
semipallida. 35. P. with strap-battledore-shaped, smooth leaves; terminal knobs, many-cleft; floral leaves. h C. of G. Hope.
linearis. 36. P. with strap-battledore-shaped smooth leaves; a cottony terminal knob. h C. of G. Hope.
patens. 37. P. with strap-wedge-shaped silky leaves, and a silky terminal knob. h C. of G. Hope.
scopulosa. 38. P. with sharp spear-shaped leaves, and a round terminal knob or head. h C. of G. Hope.
abysinica. 39. P. with spear-shaped leaves, obtuse and slender at the base, and a hemispherical terminal knob. h Abyssinia.
mellifera. 40. P. with strap-elliptical-shaped leaves, and an oblong terminal knob. h C. of G. Hope.
repens. 41. P. with strap-elliptical-shaped smooth leaves, an oval knob, and short decumbent stem. h C. of G. Hope.
plumosa. 42. P. with spear-wedge-shaped hoary leaves, an oblong terminal knob, petals smooth beneath, and hairy above. h C. of G. Hope.
obliqua. 43. P. with strap-spear-shaped, callous, smooth, oblique leaves, and a terminal knob belonging to the stem. h C. of G. Hope.
parviflora. 44. P. with elliptical obtuse, callous, oblique leaves, and smooth terminal heads of little branches. h C. of G. Hope.
patens. 45. P. with leaves spear-shaped, slender at the base, smooth, sharp, callous; and a terminal knob furred with a pale cover. h C. of G. Hope.
compta. 46. P. with leaves spear-shaped, attenuate at the base, smooth, sharp, callous, and a terminal head, furred with a long sharp cover of the same colour. h C. of G. Hope.
levigatus. 47. P. with leaves inversely egg-shaped, obtusely tapering, tilled smooth, a hairy stem, and a head with an obtuse long covering. h C. of G. Hope.
sericifera. 48. P. with elliptical leaves, blunt, callous, smooth, and a terminal knob. h C. of G. Hope.
imbricata. 49. P. with leaves spear-shaped, smooth, scored, tilled, and a terminal knob. h C. of G. Hope.
sericea. 50. P. with leaves spear-shaped; smooth, thread-shaped branches; stem decumbent. h C. of G. Hope.
saligna. 51. P. with spear-shaped silky leaves; a shrubby stem; and oblong enveloped knobs. h C. of G. Hope.
argentea. 52. P. with leaves spear-shaped, silver-cottony, fringed, with woody stem and globular knobs. h C. of G. Hope.

ANY. P. with leaves oblong and smooth; a globular ocaulis. knob or head; and a short decumbent stem. h C. of G. Hope.

54. P. with oblong smooth leaves; and aggregate myrtifolia. terminal knobs. h C. of G. Hope.
56. P. with smooth oblong leaves without veins, a glabra. hemispherical knob, and a shrub-like stem. h C. of G. Hope.
57. P. with oblong smooth leaves, an oblong knob, speciosa. the scales of the calyx barbed at the point. h C. of G. Hope.
58. P. with oval, smooth, callous leaves; cor. hairy, totta. and cylindrical. h C. of G. Hope.
59. P. with smooth, oval leaves; and lateral flowers. hirta. h C. of G. Hope.
60. P. with oval leaves; and cottony terminal knobs. pubera. h C. of G. Hope.
61. P. with hairy oval leaves, terminal knobs, and divaricata. stradling branches. h C. of G. Hope.
62. P. with smooth, battledore conical leaves. h C. of G. Hope.
63. P. with leaves nearly round; and smooth leaf-cyananostalks. h C. of G. Hope.
64. P. with heart-shaped leaves. h C. of G. Hope.

166. BANGKIA.
Recept. common, elongated, scaly. Cor. 4 petals. The stamens inserted in the border. The caps. 2-valved, 2-seeded. A moveable partition between the seeds, which are winged.
* Of this genus there are 8 species, viz. serrata, grandis, integrifolia, pyrrhformis, dentata, spinulosa, ericifolia, gibbosa. N. Holland.

167. RUFALA.
This genus has two species; viz. montana, and sessifolia.

168. EMBOTHRIUM.
Eight species; viz. speciosissimum, coccinum, grandiflorum, umbellatum, hirsutum, buxifolium, sericeum, silatifolium.

169. GLOBULARIA, or BLUE DAISY.
Four species; viz. longifolia, nana, nudicalis, orientalis. S. Eur.

170. CEPAHANTHUS, or BUTTON-WOOD.
Has one species; viz. occidentalis. N. America.

171. DIPSACUS, or Teasel.
Has four species; viz. *fullosum, *sylvestris, laciniosus, and *pilosus.
* D. leaves sitting, serrated; chaff bent backwards. fullosum.
It is cultivated for the use of the clothes, who employ the heads with crooked awns, to raise the knap upon woollen cloths. For this purpose they are fixed round the circumference of a large broad wheel, which is made to turn round, and the cloth is held against them. The plant flowers in June and July, and the heads are collected in August. It is sometimes sown along with caraway and coriander; by which means three crops are on the soil at once, without inconvenience, as they ripen at different periods.

172. SCABIOSA, or Scabious.
Has 41 species; viz. alpina, ustulata, rigida, attenuata, scabra, transylvanica, syriaca, lenceanthis. *succisa, integrifolia, amplexicaulis, humilis, decurrens.

P. tatarica,
Tetrandra. 

114. BOTTATIA. 

173. KNOUTIA. 

Has four species; viz. orientalis, proposita, palentina, and plumosa. Levant, Archipelago.

174. ALLIONIA. 

Has two species; viz. violacea, and incarnata. Am.

175. OPERCULARIA. 

Has three species; viz. umbellata, aspera, diphyllea. N. Holland.

176. HEDYOTIS. 

Has 11 species; viz. fruticosa, racemos, arcuicularia, hyssipida, maritima, pumila, diffusa, herbacea, graminifolia, virgata, rupestris. E. and W. Ind. S. Amer.

177. SPERMATOCR, or Button-wood. 

Contains three species; viz. arvensis, muralis, fruticosa. Eur. Isle of Ascension.

178. SHERARDIA, or Little Field-madder. 

Has seven species; viz. odorata, hexaphylla, arvensis, taurina, crus-galli, calabria, aristata, tinctoria, pyrenacea, cynanchica, levigata. Eur.

A. leaves 8 in a whirl, spear-shaped; flowers in bundles on fruitstalks. The scent of it is said to drive away ticks and other insects. (Linn.) It gives a grateful flavour to wine. Cows, horses, sheep, and goats eat it.

180. DODIA. 

Has 6 species; viz. virginica, simplex, verticillata, prostrata, scandens, sarmentosa. Amer. Jamaica.

181. HYDROPHYLAX. 

Contains only one species; viz. maritima.

182. KNOXIA. 

Has under it two species; viz. zeylanica, and corymbosa. Ceylan.

183. CARPHALEA. 

Has one species; viz. corymbosa. Madagascar.

184. HOUSTONIA. 

Has three species; viz. curules, longifolia, and purpurea. N. America.

185. GALIUM, or Ladies Bed-straw. 

Includes 30 species; viz. rubiodes, palustr, trifolium, frutescens, moutanum, tinctoria, capens, macrostemon, expansum, asperum, glabrum, australicum, boconi, viscosum, satizale, tenue, jussieii, pyramicaum, monium, psyllium, acanthum, varum, malago, sylvaticum, linifolium, rigidum, aristatum, hieronymi, tannum, aspalach, glaucum, purpureum, rubrum, megaplerum, aprium, haramica, uliginosum, borreale, rotundifolium, bermudianum, ericosides, bithum, ruthenicum, aparine, album, microcarpus, parisiense, pilosum, maritimum, grevecum. Eur. Arab. N. Amer. Of these the following deserve notice.

G. leaves 5 in a whirl, strap-shaped, furrowed; flower-corollas short:—The flowers will coagulate boiling milk; and their juice changes blue infusions to a red colour, thereby discovering marks of acidity. The French prescribe them in hysterical and epileptic cases. Boiled in alum-water, they tinge wool yellow. The roots dye a very fine red, not inferior to madder, and are used for this purpose in the island of Jura. (Pennant 1772. p. 212.) Sheep and goats eat it. Horses and swine refuse it. Cows are not fond of it. It is subject to a disease, in which the stem and leaves are set with fishy balls, about the size of a pea, hollow within and covered with a purplish skin.

G. leaves 4 in a whirl, spear-shaped, smooth, 3-fibred; branchlets upright. The roots afford a red dye for woolens. G. leaves 6 in a whirl, spear-shaped; leaf rough with spinies, with blackish pointing backwards; joints woody. —The branches are used by the Swedes instead of a set to strain young green. The seeds may be used instead of coffee. The plant is eaten by horses, cows, sheep, and goats. Swine refuse it. (Linn.) The expressed juice of the stem and leaves, taken to the amount of four ounces night and morning, is very efficacious in removing many of those cutaneous eruptions, which are called, although improperly, acutitic. It must be continued for several weeks.

186. CRUCIANELLA, or Petty madder. 

Nine species; viz. angustifolia, latifolia, myrticina, patula, ciliata, pubescens, maritima, capita, monspeliaca. S. Eur. Arab.

187. RUBIA, or Madder. 

Seven species; tinctorum, or dysce madder, with annual leaves and a prickly stem, 7; chilenia, peregrina, lucida, fruticos, angustifolia, cordifolia. Siber. S. Eur. Canar.

188. MATTUSCHKEA. 

One species; viz. hisreta. Carolina.

189. SIPHONANTHUS. 

Two species; viz. indica, and angustifolia. India.

190. ROUSSEA. 

One species; viz. simplex. Mauritius.

191. FREELICHA. 

One species; viz. paniculata.

192. SCOLEANTHUS. 

One species; viz. vernicolor.

193. CATERSSEA, or Lily Thorns. 

Two species; viz. spinosa, and parviflora. Jamaica, Isle of Providence.

194. IXORA, or American Jessamine. 

Six species; viz. cocinea, parviflora, alba, americana, fasciculata, and multiflora. E. Ind. Jam. S. Am.

195. PAVETTA. 

Five species; viz. indica, vilosa, longiflora, caffra, pentandra. ·G. of G. Hope.
Tetrandria.

196. Eneidea.
One species; viz. littoralis. Jamaica.

197. Siderodendrum.
One species; viz. triflorum. S. Amer.

198. Petesi.a.
Three species; viz. stipularis, carneae, tomentosa.

199. Hoffmannia.
One species; viz. pedunculata. Jamaica.

200. Chomelia.
One species; viz. spinosa.

201. Petitia.
One species; viz. domingensis. St Domingo.

Two species; viz. obovata, lanceolata. Isle of Bourb.

203. Pyrostria.
One species; viz. salicifolia.

204. Cunninghamia.
Two species; viz. sericea, verticillata. Guiana, Isle of Bourbon.

205. Echiphila.
Eight species; viz. martineciensis, elata, mixta, villosa, arborescens, levis, festuca, triloba. W. Indies.

206. Mitchella.
One species; viz. repens. N. America.

207. Coccorepsilum.
Three species; viz. repens, uniflorum, biflorum. Jam.

208. Wallenia.
One species; viz. laurifolia. Jamaica.

209. Calligarcia, or Jonatinia.

210. Aquaria.
Two species; viz. aculeata, macrophylla. S. Am.

211. Witheringia.
One species; viz. solanacea. S. Am.

212. Myrcemia.
One species; viz. scandens. Guiana.

213. Polyphorum, or Carolina Flax.
One species; viz. procumbens. N. Amer.

214. Labiata.
Two species; viz. selligiflora, pedunculata. Hispan.

215. Lasiosoma.
One species; viz. cirrhosa. Guiana.

216. Manettia.
Five species; viz. reclinata, lygistem, cocinea, picta, lanceolata. S. Amer. Jam.

217. Bellardia.
One species; viz. repens. Guiana.

218. Pemza.
Nine species; viz. sarcocolla, mucronata, marginata, lateriflora, tomentosa, succata, squamosa, fruticulosa, myrtoides. C. of G. Hope.

Nine species; viz. coccicoides, scabra, fascicula, articu-
lata, purpurea, muscosa, pausilla, glabella, ciliaria. Cape.

220. Buddelia.
Nine species; viz. americana, occidentalis, globosa,
salvifolia, madagascariensis, salicifolia, diversifolia, virgata, incompta. Cape. S. Amer. W. Indies.

221. Exacum.
18 species; viz. viscosum, pendulatum, albens, aureum, sessile, cordatum, punctatum, quadrangulare, gujanense, diffusum, teucrium, * filiforme, asphyl-
um, heterocentrum, spicatum, ramosum, verticillatum, hyssopifolium. Asia, Africa.

222. Plantago, or Plantain.
33 species; viz. * major, crassa, asiatica, maxima, * media, virginica, altissima, * lanceolata, capensis, lago-
pus, lunitanica, patagonica, albicans, hispida, alpina, bellard, cretica, barbata, * maritima, seniora, recur-
vata, macrobiza, serraria, * coronopis, loefingii, cornu-
noti, amplexicaulis, pellatum, squarrosa, indica, pumila, cynops, afr. Eur. Egypt, China, N. Amer.

* P. leaves spear-shaped; spike nearly egg-shaped, na-lanceolata ked; stalk angular.—It is usually called rib-wort or rib-grass. Linneaus says it is eaten by horses, sheep, and goats, and that cows refuse it; but Haller attributes the richness of the milk in the famous Alpine dair-
ies to this plant, and to the alchemilla vulgaris. The total absence of this plant in marshy lands, is a certain cri-
terion of the wretched quality thereof: in proportion as such soils are improved by draining, this plant will flourish and abound. When sown for pasturage upon rich sands and loams, this plant gives a considerable herbage; and on poorer and drier soils, it does well for sheep, but is inferior to some others. Mr Marshall ob-
erves that it has stood the test of 20 years established prac-
tice, in Yorkshire, and is in good estimation, though not well affected by horses, and bad for hay from retaining its sap. The plantago major or great plantain, is called septinervia, from its having 7 large nerves or ribs running along each leaf; the narrow-leaved sort, above described, has only five ribs, and hence it is cal-
lcd quinquenervia. The leaves are lightly aromatic, and the seeds are said to be so; and hence they stand recom-
ended in hemmorhages and other cases of this kind, where medicines of this kind are proper. The leaves bruised a little are the common application of the common people to slight flesh wounds.

Plantain has been alleged to be a cure for the bite of the rattlesnake; but for this there is probably little foundation, although it is one of the principal ingredients in the remedy of the negro Caesar, for the discovery of which he received a considerable reward from the assembly of S. Carolina.

223. Scoparia.
Three species; viz. dulcis, procumbens, arbores. Egypt. N. America.

224. Centunculus, or Base Pimpernel.
One species; called minimum. Germ. S. Eur.

225. Sanguisorba, or Great Wild Burnet.
Three species; viz. * officinalis, media, canadensis. Eu-
erope. N. America.

226. Cissus.
18 species; viz. vitiginea, capensis, repanda, latifolia, cordifolia, rotundifolia, saccoidea, quadrangularis, acida, cirrhosa, trifoliata, microcarpa, crenata, cardon, obo-
evata, japonica, pentaphylla, pedata. Arabia, Ind. Jam.

One species; viz. * alpinum.
228. **Cornus**, or Dogwood, *Cornel Cherry.*

230. **Samara.**

231. **Fagara.**
12 species; viz. triphylla, evodia, pterota, piperita, tragodes, zanthoxyloides, hordica, armata, avicennae, octandra, elaphrium. W. Ind. Japan.

232. **Hartogia.**
One species; viz. capensis. C. of G. Hope.

233. **Monetia.**
Two species; viz. barlerioides, dissecta. E. Ind.

234. **Blackburnia.**
One species; viz. pinnata.

235. **Ptelea, or Shrub Trefoil.**
One species; viz. trifoliata. N. Amer. S. sea isles.

236. **Skimmia.**
One species; viz. japonica. Japan.

237. **Othera.**
One species; viz. japonica. Japan.

238. **Oiza.**
One species; viz. japonica.

239. **Ludwigia, or Base Virginian Loose-stripe.**
Five species; viz. alternifolia, bispata, jussiaeoides, oppositifolia, erigeta. India, Amer. Jam.

240. **Oldenlandia.**
13 species; viz. verticillata, digynia, trinervia, depressa, capensis, uniflora, biflora, pentandra, umbellata, corymbosa, hirsuta, debilis, foetida.

241. **Ammania.**
Seven species; viz. latifolia, ramoseir, debilis, sanguinolenta, octandra, baccifera, pinnatifida. Ind. Virginia.

242. **Isnardia.**

243. **Trapa, or Floating Water-caltrops.**

244. **Dorstenia, or Contrayerva.**
Ten species; viz. cordifolia, brasiliensis, arifolia, houstoni, contraerba, drakena, caudescens, lucida, pubescens. Arab. S. Amer.

245. **Pothos, or Stunk-weed.**
12 species; viz. scandens, acaulis, lanceolata, crenata, violacea, crassinervia, cordata, macrophylla, pinnata, palmata, digitata, pentaphylla. Ind. Amer.

246. **Cometes.**
One species; viz. alternifolia. E. Ind. Surat.

247. **Curtisia, or Hassagey-tree.**
One species; faginea. C. of G. Hope.

248. **Chloranthus, or Tea-leaved Chus-lan.**
One species; viz. inconspicuus. Cape, China, Jap.

249. **Eleagnus, or Olearia or Wild Olive.**

250. **Conatocarpus.**
One species; viz. micranthus. Japan.

251. **Santalum, or Sanders.**
One species; viz. album.—What is usually called *White Sanders wood*, is brought from the East Indies, in billets about the size of a man's leg, of a pale whitish colour. It constitutes the outer part of the timber, or that part of the tree which is nearest the bark. This white part has little sensible smell or taste. The inner part of the timber, which usually receives the appellation of *Yellow Sanders wood*, is of a pale yellowish colour, of a pleasant smell and a bitterish aromatic taste, accompanied with an agreeable sort of pungency. Distilled with water it yields a fragrant essential oil, which thickens in the cold to the consistence of a balsam. Digested in pure spirit it imparts a rich yellow tincture, which being committed to distillation, the spirit arises without bringing over any thing considerable of the virtues of the sanders. The residuum contains the virtues of six times its weight of the wood. Hoffman looks upon this extract as a medicine of similar virtues to ambergris, and recommends it as an excellent restorative in great debilities.

252. **Struthiola.**
Five species; viz. virgata, nana, juniperina, erecta, ovata. C. of G. Hope.

253. **Krameria.**
One species; viz. ixina. S. Amer.

254. **Acena.**
One species; viz. elongata. Mexico.

255. **Rivina.**
Four species; viz. humilia, levis, brasiliensis, octandra. W. Indies.

256. **Salvadora.**
One species; viz. persica. Persia, India.

257. **Camphorosa.**
Five species; viz. palmaeas, mossepianeas, acuta, glabra, pteranthus. S. Eur. Cape.

258. **Alchemilla, or Ladies-mantle.**
Six species; viz. capensis, *vulgaris*, *alpina*, penta-phylia, aphanoides, apaches. Alps of Eur. *A. leaves gashed.—The whole of this plant is astrin-gent. In the province of Smolandia in Gothland, they make a tincture of the leaves, and give it in spasmodic or convulsive diseases. Horses, sheep, and goats eat it. Swine refuse it. Cows are not fond of it.

**ORDER II. DIGYNIAM.**

259. **Cruzita.**
One species; viz. hispanica.

260. **Bufonia, or Toad-grass.**
One species; viz. *tenuifolia.*
Pentandria.

B O T A N Y.

261. Hamamelis, or Witch Hazel.
One species; virginica. Carolina, Virginia.

262. Cuscuta, or Dodder.
Five species; viz. europaea, americana, africana, monogynia, chinesis.

263. Hypecoum.
Four species; viz. procumbens, littorale, pendulum, erectum.

264. Nerstria.
One species; viz. depressa. S. America.

265. Galopina.
One species; viz. circzeoides. C. of G. Hope.

ORDER III. TRIGYNYA.

266. Boscia.
One species; viz. undulata.

ORDER IV. TETRAGYNYA.

267. Ilex, or Holly.
19 species; viz. aquifolium, japonica, opaca, creces, serrata, latifolia, perado, prinoides, cassine, vomitoria, crenata, emarginata, salicifolia, asiatica, integra, rotunda, obcordata, acuminata, cuneifolia. Asia, N. America.

ORDER I. MONOGYRIA.

274. Heliotropium, or Turnsole.
Includes, 22 species; viz. peruvianum, amplexicaule, indicum, parviflorum, inunudatum, yillosum, europeum, coromandelianum, malabaricum, marifolium, supinum, undulatum, lineatum, strigosum, eurasiacum, zeylanicum, persicum, scarbum, orientale, gnaphaloides, terna- tum, pinnatum. S. Eur. Asia, W. Indies, Peru.

275. Myosotis.
12 species; viz. scorpioides, * arvensis, nana, fruticos, spathulata, rupestris, virginiana, lappula, squarrosa, echinophora, spinocarpos, pectinata. Europe, N. America.

276. Lithospermum, or Groverwell.

* L. seeds wrinkled; corolla or blossoms hardly longer than the calyces or cups.—The girls in the north of
Vol. IV. Part I.

† Europe, it is said, paint their faces with the juice of the root of this plant upon days of festivity. The bark of the root tinges wax and oil of a beautiful red, similar to that which is obtained from the root of the foreign alkanet that is kept in the shops. Sheep and goats eat it. Cows are not fond of it. Horses and swine refuse it.

* L. seeds smooth; corol. scarcely longer than the officinale.

277. Anchusa, or Bugloss.
13 species; viz. paniculatum, capensis, officinalis, italica, angustifolia, undulata, tinctoria, hispida, virginica, lanata, * sempervirens, parviflora, cespitosa. Europe, Madeira, N. America.

278. Cynoglossum, or Hounds tongue.
24 species; viz. * officinale, puctum, lanceolatum, virginicum, limense, cheirifolium, apenninum, hispidum, hisutum, echinatum, muricatum, angustifolium, flavivulgare, R
Any

286. Echiun, or Vipers Bugloss.
26 species; viz. fruticosum, candidans, giganteum, strictum, argenteum, sericeum, setosum, trichotomum, hispidum, paniculatum, trigonum, capitatum, lavicum, glabrum, incaicum, spicatum, caudatum, plantagineum, italicum, rubrum, vulgare, violaceum, maritimum, creticum, orientale, lusitanicum. S. Europe, Cape, Canaries.

E. stem rough with bristles and tubercles; stem-vulgare leaves spear-shaped, rough with hair; flowers in lateral spikes.—Cows and sheep are said not to be fond of this plant. Horses and goats refuse it. Bees are fond of the flowers, but get their wings torn by its strong hairs.

287. Messerschmidia.
Three species; viz. fruticosa, arguzia, cancellata. Siber. Canaries.

288. Tournefortia, or Basket Withe.
Eleven species; viz. serrata, bursutissima, volubilis, syringefolia, foetidissima, humilis, bicolour, cymosa, argentea, sericea, suffruticosa. Ceylon, West Indies, S. America.

289. Nolana.
One species; viz. prostrata. Peru.

290. Diapensia.
One species; lapponica. Lapland.

291. Aretia.
Three species; viz. helvetica, alpina, viteliana. Alps, Pyrenees.

292. Androsace.
Ten species; viz. maxima, elongata, liiformis, septentrionalis, odoratissima, villosa, chamaemelas, obtusifolia, lactea, carnea. N. Eur. Archipelago.

293. Primula, or Primrose.
17 species; viz. verticillata, veris, elatior, farinosa, cortusoides, villosa, nivalis, longiflora, glutinosa, margmata, auricula, gigantea, minima, integrifolia, cernicolor, funicularia, viscosa, sibirica. Europe.

P. leaves toothed, wrinkled, scape many-flowered, veris lumbus of the cor. concave.—This is a low plant, growing wild in woods and hedges, and producing pale yellow flowers in the spring. The leaves have an herbaceous taste. The roots are slightly bitter, with a kind of aromatic flavour, which some compare to that of aniseeds; their expressed juice purified by settling is sometimes used as a sternutatory. The flowers have an agreeable flavour, but very weak; an infusion of them in wine, and a spirit distilled from them, are used in some places as cordial and nerveine.

294. Cartuna, or Bears-corn Sanicle.
Two species; viz. mathioli, gmelini. Alps of Sibera and Austria.

295. Tricratus.
One species; viz. admirabilis.

296. Soldanello, or Soldanel.
One species; viz. alpina. Alps of Austria and Switzerland.

297. Dodecathion, or Virginian Cowslip.
One species; viz. meadia. North America.

298. Cyclamen, or Sow-bread.
Five species; viz. coum, europaeum, persicum, hederafolium, indicum. Austria, S. Europe, Ceylon.
Pentandria.

BOTANY.

299. MENYANTHES, or Bog-bean.
Four species; viz. nymphoides, ovata, indica, trifoliata. Europe, Cape, Ceylon, Malta.

300. OPHIARRHIZA, or Serpents-tongue.
Three species; viz. mungos, mitreola, subumbellata. E. Indies, S. America.

310. LISIANTHUS.
15 species; viz. longifolius, glaucifolius carulescens, alatus, chelonioues, purpurascens, grandiflorus, exsertus, glaber, frigidus, latifolius, umbellatus, cordifolius, carinatus, trinervius. West Indies, Surinam.

311. FAGREA.
One species; viz. zeylanica. Ceylon.

312. AZALEA, or Amer. Upright Honeysuckle.
Six species; viz. pontica, indica, nudiflora, viscosa, japonica, procumbens. N. Europe, N. America.

313. SHEFFIELDIA.
One species; viz. repens.

314. SPRENGELIA.
One species; viz. incarnata.

315. EFACRIS.
Four species; viz. grandiflora, longifolia, rosarninfolia, pumila. Caribbean Isles.

316. STYPHELIA.
Eight species; viz. tubiflora, ericoides, strigosa, scoparia, daphnoides, lanceolata, elliptica, juniperina.

317. WEIGELIA.
Two species; viz. japonica, coraeensis. Japan.

318. PLUMBAGO, or Lead-wort.
Seven species; viz. europaea, lapathifolia, capensis, zeylanica, rosea, scandens, auricula. S. Europe, E. Indies, S. America.

319. TRIGUEA.
Two species; viz. ambrosiaca, inodora. Isle of Bourbon.

320. PHLOX, or Base Lychnis, Lichnidea.
12 species; viz. paniculata, undulata, suaveolens, maculata, pilosa, carolina, glaberrima, divarica, ovata, subulata, sibirica, setacea. Siberia, N. America.

321. RETZIA.
One species; viz. spicata. Cape of Good Hope.

322. PORANA.
One species; viz. volubilis. East Indies.

323. CONVOLVULUS, or Bind-weed.
120 species; viz. arvensis, * sepium, wheeleri, scammonia, involucratas, sibiricus, rupesstris, farinosus, lanuginosus, incarnus, emarginatus, medium, flicaulis, tridentatus, angustifolius, japonicus, hastatus, panduratus, bracteatus, bicolor, trilobus, planatifolius, acumnatus, carolus, hederaceus, nil, purpureus, obscurus, flavus, angularis, batatas, maximus, biflorus, gemellus, striatus, pentanthus, guianensis, capitatus, hispidus, parviflorus, triflorus, verticillatus, violaceus, umbellatus, tuguriorum, cordifolius, bifidus, malabaricus, coelestis, canariensis, ferrugineus, muricatus, triquetrum, anceps, turpentum, grandiflorus, speciosus, trinervius, peltatus, jalapa, macrocarpus, tenellus, sericeus, tomentosus, quinquefloros, hermanni, arenarius, altheoides, cairicus, quinquelobus, coticus, vitifolius, dissectus, mucronatus, macrocarpus, paniculatus,
BOTANY.

Panicotinus, macrorhiza, quinquefolius, venosus, glaber, pentaphyllum, tenuifolius, siccus, pentapetaloïdes, lineatus, sactatis, cuneorum, linearis, cantabrica, aman- 
ni, pseudefolius, dorycynum, proliferus, lanatus, hy- 
strium, spinosum, eseparius, sonotheroides, floridis, cu- 
neatus, corymbosus, strigosus, tricosus, acteosolium, repens, reptans, edulis, burtus, * soldanell- 
a, imperati, pes caprae, brasiliensis, multifidus, subloba-
tus, capensis, sagittatus, littoralis, martinicenus. Eu-
ropae, Asia, Africa, America.

Sepium. * C. leaves arrow-shaped, tipped at the base; fruit-
talk four-cornered, bearing 1 flower.—The inspissated 
juice of this plant, in doses of 20 or 30 grains, is said to 
be a powerful drastic purge. Scammony is the 
inspissated juice of a species of convolulus, so much re-
ssembling this, that they are with difficulty dis-
tinguished. Though an acrid purgative to the human race, it 
is eaten by hogs in large quantities without any detri-
ment. Sheep, goats, and horses eat it. Cows refuse it.

Soldanella. * C. leaves kidney-shaped; fruitstalks with 1 flower.

It is said, that half an ounce of the juice, or a drachm 
of the powder of this plant, is an acrid purge. The 
leaves applied externally, are said to diminish dropical 
swellings of the feet. The different species furnish 
nourishment to the spinus convolulus, and pholera ef-
ferenir.

Jalap. The root of the species termed jalapa, is brought to 
us in thin slices from Xalpa, a province of New Spain. 
Such pieces should be chosen as are most compact, 
hard, weighty, dark-coloured, and about most with 
black circular strie. Slices of bryony root are said to 
be sometimes mixed with jalap. These may be easily 
distinguished by their whiter colour and less compact 
texture. This root has no smell, and very little taste 
upon the tongue; but when swallowed it affects the 
throat with a sense of heat, and occasions a plentiful 
discharge of saliva. Taken in substance in a dose of 
about half a drachm, (less or more, according to the 
circumstances of the patient) in phlegmatic 
habitis, it proves an effectual, and, in general, a 
safe purgative; performing its office mildly, seldom oc-
cassing nausea or gripes, which too frequently ac-
company other strong cathartics. In hypochondriacal 
cases, and hot bilious temperaments, it gripes violently 
if the jalap be good; but rarely takes due effect as a 
purge. An extract made with water purges almost 
universally, but weakly; and, at the same time, has 
a considerable effect by urine: the root remaining af-
fer this process gripes violently. The pure resin, pre-
bared by spirit of wine, occasions most violent, gripings 
and other distressing circumstances, but proves scarce 
at all cathartic. Triturated with sugar or with al-
monds, into the form of an emulsion, or dissolved in 
spirits and mixed with syrups, it purges plentifully in 
a small dose, without occasioning much disorder. 
The parts of the jalap remaining after the separation of 
the resin, yields to water a extract, which has no effect 
as a cathartic, but operates powerfully by urine.

Frederic Hoffman particularly cautions against giving 
this medicine to children, and assures us that it will 
destroy appetite, weaken the body, and perhaps 
occaasion death. In this point this celebrated practi-
citioner was probably deceived. Children, whose ves-
sels are lax, and their food soft and lubricating, bear 
these kinds of medicines, as Geoffrey observes, better 
than adults; and, accordingly, inoculators make much 
use of the tincture mixed with simple syrup. A com-
 pound powder of it may be employed in dropsy as a hydra-
gonlic purge; and where stimulus is not contra-
indicated, jalap is considered as a safe cathartic.

The species of the genus convolulus, called *acom-
monic, is a climbing plant, which grows in Asia.

Turkey, and affords a gum resin. The best sorts 
of the gum resin come from Aleppo, in light spongy mas-
es, easily friable, of a shining ash-colour verging to 
black; when powdered, of a light gray or whitish co-
lor. An inferior sort is brought from Smyrna in 
more compact ponderous pieces, of a darker colour, 
and full of sand and other impurities. This juice is 
chiefly of the resinous kind. Rectified spirit of wine 
dissolves five ounces out of six; the remainder is a 
mutlicaginous substance mixed with dross: proof spirit to-
tally dissolves it, the impurities only being left. It 
has a faint and unpleasant smell, and a bitterish some-
what acrimonious taste. Scammony is an efficacious 
and a strong purgative. Its dose is from three to 12 grains.

324. CANTUA.

Four species; viz. pyrifolia, buxifolia, hoitizn, co-
ronopisofila. Peru.

325. Ipomoea, or Quamoclit.

28 species; viz. quamoclit, dianthes, umbellata, sa-
roline, coccineae, lacunosa, leucaenth, solanifolia, tu-
berosa, digitata, bona nox, campanulata, violacea,
verticillata, carnea, repanda, filiformes, bastata, glau-
cifolia, simplex, hederacea, triloba, sanguinea, beder-
folia, parviiflora, heptacanthis, tannifolia, pes tigrinis.
E. and W. Indies, America.

326. Polemonium, or Greek Valerian.

Five species; viz. * coruscum, reptans, dubium, roelioideis, campanuloides. N. Eur, Asia, C. of G.
Hope, America.

327. Lightfootia.

Two species; viz. oxycoctoides, subulata. Cape of 
Good Hope.

328. Jasione, or Sheep's Scabious.

One species; viz. * montana. Europe, C. of G.
Hope.

329. Campanula, or Bell-flower.

8 species; viz. cesiana, uniflora, bellardi, pulsa,
zyosis, gracilis, glacis, grandiflora, tetraphylla, tri-
phylla, verticillata, * rotundifolia, linifolia, pubescens,
linarioides, carpatica, lobelioideis, porosa, undulata,
linearia, sessilifolia, * patula, * rapunculus, unidentata,
asciculata, persicifolia, pyramidalis, americana, nitid-
da, latifolia, ensifolia, rhomboideis, * latifolia, articu-
folia, stylosa, rapunculoides, bononiensis, vesula, pae-
ricifolia, graminifolia, * trachelium, * glomerata,
cervinaria, marginata, thyssoides, petraea, adpressa,
subulata, hispidula, panicifolia, cinerea; * peregrina,
cernua, alliiva, punctata, medium, barba, spicata,

llum, * hybrida, prismatomcarpus, cochlearifolia, limoni-
ofolia, pentagonia, perforata, capensis, procumbens,
tenella,
Pentandria. *Bophyllum.*

tenella, elatines, diffusa, hederacea, crinoides, heterophylla, erinus. Europe, N. America, Cape, Japan.

*rapunčula.*

C. leaves waved; root-leaves spear-oval; panicle compact.—The roots of this plant are said to be eaten raw in salads, or boiled like asparagus. In gardens they are blanched.

330. 

*Roezla.*

Five species; viz. ciliata, squarrosa, decurescum, muscosa, spicata. Africa.

331. Phytium, or Rampion.

16 species; viz. paniculata, schenckeri, michelli, hemisphericus, conoma, orbicularis, nigra, betonicifolia, spicata, ovata, virgata, lobelioides, lanceolata, rigida, amplexicaulis, pinnata. Europe.

332. Trachelium.

Three species; viz. careruleum, diffusum, tenifolium. Italy, Levant, Cape.

333. Samolus, Water Pimpernel.

One species; viz. *valerandi.* Europe, Asia, America.

334. Sphenoclea.

One species; viz. zeylanica.

335. Nauclea.

Six species; viz. orientalis, purpurea, parvifolia, africana, aculeata, cordifolia. E. Indies, Goiana.

336. Rondeletia.

13 species; viz. americana, odorata, trifoliata, virgata, pilosa, thyrsoides, racemosa, laurifolia, tomentosa, umbellulata, incana, hissuta, hirta. East and West Indies.

337. Macrocnemum.

Three species; viz. jamaicense, candidissimum, coccinenum. Jamaica.

338. Bellonia.

Two species; viz. aspera and spinosa. America.

339. Thouinia.

One species; viz. spectabilis. Jamaica, Hispaniola.

340. Portlandica.

Four species; viz. tetrandra, grandiflora, coccinea, hexandra. Jamaica, S. America.

341. Solandra.

One species; viz. grandiflora. Jamaica.

342. Lobelia, or Cardinal-flower.

48 species; viz. linaria, simplex, pinifolia, dorotmannia, tua, kalmania, paniculata, grammia, grandiflora, cornuta, depressa, columnnea, arborea, bellidifolia, triquetra, cingera, longiflora, tomentosa, secunda, acuminate, stricta, patula, argyrospermum, cardinalis, ferruginea, debilis, siphilitica, surinamensis, inflata, clifortiana, urens, minuta, laurentia, radicans, campanuloides, evinus, erinoides, anceps, repens, thermalis, pubescens, zeylanica, lutea, angustata, hissuta, pygmaea, coronopifolia, crenata. Cape, East and West Indies, America.

The species called siphilitica grows in moist places in Virginia, and bears our winters. It is perennial, has erect stalk three or four feet high, blue flowers, a milky juice, and a rank smell. The root consists of white fibres about two inches long, resembles tobacco in the taste, which remains on the tongue, and is apt to excite vomiting. It is used by the North American Indians as a specific for the vener-...
The white-furrowed thick outer bark is not used; the dark-brown inner bark has the common flavour, with a mixed kind of taste at first of the horse-radish and ginger, becoming at last bitter and astrigent. It seems to give out more extractive matter than the officinalis. Some of it was imported from St. Lucia, in consequence of its having been successfully used in the army and navy; and Dr. Kentish has treated of it at great length, under the name of St. Lucia bark. When fresh, it is considerably cathartic and emetic, but is said to lose these properties on drying.

The pale and red are chiefly used in Britain, the pale is brought to us in pieces of different sizes, either flat or quilled, and the powder is rather of a lighter colour than that of cinnamon. The red is generally in much larger thicker flatish pieces, but sometimes also in the form of quills, and its powder is reddish, like that of the Armenian balsam. It is much more resinous, and possesses the sensible qualities of the cinchona in a much higher degree, than the other sorts; and the more nearly the other kinds resemble the red bark, the better they are now considered. The red bark is heavy, round, and dry; friable between the teeth; does not separate into fibres; and breaks, not shivery, but short, close, and smooth. It has three layers; the outer is thin, ragged, of a reddish-brown colour, but frequently covered with mossy matter; the middle is thicker, more compact, darker-coloured, very resinous, brittle, and yields first to the pestle. The inmost is more woody, fibrous, and of a brighter red.

The Peruvian bark yields its virtues both to cold and boiling water; but the decoction is thicker, gives out its taste more readily, and forms an ink with a chalybeate more suddenly, than the fresh cold infusion. This infusion, however, contains at least as much extractive matter, but more in a state of solution; and its colour, on standing some time with the chalybeate, becomes darker, while that of the decoction becomes more faint. When they are of a certain age, the addition of a chalybeate renders them green; and when this is the case, they are found to be in a state of fermentation, and effete. Mild or caustic alkalies, or lime, precipitate the extractive matter, which in the case of the caustic alkali is re-dissolved by a farther addition of the alkali. Lime-water precipitates less from a fresh infusion, than from a fresh decoction; and in the precipitate of this last some mild earth is perceptible. The infusion is by age reduced to the same state with the fresh decoction, and then they deposite nearly an equal quantity of mild earth and extractive matter, so that lime-water, as well as chalybeate, may be used as a test of the relative strength and perissible nature of the different preparations, and of different barks. Accordingly, cold infusions are found, by experiments, to be less perissible than decoctions; infusions and decoctions of the red bark than those of the pale: those of the red bark, however, are found, by length of time, to separate more mild earth with the lime-water, and more extractive matter. Lime-water, as precipitating the extract, appears, as an equally improper and disagreeable menstrum. The power of different menstrua, as acting upon Peruvian bark, is comparatively in the following order; the most powerful solvent being placed first.

1. Dulcifried spirit of vitriol, 6. Dulcifried spirit of nitre,
2. Caustic ley, 7. Mild volatile alkali,
3. French brandy, 8. Rectified spirit of wine,
4. Soft water, 9. Mild vegetable alkali,
5. Vinegar and water, 10. Lime water.

The antiseptic powers of vinegar and bark united, are double the sum of those taken separately. The astrigent power of the bark is increased by acid of vitriol; the bitter taste is destroyed by it. The official preparations of the bark are:

1. The powder. Of this, the first parcel that passes the sieve, being the most resinous and brittle layer, is the strongest.

2. The extract. The water and spirituous extracts conjoined form the most proper preparations of this kind.

3. Spirituos tincture. This is best made with proof spirit.

4. The decoction. This preparation, though frequently employed, is inferior to a simple watery infusion.

The best form is that of powder; in which the constituent parts are in the most effectual proportion. The cold infusion, which can be made in a few minutes by agitation, the spirituous tincture, and the extract, are likewise proper in this respect. For covering the taste, different patients require different vehicles, liquorice, aromatics, acids, port-wine, small beer, porter, butter milk, brandy, rum, currant-jelly, &c.

According to some, the Peruvians learned the use of the bark, by observing certain animals affected with intermittent fevers, instinctively led to it; while others say, that a Peruvian, having an ague, was cured by having drank of a pool, in which some felled trees had so long soaked, as to give the taste of their bark to the water: and its use in gangrene is said to have originated from its curing one in an aguish patient. About the year 1649, the lady of the Spanish vicerey, the Comtessa del Cinchon, was cured by the bark, which has therefore been called cortex or pulvis comitissae, cinchona, chinachina or chimchina, kinakin or kinkina, quinaquina or quinaquina; and from the interest which the cardinal de Lugo and the Jesuits took in its distribution, it has been called cortex or pulvis Carinalis de Lugo, Jesuiticus, Patrum, &c.

As it was first introduced into practice for the cure of intermittent fevers, so it seldom fails of success, when properly exhibited in these. Practitioners, however, have differed as to the best mode of exhibiting it; some prefer giving it just before the fit, some during the fit, others immediately after it. Some again, order it in the quantity of an ounce between the fits, the dose being the more frequent and larger, according to the frequency of the fits: and this mode of exhibition, although it may sometimes lead to the employment of more bark than is necessary, is thought, upon the whole, preferable, from being the best suited to most stomachs. The requisite quantity is very different in different cases, and in many vernal intermittent it seems even hardly necessary.

It often pukes and purges, and sometimes opresses the stomach. These, or any other irregular effects that may take place, are to be counteracted by remedies particularly appropriated to them. Thus, vomiting
BOTANY.

349. Psychothria, or Ipecacuanha.

39 species; viz. asiatica, glabrata, axillaris, laurifolia, parviflora, hirsuta, pentandra, citrifolia, nitida, marginita, tenella, nervosa, carthaginesis, myristylum, laevis, parasitica, horizontalis, nutans, speciosa, involucrata, flexuosa, racemosa, violacea, brachyta, grandis, patens, uglinotha, serpens, herbacea, emetica, corymbosa, pubescens, pedunculata, crocea, alpina, paniculata, palicnren, lutea, longiflora. E. and W. Indies, S. America, China.

The root of the *Psychothria emetica*, or common ipecacuan, is brought from the Spanish W. Indies. It is divided into two sorts, the Peruvian and Brazilian; but the eye distinguishes three; ash-coloured or gray, brown, and white. The ash-coloured or Peruvian ipecacuan of the shops is a small wrinkled root, bent and contorted into a great variety of figures; brought over in short pieces full of wrinkles, and deep circular fissures, quite down to a small white woody fibre that runs in the middle of each piece. The cortical part is compact, brittle, looks smooth and resinous upon breaking. It has very little smell: the taste is bitterish and subacidic, covering the tongue as it were with a kind of mucilage. The brown is small and somewhat more wrinkled than the foregoing; of a brown or blackish colour without and white within; this is brought from Brasil. The white sort is woody and has no wrinkles, and no perceptible bitterness in taste. The first sort, the ash-coloured or gray ipecacuan, is that usually preferred for medicinal use. The brown has been sometimes observed, even in a small dose, to produce violent effects. The white, though taken in a large one, has scarce any effect at all: Mr Geoffrey calls this sort bastard ipecacuan, and complains that it is an imposition upon the public. Geoffrey, Newman, Dale, and Sir Hans Sloane inform us, that the roots of a kind of Apocynum (dog's-bane) are frequently brought over instead of it; and instances are given of ill consequences following from the use of these roots. If the marks above laid down, particularly of the ash-colour, brittleless, deep wrinkles, and bitterish taste, be carefully attended to, all mistakes of this kind may be prevented.

Ipecacuan was first brought to Europe about the middle of the century before the last, and an account of it published about the same time by Piso; but it did not come into general use till about the year 1686, when Helvetius, under the patronage of Lewis XIV. introduced it into practice. This root is one of the mildest and safest emetics with which we are acquainted; and has this peculiar advantage, that if it should not operate by vomit, it passes off by the other emunctories. It was first introduced among us with the character of an almost infallible remedy in dysenteries and other invenerate fluxes, as menorrhagia and leucorrhoea, and also in disorders proceeding from obstructions of long standing; nor has it lost much of its reputation by time. In dysenteries it almost always produces happy effects, and often very speedily performs a cure. In other fluxes of the belly, in beginning dysenteries, and such as are of a malignant kind, or where the patient breathes a tainted air, it has not been equally successful: in these cases it is necessary to continue the use of this medicine for several days, and to join with it opiates, diaphoretics, and the like. This root given in substance is as effectual, if not more so, than any of the preparations.

347. Solena.
One species; viz. longiflora.

348. Ucriana.
One species; viz. speciosa.
Botany

351. Dentella.
One species; viz. repensa. South sea isles.

352. Virecta.
One species; viz. bilora. Cayenne, Surinam.

353. Coffea, or Coffee-tree.
Eight species; viz. sambucina, opulina, odorata, arabica, triflora, guianensis, paniculata, occidentalis. Yemen in Arabia, W. Indies, S. America.
The coffee arabica, though it came originally from Arabia, is now cultivated in the West Indies. Its fruit is employed rather as food than as a medicine. The medical effects expected from it are to assist digestion, promote the natural secretions, and prevent or remove a tendency to sleepiness. It has been recommended in spasmodic asthma; and in some cases it is found highly useful in alleviating severe headache. In the influenza, or epidemic complaint of spring 1803, the use of coffee as the chief article of food was found to be attended with the best effects, particularly in removing that extreme debility which was the most universal and remarkable symptom of the disease.

354. Chiococa, or Snow-berry.
Two species; viz. racemosa and barbata. Jamaica, S. America.

355. Vangueria.
One species; viz. edulis. Isle of Madagascar.

356. Canephora.
Two species; viz. axillaris and capitata. Madagascar.

357. Cephalis.
12 species; viz. violacea, tomentosa, punicea, elata, axillaris, purpurea, alba, glabra, involucrata, tetrandra, sessiliflora, muscosa.

358. Bertiera.
One species; viz. guianensis.

359. Hamelia.
Five species; viz. patens, axillaris, chrysanth, venetiosa, sessiliflora. S. America, W. Indies.

360. Schwenkfeldia.
Three species; viz. hirta, cinerea, aspera. West Indies.

361. Lonicer, or honeysuckle.
* L. heads egg-shaped, thick, terminating; leaves *perilchyme* stinct, deciduous; blossom gaping.—The beauty and *num*. fragrance of the flowers of this plant render it a pleasing ornament to our gardens, hedges, and arbours. Cows, goats, and sheep eat it; horses refuse it. Various insects feed upon it.
* L. fruit talks 2-flowered; berries distinct; leaves *xylotum* very entire, pubescent. In the north of Europe this is a common plant; Linnaeus informs us it makes excellent garden hedges in a dry soil: that the clear parts between the joints of the shoots are used in Sweden as tubes for tobacco pipes, and that the wood being extremely hard makes teeth for rakes, &c.

362.

Chimarrhis.
One species; viz. cynosura. Martinico.
nal inflammations and hemorrhoids. The Edinburgh college directs an extract to be prepared by evaporating the expressed juice of the leaves. This has been given with great advantage in convulsive affections and epilepsies: out of 14 epileptic patients, 8 were entirely cured by it at Stockholm. The dose from 2 to 16 grains a day. The seeds or leaves given internally bring on delirium, tremors, swelling, itching, eruption, and inflammation on the skin; these effects were produced by a dose of a drachm and a half in a girl nine years old. Cows, goats, sheep, and horses, refuse it.

378. HYOSCYAMUS, or Henbane.

Eight species; viz. *niger, rosalatum, albus, aureus, muticus, pusillus, physaloides, scoparia. S. Europe, Siberia, Persia.

* H. leaves embracing the stem, indented flowers sitting. The seeds, the leaves, and the roots taken internally are reputed poisonous; and well-attested instances of their bad effects are recorded: madness, convulsion, and death, are the general consequences. But Dr Smith says, he has often eaten the seeds with impunity. It is said that the leaves scattered about a house, will drive away mice. The Edinburgh college order the expressed juice of the plant to be evaporated to an extract; and perhaps in this state it may be advantageously joined with opium, where the effects of that medicine are desirable, and costiveness is to be avoided. There is no doubt of its being an useful medicine under proper management. The dose is from half a scruple to half a drachm. Goats are not fond of it; horses, cows, sheep, and swine refuse it; sheep are, however, said sometimes to eat it when young; *Chrysomela hyoscyami and the *cicera *hyoscyami are found upon it.

379. NICOTIANA, or Tobacco.

Seven species; viz. tabacum, fruticosa, *rustica, paniculata, urens, glutinosa, pusilla. America, China.

The species called *N. tabacum was first brought into Europe about the year 1560 from the island of Tobacco in America; and is now sometimes cultivated for medicinal uses in our gardens, but in general imported from America in large quantities. The leaves are about two feet long, of a pale green colour while fresh, and when carefully dried of a lively yellowish cast. They have a strong disagreeable smell, like that of the narcotic plants, and a very acrid burning taste. Taken internally, they prove virulently cathartic and emetic, occasioning almost intolerable cardiaic-gastric anxieties. By boiling water their virulence is abated, and at length destroyed: an extract made by long coction is recommended by Stahl and other German physicians, as a safe and most effectual aperient, expectorant, detergent, &c.; but this medicine, which is extremely precarious and uncertain in strength, has never come into esteem among us. Of late, however, tobacco, under the form of a vinous or watery infusion, and taken in such small doses as to produce little effect from its action on the stomach, has been recommended by Dr Fowler. He found it to be a very useful and powerful diuretic, and published many cases of dropsy and dysuria in which its employment was attended with the best effects. These good effects have been confirmed by the observation of other physicians.

Tobacco is sometimes used externally in ungents for destroying cutaneous insects, cleansing old ulcers, &c.
Bryonia

380. **JABOROSA.**

Two species; viz. Integrifolia, runcinata. Monte Video, Buenos Ayres.

381. **ATROPA, or DEADLY NIGHTSHADE.**

Seven species; viz. mandragora, belladonna, physaloids, procumbens, solanaceae, arborescens, frutescens. Europe, Peru, Lima.

- *A. stem herbaceous; leaves egg-shaped, entire.*
- The whole of this plant is poisonous; and children, allured by the beautiful appearance of the berries, have too often experienced their fatal effects. Tumours of the breasts, even of the cancerous kind, are said to have been resolved by a topical application of the fresh leaves. Dr Graham says he found great benefit from a poultice made of the roots, boiled in milk, and applied to hard ill-conditioned tumours and ulcers: and relates a deplorable case in which this poultice effected a perfect cure. There is no doubt but their external application may be productive of good effects in several cases, but the following instance shows us that their application is dangerous when the skin is broken. A lady who had a small ulcer, a little below one of her eyes, which was supposed to be of a cancerous nature, put a small bit of the green leaf upon it. In the morning the uvea of that eye was so affected, that the pupil would not contract even by the brightest light; whilst the other eye retained its usual powers. The leaf being removed, the eye was gradually restored to its former state. This could not be an accidental effect, for it was repeated three separate times, and the same circumstances attended each application. The juice of the ripe berries stains paper of a beautiful and durable purple.

382. **PHYLALIS, or ALKALENGU WINTER CHERRY.**

17 species; viz. somnifera, arista, flexuosum, arborescens, curassavica, tomentosa, viscosa, pennsylvanica, alkeengi, peruviana, angulata, arborescens, barbadensis, chenopodifolia, minima, pruniflua, prostrata. Europe, E. and W. Indies, Carolina.

383. **SOLANUM, or NIGHTSHADE.**

83 species; viz. laurifolium, verbascifolium, auriculatum, pubescens, bombense, pseudo-capitatum, microcarpum, terminalis, paniculatum, diphyllum, fugax, nigricans, retrorsum, stellatum, ducemars, trigemum, scandens, lyciaceum, tegonum, quercifolium, laurinatum, radicans, havannense, triste, racemosum, co-

**PENTANDRIA.**

- *S. stem without prickles, rather shrub-like; zigzag: stem upper leaves half-berd-shaped: flowers in tuft-like bunches.*
- [Boerhaave says it is a medicine far superior to china and sarsaparilla as a sweetener and restorative. Linnæus says, an infusion of the young twigs is an admirable medicine in acute rheumatism, inflammations, fevers, and suppression of the lochia. Dr Hill says he has found it very efficacious in the asthama. Dr Hallenberg advises it in ischiatric and rheumatic pains, jaundice, scurvy, and lues veneræ. He directs a pint of boiling water to be poured upon two draçms of the stalks sliced and dried after standing half an hour. It must be boiled 15 minutes. The dose is two cups full or more, morning and evening. The stalks may be gathered early in spring, or at the end of autumn. The root has the smell of the potato. Sheep and goats eat it; horses, cows, and swine refuse it.

384. **CAPSCUM, or GUINEA PEPPER.**

Six species; viz. annuum, baccatum, sinense, grossum, frutescens, cerasiforme. E. and W. Ind.—The *capsicum annuum* is cultivated in our gardens. It ripens its seeds in September and October. The taste of capsicum is extremely pungent and acrimonious, setting the mouth as it were on fire. It is chiefly employed for culinary purposes, and has long been used in that way; but of late it has been employed also in the practice of medicine. And there can be little doubt that it furnishes us with one of the purest and strongest stimulants which can be introduced into the human stomach, while at the same time it has nothing of the narcotic effect of ardent spirit. Dr Mackitrick Adair, who was perhaps the first that employed it as a medicine, directs its being given to the extent of six or eight grains under the form of pills, or under the form of tincture, by infusing half an ounce in a pound of rectified spirit, and giving this from one to three draçms, diluted,
Pentandra

BO T A N Y.

dilated, for a dose. He found it useful in a variety of
affections, particularly in that morbid disposition which
he calls the cachexia africana, and which he considers
as a most frequent and fatal predisposition to disease
among the slaves. This pepper has also been success-
fully employed in a species of cyananche maligna (pat-
trid sore throat), which proved fatal in the W. Indies,
resisting the use of Peruvian bark, wine, and the other
remedies commonly employed. A variety of it, called
in the West Indies bird-pepper, is the basis of a powder
brought us from thence under the name of cayan pep-
ner.

385. STRYCHNOS, or Poison-mut.
Three species; viz. nux-vomica, calaburina, potato-
rum. E. Indies.

386. IGNATIA, or St Ignatius's Beans.
One species; viz. amara. India.

387. CELOTRUN.
11 species; viz. laurifolium, nocturnum, parqui,
auriculatum, scandens, vespertilion, diurnum, venen-
tum, tomentosum, hirtum, latifolium. W. Indies, Pé-
ré.

388. LYCIUM, or Box-thorn.
11 species; viz. arium, rigidum, ruthenicum, te-
trandrum, barbaryum, cinereum, europaeum, borridum,
barbatum, boerhaviaefolium, capsulare. Europe, Asia,
Africa, America.

389. SERISSA.
One species; viz. sativa.

390. CRYPTO STOMUM.
One species; viz. laurifolium. Guiana.

391. ARIDISA, or Aderna.
Nine species; viz. tinifolia, coriacea, serrulata, acu-
ninata, humilis, solanacea, lateriflora, excelsa, parasiti-
tica. Madeira, Ceylon, W. Indies.

392. JAQUINIA.
Five species; viz. arborea, armillaria, venosa, rusci-
folia, linearis. W. Indies, S. America.

393. BASSO VIA.
One species; viz. sylvatica. Guiana.

394. CHIRONIA.
16 species; viz. trinervia, jasmoneides, lychno-
ides, nudicaulis, campanula, angustior; * phyllela, chil-
ensis; * centaurium, inaperta, maritima, spicata, linio-
des, baccifera, frutescens, tetragonum. Ceylon, Cape,
N. America.

* C. herbaceous; leaves spear-shaped; calyx shorter
than the tube of the blossom.—This plant is extremely
bitter. It is the basis of the famous Portland powder,
which prevents fits of the gout, when taken in a large
quantity, and a long time together; but brings on hard-
ness of the liver, paley, and apoplexy. A tincture of
the leaves, and the upper part of the root, is a good
medicine in weak stomachs and cachetic habits. A
decoration of the whole plant destroys lice, and cures
the itch. Cows are not fond of it, and in sheep-pasture
it is frequently left untouched.

395. LITA.
Two species; viz. rosea, cerulea.

396. CORDIA, or Schisthen Plum.
18 species; viz. myxa, obliqua, monoco, spinosa, seb-
estena, aspera, dichotoma, geraschmannus, flavescens,
toque, macrophyllae, micranthus, elliptica, collococca,
hirsuta, tetandra, patagonula, tetraphylla. Guiana.

397. EHEETIA, or Base Cherry tree.
Nine species; viz. tinifolia, aspera, rieva, internodis,
spinosa, beuereria, virgata, exuca, buxifolia. W.
Indies, S. America.

398. VARRONIA.
Nine species; viz. lineata, bullata, mirabiloides, mar-
turnicrenalis, globosa, curasavica, angustifolia, alba,
monosperma. W. Indies, S. America.

399. LAUERIA.
Five species; viz odorata, lucida, coriacea, resinosa,
tomentosa. W. Indies, S. America.

400. CHRYSTANTHEMUM, or Star-apple.
Seven species; viz. cainito, monopyrenum, micro-
carpum, argenteum, rugosum, pyriforme, glabrum.
W. Indies, S. America.

401. BUMELIA.
12 species; viz. nigra, pallida, tenax, retusa, festi-
dissima, salicifolia, mangillo, montana, nervosa, pen-
tegon, rotundifolia, cuneata. W. Indies.

402. TECTONA, or Indian Oak or Teak-wood.
One species; viz. grandis.—The teak-wood is ex-
tremely valuable for ship-building, on account of its
resisting in the Indian seas the worms which so speedily
destroy oak and all other sorts of timber. That which
is used at Calcutta is chiefly or rather entirely imported
from Rangoon, a port belonging to the Birman empire
in the eastern peninsula of India. See Asia, N° 106.

403. SIDEROXYLON, or Iron-wood.
Nine species; viz. mite, inerne, melanchophum, cym-
noecum, sericicum, argenteum, tomentosum, lycoides,
decandrum. Morocco, Cape, N. America.

404. SCHREBERA.
One species; viz. albena. G. Hope.

405. RHAMNUS, or Buck-thorn.
32 species; viz. * catharticus, infectiosus, lyci-
oides, erythroxylon, sivcidae, crenulatus, saccatilis,
theezans, sarcomphalos, ferreus, levigatus, tetragonus,
polifolius, valetinianus, cubensis, colubrinus, daucium,
alinus, pumilus, * frangula, lantifolius, glandulosus,
ellipticus, prinoides, mystacinus, alnifolius, spheropsper-
mus, hybridus, alaternus, carpinifolia, capensis, cir-
riculum. Europe, E. and W. Indies, Africa, N.
America.

* R. thorns terminating: flowers 3-cleft; male and cathart-
ica female on different plants: leaves egg-shaped; stem
upright.—A purgative syrup prepared from the ber-
ries of this plant is kept in the shops. About an ounce of it
is a moderate dose; but it generally occasions so much
sickness and gripping that it is falling into disuse. The
flesh of birds that feed upon the berries is said to be
purgative. The juice of the urine berries is of the
colour of saffron, and is used for staining maps or pa-
per. These are sold under the name of French ber-
nies. The juice of the ripe berries mixed with alum,
is the sap-green of the painters; but if they are gar-
tered late in the summer the juice is purple. The
bay affords a beautiful yellow dye. Goats, sheep, and
horses eat it: cows refuse it.

* R. without thorns: flowers hermaphrodite, with 1 frangula,
pistil: leaves very entire.—It is said, that from a

Digitized by Google
quarter to half an ounce of the inner bark of this plant
boiled in small beer, is a sharp purge. In droppings or
constipations of the bowels of cattle, it is a very cer-
tain purgative. The berries gathered before they are
ripe, dye wool green. The bark dyes yellow, and with
preparation of iron black. Charcoal prepared from
the wood is preferred by the makers of gun-
powder. The flowers are particularly grateful to bees:
goats devour the leaves voraciously, and sheep will eat
them. The *papilio rhamni* and *argus* live upon both
the species.

406. *Zizyphus.*

Ten species; viz. lineatus, volubilis, paliurus, lotus,
napeca, jujuba, xylopyrus, *aconolia*, vulgaris, *spinosa*
christi.

407. *Ventilago.*

One species; viz. *maderaspatana.*

408. *Corymbus.*

Four species; viz. *scabrium*, *filiforme*, *glabrum*, *vil-
losum*. C. of G. Hope.

409. *Phyllica*, or *Base Alaternus.*

19 species; viz. eriooides, lanceolata, bicolor, capi-
tata, eriophoros, *plumosa*, *villosa*, imberbia, stipulosa,
pinifolia, *cordata*, dioica, *buxifolia*, *spicata*, callosa,
paniculata, *imbricata*, *racemosa*, *parviflora*. C. of G.
Hope.

410. *Carpodetus.*

One species; viz. *serratus*. South sea isles.

411. *Colletia.*

One species; viz. *horrida*. Brazil, Peru.

412. *Canthus*, or *New-Jersey Tea.*

Five species; viz. *americanus*, *macrocarpus*, *asiatic-
cus*, *africanus*, *capularis*. N. America, Cape, Ceylon.

413. *Scopalia.*

Two species; viz. *aculeata*, *inermis*. South sea islet.

414. *Ruyshia.*

Two species; viz. *clusifolia*, *surubea*. W. Indies, Guiana.

415. *Arduina*, or *Cape Buckthorn.*

One species; viz. *bipinosa*. C. of G. Hope.

416. *Camax.*

One species; viz. *fraxinea*. Guiana.

417. *Butternera.*

Seven species; viz. *scabra*, *tereticaulis*, *microphylla*,
ovata, *cordata*, *herbacea*, *catalpaefolia*. S. America.

418. *Athena.*

Four species; viz. *pusilla*, *levigata*, *tomentosa*, *mag-
na*. Jamaica, Cumanas, Peru.

419. *Gluta.*

One species; viz. *beijinga*. Java.

420. *Polycardia.*

One species; viz. *madagascarantha*. Madagascar.

Two species; viz. *africana*, *retusa*. Azores, Africa.

422. *Bladhia.*

Four species; viz. *japonica*, *glabra*, *villosa*, *crispa*.
Japan.

423. *Celastrus*, or *Staff-trees.*

32 species; viz. *lucidus*, *microphyllus*, *bullatus*, *lan-
xius*, *rostratus*, *undulatus*, *octogonus*, *filiformis*, *scas-
dens*, *paniculatus*, *procumbens*, *acuminatus*, *cassinoide-
s*, *striatus*, *ceruis*, *undatus*, *edulis*, *crenatus*, *dilatatus*, *myr-
tifolius*, *myriophyllus*, *teterogonous*, *articulatus*, *alatus*, *line-
aris*, *integrifolius*, *emarginatus*, *phyllacanthus*, *buxifo-
lius*, *pyracanthus*, *rotundifolius*, *parviflorus*. Amer.
Cape, isle of Bourbon, Japan.

424. *Evonymus.*

Seven species; viz. *tobira*, *japonicus*, *europeus*, *verrucosus*, *latifolius*, *atro-purpureus*, *americanus*.

* E. flowers mostly 4-cleft; leaves sitting.—The ber-
ries vomit and purge violently. They are fatal to
Sheep. Powdered, and sprinkled upon the hair, they
destroy lice. If the wood is cut when the plant is in
blossom, it is tough, and not easily broken; and in that
state is used by watch-makers, for cleaning watches, and
to make skewers and toothpicks. Goats and sheep eat
it; horses refuse it; cows are so fond of the shoots in
the spring as constantly to break down the banks of the
fields wherever a plant of it stands.

425. *Pilocarpus.*

One species; viz. *racemosus*.

426. *Diosma*, or *African Spirea.*

30 species; viz. *oppositifolia*, *obustata*, *linearis*, *virg-
ata*, *alba*, *hirsuta*, *rubra*, *pectinata*, *erioide*, *hispa*,
ciliata, *bifurca*, *biidea*, *capitata*, *villosa*, *cupressina*, *im-
bricata*, *marginata*, *lanceolata*, *pubescens*, *latifolia*, *crr-
nata*, *tetrosana*, *uniiflora*, *rugosa*, *ovata*, *barbigera*, *pul-
chella*, *betulina*, *orbicularis*. C. of G. Hope.

427. *Hovenia.*

One species; viz. *dulcis*. Japan.

428. *Brunia.*

Eight species; viz. *nodosifora*, *palaeaceae*, *lanuginosa*, *verticillata*, *abrotanoides*, *superba*, *fragarioides*, *ciliata*.
C. of G. Hope.

429. *Staarria.*

Two species; viz. *radiata*, *glutinosa*.

430. *Walkera.*

One species; viz. *serrata*. India.

431. *Pittosporum.*

One species; viz. *coriaceum*. Madeira, Canary isles.

432. *Barberia.*

One species; viz. *theabromefolia*. Guiana.

433. *Itexa.*

Two species; viz. *virginica*, *cyrilla*. N. America.

434. *Galax.*

One species; viz. *aphylla*. Virginia.

435. *Humboldiiia.*

One species; viz. *laureaflora*.

436. *Cedrela*, or *Barbados Base Cedar.*

One species; viz. *odorata*. West Indies.

437. *Calodendrum.*

One species; viz. *capense*. C. of G. Hope.

438. *Eleodendrum.*

Two species; viz. *orientale*, *argan*. Cape, isle of Mauritius.

439. *Escalonia.*

Two species; viz. *myrtilloides*, *serrata*. S. Amer-
rica.
Pentandra.

440. Billardiéra.
One species; viz. scandens.

441. Mangiféra, or Mango-tree.
Three species; viz. indica, laxiflora, axillaris. E. Indies.

442. Hirtella.
Three species; viz. americana, triandra, paniculata. W. Indies, Cayenne.

443. Strupphia.
One species, viz. maritima. America.

444. Plectorgia.
One species; viz. ventosa. C. of G. Hope.

445. Ribes, or Currant and Gooseberry.

446. Viola, or Violet.
39 species; viz. palma, pedata, pinnata, sagittata, lanceolata, obliqua, cuculata, primulifolia, hirta, megalanica, palustris, odorata, canina, montana, nummularifolia, cenisia, canadensis, striata, pubescens, narinata, bifiola, uniflora, decumbens, tricolor, grandiflora, zoysii, calcarata, cornuta, capensis, arboreascens, stipularis, parviflora, enneaspermata, suffruticosa, calceolaria, oppositifolia, bayanthis, ipecacuanha, diandra. Alps, Pyren. Cape, America.

odorata. * V. leaves heart shaped; suckers creeping.—The flowers and seeds of this plant are said to be mild laxatives. The powdered root, in doses from 40 to 80 grains, vomits and purge. The petals give the colour to the syrup of violets, for which purpose they are cultivated in large quantities at Stratford-upon-Avon. This syrup is very useful in many chemical inquiries, to detect an acid or an alkali, the former changing the blue colour to a red, and the latter to a green. Sips of white paper stained with the juice of the petals, and kept from the air and light, answer the same purpose.

tricolor. * V. stem branched; leaves egg-shaped, toothed; cal. smooth, but half the size of the blossom.—Some allege that it innately cures the scabby complaints in young children, called crusta lactea. Boil a handful of the fresh, or half a dozen of the dried leaves, in half a pint of milk, and give this milk morning and evening, for some weeks.

447. Impatiens, or Balsam balsamine.
12 species; viz. bifida, chinesis, latifolia, capensis, oppositifolia, fasciculata, cornuta, balsamina, bifiola, trifiola, natans, solitangere. Europe, N. America, E. Indies, China.

solitangere. * I. fruitstalks many-flowered, solitary; leaves egg-shaped; stem swollen at the joints.—The whole of this plant is considerably acrid. Goats eat it. Horses, cows, and sheep refuse it. The sphinx longus lives upon it.

448. Grónovia.
One species; viz. scandens. Jamaica, Vera Cruz.

449. Lëeà.
Three species; viz. sambucina, sequata, crispa. Cape, E. Indies.

450. Argophyllum.
One species; viz. nitidum. New Caledonia.

One species; viz. laevigata. New Zealand.

452. Hedera, or Ivy.
Four species; viz. helix, pendula, mutans, terebinthinacea. Europe, N. Amer. Jam.

* H. leaves some egg-shaped, others lobed.—The roots helix are used by leather-cutters to whet their knives upon. Its evergreen leaves adorn our walls, and cover the naked trunks of trees. Apricots and peaches covered with ivy during the month of February, have been observed to bear fruit plentifully. The leaves have a nauseous taste. Some say they are given in Germany as a specific in the atrophy of children. The common people apply them to issues. The berries have a little acidity. They purge and vomit. In warm climates a resinous juice exudes from the stalks. Horses and sheep eat it. Goats and cows refuse it. Sheep are fond of it, and in severe weather it is stripped off the trees as food.

453. Vitis, or Vine.
12 species; viz. vinifera, palma, indica, flexuosa, labrusca, vulpina, heterophylla, laciniosa, hederacea, heptaphylla, pinnata, arborea. Temperate parts of the world.

V. with leaves gashed, indented, naked.—The leaves of this species, which is the proper vine tree, were formerly celebrated as astringents, but have for a long time been entirely disregarded; their taste is herbaceous with only a slight degree of roughness. The trunk of the tree wounded in the spring produces a limpid watery juice; this, called the tear of the vine, has been accounted excellent for sore eyes, and by some recommended also in ardent and malignant fevers, and as a diuretic. The flowers have a pleasant smell, which water elevates from them in distillation; along with the water a small portion of an elegant essential oil is said to arise, possessing in great perfection the fragrance of the flowers. The unripe fruit is of a very harsh, rough, sour taste; its expressed juice, called verjuice, was in great esteem among the ancients, and still continues so in some places, as a cooling astringent medicine; a rob and a syrup were formerly prepared from it. The ripe fruit or grapes, of which there are many kinds, properly cured and dried, are the raisins of the shops. The juice by fermentation affords wine, vinegar, and tar, of which mention will be made under their proper heads.

454. Euparea.
One species; viz. amara. New Holland.

455. Xégieras.
Two species; viz. majus, minus.

456. Lagocéia, or Wild Cumin.
One species; viz. cuminoides. Crete, Levant.

457. Roridula.
One species; viz. dentata. C. of G. Hope.

458. Sauvagesia.
One species; viz. erecta. Jamaica, St Domingo, Surinam.

459. Clattónia.
Three species; viz. virginica, sibirica, parfoliata. Siberia, N. Amer.
BOTANY.

465. HELICONIA, or Base or Wild Plantain. Five species; viz. caribaea, behai, humilis, pittantorum, hirsuta. Cape, W. Indies.

464. STRILOTTA. Two species; viz. reginae, angusta. Cape of C. Hope.

462. ACHRYNTHES. 16 species; viz. argentea, aspera, lappaces, echinate, muricate, patula, prostrata, seratensa, alternifolia, polygonoides, alterisima, nivea, stellata, corymbosa, teucrioidea, dichotoma. S. Eng. E. and W. Indies.

463. CELORIA, or Cock's Comb. 18 species; viz. argentea, albida, marginata, crisata, comosa, paniculata, nitida, coccinea, castrensis, monsoniae, corymbosa, caudata, trigna, virgata, polygonoides, baccata, gynaphlaeoides, nodiflora. China, E. and W. Indies, Senegal.

464. CHENOLOEA. One species; viz. diffusa.

465. ILLECEBRUM, or Mountain Knot-grass. 19 species; viz. brachiatum, sanguinolentum, lanaatum, javanicum, verticillatum, aristatum, canariense, cymosum, paronychia, capitatum, diversicatum, benghalense, arabcum, achatranthus, frutescens, polygonoides, ficoides, sessile, alpinum. S. Europe, East Indies, S. America.

466. GLAUX, or Sea Milkwort. One species; viz. maritima. Europe.

467. PLOCAMIA. One species; viz. pendula. Canary isles.

468. HEDYKEA. One species; viz. incana. Guiana.

469. THESTUM, or Base Tooth-flax. 19 species; viz. linophyllum, alpinum, humile, lineatum, squarrosum, friese, funale, spicatum, capitatum, strictum, umbellatum, fragilis, scabrum, paniculatum, amplexicaule, trifolium, euphorbioides, colpium, spinosum. Alps of Europe, Cape, N. Amer.

470. QUINCHAMAL. One species; viz. chilenii. Chili.

471. RAUWOLFIA. Four species; viz. nuda, glabra, canescens, tenementos. W. Indies. S. America.

472. PEDERIA. Two species; viz. fertilis, fragrans. India.

473. CARISSA. Five species; viz. cardiflora, spinarum, edulis, inermis, mitis. India, Arabia.

474. GYNOPOGON. Three species; viz. stellatum, alzisia, scandens. South sea isles.

475. CERBERA. Five species; viz. abovai, ovata, parviflora, manghas, thevetia. S. Amer.

476. WEBERA. Three species; viz. corymbosa, cymosa, tetrandra.

477. GARDENIA, or Cape Jessamine. 17 species; viz. radicans, florada, thumbergia, latifolia, clusia, foliosa, gymnifera, muscenda, genipa, rothschildi, uliginosa, armata, spinosa, dometorum, randia, micranthus, scandens, multiis. Cape, E. and W. Indies, Japan.

478. WILLOWBEE. Two species; viz. acies, scandens. Guiana.

479. ALLAMANDA. One species; viz. cathartic. Surinam, Cayenne.

480. UNICA, or Periwinkle. Five species; viz. minor, major, lutes, rosea, parviflora. Ger. Fr. Sp. E. Indies, N. Amer. * U. sestrae trailing: leaves spear-egg-shaped; flowers minor on fruitstalks. The fruit of this plant seldom comes to maturity. It may, however, be easily obtained by planting the U. major in a pot, where the roots not having free room to extend themselves, the juices are more copiously p. spelt towards the pistil, which then expands into well-formed seed-vessels.

481. NERIUM, or Oleander, or Rosal Bay. Eight species; viz. oleander, odoratum, salicinum, obesum, zeylanicum, divaricatum, antidysentericum, coronarium. S. Europe, E. Indies.

482. ECHITES, or Sussana-flower. 22 species; viz. biflora, quinquangularis, annularis, tomentosa, subecta, domingensis, agglutinata, purpureis, torulos, umbellata, circinalis, floribunda, trifida, repens, corymbosa, costata, spicata, siphilitica, caudata, schizandra, succulent, basinosa. W. Indies, Surinam, Carolina, Cape.

483. PLUMARIA, or Red Jessamine. Four species; viz. rubra, alba, obtusa, pudica. W. Indies, S. America.

484. CAMERARIA. Four species; viz. latifolia, zeylanica, lutea, angustifolia. W. Indies, S. America.

485. TABERNANTHANA. 12 species; viz. citrifolia, laurifolia, echinata, grandiflora, cymosa, anglydalis, discolor, percarinifolia, elliptica, alternifolia, amsonia, angustifolia. East and West Indies, N. America, Japan.

ORDO II. DIGNYIA.

486. PERSILGARIA. Five species; viz. glabra, edulis, tomentosa, purpurea, japonica. India, Japan.

487. PERILOCAC, or Virginian Silk. 11 species; viz. greca, secamone, levigata, angustifolia, esculenta, emetica, indica, capsularis, africana, tunicata, sylvestris. Syria, Cape, India.

488. CYNNAMON, or Base Dogs-bone. 25 species; viz. viminale, filiforme, crippum, tenuilum, obtusifolium, capense, acutum, planifolium, tristratum, grandiflorum, nigrum, racemosum, maritimum, suberosum, carbolineum, obliquum, hirtum, criptiflorum, prostratum, monspeliacum, extensus, reticulatum, undulatum, parviflorum, erectum. S. Europe, Cape, E. Indies, America.

489. APOCYNUM, or Dog's-bone. 14 species; viz. filiforme, bastatum, androsemifolium,
Pentandria.

BOTANY.

lium, cannabis, hypericifolium, venetum, frutescens, paniculatum, umbellatum, reticulatum, cordatum, lanceolatum, triflorum, lineare. Am. isles, Adriatic, India.

493. ACLEPIAS, or Swallow-wort. 41 species; viz. aphylla, undulata, crispa, pubescens, mucronata, procera, giganta, grandiflora, carnos, syriaca, amoena, purpureascens, variegata, curassavica, nivea, lanifera, parviflora, incarnata, pulchra, critifolia, decumbens, lactifera, vincetoxicum, nigra, fastid, convolvulacea, vulubilis, alexia, asthmatica, viminalis, arborescens, fruticos, sibirica, da- surica, setosa, filifera, verticillata, mexicana, lianaria, rubra, tuberosa. Europe, Africa, East Indies, America.

491. HOSTEA.
One species; viz. viridiflora.

492. MELODINUS.
One species; viz. scandens. New Caledonia.

493. CYPROPEA.
Eight species; viz. candelabrum, tuberosa, bulbosa, biflora, juncea, acuminata, sagittata, tenuiflora. Cape, Ceylon, Malabar.

494. STAFELLA, or African Swallow-wort.

495. LINCOLNIA.
One species; viz. alopecuroidea. C. of G. Hope.

496. HERNIARIA, or Rupture-wort.
Six species; viz. * glabrum. * herba, alpina, fruticos, lenticulata, polygonoides. Germany, Spain, Italy, Chili.

* H. Plant smooth.—This plant is a little saltish, and astringent. It is said to increase the secretions by the kidneys, and that the juice takes away specks in the eye; but, to the virtue for which it has been most celebrated, that of curing ruptures, it has no title. Cows, sheep, and horses eat it. Goats and swine refuse it.

497. CHENOPODIUM, or Goosefoot, or Wild Orach.

* C. Leaves triangular, arrow-shaped, very entire; spikes compound, leafless, axillary.—This plant is said to be cultivated as spinach by the poor people at Boston in Lincolnshire. The young shoots, peeled and boiled, may be eaten as asparagus, which they resemble in flavour. They are gently laxative. The leaves are often boiled in broth. The roots are given to sheep that have a cough. Goats and sheep are not fond of it.

Cows, horses, and swine, refuse it.

* C. leaves diamond triangular, sawed, entire behind, album. the uppermost oblong; bunches upright.—Cows, goats, and sheep eat it. Horses refuse it. Swine are extremely fond of it. A black aphis feeds upon it, and sometimes destroys it.

* C. leaves awl-shaped, semi-cylindrical.—It is an ex-maritico- cellent pot-herb. The phalaena lubricipeda feeds upon mum, most of the species.

C. with leaves oblong indented; branches naked, botrys. many-cleft. Called Jerusalem oak.—It is cultivated in gardens. It has a strong, not disagreeable smell, and a warm, somewhat pungent taste. It is recommended as a carminative pectoral, and it has also been recommended as an emmenagogue. Infusions of the leaves and seed may be drank as tea; and in this form it has been recommended in cases of chronic catarrh. But the proper menstruum, both for the leaves and seed, is rectified spirit.

* C. with entire, diamond-shaped, oval leaves, with vulvaria: flowers incorporated at the bosom of the leaves. Stink- ing orach. It is a low plant, sprinkled all over with a kind of whitish clammy meal; it grows about dunghills and waste places. The leaves have a strong fetid smell, with which the hand, by a light touch, becomes so impregnated, as not to be easily freed from it. Its smell has gained it the character of an excellent anti- hysterical; and this is the only use it is applied to.— Tournoefort recommends a spiritual tincture, others a decoction in water, and others a conserve of the leaves, as of wonderful efficacy in uterine disorders; but in the present practice it is little employed.

498. BETE, or Beet.

Four species; viz. vulgaris, patula, cilia, maritima. France, Portugal, Madeira.—The beta vulgaris has of late attracted much notice on the continent, from the discovery of M. Achard of Berlin, that sugar may be extracted from it in large quantities with profit. See Sugar.

499. MICROTEA.
One species; viz. debilis.

500. SALSOLA, or Glass-wort.
25 species; viz. * kali, tragus, rosaceae, soda, sativa, spicata, altissima, trigyna, salsa, nudiflora, flavescens, hisuta, laniflora, hyssopofolia, polyclonos, prostrata, monandra, vermiculata, arbuscula, aphylla, arborescens, fruticos, indicia, sedoides, munitata. Europe, Egypt, Cape, Asia, Carnatic.

501. ANABASIS, or Berry-bearing Glass-wort.
Five species; viz. aphylla, cretacea, foliaceae, spinosissima, sardacifolia. Spain, Caspian sea, Egypt.

502. CRESSA.
Two species; viz. cretica, indica. Crete, Arabia.

503. COMPHRENA, or Globe Amaranth.
Ten species; viz. globosa, perennis, hispida, aegusi- florae, vermicularis, brasiliensis, serrata, interrupta, flavo, arborescens. India, S. Amer. New Gran.

504. BOSEA, or Golden-rod Tree.
One species; viz. yervamora. Canary isle.

505. ULMUS, or Elm-tree.
Seven species; viz. * campestria, suberosa, effusa, americana,
americana, memoralis, pumila, integrifolia. N. Europe, N. America.

* U. leaves doubly serrated, unequal at the base; flowers almost sitting, coronoated together.—A decoction of the inner bark, drunk freely, has been known to carry off the water in dropsies. It cures the lepra system of Sauvages. The bark dried and ground to powder has been mixed with meal in Norway, to make bread in times of scarcity. The flowers have a violet smell. The wood, being hard and tough, is used to make axe-trees, mill-wheels, heels of boots, chairs, and coffins. The tree is beautiful, and well adapted to make shady walks, as it does not destroy the grass; and its leaves are acceptable to cows, horses, goats, sheep, and swine; for this purpose, it should be grafted upon the U. glabra, and then the roots will not send out suckers, which the common elm is very apt to do, and give a great deal of trouble to keep the ground clear of them. It loves an open situation, and black or clayey soil. It bears to be transplanted. *Papilio polyxenoros and C. album, phalana lubricepda, pavonia betularia et vellica, cinex ulmi et striatus, cicada ulmi, aphid ulmi, feed upon it. The latter generally curl the leaves so as to make them a secure shelter against the weather. Silk worms will devour the tender leaves with great avidity.

506. NAMA.
One species; viz. jamaicensis. Jamaica.

507. HYDROLEA.
Three species; viz. spinosa, trigynia, zeylanica. E. and W. Indies, America.

508. ROCHEFORTIA.
Two species; viz. cuneata, ovata. Arabia.

509. HEUCHERA, or Virginian Sanicle.
One species; viz. americana. Virginia.

510. VELEGIA.
One species; viz. rigida. Spain.

511. SWERTIA, or Marsh-Gentian.
Six species; viz. *perennis, diffusorum, decumbens, corniculata, dichotoma, tetrapetala. Siberia, Austria, Virginiana, Canada.

512. GENTIANA, or Gentian.
56 species; viz. lutea, purpurea, pannonica, punctata, campanulata, septemfida, asclepiadea, montana, cruciata, macrophylla, ascendentis, *pneumonanthe, tri flora, frigida, alida, saxosa, saponaria, ochroleuca, villosa, linearia, quinquiflora, aurea, glauca, exaltata, acaulis, altaica, pyrenaica, verna, utriculosa, bavarica, imbricata, prostrata, *nivalis, pumila, aquatica, scilicoides, umiflora, germanica, *amarella, obtusifolia, uliginosa, pratensis, *campestris, auriculata, tenella, glacialis, dichotoma, nama, carinithica, sulcata, rotata, ciliata, crinita, barbata, dentosa, serrata.—The gentiana lutea is said to be found wild in some parts of England; but the dried roots are most commonly brought from Germany. They are much used in medicine. They should be chosen fresh, and of a yellow or bright colour within. This root is a strong bitter, and as such very frequently made use of in practice: in taste it is less exceptional than most other bitter. Infusions of it, flavoured with orange-peel, are sufficiently grateful. It is the capital ingredient in the

ANY.

513. DICHHONDRA.
Two species; viz. repens, sericea. Jamaica, South sea isles.

514. VAHLIA.
One species; viz. capensis. C. of G. Hope.

515. BUMALDA.
One species; viz. triflora. Japan.

516. PHYLIS, or Base Hares-ear.
One species; viz. nobila. Canary isles.

517. CUSSONIA.
Two species; viz. thyrsifolia, spicata. C. of Good Hope.

518. ERYNGIUM, or Sea-holly.

* E. root leaves roundish, plaited, thorny; flowering maritim heads on fruitstalks; shaft 3-pointed.—The leaves are mucun sweetish, with a light aromatic warmth and pungency. The roots are supposed to have the same aphrodisiac virtues as the orchis tribe. They are kept in the shops, candied.

519. HYDROCYTLE, or Water Navel-wort.

520. AZORELLA.
Two species; viz. filamentosae, cespitosa.

521. SANICULA, or Sanicle.

522. ASTRANTIA, or Black Master-wort.
Five species; viz. epipactis, major, carniliola, minor, ciliaris. Alps of Europe.

523. BUPLEURUM, Hares-ear.
23 species; viz. *rotundifolium, stellatum, petreum, graminifolium, angulosum, pyrenaicum, longifolium, falcatum, caricifolium, odontites, semicompis, ranunculoides, rigidum, *tennisimum, baldense, gerardi, junceum, nudum, fruticosum, coriacu um, frutescens, spinosum, difforme. Germany, Switzerland, S. Europe.

525. ECHINOPHORA, or Prickly Parsnip.

526. HASSELQUISTIA.
Two species; viz. aegyptiaca, cordata. Egypt, Levant.
B O T A N Y.

527. **Tordylion**, or **Haricot-wort of Crete**.
Six species; viz. syriacum, officinalis, peregrinum, apulum, maximum, silvestre. Austria, Italy, Crete, Syria.

528. **Cauclus**, or **Base Parsley**.
13 species; viz. grandiflora, daucoides, latifolia, mauritianica, pumila, orientalis, africana, leptophylla, platycarpus, arvensis, anthracos, japonica, nodosa. S. Europe, Egypt.

529. **Artemisia**.
One species; viz. squamata. Levant.

530. **Daucus**, or **Carrot**.
Six species; viz. carota, mauritianica, lucidus, visnaga, gigandias, muricatus. Europe, Barb. Carolina.—For the culture and properties of the carrot, see Agriculture, No. 40, 341—353.

531. **Ammi**, or **Bishop’s-weed**.
Four species; viz. magus, copticum, glaucifolium, daucifolium. Austria, S. Europe, Egypt.

532. **Bunium**, or **Pig or Earth-nut**.
Three species; viz. bulbocastanum, majus, aromaticum. Germany, France.

533. **Conium**, or **Hemlock**.
Four species; viz. maculatum, rugosum, rigens, africanum. Europe, Cape.

534. **Selinum**, or **Milk Parsley**.
Nine species; viz. sylvestre, palustre, austriacum, sibiricum, carduils, chabret, seguierii, monnierii, ecipsae. Europe.

535. **Athamanta**, or **Base Spigned**.
11 species; viz. libanitis, cerrirva, sibirica, condensata, incana, oreoselinum, ficula, matthii, cretenis, annua, chinensis. Europe.—The seeds of the A. Cretenis, or Candy Carrot, are brought from the Levant. It is an umbelliferous plant which grows in the island of Candy and the south of Europe. The seeds have a warm biting taste, and an aromatic smell. They are said to be diuretic, but are not at present regarded in medical practice.

536. **Fucidanum**.
11 species; viz. officinale, alpestre, capillaceum, tenuifolium, sibiricum, japonicum, silius, alatacium, aureum, nodosum, geniculatum. Alps, Canaries, Japan.

537. **Crepis**, or **Sempervirens**.
Two species; viz. maritimum, latifolium. Sea shores Europe, Canary.

538. **Cachrys**.
Seven species; viz. odontalgica, libanitis, morisonii, sica, tauricus, cretica, panactisola. Spain, Sicily.

539. **Ferula**, or **Fennel giant**.
12 species; viz. commonis, sibirica, glauca, rabenis, tingitana, farigula, orientalis, meoidea, nodiflora, canadensis, assafactis, persica. Europe, Persia, N. America.

The large umbelliferous plant, with obtuse leaflets, alternately indented, called ferula assafactis, is a native of Persia, and produces a valuable concrete juice. This juice exudes from wounds made in the root of the plant, liquid and white like milk. On being exposed to the air it turns of a brownish colour, and gradually acquires different degrees of consistency. It is brought to us in large irregular masses, composed of various little shining lump or grains, which are partly of a whitish colour, partly reddish, and partly of a violet hue. These masses are accounted the best, which are clear, of a pale reddish colour, and variegated with a great number of elegant white tears. This drug has a strong fetid smell, somewhat like that of garlic. It loses, with age, of its smell and strength, a circumstance to be attended to in the use of it. It consists of about one-third part of pure resin, and two thirds of gummy matter; the former soluble in rectified spirit, the latter in water. Proof spirit dissolves almost the whole into a turbid liquor; the tincture in rectified spirit is transparent.

Assafactis is the strongest of the fetid gums, and of frequent use in hysteric and different kinds of nervous complaints. It is likewise of considerable efficacy in fistulent colics, and for promoting all the fluid secretions in either sex. The ancients attributed to this medicine many other virtues, which are not at present expected from it. This gumy resin is an ingredient in the gum pills of the druggists, fetid tincture, tincture of soot, and fetid volatile spirit.

540. **Laserpitium**, or **Laser-wort**.
23 species; viz. latifolium, libanitis, capense, trilobum, aleuqitisolium, gallicum, angustissimum, formosum, angustifolium, aureum, prutenicum, daucicum, silosolium, aciphylla, pencecanoides, siex, archepracica, ticas.
B O T A N Y.

543. Angelica.  

544. Sium, or Water Parsnip.  
18 species; viz. filifolium, *latifolium, angustifolium; *nodiflorum, repens, sisarum, rigidius, japonicum, falcari, paniculatum, grandiflora, patulum, gr ec um, decumbens, siculum, asperum, hispidum, villosum. Europe, China, Japan, N. America.  

548. Oenanthe, or Water Drop-wort.  

549. Phellandrium.  
Two species; viz. *aquaticum, mutellina. Europe.  

Pentandria.  

It is not nauseous, and children take it readily, if mixed with milk. In the doses given, it neither affects the head, the stomach, nor the bowels.

545. Sison, or Base Stone-parsley.  

546. Buon, or Macedonian Parsley.  
Five species; viz. macedonicum, galbanum, lavignatum, gumiferum, rigidius. Greece, Barb. Cape.

547. Cuminum, or Cuminin.  
One species; viz. cyminum. Egypt, Ethiopia.—This umbelliferous plant resembles fennel in appearance, but is much smaller. The seeds used in Britain are brought chiefly from Sicily and Malta. Cumin seeds have a bitterish warm taste, accompanied with an aromatic flavour, not of the most agreeable kind. An essential oil is obtained from them by distillation, in which their activity is concentrated; and they are not unfrequently used externally, giving name both to a plaster and cataplasm in medical practice.
Pentandra.

550. Cicuta, or Water-Hemlock.
Three species; viz. *virosa, bulbifera, maculata.* Eur. N. Amer.

*virosa.* C. umbels opposite the leaves; leafstalks bordered, blunt.—This is one of the rankest of our vegetable poisons. Numerous instances are recorded of its fatality to the human species. Early in the spring, when it grows in the water, cows often eat it, and are killed by it; but, as the summer advances, and its scent becomes stronger, they carefully avoid it. Though a certain and fatal poison to cows, goats devour it greedily, and with impunity. Horses and sheep eat it with safety.

551. Aethusa, or Fools-parsley.
Four species; viz. *cynapium, bonius, meum, fatus.* Europe.

cynapium. *Æ. all the leaves alike; fruit nearly globular.—This plant, from its resemblance to common parsley, has sometimes been mistaken for it, and when eaten, it occasions sickness. If the curled-leafed parsley only was cultivated in our gardens, no such mistakes would happen. Cows, horses, sheep, and swine eat it. It is noxious to geese.

meum. *Æ. all the leaves divided into many bristle-shaped segments; involucrem 2 leaf; fruit egg-oblong, tapering at each end.—Linnæus says, that the radical fibres of this plant form the basis of the cutículae aggregatæ. The roots and seeds are aromatic and acrid. They have been used as stomachics and carminatives. They are sometimes given to cure tertians; and there is no doubt but they will often answer as well as pepper, and other acrid aromatics.

552. Coriandrum, or Coriander.
sativum. C. fruit globular.—The leaves have a very strong and disagreeable scent. The seeds are grateful to the taste, and incrusted with sugar are sold by the confectioners, under the name of coriander comfits. The Edinburgh college use them as correctors in the bitter infusion, and the preparations of senna; nothing so effectually covering the disagreeable taste of that medicine. They have been considered as suspicious, if not deleterious; but six drams of them have been taken at once, without any remarkable effect.

553. Scandix, or Shepherds-needle.

odorata. *S. seeds narrow; angular.—The seeds are used in the north of England, for polishing and perfuming oak floors and furniture.

cersolium. *S. seeds glossy, cylindrical and beaked; umbels lateral, nearly sitting.—It is cultivated in our gardens as a pot-herb, and for salads. It is slightly aromatic and aperient. Cows are extremely fond of it. Sheep and goats eat it. Horses refuse it.

554. Chelophyllum, or Wild Chervil.
sylvestre. *C. stem smoothish, scored, a little swollen at the knots. The roots, eaten as parsnips, have been found poisonous. The umbels afford an indifferent yellow dye; the leaves and stems a beautiful green. Its presence indicates a fruitful soil. Neither horses, sheep, or goats are fond of it. Swine refuse it. Rabbits are fond of it. In some parts of the kingdom, in times of scarcity, it is used as a pot-herb. Cows are so fond of it, that, when a pasture is overrun with it, as is often the case about Dudley, they always turn them in to eat it up.

555. Imperatoria, or Master-wort.
One species; viz. ostruthium. Alps of Austria, Switzerland.—Root warm and aromatic, a sudorific, diuretic, and sialagogue; recommended in dropsey, debilities of the stomach and bowels; and an infusion of it in wine is said to have cured quartans that have resisted the bark. When chewed, it excites a copious flow of saliva, exciting a warm and disagreeable sensation in the gums, and frequently curing the rheumatic toothach.

556. Seseli, or Hart-wort of Marseilles.

557. Thapsia, or Deadly Carrot.
Five species; viz. villosa, postida, asclepium, garganica, trifoliata. France, Spain, Portugal, Lev. Virg.

558. Pastinaca, or Parsnip.
Three species; viz. lucida, sativa, opopanax. South of Europe.
P. leaves simply winged.—The roots, when culti-sativa- vated, are sweeter than carrots, and are much used by those who abstain from animal food in Lent; they are highly nutritious. In the north of Ireland, they are brewed instead of malt, with hops, and fermented with yeast. The liquor thus obtained is agreeable. The seeds contain an essential oil, and will often cure intermittent fevers. Hogs are fond of the roots, and quickly grow fat with them. See Agriculture Index.

559. Smyrnium, or Alexanders.
Seven species; viz. perfoliatum, egypsiacam, late- rale, *olusrum, apifolium, aureum, integerrimum,* Italy, Crete, Egypt, N. Amer.

* S. stem leaves growing by threes on leafstalks, ser-olusrum.*—It was formerly cultivated in our gardens, but its place is now better supplied by celery. It is boiled, and greedily eaten by sailors returning from long voyages, who happen to land at the south-west corner of Anglesea.

560. Anethum, or Dill.
Three species; viz. graveolens, segetum, *fenicium.* Germ. Spain, Portugal.

* A. leaves with many divisions, hair-like; seeds egg-feniculum oblong, tapering at each end, not bordered.—The tender buds are useful in salads. The leaves, boiled, are used in sauce for several kinds of fish, and eaten raw with pickled fish. In Italy the stalks are blanched as a winter salad. The seeds abroad with an essential oil, which is carminative and diuretic, but not heating. The popilio machoon feeds upon it.

561. Carum, or Carawnees.
Two species; viz. *carui, simplex.* Europe.

* C. The young roots are said to be better eating than carui- paranips; the tender leaves may be boiled with pot-herbs. The seeds are used in cakes. Incrustted with su-
gar, they are called caraway comfits, and are distilled with
spirits of wine, for the sake of the flavour they afford.
The seeds were formerly recommended by Dioscorides
to pale-faced girls, and in more modern days their use
is not forgotten.—They are no despicable remedy in
tertian agues. They abound with an essential oil, which
is antispasmodic and carminative. Sheep, goats, and
swine eat it. Cows and horses are not fond of it.

562. Pimpinella, or Burnet Saxifrage.
Ten species; viz. saxifraga, nigrs, * magna, dis-
secta, glauca, capsensis, peregrina, anisium, dichotoma,
* dioica. Europe, Egypt.

magna.
* P. leaves uniform, winged; leaflets spear-shaped, ir-
regularly serrated; floral leaves wing-cleft.—This
and the saxifraga partake nearly of the same qualities.
The root is very acrid, burning the mouth like pepper.
It affords a blue oil. Its aeronomy hath occasioned it
to be used to cure the toothache, and to cleanse the
skin from freckles. It is chewed to promote the secretion
of saliva, and is used in gargles for dissolving viscous muc-
cus in the throat. In Germany it is prescribed in the
asthma and dropsy. The * papilia machaon is found up-
on both species.

563. Arium, or Parsley.
Two species; viz. petroselinum, * graveolens. Sar-
dinia, Carolina.

graveolens
* A. stem-leaves wedge-shaped.—The root in its wild
state (when it grows near water) is fetid, acrid, and
noxious; but when cultivated in dry ground it loses
these properties, and the root and lower part of the
leaf-stalks and stem, 'blanching by covering them up
with earth, are eaten raw, boiled in soups, or stewed.
In this latter state it is called *celery*. They are said
to be hurtful to people subject to nervous complaints.
They are certainly good antiscorbutics. The seeds
yield an essential oil. Sheep and goats eat it; cows
are not fond of it; horses refuse it.

564. Agopodium, or Gotweed.
One species; viz.

podogra-
ria.
* A. upper leaves three together; lower ones in triple
threes.—The leaves may be eaten early in the spring
with other pot-herbs. Cows, sheep, and goats eat it;
horses are not fond of it.

ORDER III. TRIGNYA.

565. Semicarpus.
One species; viz. anacardium. Ceylon.

566. Bhus, or Sumach or Poison-tree.
33 species; viz. coriaria, tiphynum, javanicum, gla-
brum, elegana, vernum, succeadanum, semilatnum, copal-
linum, alatum, pauciflorum, metopeum, digitatum, cir-
chiflorum, tridentatnum, radicans, toxicodendron, arom-
maticum, suavoleus, dentatum, sinusatum, cuneifolium,
icisium, tomentosum, villosum, pubescens, vinimale, an-
gustifolium, rosmarinifolium, levigatnum, lucidum, col-
tinus, astring. S. Europe, Cape, China, N. Amer.
coriaria.

R. with winged leaves, and leaflets elliptical, bluntly
toothed, woolly beneath. Called common sumach.—This
tree or shrub is cultivated in the south of Europe on ac-
count of the culinary uses of its fruits, and for the pur-
pouses of the dyers, &c. Amongst us it is met with only
in the gardens of the curious. The seeds and berries
are of a red colour, in shape round and flat. But these
and the leaves are moderately astrigent, and have
sometimes been exhibited with this intention by med-
ical practitioners; but they are not at present used.

R. with winged entire leaves, with a membranaceous copal-
linum jointed leaf-stalk.—This tree grows in New Spain,
and produces a resin called * copal*, which is brought to us in
irregular lumps, some transparent, of a yellowish or
brown colour; others semi-transparent and whitish. It
is used for making a very pure and hard varnish by
painters. It has never come into use in medicine in
this country, though it is introduced into some of the
foreign pharmacopoeias, and may be considered as an
article deserving attention.

567. Visnurn, or Pianta Meal-Tree.
23 species; viz. tinus, tinoides, villosum, scandens,
modum, primifolium, davuricum, dentatum, plicatum,
erosum, * lantana, tomentosum, hirtum, acerifolium,
orientale, * opulus, dilatatum, macrophyllum, cuspidat-
um, lentago, cassinoides, nitrard, levigatum. S. of
Europe, N. America.

* V. leaves heart-shaped, serrated, veined, cottony un-
lata. Gatern—The bark of the root is used to make bir-
line. The berries are drying and astringent.

568. Cassina, or Cashew-berry-bush, South Sea Tea.
Four species; viz. capensis, colpoon, barbarus, ma-
urocina. C. of G. Hope.

569. Sambucus, or Elder-tree.
Five species; viz. * ebulus, canadensis, * nigra, ja-
ponica, racemosa. Europe, China, N. America.

* S. tufts with three divisions; stipite leaf-like; stem ebulus.
herbaceous.—This plant has the same medical proper-
ties with the * nigra*, but in some respects more violent,
and therefore less manageable: A dram and a half of
the root is a strong purgative: The berries give out a vio-
et colour: The green leaves drive away mice from
houses, and the Bismarck steams them where their pigs
lie, under a persuasion that they prevent some of the
diseases to which they are liable. Neither cows, goats,
sheep, horses, or swine, will eat it.

* S. tufts with five divisions; leaves winged; leaflets* nigra,
nearly egg-shaped, serrated; stem tree-like.—The
whole plant has a narcotic smell; it is not well to
sleep under its shade. The wood is hard, tough, and
yellow. It is commonly made into skews for but-
chers; tops for angling-rods; and needles for weaving
nets. It is not a bad wood to turn in the lathe. The
inner green bark is purgative, and may be used with
advantage where acrid purgatives are requisite. In
small doses it is diuretic, and has done eminent service
in obstinate glandular obstructions, and in dropsies.
If sheep that have the rot are placed in a situation where
they can get at the bark and the young shoots, they
will soon cure themselves. It is an ingredient in the
black dye. The leaves are purgative like the bark,
but more nauseous. They are an ingredient in several
cooling ointments. If turnip-cabbage, fruit-tree or
corn, which are subject to blight from a variety of in-
sects, are whipped with the green leaves and branches
of elder, the insects will not attack them. A deco-
cction of the flowers, taken internally, is said to promote
expectoration in pleurisy. If the flowers are fresh
gathered.
Pentandria.

BoTANY.

586. Eovolvulus.

Six species; viz. 

587. Aralia, or Berry-bearing Angelica.

10 species; viz. arbores, capitata, cordata, japonica, pentaphylla, seiodaphyllum, spinosa, chinenis, racemosa, nudicaulis. China, West Indies, North America.

588. Gloxipetalum.

Two species; viz. glabrum, tomentosum. Guiana.

589. Statiche, or Thrift, or Sea-pink.

37 species; viz. armeria, juniperifolia, alliacea, cephalotes, graminifolia, * limonium, gmelini, scoparia, latifolia, oleifolia, incana, auculeifolia, cordata, scabra, tetragona, reticulata, echidra, species, tatarica, echinus, flavosa, purpurea, longifolia, minor, postis, sulphurcosa, monopetala, axillaris, cylinflosorus, linifolia, aurea, lucifera, praunosa, sinuata, lobata, spicata, micracte. Europe, Barbary, Canary, Amer.

590. Linum, or Flax.

591. Drypsis.

One species; viz. spinosa. Italy, Barbary.

592. Basella, or Malabar Nightshade.

Five species; viz. rubra, alba, lucida, cordifolia, vesicaria. East Indies, China.

593. Sarothr, or Base Gentian.

One species; viz. gentianoides. Virginia, Pennsylvania.

594. Portulacaria, or Purslane tree.

One species; viz. afric. Africa.

595. Parnassia, or Grass of Parnassus.

One species; viz. * palustris. Europe.
One species; viz. vesiculosa. Italy, India.

592. DROSERA, or Sun-dew.

* D. stalks from the root; leaves circular.—The whole plant is acrid, and sufficiently caustic to erode the skin; but some ladies know how to mix the juice with milk, so as to make it an innocent and safe application to remove freckles and sunburn. The juice that exudes from it unmixed will destroy warts and corns. This plant has the same effect upon milk as the pinguecula vulgaris, and like that is supposed to occasion the rot in sheep. The sour coagulated milk of the Syrian, called leban or leen, is supposed to be at first prepared with some plant of this kind. The name sun-dew seems to be derived from a very striking circumstance in the appearance of these plants; the leaves are fringed with hairs, supporting small drops or globules of a pellicul liquor like dew, which continue even in the hottest part of the day and in the fullest exposure to the sun. Perhaps the acrimony of the plant resides in this secreted liquor.

593. GISCHIA.

One species; viz. pharacinoides. E. Indies.

594. CRASSULA, or Lessor Orpine.

71 species; viz. coccinea, cymosa, flava, pubescens, pruinosa, scabra, corallina, vestita, argentea, perfoliata, perforata, fruticulosa, ramosa, mollis, tetragona, muticata, punctata, obvallata, cultidata, obliqua, spatulata, punctata, marginalis, cordata, lactea, arborescens, rupestris, pinnata, spinosa, retroflexa, lineolata, centauroides, dichotoma, glomerata, pulchella, strigosa, muscosa, pyramidalis, columnaris, hemispherica, alkaloides, capillata, coryledonis, barbata, ciliata, thyrsiflora, apicata, subulata, alternifolia, rubens, cespitosa, minima, moschatula, verticillata, expansa, dentata, nudicaulis, tectorum, cephalophora, montana, turrita, alpestris, marginata, tomentosa, crenulata, deltoides, orbicularis, sparsa, diffusa, prostrata, pellucida. Switzerland, Italy, Cape, China.

595. MAHERANIA.

Eight species; viz. verticillata, pinnata, pulchella, diffusa, incisa, glabrate, heterophylla, biserrata. C. of G. Hope.

596. COMMERSIONIA.

One species; viz. echinata. Otaheite.

597. SIBBALDA.

ORDER VI. DECAGYNIA.

598. SCHEFFLERA.

One species; viz. digita. South Sea isles.

ORDER VII. POLYGYNIA.

599. MYOSURUS, or Mouse-tail.

One species; viz. * minimum. Europe.

600. ZANTHORHIZA.

One species; viz. apifolia.

In the class Pentandria are

325 Genera, including 2537 Species, of which 168 are found in Britain.

CLASSIS VI.

HEXANDRIA.

ORDO I. MONOGYNIA.

Sect. I. Flores calciculati, calycis corollaque instructi, abisque spathis.

602. BROMELIA. Cor. 3 partita. Cal. 3-partitus, superus. Bacca.

603. PITCAIRNIA. Cor. 3-partita. Cal. 3-partitus, semisuperus. Capsula.

604. TILLANDSIA. Cor. 3-petala. Cal. 3-partitus, inferior. Sem. comosa.

606. BURMANNIA. Cor. 3-petala. Cal. 1-phyllos, inferius, triquetra-olatus, colorata. Cal. 3-phyllos, inferius. Filamenta barbata.

607. TRADESCANTIA. Cor. 3-petala. Cal. 3-phyllos, inferius. Germ. pedicellatum.

608. STEPHANIA. Cor. 4-petala. Cal. 2-lobus. Germ. pedicellatum.
Hexandria.

675. Cossonia. Cor. 5-petala. Cal. 5-partitus.
Caps. 3-locularis.
687. Hillia. Cor. 6-fida. Cal. 6-phyllos, superus.
Fructus 2-locularis, polysperma.
671. Richardsonia. Cor. 6-fida. Cal. 6-fidos, superus.
Sem. 3, ruda.
644. Leonice. Cor. 6-petala. Cal. 6-phyllos, inferus. Bacca inflata, supera.
674. Primus. Cor. 6-fida. Cal. 6-fidos, inferus.
Bacca 6-sperma.
678. Prathura. Cor. 6-fida. Cal. 6-dentatus.
Pomum 6-loculare.
689. Camarina. Cor. 6-fida. Cal. 6-phyllos, superus. Caps. 6-locularis.

Sect. II. Flores calcari, calyx, corolla, spatiosque instructi.

666. Corypha. Cor. 3-partita. Cal. 3-phyllos. Drupa.
667. Licoala. Cor. 3-partita. Cal. 3-partitus.
Nectary arilloforme. Drupa.
608. Mnasum. Cor. 3-dentata. Cal. 5-partit.
Spaeth 2-valv. Anthers foliaceous.

Sect. III. Flores spathacei glumacei.

610. Hesperanthus. Cor. supera, 6-partita. Involucrum polyphyllos, maximum.
613. Leucocium. Cor. supera, 6-petala, campanulata. Stamina equalia.
614. Strumaria. Cor. 6-petala, plana.
618. Crinum. Cor. supera, 6-fida, basi tubulosa. Stam. distantia, fauci inserta.

Sect. II. Double calcarious flowers, furnished with a corolla and sheaths.

C. Cor. 3-partite. Cal. 3-leaved. A drupe.
L. Cor. 3-partite. Cal. 3-partite. Nectary garland-shaped. A drupe.
M. Cor. 3-toothed. Cal. 3-partite. Sheath 2-valved. Anthers leafy.

Sect. III. Flowers sheathed bushed.

U. Cor. superior, 3-petaled. Sheaths alternate.
H. Cor. superior, 6-partite. The involucrum many-leaved, very large.
L. Cor. superior, 6-petaled, bell-shaped. Stamens equal.
S. Cor. 6-petaled, flat.
G. Cor. superior, 6-petaled. Nectary bell-shaped, without the stamens.
P. Cor. superior, 6-petaled. Nectary bell-shaped, ending with stamens.
A. Cor. superior, 6-petaled, irregular. The stamens unequal, bending.
C. Cor. superior, 6-cleft, tubular at the base. Stamens distant, inserted in the mouth.

621.
Sect. IV. Flores nudi.

X. Cor. 6-partita superior. Stigma club-shaped.

A. Cor. superior, 6-petaled, with tubular claws.

L. Cor. superior, 6-cleft, nearly bell-shaped.

H. Cor. inferior, 6-partite. Stamens bent.

A. Cor. superior, 6-cleft, with an erect border shorter than the filaments.

G. Cor. superior, 6-partite. Berry club-shaped, many-seeded.

A. Cor. inferior, 6-cleft. Filaments inserted in the receptacle.

A. Cor. inferior, 6-cleft, wrinkled. Stamens inserted in the mouth.

V. Cor. inferior, 6-cleft. Stamens inserted in the base of the corolla.

F. Cor. inferior, 6 cleft, with a crooked tube.

C. Cor. inferior, 6-cleft. Berry 3-seeded.

S. Cor. inferior, 6-partite. Berry 1-seeded.

H. Cor. inferior, 6-cleft, nearly bell-shaped. Stamens inserted in the receptacle.

D. Cor. inferior, 6-cleft. Bell-shaped. Stamens inserted in the tube of the corolla.

M. Cor. inferior, 6-cleft, funnel-shaped. Germin on a pedicle.

A. Cor. inferior, 6-cleft. Nectaries with 6 valves, bearing the stamens.

E. Cor. inferior, 6-partite, permanent. Filaments connected with the nectary.

A. Cor. inferior, 6 petals, flat.

E. Cor. inferior, 6 petals, the petals alternately bi-glandular at the base.

F. Cor. inferior, 6 petals, unequal. Caps. with 3 flat sides.

L. Cor. inferior, 6 petals, unequal. Caps. 3-winged.
Hexandria.

641. Cyanella. Cor. infera, 6-petala; petalis exterioribus propendentibus.
682. Philesia. Cor. infera, 6-petala, tribus interioribus duplicibus longioribus.
631. Gloriosa. Cor. infera, 6-petala, reflexa, caudata.
630. Uvularia. Cor. infera, 6-petala, basi fovea nectarifera; erecta.
638. Fritillaria. Cor. infera, 6-petala, basi fovea nectarifera; ovata.
627. Lilium. Cor. infera, 6-petala; petalis basi canaliculato-tubulosis.
653. Tulipa. Cor. infera, 6-petala, campanulata. Stylus o.
638. Yucca. Cor. infera, 6-petala, patens. Stylus o.
634. Albuca. Cor. infera, 6-petala, 3 exterioribus patulis; 3 interioribus conniventibus. Stigma cinc tum cuspidibus 5.

Sect. V. Flores incomplei.

668. Thirnax. Cal. 6-dentates. Drupa.

Sect. VI. Gramina.

693. Bambusa. Cal. o. Cor. 2-valvis.

Ordo II. DIGYNIA.

† Leersia hexandria. Ehrharte nonnullae.

Order I. MONOGYinia.

603. Bromelia, or Pine-apple, Ananas. 10 species; viz. ananas, pinguis, karatas, lingulata, bracteata, paniculigera, chrysanth, nudicaulis, humilis, acanga. W. Indies, S. America.—The ananas is the most grateful of all the tropical fruits. It requires a very powerful heat for its cultivation in hot-houses.
604. Tillandsia. 16 species; viz. utriculata, serrata, lingulata, tenuifolia, flexuosa, setacea, paniculata, fasciculata, nutans, polystachya, monostachya, pruinos, canescens, angustifolia, recurvta, usneoides. N. Amer. Jamaica.

605. Xerophyta. One species; viz. pinifolia. Isle of Madagascar.
607. Tradescantia, or Virginia Spiderwort. 17 species; viz. virginica, crassifolia, erecta, zonaria, discolor, malabarica, nervosa, divaricata, geniculata, monandra, multiflora, cordifolia, procumbens, axillaris, formosa, cristata, papilionacea. Virginia, Maryland, E. and W. Indies.
610. Hemphlebus, or Blood-flower. 14 species; viz. cocineus, coarctatus, puniceus, multiflora, tigrinus, quadrivalvis, pubescens, ciliaris, albiflos,
Botany.

raceum, nutans, ascalonicum, senescent, illyricum, odorum, inodorum, angelosum, striatum, narcissiflorum, pedemontanum, nigrum, camadense, **urisin, clinianum, triquetrum, cepa, moly, tricoccum,acistum, accordion, schoenoprasum, bibericum, stellerianum, capillare, teuvisssum, gracile, chame-cylym. Europe, N. America, Jamaica.

* A. umbell globular; statens 3-pointed, petals rough ameplo- on the hee.—This is eaten along with other pot-herbs. prasum. It communicates its flavour to the milk and butter of cows that eat it.

* A. filaments undivided; leaves semi-cylindrical, deracum rough furrowed underneath; (leaves not rough.)—The tender leaves are very commonly boiled in soups, or fried with other herbs. Cows, goats, sheep, and swine, eat it.

* A. stalk 3-square; leaves spear-shaped on leaf-ursinum. stalks; umbel flat-topped.—An infusion of this plant in brandy is esteemed a good remedy for the gravel. Other plants growing near it do not flourish. Cows eat it in the spring when grass is scarce; but it communicates an offensive flavour to the milk and butter.

* A.—The roots of this plant, which is the proper gar- sativum. llick, are of an irregularly roundish shape, with several fibres at the bottom; each root is composed of a number of lesser bulbs, called cloves of garlic, enclosed in one common membranaceous coat, and easily separated from each other. All the parts of this plant, but more especially the roots, have a strong offensive smell, and an acrimonious, almost caustic, taste. The root applied to the skin inflames and often excoriates the part. Its smell is extremely penetrating and diffusive. When the root is applied to the feet, its scent is soon discoverable in the breath; and when taken internally its smell is communicated to the urine, or the matter of an issue, and perspires through the pores of the skin.

This pungent root warms and stimulates the solids, and attenuates tenacious juices. Hence in cold leuco-phlegmatic habits, it proves a powerful expectorant, diuretic, and, if the patient be kept warm, sudorific; it has also been by some supposed to be an emmenagogue. In catarrhous disorders of the breast, flatulent colics, hysterical and other diseases, proceeding from laxities of the solids, it has generally good effects; it has likewise been found serviceable in many hydropic cases. Sydenham relates, that he has seen the dropsy cured by the use of garlic alone; he recommends it chiefly as a warm strengthening medicine in the beginning of the disease.

Garlic is with some also a favourite remedy in the cure of intermittent; and it has been said to have sometimes succeeded in obstinate quarters after the Peruvian bark had failed, particularly when taken to the extent of one or two cloves daily in a glass of brandy or other spirits. The liberal use of garlic, however, is apt to occasion headaches, flatulencies, thirst, febrile heats, inflammatory distempers, and sometimes discharges of blood from the haemorrhoidal vessels. In hot bilious constitutions, where there is already a degree of irritation, and where there is reason to suspect an unsound state of the viscera, this stimulating medicie is manifestly improper, and never fails to aggravate the distemper.

The most commodious form of taking garlic, a medicine to most people not a little unpleasant, is that
of a bolus or pill. Infusions in spirit, wine, vinegar, and water, although containing the whole of its virtues, and so acrimonious as to be unfit for general use. A syrup and oxymel of it were formerly kept in the shops; but it does not now enter any official preparation in our pharmacopoeias; and it is proper that even the pills should always be an extemporaneum prescription, as they suffer much from keeping.

Garlick made into an ointment with oils, &c. &c. applied externally, is said to resolve and discuss cold tumours, and has been by some greatly esteemed in cutaneous diseases. It has likewise sometimes been employed as a repellent. When applied under the form of a poultice to the tubes, it has sometimes proved effectual in producing a discharge of urine, when retention has arisen from want of a due action of the bladder; and some have recommended, in certain cases of deafness, the introduction of a single clove, wrapt in thin muslin or gauze, into the meatus auditorius or passage of the ear. Sydenham assures us, that among all the substances which occasion a derivation or revulsion from the head, none operates more powerfully than garlick applied to the soles of the feet; hence he was led to make use of it in the cutaneous amblypoxy. About the eighth day after the face began to swell, the root cut in pieces, and tied in a linen cloth, was applied to the soles, and renewed twice a-day till all danger was over.

The roots of the allium cepa, or onion, are considered rather as articles of food than of medicine. They are supposed to afford little nourishment, and when eaten liberally in their raw state, produce flatulencies, occasion thirst, headaches, and troublesome dreams. In cold phlegmatic habits, where viscid mucus abounds, they doubtless have their use; as by their stimulating quality they tend to excite appetite, attenuate thick juices, and promote their expulsion: by some they are strongly recommended in suppressions of urine, and in dropsies. The chief medicinal use of onions in the present practice is in external applications, boiled as a cataplasm, for suppurating tumours.

627. Liliuin, or Lily.
16 species; viz. cordifolium, longiflorum, candidum, japonicum, lancifolium, bulbiferum, catesbaei, speciosum, pomponium, chaliceicum, superbum, martagon, candens, maculatum, kamschatense, philadelphicum. Europe, Japan, N. America.—The Lilium candidum, or white lily, is cultivated in gardens more for its beauty than utility. The mucilaginous root is used by some as a poultice; but it possesses no advantage over the poultices formed of vegetable farina.

628. Fritillaria, or Crown-imperial, Fritillary.

629. Eucomis.
Five species; viz. nana, bifolia, regia, undulata, puunctata. C. of G. Hope.

630. Uvularia.

631. Gloriosa, or Superb Lily.
Two species; viz. superba, simplex. Guiana, E. Ind.

632. Erythronium, or Dog's-tooth Violet.
One species; viz. dens canis. Siberia, Italy, Virg. Carolina.

633. Tulipa, or Tulip.

634. Albuca, or Base Star of Bethlehem.
14 species; viz. altissima, major, flaccida, minor, viridisflora, coerecta, chastiga, candelata, setosa, sures, abysinica, fragrans, viscous, spiralis. C. of G. Hope.

635. Gethyllis.
Five species; viz. spiralis, ciliaris, villosa, picata, lanceolata. C. of G. Hope.

636. Curculigo.
One species; viz. orchiooides.

637. Hypoxis, or Base Star-flower.
15 species; viz. erecta, sobol-fera, villosa, decumbens, obliqua, aquatica, minuta, alba, ovata, veratrifolia, stellata, serrata, juncen, fascicularis, sessilis. N. Amer. Jamaica, Cape, Japan.

638. Erigeronum.
Three species; viz. latifolium, lancingolium, parvifolium.

639. Ornithogalum, or Star of Bethlehem.

* O. stalk angular, 2-leaved; fructistalks in an un-luteum, branched umbel.—The bulbous roots of all the species are nutritious and wholesome, and those of this species have been employed for food in a scarcity of provision. Horses, goats, and sheep eat it; swine are not fond of it; cows refuse it.

640. Scilla, or Squill.

S. flowers naked; floral leaves bent backwards as if maritima.

—This is the squill or sea-onion well known in medicine. It is a kind of onion growing spontaneously upon dry sandy shores in Spain and the Levant, from whence the root is annually brought into Europe. It should be chosen plump, sound, fresh, and full of clammy juice: some have preferred the red sort, others the white, though neither deserves the preference to the other. The only difference perceivable between them is that of the colour, and hence both may be used promiscuously. This root is to the taste very nauseous, intensely bitter and acrimonious. Much handled it ulcerates the skin. With regard to its medical
Hexandria.

Any.

B O T

dical virtues, it powerfully stimulates the solids and attenuates viscid juices; and by these qualities promotes expectoration, urine, and, if the patient be kept warm, sweat; if the dose be considerable it proves emetic, and sometimes purgative. The principal use of this medicine is where the prima vie abound with mucous matter, and the lungs are oppressed by tenacious phlegm. Dr. Wagner, in his clinical observations, recommends it given along with nitre in hydropical swellings, and in the nephritis; and mentions several curative facts that he performed by giving from four to ten grains of the powder for a dose, mixed with a double quantity of nitre: he says, that thus managed, it almost always operates as a diuretic, though sometimes it vomits or purges. In dropsy, dried squills are often combined with mercury. The most commodious form for the taking of squills, unless designed as an emetic, is that of a bolus or pill; liquid forms are to most people too offensive, though these may be rendered less disagreeable both to the palate and stomach by the addition of aromatic distilled waters. This root yields the whole of its virtues both to aqueous and to vinous menstrua, and likewise to vegetable acids. Its officinal preparations are a conserve of dried squills, a syrup and vinegar, an oxymel, and pills.

461. C Y A N E L L A.

Four species; viz. capensis, orchidiformis, lutea, alba. C. of G. Hope.

462. A S P H O D E L U S, or Asphodel, or King’s-spear.

Seven species; viz. luteus, creticus, ramosus, albif., fistulosus, altaicus, liburnicus. Austria, S. Europe.

*A. It is believed in Sweden to be noxious to sheep, and has been supposed to soften the bones of animals that eat it. Cows and horses eat it; sheep and swine refuse it.

464. L E N T I C E, or Lions Leaf.

Five species; viz. chrysogonum, leontopetalum, vesicaria, altaica, thalictroides. Levant, N. America.

465. P O L L I A.

One species; viz. japonica. Japan.

466. A S P A R A G U S.

20 species; viz. *officinalis, declinatus, decumbens, flexuosus, scandens, falcatus, racemosus, refractarius, aethiopicus, asiaticus, albus, acutifolius, subulatus, dependens, horridus, aphyllus, lanceus, capensis, sarmen-

*officinalis. *A. stem bristle-shaped; cylindrical, upright; leaves bristle-shaped; leaf-scales solitary or in pairs; male and female flowers sometimes on distinct plants.—The young shoots of this plant, in its cultivated state, are very universally esteemed for their flavour and nutritive properties. They impart to the urine the scent of water in which they have been boiled. The paras- gus chrysomela lives upon it.

647. D R A C E N A, or Dragon-tree.

14 species; viz. draco, indivisa, umbraculifera, australis, cernua, ferrea, terminalis, marginata, striata, undulata, erecta, enslifolia, borealis, grammifolia. Cape, E. Indies, China, N. America.

648. S A N S E V I E R I A.

Three species; viz. guineensis, zeylanica, lanuginosa.

*C. stalk naked, semi-cylindrical; flowers spiked, majalis, nodding.—The flowers are highly fragrant, but when dried are of a narcotic scent: reduced to powder, they excite sneezing. An extract prepared from the flowers, or from the roots, partsakes of the bitterness as well as of the purgative properties of aloes. The dose from 20 to 30 grains. A beautiful and durable green colour may be prepared from the leaves by the assistance of lime. Sheep and goats eat it; horses, cows, and swine refuse it.

*C. leaves alternate, embracing the stem; stem 2-polygona-edge; fruitstalks axillary, mostly 1-flowered.—In a tum. scarcity of provisions the roots have been made into bread. Sheep and goats eat it; horses, cows, and swine refuse it.

*C. leaves alternate embracing the stem; stem cylin-multiflora. drical: fruit-stalks axillary, many-flowered.—The young shoots are eaten by the Turks as asparagus, and the roots have been made into bread as the C. polygo-
natum. Cows, goats, and sheep eat it.

650. P O L T A N T H U S, or Tuberose.

Two species; viz. tuberosa, pygmaea. E. Indies.

651. D R I M I A.

Five species; viz. ciliaris, elata, pusilla, undulata, media.

*H. blossoms tubular-bell-shaped, with six divisions, non-scriptus segments rolled back; floral leaves in pairs.—The fresh roots are poisonous: They may be converted into starch. Phaëna platgnonis livos upon it.

653. F O R M I U M.

One species; viz. tenax.

654. L A C H E N A L I A.

One species; viz. tenax.

24 species; viz. glaucina, orchideae, pallida, hyacinthoides, angustifolia, contaminata, viridis, serotina, pusilla, patula, fragrans, liliflora, postulata, purpureo-erules, violacea, purpurea, lanceifolia, minifolia, bir-
ta, isoptetala, tricolor, rubina, punctata, pendula. Cape, New Zealand.
BOTANY.

655. Lanaria.
One species; viz. plumosa. C. of G. Hope.

656. Voltheimia.
Four species; viz. viridifolia, glua, uvaria, pumila.

657. Aletris, or Base Aloe.

658. Yucca, or Adam's Needle.
Four species; viz. gloriosa, aliofioza, draconis, filamentosa. Amer.

659. Aloe.
17 species; viz. dichotoma, spicata, perfoliata, picta, simulata, humilis, arachnoides, margaritifera, verrucosa, carinata, maculata, lingua, plicatilis, variegata, viscosa, spiralis, retusa. Africa.

These plants are chiefly or rather only valuable, on account of the medicinal virtues of their insipissated juice. The ancients distinguished two sorts of aloe: The pure and of a yellowish colour inclining to a red, resembling the colour of a liver, and thence named hepatic; the other was full of impurities, and hence supposed to be only the dross of the better kind. At present various sorts are met with in commerce, which are distinguished from the place in which they are produced, or from their sensible qualities.

1. The Socotrine aloe, said to be obtained from a variety of the aloe perfoliata. This is the purest sort. It is brought from the island Socotra in the Indian ocean, wrapped in skins. It is of a glossy surface, clear, and in some degree pellucid; in the lump, of a yellowish red colour, with a purple cast; when reduced to powder, of a bright golden colour. It is hard and friable in the winter, and somewhat pliable in summer, and grows soft between the fingers. Its taste is bitter, accompanied with an aromatic flavour, but insufficient to prevent its being disagreeable; the smell is not very unpleasant, and somewhat resembles that of myrrh.

2. Barbadoes or hepatic aloe. Hepatic aloe is not so clear and bright as the foregoing sort; it is also of a darker colour, more compact texture, and for the most part drier. Its smell is much stronger and more disagreeable: the taste intensely bitter and nauseous, with little or nothing of the fine aromatic flavour of the Socotrine. The best hepatic aloe comes from Barbadoes in large gourd shells: an inferior sort of it (which is generally soft and clammy), is brought over in casks.

3. Fetid, caballine, or horse aloe, may easily be distinguished from each of the foregoing, by its strong rank smell; although in other respects it agrees pretty much with the hepatic, and is not unfrequently sold in its stead. Sometimes the caballine aloe is prepared so pure and bright, as not to be distinguished by the eye from the Socotrine; but its offensive smell, of which it cannot be divested, readily betrays it. It has not now a place in almost any pharmacopoeia, and is employed chiefly by barbers.

All the sorts of aloe dissolve in pure spirit, proof spirit, and proof spirit diluted with half its weight of water; the impurities only being left. They dissolve also by the assistance of heat in water alone; but as the liquor grows cold, the resinous part subsides, the gummy remaining united with the water. The hepatic aloe is found to contain more resin, and less gum than the Socotrine, and this than the caballine. The resins of all the sorts, purified by spirit of wine, have little smell: that obtained from the Socotrine has scarce any perceptible taste; that of the hepatic, a slight bitterness; and the resin of the caballine a little more of the aloeic flavour. The gummy extracts of all the sorts are less disagreeable than the crude aloe: the extract of Socotrine aloe has very little smell, and is in taste not unpleasant; that of the hepatic has a somewhat stronger smell, but is rather more agreeable in taste than the extract of the Socotrine; the gum of the caballine retains a considerable share of the peculiar rank smell of this sort of aloe, but its taste is not much more unpleasant than that of the extracts made from the other sorts.

Aloes is a stimulating cathartic bitter: if given in so large a dose as to purge effectually, it often occasions an irritation about the anus, and sometimes a discharge of blood. Small doses of it, frequently repeated, not only cleanse the prime vis, but likewise warm the habit, quicken the evacuation, and promote the uterine and hemorrhoidal fluxes. This medicine is particularly serviceable in habitual costiveness, to persons of a phlegmatic temperament and sedentary life, and where the stomach is oppressed and weakened. In dry bilious habits, aloes proves injurious, immoderately heating the body and inflaming the bowels.

The juice is likewise, on account of its bitterness, supposed to kill worms, either taken internally, or applied in plasters to the umbilical region. It is also celebrated for restraining external hemorrhages, and cleansing and healing wounds and ulcers.

The ancients gave aloes in much larger doses than is customary at present. Dioscorides orders half a dram or a dram for gently loosening the belly; and three drams were intended to have the full effect of a cathartic. But modern practice rarely exceeds a scruple, and limits the greatest dose to ten grains for the common purposes of this medicine ten or twelve grains suffice; taken in these or less quantities, it acts as a gentle stimulating evacuant, capable of removing, if duly continued, very obstinate obstructions. Aloes are much less frequently used to operate as a purgative than merely to obviate costiveness: and indeed their purgative effect is not increased in proportion to the quantity that is taken. Perhaps the chief objection to aloes, in cases of habitual costiveness, is the tendency which they have to induce and augment hemorrhoidal affections; and with those liable to such complaints they can seldom be employed. Their purgative effect seems chiefly to depend on their proving a stimulus to the rectum.

Some are of opinion, that the purgative virtue of aloes resides entirely in its resin; but experience has shown, that the pure resin has little or no purgative quality, and that the gummy part, separated from the resinous, acts more powerfully than the crude aloe. If the aloe indeed be made to undergo long coction in the preparation of the gummy extract, its cathartic power will be considerably lessened, not from the separation of the resin, but from an alteration made in the juice.
Hexandria.

BOTANY.

juice itself by the heat. The strongest vegetable cathartics become mild by a like treatment, without any remarkable separation of their parts.

Socoterine aloe, as already observed, contain more gummy matter than the hepatic; and hence are likewise found to purge more, and with greater irritation. The first sort therefore is most proper where a stimulus is required, as for promoting or exciting the menstrual flux; whilst the latter is better calculated to act as a common purge. It is supposed that the vulnerary and balsamic virtues of this juice reside chiefly in the resin, and hence the hepatic aloe, which is most resinous, is most serviceable in external application.

Aloe enter many of the official preparations and compositions, particularly different pills and tinctures; and according to the particular purposes for which these are intended, sometimes the Barbadoes, sometimes the Socoterine aloe are the most proper.

660. AGAVE, or Common American Aloe.
Seven species; viz. americana, vivipara, virginica, cubensis, lurida, tuberosa, feroxida. America.

661. ASTROMERIA.
Six species; viz. pellegrina, pulchella, ligta, salisula, ovata, multiflora. Peru, Lima.

662. HEMEROCALLIS, Day-lily.
Four species; viz. flava, fulva, isaroiola, japonica. Siberia, Hungary, Levant, Japan.

663. ACORUS, or Sweet-smelling Rush.
Two species; viz. calamus, gramineus. Europe, India.

* A. floral leaf very much longer than the spike.—The root powdered might supply the place of our foreign spices. It is our only native truly aromatic plant. The powder of the root has cured aches, when the Peruvian bark has failed. The roots have a strong aromatic smell, and a warm pungent bitterish taste. The flavor is greatly improved by drying. They are commonly imported from the Levant, but those of our own growth are full as good. The Turks candy the roots, and think they are a preservative against contagion. Neither horses, cows, goats, sheep, or swine will eat it.

664. ORONTIUM, or Floating Arum.
Two species; viz. aquaticum, japonicum. N. America, Japan.

665. TACCA.
One species; viz. pinnatifida. E. Indies, Otaheite.

666. CORYPHA, or Mountain Palm.
Two species; viz. umbraclulifera, rotundifolia. East Indies, Carolina.

667. LICUALA.
One species; viz. spinosa. Africa, Amboyna.

668. THRINAX, or Small Jamaica Fan-palm.
One species; viz. parviflora. Jamaica, Hispaniola.

669. CALAMUS.
Eight species; viz. rotang, verus, draco, niger, viminalis, rudentum, equestris, zulca. India.

670. JUNCUS, or Rush.

* J. straw stiff and straight; panicle lateral, loose; *effusus. flowers egg-shaped, blunt, 3 stamens in each.—Rushes are sometimes used to make little baskets. The pith of this species is used instead of cotton to make the wick of rush lights. Horses and goats eat it.

* J. straw rigid; leaves like bristles; panicle terminus—*squamato-side, leafless.—Horses eat it. The leaves lying close sus. to the ground elude the stroke of the scythe. It indicates a barren soil.

671. RICHARDIA.
One species; viz. scabra. Vera Cruz.

672. DUDIOA.
One species; viz. eriolipa. Surinam.

673. ACRAS, or Sapota.
Three species; viz. dissection, marmomos, sapota. W. Indies, S. America.

674. PRINOS, or Winter-berry.
Seven species; viz. verticillata, montana, dioecia, nitidus, glaber, lucidus, sideroxyloides. N. America, Jamaica, Montserrat.

675. COSIGNEA.
Two species; viz. triphylus, pinnata. India.

676. BARBACenia.
One species; viz. brasiliensis.

677. BERBERIS, or Barberry, or Piperridge Bush.
Five species; viz. *vulgaris, ilicifolia, microphylla, cretica, sibrica. Europe, Canada, Terra del Fuego.
* B. fruitstalks forming bunches; thorns 3 together.—*vulgaris. The leaves are gracefully acid. The flowers are offensive to the smell when near, but at a proper distance their odor is extremely fine. The berries are so very acid that birds will not eat them, but boiled with sugar they form a most agreeable ro or jelly. They are used, likewise, as a dry sweetmeat, and in sugar plums. An infusion of the bark in white wine is porgative. The roots boiled in hot dye wool yellow. In Poland they dye leather of a most beautiful yellow with the bark of the root. The inner bark of the stems dyes linen of a fine yellow, with the assistance of alum. This shrub should never be permitted to grow in corn lands, for the ears of wheat that grow near it never fill, and its influence in this respect has been known to extend as far as 3 or 4 hundred yards across a field. This very extraordinary fact well merits investigation.

678. PSEATHURA.
One species; borbonica. Isle of Bourbon.

679. NANDINA.
One species; viz. domestica. Japan.

680. LINDERA.
One species; viz. umbellata. Japan.

681. ENARGEA.
One species; viz. marginata. Terra del Fuego.
682. Philesia.
One species; viz. luxifolia. Straits of Magellan.

683. Capura.
One species; viz. purpurata. India.

684. Loranthus.
26 species; viz. secula, tetrapterus, glaucus, biflorus, parviflorus, falcatus, uniflorus, europaeus, longibracteatus, hulodore, nodosus, elevatus, longiflorus, elasticus, americanus, emarginatus, occidentalis, loniceroideae, pedunculatus, sessilis, marginatus, stelis, pauciflorus, brasiliensis, pentandrus, spicatus. Europe, E. Ind., Jam. Amer.

685. Schraderia.
Two species; viz. capitata, cephalotes.

686. Stephania.
One species; viz. cleomoides. Guiana.

687. Hilla.
Two species; viz. longiflora, tetrandra. Jamaica, S. Amer.

688. Isertia.
Two species; viz. cocinea, parviflora. Guiana.

689. Canarina, or Canary Bell-flower.
One species; viz. canpanula. Canary isles.

690. Frankenia, or Sea-heath.

691. Peplis, or Water Purslain.
Two species; viz. * portula, indica. Europe.

692. Cehnia.
Two species; viz. procera, schenoides. New Zealand.

693. Bambara.
Two species; viz. arundinacea, verticillata.

694. Ehrharta.
Five species; viz. cartilaginea, bulbosa, longiflora, panicosa, calycina. Africa.

ORDER III. DIGNYA.

695. Orzya, or Rice.
One species; viz. sativa. E. and W. Indies, N. America.—Rice is the produce of many countries, particularly of the East Indies; but as used in Britain, it is brought chiefly from Carolina, where this plant is cultivated in large quantities. It is sufficiently nutritious, and affords an useful food in diarrhoeas, dysenteries, and other disorders from a thin acrimonious state of the juices.

696. Nectris.
One species; viz. aquatica. Guiana.

697. FALKIA.
One species; viz. repens. C. of G. Hope.

698. ATRAPHAXIS.
Two species; viz. spinosa, undulata. Lev. Cape.

ORDER III. DIGNYA.

699. Rumex, or Dock.

* R. valves strongly veined; leaves spear-shaped, acute, * cripus, waved and curled at the edge.—In Norfolk this plant is the pest of clover fields. The fresh roots bruised, and made into an ointment or decoction, cure the itch. The seeds have been given with advantage in the dysentery. Cows, goats, and horses refuse it.

* R. valves veinless; leaves oval-spear-shaped, uneven * acutus, at the edges.—Cows and horses refuse it. It is infected by the * aphis rumicis. The root is used by the dyers. It gives a great variety of shades, from straw colour to a pretty fine olive, and a fine deep green to cloths which have been previously blued.

* R. leaves spear-shaped, smooth, acute, very entire, hydrofusum at the base. It is a medicine of considerable pathum, efficacy, both externally applied as a wash for putrid spongy gums, and internally in some species of scurvy. In rheumatic pains and chronic diseases, owing to obstructed viscera, it is said to be useful. The powdered root is one of the best things for cleaning the teeth. The root has sometimes a reddish tinge, but soon changing to a yellowish brown when exposed to the air. The * curculio lapathi is found upon the leaves.

* R. leaves heart-obleng, bluntish, finely notched.—* obtusifolia Fallow-deer eat this and the * acutus with avidity, biting it close to the root, so that it is very rare to see a dock growing in a park.

* R. leaves oblong, arrow-shaped.—The leaves are * acetosa. eaten in sauces and in salads. The Laplanders use them to turn their milk sour. In France they are cultivated for the use of the table, being introduced in soups, ragouts and fricassees. In some parts of Ireland they eat them plentifully with milk, alternately biting and sucking. The Irish also eat them with fish, and other alkaline food. The dried root gives out a beautiful red colour when boiled. Horses, cows, goats, sheep, and swine eat it. The * aphis acetosa feeds upon it.

700. Flagellaria.
One species; viz. indica. E. Ind. Guiana.

701. Scheuchzeria, or Lesser Flowering Rush.
One species; viz. palustris. Lapland, Sweden, Helvetia.

702. Triglochin, or Arrow-headed Grass.
Three species; viz. * palustre, bulbosum, maritimum. Europe.

* T. capsule 3-celled, nearly strap-shaped.—Cows are * palustre. extremely fond of this plant. Horses, sheep, goats, and swine eat it.

* T. capsule 6-celled, egg-shaped.—It is salt to the * maritimum. taste; but horses, goats, sheep, and swine are very * maritimum. fond of it.

703.
Heptandria.

703. Wurmbea. Three species; viz. pumila, campanulata, longiflora.

704. Melanthium. 14 species; viz. virginicum, sibiricum, latum, capense, triquetrum, ciliatum, juncenum, secundum, phalangoides, indicum, yiride, uniflorum, eucomoides, pumilum. Siberia, Cape, N. America.

706. Trillium, or Three-leaved Nightshade. One species; viz. sessile. N. America.

* C. leaves flat, spear-shaped, upright.—This is one of those plants which, upon the concurrent testimony of ages, was condemned as poisonous; but Dr Storck of Vienna hath taught us that it is an useful medicine. The roots have a good deal of acrimony. An infusion of them in vinegar, formed into a syrup by the addition of sugar or honey, is found to be a very useful pectoral and diuretic; it seems in its virtues very much to resemble squill, but is less nauseous, and less acrimonious, though more sedative. In a pasture in which were several horses, and eaten down pretty bare, the grass was closely cropped, even under the leaves, but not a leaf bitten.

ORDER IV. HEXAGYNIA.

709. Wendlandia. One species; viz. populifolia.

710. Damasonium. One species; viz. indicum.

ORDER V. POLYGYNIA.

In the class Heptandria are 111 Genera, including 784 Species, of which 63 are found in Britain.

716. PANCORIA. One species; viz. bijoga.

717. ESCULUS, or Horse-Chesnut. Three species; viz. hippocastanum, pavia, flav. N. of Asia, America.

The fruit of this plant has been used as food for sheep and poultry, and as soap for washing. It was much employed in powder as a stimulant by an itinerant occultist, and has been recommended by some others in certain cases of spasm, headache, &c. in which effervescence is indicated.

Its effects as a stimulant may also be obtained by using it under the form of infusion or decoction drawn up into the nostrils; and it is entirely with a view to its effervescence that it is now introduced into the Pharmacopoeia of the Edinburgh college. But besides this, the bark has also been represented by some as a cure for intermittent fevers, and it is probably with this intention that this part of the hippocastanum is introduced as an official article in the Pharmacopoeia Rossica.

718. PETROCARPA. Two species; viz. montana, campestria. Guiana.

719. JONESIA. One species; viz. pinnata.

720. DRACONIUM, or Dragon's Head. Six species; viz. polyphylum, spinosum, fomentum, kamschatcense, lanceolatum, partium. Ceylon, W. Indies, America.

721. CALLA, or Ethiopian Arum. Three species; viz. ethiopica, palustris, orientalis. Europe, Cape.

722. HOUTTUYNIA. One species; viz. cordata. Japan.

ORDER II. DIGYNIA.

723. LIMEUM. Three species; viz. africanaum, capense, ethiopicum. C. of C. Hope.

ORDER III. TETRAGYNIA.

724. ASTRANTHUS. One species; viz. cochininchinensis.

725. SAURUS, or Lizard's Tail. One species; viz. cernus. Virginia.

ORDER IV. HEPTAGYNIA.

726. SEPTAS. One species; viz. capensis. C. of C. Hope.

In the class Heptandria are 75 Genera, which include 31 Species. Of these only one is found in Britain.

ORDER I. MONOGYNA.  

728. OSBECHIA, or Gold-rose Feather.  
Two species; viz. chinensis, zeylanica. Ceylon. China.  
729. RHEXIA, or Soap-Wood.  
17 species; viz. virginica, mariana, trichotoma, bi- valvis.
BOTA

ANY.

valvis, trivalvis, jossieicoides, hypericoideas, glutinosa, racisanthera, glomerata, longifolia, aspera, inconstans, latifolia, villosa, aquatica, oniflora. N. America, Jamaica, Brazil.

730. Oenothera, or Tree-prunrose.
15 species; viz. biennis, grandiflora, parviflora, multiflora, longiflora, mollissima, nocturna, villosa, odorata, sinuata, tetrapetra, fruticosa, pumila, rosea, purpurea. America.

731. Gaura, or Virginian Loose-strife.
Three species; viz. biennis, fruticosa, mutabilis. Virginia, Pennsylvania.

732. Epilobium, or Willow-herb.
* E. leaves scattered, strap-spear-shaped; blossoms irregular.—Goats are extremely fond of this plant. Cows and sheep eat it. Horses and swine refuse it. The phalena porcellus and sphina elpenor are found upon it. The suckers of the root are edible. An infusion of the plant has an intoxicating property, and the Kamaschatcades bow a sort of ale from the pith, and from the ale make vinegar. The down of the seeds also, mixed with cotton or fur, has been manufactured into stockings and other articles of clothing.

733. Antichorus.
One species; viz. depressus. Arabia.

734. Combreus.
Five species; viz. laxum, secundum, purpureum, decandrum, alternifolium. America.

735. Vittmanna.
One species; viz. elliptica.

736. Crislea.
Two species; viz. secunda, tomentosa. America.

737. Tetraphaca.
One species; viz. pinicea.

738. Roxburghia.
One species; viz. gloriosoides.

739. Ornithops.
Six species; viz. integrifolia, serrata, cobbe, comminia, occidentalis, rigida. Isle of Bourbon.

740. Allophyllus.

741. Correa.
One species; viz. alba.

742. Honckienya.
One species; viz. ficifolia.

743. Mimosa.
Four species; viz. elengi, hexandra, kanhi, imbricaria. Arabia, India.

744. Jambolina.
One species; viz. pedunculata.

745. Cypania.
Three species; viz. tomentosa, glabra, saponarioides. Coromandel, W. Indies.

746. Xylocarpus.
One species; viz. granatum. Ceylon, E. Indies.

747. Ephelis.
One species; viz. fraxinea. Guyana.

748. Molinex.
Three species; viz. levis, canescens, alternifolia.

749. Melicocca.
One species; viz. bijuga. Jamaica.

750. Koelreuteria.
One species; viz. paniculata. China.

751. Hagenia.
One species; viz. abyssinica. Abyssinia.

752. Persoonia.
One species; viz. gaureoides.

753. Gaurea.
One species; viz. trichilioides.

754. Hedwigia.
One species; viz. balsamifera. Hispaniola.

755. Amryis, or Shrubby Sweetwood.
19 species; viz. polygama, eleufera, sylvatica, maritime, kataf, gileadasis, opobalsamum, enneandria, heterophylla, gujanensis, ambrosia, decidens, altissima, toxiella, protium, dentata, anisata, zeylanica, balsamifera. E. Indies, Carolina, Jamaica.

The A. eleufera produces a resin, which is brought from the Spanish W. Indies, and sometimes from the E. Indies, in large roundish cakes, generally wrapped up in flag leaves. The best sort is softish, somewhat transparent, of a pale whitish yellow colour, inclining a little to green; of a strong, not unpleasant smell. It almost totally dissolves in pure spirit, and sends over some part of its fragrance along with this menstruum in distillation: distilled with water it yields a considerable quantity of pale coloured, thin, fragrant essential oil. This resin gives name to one of the officinal unguents, and is at present scarce any otherwise made use of; though it is certainly preferable for internal purposes to some others, which are held in greater esteem.

The fruit of the amryis gileadasis is the product of the tree that yields the opobalsam, or balsam of Gilead. It is about the size of a pea, of a whitish colour, enclosed in a dark-brown wrinkled bark. This fruit, when in perfection, has a pleasant warm glowing taste, and a fragrant smell, resembling that of the opobalsam itself. It is very rarely found in the shops; and such as we now and then do meet with, has almost entirely lost its smell and taste. It had formerly a place in the mithridate and theriac formulae, now banished from our pharmacopoeias; but even then the college permitted cubets to be employed as a substitute for the carpopobalsamum, which could seldom be procured; and it is probably on this account that it has now no place in our lists.

756. Cedrota.
One species; viz. longifolia. Guyana.
Octandria.

B OT A N Y.

757. XIMENIA.
Three species; viz. americana, elliptica, inermis.
West Indies, Guiana.

758. FUSCHIA.
Four species; viz. triphylla, cocinea, excorticata, multiforma. Jam. Chili, New Zealand.

759. CHLORA, or Yellow Centauria.

760. MICHAUXIA.
One species; viz. campanuloides. Levant.

761. DONONZA.
Three species; viz. viscosa, triquetra, angustifolia. Tropical climates, Cape.

762. VALENTINIA.
One species; viz. illicifolia. Cuba, Hispaniola.

763. LAWSOMIA.
Four species; viz. inermis, purpurea, acronychia, spinosa. Egypt, East Indies.

764. MELICORE.
One species; viz. ternata. South Sea isles.

765. DIMORIFUS.
One species; viz. litchin.

766. MEMECYLON.
Four species; viz. capitatulum, tinctorium, grande, cordatum. Ceylon.

767. BUGINVILLA.
One species; viz. spectabilis. Brazil.

768. VACCINIUM, or Bilberry, or Whortle-berry.

* V. fruitstalks 1-flowered; leaves serrated, egg-shaped; stem angular.—The berries of this plant are very acceptable to children, either eaten by themselves, or with milk, or in tarts. The moor game live upon them in the autumn. The juice stains paper or linen purple. Goats eat it. Sheep are not fond of it. Horses and cows refuse it.

769. V. uliginosum 1-flowered; leaves very entire, inversely egg-shaped, blunt, smooth.—Children are said sometimes to eat the berries; but in large quantities they occasion dizziness and a slight headach, especially when full grown, and quite ripe. Many victors in France are said to make use of the juice to colour their white wines red. Horses, cows, sheep, and goats eat it. Swine refuse it.

770. V. vitis ideal. * V. bunches terminating, nodding; leaves inversely egg-shaped; edge very entire, and rolled back, dotted underneath.—The berries are acid, and not very grateful; but they are eaten by the Finlanders, and by the country people in Sweden, and are sent in large quantities from W. Botnia to Stockholm for pickling. They are also made into tarts, rob, and jelly. Goats eat it. Cows, sheep, and horses, refuse it.

771. SYMPOPIUM.
* V. fruitstalks single or in pairs; leaves egg-shaped, very entire, edges rolled back; stem thread-shaped, trailing, not hairy.—The berries, made into tarts, are much esteemed; but on account of a peculiar flavour, are disliked by some. They may be kept for several years if wiped clean; and then closely corked in dry bottles, or the bottles may be filled with water.—At Long-town in Cumberland, 20 or 30 l. of the berries are sold by the poor people each market day, for five or six weeks together. The most general name, cranberry, probably originated from the fruitstalks being crooked at the top, and before the expansion of the blossom, resembling the neck and head of a crane.

772. M Z I E Z I E Z.
One species; viz. ferrugineus.

* E. leaves arrow-shaped.—This plant, but little re-vulgaris- garded in happier climates, is made subservient to a great variety of purposes, in the bleak and barren highlands of Scotland. The poorer inhabitants make walis for their cottages, with alternate layers of heath, and a kind of mortar made of black earth and straw, the woody roots of the heath being placed in the center, the tops externally and internally. They make their beds of it, by placing the root downwards; and the tops only being uppermost, they are sufficiently soft to sleep upon. Cabins are thatched with it. In the island of Ilay, ale is frequently made by brewing one part malt and two parts of the young tops of heath; sometimes they add hops. It is said, that this liquor was much used by the Picts. Woollen cloth boiled in alum water, and afterwards in a strong decoction of the tops of heath, comes out a fine orange colour. The stalks and tops will tan leather. In England besoms are made of it, and faggots to burn in ovens, or to fill up drains that are to be covered over. Sheep and goats will sometimes eat the tender shoots, but they are not fond of them. Bees extract a great deal of honey from the.
the flowers; but where heath abounds, the honey has a reddish cast.

771. **Ophira.**
One species; viz. stricta. Africa.

772. **Gruelia.**
One species; viz. rosmarinifolia. C. of G. Hope.

773. **Daphne, or Mezereum, Spurge laurel.**
30 species; viz. *mezereum, thymelica, dioica, calycina, pubescens, vermiculata, villosa, tatarum-raina, nitida, alpina, laureola, pontica, pendula, lageta, polystachya, monostachya, tinifolia, gignium, indica, furtica, rotundifolia, odorata, occidentalis, cneorum, altaica, squarrosa, glomerata, eleoideae, sericea, collina. Europe, China, Japan, W. Indies.

*mezereum*. D. flowers sitting on the stem, mostly three together; leaves spear-shaped, deciduous; berries globular.—An ointment prepared from the bark or the berries, has been successfully applied to ill-conditioned ulcers. The whole plant is very corrosive; six of the berries will kill a wolf. A woman gave 12 grains of the berries to her daughter, who had a quartan ague; she vomited blood, and died immediately.—A decoction made of two drams of the cortical part of the root, boiled in three pints of water till one pint is wasted, and this quantity drank daily, is found very efficacious in resolving venereal maladies, and other irritations of the peritoneum. It is said to have been once given, in a case of difficulty in swallowing, seemingly occasioned by a paralytic affection. The patient was directed to chew a thin slice of the root, as often as she could bear to do it; and in about two months, she recovered her power of swallowing. This woman bore the disagreeable irritation, and the ulceration its acrimony occasioned in her mouth, with great resolution; but she had been reduced to skin and bone, and for three years before had suffered extremely from hunger, without being able to satisfy her appetite; for she swallowed liquids very imperfectly, and solids not at all. This complaint came on after lying in.

*laureola*. D. bunches of about five flowers; axillary leaves spear-shaped, smooth.—Very happy effects have been experienced from this plant in rheumatic fevers. It operates as a brisk and rather severe purgative. It is an efficacious medicine in worm cases; and upon many accounts deserves to be better known to physicians; but in less skilful hands, it would be dangerous, as it is possessed of considerable acrimony. The whole plant has the same qualities, but the bark of the root is the strongest. Dr. Alston fixes the utmost dose at ten grains.

774. **Dirca, or Leather-wood.**
One species; viz. palustris. Virginia.

775. **Gnidia.**
16 species; viz. pinifolia, radiata, filamentosa, carinata, scabra, simplex, capitata, lucigata, biflora, racemosa, tomentosa, argentia, imbricata, sericea, oppositifolia, daphnaeefolia. Cape, Madagascar.

776. **Stellaera, or German Groundsel.**
Two species; viz. passerina, chamazacme. Eur.

777. **Passerina, or Sparrow-wort.**
16 species; viz. filiformis, hirsuta, ericoides, nervosa, cephalophora, capitata, orientalis, ciliata, uniflora, grandiflora, canescens, spicata, laea, shriota, anthylloides, pentandra. C. of G. Hope.

778. **Lachnka.**
Two species; viz. eriocephala, conglomerata. C. of G. Hope.

779. **Bechea.**
Two species; viz. frutescens, densifolia. China.

ORDER II. **DIGYNA.**

780. **Schmidtelia.**
One species; viz. racemosa. E. Indies.

781. **Galenia, or Cape Jessamine.**
Two species; viz. africana, procumbens.

782. **Weinmannia.**
Six species; viz. glabra, birta, tomentosa, trifoliata, racemosa, parviflora. Cape, Jamaica, New Zealand.

783. **Codia.**
One species; viz. montana. New Caledonia.

784. **Moehringia, or Mountain Chickweed.**
One species; viz. muscosa. Alps, S. of Eur.

ORDER III. **TRIGYNA.**

785. **Polygonum, or Knot-grass.**
43 species; viz. frutescens, grandiflorum, bistorta, viviparum, virginianum, lapathifolium, amphibium, ocreatum, hydropiper, filiforme, tinctorum, minus, periscia, incanaum, glabrum, barbatum, tomentosum, orientale, pensylvanicum, maritimum, avicular, bellardi, setosum, erectum, articulatum, disparatum, alpinum, undulatum, sericeum, serratum, cerebros, chinensis, sagittatum, arifolium, crassifolium, perfoliatum, tartaricum, emarginatum, fagopyrum, convolvulus, demotorum, scandens, multiflorum. Eur. E. Ind. China, N. Amer.

* P. flowers with cloven pistils; stipule somewhat hydropiper-shaped; leaves spear-shaped.—The whole plant has an acrid burning taste. It cures little aphthous ulcers in the mouth: it dyed wool yellow. The ashes of this plant mixed with soft soap, is a nostrum in a few hands for dissolving the stone in the bladder; but it may be reasonably questioned, whether it has any advantage over other semicastic preparations of the vegetable alkali. Its acrimony rises in distillation; and the distilled water, drank to the amount of two or three half pints daily, has been found very effectual in some nephritic cases. Horses, cows, goats, sheep, and swine, refuse it.

* P. styles 2; spikes egg-oblong; leaves spear-shaped; perisciafringed.—Its taste is slightly acrid and astrignent. Woolen cloth, dipped in a solution of alum, obtains a yellow colour from this plant. Goats, sheep, and horses eat it; cows and swine refuse it.

* P. leaves egg-shaped, extended at the base along the leafstalks.—The root is one of the strongest vegetable astringents. The young shoots are eaten in herb-pudding in the north of England; and about Manchester they are substituted for greens, under the name of patience dock.

* P.
Enneandria.

BOTANY.

788. Sriana. 10 species; viz. sinuata, divaricata, carcassana, racemos, spectabilis, mexicana, angustifolia, lupulina, lucida, triternata.

789. Cardiospermum, or Heart-pee. Four species; viz. holicacaibum, bursatum, corindum, grandiflorum. E. and W. Indies, Brazil.

790. Sapindus, or Soap-berry. 10 species; viz. saponaria, longifolia, spinosa, laurifolia, emarginata, rubiginosa, tetraphyllus, rigidus, arborescens, frutescens. E. and W. Indies, China.

ORDER IV. TETRAGYNIA.

792. Verea. One species; viz. crenata.

793. Paris, or True Love, or One-berry. One species; viz. quadrifolia.

794. Adoxa, or Moschatel. One species; viz. moschatellina. Europe.

795. Elatine, or Water-quart. Two species; viz. hydriper, alinsonstrum. Eur.

796. Haloragis. Two species; viz. cercodina, prostrata. New Zealand, New Caledonia.

797. Forskolea. Three species; viz. tenacissima, candida, angustifolia. Egypt, Tenerife, Cape.

In the class Octandria are

70 Genera, including 493 Species, of which 30 are found in Britain.

Order I. Monogynia.

*Laurus,* or *Bay-tree.*

34 species; viz. cinnamomum, cassia, camphora, culliban, montana, chloroxylon, glauca, pedunculata, caustica, nobileis, indicus, fistens, persica, borbonia, martinicensis, exaltata, alpigena, triandra, sanguinea, surinamensis, hexandra, salicifolia, coriacea, leucocxylon, membranacea, patens, parviflora, pendula, floribunda, lucida, umbellata, eufalvia, benzoin, sassafra. Of these we shall take notice of the following, as of considerable importance.

1. *Laurus,* or evergreen bay-tree, is a native of Italy, and hath an upright trunk branching on every side from the bottom upward; with spear-shaped, nervous, stiff, evergreen leaves, three inches long and two broad; and small, yellowish, quadrifid, discoius flowers, succeeded by red berries in autumn and winter. Of this species there are varieties with broad, narrow, striped, or waved leaves.

2. The *sativa,* or deciduous bay, grows naturally in North America. It rises with an upright stem, covered with a purplish bark; having oblong, ovate, acuminate, veined, deciduous leaves, two or three inches long, and half as broad, growing opposite; with small white flowers, succeeded by red berries.

3. The *benzoin,* or *benjamin-tree,* is also a native of North America; grows 15 or 20 feet high, divided into a very branchy head; with oval, acute, deciduous leaves, three or four inches long, and half as broad; and small yellowish flowers, not succeeded by berries in this country.

4. The *sassafras* is a native of the same country. It hath a shrub-like straight stem, garnished with both oval and three-lobed, shining, deciduous leaves, of different sizes, from three or six inches long, and near as broad, with small yellowish flowers, succeeded by blackish berries, but not in this country.

5. The *indica,* or *Indian bay tree,* rises with an upright straight trunk, branching regularly, 20 or 30 feet high: adorned with very large, spear-shaped, plane, nervous, evergreen leaves on reddish footstalks; and bunches of small whitish green flowers, succeeded by large oval black berries which do not ripen in this country.

6. The *borbonia,* or *Carolina red bay tree,* rises with an upright straight stem, branching 15 or 20 feet high; with large spear-shaped, evergreen leaves, transversely veined; and long bunches of flowers on red footstalks, succeeded by large blue berries sitting in red cups.

7. The *camphora,* or *camphire tree,* grows naturally in the woods of the western parts of Japan, and in the adjacent islands. The root smells stronger of camphire than any of the other parts, and yields it in greater plenty. The bark of the stalk is outwardly somewhat rough; but in the inner surface smooth and mucous, and therefore easily separated from the wood, which is dry and of a white colour. The leaves stand upon slender footstalks, have an entire undulated margin, running out into a point: have the upper surface of a lively and shining green, the lower herbaceous and silky; and are furnished with a few lateral nerves, which stretch archways to the circumference, and frequently terminate in small warts; a circumstance peculiar to this species of *laurus.* The flowers are produced on the tops of footstalks, which proceed from the armpits of the leaves; but not till the tree has attained considerable age and size. The flower stalks are slender, branched at the top, and divided into very short pedicles, each supporting a single flower. These flowers are white, and consist of six petals, which are succeeded by a purple and shining berry of the size of a pea, and is figure somewhat top-shaped. It is composed of a soft pulpy substance that is purple, and has the taste of cloves and camphire; and of a nucleus or kernel of the size of a pepper, that is covered with a black, shining, oily coat, of an inimical taste. 8. The *Cinnamomum,* or *cinnamon tree,* is a native of Ceylon. It hath a large root, and divides into several branches, covered with a bark, which on the outer side is of a grayish brown, and on the inside has a reddish cast. The wood of the roots is hard, white, and has no smell. The body of the tree, which grows to the height of 20 or 30 feet, is covered, as well as its numerous branches, with a bark which at first is green and afterwards red. The leaf is longer and narrower than the common *bay tree,* and it is three-nerved, the nerves vanishing towards the top. When first unfolded, it is of a flame colour: but after it has been for some time exposed to the air, and grows dry, it changes to a deep green on the upper surface, and to
Enneandria.

a lighter on the lower. The flowers are small and white, and grow in large bunches at the extremity of the branches: they have an agreeable smell, something like that of the lily of the valley. The fruit is shaped like an acorn, but is not so large. 9. The cassia, or base cinnamon, has lanceolated leaves, triple-nerved. 10. The persicaria, avocado pear tree, or alligator pear, rises to a considerable height, with a straight trunk, of which the bark and wood are of a grayish colour. The leaves are long, oval, pointed, of a substance like leather, and of a beautiful green colour. The flowers are produced in large knots or clusters at the extremities of the branches, and consist each of six petals disposed in the form of a star, and of a dirty white or yellow colour, with an agreeable odour, which diffuse itself to a considerable distance. It is a native of the West Indies. The persicaria begins to bear two years and a half, or at most three years, after being planted; and, like most of the trees in warm climates, bears twice a year. The other species of this genus are possessed of no remarkable properties.

The first species are propagated by layers, or by the berries. In order to raise a quantity of these trees by layers, some stools should be planted for the purpose; and after these are shot about a yard high, the branches must be brought down to the ground in the winter, all the preceding summer's shoots laid on it, and pegged down, being first slit in the joint, and the leaves taken off, which would otherwise be under ground. In one year's time these layers will have taken root; and in the spring they should be taken up, and planted in the nursery a foot asunder, in rows two feet distance. After they are planted out, if the weather should prove dry, they must be constantly watered; for without such care, it is difficult to make this tree grow. After they have taken well to the ground, they will require no farther trouble than keeping them clean from weeds, and digging between the rows each winter, till they are finally planted out. 2. In order to raise this tree from the berries, they ought to be hung on the trees till about January before they are gathered. A well-sheltered spot of ground for the seedlings must be made choice of: and having the mould smooth and fine, they should be sown soon after they are gathered, in beds or drills, rather more than half an inch deep. Towards the close of the spring the plants will come up, and during summer must be duly attended, by watering and weeding. In the winter following, their sheltered situation must not be trusted to, to defend them from the frost: Furze bushes, or some such things, ought to be stuck in rows between the beds or drills, to guard them from the black frosts. Indeed, without this precaution, if the winter should prove very frosty, few of the young seedlings will be alive in spring. During the following summer, weeding and watering must be observed, and the winter after that they should be defended with covering as before; for they will be still in danger of being destroyed by severe frosts. In the ensuing spring, the strongest may be taken out of the seed-beds, and planted in the nursery way; though, if they have not by that time made good shoots, it will be advisable to let them remain in their beds till the third spring; for a small plant of this kind is with more difficulty made to grow than one which is larger. When they are planted in the nursery, the distance which should be allowed them is the same as the layers, a foot asunder and two feet distance in the rows; and this will not be found too close, for notwithstanding the greatest care is exerted in planting them in the nursery, even making choice of rainy and cloudy weather, which must always be observed in setting them out, many of them will be lost by being transplanted. After they are thus planted out in the nursery, whether layers or seedlings, they must be still watered in dry weather, kept free from weeds, and the rows dug between every winter. You will even find, that those plants which suffer least by being transplanted will have met with a check, which they will not recover in two or three years; and till they have acquired new strength they should not be taken from the nursery; but when they appear to be good stiff plants, having the year before made a vigorous shoot, they will be then proper plants for planting out where they are to remain. Holes should be got ready for their reception; and as soon as the first autumnal rains fall, the work should be set about, especially if the land be gravelly or dry; but if it be moist, the spring will do as well. Being now planted at one yard distance, they will make a poor progress for two or three years more; but after this, when they have overcome all these difficulties, they will grow very fast, and arrive to be good trees in a few years. Although this tree flourishes best in old gardens, where the soil has been made rich and deep, and loves the shade, Hanbury tells us, "it thrives nevertheless exceedingly well in our hottest gravels and sands; and after it has surmounted the hardships of transplanting, will grow in such situations extremely fast, and arrive to a large bulk.

The propagation of the three next sorts of trees may be performed two or three ways: 1. By the seeds. These we receive from the places where the trees grow naturally, in the spring. They should be preserved in sand; and as soon as they arrive, should be sown in large pots an inch deep. The soil for their reception should be taken from a rich pasture at least a year before, with the sward. It should also be laid in a heap, and frequently turned, until the sward is grown rotten, and the whole appears well mixed and fine. If the pasture from whence it was taken near the surface is a sandy loam, this is the best compost for these seeds; if not, a small addition of drift or sea sand should be added, and well mixed with the other mould. After filling the pots with this soil, the seeds should be sown an inch deep; and then they should be plunged into common mould up to the rim. If the soil be naturally moist, it will keep them cooler, and be better; and if the place be well sheltered and shaded, it will be better still. Nothing more than weeding, which must be constantly observed during the summer, will be necessary; and in this station they may remain until the March following: about the middle of which month having prepared a good bed, the plants placed in the bed up and stood therein. Soon after the seeds will come up; and when the young plants have sufficiently received the benefit of this bed, they should be injured by degrees to the open air. Weeding and watering must be observed during the summer; and at the approach of the cold weather in the autumn, they should be removed under a hotbed frame, or some cover,
cover, to be protected from the frosts during the winter. In the spring, when this danger is over, they should resume their first station; namely, the pots should be plunged up to the rim, as when the seeds were first sown; and if this place be well sheltered, they may remain there all winter: if not, and severe frosts threaten, they should be taken up and placed under cover as before. After they have been thus managed three years from the seeds, they should be taken out of the pots with care, and planted in the nursery ground at small distances, where they may remain until they are strong enough to be finally set out. By sowing the seeds in pots, and assisting them by a hotbed, a year at least is saved; for they hardly ever come up, when sown in a natural border, under two years from the seeds; nay, they have been known to remain three, and even some plants to come up the fourth year after sowing; which at once shows the preference of the former practice, and should caution all who have not such convenience, not to be hasty in disturbing the beds when the seeds are sown in the natural ground; as, especially if they are not well preserved in mould or sand, these may be some years before they appear. Indeed, it is the long time we are in obtaining these plants, either by seeds, layers, &c. that makes them at present so very scarce amongst us.

2. These plants may also be increased by layers; but very slowly; for they will be two and sometimes three, or even four years, before they have struck out good roots; though the benjamin tree is propagated the fastest by this method. The young twigs should be laid in the ground in the autumn; and it will be found that twisting the wire round the bud, so as in some degree to stop the progress of the sap, and taking away with a knife a little of the bark, is a more effectual method of obtaining good roots sooner than by the slit or twisting, especially when practised on the sassafras tree.

3. Plants of those sorts are likewise sometimes obtained by suckers, which they will at all times throw out, and which may be often taken off with pretty good roots; but when they are weak, and with bad roots, they should be planted in pots, and assisted by a moderate heat in a bed: with such management they will be good plants by the autumn, and in the spring may be planted out anywhere.

4. Cuttings of these trees, when planted in a good bark bed, and duly watered, will also oftentimes grow. When this method is practised, and plants obtained, they must be inured by degrees to the open air, till they are hardy enough to be finally planted out.

The Indian bay, the campneph, the avocado, and the cinnamon tree, require the treatment common to greenhouse plants; the latter, however, is rather a stove plant in this country.—Of its culture or propagation in its native places, no particular account has been given by botanical writers; but it must now become an important consideration with us, since the island of Ceylon, where cinnamon chiefly grows, now belongs to Great Britain. Of the advantages promised by this acquisition we are indebted for the first accounts to Dr Wright in 1787; from whom also we learn, that its propagation is very easy, and its culture requires little care, as more particularly noticed below. Since that time, some observations by Dr Dance, relative to its cultivation, have appeared in the Transactions of the Society of Arts.
Enneandria.

They are smooth, and of a fine light green colour. The leaves on their upper surface are smooth and of a fine light green colour, but their under surface is ve

B O T A N Y.

The sassafras will grow to nearly the height of the others, though the branches are not so numerous. Its bark is smooth, and of a red colour, which beautifully distinguishes it in winter; whilst the fine shining green of its leaves constitutes its greatest beauty in summer. In these, indeed, there is a variety, and a very extraordinary one. Some are large and of an oval figure; others are smaller, and of the same shape; whilst others again are divided into three lobes, so as to resemble the leaves of some sorts of fig tree. In America, the sassafras generally stands single in the woods, and along the fences round the fields. It flowers in May before the leaves come out; and being entirely covered with them, it is distinguished at a great distance by their beautiful yellow colour.

The root of the sassafras has a fragrant smell, and a sweetish, aromatic, subacidic taste: the bark tastes much stronger than any other part, and the small twigs stronger than the large pieces. It is a warm opeirant and corroborant, and frequently employed with good success for purifying and sweetening the blood and juices. For these purposes, infusions made from the rasped root or bark may be drank as tea. In some constitutions indeed, such liquors are, by their fragrance, apt, on first taking them, to affect the head; but in such cases they may be advantageously freed from their flavour by boiling. A decoction of sassafras, boiled down to the consistence of an extract, proves simply bitterish and subacidic. Hoffman assures us, that he has frequently given this extract to the quantity of a scruple at a time, with remarkable success, for strengthening the tone of the visceras in cachexias; as also in the decline of intermittent fevers and in hypochondriacal spasms. Sassafras yields in distillation an extremely fragrant oil of a penetrating pungent taste, so ponderous (notwithstanding the lightness of the drug itself), as to sink in water. Rectified spirit extracts the whole taste and smell of sassafras; and elevates nothing in evaporation: hence the spirituous extract proves the most elegant and efficacious preparation, as containing the virtue of the root entire.

The bark of this tree is used by the women in Pennsylvania and other parts of North America in dyeing woveen a fine lasting orange colour, which does not fade in the sun. They use urine instead of alum in dyeing; and boil the dye in a brass boiler, because in an iron vessel it does not yield so fine a colour. The wood is made use of for posts belonging to the enclosures, for it is said to last a long time in the ground: but it is likewise said, that there is hardly any kind of wood which is more attacked by worms than this when it is exposed to the air without cover; and that in a short time it is quite worm-eaten through and through. On cutting some part of the sassafras tree, or its shoots, and holding it to the nose, it has a strong but pleasant smell. Some people peel the root, and boil the peel with the beer which they are brewing, because they believe it wholesome. For the same reason, the peel is put into brandy either whilst it is distilling, or after it is made. Professor Kalm informs us, that a decoction of the root of sassafras in water, drank every morning, is used with success in the dropsy. When part of a wood is destined for cultivation, the sassafras trees are commonly left upon it, because they have a very thick foliage, and afford a cool shade to the cattle during the great heats. Some people get their bedposts made of sassafras wood, in order to expel the bugs; for its strong scent, it is said, prevents those vermin from settling in them. For two or three years together this has the desired effect, or about as long as the wood keeps its strong aromatic smell; but after that time it has been observed to lose its effect. In Pennsylvania some people put chips of sassafras into their chests, where they keep all sorts of woolen stuffs, in order to expel the moths (or larvae of caterpillars of moths or tinies) which commonly settle in them in summer. The root keeps its smell for a long while: Professor Kalm saw one which had lain five or six years in the drawer of a table, and still preserved the strength of its scent. The people also gather its flowers, and use them as tea.

The persica, or alligator pear-tree, is cultivated universally in the West Indies by all ranks of people. The fruit is pear-shaped, and from one to two pounds in weight. On removing a green skin or covering, we come to a yellow butyrous substance, and as the heart find a large round seed or stone, which is unequal in the surface, and exceedingly hard and woody. This fruit is ripe in August and September, and constitutes one of the most agreeable articles of diet for six or eight weeks to the negroes. These pears, with a little salt and a plantain or two, afford a hearty meal. They are also served up at the tables of white people as choice fruit. When the pear is ripe, the yellow or butyrous substance is firmer than butter, and tastes somewhat like butter or marrow; hence it is called by some the vegetable marrow. But however excellent this fruit is when ripe, it is very dangerous when pulled and eaten before maturity. Dr Wright says, he has repeatedly known it to produce fever and dysentery, which were removed with difficulty. The leaves of this tree, and those of the bead vine or wild liquorice, are made into pectoral decoctions by the common people. The large stone is used for marking linen. The cloth is tied or held over the stone, and the letters are pricked out by a needle through the cloth and into the seed. The stain is a reddish brown, which never washes out.—The buds of the alligator tree are said to be used with success in pisanas against the venereal disease. An infusion of them in water, drank in the morning fasting, is strongly recommended for dissolving congealed blood in the stomach, produced by a fall or a severe stroke on that important entailie. "The wild bears in the East Indies (says Labat) eat greedily of the mamees and avocado pears, which give their flesh a luscious and most agreeable savour."

Cassia. The bark of this species is known in the shops by the name of cassia lignea. This bark, which is imported from different parts of the East Indies and from China, has a very near resemblance to the cinnamon; though distinguishable from it by being of thicker.
thicker and coarser appearance, and by its breaking short and smooth, while the cinnamon breaks fibrous and shivery. It resembles cinnamon still more exactly in its aromatic flavour than in its external appearance; and seems only to differ from it in being somewhat weaker, in abounding more with a viscid mucilaginous matter, and in being less astringent. Accordingly, it has not only a place in the Edinburgh Pharmacopoeia, but is also the basis of a distilled water. It is perhaps surprising that the London college have given it no place in their lists. But although it does not enter their Pharmacopoeia, yet we may venture to assert, that it will not be neglected by the apothecaries. At present it is very common with many of them to substitute the cassia in every case for the more expensive article cinnamon: and indeed almost the whole of what is at present sold under the title either of simple or spirituous cinnamon water is entirely prepared from cassia; and not even entirely from the bark, but from a mixture of the bark and buds.

Cinnamon is the under bark of the cinnamomum. The best season for separating it from the outer bark, which is gray and rugged, is the spring, when the sap flows in the greatest abundance. It is cut into thin slices, and exposed to the sun, and curls up in drying. The old trees produce a coarse kind of cinnamon; the spice is in perfection only when the trees are not older than three or four years. When the trunk has been stripped of its bark, it receives no further nourishment; but the root is still alive, and continues to throw out fresh shoots. The fruit of the tree is shaped like an acorn, but is not so large. Its seed, when boiled in water, yields an oil which swims at top, and takes fire. If left to cool, it hardens into a white substance, of which candles are made, which have an agreeable smell, and are reserved for the use of the king of Ceylon. The cinnamon is not reckoned excellent unless it be fine, smooth, brittle, thin, of a yellow colour, inclining to red, fragrant, aromatic, and of a poignant yet agreeable taste. The connoisseurs give the preference to that, the pieces of which are long but slender. That which comes to us is generally mixed with the cassia bark; but this last is easily distinguished. Cinnamon splinters in breaking, and has a roughness along with its aromatic flavour; while the cassia breaks over smooth, and has a mucilaginous taste. Cinnamon is a very elegant and useful aromatic, more grateful both to the palate and stomach than most other substances of this class. By its astringent quality it likewise corroborates the visceras, and proves of great service in several kinds of alvine fluxes, and immoderate discharges from the uterus.

The cinnamon plant, with other valuable ones, was taken in a French ship by Admiral Rodney in the last war, and presented by him to the assembly of Jamaica. One of the trees was planted in the botanic garden in St Thomas in the East; the other by Hinton East, Esq. in his noble garden at the foot of the Blue Mountains. From this parent tree some hundreds of young trees are already produced from layers and cuttings, and dispersed to different parts of the country, in all which it thrives luxuriantly with little trouble: we may therefore, hope it will soon be a valuable addition to our commerce. Upon comparing the parts of the tree with the description and figure given by Burman and other botanists, it appears to be the real Ceylon cinnamon, and of the best kind, called by the natives Rasticarie: but the specimens of bark taken put it out of all doubt, being, in the opinion of the best judges, of an equal, if not superior, quality to any imported from India. The smallest bit of the bark, Dr Wright assures us, is quite a cordial. The cinnamon we have from Holland, he observes, is often inert, and gives room to suspect that it has been subjected to a slight process in distillation.

In regard to the trees growing in Jamaica, Dr Dan- cer informs us, in his paper already quoted, that "The best cinnamon bark, according to the different trials I have made, is taken from the small branches, of about an inch diameter, the larger limbs not being so easily decorticated, and not yielding so good or so strong a cinnamon. The smaller twigs, or those that have not acquired a cineritious bark, are too full of sap and mucilage, and have little aroma. It is the libera, or inner bark, that constitutes the cinnamon; from which the two external barks must be carefully and entirely separated, or they vitiate the flavour of the cinnamon; to do which with dexterity, and to raise the bark from the wood, requires some practice. The bark being separated, the smaller pieces are to be placed within the larger: which, by exposure to the sun or the air, presently coil up, and require no further preparation. A dry season is the proper one for taking the bark, as it is found to be weakened after long or heavy rains. Cinnamon, though more retentive of its virtues than any of the other spices, yet requires to be protected when taken, from the air and moisture, by close packing in cedar chests. The leaves of this tree, whether recent or dried, are so strongly impregnated with an aroma, as to afford a good succedaneum for the bark both in cookery and medicine. Distilled, they give an excellent simple and spirituous water, and an essential oil. Powdered, they are a good aromatic species, or marsechal perfume." Camphor, though solid, is the essential oil of the laurus camphora; and is obtained from it by distillation in the East Indies. (See the article CAMPHORA.)—The tree is another of the captured plants given to the inhabitants of Jamaica; and, if cultivated with care, will also be an useful acquisition. The abbé Grosier informs us, that in China some of these trees are found above 100 cubits in height, and so thick that 20 persons cannot enclose them. The tree is there called tchang; and it is said that the trunk, when old, emits sparks of fire, but of so subtle a nature as not even to injure the hair of those who are near it. Common camphire costs only a penny the ounce at Pe-king; but it is inferior to that of Borneo, in the judgment even of the Chinese. The manuer in which some authors have spoken of camphire (the abbé observes), gives us reason to conclude that they have been entirely ignorant of the process employed to obtain this salutary gum. The camphire does not drop to the earth, like the gums of certain resinous trees, which are preserved by discharging that part of their substance which is too oily; neither does it distil from the top to the bottom of the tree through an incision made in it. The Chinese would practise this method could it be employed with success; for it is very common in China to make such kind
kind of incisions in resinous trees. The method used
by the Chinese for obtaining camphire is as follows—
They take some branches fresh from the 

zhong, chop
them very small, and lay them to steep in spring-water
for three days and three nights. After they have been
soaked in this manner, they are put into a kettle,
where they are boiled for a certain time, during which
they keep continually stirring them with a stick made
of willow. When they perceive that the sap of these
small chips adheres sufficiently to the stick in the form
of white froth, they strain the whole, taking care to
throw away the dregs and refuse. This juice is after-
wards poured gently into a new earthen basin well var-
nished, in which it is suffered to remain one night.
Next morning it is found coagulated, and formed into
a solid mass. To purify this first preparation, they
procure some earth from an old earthen wall, which,
when pounded, and reduced to a very fine powder,
they put into the bottom of a basin made of red cop-
per; over this layer of earth they spread a layer of
camphire, and continue thus until they have laid four
strata. The last, which is of very fine earth, they cov-
er up with the leaves of the plant 
po lo, or penny-
royal; and over the whole they place another basin,
joining it very closely to the former by means of a
kind of red earth that cements their brims together.
The basin thus prepared is put over a fire, which
must be managed so as to keep up an equal heat:
experience teaches them to observe the proper degree.
But above all they must be very attentive lest the
plaster of fat earth which keeps the basons together
should crack or fall off; otherwise the spirituous part
would evaporate, and ruin the whole process. When
the basons have been exposed to the necessary heat,
they are taken off and left to cool; after which they
are separated, and the sublimated camphire is found
adhering to the cover. If this operation be repeated
two or three times, the camphire is found purer and in
larger pieces. Whenever it is necessary to use any
quantity of this substance, it is put between two earth-
en vessels, the edges of which are surrounded with se-
veral bands of wet paper. These vessels are kept for
about an hour over an equal and moderate fire: and
when they are cool, the camphire is found in its ut-
most perfection and ready for use. This method of
procuring camphire, even from the heart of the tree,
may be practised in all seasons of the year; which
would not be the case (our author observes), were it
extracted like other resinous substances that only flow
during a certain short space of time. Besides, by lop-
ning the branches of the camphire tree, less hurt is done
to it than by making incisions, which are always hazar-
dous.

799. Anagardium, or Cathca-mut, or Aecouent.
One species; viz. occidentale. E. and W. Indies.

800. Panze.
Two species; viz. tinctoria, sonchifolia. Chili.

801. Plectorrhiza.
One species; viz. adstringens. Chili.

818. Schotia.

One species; viz. speciosa. C. of G. Hope.

819. Guaiacum, or Lignum-vitae, Rockwood.

Three species; viz. dubium, officinale, sanctum. Africa, China, W. Indies.

The wood of the guaiacum officinale is very ponderous, of a close compact texture; the outer part is of a yellow colour, the heart of a deep blackish green, or variegated with black, green, pale, and brown colours; the bark is thin, smooth, externally of a dark grayish hue: both have a slightly aromatic, bitterish, pungent taste; the bark is somewhat the weakest. The resin, which exudes from incisions made in the trunk of the tree, is brought to us in irregular masses, usually friable, of a dusky greenish, and sometimes of a reddish cast, with pieces of the wood among them: its taste is more acrid and pungent than that of the wood or bark.

Their general virtues are those of a warm stimulating medicine: they strengthen the stomach and other visceras; and remarkably promote the urinary and cuticular discharge. Hence, in cutaneous defecations, and other disorders, proceeding from obstructions of the excretory glands, and where sluggish serous humours abound, they are eminently useful; rheumatic and other pains have often been relieved by them. They are also laxative. The resin is the most active of these drugs; and the efficacy of the others depends upon the quantity of this part contained in them. The resin is extracted from the wood in part by watery liquors, but much more effectually by spirituous ones. The watery extract of this wood kept in the shops, proves not only less in quantity, but considerably weaker, than one made with spirit. This last extract is of the same quality with the native resin, and differs from that brought to us only in being purer. The gum or extracts are given from a few grains to a scruple or half a dram; which last dose proves, for the most part, considerably purgative. The official preparations of guaiacum are, an extract of the wood, a solution of the gum in rectified spirit of wine, and a solution in volatile spirit, and an empyreumatic oil distilled from the wood.

Guaiac, in form of decoction, has been said to cure the venereal disease; and in this country it is frequently used as an adjuvant to mercury. The resin, dissolved in rum, or combined with water by means of mucilage or the yolk of eggs, or in the form of volatile tincture or elixir, is much employed in gout and chronic rheumatism. The tincture or elixir has been,

823. Codon.
One species; viz. royni. C. of C. Hope.

824. Dictamnus, or Fraxinella, White Dictamy. One species; viz. albus. Germ. France, Italy.
The dictamnus albus grows wild in the mountainous parts of France, Italy, and Germany. From thence the cortical part of the root, in a dry state, rolled up in little quills, is sometimes brought to us. It is of a white colour, of a weak, not very agreeable smell, and of a durable bitter, lightly pungent taste. It has been recommended as an alexipharmac, a tonic, and an anthelmintic; but it is very seldom used, and has no place in the London Pharmacopoeia.

825. Nicandra.
One species; viz. amara. Guiana.

826. Petaloma.
Two species; viz. myrtilloides, muriri. W. Indies, Guiana.

827. Ruta, or Rue. Seven species; viz. graveolens, montana, chalepensis, pinnata, patavina, linifolia, fruticulosa. S. Eur. Africa.
The ruta graveolens is a small shrubby plant met with in gardens, where it flowers in June, and holds its green leaves all the winter. We frequently find in the markets a narrow-leaved sort, which is cultivated by some in preference to the other, on account of its leaves appearing variegated during the winter with white streaks.

Rue has a strong ungrateful smell, and a bitterish penetrating taste. The leaves, when in full vigour, are extremely acrid, insomuch as to inflame and blister the skin if much handled. With regard to their medicinal virtues, they are powerfully stimulating, attenuating, and detergent. And hence, in cold phlegmatic habits, they quicken the circulation, dissolve tenacious juices, open obstructions of the excretory glands, and promote the fluid secretions. The writers on the materia medica, in general, have entertained a very high opinion of the virtues of this plant. Boerhaave is full of its praises; particularly of the distilled oil and the distilled water, cohabated or re-distilled several times from fresh parcels of the herb: after somewhat extravagantly commending other waters prepared in this manner, he adds, with regard to that of rue, that the greatest commendations he can bestow upon it fall short of its merit. "What medicine (says he) can be more efficacious for promoting sweat and perspiration, for the cure of the hysterical passion and of epilepsies, and for expelling poison." Whatever service rue may be of in the two last cases, it undoubtedly has its use in the others; the cohabated water, however, is not the most efficacious preparation of it. An extract, made by rectified spirit, contains, in a small compass, the whole virtues of the rue; this menstruum taking up by infusion all the pungency and flavour of the plant, and elevating nothing in distillation. With water its peculiar flavour and warmth arise; the bitterness, and a considerable share of the pungency, remaining behind.
The only official preparation of rue now retained in our pharmacopoeias is the extract; but it is an ingredient in the compound powder of myrrh and some other compositions.

828. Toluifera, or Balsam of Tolu tree. One species; viz. balsamum. Carthagoana.
The toluifera balsamum flows from a tree growing in Tolu in the Spanish West Indies; from whence the balsam is brought to us in little gourd shells. It is of a yellowish brown colour inclining to red; in consistence thick and tenacious; by age it grows hard and brittle, without suffering any great loss of its more valuable parts. The smell of this balsam is extremely fragrant, somewhat resembling that of lemons; its taste warm and sweetish, with little of the pungency, and nothing of the nauseous relish, which accompany the other balsams. It has the same general virtues with the balsamum rashiriri, but is much milder; and for some purposes, particularly as a corroborant in gleet and seminal weaknesses, is supposed to be more efficacious.

829. Myroxylon, or Balsam of Peru. Three species; viz. peruiferum, pediculosum, frutescens. Mexico, Peru.
The myroxylon peruiferum, as brought to us, is nearly of the consistence of thin honey, of a reddish brown colour, inclining to black, an agreeable aromatic smell, and a very hot biting taste. Distilled with water, it yields a small quantity of a fragrant essential oil of a reddish colour; and in a strong fire, without addition, a yellowish red oil.

Balsam of Peru is a very warm aromatic medicine, considerably hotter and more acrid than copaiva. Its principal effects are to warm the habit, to strengthen the nervous system, and attenuate viscid humours. Hence its use in some kinds of asthma, gonorrhoea, dysenteries, suppressions of the uterine discharges, and other disorders proceeding from a debility of the solids, or a sluggishness or inactivity of the juices. It is also employed externally for cleansing and healing wounds and ulcers, and sometimes against palpus and rheumatic pains.

This balsam does not unite with water, milk, expressed oils, animal fats or wax; it may be mingled in the cold with this last, and likewise with the sebaceous substance called expressed oil of mace; but if the mixture be afterwards liquefied by heat, the balsam separates and falls to the bottom. It may be mixed with water into the form of an emulsion, after the same manner as the balsam of Copaiva. Alkaline lixivias dissolve great part of it; and rectified spirit the whole.

It is an ingredient in several officinal compositions, in some of which it has rather a bad than a good effect.

There is another sort of balsam of Peru of a white colour, and considerably more fragrant than the former. This is very rarely brought to us. It is said to be the produce of the same plant which yields the common or black balsam, and to exude from incisions made
Decandria.

'BOT

made in the trunk; while the former is alleged to be obtained by boiling. Besides the white, there is also a third kind, commonly called the red or dry. This is supposed to obtain a different state from the white, merely in consequence of the treatment to which it is subjected, after it is got from the tree. In its fragrance it in some degree approaches to the balsam of Gilead, held in so high esteem among the eastern nations; but it is very rarely in use in Britain, and almost never to be met with in our shops.

830. Hematoxylyon, or Logwood.
One species; viz. campechianum. Campeachy, S. America.—This species is brought chiefly from Campeachy in the bay of Honduras. It is usually in large logs, very compact and hard, of a red colour, and an astringent sweet taste. It has been for a long time used by the dyers, but not till very lately as a medicine; a decoction of it, and the extract, are in use in our hospitals, and said to have proved very serviceable in diarrhoea. It frequently tinges the stools, and sometimes the urine. The extract is now received into the shops, and it is found to be a very useful astringent.

867. Rhododendron, or Dwarf Rose-bay.
10 species; viz. ferrugineum, dauricum, camtschatci-
num, hirsutum, chinense, caucasicum, chrysanthum, ponticum, maximum, punctatum. Siberia, Alps, Gib-
ralter, Levant, N. Amer.

The rhododendron chrysanthum is a native plant of Siberia, where a weak infusion of it is used as tea. The Siberians use a kind of decoction of it in rheumatism and gout. They put about two drams of the dried shrub in an earthen pot with about ten ounces of boiling water, keeping it near a boiling heat for a night, and then they take in the morning. It is said to occasion heat, thirst, a degree of delirium, and a peculiar creeping-like sensation in the parts affected. The use of liquids is not allowed during its operation, as this is apt to induce vomiting. In a few hours the pain and disagreeable symptoms are relieved; and it is said, two or three doses generally complete the cure. The powder has also been used in doses of a few grains.

Hitherto it has been so little employed in Britain, that it has no place in the London Pharmacopoeia: but in some cases, in which it has been used at Edin-
burgh, it has been productive of good effects; and ac-
cordingly it is now introduced into the Edinburgh Pharmacopoeia, as well as into the Pharmacopoeia Ross-
sica, where it had first a place.

868. Andromeda, or Base Heath.
26 species; viz. tetragona, ericoides, hypnoides, ly-

Two species; viz. procumbens, antipoda.

871. Arbutus, or Strawberry Tree.
18 species; viz. *unedo, laurifolia, andrachne, fer-

unedo.

* A stem tree-like; leaves smooth, bluntly serrated; panicle terminating; berries with many seeds.—It is a beautiful ornament to our shrubberies, not only on ac-
count of its foliage and flowers, but of its fruit, which is pleasing to the eye, though not grateful to the taste. The country people, however, in Ireland eat it, but always drink water after.

* A. stem trailing; leaves wrinkled, somewhat ser-
rated, and fringed with hairs.—The berries have some-
thing of the flavour of black currants, but they are not so good. Goats refuse it.

* A. stems trailing; leaves oblong egg-shaped, very wea-
entire, veined like net-work underneath.—The berries of this plant are insipid, pulpy, and mealy. The plant is much used in Sweden, to dye an ash colour, and to tan leather. Half a dram of the powdered leaves, given every, or every other day, has been found useful in calculous cases. It was first used for this purpose at Montpelier, and afterwards by Dr De Haen at Vienna, who relates several cases, in which it proved of the greatest service. Its success in England has been uncertain. Sometimes the patients found no relief, but thought their complaints rather aggravated than alleviated; while, in other calculous and nephritic cases, the symptoms have been almost entirely removed. Perhaps, upon the whole, we shall find it no better than other vegetable astringents; some of which have been long used by the country people in gravelly complaints, and with very great advantage, though hitherto unnoticed by the regular practitioners. Horses, cows, goats, and sheep, refuse it.

872. Clethra.
Four species; viz. aluifolia, paniculata, arborea, ti-

873. Pyrola, or Winter-green.

874. Styrax, or Storax-tree.
Four species; viz. *officinalis, grandifolium, ben-
zoin, levigatum. Italy, Levant, S. Carolina.

The styrax officinalis is an odoriferous resinous sub-
stance, exuding from a tree growing in the warmer climates.

It has been customary to distinguish three sorts of storax, though only one is usually met with in the shops.

1. Styrax colanita, or storax in the cane; so called from its having been formerly brought inclosed in reeds from Pamphylia. It is either in small distinct tears, of a whitish or reddish colour, or in larger masses com-
pose of such.

2. Storax in the lump, or red storax. This is in masses of a uniform texture, and yellowish red or brownish colour; though sometimes, likewise, in-
spersed with a few whitish grains. Of this sort, there has been some lately to be met with in the shops, un-
der the name of storax in the tear.

3. The common storax of the shops, is in large masses, considerably lighter and less compact than the foregoing; it appears, upon examination, to be composed of a resinous juice, mixed with saw-dust. For what pur-
pose this addition is made, it is difficult to say; but it can scarcely be supposed to be done with any fraudulent view, since the saw-dust appears at sight. This com-
mon storax is much less valued than the two first sorts; though, when freed from the woody matter, it proves superior in point of fragrance to either of them.

Rectified
Decandria.

B O T A N Y.

Rectified spirit, the common menstruum of resins, dissolves the storax, leaving the wood behind; nor does this tincture lose considerably of its valuable parts, in being insipid to a solid consistence; whilst aqueous liquors elevate almost all the fragrancy of the storax.

Storax is one of the most agreeable of the odoriferous resins, and may be exhibited to great advantage in languors, and debilities of the nervous system; it is not, however, much used in common practice.

875. **Incarius.**

One species; viz. edulis. Otahite.

876. **Samyda.**

Nine species; viz. nitida, macrophylla, multiflora, villosa, gibbosa, spinosa, pubescens, serrulata, polyandra. West Indies, S. America.

877. **Casearia.**

12 species; viz. spinosa, nitida, ramiflora, hirta, parviflora, parvifolia, sylvestris, macrophylla, serrulata, elliptica, ovata, hirsuta. Jamaica, S. America.

878. **Aquilaria.**

One species; viz. ovata. West Indies.

879. **Augea.**

One species; viz. capensis.

880. **Copaefera, or Balsam of Copivi Tree.**

One species; viz. officinalis. Brazil, Antilles.

The tree which produces this balsam is a native of the Spanish West India islands, and of some parts of the continent of South America. It grows to a large size, and the balsamum copaea flows, under the form of a resinous juice, from incisions made in the trunk.

The juice is clear and transparent, of a whitish or pale yellowish colour, an agreeable smell, and a bitterish pungent taste. It is usually about the consistence of oil, or a little thicker; when long kept, it becomes nearly as thick as honey, retaining its clearness; but has not been observed to grow dry or solid, as most of the other resinous juices do. We sometimes meet with a thick sort of balsam of copaiva, which is not at all transparent, or much less so than the foregoing, and generally has a portion of turbid watery liquor at the bottom. This sort is probably either adulterated by the mixture of other substances, or has been extracted by coction from the bark and branches of the tree; its smell and taste are much less pleasant than those of the genuine balsam.

Pure balsam of copaiva dissolves entirely in rectified spirit, especially if the menstruum be previously alkalinized; the solution has a very fragrant smell. Distilled with water, it yields a large quantity of a limpid essential oil, and in a strong heat, without addition, a blue oil.

The balsam of copaeiva is a useful corroborative medicinal, accompanied with a degree of irritation. It strengthens the nervous system, tends to loosen the belly; in large doses proves purgative, promotes urine, and cleans and heals excretions in the urinary passages, which it is supposed to perform more effectually than any of the other balsams. Fuller observes, that it gives the urine an intensely bitter taste, but not a violet smell, as the turpentine does.

This balsam has been principally celebrated in gleet and the fluor albus, and externally as a vulnerary.

Vol. IV. Part L

The author above mentioned recommends it likewise in dysenteries, in scorbutive cachexies, in diseases of the breast and lungs, and in an acrimonious or putrescent state of the juices: he says, he has known very dangerous coughs, which manifestly threatened a consumption, cured by the use of this balsam alone; and, that notwithstanding its being hot and bitter, it has good effects, even in hectic cases. Most physicians seem now, however, to consider balsams and resins too stimulant to be ventured on in phthisical affections.

The dose of this medicine rarely exceeds 20 or 30 drops, though some direct 60, or more. It may be conveniently taken in the form of an elisissaccharum, or in that of an emulsion, into which it may be reduced by triturating it with almonds, or rather with a thick mucilage of gum arabic, till they are well incorporated, and then gradually adding a proper quantity of water.

881. **Bucida.**

Two species; viz. bucers, capitata. Jamaica.

**ORDER II. DIGYinia.**

882. **Royena, or African Bladder-nut.**

Seven species; viz. lucida, villosa, pallens, gibbosa, hirsuta, polyandra, angustifolia. C. of G. Hope.

883. **Hydrangea.**

Four species; viz. arborescens, hortensis, radiata, quercifolia. Virginia, Carolina.

884. **Cunonia.**

One species; viz. capensis. C. of G. Hope.

885. **Trianthema, or Horse Purslain.**

Seven species; viz. monogyna, crystallina, pentandra, fruticosa, humifusa, anceps, decandra. Egypt, India, Jamaica.

886. **Chrysosplenium, or Golden Saxifrage.**

Two species; viz. *alternifolium, *oppositifolium N. Europe, Canada.

887. **Saxifraga, or Saxifrage.**

888. **Tiarella, or American Sanicle.**

Two species; viz. cordifolia, trifoliata. North of Asia and America.

889. **Mitella, or Base American Sanicle.**

Three species; viz. *diphylia, * cordifolia, nuda. N. of Asia, America.

890. **Scleranthus, or Knawel, German Knot-grass.**

* S. calyx, segments thorless, tapering to a point, annuus, open when the fruit is ripe.—The Swedes and Germans

A x are
are said to receive the vapour arising from a decoction of it into their mouths to cure the toothache. Goats and sheep eat it; cows refuse it.

Gypsophila. * S. cal. segments blunts, closed when the fruit is ripe.

--- The Polish cock-eel (coccus polonicus) is found upon the roots in the summer months.

894. DIANTHUS, or Pink, Carnation.

32 species; viz. *barbatus, carthusianorum, atrorubens, ferrugineus, armeria, japonicus, profliger, diminutus, Caryophyllus, sylvester, pomeridianum, deltoidea, albicans, crenatus, chinensis, monspeliaca, libanotis, plumarius, crinum, superbus, attenuatus, purpureus, virginius, armerius, repens, ecaeius, cespititum, ruber, alpinus, pulchialis, arborescens, juniperinus. Europe, Cape, China, America.

Of the species called Caryophyllus, or close July-flower, a great variety is met with in our gardens; those made use of in medicine ought to be of a deep crimson colour and a pleasant aromatic smell, somewhat like that of cloves; many sorts have scarce any smell at all. The Caryophyllus rubra are said to be carmines and alexipharmics. Simon Paulii relates that he has cured many malignant fevers by the use of a decoction of them, which he says powerfully promotes sweat and urine, without greatly irritating nature, and also raises the spirits and quenches thirst. At present the flowers are chiefly valued for their pleasant flavour, which is entirely lost even by light coction; hence the college direct the syrup, which is the only official preparation of them, to be made by infusion.

ORDER III. TRIGNYIA.

894. CUCUBALUS, or Berry-bearing Chickweed.

* C. cal. nearly globular, smooth, with a net-work of behen veins; leaves egg-shape-shaped, glaucous, smooth.

--- The leaves boiled have something of the flavour of pome, and proved of great use to the inhabitants of the island of Minorca in the year 1685, when an arm of locusta had destroyed the harvest. The Gothslanders apply the leaves to erysipelas and eruptions.

897. ARENARIA, or Sandwort.

895. DECANDRIA.

Gypsophila. * S. cal. segments blunts, closed when the fruit is ripe.

--- The Polish cock-eel (coccus polonicus) is found upon the roots in the summer months.

895. BISCUTA, or Violaceous Campion.

896. STELLARIA, or Greater Chickweed.

890. ARENARIA, or Sandwort.

898. CHERLIA.

One species; viz. *sedoide. Alps of Austria, Switzerland.

899. DEUTZIA.

One species; viz. scabra. Japan.

900. BRUNNCHIA.

One species; viz. cirsiihosa. Bahamas isles.

901. GARDIELLA, or Cretan Fennel flower.

One species; viz. nigellastrum. S. France, Italy, Creto.

902. MALPAGHIA, or Barbados Cherry.

20 species; viz. glabra, biflora, pumicofolia, saginaceo-, glandulosa, tuberculata, nitida, armeniaca, dubia, uran., angustifolia, canescens, crassifolia, spicata, alissima, verbascifolia, lucida, coriacea, aquifolium, coccifer. W. Indies, America.

903. BANISTRA.

24 species; viz. angulosa, palmata, sagittata, arnica, ciliata, emarginata, quapara, sinemariensis, purpurea, microphylla, chrysophylla, laurifolia, longifolia, dichotoma, ovata, fulgens, heterophylla, brachiata. W. Indies, Guiana.

904. HIRIKI.

Three species; viz. reclinata, odorata, pinnata. Carthagea.
Decandria.

BOTANY.

905. Triopteris.

Eight species; viz. jamaicensis, indica, ovata, rigida, acutifolia, acuminata, buxifolia, citrifolia. Jamaica, Hispaniola.

906. Erythroxylon.

12 species; viz. arbiculata, hypericifolium, buxifolium, ferrugineum, rufum, havanense, coca, sideroxyloides, squamatum, macrophyllum, latifolium, longifolium. West Indies.

ORDER IV. PENTAGYNIA.

907. Avicennia.

Two species; viz. bimbi, carumbola. India.

908. Juncetia.

One species; viz. paniculata. Guiana.

909. Spondias, or Hog-plumb.

Four species; viz. mombin, myrobalanus, mangifera, dulcis. West Indies, South America.

910. Roberia.

One species; viz. frutescens. Guiana.

911. Onestis.

Four species; viz. glabra, polyphylla, corniculata, trifolia. Isle of Madagascar.

912. Cotteledon, or Novel-wort.

24 species; viz. orbiculata, paniculata, fascicularis, cuneata, spinosa, purpurea, teretifolia, ciliolato-cordata, pulicaria, amygdaliformis, hemipherica, triflora, coocinea, malacophyllum, serrata, umbilicus, leves, lanceolata, lancinata, alternata, nudicaulis, hispanic, viscosa. Sib. France, Spain, Cape, East Indies.

913. Sedum, or Lesser Houseleek, Stonecrop.

29 species; viz. verticillatum, telephium, anacampseros, divaricatum, aizoon, hybridum, populifolium, stellatum, alcinifolium, ceps, libanoticum, daeyphyllum, reflexum, virens, supertum, margatil, quadridum, hispanicum, lineare, coerulescens, album, acre, sexangulare, anglicum, anum, pubescens, villosum, atratum, nudum. Europe, Madeira, Japan.

telephium. * S. leaves flattish, serrated; corrybus leafy; stem upright.—A decoction of the leaves in milk is a forcible diuretic. It has been given with success to cure the pail. Cows, goats, sheep, and swine, eat it. Horses refuse it.

acre. * S. leaves nearly egg-shaped, growing to and sitting, bulging, nearly upright, alternate; tuft with three divisions.—This species of sedum is a small perennial, succulent, evergreen plant; growing in great abundance on the tops of walls and roofs of houses. It has a faint smell, and at first an herbaceous taste; but it afterwards shows considerable acrimony, exciting a sense of biting heat in the mouth and fauces. In its recent state it shows very active powers, proving emetic, purgative, and diuretic. The expressed juice taken, to the quantity of a table spoonful, has been said to prove a very drastic medicine; but the plant in its dried state shows little or no activity. In this country it is hardly employed, and has no place in our pharmacopoeia. Its activity, however, points it out as a subject deserving attention. Goats eat it; cows, horses, sheep, and swine, refuse it.

914. Penthorum.

One species; viz. sedoides. Virginia.

915. Bergia.

Two species; viz. verticillata, glomerata. Cape of Good Hope.

916. Subiaca.

One species; viz. maritima. Jamaica.

917. Greleum.

One species; viz. tenuifolium. Ethiopia.

918. Oxalis, or Wood-sorrel.

93 species; viz. monophylla, lepida, rostrata, asina, lanceolea, leporina, crispa, fabaefolia, laburnifolia, sanguinea, amigna, undulata, fuscata, glandulosa, tricolor, rubra-flava, flavida, exaltata, variabilis, grandifolia, sulphures, purpures, breviscapa, speciosa, aecetesella, magellanicas, marginata, polchella, obtusa, laeata, truncata, strumosa, punctata, luteola, macrogyna, fallax, tonella, musata, quinula, compressa, sericea, megallorrhiza, tetraphylla, violacea, caprins, cernua, dentata, livida, ciliaris, arcuata, linearis, cuneata, cuneifolia, glabra, bifida, filicula, longifolia, notans, convexus, versicolor, elongata, recisa, polyphylla, tenuifolia, macrostyla, hirta, tubiflora, secunda, multi-flora, rubella, rosacea, retusa, nitidula, dicticha, incarnata, ornithobiza, crenata, lateriflora, dillenii, stricta, corniculata, plumieri, pentantha, rhombifolia, rosea, barrelii, burmanni, tomentosa, lupinifolia, pectinata, flavifolia, flavica, sensitiva. S. Europe, Cape, North America.

* O. stalk with one flower; leaves three together; aecetesella leaves inversely heart-shaped, hairy.—An infusion of the leaves is an agreeable liquor in ardent fows, and boiled with milk they make an agreeable whey. Sheep, goats, and swine eat it. Cows are not fond of it. Horses refuse it. The juice is gratefully acid. The London college directs a conserve to be made of the leaves, beaten with thrice their weight of fine sugar. The expressed juice deparut, properly evaporated, and set in a cool place, affords a crystalline aced salt in considerable quantity, which may be used whenever vegetable acids are wanted. It is employed to take iron moulds out of linen, and is sold under the name of essential salt of lemons. We are lately assured, that the leaves and stalks wrapped in a cabbage leaf, and exposed in warm ashes until reduced to a pulp, have been successfully applied to scrophulous ulcers. This poultice should remain on the sore 24 hours, and be repeated four times. Afterwards the ulcer is to be dressed with a poultice made of the roots of the meadow-sweet bruised, and mixed up with the scorn of sour butter-milk.

919. Agrostemma, or Rose Campion, Wild Lychins.

Four species; viz. githago, coronaria, ros jovi, cobltese. Europe.

920. Lychins, or Campion.

11 species; viz. chalcedonica, ros coccina, corona, quadridentata, viscaria, alpina, magellanea, a 2 sibirica,
sibirica, lutea, *dioica, apetala. See Russia, Alps of Europe, China.

921. CERASTIUM, or Mouse-ear Chickweed.  

922. SPERGULA, or Spurrey.  
Seven species; viz. *arvensis, pentandra, nodosa, laricina, saginoides, *subulata, glabra. Europe.  
* S. leaves in whirled; flowers with more than five stamens; stems thick at the joints.—Poultry are fond of the seeds; and the inhabitants of Finland and Norway make bread of them when their crops of corn fail. Experience shows it to be very nutritious to the cattle that eat it. Horses, sheep, goats, and swine eat it. Cows refuse it.

ORDER V. DECAGYNIA.

923. NEURADA.  
One species; viz. procumbens. Numidita, Egypt.

924. PHYTOLACCA, or American Nightshade.  
Six species; viz. octandra, stricta, abyssinica, decandra, icosandra, dioica. East Indies, Africa, America.

In the class Decandria are 119 Genera, which include 937 Species. Of these 84 are found in Britain.

CLASSIS XI.  
DODECANDRIA (A).

Ordo I. MONOGYNIA.

927. BOCCONIA. Cor. o. Cal. 2-phyllus, inferus. Caps. 2-valvis, 1-sperma.
929. ASARUM. Cor. o. Cal. 3-fidus, superus. Caps. 6-locularis.
955. STERCULIA. Cor. o. Cal. 5-partit, Nectar. staminiferum. Germen pedicellatum. Caps. 5.
931. RHIZOPHORA. Cor. 4-partita. Cal. 4-partitus, inferus. Sem. 1, clavatum, receptaculo carnoso.
938. GARCINIA. Cor. 4-petala. Cal. 4-phyllus, inferus. Bacca 8-sperma, coronata.
943. CRATEVA. Cor. 4-petala. Cal. 4-fidus, inferus. Bacca 2-locularis, pedicellata.
928. DODECAS. Cor. 4-petala. Cal. 4-fidus, Caps. 1-locul. 4-valvis.
932. CRENEA. Cor. 4-petala. Cal. 4-fidus. Caps. 5-locularis. Polysperma.
939. HALESTIA. Cor. 4-fida. Cal. 4-dentatus superus. Pericarpium 4-spernum, 4-angulatum.
933. APACTIS. Cor. 4-petala. Cal. o. Stam. 16.
926. TORNEX. Cor. 5-petala. Cal. o. Involucrum 4 s. 5-phyllum, 5-12-florum. Bacca 1-sperma.
945. EURYTA. Cor. 5-petala. Cal. duplex. Caps. 5-locularis.
944. TRIUMFETTA. Cor. 5-petala. Cal. 5-phyllum, inferus. Caps. 4-locul. 2-sperma, muricata.
946. PEGANUM. Cor. 5-petala. Cal. 5-phyllum, inferus. Caps. 5-locul. Stam. 15.
954. KLEINHOFIA. Cor. 5-petala. Cal. 5-phyllum.

ORDER I. MONOGYNIA.

A. No cor. Cal. 3-cleft, superior. Caps. 6-celled.
R. Cor. 4-parted. Cal. 4-parted, inferior. Seed 1, club-shaped, in a fleshy receptacle.
G. Cor. 4-petalled. Cal. 4-leaved, inferior. Berry 8-seeded, crowned.
C. Cor. 4-petalled. Cal. 4-cleft, inferior. Berry 2-celled, with a pedicle.
D. Cor. 4-petalled. Cal. 4-cleft. Caps. 1-celled, 4-valved.
C. Cor. 4-petalled. Cal. 4-cleft. Caps. 5-celled, many-seeded.
H. Cor. 4-cleft. Cal. 4-toothed, superior. Seed-vessel 4-seeded, 4-angled.
A. Cor. 4-petalled. No cal. Stam. 16.
T. Cor. 5-petalled. No cal. Involucrum 4 or 5-leaved, 5-12-flowers. Berry 1-seeded.
E. Cor. 5-petalled. Cal. double. Caps. 5-celled.
T. Cor. 5-petalled. Cal. 5-leaved, inferior. Caps. 4-celled, 2-seeded, covered with sharp points.
P. Cor. 5-petalled. Cal. 5-leaved, inferior. Caps. 3-celled. Stamens 15.
K. Cor. 5-petalled. Cal. 5-leaved. Nectary bear-

(A) Thus far the classes have received their denomination from the number of stamens contained in the flowers. The name given to the present class would seem to imply, that the flowers arranged under it contained only 12 stamens; but it is in fact an assemblage of plants, whose flowers contain from 11 to 19 stamens, inclusive.
Dodecandra.

BOTANY.

Reseda purpureascens.

Order VI. Dodecagynia.

Alisma cordifolia.

Order I. Monogynia.

925. Asarum, or Asarabacca.

* europeum. A leaves kidney-shaped, blunt, in pairs.—This is a very low plant, growing naturally in France, Italy, and other warm countries. It grows readily in our gardens, and although the dried roots have been generally brought from the Levant, those of our own growth do not seem to be weaker. Both the roots and leaves have a nauseous, bitter, acrimonious, hot taste. Their smell is strong, and not very disagreeable. Given in substance from half a dram to a dram, they evacuate powerfully both upwards and downwards.

It is said, that tinctures made in spirituous menstrus, possess both the emetic and cathartic virtues of the plant: that the extract, obtained by inspissating these tinctures, acts only by vomiting, and with great mildness: that an infusion in water proves cathartic, rarely emetic: that aqueous decoctions, made by long boiling, and the watery extract, have no purgative or emetic quality, but prove good diaphoretics, diuretics, and emmenagogues. The principal use of this plant among us is as a sternutatory. The root of asarum is perhaps the strongest of all the vegetable errhines, white hellebore itself not excepted. Sniffed up the nose in the quantity of a grain or two, it occasions a large evacuation of mucus, and raises a plentiful spitting. The leaves are considerably milder, and may be used to the quantity of three, four, or five grains. Geoffrey relates, that after sniffing up a dose of this errhine at night, he has frequently observed the discharge from the nose to continue for three days together; and that he has known a paralysis of the mouth and tongue cured by one dose. He recommends this medicine in stubborn disorders of the head, proceeding from viscid tenacious matter, in palsy, and soporific distempers. The leaves are the principal ingredient in the pulvis sternutatorius, or pulvis asari compositus, as it is now termed, of the shops.

926. Tomerx.

Three species; viz. japonica, tetranthera, sobifera. Arabia.

927. Bacconia.

Two species; viz. flaveosum, cordata.

928. Dodecal.

One species; viz. surinamensis. Surinam.

929. Agathophyllum.

One species; viz. aromaticum. East Indies.

930. Bassia.

Three species; viz. longifolia, latifolia, obovata. Malabar.

931. Rhizophora, or Mangrova-canale of India.

Five species; viz. conjugata, gymnorrhiza, candel, mangle, cylindrica. India, Malabar, Molucca.

932. Crenza.

One species; viz. martitima. Guiana.

933. Apactis.

One species; viz. japonica. Japan.

934. Blakea.

Three species; viz. triaservia, triplinervia, pulverulenta. Jamaica, Surinam.

935. Belaria.

Two species; viz. resinosa, metaur. New Granada.

936. Vatica.

One species; viz. chinensis. China.

937. Grangeria.

One species; viz. borbonica. Isle of Bourbon.

938. Garcinia, or Mangostan.

Four species; viz. mangostana, celebica, cambogia, cornea. East Indies.

939. Halesia, or Snow-drop Tree.

Two species; viz. tetrapetala, dipetala. Carolina.

940. Decumaria.

Two species; viz. barba, serrata. Carolina.

941. Aristotelica.

One species; viz. macqui. Chili.

942. Canella, or White Cinnamon.

One species; viz. alba. West Indies.

The bark of the canella alba is brought to us rolled into
Dodecandra.

BOTANY.

932. CUPHEA.
One species; viz. viscosissima. America.

953. GINORIA.
One species; viz. americana. America.

954. KLEINHOFIA.
One species; viz. hospital. E. Indies.

955. STROGOLA.
Eight species; viz. lanceolata, balanophora, crinita, cordifolia, colorata, urceo, plataniifolia, fistula. Arabia, East and West Indies, China.

ORDER II. DIGYNIA.

956. HELIOCARPUS, or Sun-weed.
One species; viz. americana. Vera Cruz.

957. AGROMONIA, or Agrimony.
Five species; viz. eupatoria, odorata, repensa, parvisera, agrimonoides. Europe, N. America.
* A. stem-leaves winged, the odd leaflet on a leafstalk; eupatoria. fruit hispid.—The Canadians are said to use an infusion of the roots in burning fevers, and with great success. An infusion of six ounces of the crown of the root, in a quart of boiling water, sweetened with honey, and half a pint of its drunk three times a day. Dr. Hill says, is an effectual care for the jaundice. He advises to begin with a wine, afterwards to keep the bowels soluble, and to continue the medicine as long as any symptoms of the disease remain. Sheep and goats eat it. Cows, horses, and swine refuse it. The flowers fresh gathered smell like apricots.

ORDER III. TRIGYNIA.

958. RESEDA, or Mignonette, Base-rocket.
13 species; viz. lutea, canescens, glauca, dipetala, purpurascens, sesamoides, fruticulosa, alta, undata, * lutea, phyteuma, mediterranea, odorata. S. Europe, Egypt, Cape.
* R. leaves spear-shaped, entire, with a tooth on each side; cal. 4-5-lobed.—This plant affords a most beautiful yellow dye for cotton, woolen, mohair, silk, and linen, and in that which is most commonly used by the dyers for that purpose, as it gives the brightest dye. Blue cloths dipped in a decoction of it become green. The yellow colour of the paint called Dutch pink is got from this plant. The colouring quality resides in the stems and roots, and it is cultivated in sandy soils, rich soil making the stalk hollow and not so good. Cattle will not eat it, but sheep sometimes browse it a little.

959. EUPHORIA, or Burs, Thorny-plant, Spurge.
124 species; viz. antiquorum, canariensis, virosa, heptagona, memphilila, cereiformis, officinarum, triauata, cereifolia, brytis, tribuloides, stellata, cencimina, meloformis, caput medusae, tuberculata, canthia, clava, bupleurifolia, lophogona, mauritanica, piscatoria, balsamifera, tiruccoli, laurifolia, pyrolifolia, lathyroleidos, heterophylla, eystophora, nudiflora, cotinifolia, mellifera, glabra, lurifolia, lirifolia, eunesta, ocmoidae, lavigata, origanoides, atoto, hyosc.
BOTANY.

Icosandra.

every species of spurge is so acid, that it corrodes and ulcerates the body wherever it is applied; so that physicians have seldom ventured to use it internally. Warts or coron amoxied with the juice presently disappear. A drop of it put into the hollow of a decayed and aching tooth, destroys the nerve, and consequently removes the pain. Some people rub it behind the ears, that it may blister and by that means give relief.

960. V Isaac.
One species; viz. mocanera. "Canary isles."

ORDER IV. TETRAGNYIA.

961. Calligonum.
Three species; viz. polygonoides, comosum, pallosia. Russia, Siberia.

962. Aponegeton.
Four species; viz. monostachyon, ‘crispum, distachyon, angustifolium. Cape, E. Indies.

ORDER V. PENTAGNYIA.

963. Glinus.
Three species; viz. lotoides, setiflorus, dictamnoides. Spain, Levant, Egypt.

964. Blackwellia.
Three species; viz. integrifolia, paniculata, axillaris. W. Indies.

ORDER VI. DODECAGNYIA.

965. Semperivium, or House-leek.
* S. leaves fringed; offsets expanding.—The juice of tectorum. this plant either applied by itself, or mixed with cream, gives present relief to burns, and other external inflammations. Mixed with honey, it is a useful application in aphthous cases. Sheep and goats eat it.

In the class Dodecandria are

41 Genera, including 273 Species, of which 18 are found in Britain.

CLASSIS XII.

ISOCANDRIA (b).

Ordo I. MONOGNYIA.

CLASS XII.

ICOSANDRIA.

Ordo I. MONOGNYIA.

(b) Although this is called the class of twenty stamens, because the flowers arranged under it generally contain about
about that number; yet the mark or character of the class is not to be taken merely from the number of stamens, but from attending also to the following circumstances: 1. The calyx, consisting usually of one concave leaf; 2. Petals, fixed by claws to the inside of the calyx; and, lastly, Stamens, more than 19, standing upon the petals or the calyx, but not upon the receptacle. Very few are poisonous.

Order I. MONOGYNIA.

965. CACTUS, or Mexican Thistle.
24 species; viz. mamillaria, melocactus, pitajaya, heptagona, tetragonae, hexagona, pentagona, repandus, lanuginosae, peruviana, rojeni, grandiflorae, flagelliformae, parasiticae, triangularae, moniliformae, opuntiae, ficus indies, tawa, cochenillae, curassavicae, phyllanthae, peresimae, portulacioli. West Indies, America.

967. PHILADELPHUS, or Mock Orange, Syringa.

968. LEPTOSPERMUM
Has 12 species; viz. scoparium, thea, flavescens, attenuatum, lanigerum, pubescens, parviflorium, archnoides, juniperinum, baccatum, ambiguum, virgatum. New Holland.

969. FABRICIA
Has two species; viz. myrtifolia, lavigata. New Holland.

970. METROSIDEROS.
14 species; viz. bispida, floribunda, costata, diffusa, villosa, florida, glomulifera, angustifolia, ciliata, linearia, lanceolata, saligna, viminalis, capitata. N. Holland, N. Zealand, C. of G. Hope.

971. PAIDIUM, or Guara, or Bay Plum.
Three species; viz. pyriferum, pumiferum, decaspernum. East and West Indies.

972. EUGENIA, or Pomey Rose, Yambos.
Seven species; viz. malaccensis, yambos, pseudo-paidium, uninorum, cotinifolium, scutantina, racemos. E. Indies, Jamaica, S. America.

973. MYRTUS, or Myrtle.
14 species; viz. communis, brasiliana, biflora, angustifolia, lavisc, lucida, cuminia, dioica, chrysantha, zuzzygnum, zeylanica, androsaemoides, carophyllata, pimenta. E. Europe, Asia, Africa, America.—The myrtus communis is an evergreen shrub, growing in Italy, and cultivated in our botanic gardens. The leaves and berries have been sometimes made use of as astringents,
Icosandra.

Botany.

Astringents, but not at present regarded. The pimento is the fruit of a large tree growing spontaneously in the mountainous parts of Jamaica, called by Sir Hans Sloane, myrtus arborea aromatica, foliis launiri. The smell of this spice resembles a mixture of cinnamon, cloves, and nutmegs; its taste approaches that of cloves, or a mixture of the three foregoing; whence it has received the name of all-spice. The shops have been for some time accustomed to employ this aromatic as a succedaneum to the more costly spices, and from them it has been introduced into our hospitals.

Pimento is now in our pharmacopoeias the basis of a distilled water, a spirit, and an essential oil; and these are not unfrequently employed, where aromatics are indicated.

974. Calyptranthus.
Six species; viz. suygium, guineensis, carvophyllifolia, jambolana, chrytraculia, rigida. Jamaica, Guinea, East Indies.

975. Eucalyptus.
12 species; viz. robusta, pilularis, tereticornis, resinifera, capitellata, saligna, botryoides, hemastoma, pipireta, obliqua, corymbosa, paniculata. N. Holland.

976. Banara.
One species; viz. figifolia. Cayenne.

977. Anthelium.
One species; viz. robori. W. Indies.

978. Fodetidea.
One species; viz. mauvitiana. Isle Mauritius.

979. Scopolia.
One species; viz. pusilla. Ceylon.

980. Punica, or Pomegranate-tree.
Two species; viz. granatum, nana. Spain, Italy, Barb. W. Indies.—The pomegranate is a low tree, or rather shrub, growing wild in Italy, and other countries in the south of Europe; it is sometimes met with in our gardens; but the fruit, for which it is chiefly valued, rarely comes to such perfection as in warmer climates. This fruit has the general qualities of the other sweet summer fruits, allaying heat, quenching thirst, and gently loosening the belly. The rind is a strong astringent, and as such, is occasionally made use of. The flowers are of an elegant red colour, in appearance resembling a dried red rose. Their taste is bitterish and astringent. They are recommended in diarrhoeas, dysenteries, and other cases where astringent medicines are proper.

981. Amygdalus, or Almond tree.
Four species; viz. persica, communis, punila, nana. Persia, Jordan, Barbary.—The fruits of the amygdalus persica have an agreeable smell, and a bitterish taste. Distilled without any addition, by the heat of a water bath, they yield one-sixth their weight, or more, of a whitish liquor; which, as Mr Bolduc observes, communicates to a large quantity of other liquids, a flavour like that of the kernels of fruits. An infusion in water, of half an ounce of the fresh-gathered flowers, or a dram of them when dried, sweetened with sugar, proves for children an useful laxative and anthelmintic; the leaves of the tree are, with this intention,
common emulsion, or the *luc amygdales*, as it is now called by the London college, is prepared from the sweet almond alone; but in the emulsion of the Edinburgh college, a small proportion of bitter almonds is added, which has a much better effect in improving its taste, than the sugar added by the London college. An emulsion formed entirely of bitter almonds, taken to the quantity of a pint or two daily, is said to have been given in obstinate intermitentes with success.

**982. Prunus, or Plum-tree.**

22 species; viz. *padus, virginiana, canadensis, lu-
sitanica, lauro-cerasus, elliptica, paniculata, mahaleb, armeniaca, sibirea, pupilla, * cerasus, *avium, pen-
sylvanica, *domestica, *insititia, *spinosa, aspera, ja-
opica, glandulosa, incisa, tomentosa. Europe, N. Amer. W. Indies.

*P.* flowers in bunches; leaves deciduous with two gla-
nds at the base on the under side.—This plant grows
well in woods, groves, or fields, but not in moist soil.
It bears lopping, and suffers the grass to grow under it.
The fruit is nauseous; but bruised and infused in wine or
brandy, it gives it an agreeable flavour. A strong
decocation of the bark is used by the Finlanders to cure
vereneral complaints, which practice is corroborated by
the testimony of M. Broerland. He directs six ounces
of the dry, or eight of the fresh bark, to be boiled in
eight to four pints of water. The dose is four ounces,
four times a-day. It alone cures the slightest infections,
and combined with mercury facilitates the cure of the
sewerer states of the disease; and a decocation of the
berries is sometimes given with success in the dysentery.
The wood being smooth and tough, is made into han-
dles for knives and whips. Sheep, goats, and swine
eat it. Cows are not fond of it. Horses refuse it.

*cerasus.*

*P.* umbels mostly on short fruitstalks; leaves egg-
spear-shaped, smooth, doubled together.—This plant
loves a sandy soil and an elevated situation. The gum
that exudes from this tree is equal to gum arabic.
It is said, that more than 100 men during a siege were
kept alive for near two months, without any other sus-
tenance than a little of this gum taken into the mouth
sometimes and suffered gradually to dissolve. The com-
mon people eat the fruit either fresh or dried; and it is
frequently infused in brandy for the sake of its fla-
vour. The wood is hard and tough. It is used by the
turner, and is formed into chairs, and stained to imitate
mahogany. This tree is the original stock from which
many of the cultivated kinds are derived.

*avium.*

*P.* umbels sitting; leaves egg-spear-shaped, downy
underneath, doubled together.—This plant grows best
in a rich soil on the side of hills, unmixed with other
trees. It bears cropping, and suffers the grass to grow
under it. In Hertfordshire there is a cultivated variety
called *carrea*, which are larger and much finer fla-
voured than the common sort.

*domestica.*

*P.* fruitstalks mostly solitary; leaves spear-egg-sha-
ped, coiled; branches thorny.—This plant loves a
lofty exposure, and is favourable to pasturage. The
varieties have probably originated from the red and
white cultivated plums, either sown by design or ac-
cident. The cultivated garden plums are derived from
this species. The bark dyes yellow. Its medical effects
are to abate heat and gently loosen the belly; which
they perform by lubricating the passage, and softening
the excrement. They are of considerable service in
costiveness, accompanied with heat and irritation, which
the more stimulating cathartics would tend to aggra-
crete. Where prunes are not of themselves sufficient,
their effects may be promoted by joining with them a
little rhubarb or the like; to which may be added some
permeative ingredient, to prevent their occasioning
flatulencies.

*P.* fruitstalks in pairs; leaves egg-shaped, slightly
insititia, woolly, coiled; branches with thorns.—The fruit is a
acid, but so tempered by a sweetness and roughness, as
not to be unpleasant, particularly after it is mollified
by the fruits. A conserve is prepared by mixing the
pulp with thrise its weight of sugar. The bark of the
root and branches is considerably stictic. An infusion
of the flowers, sweetened with sugar, is a mild purge-
itive, not improper for children.

*P.* fruitstalks solitary; leaves spear-shaped, smooth;
spinosa, branches thorny.—This plant is not well adapted
to grow in hedges, because it spreads its roots wide, and
encroaches upon the pasturage; but it makes a good
dead fence. The wood is hard and tough, and is formed
into teeth for rakes and walking-sticks. From some
effects which have been repeatedly observed to follow
the prick of the thorns, there is reason to believe there
is something poisonous in them, particularly in autumn.
The tender leaves dried are sometimes used as a substi-
tute for tea, and are thought the best substitute that
has yet been tried. The fruit bruised and put into
wine, gives it a beautiful red colour, and a pleasant
subacid roughness. An infusion of a handful of the
flowers is a safe and easy purge. The bark powdered,
in doses of two drams, will cure some agues. Letters
written upon linen or woolen with the juice of the fruit
will not wash out. Sheep, goats, and horses eat the
leaves. The different species of Prunus furnish nour-
ishment to various insects.

**983. Plinia.**

Two species; viz. croceus, pendunculata. Surinam.

**984. Chrysobalanus, or Cocoa Plum.**

One species; viz. icaco. W. Indies, S. America.

**985. Robinsonia.**

One species; viz. melianthifolia. Guiana.

**986. Sonneratia.**

One species; viz. acida. East Indies, China.

**ORDER II. DIGYNIA.**

**987. Crategus, or Wild Service Tree.**

25 species; viz. *avium, *torminalis, coccinus, vi-
ridis, punctata, crus galli, tormentosa, indica, *oxya-
canthus, monogyne, azerolus, maura, villosa, levis,
glabra. Europe, India, N. America.

*C.* leaves egg-shaped, cut, serrated, cottony under-
neath.—It loves dry hills and open exposures, and
flourishes either in gravel or clay. It bears lopping,
and permits the grass to grow. The wood, being
hard, tough, and smooth, is used for axle-trees, wheels,
walking sticks, carpenters and other tools. The fruit
is edible when mellowed by the autumnal frosts, and
an ardent spirit may be distilled from it. It seldom
bears a good crop of fruit two years together. Sheep
and
and goats eat it. The wood affords an excellent charcoal for the makers of gunpowder.

--- Upon account of the stiffness of its branches, the sharpness of its thorns, its roots not spreading wide, and its capability of bearing the severest winters without injury, this plant is universally preferred for making hedges, whether to clip or to grow at large. The wood is tough, and is formed into axle-trees and handles for tools. The berries are the winter food of thrushes and many other birds. Its different species afford nourishment to various insects.

[Italics added]

ORDER III. TRIGYNIA.

ancuparia. S. leaves winged, smooth on both sides.—It grows either in woods or open fields, but best on the sides of hills and in fertile soil. It will not bear lopping. Plants grow well in its shade. The wood is soft, tough, and solid. It is converted into tables, spokes for wheels, shafts, chairs, &c. The roots are formed into handles for knives and wooden spoons. The berries, dried and reduced to powder, make wholesome bread; and an ardent spirit may be distilled from them, which has a fine flavour, but it is small in quantity. The berries too, infused in water, make an acid liquor somewhat like perry, which is drank by the poorer people in Wales. In Germany, the fowlers use the berries to entice the redwings and fieldfares into nooses of hair, suspended in the woods; hence its trivial name.

domestica. S. leaves winged, woolly underneath.—The fruit is mealy and austere, not much unlike the medlar. The wood is valuable for making mathematical rulers and excisemen’s gauging sticks.

980. Sesuvium. One species; viz. portulacastrum. W. Indies.

ORDER IV. PENTAGYNIA.

germanica. M. thorny; leaves spear-shaped, cottony underneath; flowers solitary, sitting.—Many people are fond of the fruit of this when it becomes soft by keeping; it is somewhat austere, and binds the bowels.

communis. P. leaves serrated, smooth; flowers forming a cyrampa.—This plant loves a fertile soil and sloping ground; but will not thrive well in moist bottom. It stands the severest winters, and does not destroy the grass. The wood is light, smooth, and compact; it is used by turners, and to make joiners tools; and for picture frames to be stained black. The leaves afford a yellow dye, and may be used to give a green to bleached cloths. The fruit is austere; but when cultivated, highly grateful, as is proved by the great variety of excellent pears, which the industry of mankind has raised, for they all originate from this. The juice of the fruit fermented, is called perry, large quantities of which are raised in Worcestershire and Herefordshire for that purpose. The Squash, the Oldfield, and the Bardlow perrys are reckoned the best, and are little inferior to wine. Horses, cows, sheep, and goats eat the leaves, which afford nourishment to various insects.

--- This malus plant flourishes better on declivities and in shady places, than in open exposures or boggy lands. Grass, and even corn, will grow beneath it. It is much used as a stock, on which to ingraft the better kind of apples, because its fruits are neither killed by frost nor eaten by field-mice. The bark affords a yellow dye. The wood is tolerably hard; it turns very clean, and when made into cogs for wheels obtains a polish and wears a long time. The acid juice of the fruit is called by the country people very juice, and is much used in sprays and in other cases, as an astringent or repellent. With a proper addition of sugar, it is probable, that a very grateful liquor might be made with the juice, but little inferior to old hock. Horses, cows, sheep, and goats eat it. Swine are very fond of the fruit.

The fruit of the pyrus cydonia have a very austere acid taste; taken in small quantity, they are supposed to restrain vomiting and alvine fluxes, and, more literally, to loosen the belly. The seeds abounded with a mucilaginous substance of no particular taste, which they readily impart to water liquors; an ounce will render three pints of water thick and ropy, like the white of an egg. A mucilage of the seeds is kept in the shops. A syrup of the fruit had formerly a place, but is now rejected.

993. Tetragoncia. Seven species; viz. fruticosa, herbaecea, ivesfolia, biruta, spicata, expansa, japonica. Cape, Peru, New Zealand.

994. Mesembryanthemum, or Fig-marygold. 50 species; viz. nodiflorum, crystallinum, coticum, geniculiflorum, noctiflorum, splendidum, umbellatum, expansum, tripolium, calafotum, aetalum, cuniflorum, cordiflorum, bellidiflorum, deltoideum, barbatum, hispidum, villosum, scarbum, emarginatum, uncinatum, spinosum, tuberosum, tenuifolium, stipulaceum, crassifolium, glomeratum, loreum, filamentosum, falcatum, forficatum, edule, bicolorum, serratum, micans, glaucum, coricinatum, tortuosum, pomeridianum, verucatum, papulosum, pinnatifidum, rostratum, ringens, dolabriforme, difforme, albidum, lingeiforme, pugioniforum, capitatum. Greece, Cape, New Zealand.

995. Aizoan. Ten species; viz. canariense, hispanicum, lanceolatum, armentosum, paniculatum, perfoliatum, giloides, secundum, fruticosum, rigidum. Spain, Cape, Canary.

996. Spirax, or Spiked Willow, Dwarfwort. 18 species; viz. levigata, *salisifolia, tomentosa, callosa.

*filipendula* S. leaves interruptedly winged; leaflets strap-spear-shaped, irregularly serrated, very smooth; flowers in tufts.—The tender pea-like roots of this plant, dried and reduced to powder, make a kind of bread, which in times of scarcity is not to be despised. Hogs are very fond of them. When expanded and enlarged by cultivation, it is a beautiful addition to the flower-garden.

*ulmaria.* S. leaves interruptedly winged; leaflets egg-shaped, double serrated, hoary underneath; flowers in tufts.—The flowers, infused in boiling water, give it a fine flavour, which rises in distillation. Sheep and swine eat it. Goats are extremely fond of it. Cows and horses refuse it.

Order V. Polygynia.

997. *Rosa,* or Rose.

*spinossissima.* R. germs and fruitstalks smooth; stem and leafstalks fully set with straight prickles; leaflets circular, smooth.—The ripe fruit is eaten by children; it has a grateful subacid taste. The juice of it, diluted with water, dyes silk and muslin of a peach colour, and, with the addition of alum, a deep violet; but it has very little effect on woollen and linen. Its dwarfish growth, and the singular elegance of its little leaves, resemble those of the ophion burnet, entitle it to a place in the flower-garden.

*canina.* R. germs and footstalks smooth; stem and leafstalks prickly.—A perfumed water may be distilled from the blossoms. The pulp of the berries, beat up with sugar, makes the conserve of hips of the London dispensatory. Mixed with wine, it is an acceptable treat in the north of Europe. Several birds feed upon the berries. The leaves of every species of rose, but especially of this, are recommended as a substitute for tea, giving out a fine colour, a sub-astringent taste, and a grateful smell, when dried, and infused in boiling water. It is a difficult matter to say, which are species, and which are varieties only, in this genus; some think that there are no certain limits prescribed by nature. Various insects are nourished by the different species; and those mossy prickly excrescences which are frequently found upon the branches of roses, especially upon the last species, are the habitations of the *cyanis rose.* This excrescence was formerly in repute as a medicine, and was kept in the shops under the name of *bedeguar.* An infusion of the full blown blossoms of all the roses, especially the paler kinds, is purgative; but the petals of the red roses, gathered before they expand, and dried, are astringent.

The *rosa centifolia* is an elegant flower, common in our gardens. Its smell is very pleasant and almost universally admired; its taste bitterish and subacid. In distillation with water, it yields a small portion of butyrous oil, whose flavour exactly resembles that of the roses. This oil, and the distilled water, are very useful and agreeable cordials. Hoffman strongly recommends them as of a singular efficacy for raising the strength, cheering and reviving the spirits and allaying pain; which they perform without raising any heat in the constitution, rather abating it when inordinate. Damask roses, besides their cordial aromatic virtue, which resides in their volatile parts, have a mildly purgative one, which remains entire in the decoction left after the distillation; this with a proper quantity of sugar forms an agreeable laxative syrup, which has long kept its place in the shops.

The *rosa gallica* has very little of the fragrance of the foregoing pale sort, and instead of its purgative quality, a mild gratefully astringent one, especially before the flower has opened: this is considerably improved by hasty excision; but both the astringency and colour are improved by slow drying. In the shops there are prepared a conserve, an infusion, a honey, and a syrup of this flower.

998. *Rubus,* or Raspberry.

20 species; *viz.* *ideus, occidentalis, hispidus, parvifolius, jamaicensis, triphyllus* *ceasus,* *fruticosus, canadensis, odoratus, molococcus, palmatus, villo sus, incisus, japonicus, tridus,* *saxatilis,* *arcticus,* *chamemorus,* *dalbarda.* North Europe, Asia, America.

*ideus.* R. leaves winged with five or three leaflets, stem *ideus* prickly; leaf-stalk channelled.—The fruit of this plant is extremely grateful as nature presents it, but made into a sweetmeat with sugar, or fermented with wine, the flavour is improved. It is fragrant, subacid, and cooling. It dissolves the tartarous concretions of the teeth; but for this purpose it is inferior to the strawberry. The white berries are sweeter than the red, but they are generally contaminated by insects. The fresh leaves are the favourite food of kids.

*fruticosus.* R. leaves winged with three or five leaflets; stem and *fruticosus* leaf-stalk prickly; panicle oblong.—The berries when ripe are black, and do not eat amiss with wine. The green twigs are of great use in dyeing woollen, silk, and mohair black. Cows and horses eat it. Sheep are not fond of it. Silk worms will sometimes feed upon the leaves in defect of those of the mulberry.

*R.* leaves simple, lobed; stem without prickles, with *chamemo one flower; male and female flowers on different plants.* *rus.*

—The berries are not unpleasant, and held to be an excellent aniscorbutic. The Norwegians pack them up in wooden vessels and send them to Stockholm, where they are served up in desserts or made into tarts. The Laplanders bury them under the snow, and thus preserve them fresh from one year to another. They bruise and eat them with the milk of the rein deer. In the Highlands of Scotland also they are sometimes brought to table with the dessert.

999. *Fragaria,* or Strawberry.

Three species; *viz.* *vesca,* monophylla, *sterilis.* North of Europe, America.

*F.* leaves three together; runners creeping.—The *vesca* berries eaten either alone or with sugar, or with milk, are universally esteemed a most delicious fruit. They are grateful, cooling, subacid, juicy, and have a delightful smell. Taken in large quantities, they seldom disagree
Polyandria. BOTANY.

1000. Potentilla, or Cinquefoil.

*fruticosus.* P. leaves winged, stem-shrub-like. — The beautiful appearance of its numerous flowers has gained it admittance into gardens. Besoms are made of it. Cows, horses, goats, and sheep eat it. Swine refuse it.

*acerina.* P. leaves winged, serrated; stem creeping; fruit-stalks with one flower. — The leaves are mildly astrin-gent. Dried and powdered they have been given with success in aches. The usual dose is a meal spoonful of the powder every three hours between the fits. The roots in the winter time eat like parsnips. Swine are fond of them. Cows, horses, goats, and sheep eat it. Swine refuse it.

*repans.* P. leaflets five together, stem creeping; fruit-stalks one-flowered. — The red cortical part of the root is mildly astringent and antiseptic. A decoction of it is a good gargoyle for loose teeth and spongy gums. Horses, cows, goats, and sheep, eat it.

1001. Tormentilla, or Tormentil.
Two species; viz. *aneta, *repans. Europe. — The tormentil is found wild in woods and on commons; it has long slender stalks, with usually seven long narrow leaves at a joint; the root is for the most part crooked and knotty, of a blackish colour in the outside, and reddish within. This root has an astringent styptic taste, accompanied with a slight kind of aromatic flavour; it is one of the most agreeable and efficacious of the vegetable astringents, and is employed with good effect in all cases where medicines of this class are proper. It is more used both in extempo-

raneous prescription, and official composition, than any of the other strong vegetable astringents. It is an ingredient in the two compound powders of chalk. A tincture made from it with rectified spirit, possesses the whole astringency and flavour of the root, and loses nothing of either in insipidating.

1002. Geum, or Arvens, Herb-bennet.

*G. flowen upright; fruit globular, woolly; awns *urbanum* hooked, bare; root-leaves lyre-shaped; stem-leaves in threes. — The roots gathered in the spring before the stem grows up, and put into ale, give it a pleasant flavour, and prevent its growing sour. Infused in wine it is a good stomachic. Its taste is mildly astringent and aromatic, especially when it grows in a warm dry situation; but in shady and moist places it has little virtue. Cows, goats, sheep, and swine, eat it.

*G. flowen nodding; fruit oblong; awns feathered, *rivale.* The root-leaves twisted; petals blunt, round, wedge-shaped; leaves winged. — The powdered root will cure tertian agues, and is daily used for that purpose by the Canadians. Sheep and goats eat it. Cows, horses, and swine are not fond of it. It is made use of to cure ropy malt liquor.

1003. Dryas.

1004. Comarum, or Marsh-cinquefoil.
One species; viz. *palustris. Europe.

*C. leaves winged, petals smaller than the calyx, palustris.* The root gives a dry red. The Irish rub their milking pails with it, and it makes the milk appear thicker and richer. Goats eat it. Cows and sheep are not fond of it. Horses and swine refuse it.

1005. Calycanthus, or Carolina Allspice.
Two species; viz. floridum, praecox. Carolina, Florida, Japan.

In the class Icosandria are

39 Genera, including 346 Species, of which 42 are found in Britain.

CLASSIS XIII.

POLYANDRIA (c).

Oado I. MONOGYNIA.

Sect. I. Monopetalali.

5. Cal. 4-partita. A flat lateral petal. Leguminous.

1006.

(c) The flowers of this class have, as its title implies, many stamens, that is from 20 to 1000 or more; so that it is unnecessary to attempt to count them further, than to be satisfied that they amount to 20 or upwards. The stamens

**Nigella nonnull.**

**Order I. Monogyinia.**

1006. Marcgrafia. Two species; viz. umbellata, coriacea. West Indies.

1008. Trilix. One species; viz. lutea. Carthagenia.

1009. Ludia. Three species; viz. heterophylla, myrtifolia, sesiliflora. Isle of Mauritius.

1010. Capparis, or Cape-bush. 30 species; viz. spinosa, ovata, segetia, tomentosa, acuminata, zeylanica, hordida, erythrocarpus, sepiera, citrifolia, corymbosa, mariana, panduriformis, badducca, torulosa, longifolia, frondosa, ferruginea, grandis, jamaicensis, odoratissima, verrucosa, amplexiformis, cynophallophora, saligna, pulcherrima, tenusliqua, linearis, brevica, hastata. S. Europe, East and West Indies, South America.—The bush of the capparis spinosa is a low prickly bush, found wild in Italy and other countries; it is raised with us by sowing the seeds upon old walls, where they take root between the bricks, and endure for many years. The bark of the root is pretty thick, of an ash-colour, with several transverse wrinkles on the surface; cut in slices and laid to dry, it rolls up into quills. This bark has a bitterish acid taste; it is reckoned aperient and diuretic, and recommended in several chronic disorders for opening obstructions of the viscera. The buds pickled with vinegar, &c. are used at table. They are supposed to excite
excite appetite and promote digestion; and to be particularly useful, as detergents and aperients, in obstructions of the liver and spleen. Their taste and virtues depend more upon the saline matter introduced into them, than on the caper buds.

1011. ACTEA, or Herb-christopher.

*spicata.* A bunch egg-shaped; fruit berry-like.—The plant is a powerful repellent. The root is useful in some nervous cases, but it must be administered with caution. The berries are poisonous in a very high degree. It is said that toads, allowed by the sweet smell of this plant, resort to it; but it grows in shady places, and toads are fond of damp and shady situations. Sheep and goats eat it. Cows, horses and swine refuse it.

1012. SANGUINARIA, or Puncoon, Blood-root.
One species; viz. canadensis. N. Amer.

1013. PODOPHYLLUM, or Duck's-foot, or May-apple.
Two species; viz. peltatum, diphyllum. North America.

1014. CHELIDONIUM, or Celandine.

*majus.* C. fruitstalks forming umbels.—This plant grows upon old walls, among rubbish, and in waste shady places. The bark is of a bluish green colour; the root of a deep red; both contain a gold-coloured juice. Their smell is disagreeable, the taste somewhat bitter, very acrid, biting and burning the mouth; but the root is the most acrid. The juice of celandine has been long celebrated in disorders of the eyes; but it is too sharp, unless plentifully diluted, to be applied with safety to that tender organ. It has been sometimes used, and it is said with good success, for extinguishing warts, cleansing old ulcers, and in cataplasms for the *herpes miliaris*. This acrimonious plant is rarely given internally. The virtues attributed to it are those of a stimulating aperient, diuretic, and sudorific: it is particularly recommended in the slow kind of jaundice, where there are no symptoms of inflammation, and in dropsies. Some suppose the root to have been Helmont's specific in the *hydrocercus vesicatorius*. Half a dram or a dram of the dry root is directed for a dose; or an infusion in wine of an ounce of the fresh root.

1015. PAPAVER, or Poppy.

*rheas.* P. capsules smooth, urn-shaped; stem hairy, many-flowered; leaves wing-cleft, jagged.—The petals give out a fine colour when infused, and a syrup prepared from the infusion is kept in the shops. It partakes in a small degree of the properties of opium.

*somniferum.* P. calyx and capsules smooth; leaves embracing the stem, jagged.—Opium is the juice of this plant. This juice has of late been collected by way of experiment, by certain individuals, from poppies cultivated in Great Britain, and has been found not inferior in quality to that brought from the warmer climates. It is obtained by making wounds with a small sharp instrument in the smooth capsule of the plant when nearly ripe, and thereafter collecting the juice that exudes from the wounds. It is probable, however, that the high price of labour will scarcely permit the rearing of British opium to become an important object of agriculture. Egypt, Persia, and Hindostan, have hitherto supplied us with this commodity: in those countries large quantities of poppies are cultivated for this purpose. The opium prepared about Thebes in Egypt, hence named *Thebais opium*, has been usually esteemed the best; but this is not now distinguished from that collected in other places. This juice is brought to us in cakes or loaves covered with leaves and other vegetable matters, to prevent their sticking together: it is of a solid consistence, yet somewhat soft and tenacious, of a dark reddish-brown colour in the mass, and when reduced into powder yellow; of a faint disagreeable smell, and a bitterish taste, accompanied with a pungent heat and acrimony.

In the province of Bahar in the East Indies, it is said, the poppy seeds are sown in October or November, at about eight inches distance; and are well watered till the plants are about half a foot high, when a compost of nitrous earth, dung, and ashes, is spread over the areas; and a little before the flowers appear they are again watered profusely till the capsules are half grown: and then the opium is collected; for, when fully ripe, they yield little juice. Two longitudinal incisions, from below upwards, without penetrating the cavity, are made at sunset for three or four successive evenings; and then they are allowed to ripen their seeds. In the morning the juice is scraped off with an iron scoop, and worked in an earthen pot, in the sun's heat, till it be of a consistence to be formed into thick cakes of about four pounds weight, which are covered over with the leaves of poppy or tobacco, and dried. It is said to be adulterated with various unknown substances, with the extract of the poppy plant procured by boiling, and even with cow-dung. It is purified by reducing it to a pulp with hot water, and strongly pressing it while hot through a linen cloth from its impurities. It is then evaporated by a water-bath, or other gentle heat, to its original consistence. This extract is found to contain a resin, a kind of essential oil, a principle of odour, an essential salt, and a soapy extract.

Opium has a reddish brown colour, a strong peculiar smell, a taste at first nauseous and bitter, but soon becoming acrid, with a slight warmth: and it appears to have some astringency, as a watery tincture of it forms an ink with a chalybeate solution.

The external and internal effects of opium appear to be various in different constitutions, and in the same at different times. By some, when applied to the tongue, the nose, the eye, or any part deprived of skin, it has been said to stimulate, and to induce, in the eye in particular, a slight degree of redness. But if this effect do take place, it is at the utmost extremely inconsiderable, particularly when compared with the effect of volatile alkali, ardent spirit, or a variety of other articles applied to the same organ. And there can be no doubt, that in a very short time the sensibility of the part to which it is applied, even when there has not taken place the slightest mark of preceding stimulus or inflammation, is very considerably diminished. Some allege, that when applied to the skin, it allays pain and
Polyandria.

BOTANY.

and spasm, procures sleep, and produces all the other salutary or dangerous effects which result from its internal use; while others allege, that thus applied, it has little or no effect whatever. This variety probably arises from differences in the condition of the subcutaneous nerves, and of the sensibility of the surface, as being more or less defended. But there is no doubt that when mixed with calomel, it diminishes the pain, which would otherwise ensue, probably by deadening the sensibility of the part. It sometimes allays the pain from a carious tooth; and a watery solution of it has been used in various ulcers, certain ophthalmia, and virulent gonorrea, when pain and inflammation have before that given very great distress.

Opium, when taken into the stomach to such an extent as to have any sensible effect, gives rise to a pleasant serenity of mind, in general proceeding to a certain degree of languor and drowsiness. The action of the sanguiferous system is diminished, the pulse becoming for the most part softer, fuller, and slower than it was before. There often take place swelling of the subcutaneous veins, and sweating; both probably the consequences of a diminution of resistance at the surface, from a diminution of muscular action, as is particularly exemplified in its effect of binding the belly. Opium taken into the stomach in a large dose, gives rise to confusion of head and vertigo. The power of all stimulating causes, as making impressions on the body, is diminished; and even at times, and in situations, when a person would naturally be awake, sleep is irresistibly induced. In still larger doses, it acts in the same manner as the narcotic poison, giving rise, not only to vertigo, headache, tremors, and delirium, but to stupor and death; and these terminating in a state of stupor, from which the person cannot be roused. This stupor is accompanied with slowness of the pulse, and with stertor in breathing; and the scene is terminated in death, attended with the same appearances as take place in apoplexy.

From these effects of opium, in a state of health, it is not wonderful that recourse should have been had to it in disease, as mitigating pain, inducing sleep, allaying inordinate action, and diminishing morbid sensibility. That these effects do result from it is confirmed by the daily experience of every observer; and as answering one or other of these intentions, most, if not all, of the good consequences derived from it in actual practice are to be explained. If, therefore, by a sedative medicine, we mean an article capable of allaying, assuaging, mitigating, and composing, no substance can have a better title to the appellation of sedative than opium.

As answering the purposes of mitigating pain, indicating sleep, allaying inordinate action, and diminishing sensibility, it naturally follows, that opium may be employed with advantage in a great variety of different diseases. Indeed there is hardly any affection in which it may not, from circumstances, be proper; and in all desperate cases, it is the most powerful means of alleviating the miseries of patients.

Some practitioners are averse to its use where there takes place an active inflammation; but others have recourse to it in such cases, even at an early period, especially after blood-letting; and where such affections are attended, not only with pain and spasm, but with watchfulness and cough, it is often productive of the greatest benefit. Opium, combined with calomel, has of late been extensively employed in every form of acute inflammation, and with the greatest success. It is found also to be of very great service in allaying the pain and preventing the symptomatic fever liable to be induced by wounds, fractures, burns, or similar accidents.

In intermittents, it is said to have been used with good effect before the fit, in the cold stage, in the hot stage, and during the interval. Given even in the hot stage, it has been observed to allay the heat, thirst, headach and delirium; to induce sweat and sleep; to cure the disease with the less bark, and without leaving abdominal obstructions or dropsy.

It is often of very great service in fevers of the typhoid type, when patients are distressed with watchfulness or diarrhoea. But where these or similar circumstances do not indicate its use, it is often distressing to patients, by augmenting thirst and constipation.

In smallpox, when the convulsions before eruption are frequent and considerable, opium is liberally used. It is likewise given from the fifth day onwards; and is found to allay the pain of suppuration, to promote the ptyalism, and to be otherwise useful.

In dysentery, after the use of gentle laxatives, or along with them, opium, independently of any effect it may have on the fever, is of consequence in allaying the torments and tenesmus, and in obviating that laxity of bowels which is so frequently a reliek of that disease.

In diarrhoea, the disease itself generally carries off any acrimony that may be a source of torment, and then opium is used with great effect. Even in the worst symptomatic cases it seldom fails to alleviate.

In cholera and pyrosis it is almost the only thing trusted to. In cholic it is employed with laxatives; and no doubt often prevents ileus and inflammation, by relieving the spasm. Even in ileus, and in incarcerated hernia, it is often found to allay the vomiting, the spasms, the pain, and sometimes to diminish the inflammation, and prevent the gangrene of the strangled gut. It is given to allay the pain, and favour the descent of calculi, and to relieve in jaundice and dysuria proceeding from spasm.

It is of acknowledged use in the different species of tetanus, affords relief to the various spasmodic symptoms of dyspepsia, hysteria, hypochondriasis, asthma, rabies canina, &c. and has been found useful in some kinds of epilepsy.

Of late, in doses gradually increased to five grains, three, four, or even six times a day, it has been used in malarial; and some instances are recorded in which it would seem, that by this remedy alone a complete cure had been obtained. In other instances, however, after the fairest trial for a considerable length of time, it has been found ineffectual; and upon the whole, it seems rather to be useful in combating symptoms, and in counterring the effects resulting from the improper use of mercury, than in overcoming the venereal virus.

It is found useful in certain cases of threatened abortion and lingering delivery, in convulsions during parturition, in the after pains and excessive flooding.

The only form perhaps necessary for opium, is that of
of pill; and as it is so soluble in every menstruum, there seems the less occasion for the addition of either gum or soap. This form is more apt to sit on the stomach than any liquid form, but requires rather more time to produce its effects. The administration of opium to the unaccustomed, is sometimes very difficult. The requisite quantity of opium is wonderfully different in different persons, and in different states of the same person. A quarter of a grain will, in one adult, produce effects, which ten times the quantity will not do in another; and a dose that might prove fatal in cholera or colic, would not be perceptible in many cases of tetanus or mania. The lowest fatal dose to the unaccustomed, as mentioned by authors, seems to be four grains; but a dangerous dose is so apt to poke, that it has seldom time to occasion death. When given in too small a dose, it is apt to produce disturbed sleep and other disagreeable consequences; and in some cases, it seems impossible to be made agree in any dose or form. Often, on the other hand, from a small dose, sound sleep and alleviation of pain will be produced, while a larger one gives rise to vertigo and delirium. Some prefer the repetition of small doses, others the giving of a full dose at once. In some, it seems not to have its proper effect till after a considerable time. The operation of a moderate dose is supposed to last, in general, about eight hours from the time of taking it.

Pure opium is partially soluble in water and in rectified spirit, and totally in proof spirit, wine, or vinegar.

Water, rubbed with opium, and decanted repeatedly till it come off colourless, yields, on gentle evaporation, an extract which some use and recommend as one of the best preparations of this substance, and which requires to be given in double the dose of common opium.

It is said that alkalies diminish its soporific effects; that the fixed render it diuretic, the volatile determine it to the skin; and that acids destroy its activity almost entirely. But when conjointed with acids, particularly the diluted vitriolic acid, it often sits easily on the stomach, when it would not otherwise be retained, and afterwards produces all its sedative effects.

The chief official preparations of opium are, the opium purificatum, pulvule ex opio, pulvis opium, tinctura opii, and tinctura opii camphora. Besides this, it enters a great variety of different compositions, as the pulvis adorificus, balsamum anodynum, electuarium japonicum, pulvis 2 creta compositus, &c.

The occasional bad effects of opium may result from the same power, by which in other states of the system it proves beneficial. The methods, therefore, proposed of correcting these by roasting, fermentation, long-continued digestion, repeated solutions and distillation, have not succeeded.

1016. Argemone, or Prickly Poppy.
Three species; viz. mexicana, armeniaca, pyremaica. W. Indies, Mexico, Pyrenees.

1017. Muntingia.
One species; viz. calabura. W. Indies.

1018. Sarracenia, or Sidesaddle-flower.

1044. SIBERCHIA.
One species; viz. lateriflora.

1045. LAGERSTROMIA.
Five species; viz. indica, regine, hisutus, murchhausia, parviflora. East Indies, China.

1046. FREZIERA.
Two species; viz. thychoides, undulata.

1047. THEA, or Tea-tree.
Two species; viz. bohca, viridis. China, Japan.

The several sorts of tea met with among us, are the leaves of this same genus collected at different times, and cured in a somewhat different manner; the small young leaves, very carefully dried, are the finer green, the older afford the ordinary green and bohea. The two first have a sensible flavour of violets, the latter of roses; the former is the natural odour of the plant, the latter, as Neumann observes, is probably introduced by art. Some of the dealers in this commodity in Europe, are not ignorant that bohea tea is imitable by the leaves of certain plants, artificially tinctured and impregnated with the rose flavour. The taste of both sorts is lightly bitterish, subastrangent, and somewhat aromatic. The medical virtues attributed to these leaves are sufficiently numerous, though few of them have any foundation; little more can be expected from the common infusions than that of a diluent acceptable to the palate and stomach; the diuretic, diaphoretic, and other virtues which they have been celebrated, depend more on the quantity of warm fluid, than any particular qualities which it gains from the tea. Nothing arises in distillation from either sort of tea with rectified spirit; water elevates the whole of their flavour.

Good tea, in a moderate quantity, seems to refresh and strengthen; but if taken in a recent highly flavoured state, and in considerable quantity, its use is apt to be succeeded by weakness and tremors, and other similar consequences, resulting from the narcotic vegetables; yet it is highly probable that many of the bad, as well as good effects, said to result from it, are consequences of the warm water.

1048. CISTUS, or Rock-rose.
79 species; viz. capensis, villous, populifolius, laurifolius, vaginatus, ledon, ladaniferus, monspeliensis, laxus, salvifolius, heterophyllus, ineanus, creticus, parvifolius, albidus, sericeus, hybridus, crispus, formosus, halimifolius, elongatus, libanitis, umbellatus, levi, calycinus, humana, canus, scabrosum, cinerius, ocymoides, italicus, marifolius, origanifolius, mollis, dichotomus, anglicus, vinealis, oelandicus, alternifolius, globularifolius, toberaria, plantagineus, serratus, gattatus, camadenis, punctatus, ledifolius, salicifolius, ulotocic, aegyptiacus, squamatus, lippii, sessiliflorus, elipticus, suerejanus, polyanthos, glaucus, nummularius, canariensis, serpillifolius, violaceus, linearis, levis, strictus, glutinosus, thymifolius, pilous, lavandulifolius, racemosus, ciliatus, angustifolius, helianthemum, mutabilis, fastidius, croceus, hirtus, apenninus, polifolius, arabischus. Alps, S. Europe, Egypt, Cape.

1049. BASELLA.
One species; viz. stipularis. New Granada.

1050. BONNETIA.
One species; viz. palustris. Guiana.

1051. PROCTORIA.
Four species; viz. crucis, serrata, thunbergi, integriolus. Isle of Santa Cruz.

1052. CORCHORUS, or Jesus-mallow.
14 species; viz. olitorius, trilocularis, tridens, castaneus, acantognus, fasicularis, capsularis, scandens, serratus, hisutus, japonicus, flexuosus, hirtus, silkiosus.

1053. SEGUERIELA.
One species; viz. americana.

1054. SWARTIA.
Six species; viz. simplicifolia, grandiflora, jodendron, triphylla, pinnata, alata. Caribbe isles, Guiana.

ORDER II. DIGNYIA.

1055. PENOMA, or Pouncy.
Seven species; viz. officinalis, carallina, albiflora, humilis, anomala, hybrida, tenuifolia. Switz. Ukraine.

The
ANY.

1064. Tetracera.
12 species; viz. sarmentosa, tomentosa, aspera, dolio-carpus, stricta, calinea, obovata, nitida, euryandra, volubilis, laevia, alnifolia. Ceylon, West Indies, South sea isles.

1065. Cartocar.
Three species; viz. nuciferum, butyrosum, tomentosum. Barbary.

1066. Wahlbomia.
One species; viz. indica.

1067. Cimicifuga.
One species; viz. foetida. Siberia.

Order V. Pentagynia.

1068. Aquilegia, or Columbine.
Five species; viz. viscosa, vulgaris, alpina, canadensis, viridiflora.
* A. nectararies bowed inwards, nearly equal to the per-vulgaris.
* leaflets all on leafstalks; lobes distant, roundish, bluntish.—The beauty of its flowers has long introduced it into our flower borders. Goats eat it. Sheep are not fond of it. Cows, horses, and swine refuse it.

1069. Nigella, or Fennel-flower.
Five species; viz. damascena, sativa, arvensis, hispanica, orientalis. Germany, S. Europe, Egypt.

1070. Reaumuria.
Two species; viz. verniculata, hypericoides. Sicily, Egypt.

Order VI. Polygynia.

1071. Dillenia.
Eight species; viz. scandens, integra, speciosa, elliptica, serrata, pentagynia, retusa, dentata. India.

1072. Ilicium, or Anise-seed-tree.
Two species; viz. anisatum, floridanum. Florida, China, Japan.

1073. Liriophyllum, or Tulip-tree.
Four species; viz. tulipifera, coco, figo, liliifera. Amboyna, N. America.

1074. Magnolia, or Laurel-leaved Tulip-tree.
Eight species; viz. grandiflora, plumieri, glauca, obovata, tomentosa, acuminata, tripetalata, auriculata. N. America.

1075. Nelumbium.
Four species; viz. speciosum, luteum, pentapetalum, reniforme.

1076. Michelia.
Two species; viz. champae, taiampea. Indies.

1077. Uvaria.
11 species; viz. zeylanica, lanceolata, cerusoides, suberosa, tomentosa, odorata, monosperma, lutea, ligularia, longifolia, japonica. Ceylon, Japan, Surinam.

1078. Annona, or Custard-apple.
18 species; viz. muricata, tripetala, aquamosa, paludosa, longifolia, punctata, hexapetala, palustris, glabra, triloba,
Polyandria. B O T
trilobez, sazatica, amboata, africana, pygmaea, obovata,
grandiflora, ampelicacaulis. Egypt, E. and W. Indies,
America.

1079. Xyloia, or Bitter-wood.
Three species; viz. muricata, frutescens, glabra.
America.

1080. Unona.
Four species; viz. discretz, tomentosa, discolor, con-
color.

1081. Anemone, or Wind-flower.
29 species; viz. hepatica, patens, cernua, vernalis,
balleri, pulsatilla, pratenis, alpina, apiifolia, coro-
naria, hortensia, palmata, sibircia, baldensia, sylvestris,
virginiana, decapetalza, triternata, pensylvanica, dixo-
toma, triioia, quinquefolia, nemorosa, appenina,
reyna, ranunculoides, narcissiflora, umbellata, than-
lactroides. Europe, N. America.

pratenis. A. leaves double-winged; petals the ends turned
back.—This is the most acrid of the anemonies; and
is recommended by Dr. Stork in the quantity of half
an ounce of the distilled water, or five grains of the
extract, twice or thrice a day, in venereal nodes, pains,
ulcers with carbuncles, chronic eruptions, amenorrheas,
various chronic affections of the eye, particularly blindness
from obstructions of the cornen. Its common effects are
nausea or vomiting, an augmented discharge of urine,
diarrhoea, and increased pain at first in the affected
parts.

pulsatilla. A. leaves doubly winged; petals straight.—The
whole plant is acrid, and blisters the skin. The juice
of the petals stains paper green. Goats and sheep eat
it. Horses, cows, and swine, refuse it.
nemorosa. A. seeds pointed; leaves spiny; petals roundish;
stem mostly 2-flowered.—The flowers fold up in a curi-
ous manner against rain. The whole plant is acrid.
When sheep are unaccustomed to eat it, it brings
on a bloody flux. Goats and sheep eat it. Horses,
cows, and swine, refuse it. This plant is sometimes
found with yellow dots on the under surface of the
leaves.

1082. Atragine.
Six species; viz. alpina, ochotensis, japonica, capen-
sis, tenuifolia, zeylandica. Alps of Europe, Ceylon,
Cape.

1083. Clematis, or Virgin's-bower.
24 species; viz. cirrhosa, floridz, vitiella, viorna,
crispa, calycina, orientalis, glauc, hexapeta, trifolia,
virginiana, japonica, trifoliatea, dioica, indivisa, panica-
leta, vitalba, chinenze, flamula, maritima, angusti-
folia, erecta, ochroleuca, integrifolia. Europe, N. A-
merica.—The ctematis erecta is introduced into but
few of the modern pharmacopoeias, and has never been
found in Britain. As well as many other active
articles, supposed to be of a poisonous nature, it was
some time ago recommended to the attention of practi-
tioners by Dr. Stork of Vienna. Its leaves and flowers
are so acrid as to blister. Dr. Stork recommends it in
venereal, cancerous, and other cutaneous affections, in
those headaches, pains of the bones, and aches in the
habit, the consequences of lavs venera. Externally the
acid powder is sprinkled on the ulcers, and the forms
for internal use are those of infusion and extract.

1084. Taliolcutrum, or Meadow-ruw.
23 species; viz. alpinum, fastidium, tuberosum,

Vol. IV. Part I.
BOT

strap-shaped.—Sheep and goats eat it. Cows, horses, and swine refuse it. Cows and horses leave this plant untouched, though their pasture be ever so bare. It is very acrid, and easily blisters the skin.

* arvensis. 

• R. seeds prickly; upper leaves doubly compound, strap-shaped.—It has lately been said that cows, horses, and sheep, in Italy, eat it greedily, though it is so acrid as to poison the latter. Three ounces of the juice killed a dog in four minutes. Its growing chiefly, if not solely, in corn-fields where cattle are excluded, may possibly be the reason why we have not heard of mischief being done by it in this country.

1887. Trollius, or Globe-romanesus. 

Two species; viz. * europaeus, asiaticus. Europe, Asia.

1888. Isoptium. 

Three species; viz. funarioides, thalictroides, aquilegioides. Siberia, Alps of Austria, Italy.

1889. Helleborus, or Black Hellebore. 

Eight species; viz. hyemalis, ranunculoides, niger, viridis, orientalis, sectus, lividus, trifolius. Austria, Italy, Canada.

• H. stem many-flowered; leafy; leaves bird-footed. 

Bearsfoot, or Helleboraster.—The leaves of this plant, taken in several different forms, have been by some recommended as a very powerful anthelmintic. They are particularly extolled by Dr. Bissett, in his essay on the medical constitution of Great Britain, especially under the form of syrup, made by moistening the leaves of the fresh herb in vinegar, and then pressing out their juice, which was formed into a syrup with coarse sugar. Of this syrup, Dr. Bissett gave to children from two to six years of age, one tea-spoonful at bed-time, and another in the morning, for two or three days successively. The dose was increased or diminished according to the strength of the patient; and in this way he found it very successful in the expulsion of lumbrici.

Where the helleboraster is to be employed, this form is perhaps the best, and we doubt not that it may succeed where others have failed; but it should not, we apprehend, be employed till safer anthelmintics have been tried in vain. For we have heard of some instances where the imprudent administration of it has been attended even with fatal consequences.

The species called helleborus niger, black hellebore or melampodium, grows wild in the mountainous parts of Switzerland, Austria, and Stiris; the earliness of its flowers, which sometimes appear in December, has gained it a place in our gardens. In some parts of Germany, a species of black hellebore has been made use of, which not unfrequently produced violent and sometimes deleterious effects; this the Wurtzburg college particularly caution against, though without mentioning any marks by which it may be distinguished, or even giving the precise name of the plant. It appears to be the sectis hellebore of Linneus, called in England, where it grows, setterwort, settelwort, or bastard hellebore; the roots of this may be distinguished from the official sort by their being less black. The roots of the poisonous aconites resemble in appearance those of the black hellebore; and in the Breslaw collections we find some instances of fatal effects occasioned by mistaking the former for the latter:

ANY.

Polyandria.

the leaves of the plant are happily discoverable by their colour; the aconites being lighter coloured than even the paler of the black hellebore. The faculty of Paris, by allowing the use of one of the paler hellebore (the green-flowered which grows wild in England, and is called by our farriers peg-root) have in some degree deprived the shops of the benefit of this criterion. Since, therefore, the two noxious roots which the buyer is most apt to mistake for this, are distinguishable from it by their colour, but have no other external mark by which they may be with certainty known, particular regard ought to be had to this circumstance; only the deepest black being chosen, and all the paler roots rejected.

The taste of the hellebore is acrid and bitter. Its acrimony is first felt on the tip of the tongue, and then spreads immediately to the middle, without being much perceived on the intermediate part; on chewing it for a few minutes the tongue seems benumbed and affected with a kind of paralytic stupor, as when burnt by eating anything too hot; the fibres are more acrimonious than the head of the root from which they issue. Black hellebore root, taken from fifteen grains to half a dram, proves a strong cathartic, and as such has been celebrated for the cure of maniacal and other disorders proceeding from what the ancients called the atrabilis; in these cases medicines of this kind are doubtless occasionally of use, though they are by no means possessed of any specific power. It does not however appear, that our black hellebore acts with so much violence as that of the ancients, whence many have supposed it to be a different plant; and indeed, the descriptions which the ancients have left us of their hellebore, do not agree to any of the sorts usually taken notice of by modern botanists. Another species has been discovered in the Eastern countries, which Tournefort distinguishes by the name of black oriental hellebore, with a large leaf, a lofty stem, and purplish flower; and supposes to be the true ancient hellebore, from its growing in plenty about Mount Olympus, and in the island of Anticyra, celebrated of old for the production of this antiamanic drug; he relates that a scruple of this sort given for a dose, occasioned convulsions.

Our hellebore is at present looked upon principally as an alterative; and in this light is frequently employed in small doses, for attenuating viscid humours, promoting the uterine and urinary discharges, and opening inveterate obstructions of the remoter glands; it often proves a very powerful emmenagogue in phlegmatic habits, where steel is ineffectual or improper. An extract made from this root with water, is one of the mildest, and, for the purposes of a cathartic, the most effectual preparations of it: this operates sufficiently, without occasioning the irritation which the pure resin is accompanied with. A tincture drawn with proof spirit contains the whole virtue of the hellebore, and seems to be one of the best preparations of it when designed for an alternative; this tincture and the extract are kept in shops.

The melampodium is the basis of Bacher's tonic pills for the dropsy. The root is ordered to be macerated in rectified spirit of wine; the liquor expressed is repeatedly mixed with water, and duly evaporated. This is made up into pills, with an extract of myrrh and
Didynamia.

and powder of carduus benedictus. They are said to be cathartic and diuretic, and at the same time strengtheners of the solids.

1099. Caltha, or Marsh-marygold.

Two species; viz. *palustris, natans. Europe.

*palustris. C. the flowers of this plant gathered before they expand, and preserved in salted vinegar, are a good substitute for capers. The juice of the petals, boiled with a little alum, stains paper yellow. The remarkable yellowness of butter in the spring has been supposed to be caused by this plant: but cows will not eat it, unless compelled by extreme hunger, and then, as some say, it occasions such an inflammation that they generally die. Upon May-day the country people in England strew the flowers before their doors.

1091. Hydrastis, or Yellow-root.

One species; viz. canadensis. Carolina, Canada.

In the class Polymenia are

85 Genera, including 563 Species, of which 50 are found in Britain.

stituting the lower lip.

**ORDER I. GYMNOSPERMIA.**

1002. Ajuga, or Bugle.

10 species; viz. orientalis, decumbens, *pyrami-

dalis, alpina, *genevensis, *teptans, *champepithys, chia,

iva, salicifolia. Europe.

- A: leaves 3-cleft, strap-shaped, very entire; flowers sit-

ting, lateral, solitary; stem spreading.—This plant has a
degree of bitterness and acrimony; but its real use is far from being ascertained. It stands rec-

ommended in the gout, jaundice, and intermitt-

ting fevers.

1003. Teucrium, or Germander.

64 species; viz. campanulatum, lavigatum, orien-
tale, parviflorum, botrys, nissolaniun, tribidum, pseudo-
champepithys, fraicus, brevifolium, cetricum, ma-
rum, quadratum, multiflorum, regium, laxmanni, 
sibircum, asianticum, eubense, arduini, canadense, vir-
ginicum,

* T. leaves heart-shaped, serrated, on leaf-stalks; flowers in lateral bunches, pointing one way; stem upright. — The people of Jersey are said to make use of this plant in brewing. It possesses the bitterness and a good deal of the flavour of hops; but, upon trial, it gave too much colour to the liquor.

scordium.*

* T. leaves oblong, sitting, toothed, naked; flowers in pairs, on fruit-stalks, axillary; stem pubescent, spreading. — The fresh leaves of this plant are bitter, and somewhat pungent. Powdered, they destroy worms. A decoction of this plant is a good fomentation in gangrenous cases. If cows eat it, when compelled by hunger, their milk gets a garlic flavour. Sheep and goats eat it. Horses, cows, and swine, refuse it.

chamaedrys.*

* T. leaves wedge-egg-shaped, cut, scolloped, on leaf-stalks; flowers 3 together; stems somewhat hairy. — This plant is bitter, with a degree of aroma, and may be used with advantage in weak and relaxed constitutions. It is an ingredient in the celebrated gout powders.

The * teucrium chamapathys * is a low hairy plant, clamy to the touch, of a strong aromatic resinous smell, and a little roughish taste. It is an aperient and vulnerary, and is used also in gouty and rheumatic pains.

The * teucrium marum * is a small shrubby plant, growing spontaneously in Syria, Candy, and other warm climates, and cultivated with us in gardens. The leaves have an aromatic bitterish taste, and, when rubbed between the fingers, a quick pungent smell, which soon affects the head and occasions sneezing. Distilled with water, they yield a very acrid, penetrating essential oil, resembling one obtained by the same means from scurvy grass. These qualities sufficiently point out the uses to which this plant might be applied: at present, it is little otherwise employed than in cephalic snuffs.

1094. Satuereja, or Scroory.

II species; viz. juliana, nervosa, thymbra, gracies, filiformis, montana, roeperis, hortensis, capitata, spiranosa, juniper. S. Europe, Jamaica. — The herb of the * satureja hortensis * is raised annually in gardens for culinary purposes. It is a very warm aromatic, and affords in distillation with water, a subtile essential oil, of a penetrating smell, and very hot acrid taste. It yields little of its virtues by infusion to aqueous liquors; rectified spirit extracts the whole of its taste and smell, but elevates nothing in distillation.

1095. Thymbra, or Mountain-hysop.

Three species; viz. spicata, verticillata, ciliata. Spain, Italy, Levant.

1096. Hysopus, or Hysop.

Four species; viz. officinalis, lophanthus, nepetoides, scrophularilofus. Siberia, S. Europe, N. America. — The leaves of hysop have an aromatic smell, and a warm pungent taste. Besides the general virtues of aromatics, they are particularly recommended in humoral asthmas, coughs, and other disorders of the breast and lungs, and said to promote expectoration; but so little dependence is put upon any property of this kind, that hysop has now no place in the Pharmacopoeia of the London college.

1097. Nepeta, or Nep, or Cat-mint.

29 species; viz. * cataria, angustifolia, crispa, heliotropifolia, panonica, coccine, violaces, incana, japonica, urianica, nepetella, nuda, melissioflora, hiserta, italica, multibracteata, reticulata, tuberosa, lanata, scorodota, virginica, malabarica, indica, amboinica, madagascariensis, multiflora, botryoides. Europe, India, N. America. — N. flowers in spikes; whirs on short fruit-stalks: cataria leaves on leaf-stalks, heart-shaped, tooth serrated. — An infusion of this plant is deemed a specific in chroatic cases. Two ounces of the expressed juice may be given for a dose. Cats are so delighted with this plant that they can hardly be kept out of the garden where it grows. Mr Miller says, that cats will not meddle with it if it is raised from seeds; and in support of this opinion quotes an old saying, "If you set it, the cats will eat it; if you sow it, the cats will not know it." It cannot well be planted without being more or less bruised. Sheep eat it; cows, horses, goats, and swine, refuse it.

1098. Elsholtzia.

Two species; viz. crisata, paniculata.

1099. Lavandula, or Lavander.

Eight species; viz. spica, stoechas, viridea, dentata, pimata, multifida, abrotanoides, carnosa. S. Europe, Madeira, E. Indies. — There are different varieties of the * lavandula spica *, particularly the narrow and broad leaved. The flowers of both have a fragrant smell, to most people agreeable, and a warm pungent bitterish taste; the broad-leaved sort is the strongest in both respects, and yields in distillation twice as much essential oil as the other; its oil is also hotter and specifically heavier: hence in the southern parts of France, where both kinds grow wild, this only is made use of for the distillation of what is called oil of spike. The narrow-leaved is the sort commonly met with in our gardens.

Lavander is a warm stimulating aromatic. It is principally recommended in vertigoes, palsy, tremors, suppression of the menstrual evacuations; and in general in all disorders of the head, nerves, and uterus. It is sometimes also used externally in fomentations for paralytic limbs. The distilled oil is particularly celebrated for destroying various cutaneous insects. If soft spongy paper, dip in this oil, either alone or mixed with that of almonds, be applied at night to the parts infested by the insects, they will certainly be all found dead in the morning. The official preparations of lavender are, the essential oil, a simple spirit, and a compound tincture.

The * Lavandula stoechas * is a shrubby plant, considerably smaller than the common lavender. The flowery heads are brought from Italy and the southern parts of France;
any. 217

light; however, when held between the eye and a
candle, or between the eye and the sun, it appears
red; so that if put into a flat bottle, it appears either
green or red, as it is viewed through the flat side or
through the edge of the bottle.

* M. leaves egg-shaped, on leafstalks; stamens short- 
piperita.

or than the blossom.—The stem and leaves of it are be-
set with numbers of very minute glands, containing the
essential oil, which rises plentifully in distillation. Pe-
permint-water is well known as a carminative and an-
tispasmodic. The essence of peppermint is an elegant
medicine, and possesses the most active properties of
the plant.

* M. leaves egg-shaped, acute, serrated; stamens as arvensis.

long as blossoms.—This species prevents the conca-
gulation of milk; and when cows have eaten it, as they
will do largely at the end of summer when the pastures
are bare, and hunger distresses them, their milk can
hardly be made to yield cheese; a circumstance which
sometimes puzzles the dairy-maids. Horses and goats
eat it; sheep are not fond of it; cows and swine refuse it,

* M. leaves egg-shaped, blunt, somewhat scoloped; pulegium.

stems roundish, creeping; stamens longer than the
blossom.—The expressed juice of this plant, with a lit-
tle sugar, is not a bad medicine in the hooping cough.
A simple and a spirituous water, distilled from the
dried leaves, are kept in the shops. They are pre-
scribed in hysterical affections, and are not without con-
siderable antispasmodic properties. An infusion of the
plant may be used with the same intention.

1103. Perilla.  
One species; viz. ocyumoides. India.

1104. Hyiptis.  
Four species; viz. verticillata, capitata, radiata, cha-
medrys.

1105. Glechoma, or Gill, or Ground-Ivy.  
One species; viz. hederae. N. of Europe.

G. leaves kidney-shaped, scoloped.—The leaves of this
plant, thrown into the vat with ale, clarify it and
give it a flavour. Ale thus prepared is often drank as
an antiscorbutic. The expressed juice, mixed with a
little wine, and applied morning and evening, destroys
the white specks upon horses eyes. The plants that
grow near it do not flourish. It is said to be hurtful to
horses if they eat much of it. Sheep eat it; horses are
not fond of it; cows, goats, and swine, refuse it. Lit-
tle protuberances, composed of many cells, are some-
times found upon the leaves, and are occasioned by in-
sects.

1106. Lamium, or Dead-nettle.  
13 species; viz. ovulaa, lavigatam, rugous, gar-
ganicum, maculatum, * album, moll, * purpureum,
incisum, bifidum, tomentosum, * amplexicaule, multi-
fidum. Europe.

* L. leaves heart-shaped, tapering to a point, serrated, album.
on leafstalks; flowers about 20 in a whiril.—This plant
grows wild in hedges; and flowers in April and May.
The flowers have been particularly celebrated in be-
riue floors, and other female weaknesses, and also in
disorders of the lungs; but they appear to be of very
weak virtue, and are at present little used in Britain.

E e 1107.
1107. Galeapis, or Hedge-nettle.

1108. Betonica, or Betony.

Eight species; viz. *officinalis, stricta, incana, orientalis, alpinae, hispanica, grandiflora, heraclea.

* B. spike interrupted; blossoms, upper lip entire; lower lip, the upper segment notched; calyxes smoothish.—This is a low plant, growing in woods and shady places, in several parts of England; the flowers come forth in June or July; they are of a purplish colour, and stand in spikes on the top of the stalks. The leaves and flowers have an herbeaceous, roughish, somewhat bitterish taste, accompanied with a very weak aromatic flavour. This herb has long been a favourite among writers on the materia medica, who have not been wanting to attribute to it abundance of good qualities. Experience does not discover any other virtue in betony than that of a mild corrombator; as such, an infusion or light decoction of it may be drank in tea, or a saturated tincture in rectified spirit given in suitable doses, in laxity and debility of the viscera, and disorders proceeding from thence. The powder of the leaves, snuffed up the nose, provokes sneezing; and hence betony is sometimes made an ingredient in stimulant powders: this effect does not seem to be owing, as is generally supposed, to any peculiar stimulating quality in the herb, but to the rough hairs which the leaves are covered with. The roots of this plant differ greatly in quality from the other parts; their taste is bitter, and very nauseous; taken in a small dose, they vomit and purge violently, and are supposed to have somewhat in common with the roots of belladonna. It is pretty singular, if true, that betony affects those who gather any considerable quantity of it, with a disorder resembling drunkenness, as affirmed by Simon Pauli and Bartholinus. From these sensible qualities and operative effects, although it has now no place in our pharmacopoeias, yet it is perhaps to be considered as a vegetable deserving farther attention.

1109. Stachys, or Base Horehound.

*sylvatica.* S. six flowers in a whirl; leaves heart-shaped, on leaf-stalks.—It will dye yellow. The whole plant has a fetid smell, and toads are thought to be fond of living under its shade. Sheep and goats eat it. Horses, cows, and swine refuse it.

1110. Ballota, or Black Horehound.

Four species; viz. *nigra, alba, lanata, disticha. Europe, East Indies.

*nigra.* B. leaves heart-shaped, undivided, serrated; calyx, teeth tapering to a point.—It stands recommended in hysterical cases. The Swedes reckon it almost an universal remedy in the diseases of their cattle. Horses, cows, sheep, and goats refuse it.

1111. Marrubium, or Horehound.

14 species; viz. alhysum, australicum, peregrinum, cacticum, candidissimum, superium, cataractifolium, *vulgar.

1112. Leonurus, or Lion-tail.

Seven species; viz. *rispus, *cardiaca, marrobiastrum, galeobdolon, supinus, tataricus, sibiricus. Russia, Siberia, Austria.

*L. stem-leaves spear-shaped, 3-lobed.—The leaves cardiaca have a strong but not agreeable smell, and a bitter taste. Goats, sheep, and horses eat it. Cows are not fond of it. Swine refuse it.

1113. Phlomis, or Jerusalem Sage.

27 species; viz. fruticosa, purpurea, italica, nissolia, armecina, lychites, lyciatica, samia, crinita, iloba, purpurata, merina, tuberosa, zeylanica, martincensis, urticifolia, decemdentata, biforma, chinensis, indica, molucoides, glabrata, alta, nepetifolia, leonurus, leonitone. South Europe, Cape, East and West Indies.

1114. Molluccella, or Mobbaco-Balm.

Six species; viz. spinosa, levii, tuberosa, persica, frutescens, grandiflora. Siberia, Levant, India.

1115. Clinopodium, or Field Balm.

1116. Originum, or Wild Marjoram.

16 species; viz. aegyptiacum, dictaminum, sipleum, tounefortii, ciliatum, benghalense, cisticum, smyrnum, heracleoticum, *vulgar, glaphylosum, onites, syriacum, maru, majorana, majoranoides. S. Europe, Egypt, Carolina.

*O. spikes roundish, panicked, clustered; floral leaves vulgar. egg-shaped, longer than the calyx.—The whole plant is a warm aromatic. The dried leaves, used instead of tea, are exceedingly grateful. The essential oil of this plant is so acrid, that it may be considered as a caustic, and is much used with that intention by farriers. A little cotton wool moistened with it, and put into the hollow of an aching tooth, frequently relieves the pain. The country people use the tops to dye purple. Goats and sheep eat it. Cows are not fond of it. Cows refuse it.

The originum dictaminus is a kind of originum said to grow plentifully in the Island of Candy, in Dalmatia, and in the Morea; it has been found hardy enough to bear the ordinary winters of our climate. The leaves, which are the only part in use with us, come from Italy. The best sort are well covered over with a thick white down, and now and then intermixed with purplish flowers. In smell and taste they somewhat resemble lemon thyme: but have more of an aromatic flavour,
flavour, as well as a greater degree of pungency. When fresh they yield a considerable quantity of an excellent essential oil; but they have now no place either in the London or Edinburgh Pharmacopoeias.

The *origanum majorana* is raised annually in our gardens for culinary as well as medicinal uses; the seeds are commonly procured from the southern parts of France, where the plant grows wild. It is a moderately warm aromatic, yielding its virtues both to aqueous and spirituous liquors by infusion, and to water in distillation. It is principally used in disorders of the head and nerves, and in the humidity of asthma and catarrhs of old people. An essential oil of the herb is kept in the shops. The powder of the leaves proves an agreeable erthnic, and enters the official sternitory powder.

1117. *Thymus*, or *Thyme*.

*serpyllum*—T. flowers in heads, stems creeping; leaves flat, blunt, fringed at the base.—The whole plant is fragrant, and yields an essential oil that is very heating. An infusion of the leaves removes the headache occasioned by the debauch of the preceding evening. A general opinion prevails, that the flesh of sheep that feed upon aromatic plants, particularly upon thyme, is much superior in flavour to common mutton: but some say this is a vulgar error, that sheep are not fond of aromatic plants; that they will carefully push aside the thyme to get at the grass growing beneath it; and that they never touch it unless when walking space, and then they will catch at any thing. The attachment of bees to this and other aromatic plants is well known. Sheep and goats eat it. Swine refuse it.

1118. *Melissa*, or *Balm*.

Seven species; viz. officinalis, grandiflora, *catamarinha*, *nepeta*, pyreumatica, cretica, fruticosa. South of Europe.

The *melissa officinalis*, when in perfection, has a pleasant smell, somewhat of the lemon kind, and a weak roughish aromatic taste. The young shoots have the strongest flavour; the flowers, and the herb itself when old, or produced in very moist rich soils, or rainy seasons, are much weaker both in smell and taste. Balm, the herb of this plant is appropriated by the writers on the materia medica, to the head, stomach, and uterus: and in all disorders of these parts is supposed to do extraordinary service. So high an opinion have some of the chemists entertained of balm, that they have expected to find in it a medicine which should prolong life beyond the usual period. The present practice, however, holds it in no great esteem, and ranks it: where it certainly deserves to be, among the weaker corroborants. In distillation it yields an elegant essential oil, but in very small quantity; the remaining decoction tastes roughish. Strong infusions of the herb, drank as tea, and continued for some time, have done service in a weak lax state of the viscers; these liquors, lightly sciudulated with juice of lemons, turn of a fine reddish colour, and prove an useful, and to many a very grateful, drink in dry parching fevers.

1119. *Dracopetalum*, or *Dragon's-head*.

18 species; viz. virginianum, denticulatum, cananense, pinnum, orinoides, palmatum, peregrinum, fruticosum, austriacum, russchiana, grandiflorum, alata, sibiri, elmsi, melavica, canescens, peltatum, noton, thymiflorum. N. Europe, N. America, Canaries.

1120. *Melittis*, or *Base-balm*.

Two species; viz. *melissophyllum*, japonica.

1121. *Ocimum*, or *Basil*.

27 species; viz. thyrsiflorum, inflexum, virgatum, monachorum, gratissimum, album, tentosum, grandiflorum, basilicum, minimum, integerrimum, sanctum, rugosum, crispum, scabrum, americanum, verticillatum, acutum, tenuiflorum, polystachyon, serpyllifolium, menthoide, molle, ascendens, scutarioides, prostratum, capitellatum. Persia, E. Indies, Japan, Chili.

1122. *Plectranthus*.

Six species; viz. fruticosus, galeatas, nudiflorus, forskohli, anisifolius, punctatus. Africa.

1123. *Trichostema*.

Two species; viz. dichotoma, brachiatia. North America.

1124. *Scutellaria*, or *Scut-cap*.

* S. leaves heart-shaped or scollop flowers axil-galericulate.—When the blossoms fall off, the cup closes upon itself. The seeds, which when ripe, being still smaller than the cup, could not possibly open its mouth, or overcome its elastic force, as the down of the seeds do in the compound flowers, must consequently remain useless, without a possibility of escaping. But nature, ever full of resources, finds a method to discharge them. The cup grows dry, and then divides into two parts so that the seeds, already detached from the receptacle, fall to the ground. Cows, goats, and sheep eat it; horses and swine refuse it.

1125. *Prunella*, or *Self-heal*.

Three species; viz. vulgaris, grandiflora, hyssopifolia. Europe, Barbary.

1126. *Cleonia*.

One species; viz. lusitaniaca. Spain, Portugal.

1127. *Prasium*, or *Shrubby Hedges-wort*.

Two species; viz. minutum, minus. Spain, Italy, Carolina.

1128. *Phryma*.

Two species; viz. leptostachia, dehiscenta. North America.

1129. *Seleca*.

20 species; viz. corymbosa, cinerea, polyactida, verbascens, rapunculoides, spurius, hirta, rotundifolia, fasciculata, polygaloides, ovata, coccinea, canescens, geniculata, divaricata, capitata, triquetra, fruticosa, hirsuta, ciliata. C. of C. Hope.
ORDER II. ANGIOSPERMIA.

1130. Bartsia.
Five species; viz. cocinea, pallida, *viscosa, gymnandra, *alpina. Alps of Europe, Hudson's Bay.

1131. Rhinanthus, or Elephants-head.
10 species; viz. orientalis, elaphus, *crista-galli, tricagia, maximus, versicolor, capensis, indicus, virgincus, trifidus. Europe, Cape, India, Virginia.

1132. Euphrasia, or Eye-bright.

officinalis. *F. leaves egg-shaped, serrated, sharply toothed. It is a weak astrigent, and was formerly in repute as a remedy for impaired vision. It will not grow but when surrounded by plants taller than itself. Cows, horses, goats, and swine eat it. Swine refuse it.

1133. Melampyrum, or Cow-wheat.

arvense. *M. spikes conical, loose; floral leaves, with bristle-shaped teeth, coloured. The seeds when ground with corn give a bitterish and grayish cast to the bread, but do not make it unwholesome. Cows and goats eat it. Sheep refuse it.

pretense. *M. flowers lateral, pointing one way; leaves in distant pairs; blossoms closed. Where this plant abounds, the butter is yellow and uncommonly good. Swine are very fond of the seeds. Sheep and goats eat it. Cows are very fond of it. Horses and swine refuse it.

1134. Lathrea.
Three species; viz. clandestina, sublatum, *aquamarina. Europe.

1135. Schwalbea.
One species; viz. americana. N. America.

1136. Tozzia.
One species; viz. alpina. Alps of Austria, Italy, Pyrenees.

1137. Pedicularis, or Rattle-coccom.
34 species; viz. *palustris, *sylvestria, euphrasiodii, myriophrilla, spicata, resupinata, scepturn carolinum, tristis, lapponica, asplenifolia, flava, striata, sudetica, recurvata, elata, foliosa, canadensis, groenlandica, incarnata, uncinata, interrupta, verticillata, acuila, fumnea, hirsuta, rosea, rostrata, tuberosa, pyroglossa, fasciculata, rubens, compacta, achilleilolia, comosa. Europe, N. America.

palustris. *P. stem branched; calyx crested with callous dots; lip of the blossom slanting. This plant is an unwholesome guest in meadows, being very disagreeable to cattle. Goats eat it. Horses, sheep, and swine refuse it. Swine are not fond of it.

sylvestria. *P. stem branched; calyx oblong, angular, smooth; lip of the blossom heart-shaped. The expressed juice, or a decoction of this plant, has been used with advantage as an injection for sinus ulcers. It is said, that if the healthiest flock of sheep be fed with it, they become scabby and scurfy in a short time; the wool will get loose, and they will be overrun with vermin. Cows and swine refuse it.

1138. Gerardia.
12 species; viz. tuberosa, delphinifolia, purpurea, tenuifolia, tubulosa, nigra, flav, scabra, pedicellaria, japonica, glutinos, sessilifolia. E. India, China, Japan, N. America.

1139. Chelone, or Humming-bird Tree.
Four species; viz. giabra, obliqua, ruelliioides, barbata. N. America.

1140. Pentstemon.
Four species; viz. hisruta, pubescens, lavigata, campanulata. N. America.

1141. Cyrella.
One species; viz. pulchella. Jamaica.

1142. Gloxinia.
One species; viz. maculata. Guiana.

1143. Generia.
11 species; viz. humilis, corymbosa, acusil, pumila, craniaria, grandis, tomentosa, scabra, exserta, calycina, ventricosa. Jamaica, Hispan, S. America.

1144. Antirrhinum, or Snap-dragon, Catlas-mout.

* A. leaves heart-shaped, 5-lobed, alternate; stems cymbala-

trailing. Its trailing branches, variably interwoven, often cover old moist walls with a thick tapestry, and when in blossom, make a beautiful appearance.

A. leaves balder-shaped, alternate; stems trailing, elatine.

This is considerably more bitter than the other spe-

cies, and is said to have been used successfully in cases of foul ulcers, and in cutaneous eruptions.

A. leaves spear-strap-shaped, crowded; stem upright; linaria.

spikes terminating, sitting. An infusion of the leaves is diuretic and purgative. An ointment, prepared from them, gives relief in the piles. The expressed juice, mixed with milk, is a poison to flies, as is likewise the smell of the flowers. Cows, horses, and swine, refuse it. Sheep and goats are fond of it.

A. blossom without a spur; flowers in spikes; cups majus.

sounded. Though the seeds of this plant vegetate on any ground, it is only in dry soils and situations that the plant continues to live long enough to produce flowers.

1145. Anarrhinum.
Five species; viz. bellidifolium, pedatum, fruticosum, erosifolium, tenuifolium.

1146. Cymbaria.
One species; viz. daurica. Dauria.
Didynamia.

BOTANY.

1147. Tourretia.
One species; viz. lappacea. Isle of Bourbon.
1148. Martynia.
Four species; viz. diandra, carniolaria, proboscides, longiflora. Cape, America.
1149. Torenia.
Two species; viz. asiatica, hirsuta. India.
1150. Beesiaria.
Eight species; viz. multifolia, lutea, violacea, incarnata, serrulata, cristata, cocinea, bivalvis. West Indies, S. America.
1151. Brunfelsia.
Two species; viz. americana, undulata. W. Indies.
1152. Schrophularia, or Fig-wort.

* S. leaves oblong heart-shaped, 3-fibred at the base; corners of the stem acute.—This plant is hardly known in modern practice; but the rank smell and bitter taste of the leaves seem to indicate some active properties. Swine that have the scab are cured by washing them with a decoction of the leaves. Goats eat it, Cows, horses, sheep, and swine refuse it.
1153. Celsia.
Five species; viz. orientalis, arcturus, coromandeliana, cretica. Crete, Levant, E. Indies.
1154. Hemimeris.
Five species; viz. montana, sabulosa, diffusa, urticifolia, cocinea. C. of G. Hope.
1155. Digitalis, or Fox-glove.
12 species; viz. * purpurea, minor, thapsi, parviflora, lutea, ambugia, ferruginea, orientalis, lanata, obscura, canariensis, sceptrum. S. Europe, Canary.

* D. segments of the calyx egg-shaped, acute; blossom blunt, upper lip nearly entire.—This species is certainly a very active medicine, and merits more attention than modern practice till very lately bestowed upon it. It grows wild in woods and on uncultivated heaths: the elegant appearance of its purple flowers (which hang in spikes along one side of the stalk), has gained it a place in some of our gardens. The leaves have been strongly recommended, externally, against scrofulous tumours, and likewise internally, in epileptic disorders; what service they may be capable of doing in these cases, is not ascertained by accurate experiments. Several examples are mentioned by medical writers of their occasioning violent vomiting, hypercatharsis, and disordering the whole constitution; insomuch that Boerhaave accounts them poisonous. Their taste is bitter, and very nauseous. Digitalis, however, has lately been employed with great success in other diseases. A treatise has lately been published by Dr. Withering, professedly on the subject of its use in medicine, containing many important and useful observations. An infusion of two drams of the leaf, in a pint of water, given in half-ounce doses every two hours or so, till it begin to puke or purge, is recommended in dropsy, particularly that of the breast. It is said to have produced an evacuation of water so copious and sudden, in ascites, by stool and urine, that the compression of bandages was found necessary. The plentiful use of diuretics is ordered during its operation. The remedy, however, is inadmissible in many weakly patients. But besides being given in infusion, it has also been employed in substance; and when taken at bed-time, to the extent of one, two, or three grains of the dried powder, it often in a short time operates as a very powerful diuretic, without producing any other evacuation. Even this quantity, however, will sometimes excite very severe vomiting; and that too, occurring unexpectedly. During its operation, it has often very remarkable influence in rendering the pulse slower; and it frequently excites very considerable vertigo, and an affection of vision.

Besides dropsy, digitalis has of late been employed in some instances of haemoptysis, of phthisis, and of mania, with apparent good effects. But its use in these diseases is much less common than in dropsy.
1156. Incarvillea.
One species; viz. sinensis.
1157. Bignonia, or Trumpet-flower.
54 species; viz. catalpa, longissima, tomentosa, linearis, sempervirens, tenuissilis, castanoides, obtusifolia, microphylia, unguis, staminea, sequinocilia, alatae, spectabilis, laurifolia, rigescens, lactiflora, paniculata, elongata, corymbifera, rugosior, grandifolia, capsulata, pubescent, villosa, echinata, heterophylla, triplophylla, mollis, hirsuta, pentaphylloidea, ochracea, brevifolia, flavifolia, serratifolia, radiata, radicans, grandifolia, stans, africana, bijuga, racemosa, compresa, spathacea, chelonoides, variabilis, alba, peruviana, indica, longifolia, procera, coriacea, brasiliensis. E. and W. Ind. Amer.
1158. Cytherea, or Fiddle-wood.
Six species; viz. cinereum, caudatum, villosum, subseratatum, quadrangular, melanocardium. W. Ind.
1159. Halleria, or African Fly-honeysuckle.
Two species; viz. lucida, elliptica. Cape of Good Hope.
1160. Crescentia, or Calabash Tree.
Two species; viz. cujete, cocurbitina. Virginia, Jamaica, Brazil.
1161. Tanecium.
Three species; viz. parasiticum, jaroba, pinnatum. Jamaica.
1162. Gmelina.
One species; viz. asiatica. Asia.
1163. Petrea.
One species; viz. volubilis. S. Amer.
1164. Premna.
Three species; viz. integrifolia, tomentosa, serratifolia. E. Indies.
1165. Lantana, or American Viburnum.
15 species; viz. mista, trifolia, viburnoides, annua, stricta, radula, camara, involucrata, recta, odorata, lavandulacea, salviifolia, melissifolia, scabrida, aculeata. W. Ind. S. Amer. 2166.

1165. Spikelmia.
One species; viz. africana. C. of G. Hope.

1167. Cornutia.
Two species; viz. pyramidata, punctata. W. Ind.

1168. Leucaena.
One species; viz. ciliata. Vera Cruz.

1169. Capraia, or Sweet-weed.
Six species; viz. biflora, lucida, lanceolata, semisserrata; undulata, humilis. E. and W. Indies, Cape, S. America.

1170. Lindernia.

1171. Manuela.
17 species; viz. cheriranthus, corymbosa, altissima, pinnatifida, plantaginis, capitata, antirrhineoides, thyrsiflora, argentus, tomentosa, rubra, capillaris, cuneifolia, coriacea, heterophylla, integrifolia, microphylla. C. of G. Hope.

1172. Helenium.
Six species; viz. dentata, ciliata, integrifolia, erinooides, fruticosa, cordata. C. of G. Hope.

1173. Erinus.
Seven species; viz. alpina, maritimus, africanus, lychnoides, fragrans, peruvianus, tri时常. Alps, Pyrenees, Cape, Peru.

1174. Buchnera.
14 species; viz. americana, elongata, cerrus, cuneifolia, cordifolia, grandiflora, anthophila, viscosa, capensis, humifusa, aristata, euphrasiae, geanerioides, pinnatifida. Cape, Ceylon, China, America.

1175. Browallia.
Three species; viz. demissa, elata, alienata. South America.

1176. Linnea.
One species; viz. borealis. N. Europe, Asia, and America.

1177. Sedtoria, or Base Money-wort.
One species; viz. europaea. Europe, Africa.

1178. Limosella, or Mud-wort.
Two species; viz. aquatica, diandra. North of Europe.

1179. Phyllopsis.
One species; viz. parviflora.

1180. Vandellia.
Two species; viz. diffusa, pratensis. Isle of St Thomas.

1181. Russelia.
One species; viz. sarmatensis.

1182. Conorea.
One species; viz. aquatica. Guiana.

1183. Stereoidia.
Five species; viz. maritima, durantas, ruderalis, camphorata, aquatica. Jamaica.

1184. Oboaria.
One species; viz. virgicica. N. America.

1185. Aeginetia.
One species; viz. indica.

1186. Ocrasanche, or Broom-robe.
18 species; viz. major, leclia, caryophyllacea, corullescens, elatior, purpurea, minor, alba, gracilis, americana, virginiana, uniflora, corulea, phylaea, tinctoria, cernus, * ramosa, cocinea. Europe, Malabar, N. Amer.

1187. Hydrangea.
One species; viz. sanguinea. Cape of Good Hope.

1188. Dodartia.
Two species; viz. orientalis, indica. Lev. Ind.

1189. Lippia.
Five species; viz. americana, hirsuta, umbellata, cymostoa, hemisphaerica. Cape, America.

1190. Achnemon.
One species; viz. sessamoides. East Indies.

1191. Sesamum, or Oil Purging-grain.
Four species; viz. orientale, luteum, indicum, lacinatum. E. Indies.

1192. Tortula.
One species; viz. aspera.

1193. Holmskioldia.
One species; viz. sanguinea.

1194. Mimulus, or Monkey-flower.
Four species; viz. ringens, glutinosus, alatus, luteus. Virginia, Canada, Peru.

1195. Ruellia.
46 species; viz. blechum, blechiioides, angustifolia, ovata, strepens, patula, pallida, fragrans, lactes, candelula, violacea, rubra, macrophylla, guttata, imbricata, aristata, intrusa, paniculata, tuberosa, tentaculata, bipora, crispus fasciculata, mollissima, undulata, involucrata, repanda, ringena, cococened, repens, uliginosus, pilusa, hirta, depressa, cordifolia, secunda, repans, japonica, slopecueroidea, barbata, balsamea, salicifolia, longiflora, difformis, rupestris, scabrosa. Egypt, E. and W. Ind. Jap. Amer.

1196. Barkelia.
13 species; viz. longifolia, solanifolia, hystrix, prionitis, trispinosa, bispinosa, buxifolia, nodiflora, acanthoidea, cristata, strigosa, pungens, longiflora.

1197. Duranta.
Three species; viz. plumier, ellisia, mutissii. W. Ind. S. Amer.

1198. Myoporum.
Four species; viz. luteum, baboucom, crassifolium, tenuifolium. South sea isles.

1199. Oviida.
Two species; viz. spinosa, mitis. Java, W. Indies.

1200. Mallingonia.
One species; viz. hortensis.

1201. Volkmannia.
Eight species; viz. acaulea, legastria, interna, capitata, serrata, scandens, japonica, kampferi. E. and W. Indies, Japan.

1202. Clerodendrum.
Eight species; viz. infortunatum, fortunatum, calmitosum, phlomoides, squamatum, trichotomum, diversifolium, paniculatum. E. Indies, Japan.

1203.
Tetradynamia.  
1203. Thunbergia.  
Two species; viz. capensis, fragrans. C. of Good Hope.

1204. Maurandia.  
One species; viz. amplexiflora.

1205. Culzillaea.  
Two species; viz. integfrisia, sessifolia. Egypt, E. Indies, S. America.

1206. Vitex, or Chase-Tree.  
13 species; viz. ovata, triandra, divaricata, pubescens, altissima, agnus castus, incisa, leucocarpa, triflora, umbrosa, capitata, negundo, pinnata. Naples, Sicily, E. and W. Indies.

The vitex agnus castus is a small tree, or rather shrub, growing spontaneously in Italy, &c. and raised with us in gardens. Its fruit, which is about the size of a pepper corn, contains four longish seeds, which are said to be of an aromatic smell and an acrid bitterish taste, but which are found, on examination, to be almost inodorous and insipid. These seeds have been celebrated as antiphlogiuncta, and were formerly much used by the monks for allying the venereal appetite; but experience does not warrant their having any such virtues.

1207. Amassonia.  
Two species; viz. creta, pungens. Surinam.

1208. Bontia, or Barbados Wild-olive.  
One species; viz. daphnoides. W. Indies.

CLASSIS XV.  
TETRADYNAMIA. (x)

ORDO I. SILICULOSÆ.  

Sect. I. Silicula integra, nec apice marginata.

(x) In the flowers of this class of plants there are six stamens, four of them long and two short. It is also most worthy of notice, that the flowers of this class have uniformly four petals, a circumstance which renders it easy to distinguish them. The difference in length of the stamens is not always very obvious, but as the Hexapodria class contains no plants with four petals, this last circumstance readily distinguishes the plants of the present class. The orders are two, and are distinguished by the figure of the seed-vessel, which in the first order is a broad and short pouch; that is, a roundish flat seed-vessel furnished with a style, which is sometimes as long as the seed-vessel itself. In the second order, the seed-vessel is a long pod; that is, a very long seed-vessel, without any remarkable style. This is a natural rather than an artificial class. The plants belonging to it are called antipodaria, and their seeds are hard and unhealthy. They lose most of their virtues by drying. None of them are...
BOTANY.

Tetradynamia.

- V. Pouch with valves shorter by half than the partition.
- C. Pouch spear-shaped, 2-jointed, with 1-seeded joints, the last joint retiring.
- P. Pouch placed crossways, beaked on both sides, no valves, 1-seeded.
- B. Pouch 4-sided, without valves, 2 or 4-celled, wrinkled.
- C. Pouch bulging, 1-celled, 1-seeded, without valves.

Sect. II. Pouch with a notched end.

- I. Two outer petals large.
  A. Some filaments in the inner side toothed. Pouch 2-celled.
  C. Pouch round and flat, with flat valves, deciduous.
  P. Pouch round and flat, compressed plane, not opening.
  C. Pouch heart-shaped, with blunt bulging valves.
- L. Pouch heart-shaped, with valves sharply keeled.
- T. Pouch heart-shaped, reversed; valves keel bordered.
- I. Pouch heart-reversed; keeled valves, divisible into 2, 1-seeded; window-shaped partition.
- B. Pouch 2-lobed above and beneath, with a keel-shaped border.
  A. Pouch bluntly notched at the end. Valves long, with a dagger-pointed partition.

ORDER II. SILIQUSÆ, or those having a long Pod.

Sect. I. Calyx shut by leaflets closing lengthwise.

- R. A jointed pod.
- E. Pod 4-gon.
- C. Pod, with a seed-bud marked on both sides with a gland.
- A. Four glands between the leaflets of the calyx. Stigma undivided.
- B. Two glands between the shorter stamens, 2 beyond the longer stamens.
  C. Pod a little swelling out, with the last seed in a separate joint.
  T. Petals erect.
  D. Pod with valves rolled back, open.

R. Pod 1-celled.

Sect. II. Calyx open, with leaflets distant above.

C. Pod open, 1-celled.

- 1237.

are poisonous. It is not a little singular, that they are most acrimonious in moist situations, and wet seasons. Thus the cochlearia armoracia (horse radish), growing near water, is so very acrimonious that it can hardly be used; and the brassica rapa (turnip) whose root in a dry sandy soil is succulent and sweet, in stiff wet lands is hard and acrimonious.
Tetradynamia.

BOTANY.

ORDER I. SILICULOSÆ.

1216. Myagrum, or Gold of Pleasure.
12 species; viz. perenne, orientale, rugosum, hispanicum, perfoliatum, chlorocele, sativum, dentatum, austriacum, paniculatum, saxatile, egypti. Europe, Egypt.

1217. Buniæ, or Sea Rocket.
11 species; viz. spinosa, erucago, apera, orientalis, coelocacidea, tatarica, syriaca, myagroides, egyptiaca, balsearica, prostrata. Europe, Africa, America.

1218. Pugionium.
One species; viz. cornutum.

1219. Carile.
Two species; viz. maritima, egyptiaca.

1220. Crambe, or Sea-cabbage, or Kale.
Eight species; viz. *maritima, tatarica, orientalis, hispanicum, reniformis, cf FORMAS, fruticosa, striosa. Sea shores of Europe, Madeira.

maritima. C. leaves and stem smooth.—The young and tender plants are boiled as cabbage; but when full grown they occasion giddiness. Horses, cows, goats, sheep, and swine eat it.

1221. Isatis, or Woad.
Four species; viz. *tintoria, lusitanica, armena, alpina. Sea shores of Europe, Egypt.
tintoria. *l. root-leaves scapped; stem-leaves arrow-shaped; ponches oblong.—With the juice of this plant, it is said, the ancient Britons painted their bodies, to render them more terrible to their enemies. It is much used by the dyers for its blue colour, and it is the basis of many other colours. It is cultivated for their use. Cows eat it; horses, sheep, and goats refuse it.

1222. Vella, or Spanish Cress.
Two species; viz. *annua, pseudo-cytisus. Siberi, Spain.

1223. Anatatica, or Rose of Jericho.
One species; viz. hierochuntica. Austria, Levant.

1224. Subularia, or Aewl-wort.
Two species; viz. *aquatica, alpina. N. of Europe, Arabia.

1225. Draba, or Whithlow-grass.

1226. Lepidium, or Dittander.

L. leaves egg-spear-shaped, entire, serrated.—This is latifolium one of the most aromatic of the Lepidiums, and was formerly used in the place of horseradish. An infusion of it excites vomiting.

1227. Thlaspi, or Tarelle-mustard.

Two sorts of the thlaspi arvensis are used promiscuously; they both grow wild; their seeds have an acrid biting taste like common mustard, with which they agree in medical qualities.
The thlaspi burse pastoris is common in waste places, and is found in flower all the summer. Shepherd's-purse, or the leaf, has long been celebrated as an astringent, and strongly recommended in diarrhoea, dysenteries, urinous fluxes, and in general in all diseases where astringents of any kind can avail. Some have esteemed it so powerful a styptic as scarcely to be safely exhibited internally. Others have thought it to be of a hot fiery nature, and supposed it to stop fluxes and hemorrhages by coagulating the juices like alcohol, and burning or searing the orifices of the vessels. The sensible qualities of shepherd's purse discover little foundation for either of these opinions: it has no perceptible heat, acrimony, pungency, and scarcely any astringency: the taste is almost merely herbaceous, so as sufficiently to warrant the epithet given to this plant, *fustum. It is hardly in use in Britain.

1228. Cochlearia, or Sea-cabbage.

C. root-leaves heart-circular; stem-leaves oblong, officinalis. little indented.—Notwithstanding this plant is a native of the sea coast, it is cultivated in our gardens without any sensible alteration of its properties. It possesses a considerable
considerable degree of astringency, and this astringency seems to reside in a very subtle essential oil. Its effects as an antiscorbutic are universally known, and it is a powerful remedy in the putridous asthma, and in what Sydenham calls the scorbatic rheumatism. A distilled water and a conserve are prepared from the leaves, and its juice is prescribed along with that of oranges, by the name of antiscorbutic juices. It may be eaten as a salad. Cows eat it. Horses, goats, and sheep refuse it.

armoracia. C. root-leaves spear-shaped, scoloped; stem-leaves snip.—The root of this plant, scraped, is in common use in England as a condiment for fish, roast beef, &c. and it is used for many other culinary purposes. An infusion of it in cold milk makes one of the softest and best cosmetics. In paralytic and dropsical cases, it is a useful stimulant and diuretic. A strong infusion of it excites vomiting. A distilled water is prepared from it. Horses, cows, goats, sheep, and swine refuse it.

anglica. C. all the leaves egg-spear-shaped. This is a pungent stimulating medicine; capable of dissolving viscid juices, opening obstructions of the viscera and the more distant glands, and promoting the fluid secretions; it is particularly celebrated in scurvy, and is the principal herb employed in these kinds of disorders in the northern countries.

1230. IBERIS, or Comdy-tuft.
18 species; viz. semperflorers, capadocica, sempervirens, gibraltarica, saxatilis, verniculata, rotundifolia, cephalophora, carnosa, ciliata, parviflora, nana, unbellata, *amara, linifolia, odorata, *nodicaulis, pinnata. S. Europe, Arabia, Persia.

1231. ALYSUM, or Mad-wort.
31 species; viz. spinosus, maritimum, balimifolium, tenuifolium, saxatile, lunarioideae, argenteum, alpestre, serpyllifolium, atlanticum, orientale, hyperboreum, incanum, minimum, strictum, calycinum, sibiricum, spathulatum, montanum, tortuosum, campestre, linifolium, clypeatum, cheiranthifolium, sinuatum, creticum, geminense, dasyacarpum, utriculatum, vesicaria, deltodeae. Europe, N. Amer.

1232. CLYPFOLEA, or Trecle-mustard.
One species; viz. jonthlapi. Italy, France, Carolina.

1233. PELATRIA. Three species; viz. alliacea, garcini, capensis. Cape.

1234. BISCUETTUL, or Buckler-mustard.
Ten species; viz. auriculata, apala, lynata, raphanifolia, coronopifolia, lavigata, subspathulata, montana, semprevirens, peruviana. Europe, N. Amer.

1235. LUNARIA, or Moon-wort, Honesty.
Two species; viz. rediviva, annua. N. of Eur.

ORDER II. SILICOSÆ.

1236. RICOTTA, Egypt.
One species; viz. sanguigna. Egypt.

1237. CARDAMINE, or Lady's-smock.

* C. leaves of the root-leaves roundish, those of the prunifolia report-shirts, stem-leaves spear-shaped, very entire.—This is a perennial plant which grows in meadow grounds, sends forth purplish flowers in the spring, and in its sensitive qualities resembles the nasturtium aquaticum. Long ago it was employed as a diuretic, and of late it has been introduced in nervous diseases. A dram or two of the powder is given twice or thrice a day. It has little sensible operation, except that it sometimes sweats. Goats and sheep eat it. Horses and swine refuse it. Cows are not fond of it.

* C. leaves winged; suckers from the bosom of the leaves, leaflets of the stem-leaves angular, sitting. Sheep eat it. Cows are not fond of it. The young leaves are acrid and bitterish, but do not taste amiss in salads. They are much used for that purpose in Lancashire. The leaves are pungent, bitter, and aromatic, in such a degree as to promise very considerable uses.

1238. SISYMBRIUM, or Water-cresses.

* S. leaves winged; leaflets egg-shaped.—This plant nasturtium is very universally used as an early and wholesome spring salad. It is an excellent antiscorbutic and stomachic, with less acrimony than the scurvy-grass. It is an ingredient in the antiscorbutic juices. It is recommended as of singular efficacy for accelerating the circulation, strengthening the viscera, opening obstructions of the glands, promoting the fluid secretions, and purifying the blood and humours; for these purposes the expressed juice, which contains the peculiar taste and pungency of the herb, may be taken in doses of an ounce or two, and continued for a considerable time. S. pods oblong egg-shaped; leaves wing-cleft, ser-amphirated; petals longer than the cup.—The ends of the pinnas general fruits are often swollen into a caulliflower-like substance, purplish, and containing small grubs of the same colour. Cows refuse it. Sheep and goats are not fond of it.

* S. petals smaller than the cups; leaves doubly com-sophias pound, winged.—The pods retain the seeds all winter, and small birds feed upon them. The plant has been sometimes prescribed in hysteric and dysenteric cases; and the seeds are given to destroy worms. Sheep and cows eat it. Horses and goats are not fond of it. Swine refuse it.
Tetradyneim. B O T

1239. Erysimum, or Hedge-mustard. 227

officinale. * E. pods pressed to the spike-stalks; leaves notched.—The plant is warm and acrid to the taste; and when cultivated is used as a spring pot-herb. Birds are fond of the seeds. Sheep and goats eat it. Horses, horses, and swine refuse it. By means of it a hoarseness, occasioned by loud speaking, is said to have been cured in three days by Rondeletius.

barbara. * E. pods indistinctly four-cornered; leaves lyre-shaped, the terminating segment circular.—The common people in Sweden are said to use this plant in salads, early in the spring, and late in the autumn; they also boil them as kale. It is sown in gardens as an early spring salad; and also in England, where it is called French cress. Cows eat it. Horses and swine refuse it. Goats and sheep are not fond of it.

alia. * E. leaves heart-shaped.—The Prussians are said to eat the leaves along with salted meats in the spring. They are used with lettuce and the colder salads. The seeds excite sneezing. Cows and goats eat it. Horses, sheep, and swine refuse it. When it grows in poultry yards the fowls eat it, and it gives an intolerable rank taste to their flesh. In Wales it is much used as a frying herb.

eleuran-thoides. * E. stem very much branched; leaves spear-shaped, oblique, waving and toothed; pods expanding.—The country people give the seeds of this plant to destroy worms, and with good effect. Horses, cows, goats, sheep, and swine, eat it.

1240. Cheiranthus, or Stock July-flower.
34 species; viz. erysinoideae, helveticae, alpinus, lanceolatus, * cheiri, fruticulosus, callous, strictus, tenuifolius, mutabilis, apricus, chius, maritimus, parviflori, salinus, bicuspidatus, incanum, fenestratis, annuum, litora, areolatus, contortuplicatus, leucanthus, tristis, pilosum, pulchellus, pillatifidus, tricuspidatus, tomentosus, odoratissimus, simule, taraxaciolius, cuspatus, quadrangulius, laricetia. Alp., S. Europe, Egypt, Madeira.

cheiri. * C. leaves spear-shaped, acute, smooth; branches angular; stem shrub-like.—This plant has found place in our gardens, where it has produced a considerable number of varieties, but none which have a more delightful scent than the wild one. The flowers have a pleasant smell, and a subacid, bitterish, not agreeable taste; they are said to be cordial, antidote, apert, and emmenagogue, but are wholly neglected in the present practice.

1241. Heliohila.
12 species; viz. integrifolia, incan, circinoides, amplexicaulis, flavo, canescens, pusilla, filiformis, pendula, pinata, coronopfolia, digitata. C. of G. Hope.

1242. Hesperis, or Dames-violet, Rocket.
Ten species; viz. tristis, lanciati, matronalis, * inodora, tataria, africana, ramossissima, arenaria, verna, lacera. Siberia, S. Europe, Africa.

1243. Arabis, or Base Tower-mustard.

1244. Turritis, or Tower-mustard.

1245. Brassica, or Cabbage.

* B. the root a regular continuation of the stem, spindle-shaped.—The roots of the cultivated variety may be eaten like the turnip, but they have a strong taste; and its seeds, which are called cole-seed, afford a large quantity of expressed oil, called rape oil: what remains after expressing the oil, is called oil-cake, and is used for fattening oxen. In Norfolk, the cakes are broken to pieces, and strewed on the land as a manure. It is thought to be a very efficacious one, and is sold from 4l. to 6l. per ton. About half a ton is laid on an acre. Cows, goats, and swine eat it.

* B. the root a regular continuation of the stem, cylindrical, fleshy. Turnip.—The roots of it are eaten either raw, boiled, or roasted. Pepper is commonly used with them. They relax the bowels, and are supposed to sweeten the blood. They are hurtful to pregnant and hysterical women, and to those who are subject to flatulencies. The juice well fermented affords by distillation an ardent spirit. The rind is acrimonious. If the roots are kept in sand, or in a cellar, during the winter, they send out white shoots, and yellowish leaves, which being rather sweet, and not unpleasant to the palate, are used as salad, when other esculent plants are not to be had. But the greatest use of turnips is in feeding oxen and sheep in the winter.

* B. the root a regular continuation of the stem, cylindrical, fleshy. Sea and Common Cabbage.—Early in the spring, the sea-cabbage is preferred to the cultivated kinds, but when gathered on the sea-coast, it must be boiled in two waters. To take away the saltiness. The roots may be eaten like those of the preceding species, but they are not so tender. The different varieties of cultivated garden cabbage originate from this, all of which are much in use at our tables. The red cabbage is chiefly used for pickling. In some countries they bury the white cabbage when fully grown in the autumn, and thus preserve it all winter. The Germans cut them to pieces, and along with some aromatic herbs and salt press them close down in a tub, where they soon ferment, and are then eaten under the name of sour-croat. If cabbages are sowed or planted for several years together in the same soil, the heads become smaller, and the roots knotty. This is occasioned by the larvae of flies. Cows eat the leaves, but do not seem fond of them. Cows grow fat upon them.

The brassica eruc is formerly much cultivated in gardens, for medical use, and for salads; but is at present less common. In appearance it resembles mustard, but it is easily distinguishable, by the smoothness of its leaves and its disagreeable smell. The seeds have a pungent taste of the mustard kind, but weaker; they

F 2 have
have long been celebrated as aphrodisiacs; and may probably have in some cases a title to this virtue, in common with other acrid plants.

1246. Sinapis, or Mustard.

* arvensis. S. pods with many angles, swoln and bunched out by the seeds; smooth, longer than the 2-edged beak.—The Scandinavians are said to boil and eat it as a cabbage, and in Ireland the tender tops are collected for the same purpose. Cows, goats, and swine eat it. Sheep are very fond of it. Horses generally refuse it.

* alba. S. pods rough with hair; beak very long, slanting, sword-shaped.—It is sown in the winter and early in the spring, to supply our tables with salading. The seeds have nearly the same properties as those of the next species.

* nigra. S. pods smooth, laid flat to the spike-stalk.—The seeds of this plant, reduced to powder, make the common mustard so much in request at our tables. They yield a considerable quantity of expressed oil, which parboils but little of the acridity of the plant. The seeds when unbruised impart but little taste to boiling water. Taken inwardly, in the quantity of a table spoonful or more, they gently loosen the bowels, and are of service in asthma, chronic rheumatism, and palsy. The powdered seeds curdle milk, and give a strong impregnation to boiling water. This infusion taken in considerable quantity vomits, in smaller doses it is an useful aperient and diuretic. Cataplasms formed with crumb of bread, vinegar, and powdered mustard seed, are very commonly applied to the soles of the feet, as stimulants, in fevers that require such treatment; they are used with advantage, topically applied, in fixed rheumatic and sciatic pains. Upon the whole, wherever we want a strong stimulus, that acts upon the nervous system, without exciting much heat, we know none preferable to mustard seed. Its acrimony consists in an essential oil.

1247. Raphanus, or Radish.
Eight species; viz. sativus, caudatus, *raphanis-trum, sibiricus, tenellus, arcuatus, lanceolatus, pilosus, Egypt, China.

* R. pods round, jointed, smooth, of one cell.—In raphanis-wet seasons it grows in great quantity amongst the barley in Sweden, and the common people who eat barley bread, are afflicted with very convulsive complaints, in those provinces, and in those seasons, wherein this plant abounds. Horses eat it. Cows refuse it.

1248. Cordylocarpus.
Two species; viz. mucicat, levigatus.

1249. Cleome, or Base Mustard.
23 species; viz. juncea, heptaphylla, pentaphylla, triphylla, polygama, icossandra, viscosa, dodecandra, felina, chelidonia, gigantea, aculeata, spinosa, serrata, ornithopodioides, violacea, arabica, tenella, filifolia, guianensis, monophylla, capensis, procumbens. Portugal, Cape, East and West Indies.

In the class Tetracyclinae are

34 Genera, including 436 Species, of which 58 are found in Britain.

CLASSIS XVI.
MONADELPHIA (f).

ORDO I. TRIANDRIA.

CLASSIS XVI.

ORDO I. TRIANDRIA, or 3 Stamens.

G. One pistil. Sheath 1 or 2-leaved. Cor. 1-petala, 6-cleft.
S. One pistil. Sheath 2-leaved. Petals 6, nearly equal.

(f) In this class the filaments are all united together at the bottom, but separate at the top. The union at the bottom gives rise to the name Monadelphia or one brotherhood. The orders are determined by the number of stamens. The plants of this class were considered by Tournefort as having only one petal. But all the petals are distinct at the base; though, by the intervention of the united filaments, they cohere all together as one body; on which account they may properly be considered as having five petals. Linnaeus remarks, that the fruit does not afford sufficient marks whereby to distinguish the genera in this class; but that the calyx is of the utmost importance, as it furnishes invariable characters. Withering observes, that the petals are truly a continuation of the cylindrical sheath formed by the united filaments, which incloses the styles and gemens as it descends; when rising upwards it spreads out into petals.
Monadelphia.

Order VIII. POLYANDRIA, or many Stamens.

G. One pistil. Cal. simple, 4 or 6-cleft. Berry dry, 4 or 5-celled, many-seeded. Petals 4 or 6.

C. One pistil. Cal. simple, 4-parted. Berry 1-celled, many-seeded.

L. One pistil. Cal. simple, 5-cleft. Caps. 5-celled, with opposite partitions.
ANY.

G. One pistil. Cal. exterior, 3-cleft. Caps. 3 or 4-celled, many-seeded, joined together at the base.

* M. Many pistils. Outer cal. 3-leaved. Caps. 1-seeded.

* M. Many pistils. Outer cal. 3-leaved. Several caps. 1-seeded, growing in whirs.

M. Many pistils. Outer cal. 3-leaved. Caps. 1-seeded, incorporated and without order.

U. One pistil. Outer cal. 5-cleft. Caps. 5-celled, 5-divisible, with closed cells.

P. One pistil. Outer cal. 8-leaved. Caps. 5-celled, 5-divisible, with 2-valved cells.

H. One pistil. Outer cal. 8-leaved. Caps. 5-celled, many-seeded.

K. Many pistils. Outer cal. 7 or 9-cleft. Caps. 1-seeded, incorporated into a 5-lobed knob.

ORDER I. TRIANDRIA.

1250. TAMARINDUS, or TAMARIND-TREE.

One species; viz. indica. Egypt, E. and W. Indies.—The fruit of this species is a pod resembling that of a bean, including several hard seeds, together with a dark-coloured viscid pulp of a pleasant acid taste: the East India tamarinds are larger than the West Indian sort; the former containing six or seven seeds each, the latter rarely above three or four. The pulp of these fruits, taken from the quantity of two or three drams to an ounce or more, proves gently laxative or purgative; and at the same time by its acidity quenches thirst, and allays immoderate heat. It increases the action of the purgative sweets, cassia and manna, and weakens that of the resinous cathartics. Some have supposed it capable of abating the virulence of antimonial preparations; but experience shows that it has rather a contrary effect, and that all vegetable acids augment their power. Tamarinds are an ingredient in the electuary of cassia, the leventic electuary, and decoction of tamarinds with senna.

1251. SISYRINCHIUM, or BERMUDANA.

Eight species; viz. elegans, collarium, grandiflorum, bermudiana, anceps, micranthum, palmisetum, striatum. Bermuda, W. Indies.

1252. FERRARIA.

Four species; viz. undulata, ferrariola, pavonia, ixiodides. Cape, Mexico.

1253. GALAXIA.

Three species; viz. ovata, graminis, narcissoides. C. of G. Hope.

1254. APHYJEJA.

One species; viz. hydnora. C. of G. Hope.

ORDER II. PENTANDRIA.

1255. OZOPHYLLUM.

One species; viz. trifoliatium.

1256. SYMPHONIA.

One species; viz. globulierra. Surinam, Guiana.

1257. LERCHIA.

One species; viz. longicauda. E. Indies.

1258. WALThERIa.

Six species; viz. americana, indica, lophanthus, ovata, angustifolia, elliptica. E. and W. Indies, S. America.

1259. HERMANNIA.

30 species; viz. altbezoilia, plicata, candicans, disticha, salviifolia, nicans, involucrata, scoridifolia, denudata, disermesfolla, alnifolia, cuneifolia, bolosarica, biruta, scabra, multiflora, flammea, angularis, hyssopifolia,

1282. CAROLINA.
Two species; viz. princeps, insignis. W. Indies.

1283. ADANSONIA, or Sour-gourd, Monkeys-bread.
One species; viz. digitata. Senegal, Egypt.

1284. BOMBAX, or Silk Cotton-tree.
Six species; viz. pentandrum, erianthus, ceiba, heptaphyllum, globosum, gossypium. E. and W. Indies, S. Amer.

1285. LAGUNA.
Three species; viz. lobata, ternata, aculeata. Coast of Coromandel.

1286. SIDA, or Indian Mallow.
99 species; viz. limifolia, angustifolia, acuta, canariensis, lanceolata, spinosa, frutescens, carpinafolia, jamaicensis, orientalis, glomerata, mucilagana, suberosa, capensis, microphylla, micans, pumilla, rhombifolia, caespitosa, retusa, alnifolia, ciliaris, periplocifolia, excelsior, hermodendroides, nudiflora, triquetra, fragrans, lignosa, reflexa, humilis, repens, bivalvis, umulifolia, multiloba, microspora, viscosa, festida, calycina, crispa, persica, sylvatica, arborea, mauritiana, occidentalis, americana, abutilon, abutiloides, asiatica, populi-folia, hirta, indica, mollissima, sonneratiana, pubescens, altheifolia, gluminosa, estipulifera, nutans, borbonica, flavescens, radicans, arguta, multicaulis, pilosa, rotundifolia, supina, truncata, herbacea, emarginata, alba, cordifolia, hederafolia, verticillata, urens, umbellata, pyramidalis, paniculata, dunosa, ramosa, spicata, terminalis, vesicaria, crassifolia, hispida, obtusa, gigantea, javensis, bastata, crisata, dilillians, triloba, ternata, pterospermum, ricinoides, jatrophioides, neapae, dioica, phyllanthus. E. and W. Indies, Cape, America.

1287. PALAVIA.
Two species; viz. malvifolia, moschata. Lima, Peru.

1288. MALACHRA.
Six species; viz. capitata, fasciata, s'cefolia, radicata, bracteata, pluminosa. W. Indies.

1289. ALTHEA, or Marsh-mallow.
Nine species; viz. officinalis, narbonensis, canabitilis, hisruta, ludwigi, acutula, rosea, pallida, ficifolia. Europe, Hispaniola.

officinalis. * A. leaves undivided, angular, cottony. This plant grows wild in marshes and other moist places in several parts of England, though frequently cultivated for medicinal use in gardens. All the parts of it have a milky taste, and abound with a soft mucilaginous substance which is readily extracted by water: the mucilage of the roots appears to be the strongest; and hence this part is generally made use of in preference to the others.

This plant has the general virtues of an emollient medicine, and proves serviceable where the natural

Vol. IV. Part L

†
mucus of the intestines is abraded. It is chiefly recommended in sharp defluxions upon the lungs, hoarseness, dysenteries, and likewise in nephritic and calculous complaints; not, as some have supposed, that this medicine has any particular power of dissolving or expelling the calculus, but as, by lubricating and relaxing the vessels, it procures a more free and easy passage. Althea root is sometimes employed externally for softening and maturating hard tumours; chewed, it is said to give ease in difficult dentition of children.

1290. MALVA, or Mallow.
55 species; viz. spicata, polystachys, tomentosa, scoparia, gangetica, coromandeliana, americana, calycina, cuneifolia, angustifolia, subhastata, scabra, peruviana, limensis, capitata, bryonifolia, umbellata, abutiloides, abulensis, lobata, fastigiata, bonariensis, stricta, lactea, operculata, fragrans, capensis, balsamica, grossularifolia, virgata, miniata, retusa, tristactylides, altheoides, caroliniana, prostrata, cretica, parviflora, nicceensis, rotundifolia, aculis, sherardiana, * sylvestris, mauritiana, hispanica, verticillata, crispa, papaver, stipulacea, alcea, * moschata, eglana, tournefortiana, aegyptia, trifida.

Europe, Barbary, Cape, China, America.

* M. stem rough; leaves 5 or 7-lobed; toothed; outer * sylvestris. calyx leaves partly united at the base. — The leaves of this plant have a somewhat mucilaginous sweetish taste. They are ranked the first of emollient herbs: they were formerly in some esteem as food of a laxative quality; at present decoctions of them are sometimes employed in dysenteries, heat and sharpness of urine, and in general for obtaining acrimonious humours; their principal use is in emollient glysters, cataplasmata, and fomentations. The leaves enter the official designation for glysters, and a conserve was formerly prepared from the flowers.

1291. LAVATERA, or Mallow-tree.
12 species; viz. * arborea, micanus, hispida, olbia, trioloba, lusitanica, maritima, thurignesca, cretica, flaviscantata, trimestris. Europe.

1292. RUZIA.
Three species; viz. cordata, lobata, variabilis. Isle of Bourbon.

1293. MALPE, or Base Mallow.
Three species; viz. malacoides, multiiflora, trifida.

Hetruria, Mauritania.

1294. KITAIHELIA.
One species; viz. vitifolia.

1295. URENA, or Indian Mallow.
Eight species; viz. lobata, reticulata, tricuspidia, americana, sinuata, multiplana, procumbens, viminalis. China, E. Indies, Surinam.

1296. GOSSEYPIUM, or Cotton-tree.
Ten species; viz. herbaceum, indicum, micranthum, arboeum, vitifolium, hisruta, religiosum, latifolium, barbadense, peruvenum. Lev. E. and W. Indies.

1297. HIBISCUS, or Syrian Mallow.
66 species; viz. moscheutos, incanus, lasiocephalus, palustris, militaris, bastates, ferrugineus, cordifolius, populeus, tiliaceus, elatus, lammas, membranaceus, lunarifolius, rosa sinensis, spiralis, brasiileficus, unilateralis, acuminatus, phacenicus, ovalifolius, clandestinus, G. rigidus,
Rigida, microphyllus, urens, calycinus, renubilis, syriacus, rhombifolius, lilifolius, bifurcati, trilobus, diversifolius, domingense, fulvus, sabbartii, speciosus, cannabina, freynii, sororia, surattensis, radiata, manihot, digitata, flavescens, spicatus, micans, abelmoschus, columnaris, pendunculata, esculentus, longifolius, clupeatus, senegalensis, tubulosa, obtusifolius, vitifolius, tricuspid, virginicus, pentacarpos, vescarius, trinum. Syria, Cape, E. and W. Indies, N. America.

The seeds of the hibiscus abelmoschus are the product of a plant indigenous in Egypt, and in many parts both of the East and West Indies. They are of a small size and reniform shape; they are very remarkable from possessing a peculiar and very fragrant odour; the smell which they give out may be compared to that of musk and amber conjoined; those brought from the island of Martinico are generally esteemed the most odorous, but we have seen some, the product of hot-houses in Britain, which in point of flavour seemed not inferior to any imported from abroad.

These seeds, although introduced into some of the foreign pharmacopoeias, have hitherto been used principally, if not only, as a perfume; and as their medicinal powers still remain to be ascertained, it is perhaps with propriety, that hitherto no place has been given them in the list either of the London or Edinburgh colleges. But their flavour as well as other sensible qualities point them out as a subject well deserving a particular investigation.

In the class Monadelphia are
60 Genera, including 682 species, of which 16 are found in Britain.

CLASS XVII.

DIADELPHIA.

ORDO I. PENTANDRIA.

M. Cal. 5-parted. Cor. gaping. Superior fim. with 2 anthers, inferior with 3. Capsules 5.

Ordo

(q) This class comprehends the butterfly-shaped flowers, and the leguminous plants of some authors. Linnaeus takes the character of the class from the number of the stamens, and the character of the orders from their number. From the title of this class, Diadelphia or two brotherhoods, it might be supposed, that the filaments are always found in two sets. This, however, is by no means always correctly the case. The papilionaceous or butterfly shape of the corolla or blossom, as in a garden pea, will therefore be a surer guide. The class is not artificial, but perfectly natural, and the structure of the flowers extremely singular: their situation is generally obliquely pendant. The seeds of this class furnish food for men and other animals; they are farinaceous and fistulent. The leaves are food for cattle. None of them are poisonous.

Sect. IV. Leguminous, nearly 1-seed (not as above).

P. Cal. with glandular points.
T. Legume scarce longer than the cal. 1 or 2-seeded. Flowers growing in heads.
G. Cal. 2-lipped, upper 3-cleft.

Sect. V. Legume nearly jointed.

Æ. Legume, with 1-seeded joints. Cal. 2-lipped.
H. Legume with joints nearly round, compressed. Keel very obtuse.
C. Legume interrupted by necks, straight.
O. Legume jointed, bowed.
S. Legume interrupted by necks, tapering, rolled inwards.
H. Legume compressed, membranous; one seam notched, cut at the middle.
M. Legume spiral, membranous compressed. Pistil bending away the keel.

Sect. VI. Legume 1-celled, many-seeded (not as above).

T. Standard and wings expanding, as if 3-petaled. Keel minute.
G. Keel bending back the standard.
C. Standard large, covering the wings. Cor. horizontally turned upside down.
R. Standard bent back, expanding, nearly round.
I. Keel toothed on both sides.
C. Four upper segments of the cal. leaning on the standard.
E. Cal. 5-parted, nearly equal, almost of the length of the cor.
L. Lower segments of the cal. long. Wings 2-lobed below.
C. Legume pedicelled. Cal. 2-lobed.
M. Pericarp elongated, fleshy, bracelet-shaped, with 1-seeded globules.
G. Legume strap-shaped, with streaks obliquely transverse.
L. Legume tapering, filled with cylindrical seeds.
G. Drupes, with a woody kernel.

ORDER
B O T A N Y.

Order I. PENTANDRIA.

831. Monniera.
One species; viz. tristia.

Order II. HEXANDRIA.

1267. Saraca.
One species; viz. indica. India.

840. Fumaria, or Fumitory.

* F. seed vessels in bunches, 1 seed in each; stem spreading.—Cows and sheep eat it. Goats are not fond of it. Horses and swine refuse it. The leaves are succulent, saline, and bitter. The expressed juice, in doses of two or three ounces, is useful in hypochondriacal, scorbutic, and cachectic habits. It corrects acidity, and strengthens the tone of the stomach. Some prefer it to all other medicines as a sweetener of the blood. There is no doubt of its utility in obstructions of the viscera and the diseases arising therefrom. An infusion of the leaves is used as a cosmetic to remove freckles and clear the skin.

Order III. OCTANDRIA.

851. Polygala, or Milk-wort.
38 species; viz. incarnata, aspalathia, brasiliensis, trichosperma, amara, *vulgaris, major, monspeliaca, paniculata, sibrica, bracteolata, umbellata, myrtifolia, oppositifolia, spinosa, teretifolia, theezans, trinervia, penaca, diversifolia, microphylla, aestuana, chinensis, shamebooxus, alopecuroides, mixta, squarrosea, bistertia, stipulacea, senega, lutea, viridescens, trillora, glaucoidea, ciliata, sanguinea, verticillata, cruciata. Europe, Cape, India, N. America.

* F. flowers in bunches; stems herbaceous, simple, trailing; leaves strap-spear-shaped.—This plant has been found to possess the properties of the Senega rattlesnake root (polygala senega), but in an inferior degree. The powdered root may be given in doses of half a dram. Cows, goats, and sheep eat it. Swine refuse it. An infusion of the herb, which is very bitter, taken in the morning fasting, about one fourth of a pint daily, promotes expectation, and is good for a catarrhal cough.

The polygala senega grows spontaneously in Virginia, and bears the winters of our own climate. This root is usually about the thickness of the little finger, variously bent and contorted, and appears as if composed of joints, whence it is supposed to resemble the tail of the animal whose name it bears: A kind of membranous margin runs on each side, the whole length of the root. Its taste is at first acid, afterwards very hot and pungent.

The Senegavo Indians are said to prevent the fatal effects which follow from the bite of the rattlesnake, by giving it internally, and by applying it externally to the wound. It has been strongly recommended in pleurisies, peripneumonies, and other inflammatory dis-temper. Its more immediate effects are those of a diuretic, diaphoretic, and cathartic; sometimes it proves emetic: the two last operations may be occasionally prevented by giving the root in small doses along with aromatic simple waters, as that of cinnamon. The usual dose of the powder is 30 grains or more.

Some have likewise employed this root in hydropic cases and not without success. There are examples of its occasioning a plentiful evacuation by stool, urine, and perspiration; and by this means removing the disease, after the common diuretics and hydrargyros had failed. Where this medicine operates as a cathartic it generally proves successful; if it acts by liquefying the blood and juices, without occasioning the due discharge, it should either be abstained from, or assisted by proper additions.

852. Securidaca, or Hatchet-chetch.
Two species; viz. erecta, volubilis. W. Indies.

1416. Dalbergia.
Two species; viz. lanceolaria, monetaria. Surinam, Ceylon.

Order IV. DECANDRIA.

853. Nissolia.
Two species; viz. arborea, fruticosa. S. Amer.

1286. Abrus, or Javaica Wild Liquorice.
One species; viz. precatorius. E. and W. Indies.

854. Pterocarpus, or Red Sanders.
Five species; viz. draco, lunatus, santalinus, ecastaphyllum, buxifolius. E. and W. Indies.

855. Erythrina, or Coral Tree.
Five species; viz. herbacea, corollodendrum, picta, crisata galli, planisiliqua. Carolina, E. and W. Indies, Brazil.

856. Piscidia, or Dogwood Tree.
Two species; viz. erythrina, carthaginensis. West Indies.

857. Borbonia.
Six species; viz. ericifolia, levigata, trinervia, lanceolata, cordata, ternata. C. of G. Hope.

858. Spartium, or Broom.
16 species; viz. contaminatum, sep iarium, junceum, monospermum, sphaerocarpum, purgans, aphyllosum, scorpium, angulatum, patens, supranulum, complicatum, *scoparium, radiatum, cytisoides, spinosum. S. Europe, Barbery, Cape, Madeira.

* S. leaves in threes, and solitary; branches without scoparium prickles.—The young flowers are sometimes preserved as pickles. The plant, when burnt, affords a tolerable pure alkaline salt. Dr. Mead relates the case of a dyspeptic patient, that was cured by taking half a pint of a decoction of green broom-tops, with a spoonful of whole mustard seed, every morning and evening. The patient had been tapped three times, and tried the usual remedies before. An infusion of the seeds, drank freely, has been known to produce similar happy effects; but whoever expects these effects to follow in every dyspeptic case, will be greatly deceived. A strong lixivium of the ashes was used in the Swedish army in the year 1759, to cure dropsies, consequential to a catarrhal epidemic fever. The urine became plentiful, and the dropsies soon disappeared. Some use the seeds.
seeds toasted, so as to make a kind of coffee. The plant, when growing large, merits a place among our flowering-shrubs, on account of the profusion of its golden-coloured blossoms. Cows, horses, and sheep refuse it.

859. Genista, or Dyers Broom.
Europe, Canaries.

* G. tridentata, scented, cylindrical, upright; leaves spear-shaped, smooth; legumen cylindrical. A yellow colour may be prepared from the flowers; and for wool that is to be dyed green, the dyers prefer it to all others. A dram and a half of the powdered seeds operates as a mild purgative. A decoction of the plant is sometimes diuretic, and therefore has proved serviceable in dyspeptic cases. Horses, cows, goats, and sheep, eat it.

The wood or root of the genista canariensis is chiefly brought to us from the Canary Islands. In the shops of the apothecaries it usually receives the appellation of rhodium rhodium. It is in long crooked pieces full of knobs, which when cut, appear of a yellow colour like box, with a reddish cast. The largest, smoothest, most compact, and deepest coloured pieces, should be chosen; and the small, thin, or pale ones, rejected. The taste of this wood is lightly bitterish, and somewhat pungent; its smell very fragrant, resembling that of roses: long kept, it seems to lose its smell; but, on cutting or rubbing one piece against the other, it smells as well as at first. Distilled with water, it yields an odorous essential oil, in very small quantity. Rhodium is at present in esteem, only upon account of its oil, which is employed as a high and agreeable perfume in scenting pomatum and the like. But if we may reason from analogy, this odorous simple might be advantageously applied to more useful purposes; a tincture of it in rectified spirits of wine, which contains in small volume the virtues of a considerable deal of the wood, bids fair to prove a serviceable cordial, not inferior perhaps to any thing of this kind.

860. Aspalathus, or African Broom.
35 species; viz. spinosa, verrucosa, capitata, glomerata, anthocodia, albicans, thymifolia, ericifolia, nigra, carnea, ciliaris, genistoides, hystrix, galoides, retroflexa, uniflora, araneosa, asparagoides, oreas, canescens, heterophylla, indica, eburnea, cretica, quinquefolia, tridentata, pilosa, antholydis, laxata, argentea, callosa, orientalissima, muronata, pinnaet.
Cape, Cape, E. Indies.

861. Amorpha, or Shrubby Blue Indigo.
One species; viz. fruticosa. Carolina.

862. Crotalaria, or Rattle-nut.
23 species; viz. perforata, perforata, amplexicaulis, sagittalis, chinesia, juncea, imbricata, retusa, sessiflora, triflora, verrucosa, biflora, opposita, linifolia, bifaria, latifolia, linearis, laburnifolia, cordifolia, incana, incanescens, heterophylla, quinquefolia. E. and W. Indies, Africa, America.

863. Oenonis, or Rush-grass.
31 species; viz. antiquorum, * spinosa, * urvatis, repens, minuta, minima, salicifolia, variegata, pubescens, hircina, common, variegata, arenaria, filiformis, capensis, praestans, eucalyptus, canina, cherleri, viscosa, ornithopodioides, pinus, matrata, tridentata, crispae, hispanica, fruticosa, retnanfolia, micropylla, neustaniana. Europe, Cape.

* O. flowers in bunches, solitary; leaves solitary or spinosa three together; branches thorny. A decoction of the root has been recommended in cases of stone and jaundice. Cows and goats eat it. Sheep are very fond of it. Horses and swine refuse it. A horse is said to have refused the whole branch, but ate of the younger shoots when picked off.

863. Anthyllis, or Lady's Finger, Kidney vetch.
15 species; viz. tetraphylla, * vulneraria, montana, cornicula, lotoides, gerardii, quinqueloba, inavulcata, linifolia, barba-jovis, heterophylla, viacifolia, cyrtisoides, herbaecae, erioarena. Europe.

* A. herbaceae; leaves winged, unequal; flowers in vulnera.

864. Lupinus, or Lupine.
Seven species; viz. perennis, albus, varia, hirsuta, pilosus, angustifolia, latens. S. Europe, Egypt, Virginia.

The seeds of the lupinus albus have a leguminous taste, accompanied with a disagreeable bitter one. They are said to be anthelmintic, both internally taken, and applied externally. Hoffmann cautions against their internal use, and tells us that they have sometimes occasioned death. Simon Pauli also observes, that he saw a boy of eight or ten years of age, after taking a draught of these seeds in powder, seized with exquisite pains of the abdomen, a difficulty of respiration, and almost total loss of voice; and that he was relieved from these complaints by a glossey of milk and sugar, which brought away a vast quantity of worms.

But Mr. Geoffrey observes, very justly, that either
Diadelphia.

Botany.

866. Phaseolus, or Kidney Bean.
17 species; viz. vulgaris, lunatus, bipunctatus, inma-
cinus, farinosus, vettilatus, helvus, semierectus,
altus, caracalla, aconitifolius, nanus, radiatus, max,
monso, lathyroides, sopherstomus. E. and W. In-
dies, Africa, America.

887. Dolichos, or Cow-itch.
31 species; viz. benghalensis, lablab, sinensis, unc-
cinatus, luteolus, unguiculatus, tranquilaricus, ensi-
formis, tetragonolobus, sesquipedalis, altissimus, pru-
riens, urens, minimus, lineatus, capensis, scarabaeoides,
incunavus, bulbosus, triobus, aristatus, filiformis, pur-
purans, regularis, lignosus, polystachys, ensiformis,
saja, catanni, biflorus, repens. Egypt, E. and W. In-
dies, Cape, America.

The dolichos pruriens is a plant growing in great
abundance in warm climates, particularly in the West
India islands, and there it is very troublesome to cattle
and other domestic animals: for on account of the
spiculis of the seed-pod, it excites, when touched,
a very uneasy itching. These spiculis have been long
used in South America, in cases of worms; and have
of late been frequenty employed in Britain. The
spiculis of one pod, mixed with syrup or molasses, and
taken in the morning fasting, is a dose for an adult.
The worms are said to appear with the second or third
dose; and by means of a purge in some cases, the
stools are said to have consisted almost entirely of
worms; and in cases of lambrici it is said to produce
a safe and effectual cure. Those who have used it most
affirm, that they have never seen any inconvenience
resulting from the internal use of it, notwithstanding
the great uneasiness it occasions, on the slightest touch, to
any part of the surface.

868. Glycine, or Kidney-bean tree.
15 species; viz. subtropica, mocoica, triloba, vil-
losa, javanica, concava, tomentosa, bituminosa, num-
ularia, labialis, striata, susvea, apiis, frutescens,
monophylla. Cape, East and West Indies, North A-
merica.

869. Clitoria.
Five species; viz. ternata, brasiliensis, virginiana,
mihan, galactia. East and West Indies, America.

870. Pisum, or Pea.
Four species; viz. sativus, arvensis, maritimum,
scariosus. Europe, North America.

871. Orobus, or Bitter Vetch.
12 species; viz. lathyroides, hirsutus, lutescens,
tuberosus, sylvestris, angustifolius, albus, ca-
neosonnus, niger, pyrencias, sylvaticas. Europe.

Lathyrus, or Chickling Vetch.
21 species; viz. apiaca, nissolia, amplifolus,
sicora, sativus, inconstipicus, setifolius, angustatus, arti-
culatus, odoratus, annuus, tingitani, elymenin, bi-
hirntus, tuberosus, pratensis, sylvestris, latifolius,
heterophyllus, palustris, sphyreformis. Europe, Barbary,
Ceylon.

L. tendris with two leaves, quite simple, leaflets
pratensis, spear-shaped.—This has been recommended as a
new plant for the experiments of the farmers, and premiums
have been offered for its cultivation. But it does not
seem to be a plant at all agreeable to cattle, as where
they have a choice of food they seldom touch it. Be-
sides it produces very few seeds, and those are for the
most part devoured by a species of curculio.

873. Viclia, or Vetch, Bean, Tar.
20 species; viz. pisiformis, duetemor, sylvatica,
cassubicus, cerasi, gerardi, onobrychoides, nissohiana,
biennis, benghalensis, sativa, lathyroides, lutea,
hybrida, peregrina, sepium, bithynica, nardonensis,
saba, serratuloides. Europe, Egypt, India.

V. leguminos mostly in pairs, upright; leaflets in-
sativa, versus spear-shaped, blunt, notched; stipule toothed;
seeds compressed.—In Gloucestershire and Worces-
tershire, they sow it as pastureage for horses, and eat it off
early enough to allow of turnips being sown the same
year. The seeds are excellent food for pigeons.
Horses, cows, sheep, and geese eat it.

V. leguminos mostly four together, upright; leaflets
sepium, egg-shaped, very entire, the outer ones gradually smaller.—This plant shoots earlier in spring than any plant
eaten by cattle, vegetates late in the autumn, and
continues green all winter; but it is difficult to collect the
seeds, as the pods burst and scatter them about, and
moreover, hardly a third part of them will vegetate,
being made the nidus of an insect. A patch of them
sown in drills in a garden was cut five times in the
course of the second year, and produced at the rate of
24 tons per acre of green food, which when dry would
weigh near 4½ tons.

The seeds of the vicia saba, or common bean, are a
strong flatulent food, sufficiently nutritious, but not
easy of digestion, especially when growing old. A wa-
ter distilled from the flowers has been celebrated as a
cosmetic, and still retains its character among some fe-
male artists.

874. Eravum, or Bitter Vetch.
Six species; viz. lenus, tetrapodum, hirsutum,
acsonium, monanthos, eruvia. Europe, Asia.

E. frushtals many-flowered; seeds 2, globular.—hirsutum.
Horses, cows, goats, and sheep eat it. In wet seasons
whole fields of corn have been overpowered and wholly
destroyed by it.
875. Cicer, or Chick-pea.
One species; viz. arietinum. S. Eur. Lev.

1319. Liparia.
Five species; viz. sphærica, graminifolia, umbellata, villosa, sericea. C. of G. Hope.

876. Cyttisus, or Trefoil-tree.
17 species; viz. laburnum, nigrum, wolgaricus, sessilifolius, cajan, patens, hisrutus, capitatus, austriacus, supinus, prolifer, argentus, pendulurn, purpureus, glaber, græceus, tener. Eur. Cape, E. Indies.

1417. Mullera.
One species; viz. moniliformis. Surinam.

878. Geoffroya, or Base Cabbage-tree.
One species; viz. spinosa. Jam. Brazil.

879. Robinia, or False Acacia.
Nine species; viz. pseud-acacia, violacea, hispida, mitis, bolodendron, caragana, spinosa, frutescens, pygmaea. Siberia, Tartary, N. Amer. W. Indies.

880. Colutea, or Bladder-seam.
Four species; viz. arborescens, frutescens, perennans, herbaeeae. Austria, Italy, Levant, Africa.

881. Glycyrrhiza, or Liquorice.
Four species; viz. echinata, glabra, hisruta, asperrima. Spain, Italy, Levant, Apulia.

882. Coronia, or Joint-podded Colutea.
11 species; viz. emerus, junceca, valentina, glauca, coronata, minima, argentea, securidæa, varia, cretica, scandens. S. Europe, America.

883. Ornithopus, or Birds-foot.

884. Hippocrepis, or Horse-shoe Vetch.
Four species; viz. unilisiquosa, multisiliquosa, *comosa, balearica. S. Europe.

885. Scorpiurus, or Caterpillars.
Four species; viz. vermiculata, muricata, sulcata, subvillosa. S. Eur.

888. Æschynomene, or Base Sensitive Plant.
Eight species; viz. grandiflora, arboreca, coccinea, aspera, americana, indica, sesban, pumila. Egypt, E. and W. Indies.

887. Hedysarum, or French heeswinkle.
97 species; viz. albati, bupleurifolium, limbifolium, numulariifolium, monilifera, styracifolium, reniforme, sororium, vespertilionis, gangeticum, muculatum, latebrosum, vaginale, imbricatum, triquetrum, strobiliferum, diphylleum, pulchellum, spartium, lineatum, retrolaxum, umbellatum, biarticulatum, heterocarpum, viscidiun, canadense, canescens, marilandicum, frutescens, viridiflorum, hirtum, junceum, violaceum, paniculatum, nudiflorum, repens, hamatum, trifolium, barbatum, lagopodioides, microphyllum, racemosum, caudatum, tomentosum, sericeum, virgatum, pilosum, striatum, volubile, gryaus, argentatum, alpinum, obscurum, coronarium, flexuosum, humile, spinosissimum, virginitum, fruticosum, pumilum, *onobrychis, saxatile, caput galli, crista galli, crinitum, coriunctum, incanum. S. Eur. E. and W. Indies, N. Amer.

874. Diadelphus.
* H. leaves winged; legumen with one seed pricky glutinous wings as long as the calyx; stem growing long.—This plant is cultivated like clover for feeding cattle, and is particularly advantageous in dry hilly situations and chalky soils.

889. Indigofera, or Indigo.
23 species; viz. sericea, ovata, trifoliata, psoraloides, procumbens, sarmentosa, denudata, mexicana, tinta, fibrifera, digitata, stricta, frutescens, enneaphylla, pentaphylla, glabra, cyrtoides, hisruta, angustifolia, anil, tintoria, disperma, argentea. Arabia, E. and W. Indies, Cape, Carolina.

890. Galega, or Goat's-true.
12 species; viz. officinalis, cinerea, littoralis, virgina, villosa, spinosa, maxima, purpurea, carborescens, cereale, tintoria, senticosa. S. Europe, E. and W. Indies, America.

The galega officinalis was celebrated as an alexipharmacum; but its sensible qualities discover no foundation for any virtues of this kind; the taste is merely leguminous, and in Italy, where it grows wild, it is said to be used as food.

891. Phaca, or Base Milk-vetch.
Ten species; viz. bestica, alpina, saluta, sibirica, australis, trifoliata, vesicaaria, prostrata, microphylla, muricata. Lapland, Siber. S. Eur.

892. Astragalus, or Liquorice, or Milk-vetch.

893. Biserula, or Base Hatchet-vetch.
One species; viz. pelecinus. S. Eur.

894. Psealrea.
23 species; viz. rotundifolia, pinnata, aculeata, bracteata, spicata, axillaria, stachydes, aphylla, tenuifolia, capista, hirta, repens, bituminosa, glandulosa, palestina, americana, tetragonalia, corylifolia, pentaphylla, prostrata, dales, enneaphylla, levigata. S. Europe, India, Africa, America.

896. Trifolium, or Trefoil, Clover.

* T. capsules in bushes, often 2-seeded, wrinkled, officinalis. Acute; stem upright.—This plant is more fragrant when
Polyadelphia.

when dry than when green. A water distilled from the flowers possesses but little odour in itself, but improves the flavour of other substances. Horses are extremely fond of it. Cows, goats, sheep, and swine eat it.

* T. heads like umbles; legumens 4-seeded; stem creeping.—Horses, cows, and goats eat it. Sheep are not fond of it. Swine refuse it. The leaves stand upright against rain. Wherever this plant abounds spontaneously, it is considered as an indication of the goodness of the soil, and this is a thing well known to farmers. The richness of meadows and pastures is naturally owing to their abounding principally with the trefoils, and others of the same class, with a due mixture of the more acceptable grasses.

pretense. * T. spikes crowded; blossoms unequal; calyx with four of the teeth equal; stipules awned; stems ascending.—In a great scarcity of provisions, bread has been made of the flowers. The heads are used in Sweden to dye woolen green. With alum they give a light, with COPPERS a dark green.

897. Lotus, or Bird's-foot Trefoil.

18 species; viz. maritimus, filiformis, tetragonolobus, conjugatus, tetraphyllus, edulis, pergerma, angustissimus, arabicus, ornithopodioides, jacobaeus, creticos, bubinum, griceps, rectum, cornelius, cytisoides, dorycinum. Europe, Arabia, Madeira.

corniculatus. * L. heads of the flowers flattened at the top; stems herbaceous, trailing: legumens cylindrical, expanding.—The flowers of this plant become greenish when dried, in which respect they resemble the flowers of the plants which produce indigo. Cows, goats, and horses eat it. Sheep and swine are not fond of it. In Hertfordshire it is cultivated as pasturage for sheep. There is no doubt but it might be cultivated to great advantage. In moist meadows it grows to a great height, and makes extremely good hay.

898. Trigonella, or Fenugreek.

12 species; viz. rubens, platycarpus, striata, polycarpa, hamoea, spinosa, corniculata, monspeliaca, lasiacista, fenium greceum, sylvustris, indica. Siberia, 8. Europe, Egypt, India.

The Trigonella fenium greceum is cultivated chiefly in the Southern parts of France, Germany, and Italy; from whence the seeds are brought to us. They are of a yellow colour, rhomboidal figure, a disagreeable strong smell, and a mucilaginous taste. Their principal use is in cataplasms, fomentations, and the like, and in emollient glysters.

899. Medicago, or Medich, Moon-trefoil.

24 species; viz. arbores, virginica, radiata, cincinata, sativa, falcata, Iupulina, marina, polymorpha, prostrata, orbicularis, scutellata, tornata, turbata, intertexta, araba, coronata, ciliaris, hirsuta, rigida, minima, moricata, nigra, laciniata. Europe, North America.

* M. flowers in bunches; legumens narrow, regular, sativa twisted; stem upright, smooth.—Modern writers upon husbandry strongly recommend the cultivation of this plant, for the purpose of feeding cattle; but it is not yet generally adopted.

* M. flowers in bunches; legumens crescent-shaped; falcata, stem prostrate.—In hot, dry, barren sandy places it is well worth the trouble of sowing for the purpose of making hay; a practice long since adopted in some parts of Sweden. Cows, horses, goats, and sheep eat it.

* M. spikes oval; seed-vessels kidney-shaped, with 1 lupulina, cell and 1 seed; stems trailing.—Cows, horses, goats, and sheep eat it; but it is less grateful to them than the other species. It is cultivated in Norfolk under the name of nonsuch, and is usually sown with rye-grass. The crop is then called black and white nonsuch. It has been sown in the isle of Wight. It is sometimes sown along with clover and rye grass.

In the class Diadelphia are

56 Genera, including 710 Species, of which 59 are found in Britain.

---

CLASS XVIII.

POLYADELPHIA (H).

ORDO I. PENTANDRIA.

300. Thesium. Cal. 3-petala, nectaris 2. Stam. 3. Anther. 3. Pistill. 3.

CLASS XVIII.

POLYADELPHIA.

ORDO I. PENTANDRIA.

T. Cal. 3-leaved. *Cor. 5-petalaed. Nectaris 5. Stam. 5. Anther. 3. Pistill. 3.

(H) This class comprehends the plants whose flowers have stamens united by the filaments into three or more sets. The orders depend upon the number of stamens. There is only a single genus of British plants belonging to this class, viz. the Hypericum.

Vol. IV. Part I.
ORDO II. DODECANDRIA.

ORDO III. ICOSANDRIA.

ORDO IV. POLYANDRIA.

677. Symlocos. Cal. 5-fidus, inferus. Cor. 5-petala. Stam. 5-fidus, serie corolla adnata.

ORDO I. PENTANDRIA.

900. Theobroma, or Chocolate-nut Tree. Two species; viz. cacao, guanuma. Javana, S. America.—The nuts of the theobroma cacao are the fruit of an American tree resembling the almond: the tree, though small, bears a large fruit, shaped like a cucumber, which contains 20 or more of the nuts. These, by pressure, yield a considerable quantity of a fluid oil. Boiled in water, they give out a large portion of a savourous matter, which congeals on the surface of the liquor as it cools. The principal use of these nuts is for the preparation of the diuretic liquor chocolate. This is a mild, unctuous, nutritious fluid, capable of softening acute chronic humours, and of great service in consumptive disorders, especially if made with milk, and with only a small proportion of aromatics.

1418. Abrus. One species; viz. abyssinica. California.

ORDO II. DODECANDRIA.

ORDER III. ICOSANDRIA.

901. Citrus, or Lemon-orange, Shaddock. Four species; viz. medica, aurantium, decumanus, japonica. Asia, India.

The citron, or the citrus medica, is an evergreen tree or shrub, of the same genus with the orange and lemon: it was first brought from Assyria and Media (whence the fruit is called mala assyria, mala medica) into Greece, and thence into the southern parts of Europe, where it is now cultivated. Citrons are rarely made use of among us; they are of the same quality with lemons, except that their juice is somewhat less acid. They are with us frequently employed as a condiment.

The juice of lemons is similar in quality to that of oranges, from which it differs little otherwise than its being more acid. The yellow peel is an excellent aromatic, and is frequently employed in stomatico tinctures and infusions: it is considerably less hot than orange peel, and yields in distillation with water a less quantity of essential oil; its flavour is nevertheless more perishable, yet does not arise so readily with spirit of wine; for a spirituous extract made from lemon peel possesses the aromatic taste and smell of the subject, in much greater perfection than an extract prepared in the same manner from
from the peel of oranges. In the shops a syrup is prepared from the juice, and the peel is candied; the peel is an ingredient in the bitter infusions and wines: the essential oil enters the volatile aromatic spirit, or *spiritus ammoniacus compositus*, as it is now called, and some other formularies.

The orange or the *citrus aurantium* is a beautiful evergreen tree, or rather shrub; it is a native of the warmer climates, and does not easily bear the winters of this.

The flowers are highly odoriferous, and have been for some time past in great esteem as a perfume; their taste is somewhat warm, accompanied with a degree of bitterness. They yield their flavour by infusion to rectified spirits, and in distillation both to spirit and water: the bitter matter is dissolved by water, and on evaporating the decoction, remains entire in the extract. An oil distilled from these flowers is brought from Italy, under the name of *oleum* or *essentiae neros*.

Orange flowers were at one time said to be an useful remedy in convulsive and epileptic cases; but experience has not confirmed the virtues attributed to them. The leaves of the orange have also been recommended for the same purpose, but have by no means answered the expectations entertained by some.

The outer yellow rind of the fruit is a grateful aromatic bitter; and proves an excellent stomachic and carminative, promoting appetite, warming the habit, and strengthening the tone of the visera. Orange peel appears to be very considerably warmer than that of lemons, and to abound more with essential oil: in this circumstance, therefore, regard ought to be had in the use of these medicines. The flavour of the first is likewise supposed to be less perceptible than that of the other; hence the London college employ orange-peel in the spirituous bitter tincture, which is designed for keeping; whilst in the bitter infusion, lemon-peel is preferred. A syrup and distilled water are for the same reason prepared from the rind of oranges in preference to that of lemons.

The outer rind of the orange is the basis of a conserve both in the Edinburgh and London pharmacopoeias; and this is perhaps one of the most elegant and convenient forms for exhibiting it.

The juice of oranges is a grateful acid liquor, of considerable use in febrile or inflammatory distempers, for allaying heat, abating excorbid commotions of the blood, quenching thirst, and promoting the salutary excretions; it is likewise of use in genuine scorbutus or sea-scurvy. Although the Seville or bitter orange, as it is called, has alone a place in our pharmacopoeia, yet the juice of the China or sweet orange, is much more employed. It is more mild and less acid; and it is employed in its most simple state with great advantage, both as a cooling medicine, and as an useful antiseptic in fevers of the worst kinds, as well as in many other acute diseases, being highly beneficial in allaying thirst.

**ORDER IV. POLYANDRIA**.

1320. **Glabraria**.
One species; viz. *tera*. E. Indies.

1321. **Minthimausia**.
One species; viz. *speciosa*.

**DURIO**.
One species; viz. *zibethinus*. E. Indies.

1269. **Melaleuca**, or *Cypripedium*.
Seven species; viz. *leucadendron*, latifolia, angustifolia, lucida, villosa, scaparia, virgata. New S. Wales, New Zealand.

1270. **Hopera**.
One species; viz. *tectoria*. Carolina.

677. **Symphogoras**.
One species; viz. *martinicensis*. Jamaica, Martinico.

902. **Hypericum**, or *St John's Wort*.

* H. stem 2-edged; leaves blunt; with pellucid dots.

—This plant has long held a place in the materia medica, but its use is very much undetermined. The semitransparent dots on the leaves are the receptacles of an essential oil. The leaves given in substance are said to destroy worms. The flowers tinge spirits and oils of a fine purple colour, which is probably derived from the little glands upon the anther, and upon the edges of the petals. Cows, goats, and sheep eat it. Horses and swine refuse it.

903. **Ascrum**, or *St Peter's Wort*.

---

**In the class Polycladophilus are**

**24 Genera**, which include **65 species**. Of these 8 are found in Britain.

---

**Classis**
CLASSIS XIX.

SYNGENESIA (1).

ORDO I. POLYGAMIA EQUALIS.

Sect. I. Semiflocculi Tournefortii, corollis ligulatis omnibus.

927. PICRIS. Recept. nudum. Pappus plumosus, stipitatus. Cal. calycatus.

* 912. LEONTODON. Recept. nudum. Pappus plumosus, stipitatus. Cal. imbricatus squamis laxis.

SYNGENESIA, OR COMPOUND FLOWERS.

CLASS XIX.

Sect. I. Semiflocculi Tournefortii, all the florets ligulati, or strap-shaped.

* C. Recept. nearly chaffy. Down nearly 5-toothed. Cal. calycled, i.e. having a double calyx.

G. Recept. chaffy. Down of the disc feathered, of the radius 5-awned. Cal. simple.

* C. Recept. naked. Down hairy. Cal. calycled, with irregular scales.

* 913.

(1) This class comprehends those flowers which botanists have very generally agreed to call compound. The essential character of a compound flower consists in the anthers being united so as to form a cylinder, and a single seed being placed upon the receptacle under each floret. The dandelion and thistle are compound flowers; that is, each of these flowers is composed of a number of small flowers called florets. The plants of this class are supposed to have various specific virtues. Most of them are bitter; almost none of them are poisonous. The lactuca species, when growing in shady situations, is however said to be an exception to this last rule.

The elasticity of the calyx in the picris, carduus, and many other genera, is too remarkable to pass unnoticed by the slightest observer. It seems as if the expansion of the plants first burst the calyx open, and when these wither it closes again. The downy hairs that crown the seeds, before upright, now begin to expand, and by this expansion again open the leaves of the calyx, and bend them quite back. The seeds now escape, and the calyx, becoming dry and withered, no longer retains its elastic power.

The hairy or downy appendages of the seeds occasion them to be wafted about in the air, and disseminated far and wide. The structure of this down deserves our notice; there is hardly a child that is insensible to its curious and beautiful appearance in the leontodon or dandelion.

In this class the orders are determined by the state of the florets with regard to stamens and pistils.
Syngenesia.

Sect. II. Capitate.

923. Actium. Cal. squamis apice incurvato-compactis.
* 924. Serratula. Cal. squamis acutisculis mutis imbricatis, subcriphridis.

Sect. III. Discoidi.

Ordo II. Polygammia Superflua.

Sect. I. Discoides.

Sect. II. Capitata, or growing in heads.

A. Cor. radiata.
B. Cor. radiata. Cal. naked, tiled, pungent. Down of the radius feathered; of the disc bristle, broken backwards.
* C. Cal. radiata (or with the outer different from the central florets); radii (outer florets) coloured.
C. Cal. surrounded by floral leaves.
* A. Cal. with scales hooked, curved at the point.
C. Cal. scurfy, with leafy scales.
C. Cal. scurfy, with channelled scales, thorny.
* C. Cal. bellied, with thorny scales.
* O. Cal. bellied, with thorny scales. Recept. honey-combed.
* S. Cal. tiled with sharp awns, scales, nearly cylindrical.

Sect. III. Discoid (florets tubular).

A. Recept. naked. Down 5-awned. Cal. nearly equal. Cor. 4-cleft.
* S. Recept. chaffy. No down. Cal. tiled, hemispheric.

Order II. Polygammia Superflua.
(See p. 66.)

Sect. I. Discoid (without ligulate florets).

* A. Recept. nearly naked. No down. No cor. in the florets of the radius.

948.
ANY.

C. Recept. naked. No down. Cor. of the outer florets 5-cleft.
* T. Recept. naked. Down with a slight border. Cor. of the ray 3-cleft.
C. Recept. nearly naked. Down with a border. Cor. of the disc 4-cleft.
B. Recept. naked. Down hairy. Cor. female, mixed with hermaphrodites.
* C. Recept. naked. Down hairy. Cor. of the ray 3-cleft.
X. Recept. chaffy. Down a little bristly. Cal. skinny, the ray flattened.
A. Recept. chaffy. No down. Seeds bordered and not bordered.

Sect. II. Florists half tubular, nearly 3-lipped.

P. Down hairy. Cor. 3-cleft, the outer largest, 3-lobed.

Sect. III. Radiate.

* B. Recept. naked. No down. Cal. simple with equal scales.
* M. Recept. naked. No down. Cal. tiled with sharp scales.
* C. Recept. naked. No down. Cal. inner scales skinny.
U. Recept. naked. No down. Cal. 5-leaved. Flowers of the ray and disc (extremity and centre) five.
* D. Recept. naked. Down hairy. No down of the ray.
A. Recept. naked. Down hairy. Stamens of the ray without anthers.
* E. Recept. naked. Down hairy. Cor. of the ray hairy-like.
* S. Recept. naked. Down hairy. Cor. of the ray nearly in sixes, remote.
* S. Recept. naked. Down hairy. Cor. with scales, brittle at the point.
M. Recept. naked. Down feathered. Cal. cylindrical, tiled. Cor. of the ray oval-oblong, of the disc 3-cleft.
Syngenesia.

BOTANY.

E. Recept. char. No down. Cor. of the disc 4-cleft.
* A. Recept. char. No down. Cal. hemispherical.
T. Recept. char. Down hairy. Cor. of the ray 3-parted.

ORDER III. POLYGAMIA FRUSTRANEA.

G. Recept. naked. Down hairy. Cor. of the ray strap-shaped.
* C. Recept. bristly. Down hairy. Cor. of the ray tubular.
Z. Recept. bristly. Down bristly. Cor. of the ray strap-shaped.

ORDER IV. POLYGAMIA NECESSARIA.

* F. Recept. naked. No down. Female florets between the scales of the calyx.
M. Recept. naked. No down. Female florets sheathed by the scales of the cal.
M. Recept. naked. No down. Female florets nearly solitary.
E. Recept. woolly. No down. Florets of the ray 5.
P. Recept. char. No down. Cal. 5-leaved.
M. Recept. char. Down curved. Cal. 5-leaved.

ORDER IV. POLYGAMIA NECESSARIA.

986.
Order VI. Monogamia.

1008. Impatiens. Cal. 5-phyllosum. Cor. 5-petala irregularia. Caps. supera, 5-valvis.

Order I. Polygamia æqualis.

1004. Geropogon, or Old Man's Beard.
Three species; viz. glabrum, hiserotum, calycalatum. Italy.

1005. Tragopogon, or Goats Beard.
14 species; viz. pratense, mutabile, undulatum, orientale, majus, porrifolium, crocifolium, villosum, dalechampii, picoideae, asperum, dandelion, lanatum, virginicum. Europe, North America.

1006. Scorzonera, or Vipers Grass.
14 species; viz. tormentosum, humilis, purpurea, hispanica, graminifolia, purpurea, angustifolia, hisruta, resedifolia, lacinia, orientalis, taraxacifolia, tingitana, picoideae. Europe, Arabia, Barbary.

1007. Picris, or Ox Tongue.
Four species; viz. echoides, hieracioides, japonica, asplenoides. Germany, France, Italy, Japan.

908. Sonchus, or Sow-thistle.
13 species; viz. canadensis, arvensis, palustris, oleracea, maritimus, fruticosus, tenerrimus, plumieri, alpinus, floridanus, sibiricus, tataricus, tuberosus. Europe, Madeira, N. Amer. Japan.

909. Lactuca, or Lettuce.
Ten species; viz. scorilla, virosa, saligna, quercina, intybas, sativa, tuberosa, canadensis, indica, perennis. Europe, E. Indies, N. America.

* L. all the leaves horizontal, toothed; their mid-rib virosa prickly on the back. Wild lettuce.—The juice smells like opium. It is milky, acrid and bitter. Dr Cullen relates 24 cases of dropsy, out of which 23 were cured by taking the extract prepared from the expressed juice in
in doses, from 18 grains to three drams in the 24 hours. It commonly proves laxative, promotes urine and gentle sweats, and removes the thirst. It must be prepared when the plant is in flower.

910. Chondrella, or Gum Succory.
Three species; viz. juncea, crepodea, nudicaulis. Germany, Switzerland, France.

911. Prenanthes, or Wild Lettuce.
19 species; viz. tentifolia, chinensis, chimineae, purpurea, nuralis, altissima, chondrilloides, japonica, alba, repens, pinnata, integra, debilis, dentata, hastata, humilis, multiflora, lyrata, squarrosa. Europe, Japan, N. America.

912. Leontodon, or Dandelion.

913. Hieracium, or Hawkweed.

914. Crepis, or Base Hawkweed.

915. Andryala, or Downy Sow-thistle.
Three species, viz. integrifolia, ragusina, lanata. S. Europe, Archipelago, Canary.

916. Hypoestes, or Yellow-eye.
Nine species; viz. fetida, radiata, lucida, scabra, virginica, *minima, bedynois, rhagadioides, cretica. Europe, N. America, Madeira.

917. Scirpola.
Four species; viz. levis, setifera, alpina, cretensis, urens. S. of Europe.

918. Hypocheris, or Goshmore.

maculata.
* H. stem almost bare, with a solitary branch; leaves egg-oblong, entire, toothed.—The leaves of this plant are boiled, and eaten as cabbage. Horses are fond of this plant when green, but they do not like it when dry. Cows, goats, and swine eat it. Sheep are not fond of it. The country people believe it a cure for tetters and other cutaneous eruptions, possibly through a vulgar prejudice, founded on its spotted leaves.

919. Lapana, or Nipple-wort.
Five species; viz. communis, zacintha, stellata, kolpinii, rhagadioides. Siberia, S. of Europe.

920. Catanaanche, or Candia Lion's-foot.
Three species; viz. *corrulnea, lutes, greca. South of Europe.

921. Chicorium, or Sorrel, Endive.
Three species; viz. *intybus, endivia, spinosum. Europe.
* C. flowers in pairs, sitting; leaves notched.—The intybus leaves, when blanched, are eaten early in the spring in salads. They lose their bitterness by cultivation. The roots, gathered before the stem shoots up, are eatable, and when dried, will make bread. Sheep, goats, and swine eat it.

The seed of the chicorium endivia is raised in gardens for culinary use. It is a gentle cooler and aperient, nearly of the same quality with the former species. The seeds are ranked among the four lesser cold seeds.

922. Scythus, or Golden Thistle.
Two species; viz. maculatus, hispanicus. S. Europe.

923. Actium, or Burdock.
Three species; viz. lappa, personata, carduelis. Europe.
* A. leaves heart-shaped, without thorns, on leaf-stalks. lappa.—Before the flowers appear, the stems, stripped of their inedible, are boiled, and eaten like asparagus; when raw, they are good with oil and vinegar. A decoction of the roots is esteemed by some very sensible physicians, as equal, if not superior to that of arvensis. Boys catch bate by throwing the prickly heads up into the air. Cows and goats eat it. Sheep and horses refuse it. Swine are not fond of it.

924. Seratula, or Saw-wort, Way-thistle.
* S. leaves lyre-shaped and wing-cleft; the terminating tinctoria segments very large; florets all alike.—This plant is very much used by the dyers to give a yellow colour, but is inferior to the reseda; therefore its use is confined to the coarser woollen cloths. Goats eat it.

Horses are not fond of it. Sheep, swine, and cows
doe it.

* S. leaves toothed, thorny.—This species is said to arvensis yield a very pure vegetable alkaloid when burnt. Goats eat it: neither cows, horses, sheep, nor swine are fond of it. Horses sometimes eat the young tops.

925. Carduus, or Thistle.
* C. leaves toothed, thorny at the edge; flowers in bunches, upright; fruit stalks without thorns.—This, palustris, and almost all the other species of this genus, may be eaten like the burdock, before the flowers are formed. Swine eat it. Horses are very fond of it. Cows refuse it.
BOTANY.

* C. leaves with winged clefts, hispid; segments striped; calyx egg-shaped, thorny, woolly; stem hairy.

—Few plants are more disre garded than this, and yet its use is very considerable. If a heap of clay is thrown up, nothing would grow upon it for several years, did not the seeds of this plant, wafted by wind, fix and vegetate thereon. Under the shelter of this other vegetables appear, and the whole soon becomes fertile. The flowers, like those of the artichoke, have the property of curdling milk. Sheep and swine refuse it.

Neither horses, cows, nor goats are fond of it.

* C. leaves embracing the stem, halberd-shaped and wing-cleft, thorny; calyx without any leaves near it; thorns channelled, and set with other little thorns.—This plant is eaten as a salad when young. The young stalks, peeled and soaked in water to take off the bitterness, are excellent. The scales of the cup are as good as artichokes. The root is good to eat early in the spring.

acaulis. * C. stemless; calyx smooth.—Cows refuse the plant. It kills all plants which grow beneath it, whence it is very injurious.

936. Cnicus, or Blessed Thistle.

Nine species; viz. oleracea, crisithales, ferox, pygmoeus, acarnana, spinosissimae, centaururoides, uniflorus, cernua. Europe.

927. Oenopordum, or Woolly or Cotton Thistle.

Five species; viz. * acanthium, illyricum, arabicum, grcecum, acanthon. Europe, Arabia.

* O. calyx scales expanding, their points standing out; leaves egg-oblong, indented.—The receptacle and the young stems may be boiled and eaten like artichokes. The ancients thought this plant a specific in cancerous cases. Cows, sheep, and horses refuse it.

928. Cynara, or Artichoke.

Four species; viz. scolymus, cardunculus, humilis, acaulis. S. Europe, Madeira, Barbary.

929. Carlina, or Cardin Thistle.

Eight species; viz. acanisin, latana, corymbosa, * vulgaris, racemosae, pyrenacea, xeranthemoides, atractylodes. Europe, Cape, Barbary.

vulgaris. * C. stem, with many flowers in a corymbus; flowers terminating; rays of the calyx yellow white.—Its flowers expand in dry, and close in moist weather. They retain this property a long time, and therefore are employed as hygrometers. It is said to be an excellent remedy in hysterical cases. Goats eat it. Cows refuse it. Its presence indicates a very barren soil.

The carinna acaulis is a very prickly sort of thistle, growing spontaneously in the southern parts of France, Spain, Italy, and the mountains of Switzerland; from whence the dried roots are brought to us. This root is about an inch thick, externally of a pale rusty brown colour, corroded, as it were, on the surface, and perforated with numerous small holes, appearing, when cut, as if worm-eaten. It has a strong smell, and a subacid, bitterish, weakly aromatic taste. Carlina is looked upon as a warm diaphoretic and alexipharmac; and has been for some time greatly esteemed by foreign physicians, but never came much into use amongst us: the present practice has entirely rejected it, nor is it often to be met with in the shops.

ANY.

930. Atrastylis, or Distaff Thistle.

Eight species; viz. gymniftera, humilis, cancellata, lancea, ovata, oppositifolia, purpurea, mexicana. S. Europe, Mexico, Japan.

1419. Barnadesia.

One species; viz. spinosa. S. America.

931. Carthusian, or Base Saffron.

10 species; viz. tinctoria, lanata, creticum, tingitanus, curvullus, mitisissima, carpunculosa, arborescens, salicifolia, corymbosa. S. Eur. Barb. Madeira, California.

The carthusian tinctoria is a soft kind of thistle, with only a few prickles about the edges of the leaves. It is cultivated in large quantity in some parts of Germany, from whence the other parts of Europe are supplied with the flowers as a colouring drug, and the seeds as a medicinal one. The flowers, well cured, are not easily distinguishable by the eye from saffron; but their want of smell readily discovers them. The seeds are white, smooth, of an oblong roundish shape, yet with four sensible corners, about a quarter of an inch in length, so heavy as to sink in water; of a viscid sweetish taste, which in a little time becomes acrid and nauseous. These seeds have been celebrated as a cathartic: they operate very slowly, and for the most part disorder the bowels, especially when given in substance. Triturated with aromatic distilled waters, they form an emulsion less offensive, yet inferior in efficacy to more common purgatives.

1287. Spilanthis.

Seven species; viz. urens, pseudo-acmella, acmella, salvaria, atriplifolia, insipida, oleracea. E. Indies, Peru, Jamaica.

932. Bidens, or Water Hemp-agrimony.

933. Calamia, or Foreign Cocks-foot.

27 species; viz. papillaris, antepubicam, conselitia, kleinia, ficoides, lacinata, repens, suffruticosa, laurofolis, cordifolia, asclepiodes, appendiculata, elongata, porphyrobladi, sonchifolia, incana, saracenica, hastata, suaveolens, atriplifolia, alpina, echinata, albitrons, bipinnata, acaulis, radicans, articulata. Alps, E. Indies, N. America.

934. Ethulia.

Five species; viz. conyzoides, sparganophora, divaricata, tomentosa, bidentis. India, Jam. Carolina.

935. Eupatorium, or Hemp Agrimony.

28 species; viz. dalea, hyssopifolium, scandens, houstonia, zeylanicum, sessilifolium, abies, chinesca, rotundifolium, altissimum, hastatum, syriacum, trifoliatum, * cannabium, cinereum, purpureum, macrocarpum, sclerum, perfellatum, coelestium, aromaticum, agetoides, odoratum, ivacolinum, urticaefolium, stachydifolium, microphyllum, japonicum, Europe, America, E. and W. Indies, Japan.

* E. calyx 5-flowered; leaves with finger-like divi-cannabions.—An infusion of a handful of it vomits and purges smartly. An ounce of the root, in decoction,
Syngenesia.

is a full dose. In similar doses the Dutch peasants take it as an alternative, and as an antiscorbutic. Goats eat it. Cows, horses, sheep, and swine refuse it.

936. AGERATUM, or Base Hamp-ugrmony.

Two species; viz. conyzooides, ciliare. America.

937. PETRONIA.

17 species; viz. camphorata, oppositifolia, flexuancis, retorta, hirsuta, glabra, inflexa, scariosa, glomerata, cinera, villosa, membranacea, spinosa, cephalotes, pallens, minuta, fasciculata. C. of G. Hope.

938. STACHELINA.

Eight species; viz. gusphaloides, dubia, arborescens, fruticosa, ilicifolia, corymbosa, chamaeneque, imbricata. S. of France, Spain, Cape, S. America.

939. CHRYSOCOMA, or Goldybokes.

13 species; viz. oppositifolia, comaraea, dichotoma, sericea, patula, cernua, ciliata, amentosa, scabra, liosyris, biflora, granifolia, villosa. Europe, Cape, Carolina.

940. TRACHONANTHUS, or Shruby African Flea-bane.

Three species; viz. camphoratus, glaber, ericoideae. C. of G. Hope.

941. CALEA, or Halbert-weed.

Four species; viz. jaemicensis, oppositifolia, amellus, scoparia. W. Indies, S. sea isles, Carolina.

942. SANTOLIA, or Lavender Cotton.

Four species; viz. chamaeparisiaca, rosamarinifolia, alpina, anthemoides. S. of Europe.

943. ATHANASTA.

20 species; viz. squarrosa, sessiliflora, pumila, crenata, uniflora, capitata, maritime, genistifolia, pubescens, annua, trifurcata, crithmifolia, linifolia, dentata, parviflora, pinnata, pectinata, dentata, liliformis, cinerea. S. Europe, Africa, Carolina.

ORDER II. POLYGAMIA SUPERFLUA.

944. TAMACETUM, or Taney.

Seven species; viz. sibiricum, incanum, cotulioides, annuum, monanthus, vulgare, balsamita. Europe, C. of G. Hope.

vulgare.

* T. leaves doubly winged, cut, serrated.—This plant is a warm dehstreece bitter, and its flavour not ungrateful. The tender leaves are sometimes used to give a colour and flavour to puddings. If a dead animal substance is rubbed with this plant, the flesh-fly will not attack it. The Finlanders obtain a green dye from it. Cows and sheep eat it. Horses, goats, and swine refuse it. The seeds are an excellent vermifuge.

The tamacetum balsamita was formerly a very common garden plant, and of frequent use both for culinary and medicinal purposes; but it is at present very little regarded for either, though it should seem from its sensible qualities to be equal or superior, as a medicine, to some aromatic herbs which practice has retained. The leaves have a bitterish warm aromatic taste; and a very pleasant smell, approaching to that of mint, or a mixture of mint and mauldin. Water elevates their flavour in distillation, and rectified spirit extracts it by infusion. It has been recommended in hysterical affections; and by some it has been supposed to be very powerful in correcting the influence of opium. The leaves should be collected in the month of July or August.

945. ARTEMISIA, or Wormwood, Mugwort.

29 species; viz. vermiculata, capillaris, judaica, ethiopica, contra, abrotanum, arborescens, santonica, campestris, palustris, crithmifolia, maritima, gracilis, ropestris, spicata, pontica, australis, annua, tancetifolia, absinthium, vulgaris, pectinata, integrofolia, japonica, ceruleascens, drunculcus, chinensis, madracas, patina, minima. Eur. Cape, Egypt, China.

* A. leaves many-cleft, cottony; bunches on crooked maritima. footstalks; female florets 5.—This plant, in its wild state, smells like marum or campher; but in our gardens it is less grateful, though still much more grateful than the next species. It is used as an ingredient in distilled waters, and beat with thricce its weight of fine sugar, it is formed into a conserve. Its virtues are the same with those of the next species, but in a weaker degree. Horses eat it. Cows, goats, and sheep, refuse it.

* A. leaves compound, many-cleft; flowers somewhat absinthioglo
globular, pendant; receptacle woolly.—The leaves um.

and flowers of this species are very bitter: the roots are warm and aromatic. A considerable quantity of essential oil rises from it in distillation. This oil is used both externally and internally to destroy worms. The leaves put into sour beer, soon destroy the acceasency. They resist putrefaction, and are therefore a principal ingredient in antiseptic fomentations. An infusion of them is a good stomachic; and, with the addition of fixed alkaline salt, a powerful diuretic in some dropsic
cases. The ashes afford a more pure alkaline salt than most other vegetables, excepting bean-stalks, bream, and the larger trees. Linneas mentions two cases, wherein an essence prepared from this plant, and taken for a considerable time, prevented the formation of stones in the kidneys or bladder: the patients for

bearing the use of wine and acids. It might be suspec
ted, that, like other bitters, its long continued use must weaken the action of the nervous system; but in these instances no such effect took place. An infusion of it given to a woman that suckles, makes her milk bitter. It gives a bitterness to the flesh of sheep that eat it. Horses and goats are not fond of it. Cows and swine refuse it. Turkeys are fond of it. The plant, steeped in boiling water, and repeatedly applied to a bruise, will remove the pain in a short time, and pre

vent the swelling and discoloration of the part.

* A. leaves wing-cleft, flat, cut, cottony underneath; vulgaris.
bunches simple, bending; florets of the circumference 5.—In some countries this plant is used as a culinar

y aromatic. A decoction of it is taken by the common people to cure the ague. The Chinese make use of it in

healing wounds, applying the fresh plant bruised. A dram of the leaves, powdered, was given four times a day, by Dr Home, to a woman who had been affect

ed with hysterical fits for many years. The fits ceased in a few days. Sheep and swine refuse it. Neither horses, cows, or goats, are fond of it. Dr Anderson in
forms us, that sheep are very fond of it, devouring it with great greediness, especially the roots, which seem to form a most delicate morsel.

The artemisia abrotanum, or southernwood, is a shrub-
by plant, clothed with very finely divided leaves, of a light-green colour. The flowers, which are very small and yellowish, hang downwards, several together, from the middle of the branches to the top. It is not like some other species of the artemisia, indigenous in Britain; but although a native of warm climates, it readily bears the vicissitudes of ours, and is easily cultivated in gardens; from thence alone it is obtained when employed for medical purposes. The leaves fall off every winter, but the roots and stalks continue for many years.

Southernwood has a strong smell, which to most people is not disagreeable. It has a pungent, bitter, and somewhat nauseous taste. These qualities are very completely extracted by rectified spirit, and the tincture, thus formed, is of a beautiful green colour. They are less perfectly extracted by water liquor, the infusion being of a light brown colour.

Southernwood, as well as some other species of the same genus, particularly the absinthium and santonicum, has been recommended as an anthelmintic; and it has also been sometimes used as a stimulant, detergent, and sudorific. It has likewise been employed externally in discutient and antiseptic fomentations. It has also been used under the form of lotion and ointment for cutaneous eruptions, and for preventing the hair from falling off. It is at present very little employed in practice.

The worm-seed of the artemisia austriaca is the produce of a plant of the wormwood or mugwort kind, growing in the Levant. It is a small, light, chalky seed, composed, as it were, of a number of thin membranous coats, of a yellowish colour, an unpleasant smell, and a very bitter taste. These seeds are celebrated for anthelmintic virtues, which they have in common with other bitters; and are sometimes taken with this intention, either mixed with molasses or candied with sugar: their unpleasant taste renders the form of a powder or decoction inconvenient.

946. Gnaphalium, or Everlasting, or Cudweed.

947. Xeranthemum, or Austrian Sneezewort.

16 species; viz. annuum, vestitum, speciosissimum, prolifereum, imbricatum, canescens, retortum, spinosum, sesamoides, virgatum, stachelina, variegatum, paniculatum, fulgidum, stoloniferum, recurvatum. S. Europe, Cape.

948. Carpeium.

Two species; viz. cernum, abrotanoides. Austria, Spain, Italy, China.

949. Baccharis, or Ploughman’s Spike-reed.

Eight species; viz. ivossifolia, nervifolia, arborca, halimifolia, dioecoides, indica, brasiliensis, fistulosa. Cape, India, America.

750. Contza, or Greater Fleabane.

951. Erigeron, or Lesser Fleabane.

952. Tussilago, or Colts-foot.

* T. stalks with one flower, tilled; leaves somewhat farfara heart-shaped, angular, finely toothed.—This is the first plant that vegetates in marle, or limestone rubble. The downy substance on the under surface of the leaves, wrapped in a rag, dipped in a solution of salt petre, and dried in the sun, makes the best tinder; the leaves are the basis of the British herb-tobacco. They are somewhat austere, bitterish, and musclaginous to the taste. They were formerly much used in coughs and consumptive complaints; and perhaps, not without reason, for Dr. Cullen has found them to do considerable service in scrophulous cases: he gives a decoction of the dried leaves, and finds it succeed where sea water has failed. And Fuller relates a case of a girl, with 12 scrophulous sores, who was cured by drinking daily in as much as she could, for above four months, of a decoction of the leaves made so strong as to be sweetish and glutinous. Goats and sheep eat it. Cows are fond of it. Horses and swine refuse it. It may be destroyed by cutting off the crown of the root in March.

* T. panicle egg-shaped; female florets few.—Its roots petasites abound with a resinous matter. They have a strong smell, and a bitterish acrid taste. Horses, cows, goats, and sheep eat it. Its large leaves afford shelter from showers to poultry and other small animals.

953. Senecio, or Groundsel, Ragwort.

Syngenesia.

BOTANY.

S. vulguris. * S. leaves winged, indented, embracing the stem; flowers scattered.—A strong infusion of this plant vomits. The bruised leaves are a good application to boils. The seeds are very acceptable to linnets and goldfinches when confined in cages. Cows are not fond of it. Goats and swine eat it. Horses and sheep refuse it.

S. jacobae. * S. leaves lyre-shaped, almost winged; segments finely jagged; stem upright. If this plant is gathered before the flowers open, and used fresh, it dyes wool of a full green, but the colour is apt to fade. If woolen cloth is boiled in alum water, and then in a decoction of the flowers, it takes a beautiful deep yellow. Horses and sheep refuse it. Cows are not fond of it. Horses and cows, however, eat it when young.

954. ASTER, or Starwort.
38 species; viz. taxifolius, reflexus, crinitus, fruticulosus, tenellus, alpinus, sibiricus, * tripolium, amellus, divaricatus, bispilofolius, dumasus, ericoides, tenellifolius, larinifolius, linifolius, acris, concolor, rigidus, novaeangliae, undulatus, grandiflorus, cordifolius, puinicus, annuus, vernus, indicus, levis, mutabilis, tradescanti, nov-belgii, tardiiflorus, miser, macrophyllus, chinesis, tataricus, biapidis, saccar. Europe, Cape, Asia, N. America.

tripolium. * A. leaves strap-spear-shaped, fleshy, smooth, 3-flowered; calyx scales blust, somewhat membranaceous.—Goats and horses eat this species. Cows and swine refuse it. Sheep are not fond of it.

955. SOLIDAGO, or Golden Rod.
14 species; viz. sempervirens, canadensis, altissima, lateriflora, bicolor, lanceolata, casa, mexicana, flexicaulis, latifolia, * virgaurea, minuta, rigida, noveboracensis. Europe, N. America.

virgaurea. * S. stem serpentine, branched; leaves mostly sitting; flowers in crowded panicles.—This plant is found wild on heaths and in woods, producing spikes of yellow flowers in August. The leaves have a moderately astrangent bitter taste; and hence prove serviceable in debility and laxity of the viscera, and disorders proceeding from that cause.

957. CINERARIA, or Sky-flower.

956. INULA, or Elecampane.
29 species; viz. * helum, odor, suaveolens, odorum-christi, britannica, * dysenterica, undulata, indica, pulicaria, arable, spirecifolia, squarrosa, buhonum, salicina, birta, mariana, germanica, japonica, dubia, ensifolia, erithrifolius, provincialis, montana, astuana, bifrons, corules, aromatica, pinnifolia, setida. Europe, Cape, E. Indies, N. America.

helium. * I. leaves embracing the stem, eggy-shaped, wrinkled, cottony beneath; scales of the calyx egg-shaped. This is a large downy plant, sometimes found wild in moist rich soils. The elecampane, or root, especially when dry, has an agreeable aromatic smell; its taste on first chewing, is pungent, and as it were, somewhat ran-

958. ARNICA, or Leopard’s Bane.
II species; viz. montana, piloselloides, scorpioides, doronicum, maritima, croceas, ciliata, japonica, palma, gerbera, coronopifolia. Europe, Africa, Japan.

The arnica montana had formerly a place in our pharmacopoeias, under the title of doronicum germanicum. Then, however, it was little known or used; and being justly considered as one of the deleterious vegetables, it was rejected: but it has again been introduced into the list both of the London and Edinburgh colleges on the authority of fresh observations, particularly of those of Dr Collins of Vienna, who has lately published a dissertation on the medical virtues of the arnica.

This plant grows in different parts of Europe, particularly Germany. It has an acid bitter taste, and when bruised, emits a pungent odour, which excites sneezing. On this account the country people in some parts of Germany use it in snuff, and smoke it like tobacco. It was formerly represented as a remedy of great efficacy against effusions and suffusions of blood from falls, bruises, and the like; and it was then also mentioned as a remedy in jaundice, gout, nephritis, &c. but in these affections it is now very little if at all employed.

Of late it has been principally recommended in paralytic affections, or in cases where a loss or diminution of sense arises from an affection of the nerves, as in instances of amaurosis. In those it has chiefly been employed under the form of infusion. From a dram to half an ounce of the flowers has been directed to be infused in a pint of boiling water, and taken in differ-
ent doses in the course of the day; sometimes it produces vomiting, sometimes sweating, sometimes diuresis; but frequently its use is attended with no sensible operation, unless it can be considered as such, that in some cases of paralysis, the cure is said to be preceded by a peculiar prickling, and by shooting pains in the affected parts.

Besides being employed in paralytic affections, it has also been of late represented as a very powerful antispasmodic; and it is said to have been successfully employed in fevers, particularly those of the intermittent kind, and likewise in cases of gangrene. In those diseases it has been said to prove as efficacious as the Peruvian bark, when employed under the form of a pretty strong decoction, taken in small doses frequently repeated, or under the form of an electuary with honey.

But these alleged virtues of the sinica have not been confirmed by any trials made in Britain, with which we are acquainted; and we are of opinion that its real influence still remains to be determined by future observations. It is, however, one of those active substances from which something may be expected.

959. Doronicum, or Leopard's Bane.

Three species; viz. *pardinches, plantagineum, bellidiastum. Europe, N. Amer.

960. Perdicium.

Five species; viz. *semiflorulare, radiale, brasilienne, magellanicum, tomentosum. Cape, Japan, Jamaica, S. America.

1421. Mutisia.

One species; viz. clematis. New Granada.

961. Helianthus, or Base Sun-flower.

One species; viz. annuus. N. Amer.

962. Bellis, or Daisy.

Two species; viz. *perennis, anua. Europe.

* B. stalk naked.—The leaves are slightly acrid. The roots have a penetrating purgency. No attention is paid to it, except what it claims from the beauty of its flowers. The flowers close at night. Horses, sheep, and cows refuse it.

1322. Bellium, or Base Daisy.

Two species; viz. bellidioideo, minutum. Levant, India.

964. Tagetes, or African Marigold.

Three species; viz. patula, erecta, minuta. Mex.

965. Leysera.

Three species; viz. gnaphalodes, callicornia, paleacea. Cape, California, Carolina.

974. Zinnia.

Two species; viz. pauciflora, multiflora. N. America, Peru.

965. Pectis.

Three species; viz. ciliaris, punctata, linifolia. America.

966. Chrysanthemum, or Corn Marigold.

* C. leaves embracing the stem, oblong, serrated upwell, toothed at the base.—The young leaves may be eaten in salads. Horses and goats eat it. Cows and swine refuse it.

* C. leaves embracing the stem, jagged upwards, segetum, tooth-serrated towards the base.—This species was imported into Sweden along with corn from Jutland about the end of last century. In Denmark there is a law to oblige the farmers to root it up from their corn fields. It may be destroyed by digging the ground in autumn, followed by a summer fallow, and harrowing the land about five days after sowing the grain. Its yellow flowers, however, which follow the sun in a very remarkable manner, give a very remarkable brilliancy to the fields in tillage, and please the eye of the passing traveller.—A large quantity which grew on some arable land, was cut when in flower, dried and eaten by horses as a substitute for hay. It is used by the Germans for dying yellow.

967. Matricaria, or Feverfew.

* M. leaves compound, flat; leaflets egg-shaped, cut; parthenium-stalks branched.—The whole plant has a strong scent. Its smell and a bitter taste, and yields an essential oil by distillation. A horse refused it.

* M. receptacle conical, rays expanding; calyx scales chamaemelum equal at the edges.—Its property is probably that of millefolium. anthemis nobilis. The Finlanders use an infusion of it in consumptive cases. Cows, goats, and sheep eat it. Horses are not fond of it. Swine refuse it.

1420. Unxia.

One species; viz. camphorata. Surinam.

968. Cotula, or May-weed.

969. Amacyclus.

Four species; viz. creticus, orientalis, aureus, valentinus. Europe.

1370. Anthemis, or Chamomile.

* A. receptacle conical; chaff bristle-shaped; seeds cotula. naked.—Toads are said to be fond of this plant. It is very ungrateful and displeasing to bees. Goats and sheep are not fond of it. Horses, cows, and swine refuse it. It frequently blisters the skin of reapers, and of children who happen to gather it. The heads rubbed between the fingers smell intolerably disagreeable.

* A. leaves winged compound, strap-shaped, acute, *nobilis, somewhat woolly.—The leaves and flowers have a strong not ungrateful smell, and a bitter nauseous taste. They afford an essential oil. An infusion of the flowers is often used as a stomachic, and as an antispasmodic. In large quantities it excites vomiting. The powdered flowers
flora

Syngenesia.

flowers in large doses have cured aches, even when the bark had failed. Both the leaves and flowers possess very considerable antiseptic properties, and are therefore used in aseptic fomentations and poultices. From their antiseptic powers they are frequently found to relieve pain, either applied externally or taken internally. Hay recommends the flowers in calculus cases.

* A. leaves doubly winged, serrated, cottony underneath; stem supporting a corymbus.—The flowers afford a remarkably clean and good yellow dye. The flowers of the chrysanthemum segatum resemble them much in appearance, but experience proves they cannot be substituted in their place. Horses and goats eat it. Sheep are not fond of it. Cows and swine refuse it.

797. Achillea, or Milfoil, Yarrow. 

21 species; viz. santolina, ageratum, falcata, tomentosa, pubescens, abrotanifolia, bipinnata, egypuza, macrophylla, impatiens, clavennae; * pismica, alpina, atrata, meeskata, nana, magna, * millefolium, nobilis, odorata, cretica. Europe, Africa.

* A. leaves strap-shaped, embracing the stem, finely serrated.—The roots have a hot biting taste. The young tops are sharp and pleasant in spring salads. The powdered leaves excite sneezing. Horses, cows, sheep, goats, and swine eat it.

799. Helianthus, or Sun-flower.

13 species; viz. annuus, indicus, multiiflorus, tuberosus, decapetalus, frondosus, strumosus, giganteus, altissimus, lavis, angustifolius, divaricatus, atrorubens. America.
up; a strong decoction is very nauseous and offensive to the stomach. Rectified spirit gains a very pleasant bitter taste, which remains uninjured in the extract. The virtues of this plant seem to be little known in the present practice. The nauseous decoction is sometimes used to provoke vomiting, and a strong infusion to promote the operation of other emetics. But this elegant bitter, when freed from the offensive parts of the herb, may be advantageously applied to other purposes. Excellent effects have frequently been experienced from an infusion of this plant, in loss of appetite, where the stomach was injured by irregularities. A stronger infusion made in cold or warm water, if drunk freely, and the patient kept warm, occasions a plentiful sweat, and promotes all the secretions in general.

The seeds of this plant are also considerably bitter, and have been sometimes used with the same intentions as the leaves.

ORDER IV. POLYGAMIA NECESSARIA.

985. MILLERIA.
Two species; viz. quinqueflora, biflora. Panama, Vera Cruz.

983. BALTIMORA.
One species; viz. recta. Maryland, Virginia.

986. SILPHIUM, or Base Chrysanthemum.
Eight species; viz. laciniatum, terebinthineum, perfoliatum, connatum, asteriscus, solidaginoides, trifoliatum, trilobatum. N. America.

987. POLYMNIA, or Dwarf Sun-flower.
Seven species; viz. canadenesis, carnosa, uvedalia, tetragonothea, abyssinica, spinosa, wodelia. Africa, Canada, Virginia.

988. CHRYSOGONUM.
One species; viz. virginianum. Virginia.

989. MELOMADION.
Two species; viz. americanum, australe. Jamaica, St Domingo, S. America.

990. CALENDULA, or Marygold.
Nine species; viz. arvensis, sancta, officinalis, pru-bialis, hybrida, nudicaulis, graminifolia, fruticosa, tormentosa. Europe, Cape.

arvensis. * C. seeds boat-shaped, prickly, turned inwards; the innermost crowded together, the outermost upright, furnished with a tail.—This is a very common plant in the corn fields, and in the vineyards in Portugal; and is used as food for milk cows. It is found in England near Falmouth, to which place it has probably been imported from Portugal, in consequence of the frequent communication by the packets and otherwise. The milk yielded by the cows which are fed upon it is very good.

The herb of the calendula officinalis is common in gardens, where it is found in flower greatest part of the summer. Marygold flowers are supposed to be aperient and attenuating, and also cardiac, alexipharmac, and sudorific; they have been principally celebrated in uterine obstructions, in the jaundice, and for throwing out the smallpox. Their sensible qualities give little foundation for these virtues; they have scarce-}

ANY.

Syngenesia.

991. ARCTOTIS.
12 species; viz. calendulaceae, hypochondriaca, tristis, coruscans, superba, serrata, tenuifolia, plantaginex, angustifolia, aspera, paradoxus, dentata, anthemoides, tenuifolia, acaulis. Cape, Carolina.

992. OSTEOSPERMUM, or Hard-seeded Chrysanthemum.
15 species; viz. spinosum, pisiferum, moniliferum, illicifolium, ciliatum, junceum, triquetrum, corymbosa, imbricatum, herbaceum, niveum, perfoliata, polygaloides, calendulaeum, arctotoides. Cape, E. Indies.

993. ONONNA, or African Reg-wort.
26 species; viz. bulbosa, tagetes, trifida, pectinata, abrotanifolia, athanassie, ciliata, pinnata, trifurcata, monita, coronopifolia, cheiriolia, crassifolia, parviflora, tenuissima, linifolia, digitata, lingua, lateriflora, heterophylla, caccaloides, ericoides, capillaris, virgines, frutescentes, arborescens. Africa.

1324. HIPPIA, or Shaggy Tansy.
Three species; viz. integrifolia, minuta, frutescens. Cape, E. Indies, America.

994. ERIOCEPHALUS.
Two species; viz. africanus, racemosus. C. of G. Hope.

995. FILAGO, or Cotton, or Cud-weed.

996. MICROPUS, or Base Cud-weed.
Two species; viz. supinus, erectus. Spain, Portugal, Italy, Levant.

ORDER V. POLYGAMIA SEGREGATA.

997. ELEPHANTOPUS, or Elephants-foot.
Two species; viz. scaber, tomentosus. E. and W. Indies.

1325. OZERDA.
Two species; viz. prolifera, aliena. C. of G. Hope.

998. SPHERANTHUS, or Globe-flower.
Three species; viz. indicus, africanus, chinensis. E. Indies, China.

999. ECHINOPS, or Globe-thistle. Four species; viz. spheroccephalus, spinosus, ritro, strigosus. Siberia, Austria, France, Spain, Italy.

1000. GUNDELLA.
One species; viz. tournerfortii. Syria, Aleppo, Amer.

1422. JUNCIA.
One species; viz. ferruginea. S. America.

1001. STOEBE, or Base Ethiopian Elychium. Nine species; viz. ethiopica, ericoides, prostrata, gunaphaloides,
Gynandria. B O T A N Y.

guaphaloides, gomphrenoides, scabra, reflexa, rhinocerotis, disticha. C. of G. Hope.

ORDER VI. MONOGAMIA.

1003. Serrigium. Four species; viz. cinereum, plumosum, fuscum, ambiguum. C. of G. Hope.

1006. Lobelia, or Cardinal-flower. 42 species; viz. simplex, pinifolia, dortmannia, tupa, ances, kalanit, paniculata, grandis, cornus, pyleuma, columnae, bellidiaria, bulbosa, triquetra, longiflora, tomensosa, secunda, patula, assurgent, cardinalis, lirigata, ferruginea, debilis, siphilitica, surinamensis, infata, cliffortiana, aurea, minuta, volubilis, bulbosa, laereinia, erinus, erinoides, zeylanica, latens, hirutus, cormophila, conocea, tenella, depressa. Cape, E. and W. Indies, America.

The lobelia siphilitica grows in moist places in Virginia, and bears our winters. It is perennial, has an erect stalk three or four feet high, blue flowers, a milky juice, and a rank smell. The root consists of white fibres about two inches long; resembles tobacco in taste, which remains on the tongue, and is apt to excite vomiting. It is used by the North American Indians as a specific in the veneral disease. The form is that of decoction; the dose of which is ordered to be gradually increased, till it bring on very considerable purgings, then to be intermitted for a little, and again used in a more moderate degree till the cure be completed. The ulcers are also washed with the decoction, and the Indians are said to sprinkle them with the powder of the inner bark of the spruce tree. The same strictness of regimen is ordered as during a salivation or mercurial course. The benefit to be derived from this article, has not, as far as we know, been confirmed either in Britain or by the practitioners in Virginia; for there, as well as in this country, recourse is almost universally had to the use of mercury; and it is probably from this reason that the London college have not received it into their list. It, however, seems to be an article, which, in some cases at least, deserves a trial.

1007. Viola, or Violet. 28 species; viz. palmata, pedata, pinnata, lancifolia, primulifolia, hirta, palustris, odorata, canina, montana, cenisia, canadensis, mirabilis, biflora, uniflora, decumbens, tricolor, grandiflora, calcara, cornuta, arborea, amoenus, suffruticosa, calceolaria, oppositifolia, hybanthus, ippaeusana, disandra. Alps, Pyrenees, Cape, America.

The viola odorata is often found wild in hedges and shady places, and flowers in March: the shops are generally supplied from gardens. In our markets we meet with the flowers of different species; those may be distinguished from the others by their being large, of a pale yellow colour, and of no smell. The official flowers have a very pleasant smell, and a deep purplish blue colour, denominated from them violet. They impart their colour and flavour to aqueous liquors: A syrup made from this infusion has long maintained a place in the shops, and proves an agreeable and useful laxative for children.

1008. Impatiens, or Balsam, Balsamine. Seven species; viz. chinesis, latifolia, oppositifolia, cornuta, balsamia, triloba, soli-tangere. Europe, N. America, E. Indies, China.

In the class Syngenesia are 115 Genera, including 1252 Species, of which 113 are found in Britain.

CLASS XX.

GYNANDRIA (κ).

Ordo I. DIANDRIA.

• 1009. Orchis. Nectarium corniculatum.
• 1011. Ophrys. Nect. subarcarinatum.

• O. Nectar horned.
• S. Nect. purse-shaped.
• O. Nect. nearly keel-shaped.

* 1012:

(κ) This class is distinguished from the others by the situation of the stamens (male parts of the flower) upon the pistil (female parts). The stamens are either placed upon the style itself, or upon the receptacle, which in that case is lengthened into the appearance of the style which supports the pistil with the stamens, and forms a part of the pistil. The orders are determined by the number of stamens.

ORDO
Order IX. Polyandria.

Order I. Diandria.

*mascula.* O. lip of the nectary 4-lobed, finely scollop'd; horn blunt; upper petals turned back.—This species is called *satyrion*, or *early orchis*. It is frequent in shady places and moist meadows. Each plant has two oval roots of a yellowish colour, a viscid sweetish taste, and a faint unpleasant smell. They abound with a glutinous slimy juice. With regard to their virtues, like other mucilaginous vegetables, they defend the solids against acrimonious humours: they have also been celebrated, though on no good foundation, for analectic and aphrodisiac virtues, and frequently made use of with these intentions. Salep, a celebrated restorative among the Turks, is prepared from the root of plants of this genus. It has been successfully imitated by means of the roots of this species. Mr. Moulton, in a letter to Dr. Percival, describes his method of making salep. He observes, that the best time to gather the roots, is when the seed is formed and the stalk is about to fall, then for the new bulb, of which salep is made, is arrived at its full size. The new roots being separated from the stalk, are to be washed in water, and the outer thin skin taken off. They are then to be set on a tin-plate in an oven, heated to the degree of a bread oven. In six, eight, or ten minutes, they will have acquired a transparency like horn, without being diminished in size. They are then to be removed into another room to dry and harden, which will be done in a few days; or they may be dried in a very slow heat in a few hours. Salep, thus prepared, may be sold in less than a shilling a pound, and affords a mild nutriment, which in times of scarcity, in cases of dysentery and strangury, and on shipboard, may be extremely useful. The salep, hitherto imported from Turkey, may thus be prepared at home. The plants must be propagated by the roots, as the seeds seldom come to perfection.

1010. *Satyrium*, or Lizard-flower. 15 species; viz bicornis, tabulare, triste, gigan- tumum, aculeatum, viride, nigrum, albidum, epigogum, plantagineum, repens, capense, aians, orobanchoides, pedicellatum. Europe, Cape, America.

1013. *Limodorum*, or Base Hellebore. Three species; viz. tuberosum, altum, striatum.

1016. *Epidendrum*, or *Vanello*. 32 species; viz. *vanilla*, *flos seris*, *tenuifolium*, spe- *K k 2* tulatum,

1027. Xylocopia, or Bitter-wood. Two species; viz. muricata, glabra. America.

1026. Grewia. Six species; viz. occidentalis, orientalis, asiatica, maloococa, salviolosa, microcos. Asia, Cape, America, South seas.

* A. leaves halberd-shaped, very entire; spiketalk macula- club-shaped.—This root grows wild under hedges, and is grown by the sides of banks, in most parts of England. It sends forth in March three or four triangular leaves, which are followed by a naked stalk, bearing a purplish pistil, enclosed in a long sheath: this is succeeded in July by a bunch of reddish berries. In some plants the leaves are spotted with black, in others with white spots, and in others not spotted at all: the black spotted sort is supposed to be the most efficacious in medicine. All the parts of the arum maculatum, particularly the root, have an extremely pungent acrimonious taste; if the root be but slightly chewed, it continues to burn the tongue for some hours, occasioning at the same time a considerable thirst: these symptoms are alleviated by butter milk and cold iced liquors. Dried and kept some time, it loses much of its acrimony, and becomes at length an almost insipid farinaceous substance. The root is a powerful stimulant and astringent. It is reckoned a medicine of great efficacy in some cachetic and chlorotic cases, in weakness of the stomach occasioned by a load of phlegm. Great benefit is said to
have been obtained from it in deeply seated rheumatic pains. In these cases it may be given from 10 grains to a scruple of the fresh root, twice or thrice a-day, made into a bolus or emulsion, with unctuous or mucilaginous substances, which cover its pungency, and prevent its making any painful impression on the tongue. Neither wine nor spirits extract its virtues. The root, dried and powdered, is used by the French to wash the skin, and is sold at a high price under the name of cypress powder. It is undoubtedly a good and innocent cosmetic. Starch may be made from the roots.

1030. DRACOPTIUM, or Drages.

Five species; viz. polyphyllinum, spinosum, sectidum, caneschatense, pertusum. Ceylon, W. Indies, America.

1031. CALLA, or Ethiopian Arum.

Two species; viz. ethiopica, palustris. Europe, Cape.

In the class Gynandrae are 32 Genera, including 270 Species, of which 25 are found in Britain.

A. (1) Cal. 5-leaved. Cor. 5-petaled. Stam. 5. (2) Cal. 5-leaved. No cor. Styl. 5. Caps. 3-celled 2-seeded.

ORDER I. MONANDRIA.

1034. ZANNICHIELLIA, or Three-headed Pond-lettuce.
One species; viz. palustris.

1035. CERATOCARUS.
One species; viz. arenarius. Tertiary.

1426. ARTOCARUS, or Bread-fruit.
Two species; viz. incisa, integrifolia.—It has a cylindric amentum or catkin, which thins gradually, and is covered with flowers; the male and female in a different amentum. In the male, the calyx is two-valved, and the corolla is wanting. In the female, there is no calyx nor corolla; the stylus is one, and the drupa is many-celled.

Though this tree had been mentioned by many voyagers, particularly by Dampier, by Rymsbus, and by Lord Anson, yet very little notice seems to have been taken of it till the return of Captain Wallis from the South seas, and since that time by others who have touched at Otaheite and some countries in the East Indies. Captain Dampier relates, that in Guam, one of the Ladrone islands, “there is a certain fruit called the bread-fruit, growing on a tree as big as our large apple-trees, with dark leaves. The fruit is round, and grows on the boughs like apples, of the bigness of a good penny-loaf; when ripe, it turns yellow, soft, and sweet; but the natives take it green, and bake it in an oven till the rind is black; this they scrape off, and eat the inside, which is soft and white, like the inside of new baked bread, having neither seed nor stone; but if it is kept above 24 hours it is hard. As this fruit is in season eight months in the year, the natives feed upon no other sort of bread during that time. They told us that all the Ladrone islands had plenty of it. I never heard of it in any other place.”

Rumphius, after describing the tree, observes, that “the fruit is shaped like a heart, and increases to the size of a child’s head. Its surface or rind is thick, green, and covered everywhere with warts of a quadrangular or hexagonal figure, like cut diamonds, but without points. The more flat and smooth these warts are, the fewer seeds are contained in the fruit, and the greater is the quantity of pith, and that of a more glutinous nature. The internal part of the rind, or peel, consists of a fleshy substance, full of twisted fibres, which have the appearance of fine wool; these adhere to, and in some measure form it. The fleshy part of this fruit becomes softer towards the middle, where there is a small cavity formed without any nuts or seeds, except in one species, which has but a small number, and this sort is not good, unless it is baked or prepared some other way; but if the outward rind be taken off, and the fibrous flesh dried and afterwards boiled with meat as we do cabbage, it has then the taste of artichoke bottoms. The inhabitants of Ambayna dress it in the liquor of cocoa nuts; but they prefer it roasted on coals till the outward part or peel is burnt. They afterwards cut it into pieces, and eat it with the milk of the cocoa-nut. Some people make fritters of it, or fry it in oil; and others, as the Sumatrans, dry the internal soft part, and keep it to use instead of bread with other food. It affords a great deal of nourish-
Bread-fruit is now reared in Jamaica and the other West India islands. Plants of this genus have also been brought to his majesty's gardens at Kew. The taste of the fruit is said to be a sort of medium between the taste of common wheaten bread, and the taste of a boiled potato. Those who prefer potatoes to ordinary bread also prefer the bread-fruit to it.

1033. CYMORUM.  
One species; viz. coccineum. Jamaica.

NIPA.  
One species; viz. fruticans. Africa.

1203. CHARA.  

1036. ELATERIUM, or Spring-gourd.  
Two species; viz. carthagineum, trifoliatum. Carthagena.

1427. PHYLLACONE.  
One species; viz. uliginosa. Terra del Fuego.

1428. CASUARINA.  
Two species; viz. eucinetifolia, nodiflora. E. Indies, New S. Wales.

1429. AEGOPRON.  
One species; viz. betulinum. Surinam, Cayenne.

ORDER II. DIANDRIA.

1037. ANGUIA.  
Three species; viz. trilobata, pedata, trifoliata. America.

1038. LEMNA, or Duck-meat.  

ORDER III. TRIANDRIA.

1040. TYLPA, Cat's-tail, Reed-mace.  
Two species; viz. *angustifolia, *latifolia.

1041. SPARGIANTUM, or Burr-reed.  

1042. ZEA, or Indian or Turkey Wheat.  
One species; viz. mays. America.

1043. COIX, or Job's-tears.  
One species; viz. lacryma. E. Indies.

1044. TRIPACUM.  
Two species; viz. dactyloides, hermaphroditum. Virginia, Canada, Jamaica.

1045. OLYRA.  
One species; viz. latifolia. W. Indies.

1046. CAREX, or Sedge, Cyperus-grass.  

1047. *Axyris.*
Four species; viz. ceratoide, amaranthoides, hybrida, prostrata. Siber. Tartary.

1039. *Omphalea.*
Two species; viz. diandra, triandra. Jam.

1048. *Tragia.*
Six species; viz. volubilis, involucrata, mercurialis, urens, chamelea, cannabina. India, Virg. Carolina.

1049. *Hernandia,* or Jack in-a-box.
Two species; viz. sonora, ovigera. W. Indies, S. America.

1050. *Phyllanthus,* or Sea-side Laurel.
Seven species; viz. grandifolia, niruri, urinaria, bacciforinus, racemosa, emblica, maderaspatensis. Arab. E. and W. Ind. Carolina.

**ORDER IV. TETRANDRIA.**

1274. *Serriculata.*
Two species; viz. *verticillata, repens.* India.

1275. *Aucuba.*
One species; viz. *japonica.* Japan.

1328. *Littorella.*
One species; viz. *lacustris.*

1275. *Cicca.*
One species; viz. *disticha.* India.

1352. *Betula,* or Birch-tree.
Eight species; viz. *alba, ablus, nana, daeacarlica, nigra, lenta, pumila, incana.* Europe, N. America.

1353. *Buxus,* or Box-tree.
One species; viz. sempervirens.—The wood is very hard and smooth, and not apt to warp, and therefore well adapted for the use of the turner. Combs, mathematical instruments, knife handles, and button moulds are made of it. An empyreumatic oil, distilled from the shavings, is often used as a topical application for the piles, and seldom fails to procure ease. It will frequently relieve the toothache, and has been given internally in epilepsies. The leaves, powdered, destroy worms. In the south of Europe it is cultivated in gardens, and kept in flower-pots, with as much attention as we bestow upon myrtle.

1054. *Urtica,* or Nettle.
28 species; viz. *dioica, pilulifer, urens, balearica, dodartii, pumila, grandifolia, cannabina, alienata, cylindrica, parietaria, ciliaria, spicata, macrophylla, rhombica, martiana, capitata, divaricata, canadensis, interrupta, nives, baccifera, arborea, capensis, frutescens, stimulans, japonica, villosa. Europe, N. Amer. E. and W. Indies.

*U.* leaves opposite, heart-shaped; bunches in pairs. This species is the common nettle. Its stings are very curious microscopic objects: They consist of an exceedingly fine-pointed tapering hollow substance, with a perforation at the point, and a bag at the base; or they are sharp tubes seated upon a bag. When the sharp point of the tube, that is to say the sting, is pressed upon, it readily punctures the skin, and the same pressure forces up an acrimonious fluid from the bag, which is squirted into the wound, and produces an effect which most persons have experienced. The plant was formerly used as an astringent, but is now disregarded. A stalk of it, when the leaves are in their prime, put into milk, coagulates it, and may serve to prepare it for being made into cheese. A leaf cut upon the tongue, and then pressed against the roof of the mouth, is pretty efficacious in stopping a bleeding at the nose. Paralytic limbs have been recovered by stinging them with nettles. The young shoots are gathered early in the spring to boil in broth or gruel. Cows eat the leaves when they are a little withered. The leaves are cut to pieces to mix with the food of young turkeys and other poultry. Cows, horses, sheep, goats, and swine, refuse them. Asses are fond of it, and cows eat it in hay. The stalks may be dressed like flax or hemp for making cloth or paper. In Kamtschatka they make use of no other material in the manufacture of cordage or sailcloth, and linen; and consider these fabrics, when produced from nettles, as superior in every respect to those made from hemp and flax. As the nettle seems of all plants the most congenial to our soil and climate, growing in all situations both fertile and barren, in spite of every attempt to extirpate it; and as there exists no doubt, that as a material of manufacture, it is not inferior to either flax or hemp, it is a singular circumstance that it has never come into general use. This, perhaps, is chiefly to be accounted for from the difficulty of collecting its seeds and handling it: difficulties, however, which a little attention and industry would probably soon enable us to overcome.

1055. *Morus,* or Mulberry-tree.
Seven species; viz. *alba, nigra, papyrifera, rubra, indica, tartarica, tinctoria.* Italy, China, Japan, America.—The mulberry is chiefly remarkable on account of the value of its leaves, as the food of that valuable insect the silk-worm. The *morus alba* or white mulberry, with leaves obliquely heart-shaped and leafy, grows in Britain in the open air, as far northward as the frith of Forth, and silk-worms may be fed with it. The fruit of the black mulberry has the common qualities of other sweet fruits, abating heat, quenching thirst, and promoting the grosser secretions; a syrup, made from the juice, is kept by the apothecaries. The bark of the roots has been in considerable esteem as a cure for worms; its taste is bitter and somewhat astringent.

**ORDER V. PENTANDRIA.**

1277. *Nephelium.*
One species; viz. *lappaceum.* India.

1056. *Xanthium,* or Lesser Burdock.
Five species; viz. *strumarium, orientale, echinatum, spinosum, fruticosum.* S. Eur. Ceylon, China, Peru.

* X.
BOTANY.

1062. POTERIUM, or Garden Burnet.

Three species; viz. *sanguisorba, hybridum, spinosum.*

* P. without thorns; stems somewhat angular.—The *sanguis-* leaves and seeds of this plant are mildly astringent, and *sorbus.*

have been used in dysenteries and hemorrhages. The seeds, when bruised, smell like cucumbers. There are large tracts of the finest parts of what are called the South Downs in England, upon which this plant forms half the indigenous pastureage. It seems to grow naturally (without being sown) only on chalky soils; but it will flourish, when sown, on any soil; on sand, clay, pest, &c. It is chiefly valuable for sheep pastures that are to be kept fully stocked. It forms a fine herbage when close bitten; but when suffered to run to a height it is rather coarse.

1070. Quercus, or Oak-tree.

20 species; viz. *phellos, molucca, gibara, acuta, glauca, cuspidata, serrata, ilicex, suber, cocicifera, pri- tium, dentata, nigra, rubra, alba, esculentus, robur, eglipsa, cerris, ferrina.*

* Q. leaves on leaf-stalks, oblong, broadest towards the robur- end; indentations rather acute, angles blunt; fruit nearly sitting.

* Q. leaves oblong, on short leaf-stalks, blunt, wing-ferrina cleft, with indentations; fruit mostly solitary, on long fruit-stalks. *Withering,* vol. iii. p. 387. The oak is a native of the temperate climates. It loves hilly better than boggy ground, and thrives best, while young, in large plantations. Its roots descend deep into the earth, and therefore will not bear to be transplanted. Much lopping destroys it. Grass will hardly grow beneath it. The wood is hard, tough, tolerably splintery; and therefore is preferred before all other timber for building ships of war. It is well adapted to almost every purpose of the carpenter; but an attempt to enumerate the uses of this well-known wood, would be equally superfluous and difficult. Oak saw-dust is the principal indigenous vegetable used in dyeing fustian. All the varieties of drabs and different shades of brown are made with oak saw-dust, differently managed and compounded. The ashes or oak ashes are likewise used in dyeing, as a substitute for galls. The black, got from them by the addition of copperas, is more beautiful than that from galls, but not so durable. The bark is universally used to tan leather; and it is said, that the saw-dust has been used for the same purpose with equal success. The bark is used to make writing ink. Its astrignent properties might be rendered useful in medicine. An infusion of it, with a small quantity of copperas, is used by the common people to dye woolen of a purplish blue: the colour, though not very bright, is durable. The balls or galls upon the leaves, are occasioned by a small insect with four wings, called *cy- nips quercifolii,* which deposits an egg in the substance of the leaf by making a small perforation in the under surface. The ball presently begins to grow, and the egg in the centre of it changes to a worm; this worm again changes to a nymph, and the nymph to the flying insect, with four wings. Horses, cows, sheep, and goats, eat the leaves. Swine and deer fatten on the acorns. The oak grows in a good soil sometimes to a most immense size. At Little Shelsley in Worcestershire,

1063. Pharus.

One species; viz. latifolius. Jamaica, S. Amer.

ORDER VII. HEPTANDRIA.

1064. Guettarda.

One species; viz. speciosa. Java, W. Indies.

ORDER VIII. POLYANDRIA.

1065. Ceratophyllum, or Hornwort.

Two species; viz. *demersum,* submersum.

1066. Myriophyllum, or Water Milfoil.

Two species; viz. *spicatum,* verticillatum.

1067. Sagittaria, or Arrowhead.

Five species; viz. *sagittifolia, obtusifolia, lancifolia, acutifolia, trifolia.* Europe, Asia, America.

* S. leaves arrow-shaped, acute.—It grows in ditches and on the banks of slow-running rivers. There is always a bulb at the lower part of the root, growing in the solid earth beneath the mud. This bulb constitutes a considerable part of the food of the Chinese, and upon that account they cultivate it. Horses, goats, and swine eat it. Cows are not fond of it.

1176. Begonia.

Three species; viz. ferruginea, capensis, urtica. Cape, E. and W. Indies.

1068. Thelgonum, or Dog-cabbage.

One species; viz. cynogroambe. S. of Europe.
Bany.

Monorea.

Two species; viz. *avellana, columna. -Europe, N. America.

C. - This wood is profitably planted in many places avellana in hedges and coppices, for the purpose of cutting down portions in rotation, to be converted into charcoal for forges. The wood is used for fishing-rods, walking-sticks, hoops, &c. The roots are preferred where beautiful wood is wanted for inlaying or staining. It is a practice in Italy, to put chips of hazel into turpentine to clear it, which it does in 24 hours. In countries where yeast is scarce, they twist together hazel twigs, so as to leave a multitude of chinks; these they steep in their ale while it is fermenting; then hang them up to dry, and when they have dried again they put them into the wort instead of yeast. Charcoal of hazel, when used in drawing, leaves stains which are easily rubbed out. The nuts, which are agreeable to most people, afford, by pressure, an oil for the use of painters.

Platanus, or Plane-Tree.

Two species; viz. orientalis, occidentalis. Levant, N. America.

Liquidambar, or Sweet Gum.

Two species; viz. styraciflua, peregrina. Levant, N. America.—The resinous juice of the former of these species, brought from America, was once used as a perfume, but is now neglected.

ORDER IX. MONADELPHIA.

Pinus, or Pine-tree.

12 species; viz. *sylvestris, pinea, taeda, cembra, strobus, cedrus, larix, picea, balsams, canadensis, abies, orientalis. Europe, north of Asia, America.

P. leaves in long pairs, rigid; cones egg-conical, sylvestris mostly in pairs, as long as the leaves; scales oblong, blunt. Scotch fir.—This species, which is a native of our island, flourishes best on a poor sandy soil. In a grove the trunk is tall and naked; in open places branched. It does not bear the least clipping, as the terminating buds send forth the branches. The roots spread near the surface of the earth, except the central root, which pushes perpendicularly downwards. If it is either broken off or interrupted in its passage, the stem ceases to shoot upwards, and the tree remains a dwarf. Hence is it apt to suffer by transplanting. The bark will tan leather. In the north of Europe bread is thus made from it by the inhabitants: They choose a straight tree, as these have least resin, and strip off the bark in the spring, when it separates most readily. This they dry gently in the shade; then in a greater heat, and reduce it to powder. With this powder they mix a small quantity of corn meal, and with water they knead it into bread. This they eat, not only in times of scarcity, but at other times, from an apprehension, that long disuse might render it dis-
Monoezia. B O T A N Y.

agreeable to them. Their children are very fond of the fresh bark in the spring time, either shaved with a knife or grated with a rasp. The young shoots, distilled, afford a fragrant essential oil. Sheep and goats are not fond of it. Horses refuse it. Burnt with a close smothering fire, the wood of this species yields tar. The species called latix has risen into considerable reputation in this country, on account of its beauty, rapid growth, and the value of the timber. It is extremely hardy, growing in Siberia almost to the coasts of the Icy sea; but this very hardiness, or capacity of vegetating with a very small degree of heat, renders it in this country delicate when young. The first warmth of the spring is sufficient to bring forth its buds, which are thus, by the unsteadiness of our climate, exposed to frequent pernicious frosts. In this way nurserymen often suffer great losses by the latix, in consequence of an early spring and a premature vegetation, which is afterwards nipt by frosty weather. From the trees of the genus pinus the different turpentine are extracted by bleeding the trees, by wounds in the bark or branches.

1079. Cupressus, or Cypress-tree.
Six species; viz. sempervirens, disticha, thyoides, juniperoides, pendula, japonica. Crete, Cape, Japan, N. America.

1080. Plukenetia.
One species; viz. volubilis. E. and W. Indies.

1081. Dalechampia.
Two species; viz. colorata, scandens. W. Indies, New Granada.

1082. Agalympha.
Five species; viz. virginis, virgatea, indica, villosa, notialis. N. America, E. and W. Indies.

1083. Croton, or Base Ricinus, Tallow-tree.
23 species; viz. variegatum, cascarilla, castaneifolium, palustris, glabellum, tinctorium, glandulosum, argenteum, sebiferum, japonicum, acutum, tigilum, lucidum, lacciferum, balsamiferum, aromaticum, humile, riciocarpus, moluccanum, flavens, capense, lotum, spinosum. China, Japan, W. Indies, N. America.

279. Cupania.
One species; viz. americana. West Indies, Commandel.

1084. Jatropha, or Cassado, Manihot.

1085. Ricinus.
Four species; viz. inermis, communis, tanacera, mappa. Vera Cruz.—The species called R. communis produces nuts about the size of small beans, which like bitter almonds are deleterious. An oil is obtained from them by expression, called castor oil, which is used as a safe and mild laxative; half an ounce or an ounce for an adult, and a dram for an infant.

1086. Sterculia.
Three species; viz. halsungans, sevidia, platamifolium. Arabia, E. and W. Indies, China.

1087. Hurua, or Sandalwood-tree.
One species; viz. crepita. Mexico, W. Indies.

1088. Hippomanx.
Three species; viz. mancinella, biglandulosa, spinosa.

1278. Gnetum.
One species; viz. gnemon. India.

1279. Stillington.
One species; viz. sylvatica. Carolina.

ORDER X. SYNCGENESIA.

1089. Trichosanthes, or Serpent-cucumber.
Four species; viz. anguina, nervifolia, cucumerina, anular. E. Indies, China.

1090. Momordica, or Male Balsam-apple.
Eight species; viz. balsamina, charantia, operculata, luvis, cylindrica, trifolia, pedata, elaterium. S. Europe, India, America.

1091. Cucubita, or Gourd.
Seven species; viz. lagenaria, bispida, ovifera, pepo, verrucosa, melopepo, citrullus. E. and W. Indies, America.

1092. Cucumis, or Cucumber.
13 species; viz. colocynthis, prophetarum, anguria, africana, acutangulus, melo, dudaim, chate, salvinus, anguina, flexuosus, conoma, madraspatana. Levant, India, Africa, Jamaica.—The species called sativus, is the ordinary garden cucumber. It is less apt to grow rancid by keeping than others of the class. C. colocynthis, called colocynthica or bitter apple, is a native of Turkey. The fruit is about the size of an orange. Its medullary part, freed from the rind and seeds, is light, white, and spongy, composed of membranous leaves, of an extremely bitter, nauseous, acrimonious-taste. Colocynthis is one of the most powerful and violent cathartics; but is accounted dangerous by the best physicians. The best mode of abating its virulence, consists of triturating it with gummy farinaceous substances, or oily seeds. Without this precaution, a few grains of it will often disorder the body, and even occasion a discharge of blood. The C. melo is used in hot countries as a cooling and agreeable food.

1093. Bryonia, or Bryony.
* B. leaves hand-shaped, rough on both sides, with dioica. callous points; male and female flowers on different plants.—The root is purgative and acrid. A draught of it in substance, or half an ounce of it infused in wine, is a full dose. A cold infusion of the root in water is used externally in sciatic pains. A cataplasme of it is a most powerful diuretic. A decoction, made with one pound of the fresh root, is the best purge for horned cattle. The plant is rough, growing on dry banks under hedges, and climbing upon the bushes. The roots are large, sometimes as thick as a man’s thigh. Their juice, when fresh, soon excoriates the skin, but in drying they lose much of their acrimony.
1904. *Sicyos*, or *Single-seeded Cucumber*.
Three species; viz. angulatus, laciniata, gircini. America.

**ORDER XL. GYNNANDRIA.**

1905. *Andracine*, or *Base Orpine*.
Two species; viz. telephioides, fruticosa. Italy, Levant, Egypt.

ORDER I. **MONANDRIA.**

1430. **Pandanus, or Screw-pine.**

One species; viz. odoratisima. East Indies, South sea isles.

1096. **Najas.**

One species; viz. marina. Europe.

ORDER II. **DIANDRIA.**

1097. **Vallisneria.**

One species; viz. spiralis. Italy.

1099. **Cecropia, or Trumpet-tree.**

One species; viz. peltata. Jamaica.

1098. **Salix, or Willow.**

34 species; viz. *acuminata, alba, amygdalina, aurita, caprea, cinerea, fragilis, fusca, herbacea, lanata, lappounum, monandra, myrsinites, pentandra, repens, reticulata, retusa, rosmarinifolia, rubra, triandra, viminalis, vitellina, phyllicifolia, japonica, hastata, aegyptiaca, baillonica, helix, arbuscula, myrtilloides, integra, glauca, arenaria, incubacea. Europe, America.

* S. leaves strap-shaped, upper leaves oblique; catkins monandra downy; one stamen.—Rose willow, or purple willow. Withering. Called by Linnaeus S. purpurea. Baskets, erades, and all sorts of twig-work are made of its long, slender, and flexible shoots.

* S. leaves oblong, spear-shaped; flowers with three triandra. stamens, sometimes two. Smooth willow.—The bark, in doses of one or two drams, cures angina.

* S. leaves egg-shaped, acute; flowers with five sta-pentandra mens. Sweet willow, or bay-leaved willow. Called by Linnaeus S. hermaphrodita. The wood crackles greatly in the fire. The dried leaves afford a yellow dye. Used in Yorkshire to make the large sort of baskets.

* S. leaves egg-spear-shaped, acute, smooth above, see-vitellina; M in 2
nature like gristle. **Yellow willow.**—The wood is white and very tough. The shoots are used by basket-makers.

*S. leaves egg-spear-shaped; leaf-stalks toothed with glands. Crack willow.—* A quick grower, and bears cropping. Thrives in any soil if moist. The bark in doses of one or two draughts cures agues.

**rubra.**—S. leaves strap-spear-shaped, acute. **Red willow.**—The twigs much sought after by basket-makers.

**viminalis.**—S. leaves spear-strap-spear-shaped, very long, acute, silky underneath. Branches rod-like. **Osier.**—Much used for making hoops, and the larger baskets. Is planted to prevent the banks of rivers from being washed away by torrents.

**alba.**—S. leaves spear-shaped, tapering to a point, serrated, downy on both sides; the lowermost serratures glandular. **White willow.** Grows quick, and bears lopping. The bark collected in summer when full of sap, and dried by a gentle heat, is extremely valuable, as a substitute for Peruvian bark, in the cure of intermittent fevers. It will tan leather. Horses, cows, sheep, and goats, eat the leaves and young shoots. If a shady walk with willows is wanted, male sets only ought to be planted, otherwise they will spreadly multiply so as to form a thicket instead of a grove.

**ORDER III. TRIANDRIA.**

1100. *Empetrum,* or **Berry-bearing Heath.**

Two species; viz. *nigrum,* album.

1101. *Oxyris,* or **Poets-cassia.**

Two species; viz. *alba,* japonica. South Europe, Japan.

1421. *Maba.

One species; viz. *elliptica.** Tongataboo, Namoka.

1331. *Restis.*

Nine species; viz. paniculatus, verticillaris, dichotomus, viminalis, trilobus, simplex, elegia, cernus, tectorum. C. of G. Hope.

1102. *Exoeccaria,* or **Abies wood.**

One species; viz. *agallocha.** Amboyna, Malacca, China.

1280. *Catarius.*

Two species; viz. spiciflorus, ramiflorus. East and West Indies.

**ORDER IV. TETRANDRIA.**

1103. *Trophis.*

One species; viz. *americana.** Jamaica.

1104. *Batis.*

One species; viz. *maritima.** Jamaica.

1105. *Viscum,* or **Misiletoe.*

Nine species; viz. *album,* rubrum, purpureum, apuntioideae, capense, verticillatun, pauciflorum, terrestre, rotundiflorum. Europe, Cape, West Indies, North America.

*V. leaves spear-shaped, blunt; stem forked; spikes axillary. **White misiletoe.** A singular parasitical evergreen plant. The barren plant opposite to the fertile one. The root imminates itself into the substance of the tree on which it grows. Blossom greenish white. Berries whitish. Birdlime may be made from the berries or the bark. Birds having swallowed the berries, void them unchanged upon trees, where they take root. No art has hitherto been able to make them take root in the earth. Sheep eat it greedily; and in the southern English counties, where chiefly it grows, it is often torn from the trees to feed them. It is said to preserve them from the rot. If the berries, when fully ripe, be rubbed on the smooth bark of almost any tree, they will adhere closely, and produce plants the following winter.
BOTANY.

1109. Zanthoxylum. Two species; viz. clava-herculis, trifoliatum.

1110. Astronium. One species; viz. graveolens. South America.

1281. Canarium. One species; viz. communis. India.

1112. Antidesma, or Chinese Laurel. One species; alexiteria. E. Indies, China, Japan.

1113. Iresine. One species; viz. celosia. Virginia, Jamaica.

1112. Spinacia, or Spinage. Two species; viz. oleracea, fera. Siberia.

1114. Acantha, or Virginian Hemp. One species; viz. cannabina. Virginia.

1115. Cannabis, or Hemp. One species; viz. sativa. India. See Agriculture Index.

1116. Humulus, or Hops. One species; viz. * lupulus. Europe.—Cultivated in England to preserve malt liquors. The young shoots are eaten in the spring instead of asparagus. Strong cloth is in Sweden made from the stalks, which are soaked in water all winter, and in the spring dressed like flax. A decoction of the roots, or from 20 to 30 grains of the extract, is said to be sudorific.

1118. Fevilla. Two species; viz. triloba, cordifolia. W. Indies.

ORDER VI. HEXANDRIA.

1119. Tamus, or Black Bryony. Two species; viz. * communis,cretica. South Europe, Cape.

1120. Smilax, or Rough Bindweed. Four species; viz. aspera, excelsa, zelania, sarsaparilla, china, rotundifolia, laurifolia, tamnoides, caduca, bona nox, herbacea, tetragona, lanceolata, pseudochinia. South Europe; East Indies, North America.

1122. Dioscorea, or Indian Yam. Twelve species; viz. pentaphylla, tripithya, trifida, aculeata, alata, bulbifera, sativa, villoso, oppositifolia, septemloba, quinquefolia, japonica. East and West Indies, North America.

ORDER VII. OCTANDRIA.

1124. Rhodiola, or Rose-root. One species; viz. * rosea.—The root, particularly when dried, has the fragrance of a rose; but cultivated in a garden it loses most of its sweetness.

ORDER VIII. ENNEANDRIA.

ORDER IX. DECANDRIA.

1127. Carica, or Papaw tree. Two species; viz. papaya, posoposa. E. and W. Indies.

1130. Schinus, or Indian Mastic tree. Two species; viz. molla, areina. Peru, Brazil, Chili.

1131. Coriaria, or Myrtle-leaved Sumach. Two species; viz. myrtifolia, ruscifolia. Spain, S. France, Peru.

ORDER X. DODECANDRIA.

1133. Datisca, or Base Hemp. Two species; viz. cannabina, hirta. Crete, N. America.

1134. Menispernum, or Moon seed. Eleven species; viz. canadenum, virginicum, japonicum, carolinum,
BOTANY.

Polygamy.

* T. leaves solitary, strap-shaped, prickle-pointed, near baccata. together. receptacle of the male flowers somewhat globular. It grows best on a moist loamy soil, and languishes in bogs and dry mountains. It bears transplanting, even when old; and, as an evergreen hedge, is a valuable screen to delicate plants. The wood is used for bows, axletrees, spoons, cups, cogs for mill-wheels, and flood gates for fish ponds, which hardly ever decay. The berries are sweet, viscid, and harmless. The fresh leaves are fatal to the human species.

Order XI. POLYANDRIA.

1133. Clifforia.
18 species; viz. odorata, ilicifolia, ruscifolia, ferruginea, graminea, polygonifolia, filifolia, crenata, pulchella, trifoliate, sarmentosa, strobilifera, obcordata, ternata, juniperina, falcata, teretifolia, ericaefolia. C. of G. Hope.

1432. Hedycaria.
One species; viz. dentata. N. Zealand.

Order XII. MONADELPHIA.

1134. Juniperus, or Juniper-tree.
11 species;viz. *communis, thurifera, barbadensis, bernudiana, chinensis, sabina, virginiana, oxycedrus, phoenicis, lycina. Europe, Bermudas, America. *J. leaves three together, expanding, sharp pointed, longer than the berry. It grows in all soils and situations, and to a corresponding variety of sizes. It is easily transplanted, and bears cropping. Grass will not grow beneath it, but the *avena pratensis destroys it. The wood is hard and durable. The bark may be made into ropes. The berries are two years in ripening. When bruised they afford a pleasant diuretic liquor, but it is not easy to prevent its growing sour. It is esteemed a good antiscorbutic. Ardent spirits, impregnated with the essential oil of those berries, is termed gin, though it is said that some distillers know how to produce the same effect, by means of the spirit of terpentine. Gum sandarach, more commonly called peauce, is the product of this tree. Horses, sheep, and goats eat it. From the J. acutiss, a gum resin called olbanum is produced. From the J. sabina, is extracted an essential oil, which is accounted a most powerful emmenagogue. It is a warm, irritating, aperient medicine.

1135. Taxus, or Yew-tree.

CLASSIS XXIII.

POLYGAMIA (o).

Order I. MONOECIA.

(0) The character of this class consists of the following circumstances: that every plant belonging to it produces, 1st, Hermaphrodite flowers, that is, flowers having both stamens and pistils in the same flower; and, 2dly, In addition to the hermaphrodite flowers, the same plant produces also other flowers, not hermaphrodite, but either male or female, that is, which have stamens, one or more, without pistils, or the reverse. The hermaphrodite
maphrodite flowers of this class are usually imperfect in one of their parts (either stamens or pistils), which renders an additional male or female flower necessary. Sometimes there are two hermaphrodite flowers on the same plant of different powers: and this circumstance constitutes the polygamy, or is understood to bring the plant under the present class. As in the two former classes, the male and female flowers are here distinguished by prefixing to them the figures (1) and (2). The hermaphrodite flowers are here marked (3).

ORDER
Polygania.

B O T A N Y.

ORDER I. MONOECIA.

1141. MUSA, or Plantain-tree.
Three species; viz. paradisaica, sapientum, troglodytarum. E. and W. Indies.

1144. VERATRUM, or White Hellebore.
Three species; viz. album, nigrum, luteum. Russia, Austria, Italy, N. America.—The V. album grows spontaneously on the mountains of Switzerland and Germany. The root is nauseous and acrid. If wounded, when fresh, it emits an acrid juice, which is said to prove dangerous when mixed with the blood by an wound. The powder of the dry root applied to an issue, occasions violent purging. Sniffed up the nose, it is a strong, but not always a safe sterntary. It is also a violent emetic. The ancients used it in desperate cases; but modern practice rejects it, though it is said to have been given with success to the amount of a scruple in cases of mania.

1333. SPINIFEX.
One species; viz. squarrosus. E. Indies.

1145. ANDROPOGON, or Beard-grass.
The A. nardus, Indian nard or spikenard, as it comes from the East Indies, is a matted congeries of fibres issuing from one head, and probably forming the root of the plant. Spikenard has a warm, pungent, bitterish taste, and a strong not very agreeable smell. It is stomachic and carminative; and said to be alexipharmic, diuretic, and emmenagogue; but it is at present little employed.

1146. HOLCUS, or Indian Millet.
* H. husks two-flowered, woolly; hermaphrodite floret awnless; male floret with a bent awn, inclosed in the calyx.—This grass flourishes well on any moist soil, and grows very generally, except on the most dry and barren ones. It should be sown chiefly with a view to pasture by sheep. It makes a soft spougy hay unfit for horses.

1147. APLUDA.
Four species; viz. mutica, aristata, zeugites, digitata. E. and W. Indies, N. America.

1148. ISCHÆMUM.
Two species; viz. muticum, aristatum. India, China, Carolina.

1149. CENCRUS, or Hedgehog-grass.
Nine species; viz. racemosus, lappaceus, muricatus, capitatus, echinatus, tribuloides, ciliaris, granularis, frutescens. S. Europe, Virginia, W. Indies.

1150. ÂÆGILOPS, or Hard-grass.
Four species; viz. ovata, cuspidata, triuncialis, squarrosa. S. Europe, Carolina.

1334. MANIBURUS.
One species; viz. myurus. E. and W. Indies, N. America.

1151. VALANTIA, or Grass-wort.

1152. PARITARIA, or Pellitory.
Eight species; viz. *officinalis, indica, judaica, lusitanica, urticefolia, erecta, zeylanica, microphylla. S. Europe, Canaries, isle of Bourbon.

1153. ATRIFLEX, or Oroche, Sea Parslane-tree.

1283. TERMINALIA, or Bensoin.
Two species; viz. catappa, benzoin. E. Indies.—From the last of these species a resin of the same name is supposed to be extracted, though others represent it as the product of another plant called styrox benzoe. Benzoin is used in perfumes, and as a cosmetic.

160. BRAEBEUM, or African Almond.
One species; viz. stellulifolium.

1154. CLUSIA, or Balsam-tree.
Four species; viz. rosea, alba, flavâ, venosa. America, Jamaica.

1142. OPHIOXYLUM.
One species; viz. serpentinum. E. Indies.

1155. ACKER, Maple-tree.
17 species; viz. *campestræ, *pseudoplatanus, sempervirens, tataricum, rubrum, saccharinum, dissectum, japonicum, palustre, septemlobum, pictum, platanoidea, pensylvanicum, monspessulanum, creticum, trifidum, negundo. Europe, N. America, Japan.
* A. leaves 5-lobed, blunt, unequally serrated; flowers pseudo-in compound pendent bunches. Sycomore tree, sy-planæus. camore maple.—It flourishes best in open places and sandy ground, but will thrive in a richer soil. It grows quick, is easily transplanted, bears cropping, and the grass furnishes under its shade. It is said to grow well near the sea, and that a plantation of these trees, at 50 feet asunder, with three sea lallow thorns between every two of them, will make a fence sufficient to defend the herbage of the country against the sea spray. Gent. Mag. 1757, p. 252. The wood is soft and very white, and is used by the turners. By boring a hole into the body of the tree, when the sap rises in spring, a sweetish watery liquor is obtained, which is used in making wine, and, if inspissated, affords a fine sugar. From the A. saccharinum large quantities of sugar are annually thus made in North America. See United States, and Sugar.

1143. CELTIS, or Lote, Nettle-tree.
Three species; viz. australis, occidentalis, orientalis. S. Europe, Virginia, W. Indies.
1157. Cownia, or Chaw-stick.
One species; viz. dongenings. West Indies.

1158. Mimosa, or Sensitive Plant.
3 species; viz. simplicifolia, inga, sagiota, nodosa, natans, bigeminina, anguis-cati, terginnenn, latifolia, purpurea, rizicata, viva, circinella, ciaures, casta, sensitiva, pudica, entada, scandens, plena, virgata, punctata, pernambucana, arborea, lebebeck, odoratissima, speciosa, vasa, latissilica, polystachya, muricata, peregrina, glaucia, cinerea, cornigera, catechu, horrida, eburnea, latrunum, tortuosa, sarseniana, nilotica, pigra, asperata, senegal, cusia, pinnavia, intia, semispinosa, quadrivalvis, tenusilium, ceratonia, tamarindifolia. Egypt, E. and W. Indies, New Holland.

—The plants of this genus possess the singular property of shrinking or drawing in their leaves, when touched, which has obtained for them the English appellation of sensitive plants. From the species M. catechu a vegetable extract is obtained, which has long improperly received the appellation of terra japonica or Japan earth. This extract is outwardly of a reddish colour, internally of a dark brown, with a slight cast of red. It is capable of being reduced to the state of a powder; and is a mild but powerful astringent. It is particularly useful in alvine fluxes; and where these require astringents, no one is so beneficial. It is likewise employed in uterine products, and in laxity and debility of the viscera in general. It is often suffered to dissolve leisurely in the mouth, as a topical astringent, for laxities and excretures of the gums, for aphthisous ulcers in the mouth, and similar affections; and it is in some other cases applied externally under the form of solution, and as an ointment. Catechu dissolves in water, with the exception of its impurities, which amount to an eighth part of the mass. Rectified spirit dissolves seven-eighths of the pure matter into a red liquor, leaving, undissolved, an insipid mucilaginous substance. The best form of administering it is that of simple infusion in warm water, with the addition of some cinnamon or cassia. From the M. nilotica gum arabic exudes, the uses of which are well known to be extremely numerous. The insippiated juice of the unripe fruit of this tree is termed acacia, and is used as a mild astringent medicine.

ORDER II. DIOECIA.

1159. Gleitishia, or Three-horned Acacia.
Two species; viz. triacanthos, inermis. Java, N. America.

1160. Fraxinus, or Ash-tree.
Three species; viz. excelsior, ornus, americana. S. Europe, N. America.

excelsior. * F. leaflets serrated; flowers without petalae.—It flourishes best in groves, but grows in a rich soil, though in the open field. It bears transplanting and lopping. Horses, cows, sheep, and goats, eat it; but it is said to spoil the milk of cows. It will give a good, though not a beautiful green, to cloths that have been dyed blue. The wood is nearly as good when young as when old. It is hard and tough, and much used to make the tools employed in husbandry. The bark is used to tan calf-skin. An infusion of the leaves, from half an ounce to an ounce, is a very good purge; and a decoction of two drams of the bark, or of six drams of the leaves, has been used to cure agues.

1161. Diospyros, or Indian Date-plum.
Five species; viz. lotus, virginius, kaki, hirsuta, ebenum. Italy, Barbary, Ceylon, N. America, Japan.

1163. Nyssa, or Tupelo-tree.
One species; viz. aquatica. N. America.

1164. Anthospermum, or Amber-tree.
Three species; viz. ethiopicum, ciliare, herbaceum. C. of G. Hope.

1165. Stilbe.
Three species; viz. pinastra, ericoides, curns. C. of G. Hope.

ORDER III. TRIOECIA.

1166. Ceratonia, or Crab-tree, St John's Bread.
One species; viz. siliqua. Spain, Sicily, Levant, Chili.

1168. Ficus, or Fig-tree.
15 species; viz. carica, sycomorus, religiosa, benjamina, benghalensis, indica, racemosa, pertusa, pumila, toxicaria, maculata, trigona, hispida, heterophylla, microcarpa. S. Europe, India, China, America.—The dried fruit of the F. carica, or ordinary fig-tree, is sometimes used in medicine as a soft emollient sweet substance. It is much esteemed by some as a suppressive; in which case it is applied as warm as it can well be endured.

In the class Polygamia are
34 Genera, including 222 Species, of which 15 are found in Britain.

CRYPTOGAMIA.

ORDEN L FERNS.

Sect. I. Fructificationes spiked.

* E Spike scattered. Fructificationes target-shaped, valved at the base.  
* C. (1) Catkin tiled. Pollen or dust covering the scale. (2) Sheath sword-shaped. Drupe with a woody kernel.  
* Z. (1) A cone with scales covered beneath with pollen. (2) A cone with scales in each border. Drupe solitary.  
* O. A 2-rowed spike. Fructificationes 5-valved.  
* O. A jointed spike. Fructificationes cut round.  
* O. Spike branchy. Fructificationes 2-valved.

Sect. II. Fructificationes frondosae, in the under surface.

* A. A spot occupying the whole disc.  
* P. Distinct spots on the disc.

(o) This class contains a number of vegetables whose stamens and pistils are too minute to admit of that mode of investigation which prevails through the preceding classes. The structure too of these vegetables differs considerably from that of other plants.

The Filices or Ferns constitute the first order. Their flowers are generally disposed in spots or lines on the under surface of the leaves, but sometimes in spikes. In the male flowers the anthers are found sitting or supported on a very short filament, egg-shaped or globular, scattered on the under surface of the leaves. The male flowers unite so as to form a spike or bunch, or form lines or dots undernesthe the leaves, either on the surface at the edge, or at the point. In some cases they entirely cover the under surface. None of the flowers have any corolla, or even a calyx, excepting perhaps a scale formed from the leaf, opening, containing globules. The seeds are very minute and globular.

The second order, called Musci or Mosses, have the female parts of fructification inclosed in a veil, which adheres to the top of the ripe capsules, and covers it. Capsule opening transversely. Stem leafy. Leaves membraneaceous, reticulated; after being dead, reviving when soaked in water. In general the stamens and pistils are on separate flowers on the same or distinct plants.

The third order, or Algae, includes a division of plants which scarcely admit of a distinction of root, stem, and leaf; much less can the parts of their flowers be described. Their substance is flesh-like or leather-like, membraneous or fibrous, jelly-like or horn-like, or resembling calcareous earth. The female fructifications are either found in saucers or tubercles, as in lichens; in hollow bladders, as in fucus; or dispersed through the substance of the plant, as in udos. The aquatic genera, which grow on the sea-coast, are called, in ordinary language, sea-weeds, or sea-ware, and, by incineration, produce soda or mineral alkali. The lichens are of much importance in the economy of nature. They grow on the barren rocks, and their remains form a soil on which better vegetables afterwards flourish. Some of them afford valuable colours.

The order of Fungi, or Mushrooms, consists of plants mostly of a cork-like texture, and short duration, bearing their seeds either in gills or tubes, or attached to fibres or to a spongy substance. As little is known of their fructification, the generic characters are taken from their external form.
BOTANY.

ANY. Cryptogamia.

1176. HEMIONITIS. Lineae disci decussantes.
* 1178. ASPLENIUM. Lineae disci subparallelis, variae.
* 1175. BLECHUM. Lineae disci costae utrinque adjacentes.
1177. LONGITIS. Lineae marginis ad sinus.
* 1174. PTERIS. Lineae marginis ad peripheriam.
* 1180. ADIANTHUM. Macula apicem marginis reflexo obtecta.
* 1181. TRICHOMANN. Fr. solitaria, margini ipsi inserte.

Sect. III. Fructificationes radicales.

1182. MARSILIA. Fruct. 4-capsularis.
* 1183. PILULAREA. Fruct. 4-locularis.
* 1184. ISOETES. Fruct. 2-locularis.

ORDO II. MUSCI.

Sect. I. Acauloteri.

1186. PORELLA. Anthera pertusa poris.
1187. SPHAGNUM. Anthera ore levii.

Sect. II. Calycotrichia diclini.

* 1191. SPLANCHNUM. Anth. cum apophysi maxima.
* 1192. POLYTRICHUM. Anth. cum apophysi minimis, marginatis.
* 1193. MNTIUM. Anth. sine apophysi.

Sect. III. Calycotrichia monoclini.

* 1189. PHASCUM. Anth. operculata, ore ciliato.
* 1194. BRYUM. Anth. pedunculo terminali à tuberculo.
* 1195. HYPNUM. Anth. pedunculo laterali è pericheto.
* 1190. FONTINALIS. Anth. sessilis, pericheto imbricato obvoluta.
* 1188. BUXBAUMIA. Anth. pedunculata, altero lateri membranae.

ORDO III. ALGÆ.

Sect. I. Terrestres.

* 1198. MARCHANTIA. Fl. calyce communis peltato, antbus florido.
* 1196. JUNGERMANNIA. Fl. calyce simplici, 4-valvi.
* 1197. TARGIONIA. Fl. calyce 2-valvi.
* 1201. ANTHOCEROS. Fl. calyce tubuloso. Antheter subtulata, bivalvis.
* 1199. BLASIA. Fr. cylindrica, tubulosa.
* 1200. RICCIA. Fr. granulis frondi innatis.
* 1202. LICHEN. Fr. receptaculo levii nitido.
* 1208. BYSSUS. Substantia lanuginosa, vel pulve-rulentia.

ORDER III. ALGÆ.

Sect. I. Terrestrial.

* M. Flower with a common calyx, target-shaped; flowering underneath.
  J. Flow. calyx simple, 4-valved.
  T. Flow. calyx 2-valved.
  B. Fructif. cylindrical, tubular.
  R. Fructif. granules imbedded in the frond.
  L. Fructif. receptacle even, shining.
  R. Substance downy, or powdery.

ORD. II. MOSSES.

Sect. I. Not calyptrated, i.e. not veiled.

* L. Anther 2-valved, sitting.
P. Anther pierced with holes.
S. Anther with a level mouth.

Sect. II. Veiled diclinous.

* S. Anth. with a very large excescence.
P. Anth. with a very small excescence, bordered.
M. Anth. without an excescence.

Sect. III. Veiled monoicous.

* P. Anth. lidded, mouth fringed.
B. Anth. on a terminal fruit-stalk arising of a little solid pimple.
H. Anth. on a lateral fruit-stalk out of an involu-crum or cover.
Anth. sitting, enveloped in a tiled cover.
B. Anth. on a fruit-stalk, one side membranous.

N.B. The term anthera in this order ought rather to be translated by the word capsule, as there are seeds contained in it.
Sect. II. Aquatica.

- 1204. TREMELLA. A. gelatinosa.
- 1206. ULVA. A. membranacea.
- 1205. FUCUS. A. coriacea.

Sect. I. Pileati.

- 1209. AGARICUS. Pileus subsatus lamellatus.
- 1210. BOLETUS. Pileus subsatus porosus.
- 1211. HYDNUM. Pileus subsatus echinatus.
- 1212. Phallus. Pileus subsatus levis.

Sect. II. Pilei destituti.

- 1213. CLATHRUS. F. cancellatus.
- 1214. HELVella. F. turbinata.
- 1215. PEZIZA. F. campanulata.
- 1216. CLAVARIA. F. oblonga.
- 1217. LYCOPEERON. F. globosa.
- 1218. MUCOR. F. vesicularis stipitatus.

Order I. FERNS.

1169. Equisetum. E. stem naked, rough, somewhat branched at the base. Rough horsetail, shade-grass, pewter-wort, Dutch rushes. The turners or cabinet-makers use it to polish their work. It is said to be wholesome to horses, but hurtful to cows. Sheep dislike it.

1222. Cycas, or Todd a Pana. Two species. E. Indies, China, Japan.

1171. Ophioglossum, or Adder’s Tongue. Nine species; one British. Europe, East and West Indies, America.

1172. Osmunda, or Flowering Fern. 21 species; 4 British. Europe, America.

1179. Polyodium, or Polypody. 78 species; 18 British. Europe, Madeira, India, America. 

1180. Adiantum, or Maiden-hair. 27 species; one British. Europe, Africa, America.
1181. TRICHOMANES, or Tunbridge Maiden-hair. 13 species; two British. S. Europe, Cape, China, America.

1182. MARSEILLE. Three species. Siber. France, Italy, S. Amer.

1183. PILULARIA, or Pepper-grass. One species; British.

1184. ISOTELES, or Quillwort. Two species; one British. Coromandel.

ORDER II. MUSCI.

1185. Lycopodium, or Club-moss. 20 species; three British. E. and W. Indies, Madeira, America.

clavatum. * L. leaves scattered, terminating in threads; spikes cylindrical, on fruit-stalks, in pairs. Common club-moss, wolf’s claw.—In Sweden they form it into mats or basins, which lie at their doors to clean shoes upon. It restores rosy wine in a few days. The seeds flash when cast into a flame, and are said to be sometimes used in theatres to imitate lightning. They are with difficulty made wet, and if scattered on a bason of water, the hand may be dipped to the bottom without wetting it.

1186. PORELLA. One species. Pennsylvania.

1287. Sphagnum, or Bog-moss. Three species; all found in Britain.

1192. Polytrichum, or Golden Maiden-hair. 18 species; 16 British. Jamaica, Magellan.

1193. Mniium. 20 species; all British.

1194. Bryum. 93 species; British.

1195. Hypnum. 70 species; all British. W. Indies, &c.

1190. Fontinalis, or Water-moss. Six species; British.

—Contrary to the nature of all other mosses, this species is scarcely combustible. Accordingly, the Scandinavians line the inside of their chimneys with it to defend them against fire.

1188. BUxbaumia. Two species; one British. Europe.

ORDER III. ALGÆ.

1198. Marchantia, or Liver-green. Seven species; five British. N. Amer. W. Ind.

1196. Jungermannia, or Star-tip. 48 species; British.

1197. Targionia. Two species; British. S. Europe.

1190. Blasia. One species; British.

1202. Lichen, or Liverwort. 218 species; all British. Also Cape, India, America.

Lord Dundonald obtained a patent, dated July 31, 1802, for the discovery of a substitute for the foreign gums, to be obtained from the plants of this genus. The specification of his lordship’s patent is in these terms: “My invention consists in procuring substitutes for gum senegal, or other gums, from the class of plants called in botany lichens; from the plants of hemp and flax, previous to being steeped in water, or after being steeped; likewise from the bark or rind of the willow or lime tree. The process for obtaining the gum may be varied according to circumstances, and is done by washing the materials in water, digestion, and boilings, and with or without the aid of fixed or volatile alkaline salts or their solutions.

“* It does not appear, from such trials as I have hitherto made, that there is any very great difference of the produce of gum from the lichens collected from different trees or shrubs: all of them answer equally well for yielding a gum fit for calico-printing. The lichen is most abundant on the trees which grow in a poor stiff clay soil, and particularly if situated at some considerable height above sea level. It should be pulled in dry weather, otherwise it is apt to break in the pulling; besides, in this case, requiring to be dried before it can with safety be laid up in the storehouse, where, if put in dry, it may be kept for years. Should a sufficient quantity of it not be found in this country, it may be had in almost unlimited abundance in Sweden, Norway, and in the northern parts of America, where it grows to the length of from a foot to 18 inches, depressing the branches of the trees by its weight. There is, however, every reason to believe that a sufficient quantity is to be had in this country. According to information received from botanists, it takes three or four years in coming to maturity or its full size; so that a crop from the same tree may be had every fourth year. The lichen does not consist entirely of a gummy matter; there is the outer skin or epitome, below that a green resinous matter. The remainder of the plant consists of partly gum, partly somewhat analogous to animal substances, and a small proportion of fibrous matter, which cannot be dissolved by boiling, or the action of alkaline salts.

“* The first process in preparing gum from the lichen, is to free it of the outer skin of the plant and the resinous matter. This is done by scalding the lichen two or three times with boiling water, allowing it to remain so long in the water as by absorbing it to swell; in doing this the skin cracks, and comes off along with the greatest part of the resinous matter; or it may be freed from them by gently boiling the lichen for about 15 or 20 minutes, then washing it in cold water.
Cryptogamia.  

BOT  ANY.

water, laying it afterwards on a stone or brick floor, where it should lie for 10 or 12 hours, perhaps more. The reason for this is, that the exposure for that time to air, greatly facilitates the subsequent extraction of the gum.

"The scalded lichen is then to be put into a copper boiler, with a due proportion of water, say three Scots pints, or two wine gallons, to every pound of lichen, and boiled during 10 or 12 hours, adding about a quarter of an ounce of soda or pearl ashes for every pound of lichen; or instead of these salts, about two ounces of volatile alkali. The boiling should be continued until the liquor acquires a considerable degree of gumminess consistency. It is then to be taken out of the boiler, allowed to drain or drip through a wire or haircloth screen. The residue is to be put into a haircloth bag or bags, and to be squeezed in a press similar to that which is used by the melters or rinders of tallow.

"The first boiling does not extract the whole of the gum. The lichen should be boiled a second, or even a third time, repeating the process as above described, diminishing at each process the quantity of water and the quantity of alkali, which a little experience will soon point out: when three boilings are employed, the gummy extract of the last boiling should be kept for the first boiling of a fresh batch of lichen; the extract proceeding from the first and second boilings should be mixed together, and evaporated to the consistence necessary for block or press printing. The evaporating vessels should be of tin or thin lead, placed over a range of stoves, and moderately heated by fire, or the steam of water. It has been neglected to state, that before evaporating the gummy extract to the consistence necessary, it should be kept 10 or 12 hours, so as to allow the sediment or dregs to subside. The clean liquor may either be drawn off by a syphon, or the dregs may be drawn off by a cock at the bottom of the wooden vessel; the bottom of which should be made sloping, higher at the back than the fore part, in order that the dregs may run more completely off. The proportion of gummy matter remaining in the dregs may be got off by mixing them with a due proportion of boiling water, allowing the liquor to clear, and proceeding as above directed, employing this weak solution for boiling the next batch of lichen. When volatile alkali is used, the boiler should be of iron, as volatile alkali acts on copper. Hemp, flax, and the bark of the willow and lime trees, or sea weed, are to be heated in a similar manner, to extract the gum or mucilage contained in them. Likewise it is intended that this patent shall include every tree, plant, or vegetable of whatever kind, from whence a mucilage or gum is to be obtained by the action of volatile or fixed alkaline salts, or their solutions, when used in the processes of maceration, digestion, or boiling these vegetable matters; being a method of obtaining a mucilage or gum never before practised and adopted by any other person."

The above invention was for some time practised to a great extent by the calico-printers in the west of Scotland, where it was found to answer for almost all colours. We have heard, however, that the use of it has been discontinued; whether from the price of gum senegal, for which it was employed as a substitute, ha-
BOTANY.

1205. Fucus, or Wrack, Sea-seed. 85 species; British.
1207. CONVEXA, or Crown-fish. 53 species; British.

ORDER IV. FUNGI.
1209. Agaricus, or Agaric. 278 species; British.
1218. Boletus. 50 species; British. China, America.
1211. Hydnium. 11 species; British. N. Amer. W. Indies.
1212. Phallus, or Stink-horns. Four species; three British.

1214. Helvella, or Turban-top. 13 species; British.
1215. Peziza, or Cup-mushroom. 39 species; British.
1216. Clavaria, or Club-mushroom. 24 species; British.
1217. Lycoberdon, or Truffle, Puff-ball. 25 species; British.
1218. Mucor, or Mould. 17 species; British.

In the class Cryptogamiae are
51 Genera, including 1467 Species, of which 1210 are found in Britain.

(?) These, though capable of being arranged in the several classes of the system, yet on account of their singular structure, have been placed in an appendix, containing such genera as have a spadix and spatha, i.e. whose flowers and fruit are produced on that particular receptacle or seat called a spadix, protruded from a common calyx in form of a sheath called spathe. This order consists of trees and shrubs only. These have always a simple stem, not branched, bearing leaves at the top resembling those of fern, being a composition of a leaf and a branch, called frondes; and the corolla hath always three petals, or three deep divisions. The known genera are 10 in number.
History.

BOTANY.

1219. CHAMAROPS, or Dwarf Palm, Palmea.  
Two species; viz. humilis, excelsa.  S. Europe.

1220. BORASSUS, or Fan Palm.  
One species; viz. flabelliformis.  Malabar.

1221. CORYPHA, or Mountain Palm.  
Two species; viz. umbraculifera, minor.  E. Indies, Carolina.

1223. COCOS, or Cocoa-nut Tree.  
Three species; viz. nucifera, butyrospermum, guineensis.  Guinea, E. and W. Indies.—This tree is well known on account of the rich milky juice that its nuts contain. The species, styled butyrospermum, yields what is called palmoil. This oil, as brought to us from the West Indies and Africa, is about the consistence of an ointment, and of an orange colour. It has a strong, not disagreeable smell, but very little taste. By long keeping it loses its high colour, and becomes white, when it ought to be rejected as no longer fit for use. The inhabitants of the Guinea coast are said to make the oil part of their food, and to employ it for the same purposes as we do butter. With us it is rarely given inwardly, and used only in some external applications for pains and weaknesses of the nerves, cramps, sprains, and the like. The common people apply it for the cure of chilblains; and when early made use of, not without success.

1224. PHOENIX, or Common Palm, Date-tree.  
One species; viz. dactylifera.  Levant, India.—Dates, the fruit of this tree, are imported into Britain in the state of a half-dried fruit, about the size of an acorn, but generally larger, consisting of a sweet pulpy part, and a hard stone: the best are brought from Tunisia. They were formerly used in pectoral decoctions; and supposed, besides their emollient and interesting virtue, to have a slight astrigency. They form the principal part of the food of the inhabitants of some of the oases, or inhabited spots, of the great African desert.

1225. ARECA, or Cabbage-tree.  
Two species; viz. catechu, oleracea.  E. and W. Ind.

1228. CARYOTA.  
One species; viz. urens.  India.

1229. ELATE, or Wild Malabar Palm.  
One species; viz. sylvestris.  E. Indies.

1436. MAURITIA, or Ginkgo, Maiden-hair-tree.  
One species; viz. sexangula.

In the order of Palmae are

10 Genera, including 15 species, all foreign.

Append. Palmae 10 15 0

1749 14721 2391

HISTORY OF BOTANY.

HAVING thus stated the botanical arrangement contrived by Linnaeus, which proceeds upon the supposition of the existence of a sexual system in the vegetable world; we proceed to take notice of some other important circumstances connected with this branch of science, more particularly its history, and the natural orders, as opposed to the above artificial classification of plants.

Sect. I. Ancient Writers upon Botany.

The origin of this science, like that of most others, cannot be found out from the most ancient histories; but it is very probable, that some degree of botanical knowledge has existed in every age of the world. The first botanical writings of which we have any account are those of Solomon, who we are informed by Scripture wrote a treatise upon this subject; which, however, is absolutely lost, not being quoted by any ancient author, nor the least fragment of it remaining. Among the Greeks, Anaxagoras, Pythagoras, and other ancient philosophers, wrote treatises on plants; but their works are also lost; and from the quotations that yet remain in the works of Theophrastus, Dioscorides, and Pliny, we learn, that those first botanical writings could convey but very little information.

The historical era of botany, therefore, commences with Theophrastus the disciple of Aristotle. He was born at Eresium, in the island of Lesbos; and flourished in the third century before the Christian era, being about 100 years posterior to Hippocrates. His work is entitled The History of Plants, and treats of their origin,
origin, propagation, anatomy, and construction; of vegetable life, and of vegetation. It consisted originally of ten books; but of which only nine are now extant. In these, vegetables are distributed into seven classes or primary divisions, which have for their object, the generation of plants; their place of growth; their size, as trees and shrubs; their use, as pot herbs, and esculent grains; and their tincture, or the liquor, of whatever colour, that flows from plants when cut. In his work, above 500 different plants are described.

The next botanist of any note was Dioscorides, a Grecian by birth, but under the Roman empire, being near 300 years posterior to Theophrastus. He describes about 600 plants; and these he has arranged, from their uses in medicine and domestic economy, into four classes, which are thus designed: aromatics; alimentary vegetables, or such as serve for food; medicinal, and vinous plants.

Almost contemporary with Dioscorides flourished Antonius Musa, Cato, Varro, Virgil, and Columella; the first, a treatise still extant on the plant betony; the four others celebrated for their useful tracts on agriculture and rural economy.

Pliny the Elder, in his voluminous work entitled The History of the World, hath a botanical part which is contained in 15 books. In these, besides the plants of Theophrastus and Dioscorides, he has given descriptions of several new species, extracted probably from works which would otherwise have been totally lost. Pliny uses scarce any mode of arrangement, except the ancient but very incorrect, distinction into trees, shrubs, and herbs. His plan, however, extends not only to botanical distinctions, but to gardening, agriculture, and whatever is connected either more nearly or remotely with the science of plants. He gives descriptions of above 1000 different species; but from the want of a proper systematic arrangement, it is often difficult, and perhaps impossible, to determine what plants he or other ancient botanists do really describe.

This want of precision in properly arranging their plants was the reason why the botany of the ancients was always very limited, and after the time of Pliny declined so rapidly. On the destruction of the Western empire by the Goths and other barbarous nations, it is not to be thought that botany could survive any more than the other sciences. It was not till near the close of the eighth century, that the ancient botany began again to appear in Arabia. Serapion, well known in medicine, stands first in the Arabian catalogue of botanists; to him succeeded Razia, Avicenna, Averrhoes, and others. An author known by the name of Plato Apuleius, or Apuleius, one of whose Herbariums, yet old manuscript copies are preserved in some curious libraries, is supposed to have lived near this period. The works of most of these botanists, however, were only translations and compilations from the Greek writers: so that, for want of a proper systematic arrangement, the science sunk a second time into total oblivion. For near 400 years after Abenguëf, an Arabian physician who flourished in the end of the 12th century, scarce any attempts were made in the botanical way. Some obscure writers indeed appeared in several parts of Europe; as Arnoldus de Ville Nova; Platearius; Matheus Sylvaticus; and Bartholomew Glanville, commonly called Bartholomew Anglicus, a Franciscan monk, descended of the family of the earls of Suffolk, who lived in the reign of King Edward III. and wrote a book of natural history, entitled De proprietatis rerum, which was translated into English by John de Trevissus in 1398: but though all these wrote of plants, they were all totally destitute of method, that their works remain one great chaos, from whence it is impossible to extract any thing intelligible.

On the revival of letters in the beginning of the 16th century, the botany of the ancients was restored a second time. The Greek writings were translated into Latin; the common language of Europe. Caza, a Greek refugee at Rome, made elegant translations of Aristotle and Theophrastus, who afterwards were commented upon by Scaliger and Stapel. Dioscorides was also translated and commented on. His best commentators are Hermolaus Barbarus, Fuchsius, Ruellius, Cordus, Gesner, and Matthioli. The most distinguished commentators on Pliny are Dalechamp in 1604; Salmatis in 1689; Harduin and Guilandinus. Menius and Urinus have written commentaries upon Cato; Campegius and Monardus upon Mene the Arabian, and Lonicer upon Avicenna. This last hath been translated by several writers, particularly Alpagus, Costeus, and Plemiatus, into Latin; and by one writer, Amaltheus, into Hebrew.

Hieronymus Boeck, or Bouc, a German, generally known by the name of Tragus, is the first modern who has given a methodical distribution of vegetables. In 1538, he published a History of Plants, in which he describes 800 species; and these he divides into three classes, founded on the qualities of vegetables, their figure, habit, and size. The same method of arrangement was followed by Lonicer, Dozenius, L'Oebel, Clusius, Brunfelsius, Monardus, Cordus and some other botanists of this period. How far such a method was deficient, shall be considered in the following sections; however, it was not till 1560 that Conrad Gesner first proposed to the world an arrangement of vegetables from the parts of the flower and fruit. He did not establish any plan founded upon this principle; but having suggested the idea, left the application to be made by others: and in 1582 Dr Andrew Cassalpinus, physician at Pisa, and afterwards professor of botany at Padua, first availing himself of the ingenuity of his predecessor, proposed a method of arrangement which has the fruit for its basis; and thus gave origin to systematic botany, the second grand era in the history of that science.

Even this improved method of Cassalpinus was not without very great inconveniences, which shall be taken notice of hereafter. As it was, however, so greatly superior to every thing that had happened before, it might have been expected that the learned would have immediately adopted it, and that all the former equivocal and insufficient characters would have been rejected. But the fact was otherwise. Cassalpinus's method of arrangement died with him; and it was not till near a century after, that Dr Robert Morrison of Aberdeen, attaching himself to the principles of Gesner and Cassalpinus, re-established scientific arrangement upon a solid foundation; so that, from being only the restorer of system, he has been generally celebrated as its founder. In the long interval between Cassalpinus and
and Morrison flourished some eminent botanists. The most noted are, Dalechamp, author of A General History of Plants; Theodore, named Tabernemontanus, and Thalibius, two German writers; Porta, an Italian, famous for an arrangement of plants from their relations to the stars, to men, and other animals; Prosper Alpinus, author of a Catalogue of the Plants of Egypt; Fabius Columna, inventor of many of the botanical terms now used; the two Bauhinus; Gerard and Parkinson; Zaluzianski, a Pole, author of an arrangement from the qualities and habits of plants; Margraef and Piso, celebrated for their natural history of Brazil; Hernandez, equally celebrated for his history of Mexico; Passeres, or Du Pas, author of an arrangement of plants from the time of flowering, of all characters the most uncertain and insufficient; Johnston; Bentius, a Dutchman, author of a Natural History of the East Indies; Aldrovandus, the celebrated naturalist; and Reinhold, governor of Malabar, and author of the well-known Hortus Malabaricus.

The method proposed by Morrison has the fruit for its basis, as well as that of Casalpinus; to which, however, it is greatly inferior both in the plan and execution. It is indeed of all others the most difficult in practice, and was therefore not adopted by any succeeding writer, except Bobart, who in 1690 completed Morrison's Universal History of Plants, and an anonymous author whose work appeared in 1720. Imperfect, however, as his method is, it furnished many useful hints, which succeeding botanists have not failed to improve. Ray and Tournefort have owed him much, and are not ashamed to own the obligation. The same has been done even by Linnaeus; who hath established the science of botany on the most solid foundation, by introducing a method of arrangement, if not absolutely perfect, at least as nearly approaching to perfection as can be expected; and which therefore hath been deservedly followed, in preference to every other, by all botanists, since its first publication. But to give a particular account of all the different botanical systems, with the particular advantages and disadvantages attending each, shall be the business of the subsequent sections.

Sect. II. Of the Ancient Method of arranging Vegetables.

Defects of the arrangement of Dioscorides.

In giving an account of the works of Theophrastus and Dioscorides, we have already taken notice that the former chose seven distinguishing characters, viz. the generation of plants; their place of growth; their size, as trees and shrubs; their use, as pot herbs and esculent grains; and their lacticeness, or liquor that flows from them when cut. Dioscorides divided them into aromatics, alimentary, medicinal, and vinous plants. The good properties of this method are, that the botanist as it were comes to the point at once; and when he knows the plant, knows also its virtues and uses, or at least part of them: but this convenience is greatly overbalanced by innumerable disadvantages; for the qualities and virtues of plants are neither fixed and invariable, nor are they impressed in legible characters on the plants themselves. The different parts of a plant often possess different and even opposite virtues; so that supposing the virtues to be known, and applied to the purpose of vegetable arrangement, the roots must frequently fall under one division, the leaves under a second, and the flower and fruit under a third. Besides, if we reflect that the sole end of such arrangement is to facilitate the knowledge of plants to others, the insufficiency and even absurdity of methods founded up on their virtues will immediately appear. A stalk of verbain, for instance, is presented to me, which I am to investigate from a presupposed knowledge of the virtues of plants. Before I can settle the class to which it belongs, I must discover whether or not it has the virtues belonging to any of the plants I know; and this discovery being the result of repeated experiments on various parts of the human body, may require many years for its accomplishment.

The same causes which render methods founded on the virtues of plants unfavourable for the purpose of Theophrastus's arrangement, must evidently disqualify all their other variable quantities and accidents from having a place in a genuine systematic arrangement. The natale solum of plants, which is one of Theophrastus's divisions, affords no better distinctive characters than their powers and virtues. Many countries, or national, produce the same individual plants. The same species which crown the mountains, frequently cover the plains; and plants which have long been reckoned the peculiar inhabitants of some parts of Asia and America, are now found to grow naturally in equal perfection in the very different climates of Lapland and Siberia. The size of plants, which suggested the ancient division into trees and shrubs, is no less an equivocal mark of distinction than the circumstances already mentioned. The vine, which modern botanists denominate a shrub, was ranged by Theophrastus in his third class containing trees. In fact, every thing respecting size is so much affected by differences of soil, climate, and culture, that the same plant, in different circumstances, shall differ exceedingly in height; and in a method founded upon the size, would sometimes be ranged as a tree, and sometimes as a shrub, or even an under-shrub, according as it happens to exceed, equal, or fall short of, a given standard. No less insufficient are characteristic marks derived from the colour, taste, and smell of plants. Of all the attributes of vegetable nature, colour is perhaps the most inconsistent. Heat, climate, culture, soil, &c. contribute to the production of endless diversities of colour, and render the transition from one to another natural and easy. Red and blue pass easily into white, white into purple, yellow into white, red into blue, blue into yellow, &c. In the same leaf or flower, different colours are frequently observed. Variations too in point of colour are frequently observed to take place not only in different individuals of the same species, but even in similar parts of the same plant. Marvel of Peru and sweet William produce flowers of different colour upon the same stalk. Objections equally valid lie against characteristic marks drawn from the taste and smell. The former varies in different individuals from differences of age, and even in the same individual at different times, according to the morbid or sound state of the organ. The latter is different in different subjects, and varies in each; nor are the effluvia sent forth from the same leafy plants of equal intensity. In plants, taste is subject to wanton variations, from difference of climate, soil, and culture.
Botany.

Garlic in some climates, particularly in Greece, is said to lose its rankness: apples and pears that grow naturally in the woods, are intolerably acid; celery and lettuce, which culture renders sweet and palatable, are in their wild uncultivated state bitter, disagreeable, and in some cases noxious.

These considerations are abundantly sufficient to show the imperfections of the ancient system of botany; and, indeed, considering the vague and uncertain marks by which the ancients distinguished one plant from another, we may rather wonder how such a science as botany came to have an existence among them, than that they arrived at no greater perfection in it, or suffered it so soon to fall into oblivion.

Sect. III. Of the different Botanical Systems from the time of Gesner to that of Linnaeus.

The insufficiency of the ancient botanical system being so fully shown in the last section, we think it needless to take much notice of the methods used by Tragus and his contemporaries and followers. The virtues of plants being found an insufficient characteristic, succeeding botanists had taken in the root, stem, and leaves; but these being also found insufficient and variable, Gesner turned his eye to the flower and fruit, as being the most permanent and unchangeable parts of the plant. In proposing the parts of fruitation, however, as the most proper for arranging plants, he communicated no hints respecting the choice of some of those parts in preference to others. Each particular organ of the flower and fruit furnishes sufficient variety to serve as the foundation of a method; but all of them are not equally proper for this purpose. Cæsiana, the first follower of Gesner, made a mistake in his choice, and took his distinguishing characteristics only from the fruit. The parts of the flower, therefore, being employed by the first systematic writers only as subaltern directions in finding out orders and genera, it is evident that the plant could not be fully investigated for several months. Suppose a plant ripens its fruit in October, and does not produce flowers till the following May: the class, upon inspection of the fruit in the month of October, is immediately ascertained; but the plant still remains unknown, and will continue so upwards of six months after, if the characters of the order and genus have been made to depend on any part of the flower. Methods founded on the fruit have another inconvenience; plants constantly ripen their fruit in these countries where they grow naturally, but not always in the countries to which they may be accidentally transported. So far from this, that many plants that are natives of a warm climate, neither ripen nor form fruit in a cold one. Few of the African, Asiatic, and West Indian plants produce fruit in Britain. A method, therefore, founded upon the fruit, could only facilitate the knowledge of such plants to the inhabitants of those countries where they grow: the English botanist they could be of little or no service. The same objection cannot reasonably be urged against methods founded on the flower, since the influence of climates much colder than that of Britain has not been able to destroy the faculty of producing flowers in many, perhaps in most of the plants just mentioned.

Cæsiana sets out with an ancient distinction of vegetables, from their duration, into trees and herbs. With the former he combines shrubs; with the latter, under-shrubs; and distributes his plants into the following classes. 1. Trees with the germ (radicle or principle of life in the seed) on the point of the seed. 2. Trees with the germ on the base of the seed. 3. Herbs having one seed only. 4. Herbs having two seeds. 5. Herbs having four seeds. 6. Herbs having many seeds. 7. Herbs having one capsule. 8. Herbs having one capsule. 9. Herbs having two capsules. 10. Herbs having fibrous roots. 11. Herbs having bulbous roots. 12. Herbs having succory or endive-like flowers. 13. Herbs having common flowers. 14. Herbs having several follicles or seed-bags. 15. Herbs having neither flower nor seed.

The inconvenience of this method has been already pointed out pretty fully, and will evidently appear upon an attempt to refer any common plant to one of the 15 above-mentioned classes. His sections, orders, or secondary divisions, are 47 in number, and depend upon a variety of parts and circumstances. The principal of these are, the disposition, situation, and figure of the flowers; the nature of the seed-vesSEL, or cover of the seeds; the situation of the radicle in the seed; the number of seed-lobes, or seminal leaves; the disposition of the leaves, and colour of the flowers. The lacinence too, or milkiness, which is observed in the compound flowers with flat florets, is made a characteristic distinction, and discriminates the first order of the 15th class. Thus, in the first systematic arrangements, the characters of the classes only were borrowed from the parts of fruitation; while those of the subaltern divisions were very numerous, and respected every part of the plant; but that such divisions might be perfect, they should be constituted, like the classes, from the modifications of a single part of the fruitation.

The great object had in view by Morrison, who comes Morisson's next in order to Cæsiana, was to investigate the method, order of nature, not to fabricate an easy method of arranging plants. Hence his system is devoid of uniformity, and clogged with a multiplicity of characters; his classes are frequently not sufficiently distinguished from one another, and the key of arrangement seems totally lost. He sets out with a division of plants, from their consistence, into ligneous or woody, and herbaceous. He founds his system on the fruit, the corollas or blossoms, and the habit of the plants. His classes are as follow: 1. Trees. 2. Shrubs. 3. Under-shrubs. 4. Herbs climbing. 5. Herbs leguminous or pappilaceous. 6. Herbs pedunculus. 7. Herbs tricapsular or with three capsules. 8. Herbs with four or five capsules. 9. Herbs corymbiferous. 10. Herbs having a milky juice, or downy tops. 11. Herbs culminiferous, as grasses. 12. Herbs umbelliferous. 13. Herbs having three kernels. 14. Herbs having helmet-shaped flowers. 15. Herbs having many capsules. 16. Herbs berry-bearing. 17. Herbs called capillary plants, as the fern kind. 18. Anomalous or irregular herbs.

Of these classes, the fourth and eighth possess no genuine distinctive character; nor are the ninth and tenth classes sufficiently distinguished; the fifteenth class is not sufficiently distinguished from the eighth, nor the sixteenth from the fourth. His sections or secondary divisions, which are 108 in number, arise from the figure and substance of the fruit; the number of seeds, leaves,
leaves, and petals; the figure of the root; the direction of the stem; the colour of the flowers; the place of growth; and, in one class, from the medicinal virtues of some of the plants that compose it.

This method Ray carefully corrected and amended at different times; so that the plan of arrangement which now bears the name of that author, and was first published in 1700, is entirely different from what had appeared in 1682. It now consists of 33 classes. Their distinguishing marks are taken from the port or habit of the plants; their greater or less degree of perfection; their place of growth; the number of seed-lobes, or seminal leaves, petals, capsules, and seeds; the situation and distribution of the flowers and calyx; the number and regularity of the petals; the substance of the leaves and fruit; and the difficulty of classing certain plants. They are as follow:

The distinction into herbs and trees with which Ray's method sets out, acknowledges a different, though not more certain principle than that of Casalipinus and Morrison. The former, in making this distinction, had an eye to the duration of the stem; the latter to its consistence. Ray called in the buds as an auxiliary; and denominate trees, "all such plants as bear buds!" herbs, "such as bear none." But against this auxiliary there lies an unanswerable objection; namely, that though all herbaceous plants rise without buds, all trees are not furnished with them: many of the largest trees in warm countries, and some shrubby plants in every country, being totally destitute of that scaly appearance which constitutes the essence of a bud. In other respects, it is evident that neither Mr Ray's plan nor execution is in any degree calculated to facilitate the knowledge of plants. In fact, it seems to have been Ray's great object, no less than Morrison's, to collect as many natural classes as possible; and these being separately investigated, a multiplicity of characters and steps was necessarily required to connect them: and hence the intricacy complained of by both these methods, which must always take place where the classes give rise to the connecting characters, not the characters to the classes. The characters of the orders, or secondary divisions, in Ray's method, are no less multifarious than those of the classes. They respect the place of growth of plants; their qualities; the figure of the stem; the number, situation, substance, and division, of the leaves; the situation and disposition of the flowers and calyx; the number and regularity of the petals; with the number and figure of the fruit. In his improved method, Ray has adopted Tournefort's characters of the genera, wherever his plan would permit. His general History of Plants contains 18,655 species, and varieties. The third volume, which was not published till 1704, and was designed as a supplement to the two former, contains the plants discovered by Tournefort in the Levant, and by Camellis at Luzon one of the Philippine islands. Ray's method was followed by Sir Hans Sloane, in his Natural History of Jamaica; by Petiver, in his British Herbal; by Dillenius, in his Synopsis of British plants; and by Martin, in his Catalogue of plants that grow in the neighbourhood of Cambridge.

To Ray's original method succeeding that of Christopher Knaut, a German; which acknowledges the same Knaut's principle, and is manifestly founded upon it. In his arrangement, the enumeration of the plants that grow round Hal in Saxony, published in 1687, he divides vegetables into 17 classes, which have for their basis the size and duration of plants, the presence or absence of the petals, the disposition of the flowers, the substance of the fruit, the number of capsules or seeds, the number and figure of the petals, and the presence, absence, or figure of the calyx. His classes are: 1. Herbs berry-bearing. 2. Monopetalous, or with one flower-leaf. 3. Tetrapetalous and regular, with four petals. 4. Tetrapetalous and irregular. 5. Pentapetalous, or with five petals. 6. Hexapetalous, or six petals. 7. Polyptalous, or many petals. 8. Multicapular, or many capsules. 9. Naked seeds. 10. Solid, or not downy. 11. Downy seeds. 12. Without petals. 13. Staminous, without petals or calyx. 14. Imperceptible. 15. Imperfect. 16. Trees. 17. Shrubs.

The sections or subdivisions of the classes in Knaut's method are 62 in number; and arise from the figure of the stem and petals, the number of capsules and cells, their figure, the number of seeds and leaves, and situation of the flowers.

In 1696, a new method, proposed by Dr Herman Hermann's professor of botany at Leyden, was published by Zum-method, who arranged according to it the plants contained in the public garden of Leyden. Rudbeckius the Younger, in a dissertation published the same year, on
the fundamental knowledge of plants, adopted Herman's method, with a few inconsiderable variations. The classes of Dr Herman are 25 in number. They are founded on the size and duration of the plants; the presence or absence of the petals and calyx; the number of capsules, seeds, and naked seeds; the substance of the leaves and fruit; the form and consistency of the roots; the situation and disposition of the flowers, leaves, and calyx; and figure of the fruit. 1. Herbs having one naked seed and a simple flower. 2. Having one naked seed and a compound flower. 3. With two naked seeds, and stellated or star-shaped. 4. Two naked seeds, and umbelliferous. 5. Four naked seeds, and rough leaves. 6. Four naked seeds, and verticillated or whorl-shaped. 7. With many naked seeds. 8. Having seed-vessels, bulbous and tricapsular. 9. Having one seed-vessel. 10. With two seed-vessels. 11. With three seed-vessels. 12. With four seed-vessels. 13. With five seed-vessels. 14. Podded, which are always tetraptalous. 15. Leguminous and papilionaceous. 16. With many capsules. 17. Having fleshy fruit, berry-bearing. 18. With fleshy fruit, apple-bearing. 19. Without petals, but having a calyx. 20. Without petals, shabby, or staminous. 21. Without petals, calyx, chaff, or staminia, i.e., naked anthers, as the mosses. 22. Trees. Imperfect fructification, bearing catkins. 23. Trees with a fleshy fruit, umbilicated. 24. Trees with a fleshy fruit, not umbilicated. 25. Trees with a dry fruit.

The classes in Herman's method are subdivided into 82 sections or orders; which have for their basis the number of petals, seeds, capsules, and cells, the figure of the seeds and petals, and disposition of the flowers.

These 24 classes of Dr Boerhaave are subdivided into 104 sections, which have for their characters, the figure of the leaves, stem, calyx, petals, and seeds; the number of petals, seeds, and capsules; the substance of the leaves; the situation of the flowers, and their difference in point of sex. By this method, Dr Boerhaave arranged near 6000 plants, the produce of the botanical garden at Leyden, which he carefully superintended for the space of 20 years, and left to his successor Dr Adrien Royen, in a much more flourishing state than he himself had received it. His Index or Catalogue of the Leyden plants was published in octavo in 1710; and afterwards with great additions, in quarto, in 1720. This last edition contains descriptions of 5652 plants; of which number upwards of two-thirds had been introduced into the garden since the time of Herman, by his illustrious successor. Boerhaave's characters are derived from the habit or general appearance of plants combined with all the parts of fructification; so that, as Linnaeus very properly observes, he was the first who employed the calyx, stamens, and style, in determining the genus. About 17 new genera were established by this author; among others, the very splendid family of the proton and silver tree, which, although partly described by Morrison, had remained generally unknown till this period. His method was adopted by one Ernsting, a German, in a treatise entitled The first Principles of Botany, published in octavo at Wolfenbüttel, in 1748.

Hitherto all the botanists had been intent upon Rrivinus's investigating the order of nature, rather than facilitating the arrangement of vegetables; therefore their methods were very intricate and perplexed; and their writings, however entertaining to the learned, could afford but very little instruction to the young botanist. In 1690, however, Augustus Quirinus Rivinus, a German, professor of botany at Leipsic, relinquishing the pursuit of natural affinities, and convinced of the insufficiency of characteristic marks drawn only from the fruit, attached himself to the flower, which, he was sensible, would furnish characters no less numerous, permanent, and conspicuous, than those drawn from the fruit. The calyx, petals, stamens, and style, or part which constitutes the flower, are sufficiently diversified in point of number, figure, proportion, and situation, to serve as the basis of a mode of arrangement; yet all are not equally proper for this purpose. Rivinus made use of the petals as the largest and most beautiful part, and from that which the flower itself is commonly characterized. His method consists in the following 18 classes, for their basis the perfection and disposition of the flowers, and regularity and number of the petals. 1. Regular monopetalous, or having one petal. 2. Dipetalous. 3. Tripetalous. 4. Tetrapetalous. 5. Pentapetalous. 6. Hexapetalous. 7. Poly- petalous, or having many petals. 8. Irregular monopetalous. 9. Irregular dipetalous. 10. Irregular tripetalous. 11. Irregular tetrapetalous. 12. Irregular pentapetalous. 13. Irregular hexapetalous. 14. Irregular poly- petalous. 15. Compound flowers of regular flowers. 16. Compound flowers of regular and irregular flowers. 17. Compound flowers of irregular flowers only. 18. Incomplete or imperfect plants.

As Rivinus set out with the professed design of imparting facility to botany, he judged very properly in deviating his method of all extraneous matter, and rendering it as simple and uniform as the nature of the science would admit. The distinction into herbs and trees had been adopted by every writer on plants since the time of Aristotle. Rendered in some measure sacred by its antiquity, this distinction maintained a kind of
History.

BOTANY.

of importance to which it was by no means essentially entitled. Rivinus was the first who in this matter dared to think for himself. He was early sensible of the inconveniences to which those who had submitted who employed it as a primary division; and therefore resolved at once to get rid of a distinction that is frequently uncertain, always destructive to uniformity, and in its nature repugnant to the genuine spirit of system, because totally unconnected with the parts of fructification. In the uniformity of its orders or secondary divisions, which are 91 in number, and acknowledge the fruit for their principle, Rivinus’s method equals, perhaps excels, all that went before or succeeded it. Only three classes of this method were published by Rivinus himself. These are the 15th, 14th, and 15th, which were offered to the public at different times, illustrated with very splendid figures. The method was completed and published entire by Hencher, in a work entitled Hortus Wurttenbergensis, printed in quarto at Wurtzenberg in 1711.

Several German authors have followed Rivinus’s method, either wholly or in part, without offering any considerable amendment. The principal of these are, Koenig, in a work on vegetables, published at Basil in 1696; Welch, in his Basis Botanica, printed at Leipzig in octavo, in 1697; Gemeinhardt, in a catalogue of plants published in 1725; Kramer, in a work entitled Tentamen Botanicum, published at Dresden in 1728, and afterwards reprinted with additions at Vienna in 1744; and Hecker, in a dissertation on botany published at Hal in Saxony, in 1734. To these may be added Hebenstreit, an ingenious botanist, who in a treatise on plants published at Leipzig in 1731, just before his famous African expedition, established generalised characters, which had hitherto been wanting in Rivinus’s method.

The writers who have attempted to improve upon Rivinus’s method are Bernard Ruppius, Christopher Ludwig, and Christian Knaut. Ruppius, in his Flora Jenensis, published at Francfort in 1718, has arranged the 1200 plants there described by a method partly Rivinus’s and partly his own. It consists of 17 classes, and sets out with the same divisions and subdivisions as that of Rivinus’s; with this difference, however, that, whereas in Rivinus’s method all perfect flowers are divided into simple and compound, in Ruppius the division of regular and irregular flowers precedes that just mentioned, and simple and compound flowers are made subdivisions of the regular flowers only.

Ludwig’s method.

Christopher Ludwig’s method, which was published in 1737, and consists of 20 classes, differs but little from that of Rivinus. The author accompanied Hebenstreit on his expedition to Africa, and seems to have made plants his favourite study. The improvement, however, which he has made on Rivinus’s plan, consists only in rendering it more universal, having enriched it with a multitude of genera collected from the works of Tournefort, Tournefort, Tournefort, Tournefort, Linnaeus, and other eminent botanists, whose general characters he has likewise adopted. His plan of arrangement has been followed by two succeeding writers: M. Wedel, in a botanical essay published in 1747; and three years after by M. Bocher, in his catalogue of the plants which grow in the garden of Leipzig.

The method of Christian Knaut is much more properly his own, and departs in a much greater degree from that of Rivinus than either of the two former. The regularity and number of the petals furnished the classical divisions in Rivinus’s method: in that of Knaut’s number takes place of regularity; so that it is very properly termed by Linnaeus, “The system of Rivinus inverted.” This method was published in 1716; and sets out with a division into flowers which have one petal, and such as have more than one. It consists of the 17 following classes. 1. Monopetalous uniform or regular. 2. Monopetalous disform or irregular. 3. Monopetalous compound uniform or regular. 4. Monopetalous compound disform or irregular. 5. Monopetalous compound uniform and disform together. 6. Dipetalous uniform or regular. 7. Dipetalous disform or irregular. 8. Tripetalous uniform or regular. 9. Tripetalous disform or irregular. 10. Tetrapetalous uniform or regular. 11. Tetrapetalous disform or irregular. 12. Pentapetalous uniform or regular. 13. Pentapetalous disform or irregular. 14. Hexapetalous uniform or regular. 15. Hexapetalous disform or irregular. 16. Polypteralous uniform or regular. 17. Polypteralous disform or irregular.

The sections or secondary divisions in Knaut’s method are 121, and depend upon the internal divisions of the fruit; and upon this his opinions are somewhat singular. Every kind of fruit, whether pulpy or membranaceous, is termed by our author a capsule. Neither is the term restricted to fruits properly so called: it is extended also to those termed by botanists naked seeds, the existence of which Knaut absolutely denies. Agreeable to this opinion, capsules, he says, with respect to their consistence or substance, are of two sorts; pulpy, or membranaceous. The former correspond to the fruits of the apple, berry, and cherry kind; the latter to the capsules properly so called, and naked seeds of other botanists. Again, with respect to their cells or internal divisions, capsules are either simple or compound. Simple capsules have an undivided cavity or a single cell; compound capsules are internally divided into two or more cells. With other botanists, the umbelliferous flowers bear two, the lip flowers four, naked seeds; according to Knaut, the former produce two, the latter four, simple capsules. Ranunculus, adonis, and some other plants, have their flowers succeeded by a number of naked seeds collected into an aggregate or head; each of these seeds passes with Knaut for a simple capsule; so that the whole is an aggregate of several capsules with an undivided cavity or single cell. In numbering the cells or internal divisions of the pulpy fruits, our author has adopted a very singular method. Some fruits of the apple kind enclose a capsule that is divided into five membranaceous cells. It might then be very reasonably expected to find such fruits arranged with compound capsules of five cells: but, instead of this, the author whimsically enough combines in their arrangement the idea both of a single and compound capsule. The pulpy part is undivided; in other words, it is a simple capsule furnished with one cell; the compound capsule enclosed contains five cells, which added to that of the pulp make the number six; and thus these kinds of fruits are arranged with those having capsules of six cells. By the same kind of reasoning, the fruit of the dogwood, which is of the cherry kind, and contains a stone...
stone with two cells or cavities, is placed by Knaut among compound capsules with three cells; the pulp passing for one division, and cavities of the stone or nut for the remaining two. This method of calculation is not the only singularity for which Knaut is remarkable. The essence of the flower is made by Ray, Tournefort, Rivinus, and most other botanists, to consist in the stamens and style. This position Knaut absolutely denies; and has established for a principle, that the flower is essentially constituted by the petals only. With him, the flower-cup, stamens, and style, are of little significance: their presence does not constitute a flower, if the petals are wanting; neither is their absence sufficient to destroy its existence, if the petals are present: from this it follows, 1. That there can be no flowers without petals; and, 2. That the regularity or irregularity of the flower can never depend on the stamens and style, which are only occasionally present, and nowise essential to its existence; both of which are evidently false to every botanical reader.

Since the time of Rivinus, no leading method in botany has appeared except those of Tournefort and Linnæus. Tournefort sets out with reviving the distinction of plants into herbs and trees, which had been exploded by Rivinus. His system is founded on the regularity and figure of the petals, together with the twofold situation of the receptacle of the flowers; his orders, on the pistil or calyx. The classes are, 1. Herbs with simple flowers monopetalous, and bell-shaped. 2. Simple flowers monopetalous, stamens and wheel-shaped. 3. Simple flowers monopetalous, labiate or lipped. 4. Simple flowers monopetalous, anomalously or irregularly. 5. Simple flowers polymetalous, cruciform or cross-shaped. 6. Simple flowers polymetalous, and rosaceous or rose-like. 7. Simple flowers polymetalous, umbellated. 8. Simple flowers polymetalous, Caryophyllaceæ, or clove-like. 9. Simple flowers polymetalous, liliaceous or lily-form. 10. Simple flowers polymetalous, papilionaceous, or butterfly-form. 11. Simple flowers polymetalous, anomalous or irregular. 12. Compound flowers, Roscous, tubular or whole flowers. 13. Compound flowers, semisuccous, fat or half flowers. 14. Compound flowers radiated, like the spokes of a wheel. 15. Apetalous, having no petals. 16. No flower, but bearing seed. 17. No flower nor seed, in the vulgar estimation. 18. Trees without petals, but bare stamens. 19. Trees without petals bearing catkins. 20. Trees monopetalous. 21. Trees rosaceous. 22. Trees papilionaceous.

The secondary divisions in Tournefort's method, which are 122 in number, have obtained the name of sections. Their general distinctions are founded principally upon the fruit, as those of the classes are upon the flower.

Other writers.

Tournefort hath been followed by a vast number of botanical writers, of whom the most considerable are, Dr. William Sherard, an eminent botanist of the last and present centuries. In 1689, he published the first sketch of Tournefort's method, under the title of Schola Botanices; or a catalogue of the plants demonstrated by Dr. Tournefort, in the royal gardens at Paris. It was not till five years after, that the Elementa Botanica, a work which contains the rudiments and illustration of his method, was published by Tournefort himself—

Father Plumier, termed by way of eminence the Tournefort of America, published in 1703, at Paris, a description of American plants, which he has arranged according to the system of Tournefort. In this work he accurately characterized 96 new genera. Fagoli, an Italian, has described, in pretty elegant Latin verse, all the genera of Tournefort, in a work entitled Prosopopoea Botanica, published at Florence, 1705. Several celebrated French academicians, particularly Marchant, Dodart, Nisson, Jussieu, and Vaillant, have also occasionally paid their tribute of acknowledgment to this author, from the year 1700 to 1740. The other authors of note who have followed Tournefort's method, are, M. Petit, an ingenious French botanist; Johren, a German, author of a treatise published at Colberg in 1710, entitled Vade mecum Botanicum, seu Oseges Botanicæ; Fucille, in his description of the plants of Chili and Peru, published at Paris in quarto, 1714; Christopher Valentin, a German, author of a book entitled Tournefortius Contractus, published at Francfort, in folio, 1715; Ripa, an Italian, in a work entitled Historia Universalis Plantarum, published at Padua, in 1725; Michael Valentin, a German, in his Viridariae Reformatum, published in folio, at Francfort, in 1719; the celebrated Dillenius, professor of botany at Oxford, and author of several much esteemed publications on botany; particularly the Hortus Elthamensis, and History of Mosses, in his Flora Gissensis, printed at Francfort in 1719; Pontedera, an Italian, author of the delineation of a method which combines those of Tournefort and Rivinus, published at Padua, in his botanical dissertations, in 1720; Monti, an Italian, in a work published at Bologna in 1724, under the title of Indices Plantarum Varii; Dindem, a German, in his Tournefortius Alatus, first published in 1728; Signior Michaeli, author of several curious discoveries respecting mosses and mushrooms, in his Nova Genera Plantarum, published in folio at Florence in 1729; Elvebemes, a Swede, in a work published in the Swedish language at Upsal in 1730; Fabricius, a German, author of a work entitled Prætiosa Flora Butchacensis, seu duo Declamations Plantarum Barbarorum, published in folio at Nuremberg in 1743; and above all, an Italian, in his catalogue of the plants that grow in the neighbourhood of Rome, printed at Rome in 1743; and the ingenious Dr Charles Alston, late professor of botany at Edinburgh, in his Tyrocinium Botanicum, published at Edinburgh in 1753.

BoT.

History.

Magnol's method. Besides all these methods, there have been invented two others, founded upon the calyx. The first of these was the invention of Peter Magnol, a celebrated professor of botany at Montpelier, and published in 1729, five years after the author's death. The other was delineated by Linnæus, and published in his Classes Plantarum in 1738, three years after the publication of the sexual system. Magnol distinguishes two kinds of calyx; one external, which envelopes and sustains the flower, and is the flower-cup properly so called; the other internal, which is the seed-vessel or fruit. According to this idea, all plants, whether herbaceous or woody, are furnished with either the external calyx only, or with both. His classes are, 1. Herbs with the calyx external, including a flower unknown. 2. Calyx external, including a flower staminose. 3. Calyx external, including a flower monopetalous. 4. Calyx external, including a flower polyptalous. 5. Calyx external, supporting a flower monopetalous. 6. Calyx external, supporting a flower polyptalous. 7. Calyx external, only, which is the corolla. 8. Calyx external and internal, flower with two and three petals. 9. Calyx external and internal, tetrapetalous. 10. Calyx external, and internal, flower with two and three petals. 11. Calyx external and internal, polyptalous. 12. Calyx external and internal, polyptalous. 13. Trees with the calyx external only. 14. Calyx internal only. 15. Calyx external and internal both.

The characters of the orders, or secondary divisions, in Magnol's method, are derived chiefly from the figure of the calyx, petals, and seeds; from the disposition of the flowers; from the number of petals, and substance of the fruit. Fifty-five sections or orders arise from the combination of these characters with those of the classes; and these are again subdivided into genera, which possess this singularity, that, in place of distinctive characters hitherto employed, they exhibit complete descriptions of all the parts of fructification of one or two species of each genus. From this improvement Linnæus manifestly borrowed the hint of his general characters.

Sect. IV. Of the Senses of Plants.

As many philosophers and botanists deny that such a thing as the distinction of sexes takes place in vegetables, it will be necessary to give a statement of the arguments employed by both parties on this subject. We shall begin with the arguments in favour of the sexes.

I. Linnæus is at great pains in tracing the notion of sexual sexes in plants to the remotest periods of antiquity. His system informs us, that Empedocles, Anaxagoras, and other ancient philosophers, not only attributed the distinction of sexes to plants, but maintained that they were capable of perceiving pleasure and pain.

Hippocrates and Theophrastus are next introduced as distinguishing the conyza, the asies, the lix, &c., into male and female. The latter of these writers affirms that the fruits of the female palm will not germinate, unless the pollen of the male be shaken over the spathes of the female previous to the ripening of the seed.

Dioscorides takes notice of a male and female mandragora, mercurialis, cistus, &c.
Pliny does not confine his views of sex to animals, but exclaims, that every thing this earth produceth is characterized by the distinction of sex.

From the days of Pliny to those of Cesalpinus, who lived in the 16th century, the analogy between the vegetable and animal seems to have been entirely neglected. Cesalpinus tells us, that the males of the oxycedrus, taxus, mercurialis, urtica, and cannabis, are barren; and that the females of these plants only bear fruit.

After Cesalpinus, we find Dr Grew and Sir Thomas Millington engaged in a conversation concerning the utility of the stamina and styli of plants. The result of this conversation was the mutual agreement of these two eminent naturalists, that the stamina and styli of vegetables are analogous to the organs of generation in animals, and that they were adapted by nature to answer the same purposes. Dr Grew, in his anatomy of plants, after enumerating the analogies between plants and animals, concludes, that the pollen probably emits certain viscid effusions, which may serve for the impregnation of the seeds.

Mr Ray gave further sanction to the doctrine of sexes, by concurring with Grew, and adding some further illustrations from analogy.

In the year 1695, Camerarius attempted to prove the sexes of plants. But, as he trusted solely to the palm-tree, and wished to be doubtful as to the authenticity of the fact, he cannot be considered as having done any thing in confirmation of the sexual hypothesis.

Mr Morland, in the year 1703, adopted the same hypothesis, but gave it a new modification, by supposing that the pollen contained the seminal plant in miniature, and consequently that it behaved one pollen at least to be conveyed into every separate seed before it could be properly impregnated. Analogy and the structure of the parts are the only arguments he employs.

Some years after this, Mr Geoffrey wrote a treatise on the sexes of plants: but as he advanced nothing new, we shall take no further notice of him.

Vaillant, in the year 1717, judiciously considering that the canal in the stylus of most plants was too narrow to admit the pollen itself, republished Dr Grew's theory of impregnation by means of a subtle seminal aura.

These were the sentiments of the principal botanists with regard to the generation of plants, till the celebrated Linnaeus made his appearance as a botanical writer, who has extended the idea so far as to compose a complete system upon it.

Although Linnaeus has no claim to the supposed discovery of the sexual hypothesis, his being precisely the same with that of Dr Grew; yet, as he is the chief supporter and improver of this doctrine, we shall give a succinct narration of the arguments he makes use of in order to prove that vegetables propagate their species by a regular commerce of sexes.

In a treatise entitled, Sponsalia Plantarum, published as an inaugural dissertation by Walibom, in the first volume of the Amoenitates Academica, all the arguments made use of by Linnaeus in his Fundamenta Botanica, and other works, are collected and arranged in one view. But asWalibom honestly attributes all the merit ofthis dissertation to his great master, we shall here drop his name altogether, and give the arguments as the property of Linnaeus, by whom they were originally employed.

Linnaeus, then, first attempts to show, that vegetables are endowed with a certain degree of life; and, secondly, that they propagate their species in a manner similar to that of animals.

"That vegetables are really living beings (says he), Vegetables must be obvious at first sight; because they possess all possible life. The properties contained in that accurate definition of life laid down by the great Dr Harvey, namely, Fita est spontanea propiusa humorum. But universal experience teaches, that vegetables propel humours or juices: hence it is plain that vegetables must be endowed with a certain degree of life."

Not trusting solely to a syllogism founded on a definition, Linnaeus proceeds to support the life of vegetables by arguments drawn from the following particulars in their economy; the first of which he entitles, "1. Nutritio. The very idea of nutrition implies a propulsion of humours, and of course the idea of life. But vegetables derive their nourishment from the earth, air &c. and consequently must be considered as living creatures.

"2. Etae. Every animal must not only begin to exist, and have that existence dissolved by death, but must likewise pass through a number of intermediate changes in its appearance and affections. In infancy, youth, manhood, old age, are characterized by immobility, beauty, fertility, dotage. Are not all these vicissitudes conspicuous in the vegetable world? Weak and tender in infancy; beautiful and salacious in youth; grave, robust, and fruitful, in manhood; and when old age approaches, the head droops, the springs of life dry up, and, in fine, the poor tottering vegetable returns to that dust from whence it sprang.

"3. Motus. No inanimate body is capable of self-motion. Whatever moves spontaneously, is endowed with a living principle: for motion depends on the spontaneous propulsion of humours: and wherever there is a spontaneous propulsion of humours, there also is life. That vegetables are capable of motion, is evident from the following facts: Plants, when confined within doors, always bend towards the light, and some of them even attempt to make their escape by the windows. The flowers of many plants, especially those of the syngenesia class, pursue the sun from east to west, rejoicing in his beams. Who then can deny that vegetables are possessed of living and self-moving powers?

"4. Morbus. The term disease means nothing more than a certain corruption of life. It is well known, that vegetables are subject to diseases as well as animals: when over-heated, they turn thirsty, languish, and fall to the ground; when too cold, they are tormented with the chillblain, and not unfrequently expire: they are sometimes afflicted with cancers; and every plant is infested with lice peculiar to its species.

"5. Mors. Death is opposed to life, the former being only a privation of the latter. Experience shows that every living creature must die. But as vegetables are daily cut off by internal diseases and external injuries; as they are subject to death from the attack of hunger,
hunger, thirst, heat, cold, &c. with what propriety could vegetables be thus said to do, unless we allow that they previously lived.

"6. Anatomia.—Under this article we are referred to Malphigius and Crew for the organic fibres, membrane, canals, vessels, &c. of plants, as additional proofs of their living powers.

"7. Organization.—Vegetables not only propel humours, but also prepare and secrete a number of different juices for the fruit, the nectar, &c. analogous to the various secretions in animal bodies.

From these facts and observations, Linneus concludes, that plants are unquestionably endowed with life as well as animals; and then proceeds in the following manner to show how these animated vegetables propagate their species.

Arguments for the sexual system.

After discussing the long-explored doctrine of equi-vocal generation, he lays hold of another maxim of Dr Harvey, viz. *Omne vivum ex ovo.* "It being fully evident (says he), from the foregoing chain of reasoning that vegetables are endowed with life, it necessarily follows, agreeable to this maxim of Harvey's, that every vegetable must in like manner derive its existence from an egg. But as vegetables proceed from eggs, and as it is the distinguishing property of an egg to give birth to a being similar to that which produced it, the seeds must of course be the eggs of vegetables.

"Granting then that the seeds of vegetables are intended by nature to answer the same end as the eggs of animals; and considering at the same time that no egg can be fecundated without receiving an impregnation from the male, it follows, that the seeds or eggs of vegetables cannot be fecundated by any other means. Hence also the necessity of vegetables being provided with organs of generation. But where are these organs situated? The answer is easy. —We have already found impregnated seeds within the flowers of plants; and it is natural to expect that the *genitalia* should not be at a greater distance. Now, as copulation always precedes birth, and every flower produces the fruit, the generating faculty must be ascribed to the flower, and the birth to the fruit. Again, As the *antherae* and *stigmata* are the only essential parts of flowers, these parts must necessarily be the *organs of generation."

Being thus far advanced, Linneus affirms, that the *antherae* are the *testes,* and that the pollen performs the office of the male *semen.* These affirmations he attempts to establish by the following arguments; the first of which are terms

"1. Procedentia.—The *antherae,* or vegetable testes, always precede the fruit; and as soon as the *antherae* come to maturity, which constantly happens before the maturity of the fruit, they continue to throw out their pollen as long as the flower lasts; but decay and fall off whenever the fruit comes to perfection.

"2. Situs.—The *antherae* of all plants are uniformly situated in such a manner that the pollen may, with the greatest facility, fall upon the stigma or female organ.

"3. Tempus.—The *antherae* and *stigmata* always flourish at the same time, whether the flowers be of the hermaphrodite or dioecious kind.

"4. Loculamenta.—When the *antherae* are dissected, they discover as great a variety of structure as the pericarpia or seed-capsules; for some of them have one cell, as the mercury; some two, as the hellebore, &c.

"5. Castration.—If all the *antherae* be cut off from a hermaphrodite plant, just before the flowers begin to expand, taking care at the same time that no plant of the same species grow near it, the fruit will either prove entirely abortive, or produce barren seeds.

"6. Figura.—When the pollen of different plants is examined by the microscope, it exhibits as great a variety of figures as is discoverable in the seeds themselves.

"The accumulated force of these arguments (concludes Linneus) amounts to a full demonstration that the *antherae* are the testes, and that the pollen is the semen or geniturna of vegetables.

"The male organ being thus investigated, we hope (says Linneus) that none will hesitate to pronounce the stigma to be the female organ, especially when the following observations are attended to.

"The pistillum is composed of the germin, stylus, and stigma. The germin, being only a kind of rudiment of the future fruit or seed, ceases to exist as soon as the flower comes to maturity. Neither is the stylus an essential part, as many flowers have no stylus. But no fruit ever comes to maturity without the assistance of the stigma. It follows, that the stigma must be the female organ adapted by nature for the reception of the pollen or impregnating substance. This will appear still clearer from the following chain of reasoning.

"1. Situs.—The stigmata are always situated so that the pollen may with most ease fall upon them. Besides, it is remarkable, that in most plants (though not in all) the number of the stigmata exactly corresponds with the loculaments or cells of the pericarpium.

"2. Tempus.—Here the observation, that the stigmata and *antherae* constantly flourish at the same time, is repeated.

"3. Deciduitia.—The stigmata of most plants, like the *antherae,* decay and fall off as soon as they have discharged their proper function; which evidently shows, that their office is not to ripen the fruit, but solely to answer the important purpose of impregnation.

"4. Abcessus.—The argument here is precisely the same with the castration of the *antherae,* and the result is likewise the same, namely the destruction of the fruit.

"These arguments (concludes Linneus) are sufficient to demonstrate, that the stigma is the female organ of generation, or that organ which is suited for the reception and conveyance of the semen to the vegetable eggs. Hence plants may be said to be *in actu veners,* when the *antherae* or testiculi spread their pollen over the stigma or female *valva.*"

To show how the *coitus* of vegetables is effected, is our author's next object of investigation. He affirms, that the pollen is conveyed, by means of the wind or insects, to the moist stigma; where it remains until it discharges a subtile fluid, which being absorbed by the vessels of the stigma, is carried to the seeds or ovula, and impregnates them. His proofs are taken from the following particulars.

"1. Octopus.—When the flowers are in full blow, and the pollen flying about, every one may then see the pollen adhering to the stigma. This he illustrates by mentioning
mentioning as examples the viola tricolor, iris, campanula, &c.

2. Propositio. — The staminas and pistillas, in most plants, are of equal heights, that the pollen, by the intervention of the wind, may, with the greater facility, fall upon the stigmas.

3. Loca. — The staminas of most plants surround the pistillum, to give the pollen an opportunity of falling upon the stigmas at every breeze of wind. Even in the monocots class, the male flowers stand generally above the female ones, to afford an easier conveyance of the pollen to the stigmas.

4. Tempus. — It is remarkable that the staminas and pistillas constantly appear at the same time, even in plants belonging to the monocots class.

5. Pluviæ. — The flowers of most plants expand by the heat of the sun, and shut themselves up in the evening or in rainy weather. The final cause of this must be to keep the moisture from the pollen, lest it should be thereby coagulated, and of course prevented from being blown upon the stigmas.

6. Palmicola. — That the cultivators of palm-trees were in use to pull off the spathes from the males, and suspend them over the spathes of the females, is attested by Theophrastus, Pliny, Prosper Alpinus, Kempter, and many others. If this operation happened to be neglected, the dates were sour and destitute of nuts. Kempter adds this singular circumstance, that the male spadix, after being thoroughly dried and kept till next season, still retained its impregnating virtue.

7. Flores nascentes. — As the pollen is specifically heavier than air, such flowers as have their pistillums longer than the staminas, hang down or incline to one side, e.g. the fraxillaria, campanula, &c. An easy admission of the pollen to the stigma is the final cause of this appearance.

8. Submersæ. — Many plants that grow below water, emerge when their flowers begin to blow, and swim upon the surface till they receive their impregnation, and then sink down.

9. Omnia florum genuina consideratio. — Here a number of particulars are recited. We shall confine ourselves to those that are most striking and applicable to the subject.

When the flowers of the male hemp are pulled off before those of the female are fully expanded, the females do not produce fertile seeds. But as a male flower is sometimes found upon a female plant, this may be the reason why fertile seeds are sometimes produced even after this precaution has been observed.

The tulip affords another experiment of the same purpose. Cut off all the anthers of a red tulip before the pollen is emitted; then take the ripe anthers of a white tulip, and throw the pollen of the white one upon the stigma of the red; the seeds of the red tulip being thus impregnated by one of a different complexion, will next season produce some red, some white, but most variegated flowers.

In the year 1744, Linneæus published a description of a new genus which he called petoria, on the supposition of its being a hybrid or mule plant, i.e. a plant produced by an unnatural commixture of two different genera. The root, leaves, caulis, &c. of this plant are exceedingly similar to those of the antirrhinum linaria; but the flower and other parts of the fruitification are totally different. On account of its similarity to the linaria in every part but the flower, Linneæus imagined it to have been produced by a fortuitous commixture of the linaria with some other plant, although he has never yet been able to point out the father. This doctrine of the production of mule plants has since been greatly prized, and carefully propagated, by Linneæus and the other supporters of the sexual hypothesis.

In the third volume of the Acronomus Academica, there is a complete dissertation, entitled Planta Hybridae, wherein the doctrine of vegetal mules is much improved and extended. This dissertation contains a list of 47 mules, with their supposed fathers and mothers. For example,

The Veronica spuria is said to be a mule plant begot by the Verbena officinalis upon the Veronica maritima.

The Delphinum hybrida, a mule begot by the Aconitum napellus upon the Delphinium elatum.

The Arctotis calendula, a mule begot by the Calendula plurivialis upon the Arctotis tristis.

The Asclepias nigræ, a mule begot by the Cynanchum acutum upon the Asclepias verticophilium, &c.

From the examples given in this dissertation, Linneæus draws this conclusion, That only two species of each genus exist, ab origine; and that all the variety of species which now appear have been produced by unnatural embraces between species of different genera.

Under this head Linneæus likewise quotes from Ray the story of Richard Baal gardener at Brentford. This Baal sold a large quantity of the seeds of the brassica florda to several gardeners in the suburbs of London. These gardeners, after sowing their seeds in the usual manner, were surprised to find them turn out to be plants of a different species from that which Baal made them believe they had purchased; for, instead of the brassica florda, the plants turned out to be the brassica longifolia. The gardeners, upon making the discovery, commenced a prosecution of fraud against Baal in Westminster-hall. The court found Baal guilty of fraud, and decreed him not only to restore the price of the seeds, but likewise to pay the gardeners for their lost time, and the use of their ground. Hard these judges (says Linneæus) been acquainted with the sexual hypothesis, they would not have found Baal guilty of any crime, but would have ascribed the accident to the fortuitous impregnation of the brassica florda by the pollen of the brassica longifolia.

Linneæus next proceeds to celebrate the utility of insects, because they convey the pollen of the male to the stigma of the female. In this way (says he), it is reasonable to think that many dioecious plants are impregnated. Nay, even the hermaphrodites themselves are greatly obliged to the different tribes of insects, which, by fluttering their tails, cause the corollas, are constantly scattering the pollen about the stigmas.

Upon the whole then (concludes Linneæus), the coitus of vegetables is evident to a demonstration. This coitus is nothing more than the conveyance of the pollen to the stigma, to which it adheres till it bursts, and discharges a subtle elastic fluid. This fluid or aura is absorbed by the vessels of the stylus, and carried directly to the ovarium or germen, where the mysterious work of impregnation is fully completed.

These are the arguments employed by Linneæus and other
other advocates for the sexual commerce of vegetables. Let us next attend to those employed by the opposers of this hypothesis.

Objections to the sexual system.

It is admitted by Pontedera, Dr Alston, &c. that some of the ancients applied the terms male and female to several plants. But then they deny that these terms conveyed the same ideas to the ancients that they do to the moderns. Male and female, when applied to plants, were to the ancients mere terms of distinction, serving only as trivial names to distinguish one species or variety from another. The ancients were ignorant of the very characters which constitute the difference between what is called a male and female plant among the moderns. Theophrastus, Dioscorides, Pliny, and, in a word, the whole ancient botanical writers, confounded the very notion of the modern sexes: they call the real female, or seed-bearing plant, the male; and the male, or barren plant, the female. Nay, they have even applied the terms male and female to many plants which bear nothing but hermaphrodite flowers.

Such is the nature of this controversy, that it cannot be determined with any degree of certainty, but by experiments made upon dioecious plants. If a female plant can produce fertile seeds without having any communication with the pollen of the male, the use of this pollen with respect to the impregnation of seeds must of necessity be entirely superseded.

Now, both Camerarius and Dr Alston tried these experiments with the same success. These two eminent botanists took female plants of the mercury, spinaige, and hemp; transplanted them at a great distance from any males of the same genus, and besides had them enclosed by double rows of hedges. The result was, that each of these plants produced great quantities of fertile seeds. Tournefort made the same trial upon the lupinus, Millich, upon the bryony, and Geoffroy upon the mays; and all of them declared that the seeds of these plants were as fertile as if they had been surrounded by a thousand males.

Linnaeus, in his first argument for the coitus of plants, refers every man to the evidence of his senses.

"Do we not see (says he) the stigmas of almost every hermaphrodite flower covered over with the pollen or impregnating substance? Do we not see the parietaria, the urticae, &c. by violent explosions, discharging their pollen in the open air, that it may be carried in that vehicle to the stigmata of their respective females?—All this is admitted by the opposers of the sexes: but then they deny that these explosions, &c. are intended to create any intercourse between the male and the female; and further allege, that this ejection of the pollen is intended by nature to throw off something excrementious, or at least something which, if retained, would prove noxious to the fructification.

Linnaeus takes his second argument from the proportion which the stamens bear to the styles, alleging that they are generally of the same height. This observation (says the anti-sexualists) is not only contrary to experience, but, allowing it to be universal, no conclusion can be drawn from it either for or against the sexual hypothesis.

The third argument is taken from the locus or situation of the stamens with respect to the styles: "and as the male flowers in the monoecea class stand always above the female flowers, it must be concluded (says Linnaeus), that the intention of nature, in this disposition of the parts, is to allow a free and easy access of the pollen to the stigma."—But the stamena cannot be said to surround the pistillum in the monandra and diandra classes: and the position of the male flowers in the monoecea class is a mere chimera; for in the ricinus, one of the examples which Linnaeus mentions in confirmation of his doctrine, the female flowers stand uniformly some inches above the males.

That the stamena and pistilla generally come to perfection at the same time, and that this happens even in the dioecious plants, is Linnaeus's fourth argument. But, as it is acknowledged by Linnaeus himself, that there are many exceptions with respect to this fact, the opposers of the sexual hypothesis allege that it carries the best answer in its own bosom.

The fifth argument is founded on the circumstance of some flowers shutting up their petals in rainy or moist evenings. But many flowers do not shut themselves up, either in the night or moist weather, as the passionflower, &c.; the lychnis noctiflora, mirabilis peruana, &c. open their flowers in the night, and shut them at the approach of the sun. Hence this is another fatal cause (say the anti-sexualists) perverted to support a favourite hypothesis.

We come now to the culture of the palm tree, which in the sixth and most plausible argument employed by the sexualists. Of this, the most authentic account we have is the following by Dr Hasselquist, in one of his letters to Linnaeus, dated Alexandria, May 18. 1750.

"The first thing I did after my arrival was to see the date tree, the ornament and a great part of the riches of this country. It had already blossomed; but I had, nevertheless, the pleasure of seeing how the Arabs assist its fecundation, and by that means secure to themselves a plentiful harvest of a vegetable, which was so important to them, and known to them many centuries before any botanist dreamed of the difference of sexes in vegetables. The gardener informed me of this before I had time to enquire; and would show me as a very curious thing, the male and female of the date or palm trees; nor could he conceive how I, a Frank, lately arrived, could know it before; for (says he) all who have yet come from Europe to see this country, have regarded this relation either as a fable or miracle. The Arab seeing me inclined to be further informed, accompanied me and my French interpreter to a palm tree, which was very full of young fruit, and had by him been wedded or fecundated with the male when both were in blossom. This the Arabs do in the following manner: when the spadix has female flowers, that come out of its spathae, they search on a tree that has male flowers, which they know by experience, for a spadix which has not yet burst out of its spathae: this they open, take out the spadix, and cut it lengthwise in several pieces, but take care not to hurt the flowers. A part of this spadix with male flowers they put lengthwise between the small branches of the spadix which hath female flowers, and then lay the leaf of a palm over the branches. In this situation I yet saw the greatest part of the spadices which bore their young fruit; but the male flowers which were put between were withered. The Arab besides gave me the following anecdote: First, unless they in this manner wed and fecundate the date tree, it bears no fruit. Secondly,
condly, They always take the precaution to preserve some unopened spathes with male flowers from one year to another, to be applied for this purpose, in case the male flowers should miscarry or suffer damage. Thirdly, If they permit the spadix of the male flowers to burst or come out, it becomes useless for fecundation: it must have its maidenhead (these were the words of the Arab), which is lost in the same moment the blossoms burst out of their case. Therefore the person who cultivates date trees must be careful to hit the right time of assisting their fecundation, which is almost the only article in their cultivation. Fourthly, On opening the spathes, he finds all the male flowers full of a liquid which resembles the finest dew; it is of a sweet and pleasant taste, resembling much the taste of fresh dates, but much more refined and aromatic; this was likewise confirmed by my interpreter, who had lived 32 years in Egypt, and therefore had opportunities enough of tasting both the nectar of the blossoms and the fresh dates.

Now, though this account seems fully to confirm the fact, viz. that such a practice obtains among the Arabs, and that they assert its efficacy in fecundating the trees, it is certain (say the opposers of this doctrine), that no intelligent person, who is not already wedded to an hypothesis, will attempt to find an argument upon the assertions of a people so full of ridiculous superstitions. Before Dr Haselquist, or any other person, can draw any argument from the above-mentioned account, he ought to see the experiment several times repeated, with his own eyes, and not take it upon the word of a people who, besides their superstition, may very probably find it their interest to impose upon travelers.

Mr Milne, author of the Botanical Dictionary, however, relates an experiment, near skin to the above mentioned, which merits some attention: "In the garden of M. de la Serre, of the Rue S. Jacques at Paris, was a female turpentine tree, which flowered every year, without furnishing any fruit capable of vegetation. This was a sensible mortification to the owner, who greatly desired to have the tree increased. Messieurs Dubamel and Jussieu very properly judged that they might procure him that pleasure by the assistance of a male pistachio tree. They sent him one very much loaded with flowers. It was planted in the garden of M. de la Serre, very near the female turpentine tree, which the same year produced a great quantity of fruits, that were well conditioned, and rose with facility. The male plant was then removed; the consequence of which was, that the turpentine tree of M. de la Serre in none of the succeeding years bore any fruit that, upon examination, was found to germinate.

Upon this experiment, it is observed by the antisexualists, that, though it were a thousand times repeated, it never could be decisive. The nature of the controversy, say they, is such, that one experiment is more decisive in favour of their opinion than 10,000 can be against them. The reason is plain: If there is such a thing as a sexual intercourse in vegetables, it is as wonderful that any seeds should be perfected without this intercourse, as that a virgin should have a child; the last is not in the least more extraordinary than the first. One experiment, therefore, which shows that seeds may be perfected without such sexual intercourse, is either to be resolved into a miracle, or must prove absolutely decisive against the sexual system; while numberless experiments, such as that above mentioned, could prove nothing, because we know not what effect vegetables may have by growing in each other's neighbourhood, independent of any sexual intercourse.

In Milne's Botanical Dictionary, under the article Sexus Plantarum, the author quotes Dr Alston's experiments partially. The facts recorded by Dr Alston are as follow: 1. Three sets of spinach, planted at a great distance from each other, proved all of them fertile, and ripened plenty of seeds, which were found to answer as well as other spinach seed. 2. A plant of hemp growing by itself, being taken care of, produced about 30 good seeds, though in a situation very much exposed, and plucked up too soon, on account of bad weather, in the autumn. 3. This experiment, which is the most remarkable of the three, we shall give in the Doctor's own words. "In the spring of 1741, I carried two young seedling plants of the French mercury, long before there was any in, from this city physic garden, the only place where it was then to be found in this country, to the king's garden at the Abbey; which are more than 700 yards distant from one another, with many high houses, trees, hedges, and part of a high hill between them; and planted one of them in one enclosure, where it was shaded from the sun the greatest part of the day; and the other in another 25 yards distant, exposed to the south and west. Both plants ripened fertile seeds; and the last shed them so plentifully, that it proved a troublesome weed for several years, though none of the species was to be found in that garden for more than 20 years preceding.)

Of this experiment Mr Milne hath not taken any notice; but upon the other two, has the following remark: "The result of these, and such like experiments, can be accounted for, on the principle of the sexes, in no other way than on the supposition that some male flowers have been intermixed with the female, and operated the fecundation in question. This appears the more probable, as only a part of the seed in the above experiments attained to perfect maturity, so as to be capable of vegetation.

The seventh argument of Linnaeus is taken from the Flores mutantes. — The pistils of these flowers, according to Linnaeus, are always longer than the stamens; and nature has assigned them this penile posture, that the pollen, which is specifically heavier than air, may the more conveniently fall upon the stigma. But the pistil of the canranus, lilium, and many other Flores mutantes, are not longer than the stamens. Besides, granting this was uniformly the case; yet, as the pollen is heavier than air, this posture must of necessity either make the pollen miss the pistillum altogether; or, at any rate, it can only fall upon the back part of the pistillum in place of the stigma; and, of course, such a direction would rather tend to frustrate than promote the impregnation of the seed.

The eighth argument is taken from the plantas submersae, which are said to emerge as soon as their flowers begin to blow, lest the pollen should be coagulated or washed off by the water. But many submarine and aquatic plants fructify entirely below water; and, supposing they did not, the same argument would equally prove
prove it to be the intention of nature, that the pollen should be blown away by the winds, as that it should be subservient to the impregnation of the seed.

The ninth and last argument is entitled *Omnium florum genuina consideratio*; which (say the antisexualists) is nothing more than a collection of vague observations upon the structure and economy of particular plants, some of them true, others false, but all of them evidently thrust in as supports to a favourite hypothesis.

Thus the dispute rested some years ago; but of late there has appeared a translation of one of Linnaeus’s works upon the subject, which, though published in 1759, was but little known in this country. A treatise on the Sexual System had also been published by the abbé Spallanzani, in which he not only opposed the Linnean doctrine, but treated it with ridicule, though without taking any notice of this last publication, which he seems to have been ignorant of. In this he mentions an experiment with hemp similar to some of those already related; but which was also tried by Linnaeus, and in his hands turned out the very reverse of what it did with Spallanzani. In the treatise alluded to, Linnaeus mentions Sir Thomas Millington as the first among the moderns who thought of the distinction of sexes in plants. He was Savilian professor at Oxford; and Dr. Grew, in his Anatomy of Plants, relates, that in a conversation on the nature of the anthers of flowers, Sir Thomas hinted, that those parts might probably be analogous to the male organs of animals, and serve for the impregnation of the fruit. Grew improved on the idea, and pursued it. That the subject, however, may be properly understood, our author is of opinion, that we should first accurately understand the nature of vegetable bodies; and in order to do this, we ought first to consider the operations of nature in the human frame, and from thence continue our researches through the various tribes of inferior animals, till at last we arrive at the vegetable creation. In like manner, to illustrate the generation of plants, we must likewise take our first lights from the animal kingdom, and pursue the same chain till we come to vegetables. This subject, indeed, he owns to be so obscure, that no naturalist has hitherto been able to say any thing satisfactory concerning it; he only mentions some remarkable facts concerning the production of mule animals from the copulation of two individuals of different species. In the horse kind we see two different kinds of mules produced. *" From the mare and male ass (says he) proceeds the mule properly so called, which in its nature, that is, in its medullary substance and nervous system, agrees with its mother; but in its cortical substance and outward form, in its mane and tail, resembles the ass. Between the female ass and the horse, the other kind of mule is engendered, whose nature or medullary substance resembles that of the ass; but its cortical structure that of the horse. If the he-goat of Angora copulates with the common she-goat, the kid, by that means procured, inherits the external structure and valuable coat of its father; while, on the other hand, if the common he-goat impregnates the goat of Angora, the kid produced has the same external form, and bears the same worthless hair with its father. Hence it seems probable, that the medullary substance, with what Malpighi calls the keel (carina), and the nervous system, are latent in the egg of the mother; the cortical substance, or vascular system, being derived from the father.*

These cortical and medullary substances are previously explained by our author to be those of which both animal and vegetable bodies are composed. By the medullary substance in animal bodies, he means the spinal marrow arising from the organized brain, and sending off the nerves; by the cortical substance the vessels with the heart attached to them, by which the medullary part is nourished. In vegetables, the cortical part nourishes the plant, not only by its roots, but with its whole surface. For a small branch torn from the parent stem, and placed in water, imbibes nourishment at its pores. Thus the Fuci, and other marine vegetables, are nourished without a root, solely by the pores dispersed through their whole substance. The bark of trees every year deposits its gelatinous internal layer, which is added to the wood, and assimilates itself to it. The medullary, which is the other essential part of vegetables, is multiplied and extended without end; and whenever it is entirely lost, the death of the plant necessarily follows. In examining this substance, we must be careful, in two cases, that we be not misled; first, by the straws of grasses, and by other hollow stems, where the medulla lines the inside of the bark; and secondly, by large trees, whose trunks become perfectly solid, throughout, except in the very summits of the branches. The wood performs the office of bones, when there is no longer any occasion for the medulla in that part; and trees, although become hollow, continue nevertheless to grow so long as this substance remains in the extreme branches. It is by no means necessary that the medulla should have any connexion with the root, as it is only nourished by the cortical substance of the plant, and is therefore increased at its upper extremity without end if it meets with no resistance. In those animals whose spinal marrow is surrounded by a bony covering, as in the larger and more perfect kinds, this substance never comes out of its confinement; and the harder its case, the more absolutely is its increase prevented; but in the smaller tribes of worms, where this covering is less rigid, a perpetual and unlimited increase of the animal takes place.

*"The most important parts of the flower, and which are absolutely essential to it (our author proceeds to observe *), are the stamina and pistilla. So a *Disser*.

The essential are they, that among the many thousands of the Sex-flowers with which we are acquainted, no one can be found not furnished with both these organs. The Plants, staminal and Stamina derive their origin from the substance of the wood, which was originally formed from the inner bark, and they may therefore be said to spring from the cortical substance of the vegetable. This is perfectly evident in the asarum (asarabacca), whose twelve stamina proceed from twelve fibres in the inner bark. Double flowers illustrate the same fact: in them, the stamina being weakened and dissolved by excess of nourishment, the woody substance reassumes the softness of the inner bark, of which it was originally formed. All stamina consist of vessels containing the pollen, or impregnating powder, which they discharge in due time, not without the strictest observance of certain natural laws. The form of these vessels, like that of the
the capsules of the fruit, is accurately defined, as well as their cells, their particular manner of bursting, and the pollen which they contain; this pollen, likewise, is no less certain and uniform in its figure, size, and colour, than the seeds themselves.

"The pistillum is the only part which originates from the medullary substance, and is therefore invariably situated in the centre of the flower. It always contains the rudiments of the seed, which, in process of time, ripen into fruit. The rudiments of the fruit are called the germ, or seed-bud; this has constantly another organ connected with it, named the stigma, which is in its highest degree of vigour and perfection during the time of flowering.

"Another circumstance worthy of attention is, that the root, which the first year of its growth is large and filled with medullary pulp, the following season becomes hollow, in producing the stem, flowers, and seed; all this pulp being conveyed to the flower, and seeming to be only destined to the formation of seed, so many new and distinct animations being formed from it as there are rudiments of new plants. This is particularly observable in the turnip.

"Thus vegetables, like insects, are subject to a metamorphosis; with this difference only, that their flowers are fixed to one spot, instead of being able, like insects, to fly from place to place; and that their nourishment is not given them by means of peculiar organs for the formation of chyle. We have seen, that the outer bark becomes calyx, the internal bark corolla, the wood stamina, and the medulla pistillum; the fructification exhibiting the internal parts of a plant naked and unfolded. We have likewise seen, that the fructification puts an end to vegetation in the part from whence it arises, stopping the progress of the medulla, which would otherwise have extended itself without end by the branches, and occasioning the division of that medulla into a number of seeds, each endowed with a separate living principle. But as the medulla exists naked in the germen, it cannot support itself, or make any farther progress, without the assistance of the cortical substance which it has left; it must therefore receive this assistance by some means or other, and in fact does receive it from the stamina and their pollen, which owe their origin to the woody matter derived from the inner bark, and originally generated by the outer bark. But if it happens that the cortical substance is able to invest the medullary rudiments of the seed in the flower itself, the plant becomes viviparous, as in festuca, aura and poa vivipara, in which nearly the same thing takes place as in the medulla of other plants, which remains in the branches, and is variously distributed, being at once both clothed and nourished by the bark, and enabled to form new branches, just as it happens in the compound animals, or cerculariae.

"The organs common in general to all plants are, 1. The root, with its capillary vessels, extracting nourishment from the ground. 2. The leaves, which may be called the limbae, and which, like the feet and wings of animals, are organs of motion; for being themselves shaken by the external air, they shake and exercise the plant. 3. The trunk, containing the medullary substance, which is nourished by the bark, and for the most part multiplied into several compound plants.

4. The fructification, which is the true body of the plant, set at liberty by a metamorphosis, and consists only of the organs of generation; it is often defended by a calyx, and furnished with petals, by means of which it in a manner flutters in the air.

"Many flowers have no calyx, as several of the lily tribe, the hippuris, &c.; many want the corolla, as grasses, and the plants called apetalous; but there are none destitute of stamina and pistilla, those important organs destined to the formation of fruit. We therefore infer from experience, that the stamina are the male organs of generation, and the pistilla the female; and as many flowers are furnished with both at once, it follows that such flowers are hermaphrodites. Nor is this so wonderful, as that there should be any plants in which the different sexes are in distinct individuals; for plants being immovable fixed to one spot, cannot, like animals, travel in search of a mate. There exists, however, in some plants, a real difference of sex. From seeds of the same mother, some individuals shall be produced, whose flowers exhibit stamina without pistilla, and may therefore be properly called males; while the rest, being furnished with pistilla without stamina, are therefore denominated females; and so uniformly does this take place, that no vegetable was ever found to produce female flowers, without flowers furnished with stamina being produced, either on the same individual, or on another plant of the same species, and vice versa.

"As all seed-vessels are destined to produce seeds, so are the stamina to bear the pollen, or fecundating powder. All seeds contain within their membranes a certain medullary substance, which swells when dipped into warm water. All pollen, likewise, contains in its membrane an elastic substance, which although very subtle and almost invisible, by means of warm water often explodes with great vehemence. While plants are in flower, the pollen falls from the antherae, and is dispersed abroad, as seeds are dislodged from their situation when the fruit is ripe. At the same time that the pollen is scattered, the pistillum presents its stigma, which is then in its highest vigour, and, for a portion of the day at least, is moistened with a fine dew. The stigma either surround this stigma, or, if the flowers are of the drooping kind, they are bent towards one side, so that the pollen can easily find access to the stigma; where it not only adheres by means of the dew of that part, but the moisture occasions its bursting, by which means its contents are discharged. What issued from it, being mixed with the fluid of the stigma, is conveyed to the rudiments of the seed. Many evident instances of these present themselves to our notice; but I have nowhere seen it more manifest than in the Jacobean lily (amaryllis formosata), the pistillum of which, when sufficient heat is given to the plant to make it flower in perfection, is bent downwards, and from its stigma issues a drop of limpid fluid, so large that one would think it in danger of falling to the ground. It is, however, gradually re-absorbed into the style about three or four o'clock, and becomes invisible till about ten the next morning, when it appears again; by noon it attains its largest dimensions; and in the afternoon, by a gentle and scarcely perceptible decrease, it returns to its source. If we shake the antherae over the stigma, so that the pollen may fall..."
fall on this insipid drop, we see the fluid soon after become turbid, and assume a yellow colour; and we perceive little rivulets, or opaque streaks, running from the stigmas towards the rudiments of the seed. Some time afterwards, when the drop has totally disappeared, the pollen may be observed adhering to the stigmas, but of an irregular figure, having lost its original form. No one, therefore, can assert to what Mörland and others have asserted, that the pollen passes into the stigmas, pervades the style, and enters the tender rudiments of the seed, as Leeuwenhoek supposed his worms to enter the ova. A most evident proof of the falsehood of this opinion may be obtained from any species of mirabilis (marvel of Peru), whose pollen is so very large, that it almost exceeds the style itself in thickness, and, falling on the stigmas, adheres firmly to it; that organ sucking and exhausting the pollen, as a cuttle-fish devours every thing that comes within its grasp. One evening in the month of August I removed all the stamens from three flowers of the mirabilis longiflora, at the same time destroying all the rest of the flowers which were expanded; I sprinkled these three flowers with the pollen of mirabilis jalappa; the seed-buds swelled, but did not ripen. Another evening I performed a similar experiment, only sprinkling the flowers with the pollen of the same species; all these flowers produced ripe seeds.

"Some writers have believed, that the stamens are parts of the fructification which serve only to discharge an impure or excrementitious matter, and by no means formed for so important a work as generation. But it is very evident, that these authors have not sufficiently examined the subject; for, as in many vegetables, some flowers are furnished with stamens only, and others only with pistils, it is altogether impossible, that stamens situated at so very great a distance from the fruit as on a different branch, or perhaps on a separate plant, should serve to convey any impurities from the embryo.

"No physiologist could demonstrate, à priori, the necessity of the masculine fluid to the rendering the eggs of animals prolific; but experience has established it beyond a doubt. We therefore judge à posteriori principally of the same effect in plants.

"In the month of January 1760 the antholyza cornonias flowered in a pot in my parlour: but produced no fruit, the air of the room not being sufficiently agitated to waft the pollen to the stigmas. One day, about noon, seeing the stigmas very moist, I plucked off one of the anthers, by means of a fine pair of forceps, and gently rubbed it on one of the expanded stigmata. The spike of flowers remained eight or ten days longer; when I observed, in gathering the branch for my herbarium, that the fruit of that flower only on which the experiment had been made had swelled to the size of a bean. I then dissected this fruit, and discovered that one of the three cells contained seeds in considerable number, the other two being entirely withered.

"In the month of April I sowed the seeds of hemp (cannabis) in two different pots. The young plants came up so plentifully, that each pot contained 30 or 40. I placed each by the light of a window, but in different and remote apartments. The hemp grew extremely well in both pots. In one of them I permitted the male and female plants to remain together, to flower and bear fruit, which ripened in July; and being macerated in water and committed to the earth, sprung up in twelve days. From the other, however, I removed all the male plants as soon as they were old enough for me to distinguish them from the females. The remaining females grew very well, and presented their long pistilla in great abundance, these flowers continuing a very long time, as if in expectation of their mates; while the plants in the other pot had already ripened their fruit, their pistilla having, quite in a different manner, faded, as soon as the males had discharged all their pollen. It was certainly a beautiful and truly admirable spectacle, to see the unimpregnated females preserve their pistilla so long green and flourishing, not permitting them to begin to fade till they had been for a considerable time exposed, in vain, to the access of the male pollen. Afterwards, when these virgin plants began to decay through age, I examined all their calyces in the presence of several botanists, and found them large and flourishing, although every one of the seed-buds was brown, compressed, membraneous, and dry, not exhibiting any appearance of cotyledons or pulp. Hence I am perfectly convinced, that the circumstance which authors have recorded, of the female hemp having produced seeds, although deprived of the male, could only have happened by means of pollen brought by the wind from some distant place. No experiment can be more easily performed than the above; none more satisfactory in demonstrating the generation of plants.

"The clucia tenella was in like manner kept growing in my window through the months of June and July. The male plant was in one pot, the female in another. The latter abounded with fruit, not one of its flowers proving abortive. I removed the two pots into different windows of the same apartment: still all the female flowers continued to become fruits. At length I took away the male entirely, leaving the female alone, and cutting off all the floggers which it had already borne. Every day new ones appeared from the axilla of every leaf; each remained eight or ten days; after which their footstalks turning yellow, they fell barren to the ground. A botanical friend, who had amused himself with observing this phenomenon with me, persuaded me to bring from the stove in the garden a single male flower, which he placed over one of the female ones, then in perfection, tying a piece of red silk round its pistillum. The next day the male flower was taken away, and this single seed-bud remained and bore fruit. Afterwards I took another male flower out of the same stove, and with a pair of slender forceps pinched off one of its anthers, which I afterwards gently scratched with a feather, so that a very small portion of its pollen was discharged upon one of the three stigmata of a female flower, the other two stigmata being covered with paper. This fruit likewise attained its due size; and being cut transversely, exhibited one cell filled with large seed, and the other two empty. The rest of the flowers, being unimpregnated, faded and fell off. This experiment may be performed with as little trouble as the former.

"The datisca cannabina came up in my garden from seed ten years ago, and has every year been plentifully increased by means of its perennial root. Flowers ...
great number have been produced by it; but being all female, they proved abortive. Being desirous of procuring male plants, I obtained more seeds from Paris. Some more plants were raised; but these likewise, to my great mortification, all proved females, and bore flowers but no fruit. In the year 1757, I received another parcel of seeds. From these I obtained a few male plants, which flowered in 1758. These were planted at a great distance from the females; and when their flowers were just ready to emit their pollen, holding a paper under them, I gently shook the spikes or panicle with my finger, till the pollen was almost covered with the yellow powder. I carried this to the females, which were flowering in another part of the garden, and placed it over them. The cold nights of the year in which this experiment was made, destroyed these datises, with many other plants, much earlier than usual. Nevertheless, when I examined the flowers of those plants which I had sprinkled with the fertilizing powder, I found the seeds of their due magnitude; while in the more remote datises, which had not been impregnated with pollen, no traces of seeds were visible.

"Several species of mumordica, cultivated with us, like other Indian vegetables, in close stoves, have frequently borne female flowers, which, although at first very vigorous, after a short time have constantly faded and turned yellow, without accomplishing any seed, till I instructed the gardener, as soon as he observed a female flower, to gather a male one and place it above the female. By this contrivance we are so certain of obtaining fruit, that we dare pledge ourselves to make any female flowers fertile that shall be fixed on.

"The jatropha curcas has flowered every year in my hot-house; but the female flowers coming before the males, in a week’s time dropped their petals, and faded before the latter were open; from which cause no fruit has been produced, but the germs themselves have fallen off. We have therefore never had any fruit of the jatropha until the year 1752, when the male flowers were in vigour on a tall tree at the same time that the females began to appear on a small jatropha, which was growing in a garden pot. I placed this pot under the other tree, by which means the female flowers bore seeds, which grew on being sown. I have frequently since amused myself with taking the male flowers from one plant, and scattering them over the female flowers of another, and have always found the seeds of the latter impregnated by it.

"Two years ago I placed a piece of paper under some of these male flowers, and afterwards folded up the pollen, which had fallen upon it, preserving it so folded up, if I remember right, four or six weeks, at the end of which time another branch of the same jatropha was in flower. I then took the pollen, which I had so long preserved in paper, and strewn it over three female flowers, the only ones at that time expanded. These three females proved fruitful, while all the rest which grew in the same bush fell off abortive.

"The interior petals of the annigogalum, commonly, but improperly, called canadense, cohere so closely together, that they only just admit the air to the germs, and will scarcely permit the pollen of another flower to pass; this plant produced every day new flowers and fruit, the fruitification never failing in any instance; I therefore, with the utmost care, extracted the anthers from one of the flowers with a hooked needle; and, as I hoped, the single flower proved barren. This experiment was repeated about a week after with the same success.

"I removed all the anthers out of a flower of chelidonium amuria (scarlet horehound poppy), which was growing in a remote part of the garden, upon the first opening of its petals, and stripped off all the rest of the flowers; another day I treated another flower of the same plant in a similar manner, but sprinkled the pistillum of this with the pollen borrowed from another plant of the same species; the result was, that the first flower produced no fruit, but the second afforded very perfect seed. My design in this experiment was to prove, that the mere removal of the anthers from a flower is not in itself sufficient to render the germs abortive.

"Having the nicotiana fruticosas growing in a garden parterre, and producing plenty of flowers and seed, I extracted the anthers from a newly-opened flower before they had burst, at the same time cutting away all the other flowers; this germs produced no fruit, nor did it even swell.

"I removed an arm, in which the cappodaca fastuosa was growing, to a corner of the garden, and from one of the flowers which had lately opened I extracted its anthers; this caused the impregnation to fail. Another day I treated another flower in the same manner; but bringing a flower from a plant in a different part of the garden, with which I sprinkled the pistillum of the mutilated one, its germs became by that means fruitful.

"Leuca chinensis, flowering in my stove, the windmills of which were shut, all its flowers proved abortive. I therefore took some of its anthers in a pair of pincers, and with them sprinkled the stigmas of two flowers, and the next day one stigma only of a third flower; the seed-buds of these flowers remained, grew to a large size and bore seed; the fruit of the third, however, contained ripe seed only in one of its cells.

"To relate more experiments would only be to fatigue the reader unnecessarily. All nature proclaims the truth I have endeavoured to inculcate, and every flower bears witness to it. Any person may make the experiment for himself, with any plant he pleases, only taking care to place the pot in which it is growing in the window of a room sufficiently out of the reach of other flowers; and I will venture to promise him that he will obtain no perfect fruit, unless the pollen has access to the pistillum."

Sect. V. Of the Natural Method of Classification.

Besides all the above-mentioned methods of classing and distributing plants into their different orders, genera, &c. which are deduced from the fruitification, and are therefore called artificial, Linnaeus and most other botanists are of opinion that there is a natural method, or nature’s system, which we should diligently endeavour to find out. That this system, say they, ia no chimera, as some imagine, will appear particularly from hence, that all plants, of what order soever, show an affinity to some others; and thus, as formerly oberved,
History.

BOT

ANY.

which embraces the stalk like a glove, has no longitudinal aperture, but is perfectly entire. The stalk is generally triangular, and without knots or joints. The roots of some are long and knotty; in others they are composed of fleshy fibres which pierce deep into the ground; and in others, of a bulb. The flowers are either hermaphrodite, or male and female upon the same root. The mode of inflorescence in this order is generally a spike; sometimes a capitulum or head. The calyx is either a gluma or an amnentum. The corolla is wanting. The filaments of the stamens are three in number, short, slender like a hair, and sometimes bristly. The anthers are generally long, slender, and erect. The seed-bud is very small, bluish, and sometimes three-cornered. The style is thread-shaped, and of the length of the scaly calyx. The stigmas are generally three in number; slender, hairy, and sometimes permanent. The virtues, uses, and sensible qualities, of this order of plants are the same with those of the following.

4. Gramina. Most of these plants are annual or perennial herbs; some of them creep upon the ground, others are erect. The roots, in the greatest number, are creeping, and emit fibres from each knot or joint; in others they are simply branching and fibrous. The stems and branches are round. The leaves are simple, alternate, entire, very long, and commonly narrow. They form below a sort of sheath, which embraces or surrounds the stem, and is generally cleft or divided on one side through its whole length. The flowers are either hermaphrodite, male and female on the same root, or hermaphrodite and male on the same root. They proceed either singly from the sheath of the leaves, or are formed into a panicle or loose spike. The calyx and corolla in this order are not sufficiently ascertained; in some a single scale or husk, in others two, supply the place of both covers; some grasses have four husky scales, two of which serve for the calyx, and the other two for the corolla; some have six; others six, four of which constitute the calyx, and the other two are termed improperly enough the husky petala. The corolla is sometimes composed of one petal with two divisions; and in general the husks of the calyx are always placed opposite to those of the corolla. The stamens are generally three in number, and placed irregularly with regard to the situation of the calyx and corolla. The anthers are long, furnished with two cells, and slightly attached to the filaments. The seed-bud is placed upon the same receptacle as the calyx, corolla, and stamens. The style is generally double, and crowned with a hairy stigma or summit. The seed-vessel is wanting. The seeds are single, oval, and attached below to the bottom of the flower. The roots of the grasses are opening; such as have an aromatic smell are stomachic; their seeds are mealy, mucilaginous, and nourishing. All the parts of these plants are wholesome.

5. Trichosanthes (from tres, three; and petalum, a petal). These plants have no very striking characters, and are nearly allied to the grasses. All the genera of this order have not the circumstance expressed in the title.

6. Erucaceae. This order, which is very nearly allied to the grasses and filicaceae plants, furnishes a very

Digitized by Google
beautiful collection of perennial herbs, which are of different heights, from one inch to 15 feet. The roots are tuberous or fleshy, and garnished with fibres; the stalks are simple, and commonly flat or compressed on the sides. The leaves are simple, alternate, entire, sword-shaped, and, like the liliaceous plants, form at their origin a sheath or blade, which in the greatest number is cleft or divided through the whole length, except at the base, where it is entire, and embraces the stalk like a ring. The flowers are hermaphrodite, and generally proceed from the summit of the stalks, either singly, in an umbel, a spike, or in a panicle. In many of these plants the perianthium or flower-cup; the flowers burst from a common cover or sheath, termed by Linnaeus a *spatha*, which in this order is frequently permanent. The petals are in number from one to six. The stamens are generally three. The seed-bud is placed sometimes above the flower, sometimes below it. The style is generally simple, and crowned with a three-lobed stigma. The seed-vessel is a dry capsule, generally of an oblong shape, and opens at three valves, discovering the same number of cells, each inclosing a quantity of roundish seeds. These plants resemble the liliaceous in their powers and sensible qualities; very few of them, however, are used in medicine.

7. *Orchidaceae*. The roots of many of these plants are composed of one or more fleshy tubercles or knobs, attached to the lower part of the stem, and sending forth fibres from the top. Those of orchis bear an obvious resemblance to the scrotum in animals: from which circumstance the genus has derived its name. The leaves are of a moderate size, inscribed with a number of longitudinal nerves or ribs, and without any footstalk. At their origin, they form round the stalk a kind of sheath, which is long, entire, cylindrical, but not furnished, like the grasses and some other plants, with a crown at top. The flowers are hermaphrodite, and placed at the summit of the stalk either in a spike or in a panicle. The calyx is that sort termed by Linnaeus a *spatha* or sheath, that bursting open protrudes a head or cluster of flowers, termed the *spadix*, which have no perianthium or flower-cup. The petals are five in number, and very irregular. The nectarium in this order is remarkably conspicuous; yet so different in the different genera, that Linnaeus has employed it for his principal character or mark of distinction, instead of the root, which had chiefly engaged the attention of former botanists. It has the appearance of a sixth petal. The filaments are always two in number, and placed upon the pistillum or female organ. The antherae are erect, and generally covered by the upper lip of the nectarium. The seed-bud is either oblong or pillar-shaped, twisted like a screw, and universally placed below the receptacle of the flower. The style is single, very short, and forms one substance with the inner margin of the nectarium. The seed-vessel is generally a capsule with one cavity or cell, and three valves or openings, which are keel-shaped, and open on the angular sides, being jointed both at the bottom and top. The seeds are numerous; very small, like saw-dust; and attached, without foot-stalks, to a slender receptacle or rib, which extends itself lengthwise in the middle of each inclosure or valve. The plants of this order are reckoned strong aphrodisiacs.

8. *Sectaminae*. This class consists of beautiful exotic plants, all natives of very warm countries. Some of them furnish exquisite fruits; but though the plants rise very high, they are perennial only by their roots. Those which have only one filament, have in all their parts an aromatic odour, and an acid or poignant taste; qualities, however, possessed in a much greater degree by the roots, which are hot and resinous.

9. *Spathacaceae*, so called because their flowers are protruded from a spatha or sheath. They are nearly allied in habit and structure to the liliaceous plants, from which they are chiefly distinguished by the spatha out of which their flowers are protruded.

10. *Coronaria*. These plants are herbaceous, perennial, and from one inch to 15 feet high. The roots are either bulbous, fibrous, or composed of small fleshy knots, which are jointed at top. The bulbs either consist of scales laid over each other like tiles, or are solid. The stem of the liliaceous bulbous plants is properly wanting; what supplies its place being nothing else than the base of the leaves, which, wrapping or enfolding each other, form at bottom a roundish fleshy bulb, hitherto distinguished, though perhaps improperly, by the name of root. In the others the stem is simple, that is, has few branches, and is either furnished with leaves, or rises naked. The branches are alternate and cylindrical. The leaves are simple, alternate, and entire. Those next the root, termed radical leaves, generally form at their origin a sheath, which in a great number is entire, that is, goes all round; whilst in others, it is cleft or divided longitudinally on one side. The flowers are universally hermaphrodite, except in white hellebore, which has both male and hermaphrodite flowers mixed together on the same root. The flowers are sometimes single, and terminate the stem; sometimes they form an umbel, sometimes a spike, and sometimes a panicle. The calyx or flower-cup, in this order, according to Linnaeus, is generally wanting. In strict propriety, however, the single cover that is present in most of these plants, though beautifully coloured, ought to be denominated a calyx, as its divisions, generally six in number, are placed opposite to the stamens. The petals, or, to speak more properly, the coloured leaves of the flower, are in number from one to six. Plants which have a single petal, have the limb or upper part split into six divisions or segments. The petals in some species are rolled or turned back. The nectarium is various; in the lily it is a longitudinal line which runs through each petal, and reaches from the base to the middle. In crown imperial, it is a small hollow or pore, formed at the base of each petal; in asphodel, it consists of six very small valves, which, approaching, form a globe, and are inserted into the base of the petal; in hyacinth, it is composed of three melliferous pores, situated on the top of the seed-bud. In pineapple, it is a small scale lying within the substance of each petal above the base; and in albus, or bastard star of Bethlehem, it consists of two sharp-pointed bodies proceeding from the furrows of the seed-bud, and covered by the broader base of the three fertile filaments. In some species of lily the nectarium is hairy; in others it is naked. The stamens are six in number; erect,
History: **BOTANY.**

ers, and inserted into the common receptacle, if the flower consists of many petals; into the tube, or division of the corolla, if it consists of one. The anthers are long, commonly divided below, and slightly attached by their sides to the filaments on which they turn like a vane or the needle of a compass. The seed-bud is single, and placed either within the flower-cup or below it. The style is single, thread-shaped, and generally of the length of the petals. The stigma is generally single, of a conic form, and shaggy or hairy at the extremity. The seed-vessel is generally a capsule, divided externally into three valves, internally into three cells. — With respect to the powers of the plants of this order, it may be affirmed in general, that such as have little taste or smell, as the roots of tulip, and star of Bethlehem, are perfectly innocent; whilst those which have a heavy nauseous smell, as squill, hyacinth, crown imperial, and spider-wort, are at least suspicious, and frequently prove noxious.

11. Sarraceniaceae. (From sarraceni, a long shoot, like that of a vine.) This order consists of plants which have climbing stems and branches, that, like the vine, attach themselves to the bodies in their neighborhood for the purpose of support. These plants are far from being a true natural assemblage; in fact they scarcely agree in a single circumstance, except that expressed in the title, which is far from being peculiar to this order.

12. Holariaceae. This order consists of plants which are used for the table, and enter into the economy of domestic affairs; it contains trees, shrubs, perennial and annual herbs. Some of the woody vegetables retain their green leaves during the winter. The roots are very long, and frequently spindle-shaped; from the knots on the stems and branches of such plants as creep on the ground, or float on the water, proceed fibrous and branching roots. The stems and young branches are cylindric; and in the greatest part of the aquatic plants of this order, the stalks are hollow within. The buds are of a conic form, and naked; that is, not accompanied with scales. The leaves are generally simple, entire, alternate, and attached to the branches by a cylindric footstalk, which is sometimes very long, but commonly very short. Some plants of this kind have two stipule or scales which are attached to the branches near the origin of the foot-stalk of each leaf. In many others, instead of stipule, each leaf bears on its foot-stalk a membranaceous sheath, which is cylindric, frequently fringed on the margin, and pierced or penetrated by the stem. The flowers are either hermaphrodite; male and female upon the same root; male and female upon different roots; hermaphrodite and male on the same root; hermaphrodite and female on the same root; or hermaphrodite and male upon different roots.

13. Succulentae. This order consists of flat, fleshy, and juicy plants, most of them evergreen. They are astrigent, refreshing, and very wholesome.

14. Grumiales (from grus a crane). They consist of geranium, vulgarly called cranes-bill, and a few other genera which Linnaeus considers as allied to it in their habit and external structure. The order furnishes both herbaceous and woody plants. The roots are sometimes fibrous, sometimes tuberous. In some species of wood-sorrel they are jointed. The stems are cylindric; the young branches, in some, nearly square. The buds are of a conic form, and covered with scales. The leaves are either simple or compound. The flowers are hermaphrodite; they proceed from the wings of the leaves either singly or in clusters. The calyx or flower-cup consists of five distinct leaves, or of one leaf divided almost to the bottom into five parts. It generally accompanies the seed-bud to its maturity. The petals are five in number, spreading, and frequently funnel-shaped. The stamens are generally ten in number, awl-shaped, erect, and of the length of the petals. The stamens are generally oblong; and frequently attached to the filaments by the middle, so as to lie, and sometimes to veer about, upon them. The seed-bud is either oblong or five-cornered. The number of styles is either one or five. In tribulus, the style is wanting. The seed-vessel is generally a five-cornered capsule, with one, three, five, or ten cells. The seeds are generally equal in number to the internal divisions or the cells of the seed-vessel; one seed being placed in each cell.

15. Laurifoliae. The plants of this order are aquatic, of low stature, herbaceous, and mostly perennial. The roots are fibrous. The stem is generally wanting. In its place is an assemblage of leaves, which wrapping or enfolding each other mutually form a sheath; and from the middle of this sheath is produced the footstalk of the flower. The leaves are sometimes alternate, sometimes placed in whirls round the stem. In a great many genera the foot-stalk is extended at its origin into a membranaceous substance, which forms a sheath that is cleft through the whole length, on the side opposite to the leaf. The flowers are hermaphrodite, or male and female on the same root. The flower-cup is either wanting, or consists of three, four, or five divisions or leaves, which accompany the seed-bud to its maturity. The petals are generally wanting. The stamens are in number from 1 to 16 and upwards. The filaments of some genera are so short, that they seem wanting. The anthers are short, and generally marked with four longitudinal furrows. The seed-buds are in number from one to four, the style is frequently wanting. The seed-vessel is universally wanting, except in elatinia, which has a dry capsule, with four external openings, and the same number of cells. The seeds are generally four in number.

16. Calyciflorae, (from calyx the flower-cup, and flos the flower), consisting of such plants as have the stamens (the flower) inserted into the calyx. All the plants of this order are of the shrub and tree kind. Some of them rise to the height of 12 or 14 feet; others not above two or three. The roots are branching, fibrous, and woody. The stems are cylindric. The branches, when young, are cornered; the buds of a conic form, and without scales. The leaves are simple, alternate, and attached to the branches by a very short foot-stalk. The flowers are either male or female upon distinct roots, or hermaphrodite and male on the same root. The calyx is a perianthium composed of one leaf, divided into two, three, or four segments. It is commonly placed upon the germen or seed-bud, which accompanies it to maturity. The corolla is universally wanting, except in trophi, the male plants of which, according to Linnaeus, have four oblong and spreading petals. The stamens are generally four in number, slender.
slender like a hair, short, placed at a considerable distance from the style, and inserted into the tube of the calyx. The pistillum is composed of a roundish germin, crowned with the calyx; a single thread-shaped style; and a cylindric stigma. The seed-vessel is either an obtuse oval fruit of the cherry kind, or a globular berry with one cell, containing a roundish seed. The plants of this order are astringent.

17. Calyxantheres, (from calyx the flower-cup, and anther the flower); consisting of plants, which, among other characters, have the corolla and stamina inserted in the calyx. This order furnishes trees, shrubs, and annual, biennial, and perennial herbs. The herbaceous annuals are by much the most numerous. The roots are branching and fibrous: the stems and branches cylindric, square, or four-cornered while young. The buds are of a conic form, and without scales. The leaves are generally either alternate, simple, and attached to the branches by a short foot-stalk, or opposite at the bottom of the stem; and, in some, alternate towards the top. They are universally sessile; that is, attached to the branches without any foot-stalk. The calyx is universally a perianthium, and generally monophyllous, or composed of one leaf. The corolla consists of four, five, and six petals, which are attached to the tube of the calyx, and are sometimes placed alternate, sometimes opposite to the divisions of the limb. The stamens, which are in number from 4 to 20 and upwards, are attached to the tube of the calyx either on its margin or lower down. When the number of stamens is double the divisions of the calyx, the stamens which stand opposite these divisions are a little longer than the rest. The anthers are generally of a hemispherical figure; frequently cleft or slit below; and by that aperture attached slightly to the filaments, on which they often veer about like a vane or needle. They are surrounded longitudinally, and open on the sides into two loculi or cells. The pollen, or male dust, consists of a number of minute particles, of an oval figure, yellow and transparent. The germin, or seed-bud, is placed either above or under the receptacle of the flower. The style is single, thread-shaped, and of the length of the stamens. The stigma is generally single and undivided. The seed-vessel is a capsule, which is generally divided internally into four loculi or cells. The seeds are numerous, minute, and frequently three-cornered. The plants of this order are reckoned astringent.

18. Bicorneae, (from bis twice, and corona a crown), plants whose anthers have the appearance of two horns. This appearance, however, is not very conspicuous, unless in a few genera. The plants of this order are all of the shrub and tree kind. The roots are branching and fibrous. The stems and branches are cylindric; the buds conic, sometimes covered with scales, and sometimes naked. The leaves are generally alternate. In most plants of this order they are either sessile, or supported by a very short foot-stalk, which is semi-cylindric, and flat above. The flowers are universally hermaphrodite, except in one genus, the Indian date-plum, where hermaphrodite and male flowers are produced in the same species upon distinct roots. They proceed either solitary, or in a corymbus, from the angles formed by the leaves and branches: or hang down in spikes and clusters at the end of the branches; each flower having a small scale or floral leaf placed under it. In most plants of this order the calyx is placed around or below the germin. The calyx is universally a perianthium, and generally monophyllous or of one piece, deeply divided into four or five segments, which are permanent, that is, accompany the germin to its maturity. The segments are often acute, and sometimes colourless. The corolla is generally monopetalous, and bell or funnel-shaped: the figure, however, is not very constant, even in plants of the same genus. The limb or upper part of the petal, is generally divided into four or five segments, which are sometimes rolled back, sometimes bent inwards. The limb too is sometimes slightly cut, sometimes divided almost to the bottom. The tube, or lower part of the petal, is cylindric, and generally of the same length with the calyx. The number of stamens is from 4 to 20. These are generally erect, and attached to the lower part of the tube of the corolla. The anthers are biform or forked below, and, being slightly attached to the filaments, are frequently inverted in such a manner as to exhibit the appearance of two horns at top. The germin or seed-bud, is generally roundish, and seated above the receptacle. The style is single, thread-shaped, of the same length with the corolla, and in a few genera permanent. The seed-vessel is either a capsule with five cells, a roundish berry, or an oblong four-cornered nut with two cells.—The plants of this order are astringent.

19. Hesperides, (from the Hesperides, whose orchards are said to have produced golden apples). The plants of this order are of the shrub and tree kind, and mostly evergreen. The bark of the stalks is slender, and comes off in thin plates. The leaves are generally opposite, and covered with small transparent points. In some, the leaves are placed opposite at the bottom of the stalks, and alternate above. The buds are of a conic form, the flowers generally hermaphrodite; they proceed from the wings of the leaves either singly, or in clusters like ivy-berries. The calyx is placed above the seed-bud, and accompanies it to its maturity. The petals are three, four, or five in number, and stand upon the brims of the tube of the calyx. The seed-bud is large, oblong, and placed below the receptacle of the flower. The style is single,awl-shaped, of the length of the stamens, and terminated with a single stigma. The seed-vessel in some genera is a berry furnished with one or three cells; a capsule with four cells, or of the nature of the cherry, containing a stone. The seeds are generally numerous, small and oblong. The leaves and fruits are astringent, the berries esculent.

20. Rosaceae (from rota, a wheel), consisting of plants with one wheel-shaped petal without a tube. These resemble in quality those of the order of Premieae, to which they are in all respects very nearly allied, but very few of them can be said in strict propriety to possess the character specified in the title.

21. Premieae (from premieus early). These consist of primrose, an early flowering plant, and some others which agree with it in habit and structure, though not always in the character or circumstance expressed in the title. These plants, which possess no striking uniform characters, are, in general, innocent in their quality; yet the root of sow-bread is dangerous, if taken internally.

22. Caryophylleae. All the plants of this order are herbaceous, and mostly annual. Some of the creeping kinds
kinds do not rise above an inch, and the tallest exceed not seven or eight feet. The roots are branching, fibrous, and of a moderate length. The stems are cylindrical. The branches proceed from the wings or angles of the leaves, and are generally opposite, and as it were joined at each knot. In some species of Cerasium the branches are square. The leaves are generally placed opposite in pairs, so as to resemble a cross; and are slightly united at the bottom by their foot-stalks, which form a sort of glove round the stem. The hairs are simple, like silk. The flowers are hermaphrodite; but some have male and female flowers upon distinct roots. They either stand single on their foot-stalks, and proceed from the wings or angles of the leaves and branches, or are disposed in a spike, corymbus, umbel, or panicule. The calyx is permanent, and composed either of one piece with five indentments, or of four or five distinct leaves. The corolla generally consists of five petals, which have claws of the length of the calyx; and a spreading limb, sometimes entire, but often cleft or divided into two. The stamens are in number from 3 to 15, and of a moderate length. When their number is double the divisions of the calyx, they are attached alternately to the claw of the petals, those so attached being shorter than the rest; the remaining stamens are inserted into the common receptacle, and stand opposite to the segments of the calyx. In some genera of this order the number of stamens is found to vary, even in the different flowers of the same plant. The anthers are short, hemispherical, marked with four longitudinal furrows, frequently divided or cleft below, most commonly erect; sometimes, however, incurved, that is, fastened to the filaments by the sides. The pistil is composed of a single seed-bud, which is generally roundish, sometimes corded. The styles are thread-shaped, of the length of the stamens, and crowned with a simple stigma, which is sleek or smooth externally, and slightly hollowed or vaulted within. The seed-vessel is a dry capsule, of an oval form, of the length of the calyx, and consists of one or three cells. The plants of this order are innocent in their quality; they abound in a watery sort of phlegm, and have bitter seeds. With respect to their virtues, they are reckoned astringent, attenuating, and deersive.

25. Putaminaea (from putamen, a shell): consisting of a few genera of plants allied in habit, whose fleshy seed-vessel or fruit is frequently covered with a hard woody shell. Most of these plants are acid and penetrative; and yield, by burning, a great quantity of fixed alkali. With respect to their virtues, they are powerful aperients. The Indians pretend that the fruit of a species of caper-bush, which they call bahecce, extinguishes the flames of love.

26. Multiflora (from multus, many, and silqua a pod); consisting of plants which have more seed-vessels than one. From the etymology of the term, one would naturally imagine that the seed-vessels in question were of that kind called by Linnaeus silqua, or pod; but the fact is, that not a single plant of this order bears pods; the greater part having many dry capsules, and the remainder being furnished properly with no seed-vessel, but bearing numerous distinct seeds. Plants of this order are mostly perennial herbs: the stems of some are erect; others creep upon the ground, and produce roots near the origin of each leaf; lastly, others climb, and attach themselves to the bodies in their neighbourhood, either by the footstalk of the leaves, or by tendrils and clasps which terminate the footstalk. The greatest height of those which rise erect seldom exceeds eight feet. Those which climb rarely exceed 15 or 20 feet. The roots are generally fleshy. In some they are hand-shaped; in others longer-shaped, or cylindric. In some species of helichore and ranunculus they are divided into spherical knobs. Lastly, in some plants of this order, the roots are fibrous. The stems and young branches are cylindric. The leaves which are of different forms, being sometimes simple and entire, sometimes hand-shaped or winged, are generally alternate. The footstalk, which is sometimes cylindric, sometimes angular, is membranous, and very large as its origin, surrounding the great part of the stem from which it proceeds. The flowers are hermaphrodite. They proceed either singly from the wings of the leaves or termination of the branches, or terminate the branches in a spike, panicule, or head. The calyx in some is wanting; in others it is generally composed of five pieces, which fall off with the petals. The petals are in number from 4 to 15; generally equal, and sometimes disposed in two or three series; five is the prevailing number. The stamens are in number from 5 to 300, distinct, and attached generally in several rows or series to the receptacle. The seed-buds are generally numerous; the style is frequently wanting. In some
from the seed-vessel is wanting; in others it is composed of several dry capsules, each containing a single cell. The seeds are numerous, and frequently angular. Most of these plants are acrid, and many of them poisonous. In general, plants that have a great number of staminæ are noxious in their quality. When burnt, these plants furnish a fixed alkali; by distillation there is drawn from them a kind of nitrous and aluminous substance. With respect to their virtues, they are caustic and purgative.

27. Rhaeades, consisting of poppy, and a few genera which resemble it in habit and structure. These plants, upon being cut, emit plentifully a juice, which is white in poppy, and yellow in the others. With respect to their virtues, they seem to operate principally upon the nerves. Their juice is soporific and narcotic, their seeds less so, their roots apertent. Applied externally they are slightly corrosive.

28. Lurideæ, consisting of plants whose pale and ommous appearance seems to indicate something baleful and noxious in their natural quality. Most of these plants are herbaceous and perennial. Many of them are of the masked tribe of flowers; others resemble these in their general appearance, but differ from them essentially in the equality of their stamens. The roots are generally branched, sometimes tuberous. The stems and branches are cylindric. The leaves are generally simple, and placed alternate. The flowers are hermaphrodite. They proceed either singly or in clusters from the angle formed by the leaves and branches. In some species of lycoctus, they terminate the branches. The calyx is generally of one piece, deeply divided into five parts. The corolla consists of one petal, which is either bell, funnel, or wheel-shaped. The stamens are four or five in number; and those either of equal lengths, as in the greater, or unequal. The seed-bud is placed above the receptacle of the flower. The style is single; and is terminated by a summit which is hemispherical, and frequently channelled or furrowed. The seed-vessel, in such as have equal stamens, is a berry; in the rest, it is generally a capsule. The seeds are numerous, and frequently kidney-shaped. These plants in general are poisonous. They have an insipid taste, and a nauseous disagreeable smell.

29. Campanaceæ (from campa, a bell); plants with bell-shaped flowers. The plants of this order are herbaceous and perennial. The roots are either spindle-shaped, or branching and fibrous. The stems are round. The branches are generally alternate. The leaves are simple alternate, and commonly attached to the branches by a semi-cylindric footstalk, which is furrowed above. The indument is terminated by a small white tuberole or knob, which renders them conspicuous. The flowers are hermaphrodite; and proceed either solitary from the wings of the leaves, or are collected into a spike and head at the end of the footstalk. The calyx is universally a perianthium situated upon or round the germen, and generally composed of one leaf deeply divided into five segments. The corolla is monopetalous, and of the bell, funnel, or wheel shape. The tube, in flowers of the bell and wheel shape, is very short; in those of the funnel shape, very long. In Greek valerian, the tube is shut with five valves, which are placed on its apex or top. The limb or upper part of the corolla is deeply divided into five segments, which spread, and are alternate with the divisions of the calyx. The corolla is generally permanent. The stamens are five in number, attached to the base of the tube of the corolla, alternate with its divisions, and opposite to those of the calyx. The filaments are distinct; very large at their origin; and frequently approach so as to form a sort of vault, which covers the summit of the germen. They are slender and awl-shaped above. The anthers are very long; oval; marked with four longitudinal furrows, either distinct, or united in a cylinder. The pollen is composed of very small, spherical, white, shining, and transparent particles. The germen is roundish, and situated either wholly, or in part under the flower. The style is generally single, and of the length of the stamina or corolla. The stigma is commonly single, but deeply divided. The seed-vessel is a roundish capsule, generally divided into three cells, and furnished externally with the same number of valves. The seeds are small, numerous, attached to a receptacle in the centre of the fruit, generally rounded, and sometimes cornered. This order furnishes many excellent medicines. The plants abound with a white milky juice, which, upon the stalk being cut, flows out in great quantities.

30. Contortæ, (from con together, and turn to twist); consisting of plants which have a single petal that is twisted or bent towards one side. This order furnishes trees, shrubs, and fat succulent plants, some of which retain their leaves during the winter. The herbaceous vegetables in this order are generally perennial. The roots are sometimes branching, but commonly fleshy, succulent, and garnished with fibres or strings like those of turnip. The stems are round, and in some genera pulpy and succulent. The branches are sometimes placed alternate, and sometimes opposite. The buds are of a conic form, and naked or without scales. The leaves are sometimes alternate, sometimes placed opposite in pairs, and not seldom surround the stem in whorls. They are attached to the branches by a cylindrical footstalk, which is short, and frequently united to the footstalk of the opposite leaf. The defensive and offensive weapons in this order are a downy sort of pubescence, and simple or forked prickles, which, in some genera, issue from the wings of the leaves. The flowers are hermaphrodite; and stand either singly upon their footstalks, or are collected into umbels and clusters. These bunches or collections of flowers sometimes terminate the branches, sometimes proceed from the angles of the branches, and sometimes stand at the side of the wings without issuing from them. The flower-cup is composed of one leaf divided almost to the base in five unequal segments, which embrace each other, and are permanent, or accompany the seed-bud to its maturity. The corolla consists of one petal, which in the different genera is bell, salver, funnel, or wheel-shaped. The limb, or upper spreading part of the petal, is generally divided into five equal parts, which are slightly bent or twisted to the left, and embrace or enfold each other like the petals of the mallow tribe. The tube is generally long and cylindrical; sometimes club-shaped, and often wanting. In several flowers of this order the petal is accompanied with that species of superfluous termed a nectarium. In the different genera, however, it assumes very different appearances. The stamens are five in number, short, equal,
equal, attached at the same height to the tube of the petal, alternate with its divisions, and opposite to those of the calyx. The anthers are generally erect, and frequently approach so as to form a compact body in the middle of the flower. The seed-bud is either single or double. In some the style is wanting. The stigma is frequently double. The seed-vessel in some genera is a pulpy fruit, of the berry and cherry kind; but most frequently that species termed by Linnaeus conceptuatum, and folliculus, which has one valve or external enclosure, opens lengthways on one side, and has not the seeds fastened to it. Two of these dry fruits, with a single cell, compose the seed-vessel of most plants of this order. The seeds are generally numerous, and in several genera crowned with a long pappus or downy wing like that of the compound flowers, by means of which they easily disperse and sow themselves.

The plants of this order being cut, emit a juice which is generally milky, and of a greenish white. From the circumstance of their abounding in this milky juice, the greater part are deemed poisonous; repeated observations having established this aphorism. That milky plants, except those of the plain compound flowers, are generally of a baneful destructive nature, and ought at least to be administered with caution. With respect to their sensible qualities, they are bitter; particularly the seed, roots, and bark, in which resides their principal virtue.

31. Vespercula, (from vepres, a briar or bramble), consisting of plants resembling the daphne, diersa, gaulis, &c. but which, however, do not constitute a true natural assemblage.

32. Papilionaceae, plants that have papilionaceous flowers, i.e. somewhat resembling a butterfly in shape; of which there are all the genera long plants. The plants of this order are of very different duration; some of them being herbaceous, and those either annual or perennial; others woody vegetables of the shrub and tree kind, a few of which rise to the height of 70 feet and upwards. The herbaceous plants of this order generally climb; for, being weak, and as it were helpless of themselves, they are provided by nature with tendrils, and even sharp-pointed hooks, at their extremities, to fasten upon the neighbouring trees or rocks; or the stalks are endowed with a faculty of twisting themselves, for the purpose of support, around the bodies in their neighbourhood. The pea, vetch, and kidney-bean, afford familiar examples of this appearance. The shrubs and trees of this order are mostly armed with strong spines. The roots are very long, and furnished with fibres; but some genera have fleshy knobs or tubercles placed at proper intervals along the fibres. The stems are cylindrical, as likewise the young branches, which are placed alternately; those which climb themselves from right to left, in a direction opposite to the apparent motion of the sun. The bark of the large trees is extremely thick and wrinkled, so as to resemble a net with long meshes; the wood is very hard in the middle, and commonly coloured or veined. The buds are hemispherical, without scales, and proceed from the branches horizontally a little above the angle which they form with the leaves. The leaves are alternate, and of different forms, being either simple, finger-shaped, or winged. This last form is very common; the lobes or lesser leaves are entire, and sometimes placed in pairs, but most commonly the winged leaf is terminated by an odd lobe. The winged or pinnated leaves of this order have a daily or periodical motion, depending upon the progress of the sun in his diurnal course. The common footstalk of the winged and compound leaves is marked on the upper surface with a cavity or furrow which runs through its whole length. The flowers are hermaphrodite, and proceed either from the wings of the leaves, or from the extremity of the branches. The calyx is a perianthium of one leaf, bell-shaped, bunching out at the bottom, and cut on its brim or margin into five irregular divisions or teeth; the lowermost of which, being the odd one, is longer than the rest: the other four stand in pairs, of which the uppermost shortest, and stands farthest a mum. The bottom of the calyx is moistened with a sweet liquor like honey, so may be deemed the nectarium of these plants. The petals are four or five in number, very irregular, and from their figure and position bear an obvious resemblance to a butterfly expanding its wings for flight. These petals have been characterized by distinct names; the upper one, which is commonly the largest, is termed the standard, (vexillum); the two side petals, the wings, (ala); and the lowermost, which is generally united at top, and divided at bottom, the keel, (carina). The stamens are generally ten: these are either totally distinct, or united by the filaments into one or two bundles involving the seed-bud. In the latter case, where there are two sets of united filaments, one of the sets is composed of nine stamens, which are united into a crooked cylinder, that is cleft on one side through its whole length, and along this cleft lies the tenth filament or stamen, which constitutes the second set, and is often so closely attached to the second bundle, that it cannot be separated from it without some difficulty. The anther is small, round, marked with four longitudinal furrows, and slightly attached to the filaments. In lupine, the anthers are alternately round and oblong. The seed-bud is single, placed upon the receptacle of the flower, oblong, cylindrical, slightly compressed, of the length of the cylinder of the united stamens by which it is involved, and sometimes elevated by a slender footstalk which issues from the centre of the calyx. The style is single, slender, and generally crooked or bent. The stigma is commonly covered with a beautiful down, and placed immediately under the anther. The seed-vessel is that sort of pod termed a legumen, which is of an oblong figure, more or less compressed, with two valves, and one, two, or more cavities. These cavities are often separated, when ripe, by a sort of joints. The seeds are generally few in number, round, smooth, and fleshy. Jointed pods have generally a single seed in each articulation. The seeds are all fastened along one suture, and not alternately to both sides of which they climb, and termed stipes. The plants of this family are, in general, mucilaginous. From the inner bark of most of them flows, either naturally or by incision, a clammy liquor, which dries and hardens like gum; the juice of others is sweet like sugar; some taste bitter, and are purgative, emetic, or even mortal. A species of eastern astragalus, with goats-ruce leaves, is said to be remarkably caustic, and to burn the tongue excessively when chewed. In general, however, these plants are soft and clammy. With respect to their virtues, the plants of this order are highly emollient; some of them are vulnerary.
vulnerary and astringent; and the root of anise, or rest-harrow, is diuretic.

33. Lomentaceae, (from lomentum, a colour used by painters.) Many of these plants furnish beautiful tinctures, and some of them are much used in dyeing. They very much resemble the last order, differing only in the following particulars. 1. In all plants of this order, except milk-wort, the stamens are distinct. The flower is shaped like a butterfly, but is less irregular, and frequently consists but of one petal. The leaves are sometimes simple, but most commonly winged. The seeds are commonly marked with a circular furrow on both sides. Like those of the leguminous tribe, the plants of this order are generally mucilaginous. From the inner bark of the greater number exudes, either naturally or by incision, a mucilaginous liquor, which sometimes dries upon the plant, and becomes a gummy substance.

34. Cucurbitaceae, (from cucurbita, a gourd); consisting of plants which resemble the gourd in external figure, habit, virtues, and sensible qualities.—The plants of this order, which generally climb, and have long diffused branches, are mostly herbaceous and perennial. The roots in the perennial plants of this order are shaped like those of the turpib; in the annuals they are branching and fibrous. The stems are cylindrical and succulent. The young branches have generally five corners. In some species of passion-flower they are square. The leaves are alternate, angular, and sometimes hand-shaped. They are attached to the branches by a footstalk, which is pretty long and cylindrical, without any furrow. From the wing or angle of each of the upper leaves proceeds a tendril, which is either simple or branching, and twists itself spirally round the different bodies in its neighborhood, for the purpose of supporting and training of the branches. The lower leaves have no tendril. The flowers are either hermaphrodite or male and female. In this last, the male flowers are generally separated from the female upon the same root; and that either in the same wing or angle of the leaves, or in different angles. The flower-cup, in the female flowers, is placed upon the seed-bud; and generally consists of one bell-shaped leaf, that is deeply divided into five unequal segments, and unlike the other plants which have the calyx seated upon the fruit, falls off with the petals and the other parts of the flower. The corolla consists of one petal, with five equal divisions, which adhere to the tube of the calyx, as if glued to it. A species of passion-flower, termed by Linnaeus passiflora auberoon, wants the petals. The stamens are in number from one to five, short, and generally inserted into the calyx. The filaments are distinct; the anthers of many genera are united in a cylinder. In the passion-flower they are slightly attached to the filaments, on which they turn like a vane or the needle of a compass. The seed-bud is single, and placed below the receptacle of the flower. The style is generally single, cylindrical, of the length of the calyx, and crowned with a triple stigma. The seed-vessel is generally pulpy, of the apple or berry kind, and consists of one, two, or three cells. The seeds are numerous, generally flat or compressed, and sometimes covered with that kind of proper coat called by Linnaeus aristae.—The fruit of these plants is generally agreeable and refreshing; that of some of them inspires a very violent emetic when used too freely.

35. Berrisaceae (from berris, a briar or bramble); consisting of the rose, bramble, and other plants which resemble them in port and external structure. These plants are so nearly alike in form, habit, and structure, to those of the natural order 31. sycamore, that they ought never to have been separated from it. The leaves have a styptic taste; the fruits are acid and cooling. With respect to their virtues, the leaves are vulnerary and astringent, the roots are diuretic. The acid fruits, as strawberry and raspberry, are used with success in gout and bilious fevers, as likewise in contagious and epidemic dysenteries, which prevail in summer and autumn, and are occasioned by a sudden transition from a hot to a cold air, or by the aerial humour which flows into the intestines.

36. Pomaceae, (from pomum an apple); consisting of those which have a pulpy excellent fruit, of the apple, berry, or cherry kind. The plants of this order, which furnish many of our most esteemed fruits, are mostly of the shrub and tree kind. The roots are branched, fibrous, and in the greater part very long. The stems and branches are cylindrical. These last are placed alternate; and, when young, are, in some genera, angular. The bark is thick and wrinkled. The buds are of a conic form, placed in the angles of the leaves, and covered with scales which lie over each other like tiles. The leaves, which differ in form, being in some genera simple, in others winged, are, in the greater number, placed alternate. The footstalks of the leaves are narrowed above, and frequently accompanied by a number of knobs like glands. Most of these plants are furnished with two stipules at the origin of the young footstalks of the leaves. These, in some genera, are pretty large: in others, they are so small as scarce to be perceived; and in coco plum, in particular, they by their minuteless resemble hairs. The flowers are universally hermaphrodite, except in spira aaronus, in which male and female flowers are produced on distinct parts. In the greater number of genera they are produced in clusters or heads at the end of the branches. The calyx is of one piece, with five segments or divisions, which are permanent, and placed above the seed-bud in some; in the rest, they either fall off with the flower, or wither upon the stalk. The petals are five in number, and are inserted into the tube of the calyx. The stamens are generally 20 and upwards, and attached like the petals to the margin of the tube of the calyx. The anthers are short, and slightly attached to the filaments. The seed-bud is single; and in those genera which have the calyx persistent, it is placed below the receptacle of the flower. The seed-vessel is a pulpy fruit of the apple, berry, or cherry kind. Those of the apple kind are divided internally into a number of cavities or cells. The seeds are numerous.—The pulpy fruits of this order are acid, excellent, and of great efficacy in putrid and bilious fevers.

37. Coloniferae, (from columna a pillar, and frut to bear); consisting of plants whose stamens and pistil have the appearance of a column or pillar in the centre of the flower. This order furnishes a choice collection of herbs both annual and perennial, shrubs and trees. These are very different in size and height, from the creeping
history.

48. *Tricoccos* (from tria, three, and semen, a grain); consisting of plants with a single three-corned capsule, having three cells or internal divisions, each containing a single seed. The single seed-vessel of these plants is of a singular form, and resembles three capsules, which adhere to one common footstalk as a centre, but are divided externally into three pretty deep partitions. This family is not completely natural. It must be observed, however, that the character expressed in the title is a striking one; and that though the plants which possess it are not connected by such numerous relations as to form a true natural assemblage, yet they are by that circumstance distinguished from all other plants with as great, nay greater facility, than by any artificial character yet known. But all the genera of this order have not the striking character just mentioned.

39. *Siliqueae*, (from siliqua a pod); consisting of plants which have a pod for their seed-vessel. This order chiefly furnishes biennial and perennial herbs of an irregular figure. The roots are long, branched, crooked, and fibrous. In some they are succulent and fleshy, in others jointed. The stems and young branches are cylindrical. The leaves, which differ in point of form, being sometimes simple, sometimes winged, are generally placed alternate. The flowers are herbaceous, and in the greater number disposed in a spike at the extremity of the branches. The flower-cup is composed of four leaves, which are oblong, hollow, blunt, bunched at the base, and fall with the flower. These leaves are sometimes erect, and sometimes spread horizontally. The petals, which are four in number, spread at top, and are disposed like a cross: the claws or lower part of the petals are flat, awl-shaped, and somewhat longer than the calyx. The upper part widens outwards. The stamens are six in number; two of which are of the length of the calyx, and the remaining four somewhat longer, but shorter than the petals. The anthers are of an oblong figure, pointed, thicker at the base, and erect. Betwixt the stamens, in plants of this order, are generally lodged one, two, or four, round greenish knobs, which in some genera are so small as to elude the sight. These glands, called by Linnaeus *glandulae nectariferae*, and used very improperly by that author as an essential character in discriminating the genera, seem to be prominences of the receptacle of the flower, occasioned by the stamens being deeply lodged in its substance. The seed-vessel is single, and stands upon the receptacle of the flower. The style, which is either cylindrical or flat like a scale, is of the length of the four longer stamens in some genera; in others it is very short, or even wanting. It accompanies the seed-vessel to its maturity. The stigma is bent, and sometimes deeply divided into two parts. The stigmas are either a long pod or a short and round one. Either sort has two valves, or external openings, and in a great many genera the same number of internal cavities or cells, the partition of which projects at the top beyond the valves. The seeds are roundish, small, and attached alternately by a slender thread to both sutures or joinings of the valves. These plants have a watery, sharp, lachrymal taste; and are charged with a fixed alkaline

knight-shaped. These plants are mucilaginous and lubricating.
BOTANY.

History.

316 salt, which is drawn from them by burning, and being distilled without any addition produces a volatile alkali. Most of them have a stinking smell. With respect to their virtues, they are diuretic, attenuating, detensive, and antiscorbutic. These qualities, however, are most eminently possessed by the live plants; when dried, they either entirely disappear, or are greatly diminished. Applied externally, these plants are useful in diseases of the skin, as the itch, leprosy, &c.

40. Fucus, (from fluous, a gum, mucus); consisting of a number of plants whose flowers are furnished with an irregular, gaping, or grinning petal, in figure somewhat resembling the snout of an animal. This order furnishes both herbaceous and woody vegetables of the shrub and tree kind. The roots are generally fibrous and branched. The stems and branches are cylindric when young, except in some species of figwort, in which they are square. The leaves are simple, generally placed opposite in pairs at the bottom of the branches, but in many genera stand alternate towards the top. The flowers are universally hermaphrodite; they proceed either singly or in clusters from the wings of the leaves, or terminate the branches in a spike, panicle, or head. The calyx is of one leaf, which is cut into two, three, four, or five segments, or divisions, that are permanent. The corolla is composed of one irregular petal, with two lips, resembling as was already observed, the head or snout of an animal. In some plants the stamens are two or four in number, and of an equal length; in others they are universally four in number, two of which are long and two short. The seed-bud is single, and placed above the receptacle of the flower. The calyx is single; thread-shaped; bent in the direction of the stamens; and crowned with a stigma, which is generally blunt, and sometimes divided into two. The seed-vessel is a capsule, generally divided internally into two cavities or cells, and externally into the same number of valves or enclosures. The seeds are numerous, and affixed to a receptacle in the middle of the capsule.—These plants possess nearly the same qualities with the lip flowers, though in a less degree. With respect to their virtues, many of them are aperient, anodyne, purgative, and even emetic. The internal use of many of them is extremely pernicious; applied externally, they are anodyne, and powerful resolvents.

41. Aperifolius, rough-leaved plants. The greatest part of these are herbaceous and perennial. The roots are branching and fibrous; the stems and branches rounded; the buds of a conic form, naked or without scales. The leaves are simple, alternate, commonly very rough to the touch, and in most of the herbaceous plants sessile, or attached to the stem and branches without any footstalk. In the few trees, however, of this order, the leaves have a footstalk, the lower part of which, after the fall of the leaves, remains like a spine or thorn. The hairs are simple, and generally very rough to the touch. The flowers are in some genera solitary; but commonly collected in a spike or corymbus. They do not proceed from the single formed by the stem or branch, with the leaf, as in many plants; but from the side of the leaf, or from that part of the stem which is opposite to the leaf. They are almost universally hermaphrodite: in a few species of cordia, male and female flowers are produced upon different roots. The calyx is composed of one leaf, which is divided into three to ten equal or unequal parts. Those with four naked seeds have the calyx deeply divided into five parts which are permanent. The corolla is monopetalous, or composed of one petal, which in different plants is bell, funnel, salver, and wheel-shaped. The divisions of the limb or upper part of the petal are generally five, alternate with those of the calyx, equal and regular, except in echium. The stamens are five in number, alternate with the divisions of the corolla. They are equal, attached to the tube of the corolla, a little above its origin, and of the same height. The anthers are in some genera connivent; that is, approach and form a compact body above the filaments. The pistillum is generally composed of a slender style of the same length with the stamens, and crowned with a simple stigma. It proceeds from a germin or seed-bud, which in some plants is divided, but generally split into four. The seeds are generally four in number, and lodged in the bottom of the calyx. Most of the rough-leaved plants are used in medicine: the flowers are esteemed cordial; the leaves and roots vulnerary and astringent; and the hard bony seeds are reckoned powerful promoters of urine. Externally, these plants are used for burns, and poisonous bites; they expel orals, and relieve disorders of the loins.

42. Verticillata, consisting of herbaceous vegetables, bearing four naked seeds, and the flowers placed in whorls round the stalk. The roots are branched and fibrous. The stems are round when old, but square when young; as are likewise the young branches, which stand opposite. The leaves are opposite, and in the greater number covered with transparent points. Those which are placed next the flower generally differ from the stem leaves. In the greater number of plants of this kind, the leaves are supported upon a long cylindrical footstalk that is furrowed above. The flowers are universally hermaphrodite, except in a species of thyme mentioned by Mr Adamson, which appears to have male or barren flowers on one root, and female or fertile flowers on the other. They are disposed round the stem in whorls or small heads with short footstalks. The calyx is of one piece, that is generally cut into five unequal divisions, whose disposition sometimes represents two lips; the uppermost of which has commonly a less number of divisions: it accompanies the seeds, which it nourishes in its bosom, to their maturity. The petal is of the gaping or lip kind, and in the different genera is more or less irregular or unequal, either in its tube, or in the divisions of the lips; the number of which varies from two to five. These divisions frequently form two lips; of which the uppermost, termed the crest and the helmet, is sometimes entire, sometimes more or less deeply cut into two; the lowermost, termed the beard, generally into three. The stamens are two or four in number. In the greater part there are four stamens of unequal length, two of them being long and two short. These four unequal stamens are frequently dissimilar, and approach by pairs: they are inclined towards the back of the petal, and parallel: the two innermost being shortest, and attached somewhat lower than the two others to the tube of the flower. The seed-bud which consists of four distinct ovaries, is placed upon the seat of the flower, and eleva
B O T A N Y.

as in the greater number. They are supported by a footstalk, which is very broad and membranous at its origin, and commonly embraces the whole contour of the stem and branches. The flowers are in general hermaphrodite. There are, however, some that have male or barren flowers in the same umbel. This is particularly the case with those umbelliferous plants which have the petals in the flowers of the circumference large and unequal. In these plants the flowers in the circumference only prove fertile; those in the centre, or disk, proving abortive. Oenanthe and imperatoria, on the contrary, have the flowers in the circumference abortive. In ginseng, hermaphrodite and male flowers are produced upon distinct plants. The flowers are disposed in an umbel, which is either simple or compound. The common calyx in this order is that sort termed very improperly by Linnaeus involucrum, or the flower-cover; which in the greater number consists of one or more leaves placed under the partial or universal umbel, or both, for the purpose of support. The presence or absence of one or both of these covers has led to excellent marks in discriminating the genera of this very similar order of plants. The proper calyx of each flower, in the aggregate, consists of five minute indentsments placed upon the seed-bud, which it envelopes, and accompanies to its maturity. The petals are five in number, and disposed upon the sides of the flower-cup in form of a rose. In the florets of the centre, the petals are generally equal and small; in those of the circumference, they are frequently unequal and larger; in the greater number, they are heart-shaped, and cut almost to the middle in two. The stamens are five in number, placed opposite to the divisions of the flower-cup, and alternate with the petals. The seed-bud is universally placed under the seat of the flower, and supports two styles which are turned backwards, and crowned with simple summits which do not differ in appearance from the styles. The seed-vessel in this order is wanting. The seeds are two in number, which, when ripe, separate below, but remain closely attached at top. The plants of this order, which grow in dry places, are sudorific, stomachic, and warming. Their virtue resides chiefly in the seeds and leaves. Those which grow in marshy places are generally poisonous; but, notwithstanding the extremely warm and even caustic quality of most of these plants, many of them are employed in the kitchen, and in the economy of domestic affairs.

46. Hederacea (from heder, ivy); consisting of ivy and a few other genera that seem nearly allied to it. This order furnishes both herbaceous and shrubby plants; most of which, particularly ivy and vine, have creeping branches, which attach themselves by roots or tendrils to the bodies in their neighbourhood. The roots are long, with few branches. The stems and young branches are cylindrical. In some species of vine they are square. The leaves are alternate; sometimes simple, sometimes winged, in which the surface of the leaves is covered with points. The footstalk of the leaves is cylindrical, and without any furrow. The buds are of a conic form, and without any scales. The flowers are either hermaphrodite, male and female upon different roots, or hermaphrodite and male upon different roots. In some they terminate the branches in an umbel; in others they proceed in clusters from the sides.
side opposite to the leaves; and in some, they are produced along the branches. The calyx consists of one leaf divided in five parts, which are small and generally permanent. The stamens are in number five; awl-shaped, erect, and generally of the length of the petals. Cissus has only four stamens, which are inserted into the nectarium, a sort of border surrounding the seed-bud. The anthers are roundish, and sometimes, as in ivy, attached to the filaments by the sides. The seed-bud is sometimes round, sometimes shaped like a top or pear, and ends in one, two, or five awl-shaped styles, which are crowned with a simple stigma. The flowers of the vine have no style. The seed-vessel is of the berry kind, with one, two, or five styles. The seeds are from one to five in number; placed either in distinct cells, or dispersed through the pulp without any partition.

47. Stellata, (from stella, a star); consisting of plants with two naked seeds, and leaves disposed round the stem in form of a radiant star. This order contains herbs, shrubs, and trees. The herbs, which are most numerous, are chiefly annuals, and creep along the surface of the ground. The shrubs and trees are mostly evergreens, which rise erect, and are of an agreeable conic form. — These plants are opening; some of their seeds, particularly those of coffee, are bitter and cordial; some of them are used in dyeing, and others in medicine.

48. Aggregata, (from aggregare, to assemble or collect); comprehending those plants which have aggregate flowers, consisting of a number of florets or small flowers, each of which has a proper and common calyx.

49. Composite, consisting of plants with compound flowers. In this order Lioueneus has constructed his first or primary divisions from the different sexes of the florets, which he terms polygamy; the subaltern divisions are constructed from the figure of the petals, the disposition of the flowers, the pappus or crown of the seed, the common receptacle, and other circumstances which characterize the subaltern divisions in other authors.

50. Amentaceae (from amentum a catkin), plants bearing catkins; as salix, populus, plantanus, &c.

51. Conifera, (from conus a cone, and ferre to bear); consisting of plants whose female flowers, placed at a distance from the male, either on the same or distinct roots, are formed into a cone. In this character, the only one expressed in the title, the plants in question seem to be nearly allied to the family of mosses: from which, however, they are easily distinguished by their habit, as well as by the structure of the small flowers, in which the stamens are united below into a cylinder, and distinct at top. The plants of this order are usually of the shrub and tree kind, and retain their leaves all the year. The form of these plants is generally conic, and extremely beautiful, from the disposition of the branches, which cover the stems even to the roots, extending themselves horizontally and circularly like so many rays. The height of some genera of this order does not exceed half a foot, that of others approaches to a hundred. The roots are short, branching, not very fibrous, and extend horizontally. The stems and branches are cylindric. The bark is thin, and split into slender scales. The wood, except that of the yew tree, possesses little hardness. The buds are of a conic form, and naked; or without scales. The leaves are entire, small, and thick, frequently triangular, and generally pointed. Juniper has a prickly and thorny leaf. With respect to situation, they admit of great variety, being either alternate, opposite, placed in whorls round the stem, or collected into small bundles which proceed from a single point. They are placed on the branches without any sensible footstalk. The flowers in this order are universally male and female. In some genera, the male flowers are collected into a spike or cone at the end of the branches; in others, they proceed singly from the wings of the leaves, or termination of the branches. The female flowers are generally collected into a cone; but in yew tree and shrubby horse-castal they are single, and terminate the branches. The calyx of the male flowers is a calyx; of the female, a cone. The petals of this order are wanting; except in the female flowers of juniper, which have three sharp, rigid, and permanent petals. The stamens are in number from 3 to 20 and upwards; united by their filaments into a cylinder or pillar, which rises out of the centre of the calyx. The anthers are erect, distinct, of a roundish form, and divided into internal partitions or cells, which, in the different genera, are in number from two to ten. The seed-buds are generally numerous, and placed between the scales of the cone, which serve for a calyx. From each seed-bud arises a very short cylindric style, crowned with a simple stigma, of a conic form. These plants have probably no seed-vessel or fruit; the seeds being naked, and involved only by the scales of the calyx. In some genera these scales are of a bony nature, and almost united; in others, they are of a substance like leather, generally united and become fleshy and succulent like a berry. The seeds in this order, being nourished, as in a seed-vessel, by the scales of the cone, or common calyx, differ in nothing from the germin or seed-buds.— Most of the cone-bearing plants are resinos, or gummy; and the gums proceeding from them have a bitter taste, but generally a very agreeable smell.

52. Coeadunatae, (from coadunare, to join or gather together); so termed from the general appearance of the seed-vessels, which are numerous, and being slightly attached below, form altogether a single fruit in the shape of a sphere or cone; the parts of which, however, are easily separated from one another. This order, which consists of exotic plants, furnishes a beautiful and choice collection of shrubs and trees, both evergreen and deciduous. The trees are often 60 feet high, and garnished from the bottom to the top with spreading branches and leaves of a bright green colour, which assume a very agreeable conic form. The roots are branching and fibrous. The stems are cylindric, and the wood very hard. The buds are conic, flat, and generally without scales. The leaves are universally simple and alternate. The footstalk is cylindric, without furrows, frequently swelled at its origin, and appears jointed at its insertion into the branch. The flowers are hermaphrodite, and are generally produced either along or at the end of the branches. The calyx generally consists of three oblong plain leaves, like petals, which fall off with the flower. The petals are in number from 6 to 18, oval, long, concave, and frequently disposed in two or three series or rows, the outermost of which are largest. The stamens are numerous, short, inserted into the common
common receptacle in some, and into the seed-bud in others. The filaments are very short and slender, some genera having scarce any at all. The anthers are numerous, slender, and placed round the seed-bud. The pistillum generally consists of a number of seed-buds disposed in the form of a cone, and seated upon a receptacle which seems like a small pillar above the receptacle of the calyx. From each seed-bud generally arises a cylindric style, which is very short. The stigma is commonly blunt. The seed-vested is commonly a berry; but in magnolia it is an oval cone, consisting of a number of roundish capsules laid over each other like tiles. These fruits or seed-vested, whether of the berry, capsule, or cherry kind, are equal in number to the seed-buds, and generally slightly attached below. The seeds are numerous, hard, roundish, and sometimes covered. The plants of this order have a strong, agreeable, and aromatic smell; the fruits and seeds have a pungent taste like pepper: the bark and wood are bitter.

53. Scrobiger, (from scabber, rough, rugged or bristly), consisting of plants with rough leaves. There seems to be some impropriety in characterising these plants by a name expressive of the roughness of their leaves, as that circumstance had previously furnished the classic character of the Asperifolii. The degree of roughness, however, is much greater in the plants which make the subject of the present article.—The plants of this order are in general of an oppressed nature: their stems are bitter and styptic.

54. Miscellaneae, miscellaneous plants. This order consists of such genera as are not connected together by any general relations. They are: adonis, reseda, sanguisorba, lemn, pistia, corallia, emetrium, antheranthus, amatamus, celycos, gynomeres, tizym, physoboeus, nymphaea, seracenia, sedula, water-ten, corrugum, limnum, telephum.

55. Filices, ferns; consisting of plants which bear their flower and fruit on the back of the leaf or stalk. These plants, in figure, appear the more perfect vegetables; being furnished, like them, with roots and leaves. The roots creep, and extend themselves horizontally under the earth, throwing out a number of very slender fibres on all sides. The stem is not to be distinguished from the common foot-stalk, or rather middle rib of the leaves: so that in strict propriety the greater number of ferns may be said to be uninnerved: that is, to want the stem altogether. In some of them, however, the middle rib, or stalk proceeding from the root, overtops the leaves, and forms a stem upon which the flowers are supported. The leaves proceed either singly, or in greater number, from the extremities of the branches of the main root. They are winged or hand-shaped in all the genera except in adders-tongue, pepper-grass, and some species of spleen-wort. The flowers, whatever be their nature, are, in the greater number of genera, fastened, and as it were glued, to the back of the leaves; in others, they are supported upon a stem which rises above the leaves; but in some, are supported on a flower-stalk, as already mentioned. The stamens are placed apart from the seed-bud in a genus termed by Mr. Adamsen palmata ferse: in the other ferns, where we have been able to discover the stamens, they are found within the same covers with the seed-bud. Most of the ferns have a heavy disagreeable smell: as to their virtues, they are opening and attenuating.

56. Musci, mosses. These plants resemble the pine, fir, and other evergreens of that class, in the form and disposition of their leaves, and manner of growth of the female flowers, which are generally formed into a cone. They frequently creep, and extend themselves like a carpet upon the ground, trees, and stones, being generally collected into bunches and tufts: the smallest are only one-third of an inch in height, and the largest do not exceed five or six. Few of the mosses are annual: small as they are, the greater number are perennials: and evergreens. Their growth is remarkably slow, as may be judged by the time that the antherae take to ripen. This, reckoning from the first appearance of the antherae to the dispersion of its powder or male dust, is generally four or six months. Although preserved dry for several years, these plants have the singular property of resuming their original verdure upon being moistened. It would be worth while to determine whether they do not also resume their vegetative quality. The roots of plants of this order are fibrous, slender, branched, and short. The stems are cymular and weak, as are also the branches: they creep upon the ground, and strike root on every side. The leaves are very small and undivided. They differ with respect to situation: being either alternate, opposite, or placed by fours round the stalk. They have no perceptible foot-stalk nor middle rib, and are seated immediately upon the stems. The flowers are universally male and female: in some, the male flowers are produced upon the same plants with the female, and stand before them; in others, they are produced sometimes on the same plants, sometimes on distinct plants. The male flowers consist entirely of antherae, and their covering; produced either singly, or in clusters, from the extremities of the branches, or angles of the leaves; and are either seated immediately upon the branches, or supported by a long foot-stalk. The female flowers, which generally resemble capsules or cones, are all placed immediately upon the stem or branches, without any foot-stalk; and proceed singly either from the wings of the leaves, or summit of the branches; when produced upon the same plant with the male, they are always placed under them. The female cones of the mosses greatly resemble those of the pines and evergreen trees of that class; the scales which form them are true leaves, each containing in its wing or angle a single seed. When the seeds are ripe, the cones probably open for their dispersion. When shot, they resemble buds; and have sometimes been ignorantly mistaken for such. The calyx, in this order, if it can be called such, is that appearance resembling a veil or monk's cowl, which in the male flower covers or is suspended over the tops of the stamens like a mantleshirt, and is termed by Linnaeus calyptra. The petals are universally wanting. The mosses in general are almost tasteless, have few juices, and being once dried do not readily imbibe moisture from the air. Those which grow in water, being thrown into the fire, grow red, and are reduced to ashes without emitting or communicating any flame; on which account some superstitious people, the Siberians in particular, place water moss in their chimney as a preservative against fire. Most of the mosses are purgatives: some violently so, and even emetics. They also all of wonderful efficacy in preserving
serving dry such bodies as are susceptible of moisture; and in retaining, for a long time, the humidity of young plants, without exposing them to putrefaction. For this reason, such plants are to be sent to any considerable distance, are generally wrapped up in them.

57. Algae, flags; consisting of plants whose root, leaf, and stem, are all one. Under this description are comprehended all the sea weeds, and some other aquatic plants.

58. Fungi, mushrooms. These plants are rarely branched, sometimes creeping, but most commonly erect. Such as are furnished with branches have them of a light spongy substance like cork. Mushrooms differ from the fuci, in that those which, like the fuci, have their seeds contained in capsules, are not branched, as that numerous class of sea weeds are. The greatest part of mushrooms have no root: some, instead of roots, have a number of fibres, which, by their insoucillations, frequently form a net with unequal meshes, some of which produce plants similar to their parent vegetable. The stamens in these plants are still undetermined. The seeds are spread over the surface of the plant, or placed in open holes or cavities, resembling the open capsules of some of the fuci. In mushrooms which are branched, the seeds are frequently visible by the naked eye, and always to be distinctly observed by the assistance of a good microscope. These plants are very astringent, and some of them are used for stopping violent hemorrhages. As a vegetable food they are at best suspicious: some of them are rank poison.

Dubia ordinis. Under this name Linnaeus classes all the other genera which cannot be reduced to any of the above-mentioned orders, and which are near 120 in number.

For a historical view of the different systems of botany, and of the progress and latest improvements of the science, see Botany, Supplement.

ALPHABETICAL EXPLANATION OF BOTANICAL TERMS.

A.

Abrupt (abruptus), when a winged leaf ends without a little leaf.

Acorn, the seed of the oak.

Actinidium, seeds without lobes, which produce no seminal leaves.

Acute (acutus), tapering to a slender, but not thorny termination.

Air-bag (folliculus), a distended seed-vessel opening on one side.

Alternate (alternus), applied to branches, leaves, or flowers, springing out regularly one above another.

Androgynous, having some flowers on the same plant, bearing stamens, but no pistils; and other flowers bearing pistils, but no stamens.

Angiospermia, seeds in a capsule.

Angular (angularis) having corners; opposed to cylindrical.

—— capsule, as in flower-de-luce.

Annual (annuus), living only one year.

Anomalous (anomalous), irregular.

Anther (anthera), the top of the stamen fixed on the filament, and containing the pollen.

Apex, termination.

Apophysia, excrescence.

Approaching, see Converging.

Arrow-shaped, (sagittatus), leaf shaped like an arrow head, as sorrel.

Ascending, growing first horizontally, and then bent upwards.

Attenuate (attenuatus), tapering.

Atw-shaped (subulatus), slender.

Axum (ariata) or beard, the sharp substance growing to the valves of corn or grass.

Axumnless (mucius), without awns.

Axillary (axillaris) at the base of the leaves or branches.

B.

Bark (cortex), the covering of the stems, roots, and branches of vegetables.

Barren (masculi, abortivi), flowers or florets which produce no perfect seeds; generally wanting pistils.
History.

Botany.

**Bunch** (racemus), a fruitstalk with short lateral branches.

**Bundle** (fasciculus), several flowers rising to the same point from their respective fruitstalks, as in sweet-william.

**Bundled**, applied to leaves, as in the larch.

**Butterfly-shaped** (papilionaceous), as the pea and broom flowers.

C.

**Calyced** (calycatum), having a double calyx.

**Calyptra**, veil.

**Calyx**, or emplacement, a continuation of the outer bark of the plant, forming part of the flower, is called a cup, as in primrose, involucreum in carrot, cattin in hazel, calyptra in the moses, a husk in oats, a sheath in the narcissus, and a curtain in some fungi.

**Capsule**, a dry hollow seed-vessel opening in some determinate manner.

**Cattin** (amentum), a composition of flowers and chaff on a long thread-shaped receptacle; the whole like a cat's tail; e.g. the willow.

**Cell** (lenticulatum), vacuity in the capsule to lodge the seed.

**Central florets** (flores flocculati); those which occupy the middle part of a compound flower, as the yellow ones in a common daisy.

**Chaff** (palea), thin membranaceous substance separating the florets from each other, and growing on a common receptacle.

**Channelled** (canalicularus), having a furrow from the base to the end.

**Cicatricised**, scarred.

**Ciliate**, fringed.

**Circumference**, the florets farthest from the centre of a compound flower, as the white ones in the common daisy.

**Clamyd** (viscoseus), adhesive like bird-lime.

**Claw** (anguis), the part of a petal next the base, distinguished from the limb or upper part.

**Cleft**, divided half-way down.

**Climbing** (scandens), plants that rise by the aid of others.

**Clothing** (lubes), hairiness on the surface of plants.

**Cleft**, see **Cleft**.

**Club-shaped** (clavatus), thinner at the base, and thicker upwards.

**Cluster** (thrysus), flowers collected in somewhat of an egg-shaped form, like the lilac.

**Coated** (tunicatus), root, composed of layers like the onion.

**Cobbled** (arachnoides), covered with a substance resembling a cobweb.

**Coloured** (coloratus), not green.

**Column** (fumella), the little pillar in the centre of some capsules to which the seeds are fixed.

**Comb** (cornua), a collection of floral leaves terminating the flowering stem, as in the pine-apple.

**Comb-like** (pectinatum), a sort of winged leaf, the leaflets of which are like the teeth of a comb.

**Common calyx**, including several flowers, as in thistles.

**Compact**, growing close together.

**Compound flowers** (compositi flores) consist of many florets or little flowers, on a receptacle or seat, as in thistles.

Vol. IV. Part I.  

Any.

**Compressed** (compressus), a cylindrical substance, more or less flattened.

**Cone** (strobilus), a seed-vessel, formed by a cattin, with hardened scales, as in the pine and fir.

**Cone-shaped** (cucullatus), applied to leaves rolled up, as the grocer's roll up paper to hold spices, sugar, &c.

**Confluent** (confluentia folius), running into one another at the base.

**Congregated** (glomeratus), spikes, &c. crowded together, somewhat in a globular form.

**Connected** (adunatus) leaves, having their upper surface at the base, growing to the stem or branch.

**Contiguous** (adpressus) leaves, &c. close to the stem.

**Converging** (concinnus) approaching at the top.

**Cone**, rising like the surface of a globe.

**Convolvate**, twisted spirally.

**Corolla**, blossom.

**Coronach**, a collection of flowers standing each on its own fruitstalk, with fruitstalks of such a length, that the whole collection forms a flat broad surface at the top, as in the pear-tree.

**Corollas** (corollus) (tomentosum, tomentosus), downy, covered with a whitish soft substance.

**Coriaceous**, seed-lobes.

**Creeping** (repens) stem; creeping along the ground, as ivy.

—— root, as spearmint.

**Crescent-shaped** (lunatus, lunatus), shaped like a waxing moon, like the anthers of the strawberry.

**Crested** (cristatus) flowers, tufted.

**Crooked** (cruentus) fruitstalk, with the flower facing the earth, and so stiff, that it cannot be straightened without breaking; as in the crown imperial.

**Cross-pairs** (decussatus), leaves in pairs, each pair pointing in a direction different from the pair above or below it.

**Cross-shaped** (cruciatus, cruciformis) flowers, having four petals in a form of a cross; called cruciform plants.

**Crown** (coronatus) seed, a seed to which the calyx adheres, e.g. teasel.

**Cruciform**, see **Cross-shaped**.

**Cryptogamia**, stamens and pistils indistinct.

**Cup** (perianthium), a calyx contiguous to the other parts of the flower.

—— double (calycatum), when the base of one cup is surrounded by another cup.

**Curved** (volva), the calyx of agracis and boleti.

**Cut-round** (circumscissus), when a seed-vessel opens in a circle, and not loopways.

**Cylindrical** (teres), round like a walking stick.

D.

**Dagger-pointed** (mucronatus), ending, not gradually, but suddenly in a sharp point.

**Deciduous** (deciduus) leaves, which fall at the approach of winter.

—— cup or calyx, falling off before the blossom.

**Declining** (declinatus), bent like a bow, with the arch downwards.

**Decurrent** (decurrens) leaf, without a leafstalk, but where the leaf runs down the stem.

**Dent**
Dental (retusus), a blunt leaf with a blunt notch at the end.
Depressed (depressus), when the surface of a leaf is slightly sunk.
Diadelphus, the 17th class of plants, having the filaments united into two sets.
Diamond-shaped (rhombic), applied to leaves resembling a diamond on cards.
Diantheria, two stamens.
Didynamia, the 14th class, having two stamens longer.
Dipyx, two pistils.
Dimpled (umbilicatus), having a hollow dot.
Dock (dioscoris), having the flowers bearing stamens and those bearing pistils on different plants.
Disk (discus) of a leaf is its surface: of a compound flower its central florets; thus, in a daisy, the minute yellow florets form the disc, and the larger white-shaped florets form the ray.
Distended (ventricosus), as the cup of the rose.
Diverging (diergens), spreading wide from the stem almost horizontally, opposite to compact.
Divided (partitus), or parted, partite, signifies that a cup, leaf, or petal, is parted more than half way down.
Dodecaandria, 12 stamens.
Dorsal, fixed to the back.
Dotted (punctatus), marked with little hollow dots.
Double (didymus), applied to two anthers on one filament.
Doubly-compound (decompositus) leaves, having the primary leaf-stalk divided, so that each division forms a compound leaf. They are twin-fork (bimexus), when a forked leaf-stalk has several leaflets at the end of each fork; or, doubly-threefold (trimurus), when a leaf-stalk, with three divisions, has three leaflets on the end of each division or fork; or doubly-winged (duplicato-pinnatum, bi-pinnatum), when a leaf-stalk has lateral, each of which forms a winged leaf.
Down (pappus), the fine hair or feather-like substance, crowning the seeds of some plants, and wafting them abroad.
Downy leaf, see Cottony.
Drupes, a pulpy seed-vessel, without valves, consisting of a nut surrounded by a pulpy substance, ex gr. a cherry.
Dusted (pulveratus), applied to some plants which appear covered with a kind of powder.

E
Ear-shaped (auriculatus), somewhat resembling a human ear.
Egg-shaped (ovatus), in form of an egg.
Egg-spear-shaped (ovato-lanceolatum), see Spear-egg-shaped.
Elliptic, oval.
Embracing (amplicaulis) the stem, when the base of a leaf nearly surrounds the stem.
Entire (integer), opposed to cleft, gashed, &c.
Equal (aequalis), regular.
Erect, upright.
Even (levius) surface; level, regular.
Excrecence (apophysia), a substance growing on some of the mosses from the seat of the flower.
Expanding (patens), between upright and horizontal.

F
Eye (ulnum), the scar by which a seed is fixed to the seed-vessel.

G
Gaping (ringens, personatus) blossom, so called from its resemblance to a gaping mouth.
Gashed (lobatus), divided nearly half way down into lobes, convex at the edges, and distant from each other.
Gelatinous, jelly-like.
Gem, a bud.
General involucrum, a calyx at the base of a general umbel, as in carrot.
Germ, germen, seed-bud.
Gibbous, bulged, or bulging.
Gills (lamellae), thin plates on the under side of the pileus.
History.

Any.

Involucellum, a partial involucrum.
Involucrum or fence, the calyx of an umbel placed at a distance from the flowers.
Jointed (articulatus), en gr, a wheat straw.
K.
Keel, the lowest petal in a butterfly-shaped corolla.
Keel-ed (carinatus), bent.
Knob, see Heads.
L.
Lactescent, having a milky juice.
Laminated, when the flat surfaces of leaves lie close on each other.
Lateral branches, growing from the sides of the stem, opposed to terminating.
Leaf, part of a plant corresponding to the lungs, and also to the organs of motion of animals.
Leaflet, or little leaf, one of the single leaves of a compound leaf.
Leaf-stalk (petiolum), the footstalk of a leaf.
Leather-like (coriaceous), tough like leather.
Legume (legumen) or shell, a seed-vessel of two valves with the seeds fixed to one seam, as in the pea.
Ler, when several branches or fruitstalks grow to equal heights.
Lid (operculum), a cover to the capsules of several mosses.
Ligulate, strap-shaped.
Limb, the upper spreading part of a petal.
Limber (flaccidus) bending with its own weight.
Lip, the upper or under division of a gaping corolla.
Lobes, the division of a gashed leaf.
Lopped ( truncatus), looking as if cut off by scissors.
M.
Male flowers, which have stamens, but no pistils.
Matted (cespitosus), thickly interwoven.
Membranous (membranaceus), thin, skinny, and semi-transparent.
Monadelphia, united filaments.
Monandria, one stamen.
Monoezia, one house, or plants having the stamens and pistils in different flowers, but on the same plant.
Monogyne, one pistil in each flower.
Monopetalous, one-petalled.
Mouth (flos), the upper or opening part of the tube in one-petalled corolla.
Mules, see Hybrid.
N.
Naked, without leaves or hairs.
Nectary, or honey-cup, the part of the flower which secretes the honey.
Nut, a seed covered by a hard woody shell.
O.
Oblong-egg-shaped, oblong at the base, but egg-shaped towards the end.
Octandria, eight-stamened.
Octogynia, eight pistils.

P.
Paleaceous, shiny.
Panicle, an irregular assemblage of flowers.
Papilionaceous flowers, butterfly-shaped, as the pea.
Parasitical plants, which grow not on the earth, but on other plants.
Pedicel, a little fructstalk.
Pentagon, five-cornered.
Pentagynia, five pistils.

Hexandria, six-stamened.
Hexaquia, having six pistils.
Hexagynia, six-stamened.
Hoary (incanus), covered with a silvery-looking substance.
Honey-combed (favosum), a receptacle with cells open at the top, and having a seed in each.
Husk (gluma), the calyx of a grass plant.
Hybrid (hybrida), a plant produced by the pollen of one plant fertilizing the germen of a plant of a different species. A mule.

Jagged (laciniatus) leaves, irregularly divided and subdivided into lobes.
Icosandria, 20-stamened.
Imperfect flowers, wanting anther or pistil, or both.
Incomplete flowers want the cup, the corolla, or some other important part. See Flower. The tulip wants a cup, and the nettle has no blossom or corolla.
Incorporated (aggregatus), when little flowers or florets form a compound flower, as a daisy.
Incumbent, anthers fixed by the side, or stamens leaning or resting against.
Indented leaf, having the edges deeply scoloped, and the lobes far asunder.
Inflated, as if blown up like a bladder.
Inferior, see Beneath.
Interrupted, broken in its regular form, as a spike by leaves intervening.
Inversely heart-shaped (obcordatus), with the point of the heart next the stem.
Pentandra, five stamened.
Perennual, continuing more than two years.
Petals (petals), the leaves which constitute the corolla or blossom.
Pillar (stipes), the pedicle of the down of some seeds, as in dandelion.
Pimped (papillosus), beset with little hard protuberances.
Pistil, a part of a flower consisting of the germen, the style, and the summit.
Pitcher-shaped (urceolatus), bellying like a jug.
Pitch, a soft substance filling the cavities of some plants.
Plaited, folded.
Pod (siliqua), seed-vessel of two valves, within which the seeds are alternately fixed to each seam.
Pollen (farina), a fine powder in the anthers of flowers.
Polyadelphus, stamens in three or more sets.
Polyandra, many stamens.
Polygamia, see introduction to the 23d class.
Pores, little holes.
Pouch, a short pod.
Prism-shaped, different from cylindrical, in having the circumferenee anguular.
Proiferous, when one flower, &c. springs out of another.
Pubescent, clothed with soft wool or hair.
Radiate, compound flowers in which the florets of the centre differ from those of the circumference. See Disk.
Ray (radii), outer florets of a radiate compound flower. See Disk.
Receptacle, the seat or base of a flower.
Reflected, bent back.
Remote whorls, having a considerable length of stem between each.
Rhomboideal, nearly diamond-shaped.
Rigid, inflexible.
Root-leaves (radicaria), those which proceed immediately from the root.
Ruffle or ring, the part of the curtain of an agaric which adheres to the stem after the outer part is gone.
Salver-shaped (hypoecteriformis), when a one-petaled corolla has its lower part tubular, and its higher part flat and expanded.
Scaly (squamosus), like the skin of a fish.
Scurfy (squarrosus), applied to the rough cup of some compound flowers.
Seed, that which contains the rudiments of the new plant.
Seed-lobes (cotyledones), the perishable part of a seed which affords food to the rest in germination.

B O T A N Y.

Seminal leaves, those which rise from the seed-lobes.
Serrated, like the teeth of a saw.
Sheath (spatha), a kind of calyx like that of the crocus.
Simple, undivided.
Sitting leaves or flowers, without leaf or flower-stalks.
Solitary, only one in a place.
Spear-egg-shaped, like a spear at the base, and an egg at the extremity.
Spike (spica), a collection of flowers placed alternately on each side of a common fruitstalk without little fruitstalks.
Stamen, consists of a filament and anther.
Staminiferous, bearing stamens.
Streaked, marked with depressed lines.
Syngenesia, united anthers.

T.

Target-shaped leaf, having the stalk fixed, not in the edge, but the centre.
Tetragynia, four pistils.
Tetradynamia, four stamens longer.
Tiled, one leaf or scale partly covering another.
Tooth-serrated, when the edge of a leaf is marked with little serrated teeth.
Triandria, three stamens.
Trigynia, three pistils.
Tubercled, having solid warts; applied to certain lichens.
Tuberos root, having many roundish knobs in a bundle.
Tubular, hollow like a tube.

U.

Umbel (umbella), an assemblage of flowers in which a number of slender fruitstalks, proceeding from the same centre, rise to nearly the same height, so as to form a regular surface at the top, as in hemlock or carrot.
Unequal florets (radiati), when the florets of an umbel are larger in the circumference than in the centre.
Valve, the pieces of a capsule are called valves.
Vaulted (fornicatus), like the roof of the mouth.
Veil (calyptra), the calyx of mosses.

W.

Wheel-shaped, a corolla of one petal, with a flat border and a short tube.
Whirls of branches, leaves or flowers; ex gr. the branches of the fir.
Wings, the lateral petals of a butterfly-shaped blossom.
Winged leaf-stalk, with a thin membrane on each side.
Wingless leaf, when an undivided leaf-stalk has many little leaves growing from each side.
Wing-cleft, a leaf deeply cut.
Woody, opposed to herbaceous.
Woolly, curly haired clothing on some plants.

Z.

Zigzag, having many contrary bendings.

</table>
BOTANY-BAY, so called from the great number of new plants which were discovered by the naturalists who first visited it. See New-Holland.

BOTANOMANCY, (from σεβαίον, herb, and μαντεία, divination), an ancient species of divination, by means of plants; especially sage and fig leaves. The manner of performing it was thus: the persons who consulted wrote their own names and their questions on leaves, which they exposed to the wind; and as many of the letters as remained in their own places were taken up, and being joined together, contained an answer to the question.

BOTARCO, a kind of sausage, made with the eggs and blood of the mullet, a large fish common in the Mediterranean. The best kind comes from Tunis in Barbary: It must be chosen dry and reddish. The people of Provence use a great deal of it, the common way of eating it being with olive oil and lemon juice. There is also a great consumption of it throughout the Levant.

BOTE, (Sax.), signifies a recompense, satisfaction, or amends: hence comes manbe, compensation or amends for a man slain, &c. In King Ina’s laws is declared what rate was ordained for expiation of this offence, according to the quality of the person slain. From hence likewise we have our common phrase, to boot, i.e. compensation gratia. There are house-bote, plough-bote, &c. privileges to tenants in cutting of wood, &c.

BOTELESS, (sine remedio). In the charter of Hen. I. to Tho. archbishop of York, it is said, “that no judgment or sum of money shall acquit him that commits sacrilege; but he is in English called botelens; viz. without emendation.” We retain the word still in common speech; as, It is botelless to attempt such a thing; that is, It is vain to attempt it.

BOTH, JOHN and ANDREW, Flemish painters, and pupils of Bloemart. The union of these brothers was very singular; they were inseparable in their studies, travels and painting. John painted the landscape part of their pictures in the manner of Lorraine, and Andrew the figures and animals in the style of Bamboche. They both died in 1630. John’s taste in landscape is elegant; his ideas are grand; his composition beautiful; and his execution rich and masterly in the highest degree. His light is not always well distributed; but his figures are excellent. It is to be regretted that we have not more of his works; for they are certainly, upon the whole, among the best landscapes we have.

BOTHNIA, a province of Sweden, at the end of the gulf of the same name. It is divided into two parts, called east and west Bothnia, the former of which belongs to Finland, and is now subject to Russia. West Bothnia is full of mountains; the earth is sandy, and yet a scarcity of provisions is seldom known. Cattle and game are so common, salmon and a sort of herrings so plenty, and the trade of skins is so gainful, that the inhabitants can command what they want from their neighbours. There are only two towns worth mentioning, viz. Tornea and Umea. The inhabitants of this province are Protestants.

BOTRYS, BOTRUS, or Bostrum, in Ancient Geography, a town of Phoenicia, on the Mediterranean, built by Saturn, (a proof at least of antiquity); twelve miles to the north of Byblos, and twenty to the south of Tripolis. Now almost in ruins, and called Botrom or Boterm (Postellus), E. Long. 37. 30. N. Lat. 34. 6.

BOT, among bone-lace weavers, a kind of round cushion of light matter placed on the knee, whereon they work or weave their lace with bobbins, &c.

BOTT, in Zoology. See BOTTs.

BOTTICELLI, SANDRO, or ALE桑DRO, born at Florence in 1437, learned the rudiments of painting under Filippo Lippi. He executed several pictures for Pope Sixtus IV. and others for the city of Florence: for these he received large sums of money, all of which he expended, and died at last in great distress, aged 78. He was not only a painter but a man of letters. Baldini, according to the general report, communicated to him the secret of engraving, then newly discovered by Finiguerra their townsman. The famous edition of Dante’s poem of Hell, printed at Florence by Nicholo Lorenzo della Magna, A. D. 1481, and to which, according to some authors, Botticelli undertook to write notes, was evidently intended to have been ornamented with prints, one for each canto; and these prints (as many of them as were finished) were designed, if not engraved, by Botticelli. It is remarkable, that the two first plates only were printed upon the leaves of the book, and for want of a blank space at the head of the first canto, the plate belonging to it is placed at the bottom of the page. Blank spaces are left for all the rest; that as many of them as were finished might be pasted on. Mr Wilbraham possesses the finest copy of this book extant in any private library; and the number of prints in it amounts to nineteen. The two first, as usual, are printed on the leaves; and the other seventeen, which follow regularly, are pasted on the blank spaces; and these apparently were all that Botticelli ever executed. About
the year 1460, it is said that he engraved a set of plates representing the Prophets and Sibyls. Basan tells us that he marked those plates with a monogram composed of an A and a B joined together.

**BOTTLE,** a small vessel proper to contain liquors, made of leather, glass, or stone. The word is formed from butella or botella, used in barbarous Latin writers, for a lesser vessel of wine; being a diminutive of bota, which denoted a but or cask of that liquor.

The ancient Jewish bottles were made of goats or other wild beasts skin, with the hair on the inside, well swed and pitched together; an aperture in one of the animals paws serving for the mouth of the vessel.

Glass bottles are better for cyder than those of stone.

Foul glass bottles are cured by rolling sand or small shot in them; nasty bottles, by boiling them. See GLASS.

Bottles are chiefly made of thick coarse glass: though there are likewise bottles of boiled leather made and sold by the case-makers. Fine glass-bottles covered with straw or wicker, are called flasks or bettees. The quality of the glass has been sometimes found to answer the temper of the bottle.

Dr Percival cautions against the practice of cleaning of wine bottles with leaden shot. It frequently happens, he thinks, through inattention, that some of the little pellets are left behind; and when wine or beer is again poured into the bottles, this mineral poison will slowly dissolve, and impregnate those vinous liquors with its deleterious qualities. The sweetness which is sometimes perceived in red port wine may arise from this cause, when such an adulteration is neither design-ed nor suspected.—Potash is recommended for cleansing bottles: a small quantity in the water will clean two gross.

**BOTTLING,** the operation of putting up liquors in bottles corked, to keep, ripen, and improve. The writers on good husbandry give divers rules concerning the bottling of beer, cyder, and the like. The virtues of Spaw, Trympton, Scarborough, and other waters, depend on their being well bottled and corked, otherwise they lose both their taste and bennel. To preserve them, it is necessary the bottles be filled up to the mouth, that all the air may be excluded, which is the great enemy of bottled liquors. The cork is also further secured by a cement. Some improve their bottled beer, by putting crystals of tartar, and wine or malt spirits, and others, by putting sugar boiled up with the essence of some herb, and cloves, into each bottle.

Cyder requires special precautions in the bottling; being more apt to fly, and burst the bottle, than other liquors. The best way to secure them, is to have the liquor thoroughly fine before it be bottled. For want of this, some leave the bottles open a while, or open them after two or three days bottling to give them vent. If one bottle break, through fermentation, it is best to give them all vent, and cork them up again. Mean cyder is apter to break the bottles than rich. Some soak the corks in scaling water, to render them more pliant and serviceable. Another particular to be observed is, to lay the bottles so as that the liquor may always keep the cork wet and swelled. Something also depends on the place where the bottles are set, which ought to be such as exposes them as little as possible to the alterations and impressions of the air; the ground is better for this purpose than a frame; sand better than the bare ground; and a running water, or a spring often changed, best of all.

To hasten the ripening of bottled liquors, they are sometimes set in a warm place, or even exposed to the sun, when a few days will bring them to maturity.

**BOTTOM,** in a general sense, denotes the lowest part of a thing, in contradistinction to the top or uppermost part.

**Bottom,** in Navigation, is used to denote as well the channel of rivers and harbours, as the body or hull of a ship. Thus, in the former sense, we say, gravelly bottom, clayey bottom, sandy bottom, &c. and in the latter sense, a British bottom, a Dutch bottom, &c. By statute, certain commodities imported in foreign bottoms, pay a duty called petty custom, over and above what they are liable to if imported in British bottoms.

**BOTTOMRY,** in Commerce, (a practice which originally arose from permitting the master of a ship in a foreign country to hypothecate the ship in order to raise money to refit,) is in the nature of a mortgage of a ship; when the owner takes up money to enable him to carry on his voyage, and pledges the keel or bottom of the ship (pars pro toto) as a security for the repayment. In which case it is understood, that if the ship be lost, the lender loses also his whole money; but if it return in safety, then he shall receive back his principal, and also the premium or interest agreed upon, however it may exceed the legal rate of interest. And this is allowed to be a valid contract in all trading nations, for the benefit of commerce, and by reason of the extraordinary hazard run by the lender. And in this case, the ship and tackle, if brought home, are answerable (as well as the person of the borrower) for the money lent. But if the loan is not upon the vessel, but upon the goods and merchandise, which must necessarily be sold or exchanged in the course of the voyage, then also the borrower, personally, is bound to answer the contract; who therefore, in this case, is said to take up the money at respondentibus. These terms are also applied to contracts for the repayment of money borrowed, not on the ship and goods only, but on the mere hazard of the voyage itself; when a man lends a merchant 1000L. to be employed in a beneficial trade, with condition to be repaid with extraordinary interest, in case such a voyage be safely performed; which kind of agreement is sometimes called fessis nauticum, and sometimes usura maritima. But as this gave an opening for usurious and gaming contracts, especially upon long voyages, it was enacted by the statute 19 Geo. II. c. 37, that all moneys lent on bottomry, or at respondentibus, on vessels bound to and from the East Indies, shall be expressly lent only upon the ship, or upon the merchandise; that the lender shall have the benefit of salvage; and that if the borrower has not on board effects to the value of the sum borrowed, he shall be responsible to the lender for so much of the principal as hath not been laid out, with legal interest and all other charges, though the ship and merchandise be totally lost.

**BOTTONY.** A cross bottony, in Heraldry, termi-
notes at each end in three hedæ, knots, or buttons, resembling, in some measure, the three-leaved grass; on which account Segovia, in his *Tesor Heraldisque, terms it crosst treffes*. It is the badge of the order of St Maurice. See *Heraldry Plaids*.

**BOTRIGARO, HERCULE, a person eminently skilled in the science of music, though not a musician by profession. He was a man of rank in Bologna; and appears, from several letters to him that have been printed, to have had the title of Count. He published several controversial pieces in the subject of music. It seems that he entertained strong prejudices in favour of the ancient music; and that he attempted, as Vincentius and others had done, to introduce the chromatic genus into practice, but with no better success than he had the endeavours of others. He corrected Gogavino’s Latin version of Ptolemy in numberless instances; and that to so good a purpose, that Dr Wallis has in general conformed to it in that translation of the same author which he gave to the world many years after. He also translated into Italian *Boethius de Musica*, and as much of Plutarch and Macrobius as relates to music: besides this, he made annotations upon Aristoxenus, Franchinus, Spataro, Vicentino, Zarlino, and Galilei; and, in short, on almost every musical treatise he could lay his hands on, as appears by the copies which were once his own, and are now preserved in many libraries in Italy. Of Botrigraro’s works it is said, that they contain greater proofs of his learning and skill in music, than of his abilities as a writer, his style being remarkably inelastic: nevertheless, he affected the character of a poet; and there is extant a collection of poems by him, in 8vo, printed in 1557. Walther * Lexicon * represents him as an able mathematician, and a collector of rarities; and says that he was possessed of a cabinet, which the emperor Ferdinand II. had a great desire to purchase. He died in 1609.

**BOTTS, in Zoology, a species of worms which can be produced and nourished only in the intestines of a horse. It is there alone they can enjoy the proper temperature of heat, and receive the nourishment necessary for them. See *Oestrus*, *Entymology Indem*.

Besides the long worms which have been observed in the bodies of horses, there are also short ones. — By these are to be understood what we call *bottis*.

All authors, both ancient and modern, who have treated of the diseases of horses, have taken notice of these worms; but M. Vallianieri is the first who has traced them to the last stage of their transformation, and has seen them change into a hairy kind of fly like the drone.

The flies from which these botts are produced inhabit the country, and do not come near houses, at least not near those of large towns: and therefore horses are never liable to have the worms (i.e. bottis) in their bodies, if they have been kept in the house, especially in a town, during the summer and autumn.

It is in the former of these seasons, and perhaps too in the beginning of the latter, that the females of these flies apply themselves to the anus of horses, and endeavour to gain admittance, in order there to deposit their eggs, or perhaps their worms.

The precise instant of their entrance will scarce admit of an eye-witness, but by the merest chance; yet M. Vallianieri says, that Dr Gaspary had attained this very uncommon sight. The doctor (he tells us) was one day looking at his mares in the field; and from being very quiet, he observed, that on a sudden they became very restless, and ran about in great agitation, prancing, plunging, and kicking, with violent motions of their tails. He concluded, that these extraordinary effects were produced by some fly buzzing about them, and endeavouring to settle upon the anus of one of them; but the fly not being able to succeed, he observed it to go off with less noise than before, towards a mare that was feeding at a distance from the rest; and now the fly taking a more effectual method to obtain its design, passed under the tail of the mare, and so made its way to the anus. Here at first it occasioned only an itching, by which the intestine was protruded with an increasing aperture of the anus; the fly taking the advantage of this, penetrated further, and secured itself in the fold of the intestine: — this effected, it was in a situation proper for laying its eggs. Soon after this, the mare became very violent, running about, prancing, and kicking, and throwing herself on the ground; in short, was not quiet, nor returned to feeding till after a quarter of an hour.

The fly then, we see, can find means of depositing its eggs, or perhaps its worms (i.e. bottis), in the fundament of the horse; which once effected, it has done all that it is necessary for them. If these bott-worms are not hatched when first deposited in the horse, but are then only eggs, it will not be long before it happens, from the nutritive heat they there receive.

These bott-worms soon make their way into the intestines of the horse: they occupy such parts of this region as are to them most convenient; and sometimes (as we shall see presently) they penetrate even to the stomach. All the hazard they appear to be exposed to, is that of being carried away from the places they have fixed on by the excrement, which may seem likely to drive all before it. But nature has provided for all things; and when we shall have further described these bott-worms, it will seem that they are able to maintain their situation, and to remain in the body of the horse, as long as they please.

There is a time when these bott-worms are of themselves desirous to leave this their habitation, it being no longer convenient for them after the purposes of their growth are answered. Their transformation to a fly must be performed out of the horse’s body: and accordingly, when the time of their transformation draws near, they approach towards the anus of the horse; and then leave him of their own accord, or with the excrement, with which they then suffer themselves to be carried along.

According to M. de Rannu’s observations, the bott-worms have two unequal claws, by which they are enabled to remain in the intestines of the horse in opposition to all efforts of the excrement to force them out. — These claws are a sort of anchor, differently disposed from those of common anchors, but contrived to produce the same effect. Besides these two claws, nature has given them a great number of triangular spines or bristles, very sufficient to arm them against the coats of the intestines, and to resist the force employed to drive them towards the anus, provided the head be directed towards the stomach of the horse.

It will be asked, no doubt, if these bott-worms are not
BOUCHAIN, a fortified town of the French Netherlands, in the department of the north. It is divided into two parts by the river Scheld. It was taken by the French in 1675; and by the allies under the duke of Marlborough in 1711, which was the last military achievement of that great general; but the following year it was retaken by the French. E. Long. 3. 15. N. Lat. 50. 17.

BOUCHE OF COURT, the privilege of having meat and drink at court scot-free. The word is also written bouge, bouge, and budge; it is mere French, where it signifies mouth. —The French still use the phrase, Avoir bouge à la cour; that is, to have table or diet at court. This privilege is sometimes only extended to bread, beer, and wine; it was a custom anciently in use, as well in the houses of noblemen as in the king's court. Thomas earl of Lancaster retained Sir John de Ewe, to serve him with ten men at arms in time of war, allowing them bouge of court, with livery of hay and oats, horse-shoes and nails. Sir Hugh Merril had the same privilege for life, on condition of serving King Edward II.

BOUCHET, John, a French poet and historian, flourished in the 16th century. The most considerable of his writings are the Annals of Aquitaine, and his Chaplet des Princes.

BOUDRY, a small town of Switzerland, in the province of Neuchatel, and capital of a canton, of the same name. E. Long. 7. 5. S. Lat. 47. 11.

BOVEY COAL, an inflammable fossil found in England, France, Italy, Switzerland, Germany, Ireland, &c. Its colour is brown or brownish black, and of a laminar structure. It is composed of wood, penetrated with petrol or bitumen; and frequently contains pyrites, alum, and copperas.

BOUFLERS, Lewis Francis, Duke of, a peer and marshal of France, and a general of distinguished reputation, was the son of Francis count of Bouflers. He was born in the year 1644, and entering early into the army, he was raised in 1669 to the rank of colonel of dragoons, and in the conquest of Lorraine, served under Marshal Crequi. In the war against Holland he served under the celebrated Turenne, and frequently distinguished himself by his skill and bravery; and when that general was killed, in 1675, he commanded the rear-guard during the retreat of the French army. After performing various military services in Germany, in Flanders, and on the frontiers of Spain, he gradually rose in rank as well as in reputation. In 1690, he was created general of the army of the Moselle. In the following year, he acted as lieutenant-general, under the king in person; and while he invested Mons was wounded in an attack on that place. He conducted the bombardment of Liege, although it was defended by a superior enemy, and he forced the allied generals to abandon Luxembourg. He was entrusted with the command of the covering army, against King William, at the siege of Namur; and for this and many other important services, he was raised in 1695 to the high rank of marshal of France. In 1694, he was appointed governor of French Flanders, and of the town of Lille. By a skilful manoeuvre he threw himself into Namur, in 1695, and held it for sixty-three days; against the combined armies of the allies under King William. Having agreed to a capitulation, he was arrested prisoner of war.
profit by making and selling them. Scultetus, about the middle of the 17th century, used bougies in diseases of the urethra, and Mons. Daran probably took the hint from him. Different compositions have been used, and generally mercury was a part of them. Rivierre made a plaster as follows: An. oliv. 1b iv. cerus i-
tr. 1b. i. mus. & cerae., tereb. veset. & ren.
ab. 55 i ii. m. Whether the bougies are made up of this or any other composition, they must be of different sizes, from the bigness of a knitting needle to that of a goose quill. They are made of linen rags, spread with a proper matter, and then rolled up as follows. Having spread any quantity of the linen rag with the composition that is chosen for the purpose, cut it into slips from six to ten inches long, and from half an inch to an inch broad: then dexterously roll them on a glazed tile into the form of a waxed candle: and as the end of the bougie that is to be entered first into the urethra should be somewhat smaller than the rest, it would be as well to cut the slips a little tapering. It should also be observed, that when the bougies are rolled up, that side must be outward on which the plaster is spread.

Mons. Daran, and some others, attributed the action of their bougies to the composition they made use of in forming them. Mr Sharp apprehended, that as much of their efficacy was owing to the compression they made on the affected part, as to any other principle, and Mr Aiken very justly says, As it is evident that bougies of very different compositions succeed equally well in curing the same disorders in the urethra, it is plain that they do not act by means of any peculiar qualities in their composition, but by means of some property common to them all. This must be their mechanical form and texture, therefore their mode of action must be simple compression. The efficacy of mere compression in many cases of constriction is well known, from the use of sponge tents for widening parts that are straitened by cicatrices; and admitting obstructions in the urethra to be from a constriction formed by cicatrized ulcers, or a projection of the spongy substance of the urethra into the canal, we may easily conceive, that a gentle continued elastic compression will in time overcome the disease. We may also readily account for the inferior efficacy of metallic and whalebone bougies, from their not having the property of swelling with moisture, and therefore not making so equal a compression. As to bougies procuring a discharge of matter, there is no doubt but the mechanical stimulus of a foreign body in such a tender part, though free from disease, must produce it in some degree; and that this will be varied according to the chemically irritating quality of the composition, and the irritable state of the urethra; but it seems an absurdity to apply a topic, made uniform throughout, to the whole length of a canal, with a view of producing extraordinary effects upon a particular part of it, by means of some powerful quality in the ingredients. That a part of the bougie is particularly covered with matter, is probably owing to the greater irritation of that part of the urethra where the disorder is.

BOUGUER, FÉTIER, an eminent French mathematician. See Supplement.

BOUHOUS, DOMINIC, a celebrated French cri-

BOUGAINVILLE, L. A. a celebrated French na-
vigator. See Supplement.

BOUGANT, WILLIAM HYACINTH, a famous Jesuit, first taught humanity at Caen and Nevers, and afterwards settled at the college of Louis the Great, where he employed himself in writing several works; the principal of which were, 1. A collection of physical observations, extracted from the best authors. 2. A history of the wars and negotiations which preceded the treaty of Westphalia. 3. The female doctor, a philo-
sophical amusement on the language of beasts, &c. He died in 1743.

BOUGH, denotes much the same with BRANCH.—Green boughs anciently made part of the decoration of altars and temples, especially on festival occasions. Oaken boughs were offered to Jupiter; those of laurel, to Apollo; of olive, to Minerva; myrtle, to Venus; ivy, to Bacchus; pine, to Pan; and cypress to Pluto.

BOUGIE, in the French language, signifies a wax candle, and is applied to a machine which (as the wax candle formerly was) is introduced into the urethra for removing obstructions there. Mons. Daran, a French surgeon, lately boasted of his introducing them as an improvement in his art, and acquired considerable
BOUILLON, a town of the Netherlands, in the duchy of the same name, and in the county of Luxemburg, with a fortified castle, which is seated on a rock that is almost inaccessible. The French took it in 1676; upon which it was given to the duke of Bouillon. This duchy was a sovereignty, independent of France; and in 1792, the king of Great Britain granted to Philip d'Avouergne, captain in the royal navy, his license to accept the succession to the said duchy, in the case of the death of the hereditary prince, only son of the reigning duke, without issue male, pursuant to a declaration of his severe highness, in 1791, "at the desire, and with the express and formal consent of the king and queen." Accordingly, Captain d'Avouergne afterwards assumed the title of prince of Bouillon. In May 1794 this town was taken by storm, by General Beaujolais, after defeating a considerable body of republicans, and given up to pillage; 1200 French were killed, and 300 taken prisoners. It is seated near the river Semois, 12 miles north of Sedan. E. Long. 5° 30'. N. Lat. 49° 45'.

BOUILLON, in the mange, a lump or excrescence of flesh that grows either upon or just by the flesh, insomuch that the flesh shoots out, just like a lump of flesh, and makes the horse halt; and this is called the flesh blowing upon the flesh. Manse horses, that never wet their feet, are subject to these excrescences, which make them very lame. See FRUSH.

BOVINA AFFECTIO, a distemper of black cattle, caused by a worm lodging between the skin and the flesh, and perforating the same. This distemper is not mentioned by the ancient Greeks, and is but little known in Europe.

BOVINUS, a small town of the French Netherlands, in the department of the North, seated on the river Meuse, in E. Long. 4° 59'. N. Lat. 49° 45'.

BOVINO, an episcopal town of Italy, in the Capitanata, seated at the foot of the Apennine mountains, in E. Long. 16° 15'. N. Lat. 41° 17'.

BOVIVM (Itinerary); a town of the Silures, in Britain, fifteen miles to the south of Isca Silurum, or Caerleon, in Monmouthshire: Now called Cowbridge; according to Baudrand, Bangor in Caernarvonshire.

BOULAINVILLIERS, Henry de, Lord of St Saise, and an eminent French writer, was descended from a very ancient and noble family, and born at St Saise in 1658. His education was among the fathers of the oratory; where he discovered from his infancy those uncommon abilities for which he was afterwards distinguished. He applied himself principally to the study of history; and his performances in this way are numerous and considerable. He was the author of a history of the Arabians; fourteen letters upon the ancient parliaments of France; a history of France to the reign of Charles VIII.; the state of France, with historical memoirs concerning the ancient government of that monarchy, to the time of Hugh Capet; "written (says M. Mantesques) with a simplicity and honest freedom worthy of that ancient family from which their author was descended." M. Boulainvilliers died at Paris in 1722; and after his death was published his Life of Mahomet.

BOULANGER, Nicholas Anthony, a very singular Frenchman, was born at Paris in 1722, and died there in 1759, aged only 37. During his education, he is said to have come out of the college of Beauvais almost as ignorant as he entered into it; but struggling hard against his unfitness to learn, he at length overcame it. At seventeen, he began to study mathematics and architecture; and in three or four years made such a progress, as to be useful to the baron of Thiers, whom he accompanied to the army in quality of engineer. Afterwards he had the superintendence of the highways and bridges; and he executed several public works in Champagne, Burgundy, and Lorraine. The author of his life, in the Dictionnaire des Hommes celebres, writes, that in this province a terrible spirit discovered itself in him, which he himself did not suspect before; and this was, it seems, the spirit of "thinking philosophically." In cutting through mountains, directing and changing the courses of rivers, and in breaking up and turning over the strata of the earth, he saw a multitude of different substances, which (he thought) warned the great antiquity of it, and a long series of revolutions which it must have undergone. From the revolutions in the globe, he passed to the changes that must have happened in the manners of men, in societies, in governments, in religion; and he formed many conjectures upon all these. To be far from satisfied, he wanted to know what, in the history of ages, had been said upon these particulars; and

U a that
BOULANGER, John, an engraver, who flourished towards the end of the last century, was a native of France. His first manner of engraving appears to have been copied, in some degree, from that of Francis de Poilly; but soon after he adopted one of his own, which, though not original, he however greatly improved. He finished the faces, hands, and all the naked parts of his figures, very neatly, with dots instead of strokes, or strokes and dots. The effect is singular enough, and by no means unpleasant: only, in some few instances, he has opposed the coarse graving of his drapery and back ground, so violently to the neater work of the flesh, that the outline of the latter is thereby rendered hard, and the general appearance of it flat and chalky. This style of engraving has been carried to its greatest perfection in the present day, particularly in England. He did not draw the naked parts of his figures correctly, or with fine taste. His drapery are apt to be heavy, and the folds not well marked. However, his best prints possess much merit, and are deservedly held in great esteem.

BOULAY, César Égasse du, in Latin Bulaeus, was born at St Ellier, a village of Maine in France; and became professor of humanity at the college of Navarre, register, rector, and historiographer of the university of Paris. He died in 1678, after having published several works. The principal of them are, A History of the University of Paris, in Latin, 6 vols. folio; and the Treasure of Roman Antiquities, in 1 vol. folio.

BOULCOLACA, among the modern Greeks, denotes the spectacle of some wicked person who died excommunicated by the patriarch, reanimated by the devil, and causing great disturbance among the people; of which many strange stories are told. The word is Greek, and is sometimes written Βουτςλοκας, boukolakas; and supposed to be derived from μυκας, or μυκας, "mud," and λαγας, "a ditch," on account of the filthiness of the sight.

BOULDER-WALL, a kind of wall built of round stones or pebbles, laid in strong mortar, and used where the sea has a beach cast up, or where there are plenty of winds.

BOULLETTE, in the manage. A horse is called boulette, when the fretlock, or pastern-joint, bends forward, and out of its natural situation, whether through violent riding, or by reason of being too short jointed, in which case the least fatigue will bring it.

BOULOGNE, Lewis, painter to the French king, and professor of the academy of painting, distinguished himself by his art; and died at Paris in 1674, aged 65. There are three of his pictures in the church of Notre Dame. He left two sons who were admired for their skill in painting. The elder, who is well known under the name of Bon Boullogne, was first instructed by his father; after which he went to perfect himself in Italy, and for that purpose the king allowed him a pension: at his return, he was made professor of the academy of painting. Louis XIV. employed him in adorning several of his palaces; and there is a great number of his pictures at Paris. His talents for copying the pictures of the great Italian masters were so very extraordinary, that he frequently deceived the greatest judges. He died in 1717. Lewis Boullogne, his brother, after being also instructed by his father, gained the prize of painting at 18 years of age; upon which he obtained the king’s pension. He set out for Italy at his brother’s return, and acquired great skill in designing and colouring. At his return to Paris he was much employed: and at length became director of the academy of painting, knight of the order of St. Michael, and first painter to the king. Louis XIV. allowed him several pensions, and raised him and his posterity to the rank of nobility. He embellished the church of the Invalids, the chapel of Versailles, &c.

BOULLOGNE, Bon de, a painter of some eminence, was born at Paris in 1649. From his father, Louis de Boullogne, he learned the first principles of the art: but went to Rome in order to perfect himself from the works of the best masters. He abode in Italy five years. He excelled in history and portrait. His talents for copying the pictures of the great Italian painters were so very extraordinary, that he frequently deceived the greatest judges. He died at Paris in 1734, aged 80 years.

BOULLOGNE, Louis de, born at Paris in 1650, was the younger brother of the preceding; and, like him, learned from his father the first principles of painting, and afterwards went to Rome to complete his studies. His works, on his return, were so much esteemed, that Louis XIV. honoured him with the order of St. Michael, and, after the death of Anthony Coyell, appointed him his principal painter. He chiefly excelled in historical and allegorical subjects. He died at Paris in 1734, aged 80 years.

BOULOGNE, a large sea-port town of Picardy in France, and capital of the Boulognais, now called the department of the Straits of Calais, with a harbour, and formerly a bishop’s see. It is divided into two towns; the higher, and the lower. The former is strong both by nature and art; and the latter is only surrounded with a single wall. The harbour has a mole for the safety of shipping, which at the same time prevents it from being choked up. The lower town is inhabited by merchants, and has three large streets, one of which leads to the high town, and the other two run in a line on the side of the river. It is situated at the mouth of the river Liane, and contained 10,140 inhabitants in 1815. E. Long. 1° 42’. Lat. 50° 42’.

BOULUGNOIS, a territory of France, in the north part of Picardy, about 30 miles in length and 20 in breadth. The chief town is Boulogne, and the chief trade
Boultier, Dr. Hugh, was born in or near London, of reputable and wealthy parents. He was educated at Merchant-tailors school; and, before the Resolution, was from thence admitted a commoner of Christ-church in Oxford. Some time after he was chosen a demy of Magdalen college, at the same election with Mr. Addison and Dr. Wilcox. From the merit and learning of the persons elected, this was commonly called by Dr. Hough, president of the college, the golden election. He afterwards became fellow of the same college; in which station he continued in the university till he was invited to London by Sir Charles Hedges, principal secretary of state, in the year 1700, who made him his chaplain, and recommended him to Dr. Tenison archbishop of Canterbury; but his first preferences were owing to the earl of Sunderland, by whose interest and influence he was promoted to the patronage of St. Olave in Southwark, and the archdeaconry of Surry. Here he continued discharging very faithfully and diligently every part of his pastoral office, till he was recommended to attend George I. as his chaplain when he went to Hanover in 1719. He had the honour to teach Prince Frederic the English language; and by his conduct he so won the king's favour, that he promoted him to the deanship of Christ-church, and the bishopric of Bristol, in the same year. As he was visiting his diocese five years afterwards, he received a letter from the secretary of state, acquainting him that his majesty had nominated him to the archbishopric of Armagh and primacy of Ireland. This honour he would gladly have declined; and desired the secretary to use his good offices with his majesty to excuse him from accepting it. Ireland happened to be at this juncture in a great flame, occasioned by Wood's ruinous project; and the ministry thought that the bishop would greatly contribute to quench it by his judgment, moderation, and address. The king therefore laid his high estate commands upon him: to which he submitted, but with some reluctance. As soon as he had taken possession of the primacy, he began to consider that country, in which his lot was cast for life, as his own; and to promote its true interest with the greatest zeal and assiduity. Accordingly, in innumerable instances, he exerted himself in the noblest acts of beneficence and public spirit. In seasons of the greatest scarcity, he was more than once instrumental in preventing a famine which threatened that nation. On one of these occasions he distributed vast quantities of corn throughout the kingdom, for which the house of commons passed a vote of public thanks; and at another time 2,000 persons were fed at the poor-house in Dublin, every morning, and as many every evening, for a considerable time together, mostly at the prince's expense. When schemes were proposed for the advantage of the country, he encouraged and promoted them not only with his counsel but his purse. He had great compassion for the poor clergy of his diocese, who were disabled from giving their children a proper education; and he maintained several of the children of such in the university. He erected four houses at Drogheda for the reception of clergymen's widows, and purchased an estate for the endowment of them. His charities for augmenting small livings and buying globes amounted to upwards of 30,000l. besides what he devised by will for the like purposes in England. In short, the instances he gave of his generosity and benevolence of heart, his virtue, his piety, and his wisdom, are almost innumerable, and the history of his life is his noblest panegyric. This excellent prelate died at London, on the 2d of June 1742, and was interred in Westminster-abbey, where a beautiful monument of finely polished marble is erected to his memory.

BOULTINE, a term which workmen use for a moulding, the convexity of which is just one-fourth of a circle; being the member just below the plinth in the Tuscan and Doric capital.

BOULTON, Matthew, an eminent English engineer. See SUPPLEMENT.

BOULKE, in the military orders of the Turks, a body of the janizaries, with an officer in the place of a colonel at their head, sent upon some particular enterprise.

BOUM, in Ancient Geography, a town in Ethiopia beyond Egypt, on the west side of the Nile.

BOUM SOLIS STABULA, in Ancient Geography, the territory of Mylex, so called: A peninsula on the east coast of Sicily, to the north of Syracuse; remarkable for its fertility and rich pastures (Theophrastus); and hence arose the fable of the oxen of the sun feeding there (Scholiast on Apollonius). Pline and Seneca say, that something like dung is thrown out on the coast of Mylex and Messana, which gave rise to the fable of the oxen of the sun being stabled there; and at this day the inhabitants affirm the same thing (Cluverius).

BOUNCE, in Ichthyology, the English name of a species of squalus. See SQUALUS.

BOUND, in dancing, a spring from one foot to the other; by which it differs from a hop, where the spring is from one foot to the same. It also differs from a half coupse, as in the latter the body always bears on the floor, either on one foot or the other; whereas, in the bound, it is thrown quite from the floor.

BOUND-Bailiffs, are sheriffs officers for executing of process. The sheriffs being answerable for their misdemeanors, the bailiffs are usually bound in a bond for the due execution of their office; and hence are called bound-bailiffs, which the common people have corrupted into a much more homely appellation.

BOUNDS OF LANDS. See abuttals.

BONTY, in Commerce, a premium paid by government to the exporters of certain British commodities, as sail-cloth, gold and silver lace, silk stockings, fish, corn, &c. The happy influence which bounties have on trade and manufactures is well known: nor can there be a more convincing proof of the good intentions of the government under which we live, than the great care that is taken to give all possible encouragement to those who shall establish or improve any hazardous branch of trade.

All undertakings, in respect either to mercantile enter-##Campbell's Political Survey of Britain.##prises, or in the establishment of manufactures, are weak and feeble in their beginnings; and if unsuccessful, either sink entirely, or at least are seldom revived in the same age. Accidents of this nature are not only destructive to private persons, but exceedingly detrimental to the public interest. On this principle, more especially
Bounties. especially since trade, for which Providence designed us, hath been attended to, such attempts have been thought deserving, and have been favoured, with public support. This in former times usually flowed from the crown, in the form of letters-patent, charters, or other grants of privileges, which, however requisite they might be, were notwithstanding very frequently objects of censure. If such as obtained them failed in their endeavours, they were reputed projectors; if, on the other hand, they succeeded, they were considered as monopolizers. Corporations, which imply the uniting of certain individuals into a body, that they may thereby become more useful to the community, are created by the crown. Many of these were formed for promoting trade; and, according to the old system of our government, were necessary and useful. On the same principle, privileges were granted to private persons, on a suggestion, that what was immediately of use to them would terminate in public utility. These also did good in bringing many arts and manufactures; though, in some cases, tending to private interest more than public emolument, they were liable to legal correction. In later times, and in concerns of moment, a much better method has been adopted, as often as it hath been found practicable, by rejecting private or particular interest, and proposing the designed advantages to such as should perform the stipulations on which they are granted. These bounties, as they are paid by the public, so they are solely calculated for the benefit of the public. They are sometimes given to encourage industry and application in raising a necessary commodity; which was intended by the bounty on exporting corn. The intention of this bounty was to encourage agriculture; and the consequence hath been, that we now grow more than twice as much as we did at the establishment of the bounty; we even consume twice as much bread as we then grew; yet in A. D. 1697, we exported a fifteenth part of what we grew, of late years a twenty-ninth part only. The bounty on this twenty-ninth part amounted to somewhat more than 50,000l. and the produce to more than 400,000l. It is evident that all this is so much clear gain to the nation. But this is far from being all that we have annually gained. For if our cultivation is double, as indeed it is, then the rent of lands, the subsistence of working hands, the profits of the tradesmen supplying them with utensils, clothes, the value of horses employed, &c. must all be taken into the account. Besides this, we must add the freight (amounting to half the bounty), to make the idea of the advantages complete.

Sometimes bounties are given with a view to promote manufactures, as in the case of those made of silk. Many laws are to be found in our statute books in favour of the silk manufacture, made with great wisdom and propriety, for the encouragement and support of many thousands of industrious persons employed therein. By statute 8 Geo. L. cap. 15. § 1. a bounty was given on the due exportation of ribbons and stuffs, of silk only, of three shillings upon a pound weight; silk, and ribbons of silk, mixed with gold and silver, four shillings a-pound; on silk gloves, silk stockings, silk fringes, silk laces, and sewing silk, one shilling and threepence a-pound; on stuffs of silk and gromam yarn, eightpence a-pound; on silks mixed with inkle or cotton, one shilling; on stuffs of silk mixed with worsted, six-
Bou [341]

Bou, ly seems to do. For, looking a little closer, we cannot help observing, that the bounty is paid to individuals, who, as such make a part of the public. But the commodities or manufactures exported are sold to foreigners, and the whole produce of them, be it what it will, comes into the purse of the public. By attending to this self-evident doctrine, every reasonable and public-spirited man will be easily reconciled to bounties; and the three following considerations will be sufficient to obviate the most common objections that have been made to the practice of giving them. 1. That no bounty can be desired but on the plea of national utility, which always deserves notice, and cannot be mistaken. It must likewise be alleged and proved, that this is the only means whereby the national benefit can be attained. 2. The sums issued on this account not only show the clear expence of the bounty, but also indicate the profit gained by the public; for as the one cannot exist without the other, that amount must be the incontestable index of both. 3. It must be remembered (and of this too some instances might be given), that if bounties should be improperly bestowed, they will of course prove ineffectual, and after a few fruitless trials will remain unclaimed, and consequently produce no expense. There is indeed another objection which hath been made against the giving of bounties. This is grounded on the frauds to which they are supposed to be liable; and particularly the relarding of the goods on which the bounty hath been paid, and thereby deceiving and cheating the public. But whoever peruses the laws made on this head, and attentively considers the numerous precautions taken to fix every circumstance relative to the obtaining the bounty, the checks on the shipping of goods, the securities taken for their due exportation, the certificates required to ascertain their being actually delivered and sold in a foreign market, must be convinced, that to discharge all those securities, in case of an intended fraud, is a thing very difficult, if not impossible.

To these remarks we may add, that bounties are usually granted only for a limited time, and then expire; are always liable to be suspended; and of course cannot be the cause of any great national loss. There is no doubt that, exclusive of frauds, the immoderate thirst of gain may tempt interested men to aim at converting what was calculated for public benefit to its detriment, for their own private advantage. Thus, on a prospect of short crops in other countries, men may take measures within the letter, but directly against the spirit, of the law, to send so much of our corn abroad as to endanger a famine at home. For this the wisdom of parliament provides, not barely by suspending the bounty, but by prohibiting exportation and opening the ports for foreign supplies. We cannot with any shadow of justice ascribe scarcity to the bounty on the exportation. If this was the case, suspensions would be frequent, whereas there have been but five in a course of 70 years. If the bounty had any share, the larger the exportation, the greater would be the scarcity. In A.D. 1750 we exported more than one fifth of our growth of wheat, which was notwithstanding but at four shillings per bushel; whereas a century before, A.D. 1650, when we had neither bounty nor exportation, wheat was at nine shillings and sixpence per bushel. The causes of scarcity are unkindly season; which though human policy cannot prevent, yet their sad effects have been evidently lessened by our increased growth, since the taking place of bounty and exportation.

Queen Anne's Bounty, for augmenting poor living under 50l. per annum, consists of the produce of the first fruits and tenths, after the charges and pensions payable out of the same are defrayed. A corporation for management of the same was settled, &c. in 1704. See AUGMENTATION.

BOURBON, or MASCARENHAS, Isle of, an island in the Indian ocean, lying on the east of Madagascar, in E. Long. 58° 30'. S. Lat. 21° 23'. This island has no port, and is in some places inaccessible. Its length and breadth have not been well determined; but the circumference, according to the account of a person who resided there some time, is about 57 leagues. It is for the most part mountainous, but in some places there are very beautiful and fertile plains. In the south part of the island there is a burning mountain, which has thrown out vast quantities of bitumen, sulphur, and other combustible materials; neither does it cease throwing them out still, so that the country about it is useless, and is called by the inhabitants pays brûlé, that is, burnt land. The shore is high and rocky all round; but though on this account it hath no ports, there are several good roads, particularly one on the west, and another on the north-east. As to its form, this island is irregular, so that it is difficult to judge from the maps whether it is round or long. The air is equally pleasant and wholesome, insomuch that the people live to a great age without feeling either infirmities or diseases. This is occasioned by the hurricanes, of which they have one or two every year. These purge and cleanse the air so as to render it highly salubrious; the certainty of which is thus distinguished, that when they fail of making their annual visits, as sometimes they do, diseases and death find an entrance into the island, which otherwise would soon be overstocked with inhabitants. The climate is hot, but not to such a degree as might be expected from its situation, the breezes from the mountains being constant and very refreshing. The tops of these mountains are in winter covered with snow; which, melting in the summer, furnishes abundance of rivers and rivulets, with which the country is plentifully watered; so that the soil, though not very deep, is wonderfully fruitful, producing Turkey corn and rice twice a year, and the latter in great abundance. Most sorts of cattle are found here, good in their kind, and are very cheap; wild goats and wild hogs are found in the woods and on the tops of the mountains; here also are vast quantities of wild fowl of different kinds, fish, and land tortoises, affording at once the most delicate and wholesome food. As to fruits, they have bananas, oranges, citrons, tamarinds, and other kinds; neither does it want valuable commodities, particularly ebony, cotton, white pepper, gum benzoin, aloes, and tobacco; all excellent in their kind, when compared with those of other countries. This island is also happy in its deficiencies; for no animals that are venomous are to be found therein, and only two sorts that are disagreeable to the sight, viz. spiders of the size of a pigeon's egg, which weave nets of a surprising strength, reckoned by some capable of being treated so as to become as va-
BOU [342] BOU

Bourbon. isible as silk; and bats of a most enormous size, which are not only skinned and eaten, but esteemed also the greatest delicacy that they have.

The island of Bourbon was discovered by the Portuguese in 1545, as appears by a date inscribed by them upon a pillar when they first landed; but when the French settled in Madagascar, this island was totally desolate. Three Frenchmen being banished thither, and left there for three years, made such a report of it at their return as surprised their countrymen. They lived most of that time upon pork; and though they were in a manner naked, yet they affirmed that they never had the least pain or sickness whatever. This tempted one Anthony Taurou to go over thither in 1654, accompanied by seven French and six negroes, who carried with them the cattle from which the island has been stocked ever since. The first thing they did was to erect the arms of France, by order of M. Falcourt who was governor of Madagascar, and to bestow upon the island a new name. Then they set up huts, and laid out gardens, in which they cultivated melons, different sorts of roots, and tobacco; but just as the last became ripe, the whole plantation was destroyed by a hurricane. The French, however, went to work again; and by having some acquaintance with the climate, succeeded better, and added aloe to the rest of their plantations; but receiving no succour from Madagascar, and being tired of living by themselves in the isle of Bourbon, they very readily embraced the offer of an English captain, and in the year 1658 embarked for Madras. When the last great blow was given to the French at Madagascar by the natives, who surprised and cut them off in one night, there escaped as many men as, with their wives, who were natives, filled two canoes; and these being driven by the wind on the isle of Bourbon, were the next set of people who inhabited it. This last colony, for want of an opportunity to remove, were constrained to cultivate this now country of theirs, and to remain in it. It was not long before a further stock of inhabitants arrived. A pirate that had been committing depredations in the Indies, returning to Europe, ran ashore and was split to pieces on the rocks, so that the crew was forced to join themselves to the former inhabitants; and as they had on board their vessel a great many Indian women whom they had made prisoners, they lived with them, and in process of time had a numerous posterity. As East India ships touched frequently here, when too late to double the Cape, many of the sailors, for the sake of the women, deserted at the time of their departure, and staying behind became planters in the isle of Bourbon. As the place grew more populous, the people naturally became more civilized, and desirous of living in a more commodious manner; which induced them to build small vessels, that in these they might sometimes make a trip to Madagascar, in order to purchase slaves, whom they employed in their plantations to cultivate aloes, tobacco, and other things, with which they drove a small trade, when ships of any nation anchored in their roads for the sake of refreshments. In this situation they were, when the French East India Company put in their claim; and assuming the property of the island, sent thither five or six families and a governor. At first the inhabitants expected to reap some benefit from their new masters; but finding very little, and thinking the governor took too much upon him, they revolted at the instigation of a priest, seized their governor and put him into a dungeon, where he died of hunger and grief. For this some of the ring-leaders were punished, a kind of fort was erected, some guns placed on it, and the French flag kept flying; but in other respects, so little care was taken, that, till within these 40 years, the island was in no state of defence.

The number of inhabitants in the year 1717 was computed at 2000; viz. 500 free, and 1500 slaves. Amongst these people the usual distinction of whites and blacks entirely fails: for even the free are of different colours; and a French writer assures us, that he saw in a church one family, consisting of five generations, of all complexion. The eldest was a female, 108 years of age, of a brown black, like the Indians of Madagascar; her daughter, a mulatto; her grand-daughter, a mestizo; her great grand-daughter, of a dusky yellow; her daughter again, of an olive colour; and the daughter of this last, as fair as an English girl of the same age. These people are, general speaking, of a gentle quiet disposition, very industrious, and submissive enough to authority, provided it is exercised with a tolerable degree of equity and decency; for otherwise the whole of them are apt to rise in rebellion at once; and the slaves have so little reason to complain of their masters, that they are always on the same side. The island is divided into four quarters. The first is that of St Paul, which is the largest and best peopled: their houses are built at the foot of a steep mountain, on both sides of a fresh water lake. As for the plantations, they are on the top of a mountain, which they ascend by a very rough and troublesome passage. On the summit there is a spacious plain, a great part of which is divided into plantations of rice, tobacco, corn, sugar, and fruits. The quarter of St Dennis lies seven leagues from that of St Paul, towards the east, and there the governor resides. It is not so well peopled as the former; but the country is more pleasant, and the situation better. At two leagues distance, proceeding along the sea-coast, is the quarter of St Mary's, which is but thinly peopled. The last and most fertile quarter is that of St Susanah, which is at the distance of four leagues from St Dennis. The road between these two quarters is tolerable, though part of it has been out with much difficulty through a wood; but the passage from St Dennis to St Paul is only by sea.

When the present company of India became, by their perpetual establishment, possessed of the island of Bourbon, they began to improve it exceedingly; raising new forts and batteries, so as to render it in a manner inaccessible; and importing coffee-trees from Arabia; which have succeeded so well, that it is believed they produce an eighth, according to some a sixth, part as much coffee as is raised in the kingdom of Yemen in Arabia, and it is likewise held next in goodness to that.

In 1762, the population amounted to 4629 white people, and 15,149 blacks; the cattle consisted of 8702 besses, 4084 sheep, 7405 goats, and 761 horses. Upon an extent of 125,000 acres of cultivated land, they gathered as much Cassava as would feed their slaves, 1,135,000 pounds weight of corn, 844,100 pounds of
BOURBON

rice, 2,879,100 pounds of maize, and 2,535,100 pounds of coffee; which last the company bought up at about 20d. per pound. In 1811 the population was 16,400 Europeans, 3,496 free negroes, and 60,450 slaves.

In 1748, Admiral Boscawen appeared before this island with a British fleet; but found it too strong to be attacked. See BOURBON, SUPPLEMENT.

Bourbon, Nicholas, a famous Latin poet in the 17th century, was a native of Vaudreuil near Langres, and the son of a wealthy man who was master of several forges. Marguer de Valois appointed him preceptor to her daughter Jane d'Albret of Navarre, the mother of King Henry IV. At length he retired to Conde, where he had a benefice, and died about the year 1550. He wrote eight books of Epigrams; and a poem on the forge, which he has entitled Ferraria. He had great knowledge of antiquity, and of the Greek language. Erasmus praises his Epigrams.

Bourbon, Nicholas, a celebrated Greek and Latin poet, was nephew of the preceding. He taught rhetoric in several colleges of Paris; and the cardinal de Perron caused him to be nominated professor of eloquence in the Royal College: he was also canon of Langres, and one of the 40 of the French academy. At length he retired to the fathers of the oratory, where he died in 1644, aged 70. He is esteemed one of the greatest Latin poets France has produced. His poems were printed at Paris in 1630.

Bourbon-Lancy, a town of France, in the department of Saone and Loire. It is remarkable for its castle and baths; and there is a large marble pavement, called the great bath, which is a work of the Romans. It is seated near the river Loire, in E. Long. 3° 40', N. Lat. 46° 37'.

Bourbon-Larchamond, a town of France, in the department of Allier, remarkable for its baths, which are exceedingly hot. E. Long. 3° 28'. N. Lat. 46° 35'.

Family of Bourbon, the present royal family of France. Henry IV. in 1589, though of the 10th generation, was the nearest heir, and succeeded Henry III. (the last of the Valois race), whose brother Francis II. married Mary queen of Scots, and both died without issue. Louis XVI. was the fifth king of this family in succession: This family also mounted the throne of Spain in 1700, by Philip V. grandson to Louis XIV. which was the occasion of the long and bloody war that ended in the peace of Utrecht. A branch of the Spanish family likewise mounted the throne of the two Sicilies in 1734.

These three branches entered into a treaty offensive and defensive in 1761, which goes by the name of the family-compact.

Bourbonne-le-Bains, a town of France, in Champagne, and in the Hauteville, famous for its hot baths. E. Long. 5° 45'. N. Lat. 47° 54'.

Bourbonnais, a province of France; with the title of a duchy; bounded on the north, by Nivernais and Berry; on the west, by Berry and a small part of Upper Marché; on the south, by Auvergne; and on the east, by Burgundy and Forez. It abounds in corn, fruits, pastures, wood, game, and wine. Its principal town is Moulins; and the rivers are the Loire, the Allier, and the Chur.

Bourbourg, a town in French Flanders; whose fortifications are demolished. It is seated on a canal that goes to Dunkirk, in E. Long. 2° 15'. N. Lat. 50'. Bourbourg 55.

BOURCHIER, John, Lord Bertram, grandson and heir of a lord of the same name, who was descended from Thomas of Woodstock, duke of Gloucester, and had been knight of the Garter and constable of Windsor castle. Under Edward IV., our Lord John was created a knight of the Bath, at the marriage of the duke of York second son of Edward IV. and was first town by quelling an insurrection in Cornwall and Devonshire, raised by Michael Joseph a blacksmith, in 1495, which recommended him to the favour of Henry VII. He was a captain of the pioneers at the siege of Theuonne, under Henry VIII. by whom he was made chancellor of the exchequer for life, lieutenant of Calais and the Marches, appointed to conduct the lady Mary, the king's sister, into France on the marriage with Louis XII. and had the extraordinary happiness of continuing in favour with Henry VIII. for the space of 18 years. He died at Calais in 1532, aged 63. He was translated, by King Henry's command, Froissart's Chronicle; which was printed in 1532, by Richard Pynson, the scholar of Caxton, and the fifth on the list of English printers. His other works were a whimsical medley of translations from French, Spanish, and Italian novels, which seem to have been the mode then, as they were afterwards in the reign of Charles II. These were, The life of Sir Arthur, an Armoricam knight; The famous exploits of Sir Hugh Bourdeaux; Marcus Aurelius, and, The Castle of Love. He composed also a book of the duties of the inhabitants of Calais; and a comedy entitled Ise in Finesoom, which is mentioned in none of our catalogues of English plays. Anthony Wood says it was usually acted at Calais after vespers.

BOURDALOUE, Lewis, a celebrated preacher among the Jesuits, and one of the greatest orators France has produced, was born at Bourges on the 20th of August 1632. After having preached in Provence, he in 1669 went to Paris; and there met with such applause, that the king resolved to hear him; on which he was sent for to court, and frequently preached before Louis XIV. He assisted the sick, visited the prisoners and hospitals, and was very liberal in giving alms. He died at Paris on the 13th of May 1704. The best edition of his sermons is in octavo.

BOURDEAUX, an ancient, large, handsome, and rich town in France, in the department of Gironde, is the capital of Guienne, and an archbishop's see; has an university and an academy of arts and sciences. It is built in the form of a bow, of which the river Garonne is the string. This river is bordered by a large quay, and the water rises four yards at full tide, for which reason the largest vessels can come up to it very readily. The castle called the Trumpet is seated at the entrance of the quay, and the river runs round its walls. Most of the great streets lead to the quay. The town has 12 gates; and near another castle are four walks under several rows of trees. The ancient city of Bordeaux, though considerable in point of size, was ill built, badly paved; dangerous, without police or any of those municipal regulations indispensably requisite to render a city splendid or elegant. It has entirely changed its appearance within these last thirty years: The public edifices are very noble, and all the streets newly built are regular and handsome. The quays are four
BOU

The beauty of the river Garonne, and the fertility of the adjoining country, were probably the causes which induced the Romans to lay the foundations of this city. The ruins of a very large amphitheatre yet remain, constructed under the emperor Gallienus; it is of brick, as are most of the edifices of that period, when the empire was verging to its fall, and the arts began rapidly to decline. During the irruptions of the barbarous nations, and particularly in those which the Normans repeatedly made, Bordeaux was ravaged, burnt, and almost entirely destroyed. It only began to recover again under Henry II. of England, who having united it to the crown by his marriage with Eleanor of Aquitaine, rebuilt it, and made it a principal object of his policy to restore the city again to the lustre from which it had fallen. The Black Prince received all Guienne, Gascony, and many inferior provinces, in full sovereignty from his father Edward III. He brought his royal captive, John king of France, to this city, after the battle of Poictiers in 1356; and held his court and residence here during eleven years. His exalted character, his uninterrupted series of good fortune, his victories, his modesty, his affability, and his munificence, drew strangers to Bordeaux from every part of Europe; but all this splendour soon disappeared. He lived to experience the ingratitude of Peter the Cruel, to whom he had restored the kingdom of Castile; he became a prey to distempers in the vigour of life; he saw his dominions reunited again in many of their branches to the crown of France, by Charles V.; he lost his eldest son Edward, a prince of the highest expectations; and at length, overcome with sorrow at this last affliction, he quitted Bordeaux, and re-embarked for England, there to expire a memorable example of the hostile revolution of human greatness. In 1453, Charles VII. king of France, re-entered the city, and subjected the whole province of Guienne, which had been near three centuries under the English government. Conscious of the importance of such a conquest, he ordered the Chateau Trompette to be built to defend the passage of the river; and Louis XIV. afterwards employed the celebrated Vauban to erect a new fortress in the modern style of military architecture, on the same spot.—Madame de Maintenon, whom fortune seemed to have chosen as the object of her extremest rigour and extremest bounty, was removed from the prisons of Niort in Poictou, where she was born, with her father the Baron d'Aubigne, to this castle, where she used to play with the daughter of the turnkey, in the greatest indignence. Bordeaux presents few remains of antiquity. The cathedral appears to be very old, and has suffered considerably from the effects of time. The unfortunate duke of Guienne, brother to Louis XI., who was poisoned in 1473, lies buried before the high altar. The adjacent country is exceedingly pleasant, and at the season of the vintage forms one of the most delicious landscapes in the world. The population in 1815 was 92,374. W. Long. o. 39. N. Lat. 44. 50.

BOURDELLOT, John, a learned French critic, who lived at the close of the 16th and beginning of the 17th centuries. He distinguished himself by writing notes on Lucian, Petronius, and Heliodorus; by an Universal History; Commentaries on Juvenal; a Treatise on the Etymology of French words; and by some other works which were never published.—There was also an abbé Bourdelot, his sister's son, who changed his name from Peter Michon to oblige his uncle. He was a celebrated physician at Paris, who gained great reputation by a Treatise on the Viper, and other works. He died in 1685.

BOURDINÉS, a town of the Netherlands, in the province of Namur. E. Long. o. 39. N. Lat. 50. 35.

BOURDON, Sébastien, a famous painter, born at Montpellier, in 1619. He studied seven years at Rome; and acquired such a reputation, that at his return to France he had the honour of being the first who was made rector of the academy of painting at Paris. He succeeded better in his landscapes than in his history painting. His pieces are seldom finished; and those that are so, are not always the finest. He once laid a wager with a friend, that he should paint twelve heads after the life, and as big as the life, in one day. He won it: and these are said not to be the worst things he ever did. His most considerable pieces are, The gallery of M. de Bretonvilliers, in the aisle of Notre Dame; and, The seven works of mercy, which he etched by himself. But the most esteemed of all his performances is, The martyrdom of St Peter, drawn for the church of Notre Dame: It is kept as one of the choicest rarities of that cathedral. Bourdon was a Calvinist; much valued and respected, however, in a Popish country, because his life and manners were good. We have also by this master a great number of etchings; which are executed in a bold masterly style, and much more finished than those we generally meet with from the point of the painter. They are justly held in the highest estimation by the generality of the collectors. He died in 1673, aged 74.

BOURDONNÉ, in Heraldry, the same with POITIERS.

BOURG, the capital of the island of Cayenne, a French colony on the coast of Guiana, in South America, in W. Long. 32. o. N. Lat. 5. o.

BOURBON-EN-BRESSE, a town in France, and capital of Bresse, in the province of Burgundy. It is seated on the river Ronsesse, almost in the centre of Bresse, in E. Long. 4. 49. N. Lat. 46. 13.

BOURG-SUR-MER, a sea-port town of France in Guienne, and in the Bourbonnais, with a tolerable good harbour: seated at the confluence of the rivers Dordogne and Garonne, in W. Long. 3. 35. N. Lat. 45. o.

BOURGES, an ancient town of France, in the department of Cher, and formerly an archbishop's see, with a famous university. The archbishop assumes the title
BOU

BOUGET, Dom John, an ingenious French antiquary, was born at the village of Beaumains near Falaise, in the diocese of Sez, in 1724. He was educated at the grammar-school at Caen, whence he was admitted at that university, and pursued his studies with great diligence and success till 1745, when he became a Benedictine monk of the abbey of St Martin de Sez. Some time after this, he was appointed priorclausal of the said abbey, and continued six years in that office, when he was nominated prior of Tiron en Perche: whence being translated to the abbey of St Stephen at Caen, in the capacity of sub-prior, he managed the temporalities of that religious house during two years, as he did their spiritualities for one year longer; after which, according to the custom of the house, he resigned his office. His superiors, sensible of his merit and learning, removed him thence to the abbey of Bec, where he resided till 1764. He was elected an honorary member of the Society of Antiquaries of London, Jan. 10. 1765; in which year he returned to the abbey of St Stephen at Caen, where he continued to the time of his death. These honourable offices, to which he was promoted on account of his great abilities, enabled him not only to pursue his favourite study of the history and antiquities of some of the principal Benedictine abbeys in Normandy, but likewise gave him access to all their charters, deeds, register-books, &c. &c. These he examined with great care, and left behind him in MS. large and accurate accounts of the abbeys of St Peter de Junieges, St Stephen, and the Holy Trinity at Caen (founded by William the Conqueror and his queen Matilda), and a very particular history of the abbey of Bec. These were all written in French. The "History of the Royal Abbey of Bec" (which he presented to Dr Ducarel in 1764) is only an abridgment of his larger work. This ancient abbey (which hath produced so

VERAL archbishops of Canterbury and other illustrious prelates of this kingdom) is frequently mentioned by our old historians. The death of our worthy Benedictine (which happened on new-year's day 1775) was occasioned by his unfortunate neglect of a hurt he got in his leg by falling down two or three steps in going from the hall to the cloister of the abbey of St Stephen at Caen, being deceived by the ambiguous light of a glimmering lamp that was placed in the passage. He lived universally esteemed, and died sincerely regretted by all those who were acquainted with him; and was buried in the church of the said abbey, Jan. 3. 1776.

BOURG., a town of Savoy, subject to the king of Sardinia, seated at the southern extremity of a lake of the same name. E. Long. 5. 55. N. Lat. 44. 45.

BOURGIGNON, or BURGUNDIANS, one of the northern nations who overran the Roman empire, and settled in Gaul. They were of a great stature, and very warlike; for which reason the emperor Valentinian the Great engaged them in his service against the Germans. They lived in tents which were close to each other, that they might the more readily unite in arms on any unforeseen attack. These conjunctions of tents they called Burgi; and they were to them what towns are to us. Sidonius Apollinaris tells us that they wore long hair, took great pleasure in singing, and were fond of praise for their vocal talents. He adds, that they ate great quantities; and anointed their hair with butter, deeming that unctiun very ornamental. Their crown was at first elective, and the authority of their kings expired with their success. They were not only accountable for their own misconduct, but likewise for the calamities of nature, and the caprices of fortune. They were
were deposed if they had lost a battle; if they succeeded ill in any enterprise; or if, in short, any great event had not corresponded with the hopes of the public. They were not more favourably treated in case of a bad harvest or vintage, or if any epidemical distemper had ravaged the state. At first they were governed by many kings, and *henden* was the title of the royal dignity. But in latter times they were subject to one sovereign; and they grew humane and civilized, especially when Christianity was propagated in their country. Before that epocha their religion was much the same with that of the other northern nations. They had many priests, the chief of whom was distinguished by the name of *sinistrus*. He was perpetual, and they paid him great respect and veneration.

BOURIGNON, ANTONIETTA, a famous enthusiastic preacher and pretended prophetess, was born at Lisle in 1616. At her birth she was so deformed, that it was debated some days in the family whether it was not proper to stifle her as a monster; but her deformity diminishing, she was spared; and afterwards attained such a degree of beauty, that she had her admirers. From her childhood to her old age she had an extraordinary turn of mind. She set up for a reformer, and published a great number of books filled with very singular notions; the most remarkable of which are entitled *The Light of the World*, and *The Testimony of Truth*. She was an enemy to reason and common sense, which she maintained ought to give place to the illumination of divine faith; and asserted, that whenever any one was born again by embracing her doctrine, she felt the pain and throws of a woman in labour. Of her pretended visions and revelations we shall give one instance as a sample. In one of her ecstacies she saw Adam in the same form in which he appeared before his fall, and the manner in which he was capable of procreating other men, since he himself possessed in himself the principles of both sexes. Nay she pretended it was told her that he had carried this procreating faculty so far as to produce the human nature of Jesus Christ. "The first man (says she,) whom Adam brought forth without any concurrent assistance in his glorified state, was chosen by God to be the throne of the Divinity; the organ and instrument by which God would communicate himself externally to men: This is Christ the first born united to human nature, both God and man." Besides these and such like extravagances, she had other forbidding qualities: her temper was morose and peevish, and she was extremely avaricious and greedy of amassing riches. She dressed like a hermit, and travelled to France, Holland, England, and Scotland. In the last she made a strong party, and some thousand sectarists, known by the name of *Bourigonists*. She died at Franeker in the province of Fries, October 30. 1690. Her works have been printed in 18 vols. 8vo.

BOURN, a town of Lincolnshire, in England, seated in E. Long. 1. 17. N. Lat. 52. 40. It is a pretty large place, has a good market for corn and provisions, and is noted for the coronation of King Edmund.

BOURNE, or BURN, an appellation anciently given to all little brooks or rivulets, and still used in the same sense in Scotland and in the north of England.

BOURO, an island in the East Indian ocean, between the Moluccas and Celebes. It is well cultivated; and is now subject to the Dutch, who have built a fortress here. Some mountains in it are exceeding high, and the sea on one side is uncommonly deep. It produces nutmegs and cloves, as well as cocoa and banana trees; besides many vegetables introduced by the Dutch. It is about 30 miles in circumference. E. Long. 120. S. Lat. 4. 30.

BOUTANT, or ARCHI-BOUTANT, in *Architecture*, an arch, or part of an arch, abutting against the reins of a vault to prevent its giving way.

A Pillar BOUTANT, is a large chain or pile of stone, made to support a wall, terrace, or vault.

BOUTE, in the mange, A horse is called boute, when his legs are in a straight line from the kneé to the coronet: short-jointed horses are apt to be boute, and on the other hand long-jointed horses are not.

BOUTS-RIMES, a popular term in the French poetry; signifying certain rhymes, disposed in order, and given to a poet together with a subject, to be filled up with verses ending in the same words, and the same order. The invention of the bouts-rimes is owing to one Du Lot, a poet, in the year 1649. In fixing the bouts, it is usual to choose such as seem the remotest, and have the least connexion.

Some good authors fancy that these rhymes are of all others the easiest, that they assist the invention, and furnish the most new thoughts of all others. Sarrasin has a poem on the defeat of the bouts-rimes. The academy of Lanternists at Toulouse have contributed towards keeping in countenance the bouts-rimes, by possessing each year a set of fourteen, to be filled up on the glories of the grand monarque; the victorious sonnet to be rewarded with a fine medal. An instance hereof may be given in the following one, filled up by P. Commire.

*Tout est grand dans le roi, l'aspect seul de son buste
Rend nos fiers ennemis plus froids que des glacons.
Et Guillaume s'attend que le tems des moissons,
Pour se voir accoster sous un bras si robuste.*

Qu'on ne nous vante plus les merveilles d'
Auguste ;
Louis de bien regner lui ferait des leçons :*

Honneur en vain l'egale aux dieux dans ses chaussons :
Moins que mon heros il eut sage et juste, &c.

BOUTON, an island in the East Indian ocean, about 12 miles distant from the south-east part of the island of Macassar, or Celebes. The inhabitants are small but well shaped, and of a dark olive complexion. The principal town is Callausung, which is about a mile from the sea, on the top of a small hill, and round it a stone wall. The houses are not built upon the ground, but on posts. The religion of the inhabitants is Mahometanism. E. Long. 122. 30. S. Lat. 4. 30.

BOUVILLON, a city of Luxembourg in the kingdom of the Netherlands, situated in E. Long. 5. O. N. Lat. 49. 55.

BOW, (arcus), a weapon of offence made of wood, born, or other elastic matter, which, after being strongly bent, by means of a string fastened to its two ends, in returning to its natural state throws out an arrow with great force. It is also called the long-bow, by way of distinction from the cross-bow or arbalist.

The bow is the most ancient, and the most universal

...of...
Bow

of all weapons. It has been found to obtain among the most barbarous and remote people, and who had the least communication with the rest of mankind.

The use of the bow and arrow was first abolished in France under Louis XI. in 1481, and in their place were introduced the Swiss arms, that is, the halberd, pike, and broad-sword. The long-bow was formerly in great vogue in England; most of our victories in France were acquired by it; and many laws were made to regulate and encourage its use. The parliament under Henry VIII. complain "of the disuse of the long-bow, heretofore the safeguard and defence of this kingdom, and the dread and terror of its enemies." 33 Hen. VIII. cap. 6.

The art of using bows is called archery, and those practised therein, archers or bowmen. See Archery.

The strength of a bow may be calculated on this principle, that its spring, i. e. the power whereby it restores itself to its natural position, is always proportionate to the distance or space it is removed therefrom.

The most barbarous nations often excel in the fabric of the particular things which they have the greatest necessity for in the common offices of life. The Laplanders, who support themselves almost entirely by hunting, have an art of making bows, which we, in these improved parts of the world, have never arrived at. Their bow is made of two pieces of tough and strong wood, shaved down to the same size, and flattened on each side; the two flat sides of the pieces are brought closely and evenly together, and then joined by means of a glue made of the skins of perch, which they have in great plenty, and of which they make a glue superior in strength to any which we have. The two pieces, when once united in this manner, will never separate, and the bow is of much more force to expel the arrow, than it could possibly have been under the same dimensions if made only of one piece.

Among the ancients, the bow-string, called ὀξύπλωτος, was made of horses hair, and hence also called ὕποπλωτος; though Homer's bow-strings are frequently made of hides cut into small thongs: whence ὀξυ. The uppermost part of the bow, to which the string was fastened, was called ἀκροβλήτος, being commonly made of gold, and the last thing towards finishing the bow. The Cretian bows were frequently beautified with gold or silver; whence we have mention of aurei arcus; and Apollo is called Ἀρεώπτερος. But the matter of which they were ordinarily composed, seems to have been wood: though they were anciently, Scythian-like, made of horn, as appears from that of Pandaros in Homer, Iliad. II. v. 105.

The invention of the bow is usually ascribed to Apollo, and was communicated to the primitive inhabitants of Crete, who are said to have been the first of mortals who understood the use of bows and arrows. And hence, even in later ages, the Cretan bows were famous, and preferred by the Greeks to all others. Some, however, rather choose to honour Perseus, the son of Peleus, with the invention of the bow; while others ascribe it to Scythus, son of Jupiter, and progenitor to the Scythis, who were excellent at this art, and by many reputed the first masters of it. From them it was derived to the Grecians, some of whose ancient nobility were instructed by the Scythis in the use of the bow, which in those days passed for a most princely education. It was first introduced into the Roman army in the second Punic war.

The Indians still retain the bow. In the repository of the Royal Society we see a West Indian bow two yards long.

The Scythian bow was famous for its incurvation, which distinguished it from the bows of Greece and other nations; being so great as to form a half moon or semicircle: whence the shepherd in Athens, being to describe the letters in Theseus's name, and expressing each of them by some opposite resemblance, compares the third to the Scythian bow; meaning not the more modern character ξ, but the ancient ξ, which is semicircular, and bears the third place in ΘΕΓΕΥΣ.

Coss-Bow, is also called arbalet or arbaile; which word is derived from arbalista, i.e. arcubalista, "a bow with a sling." The arbalet consists of a steel bow set in a shaft of wood, furnished with a string and a trigger; and is bent with a piece of iron fitted for that purpose. It serves to throw bullets, large arrows, darts, &c. The ancients had large machines for throwing many arrows at once, called arbalets or baliste.

Bow, is also an instrument used at sea, for taking the sun's altitude; consisting of a large arch of 90° graduated, a shank or staff, a side vane, a sight vane, and a horizon vane. It is now out of use.

Bow, among builders, a beam of wood or brass, with three long screws that direct a lathe of wood or steel to any arch; chiefly used in drawing draughts of ships and projections of the sphere, or wherever it is requisite to draw large arches.

Bow, in Music, a small machine, which being drawn over the strings of a musical instrument, makes it resound. It is composed of a small stick, to which are fastened 80 or 100 horse hairs, and a screw which serves to give these hairs a proper tension. In order that the bow may touch the strings briskly, it is usual to rub the hairs with rosin. The ancients do not appear to have been acquainted with bow of hairs; in lieu hereof they touched their instruments with a plectrum; over which our bows have great advantage, for giving long and short sounds, and other modifications which a plectrum cannot produce.

Bow, among artificers, an instrument so called from its figure; in use among gunsmiths, locksmiths, watchmakers, &c. for making a drill go. Among turners it is the name of that pole fixed to the ceiling, to which they fasten the cord that whirs round the piece to be turned.

Bow, a town of Devonshire in England, 188 miles west from London, and a little to the west of Credinton, has a weekly market, and two fairs in the year. The court of the duchy of Lancaster is commonly kept here.

Bow's of a Saddle, are two pieces of wood laid arch-wise to receive the upper part of a horse's back, to give the saddle its due form, and to keep it tight.

The fore-bow which sustains the pommel, is composed of the withers, the breasts, the points or toes, and the corking.

The hind-bow bears the torsesquin or quilted roll. The bows are covered with sinews, that is, with bulls pizzles beaten, and so run all over the bows to make them stronger. Then they are strengthened with bands ξ x 2 of
of iron to keep them tight; and on the lower side are
nailed on the saddle-strap, with which they make fast
the girths.

Bow (Epaule), in Ship-Building, the rounding part
of a ship's side forward, beginning at the place where
the planks arch inwards; and terminated where they
close, at the stem or prow. It is proved by a variety of
experiments, that a ship with a narrow bow is much
better calculated for sailing swiftly, than one with a
broad bow; but is not so well fitted for a high sea, into
which she always pitches or plunges her fore part very
depth, for want of sufficient breadth to repel the volume
of water which she so easily divides in her fall. The
former of these is called by seamen a lean, and the
other a bluff bow. "The bow which meets with the
least resistance in a direct course, not only meets with
the least resistance in oblique courses, but also has the
additional property of driving the least to leeward,
which is a double advantage gained by forming the
bow so as to give it that figure which will be least re-
sisted in moving through any medium."

On the Bow, in Navigation, an arch of the horizon
comprehended between some distant object and that
point of the compass which is right a-head, or to which
the ship's stem is directed. The phrase is equally ap-
licable when the object is beheld from the ship, or dis-
covered by trigonometrical calculation: As, We saw
a fleet at day-break bearing three points on the starboard
bow: that is, three points from that part of the horizon
which is right a-head, towards the right hand. See the
article Bearing.

Bow-dye, a kind of scarlet red, superior to madder;
but inferior to the true scarlet grain for fixedness and
duration. It was brought into England, and first prac-
tised at the village of Bow, near London, by Kephver,
a Dutchman, in the year 1643.

Bow-grace, in the sea-language, a frame or compo-
sition of old ropes or junk of cables, used to be laid
out at the bows, stems, and sides of ships, to preserve
them from great flakes of ice, chiefly when they sail in
high north or south latitudes.

Bow-net, or Bow-wheel, an engine for catching fish,
chiefly lobsters and craw-fish, made of two round wick-
er baskets, pointed at the end, one of which is thrust
into the other; at the mouth is a little rim, four or five
inches broad, somewhat bent inwards. It is also used
for catching sparrow.

Bow-legged or Bandy-legged. Some children are
bow-legged from their birth: others become so from
setting them on their feet too early. The tibia of some
is crooked; the knees of others are distorted; from a
fault in the ankle, the feet of some are turned inwards.
These are called varii; and in others, who are called
valgæ, they are turned outwards. The best method of
preventing these disorders in weakly children is to ex-
ercise them daily, but not violently, by dancing or toss-
ing them about in one's arms; and not setting them
much upon their feet, at least not without properly
supporting them: if the disorder attends at the birth,
or increases after it is begun, apply emollients, then
apply boots of strong leather, wood, &c. so as gradu-
ally to dispose the crooked legs to a proper form; or
other instruments may be used instead of boots, which,
when not too costly, are usually to be preferred.

Slighter instances of these disorders yield to carefull
nursing, without instruments.

Bow-line, or Bowling, a rope fastened near the
middle of the leech, or perpendicular edge of the square
sails, by three or four subordinate parts called bridles.
It is only used when the wind is so unfavourable that
the sails must be all braced sideways, or close hauled to
the wind: in this situation the bow-lines are employed
to keep the weather or windward edges of the principal
sails tight, forward, and steady, without which, they
would always be shivering, and rendered incapable of
service. To check the bow-line is to slacken it, when
the wind becomes large.

Bow-Pieces, are the pieces of ordnance at the bow of
a ship.

Rain-Bow. See Rain-Bow.

Bow-Bearer, an inferior officer of the forest, who
is sworn to make inquisition of all trespasses against
vert or venison, and to attach offenders.

BOWELS, in Anatomy, the same with intestines.
See Anatomy Index.

BOWER, in Gardening, a place under covert of
trees, differing only from an arbour, as being round or
square, and made with a kind of dome or ceiling at
top; whereas the arbour is always built long and
arched.

BOW, in the sea-language, the name of an anchor
carried at the bow of a ship. There are generally two
bowers, called first and second, great and little, or best
and small bower. See Anchor.

BOWESS, or BOWet, in Falconry, a young hawk,
when she draws anything out of her nest, and covets
to clamber on the boughs.

BOWL, denotes either a ball of wood, for the use of
bowling: or a vessel of capacity, wherein to hold li-
quors.

BOWLER STONES, small stones of a roundish fi-
gure, and no determinate size, found on the sea-shore,
and on banks or rather channels of rivers.

BOWLING, the art of playing at bowls.—This
game is practised either in open places, as bares and
bowling-greens, or in close-bowling-alleys.

The skill of bowling depends much on a knowledge
of the ground, and the right choice of a bowl suitable
to it: for close alleys, the flat bowl; for green swards,
plain and level, the bowl as round as a ball is prefer-
ed.

The terms used in bowling are, to bowl wide, which
is when the bias does not hold, or is not strong enough; narrow, when it is too strong, or holds too much;
fine bawled, is when the ground is well chosen, and
the bowl passes near the block, even though it goes
much beyond it; bowling through, or a yard over, is
done in order to move the block; an over-bowl, that
goes beyond it; a bowl laid at hand, is that put
down within the gamer's reach, to be in the way of
the next bowler, and hinder his having the advantage
of the best ground; bowling at length, neither bowling
through nor short; a dead length, a just or exact one;
throwing or flinging, is Discharging a bowl with a
strength purposely too great for a length, in order
to carry off either the block or some near bowl; bowl-
room, or missing-wood, is when a bowl has free passage
without striking on any other; get off, is when a bowl
being...
being narrow, is wanted to be wider; bowl best at block, that nearest the block: drawing a cast or bowl, is to win it by bowling nearer, without stirring either the bowl or block; a bowl is said to rub, when it meets with some obstacle in the ground, which retards its motion, and weakens its force; it is gone, when far beyond the block. Block signifies a little bowl laid for a mark, also called a jack. Mark, is a proper bowling distance, not under so many yards; and being at least a yard and a half from the edge of the green. Ground, a bag or handkerchief laid down to mark where a bowl is to go. Lead, the advantage of throwing the block, and bowling first. Cast, is one best bowl at an end. End, a bit, or when all the bowls are out. The game; or up, is five casts or best bowls.

BOWLING-Green, in Gardening, a kind of parterre in a grove, laid with fine turf, requiring to be frequently mowed, laid out in compartments of divers figures, with dwarf-trees and other decorations. Bowling-greens are of English origin, but have been adopted by the French and Italians, who have them only for ornament; being unacquainted with or not fancying the exercise, on account of which they were first made in England.

BOWLING-Bridles, are the ropes by which the bowline is fastened to the leech of the sail.

BOSE, in the sea-language, signifies as much as to take or pull. Thus bowling upon a tack, is hauling upon a tack. Bowse away, that is, Pull away all together.

BOWSPRIT, or BOLTSPIRIT, a kind of mast, resting slopewise on the head of the main stern, and having its lower end fastened to the partners of the fore-mast, and farther supported by the fore stay. It carries the sprit-sail, sprit-top-sail, and jack-staff; and its length is usually the same with that of the fore-mast.

BOWYER, WILLIAM, the most learned printer of his age, was born at White Friars in London, December 17, 1699. His father, whose name also was William, had been eminent in the same profession; and his maternal grandfather (Isabod Dawes) was employed in printing the celebrated Polyglott bible of Bishop Walton. At a proper age, he was placed for grammatical education under the care of Mr Ambrose Bonwicke, a nonjuring clergyman of known piety and learning, who then lived at Hradly, near Leatherhead in Surry. Here Mr Bowyer made great advances in literature, and a firm attachment commenced between him and his master. On the 30th of January 1713, the whole property of the elder Mr Bowyer was destroyed by fire; on which occasion Mr Bonwicke generously undertook the education of his pupil for one year. In 1716, young Mr Bowyer was admitted a sizar at St John's college, Cambridge, where Dr Robert Jenkin was at that time master. He continued at the college of Cambridge under the tuition of the reverend Dr John Newcome till June 1722, during which period he probably took his degree of bachelor of arts; and it appears that he was desirous of obtaining a fellowship, though it is not certain that he ever stood a candidate for that honour. Soon after this he had an opportunity of repaying the kindness which Mr Bonwicke had shown him, by officiating some time after his death in the capacity of a schoolmaster for the benefit of his family.

Mr Bowyer now entered into the printing-business along with his father. One of the first books which received the benefit of his correction was the complete edition of Selden, in three volumes folio, by Dr David Wilkins. This edition was begun in 1722, and finished in 1726; and Mr Bowyer's great attention to it appeared in his drawing up an epitome of Selden de Syndeitis, as he read the proof sheets. In 1727, he drew up an excellent sketch of William Baxter's Glossary of the Roman Antiquities. The following is a view of a book entitled Religionis Christianae. In a letter to a friend. A single sheet 5vo. By this first public proof of Mr Bowyer's abilities, Dr Wotton and Mr Clarke were highly pleased; but as it was never published, and a very few copies printed, it is seldom found with the glossary. In 1727 Mr Bowyer lost his mother; on which occasion he received a letter of consolation from Mr Chishull the learned editor of the Antiquitates Asiaticae. In October 1728 he married Miss Ann Prudom, his mother's niece, a very accomplished lady, by whom he had two sons, William and Thomas: the former of whom died an infant, and the latter survived his father. In 1729 Mr Bowyer published a curious treatise, entitled, "A Pattern for young Students in the University; set forth in the Life of Ambrose Bonwicke, some time scholar of St John's College, Cambridge:" but though this treatise was generally ascribed to Mr Bowyer, it was in reality the production of Mr Ambrose Bonwicke the elder. About this time it appears, that Mr Bowyer had written a pamphlet against the Separatists, though neither the title nor the occasion of it are now remembered. The same year, through the friendship of the Right Hon. Arthur Onslow, he was appointed printer of the votes of the house of commons; which office he held, under three successive speakers, for near fifty years. In 1731 Mr Bowyer published, and, it is believed, translated, Voltaire's Life of Charles XII. This year also his wife died; on which occasion his friends Mr Clarke and Mr Chishull wrote him very affectionate and Christian letters. He remained a widower till 1747, when he married a very benevolent and worthy woman, Mrs Elizabeth Bill, by whom he had no children. In 1733 he published a piece in two sheets 4to, entitled, "The Beau and the Academic:" being a translation from a Latin poem recited that year at the Sheldonian theatre; and in 1736 he was admitted into the Society of Antiquarians, where he became an active and useful member. In 1737 Mr Bowyer lost his father; and on this occasion Mr Clarke again addressed to him a letter of consolation. In 1742 our author published a translation of Trapp's Latin Lectures on Poetry, in which he was assisted by Mr Clarke, though the latter had a contemptible opinion of the performance.

In 1749, Mr Bowyer, along with Dr Burton, was virulently attacked by Dr King in a piece entitled Elogium famae inserviens Jacc Jetonis sive Gigantis: or The praises of Jack Eaton, commonly called Jack the Giant. This abuse was probably occasioned by Mr Bowyer's having hinted in conversation some doubts concerning the Doctor's skill in Latin. Our author drew up some strictures in his own defence, which he intended to insert at the conclusion of a preface to Montesquieu's Reflections; but by Mr Clarke's advice they
they were omitted. In 1750, a preface to a new edition of Lactantius' *De verborum mediorum*; a new edition of which, with further improvements, appeared in 1773. He wrote likewise about the same time a Latin preface to *Lactantius' De verborum mediorum*; and an English translation of Cesar's *Commentaries*, that work received considerable improvements from Mr Bowyer's hands, with the addition of such notes in it as are signed *Trog.* In the subsequent editions of this work, though printed by another person during our author's lifetime, the same signature, though contrary to decorum, and even to justice, was still retained. In 1751, he wrote a long preface to Montesquieu's "Reflections on the Rise and Fall of the Roman Empire"; translated the dialogue between Sylla and Socrates; made several corrections to the work from the Baron's "Spirit of Laws"; and improved it with his own notes. A new edition, with many new notes, was printed in 1759. In 1751 he also published the first translation that ever was made of Rousseau's *Le MAL,* which gained the prize at the academy of Dijon in 1750; and which first announced that singular genius to the attention and admiration of Europe. On the publication of the third edition of Lord Orrery's "Remarks on the Life and Writings of Dr. Swift," in 1753, Mr Bowyer wrote and printed, but never published, "Two Letters from Dr. Bentley in the Shades below, to Lord Orrery in a Land of thick darkness." The notes signed B, in the ninth quarter volume of Swift's works, are extracted from these Letters. In 1753, he endeavoured to lay the ferment occasioned by the Jew bill; with which view he published, in quarto, "Remarks on the speech made in common-council, on the bill for permitting persons professing the Jewish religion to be naturalized, so far as prophecies are supposed to be affected by it." This little tract was written with spirit, and well received by those who were superior to narrow prejudices. Its design was to show that whatever political reasons might be alleged against the bill, Christianity was in no danger of being prejudiced by the intended protection promised to the Jews. The same year some of Mr Bowyer's notes were annexed to Bishop Claton's translation of "A Journal from Grand Cairo to Mount Sinai and back again."—In 1754, Mr Bowyer, with a view of lessening his fatigue, entered into partnership with a relation; but some disagreement arising, the connection was dissolved in three years. On the death of Mr Richardson in 1761, Mr Bowyer succeeded him as printer to the Royal Society, through the favour of the late Earl of Macclesfield; and, under the friendship of five successive presidents, enjoyed that office till his death.

In 1763, Mr Bowyer published an excellent edition of the Greek Testament, in two vols 12mo. It appeared under the following title: *Novum Testamentum Graecum; ad fidem Graecorum solum Codicum MSS. nunc primum impressum, adspiciante Joanne Jacobo Wetstein, justa Sectiones Jo. Alberti Bengelii divisi; et nova interpretatione sapientis illustratum. Accessor in altero volumine, Emendationes conjecturales virorum doctorum undeceunque collecte.* This sold with great rapidity: the Conjectural Emendations were well received by the learned, and are thought to be a valuable work. The president and fellows of Harvard college in Cambridge expressed their approbation of this edition in very high terms, in a letter to Mr Bowyer, written in the year 1767. "This work (say they), though small in bulk, we esteem as a rich treasure of sacred learning, and of more value than many large volumes of the commentators." A second edition of the *Conjectures* on the New Testament, with very considerable enlargements, was separately published, in one vol. 8vo, in 1772. Bishop Warburton having censured a passage in the former edition, Mr Bowyer sent him a copy of this book, with a conciliatory letter. Dr Warburton's Divine Legation had received very considerable advantage from Mr Bowyer's corrections; and this even in an edition which was necessarily given to another press. In 1761 he was employed to print his Lordship's *Doctrine of Grace.* A second edition being soon wanted, and Mr Bowyer not having been intrusted with the care of it, he prepared a series of letters to the bishop in his own defence; of which, together with a few he had formerly received from that great writer, he afterwards printed twelve copies, of which ten have since been destroyed. However, there is the best authority for ascertaining, that notwithstanding any little altercations which happened, Dr Warburton always retained a sincere regard for our author. In 1765, at the request of Thomas Hollis, Esq., Mr Bowyer wrote a short Latin preface to Dr Wallis's *Grammatica Linguæ Anglo-Canae.* He wrote also a large English preface for the same work, which, however, still remains unprinted. In 1766 he entered into partnership with Mr Nichols, who had been trained by him to the profession, and had for several years assisted him in the management of his business. The same year, Mr Bowyer wrote an excellent Latin preface to Joannis Hardwicii, *Justitsia ad Censuram Scriptorum veterum Propagem.* *Justitiae Autographum.* In 1767 he was appointed to print the journals of the house of lords and the rolls of parliament. This year he printed Clarke's excellent and learned work on "The Connection of the Roman, Saxon, and English Coins;" and wrote some notes upon it, which are interspersed throughout the volume with those of the author. Part of the Dissertation on the Roman sestertius was likewise Mr Bowyer's production; and the index, which is an uncommonly good one, was drawn up by him entirely.

In January 1771 Mr Bowyer lost his second wife, and again received a letter of consolation from his old friend Mr Clarke, who had sent him one almost forty years before on a similar occasion. In the *Philosophical Transactions* for this year was printed a very ingenious "Inquiry into the Value of the ancient Greek and Roman Money," by the late Matthew Raper, Esq. But his opinions not coinciding with those of Mr Bowyer, he printed a small pamphlet, entitled, "Remarks, occasioned by a late Dissertation on the Greek and Roman Money." In 1773 three little tracts were published by him, under the title of "Select Discourses." 1. Of the correspondence of the Hebrew months with the Julian, from the Latin of Professor Michaelis. 2. Of the Sabbatical years, from the same. 3. Of the years of Jubilee, from an anonymous writer in Masson's *Histoire Critique de la Republique des*
BOXERS, a kind of athletes, who combat or contend for victory with their fists. Boxers amount to the same with what among the Romans was called pugiles. The ancient boxers battled with great force and fury, insomuch as to dash out each other's teeth, break bones, and often kill each other. The strange disharmonies the boxers underwent were such that they frequently could not be known, and rendered them the subject of many raillery. In the Greek inscription, the four epigrams of the poet Lucilius, and one of Lucan, wherein their disharmonies are pleasantly enough exposed. See BOXING.

BOXHORNIIUS, MARC ZUERIIUS, a learned critic, born at Bergen-op-Zoom in 1612, was professor of eloquence at Leyden, and at length of politics and history in the room of Heinsius. He published, 1. Theatr um urbim Hollandiae. 2. Scriptores historie Augustae, cum notis. 3. Poeta satirici minores, cum comment. 4. Notes on Justin, Tacitus; and a great number of other works. He died in 1653, aged 41.

BOXING, the exercise of fighting with the fists, either naked or with a stone or leaden ball grasped in them: in which sense, boxing coincides with the pugilatus of the Romans, and what in our amphitheatre is sometimes called trial of mankind. When the champions had σφυραία, or balls, whether of lead or stone, it was properly denominated σφυρείας. The ancient boxing differed from the pugna castitum, in which the combatants had leather thongs on their hands, and balls to offend their antagonists; though this distinction is frequently overlooked, and fighting with the castus ranked as part of the business of pugiles. We may distinguish three species of boxing; viz. where both the head and hands were naked; where the hands were armed and the head naked; and where the head was covered with a kind of cap, called amphitrides, and the hands also furnished with the castus.

Boxing is an ancient exercise, having been in use in the heroic ages. Those who prepared themselves for it, used all the means that could be contrived to render themselves fat and fleshy, that they might be better able to endure blows: whence corpulent men or women were usually called pugiles, according to Terence: Siqua est habitio pavo, pugile esse aiunt.

In modern times this art has been in a manner appropriated by the English. About half a century ago it formed as regular an exhibition as we now see at any of the places of public amusements, the theatres alone excepted. It was encouraged by the first ranks of the nobility, patronized by the first subjects in the realm, and tolerated by the magistrates. Before the establishment of Broughton's amphitheatre, a booth was erected at Tottenham Court, in which the proprietor, Mr. George Taylor, invited the professors of the art to display their skill, and the public to be present at its exhibition. The bruises then had the reward due to their prowess, in a division of the entrance money, which sometimes was 100l. or 150l. The general mode of sharing was for two-thirds to go to the winning champion, while the remaining third was the right of the loser; though sometimes by an express agreement of the parties, the conqueror and the vanquished shared alike. The nobility and gentry having complained of the inconveniences sustained at Taylor's Booth, prevailed on Mr. Broughton, who was then

BOX, in its most common acceptation, denotes a small chest or coffer for holding things.

Dice-Box, a narrow deep casket, channelled within, wherein the dice are shaken and thrown. This answers to what the Romans called frizellius; whence, crepitantes frizellis; and, in Seneca, resonante frizello. The same author uses also concivere frizellum, figuratively, for playing. Besides the frizellius, the Romans, for greater security, had another kind of dice-box called pygma, signum, and sometimes terricula. It was placed immovable in the middle of the table, being perforated or open at both ends, and likewise channelled within; over the top was placed a kind of funnel, into which the dice were cast out upon the frizellius; whence descending, they fell through on the bottom on the table; by which all practising on them with the fingers was effectively prevented. For want of some contrivance of this kind, our sharper have opportunities of playing divers tricks with the box, as palming, topping, slabling, &c.

BOX, is also used for an uncertain quantity or measure: Thus a box of quicksilver contains from one to two hundred weight; a box of prunellas only 14 pounds; a box of rings for keys, two gross, &c.

Box-Trees. See BUXUS, BOTANY Index.

African Box. See MYRSINE, BOTANY Index.
then rising into note, as the first cruiser in London, to build a place better adapted for such exhibitions. This was accordingly done in 1742, principally by subscription, behind Oxford-road. The building was called Brighton's New Amphitheatre; and, besides the stage for the combatants, had seats corresponding to the boxes, pit, and galleries, much in the same manner as Ashley's. After a course of years, however, these exhibitions became gradually less patronized and frequented, owing probably to the refinement of our manners. Some time indeed, they seemed to be revived, and very considerably engaged the attention of the public; but a fatal issue which attended one of them, brought the practice again into disrepute. One of the combatants was killed on the spot. His royal highness the prince of Wales was present, and declared that he would have some settlement made on the nearest relation of the deceased, but that, on account of the dreadful example he had then witnessed, he would never more either see or patronize another stage-fight.

BOXING, among sailors, is used to denote the rehearsing the several points of the compass in their proper order.

BOXING is also used for the tapping of a tree, to make it yield its juice. The boxing of maple is performed by making a hole with an axe or chisel into the side of the tree, about a foot from the ground; out of it flows a liquor of which sugar is made.

BOXTHEUDE, a town of Germany, in the circle of Lower Saxony, subject to the Danes. It is seated on the rivulet Esse, which falls into the Elbe, in E. Long. 9° 35'. N. Lat. 53° 40'.

BOXTL, a town in Dutch Brabant, with sluices, seated on the river Bommel. E. Long. 5° 15'. N. Lat. 51° 30'.

BOYAR, a term used for a grandee of Russia and Transylvania. Becman says that the boyars are the upper nobility; and adds, that the Czar of Muscovy, in his diplomas, names the boyars before the waywodes. See WAYWODE.

BOYAU, in Fortification, a ditch covered with a parapet, which serves as a communication between two trenches. It runs parallel to the works of the body of the place; and serves as a line of contravallation, not only to hinder the assailants of the besieged, but also to secure the miners. But when it is a particular cut that runs from the trenches to cover some spot of ground, it is drawn so as not to be enfiladed or scourged by the shot from the town.

BOYD, MARK ALEXANDER, an extraordinary genius, was son of Robert Boyd, who was eldest son of Adam Boyd of Pinkhill, brother to Lord Boyd. He was born in Galloway on the 13th of January 1702, and came into the world with teeth. He learned the rudiments of the Latin and Greek languages at Glasgow, under two grammarians; but was of so high and untractable a spirit, that they despaired of ever making him a scholar. Having quarrelled with his masters, he beat them both, burnt his books, and forsore learning. While he was yet a youth, he followed the court, and did his utmost to push his interest there; but the fervour of his temper soon precipitated him into quarrels, from which he came off with honour and safety, though frequently at the hazard of his life. He, with the approbation of his friends, went to serve in the French army, and carried his little patrimony with him, which he soon dissipated at play. He was shortly after roused by that emulation which is natural to great minds, and applied himself to letters with unremitted ardour, till he became one of the most conspicuous scholars of his age. He is said to have translated Caesar's Commentaries into Greek in the style of Herodotus, and to have written many Latin poems which were little inferior to the first productions of the Augustan age. He also left several manuscripts on philological, political, and historical subjects, in Latin and French, which languages were as familiar to him as his native tongue. He could with facility dictate to three amanuenses at the same time, in different languages, and on different subjects. He was also one of the best Scottish poets of the age. To all this we must add, that his personal beauty and accomplishments were equal to his mental superiority. He died at Pinkhill in Scotland, in 1601. The following works, which are all that have been printed, were published in the Delicia Poetarum Scotorum; Amstel. 1637, 12mo. 1. Epigrammata, lib. ii. 2. Heroicum Epistola Xiv. lib. ii. 3. Hymni XIV.

BOYER, Abel, a well-known glossographer and historiographer, born at Castres in France, in 1604. Upon the revocation of the edict of Nantes, he went first to Geneva, then to Frankfort, where he finished his studies; and came finally to England, where he applied himself so assiduously to the study of the English language, and made so great a proficiency therein, that he became an author of considerable note in it, being employed in the writing of several periodical and political works. He was for many years concerned in a newspaper called the Post-boy, of which he had the principal management. He likewise published a monthly work entitled the Political State of Great Britain. He wrote a life of Queen Anne in folio, which is esteemed a very good chronicle of that period of the English history. But what has rendered him the most known, and has most firmly established his reputation, are the excellent Dictionary and Grammar of the French language, which he compiled, and which are still reckoned the best in their kind. He also wrote, or rather translated from the French of M. de Racine, the tragedy of Iphigenia, which he published under the title of The Victim. It was performed with success at the theatre of Drury-Lane, and is far from being a bad play. Nor can there perhaps be a stronger instance of the abilities of its author, than success in such an attempt; since writing with any degree of correctness or elegance, even in prose, in a foreign language, is an excellence not very frequently attained; but to proceed so far in the perfection of it as to be even tolerable in poetry, and more especially in that of the drama, in which the diction and manner of expression require a peculiar dignity and force, and in a language so difficult to attain the perfect command of as the English, is what has been very seldom accomplished. He died in 1729.

BOYER, in Navigation, a kind of Flemish sloop, or small vessel of burden, having a boltsprit, a castle at each end, and a tall mast; chiefly fit for the navigation of rivers, and in many of its parts resembling a smack.

BOYES,
BOY

BOYES, idolatrous priests among the savages of Florida. Every priest attends a particular idol, and the natives address themselves to the priest of that idol to which they intend to pay their devotion. The idol is invoked in hymns, and his usual offering is the smoke of tobacco.

BOYLE, RICHARD, one of the greatest statesmen of the 17th century, and generally styled the Great Earl of Cork, was the youngest son of Mr Roger Boyle, and was born at Canterbury, on the 3d of October 1636. He studied at Benet college, Cambridge, and afterwards became a student in the Middle Temple. Having lost his father and mother, and being unable to support himself in the prosecution of his studies, he became clerk to Sir Richard Manhood, one of the chief barons of the exchequer; but finding that by his employment he could not improve his fortune, he went to Ireland in 1588, with fewer pounds in his pocket than he afterwards acquired thousands a-year. He was then about 22, had a graceful person, and many accomplishments, which enabled him to render himself useful to several of the principal persons employed in the government, by drawing up for them memorials, cases, and answers. In 1593, he married Jean, the daughter and co-heiress of William Amley, who had fallen in love with him, and she dying in 1599, in labour of her first child, which was stillborn, left him an estate of 500l. a-year in land. In consequence of various services, and the great abilities he displayed, he gradually rose to the highest offices, and even to the dignity of the peerage of Ireland; to which he was raised by King James I. on the 20th of September 1616, by the style and title of 'baron of Youghall, in the county of Cork: four years after, he was created Viscount Dungarvan and earl of Cork; and in 1631 was made lord treasurer of Ireland, an honour that was made hereditary to his family. He particularly distinguished himself by the noble stand he made, when the fatal rebellion broke out in that kingdom, in the reign of Charles I.; and in his old age acted with as much bravery and military skill, as if he had been trained from his infancy to the profession of arms. He turned the castle of Lismore, his capital seat, into a fortress capable of demanding respect from the Irish. He immediately armed and disciplined his servants and Protestant tenants; and by their assistance, and a small army raised and maintained at his own expense, which he put under the command of his four sons, defended the province of Munster, and in the space of a year took several strong castles, and killed upwards of 3000 of the enemy; during which time he paid his forces regularly; and when all his money was gone, like a true patriot converted his plate into coin. This great man died on the 15th of September 1634.

BOYLE, Richard, earl of Burlington and Cork, son to the former, was a nobleman of unblemished loyalty in rebellious times, and of untainted integrity in times of the greatest corruption. He was born at Youghall, October 20. 1612, while his father was in the beginning of his prosperity, and only Sir Richard Boyle. He distinguished himself by his loyalty to King Charles I. He not only commanded troops, but raised and for a long time paid them, and continued to wait upon the king as long as any one place held out for him in England, and then was forced to compound for his estate. He contributed all in his power to the Restoration; on which King Charles II. raised him to the dignity of earl of Burlington, or Bridlington, in the county of York, in the year 1653. He died Jan. 15. 1697-8, in the 86th year of his age.

BOYLE, Roger, earl of Orrery, younger brother of the former, and the fifth son of Richard, styled the Great Earl of Cork, was born April 25. 1621; and by the credit of his father with the lord deputy Faulkland, raised to the dignity and title of Baron Broghill, when only seven years old. He was educated at the college of Dublin, where he soon distinguished himself as an early and promising genius. He afterwards made the tour of France and Italy; and at his return assisted his father in opposing the rebellious Irish, in which he behaved with all the spirit of a young, and all the discretion of an old, officer. Upon the murder of the king, he retired to Marston in Somersetshire, and hid himself in the privacy of a close retirement; but being at length ashamed to sit the same spectator of all the mischief that appeared round him, he resolved to attempt something in favour of the king; and under the pretence of going to the Spa for the recovery of his health, he determined to cross the seas, and apply himself to King Charles II. for a commission to raise what forces he could in Ireland, in order to restore his majesty and recover his own estate. To this purpose, he prevailed on the earl of Warwick to procure a license for his going to the Spa; and having raised a considerable sum of money, came up to London to prosecute his voyage; but he had not been long in town when he received a message from Cromwell, who was then general of the parliament's forces, that he intended to wait upon him. The lord Broghill was surprised at this message, having never had the least acquaintance with Cromwell; and desired the gentleman to let the general know, that he would wait upon his excellency. But while he was waiting the return of the messenger, Cromwell entered the room; and after mutual civilities had passed between them, told him in few words, that the committee of state were apprised of his design of going over and applying to Charles Stuart for a commission to raise forces in Ireland; and that they were determined to make an example of him, if he himself had not diverted them from that resolution. The lord Broghill interrupted him, by assuring him that the intelligence which the committee had received was false, and that he neither was in a capacity nor had any inclination to raise disturbances in Ireland: but Cromwell, instead of making any reply, drew some papers out of his pocket, which were the copies of several letters which the lord Broghill had sent to those persons in whom he most confided, and put them into his hands. The lord Broghill, upon the perusal of these papers, finding it to no purpose to dissemble any longer, asked his excellency's pardon for what he had said, returned him his humble thanks for his protection against the committee, and intreated his direction how to behave in such a delicate conjecture. Cromwell told him, that though till this time he had been a stranger to his person, he was not so to his merit and character: he had heard how gallantly his lordship had behaved in the Irish wars; and therefore, since he was named lord lieutenant of Ireland, and the reducing that kingdom was now become his province, he had
BOY [ 354 ]

Boyle obtained leave of the committee to offer his lordship the command of a general officer, if he would serve in that war; and he should have no oaths or engagements imposed upon him, nor be obliged to draw his sword against any but the Irish rebels.

The lord Broghill was infinitely surprised at so generous and unexpected an offer. He saw himself at liberty, by all the rules of honour, to serve against the Irish, whose rebellion and barbarities were equally detested by the royal party and the parliament. He desired, however, some time to consider of what had been proposed to him. But Cromwell briskly told him, that he must come to some resolution that very instant: that he himself was returning to the committee, who were still sitting; and if his lordship rejected their offer, they had determined to send him to the Tower. Upon this, the lord Broghill, finding that his liberty and life were in the utmost danger, gave his word and honour that he would faithfully serve him against all the Irish rebels: on which Cromwell once more assured him, that the conditions which he had made with him should be punctually observed; and then ordered him to repair to Bristol, adding, that he himself would soon follow him into Ireland. Lord Broghill, therefore, having settled the business of his command, went over into that country; where, by his conduct and intrepidity, he performed many important services, and fully justified the opinion Cromwell had conceived of him. By his own interest he now raised a gallant troop of horse, consisting chiefly of gentlemen attached to him by personal friendship; which corps was soon increased to a complete regiment of 1500 men. These he led into the field against the Irish rebels; and was speedily joined by Cromwell, who placed the highest confidence in his new ally, and found him of the greatest consequence to the interest of the commonwealth.

Among other considerable exploits performed by Lord Broghill, the following deserves to be particularly mentioned. Whilst Cromwell laid siege to Clonmel, Broghill being detached to disperse a body of 500 men who had hitherto resented the victors, he with 2000 horse and dragoons, marched up to the enemy at Macroom on the 10th of May 1657; and, without waiting for the arrival of his foot, immediately attacked and routed them, making their general prisoner. Then proceeding to the castle of Carrigdrohid, he sent a summons to the garrison to surrender before the arrival of his battering cannon, otherwise they were to expect no quarter. His own army was surprised at this summons, as knowing he had not one piece of heavy cannon: but Broghill had ordered the trunks of several large trees to be drawn at a distance by his baggage horses; which the besieged perceiving, and judging from the slowness of the motion that the guns must be of a vast bore, immediately capitulated. He afterwards relieved Cromwell himself at Clonmel, where that great commander happened to be so dangerously situated, that he confessed, nothing but the seasonable relief afforded him by Lord Broghill could have saved him from destruction. When Ireton sat down before Limerick, he gave Broghill 600 foot and 400 horse, with orders to prevent Lord Muskerry's junction with the pope's nuncio, who had got together a body of 8000 men, and was determined to attempt the relief of Limerick. Muskerry was at the head of 1000 horse and dragoons, and about 2000 foot: notwithstanding which, Lord Broghill fell resolutely upon him. The Irish, having the advantage of the ground and numbers, would have conquered, but for a stratagem of Lord Broghill. In the heat of the action he desired those about him to repeat what he said; and then cried out as loud as he could, "They run, they run." The first line of the Irish looked round to see if their rear broke; and the rear seeing the faces of their friends, and hearing the shouts of the enemy, imagined that the first line was routed, and fled. The taking of Limerick, which put an end to the war in Ireland, was the consequence of this defeat.

When Cromwell became protector, he sent for Lord Broghill, merely to take his advice occasionally. And we are told, that, not long after his coming to England, he formed a project for engaging Cromwell to restore the old constitution. The basis of the scheme was to be a match between the king (Charles II.) and the protector's daughter. As his lordship maintained a secret correspondence with the exiled monarch and his friends, it was imagined that he was beforehand pretty sure that Charles was not adverse to the scheme, or he would not have ventured to have proposed it seriously to Cromwell; who at first seemed to think it not unfeasible. He soon changed his mind, however, and told Broghill that he thought his project impracticable: "For (said he) Charles can never forgive me the death of his father." In fine, the business came to nothing, although his lordship had engaged Cromwell's wife and daughter in the scheme; but he never durst let the protector know that he had previously treated with Charles about it.

On the death of the protector, Lord Broghill continued attached to his son Richard, till, when he saw that the honesty and good-nature of that worthy man would infallibly render him a prey to his many enemies, he did not think it advisable to sink with a man that he could not save. The dark clouds of anarchy seemed now to be hovering over the British island. Lord Broghill saw the storm gathering, and he deemed it prudent to retire to his estate in Ireland, where he shortly after had the satisfaction of seeing things take a turn extremely favourable to the design that he had long been a well-wisher to, viz. that of the king's restoration. In this great event Lord Broghill was not a little instrumental; and, in consideration of his eminent services in this respect, Charles created him earl of Orrery by letters-patent bearing date September 5, 1660. He was soon after made one of the lords justices of Ireland; and his conduct, while at the head of affairs in that kingdom, was such as greatly added to the general esteem in which his character was held before.

His lordship's active and toilsome course of life at length brought upon him some diseases and infirmities which gave him much pain and uneasiness; and a fever which fell into his feet, joined to the gout with which he was often afflicted, abated much of that vigour which he had shown in the early part of his life: but his industry and application were still the same, and bent to the same purposes; as appears from his letters, which show at once a capacity, and an attention to business, which do honour to that age, and may serve as an example to this.

Notwithstanding
Notwithstanding his infirmities, on the king's desiring to see his lordship in England, he went over in 1665. He found the court in some disorder; where his majesty was on the point of removing the great earl of Clan-
rendon, lord high chancellor; and there was also a great misunderstanding between the two royal brothers. Lord Orrery undertook to reconcile the king with the duke of York; which he effected by prevailing on the latter to ask his majesty's pardon for some steps he had taken in support of the lord chancellor. On his return to Ireland, he found himself called to a new scene of action. The Dutch war was then at its height; and the French, in confederacy with the Hollanders, were endeavouring to stir up the asbes of rebellion in Ireland. The duke de Béaufort, admiral of France, had formed a scheme for a descent upon Ireland; but this was rendered abortive by the extraordinary diligence, military skill, and prudent measures, of Lord Orrery.

But, in midst of all his labours, a dispute arose, founded on a mutual jealousy of each other's greatness, betwixt him and his old friend the duke of Ormond, then lord lieutenant; the bad effects of which were soon felt by both disputants, who resorted to England to defend their respective interests and pretensions, both having been attacked by secret enemies who suggested many things to their prejudice. This quarrel, though of a private beginning, became at last of a public nature; and producing first an attempt to frame an impeachment against the duke of Ormond, occasioned in the end, by the way of revenge, an actual impeachment against the earl of Orrery. He defended himself, however, so well against a charge of high crimes, and even of treason itself, that the prosecution came to nothing. He nevertheless lost his public employments; but not the king's favour: he still came frequently to court, and sometimes to council. After this revolution in his affairs, he made several voyages to and from Ireland; was often consulted by his majesty on affairs of the utmost consequence; and on all occasions gave his opinion and advice with the freedom of an honest plain-dealing man and a sincere friend; which the king always found him, and respected him accordingly.

In 1678, being attacked more cruelly than ever by his old enemy the gout, he made his last voyage to England for advice in the medical way. But his disorder was beyond the power of medicine; and having in his last illness given the strongest proofs of Christian patience, manly courage, and rational fortitude, he breathed his last on the 16th of October 1679, in the 59th year of his age. His lordship wrote: 1. A work entitled "The Art of War." 2. Parthenissa, a romance, in one volume folio. 3. Several poems. 4. Dramatic pieces, two volumes. 5. State-tracts, in one volume folio, &c. Mr Walspole, speaking of this nobleman, says, he never made a bad figure but as a poet. As a soldier, his bravery was distinguished, his stratagems remarkable. As a statesman, it is sufficient to say, that he had the confidence of Cromwell. As a man, he was grateful, and would have supported the son of his friend: but, like Cicero and Richelieu, he could not be content without being a poet; though he was ill qualified, his writings of that kind being flat and trivial.

BOYLE, Robert, one of the greatest philosophers as well as best men that our own or indeed any other nation has produced, was the seventh son and the 14th child of Richard earl of Cork, and born at Lismore in the province of Munster in Ireland, January 25. 1620-7. Before he went to school, he was taught to write a very fair hand, and to speak French and Lat-
in, by one of the earl's chaplains, and a Frenchman that he kept in the house. In the year 1635, his father sent him over to England, in order to be edu-
cated at Eton school, under his Henry Votton, who was the earl of Cork's old friend and acquaintance. Here he soon discovered a force of understanding which pro-
mised great things, and a disposition to cultivate and improve it to the utmost. While he remained at Eton, there were several very extraordinary accidents that befell him, of which he has given us an account; and three of which were very near proving fatal to him. The first was, the sudden fall of the chamber where he was lodged, when himself was in bed; when, besides the danger he ran of being crushed to pieces, he had certainly been choked with the dust during the time he lay under the rubbish, if he had not had presence of mind enough to wrap his head up in the sheet, which gave him an opportunity of breathing without hazard. A little after this, he had been crushed to pieces by a starting horse that rose up suddenly, and threw himself backwards, if he had not happily disengaged his feet from the stirrups, and cast himself from his back before he fell. A third accident proceeded from the carelessness of an apothecary's servant, who, by mishapening the phials, brought him a strong vom-
it instead of a cooling julep.

He remained at Eton upon the whole, between three and four years; and then his father carried him to his own seat at Stalbridge in Dorsetshire, where he remained for some time under the care of one of his chaplains who was the parson of the place. In 1638, he attended his father to London; and remained with him at the Savoy, till his brother Mr Francis Boyle espoused Mrs Elizabeth Killigrew; and then, towards the end of October, within four days after the marriage, the two brothers, Francis and Robert, were sent abroad upon their travels, under the care of Mr Mar-
combes. They embarked at Rye in Sussex, and from thence proceeded to Dieppe in Normandy: then they travelled by land to Rouen, so to Paris, and from thence to Lyons; from which city they continued their journey to Geneva, where his governor had a family; and there the two gentlemen pursued their studies without interruption. Mr Boyle, during his stay here, re-
sumed his acquaintance with the mathematicians, or at least with the elements of that science, of which he had before gained some knowledge. For he tells us, in his own memoirs, that while he was at Eton, and afflicted with an auge, before he was ten years old, by way of diverting his melancholy, they made him read Amadis de Gaul, and other romantic books, which pro-
duced such a restlessness in him, that he was obliged to apply himself to the extraction of the square and cube roots, and to the more laborious operations of algebra, in order to fix and settle the volatile operations of his fancy.

In September 1641, he quitted Geneva, after having spent 12 months in that city; and passing through Switzerland, he
Switzerland and the country of the Grisons, entered Lombardy. Then, taking his route through Bergamo, Brescia, and Verona, he arrived at Venice; where; having made a short stay, he returned to the continent, and spent the winter at Florence. Here he employed his spare hours in reading the modern history in Italian, and the works of the celebrated astronomer Galileo, who died in a village near this city during Mr Boyle's residence in it. It was at Florence that he acquired the Italian language; which he understood perfectly, though he never spoke it so fluently as the French. Of this indeed he was such a master, that as occasion required he passed for a native of that country in more places than one during his travels.

About the end of March 1642, he began his journey from Florence to Rome, which took up but five days. He surveyed the numerous curiosities of that city; among which, he tells us, "he had the fortune to see Pope Urban VIII. at chapel, with the cardinals, who, severally appearing mighty princes, in that assembly looked like a company of common friars." He visited the adjacent villages which had any thing curious or antique belonging to them; and had probably made a longer stay, had not the heats disagreed with his brother. He returned to Florence; from thence to Leghorn; and so by sea to Genoa: then passing through the county of Nice, he crossed the sea to Antibes, where he fell into danger from refusing to humour the crucifix: from whence he went to Marseilles by land. He was in that city, in May 1642, when he received his father's letters, which informed him that the rebellion had broken out in Ireland, and bow difficulty he had procured the 250l. then remitted to them in order to help them home. They never received this money; and were obliged to go to Geneva with their governor Marcombes, who supplied them with as much as least as carried them thither. They continued there a considerable time without either advice or supplies from England; upon which Marcombes was obliged to take up some jewels upon his own credit, which were afterwards disposed of with as little loss as might be; and with the money thus raised, they continued their journey for England, where they arrived in the year 1644. On their arrival, Mr Boyle found his father dead; and though the earl had made an ample provision for him, by leaving his manor of Stalbridge in England, as well as other considerable estates in Ireland, yet it was some time before he could receive any money. However, he procured protections for his estates in both kingdoms from the powers then in being; from which he also obtained leave to go over to France for a short space, probably to settle accounts with his governor Mr Marcombes.

In March 1646, he retired to his manor at Stalbridge, where he resided for the most part till May 1650. He made excursions sometimes to London, sometimes to Oxford; and in February 1647, he went over to Holland; but he made no considerable stay anywhere. During his retirement at Stalbridge, he applied himself with incredible industry to studies of various kinds, to those of natural philosophy and chemistry in particular. He omitted no opportunity of obtaining the acquaintance of persons distinguished for parts and learning; to whom he was in every respect a ready, useful, generous assistant, and with whom he held a constant correspondence. He was also one of the first members of that small but learned body of men which, when all academical studies were interrupted by the civil wars, secluded themselves about the year 1645; and held private meetings, first in London, afterwards at Oxford, for the sake of canvassing subjects of natural knowledge upon that plan of experiment which Lord Bacon had delineated. They styled themselves then The philosophic college; and, after the Restoration, when they were incorporated, and distinguished openly, they took the name of the Royal Society.

In the summer of 1654, he put in execution a design he had formed for some time of residing at Oxford, where he chose to live in the house of one Mr Cross, an apothecary, rather than in a college, for the sake of his health, and because he had more room to make experiments. Oxford was indeed the only place at that time in England where Mr Boyle could have lived with much satisfaction; for here he found himself surrounded with a number of learned friends, such as Wilkins, Wallis, Ward, Willis, Wren, &c. suited exactly to his taste, and who had resorted thither for the same reasons that he had done, the philosophical society being now removed from London to Oxford. It was during his residence here that he improved that admirable engine the air-pump; and by numerous experiments was enabled to discover several qualities of the air, so as to lay a foundation for a complete theory. He was not, however, satisfied with this; but laboured incessantly in collecting and digesting, chiefly from his own experiments, the materials requisite for this purpose. He declared against the philosophy of Aristotle, as having in it more words than things; promising much, and performing little; and gave the inventions of men for indubitable proofs, instead of building upon observation and experiment. He was so zealous for, and so careful about, this true method of learning by experiment, that though the Cartesian philosophy then made a great noise in the world, yet he would never be persuaded to read the works of Des Cartes, for fear he should be amused and led away by plausible accounts of things founded on conjecture, and merely hypothetical. But philosophy, and inquiries into nature, though they engaged his attention deeply, did not occupy it entirely; since we find that he still continued to pursue critical and theological studies. In these he had the assistance of some great men, particularly Dr Edward Pocock, Mr Thomas Hyde, and Mr Samuel Clarke, all of great eminence for their skill in the oriental languages. He had also a strict intimacy with Dr Thomas Barlow, at that time head keeper of the Bodleian library, and afterwards bishop of Lincoln, a man of various and extensive learning. In the year 1659, Mr Boyle, being acquainted with the unhappy circumstances of the learned Sanderson, afterwards bishop of Lincoln, who had lost all his premonstrants on account of his attachment to the royal party, conferred upon him an honorary stipend of 50l. a-year. This stipend was given as an encouragement to that excellent master of reasoning to apply himself to the writing of "Cases of Conscience," and according
imply he printed his lectures De obligatione conscientiae, which he read at Oxford in 1647, and dedicated them to his friend and patron.

Upon the restoration of Charles II. Mr Boyle was treated with great civility and respect by the king, as well as by the two great ministers the lord treasurer Southampton and the lord chancellor Clarendon. He was solicited by the latter to enter into holy orders, not only out of regard to him and his family, but chiefly with a view to serve the church itself; for Mr Boyle's noble family, his distinguished learning, and, above all, his unblemished reputation, induced Lord Clarendon to think that any ecclesiastical preferment he might obtain would be worthily discharged, so as to do honour to the clergy, and service to the established communion. Mr Boyle considered all this with due attention: but, to balance these, he reflected, that, in the situation of life in which he was, whatever he wrote with respect to religion would have so much the greater weight as coming from a layman: since he well knew that the irreligious fortified themselves against all that the clergy could offer, by supposing, and saying, that it was their trade, and that they were paid for it. He considered likewise, that, in point of fortune and character, he needed no accessions; and indeed he never had any appetite for either. He chose, therefore, to pursue his philosophical studies in such a manner as might be most effectual for the support of religion; and began to communicate to the world the fruit of these studies.

The first of these was printed at Oxford in 1660, in 8vo, under the title of: 1. New experiments, physico-mechanical, touching the spring of the air and its effects. 2. On the ablation of love; or some motives and incentives to the love of God, pathetically discoursed of in a letter to a friend. 3. Certain physiological essays and other tracts, 1661, 4to. 4. Sceptical chemist, 1662, 8vo; a very curious and excellent work, reprinted about the year 1679, 8vo, with the addition of divers experiments and notes about the producibleness of chemical principles.

In the year 1663, the Royal Society being incorporated by King Charles II. Mr Boyle was appointed one of the council; and as he might be justly reckoned among the founders of that learned body, so he continued one of the most useful and industrious of its members during the whole course of his life. In June 1663, he published, 5. Considerations touching the usefulness of Experimental Natural Philosophy, 4to. 6. Experiments and considerations upon Colours; to which was added a letter, containing Observations on a Diamond that shines in the dark, 1663, 8vo. This treatise is full of curious and useful remarks on the hitherto unexplained doctrine of light and colours; in which he shows great judgment, accuracy, and penetration; and may be said to have led the way to that mighty genius, the great Sir Isaac Newton, who has since set that point in the clearest and most convincing light. 7. Considerations on the style of the Holy Scriptures, 1663, 8vo. It was an extract from a larger work, entitled, "An Essay on Scripture;" which was afterwards published by Sir Peter Pett, a friend of Mr Boyle's.

In 1664, he was elected into the company of the royal mines; and was all this year taken up in the prosecution of various good designs, which probably was the reason why he did not send abroad any treatises either of religion or philosophy. The year following, came forth, 8. Occasional reflections upon several subjects; whereto is prefixed a discourse about such kinds of thoughts, 1665, 8vo. This piece is addressed to Sophronia, under which name he concealed that of his beloved sister the viscountess of Ranelagh. The thoughts themselves are on a vast variety of subjects, written many years before; some indeed upon trivial occasions, but all with great accuracy of language, much wit, more learning, and in a wonderful strain of moral and pious reflection. Yet this exposed him to the only severe critic, that ever was passed upon him; and that too from no less a man than the celebrated Dean Swift, who, to ridicule these discourses, wrote A pious meditation upon a broomstick, in the style of the honourable Mr Boyle. But as his noble relation, the late Lord Orrery has said, "To what a height must the spirit of sarcasm arise in an author, who could prevail on himself to ridicule so good a man as Mr Boyle? The sword of wit, like the scythe of time, cuts down friend and foe, and attacks every object that lies in its way. But, sharp and irresistible as the edge of it may be, Mr Boyle will always remain invulnerable."

The same year, he published an important work, entitled, 9. New experiments and observations upon cold, 1665, 8vo. In the year 1666, he published, 10. Hydrostastical paradoxes made out by new experiments, for the most part physical and easy, in 8vo. 11. The origin of forms and qualities, according to the corpuscular philosophy, illustrated by considerations and experiments. This treatise did great honour to Mr Boyle, whether we consider the quickness of his wit, the depth of his judgment, or his indefatigable pains in searching after truth. We must not forget to observe, that, both in this and the former year, he communicated to his friend Mr Oldenburg, who was secretary to the Royal Society, several curious and excellent short treatises of his own, upon a great variety of subjects, and others transmitted to him by his learned friends both at home and abroad, which are printed and preserved in the Philosophical Transactions.

In the year 1668, Mr Boyle resolved to settle in London for life: and removed for that purpose to the house of his sister, the lady Ranelagh, in Pall-Mall. This was to the infinite benefit of the learned in general, and particularly to the advantage of the Royal Society, to whom he gave great and continual assistance, as the several pieces communicated to them from time to time, and printed in their Transactions, do abundantly testify. Those who applied to him, either to desire his help, or to communicate to him any new discoveries in science, he had his hours for hearing; otherwise it is easy to conceive that he would have had very little of his time for himself. But, besides these, he kept a very extensive correspondence with persons of the greatest figure, and most famous for learning, in all parts of Europe. In the year 1669, he published, 12. A continuation of new experiments touching the heat and cold of the air; to which is added, A discourse of the atmospheres of constant bodies: and the same year he revised and made many additions to several of his former tracts, some of which
BOY [ 358 ] BOY

which were now translated into Latin, in order to gratify the curious abroad. 13. Tracts about the cosmical qualities of things; cosmical suspicions: the temperature of the subterraneous regions; the bottom of the sea: to which is prefixed an introduction to the history of particular qualities. This book occasioned much speculation, as it seemed to contain a vast treasure of knowledge which had never been communicated to the world before; and this too grounded upon actual experiments, and arguments justly drawn from them, instead of that notional and conjectural philosophy which in the beginning of the 17th century had been so much in fashion.

In the year 1671, he published, 14 Considerations on the usefulness of experimental and natural philosophy; the second part, 4to. And, 15. A collection of tracts upon several useful and important points of practical philosophy, 4to. Both of which works were received as new and valuable gifts to the learned world. 16. An essay about the origin and virtues of gums, 1672, 8vo. 17. A collection of tracts upon the relation between flame and air; and several other useful and curious subjects: besides furnishing, in this and the former year, a great number of short dissertations upon a vast variety of topics, addressed to the Royal Society, and inserted in their Transactions. 18. Essays on the strange subtility, great efficacy, and determinate nature of effluvia; to which were added a variety of experiments on other subjects; 1673, 8vo. 19. A collection of tracts upon the saltiness of the sea, the moisture of the air, the natural and preternatural state of bodies; to which is prefixed a dialogue concerning cold; 1674, 8vo. 20. The excellency of theology, compared with philosophy, 1673, 8vo. This discourse was written in the year 1665, while Mr Boyle, to avoid the great plague which then raged in London, was forced to go from place to place in the country, and had little or no opportunity of consulting his books. It contains a great number of curious and useful, as well as just and natural observations. 21. A collection of tracts containing suspicions about hidden qualities of the air; with an appendix touching celestial magnets; animadversions upon Mr. Hobbes's problem about a vacuum; a discourse of the nature of attraction and suction; 1674, 8vo. 22. Some considerations about the reconcileableness of reason and religion. By T. E. a layman. To which is annexed a discourse about the possibility of the resurrection. By Mr Boyle, 1675, 8vo. The reader must be informed, that both these pieces were of his writing; only he thought fit to mark the former with the final letters of his name. Among other papers that he communicated this year to the Royal Society, there were two connected into one discourse; the first was entitled, An experimental discourse of quicksilver growing hot with gold; the other related to the same subject; and both of them contained discoveries of the utmost importance.

In the year 1676, he published, 23. Experiments and notes about the mechanical origin or production of particular qualities; in several dissertations on a great variety of subjects, and among the rest on electricity. In 1678, he communicated to Mr Hooke a short memorial of some observations made upon an artificial substance that shines without any preceding illustra-

tion; which that gentleman thought fit to publish in his Lectiones Cutleriæae. 24. Historical account of a degradation of gold made by an anti-elixir. This made a great noise both at home and abroad, and is looked upon as one of the most remarkable pieces that ever fell from his pen; since the facts contained in it would have been esteemed incredible, if they had been related by a man of less integrity and piety than Mr Boyle. The regard which the great Newton had for Mr Boyle, appears from a very curious letter, which the former wrote to him, at the latter end of this year, for the sake of laying before him his sentiments of that ethereal medium, which he afterwards considered in his Optics as the cause of gravitation. This letter is to be found in the life of our author by the reverend Dr Birch.

In the year 1680, Mr Boyle published, 25. The aerial noctiluca; or some new phenomena, and a process of a factitious self-shining substance, 8vo. This year the Royal Society, as a proof of the just sense of his great worth, and of the constant and particular services which through a course of many years he had done them, made choice of him for their president; but he being extremely, and, as he says, peculiarly tender in point of oaths, declined the honour done him, by a letter addressed to his much respected friend Mr Robert Hooke, professor of mathematics at Gresham college.” 26. Discourse of things above reason; inquiring, whether a philosopher should admit any such; 1681, 8vo. 27. New experiments and observations upon the icy noctiluca: to which is added a chemical paradox, grounded upon new experiments, making it probable that chemical principles are transmutable, so that out of one of them others may be produced; 1682, 8vo. 28. A continuation of new experiments, physico-mechanical, touching the spring and weight of the air, and their effects; 1682, 8vo. In 1683, he published nothing but a short letter to Dr Beale, in relation to the making of fresh water out of salt. In 1684, he published two very considerable works; viz. 29. Memoirs for the natural history of human blood, especially the spirit of that liquor, 8vo; and 30. Experiments and considerations about the posibility of bodies, &c.

In 1684, Mr Boyle obliged the world with, 31. Short Memoirs for the natural experimental history of mineral waters, with directions as to the several methods of trying them; including abundance of new and useful remarks, as well as several curious experiments. 32. An essay on the great effects of even languid and unheeded motion; whereunto is annexed an experimental discourse of some hitherto little regarded causes of the salubrity and insalubrity of the air and its effects. None of his treatises, it is said, were ever received with greater or more general applause than this. 33. Of the reconcilableness of specific medicines to the corpuscular philosophy; to which is annexed a discourse about the advantages of the use of simple medicines, 8vo. Besides these philosophical tracts, he gave the world, the same year, an excellent theological one, 34. Of the high veneration man's intellect owes to God, peculiarly for his wisdom and power, 8vo.

At the entrance of the succeeding year, came abroad his, 35. Free inquiry into the vulgarly received notion of
of nature; a piece which was then, and will always be, greatly admired by those who have a true zeal and relish for pure religion and philosophy. In 1687, he published, 36. The martyrdom of Theodora and Diodima; a work he had drawn up in his youth. 37. A disquisition about the final causes of natural things; wherein it is inquired, whether, and (if at all) with what caution, a naturalist should admit them; with an appendix about vitiated light; 1688, 8vo. In the mouth of May this year, our author, though very unwilling, was constrained to make his complaint to the public, of some inconveniences under which he had long laboured; and this he did by an advertisement, about "the loss of many of his writings addressed to J. W. to be communicated to those of his friends that are virtuous; which may serve as a kind of preface to most of his mutilated and unfinished writings." He complains in this advertisement of the treatment he had met with from plagiarists both at home and abroad; and though it might have been difficult in any other man to have done so without incurring the imputation of self-conceit and vanity, yet Mr Boyle's manner is such as only to raise in us a higher esteem and admiration of him. This advertisement is inserted at length in his life by Birch.

He began now to find that his health and strength, notwithstanding all his care and caution, gradually declined, as he observes in a letter to M. de Clerc, dated May 30. 1689; which put him upon using every possible method of husbanding his remaining time for the benefit of the learned. It was with this view that he no longer communicated particular discourses, or new discoveries to the Royal Society; because this could not be done without withdrawing his thoughts from tasks which he thought of still greater importance. It was the more steadily to attend to these, that he resigned his post of governor of the corporation for propagating the gospel in New England; nay, he went so far as to signify to the world that he could no longer receive visits as usual, in an advertisement which begins in the following manner: "Mr Boyle finds himself obliged to intimate to those of his friends and acquaintance, that are wont to do him the honour and favour of visiting him, 1. That he has by some unlucky accidents, namely, by his servant's breaking a bottle of oil of nitroil over a chest which contained his papers, had many of his writings corroded here and there, or otherwise so maimed, that, without himself fill up the lacuum out of his memory or invention, they will not be intelligible. 2. That his age and sickness have for a good while admonished him to put his scattered and partly defaced writings into some kind of order, that they may not remain quite useless. And 3. That his skilful and friendly physician, Sir Edmund King, seconded by Mr Boyle's best friends, has pressingly advised him against speaking daily with so many persons as are wont to visit him, representing it as what cannot but waste his spirits, &c. He ordered likewise a board to be placed over his door, with an inscription signifying when he did, and when he did not, receive visits."

Among the other great works, which by this means he gained time to finish, there is great reason to believe, that one was a collection of elaborate processes in chemistry; concerning which he wrote a letter to a friend, which is still extant; wherein we read, that "he left it as a kind of hermetic legacy to the studious disciples of that art." Besides these papers committed to the care of one whom he esteemed his friend, he left very many behind him at his death, relating to chemistry; which, as appears by a letter directed to one of his executors, he desired might be inspected by three physicians whom he named, and that some of the most valuable might be preserved.

In the mean time, Mr Boyle published some other works before his death; as, 38. Medicina Hydrostatica; or, Hydrostatics applied to the materia medica, showing bow, by the weight that divers bodies used in physic have in water, one may discover whether they be genuine or adulterated. To which is subjoined a previous hydrostastical way of estimating ores, 1690, 8vo. 39. The Christian virtuoso; showing, that, by being addicted to experimental philosophy, a man is rather assisted than indisposed to be a good Christian. To which are subjoined, 1. A discourse about the distinction that represents some things as above reason, but not contrary to reason. 2. The first chapters of a discourse entitled Greatness of mind promoted by Christianity. The last work which he published himself, was in the spring of 1691; and is entitled, 40. Experiments et Observationes Physicae: wherein are briefly treated of several subjects relating to natural philosophy in an experimental way. To which is added a small collection of strange reports, 8vo.

About the entrance of the summer, he began to feel such an alteration in his health as induced him to think of settling his affairs; and accordingly, on the 8th of July, he signed and sealed his last will, to which he afterwards added several codicils. In October, his distresses increased; and on the last day of December 1691, he departed this life, in the 65th year of his age. He was buried in St Martin's church in the Fields, Westminster, on the 7th of January following; and his funeral sermon was preached by Dr Gilbert Burnet, bishop of Salisbury. The bishop made choice upon this occasion of a text very appropriate to the subject; namely, "For God giveth to a man that is good in his sight, wisdom, knowledge, and joy." After explaining the meaning of the words, he applied the doctrine to the is. 16. honourable person deceased; of whom, he tells us, he was the better able to give a character, from the many happy hours he had spent in conversation with him, in the course of 29 years. He gives a large account of Mr Boyle's sincere and unaffected piety; and more especially of his zeal for the Christian religion, without having any narrow notions concerning it, or mistaking, as so many do, a bigotted heat in favour of a particular sect, for that zeal which is an ornament of a true Christian. He mentions as a proof of this, his noble foundation for lectures in defence of the gospel against infidels of all sorts; the effects of which have been so conspicuous in the many volumes of excellent discourses which have been published in consequence of that noble and pious foundation. He was at the charge of the translation and impreison of the New Testament into the Malay language, which he sent over all the East Indies. He gave a noble reward to him that translated Grotius's incomparable book "Of the truth of the Christian religion" into Arabic; and was at the charge of a whole impression, which he took care should.
should be dispersed in all the countries where that language was understood. He was resolved to have carried on the impression of the New Testament in the Turkish language; but the company thought it became them to be the doers of it, and so suffered him only to give a large share towards it. He was a local charge in the edition of the Irish bible, which he ordered to be distributed in Ireland; and he contributed liberally to the impression of the Welsh bible. He gave, during his life, 300l. to advance the design of propagating the Christian religion in America; and as soon as he heard that the East India Company were entertaining propositions for the like design in the east, he sent 300l. for a beginning, as an example, but intended to carry it much farther when it should be set on foot to purpose.

In other respects his charities were so bountiful and extensive, that they amounted, as this prelate tells us, from his own knowledge, to upwards of 1000l. a-year. But as our limits will not allow us to follow the bishop in the copious and eloquent account he has given of this great man's abilities, we must therefore content ourselves with adding the short eulogium by the celebrated physician, philosopher, and chemist, Dr. Herman Boerhaave; who, after having declared Lord Bacon to be the father of experimental philosophy, asserts, that "Mr. Boyle, the ornament of his age and country, succeeded to the genius and inquiries of the great chancellor Verulam. Which (says he) of all Mr. Boyle's writings shall I recommend? All of them. To him we owe the secrets of fire, air, water, animals, vegetables, fossils: so that from his works may be deduced the whole system of natural knowledge." The reader perhaps may here be pleased to know, that Mr. Boyle was born the same year in which Lord Bacon died.

As to the person of this great man, we are told, that he was tall, but slender; and his countenance pale and emaciated. His constitution was so tender and delicate, that he had divers sorts of cloaks to put on when he went abroad, according to the temperature of the air; and in this he governed himself by his thermometer. He escaped indeed the small-pox; but for almost forty years he laboured under such feebleness of body, and such lowness of strength and spirits, that it was astonishing how he could read, meditate, make experiments, and write, as he did. He had likewise a weakness of his eyes; which made him very tender of them, and extremely apprehensive of such distempers as might affect them. He imagined likewise, that if sickness should confine him to his bed, it might raise the pains of the stone to a degree which might be above his strength to support; so that he feared his last minutes should be too hard for him. This was the ground of all the caution and apprehension with which he was observed to live; but, as to life itself, he had that just indifference for it which became a philosopher and a Christian. However, his sight began to grow dim not above four hours before he died; and when death came upon him, he had not been above three hours in bed before it made an end of him, with so little pain that the flame appeared to go out merely for want of oil to maintain it.

Mr. Boyle was never married; but Mr. Evelyn was assured, that he courted the beautiful and ingenious daughter of Cary earl of Monmouth, and that to this passion was owing his "Seraphic Love." In the memorandum of Mr. Boyle's life set down by Bishop Burnett, it is remarked that he abstained from marriage, at first out of policy, afterwards more philosophically; and it is said that he received from Dr. John Wallis to him, dated at Oxford, July 17th 1669, that he had an overture made him with respect to the lady Mary Hastings, sister to the earl of Huntingdon; but it does not appear from any of his papers, that he had ever entertained the least thoughts of that kind; nay, there is a letter of his, written when he was young, to the lady Barrymore his niece, who had informed him of a report that he was actually married, which almost shows that he never did. The letter is written with great politeness, and in the true spirit of gallantry; and is a clear proof that though Mr. Boyle did not choose to marry, yet it was no misanthropic cynical humour which restrained him from it. It is impossible to entertain the reader better than by presenting him with that part of it which concerns the point in question. "It is high time for me to hasten the payment of the thanks I owe your ladyship for the joy you are pleased to wish me, and of which that wish possibly gives me more than the occasion of it would. You have certainly reason, madam, to suspend your belief of a marriage, celebrated by no priest but fame, and made unknown to the supposed bridegroom. I may possibly ere long give you a fit of the spleen upon this theme; but at present it were incongruous to blend such pure ratiocination, as I ever prate of matrimony and amours with, among things I am so serious in as those this scribble presents you. I shall therefore only tell you, that the little gentleman and I are still at the old defence. You have carried away too many of the perfections of your sex to leave enough in this country for reducing so stubborn a heart as mine; whose conquest were a task of so much difficulty, and so little worth it, that the latter property is always likely to deter any that hath beauty and merit enough to overcome the former. But though this untamed heart be thus insensible to the thing itself called love; it is yet very accessible to things very near of kin to that passion; and esteem, friendship, respect, and even admiration, are things that their proper objects fail not proportionably to exact of me, and consequently are qualities which in their highest degrees are really and constantly paid my lady Barrymore by her most obliged humble servant, and affectionate uncle, ROBERT BOYLE."
Boyle, Charles, earl of Orrery in Ireland, and baron of Maston in the county of Somerset, was the second son of Roger the second earl of Orrery, and was born in August 1679. He was educated at Christ-church, Oxford, and was distinguished himself by his learning and abilities. Like the first earl of Orrery, he was an author, a soldier, and a statesman. He translated the life of Lysander from the Greek of Plutarch; and published a new edition of the epistles of Phalaris, which engaged him in a literary dispute, in which he defended the genuineness of those epistles against Dr. Bentley. He was three times member for the town of Huntington; but his elder brother, Lionel earl of Orrery dying on the 23rd of August 1703 without issue, he succeeded to that title; and, entering into the queen's service, had a regiment given him, when he behaved with such bravery, that in 1709 he was raised to the rank of major-general, and sworn one of her majesty's privy council. At the famous battle of the Wood, he gave the strongest proofs of his intrepid courage, remaining at the head of his regiment in the warmest part of the action, till the victory was complete, which, as it was one of the most glorious, so it was the dearest bought, of any of that war. His lordship had the honour of being appointed the queen's envoy to the states of Brabant and Flanders; and having honourably discharged the trust, was raised to the dignity of a British peer, by the title of Lord Boyle, baron of Maston, in Somersetshire. He enjoyed several other additional honours in the reign of King George I.; but having the misfortune to fall under the suspicion of the government, his lordship was committed to the Tower; he was, however, at length, admitted to bail; and nothing being found that could be esteemed sufficient ground for prosecution, he was discharged. His lordship died after a slight indisposition, on the 21st of August 1731. To his tutor Mr. Atterbury, he probably owed a good part of that fine relish he had for the writings of the ancients. He made these his constant study, and expressed a high contempt, says Budgell, for the greater part of our modern wits and authors. He was delighted with the company of two sorts of persons; either such as were really geniuses of the first rank, who had fine understandings, strong judgments, and true tastes; or such as had a few fancies, and an eye of ridicule in them, which served to make him laugh. He would rally these in so agreeable, and yet so tender a manner, that, though it diverted himself and others, it was never offensive to the person rallied. The instrument which was invented by him, and bears his name, representing the solar system according to the sentiments of the new astronomers, is an undeniable proof of his mechanic genius. His lordship had also a turn for medicine; which led him not only to buy and read whatever was published on that subject, but also to employ his friends to send him accounts of herbs and drugs in foreign countries. Boyle, John, earl of Cork and Orrery, a nobleman distinguished by his learning and genius, was the only son of Charles earl of Orrery, and was born on the 2d of January 1707. He was educated at Christ-church college in Oxford; but, as he himself declares, early disappointments, indifferent health, and many untoward accidents, rendered him fond of retirement, and of improving his talents for polite literature and poetry; of which last art he gave several excellent specimens. He also wrote a translation of Pliny the Younger's letter, with various notes, for the service of his eldest son the Lord Boyle, in two volumes, 4to. This was first published in 1717. The year following, 1718, he was first clerk of Dean Swift, in several letters, addressed to his second son Hamilton Boyle; and afterwards printed Memoirs of Robert Cary earl of Monmouth, a manuscript presented to him by a relation, with explanatory notes. He died in 1762. Boyle's Lectures, a course of eight sermons or lectures preached annually, set on foot by the honourable Robert Boyle, Esq., by a codicil annexed to his will in 1691; whose design, as expressed by the insti- tuto, is, to prove the truth of the Christian religion against infidels, without descending to any controversies among Christians; and to answer new difficulties, scruples, &c. For the support of this lecture he assigned the rent of his house in Crooked-lane to some learned divine within the bills of mortality, to be elected for a term not exceeding three years, by the late Archbishop Tenison and others. But the fund proving precarious, the salary was ill paid; to remedy which inconveniences, the said archbishop procured a yearly stipend of 50l. for ever, to be paid quarterly, charged on a farm in the parish of Brill in the county of Bucks. To this appointment we are indebted for many elaborate defences both of natural and revealed religion.

Boyné, a river in Ireland, which rises in Queen's county in the province of Leinster, and runs north-east by Trim and Cavan, falling at last into the Irish channel a little below Drogheda. It is memorable for a battle fought on its banks between James II. and King William III. in which the former was defeated.

Boyné, Boys or Bois, John, one of the translators of the Bible in the reign of James I. was son of William Bois, rector of West Stowe, near St Edmunsbury, Suffolk, and born at Nettlestead in Suffolk on the 3d of January 1560. He was taught the first rudiments of learning by his father; and his capacity was such, that at the age of five years he read the Bible in Hebrew. He went afterwards to Hadley school; and at 14 was admitted of St John's college, Cambridge, where he distinguished himself by his skill in Greek. Happening to have the small-pox when he was elected fellow, he, to preserve his seniority, caused himself to be carried in blankets to be admitted. He applied himself for some time to the study of medicine; but, finding himself affected with every disease he read of, he quitted that science. He was ten years chief Greek lecturer in his college, and read every day. He voluntarily read a Greek lecture for some years at four in the morning, in his own chamber, which was frequented by many of the fellows. On the death of his father, he succeeded him in the rectory of West Stowe. At the age of 36, he married the daughter of Mr. Holt, rector of Buxworth, in Cambridgeshire; whom he succeeded in that living, October 13, 1596. On his quitting the university, the college gave him
BOY [ 362 ]

Boyes. 1901. His young wife, who was bequeathed to him with the living, which was an advowson, proving a bad economist, and he himself being wholly addicted to his studies, he soon became so much involved in debt, that he was obliged to sell his choice collection of books, consisting of almost every Greek author then extant. When a new translation of the Bible was by King James I. directed to be made, Mr Bois was elected one of the Cambridge translators. He performed not only his own, but also the part assigned to another, with great reputation; though with no profit, for he had no allowance but his commons. He was also one of the six who met at Stationers Hall to revise the whole; which task they went through in nine months, having each from the company of stationers, during that time 30s. a week. He afterwards assisted Sir Henry Savile in publishing the works of Sir Chrysostom. In 1615, Dr Lancelet Andrews, bishop of Ely, bestowed on him, unasked, a prebend in his church. He died on the 14th of January 1643, in the 84th year of his age. He left a great many manuscripts behind him, particularly a Commentary on almost all the books of the New Testament. When he was a young student at Cambridge, he received from the learned Dr Whitaker three rules for avoiding those distempers which usually attend a sedentary life, to which he adhered with equal constancy and success. The first was, To study always standing; the second, Never to study in a window; and the third, Never to go to bed with his feet cold.

Boyez, Joseph, a late eminent dissenting minister in Dublin, much respected not only for his learning and abilities, but his extensive humanity and unsoldierly piety. During his ministerial charge at Dublin, he published many sermons which compose several folio volumes, a few poems, and other tracts; but what chiefly distinguished him as a writer, was the controversy he carried on with Dr King, archbishop of Dublin, and author of the Origin of Evil, concerning the office of a scriptural bishop. This controverted point was managed on both sides with great force of argument and exactness of temper. The bishop asserted, that the episcopal right of jurisdiction had its foundation in the New Testament; Mr Boyze, consistent with his principles, denied that any ecclesiastical superiority appeared there, with the greatest candour and good manner. He was father to

Boyez, Samuel, the poet, a man remarkable for the fineness of his genius, the lowness of his manners, and the wretchedness of his life. He was born in 1708, and received the rudiments of his education in a private school in Dublin. When he was but 18 years old, his father, who probably intended him for the ministry, sent him to the university of Glasgow, that he might finish his education there. He had not been a year at the university, when he fell in love with the daughter of a tradesman in that city, and was imprudent enough to interrupt his education by marrying her before he had entered into his 22d year. The natural extravagance of his temper soon exposed him to want; and as he had now the additional charge of a wife, his reduced circumstances obliged him to quit the university, and go over with his wife (who also carried a sister with her) to Dublin, where they relied on the old gentleman for support. Young Boyze was of all men the farthest removed from a gentleman; he had no grace of person, and fewer still of conversation. Never were three people of more libertine characters than young Boyze, his wife, and sister-in-law; yet the two ladies wore such a mask of decency before the old gentleman, that his fondness was never abated. The estate his father possessed in Yorkshire was sold to discharge his debts; and when the old man lay in his last sickness, he was entirely supported by presents from his congregation, and bore at their expense. We have no further account of Mr Boyze, till we find him soon after his father's death at Edinburgh. At this place his poetical genius raised him many friends, and some patrons of very great eminence. He published a volume of poems in 1737, to which are subjoined The Tablature of Cebes, and A Letter upon Liberty, inserted in the Dublin Journal, 1746; and by these he obtained a very great reputation. They are addressed to the countess of Eglington. This amiable lady was the patroness of all men of wit, and greatly distinguished Mr Boyze while he resided in that country. Upon the death of the viscountess Stormont, Mr Boyze wrote an elegy, which was very much applauded by her ladyship's relations. This elegy he entitled The Tears of the Muses, as the deceased lady was a woman of the most refined taste in the sciences, and a great admirer of poetry. The lord Stormont was so much pleased with this mark of esteem paid to the memory of his lady, that he ordered a very handsome present to be given to Mr Boyze by his attorney at Edinburgh. The notice which Lady Eglington and the lord Stormont took of our poet, recommended him likewise to the patronage of the duchess of Gordon; who was so solicitous to raise him above necessity, that she employed her interest in procuring the promise of a place for him. She gave him a letter, which he was next day to deliver to one of the commissioners of the customs at Edinburgh. It happened that he was then some miles distant from the city; and the morning on which he was to have rode to town with her grace's letter of recommendation proved to be rainy. This slender circumstance was enough to discourage Boyze, who never looked beyond the present moment: he declined going to town on account of the rainy weather; and while he let slip the opportunity, the place was bestowed upon another, which the commissioner declared he kept for some time vacant in expectation of seeing a person recommended by the duchess of Gordon. Boyze at last having defeated all the kind intentions of his patron towards him, fell into contempt and poverty, which obliged him to quit Edinburgh. He communicated his design of going to London to the duchess of Gordon; who, having still a very high opinion of his poetical abilities, gave him a letter of recommendation to Mr Pope, and obtained another for him to Sir Peter King the lord chancellor of England. Lord Stormont recommended him to the solicitor-general his brother, and many other persons of the first fashion. Upon receiving these letters, he, with great caution, quitted Edinburgh, regretted by none but his creditors. Upon his arrival in London, he went to Twickenham, in order to deliver the duchess of Gordon's letter to Mr Pope; but that gentleman not being at home, Mr Boyze never gave himself the trouble to repeat his visit. He wrote poems; but those, though excellent in their kind, were lost to the world, by being introduced with no advantage. He
BOY

Boyse. He had so great a propensity to travelling, that his acquaintance were generally of such a cast as could be of no service to him; and those in higher life he addressed by letters, not having sufficient confidence or politeness to converse familiarly with them. Thus unfit to support himself in the world, he was exposed to a variety of distresses, from which he could invent no means of extricating himself but by writing mendicant letters. It will appear amazing, that this man, of so abject a spirit, was voluptuous and luxurious; he had no taste for any thing elegant, and yet was to the last degree expensive. Can it be believed, that often when he had received but a guinea in consequence of a supplicating letter, he would go into a tavern, order a supper to be prepared, drink of the richest wines, and spend all the money that had just been given him in charity, without having any one to participate the regale with him, and while his wife and child were staring at home?

It was about the year 1740, that Mr Boyse, reduced to the last extremity of human wretchedness, had not a shirt, a coat, or any kind of apparel, to put on; the sheets in which he lay were carried to the pawn-brokers, and he was obliged to be confined to his bed with no other covering than a blanket. He had little support but what he got by writing letters to his friends in the most abject style; but was perhaps ashamed to let this instance of his distress be known, which probably was the occasion of his remaining six weeks in that situation. During this time he had some employment in writing verses for the Magazines; and whoever had seen him in his study, most have thought the object singular enough; he sat up in bed with the blanket wrapped about him, through which he had cut a hole large enough to admit his arm, and placing the paper upon his knee, scribbled in the best manner he could the verses he was obliged to make: whatever he got by these, or any other of his begging letters, was but just sufficient for the preservation of life. And perhaps he would have remained much longer in this distressful state, had not a compassionate gentleman, upon hearing this circumstance related, ordered his clothes to be taken out of pawn, and enabled him to appear again abroad.

About the year 1745, Mr Boyse's wife died. He was then at Reading, and pretended much concern when he heard of her death. His business at Reading was to compile a Review of the most material transactions at home and abroad during the last war: in which he had included a short account of the late rebellion. Upon his return from Reading, his behaviour was more decent than it had ever been before; and there were some hopes that a reformation, though late, would be wrought upon him. He was employed by a bookseller to translateension oon the Existence of a God; during which time he married a second wife, a woman in low circumstances; but not well enough adapted to his taste. He began now to live with more regard to his character, and supported a better appearance than usual; but while his circumstances were mending, and his irregular appetites losing ground, his health visibly declined. He had the satisfaction, while in this lingering illness, to observe a poem of his, entitled The Deity, recommend method by two eminent writers, the ingenious Mr Fielding, and the reverend Mr James Harvey, author of The Meditations.

Mr Boyse's mind was often religiously disposed; he frequently talked upon that subject, and probably suffered a great deal from the remorse of his conscience. The early impressions of his good education were never entirely obliterated; and his whole life was a continued struggle between his will and reason, as he was always violating his duty to the one, while he fell under the subjecting of the other. It was in consequence of this war in his mind, that he wrote a beautiful poem called The Reconciliation. In May 1749, he died in obscure lodgings near Shoe-lane; but in sentiments, there is the greatest reason to believe, very different from those in which he had spent the greatest part of his life. An old acquaintance of his endeavoured to collect money to defray the expenses of his funeral, so that the scandal of being buried by the parish might be avoided; but in vain; the remains of this son of the muses were, with very little ceremony, hurried away by the parish-officers.

Never was a life spent with less grace than that of Mr Boyse, and never were such distinguished abilities given to less purpose. His genius was not confined to poetry only: he had a taste for painting, music, and heraldry; with the latter of which he was very well acquainted. His poetical pieces, if collected, would make six moderate volumes. Many of them are scattered in The Gentleman's Magazine, marked with the letter Y, and Alcenu. Two volumes were published in London. An ode of his in the manner of Spenser, entitled The Olive, was addressed to Sir Robert Walpole, which procured him a present of ten guineas. He translated a poem from the High Dutch of Van Haren, in praise of peace, upon the conclusion of that made at Aix-la-Chapelle; but the poem which procured him the greatest reputation was that upon the attributes of the Deity. He was employed by Mr Ogle to translate some of Chaucer's tales into modern English, which he performed with great spirit, and received at the rate of threepence a line for his trouble. Mr Ogle published a complete edition of that old poet's Canterbury Tales modernised; and Mr Boyse's name is put to such tales as were done by him. In 1743, Mr Boyse published, without his name, an ode on the battle of Dettingen, entitled Albion's Triumph.

BOZOLA, a town of Italy, in the duchy of Mantua, capital of a territory of the same name, and subject to the house of Austria. E. Long. 10. 25. N. Lat. 45. 9.

B QUADRO, QUADRATO, or DURALE, in Music, called by the French b quarr, from its figure 4. This is what we call B natural or sharp, in distinction to B natural or flat. See Flat and Sharp.

If the flat ♭ be placed before a note in the thorough bass, it intensifies, that its third is to be minor; and if placed with any cypher over a note in the bass as ♭ 6, or ♭ 5, &c. it denotes, that the fifth or sixth thereto are to be flat. But if the quadro ♭ be placed over any note, or with a cypher, in the thorough bass, it has the contrary effect; for thereby the note or internal thereto is raised to its natural order.

BRABANCIONES, in middle age writers, a kind of Netherland soldier, infamous for rapine, being little
BRA [ 364 ]

BRA

Bethe better than commissioned banditti, who hired themselves to fight for any that could pay them best. The word is variously written by the historians of those days; all given them from the country of Brabant, which was the chief nursery of those troops. They are also frequently confounded with the Routiers, Routiers, Ruparii, Rurarii, Cortoarsus, &c.

BRABANT, a large province of the Netherlands, with the title of a duchy. It is bounded on the north by the province of Holland and the duchy of Guelders; on the east, by the same duchy and the bishopric of Utrecht; on the south, by the province of Namur and Hainault; and on the west, by Zeeland. It was formerly divided into Dutch Brabant and Austrian Brabant; and is watered by several rivers, of which the Scheld, the Rupell, and the Dommel, are the chief. The soil is very fertile; and it contains 26 fortified towns, of which Brussels is the capital.

BRABEUM, the AFRICAN ALMOND. See BOTANY Index.

BRABEUTES, or BRABEUDA, in antiquity, an officer among the Greeks, who presided at the public games, and decided controversies that happened among the antagonists in the gymnastical exercises. The number of brabeutes was not fixed; sometimes there was only one, but more commonly they amounted to nine or ten.

BRACCIANO, a town of St Peter's patrimony, about 12 miles north of Rome, situated on the west side of a lake to which it gives name. E. Long. 13° N. Lat. 42°.

BRACCIOLENI, FRANCIS, an Italian poet, a native of Pistoia, and the friend of Pope Urban VIII. He was born about the year 1566. Removing to Florence, he was admitted into the academy there, and devoted himself to literature. At Rome he entered into the service of Cardinal Maffeo Barberini, with whom he afterwards went to France. After the death of Clement VIII. he returned to his own country, and for some years prosecuted his studies in retirement. When his patron Barberini was elected pope, under the name of Urban VIII. Bracciolini repaired to Rome, where he was well received, and made secretary to the pope's brother, Cardinal Antonio. He had also the honour conferred on him of taking a surname from the arms of the Barberini family, which were Bees; and thenceforth he was known by the name of Bracciolini dell'Ape. He resided in Rome during the whole of that pontificate, frequenting the most illustrious academies, and listened to with general applause, but, at the same time, censured for his sordid avarice. He returned at length to his native city, where he died in the year 1645.

Bracciolini was a copious writer. There is scarcely any species of poetry, epic, dramatic, pastoral, lyric, or burlesque, which he did not attempt. He is principally noted for his mock-heroic poem, entitled Schermo degli Dei, which is a ridicule of the heathen mythology, and which disputes priority of date with Tassoni's Scocchia Rapita. In merit, indeed, its inferiority is acknowledged, yet it obtained considerable applause. Of his serious heroic poems, the most celebrated is the Croce Racquistata, which by some is placed next to the great works of Ariosto and Tasso, but not without a large interval. He celebrated the elevation of his patron Urban VIII. in a poem of twenty-three books, Bracciolini, which shews with what facility he could write verses. His dramatic pastoral entitled E. Amoroso Sdegno, Brachmia, is accounted one of the best productions of the age in which it was written; and some of his tragedies met with much applause, particularly his Euvandro.

BRACE is commonly taken for a couple or pair, and applied by huntsmen to several beasts of game, as a brace of bucks, foxes, hares, &c.

BRACE, or BRACCHIUM, is also a foreign measure, answering to our fathom. See Fathom.

Brace, in Architecture, a piece of timber framed in with bevel joints, the use of which is to keep the building from swerving either way. When the brace is framed into the kinglessers or principal rafters, it is by some called a strut.

Brace, in writing or printing, a crooked line enclosing a passage, as in a triplet.

BRACES, in the sea-language, are ropes belonging to all the yards of a ship, except the mizen, two on each yard, reeved through blocks that are fastened to pennants, seized to the yard-arms. Their use is either to square or traverse the yards. Hence to brace the yard, is to bring it to either side. All braces come aftward on; as, the main brace comes to the poop, the main-top-sail brace comes to the mizen-top and thence to the main-shrouds; the fore and fore-top-sail braces come down by the main and main-top-sail stays, and so of the rest. But the mizen-bowline serves to brace to the yard, and the cross-jack braces are brought forwards to the main-shrouds, when the ship sails close by a wind.

BRACES of a COCK, thick straps of leather on which it hangs.

BRACLET, an ornament worn on the wrist, much used among the ancients; it was made of different materials, and in different fashions, according to the age and quality of the wearer. The word is French, bracelet; which Menage derives further from bracelium, a diminutive of bracile, a word occurring in writers of the Justinian age; all formed from the Latin brachium, arm. It amounts to the same with what was called by the ancients arnilla, brachiule, occibus; in the middle age, boga, bangia, armispata.

Bracelets are much worn by the savages of Africa, who are so excessively fond of them, as to give the richest commodities, and even their fathers, wives, and children, in exchange for those made of no richer materials than shells, glass-bands, and the like.

They form also, in modern civilized countries, a very common part of the ornaments of the ladies.

BRACHILEUS, the name of a muscle. See Anatomy, Table of the Muscles.

Coraco-Brachialis. See Anatomy Index.

BRACHIUM, or ARM. See Anatomy Index.

BRACHIMINS, or BRACHMANS, a branch of the ancient Gymnosophists, or philosophers of India, remarkable for the severity of their lives and manners. See the article Gymnosophists.

Some say they derive their name from the patriarch Abraham, whom they call in their language Brachma, or Brahma. Others deduce it from the name of their god Brachma; which some again take to be the same with Abraham: whence Postel calls them Abrahamites.

F. Thomasin
BRA

F. Thomasian derives the word from the Hebrew barach, to fly or escape; because the Brachmans retire into the country and live in deserts. The same author gives us another derivation, viz. from the Hebrew barach (benedicere, orare), to bless or pray; in regard this is their principal occupation.—The Greeks ascribe to them the doctrine of the immortality of the soul, and certain notions concerning the nature of the Supreme Being and future rewards and punishments. To this species of knowledge the Brachmans added an infinite number of religious observances, which were adopted by Pythagoras in his school; such as fasting, prayer, silence, and contemplation. They were looked upon as the friends of the gods, because they affected to pay them so much regard; and as the protectors of mankind, because they paid them no regard at all. No bounds were therefore set to the respect and gratitude that were shown them: princes themselves did not scruple to consult these recluses upon any critical conjectures, from a supposition, no doubt, that they were inspired; since it was impossible to imagine that they had the advantages of experience. We can scarcely, however, deny, that there might be among them some men of real virtue, whose minds relished the pure and ingenious delights of study and science; and who, by nobly raising their thoughts to the contemplation of the First Being, must have had more powerful incitements to render themselves worthy of his care, and none to justify them in deceiving and tyrannizing over their fellow-creatures.

There appear still some remains of the ancient brachmans in the east, under the denomination of Bramins. See Bramins.

BRACHYGRAPHY, the art of short-hand-writing. See Short Hand.

BRACHYLOGY, (from brachy- and logos "expression"), in Rhetoric, the expressing any thing in the most compressible manner. This, so far as consistent with perspicuity, is a virtue and beauty of style; but if obscurity be the consequence, which is often the case, it becomes a blemish and inexusable defect.—Quintilian gives an instance of brachylogy from Sullust: Mithridates corpusse ingenti periade armatus; " Mithridates, as it were, armed with the hugeness of his stature."

BRACHYPEPTERA, a term used by Willoughby, to denote those hawks which have their wings so short as not to reach to the end of the tail. Of this kind are the gosh-hawk, sparrow hawk, &c.

BRACHYPRENA, in the history of fossils, a genus of septarian, with a short, roundish nucleus. See Septarian.

BRACHYTELOSTYLA, in Natural History, the same by which Dr Hill calls those crystals which are composed of a short hexagonal column terminated at each end by an hexagonal pyramid. See Crystal.

BRACKET, among carpenters, &c. a kind of wooden stay, serving to support shelves and the like.

Brackets, in a ship, the small knees, serving to support the galleries, and commonly carved. Also the timbers that support the graining in the head are called brackets.

Brackets, in Gunnerie, are the cheeks of the carriage of a mortar: they are made of strong planks of wood, of almost a semicircular figure, and bound round with thick iron plates; they are fixed to the beds by four bolts, which are called bed-bolts; they rise up on each side of the mortar, and serve to keep her at any elevation by means of some strong iron bolts, called bracket-bolts, which go through these cheeks or brackets.

BRACKLAU, a strong town in Poland, capital of a palatinate of the same name. The houses are built of wood. It was taken by the Turks in 1672, but re-taken three years afterwards. It is seated on the river Bog, in E. Long. 29. 20. N. Lat. 48. 5.

BRACKLAW, a palatinate of that name, which is the eastern part of Podolia; it is also called Lower Podolia, and is of greater extent than Upper Podolia, but is more desolate, on account of the neighbourhood of the Tartars.

BRACKLEY, a borough-town in Northamptonshire, in England, seated on the edge of the county, next Buckinghamshire, on a branch of the river Ouse. It is an ancient and large corporation-town, containing two parish-churches; is governed by a mayor and aldermen; and sends two members to parliament. It had formerly a college, which is turned into a free school. W. Long. 1. 15. N. Lat. 52. 0.

BRACTEA, in Natural History, denotes a spangle, or thin flake of any substance.

BRACTEA, in Botany, a thin leaf or plate of any foliis flore, ranged by Linneus among the fulcra of plants. These floral leaves differ in shape and colour, from the other folia of the plant; are generally situated on the penduculus, and often so near the corolla as to be easily mistaken for the calyx; than which, however, the bracteae are generally more permanent. Examples of the floral leaves are seen in the tilia, fumaria bulbosa, lavandula and herminum.

BRACTEARIA, in Natural History, a genus of tales, composed of small plates in form of spangles, each plate either being very thin, or fissile into very thin ones.

Of this genus there are a great many species, called from their different colours, mica aurea, or gold-glimmer; and mica argentea, silver-glimmer, or cats-silver, &c.

BRACTON, HENRY, lord chief justice of England in the reign of Henry III. was probably a native of Devonshire. He was educated at Oxford, where he took the degree of doctor of laws, and was made one of the itinerant judges about the year 1244. Ten years after he became chief justice, and had the earl of Derby's house in London assigned him for his town residence, during the minority of that nobleman. He is said to have filled this important office with singular reputation during 20 years. When he died is not known; probably it was in the reign of Edward L. He wrote De legibus et consuetudiniis Angliae, which is one of the most ancient, and also most methodical books on our laws. His method is copied from Justinian. This work was printed at London in 1569, folio; and in 1640, 4to. The first is very incorrect.

BRAD, a town of Scythia, seated on the north side of the river Save, in E. Long. 18. 40. N. Lat. 45. 20.

BRADFORD, John, a divine, and martyr, to the reformation,
BRA [366] BRA

Bradford

Henry VIII, at Manchester in Lancashire. Being a remarkable penman and accountant, he became secretary to Sir John Harrington, who was several times employed by King Henry, and his successor Edward VI, as paymaster to the troops abroad. Bradford at this time was a gay man, and to support his extravagance made free with the King's money; but being at last unable to support the reflection of his guilt, he determined to make restitution, and actually repaid the money. Quitting his employment of secretary, about the year 1547, he took chambers in the inner temple, and for some time studied the law; but finding in himself an inclination to preach the gospel, in the following year he removed to Catharine-hall in Cambridge, where he applied with such uncommon assiduity to the study of divinity, that in a much shorter time than usual he was admitted to the degree of master of arts, and soon after made fellow of Pembroke-hall. Bishop Ridley, who, in 1550, was translated to the see of London, charmed with Bradford's application and zeal, sent for him to the metropolis, ordained, and appointed him his chaplain. In 1553, he was also made chaplain to Edward VI, during which time he became one of the most popular preachers in the kingdom. Such a reformer was too dangerous to be suffered in the succeeding reign. Mary was hardly in possession of the crown, before Bradford's persecutions began. He was first confined in the Tower for sedition, where he continued a year and a half; during which time he wrote several epistles that were dispersed in various parts of the kingdom. He was afterwards removed to other prisons, and at last brought to his trial before that infernal court of inquisition in which Cardener sat as chief inquisitor, where he defended his principles to the last, in contempt of their utmost power. They condemned him to the flames; and he was accordingly burnt alive in Smithfield, on July 1, 1555. His works are, 1. Seventy-two letters, written to various people, whilst the author was in prison; printed in Bishop Coverdale's collection. 2. Ten letters, printed in Fox's Acts and Monuments. 3. Complaint of verity, 1559, 8vo. 4. Three examinations before the commissioners, and his private talk with the priests, with the original of his life, 1561, octavo. 5. Two notable sermons 1574, octavo, 1631. 6. Godly meditations and prayers 1614, 24to. 7. Treatise of repentance, 1622. With several translations and other pieces.

BRADFORTH, a town in the west of Yorkshire, seated on a breach of the river Aire, containing 7767 inhabitants in 1811. W. Long. 1. 35. N. Lat. 53. 40. CE.

BRADLEY, Dr. James, a famous English astronomer, was the third son of William and Jane Bradley, and was born at Sherborne in Dorsetshire in the year 1692.

He was educated for the university at North Leach by Mr. Egles and Mr. Brice, who kept a boarding-school there; and from North Leach he was sent to Oxford. His friends intended him for the church, and his studies were regulated with that view; and as soon as he was of sufficient age to receive holy orders, the bishop of Hereford, who had conceived a great esteem for him, gave him the living of Bridstow, and soon after he was inducted to that of Welford in Pembroke-shire. But notwithstanding these advantages, from which he might promise himself still farther advancement in the church, he at length resigned his livings, that he might be wholly at liberty to pursue his favourite study the mathematics, and particularly astronomy. He was nephew to Mr. Pound, a gentleman who is well known in the learned world by many excellent observations, and who would have enriched it with more, if the journals of his voyages had not been lost at Pole Com- dore, when the place was set on fire, and the English who were settled there cruelly massacred. Mr. Pound himself very narrowly escaping with his life. With this gentleman, Mr. Bradley passed all the time that he could spare from the duties of his function; and perhaps he sometimes trespassed upon them: he was then sufficiently acquainted with the mathematics to improve by Mr. Pound's conversation; yet it does not appear that, in this study, he had any preceptor but his genius, or any assistant but his labour.

It may be easily imagined, that the example and conversation of Mr. Pound did not render Bradley more food of his profession than he was before; he continued, however, as yet to fulfill the duties of it, though at this time he had made such observations as laid the foundation of those discoveries which afterwards distinguished him as one of the greatest astronomers of his age. Though these observations were made as it were by stealth, they gained him at first the notice, and then the friendship, of the lord chancellor Macclesfield, Mr. Newton, afterwards Sir Isaac, Mr. Halley, and many other members of the Royal Society, into which he was soon elected a member. About the same time, the chair of Savilian professor of astronomy became vacant by the death of the celebrated Dr. Keill; and Mr. Brad- ley was elected to succeed him on the 31st of October 1724, being then just 29 years old; and his colleague was Mr. Halley, who was professor of geometry on the same foundation. Bradley, upon his being elected in to this professorship, gave up both his livings, and with great joy quitted a situation in which his duty was directly opposite to his inclination. From this time, he applied himself wholly to the study of his favourite science; and in the year 1727 he published his theory of the aberration of the fixed stars, which is allowed to be one of the most useful and ingenious discoveries of modern astronomy. Three years after this discovery, by which Mr. Bradley acquired very great reputation, he was appointed lecturer in astronomy and physics, at the museum of Oxford. He pursued his studies with equal application and delight; and in the course of his observations, which were innumerable, he discovered that the inclination of the earth's axis upon the plane of the ecliptic was not always the same, but that it varied backwards and forwards some seconds, and that the period of these variations was nine years. This period seemed altogether unaccountable, as it could not be supposed to have any thing in common with the revolution of the earth, which is performed in one year. Mr. Bradley, however, discovered the cause of this phenomenon in the Newtonian system of attraction. He published this discovery in 1737, so that in the space of about ten years he communicated to the world two of the finest discoveries in modern astronomy, which will for ever make a memorable epoch in the history of that science.

Mr
Mr. Bradley always preserved the esteem and friendship of Mr. Halley; who, being worn out by age and infirmities, thought he could do nothing farther for the service of astronomy, than procure for Mr. Bradley the place of regius professor of astronomy at Greenwich, which he had possessed himself many years with the greatest reputation. With this view, he wrote many letters, which have been since found among Mr. Bradley's papers, desiring his permission to apply for a grant of the reversion of it to him, and even offering to resign in his favour, if it should be thought necessary: but before Mr. Halley could bring this kind project to bear, he died. Mr. Bradley, however, obtained the place afterwards, by the favour and interest of Lord Macclesfield, who was afterwards president of the Royal Society. As soon as the appointment of Mr. Bradley to this place was known, the university of Oxford sent him a diploma creating him doctor of divinity. The appointment of astronomer at Greenwich placed Mr. Bradley in his proper element, and he pursued his observations with unwearyed diligence. However numerous the collection of astronomical instruments at the observatory at Greenwich, it was impossible that such an observer as Dr. Bradley should not desire to increase them, as well to answer those particular views, as in general to make observations with greater exactness. In the year 1748, therefore, he took the opportunity of the annual visit made by the Royal Society to the observatory, in order to examine the instruments and receive the professor's observations for the year, to represent so strongly the necessity of repairing the old instruments, and purchasing new, that the society thought proper to represent it to his majesty, and his majesty gave them 1000l. for that purpose. This sum was laid out under the direction of Dr. Bradley, who, with the assistance of the late celebrated Mr. Graham and Mr. Bird, furnished the observatory with as complete a collection of astronomical instruments, as the most liberal and diligent observer could desire. Dr. Bradley, furnished with such assistance, pursued his observations with new assiduity, an incredible number of which were found after his death, and put into the hands of the Royal Society.

It has been already observed, that when Dr. Bradley was elected to the professor's chair at Oxford, he gave up his two livings, which were at such a distance, that he could not possibly fulfil the duties of them himself; but it happened that after he was settled at Greenwich the living of that parish became vacant, which is very considerable, and which was offered to him, as he was upon the spot to perform the duty, and had the claim of uncomon merit to the reward. This living, however, Dr. Bradley, very greatly to his honour, refused, fearing the duties of the astronomer would too much interfere with those of the divine. His majesty, however, hearing of the refusal, was so pleased with it, that he granted him a pension of 250l. a-year, in consideration of his great abilities and knowledge in astronomy and other branches of the mathematics, which had procured so much advantage to the commerce and navigation of Great Britain, as is particularly mentioned in the grant, which is dated the 17th of February 1732. Dr. Bradley, about the same time, was admitted into the council of the Royal Society. In the year 1748, he was admitted a member of the royal academy of sciences and belles lettres of Berlin, upon the death of M. Crevier, first physician to his Catholic majesty; in the year 1752, a member of the imperial academy at Petersburg; and in 1757, of that instituted at Bologna.

Dr. Bradley was still indefatigable in his observations, and whatever honour he received became an incitement to obtain new distinction; his corporeal abilities, however, at length declined, though his intellectual suffered no abatement. In the year 1780, he became extremely weak and infirm; and towards the end of June 1782, he was attacked with a total suppression of urine, caused by an inflammation of the reins, which on the 12th of July following put an end to his life, in the 70th year of his age. He was buried at Mitcham Hampton, in Gloucestershire, in the same grave with his mother and his wife. In the year 1744, he married Susannah Peach, the daughter of a gentleman of that name in Gloucestershire, by whom he had only one daughter.

As to his character, he was remarkable for a placid and gentle modesty, very uncommon in persons of an active temper and robust constitution. It was still more remarkable, that, with this untroubled equanimity of temper, he was compassionate and liberal in the highest degree. Although he was a good speaker, and possessed the rare but happy art of expressing his ideas with the utmost precision and perspicuity, yet no man was a greater lover of silence, for he never spoke but when he thought it absolutely necessary. He did indeed think it necessary to speak when he had a fair opportunity to communicate any useful knowledge in his own way; and, he encouraged those that attended his lectures to ask him questions, by the exactness with which he answered, and the care he took to adapt himself to every capacity. He was not more inclined to write than to speak, for he has published very little; he had a natural diffidence, which made him always afraid that his works should not be his character; and therefore suppressed many, which probably were well worthy of the public attention. He was even known, as it were, in spite of himself; and, in spite of himself, he was known much, and consequently much esteemed. He was acquainted with many of the first persons in this kingdom, persons eminent as well for their rank as their abilities; he was honoured by all men of learning in general; and there was not an astronomer of any eminence in the world with whom he had not a literary correspondence. Upon the whole, it may be said of Dr. Bradley, that no man cultivated great talents with more success, or had a better claim to be ranked among the greatest astronomers of his age.

BRADNICH, a town of Devonshire, once a considerable place, but some time ago totally destroyed by fire. W. Long. 3° 35'. N. Lat. 50° 45'.

BRADS, among artificers, a kind of nails used in building, which have no spreading heads as other nails have. They are distinguished by ironmongers by six names; as joiner's brads, flooring-brads, batten-brads, bill-brads, or quarter-heads, &c. Joiner's brads are for hard wainscot; batten-brads &c. for soft wainscot; bill-brads are used when a floor is laid in haste, or for shallow joints subject to warp. See NAIL.

BRADSHAW, HENRY, a Benedictine monk, was born at Chester, about the middle of the 17th century. Discovering
Discovering an early propensity to religion and literature, he was received while a boy into the monastery of St Werberg in that city; and having there imbibed the rudiments of his education, he was afterwards sent to Gloucester college, in the suburbs of Oxford, where for a time he studied theology with the novices of his order, and then returned to his convenant at Chester: here, in the latter part of his life, he applied himself chiefly to the study of history, and wrote several books. He died in the year 1513, the fifth of Henry VIII. His poetry is not inferior to that of any of his contemporaries. His works are, 1. De antiquitate et magnificen|cia urbis Cestre. 2. Chronicum. 3. The life of the glorious virgin St Werberg. Printed Lond. 1521, 4to, in verse. The life of St Werberg makes only part of this work; for it contains also a description of the kingdom of Mercia, life of St Etheldred, the life of St Sexburg, the foundation and history of Chester, and the chronicles of some kings. Possibly this work may include the two first. Bishop Tanner says that he wrote a chronicle in English verse, extracted from Bede, Malmesbury, Giraldus, and others. Probably this is the chronicle above mentioned.

BRADWARDIN, Thomas, archbishop of Canterbury, was born at Hartfield in Sussex, about the close of the 13th century. He was educated at Oxford college, Oxford, where he took the degree of doctor of divinity; and acquired the reputation of a profound scholar, a skilful mathematician, and consummate divine. Authors are not agreed as to his first preferments. Pitt says he was professor of divinity at Oxford. They agree, however, in asserting, that from being chancellor of the diocese of London, he became a courtier and confessor to Edward III. whom he constantly attended during his war with France, assisting that victorious prince with his advice, animating the troops, and fervently praying for their success. After his return from the war, he was made prebendary of Lincoln, and afterwards archbishop of Canterbury. He died at Lambeth in the year 1349, forty days after his consecration; and was buried in St Anselm's chapel, near the south wall. His works are, 1. De causa Dei, printed at London, 1618, published by J. H. Savil. 2. De geometria speculativa, &c. Paris, 1495, 1512, 1530. 3. De arithmetica practica, Paris, 1502, 1512. 4. De proportionibus, Paris, 1495. Venice, 1505, folio.

BRADY, Robert, born in Norfolk in 1643, was master of Caius college, Cambridge, regius professor there, and twice representative of that university in parliament. In 1695, he was made keeper of the records in the Tower, and was physician in ordinary to James II. He wrote, An introduction to Old English history; A history of England, from the time of the Romans to the end of the reign of Richard II.; and, A treatise on English boroughs. He died in 1700.

BRADY, Nicholas, an excellent divine and poet, born at Bandon, in the county of Cork, October 28th 1639. He studied at Westminster-school, and afterwards at Oxford and Dublin college. He was a zealous promoter of the Revolution; and, in 1690, when the troubles broke out in Ireland, by his interest with McCarty, King James's general, he thence prevented the burning of the town of Bandon. Having quitted several preferments in Ireland, he settled in London, where he was successively promoted to several livings; and at the time of his death was rector of Clapham, minister of Richmond, and chaplain to the duke of Ormond's troop of horse-guards. He wrote part of the new version of the Psalms, now sung in many churches in England and Ireland; the Aeneids of Virgil, in 4 vols.; and 3 vols. of sermons. He died May 20th 1726.

BRADY-PELLUS, or SLOTH, a genus of quadrupeds, belonging to the order of bruta. See Mammalia Index.

BRAE-MAR, a mountainous territory of Scotland, in the shire of Aberdeen, where the last Earl of Mar began to raise a rebellion in 1715. It is 27 miles north-west of Aberdeen.

BRAE-MCRAE, a mountainous and woody tract of land, lying in the shires of Elgin and Nairn in Scotland.

BRAG, an ingenious and pleasant game at cards, where as many may partake as the cards will supply; the eldest hand dealing three to each person at one time, and turning up the last card all round. This done, each gamester puts down three stakes, one for each card. The first stake is won by the best card turned up in the dealing round; beginning from the ace, king, queen, knave, and so downwards. When cards of the same value are turned up to two or more of the gamesters, the eldest hand gains; but it is to be observed, that the ace of diamonds wins, to whatever hand it be turned up. The second stake is won by what is called the brag, which consists in one of the gamesters challenging the rest to turn up cards equal to his. Now it is to be observed, that a pair of aces is the best brag, a pair of kings the next, and so on; and a pair of any sort wins the stake from the most valuable single card. In this part consists the great diversion of the game; for, by the artful management of the looks, gestures, and voice, it frequently happens, that a pair of fives, threes, or even deuces, outrages a much higher pair, and even some pairs royal, to the no small merriment of the company. The knave of clubs is here a principal favourite, making a pair with any other card in hand, and with any other two cards a pair royal. The third stake is won by the person who first makes up the cards in his hand one and thirty; each dignified card going for ten, and drawing from the pack, as usual in this game.

BRAGA, the capital of the province of Entre-minho-douro, in Portugal, situated on the river Cavado, in W. Long. 8° 40′ N. Lat. 41° 20′.

BRAGANZA, a city of Portugal, and capital of a duchy of the same name. It is seated on an eminence, by a brook called Forvenca; and is divided into two parts, the old city and the town. The former is upon an eminence, and fortified with a double wall. That part next the town has five bastions, but no ditch; the citadel is on the opposite side joined to the wall. The town is in a plain, and defended by a fort with four bastions. It is seated near the river Sabor, on the frontiers of Galicia, in W. Long. 6° 15′ N. Lat. 41° 27′.

BRAGGOT, a kind of drink made of malt, honey, and spices, much used in Wales.

BRAHE, Tycho, a celebrated astronomer, descended of an illustrious family originally of Sweden, but settled at Denmark, was born December 14, 1546, at
he was received by the emperor at Prague with the utmost civility and respect. That prince gave him a magnificent house, till he could procure one for himself; and more fit for astronomical observations; assigned him a pension of 3000 crowns; and promised upon the first opportunity, a fee for him and his descendants, but he did not long enjoy this happy situation; for, upon the 24th of October 1601, he died of a retention of urine, in the 55th year of his age, and was interred in a very magnificent manner in the principal church at Prague, where a noble monument was erected to him. — His skill in astronomy is universally known, and he is famed for being the inventor of a new system, which he endeavoured, though without success, to establish upon the ruins of that of Copernicus. He was very credulous with regard to judicial astrology and presages. If he met an old woman who went out of doors, or a bare upon the road in a journey, he used to turn back immediately, being persuaded that it was a bad omen. When he lived at Urania burg, he had at his house a madman, whom he placed at his feet at table, and fed himself. As he imagined that everything spoken by mad persons presaged something, he carefully observed all that this man said; and because it sometimes proved true, he imagined it might always be depended on. A mere trifle put him in a passion; and against persons of the first rank, with whom it was his duty to keep on good terms, he openly discovered his resentment. He was very apt to rally others, but highly provoked if the same liberty was taken with himself. His principal works are, 1. "Prognomastica astronomiae. 2. "De mundi aetheri recentioribus phaenomenis. 3. "Epistolarum astronomicarum liber."

BRAHMA. See Brama.

BRAIDALBIN, a district of Perthshire in Scotland, stretching 32 miles from east to west, and 13 where broadest from south to north. It is a mountainous country, lying among the Grampian hills, supposed to be the country anciently known by the name of Alba; and whence the Highlanders to this day, call themselves Albinich. It is bounded on the west by Lochaber, Lorn, and Knapdale; on the north and east, by part of Lochaber and part of Athol; and on the south by Strathern and Monteith. It produces plenty of game and black cattle; is inhabited by Highlanders said to be the most ferocious in all Scotland; and gives the title of earl to a branch of the Campbell family, which is possessed of a noble and magnificent seat in this division. Much flax is cultivated here. Some years ago, when premiums were given for the greatest crops, from 70 to 120 hogheads of linseed were annually sown, each peck yielding two stones of dressed flax; and when the yarn sold highest, 2000l. worth has been sold out of the country. Oats and potatoes are the other crops. Oats yield from four to six fold at the most, oftener less; bear from eight to ten, at an average six. The corn raised seldom suffices the number of inhabitants, so they are often obliged to have recourse to importation. From their potatoes some have distilled a very strong spirit, which has been found cheaper than what is distilled from any grain. Starch is also made from them; and, in some places, bread. Corncr, or the tichen omphaloides, is an article of commerce; great quantities have been scraped from the rocks, and exported for the use of the dyers.
BRA

BRA

Bramble at the price of 1s. or 16d. per stone. A good many sheep are reared here, and much wool is sent out of the country. There are few horses raised in this country: such as feed on the tops of the higher hills are often afflicted with a distemper that commonly proves fatal, if a remedy is not applied within 24 hours. It attacks them in the months of July and August, usually after a fall of rain, or before the dew rises in the morning. An universal swelling spreads over the body; the remedy is exercise, chafing, or any other method that promotes urine and perspiration. The common people attribute this evil to a certain animal that scatters its poison over the grass; but more probably it arises from some noxious vegetable, hitherto unobserved. Before the year 1745, Lord Brabban was obliged to keep a constant guard for the protection of his vassals cattle, or to retain spies among the thievish clans; having too much spirit to submit to pay an infamous tax, called black mail, to the plundering chief-tains, as the price of their safety.

BRAIL, or Brailes, in a ship, are small ropes made use of to furl the sails across: they belong only to the two courses and the mizen-sail; they are reeved through the blocks, seized on each side the tides, and come down before the sail, being at the very skirt thereof fastened to the cringles; their use is, when the sail is furled across, to haul up its halyards, that it may the more easily be taken up or fall. Haul up the brails, or brail up the sail; that is, Haul up the sail, in order to be furled or bound close to the yard.

BRAILLOW, a town of Poles, in the province of Podolia, seated on the river Bog, in E. Long. 29°. N. Lat. 43°. 50.'

BRAIN, in Anatomy, is that large, soft, whitish mass, enclosed in the cranium or skull; wherein all the organs of sense terminate, and the soul is supposed principally to reside. See Anatomy Index.

BRAIN le Comte, a town of the Austrian Netherlands, in the province of Hainault. E. Long. 4°. 11'. N. Lat. 50°. 35.'

BRAINTHEE, a large town of Essex in England, situated in E. Long. 0°. 30'. N. Lat. 51°. 51.'

BRAKE, denotes female fern, or the place where it grows. Also a sharp bit or snaffle for horses; and a baker's kneading-trough. Also an instrument with teeth to bruise flax or hemp. See Flax-Dressing.

BRAKEL, a town of Germany, in the bishopric of Paderborn. E. Long. 9°. 8'. N. Lat. 51°. 46.'

BRAMA, or Bruma, a pagan deity of the East Indies. He is the first person of a kind of trinity in their theology; is the great progenitor of mankind; and has created as many worlds as there are considerable parts in his body. See the article Brahman, Brames, and Indostan.

BRAMA, in Ichthyology, the trivial name of a species of cyprinus.

BRAMAH, Joseph, an English engineer and machinist. See Supplement.

BRAMANT, a town of Savoy in the valley of Maurich, seated on the river Arick, in E. Long. 4°. 15'. N. Lat. 45°. 0.'

BRAMBER, a town of Sussex in England, with 95 inhabitants, though formerly of some account; however, it sends two members to parliament. W. Long. 0°. 15'. N. Lat. 50°. 50.'

BRAMBLE, in Botany, the English name of the Rubus. See Botany Index.

BRAMBLE-NEST, otherwise called hallier, is a net to catch birds in of several sizes: the great meshes must be four inches square; those of the least size are three inches square; and those of the biggest, five. In the depth they should not be above three or four inches; but as for the length, they may be enlarged at pleasure; the shortest being 18 feet long.

BRAMBLE, or Brambling, in Ornithology, the trivial name of a species of Fringilla.

BRAMER, Leonard, history-painter, was born at Delft in 1595; but learned the art of painting in the school of Rembrandt, and imitated the manner of his master in small. In the 18th year of his age he went to Rome for his improvement; but although he continued in Italy for some years, and acquired something in his style rather more graceful than Rembrandt, yet he could never divest himself of the Flemish gout. He had a fine taste of design; his expression is generally good, and in some of his compositions truly noble. His pencil is delicate, and his colouring very peculiar in the tints, being also remarkably thin in many parts, so as barely to cover the pannels; yet, by great skill in the management of the chiaro-scuro, his colouring is bright, bold, and full of lustre; particularly in the vases, which he was fond of introducing in every subject that could admit them, as he knew how to give them a rich and fine relievo. He had accustomed himself to paint with a very thin body of colour, especially in the brown and shadowy parts, in order to give his pictures a greater transparency. At Venice, Naples, Florence, Mantua, and other cities of Italy, as well as at Rome, he left many proofs of his extraordinary merit, which rendered his name deservedly famous; and his works are rarely to be met with out of Italy, where he painted most; but whenever they are to be purchased they are bought at considerable prices, if they are entire and undamaged. One of the most capital pictures of Bramer is the Rising of Lomarus, in which there is a charming opposition of light and shadow; and another in the Denial of St Peter: They are both painted in his best manner; they are bright, transparent, and finely peneiled, and are still preserved at Rome. Likewise at the palace of Ryswick, there are several valuable paintings by this master; in which the invention and execution are highly commendable. But none of his works can be more admired than a small picture on copper representing the story of Pyramus and Thisbe.

BRAMHALL, Dr John, archbishop of Armagh, was born of an ancient family at Pontefract in Yorkshire, about the year 1593. He was invited over to Ireland by the lord deputy Wentworth, and soon after obtained the arch-deaconry of Meath, the best in that kingdom. In 1634, he was made bishop of Londonderry, which see he improved very much; but the greatest service he did to the church of Ireland, was by getting, with the deputy's assistance, several acts passed for abolishing fee-farms, recovering improprations, &c. by which, and by other means, he regained to the church in the space of four years 30,000l. or 40,000l. a year. In the convocation he prevailed upon the church of Ireland to unite in the same faith with the church of England, by adopting the 39 articles.
BRAMINS. The name of the priests among the idolatrous Indians; the successors of the ancient Brachmans. See the article Brachmans.

Their name is formed from Brama, their particular deity. They are found in Siam, Malabar, China, Coremandel, and most other eastern nations likewise civilized; but their chief seat is in Indostan, or the Mogul's country. They have a language peculiar to themselves, which they call Sanscrit; in which they have several ancient books, written, as is alleged, by their great prophet Brama; as the Shastrams, which is their bible; and Purams, a history which they esteem sacred, and pretend to have been dictated by God himself.

There are several orders of Bramins. Those who mix in society are for the most part very corrupt in their morals: they believe that the water of the Ganges will wash away all their crimes; and, as they are not subject to any civil jurisdiction, live without either restraint or virtue, excepting that character of compassion and charity which is so commonly found in the mild climate of India. The others, who live abstracted from the world, are either weak-minded men or enthusiasts; and abandon themselves to laziness, superstition, and the dreams of metaphysics. We find in their disputes the same ideas that occur in the writings of our most celebrated metaphysicians; such as, substance, accident, priority, posteriority, immutability, indivisibility, &c.

Their religion, which was anciently of the allegorical and moral kind, hath degenerated into a heap of extravagant and obscene superstitions, owing to their having realized those fictions which were intended merely as so many symbols and emblems. Were it possible to obtain a sight of their sacred books, the only remains there of the Indian antiquities, we might in some measure be enabled to remove the veil that envelops these numerous mysteries; but the following story will show how little reason there is to hope that we shall ever be intrusted with such a communication.

The emperor Mahmod Akbar had an inclination to make himself acquainted with the principles of all the religious sects throughout his extensive provinces. Having discarded the superstitious notions with which he had been prepossessed by his education in the Mahometan faith, he resolved to judge for himself. It was easy for him to be acquainted with the nature of those systems that are formed upon the plan of making proselytes; but he found himself disappointed in his design when he came to treat with the Indians, who will not admit any person whatever to the participation of their mysteries. Neither the authority nor promises of Akbar could prevail with the Bramins to disclose the tenets of their religion; he was therefore obliged to have recourse to artifice. The stratagem he made use of, was to cause a boy, of the name of Feizi, to be committed to the care of these priests, as a poor orphan of the sacerdotal line, who alone could be initiated into the sacred rites of their theology. Feizi, having received the proper instructions for the part he was to act, was conveyed privately to Barama, the seat of knowledge in Indostan; he was received into the house of a learned Bramin, who educated him with the same care as if he had been his own son. After the youth had spent ten years in study, Akbar was desirous of recalling him: but he was struck with the charms of the daughter of his preceptor. The women of the sacerdotal tribe are looked upon as the greatest beauties in Indostan. The old Bramin laid no restraint upon that growing passion of the two lovers: he was fond of Feizi, who had gained his affection by his address and docility; and offered him his daughter in marriage. The young man, divided between love and gratitude, resolved to conceal the fraud no longer; and falling at the feet of the Bramin, discovered the imposture, and asked pardon for his offence. The priest, without reproaching him in the least, seized a poignard, which hung at his girdle, and was going to plunge it in his breast, if Feizi had not prevented him by taking hold of his arm. The young man used every means to pacify him, and declared himself ready to do anything to expiate his treachery. The Bramin bursting into tears, promised to pardon him on condition that he should swear never to translate the Bedas or sacred volumes, or disclose to any person whatever the symbol of the Bramin creed. Feizi readily promised all that the Bramin required: how far he kept his word is not known; but the sacred books of the Indians have never been translated by him, or any one else, to this day. As the Bramins are the only persons who understand the language of the sacred books, their comments on the text are the same as those that have ever been made on religious books; all the maxims which fancy, interest, passion, or false zeal can suggest, are to be found in these volumes. See the articles Shastar and Vedam.

They own a supreme God, who created Brahma, and gave him a power to create the world. They have also their subalteren deities, their pagods or temples, and idols, whom they fan to defend from flies, dancing before them. They also hold a feast in honour of the sun considered as the source of light and heat, whereby all nature is fecundated.

Their pagods or temples consist of three parts. The first is a vaulted roof, supported on stone columns: it lies open, and all persons, without distinction, are allowed to enter into it. It is adorned with symbolical figures made of wood, as elephants, oxen, and horses. The second part is open in the day time, and shut at night. It is filled with grotesque and monstrous figures, as men with many heads and arms. The third, which is a kind of chancel, is kept always shut, with a very strong gate. In this is placed the statue of the deity to whom the pagod is dedicated. A great number...
BRANCH, in Botany, an arm of a tree, or a part which, sprouting out from the trunk, helps to form the head or crown thereof. Branches do not spring out of the mere surface of the trunk, but are profoundly rooted therein, so as not only to penetrate into the cortical, but also the woody substance, and even the pith. The constituent parts therefore of a branch are the same as of the trunk, viz. skin, bark, wood, and pith. See the article Plants.

Branches of a Bridle, in the manege, are two pieces of iron bended, which, in the interval between the one and the other, bear the bit-mouth, the cross-chains, and the curb; so that on one end they answer to the head-stall, and on the other to the rein, in order to keep the horse’s head in subjection. With regard to their form and structure, branches are either straight, in form of a pistol, for young horses to form their mouth; or after the costable of France’s fashion, proper for a horse that carries his head well. Some are in form of a gigot or leg, which will prevent horses from carrying too low: Some are in form of a bent knee, contrived for horses that arm themselves against the operation of the bit; and others after the French fashion, which is hardly above one third of an inch at the sovile hole, and kneds 1½ inch at the jarret or harn.

It is to be observed, 1. That the farther the branch is from the horse’s neck, the more effect it will have. 2. That short branches, cæteris paribus, are ruder, and their effects more sudden, than those of longer. 3. That the branch is to be proportioned to the length of a horse’s neck; and one may sooner err in choosing one too short than too long.

Branches of Orifice, in Architecture, are the arches of Gothic vaults. They arches, tracing from one angle to another diagonal-wise, form a cross between the other arches, which make the sides of the square, of which the arches are diagonal.

Branch-Stop, with falconers, a term used to signify the making a hawk leap from tree to tree, till the dog springs the game.

Brancher, among sportsmen, a young hawk, newly taken out of the nest, that can hop from bough to bough.

Branchiae, or Gillis, in the anatomy of fishes, the parts corresponding to the lungs of land-animals. All fishes, except the cetaceous ones, and the pteronyzum, which have lungs, are furnished with these organs of respiration. See Anatomy Index.

Branchiæ, in Grecian antiquity, priests of the temple of Apollo, which was at Didymus in Ionia, a province of Lesser Asia, towards the Ægean sea, upon the frontier of Caria. They opened to Xerxes the temple of Apollo, the riches whereof he took away. After which, thinking it unsafe to stay in Greece, they fled to Sagdana, on the other side of the Caspian sea, upon the frontiers of Persia, where they built a city called by their own name: but they did not escape the punishment of their crime; for Alexander the Great having conquered Darius king of Persia, and being informed of their treachery, put them all to the sword, and razed their city, thus punishing the impiety of the fathers in their posterity.

Branchiostegi, in Ichthyology, a term used to express one of the general classes of fishes; the characters of which are, that the rays of the fins are of a bony
bony substance, but these fish have no bones or ossicles at the branchium, as the malacoptygious and ascanioptygious fishes all have.

BRANCHON, a town of the Netherlands, in the province of Namur, seated on the river Mehaigne. E. Long. 4° 40'. N. Lat. 50° 32'.

BRAND SUNDAY, Dimanche des Brandons, in French ecclesiastical writers, denotes the first Sunday in Lent, which is thus called on account of an ancient practice in the Lyonnaise, where the peasants, in the night of this day, walked about their orchards, gardens, &c. with torches lighted, or fire-branches in their hands, in which plight they visited every tree, and adorning themselves to them one after another, threatened, that if they did not bear fruit well the ensuing season, they should be cut down to the ground and burnt. This is evidently a relic of Paganism, the like of which was practised by the ancient idolaters in the month of February; hence called Febrarius, a februano.

BRANDEIS, a town of Bohemia, seated on the river Elbe. E. Long. 14° 25'. N. Lat. 50° 15'.

BRANDENBURG, Marquisate of, a large country of Germany, having Mecklenburg and Pomerania on the north; Poland, on the east; Silesia, with the Lusatian, the electorate of Saxony, Anhalt, and duchy of Magdeburg, on the south; and part of the same duchy, and that of Luneburg, on the west. Its greatest length is near 200 miles, and its greatest breadth near 100. Its northern situation makes it very cold for seven or eight months in winter. The soil in general is far from being fruitful, a great part of it consisting of sand; yet there are several fruitful spots in it; and the whole, under the last and present reign, has been greatly improved, and much better peopled. In some parts there is great plenty of potatoes and turnips; in others of buck-wheat, milk, and flax; in others of tobacco, wood, and other herbs for dyeing. All sorts of colour-earth, together with alum, salpetre, amber, iron, stone, and medicinal springs, are found in it. Abundance of cattle, especially sheep, are bred here; and the woods not only supply the inhabitants with fuel, but with timber, charcoal, tar, and wood-ashes, both for domestic uses and for exportation. The culture of silk is also carried on in this country with great success. The principal rivers by which it is watered are the Elbe, the Oder, the Frignitz, the Havel, the Warte, and the Spree. Some of the rivers and lakes abound in fish, and are united by canals for the benefit of navigation. They reckon in the whole Mark 120 towns, 2500 villages; and in 1801 about 1,200,000 inhabitants. The states here consist of the nobility and towns, whose assembly-house is in the Buen-street at Berlin, and who still enjoy some small remainks of their ancient privileges. The hereditary officers of the marquisate are a marshal, chamberlain, cup-bearer, purveyor, sewer, treasurer, and ranger. The king of Prussia, who is also elector of Brandenburg, with his whole court, are Calvinists; but the religion of most of the inhabitants is Lutheranism. The churches of both persuasions are well endowed, and the laity jointly employed by the government. The Roman Catholics are also tolerated here. In short, every inhabitant enjoys full liberty of conscience. A great variety of manufactures, most of which were introduced by the French refugees, are carried on in the marquisate, especially at Berlin and Potsdam; where are also excellent painters, statuaries, and engravers. By means of these manufactures, fabrics, and arts, not only large sums are kept in the country, but also imported from other parts, to which considerable quantities of the manufactures and natural productions are exported. For the education of youth and the advancement of learning, besides Latin schools in several places, and gymnasia, there is an university at Frankfort on the Oder, and an academy of sciences at Berlin.

The Brandenburg family is of great antiquity. Some historians say it was founded by the Sclavonians, who gave it the name of Braniber, which signifies the "Guards of the Forests;" and the Germans called it Branburg. Henry I. surnamed the Fowler, fortified this place in the year 923, to serve as a rampart against the Huns, a warlike nation, who were extremely troublesome by their frequent incursions. He bestowed the government on Sifre, count of Ringelheim, with the title of Margrave or Marquis, which signifies Protector of the Marches or Frontiers, in 923. It descended to Gerod, margrave of Lusatia; and in succession of time passed into the families of Soden, Ascains, Belenstadt, and that of Bavaria, till the emperor Sigismund, with the consent of the states of the empire, in 1416, gave perpetual investiture to Frederick VI. of Nuremberg; who also the following year received from the emperor, at the diet of Constance, the investiture of the county of Brandenburg as Frederick I.; having had previously conferred upon him the dignity of elector and arch-chamberlain of the Holy Roman empire.

Brandenburg remained long in subject to Poland; and the investiture of Prussia was granted by the Polish kings to each succeeding margrave. Frederick-William, having concluded a treaty with the king of Poland, was acknowledged to be sovereign of Docal Prussia by an assembly of the states at Königsberg. A. D. 1666. By the treaty of Vienna the emperor confirmed this title; and Frederick, the son of Frederick-William, was proclaimed king of Prussia, January 18. 4701. He was succeeded by his son, who performed the greatest services to his country, and prepared the materials of the future grandeur of the late sovereign, Frederick III. who began his reign on the 31st of May, 1740, at the age of 28. See PRUSIA.

Among the electors he possesses the seventh place. As arch-chamberlain, he carries the sceptre before the emperor at his coronation, and brings him water in a silver basin to wash with. In the college of princes of the empire he has five voices. His assessment as an elector, is 60 horse and 377 foot, or 1828 florins in lieu of them. To the chamber of Wetztar, his quota is 811 rix-dollars 58 kruitzers, each term. As to the orders of the knights of the Black Eagle, and of Merit, it is sufficient here to observe, that the former was instituted by Frederick I. at his coronation, and the other by the present king. For the government of this country and the administration of justice, there are several supreme colleges and tribunals; particularly for the departments of war, foreign affairs, and the finances, there are distinct boards. Here is a supreme ecclesiastical council and consistory for the Lutherans, a supreme directory.
BRA [ 374 ]

BRANDENBURG, a city of Germany, and capital of the marquisate of that name, situated on the river Havell, in E. Long. 13° 0'. N. Lat. 52° 25'. It is divided into the old and new town, and was anciently the seat of a bishop. The mountain in the neighbourhood, called Marienberg, is planted with vines. Here is a small colony of French Calvinists, with a manufacture of cloth, fustian, and canvas; and a pretty good trade is carried on by the Havel. The fort here looks like a suburb, and contains a riding school, with the cathedral church. The greater part also of the members of the chapter, which still subsists, and is composed of a Lutheran provost, dean, senior, subprior, and three other canons, reside in it. They are distinguished by a cross of gold enamelled with violet, terminating in eight points; and have a considerable estate. The town contains about 13,000 inhabitants.

BRANNOEUM, in ecclesiastical writers, a linen cloth or veil put over the tombs of the apostles St Peter and St Paul, and left there for some time; by which it is supposed to acquire a degree of sanctity, so as to be worshipped as a relic; and for that purpose frequently sent by the pope as a present to some prince. In this sense, Brandeiu amounts to the same with what was otherwise called sanctuarium, sudarium, orarum, and velum. The use of brandes was introduced as a means of diffusing and propagating the virtues and influences of relics, without moving, or in any way impairing, the substance of them; the translation of relics in early days being forbidden.

BRANDING, in the face or hand, denotes a punishment inflicted by law on various offences, by burning with a hot iron, after the offender hath been once admitted to benefit of clergy.

BRANDON, a town of Suffolk in England, seated on the little river Ouse, over which it has a bridge, and a ferry at a mile's distance: when it is divided into Brandon, and Brandon ferry, which last has the most business, because commodities are brought thither from the isle of Ely. This place gives the British title of duke to the family of Hamilton in Scotland. Population 1360. E. Long. 0° 55'. N. Lat. 52° 30'.

BRANDRITH, denotes a trevett or other iron stand, whereon to set a vessel over the fire.

BRANDRITH, among builders, denotes a fence or rail about the mouth of a well.

BRANDT, Gerard, a learned divine of the reformed religion, was born at Amsterdam in 1626, and was successively minister in several places of the Netherlands. He wrote some works which are esteemed, particularly the history of the reformation of the Netherlands, 4 vols 4to; and The Life of Admiral Ruyter; both written in the Flemish tongue. He died at Rotterdam in 1685.

BRANDY, a spirituous and inflammable liquor, extracted from wine and other liquors by distillation. See Distillation.

Wine-brandy, made in France, is esteemed the best in Europe. They make it wherever they make wine, and for that purpose use wine that is pickled rather than good wine. The chief brands for foreign trade, and those accounted best, are the brandies of Bourdeaux, Rochelle, Cognac, Charenton, the isle of Rhu, Orleans, the county of Blaisos, Pasien, Touraine, Anjou, Nantz, Burgundy, and Champagne.

BRANK, an instrument used in some parts of Scotland, and in Staffordshire, for correcting scolding women. It is a sort of head-piece, which opens and encloses the head of the impatient, while an iron, sharp as a chisel, enters the mouth, and subdues the more dreadful weapon within. Thus harnessed, the offender is led in triumph through the streets. Dr Pott, in his History of Staffordshire, has favoured the world with a minute description and figure of the instrument, which Page 31 is there called a scoldings bridle; and tells us, he looks upon it "as much to be preferred to the ducking-stool, which not only endangers the health of the party, but also gives the tongue liberty betwixt every dip; to neither of which this is at all liable."

BRANLIN, in Ichthyology, a species of salmon, with several transverse black streaks, resembling the impression of so many fingers.

BRANNODUNUM (Noditan), with a garrison of the Equites Dalmationes, a town of Britain, on the Sisons Meturae: now Brancester, in Norfolk, on the Washes.

BRANOGENIUM, or Brannonium, a town of the Coritani, a people in the heart of Britain: from the distances of the Itinerary, Camden supposes it to be Worcester.

BRANSKA, a town of Transylvania, situated on the river Maris. E. Long. 23° 15'. N. Lat. 46° 0'.
BRASIDA, an anniversary solemnity at Sparta, in memory of Brasidas, a Lacedaemonian captain, famous for his achievements at Methone, Pylos, and Amphipolis. It was celebrated with sacrifices and games, wherein none were permitted to attend but free-born Spartans. Whoever neglected to be present at the solemnity was fined.

BRASIDAS, a celebrated general of the Lacedaemonians, about 424 years before the birth of Christ. He defeated the Athenians by land and sea, took many places, and rendered his country formidable to all the neighboring states. He conquered the Athenians in their attempting to surprise Amphipolis, but died of the wounds he received in that battle. See ATICA and LACEDAEMON.

BRASIL, a large country of South America, being the easternmost part of that continent lying between the equinoctial line and the tropic of Capricorn. It is about 1,560 miles in length, and 1,000 in breadth; but measuring along the coast, it is 2,000 miles long, and is bordered with mountains that open from time to time, and form good harbours where vessels may lie in safety. It was accidentally discovered by the Portuguese in 1500. Emmanuel king of Portugal had equipped a squadron of 13 sail, carrying 1,200 soldiers and sailors destined for the East Indies, under the conduct of Peter Alvarez Cabral. This admiral, quitting Lisbon on the 19th of March 1500, struck out to sea to avoid the coast of Guinea, and steered his course southward, that he might the more easily turn the Cape of Good Hope, which projects a good way into the ocean. On the 21st of April, he got sight of the continent of South America, which he judged to be a large island at some distance from the coast of Africa. Coasting along for some time, he ventured to send a boat on shore; and was astonished to observe the inhabitants entirely different from the Africans in features, hair and complexion. It was found, however, impracticable to seize upon any of the Indians, who retired with great celerity to the mountains on the approach of the Portuguese; yet, as the sailors had discovered a good harbour, the admiral thought proper to come to an anchor, and called the bay Puerto Segura. Next day he sent another boat on shore, and had the good fortune to lay hold on two of the natives, whom he clothed and treated kindly, and then dismissed, to make a proper report to their countrymen. The stratagem had the desired effect. The Indians, having heard the relation of the prisoners, immediately crowded to the shore, singing, dancing, and sounding horns of different kinds; which induced Cabral to land, and take solemn possession in the name of his Portuguese majesty.

As soon as the court of Lisbon had ordered a survey to be taken of the harbours, bays, rivers, and coasts of Brazil, and was convinced that the country afforded neither gold nor silver, they held it in such contempt, that they sent thither none but condemned criminals and abandoned women. Two ships were sent every year from Portugal, to carry the refuse of the kingdom to this new world, and to bring home parrots and woods for the dyers and cabinet-makers. Ginger was afterwards added; but soon after prohibited, lest it should interfere with the sale of the same article from India.

In 1548, the Jews, many of whom had taken refuge in Portugal, beginning to be persecuted by the Inquisition, were stripped of their possessions, and banished to Brasil. Here, however, they were not entirely forsaken. Many of them found kind relations and faithful friends; others, who were known to be men of probity and understanding, obtained money in advance from merchants of different nations with whom they had formerly had transactions. By the assistance of some enterprising men, they were enabled to cultivate sugar canes, which they first procured from the island of Madeira. Sugar, which till then had been produced only in medicine, became an article of luxury. Princes and great men were all eager to procure themselves this new species of indulgence. This circumstance proved favourable to Brasil, and enabled it to extend its sugar plantations. The court of Lisbon, notwithstanding its prejudices, began to be sensible that a colony might be beneficial to the mother country, without producing gold or silver; and this settlement, which had been wholly left to the capricious management of the colonists, was now thought to deserve some kind of attention; and accordingly Thomas de Souza was sent thither, in 1549, to regulate and superintend it.

This able governor began by reducing these men, who had always lived in a state of anarchy, into proper subordination, and bringing their scattered plantations closer together: after which he applied himself to acquire some information respecting the natives, with whom he knew he must be incessantly engaged either in traffic or war. This it was no easy matter to accomplish. Brasil was full of small nations, some of which inhabited the forests, and others lived in the plains and along the rivers. Some had settled habitations; but the greater number of them led a roving life, and most of them had no intercourse with each other. It is not to be supposed that such a people would be at all disposed to submit to the yoke which the Portuguese wanted to put upon them on their arrival. At first they only declined all intercourse with these strangers; but finding themselves pursued in order to be made slaves, and to be employed in the labours of the field, they took the resolution to murder and devour all the Europeans they could seize upon. The friends and relations of the savages that were taken prisoners also ventured to make frequent attempts to rescue them, and were sometimes successful: so that the Portuguese were forced to attend to the double employment of labour and war.

Souza did not bring a sufficient number of forces to change the situation of affairs. Indeed, by building San Salvador, he gave a centre to the colony; but the honour of settling, extending, and making it really useful to the mother country, was reserved for the Jesuits, who attended him. These men, who for their acts of insurrection and address have been equalled by none, dispersed themselves among the Indians. When any of the missionaries were murdered, they were immediately replaced by others; and seeming to be inspired only with sentiments of peace and charity, the Indians, in process of time, grew not only familiar to but passionately fond of them. As the missionaries were too few in number to transact all the business themselves, they frequently deputed some of the most intelligent Indians in their stead. These men having distributed batters, knives, and looking-glasses, among the savages they met,
met with, represented the Portuguese, as a harmless, humane, and good sort of people.

The prosperity of the colony of Brasil, which was visible to all Europe, excited the envy of the French, Spaniards, and Dutch successively. The latter, indeed, bid fairest for the conquest of the whole. Their admiral Henry Lokk arrived, in the beginning of the year 1630, with 46 men of war, on the coast of Fernambucca, one of the largest and best fortified captainships of these parts. He reduced it after several obstinate engagements, in which he was always victorious. The troops he left behind subdued the captainships of Tamaraca, Pearcha, and Rio Grande, in the years 1633, 1634, and 1635; These, as well as Fernambucca, furnished annually a large quantity of sugar, a great deal of wood for dyeing, and other commodities. The Hollander were so elated with the acquisition of this wealth, which flowed to Amsterdam instead of Lisbon, that they determined to conquer all the Brasis, and, trusted Maurice of Nassau with the conduct of this enterprise. That general reached the place of his destination at the beginning of the year 1637. He found the soldiers so well disciplined, the commanders such experienced men, and so much readiness in all to engage, that he directly took the field. He was successively opposed by Albuquerque, Banjola, Lewis Roque de Borgia, and the Brasilian Cameron, the idol of his people, passionately fond of the Portuguese, brave, active, cunning, and who wanted no qualifications necessary for a general, but to have learned the art of war under able commanders. These several chiefs exerted their utmost efforts to defend the possessions that were under their protection; but their endeavours proved ineffectual. The Dutch seized upon the captainships of Sierra, Seregippe, and the greater part of that of Bahia. Seven of the 15 provinces which composed the colony had already submitted to them, and they flattered themselves that one or two campaigns would make them masters of the rest of their enemies possessions in that part of America; when they were suddenly checked by the revolution happening on the banishment of Philip IV. and placing the duchess of Braganza on the throne. After this, the Portuguese recovering their spirits, soon drove the Dutch out of Brasil, and have continued masters of it ever since.

The country of Brasil is divided into the following provinces, viz. Paria, Maragano, Siru, Rio Grande, Pearcha, Tamaraca, Fernambucca, Seregippe, Bahia, Porto Seguro, Esperito Santo, Rio de Janeiro, Angra, St Vincent, and Del Rey. See these articles.

The first aspect of the country from the sea is rather unfavourable, as it appears high, rough, and unequal; but, on a more narrow inspection, nothing can be more delightful, the eminences being covered with woods, and the valleys and savannahs with the most refreshing verdure. In so vast a tract of land, it cannot be imagined that the climate will be found at all equal, or the seasons uniform. The northern provinces are subject to heavy rains and variable winds, like other countries under the same parallels. Tornadoes, storms, and the utmost fury of the elements, weak their vengeance here, while the southerly regions are blessed with all the comforts which a fine fertile soil and temperate climate can afford. In some of the provinces, the heat of the climate is thought to prove favourable to the generation of a great variety of poisonous reptiles: some of which, as the libes or rodrucke snake, are said to extend to the length of 30 feet, and to be two or three yards in circumference. The rattlesnake and other reptiles of the same kind, grow likewise to an enormous size; and the serpent called tibikobaka is affirmed to be 7 yards long, and half a yard in circumference, possessed too of a poison instantaneously fatal to the human race. Here also are scorpions, ant-bears, tygers, armadillos, porcupines, janaonveras, and an animal called tapirrason, which is the production of a bull and an ass, having a great resemblance to both. No country on earth affords a greater number of beautiful birds, nor variety of the most exquisite fruits; but the chief commodities are Brasil wood, ebony, dyeing woods, ambergis, resin, balsams, indigo, sweetmeats, sugar, tobacco, gold, diamonds, beautiful pebbles, crystal, emeralds, jasper, and other precious stones; in all which the Portuguese carry on such an amazing trade as may justly be reputed the support, and indeed the vital fountain, of the mother country. The gold and diamond mines are but a recent discovery, which were first opened in the year 1681; and have since yielded above five millions sterling annually, of which sum a fifth belongs to the crown. So plentiful are diamonds in this country, that the court of Portugal had found it necessary to restrain their importation, to prevent too great a diminution of their value. They are neither so hard nor so clear as those of the East Indies, nor do they sparkle so much, but they are whiter. The Brasilian diamonds are sold ten per cent. cheaper than the Oriental ones, supposing the weights to be equal. The largest diamond in the world was sent from Brasil to the king of Portugal. It weighs 1680 carats, or 12½ ounces; and has been valued at 56,787,50 cl. Some skilful lapidaries, however, are of opinion that this supposed diamond is only a topaz; in which case a very great abatement must be made in its value. The crown revenue arising from this colony amounts to two millions sterling in gold, if we may credit some late writers, besides the duties and customs on merchandise imported from that quarter. This indeed is more than a fifth of the precious metal produced by the mines; but, every subsequent advantage considered, it probably does not much exceed the truth. The excessive confoundence of people to the Brasil colonies, as well from other countries as from Portugal, not only enlarged the imports of gold, but what is of infinitely more importance to Europe in general, the exportation of the manufactures of this hemisphere; of which the principal are the following. Great Britain sends woollen manufactures; such as fine broad medley cloths, fine Spanish cloths, scarlet and black cloths; serges, duryos, druggets, sagathies, shalones, camblets, and Norwich stuffs; black Colchester baine; says, and perpetuans, called long ella; hats, stockings, and gloves. Holland, Germany, and France, chiefly export fine hollands, bone-lace, and fine thread; silk manufactures, pepper, lead, block tin, and other articles, are also sent from different countries. Besides the particulars already specified, England likewise trades with Portugal, for the use of the Brasis, in copper and brass, wrought and unwrought pewter, and all kinds of hardware; all which articles have so enlarged the Portuguese trade, that, instead of 12 ships usually employed in the Brasil commerce, there are now never fewer
fewer than 100 sail of large vessels constantly going and returning to those colonies. To all this may be added the vast slave-trade carried on with the coast of Africa for the use of the Brasil colonies; which, we may believe, employs a great number of shipping, from the multitude of slaves that are annually transported. Indeed the commerce of Brasil alone is sufficient to raise Portugal to a considerable height of naval power, as it maintains a constant nursery of seamen; yet a certain infatuation in the policy of the country has prevented that effect, even amidst all these extraordinary advantages. All the ships in this trade, being under the direction of the government, have their appointed seasons of going and returning, under convoy of a certain number of men of war. In 1866, in consequence of the violence of the French government, the court of Portugal retired to Brasil, where it still remains. In March 1817 a revolt broke out in the city of Pernambuco. Some individuals, who were marked out for proscription, being apprised of the intention of the government, took up arms, and, supported by the people, drove out the military and got possession of the town. A provisional government was installed, and a republic proclaimed. An army was then sent against the town, and the republicans being defeated on the 18th May, retired into the interior, when the royal government was re-established. See Brasil, Supplement.

Brasil-Wood, or Brasil-wood, an American wood of a red colour, and very heavy. It is denominated variously, according to the places whence it is brought: Thus we have Brasil of Pernambuco, Sappan, Lamox, &c. For its description, &c. see Cæsalpinia, Botany Index.

BRASILETTO, the same with Brasil wood.

BRASLAW, a considerable town of Poland, in Lithuania, and palatinate of Wilna, with a castle. It is seated on a small lake, in E. Long. 15. S. Lat. 55° 42'.

BRASS, or, as the French call it, yellow copper, is a factitious metal, composed of copper and zinc. See Chemistry Index, and Brass, Supplement.

The first formation of brass, as we are assured by scripture, was prior to the flood, and discovered even in the seventh generation from Adam*. But the use of it was not, as is generally believed, and the Arundelian marbles assert, previous to the knowledge of iron. They were both first known in the same generation, and first wrought by the same discoverer. And the knowledge of them must have been equally carried over the world afterwards, with the spreading of the colonies of the Noachide. An acquaintance with the one or the other was absolutely necessary to the existence of the colonists; the clearing away of the woods about their settlements, and the erection of houses for their habitation.

The ancient Britons, though acquainted from the remotest periods with the use of both these metals, remained long ignorant that they were to be obtained in the island. Before this discovery they imported all their iron and brass from the continent. And when they had at length detected the former in their own hills, and had ceased to introduce it, they continued to receive the latter. Their want of the metal remained, and no mines of it were opened in the island. In the earliest ages whose manners have been delineated by history, we find the weapons of their warriors invariably framed of this factitious metal; and the most au-

* Gen. iv.
BRASS, in the glass trade.—Three calcined brass is a preparation which serves the glassman to give many very beautiful colours to their metal. The manner of preparing it is this: Place thin plates of brass on the last of the furnace near the oven; let it stand to be calcined there for four days, and it will become a black powder sticking together in lumps. Powder this, sift it fine, and recalculate it four or five days more; it will not then stick together, but remain a loose powder, of a russet colour. This is to be calcined a third time in the same manner; but great care must be taken in the third calcination, that it be not overdone nor undone; the way to be certain when it is right is, to try it several times in glass while melting. If it makes it, when well purified, to swell, boil, and rise, it is properly calcined; if not, it requires longer time. This makes, according to the different proportions in which it is used, a sea-green, an emerald-green, or a turquoise colour.

Brass, by long calcination alone, and without any mixture, affords a fine blue or green colour for glass; but they have a method of calcining it also with powdered brimstone, so as to make it afford a red, a yellow, or a chalcocyan colour, according to the quantity and other variations in the using it. The method of making the calcination is this: Cut thin plates of brass into small pieces with shears, and lay them stratum super stratum, with alternate beds of powdered sulphur, in a crucible; calcine this for 24 hours in a strong fire; then powder and sift the whole; and finally expose this powder upon tiles for 12 days to a reverberating furnace; at the end of this time powder it fine, and keep it for use. The glass-makers have also a method of procuring a red powder from brass, by a more simple calcination, which serves them for many colours. The method of preparing it is this: They put small and thin plates of brass into the arches of the glass furnaces, and leave them there till they are sufficiently calcined, which the heat in that place, not being enough to melt them, does in great perfection. The calcined matter, powdered, is of a dusky red, and requires no further preparation.

Brass-colour, one prepared by the braziers and colour-men to imitate brass. There are two sorts of it; the red brass or bronze, and the yellow or gilt brass; the latter is made only of copper-filings, the smallest and brightest that can be found; with the former they mix some red ochre, finely pulverized; they are both used with varnish. In order to make a fine brass that will not take any rust or verdigris, it must be dried with a chafing dish of coals as soon as it is applied. The finest brass-colour is made with powder-brass imported from Germany, diluted into a varnish, made and used after the following manner: The varnish is composed of one pound four ounces of spirit of wine, two ounces of gum-laurel, and two ounces of sandarac; these two last drugs are pulverized separately, and afterwards put to dissolve in spirit of wine, taking care to fill the bottle but half full. The varnish being made, you mix such quantity as you please of it with the pulverized brass, and apply it with a small brush to what you would brass over. But you must not mix too much at once, because the varnish being very apt to dry, you would not have time to employ it all soon enough; it is therefore better to make the mixture at several times. After this manner they brass over figures of plaster, which look as well as if they were of cast brass.

Brass leaf is made of copper, beaten out into very thin plates, and afterwards rendered yellow. The German artists, particularly those of Nuremberg and Augsburg, are said to possess the best method of giving to these thin plates of copper a fine yellow colour like gold, by simply exposing them to the fumes of zinc, without any real mixture of it with the metal. These plates are cut into little pieces, and then beaten out fine like leaves of gold; after which they are put into books of coarse paper, and sold at a low price for the vulgar kinds of gilding. The parings or shreds of these very thin yellow leaves being well ground on a marble plate, are reduced to a powder similar to gold; which serves to cover, by means of gum-water, or some other glutinous fluid, the surface of various mouldings or pieces of curious workmanship, giving them the appearance of real bronze, and even of fine gold, at a very trifling expense, because the gold colour of this metallic powder may be easily raised and improved by stirring it on a wide earthen basin over a slow fire.

Brass-lumps, a common name given by miners to the globular pyrites. See Pyrites, Mineralogy. Index.

BRASSAW, or CROWSTADT, a strong town of Transilvania in Buretzland; seated on the river Baxel, in E. Long. 22. 35. N. Lat. 46. 30.

BRASSE, a species of perca. See Ichthyology Index.

BRASSICA, Cabbage, in Botany, for the classification of which see Botany Index. But as many of the species of this genus are of considerable importance as articles of food, we shall here lay before our readers a more particular account of their uses and mode of culture, under the names known to practical gardeners. The species called campestris grows naturally on the sea-shore near Dover, has a perennial branching stalk, and in this it differs from all the other species. In very severe winters, when the other sorts are destroyed, this is a necessary plant, for the most severe frosts do not injure it. The flower-stalks grow from the end of the branches, and spread out horizontally; but those which arise from the centre of the plants grow erect, and seldom put out branches. The cauliflower has been much more improved in Britain than in any other part of Europe. In France they rarely have cauliflowers till Michaelmas, and Holland has been often supplied with them from Britain. In many parts of Germany there were none of them cultivated till within a few years past, and most parts of Europe are supplied with seeds from Britain. That which is generally known by the title of rape or cole seed is much cultivated in the isle of Ely, and some other parts of England, for its seed, from which rape-oil is drawn; and it hath also been cultivated of late years, in other places, for feeding of cattle, to great advantage. The cole-seed, when cultivated for feeding of cattle, should be sown about the middle of June. The ground for this should be prepared for it in the same manner as for turnips. The quantity of seeds for an acre of land is from six to eight pounds; and as the price of the seed is not great, so it is better to allow eight
BRA [ 379 ]

The Russian cabbage was formerly in much greater esteem than at present, it being now only to be found in particular gentlemen's gardens, who cultivate it for their own use. This must be sown late in the spring of the year, and managed as those before directed, with this difference only, that these must be sooner planted out, and must have an open clear spot of ground, and require much less distance every way, for it is but a very small hard cabbage. This sort will not continue long before they will break and run up to seed.

The early and sugar loaf cabbages are commonly sown for summer use, and are what the gardeners about London commonly call Michaelmas cabbages. The season for sowing of these is about the end of July, or beginning of August, in an open spot of ground; and when the plants have got eight leaves, you must prick them into beds at about three or four inches distance every way, that the plants may grow strong and short shanked; and toward the end of October you should plant them out: the distance that these require, is three feet row from row, and two feet and a half asunder in the rows. The ground must be kept clean from weeds, and the earth drawn up about your cabbage plants. In May, if your plants were of the early kind, they will turn in their leaves for cabbaging; at which time, the gardeners near London, in order to obtain them a little sooner, tie in their leaves close with a slender osier twig to Blanch their middle; by which means, they have them at least a fortnight sooner than they could have if they were left untied.

The early cabbage being the first, we should choose to plant the fewer of them, and a greater quantity of the sugar-loaf kind, which comes after them: for the early kind will not supply the kitchen long, generally cabbaging space when they begin, and as soon grow hard and burst open; but the sugar-loaf kind is longer before it comes, and as soon in its cabbaging; and being of a hollow kind, will continue for a good long time. The sugar-loaf kind may be planted out in February, and will succeed as well as if planted earlier; with this difference only, that they will be later before they cabbage. You should also reserve some plants of the early kind in some well sheltered spot of ground, to supply your plantation, in case of a defect; for in mild winters many of the plants are apt to run to seed, especially when their seeds are sown too early, and in severe winters they are often destroyed.

The Savoy cabbages are propagated for winter use, as being generally esteemed the better when pinched by the frost: these must be sown about the end of April, and treated after the manner as was directed for the common white cabbage: with this difference, that these may be planted at a closer distance than those; two feet and a half square will be sufficient. These are always much better when planted in an open situation, which is clear from trees and hedges; for in close places they are very subject to be eaten almost up by caterpillars and other vermin, especially if the autumn prove dry.

The broccoli may also be treated in the same manner, but need not be planted above one foot asunder in the rows, and the rows two feet distant; these are ne-
This sort has been neglected. There are some persons who esteem this kind for soups, but it is too strong for most palates; and is seldom good but in hard winters, which will render it tender and less strong. At the end of June the plants should be transplanted out where they are to remain, allowing them two feet distance every way, observing to water them until they have taken root; and as their stems advance, the earth should be drawn up to them with a hoe, which will preserve a moisture about their roots, and prevent their stems from drying and growing woody, so that the plants will grow more freely; but it should not be drawn very high, for as it is the globular part of the stalk which is eaten, so that should not be covered. In winter they will be fit for use, when they should be cut off, and the stalks pulled out of the ground and thrown away, being good for nothing after the stems are cut off. As food for cattle, however, the cultivation of this species deserves particular attention. See Agriculture Index.

The curled colewort or Siberian broccoli is now more generally esteemed than the former, being extremely hardy, so is never injured by cold, but is always sweeter in severe winters than in mild seasons. This may be propagated by sowing of the seeds the beginning of July; and when the plants are strong enough for transplanting, they should be planted in rows about a foot and a half asunder, and ten inches distance in the rows. These will be fit for use after Christmas, and continue good until April, so that they are very useful in a family.

The musk cabbage. This may be propagated in the same manner as the common cabbage, and should be allowed the same distance: it will be fit for use in October, November, and December; but, if the winter proves hard, these will be destroyed much sooner than the common sort.

The common colewort, or Dorsetshire kale, is now almost lost near London, where their markets are usually supplied with cabbage plants instead of them. The best method to cultivate this plant in the fields is, to sow the seeds about the beginning of July, choosing a moist season, which will bring up the plants in about ten days or a fortnight; the quantity of seed for an acre of land is nine pounds: when the plants have got five or six leaves they should be hoed, as is practised for turnips, cutting down all the weeds from amongst the plants, and also thinning the plants where they are too thick; but they should be kept thicker than turnips, because they are more in danger of being destroyed by the fly: this work should be performed in dry weather, that the weeds may be killed. About six weeks after, the plants should have a second hoeing, which, if carefully performed in dry weather, will entirely destroy the weeds, and make the ground clean, so that they will require no farther culture: in the spring they may be either drawn up and carried out to feed the cattle, or they may be turned in to feed upon them as they stand; but the former method is to be preferred, because there will be little waste; whereas, when the cattle are turned in amongst the plants, they will tread down and destroy more than they eat, especially if they are not fenced off by hurdles.

The two last sorts of cabbages are varieties fit for a botanic garden, but are plants of no use. They are annual.
BRASSICA

Cauliflowers have of late years been so far improved in Britain, as to exceed in goodness and magnitude what are produced in most parts of Europe, and by the skill of the gardener are continued for several months together; but the most common season for the great crops is in May, June, and July. Having procured a parcel of good seeds, you must sow it about the 21st of August, upon an old cucumber or melon bed, sifting a little earth over the seeds, about a quarter of an inch thick; and if the weather should prove extremely hot and dry, you should shade them with mats, to prevent the earth from drying too fast, and give in little waterings as you may see occasion. In about a month's time after sowing, your plants will be fit to prick out; you should therefore put some fresh earth upon your cucumber or melon beds; or where these are not to be had, some beds should be made with a little new dung, which should be trodden down close, to prevent the worms from getting through it; but it should not be hot dung, which would be hurtful to the plants at this season, especially if it proves hot; into this bed you should prick your young plants at about two inches square, observing to shade and water them at first planting; but do not water them too much after they are growing, nor suffer them to receive too much rain if the season should prove wet, which would be apt to make them black shanked, as the gardeners term it, which is no less than a rottenness in their stems, and is the destruction of the plants so affected. In this bed they should continue till about the 30th of October, when they must be removed into the place where they are to remain during the winter season; which, for the first sowing, is commonly under bell or hand glasses, to have early cauliflowers, and these should be of an early kind; but in order to have a succession during the season, you should be provided with another, or at all: then plant your plants, allowing about two feet six inches distance from glass to glass in the rows, always putting two good plants under each glass, which may be at about four inches from each other; and if you design them for a full crop, they may be three feet and a half row from row: but if you intend to make ridges for cucumbers between the rows of cauliflowers, as is generally practised by the gardeners near London, you must then make your rows about eight feet asunder; and the ground between the rows of cauliflowers may be planted with cabbage plants, to be drawn off for coleworts in the spring. When you have planted your plants, if the ground is very dry, you should give them a little water, and then set your glasses over them, which may remain quite close down over them, till
Till they have taken root, which will be in about a week or ten days time, unless there should be a kindly shower of rain; in which case you may set off the glasses, that the plants may receive the benefit of it; and in about ten days after planting, you should provide with a parcel of forked sticks or bricks, with which you should raise your glasses about three or four inches on the side toward the south, that your plants may have free air; in this manner your glasses should remain over the plants night and day, unless in frosty weather, when you should set them down as close as possible; or if the weather should prove very warm, which many times happens in November, and sometimes in December, in this case you should keep your glasses off in the day-time, and put them on only in the night, lest, by keeping the glasses over them too much, you should draw them into flower at that season; which is many times the case in mild winters, especially if unskilfully managed. Toward the latter end of February, if the weather proves mild, you should prepare another good spot of ground to remove some of the plants into, from under the glasses, which should be well dunged and trenched (as before): then set off your glasses; and, after making choice of one of the most promising plants under each glass, which should remain, take away the other plant, by raising it up with a trowel, &c. so as to preserve as much earth to the root as possible; but take care not to disturb or prejudice the roots of the plants which remain. Then plant the plants which you have taken out at the distance before directed, viz. if for a full crop, three feet and a half, row from row, or if for ridges of onions, three feet between them, eight feet, and two feet four inches distance in the rows: then, with a small hoe, draw the earth up to the stems of the plants which were left under the glasses, taking great care not to let the earth fall into their hearts; and set your glasses over them again, raising your props an inch or two higher than before, to give them more air, observing to take them off whenever there may be some gentle showers, which will greatly refresh the plants.

In a little time after, if you find your plants grow so fast as to fill the glasses with their leaves, you should then slightly dig about the plants, and raise the ground about them in a bed broad enough for the glasses to stand, about four inches high, which will give your plants a great deal of room, by raising the glasses so much higher when they are set over them; and by this means they might be kept covered until April, which otherwise they could not, without prejudice to the leaves of the plants; and this is a great advantage to them, for many times we have returns of severe frosts at the latter end of March, which prove very hurtful to these plants, if exposed thereto, especially after having been nursed up under glasses.

After you have finished your beds, you may set your glasses over your plants again, observing to raise your props pretty high, especially if the weather be mild, that they may have free air to strengthen them; and in mild soft weather set off your glasses, as also in gentle showers of rain; and now you must begin to harden them by degrees to endure the open air; however, it is advisable to let your glasses remain over them as long as possible, if the nights should be frosty, which will greatly forward your plants; but you must not let your glasses remain upon them in very hot sunshine, especially if their leaves press against the sides of the glasses; for it hath often been observed in such cases, that the moisture which hath risen from the ground, together with the perspiration of the plants, which by the glasses remaining over them hath been detained upon the leaves of the plants, when the sun hath shone hot upon the sides of the glasses, have acquired such a powerful heat from the beams thereof, as to scald all their larger leaves, to the no small prejudice of the plants; may, sometimes large quantities of plants have been so affected therewith, as never to be worth any thing after.

If your plants have succeeded well, toward the end of April some of them will begin to fruit: you must therefore look over them carefully every other day, and when you see the flower plainly appear, you must break down some of the inner leaves over it to guard it from the sun, which would make the flower yellow and unsightly if exposed thereto; and when you find your flower at its full bigness (which you may know by its outside parting as if it would run), you must then draw it out of the ground, and not cut them off, leaving the stalk in the ground, as is by some practised; and if they are designed for present use, you may cut them out of their leaves; but if designed to keep, you should preserve their leaves about them, and put them into a cool place; the best time for pulling them is in a morning, before the sun have exhaled the moisture; for cauliflowers pulled in the heat of the day, lose that firmness which they naturally have, and become tough.

But to return to our second crop (the plants being raised and manured as was directed for the early crop, until the end of October), you must then prepare some beds, either to be covered with glass-frames, or arched over with hoops, to be covered with mate, &c. These beds should have some dung laid at the bottom, about six inches or a foot thick, according to the size of your plants; for if they are small, the bed should be thicker of dung to bring them forward, and so vise versa: this dung should be beat down close with a fork, in order to prevent the worms from finding their way through it; then lay some good fresh earth about four or five inches thick thereon, in which you should plant your plants about two inches and a half square, observing to shade and water them until they have taken new root: but you must not keep your coverings close, for the warmth of the dung will occasion a large damp in the bed, which, if pent in, will greatly injure the plants. When your plants have taken root, you must give them as much free open air as possible, by keeping the glasses off in the day-time as much as the weather will permit, and in the night, or at such times as the glasses require to be kept on, raise them up with props to let in fresh air, unless in frosty weather; at which time these glasses should be covered with mats, or potato sheets, &c. but this is not to be done but in very hard frosts; you must also observe to guard them against great rain, which in winter time is very hurtful to them, but in mild weather, if the glasses are kept on, they should be propped to admit fresh air; and if the under leaves grow yellow and decay, be sure to pick them off: for if the weather should prove very bad in winter, so that you should be obliged to keep them close covered for two or three days together, as it sometimes happens,
these decayed leaves will render the inclosed air very noxious; and the plants perspiring pretty much at that time, are often destroyed in vast quantities.

In the beginning of February, if the weather be mild, you must begin to harden your plants by degrees, that they may be prepared for transplantation: the ground where you intend to plant your cauliflowers out (which should be quite open from trees, &c. and rather moist than dry) having been well dunged and dug, should be sown with radishes a week or a fortnight before you intend to plant out your cauliflowers; the sowing of radishes is particularly mentioned, because if there are not some radishes among them, and the month of May should prove hot and dry, as it sometimes happens, the fly will seize your cauliflowers, and eat their leaves full of holes, to their prejudice, and sometimes their destruction; whereas, if there are radishes upon the spot, the flies will take to them, and never meddle with the cauliflowers so long as they last: indeed, the gardeners near London mix spinach with their radish-seed, and so have a double crop; which is an advantage where ground is dear, or where persons are straitened for room; otherwise it is very well to have only one crop amongst the cauliflowers, that the ground may be cleared in time.

Your ground being ready, and the season good, about the middle of February you may begin to plant out your cauliflowers; the distance which is generally allowed by the gardeners near London (who plant other crops between their cauliflowers to succeed them, as cucumbers for pickling, and winter cabbages) is every other row four feet and a half apart, and the intermediate rows two feet and a half, and two feet two inches distance in the rows; so that in the latter end of May or beginning of June (when the radishes and spinach are cleared off, they put in seeds of cucumbers for pickling, in the middle of the wide rows, at three feet and a half apart; and in the narrow rows plant cabbages for winter use, at two feet two inches distance, so that these stand each of them exactly in the middle of the square between four cauliflower plants; and these, after the cauliflowers are gone off, will have full room to grow, and the crop be hereafter continued in a succession through the whole season.

There are many people who are very fond of watering cauliflower plants in summer; but the gardeners near London have almost wholly laid aside this practice, as finding a deal of trouble and charge to little purpose; for if the ground be so very dry as not to produce tolerable good cauliflowers without water, it seldom happens that watering of them makes them much better: and when once they have been watered, if it is not constantly continued, it had been much better for them if they never had any; as also, if it be given them in the middle of the day, it0 rathers helps to scald them: so that, upon the whole, if care be taken to keep the earth drawn up to their stems, and clear them from every thing that grows near them, that they may have free open air, you will find that they will succeed better without than with water, where any of these cautions are not strictly observed.

But in order to have a third crop of cauliflowers, you should make a slender hot-bed in February, in which you should sow the seeds, covering them a quarter of an inch thick with light mould, and covering the bed with glass frames. When the plants are come up, and have gotten four or five leaves, you should prepare another hot-bed to prick them into, which may be about two inches square; and in the beginning of April harden them by degrees, to fit them for transplanting, which should be done in the middle of that month, at the distance directed for the second crop, and must be managed accordingly: these, if the soil is moist where they are planted, or the season cool and moist, will produce good cauliflowers about a month after the second crop is gone, whereby their season will be greatly prolonged.

There is also a fourth crop of cauliflowers, which is raised by sowing the seeds about the 23d of May; and, being transplanted, as hath been before directed, will produce good cauliflowers in a kindly season and good soil after Michaelmas, and continue through October and November, and, if the season permit, often a great part of December.

All the species of cabbage are supposed to be hard of digestion, to afford little nourishment, and to produce flatulencies, though probably on no very good foundation. They tend strongly to putrefaction, and run into this state sooner than almost any other vegetable; when putrefied, their smell is likewise the most offensive, greatly resembling that of putrefied animal substances. A decoction of them is said to loosen the belly. Of all these plants cauliflower is reckoned the easiest of digestion. The white is the most fetid, and the red most emollient or laxative; a decoction of this last is recommended for softening acrimonious humours in some disorders of the breast, and in hoarseness. The red cabbage is chiefly used for pickling. In some countries they bury the white cabbage when full grown in the autumn, and thus preserve it all winter. The Germans cut them to pieces, and, along with some aromatic herbs and salt, press them close down in a tub, where they soon ferment, and are eaten under the name of Souv-crouet. See that article.

BRASSICAVIT, or BRACHICAVIT, in the manège, is a horse whose forelegs are naturally bended archwise: being so called by way of distinction from one arched horse, whose legs are bowed by hard labour.

BRAULS, Indian cloths with blue and white stripes. They are otherwise called turbans, because they serve to cover those ornaments of the head, particularly on the coast of Africa.

BRAUNA, a town of Germany, in Bavaria, seated on the river Inn. It has a strong fortress: notwithstanding, it was taken by the Austrians in 1743. E. Long. 13. 3. N. Lat. 48. 10.

BRAUNSBOURG, a town of Poland, in Regal Prussia, with a very commodious harbour, and belonging to the king of Prussia. It is seated near the Baltic sea, in E. Long. 20. 0. N. Lat. 54. 15.

BRAUNSFIELD, a town of Germany, is the circle of the Upper Rhine, and county of Solmes, with a handsome palace or castle. E. Long. 8. 32. N. Lat. 50. 22.

BRAVO, one of the Cape de Verd islands on the coast of Africa, remarkable for its excellent wines, and inhabited by Portuguese. The land is very high, and consists of mountains which look like pyramids. It abounds in Indian corn, gourds, water melons, potatoes, horses, asses, and hogs. There is also plenty of fish on the
the coast, and the island produces salt-petre. W. Long.
25. 35. N. Lat. 14. 0.

BRAVO, a town of Africa, on the coast of Ajan, with
a pretty good harbour. It is an independent place,
and is about 85 miles distant from Magdala. E. Long.
41. 35. N. Lat. 1. 0.

BRAVONIA, in Grecian antiquity, a festival in
honour of Diana, surnamed Bravonias, from its having
been observed at Braunon, an Athenian borough. This
festival was celebrated once in five years, being man-
aged by ten men, called in Greek Ἀρσενίμοι. The
victim offered in sacrifice was a goat, and it was cus-
tomary for certain men to sing one of Homer’s Iliads.
The most remarkable persons at this solemnity were
young virgins, habited in yellow gowns, and con-
secrated to Diana. It was unlawful for any of them to
be above ten or under five years of age.

BRAWN, the flesh of a boar scoured or pickled :
for which end the boar should be old; because the older
he is, the more barony will the brawn be. —The
method of preparing brawn is as follows: The boar being
killed, it is the latches only, without the legs, that
are made brawn; the bones of which are to be taken
out, and then the flesh sprinkled with salt, and laid in
a tray, that the blood may drain off: Then it is to be
salted a little, and rolled up as hard as possible.
The length of the collar of brawn should be as much as one
side of the boar will bear, so that when rolled up it will
be nine or ten inches in diameter.

The collar being thus rolled up, it is to be boiled in
a copper or large kettle, till it is so tender, that
it can run a straw through it; then set it by till it is
thorough cold, and put it into the following pickle.
To every gallon of water, put a handful or two of
salt, and as much wheat-braun: Boil them together,
then drain the braun as clear as you can from the liquor;
and when the liquor is quite cold, put the braun into
it.

BRAY, SIR REGINALD, a celebrated architect and
politician, was the second son of Sir Richard Bray, one
of the privy council to King Henry VI. Sir Reginald
was instrumental in the advancement of King Henry
VII to the throne of England; and was greatly in
favour with that prince, who bestowed honours and
wealth upon him. His skill in architecture appears
from Henry VII’s chapel at Westminster, and the
chapel of St George at Windsor, as he had a principal
concern and direction in the building of the former,
and the finishing and bringing to perfection the latter,
to which he was also a liberal benefactor. In the
middle of the south aisle of the above chapel is a spaci-
ous chapel built by him, and still called by his name.
He died in 1501; and was interred in the above
chapel, probably under the stone where lies Dr Waterland;
for, on opening the vault for that gentleman, who died
in 1740, a leaden coffin of ancient form was found,
which, by other appearances, was judged to be that of
Sir Reginald, and was, by order of the dean, immedi-
ately opened over.

BRAY, DR THOMAS, an eminent, learned, and pious
divine, was born at Marton, in Shropshire, in the year
1656, and educated at Oxford. He was at length pre-
sented to the vicarage of Over-Whitacre, in Warwick-
shire; and in 1690, to the rectory of Sheldon, where
he composed his Catechetical Lectures; which procured
him such reputation, that Dr Compton, bishop of Lon-
don pitched upon him as a proper person to model the
infant church of Maryland, and establish it upon a so-
lid foundation, and for that purpose he was invested
with the office of commissary. He now engaged in se-
veral noble undertakings. He procured sums to be
raised for purchasing small libraries for the use of the
poor ministers in the several parts of our plantations:
and to better this design, he published two books; one entitled Bibliotheca parochialis, or a scheme
of such theological and other heads as seem requisite
to be perused or occasionally consulted by the clergy,
together with a catalogue of books which may be pro-
fusely read on each of those points; the other, Apos-
toical Charity, its nature and excellency considered.
He endeavoured to get a fund established for the pro-
pagation of the gospel, especially among the uncultivated
Indians; and by his means a patent was obtained
for erecting the corporation called The society for the
propagation of the gospel. He, by his industry, pro-
cured relief for prisoners; and formed the plan for the
society for the reformation of manners, charity-schools,
&c. He wrote, 1. His Martyrology, or papal usurpa-
tion, in one volume, folio; 2. Directorium missionari-
um; and other works. This excellent man died in
1750, aged 73.

BRAY, a port town of Ireland, in the county of
Wicklow, and province of Leinster, seated on St
George’s channel, eight miles south of Dublin. W.
Long. 6. 16. N. Lat. 53. 8.

BRAY sur Sèine, a town of France in Champagne,
and in Senonais, on the confines of Brie. E. Long.
2. 15. N. Lat. 48. 35.

BRAYLE, among sportsmen, a piece of leather slit
to put upon the hawk’s wing, to tie it up.

BRAZED, in Heraldry, a term serving to describe
three chevrons, one clasping another.

BRAZEN, something consisting of brass, or formed
out of it. See Brass.

BRAZEN AGE. See Age.

BRAZEN DISH, among miners, is the standard by
which the other dishes are gauged, and is kept in the
king’s hall.

BRAZEN SEA, in Jewish antiquity, one of the sacred
utensils in the temple of Solomon. It was cast in the
plain of Jordan, and removed from thence into the in-
er court of the temple; where it was placed upon 12
oxen, three of which looked towards each quarter of
the world. It was ten cubits from the one brim to
the other, five cubits in height, and 30 cubits in cir-
cumference, and contained 3000 baths. The brim of
it was perfectly round, and so it continued in the two
upper cubits; but below the brim, in the three lower
cubits, it was square. It was a handbreadth thick,
and the brim was wrought like the brim of a cup, with
flowers of lilies. About the body of this huge vessel
there were two borders of engravings, being the heads
of oxen in demi-relief: out of which some suppose the
water issued, and that they were made as cocks and
conveyances for that purpose.—This brazen or molten
sea, was designed for the priests to wash themselves in
before they performed the service of the temple. The
supply of water was through a pipe out of the well
Etam; though some are of opinion, that it was con-
stantly supplied with water by the Gibeonites.

BRAZIER,
Brazier, an artificer who makes and deals in all kinds of brass ware. This trade, as exercised in Britain, may be reckoned a branch of the smithery, though they seldom keep forges, except for brazing or soldering, and tinning the insides of their vessels, which they work up chiefly out of copper and brass prepared rough to their hands. They consist of a working part, and a shop-keeping part, which latter may carry on to a great extent, dealing as well in all sorts of iron and steel, as copper and brass goods for household furniture; and lately have fallen much into selling what is called French plate, made of a sort of white metal, silvered and polished to such a degree that the eye cannot soon distinguish it from real silver.

Brazil. See Brasil.

Brazing, the soldering or joining two pieces of iron together by means of thin plates of brass, melted between the pieces that are to be joined. If the work be very fine, as when two leaves of a broken saw are to be brazed together, they cover it with pulverized borax, melted with water, that it may incorporate with the brass powder, which is added to it: The piece is then exposed to the fire without touching the coals, and heated till the brass is seen to run.

Brazing is also the joining two pieces of iron together by beating them hot, the one upon the other, which is used for large pieces by farriers, &c.

Brazil, a town and island on the coast of Dalmatia, in the gulf of Venice, opposite to Spalatro, and subject to Venice. E. Long. 28° 0'. N. Lat. 43° 0'.

Breach, in a general sense, denotes a break or rupture in some part of a fence or enclosure, whether owing to time or violence.—Inundations, or overflowings of lands, are frequently owing to breaches in the dikes or sea banks. Daytime breach is famous; it was made in 1707, by a failure of the Thames wall in a very high tide. The force wherewith it burst in upon the neighbouring level tore up a large channel or passage for water 100 yards wide, and in some places 20 feet deep, by which a multitude of subterraneous trees that had been buried many ages before were laid bare.

Breach, in fortification, a gape made in any part of the works of a town by the cannon or mines of the besiegers, in order to make an attack upon the place. To make the attack more difficult, the besieged lower the breach with crow-feet, or stop it with chevaux de frise.—A practicable breach, is that where the men may mount and make a lodgment, and ought to be 15 or 20 fathoms wide. The besiegers make their way to it, by covering themselves with gabions, earth-bags, &c.

Breach, in a legal sense, is where a person breaks through the condition of a bond or covenant; on an action upon which, the breach must be assigned: And this assignment must not be general, but particular, as, in an action of covenant for not repairing houses, it ought to be assigned particularly what is the want of reparation: and in such certain manner, that the defendant may take an issue.

Bread, a mass of dough kneaded and baked in an oven. See Baker, Baking, and Barn.

Maclure's Chem. Dict.

The grains of all vegetables are almost entirely composed of substances very proper for the nourishment of animals; and amongst grains those which contain a farinaceous matter are the most agreeable and most nutritious.

Man, who appears to be designed by nature to eat of all substances which are capable of nourishing him, and still more of vegetables than animals, has, from time immemorial, and in all parts of the earth, used farinaceous grains as the principal basis of his food: but as these grains cannot be without difficulty eaten by men in their natural state, this active and intelligent animal has gradually found means not only to extract the farinaceous part, that is, the only nutritive part of these grains, but also to prepare it so that it becomes a very agreeable and wholesome aliment, such as the bread we now generally eat.

Nothing appears so easy at first sight as to grind corn, to make a paste with the flour and water, and to bake this paste in an oven. They who are accustomed to enjoy the advantages of the finest human inventions, without reflecting on the labour it has cost to complete them, think all these operations common and trivial. However, it appears very certain, that for a long time men no otherwise prepared their corn than by boiling and forming compact viscous cakes, not very agreeable to the taste, and of difficult digestion. Before they were able to make bread of good taste and quality, as we have now, it was necessary to invent and complete ingenious machines for grinding corn, and separating the pure flour with little trouble and labour; and that inquiries, or rather some happy chance, which some observing person availed himself of, should discover, that flour, mixed with a certain quantity of water, is susceptible of a fermentation which almost entirely destroys its viscosity, heightens its taste, and renders it proper to make a light bread, very agreeable to the taste, and of easy digestion.

This essential operation, on which the good quality of bread depends, is entirely of the province of chemistry. It would add to the honour of the ancient cultivators of chemistry, to attribute to them so useful and important a discovery; but, unhappily, it is too probable that they had no share in it. The ancient chemists were engaged in other pursuits than that of bread and other common objects. They hoped to make gold; and what is bread in comparison with gold?

However that be, to the fortunate invention of raising the paste before baking we owe the perfection of the art of making bread. This operation consists in keeping some paste or dough, tilled by a peculiar spiritual fermentation it swells, rarefies, and acquires a smell and taste quick, pungent, spirituous, somewhat sour, and rather disagreeable. This fermented dough is well worked with some fresh dough, which is by that mixture and moderate heat disposed to a similar but less advanced fermentation than that above mentioned. By this fermentation the dough is attenuated, and divided; air is introduced into it, which being incapable of disengaging itself from the tenacious and solid paste, forms in it small cavities, raises and swells it: hence the small quantity of fermented paste which disposes the rest to ferment, is called leaven, from the French word leure, signifying to raise.

When the dough is thus raised, it is in a proper state to be put into the oven; where, while it is baked, it dilates.
Bread. dilates itself still more by the rarefaction of the air, and of the spirituous substance it contains, and it forms a bread full of eyes or cavities; consequently light, and entirely different from the heavy, compact, viscid, and indigestible masses, made by baking unfermented dough.

The invention of beer, or wine of grains, furnishes a new matter useful in the making of bread. This matter is the froth which forms upon the surface of these liquors during fermentation. When it is mixed with dough, it raises it better and more quickly than ordinary leaven. It is called yeast or barn. By means of this, the finest lightest bread is made. It often happens, that bread made with leaven dough has a sourish and not agreeable taste; which may proceed from too great a quantity of leaven, or from leaven in which the fermentation has advanced too far. This inconvenience does not happen to bread made with yeast; because the fermentation of this substance is not too far advanced, or because more attention is given to that finer bread.

It may be asked, Why, since dough is capable of fermenting spontaneously and singly, as we see from the leaven, a substance is added to dispose it to ferment? The true reason is, that all the parts of a fermenting substance do not ferment at the same time, nor to the same degree; so that some parts of this substance have finished their fermentation, while others have not yet begun. The fermentable liquors which contain much sugar, as hydromel, and must of wines, give proofs of this truth; for, after these liquors have become very vinous, they have still very distinctly a saccharine taste: but all saccharine matter is still susceptible of fermentation; and, in fact, if vinous hydromel, or must, or even new beer, be distilled, so that all their ardent spirit shall be separated, and the residues diluted with water, we shall see a second fermentation take place, and a new quantity of ardent spirit formed.

The same thing precisely happens to dough, and still more sensibly, from its viscosity and want of fluidity; so that if it be left to ferment alone, and without the help of leaven, as the fermentation proceeds very slowly and successively, the parts which ferment first will have become sour and vapid before all the rest be sufficiently attenuated and changed, by which the bread will acquire a disagreeable taste.

A mixture of a small quantity of leaven with dough effectually prevents this inconvenience; because the effect of this leaven, and of all fermenting substances, is to dispose to a similar fermentation all matters capable of it, with which it is mixed; or rather, by means of leaven, the fermentation of all the parts of such substances is effected more nearly at the same time.

Bread well raised and baked differs from unfermented bread, not only in being less compact, lighter, and of a more agreeable taste, but also in being more easily miscible with water, with which it does not form a viscous mass, which circumstance is of great importance in digestion.

It is observable, that without bread, or somewhat of this form, no nation seems to live. Thus the Laplanders, having no corn of their own, make a sort of bread of their dried fishes, and of the inner rind of the pine, which seems to be used, not so much for their nourishment as for supplying a dry food. For this mankind seem to have an universal appetite, rejecting bland, slippery, and mucilaginous foods. This is not commonly accounted for, but seems to depend on very simple principles. The preparation of our food depends on the mixture of the animal fluids in every stage. Among others the saliva is necessary, which requires dry food as a necessary stimulus to draw it forth, as bland, slippery, fluid aliments are too inert, and make too short stay in the mouth, to produce this effect, or to cause a sufficient degree of manuduction to emulge that liquor. For this reason we commonly use dry bread along with animal food, which otherwise would be too quickly swallowed. For blending the oil and water of our food nothing is so fit as bread, assisted by a previous manuduction. For which purpose, bread is of like necessity in the stomach, as it is proper that a substance of solid consistence should be long retained there. Now the animal fluids must be mixed with our aliment, in order to change the ascencency it undergoes. But liquid foods would not attain this end, whereas the solid stimulates and emulges the glands of the stomach. The bread then appears to be exceedingly proper, being bulky without too much solidity, and firm without difficulty of solution.

Among the ancients we meet with various denominations of bread; as, 1. Panis silicicus, called also mandus, athleticus, irinigia, colphisus, and robas, answering to our white bread; being made of the purest flour of the best wheat, and only used by the richer sort. 2. Panis secundus or secundarius, called also eullicoceus or smilagineus, the next in purity; being made of fine flour, only all the bran not sifted out. 3. Austarys, called also syncornistus and confusiones, made of the whole substance of the wheat, without either retrenching the finer flour or coarser bran; answering to our household bread. 4. Cacabaceus, apparently the same with what was otherwise denominated soridis, as being given to dogs; furfuraceus, furfuraceus, or furfuratus, because made in great part of bran; and, in the middle age, bisus, on account of its brownness; sometimes also leibo. There were other sorts of bread, denominated from the manner in which they were made, or the uses they were applied to; as, 1. The miliarius, which was prepared by the soldiers and officers in camp with their own hands; for which purpose some had hand-mills, others pounded the corn in a mortar, and baked it on the coals. 2. Cibarius, that baked in an oven, by way of contradiction from that baked on the hearth or under the embers. 3. That called subseciniriatus, or sub cinere coctus; sometimes also reversarius, because it was to be turned in the baking. 4. Nauticus, answering to our sea-biscuit, and denominated accordingly bis coctus, because baked several times over to make it keep the longer. Other kinds of bread were denominated from their qualities and accidents; as, 1. The panis siccus, that which had been long baked; such as were the bis coctus, naval and baccellated bread. 2. Madiatus, a sort made of rye or bear, sometimes also made of fine flour, wherewith they smeared their faces, by way of a cosmetic, to render them smooth. 3. Acidus, or sour bread, which was acidulated with vinegar. 4. Asperus, that unleavened or unfermented.

The French have also a great variety of breads; as...
Bread.

 queen's bread, almond bread, bread de Segovia, de Gentilhuy, quality-bread, &c. all prepared in peculiar manners by the bakers of Paris. The bread de Gonsesse excels all others, on account of the waters at Gonsesse, a town three leagues from Paris. It is light, and full of eyes, which are the marks of its goodness. Pain de mangez, is that which each family bakes for itself. Spice-bread, pain d'espice, denotes bread baked and iced over with the scum taken off sugar in refining houses; it is sometimes also made with honey and other sorts of seasonings, and answers to what the ancients call panis mellius.

Among us, bread is chiefly divided into white, wheaten, and household; differing only in degrees of purity. In the first, all the bran is separated; in the second, only the coarsest; in the third, none at all: so that fine bread is made only of flour; wheaten bread of flour and a mixture of the finer bran; and household, of the whole substance of the grain, without taking out either the coarse bran or fine flour. We also meet with symmetrical bread, manchet or roll bread, and French bread: which are only so many denominations of the finest and whitest bread, made of the purest flour; except that in ill-rolled bread there is an addition of milk, and in French bread, of eggs and butter also. In Lancashire, and several of the northern counties of England, they have several sorts of oat bread; as, 1. The bannock, which is an oat-cake, kneaded only with water, and baked on the embers. 2. Clap-bread, which is made into thin hard cakes. 3. Bitcheness bread, which is made of thin batter, and made into thin soft oat-cakes. 4. Riddle-cakes, which are thick and sour, have but little leaven, and are kneaded stiff. And, 5. Jannock, which is oat bread made up into loaves. Add to these, pease-bread, much used in many parts of Scotland; being bread consisting either wholly of the flour of pease, or of this and oat-meal mixed: the dough, sometimes leavened, sometimes made only with water, is formed either into bannocks or cakes, and baked over the embers; or into what they call loaves; it is a kind of flatish rolls, and baked in the oven. In the statute of assize of bread and ale, § Hen. III. mention is made of wastel-bread, cocket-bread, and bread of treet; which answer to the three kinds of bread now in use, called white, wheaten, and household bread. In religious houses, they heretofore distinguished bread by the names esquires bread, panis armorigerum; monks bread, panis conventualis; boys bread, panis puororum; and servants bread, panis famularum; called also panis servientalis. A like distribution obtained in the households of nobles and princes; where, however, we find some other denominations; as messengers bread, panis nuncius, that given to messengers as a reward of their labour; court-bread, panis curialis, that allowed by the lord for the maintenance of his household; solemninary bread, that distributed to the poor by way of alms.

It is for the interest of the community that the food of the poor should be as various as possible; that, in time of dearth and scarcity of the ordinary kinds, they may not be without ready and cheap resources. To the discovery of such resources several benevolent philosophers having successfully turned their inquiries, we shall lay before the reader the result of their experiments.

1. Bread of Potatoes*. Potatoes, previously deprived of their skin, cut into thin slices, and put between paper, will dry in a heat somewhat less than 35° de Beaumur's thermometer; and, when thus dried, they will preserve their white colour. By this process, they lose about two thirds of their weight, and they may then be reduced to a fine powder. A little of this powder thrown upon the fire sends out a smoke, accompanied with a smell resembling burnt bread. As the smell is perceived from all farmaceous vegetables when treated in the same manner, M. Parmentier thinks it may be considered as the characteristic of the presence of an amylaceous matter. This smell does, however, arise from the amylaceous root infra. or fibrous part separately, but from both taken together. The powder of potatoes, obtained in the manner described above, has the smell and taste of wheat; and, like it, is devoured by rats and mice; but, even when most finely powdered, it has not the feel or brightness of the flour of wheat; although, on a chemical analysis, it yields the same products. It is also nutritious, and keeps well for a long time.

Finding so great a similarity between the meal of wheat and what may be called the meal of potatoes, M. Parmentier next endeavoured to make bread of them when mixed in different proportions. His trials were made with one-fourth, one-third, one-half, and two-thirds, of the potato-meal, the remainder being flour from wheat. These proportions, with the addition of a little salt and yeast, yielded bread which was well tasted, but which had fermented little, was brown, and covered with hard brown crusts. Bread made from the meal of potatoes alone, with the addition of salt and yeast, was edible, but very heavy, unfermented, and exceedingly brown. This bread, from the meal of potatoes alone, was apt to crumble into powder. To give it more consistency, he mixed with the meal a decoction of bran, or a mixture of honey and water; either of which made it lighter and more fermented: it obtained also a crust of a golden colour, became well tasted, and sufficiently adhesive. M. Parmentier obtained bread also, well fermented, and of a good colour and taste, from a mixture of raw potato-pulp with meal of wheat, or potato-meal, with the addition of yeast and salt.

Potatoes, when used for making bread, are not readily disposed to ferment; without which, bread is very insipid, and not easily digested. But M. Parmentier found, from a variety of experiments, that good bread might be made from equal quantities of flour and potato-meal. He concludes, therefore, with recommending the mixture of potatoes, in times of scarcity, with the flour of wheat, instead of employing rye, barley, or oats, as has frequently been done.

When grain is altogether wanting, he recommends the use of bread made from a mixture of the amylaceous powder of potatoes and of their pulp, this mixture being fermented with leaven or with honey. The meal of this root, when diluted with hot water, acquires a tenacious and gluey consistence. However fair the meal of potatoes may be, it always gives a grey colour to the bread made by mixing it with the flour of wheat.
wheat: but a mixture of the pulp of potatoes with
the flour of wheat does not produce brown-coloured
bread.

M. Parmentier made bread, very much like that of
wheat, by a mixture of the following four substances,
viz. four ounces of amylaceous powder of potatoes, one
dram of mucilage extracted from barley, one dram of
the bran of rye, and a dram and a half of glutinous
mater dried and powdered.

2. Bread from different Vegetables not commonly in
Use. Although horse-chestnut has not hitherto been
employed, yet it is certain that wholesome bread, with
out any bitternes, may be obtained from it. M. Par-
mentier advises, that the fruit, after the skin is taken
off, and the juice pressed from it, be made into a paste.
This mass must be diluted in water, and then strained
through a sieve. A milky-coloured liquor is thus sepa-
rated, which, on standing, deposits a fine powder.
This, being dried, is without either smell or taste, and
very fit for aliment; the mass from which it is pro-
cured retaining the bitterness of the fruit.

The roots of the bryonia, when treated in the same
manner, yielded a similar white powder. By the same
method also, fine, white, insipid, inodorous powders
may be procured from the roots of the iris, gladiolus,
ranunculus, fomaria, arum dracunculus, mandragora,
colchicum, filipendula, and helleborus; plants which
grow spontaneously, and in great abundance.

Acorns bread has frequently been made; and to
this day, in some countries, they are in common use.
The method of preparation which M. Parmentier re-
commends is, that they be deprived of their cover by
boiling, then dried and powdered, and afterwards bak-
ed in the same manner as the flour of wheat. When
fully ripe, and made into a paste, they were deprived
of their astringency by merely pressing their juice from
them. The mass remaining after the pressure, when
dried, was easily reduced to a fine powder by no means
disagreeable.

The granum caninum arvensis, in its appearance, ap-
proaches to corn; and some naturalists have consider-
ed it as the original species from which all our grain
is produced. Its roots are sweet-tasted, and have long
been employed in making pitkins. In the preparation
of them for bread, it is only necessary that the roots
should be cleansed, cut small, dried, and pounded. This
powder, M. Parmentier observes, does not dissolve in
cold water or spirits; but it does in boiling water,
which it renders thick and cloudy, and, upon cooling,
the whole mass obtains a gelatinous consistence. Upon
a chemical analysis, it yields an acid empyreumatic oil,
which possesses a singular odour, resembling that which
is perceived on burning the plant. The spongy re-
siduum, calcined in the air, gives a fixed alkali. These
properties incontestably prove, that it contains an
amylaceous (A) matter similar to that of grain, which
appears to be the nutritive part of vegetables. This
amylaceous matter, formed into a jelly, and diffused
in water, keeps for a long time without suffering any
change; it then turns acid, and at length putrefies.

The amylaceous matter of acrid and poisonous plants,
although innocent and nutritive, cannot be converted
into bread without the addition of some mucilaginous
substance. In times of great scarcity, common bran
will answer the purpose; but when potatoes are to be
had, the addition of a proper proportion of these is to
be preferred.

M. Parmentier gives an account of the bread which
he obtained from the amylaceous powders of the dif-
f erent vegetables mentioned above, with the addition
of potatoes and a small quantity of common leaven of
grain. This bread appeared in general to be well fer-
mented; it was of a good white colour, and, free from
any disagreeable odour: but to the taste, it was some-
what insipid; which, however, he imagines, might
have been corrected by the addition of a proper quan-
tity of salt.

As the resources against scarcity here pointed out
can be procured only at particular seasons, the author
proposes a method for preserving the matter thus ob-
tained. For this purpose, he advises, that bread pre-
pared in the manner mentioned above should be care-
fully

(A) M. Beccari of the Bolognian academy has discovered in the flour of wheat two distinct substances. The
one he terms an animal or glutinous matter; the other, an amylaceous matter or vegetable paste.

The gluten has been supposed to be the nutritive part of corn, from its not dissolving unless in vegetable
acids; from its assuming a spongy form in boiling water; from its supposed analogy to the animal lymph; and,
lastly, from the similitude which the products it affords, on a chemical analysis, bear to those obtained from
animal substances. M. Parmentier, however, from various experiments, was led to conclude, with the cele-
brated Model of Petersburg, that the gluten or animal matter of Beccari exists in the bran, and is not the nu-
tritive part of the wheat. Having made experiments with four different kinds of flour, it appeared that the
quantity of animal matter was always proportioned to the coarseness of the flour. Hence, were this gluten the
nutritive part, the coarsest bread, or that which contained most bran, would afford the greatest quantity of nou-
rishment. The contrary of this, however, is now known to be fact.

The amylaceous part, or, as some have termed it, the Stacy, of wheat and other vegetables, is a peculiar
gum, not soluble in spirit of wine, vinegar, or cold water. It contains more acid, and less water, than the or-
dinary gums. It is found in many of those plants that make the nourishment of men and other animals. Hence
M. Parmentier concludes it to be the nutritive matter.

Though when not to consider the glutinous matter as the nutritious part of vegetables, yet it is a very ne-
necessary ingredient. It is that which preserves the cohesion of the paste in fermenting bread: it is that which
forms the viscous pellicle, and stops the air in fermentation; gives the savoury taste to bread; occasions it to be
light, to ferment, and which forms the small cells seen in it. It is found especially near the cortical part of
grain; and this accounts for its being found in the greatest quantity in coarse brown meal. It is this gluten
which renders wheat a superior aliment to the other grains and roots.
Bread.  

Fully dried, reduced to powder, and then kept in a close cask. By this means, he is of opinion that it may be preserved for a very long time, and will always be ready to make an agreeable and wholesome panada by the addition of a little butter and salt.

M. Parmentier, in order to discover the degree of power with which this alimentary powder nourished, made himself the subject of experiment; and found, that three ounces of it for dinner, and as much for supper, made into panada with water, was a sufficient quantity of aliment for a day. From his discharge by stool while he used it; he had reason to believe that it is almost totally alimentary. He concludes with recommending it not only as useful in times of scarcity, but as a proper substitute for sea biscuit, and as a species of food well adapted for armies and hospitals.

3. Cheap method of making wholesome Bread, when wheat-flour is dear, by mixing turnip with it. 

At the time I tried this method, bread was very dear, being so much that the poor people, in the country where I live, could hardly afford for themselves half a meal a-day. This put me upon considering whether some cheaper method not might not be found than making of wheat-meal. Turnips were at that time very plentiful. I had a number of them pulled, washed clean, pared, and boiled; when they were become soft enough to mash, I had the greatest part of the water pressed out of them, and afterwards had them mixed with an equal quantity in weight of coarse wheat-meal; the dough was then made in the usual manner, with yeast or barm, salt, water, &c. It rose very well in the rough; and after being well kneaded, was formed into loaves, and put into the oven to be baked. I had at the same time some other bread made with common meal in the ordinary way. I baked my turnip bread rather longer than the other. When they were drawn from the oven, I caused a loaf of each sort to be cut; and found, on examination, the turnip-bread was sweeter than the other, to the full as light and as white, but had a little taste (though not disagreeable) of the turnip. Twelve hours afterwards I tasted my turnip-bread again, when I found the taste of the turnip in it scarcely perceivable, and the smell quite gone off. On examining it then it had been baked 24 hours, had I not known that there were turnips in its composition, I should not have imagined it: it had, it is true, a peculiar sweetish taste, but by no means disagreeable; on the contrary, I rather preferred it to the bread made of wheat-meal alone. After it had been baked 24 hours, it underwent another examination, when it appeared to me to be rather superior to the other; it ate fresher and moister, and had not at all abated in its good qualities; to be short, it was still very good after a week: and, as far as I could see, kept as well as the bread made of common wheat-meal.

In my trials of this bread by the taste, I was not satisfied with eating it by itself; I had some of it spread with butter; I tasted it with cheese; I ate of it toasted and buttered, and finally in boiled milk and in soup; in all these forms it was very palatable and good.

Bread, in Medicine. Besides the alimentary, bread has also medical, qualities.—Decoctions, creams, and jellies of bread, are directed in some dispensatories. Bread carefully toasted, and infused or lightly boiled in water, imparts a deep colour, and a sufficiently agreeable restriptent taste. This liquor, taken as common drink, has done good service in a weak lax state of the stomach and intestines; and in bilious vomiting and purging, or the cholera morbus: examples are related in the Edinburgh essays of several cases of this kind cured by it, without the use of any other medicine. In Westphalia there is a very coarse bread eaten, which still retains the opprobrious name given it by a French traveller of Bonportwilk, "good for his horse Nickel." It is the same with what the Romans called panis furfuraceus, or panis impurus, from its not being cleansed from the husk; and panis albus, from the blackness of its colour: though we learn from Pliny, that the Romans for 300 years knew no other bread. The Germans make Hoffman, two sorts of waters by distillation from this bread; the one with the other without, the addition of a spirituous liquor: to both which great virtues are ascribed. That without any thing spirituous, is made out of the juice of craw-fish, may-dew, rose-water, nutmegs, and saffron, distilled from a large quantity of this bread. This is esteemed a great restorative, and given in hectic habits. The other is distilled from this bread and Rheinish wine, with nutmegs and cinnamon. This is given in all the disorders of the stomach, vomiting, loss of appetite, and other complaints of the same kind: and besides these, there is a spirit distilled from it by the retort in the dry way, which, when separated from its fetid oil, is esteemed a powerful sudorific, and very valuable medicine in removing impurities of the blood.

Bread is also medicinal, applied externally, as vulgarly known. Mr Boyle assures us he drew a menstruum from bread stronger than aquafortis, and which would act even upon glass itself. *

**Boyle's Phil. Works, unabridged, **

vol. iii. p. 572. *

Bread-Fruit Tree. See Supplement.

Bees-Bread. See Bee.

Cassada Bread. See Jacroopa, Botany Index.

Earth Bread. * In the lordship of Moscow in the Upper Lusitania, a sort of white earth is found, of which the poor, urged by the calamities of the war, which raged in those parts, make bread. It is taken out of a hill where they formerly worked at saltpetre. When the sun has somewhat warmed this earth, it cracks, and small white globules proceed from it as meal; it does not ferment alone, but only when mixed with meal. Mr Sarlitz, a Saxon gentleman, was pleased to inform us, that he has seen persons in Germany in a great measure lived upon it for some time. He assured us that he procured bread to be made of this earth alone, and of different mixtures of earth and meal; and that he even kept some of this bread by him upwards of six years; he further says, a Spaniard told him, that this earth is also found near Gerona in Catalonia.†

Eucharist or Sacramental Bread, in the Protestant churches, is common leavened bread, in conformity to the ancient practice. In the Roman mass, azymous or unleavened bread is used, particularly in the Gallican church, where a sort is provided for this purpose, called pain à chanter, made of the purest wheaten flour pressed between two iron plates graven like wafer-moulds, being first rubbed with white wax to prevent the paste from sticking. The Greeks observe divers ceremonies in their making the eucharist: it is necessary...
Bread.

the person who bakes it has not lain with his wife the day before; or, if it be a woman, that she have not conversed with her husband. The Abyssinians have an apartment in their churches for this service, being a kind of sacristy. F. Sirmond, in his disquisition on azymous bread, shows, from the council of Toledo, that anciently there were as many ceremonies used in the Latin church in the preparation of the unleavened bread as are still retained in the eastern churches. He cites the example of Queen Radegonda, who distributed with her own hands in the church, the bread which she herself had made. It appears also from the dispute of Cardinal Humbert against the Greeks, that in the Latin church no bread was used for the eucharist, but what was taken out of the sacristy, and had been made by the deacons, subdeacons, and even priests, who rehearsed several psalms during the process.

Ecclesiastical writers enumerate other species of bread allotted for purposes of religion; as, 1. Calendarus, that anciently offered to the priest at the kalends. 2. Prebendarus, the same with capitolarius, that distributed daily to each prebendary or canon. 3. Benediclus, that usually given to catechumens before baptism, in lieu of the eucharist bread, which they were incapable of partaking of. The panis benedictus, was called also panagium et eulogium, being a sort of bread blessed and consecrated by the priest, whereby they prepare the catechumens for the reception of the body of Christ. The same was used afterwards, not only by catechumens, but by believers themselves, as a token of their mutual communion and friendship. Its origin is dated from the 7th century, at the council at Nantz. In the Gallican church we still find panis benedictus, panis benit, used for that offered for benediction, and afterwards distributed to pious persons who attend divine service in chapels. 4. Consecrated bread is a piece of wax, paste, or even earth, over which several ceremonies have been performed with benedicitions, &c. to be sent in an Agras Dei, or relic-box, and presented for veneration. 5. Unleavened bread, panis azymes. The Jews eat no other bread during their passover: and exact search was made in every house, to see that no leavened bread was left. The usage was introduced in memory of their hasty departure from Egypt, when they had not leisure to make leavened bread. 6. Show-bread was that offered to God every Sabbath-day, being placed on the golden table in the holy of holies.

Horse-Bread is made of wheat, oats, and beans; to which sometimes are added aniseed, gentian, liquorice, fenugreek, eggs, and ale; and sometimes rye and white wine are used.

For race-horses three sorts of bread are usually given with success, for the second, third, and fourth nights feeding: they are all made of beans and wheat worked with barm; the difference consisting chiefly in the proportion of the two former. In the first kind, three times the quantity of beans is used to one of wheat; in the second, equal quantities of both; in the third, three times the quantity of wheat to one of beans.

Sago-Bread. See Sago.

See Appendix of Bread. The price and weight of bread is regulated by the magistrates according to the price of wheat. We have divers tables of the weights of the loaves both of wheat, wheaten, and household bread, at every price of wheat. If bread want one ounce in 36, the baker formerly was to suffer the pillory: now, to forfeit 5s. for every ounce wanting; and for every defect less than an ounce, 2s. 6d.; such bread being complained of and weighed before a magistrate within 24 hours after it is baked or exposed to sale within the bills of mortality, or within three days in any other place. It is to be observed, bread loses weight by keeping; in some experiments, recited by Bartholine, the diminution was near one-fourth in six months. The same author assures us, that in Norway, they make bread which keeps 30 or 40 years; and that they are there fonder of their old hard bread, than elsewhere of new or soft; since the older it is, the more agreeable it grows. For their great feasts, particular care is taken to have the oldest bread; so that, at the christening of a child, they have usually bread which had been baked perhaps at the christening of his grandfather. It is made of barley and oat-meat baked between two hollow stones.

Break Room, in a ship, that destined to hold the bread or biscuit. The boards of the bread-room should be jointed and caulked, and even lined with tin-plates or mats. It is also proper to warm it well with charcoal for several days before the biscuit is put into it; since nothing is more injurious to the bread than moisture.

Breadth, in Geometry, one of the three dimensions of bodies, which multiplied into their length constitutes a surface.

Break, in a general sense, signifies to divide a thing into several parts with violence.

In the art of war, to break ground, is to open the trenches before a place.

Among sportsmen, to break a horse in trotting, is to make him light upon the hand in trotting, in order to make him fit for a gallop. To break a horse for hunting, is to supple him, to make him take the habit of running.

Breakers, a name given to sailors to those billows that break violently over rocks lying under the surface of the sea. They are distinguished both by their appearance and sound, as they cover that part of the sea with a perpetual foam, and produce a hoarse and terrible roaring, very different from what the waves usually have in a deeper bottom. When a ship is unhappily driven among breakers, it is hardly possible to save her.

Breaking, in a mercantile style, denotes the becoming bankrupt. See Bankrupt.

Breaking-Bulk, in the sea-language, is the same with unlading part of the cargo.

Breakspear, Nicholas. See Adrian IV.

Breakwater, a sort of rampart of stone or wood, placed in the water before a harbour to break the force of the waves. See Supplement.

Bream. See Cyprinus, Ichthyology Index. To Bream, to burn off the filth, such as grass, ooze, shells, or sea-weed, from a ship's bottom, that has gathered to it in a voyage, or by lying long in a harbour. This operation is performed by holding kindled furze, faggots, or such materials to the bottom, so that the flame incorporating with the pitch, sulphur, &c. that had formerly covered it, immediately loosens and throws off whatever filth may have adhered to the planks. After this, the bottom is covered anew with a composition of sulphur, tallow, &c. which not only
Breath

Breath makes it smooth and slippery, so as to divide the fluid more readily, but also poisons and destroys those worms which eat through the planks in the course of a voyage. Breathing may be performed either when the ship lies aground after the tide has ebbed from her, or by docking, or by careening.

Breast, in Anatomy, denotes the fore-parts of the thorax. See Anatomy Index.

Smiting the breast is one of the expressions of penitence. In the Romish church, the priest beats his breast in rehearsing the general confession at the beginning of the mass.

Breasts, or Mammas, in Anatomy. See Anatomy Index.

The breasts are usually two; though we also meet with instances of trimamie or women with three breasts, and even some with four, all yielding milk alike.

Breast-Hooks, in Ship-Building, are thick pieces of timber incutated into the form of knobs, and used to strengthen the fore-part of the ship, where they are placed at different heights directly across the stem, so as to unite it with the bows on each side. The breast-hooks are strongly connected to the stem and hawse-pieces by tree-nails, and by bolts driven from without through the planks and hawse-pieces, and the whole thickness of the breast-hooks, upon whose inside those bolts are forlocked or clinched upon rings. They are usually about one-third thicker, and twice as long, as the knees of the decks they support.

Breast-Plate, in antiquity, a piece of armour worn to defend the breast, originally believed to be made of hides, or hemp, twisted into small cords, but afterwards made of brass, iron, or other metals, which were sometimes so exquisitely hardened, as to be proof against the greatest force.

Breast-Plate, in Jewish antiquity, one part of the priestly vestments, anciently worn by the high-priest. It was a folded piece of the same rich embroidered stuff of which the ephod was made; and it was set with twelve precious stones, on each of which was engraved the name of one of the tribes. They were set in four rows, three in each row; and were divided from each other by little golden squares or partitions in which they were set. The names of these stones, and that of the tribes engraved on them, as also of their disposition on the breast-plate, are as follows:

- Sardius
- Topaz
- Carbuncle
- Emerald
- Zircon
- Copenhagen
- Jaffa
- Judea
- Gad
- Dan
- Levi

This breast-plate was fastened at the four corners; those on the top to each shoulder by a golden hook or ring at the end of a wreathed chain; and those below, to the girdle of the ephod, by two strings or ribbons, which had likewise two rings and hooks.

This ornament was never to be severed from the priestly garment; and it was called the memorial, to put the high-priest in mind how dear those tribes ought to be to him, whose names he wore on his breast. It is also called the breast-plate of judgment, because it had the divine oracle of Urin and Thummim annexed to it. See Urin and Thummim.

Breast-Plate, in the manage, the strap of leather that runs from one side of the saddle to the other, over the horse's breast, in order to keep the saddle tight, and hinder it from sliding backwards.

Breast-Work, in Fortification, the same with Parapet.

Breath, the air inspired and expelled again in the action of respiration.

The ancients were very watchful over the last breath of dying persons, which the nearest relations, as the mother, father, brother or the like, received in their mouths.

Breathing, the same with Respiration.

Brechin, a town of Scotland, in the county of Angus, situated in W. Long. 2. 18. N. Lat. 56. 40. It consists of one large handsome street, and two smaller; and is on the side of a small hill, washed by the Southesk, over which there is a stone-bridge of two large arches. It contained 1200 inhabitants in 1811. At the foot of the town is a long row of houses independent of it, built on ground held in feu from the family of Northesk. It is a royal borough, and, with four others, sends a member to parliament. It has a small share of the linen manufacture, which has lately declined. It lies at no great distance from the harbour of Montrose; and the tide flows within two miles of the town; to which a canal might be made, which perhaps might create a trade, but would be of certain service in conveying down the corn of the country for exportation.

Brechin was a rich and ancient bishopric, founded by David I. about the year 1150. At the Reformation, its revenues, in money and in kind, amounted to 100l. a-year; but, after that event, were reduced to 12l. chiefly by the alienation of lands and tithes by Alexander Campbell, the first Protestant bishop, to his chieftain the Earl of Argyll—The Culdees had consent here. Their abbot Leod was witness to the grant made by King David to his new abbey of Dunfermline. In after times, they gave way to the Mathurines or Red Friars. The ruins of their house, according to Maitland, are still to be seen in the College Wynd. Here was likewise an hospital called Maison de Dieu, founded in 1266, by William de Brechin, for the repose of the souls of the kings William and Alexander; of John earl of Chester and Huntingdon his brother; of Henry his father, and Juliana his mother. Albinus bishop of Brechin, in the reign of Alexander II. was witness to the grant. By the walls which are yet standing, behind the west end of the chief street, it appears to have been an elegant little building.

The cathedral is a Gothic pile, supported by 12 pillars; is in length 166 feet, in breadth 61: part is ruinous, and part serves as the parish-church. The west end of the aisles is entire; its door is Gothic, and the arch consists of many mouldings: the window of it neat tracery. The steeple is a handsome tower, 120 feet high; the four lower windows in form of long narrow openings; the belfry windows adorned with that species of opening called the quatrefoil: the top battlemented, out of which rises a handsome spire. At a small
BRECKNOCKSHIRE, a county of Wales, bounded by Radnorshire, on the north; Cardiganshire and Caermarthenshire, on the west; Herefordshire and Monmouthshire, on the east; and by Glamorganshire and Monmouthshire, on the south. It is 35 miles in length, 30 in breadth, about 100 in circumference, and contained 37,735 inhabitants in 1831. It is surrounded with hills, which render the air in the valleys pretty temperate. The soil on the hills is very stony, but the streams descending from thence into the valleys render them fruitful both in corn and grass. The chief commodities here are corn, cattle, fish, and otter’s fur, besides manufactures of cloth and stockings. The principal rivers are the Usk, the Wye, and the Yvron. The chief towns are Brecknock, Beaufort, and Hay.

Two miles to the east of Brecknock is a large lake, called Brecknock Meer, and by the Welsh Llyn Swoddan; it is two miles in length, and nearly the same in breadth, and contains otters, tench, &c. The county sends one member to parliament. It is in the diocese of Landaff, and contains 61 parishes, and is divided into six hundreds. See Breconshire, Supplement.

Breda, a town in Holland, the capital of Dutch Brabant. It is a large, populous, well-built city, regularly fortified after the modern way, and is one of the strongest places on the Dutch frontiers. It is seated on the river Merck, in a marshy country, which may be overflowed and rendered inaccessible to an army. It is 4000 paces in circumference, and contains upwards of 11,000 inhabitants. The town is of a triangular figure, and the ramparts are all planted round with elms. At every angle there is a gate built with brick. The great church is a noble structure, remarkable for its fine spire, which is 362 feet high. The mausoleum of Angelbert II. count of Nassau, is a curious piece, adorned with several statues and inscriptions suitable to the occasion. In 1577, the garrison delivered this city to the states-general; but it was taken in 1581 by Claude de Barlaimont, assisted by the baron de Friesen, who was prisoner therein. In 1590, Prince Maurice took it again from the Spaniards.

In 1625 it was invested by Spinola; when it endured a siege too remarkable not to deserve a particular detail.

The citadel, which formed the residence of the princes of that family, was surrounded by a ditch of prodigious depth filled with water, and a strong wall defended by three great bastions; and the arsenal was celebrated for its extent, and the vast quantities of arms and military stores it contained. Spinola, perfectly acquainted with the strength of the place, thought he should expose his whole army to immediate destruction, should he attempt an assault before he had regularly carried
carried on his approaches. He even resolved upon redu-
crass, the city by famine, as the method attended
with least danger to his army; and accordingly be-
gan with drawing trenches round, for the space of
four miles, erecting forts and redoubts at certain di-

On the other hand, the garrison, consisting of seven
thousand infantry, and several troops of horse, composed
of English, French, and Dutch soldiers, took the most
vigorous measures for their own defence. The English
were under the command of Colonel Morgan, who had
frequently distinguished his valour in the service of the
States: the French were directed by Colonel de Haut-
ervise; and the Dutch troops were subject to the im-
mediate orders of Colonel Lobbe, though the whole
received their instructions from Justin de Nassau, the
governor. The first advantage was gained by Bag-
lioni, who seized a large convoy of provisions and stores
coming up the river, converting the boats into a bridge.
This soon dissipated the besieged, and reduced them to
a stated allowance of bread; and what added to their
miserable state, though they were ignorant of it, was the
death of Prince Maurice, from whom they were in
hopes of receiving relief.

Meanwhile Spinola prosecuted the siege with the
utmost diligence and vigour. On his pushing his
trains near the bastions, the besieged began a terrible
fire to retard his approaches, and kept it up with such
severity and obstinacy, that Spinola was in hopes
they must soon surrender for want of ammunition.
But here he formed a false judgment of the prudence of
Justin de Nassau, who finding he could not accomplish
his purpose by his fire, resolved to try the effect of
water. With this view, he stopped up the course of the
river Marck; and having formed a large basin of
water, opened the sluices, swept away men, horses, and
houses, in an inundation, and overawed the whole
country. The chief force of the torrent fell upon
Spinola’s quarters, and he exerted his utmost ability to
remove the consequences. He dug large pits, and cut
out ditches and canals to receive the water; but these
being filled, and the whole ground covered over, so as
to appear one uniform mass of water, served only to
entrapt his cavalry. The inundation was augmented
by the rains which happened to fall; a mortality among
the soldiers and horses ensued; and of his whole army,
Spinola had scarce twelve thousand men fit for service
by the month of December. With these inconsiderable
remains, lines of vast extent were to be defended, the
works to be advanced, the supplies from the garri-
on repulsed, and provisions to be conveyed into the
camp, while Spinola, the soul of action, was confined
to a sick-bed.

In the garrison, an epidemical disease and scarcity
likewise prevailed; but the excellent regulations made,
and strictly observed, enabled the town to hold out
three or four weeks beyond the time expected. The
magistrates bought the corn for the bakers, obliging
them to sell the bread to the inhabitants and garrison
at a fixed price, and returning the overplus of their
pay to the soldiers. A variety of other prudent regu-
lations were established by the magistrates and gover-
nor, such as we do not find equalled by any instances
recorded in history upon a similar occasion, and all

Justin de Nassau. A kind of rivalship appeared be-
tween him and Spinola, which should best fulfil their
several duties. The Spanish general caused himself to
be carried about the works in a litter; he inspected
and directed every thing; and displayed the activity of
full health at the time his life was in imminent danger
from an acute malady. He ordered several breaches
in the lines to be repaired. These the Hollanders had
made by sap, with a view of introducing succours to
the besieged. He drove piles into all the ditches and
canals through which their boats could pass. He
made drains to clear off the waters of the river Marck;
and succeeded in a great measure by dint of perse-

dance, vigilance, and conduct. He was now reinforced
with a body of eight thousand foot, and one thousand
five hundred horse; many of the sick were perfectly
recovered by his extreme care; and his army was
again become formidable, amounting to twenty-five
thousand infantry, and eight thousand cavalry. Nor
was Prince Henry idle, who now succeeded to the
titles and dominions of his brother Maurice, and was
elected governor of Holland, Zeeland, Guelderland,
Utrecht, and Overyssel. He pressed France for assis-
tance, and was joined by a body of cavalry under the
conduct of the count de Roussi and the marquis de
Rambures. With this reinforcement, and a body of
German infantry, he attacked the enemy’s lines, and
after an obstinate conflict was repulsed. He advanced
a second time; but Spinola, who entertained a high
opinion of his valour and conduct, did not choose to
wait for him in his lines; he marched out with the
greater part of his army, seized upon a convenient
post, and obliged the prince a second time to retire to-
wars Boisduc. Henry, finding no prospect of being
able to relieve the garrison, sent a permission to the
governor to surrender on the best conditions he could
obtain. This plan, which was signed with no name, fell
into the hands of the besiegers, and Spinola saw it
open, by a trumpet, to Justin de Nassau, offering him
an honourable capitulation; but that intrepid gover-
nor, suspecting the letter was forged, because it was
anonymous, replied civilly, that a permission was not
an order to surrender; and that he should better follow
the prince of Orange’s intentions, and show his respect
for Spinola, by continuing to defend the city to the last
extremity.

By this time the garrison was diminished by disease,
fatigue, want, and hardship, to half the original num-
ber; but Justin put on such a countenance, as con-
cealed his situation from Spinola. He frequently sal-
lied out upon Baglioni’s quarters, where the Italians
were perishing with cold and hunger, the whole sub-
stance of the besiegers depending on the contributions
raised in the neighbouring territories. This inconve-
nience produced a mutiny in the camp, that could not
be appeased without applying violent remedies, and ex-
ecuting within sight of the town. The incident was
brought to the ears of the general: one of the mutineers
blew up Spinola’s secret magazine, valued at two hundred thousand livres.
Urged more by necessity than compassion for the be-
sieged, Spinola sent a message to the governor, exhort-
ing him not to force him to extremities, which might
be attended with fatal consequences to a brave garri-
son; but Justin, with equal art and dissimulation, an-
swered, that Spinola was certainly ill served by his
Breeda, as he appeared wholly unacquainted with the state of affairs in Breeda, which was fully provided for a siege of several months, and defended by soldiers who preferred death to the necessity of surrendering. At that time the besieged were not informed of the death of the prince of Orange. They flattered themselves with the hopes of speedy succour, and were entirely ignorant of Prince Henry's late disappointment. When they wrote to the army an account of their miserable condition, Henry returned an answer, written with his own hand, and signed with his name, apprising them of the death of Maurice, the unsuccessful attempts made to raise the siege and throw in succours, the great inferiority of his troops in point of numbers, and the death of King James, whereby he was disappointed of a strong reinforcement; concluding, that he left the city entirely to the discretion of the governor and other principal officers. Justin was thunderstruck with the contents of this letter. He had hitherto concealed the total want of provision and ammunition from the enemy, and his own garrison, except a few officers and other persons in whom he reposed confidence. The colonels Hauterive and Morgan would listen to no propositions, saying, that the honour of their several countries was concerned, and that they were responsible for the conduct of the English and French forces. They therefore required an express order from the prince of Orange to surrender, notwithstanding they pined under the united pressure of fatigue, scarcity, and disease. Justin acquainted the prince with their resolution, and he sent back an order to surrender, threatening with capital punishment whoever should disobey; but he requested that the garrison would first acquaint him by a certain number of fires, lighted up in different parts of the city, how many days they should be able to hold out. Upon receipt of this order, eleven fires were kindled; but as the prince had sent a duplicate of the order by another messenger, and this fell into the hands of the enemy, Spinola was now acquainted with the desperate circumstances of the besieged. By this acquisition, he likewise discovered the mystery of the eleven fires: a council of war was assembled to deliberate whether they should stay the eleven days, and then oblige the garrison to surrender at discretion, or immediately offer conditions worthy of so brave a garrison. The Spanish officers were of the former opinion; the count de Berg and Spinola supported the latter. At last the marquis, determined to pursue the dictates of his noble generosity, sent such terms as could not be refused. The count de Berg conducted the negotiation. Two separate capitulations were drawn up, one for the garrison and the other for the city, and both the most honourable and advantageous that could be devised. Those were accepted, and the garrison was relieved on 6th of June, after having sustained a siege for ten months, whereby they were diminished two thirds; nor was the loss inferior on the part of the inhabitants. Spinola drew up his army to salute them, and, surrounded by his field officers, paid particular compliments to the governor, the colonels Morgan, Hauterive, and Lobre. He distributed money among the soldiers, ordered the sick and wounded to be treated with the utmost tenderness, conveyed the text in the manner most commodious for them to Gertruydenburg, and displayed all the sentiments of a hero in the regard paid to the valour and merits of his enemies.

Breeda was retaken by the prince of Orange, for the United Provinces, in 1637. There was a congress held there, and peace concluded, in 1667, between the Dutch and the English. E. Long. 4. 45. N. Lat. 51. 35.

Breeda, John Van, painter of history, landscape, and conversations, was born at Antwerp in 1683, the son of Alexander Van Breeda, an artist who was much esteemed for landscapes, views of particular scenes in Italy, fairs, and markets, with a variety of animals and figures. He was instructed by his father: and having the advantage of a good example and a good director, added to his own great acquirements, he continued his studies with his father till he was 18 years of age. Among the variety of capital paintings which were at that time in the possession of John de Wit at Antwerp, Breeda fixed upon those of Velvert Breughel, which he copied with extraordinary success; and he was also employed for nine years in copying the pictures of several other great masters; which he performed with such incredible exactness as scarcely to leave it in the power of any judicious person to distinguish the originals from the copies. Having at length established his reputation in Holland, he went to London with Rybbrack the sculptor, and there gradually rose into such esteem, that he was visited by persons of the highest rank, and particularly patronized by the unfortunate earl of Derwentwater, who was beheaded for rebellion in 1715. He found so much encouragement in London, that he was employed by the court and the nobility, and could scarce execute the large demands for his performances. The residence of some years in England, he returned to Antwerp loaded with rich annuities and testimonials of English liberality, as well as of his own merit; and in the year 1746, when Louis XV. arrived in that city, he was so far honored this master as to purchase four of his pictures: One represented Christ at the sea of Tiberias; another, Christ performing miracles; and the other two were landscapes, with a number of figures, so exquisitely drawn and finished that it would be difficult to distinguish them from those of Velvert Breughel. He certainly approached nearer to those great masters, whose manner he imitated, namely, Breughel and Wourmans, than any other artist of this time. His landscapes are in the style and taste of the former; and his conversations, historical figures, fairs, skirmishes, or battles, are in the manner of the latter. His colouring is good; his touch neat; his skies and distances natural and beautiful; and his taste of design agreeable. He had as son's Dick much fire in his composition, and perhaps more genius, than Breughel, in those subjects which he painted in the style of that master: his figures are generally well placed; his grounds skillfully broken; every small figure has its particular character, and occupies its proper place; and, in short, he is a painter of such a rank, that the value and estimation of his works must always increase. He died in 1750.

Breecch of a great gun, or cannon, the end next the touch-hole.

Breecches, a garment worn by males, reaching from the girdle to the knees, and serving to cover the hips, thighs, &c.
The ancient Romans had nothing in their dress answering to our breeches and stockings; instead of which, under their lower tunics and waistcoats they sometimes bound their thighs and legs round with silken scarves or fasciae, called sibila and femoralia. Breeches appear to be a habit peculiar to the barbarous nations, especially those inhabiting the colder countries of the north; whence Tacitus calls them barbarum tegmen. We find mention made of them among the ancient Gauls, Sarmatians, Gauls, Germans, and Britons; they also obtained among the Moors and Persians, as being a people of Scythian origin; they also afterwards got footing in Italy, some pretend, as early as the time of Augustus; but without much foundation, that emperor’s breeches, mentioned by Suetonius, being apparently only swathes tied over his thighs. However this be, breeches were at last received into Italy, and grew so highly into fashion, that it was thought necessary, under Honorius and Arcadius, to restrain them by law, and expel the brecescens or breeches-makers out of the city; it being thought unworthy of a nation that commanded the world, to wear the apparel of barbarians.

BREECHINGS, in the sea-language, the ropes with which the great guns are lashed or fastened to the ship’s side. They are thus called, because made to pass round the breech of the gun.

BREEDING, in a general sense, the producing, nourishing, and educating, all manner of young animals.

BREEDING, in a moral sense, denotes a person’s deportment or behaviour in the external offices and decoursus of social life. In this sense we say well-bred, ill-bred, a man of breeding, &c. Good-breeding is hard to define; none can understand the speculation but those who have the practice. Good-breeding amounts to much the same with what is otherwise called politeness, among the ancient Romans urbaniitas. Good-breeding is near to virtue, and will of itself lead a man a great part of the way towards the same. It teaches him to rejoice in acts of civility, to seek out objects of compassion, and to be pleased with every occasion of doing them good offices. Lord Shaftesbury compares the well-bred man with the real philosopher; both characters aim at what is excellent, aspire to a just taste, and carry in view the model of what is beautiful and becoming. The conduct and manners of the one are formed according to the most perfect ease, and good entertainment of company; of the other, according to the strictest interest of mankind: the one according to his rank and quality in his private station; the other according to his rank and dignity in nature. Horace seems to have united both characters,

Quid verum utque decens cura estroga, et omnis in hoc sum.

See the article Good-MANNERS.

BREEDING OF HORSES. See EQUUS.

BREEDING OF FISH. The necessary qualities of a pond, to make it serve well for breeding fish, are very different from those which are to make it serve for the feeding of them, insomuch that some particular ponds serve only for one of those purposes, and others for the other; and scarce ever the same pond is found to answer for them both. In general, it is much more rare to find a good breeding pond than a good feeding one.

The best indications of a good breeding pond are these; breeding that there be a good quantity of rushes and grass about its sides, with gravelly shoals, such as horse-ponds usually have: when a pond has this property, and takes to the breeding of fish, it is amazing what a progress will be made in a little time. The spawn of fish is prodigious in quantity; and when it succeeds, one is able to produce many millions; thus, in one of these breeding ponds, two or three months, and as many spawners, will, in a very little time, stock the whole country. When these ponds are not made entirely for breeding, but the owner would have the fish to grow to some size in them, the method is to thin the numbers, because they would otherwise starve one another, and to put in other fish that will prey upon the young, and thin them in the quickest manner. Eels and perch are the most useful on this account; because they prey not only upon the spawn itself, but upon the young fry from the first hatching to the time they are of considerable size. Some fish are observed to breed indifferently in all kinds of waters, and that in considerable plenty; of this nature are the roach, pike and perch.

BREENBERG, BARTHOLOMEW, an excellent painter, was born in 1620. He is best known by the name of Bartolomeo, an appellation bestowed upon him, for distinction sake, by the society of Flemish painters at Rome called Bentovels. He was born at Utrecht; but in the early part of his life went to Rome. His studies in the art of painting were attended with such success, that his pictures were held in the highest estimation. He greatly excelled in landscapes, and these he enriched with historical subjects. The figures and animals which he introduced were very spirited, and drawn in a masterly manner; especially when they were not larger than the size in which he usually painted them. He died in 1665, aged 40 years. He also etched from his own designs a set of 24 Views and Landscapes, ornamented with Ruins.

BREEZE, a shifting wind that blows from sea or land for some certain hours in the day or night; common in Africa and some parts of the East and West Indies.

Breezes differ from etenier or trade-winds, as the former are diurnal, or have their periods each day; and the latter are annual, and blow at a distance from land. The sea-breezes rule by day, and the land-breezes by night; so that, dividing their empire, they remain constant as the seasons of the year, or course of the sun, on which they seem to depend; not but that they appear sooner or later, stronger or weaker, in some places than in others; and vary the alternative according to the several latitudes, situations, and soils, &c. of the countries where they are found. See the article Wind.

BREEZE-Fly. See TABANUS, ENTOMOLOGY Index.

BREGENTZ, or BERGEENTZ, a town of Tyrol in Germany, situated at the east end of the lake of Constance, in E. Long. 9. 40. N. Lat. 47. 36.

BREGMA, in Anatomy, the same with sinicupet. See ANATOMY Index.

BREHAR, one of the Scilly islands, lying almost directly west of the Land’s End in Cornwall, about the distance of 30 miles. It lies between the isles of Micarol, Guel, Treshaw, and Samson. It is the roughest and most mountainsous of them all, and not many years since.
since, there were only two families in it, but now there are 13. There are a few poor houses, called the town of Brachar; and there are several Barrows edged with stone, in which they buried considerable persons in ancient times; besides many monuments of the Druids. Some are of opinion, that this with the rest made but one island, which is the reason why so many antiquities are now found in most of them.

BREHAVNS, the provincial judges among the ancient Irish, by whom justice was administered, and controversies decided. These sages were a distinct tribe or family, to whom competent lands were allowed in inheritance. In criminal cases the brehon had the eleventh part of all the fines; which could not but be considerable at a time when murders, rapes, robberies, and the like offences, were only subject to pecuniary commutations.

Breton-Laws, or Leges Brehonicae, denote the general maxims or rules of law observed by the brehons, and having the force of laws throughout all the provinces of Ireland. Several fragments of the leges brehonicae are still extant in public and private libraries. The most complete collection is that belonging to the duke of Chandos; containing 224 sheets close written, full of abbreviated words, and not very legible. By the statute of Kilkenny, made under Edward III. it is enacted that no English subject shall submit to a trial by the brehon law, on the penalty of high treason. Notwithstanding which, many were still under a necessity of being concluded by the Irish laws and customs, till the whole kingdom was settled on an English bottom by King James I.

BREMAGARTON, a handsome and pretty considerable town of Switzerland, which, since 1798, forms the head town of a district in the new canton of Argau. The inhabitants deal chiefly in paper; and their religion is the Roman-catholic. It is divided into the upper and lower towns, and is very advantageously seated on the river Riss. E. Long. 8° 25′. N. Lat. 47° 20′.

BREMEN, a large, populous, and very strong town of Germany, capital of a duchy of the same name, with an archbishop's see, secularized in favour of the Swedes, but now belongs to the king of Hanover. The river Weser runs through the middle, and divides it into the old and new town. In September 1739, while the inhabitants were asleep, the magazine of powder was set on fire by lightening, and all the houses were shaken, as if there had been a violent earthquake, which threw them into a terrible consternation. The town is divided into four quarters, each of which has a burgomaster; and in the middle there is a large market-place, with the statue of Roland. Bremen drives a very large trade for iron, flux, hemp, and linen, with France, England, Spain, and Portugal; and in return takes back other provisions, with which it supplies Westphalia and the countries about Hanover. It also gets a great deal by its fisheries. It contains 55,300 houses, and about 40,000 inhabitants. E. Long. 8° 45′. N. Lat. 53° 40′.

BRECON, a duchy of Germany, in the province of Lower Saxony, lying between the rivers Weser and the Elbe; of which the former separates it from the duchy of Oldenburg, and the other from that of Holstein. The air is cold; but the country is fertile, and well peopled. It formerly belonged to the Swedes, but was afterwards sold to the king of Great Britain, as elector of Hanover, in 1716. In the winter it is subject to inundations. In 1617, on Christmas-day, several thousand cattle were drowned, besides several hundred of men: and the country was so covered with water, that it has cost immense sums to repair the dykes. Bremen is the capital town.

BREMEN-VEER, a town of Germany, in the circle of Lower Saxony, and duchy of Bremen. It is an open town, seated on the river Oost, and was formerly the place of residence of the archbishop. E. Long. 8° 35′. N. Lat. 53° 32′.

BRENNAGE, BRENNACUM, in middle-age writers, a kind of tribute paid in lieu of bran, or bran itself, which the tenants were obliged to furnish for the support of the lord's bounds. The word is also written brenage, brenaicum, and breneige, breneicum, breneium, breneicum, breneium.

BRENNUS, a celebrated captain among the Gauls, who, about 308 years before the Christian era, entered Italy with a powerful army; made great conquests there; defeated the Roman; and sacked Rome. The capital alone was defended; and Camillus coming to its relief, drove the Gauls not only out of Rome, but out of all Italy. See (History of) ROME.

BRENT, a town of Devonshire, with a market on Saturdays; and two fairs, on May 13th and October 10th, for horned cattle. It contains 1,230 inhabitants, and lies on the road from Exeter to Plymouth, being 26 miles south-west from the former, and 198 west by south of London. W. Long. 5° 7′. N. Lat. 50° 30′.

BRENTO, a species of goose with a black neck, and a white collar round; usually confounded with the barnacle, though in reality a distinct species. See ANAS, ORNITHOLOGY Index.

BRENTFORD, a town of Middlesex, on the great London road to the west. It is divided into old and new Brentford, in which last are the church and market-house, and where the county elections are held. It is a long place, well stocked with public houses, and is seated on the river Thames. Population, 1733. W. Long. 0° 10′. N. Lat. 51° 26′.

BRENTWOOD or BURNTWOOD, a town of Essex in England. It stands on a rising ground in the road from London to Colchester, and contained 1,233 inhabitants in 1811. E. Long. 0° 25′. N. Lat. 51° 38′.

BREREWOOD, EDWARD, a very learned English mathematician and antiquary, was the son of Robert Breweed, a tradesman, who was thrice mayor of Chester; and born in that city in the year 1569. He was educated in grammar learning at the free school in Chester; and afterwards admitted, in 1591, of Brazen-nose college in Oxford. In the year 1596, he became the first professor of astronomy in Gresham-college in London; where he led the same private and retired course of life that he had before done in Oxford. He died there of a fever, upon the 14th of November 1613, much lamented. He was a great searcher into antiquity and curious knowledge; but is remarkable for having never published anything during his lifetime. After his death came out the following works. 1. De ponderibus et pretiis vesterum numerorum. 2. Inquiries touching the diversities of languages and religion through the chief parts of the world. 3. Elementa logicae in gramm.
[The text is not provided in the image.]

**BRE**

Brewed, tiam studi-ae juvenis in Acad. Osw. 4. Tractatus quidam logic. 5. 6. Two treatises on the Sabbath. 7. Tractatus duo, quorum primus est de materiae, secundus de oculo. 8. Commentarii in ethica Aristotelis. Mr Wood tells us, that the original manuscript of this, written with his own hand, is in the smallest and neatest characters that his eyes ever beheld: and that it was finished by him on the 27th of October 1586. 9. Patriarchal government of the ancient church.

BRESCIA, a strong and handsome town of Italy, with a bishop's see and good citadel. It is the capital of Bresciano, contains 40,000 inhabitants, and is seated in an agreeable plain on the river Garza, in E. Long. 10. 5. N. Lat. 45. 31.

BRESCIANO, a province in Italy in the territories of Austria; bounded on the north, by the Grisons and the bishopric of Trent; on the east, by the lake Garda, the Veronese, and the duchy of Mantua; on the south, by the duchy of Mantua and the Cremones; and on the west by the Cremasco, the Bergamasco, and the Valtelina. It is watered by several small rivers, which renders it very fertile; and is full of towns and villages, of which Brescia is the capital.

BRESCELLO, a small town of Italy, in the duchy of Modena, seated on the river Po, in E. Long. 10. 25. N. Lat. 44. 55.

BRESCICATE, in Commerce, a kind of baize in Germany, lying between those of Wolaw, Olase, Brieg, Schwednitz, and Lignitz. It is everywhere level and flat: is an excellent corn country, yielding also good pasture; abounding also with herds of cattle and flocks of sheep; but destitute of wood, except in one district or circle; and the roads in general are very bad. It is an immediate principality, that is, of one which both the property and jurisdiction belong to the king, forming a part of one of the three bailiwicks into which all the immediate principalities are divided.

BRESLAU, a small duchy of Lower Silesia, in Germany, lying between those of Wolaw, Olase, Brieg, Schwednitz, and Lignitz. It is everywhere level and flat: is an excellent corn country, yielding also good pasture; abounding also with herds of cattle and flocks of sheep; but destitute of wood, except in one district or circle; and the roads in general are very bad. It is an immediate principality, that is, of one which both the property and jurisdiction belong to the king, forming a part of one of the three bailiwicks into which all the immediate principalities are divided.

BRESLAU, the chief town of the duchy of that name, and of all Silesia, is situated at the conflux of the Oder and Ohlau, in E. Long. 17. 5. N. Lat. 51. 4. It contained 3096 houses in 1794, and has many large regular squares, broad streets, stately public and private edifices; but the fortifications are of no great importance. Here are in particular a great many churches and convents belonging to the Catholics; of the former, are several also belonging to the Lutherans, one to the Calvinists, and another to the Greeks. The Jews have likewise two synagogues, the bishop a stately palace, and the Lutherans two gymnasia. The Popish university is a noble structure, nor is the exchange destitute of magnificence. There is the seat of all the high colleges of the third in rank, next to Berlin and Konigberg, in all the Prussian dominions. The magistracy of it is Lutheran, and its trade and manufactures are very considerable. Several of the monasteries and nunneries are very magnificent; and there are also some good public libraries in it, with two armories, a college of physicians, and a mint. Breslau is very populous, and much frequented by Hungarians, Bohemian, Polish, and other merchants, having several yearly fairs. The city was taken by the king of Prussia in 1741, and retaken by the Austrians in 1757; but the king of Prussia took it back again in the same year.

The suburbs were destroyed when it was taken by the confederates of the French in January 1807.

BRESSE, a province of France, bounded on the north by Burgundy and the Franche Comte; on the east, by Savoy; on the south, by Viennais; on the west, by the principality of Dombes and the Sonne. It is 40 miles from north to south, and 23 from east to west. It is fertile in corn and hemp, has fine pastures, and several lakes with plenty of fish. It is divided into the higher and lower; the first is on the side of Bourges, and the second towards St. Trivier and the river Sonne. The French got possession of it in 1601. The principal places are Bourg en Bresse, Montlué, Pont de Vaux, and Coligny.

BRESSIC, in Geography. See BRETE.

BREST, a maritime town of France, in the department of Finisterre, seated on the declivity of a hill on the side of its port, which is the largest in the kingdom, and will hold 500 ships at a time. There is an arsenal with sea-stores, which was placed there on account of its nearness to the woods, mines of iron, and other things proper for the building of ships. It was entirely consumed by fire in 1744, which was an irreparable loss to France. The entrance into the port is guarded by a strong castle, seated on a rock, which cannot be attempted on the sea-side, because it is craggy, and is defended on the land-side by a large ditch and other fortifications. The streets of Brest are very narrow, ill courtrewed, few in number, and have all a descent. A great quay surrounds this side of the port, which is above a mile in length, and 200 paces broad; and there are magazines on the quay full of all foreign merchandises. On the other side of the port the fine church of Notre Dame is situated; and in a suburb, which is as big as half the city, there is a strong tower opposite to the castle, at the entrance of the port; there is also a great quay on this side, bordered with large magazines, partly within the rock, which has been cut away to enlarge the place. These are extended almost as far as the bottom of the harbour, where there are two docks very commodious for the building of large ships: the shops and houses of the workmen are all around them: the rope-walks are separated from the city by one of these docks. The entrance into the harbour is called the guliet, and is a passage extremely difficult on account of the sunk rocks on both sides of the shore; but there are experienced pilots who carry ships in very safely. The English attempted to take possession of this harbour in 1654, but were disappointed. Population 24,180 in 1811. W. Long. 4. 26. N. Lat. 48. 23.

BREZ, or BREIT, in Architecture, a term sometimes used for the member of a column, more usually called torsus. See TORSUS.

BREZER SUMMERS, in timber buildings, are pieces in the outward side thereof, into which the girders are framed: this, in the ground-floor, is called a cell: and, in the garret-floor, a beam. As to their size, it is the same with that of girders. See GIRDERS.

BRESTE, the palatinate of, is one of the provinces of Cujava, in Poland. It lies between the palatinates of Plocko, Rya, and Lencici Wia
died.
BRETE, or Brescii, the capital of the palatinate of Bresci, and of Polonia in Poland, seated on the river Bog, 80 miles east of Warsaw, and subject to Poland. It is a fortified town, and has a castle built upon a rock. Here is a famous synagogue, resorted to by the Jews from all the countries in Europe. E. Long. 24°. N. Lat. 41°. 35.

BRE, or Brethren, the name the people on the coasts of Lincolnshire give to the common turbot, a fish extremely plentiful with them, and taken in vast abundance. The way of catching them is in a net trailed on the ground by two horses; the one going up to the middle of his body in water, the other on shore.

BRETHREN, in Heraldry, denotes a line embattled on both sides.

BRETHREN AND SISTERS OF THE FREE SPIRIT, in Ecclesiastical History, an appellation assumed by a new sect which sprung up towards the close of the thirteenth century, and gained many adherents in Italy, France, and Germany. They took their denomination from the words of St. Paul, Rom. chap. viii. ver. 12, and maintained, that the true children of God were invested with the privilege of a full and perfect freedom from the jurisdiction of the law. They were enthusiasts to a degree of distraction, both in their principles and practice. They resembled the Beghards, by which name they were sometimes called, in their respect, apparel, and manner of living. Some of their approved principles resembled those of the Pantheists; for they held, that all things flowed by emanation from God; that rational souls were portions of the Deity, and that the universe was God; and that, by the power of contemplation, they were united to the Deity, and acquired thereby a glorious and sublime liberty, both from the sinful lusts and the common instincts of nature: and hence they concluded, that the person, who was then absorbed in the abyss of the Deity, became part of the Godhead, and was the son of God, in the same sense and manner that Christ was, and that he was freed from the obligation of all laws human and divine. They treated with contempt all Christian ordinances, and all external acts of religion, as unsuitable to the state of perfection at which they were arrived. Some of them were honest but deluded enthusiasts; and they endured the tortures inflicted upon them by the inquisitors with astonishing calmness and triumph. Others proceeded to the most extravagant licentiousness of conduct. They held their secret assemblies stark naked, and lay in the same beds with their spiritual sisters, and indiscriminately with other women, without the least scruple or hesitation: modesty and decency being, according to their creed, marks of inward corruption. And some of them proceeded still farther, and maintained, that the divine man, or believer, could not sin, nor his conduct be ever so horrible or atrocious. Many edicts were published against them; but notwithstanding the severities they suffered, they continued till about the middle of the fifteenth century. They were called by several other names, such as Schwestertones, Ficards, Adames, and Turlepins.

BRETHREN and CLERGY OF THE COMMON LIFE, a denomination assumed by a religious fraternity towards the latter end of the sixteenth century. They lived under the rule of St. Augustin, and were eminently useful in promoting the cause of religion and learning. Their society was first formed in the preceding century, by Gerard de Groote, a native of Deventer; but did not flourish till about the period above mentioned, when it obtained the approbation of the council of Constance, and became very respectable in Holland, the Lower Germany, and the adjacent provinces. It was divided into two classes; the lettered brethren, or clerks, and the illiterate: they lived in separate habitations, but maintained the closest fraternal union. The former applied to the study of polite literature, and the education of youth; whilst the latter were employed in manual labour, and the mechanic arts. They were frequently called Beghards and Lollards, by way of reproach.

White BRETHREN, fratres albati, were the followers of a leader, about the beginning of the sixteenth century, who was arrayed in a white garment; and as they were also clothed in white linens, they were distinguished by that title. Their leader was a priest from the Alps, who carried about a cross, like a standard, and whose apparent sanctity and devotion drew together a number of followers. This deluded enthusiast practiced many acts of mortification and penance, endeavored to persuade the European nations to renew the holy war, and pretended that he was favored with divine visions. Boniface IX. ordered him to be apprehended and committed to the flames, upon which his followers dispersed.

BRETON, or CAPE-BRITAIN, an island near the eastern coast of North America, lying between 44 and 46 degrees of north latitude. It is separated from Nova Scotia by a narrow strait called Casco, and is about 150 miles in length, and 50 in breadth. It is surrounded with little sharp-pointed rocks, separated from each other by the waves, above which some of their tops are visible. All its harbours are open to the east, turning towards the south. On the other parts of the coast there are but few anchoring places for small vessels, in creeks, or between islets. Except in the hilly parts, the surface of the country has but little solidity, being everywhere covered with a light moss, and with water. The dampness of the soil is exhaled in fogs, without rendering the air wholesome. In other respects, the climate is very cold; owing either to the prodigious quantity of lakes, which cover above half the island, and remain frozen a long time; or to the number of forests, that totally intercept the rays of the sun; the effect of which is besides decreased by perpetual clouds.

Though some fishermen had long resorted to this island every summer, not more than 20 or 30 had ever fixed there. The French, who took possession of it in August 1711, were properly the first inhabitants. They changed its name into that of Isle Royale, and fixed upon Fort Dauphin for their principal settlement. This harbour was two leagues in circumference. The ships came to the very shore, and were sheltered from winds. Forests affording oak sufficient to fortify and build a large city, were near at hand; the ground appeared less barren than in other parts, and the fishery was more plentiful. This harbour might have been rendered impregnable at an trifling expense; but the difficulty...
difficulty of approaching it (a circumstance that had at first made a stronger impression than the advantages resulting from it) occasioned it to be abandoned, after great labour had been bestowed upon the undertaking. They then turned their views to Louisbourg, the access to which was easier; and convenience was thus preferred to security: the fortification of Louisbourg, however, was not begun till 1720.

In the year 1714, some fishermen, who till then had lived in Newfoundland, settled in this island. It was expected that their number would soon have been increased by the Acadians, who were at liberty, from the treaties that had been granted them, to remove with all their effects, and even to dispose of their estates; but these hopes were disappointed. The Acadians chose rather to retain their possessions under the dominion of France, than to give them up for any precarious advantage they might derive from their attachment to France. Their place was supplied by some distressed adventurers from Europe, who came over from time to time to Cape Breton, and the number of inhabitants gradually increased to 4000. They were settled at Louisbourg, Fort Dauphin, Port Toulouse, Neresca, and on all the coasts where they found a proper beach for drying the cod. The inhabitants never applied themselves to agriculture, the soil being unfit for it. They often sowed corn, but it seldom came to maturity; and when it did thrive so much as to be worth reaping, it had degenerated so considerably, that it was not fit for seed for the next harvest. They have only continued to plant a few pot-herbs that are tolerably well tasted, but must be renewed every year from abroad. The poverty and scarcity of pastures has likewise prevented the increase of cattle. In a word, the soil of Cape Breton seemed calculated to invite none but fishermen and soldiers.

Though the island was entirely covered with forests before it was inhabited, its wood has scarce ever been an object of trade. A great quantity, however, of soft wood was found there fit for firing, and some that might be used for timber; but the oak has always been scarce, and the fir never yielded much resin. The peltry trade was a very considerable object. It consisted only in the skins of a few lynxes, elks, musk-rats, wild cats, bears, otters, and foxes both of a red and silver-grey colour. Some of these were procured from a colony of Micmac Indians who had settled on the island with the French, and never could raise more than 60 men able to bear arms. The rest came from St. John's, or the neighbouring continent. Other advantages might possibly have been derived from the coal-mines which abound in the island. They lie in a horizontal direction: and being no more than six or eight feet below the surface, may be worked without digging deep, or draining the waters. According to the prodigious demand for this coal from New England, from the year 1745 to 1749, these mines would probably have been forsaken, but not the ships which were sent out to the French islands wanted ballast. In one of these mines a fire has been kindled, which could never yet be extinguished. The people of Cape Breton did not send all their fish to Europe. They sent part of it to the French southern islands, on board 20 or 25 ships from 70 to 200 tons burden. Besides the cod, which made at least half their cargo, they exported to the other colonies timber, planks, thin oak-boards, salted salmon and mackerel, train-oil, and sea-coal. All these were paid for in sugar and coffee, but chiefly in rum and molasses. The island could not consume all these commodities. Canada took off but a small part of the surplus; it was chiefly bought by the people of New England, who gave in exchange fruits, vegetables, wood, brick, and cattle. This trade of exchange was allowed; but a smuggling trade was added to it, carried on in flour and salt fish.

This island, the key of Canada, was attacked by the English in 1745; and the event is of so singular a nature, that it deserves a particular detail. The plan of this first invasion was laid at Boston, and New England bore the expense of it. A merchant named Pepperell, who had excited, encouraged, and directed the enterprise, was entrusted with the command of an army of 6000 men, which had been levied for this expedition.

Though these forces, convoyed by a squadron from Jamaica, brought the first news to Cape Breton of the danger that threatened it; though the advantage of a surprise would have secured the landing without opposition; though they had but 600 regular troops to enclose, and 800 inhabitants hastily armed; the success of the undertaking was still precarious. What great exploits, indeed, could be expected from a militia suddenly assembled, who had never seen a siege or faced an enemy, and were to act under the direction of sea-officers only. These inexperienced troops stood in need of the assistance of some fortunate incident, which they were indeed favoured with in a singular manner.

The construction and repairs of the fortifications had always been left to the care of the garrison of Louisbourg. The soldiers were eager of being employed in these works, which they considered as conducive to their safety, and as the means of procuring them a comfortable subsistence. When they found that those who were to have paid them, appropriated to themselves the profit of their labours, they demanded justice. It was denied them, and they were determined to assert their right. As these depredations had been shared between the chief persons of the colony and the subaltern officers, the soldiers could obtain no redress. Their indignation against these rapacious extortions rose to such a height, that they despised all authority. They had lived in an open rebellion for six months, when the British appeared before the place.

This was the time to conciliate the minds of both parties, and to unite in the common cause. The soldiers made the first advances; but their commanders mistrusted a generosity of which they themselves were incapable. It was firmly believed that the soldiers were only desirous of sallying out, that they might have an opportunity of deserting; and their officers kept them in a manner prisoners, till a defence so ill managed had reduced them to the necessity of capitulating. The whole island shared the fate of Louisbourg, its only bulwark.

This valuable possession, restored to France by the treaty of Aix-la-Chapelle, was again attacked by the British in 1758. On the 20 of June, a fleet of 23 ships of the line and 28 frigates, carrying 15,000 well-disciplined troops, anchored in Gabarus bay, within half a league.
Breton. Breton. 

League of Louisbourg. As it was evident it would be to no purpose to land at a great distance, because it would be too dangerous, the garrison which was to defend the place consisted only of 2,000 men.

Notwithstanding all these disadvantages, the besieged determined to make an obstinate resistance. It is scarcely credible that the French were confirmed in their resolution by the courage of a woman. Madame de Drucourt was continually upon the ramparts, with her purse in her hand; and firing herself three guns every day, seemed to dispute with the governor her husband the glory of his office. The besieged were not dismayed at the illness of several of their allies, or the masterly operations concerted by Admiral Boscawen and General Amberst. It was but at the eve of an assault, which it was impossible to sustain, that they talked of surrendering. They made an honourable capitulation; and the conqueror showed more respect for his enemy and for himself, than to sully his glory by any act of barbarity or avarice. The possession was confirmed to Great Britain by the peace in 1763; since which the fortifications have been blown up, and the town of Louisbourg dismantled.

BRETTIGAW, a territory or valley of the Grouses, lying between the Rhine and the county of Tyrol, and along the river Lanzacum. The fortress of Castelnau is the principal town.

BREVE, in Latin, is any writ directed to the chancellor, judges, sheriffs, or other officers, whereby a person is summoned, or attached, to answer in the king's court, &c.

BREVE Perquirere, the purchasing of a writ or license for trial in the king's courts; whence comes the present use of paying 6s. 8d. fine to the king in suit, for money due in bond, where the debt is 40l. and of 10s. where it is 100l. &c.

BREVE de Recto, is a writ of right or license for a person ejected, to sue for the possession of the estate detained from him.

BREVE, in Music, a note or character of time, in the form of a diamond or square, without any tail, and equivalent to two measures or minims.

BREVET, in the French customs, denotes the grant of some favour or donation from the king; in which sense it partly answers to our warrant, and partly to letters patent.

BREVET, more particularly denotes the commission of a subaltern officer, being only written on parchment, and without seal. A brevet officer is one whose rank in the army is above his pay; for instance, a brevet major serves only as a captain, and receives pay as such.

BREUGHELD, Peter, an eminent painter, commonly called Old Breughel, to distinguish him from his son, was born at a village of the same name near Breda, in the year 1565 and was the first pupil of Peter Cock, whose daughter he married. It was customary with him to dress like a country-man, in order to be more easily admitted into the company of country-people, and be allowed to join in their frolics, by which means he became perfectly acquainted with their manners and gestures, of which he made excellent use in his pictures. He travelled to France and Italy, and for a long time studied landscapes on the mountains of Tyrol. His humorous turn of mind displayed itself in all his pictures, which generally consisted of country-dances, marriages,
has sometimes performed pieces from the historical parts of the holy Scriptures. At his return from Italy, he settled at Antwerp, and in his last illness caused his wife to gather together all his immodest pieces and burn them before his face. It is uncertain in what year he died. Of the works of old Breughel, the great duke of Tuscany has, Christ carrying his cross, with a great number of figures; and a country feast. The emperor has the tower of Babel, the massacre of the Innocents, and the conversion of St Paul, of his painting: the elector Palatine, a landscape, with St Philip baptizing Queen Candace's enuch; and St John preaching in the wilderness, with a great many figures. Old Breughel also, for his amusement, is said to have engraved some few plates of landscapes and grotesque subjects.

Breughel, Peter, the younger, was the son of the above-mentioned artist, and named Hellish Breughel, from the horrible subjects he delighted to represent. He engraved also, according to M. Heineken; but his works are not specified. He died in 1575.

Breughel, John, commonly called Velvet Breughel, from his generally wearing velvet clothes, was the son of Peter Breughel, and born about the year 1575. He first applied himself to painting flowers and fruit, in which he excelled; and afterwards had great success in drawing landscapes, and views of the sea, set off with small figures. He lived long at Cologne, where he acquired great reputation. He travelled to Italy, where his fame had got before him; and where his fine landscapes, adorned with small figures, superior to those of his father, gave very great satisfaction. If a good judgement may be formed from the great number of pictures he left behind him, all highly finished, he must have been exceedingly industrious. Nor did he satisfy himself with embellishing his own works only, but was very useful in this respect to his friends. Even Rubens made use of Breughel's hand in the landscape part of several of his small pictures, such as his Vertumnus and Pomona; the satyr viewing the sleeping nymph; and the terrestrial paradise, which is looked upon as his masterpiece. He died in 1622.

Seventy of his works are to be seen in the archbishop's gallery at Milan; particularly a hunting-piece with a vast many figures; a landscape representing a desert, with the picture of St Hierom painted by Carrano, alias Gio Baptista Crespi. In the Ambrosian library are 20 pieces of this masterly hand; particularly Daniel in the lion's den, the inside of the great church at Antwerp, the four seasons on copper, and the burning of Gomorrha. In the possession of the elector Palatine at Dusseldorf, Christ preaching on the sea-shore; a country-dance; a sea-port, with a great many figures; a coach and two chariots, with a multitude of figures and animals; a landscape, wherein Flora is crowned by a nymph; St John preaching in the wilderness; a small sea-landscape, and several other pieces. In the possession of the late king of France, a woman playing with a dog, the battle between Alexander and Darius, both in wood: Orpheus in hell, &c.

Breviary, a daily office, or book of divine service, in the Roman church. It is composed of matins, lauds, first, third, sixth, and ninth vespers, and the compline or post compline.

The breviary of Rome is general, and may be used in all places; but on the model of this various others have been built, appropriated to each diocese, and each order of religious.

The breviary of the Greeks is the same in almost all churches and monasteries that follow the Greek rites: the Greeks divide the psalter into 20 parts. In general, the Greek breviary consists of two parts: the one containing the office for the evening, the other that of the morning, divided into matins, lauds, first, third, sixth, and ninth vespers, and the compline; that is, of seven different hours, on account of that saying of David, Septies in die laudem dixit tibi.

The institution of the breviary is not very ancient; there have been inserted in it the lives of the saints, full of ridiculous and ill-attested stories, which gave occasion to several reformations of it, by several councils, particularly those of Trent and Cologne; by several popes, particularly Pius V. Clement VIII. and Urban VIII.; and also by several cardinals and bishops, each lopping off some extravagancies, and bringing it nearer to the simplicity of the primitive offices. Originally every body was obliged to recite the breviary every day; but by degrees the obligation was reduced to the clergy only, who are enjoined, under penalty of mortal sin and ecclesiastical censures, to recite it at home, when they cannot attend in public. In the 14th century, there was particular reserve granted in favour of bishops, who were allowed, on extraordinary occasions, to pass three days without rehearsing the breviary.

This office was originally called cursus; and afterwards, the breviarium: which latter name imports that the old office was abridged; or rather, that this collection is a kind of abridgement of all the prayers.

The breviaries now in use are innumerable; the difference between them consists principally in the number and order of the psalms, hymns, patronymics; among others, Maries, creeds, magnificates, cantemus's, benedictus's, castricampus's, nunc dimittis's, miserere's, hallelujah's, gloriam patri's, &c.

Breviary, in Roman antiquity, a book first introduced by Augustus, containing an account of the application of the public money.

Breviarius, an officer under the eastern empire, whose business it was to write and translate briefs. At Rome those are styled breviora, or abbreviators, who dictate and draw up the pope's briefs.

Brevibus, a rotulis librarandis, a writ or command to a sheriff to deliver to his successor the county, with the appurtenances, and the rolls, writs, and other things to his office belonging.

Brevier, among printers, a small kind of type or letter between bourgeois and minion.

Brevity, in a general sense, that which denominates a thing brief or short.

Brevity is more particularly used in speaking of the style or composition of discourse. Brevity of discourse is by some called brachylogia and brevologentia; sometimes laconismus. Tacitus and Persius are remarkable for the brevity of their style. There are two kinds of brevity, one arising from dryness, poverty, and narrowness of genius; the other from judgment and reflection; which latter alone is laudable. Brevity is so essential to a tale, a song, and an epigram, that without it they necessarily languish and become dull. Rhetoricians make brevity one of the principal marks...
BREVITAS or conditions of eloquence: but the rules they prescribe for attaining it are difficult to apply, so as still to keep the due medium between too much and too little. A just brevity is attained by using all the words which are necessary, and none but those which are necessary. Sometimes it may also be had, by choosing a word which has the force of several. It is this last kind which Quintilian admires so much in Sallust; and the imitation of which, by other writers, has caused so much obscurity.

BREVITAS CUSTOS. See CUSTOS.

BREVORSTAD, a town of Guelderland, in the United Netherlands, situated in E. Long. 6 35. N. Lat. 52.

BREWER, ANTHONY, a dramatic poet who flourished in the reign of King Charles I. and appears to have been held in high estimation by the wits of that time, as may be more particularly gathered from an elegant compliment paid to him in a poem called *Steps to Parnassus*, wherein he is supposed to have made power to call the muses to his assistance, and is even set on an equality with the immortal Shakespeare himself. There are, however, great disputes among the several writers, as to the number of his works. Those which have been ascribed to him with any certainty are, 1. The country girl, a comedy. 2. The love-sick king, a comedy. And, 3. Lingua: a piece in regard to which Winstanley records a remarkable anecdote, which points it out to have been in some measure the innocent cause of those troubles that disturbed the peace of these realms in the middle of the 17th century. He tells us, that when this play was acted at Cambridge, Oliver Cromwell (then a youth) acted a part in it. The substance of the piece is a contention among the Senses for a crown, which Lingua had laid for them to find. The part allotted to young Cromwell was that of Tactus or Touch; who having obtained the contested coronet, makes this spirited declamation:

*Roses and bays, pack hence! this crown and robe My brows and body circles and invests: How gallantly it fits me! sure the slave Must leave my head who wrought this coronet. They say that say complexion cannot change! My blood's enamelled, and I am transformed Unto the sacred temper of a king. Methinks I hear my noble parasites Styling me Caesar, or Great Alexander, Licking my feet, &c.*

It is said that he felt the whole part so warmly, and more especially the above-quoted speech, that it was what first fired his soul with ambition, and excited him, from the possession of an imaginary crown, to stretch his views to that of a real one; for the accomplishment of which he was content to wade through seas of blood.

BREWER, a person who professes the art of brewing. There are companies of brewers in most capital cities; that of London was incorporated in 1427 by Henry VI. and that of Paris is still older.

The apparatus and utensils of a brewer, or a brew-house, are, A furnace made close and hollow for saving fuel, and with a vent for the smoke lest it taint the liquor; a copper, which is preferable to lead; a mask-vat near the head; a cooler near the mask-vat; and a guille-vat under the cooler: adjoining to all are several clean tubs, to receive the words and liquors.

BREWERS HAVEN, a good harbour at the north end of the island of Chiloé on the coast of Chile, in South America, and in the South sea. The Dutch landed forces here in 1643, designing to get possession of some part of Chili; but they were driven from thence by the Spaniards and the natives. W. Long. 85°, S. Lat. 42°.

BREWING, the operation of preparing ale or beer from MALT.

Though the art of brewing is undoubtedly a part of chemistry, and certainly depends upon fixed and inva.

1. Quantity of water being boiled, is left to cool till the height process de.

2. Quantity of malt in the mashing tub, as makes it of a consis-

3. A common scribed.

4. Double beer or ale, the liquors resulting from the first two mashings must be used as liquor for the third mashing of fresh malt.

From considering this process, and the multiplicity of circumstances to be attended to in it, we may easily see that it must be a very precarious one. The success of the operation, i.e. the goodness of the beer, must depend upon the quality of the malt from which it is made; on that of the water with which it is infused; on the degree of heat applied in the infusion; on the length of time the infusion is continued; on the proper degree of boiling, the quantity and quality of the hops employed; on the proper degree of fermentation, &c.; all which, as already observed, have never yet been thoroughly investigated and ascertained.

The manner of making malt Sir Robert Murray describes as follows.—Take good barley newly threshed, method of &c.; put about six English quarters in a stone trough full of water.
BRE

BRE

BREWING.

full of water, where let it steep till the water be of a bright reddish colour; which will be in about three days, more or less according to the moisture or dryness, smallness or bigness, of the grain, the season of the year, or the temperature of the weather. In summer, malt never makes well; in winter it requires longer steeping than in spring or autumn. It may be known when it is steeped enough by other marks besides the colour of the water; as by the excessive swelling of the grain, if it be over-steeped, and by too much softness; being, when it is in a right temper, like the barley prepared to make broth of. When it is sufficiently steeped, take it out of the trough, and lay it in heaps to let the water drain from it; then, after two or three hours, turn it over with a scoop; otherwise the grains will begin to put forth the blade and spire also, which must by all means be prevented. If all the malt do not come equally, but that which lies in the middle, being warmest, come the soonest; the whole must be turned, so that what was outmost may be inmost; and thus it is managed till it be all alike. As soon as the malt is sufficiently come, turn it over, and spread it to a depth not exceeding five or six inches; and by the time it is all spread out, begin and turn it over again three or four times. Afterwards turn it over in like manner once in four or five hours, making the heap deeper by degrees; and continue to do so for the space of 48 hours at least. This frequent turning it over, cools, dries, and deadens the grain; whereby it becomes more, melts easily in brewing, and separates entirely from the husk. Then throw up the malt into a heap as high as you can; where let it lie till it grow as hot as your hand can endure it, which usually happens in about the space of 30 hours. This perfects the sweetness and mellowness of the malt. After it is sufficiently heated, throw it abroad to cool, and turn it over again about six or eight hours after; and then lay it on a kiln with a hair-cloth or wire spread under it; where, after one fire which must last 24 hours, give it another more slow, and afterwards, if need be, a third: for if the malt be not thoroughly dried, it cannot be well ground, neither will it dissolve well in the brewing; but the ale it makes will be red, bitter, and unfit for keeping.

From this account of the process of malting, it appears, that, besides the proper management in wetting, turning, &c. the drying is an article of the utmost consequence; and concerning the proper degree which must be employed for this purpose, Mr. Combrone has related the following experiments. In an earthen pan, I put about two feet diameter, and three inches deep, put as much of the palest malts, very unequally grown, as filled it on a level to the brim. This I placed over a little charcoal lighted in a small stove, and kept continually stirring it from bottom to top; at first it did not feel so damp as it did about half an hour after.

In about an hour more, it began to look of a bright orange colour on the outside, and appeared more swelled than before. Every one is sensible how long-continued custom alone makes us sufficient judges of colours. Then I macerated some of the grains, and found they were nearly such as are termed brown malts. On stirring and making a heap of them towards the middle, I placed therein at about half depth the bulb of my thermometer, and found it rose to 140 degrees: here the malt felt very damp, and had but little smell.

At 165 degrees I examined it in the same manner as before, and could perceive no damp; the malt was very brown; and, on being macerated, some few black specks appeared.

Now many corns, nearest the bottom, were become black and burnt; with all the diligence I could use, I placed my thermometer nearly there, and it rose to 175 degrees. But the particles of fire, arising from the stove, act on the thermometer in proportion to the distance of the situation it is placed in; for which, through the whole experiment, an abatement of 5 degrees should be allowed, as near as I could estimate; so, a little after, putting my thermometer in the same position, where nearly half the corns were black, it showed 180 degrees. I now judged that the water was nearly all evaporated, and the heap grew black space.

Again, in the centre of the heap raised in the middle of the pan, I found the thermometer at 180 degrees; the corn tasted burnt; and the whole, at top, appeared about one half part a full brown. the rest black: on being macerated, still some white specks appeared; which I observed to proceed from the barley corns which had not been thoroughly germinated, and whose parts, cohering more together, the fire, at this degree of heat, had not penetrated them: their taste was insipid, the malts brittle, and readily parting from the skin; but the thermometer was now more various, as it was nearer to or farther from the bottom; and here I judged all the true malt to be charred.

However, I continued the experiment; and, at 190 degrees, still found some white specks on macerating the grain; the acrosire always appearing of a deeper black or brown than the outward skin: the corn now fried at the bottom of the pan.

I next increased the fire; the thermometer, placed in the mean between the bottom of the pan and the upper edge of the corn, showed 210 degrees. The malt hissed, fried, and smoked abundantly; though, during the whole process, the grain had been kept stirring; yet, on examination, the whole had not been equally affected with the fire. I found a great part thereof reduced to perfect cinders, easily crumbling to dust between the fingers, some of it very black hue without gloss, some very black with oil shining on the outside. Upon the whole, two-thirds of the corn were perfectly black; the rest were of a deep brown, more or less so as they were hard, stely, or imperfectly germinated; which was easily discovered by the length of the shoot. Most of them seemed to have lost their cohesion, and had a taste resembling that of high roasted coffee.

In
BREWING.    “In the last stage of charring the malt, I set there-
on a wine glass inverted, into which arose a punguous
oil, which lasted very salt. Perhaps it may
not be unnecessary to say, that the length of time this
experiment took up was four hours, and that the ef-
fect it had both on myself and the person who attended
me was such as greatly resembled the case of in-
ebriation.

“Though, from hence, it is not possible to fix the
exact degree of heat in which malts char, yet we see
some black appeared when the thermometer was at
165 degrees, that some were entirely black at 175
and at 180 degrees, that the grains thus affected were
such as had been perfectly germinated, and that those
which bore a greater heat were defective in that point;
whence we may conclude, with an exactness that will
be sufficient for the purposes of brewing, that true ger-
minated malts are charred in heats between 175 and
180 degrees; and that, as these correspond to the de-
gree in which pure alcohol, or the finest spirit of the
grain itself boils, or disengages itself therefrom, they
may point out to us the reason of barley being the fit-
est grain for the purposes of brewing.”

From these experiments, our author has constructed
the following table of the different degrees of the dry-
ness of malt, with the colour occasioned by each de-
gree.

“Those, when properly brewed, become spontaneously fine,
even as far as 135°; when brewed for amber by repeated
fermentations, they become paler. By precipitation these grow
bright in a short time. With precipitation these require
8 or 10 months to become bright.

With precipitation these may be fixed, but will never become
bright.

These with difficulty can be brewed without setting the
goods, and will by no means become bright, not even with
the strongest said menstruum.

In a pamphlet entitled “Theoretic hints on an improved practice of brewing malt-liquors, &c. by John Richardson,” we have the following observations on
the nature and properties of malt.

“The process of making malt is an artificial or
forced vegetation, in which the nearer we approach
the footsteps of nature in her ordinary progress, the
more certainly shall we arrive at that perfection of
which the subject is capable. The farmer prefers a
dry season to sow his corn in, that the common mois-
ture of the earth may but gently insinuate itself into
the pores of the grain, and thence gradually dispose it
for the reception of the future shower, and the action
of vegetation. The maltster cannot proceed by such
slow degrees, but makes an immersion in water a sub-
stitute for the moisture of the earth, where a few hours
infusion is equal to many days employed in the ordi-

nary course of vegetation; and the corn is accordingly
removed as soon as it appears fully saturated, lest a
solution, and consequently a destruction, of some of its
parts, should be the effect of a longer continuance in
water, instead of that separation which is begun by
this introduction of aqueous particles into the body of
the grain.

“Were it to be spread thin after this removal, it
would become dry, and no vegetation would ensue;
but being thrown into the copper, a kind of vegetative
fermentation commences, which generates heat, and
produces the first appearance of germination. This
state of the barley is nearly the same with that of many
days continuance in the earth after sowing: but being in
so large a body it requires occasionally to be turn-
ed over, and spread thinner; the former to give the
outward parts of the heap their share of the required
warmth and moisture, both of which are lessened by
exposure to the air; the latter to prevent the progress
of the vegetative to the putrefactive fermentation,
which would be the consequence of suffering it to pro-
cceed beyond a certain degree.

“To supply the moisture thus continually decreasing
by evaporation and consumption, an occasional but
sparing
BRE [ 405 ] BRE

BREWING. Spreading sprinkling of water should be given to the floor to recruit the languishing powers of vegetation, and imitate the shower upon the corn-field. But this should not be too often repeated; for, as in the field, too much rain, and too little sun, produce rank stems and thin ears, so here would too much water, and of course too little dry warmth, accelerate the growth of the malt, so as to occasion the extraction and loss of much of its valuable parts, as by a slower process would have been done previously, and left behind.

By the slow mode of conducting vegetation here recommended, an actual and minute separation of the parts takes place. The germination of the radicles and acrospire carries off the cohesive properties of the barley, thereby contributing to the preparation of the saccharine matter, which it has no tendency to extract or otherwise injure, but to increase and meliorate, so long as the acrospire is confined within the husk; and by how much it is wanting of the end of the grain, by so much does the malt fall short of perfection, and in proportion as it has advanced beyond, is that purpose defeated.

This is very evident to the most common observation, on examining a kernel of malt in the different stages of its progress. When the acrospire has shot but half the length of the grain, the lower part only is converted into that yellow saccharine flour we are solicitous about, whilst the other half affords no other signs of it than the whole kernel did at its first germination. Let it advance to two-thirds of the length, and the lower end will not only have increased its saccharine flavour, but will have proportionally extended its bulk, so as to have left only a third part unmaltsed. This, or even less than this, is contended for by many malsters, as a sufficient advance of the acrospire, which they say has done its business as soon as it has passed the middle of the kernel. But we need seek no farther for their conviction of error, than the examination here alluded to.

Let the kernel be slit down the middle, and tasted at either end, whilst green; or let the effects of mastication be tried when it is dried off; when the former will be found to exhibit the appearances just mentioned, the latter to discover the unwrought parts of the grain, in a body of stony hardness, which has no other effect in the mash-tun than that of imbibing a large portion of the liquor, and contributing to the retention of those saccharine parts of the malt which are in contact with it; whence it is a rational inference, that three bushels of malt, imperfect in this proportion, are but equal to two of that which is carried to its utmost perfection. By this is meant the farthest advance of the acrospire, when it is just bursting from its confinement, before it has effected its enlargement. The kernel is then uniform in its internal appearance, and of a rich sweetness in flavour, equal to any thing we can conceive obtainable from imperfect vegetation. If the acrospire be suffered to proceed, the mealy substance melts into a liquid sweet, which soon passes into the blade, and leaves the husk entirely exhausted.

The sweet thus produced by the infant efforts of vegetation, and lost by its more powerful action, revives and makes a second appearance in the stem, but is then too much dispersed and altered in its form to answer any of the known purposes of art.

Were we to enquire, by what means the same barley, with the same treatment, produces unequal portions of the saccharine matter in different situations, we should perhaps find it principally owing to the different qualities of the water used in malting. Hard water is very unfit for every purpose of vegetation, and soft will vary its effects according to the predominating qualities of its impregnations. Pure elementary water is in itself supposed to be the only vehicle of the nutriment of plants, entering at the capillary tubes of the roots, rising into the body, and thence dispersing its acquired virtues, perspiring by innumerable fine pores at the surface, and thence evaporating by the purest distillation into the open atmosphere, where it begins anew its round of collecting fresh properties, in order to its preparation for fresh service.

This theory leads us to the consideration of an attempt to increase the natural quantity of the saccharum of malt by adventitious means; but it must be observed on this occasion, that no addition to water will rise into the vessels of plants, but such as will pass the filter; the pores of which appearing somewhat similar to the fine strainers or absorbing vessels employed by nature in her nicer operations, we by analogy conclude, that properties so intimately blended with water as to pass the one, will enter and unite with the economy of the other, and vice versa.

Supposing the malt to have obtained its utmost perfection, according to the criterion here inculcated; to prevent its further progress, and secure it in that state, we are to call in the assistance of a heat sufficient to destroy the action of vegetation, by evaporating every particle of water, and thence leaving it in a state of preservation, fit for the present or future purpose of the brewer.

Thus having all its moisture extracted, and being by the previous process deprived of its cohesive property, the body of the grain is left a mere lump of flour, so easily divisible, that, the husk being taken off, a mark may be made with the kernel, as with a piece of soft chalk. The extractible qualities of this flour are a saccharum closely united with a large quantity of the farinaceous mucilage peculiar to bread corn, and a small portion of oil enveloped by a fine earthy substance, the whole readily yielding to the impression of water applied at different times and different degrees of heat, and each part predominating in proportion to the time and manner of its application.

In the curing of malt, as nothing more is requisite than a total extrication of every aqueous particle, if we had in the season proper for malting, a solar heat, sufficient to produce perfect dryness, it were practicable to reduce beers nearly colourless; but that being wanting, and the force of custom having made it necessary to give our beers various tinctures and qualities resulting from fire, for the accommodation of various tastes, we are necessitated to apply such heats in the drying as shall not only answer the purpose of preservation, but give the complexion and property required.

To effect this with certainty and precision, the introduction
BRE

BRE

Brewing.

The introduction of the thermometer is necessary; but the real advantages of its application are only to be known by experiment, on account of the different construction of different kilns, the irregularity of the heat in different parts of the same kiln, the depth of the malt, the distance of the bulb of the thermometer from the floor, &c. &c.; for though similar heats will produce similar effects in the same situation, yet is the dispersion of heat in every kiln so irregular, that the medium spot must be found for the local situation of the thermometer; a standard can be fixed for ascertaining effects upon the whole. That done, the several degrees necessary for the purposes of porter, amber, pale beers, &c. are easily discovered to the utmost exactness, and become the certain rule of future practice.

Though custom has laid this arbitrary injunction of variety in our malt liquors, it may not be amiss to intimate the losses we often sustain, and the inconveniences we combat, in obedience to her mandate.

"...the further we pursue the deeper tints of colour by an increase of heat beyond that which simple preservation requires, the more we injure the valuable qualities of the malt. It is well known that scorched oils turn black, and that calcined sugar assumes the same complexion. Similar effects are producible in malts, in proportion to the increase of heat, or the time of their continuing exposed to it. The parts of the whole being so united by nature, an injury cannot be done to the one, without affecting the other; accordingly we find, that such parts of the subject, as might have been severally extracted for the purposes of a more intimate union by fermentation, are, by great heat in curing, burnt and blended so effectually together, that all discrimination is lost, the unaffectable are extracted with the fermentable, the integrant with the constituent, to a very great loss both of spirituousness and transparency. In paler malts, the extracting liquor produces a separation which cannot be effected in brown, where the parts are so incorporated, that unless the brewer is very well acquainted with their several qualities and attachments, he will bring over, with the burnt mixture of saccharine and mucilaginous principles, such an abundance of the scorched oils, as no fermentation can attenuate, no precipitants remove, for, being in themselves impediments to the action of fermentation, they lessen its efficacy, and being of the same specific gravity with the beer, they remain suspended in, and incorporated with the body of it, an offence to the eye, and a nauseous to the palate, to the latest period."  

The next consideration is the quality of the water to be employed in brewing, and here soft water is universally allowed to be preferable to hard, both for the purposes of mashing and fermentation. Transparency is, however, more easily obtained by the use of hard than soft water: first, from its insipidity to extract such an abundance of that light mucilaginous matter, which, floating in the beer for a long time, occasions its turbidity; secondly, from its greater tendency to a state of quietude after the vinous fermentation is finished, by which those floating particles are more at liberty to subside; and, lastly, from the mutual aggregation of the earthy particles of the water with those of the materials, which by their greater specific gravity thus aggregated, not only precipitate themselves, but carry down also that lighter mucilage just mentioned. For these reasons, hard water is not well adapted to the brewing of porter, and such beers as require a fulness of palate, when drawn to the great lengths of the London brewery, and of some country situations.

The purity of water is determined by its lightness; and in this, distilled water only can claim any material degree of perfection. Rain water is the poorest of all naturally produced: but by the perpetual exhalations of vegetables, and other fine substances floating in the atmosphere, it does not come down to us entirely free from those qualities which pond and river waters possess in a greater degree. These, especially of rivers running through fens and morasses, from the quantity of grass and weeds growing therein, imbibe an abundance of vegetable solutions which occasion them to contain more fermentable matter, and consequently to yield a greater portion of spirit; but at the same time induces such a tendency to acidity as will not easily be conquered. This is more to be apprehended towards the latter end of the summer than at any other time; because these vegetable substances are then in a state of decay, and thence more readily impart their pernicious qualities to the water which passes over them.

At such an unfavourable time, should the brewer be necessitated to pursue his practice, it will behove him to pay the utmost attention to the cause of this disposition in his liquor, and thence endeavour to prevent the ill consequences, by conducting his process to the extraction and combination of such parts of the materials as his judgment informs him will best counteract its effects.

Where there is the liberty of choice, we would recommend the use of that water which, from natural purity, equally free of the austerity of imbibed earths, and the rankness of vegetable saturation, has a soft fulness upon the palate, is totally flavourless, inodorous, and colourless; whence it is the better prepared for the reception and retention of such qualities as the process of brewing is to communicate and preserve.

The next thing to be considered is the proper degree of heat to be employed in making the infusion; and here it is evident, that though this must be an object of the utmost importance to the success of the operation, it is extremely difficult, perhaps impossible, to fix upon a precise standard that shall at all times fully answer the purpose. On this subject Mr. Richardson presents us with the following observations.

"The quality of the saccharine part of malt resembles that of common sugar, to which it is practicable arid's observations on the degree of heat of beer. Were it not for these properties, the brewer might adopt the use of sugar, molasses, honey, or the sweet of any vegetable, to equal advantage; which cannot now be done, unless an eligible succession be found to answer that purpose. As we are at present circumstanced, a search on the other side would turn more to the brewer's account. We have in malt a superabundance of the grosser principles, and would government
government permit the introduction of a foreign addition to the saccharine, which is too deficient, many valuable improvements might be made from it; as we could, by a judicious application of such adventitious principle, produce a second and third wort, of quality very little inferior to the first.

But in these experiments a very particular attention would be necessary to the solvent powers of the water at different degrees of heat, and to the inquiry how far a menstruum saturated with one principle may be capable of dissolving another. Such a consideration is the more necessary on this occasion to direct us clear of two extremes equally disagreeable: the first is, that of applying the menstruum pure, and at such a heat as to bring off an over proportion of the oleaginous and earthy principles, which would occasion in the beer, thus wanting its natural share of saccharum, a harshness and austerity which scarce any time the brewer could allow would be able to dissipate: the other is, that of previously loading the menstruum with the adopted sweet in such an abundance as to destroy its solvent force upon the characteristic qualities we wish to unite with it, and thereby leave it a mere solution of sugar. The requisite mean is that of considering what portion of the saccharine quality has been extracted in the first wort, according to the quantity of water and degree of heat applied; and then to make such a previous addition of artificial sweet as will just serve to counterbalance the deficiency, and assimilate with that portion of the remaining principles we are taught to expect will be extracted with the succeeding wort.

From the nature of the constituent principles of malt, it is easy to conceive, that the former, or saccharine or mucilaginous parts, yield most readily to the impression of water, and that at so low a degree of heat, as would have no visible effect upon the latter. If, therefore, we are to have a certain proportion of every part, it is a rational inference, that the means of obtaining it rest in a judicious variation of the extracting heat according to the several proportions required.

A low degree of heat, acting principally upon the saccharum, produces a wort replete with a rich soft sweet, fully impregnated with its attendant mucilage, and in quantity much exceeding that obtainable from increased heat; which by its more powerful insinuation into the body of the malt acting upon all the parts together, extracts a considerable portion of the oleaginous and earthy principles, but falls short in softness, fulness, sweetness, and quantity. This is occasioned, by the coagulating property of the mucilage, which, partaking of the nature of flour, has a tendency to run into paste in proportion to the increase of heat applied; by which means it not only locks up a considerable part of the saccharum contained therein, but retains with it a proportionate quantity of the extracting liquor, which would otherwise have drawn out the imprisoned sweet, thence lessening both the quantity and quality of the worts. And this has sometimes been known to have had so powerful an effect, as to have occasioned the setting of the goods, or the uniting the whole into a pasty mass; for though heat increases the solvent powers of water in most instances, there are some in which it totally destroys them. Such is the presence of flour, which it converts into paste; besides those of blood, eggs, and some other animal substances, which it invariably tends to harden.

From a knowledge of these effects, we form our ideas of the variations necessary in the heat of the extracting liquor: which are of more extensive utility than has yet been intimated, though exceedingly limited in their extent from one extreme to the other.

The most common effects of too low a heat, besides sometimes producing immediate acidity, are an insipidity of the flavour of the beer, and a want of early transparency, from the superabundance of mucilaginous matter extracted by such heats, which, after the utmost efforts of fermentation, will leave the beer turbid with such a cloud of its lighter fæculencies as will require the separation and precipitation of many months to disperse.

The contrary application of too much heat, at the same time that it lessens this mucilage, has, as we have seen before, the effect of diminishing the saccharum, also; whence that lean thin quality observable in some beers; and, by extracting an over proportion of oleaginous and earthy particles, renders the business of fermentation difficult and precarious, and impresses an austerity on the flavour of the liquor which will not easily be effaced.

Yet the true medium heat for each extract cannot be universally ascertained. An attention not only to the quality of the malt, but to the quantity wetted, is absolutely necessary to the obtaining every due advantage; nor must the period at which the beer is intended for use be omitted in the account. The quality of the water also claims a share in the consideration, in order to supply that deficient thinness and want of solvent force in hard, and to allow for the natural fulness and fermentative quality of soft; a particular to which London in a great measure owes the peculiar mucilaginous and nutritious quality of its malt liquors.

Although the variations above alluded to are indispensable, it is easy to conceive, from the small extent of the utmost variety, that they cannot be far distant. If, therefore, we know that a certain degree extracts the first principles in a certain proportion, we need not much consideration to fix upon another degree that shall produce the required proportion of the remaining qualities, and effect that equal distribution of parts in the extract which is the business of fermentation to form into a consistent whole.

The principal use of boiling, as it respects the worts, is to separate the grosser or more palpable parts of the extract, preparatory to that more minute separation which is to be effected in the gyle tun. The eye is a very competent judge of this effect; for the concretions into which the continued action of boiling forms these parts are obvious to the slightest inspection, whilst the perfect transparency of the interstices of the worts points out its utility in promoting that desirable quality in the beer. These coagulable parts are formed from the superabundant mucilage already mentioned; and hence they are found in greater proportion in the first worts than in those that come after; at the same time, they are in these last so mingled with a quantity of oleaginous matter, that they become much more difficultly coagulable in the weak worts.
BRE [ 408 ]

Brewing. worts than in such as are stronger, and hence these require to be much longer boiled than the others.

During this operation the hops are generally added, which are found to be absolutely necessary for preventing the too great tendency of beer to acidity. The fine essential oil of hops being most volatile and soonest extracted, we are therefore taught the advantage of boiling the first wort no longer than is sufficient to form the extract, without exposing it to the action of the fire so long as to dissipate the finer parts of this most valuable principle, and defeat the purpose of obtaining it. To the subsequent worts we can afford a larger allowance, and pursue the means of preservation so long as we can keep in view those of flavour; to which no rules can positively direct, the process varying with every variety of beer, and differing as essentially in the production of porter and pale ale as the modes of producing wine and vinegar.

The consequence of not allowing a sufficient time for the due separation of the parts of the wort and extraction of the requisite qualities of the hop must be obvious. If we proceed to the other extreme, we have everything to apprehend from the introduction of too large a quantity of the grosser principles of the hop, which are very injurious to fermentation, and from impairing the fermentative quality of the worts themselves, by suffering their too long exposure to the action of the fire passing through them, whereby they are reduced to a more dense consistence, and their parts too intimately blended to yield to the separating force of fermentation with that ease the perfection of the product requires.

The last step in the process of brewing is to ferment the liquor properly; for if this is not done, whatever care and pains have been taken in the other parts, they will be found altogether insufficient to produce the liquor desired. The first thing to be done here is to procure a proper ferment; for though all fermentable liquors would in time begin to ferment of themselves, yet, being also susceptible of putrefaction, the vinous and putrefactive fermenters would both take place at the same time in such a manner that the product would be entirely spoiled. There are only two kinds of artificial fermenters procurable in large quantity, and at a low price, viz. beer-yeast and wine-let. A prudent management of these might render the business of the brewery for distillation, as in the business of the malt-distiller, &c. much more easy and advantageous*. Brewers have always found it a considerable difficulty to procure these fermenters in sufficient quantities, and preserve them constantly ready for use; and this has been so great a discouragement to the business, that some have endeavoured to produce other fermenters, or to form mixtures or compounds of particular fermentable ingredients; but this has been attempted without any great success, all these mixtures falling short even of common baker's leaven in their use. Whoever has a turn for making experiments and attempting improvements of this kind, will find it much easier and more advantageous to preserve and raise nurseries of the common ones, than to devise mixtures of others. Yeast may be preserved by freeing it from its moist parts. This may be done by the sun's heat, but slowly and imperfectly. The best method is by gently pressing it in canvas bags: Thus the liquid part, in which there

is scarce any virtue, will be thrown off, and the solid will remain behind in form of a cake, which may be packed in a barrel or box, and will keep for a long time sweet and fragrant, and fit for the finest uses; and the same method may be taken either with wine-lees or the flowers of wine. The former may be brought from abroad with great ease in this manner: the latter may be made with us from the lees, by only dissolving them in water, and stirring them about with a stick; by this means, the lighter, more moveable, and more active part of the lees will be thrown up to the top, and may be taken off and preserved, in the manner above mentioned, in any quantity desired. By this means, an easy method is found of raising an inexhaustible fund; or a perpetual supply of the most proper fermenters may be readily formed in the way of successive generations, so as to cut off all future occasion of complaint for want of them in the business of distillation. It must be observed that all fermenters abound in essential oil much more than the liquors which produce them; whence they very strongly retain the particular flavour and scent of the subject from whence they were made. It is requisite, therefore, before the fermenter is added, to get the wine-lees or other material to be fermented, as it ought to be introduced, and accordingly what species of ferment is most suited to the liquor. The alteration thus caused by fermenters is so considerable, as to determine or bring over any naturally fermentable liquor of a neutral kind to be of the same kind with that which yielded the ferment. The benefit of this, however, does not extend to malt, or to any other matter that does not naturally yield a tolerably pure and tasteless spirit, as it otherwise makes not a simple, pure, and uniform flavour, but a compound and mixed one.

The greatest circumspection and care are necessary in regard to the quality of the ferment. It must be chosen perfectly sweet and fresh: for all fermenters are liable to grow musty and corrupt; and if in this case they are mixed with the fermentable liquor, they will communicate their nauseous and filthy flavour to it in such a manner as never to be got off. If the ferment is sour, it must by no means be used for any liquor; for it will communicate its flavour to the whole, and even prevent its rising to a head, and give it a musty, insipid, instead of a vinous, tendency. When the proper quantity is got ready, it must be put to the liquor in a state barely tepid, or scarce lukewarm. The best method of putting them together, so as to make the fermentation strong and quick, is as follows. When the ferment is solid, it must be broken to pieces, and gently thinned with some of the warm liquor; but a complete or uniform solution of it is not to be expected or desired, as this would weaken its efficacy for the future business. The whole intended quantity being thus loosely mixed in some of the lukewarm liquor, and kept near the fire or elsewhere in a tepid state, free from too rude commerce with the external air, more of the insensibly warm liquor ought at proper intervals to be brought in, till thus by degrees the whole quantity is set at work together. When the whole is thus set at work, secured in a proper degree of warmth, and kept from a too free intercourse with the external air, it becomes as it were the business of nature to finish the operation.

In the operation of fermentation, however, the degre
BRE [ 409 ]

BREWING. The quality of heat employed is of the utmost consequence. In forming the extracts of the malt, the variation of a few degrees of heat produces an important difference in the effect. In the heat of fermentation, similar consequences result from similar variety. Under a certain regulation of the process, we can retain in the beer, as far as art is capable, the finer mucilage, and thereby preserve that fulness upon the palate which is by many so much admired: on the other hand, by a slight alteration, we can throw it off, and produce that evenness and uniformity of flavour which has scarce any characteristic property, and is preferred by some only for want of that heaviness which they complain of in full beers. If a more vinous racy ale be required, we can, by collecting and confining the operation within the body of the wort, cause the separation and absorption of such an abundant portion of the oleaginous and earthy principles, as to produce a liquor in a perfect state at the earliest period, and so highly flavorful as to create a suspicion of an adventitious quality. But though all this may be done, and often hath been done, the proper management of fermenting liquors depends so much upon a multiplicity of slight and seemingly unimportant circumstances, that it hath never yet been laid down in an intelligible manner; and no rules, drawn from any thing hitherto published on the subject of brewing, can be at all sufficient to direct any person in this matter, unless he hath had considerable opportunities of observing the practice of a brewhouse.

To what we have now said we shall only add, from a practical treatise on brewing lately published, the names of the materials and their proportions, which are employed by the London brewers in the manufacture of the different kinds of malt liquors.

PORTER.

Kinds of Malt. cwt. qrs. lbs.
West country pale, 3 Hops, 1 2 0
Herts pale, 6 Cocculus indic. 0 0 6
— brown, 8 Leghorn juice, 0 0 30
— amber, 8

Quarters, 25
This yielded 89 barrels and 2 firkins of porter.

Another proportion of materials for Porter.

Kinds of Malt. cwt. qrs. lbs.
Herts pale, 11 Hops, 1 2 0
— amber, 7 Cocculus indic. 0 0 4
West country brown, 7 Leghorn juice 0 0 30

Quarters, 25
This proportion of materials yielded 87 barrels one firkin.

BROWN STOUT.

Kinds of Malt. cwt. qrs. lbs.

Kinds of Malt. cwt. qrs. lbs.
Herts pale, 16 Hops, 1 2 20
— amber, 4 Honey, 0 0 28
— Sugar, 0 0 20
Quarters, 20 Hart shavings, 0 0 14
— Ground coriander seed, 0 0 4
— Caraway seeds, 0 0 1

HOCK.

Kinds of Malt. cwt. qrs. lbs.
Herts pale, 14 Hops, 1 3 10
— amber, 6 Cocculus indicus berry, 0 0 4
Quarters, 20 Sugar, 0 0 20
— Bitter bean, 0 0 2

SCURVY-GRASS ALE.

Kinds of Malt. cwt. qrs. lbs.
Hops, 25 pounds.
Herts pale, 3 Molasses, 10 ditta.
— amber, 3 Garden scurvy-grass, 5 bunches.
— Alexandrian Sena, 2 pounds.
— Horse-radish root, 1 ditto.

Quarters, 6 which is to be sliced into the working tun.

See BREWING, SUPPLEMENT.

BREY, a town of Germany, on the frontiers of Brabant, seated on a rivulet, in E. Long. 5° 35'. N. Lat. 51° 6'.

BREYNA, in Botany, a synonyme of the capparis. See CAPPARIS, BOTANY INDEX.

BRIACON, a town of France, in Upper Dauphiny, capital of the Briéonnes. E. Long. 45° 45'. N. Lat. 44° 45'.

BRIACONEIS, a territory of France, in Dauphiny, bounded by Grenoble, Gapenzois, Arbrunois, Piedmont, and Savoy. It comprehends several valleys, which lie among the mountains of the Alps; and though it is extremely cold, yet it is fertile in corn and pastures. The inhabitants have a great deal of wood; yet they choose to be in the stables with their cattle six months in the year, to keep themselves warm. Breaçon is the capital town.

BRIAR, in Botany, the English name of a species of rosa. See ROSA, BOTANY INDEX.

BRIARE, a town of France, in the department of Loiret, seated on the river Loire. It is remarkable for nothing but a long street full of inns and taverns, it being on the great road to Lyons; and the canal of Briare, which is 33 miles in length, and maintains a communication between the Loire and the Seine. E. Long. 2° 45'. N. Lat. 47° 45'.

BRIAREUS, in fabulous history, a giant: the son of Æther, Titan, or Calos, and Terra. This was his name in heaven; on the earth he was called Ægeon. He was of singular service to Jupiter, when Juno, Pallas, Neptune, and the rest of the gods, endeavoured to bind him in chains and dethrone him. Afterwards, however, he conspired with the rest of his gigantic brethren to dethrone Jupiter. Virgil, on this occasion, describes him as having 100 hands, 50 heads, and breathing out fire. The fable says that Jupiter, to punish him, threw him under Mount Ætna, which, as often as he moves, belches out fire. See ÆTNA.

BRIBE, a reward given to pervert the judgment. See the next article.

The word is French, bribe, which originally denotes a bit, fragment, or relic of meat taken off the table; on which footing, bribe imports as much as ponis mendicatus, and still keeps up the idea of the matter whereof bribes anciently consisted. Hence also the Spaniards use brbar and brivar for begging; and briua, briuoneria, and briuonismo, for beggary. In middle-age writers, a bribe given a judge is called quato litter, and the receiver, campi particeps, or cambi particeps; because the spoils of the field, i.e. the profits of the cause, were thus shared with the giver.

BRIBERY, in Law, is a high offence, where a person in a judicial place takes any fee, gift, reward, or Brockage, for doing his office, but of the king only. But, taken largely, it signifies the receiving or offering any undue reward to or by any person concerned in the administration of public justice, whether judge, officer, &c. to act contrary to his duty; and sometimes it signifies the taking or giving a reward for a public office.

In the east it is the custom never to petition any superior for justice, not excepting their kings, without a present. This is calculated for the genius of despotic countries; where the true principles of government are never understood, and it is imagined that there is no obligation due from the superior to the inferior, no relative duty owing from the governor to the governed. The Roman law, though it contained many severe injunctions against bribery, as well for selling a man's vote in the senate or other public assembly, as for the bartering of common justice; yet, by a strange indulgence in one instance, it tacitly encouraged this practice; allowing the magistrate to receive small presents, provided they did not on the whole exceed 100 crowns a-year; not considering the inanimating nature and gigantic progress of this vice, when once admitted. Plato, therefore, in his ideal republic, orders those who take presents for doing their duty to be punished in the severest manner: and by the laws of Athens, he that offered a bribe was also prosecuted, as well as he that received a bribe. In England this offence of taking bribes is punished in inferior officers, with fine and imprisonment; and in those that offer a bribe, though not taken, the same. But in judges, especially the superior ones, it has been always looked upon as so heinous an offence, that the chief justice Thorpe was hung for it in the reign of Edward III. By a statute 11 Henry IV all judges and officers of the king convicted of bribery, shall forfeit treble the bribe, be punished at the king's will, and be discharged from his service for ever. And some notable examples have been made in parliament, of persons in the highest stations, and otherwise very eminent and able, but contaminated with this sordid vice. Thus in the reign of King James I. the earl of M. lord treasurer of England, being impeached by the commons, for refusing to hear petitions referred to him by the king, till he had received bribes, &c. was, by sentence of the lords, deprived of all his offices, and disabled to hold any for the future, or to sit in parliament; he was also fined 50,000l. and imprisoned during the king's pleasure. In the 11th year of King George I. the lord chancellor M—— had somewhat milder punishment: he was impeached by the commons, with great zeal, for bribery, in selling the places of masters in chancery for exorbitant sums, and other corrupt practices, tending to the great loss and ruin of the suitors of that court; and the charge being made good against him, being before divorced of his office, he was sentenced to pay a fine of 30,000l, and imprisoned till it was paid. It is said that one of the peers, if not two, who voted against him, had been possessed of the office of chancellor, and sold the places of masters in chancery whenever vacant.

BRIBERY in Elections. See ELECTIONS.

BRICIANI, those of the order of that name. This was a military order, instituted by St. Bridget, queen of Sweden, who gave them the rules and constitutions of those of Malta and St. Augustin. This order was approved by Pope Urban V. They were to fight for the burying of the dead, to relieve and assist widows, orphans, the lame, sick, &c.

BRICK, a fat reddish earth, formed into long squares,
Brick.

Brick squares, four inches broad, and eight or nine long, by means of a wooden mould, and then baked or burnt in a kiln, to serve the purposes of building.

Bricks are of great antiquity, as appears by the sacred writings, the tower and walls of Babylon being built with them.

The Greeks chiefly used three kinds of bricks; the first whereof was called διαφην, i.e. of two palms; the second στεφάνως, of four palms; the third στεφάνως, of five palms. They had also other bricks, just half each of those, to render their works more solid, and also more agreeable to the sight, by the diversities of the figures and sizes of the bricks.

The dimensions of the brick chiefly used by the Romans, according to Pliny, were a foot and a half long, and a foot broad; which measures agree with those of several Roman bricks in England, which are about 17 inches long, and 11 bread, of our measure. Sir Henry Wotton speaks of a sort of bricks at Venice, of which stately columns were built; they were first formed in a circular mould, and cut, before they were burnt, into four or more quarters or sides; afterwards, in laying, they were jointed so close, and the points concentrated so exactly, that the pillars appeared one entire piece. The ordinary Paris brick is eight inches long, four broad, and two thick, French measure, which makes something more than ours. But this smallness is an advantage to a building, the strength of which consists much in the multitude of angles and joints, at least if well laid, and having a good bond.

Bricks among us are various, according to their various forms, dimensions, uses, method of making, &c. The principal are, compass-bricks, of a circular form, used in lining of stables: concave or hollow bricks, on one side flat like a common brick, on the other hollowed, and used for conveyance of water: feather-edged bricks, which are like common statucy-bricks, only thinner on one edge than the other, and used for penning up the brick pannels in timber buildings: cogging bricks are used for making the indented works under the caping of walls built with great bricks: capping bricks, formed on purpose for capping of walls: Dutch or Flemish bricks, used to pave yards, stables, and for soap-boiler's vaults and cisterns: clinkers, such bricks as are glazed by the heat of the fire in making: sandel or samel-bricks, are such as lie outmost in a kiln or clamp, and consequently are soft and useless, as not being thoroughly burnt: great bricks are those twelve inches long, six broad, and three thick, used to build fence-walls: plaster or buttress bricks, have a notch at one end, half the breadth of the brick; their use is to bind the work which is built of great brick: statucy-bricks, or small common bricks, ought, when burnt, to be nine inches long, four and a quarter broad, and two and a half thick; they are commonly used in paving cellars, sinks, hearths, &c.

Worlidge, and others after him, have endeavoured to excite brick-makers to try their skill in making a new kind of brick, or a composition of clay and sand, whereof to form window-frames, chimney-pieces, door-cases, and the like. It is to be made in pieces fashioned in moulds, which, when burnt, may be set together with a fine red cement, and seem as one entire piece, by which may be imitated all manner of stone work. The thing should seem feasible, by the earthen pipes made for

fine, thin, and durable, to carry water under ground at Portsmouth; and by the earthen backs and grates for chimneys, formerly made by Sir John Winter, of a great bigness and thickness. If chimney-pieces thus made in moulds, and dried and burnt, were not found smooth enough, they might be polished with sand and water; or were care taken, when they were half dry in the air, to have them polished with an instrument of copper or iron, then leave them till they were dry enough to burn, it is evident they would not want much polishing afterwards. These were ought even be glazed, as potters do their fine earthen ware, either white or of any other colour; or it might be veined in imitation of marble, or be painted with figures of various colours, which would be much cheaper, perhaps equally durable, and as beautiful, as marble itself.

Bricks are commonly red, though there are some also of a white colour, for which sort Walpit in Suffolk is famous. Bricks may be made of any earth that is clear of stones, even sea-ouse; but all will not burn red, a property peculiar to earths which contain ferruginous particles. In England, bricks are chiefly made of a hazeltry, yellowish-coloured, fatty earth, somewhat reddish, vulgarly called loam. The earth, according to Leibourn, ought to be dug before winter, but not made into bricks before spring. For the making of such bricks as will stand the fiercest fires, Stourbridge clay or Windsor loam are esteemed the best. In general, the earth whereof bricks are made ought not to be too sandy, which would render them heavy and brittle; nor too stiff, which would make them crack in drying.

The first step in the process of brick-making is casting the clay, or earth. The next step is to mould or temper it, which ought to be performed doubly of what is usually done; since the goodness of the bricks depends chiefly upon this first preparation. The earth itself, before it is wrought, is generally brittle and dusty; but adding small quantities of water gradually to it, and working and incorporating it together, it opens its body, and tinges the whole with a tough gluey band or substance. If, in the tempering, you overwater them, as the usual method is, they become dry and brittle, almost as the earth they are made of; whereas, if duly tempered, they become smooth and solid, hard and durable. A brick of this last sort takes up near as much earth as a brick and a half made the contrary way; in which the bricks are spongy, light, and full of cracks, partly through want of due working, and partly by mixing of ashes and light sandy earth to make it work easy and with greater dispatch; as also, to save colm or coals in the burning. We may add, that for bricks made of good earth, and well tempered, as they become solid and ponderous, they take up a longer time in drying and burning than the common ones; and that the well drying of bricks before they are burned prevents their cracking and crumbling in the burning.

Bricks are burnt either in a kiln or clamp. Those that are burnt in a kiln, are first set or placed in it; and then the kiln being covered with pieces of bricks, they put in some wood to dry them with a gentle fire; and this they continue till the bricks are pretty dry, which is known by the smoke's turning from a darkish colour to transparent smoke: they then leave off putting in wood, and proceed to make ready for burning; which is performed by putting in brush furance, spray, heat, 3 F 2 brake
Brick. brake or fern faggots: but before they put in any faggots, they dam up the mouth or mouths of the kiln with pieces of bricks (which they call shinlog) piled up one upon another, and close it up with wet brick-earth instead of mortar. The shinlog they make so high, that there is but just room above it to thrust in a faggot: then they proceed to put in more faggots, till the kiln and its arches look white, and the fire appears at the top of the kiln; upon which they slacken the fire for an hour, and let all cool by degrees. This they continue to do, alternately heating and slacking, till the ware be thoroughly burnt, which is usually effected in 48 hours.

About London they chiefly burn in clamps, built of the bricks themselves, after the manner of arches in kilns, with a vacancy between each brick, for the fire to play through; but with this difference, that instead of arching, they span it over by making the bricks project one over another on both sides of the place, for the wood and coals to lie in till they meet, and are bounded by the bricks at the top, which close all up. The place for the fuel is carried up straight on both sides, till about three feet high; then they almost fill it with wood, and over that lay a covering of sea-coal, and then overspan the arch; but they strew sea-coal also over the clamp, between all the rows of bricks; lastly, they kindle the wood, which gives fire to the coal; and when all is consumed, then they conclude the bricks are sufficiently burnt.

In Dr Percival’s essays, we have the following experiment of the effects of bricks on water. “Two or three pieces of common brick were steeped four days in a basin full of distilled water. The water was then decanted off, and examined by various chemical tests. It was immiscible with soap, struck a lively green with syrup of violets, was rendered slightly lactescent by the volatile alkali, and quite milky by the fixed alkali and by a solution of saccharum saturni. The infusion of tormentil root produced no change in it.” This experiment, he observes, affords a striking proof of the impropriety of lining wells with brick, a practice very common in many places, and which cannot fail of rendering the water hard and unwholesome. Clay generally contains a variety of heterogeneous matters. The coloured loams often participate of bitumen, and the ochre of iron. Sand and calcareous earth are still more common ingredients in their composition; and the experiments of Mr Godfrey and Mr Pott prove, that the earth of alum also may in large quantity be extracted from clay. Now as clay is exposed to the open air for a long space of time, is then moulded into bricks, and burnt, this process resembles in many respects that by which the alum-stone is prepared. And it is probable that the white efflorescence which is frequently observable on the surface of new bricks, is of an aluminous nature. The long exposure of the clay to the air, the sulphurous exhalations of the pit-coal used for burning it, together with the bituminous vapour which arises from the ignited clay itself, sufficiently account for the combination of a vitriolic acid with the earth of alum. See Brickmaking, Supplement.

Oil of Bricks, olive oil imbibed by the substance of bricks, and afterwards distilled from it. This oil was once in great repute for curing many diseases, but is now justly laid aside.

Brick-Layer, an artificer, whose business is to build with bricks, or make brick-work. Brick-layers work, or business, in London, includes tyling, walling, chimney-work, and paving with bricks and tyles. In the country it also includes the mason’s and plasterer’s business.

The materials used by brick-layers are bricks, tyles, mortar, laths, nails, and tyle pins. Their tools are a brick trowel, wherewith to take up mortar; a brick-axe, to cut bricks to the determined shape; a saw, for sawing bricks; a rub-stone, on which to rub them; also a square, wherewith to lay the bed or bottom, and face or surface of the brick, to see whether they are at right angles; a bevel, by which to cut the under sides of bricks to the angles required; a small tranche of iron, wherewith to mark the bricks; a float-stone, with which to rub a moulding of brick to the pattern described; a banker, to cut the bricks on; line pins to lay their rows or courses by; plumb-rule, whereby to carry their work upright; level, to conduct it horizontal; square, to set off right angles; ten-foot rod, wherewith to take dimensions; jointer, wherewith to run the long joints; rammer, wherewith to beat the foundation; crow and pick-axe, wherewith to dig through walls.

The London brick-layers make a regular company, which was incorporated in 1708; and consists of a master, two wardens, 20 assistants, and 78 on the livery.

Brick-Laying, the art of framing edifices of bricks.

Moxon hath an excellent treatise on the art of brick-laying; in which he describes the materials, tools, and method of working, used by brick-layers.

Great care is to be taken, that bricks be laid joint on joint in the middle of the walls as seldom as may be; and that there be good bond made there, as well as on the outsides. Some brick-layers, in working a brick and half wall, lay the header on one side of the wall perpendicular to the header on the other side, and so all along the whole course; whereas, if the header on one side of the wall were tooted as much as the stretcher on the other side, it would be a stronger toothing, and the joints of the headers of one side would be in the middle of the headers of the course they lie upon of the other side. If bricks be laid in winter, let them be kept as dry as possible; if in summer, it will quit cost to employ boys to wet them, for they will then unite with the mortar better than if dry, and will make the work stronger. In large buildings, or where it is thought too much trouble to dip all the bricks separately, water may be thrown on each course after they are laid, as was done at the building the physicians college, by order of Dr Hooke. If bricks are laid in summer, they are to be covered; for if the mortar dries too hastily, it will not bind so firmly to the bricks as when left to dry more gradually. If the bricks be laid in winter, they should also be covered well, to protect them from rain, snow and frost; which last is a mortal enemy to mortar, especially to all such as have been wetted just before the frost assaults it.

Brick-Maker, is he who undertakes the making of Bricks. This is mostly performed at some small distance from cities and towns; and though some, through ignorance, look upon it as a very mean employ, because laborious, yet the masters about London, and other capital cities, are generally men of substance.

BRICKING, among builders, the counterfeiting of
BRIDGE, a woman newly married. Among the Greeks, it was customary for the bride to be conducted from her father's house to her husband's in a chariot, the evening being chosen for that purpose, to conceal her blushes; she was placed in the middle, her husband sitting on one side, and one of her most intimate friends on the other; torches were carried before her, and she was entertained on the passage with a song suitable to the occasion. When they arrived at their journey's end, the axle-tree of the coach they rode in was burnt, to signify that the bride was never to return to her father's house. Among the Romans, the bride was to seem to be ravished by force from her mother, in memory of the rape of the Sabines under Romulus: she was to be carried home in the night-time to the bridegroom's house, accompanied by three boys, one whereof carried a torch, and the other two led the bride; a spindle and distaff being carried with her: she brought three pieces of money called asses, in her hand to the bridegroom, whose doors on this occasion were adorned with flowers and branches of trees: being here interrogated who she was, she was to answer Caesa, in memory of Caesa Cecilia wife of Tarquin the Elder, who was an excellent lanista or spinstress; for the like reason, before her entrance, she lined the door-posts with wool, and smeared them with grease. Fire and water being set on the threshold, she touched both; but starting back from the door refused to enter, till at length she passed the threshold, being careful to step over without touching it: here the keys were given her, a nuptial supper was prepared for her, and minstrels to divert her; she was seated on the figure of a apopis, and here the attendant boys resigned her to the promethea, who brought her into the nuptial chamber and put her to bed. This office was to be performed by matrons who had only been once married, to denote that the marriage was to be for perpetuity.

BRIDEGROOM, a man newly married, the spouse of the bride.

The Spartan bridegrooms committed a kind of rape upon their brides. For matters being agreed on between them two, the woman that contrived and managed the match, having shaved the bride's hair close to her skin, dressed her up in man's clothes, and left her upon a mattress: this done, in came the bridegroom, in his usual dress, having supp'd as ordinary, and stealing as privately as he could to the room where the bride lay, and uniting her virgin girdle, took her to his embraces; and having staid a short time with her, returned to his companions, with whom he continued to spend his life, remaining with them by night as well as by day, unless he stole a short visit to his bride, which could not be done without a great deal of circumspection, and fear of being discovered. Among the Romans, the bridegroom was decked to receive his bride; his hair was combed and cut in a particular form; he had a coronet or chaplet on his head, and was dressed in a white garment.

By the ancient canons, the bridegroom was to forbear the enjoyment of his bride the first night, in honour of the nuptial benediction given by the priest on that day. In Scotland, and perhaps also some parts of England, a custom called marchet, obtained; by which the lord of the manor was entitled to the first night's habitation with his tenant's bride.

BRIDEWELL, a work-house, or place of correction for vagrants, strumpets, and other disorderly persons. These are made to work, being maintained with their clothing and diet; and when it seems good to their governors, they are sent by passes to their native countries; however, while they remain here, they are not only made to work, but, according to their crimes, receive once a fortnight such a number of stripes as the governor commands.

BRIDEWELL, near Fleet-street, is a foundation of a mixed and singular nature, partaking of the hospital, the prison, and work-house; it was founded in 1553, by Edward VI. who gave the place where King John had formerly kept his court, and which had been repaired by Henry VIII. to the city of London, with 700 merks of land, bedding, and other furniture. Several youths are sent to the hospital as apprentices to manufacturers, who reside there; they are clothed in blue doublets and breeches, with white hats. Having faithfully served their time of seven years, they have their freedom, and a donation of 10l. each, for carrying on their respective trades.

BRIDGE. A bridge is a mode of conveyance from one part of space to another, the intermediate part being either impassable, or difficult, or otherwise of an inconvenient access. The strength must be in proportion to the weight which is to be supported; the extent or width of the passage being likewise taken into consideration. This passage may be of a considerable distance, and the weight to be supported inconceivable; for example, a spider is the greatest weight to be supported; and she can spin as much matter from her bowels as will answer her purpose, and can find supports upon which she can make the extremities of her bridge to rest. But not to take up time to mention the ingenuity (or under whatever name it may be designed) of insects, birds, or quadrupeds, who discover admirable instances of art suitable to their nature, and uses fitted for their situation, our chief intention is to investigate the different exertions of the rational part of the creation, and their manner of accommodating themselves to answer their necessary exigencies, particularly at present confining ourselves to the formation of bridges of different kinds. The most simple part of these, we cannot doubt, were in use from the beginning of time. When any passage exceeded the step or stretch of a man's legs, we cannot imagine, but his natural invention would lead him to apply a stone, if of sufficient length to answer his purpose; but if not, a piece of wood, or trunk of a tree, would be employed in the same way to render the passage more easy for himself.

History does not inform us that this useful art was carried to any great extent, in the ages of the antediluvians; but we can scarcely imagine but they were acquainted with it, so far as we have mentioned, and even to a greater degree. Can we suppose that such geniuses as discovered the method of founding and working in iron and brass, and the formation and use of musical instruments, would be wanting in discovering methods so intimately connected with their own.
Bridge. Have we any accounts handed down to us, that they occupied houses composed of different apartments, and of different stories or flats; yet we find the infinitely wise and merciful Governor of the universe, when admonishing Noah respecting the building of an ark for his safety, speak to him of different rooms and stories, of which it was to consist, in terms with which Noah was well acquainted. As the Almighty always accommodates himself to the capacities of his creatures, if Noah had not been acquainted with these terms, can we doubt that the Almighty would not have furnished his favourite servant with a perspective view of these rooms and stories as he did to Moses, when giving him instructions to raise and construct a fabric of which he formerly never had obtained a view? But this amounts to no more than that it might be, and therefore we will not dwell upon it.

Of what took place after the flood, we have no remains of antiquity, for many years, of this art being cultivated to any extent; although it is surprising, that upon viewing the beautiful and superb dome of the heavens, and the variegated arch that at times made its appearance, that an imitation of neither of these was not earlier attempted. Among the eastern nations, and after them the Egyptians, who have left so many monuments of grandeur and art, very little of the arch is to be found in any degree of elegance. In some of the late researches into their antiquities, a zodiac painted in lively colours, and some vaultings cut in a rock, have been discovered; but what is formed of different stones is but of a rude composure; yet being of the more early period, we cannot but conclude, that they gave the idea to the Greeks, who improved it in a more elegant style.

It is probable that the Chinese, even at an earlier period, arrived at a degree of perfection and elegance in this art, which neither the Greeks nor the Romans ever reached. We, who boast, and not without some reason, of the elegance and extent to which we have carried it, have not outdone them. We find that they have constructed a bridge of one arch, the span 400 cubits, in the ordinary computation 600 feet, from one mountain to another; the height of this arch is likewise given of 300 cubits or 750 feet. It is universally allowed, that if Noah was not the founder of that monarchy, it was some of his grand-children, at a very early period; their form of government resembles the patriarchal, which is in favour of Noah's being their founder, and that they cultivate these arts, of which he instructed them in the rudiments: but this is not a place for discussion of this subject.

But to return to the Greeks and Romans, of whose history we know more than we do of the other: Although we have admitted the Egyptians to have struck out the plan, yet, in point of elegance, in combining the parts of the arch, we will not deny the Greeks to have the first share. On account of an effigy, having Janus upon the one side, and a bridge on the opposite, some have ascribed the honour of the art to him; he might indeed, on account of his improvements of the art, shewn himself deserving of having, along with his effigy, the distinguished art he had excelled in, engraved on the metal, as a memorial of his merit. Whether the bridge improved by Janus were over land or water we are not informed; but certain it is, that necessity, which is the mother of invention, could not fail to form schemes for conveyance over water. We find bridges, or some species of ships, used at a pretty early period; and we are surprised not to find them more early than we have account of. A boat or ship is an inverted arch turned down into the water. Of a bridge of this kind, we find Darius avail himself in passing the Hellespont, or the Bosphorus, for we find different historians of different opinions which of them he passed, and the word Propontis answers to either; although we rather agree with those that make the passage at the Dardanelles, or in that strait. This mode of passage is still in use, and found very convenient; but we can scarcely suppose that Darius, and his officers, and court, never heard of a bridge before that idea struck them, in the execution of which they so happily succeeded. It is highly probable that they were acquainted with, and had formed bridges in their own country, and that want of materials to make a solid wall, induced them and others to construct arches, for the purpose of aqueducts, of which there is so much occasion in Persia, on account of the scarcity of water; and as they knew not the mode of conveying their water in pipes.

Among the Romans we find arches of different kinds, and particularly triumphal arches, although these were not always formed of lasting materials; but their aqueducts were, of which the remains of several are found in France, Spain, and others of their ancient territories. Caesar formed a bridge over the Rhine, Trajan over the Danube; with many others, the particular mention of which would not much amuse our readers: at the same time we hope it will not be disagreeable to give a short account of Trajan's bridge, in the words of Dion Cassius. "Trajan built a bridge over the Danube, which in truth one cannot sufficiently admire; for though all the works of Trajan are very magnificent, yet this far exceeds all the others. The piers were 20 in number, of square stone; each of them 150 feet high above the foundation, 60 feet in breadth, and distant from one another 170 feet. Though the expense of this work must have been exceeding great, yet it becomes more extraordinary by the river's being very rapid, and its bottom of a soft nature; where the bridge was built was the narrowest part of the river thereabout, for in other parts of the river it was double or treble this breadth; and although on this account it became so much the deeper, and more rapid, yet no other place was so suitable for this undertaking. The arches were afterwards broken down by Adrian; but the piers are still remaining, which seems as it were to testify, that there is nothing which human ingenuity is not able to effect." From this account, the whole length of this bridge is 4770 feet, that is 500 feet less than an English mile. The architect of this great work is said to be Apollodorus of Damascus, who, it is likewise said, left a description of the work; but how much it is to be regretted that it is nowhere found on record!

Among the moderns, the French and German engineers, and perhaps the Italians, ought not to be neglected. Of those who have written on the subject, we
Bridge. we may name Belidor, of whom it is said, that he had the best information, from his acquaintance and knowledge of the chief works of France and Germany, as well as from his experience as an engineer. His directions as to an arch or bridge are shortly thus; that the piers ought to be one-fifth part of the opening, and not less than one-sixth; that the arch stones ought to be one thirty-fourth part of the opening: In general, that the pier ought to be of such strength, that it will support its arch as an abutment, which by practice he finds one-fifth part of the opening to be sufficient; but gives as a rule, one-sixth part, and two feet more: that is, an arch of 36 feet, one-sixth 6 + 2 = 8, the thickness of the pier. And where the arch is 72 or more, he deduces three inches for every six feet above 48; therefore the pier of 72 would be 14, that is two feet more than the one-sixth part; but with the above allowance the pier is only 13; when the width is 60 or above, he allows the one-sixth part of the opening as quite sufficient: this he seems only to deduce from observation, without adducing a reason; now why a wide arch should be supported by more slender piers, in proportion, does not appear quite consistent with his principles; that the pier must be of such strength as to serve for an abutment to the arch thrown upon it, independent of the other arches, which when thrown, are allowed to be a counterpoise to the pressure. Although we do not see why it is applicable to his principles, we will afterwards have occasion to show, that it tends to corroborate the principles we mean to advance.

We find another experienced engineer, Mr. Gautier, who only differs from Belidor, in so far as we observe, as to the length of the arch-stones. Gautier directs, that the arch itself should be 2 feet; if 45, 3 feet; if 60, 4 feet; if 75, 5 feet; if 96, 6 feet; if the stone is of a durable nature: if soft, of greater dimensions. Belidor gives the general rule, one twenty-fourth part of the opening: this must certainly be considered under some limitation; for, if the arch is only 12 feet, the arch-stone would be only six inches, which, we think, will be thought too slight; and arches over doors and windows would not be three inches; but although he mentions no limitation, we suppose, if a 24 feet arch is allowed 2 feet of an arch-stone, the rule may with safety be followed; and that a six-foot stone, of a durable nature, may be an arch-stone, although the span was 150 or 200 feet.

Under whatever names later engineers have acted, we find Belidor has in general been followed; both by Mr. Mylne and others. Peter of Colechurch, a priest, architect of London bridge, has given his pier a much greater strength, being more than half the opening; the piers being from 25 to 34 feet, 18 in number; the length of the river only 900 feet, over which this bridge extends.

An ample reparation is made for these inconveniences in Westminster bridge; the piers more slender, a more easy passage for the water, the piers being only 17 feet. The breadth of the river 1223 feet. The arches are all semicircular, and spring from about two feet above low-water mark; they consist of 13 large arches and two smaller; the middle arch is 76 feet span, and the other arches decrease on each side by four feet. The passage for carriages is not of an easy ascent, having 30 feet of rise in 611.5 feet; it is supplied with plain stones for foot passengers on each side; the ledges adorned with balustrades, and semi-octagonal towers, which form the recesses of the foot-way; the whole width is 44 feet. The whole is allowed to be elegant and well executed.

We now take a view of Blackfriars bridge (fig. 12, Plate CXXX.), which presents us with something novel, is agreeable to the eye, and no precaution is neglected that could contribute to its strength, or give addition to its elegance. Its arches are of the elliptic form, at least nearly so. Upon examination of the figure of which we are possessed, the middle arch is a span of 100 feet, the flat part of the arch is described with a radius of about 57 feet; and the lesser circles on each side 35 ½ or 36 nearly, this small arch is continued below its diameter, till its chord becomes 16 feet nearly, and its versed sine 5 feet, which gives it the degree of novelty alluded to; and which is far from being disagreeable to the eye. The shoulders are compactly filled with rubble-work; the bed of each row tending to the centre of the arch. To the height the arch can be raised without a supporting frame, an inverted semicircle is drawn, the convexity of the arch resting upon this ruble-work, which is formed of Kentish rag, but other hard stone will equally answer the purpose, as this cannot be everywhere procured. This inverted arch answers two material uses; it prevents this ruble being raised by any lateral pressure; and which we think the most material is, that it makes those parts of the arch, which form the greatest lateral pressure, to sublimate upon another; of consequence there is little or no lateral pressure upon the pier. We shall refer our observations upon this bridge, as the preceding arches, till we have given some account of other bridges; as we wish to make the article convey to the information of our readers, and at the same time methodical.

The bridge of the greatest extent in England, is that built over the Trent at Burton; its length is 1545 feet, supported by 34 arches.

The most stupendous bridge in Europe, is that built over the Tave in Glamorganshire, consisting only of one arch, the segment of a circle whose diameter is 175 feet; the chord of the segment or span of the arch is 140 feet; the height 35, and abutments 32 feet; the architect of this stupendous arch was William Edward, a country mason; it was executed in the year 1756.

We have likewise an account of the famous bridge the Rialto at Venice, the design of Michael Angelo. On account of its flatness and extent, being 984 feet span, it is reckoned a master-piece of art. It was built in the year 1591. Its height is only 23 feet above the water, but we find it now outdone by a country mason in Britain.

The next species of bridge to be noticed is a rushen bridge; this species of bridge is formed of bundles of rushes, which being covered with boards and planks, form a passage over marshy ground. Bridges formed of casks, bottles, or sometimes bullocks bladders blown up, and attached to one another, have been used upon occasions by armies. They have been named acogrofi. The materials are carried along with the army in their march, which when joined, form
In this view the balustrade along the side of the bridge is in full view.

Fig. 4. is an elevation of the binder part of the bridge or stern. \( a, b, \) The two boats; \( GH, KL, \) the two masts; \( HL, \) the upper transverse beam; \( p, q, \) the lower transverse beam, over which the cable passes, and occasionally slides from the one mast to the other; and masts on that account be kept well greased; \( p, k, g, s, \) shrouds extending from the sides of the bridge to the top of the masts; \( M, \) the cross-piece, over which the cable passes to the windlass.

Besides these temporary bridges of boats already mentioned, there are permanent bridges formed of boats, as at Rouen, Beaucarne, and Seville. Those of Rouen and Seville are the most noted; that at Rouen was constructed to supply the stone bridge built by the Romans, said to have been a stately fabric. The boats are very firm, well moored with strong chains, and kept in proper repair. It is almost 300 yards in length, paved with stones as a street. A bridge of boats has the advantage of other bridges, if well moored, for as the water rises, whether by rains or tides, they keep afloat. This bridge is represented by some as a wonder of the present age; others say, it is far surpassed by that of Seville; but when we reflect upon that constructed by Darius over the straits of the Dardanelles; and on that by Cesar over the Rhine, we cannot view either of them with so much surprise.

We find some of a different construction, called floating bridges; which we think should rather be stiled sliding bridges; they are so constructed that one lies above the other, when not in use. When intended to be used, by drawing of ropes turned over pulleys, the upper one moves forward, till it passes over the other, when they are joined in one, and form the intended passage. It will readily occur to our readers, that these must be much limited as to their length, both on account of their weight, and the strength of the rope that would be necessary, both to push them over, and return them to their place; they can only be of use in passing a moat, in besieged places, or such as are of inconvenient access and little frequented.

We cannot omit taking notice of some natural bridges, in particular two very remarkable ones; the one in Virginia, described by Mr Jefferson in his State of Virginia. It commences at the ascent of a hill, which seems to have been cloven asunder, by some convulsion of nature; the fissure at the bridge is by some measurements said to be 270 feet; by others only 205; width at bottom 45 feet, at top 90, which gives the length of the bridge; the thickness at the summit of the arch is 40 feet: considerable part is of earth, upon which grow many large trees; the residue is of the same materials with the hill on both sides, which is a solid limestone rock, and forms the arch, which is of a semi-elliptical form, very flat; the height of this arch above the water (the whole being 205 and 40 the thickness) is 165 feet; the breadth at the middle is about 60 feet. It has no ledges, but what is formed on some parts by the rock, but even at these few can stand upon their feet to look down; but go on hands and feet to peep over. On the contrary the view from below is most delightful, and enchanting. The fissure continuing narrow, and straight, both above and below; and of such height that
that it exhibits a prospect, for about five miles; gives a short but very pleasing view of Blue ridge on the one side, and North mountain on the other; the stream that passes below it is called Cedar creek, and falls into James river. The bridge is in the county of Rockbridge, to which it has given the name. We have no account of the time when it was produced. It has, however, formed a passage between two mountains otherwise impassable but at a great distance from it.

The other is in the province of Angara, in S. America, described by Don Ulloa. It is from 16 to 22 feet wide; 111 feet deep, of breadth one and one-third of a mile, and is not sensibly greater at top than at bottom. Don Ulloa thinks it has been effected by the wearing of the water, which runs below it; if, so it would have worn down plain and smooth; or most to that side, on its descent, where the rock was of softer materials; but he informs us that the cavities on the one side, where equally hard, so tally with protuberances of the other, that if they met they would fit in all their indentures, so as to leave no space void; from which we are rather inclined to conclude, that it has been formed by some violent convulsion of nature.

In comparing the two, although we find in the bridge in Virginia, the same quality of rock on both sides, and with the bridge itself, we do not find the protuberances on the one side answering to cavities on the other; if any such have been, the protuberances must have been effaced by time.

Before we proceed to make observations on the different forms already described, and the principles of their construction; we will lay down a theory founded upon approved philosophical principles; and we will endeavour to simplify our expression, so as to be understood by the mechanic, and, we hope, not despised by the philosopher.

The bridges we have described, are formed of arches of different curves; that of the circle and ellipse being the most common. These are formed of certain materials, so joined together, as to retain the curvilinear form of the original curve from which it is taken, whether circle, ellipse, or other curve; and as it is only a part of the curve, and composed of different materials, the extremities of the arch must have some sufficient support to retain the materials in the form of the intended curve. Although authors that have treated upon this subject, have not agreed upon fixed principles to ascertain the strength of these abutments or supports; yet all agree, that they must be sufficient to sustain the impressing force.

It is an universal principle in nature, that all bodies, on or near the surface of the earth, tend by the laws of gravity towards its centre, unless prevented by some force, that has the power to resist them, or change their direction. If we attend particularly to one body, having all its parts tending equally to the centre of the earth, and supported in that position, it will retain its position. If we suppose another body to press upon it, or cause change the body to press upon its support, or force away its support, in whole, or in such part, that a greater part of the body has a tendency to the centre, more than it has to its support; it will fall toward the earth in a direction to its centre.

Let A, B, fig. 5. Plate CXXIX. be two supports, suppose one foot square, of height 5 feet, or any other height less or more, standing perpendicular; and let a piece of the same dimensions, wood or stone, of three feet in length, be placed across in equilibrium; the perpendicular support is not pressed by this weight, but in the perpendicular direction; if a second piece of five feet is laid upon the other, in the same way, projecting two feet over on each side, they will still remain in equilibrio, and so on till the two bodies upon the two uprights meet one another, as in the figure, the planks or logs DD meet in E, without affecting the supports, except in the perpendicular direction; the equilibrium being preserved, no force imposed will make the supports give way, that will not separate the particles of matter, or break its contexture; neither will any weight push it over, that is not greater than the perpendicular pressure; for action and reaction are equal, acting in contrary directions. The force, then, that it will support before it yield, to press upon its support, is equal to the number of square feet that rests on the surface, and turns upon the angular point E. Let us suppose this operation continued the whole length of the bridge, and the whole level blocks in contact with one another, received by the abutments, or landstools, the bridge will support any weight that the strength of these blocks could sustain, and the abutments react upon; this would be a bridge formed of the Egyptian arches, not very elegant, but of great strength, as each block is supported at one foot distance; and the upper ones in contact with one another, only react by their own strength, at one foot distance without support; and by the reaction of the land abutments, cannot yield to give any lateral pressure upon the pier.

Let us now suppose a semicircle or any other arch described, the superfluous matter is carried off, and the arch remains in strength and beauty. Now instead of balancing the blocks by counterpoise on each side of the support, let this be taken off, and applied as weights above the pier, being equal in weight to those that form the arch, the equilibrium is still preserved, without any lateral pressure. This may be illustrated by an example. Let A, B, C, D, fig. 6, be four blocks, the first A, a square, which represents the base; the second B, a pentagon, inscribed in a circle of the same radius about which the square is described, placed with one of its angles to the perpendicular edge of the square, a perpendicular or plumb falls within the base, it is therefore firmly supported; let the hexagon C, be placed upon one of the sides of the pentagon, the two angles likewise coinciding; in this the perpendicular falls over the base, it will therefore be no longer firmly supported, but will fall, if attached to the pentagon, would carry a part of it along with it, except prevented by friction and consistency of the texture of the materials. In this situation let it be retained, till a pentagon is placed on the opposite side of the hexagon; the plumbine or perpendicular, as it now stands, falls within the base, and will be again supported so as to carry an additional block raised upon it, or require a considerable force to pull it over to that side, to which the hexagon was inclined to fall. The conclusion we would draw from the above, is that if the column or pier is of such dimensions at top, where the spring of the arch rises, that a weight of such materials as the arch is composed of can be raised, not exceeding the height of the vertex or crown of the arch, as will counterpoise that part of the arch, that produces the lateral pressure; then a
pier of such dimension is of sufficient strength to support such an arch, till the other arches are thrown, and the whole made to abut upon columns that will counterpoise the whole with any incumbent weight proposed.

The manner we would recommend to apply the arches to their pier, and to one another, is that they abut upon one another, as in fig. 7, 8, and 9. In fig. 10, Plate CXXX. we take a semicircular arch of 75 feet span; our arch-stone we think of a sufficient strength at three feet length; our pier six feet, equal to the two arch stones. As every arch can be raised to a certain height, without the support of the centre arch; allowed, to the 30th degree or one-third of the distance to the crown of the arch. We have divided the quadrant or half of the arch into 83 equal parts; and where more than half of the arch-stone falls over the perpendicular, we consider as the height, not to be exceeded without support: the weight of matter upon the pier to this height, we compare with the weight of matter from that contained in the arch-stones; or, rather, what breadth of pier will contain a quantity of matter that will counterpoise the weight of the arch-stones, of an arch, of given span, and length of arch-stones to the crown of the arch.

In investigations of this kind, we find recourse is had to trigonometrical calculations, and to algebraic and fluxionary equations. Foreign writers, as Belidor, give us rules, collected from such constructions as suited their taste; and most of the algebraic and fluxionary equations that we have investigated, take their data from some bridge, the construction of which pleases them, and bring their result agreeable thereto; and with some degree of confidence tell us that they are right, as it has agreed to the construction of so able an engineer. If we allow ourselves to follow this method, we can never expect to make improvements.

A late writer (Atwood) has treated learnedly, and we think judiciously, upon this subject; he considers each of the arch-stones, as a wedge abutting upon another, and the whole upon the land-stool, or upon the pier of the particular arch, and is resisted by a force or pressure, with a force which he expresses by a line placed at right angles to an arch-stone, at that part of the arch which would begin to rest upon the centre arch, which here he calls BS, but says, that the length of the line or the point S is not determined: this, we hope, will be found to be determined in the result of our theory.

We hope our readers will excuse us in departing from the method of investigation formerly mentioned; and, in following that plain geometrical method, which every mechanic is able to understand, and judge of; and which, at the same time, we flatter ourselves the learned will not find cause to challenge.

The thickness of our pier we have taken is, A B, fig. 10, six feet; each division of our arch is equal to two feet on the outside, and tending to the centre of the circle as a wedge: the inside measures 1.8 feet; the mean is 1.9 X 3; the length of the stone is 4.7 feet of surface; we suppose it taken three feet into the arch, equal 17.6 solid feet, in each of our divisions; the scale half an inch to 10 feet. The solid measure of the whole, is easily found; the 30° is at α, but the arch will rise without the support of the centre arch to c. Now, the number of divisions from α to the centre of the arch, is 32.2: 17.1 solid feet each, is 374.75 solid feet; our pier of six feet contains to the height a, the surface A B d α at a mean, taken as in the table, a is 72.75, being each two feet, is 145.5 superficial feet, × 3, the assumed depth is 435.5 solid feet, being fully in equilibrium with the arch-stones; but, as the arch will rise to c, there is an additional weight of 229.5 solid feet, which will be allowed more than a counterpoise to the pressure of the arch, without any aid from the pier, which has only the perpendicular pressure to support. The counterpoise is, therefore, by this ascertained, which will support this arch till the other arches are raised; which, as they all abut upon one another, the land-stool must be made of such strength as to counterpoise the whole; which is ascertained upon the same principles, and leaves no stress upon the piers but the perpendicular pressure alone. This pier is scarce one-twelfth part of the opening, by which, the river having so few a passage, will affect the bridge by pressure but very little; but this will fall in our way to consider afterwards. Fig. 7, is a perspective view of one arch of a bridge, on this construction, with part of an adjoining arch on each side.

When the situation of the river, or other circumstances, or when a segment of a circle is made choice of for the ease of the passage, or economy in the use of materials and mason work; or the base of the arch, or surface of the pier, will not admit of mason work to bear upon the spring of the arch, of such weight as to produce a sufficient counterpoise to the arch-stones that produce the lateral pressure, the pier must be made of greater breadth, as, if much flatter than fig. 8, the pier, in that case, ought to have been of the breadth as represented by the dotted line a b, a b; but this is ascertained in projecting the plan. Fig. 8, is a perspective view of one arch, with its adjoining arch, and part of the abutment on the land side, which will be considered afterwards. At the same time, as the fall of an arch is attended with very great loss, both in money, time, and loss of materials; which might prove hurtful to many ingenious undertakers of such works; boundary of precaution, if they shall doubt that the slenderess of our pier will support the arch till the others are thrown, for none can doubt them afterwards, beams may be made to abut upon another, and upon each pier, as in fig. 8: this is no loss of time or materials, as it will supply, in part, the supports of the centre arches, upon which the arch of the bridge is raised; and it is a precaution used, upon a smaller scale, when in front-walls of houses; the whole is often supported upon arcades of shop-doors and windows, many of their piers not exceeding nine or ten inches: a cross-bar or piece of wood is laid across, to prevent their yielding or losing the perpendicular, till the whole is completed. Now, the pressure upon the arch is not so great as most writers have assigned to it; that is, the whole incumbent weight of all the materials above it, together with that of passage. The art of masonry is such, that the beds or rows of stones so bind, one with another, that each makes a pressure on its contiguous part, so as to form an arch of themselves. We see in well-built walls a vast excavation made
Bridge.

made in the lower part, or in the middle of the wall, and the upper part of the building not affected. In like manner, the arches being all raised to the height that they can be, without support of the centre arch, they are completed and filled up to the level of the keystone, but not higher. The arch is properly secured, if the principles of equilibrium, in filling up, are properly attended to; but if one side is overloaded either in filling up, or in building, it must twist the arch, and if not instantly to break it, must tend to an uncertainty as to its durability. For although some have concluded, they say, from a result of their calculation, that the mathematical theory of equilibrated arches is of little value to the engineer; we do not hesitate to assert, that, if preserving the equilibrium, both in raising the arch, and filling up the haunches, is not attended to, we would not assert it to be in favour of its durability; and we know of no principles in philosophy that will support the opinion, that these can be neglected with propriety; neither do we think such a practice will be readily adopted by a skilful engineer.

Among the various writers upon bridges, some prefer the circular arch, both for strength and elegance. Others contend, that it is exceeded in both by the elliptic arch. Others will give the preference to the catenarian arch; and we are told, that the excellence lies on the side of the parabolic curve. We do not think it incumbent on us to combat each of these, neither do we think our readers would thank us for so doing. It may, however, be expected that we should not pass them entirely unnoticed. In the first place, then, we are of opinion, that the arch that bears most equally throughout the whole, one part upon another, has the best claim to strength. Our reason is, which we illustrate thus, let \( AB, AC \), be placed as in fig. 11. Suppose a weight placed upon them in such manner as to press equally upon the point \( A \), the two bodies \( AB, AC \), will in that point support the greatest weight, if the same weight is laid in the middle, between \( A \) and \( C \), or \( A \) and \( B \), they will each yield to the pressure, and the weight is not equally divided between them. But if these bodies are so placed, that in every position on which a weight can be applied to them, the weight being equally supported by both, this being the case with the circle (fig. 7.) inclines us to give it the preference as to strength. As to elegance, we know, that regularity is a qualification that suits every taste: and here the circle cannot be outvied. It is not, however, without its disadvantages; with regard to expediency, the semicircular arch is sometimes too high for the situation of some bridges. In this case, the elliptic arch (fig. 9.), formed upon the greater axis, offers itself in point of expediency, and refuses to yield in point of elegance. It is bold enough to assert, that if strength of materials forms its composition, and be properly abutted, it will not yield, in point of strength, in any exigence to which it may be opposed. In point of economy, it claims a preference to the semicircular arch; for our part, we are inclined to own the reasonableness of its claim, and to give it a preference to the segment of a circle (fig. 8.), which might perhaps be preferred in point of expediency, as it can be rendered as flat as the ellipse; but its flatness we rather consider as a disadvantage, as in the rise of the water, it is apt to choke its course and overturn it; whereas, the ellipse being nearly formed of two segments of circles of different radii, the smaller arches at its extremity rise more in the perpendicular, and give more scope to the current of the water; and likewise, it does not require a stronger pier than a semicircle of the same diameter. The segment, on the other hand, if flat, requires a stronger pier, and therefore tends more to choke the current of the river, which ought always to be avoided when it can be done.

In the catenarian arch, as every one will observe, when a chain or rope is fixed at each end, and allowed to fall down in the middle, the curvature is not equal throughout; and we therefore cannot think it entitled to equal claim with the circle or ellipse. The same objection may, with equal propriety, be made to the parabola. This curve, near its vertex, has nearly the property of a circle; but every one who knows a parabola, is convinced how much it deviates from it afterwards; although everywhere it retains the property of its own curve.

We now take a review of the different bridges we have mentioned, and make some observations upon them. In general, we remark, that all the writers upon this art have formed the abutments of each particular arch, to be placed in the pier below the spring of the arch; on which account many have constructed their piers of greater strength than necessary. The first we mentioned, was that by the Roman emperor Trajan, over the Danube: the arches being broken down by the emperor to impede the passage of his invaders, we cannot, with certainty, compute the lateral pressure upon the piers; but their height being 50 feet from the foundation, must have considerable strength to react upon an arch of 170 feet span; which would act upon this column as upon a lever of 150 feet length. We find this pier is 60 feet of thickness, more than one-third of the opening; one-fifth would have been 34 feet: we cannot think the arch was acted without principles; but we are not unacquainted with the subject, for us to conjecture what those were. If we had been informed of the figure of the arch, we might have come near; it probably was a semicircle, and if so, perhaps 20 feet thick of piers, even at that height, might have been of sufficient strength.

The next we have mentioned, are those formed upon the principles, or rather by the rules, given by Belidor; for, although he has not condescended to lay down his principles, it does not appear that he has proceeded without principles. Upon investigating what must be the breadth of a pier that will form an abutment to an arch of 75 feet span, we have formerly stated that this arch can be raised to \( e \) (fig. 10.), without applying the centre arch: from the centre of this arch-stone we raised a perpendicular \( p \), and from the lower part of the arch-stone drew the line \( f g \) parallel to it: this line \( f g \) we supposed to cut the centre of the pier in \( g \). Suppose him to have allowed a part of the pier equal to the length of his arch-stone, which we have in this figure taken three feet, one twentieth of the opening nearly, viz. \( h \), \( A \), for the perpendicular support of the arch-stones to \( e \). We find \( h g \) measures five and a half feet, we therefore extend \( h g \) to \( l \), which is 11 feet, and \( A \) 14 feet for the breadth of
Bridge. of the pier: in place of taking the whole width of the bridge, we take only three feet as formerly. The number of equal divisions from c to the vertex or middle of the keystone, is 20°. Each of the equal divisions at three breadth contains 17.5 solid feet, as by our former measure, which multiplied by 204 is 3,505.55 solid feet. The pier, 14 feet breadth by six in height, viz. the height he supposes his pier, and three deep, is 252 solid feet; the solid building efgm being supported in the perpendicular, he considers as a part of his abutment, of which ef measures 26 feet, by ef, and by 3 in depth, is 234+253=486 solid feet, to counterpoise 350.55 solid feet, which he considers more than sufficient. Suppose then the pier is 13 feet, at the above height it contains 234 feet + 234 as before =468 feet, which to account for accidents, and from his practice and observation gives his rule, which we suppose is fully accounted for. If the height of the pier is more than six feet, he would add to the breadth of his pier in proportion, which he does not take notice of, but asserts, that when the span is above 80, that one-sixth of the opening is sufficient in strength to resist every exigence; but if the arch is a segment, the same rule we have given will find the breadth of the pier, but would give it more than 14 feet. Belidor confines his rule to the semicircular arch. We have already mentioned what we think a proper limitation to his rule for taking the 24th part of the arch for the length of his arch-stone.

London bridge was executed in stone, under the direction of Peter of Colechurch, a priest; it was 33 years in building, being begun by King Henry in 1176, and finished by King John in 1209. The piers are 18 in number, from 25 to 34 feet thick. In what manner this priest executed so great an undertaking at that time, and in these days of ignorance, we are not informed; he has, however, given it a superabundant strength of pier, and choked up the course of the river from 900 feet to 194: but as this objection is about to be removed, we need say no more about it.

Westminster bridge is generally allowed to be an elegant and noble fabric. The height of the pier is only eight feet from the bed of the river; the thickness, for a sufficient counterpoise to the arch, could not exceed 14 feet: the architect, Mr Labley, has given it 27. His arches are semicircular, the middle 76 feet span; his ascent one-twentieth part of the half width of the river, which is here 1223 feet, one-half is 621.15, the rise 32 feet in that extent.

The next we notice is Blackfriars (fig. 12), executed by Mr Myline, whose ingenuity and ability as an engineer are universally acknowledged. The middle arch is a span of 100 feet, of the elliptic form; by which, with other advantages, the passage is rendered more commodious, the ascent being more easy; the quickness of the rise of the arches of the small circles, with the flatness of the large circle, are particularly well adapted to give a more easy passage to the river, rising either from a tide or other accidental causes, renders the choice of the elliptic arch here very judicious: we are likewise much pleased with the ingenuity of the inverted arch; it effectually prevents any rising of the rubble work that fills the interstices between the arches, by any pressure whatever; as it abuts upon the arch-stones at E, it presses their joints upon one another, in a more effectual manner than perhaps could be accomplished by any other method: but the effect produced by it, and in which we think its excellency mostly consists, is, that it makes the arches, at that point, where they produce the greatest lateral pressure, to abut upon one another, and thus take off the lateral pressure from the pier. It does not a little surprise us, that Mr Myline did not avail himself of this, by which his pier would have been at least one-half thinner: in place of this, he has made it at the extremity of the greater axis, A b, 19 feet, and increased it in a circular form to 22 feet; experience having proved, that when the resisting force is placed in the pier, one-fifth of the opening is more than sufficient for the resisting force; why he, after taking off the resisting force, should contract the course of the river from 100 feet to 70, when 19 feet, as has been shewn, by many experiments in practice, was more than sufficient, although he had not taken off this resistance, by making the two arches abut upon one another. The depth of the water, at ordinary tides, is not less than 16 feet, and by the principles of hydrostatics, the pressing force of a solid foot of water, at that depth, is equal to 8500 lb. X 35 the number of feet contracted, is 255,000 lb. or 131 tons upon the found of his pier, more than necessary; and which he might have avoided. We hope we shall be excused for these remarks, as a work of this kind is executed for general use, and to point out what might escape the most eminent, and far superior to what we can pretend to. We must likewise point out, under the same apology, and at the same time apologize for our own ignorance, in not understanding the significations of the word joggle, as here applied; we understand the Scots phrase to joggle, which is loose and infirm in position: when a mason is bedding a stone, if it is too heavy for trial by his arms, he stands upon it with his feet; if he do not find it firm, he says it is not firm, it joggles in such a position, and we think the Teutonic favours this Scoticism.

Now, how a phrase that signifies infirm, should be used to give firmness, may be owing to our ignorance of that language that gives it such a significiation; but this does not at all derogate from the method. It is, beyond doubt, that each stone is so bound with another by it, that they are rendered as one stone; and that one cannot be forced from its place without carrying the whole along with it, or pulling the stone aster, which no weight that can come upon a bridge would do.

That the above may be the better understood, we have given a drawing of the middle arch, and part of the adjoining arches: AB, fig. 12, is the length of the greater axis of the ellipse, and span of the arch 100 feet; C the centre of the ellipse; c the centre of the circle, that describes the flat part of the arch: f, f, represent the two foci, or in this, the centres of the lesser circles; D, D the inverted arches abutting upon the arch-stones E, E; V the vertex or crown of the arch; F, F the thickness of the pier at the bed of the river: A b d the thickness of the pier at the extremity of the greater axis. We have put on the bolt in one of the arches, done with the Kentish ragstone; the bolts about a cubic foot sunk half-way into each stone; the stones in the pier are bolted with firm
Bridge. oak, of a solid foot, dovetailed into each stone, which renders the whole pier firm as if one stone.

What has been said on the breadth of piers, renders any observations on the bridge over the Trent at Burton, or the single arch over the Tave in Glamorganshire, unnecessary; the abutments of the last being on land, the method of obtaining their strength will be pointed out when we speak of the abutments of iron bridges, of which there are now several in England.

The first, as described in the Philosophical Magazine, over the Severn near Coalbrookdale in Shropshire, was built by Mr. Abraham Darley; the iron work was cast at Coalbrookdale in 1779. It consists of one arch of 100 feet, six inches of span; rises to the height of 45 feet; consists of ribs, each cast in two pieces, secured at the crown by a cast iron key-plate and connected horizontally and vertically, by cast iron braces formed with dovetails and forelocks; the ribs are covered with cast iron plates; the railing is of iron; the weight of the whole is 387 ¼ tons. The iron work executed by Mess. Wilkinson and Darley, iron-masters, of which they have great credit, being the first instance of such material being applied in the bridge way. In 1801 it appeared as perfect as when put up, except what was owing to the failure in the stone abutments, which had occasioned some cracks in some of the small pieces.

The second bridge of this kind was built over the same river at Buildwas, at the expense of the county of Salop, agreeable to a plan under the direction of Mr. Telford, surveyor of the public works in that county; the iron work was cast at Coalbrookdale in 1795, and 1796: it consists of an arch of 120 feet span; the rise of the arch 27 feet from the spring to the soffit. The situation of the road here rendered it necessary to be kept low; the outside ribs are made to go up as high as the tops of the railing, and are connected with the ribs that bear the covering plates by bars of iron cast with deep flanges close to each other, and form a arch of themselves; so that the bridge is made upon the whole, compact and firm; the weight of the whole is 173 tons. Some smaller arches and an aqueduct at Longdon, have been made under Mr. Telford's direction in the same county.

The next upon a large scale made of iron, is that over the river Wear at Monk-Wearmouth, in the county of Durham. This bridge, fig. 13, is the segment of a circle, whose radius is 443 or 444 feet; the span of the arch, or length of the bridge, is 236 feet; the height of its vertex above the spring of the arch is 34 feet; and height above the surface of the water 60 feet, so that vessels of considerable burden may pass below it without interruption. The width of the bridge or breadth of the road-way is 32 feet; it is formed of six ribs, placed about five feet distant from one another; each rib consists of 125 blocks of cast iron, five feet in height, and two feet broad at the middle; the lines drawn from this to the centre of curvature determine the length of the block above and below, and a circle described with the radius of curvature gives the convexity of the upper part of the block, and the concavity in the lower, agreeable to the curvature of the whole arch of the bridge; the parts of the block are represented in fig. 14, upon a large scale.

In each of the three longitudinal parts of the block there is a square groove one inch deep, into which is fitted a bar of wrought iron of the same dimensions with the groove, into which it is inserted, marked $a, b, c$, by which the blocks are joined together to form the rib. These ribs are connected laterally by a hollow bar of cast iron, fig. 15, about four inches diameter, and five feet long, with flanges, through which iron bolts are made to pass it, and the sides of the ribs fitted with screws or forelocks; two of the blocks are joined by the bars of wrought iron, and connected with a bar of another rib by the iron hollow bar, as represented in fig. 16. All the ribs joined together, and connected in the same manner as in fig. 16, complete the arch of the bridge. To support the beams that form the road-way, circular pieces are formed of cast iron, to abut upon another at their horizontal diameter, the beams that form the road-way resting upon the circular pieces at the vertical diameter, which gives a firmness to these supports, that no weight coming upon the bridge can injure. The beams or planks are then covered with plates of iron, and such materials as are reckoned to be best adapted to form the road, and prevent water passing through to the injury of the bridge; we have therefore no doubt of the strength of the circular supports, and this figure is always pleasing to the eye; but perhaps in point of economy the form of a support we have given in fig. 13, and added a short description, might be sufficiently strong, and we think contains less metal, which will produce a saving. As we have at the end of this paragraph given a description of the parts agreeable to the figure, we only add, that it was constructed under the direction, and chiefly at the expense of Rowland Burdon, Esq., then M. P. for that county; it was cast at the manufactary of Mess. Walker of Rotheram in Yorkshire, and does honour to the projector and iron-masters; it is nearly double the span of that at Buildwas, and more than double the middle arch of Blackfriars Bridge. We have seen what is called a perspective drawing of this bridge, but as it is in many instances faulty, and in some instances ridiculous, we would not wish such a piece to appear in our work; in the back ground drawing, the houses vanish in the direction quite opposite to the point of sight, and the view which is allowed to be from below, the eye is made to see quite through between the arch, and the road way at both ends of the bridge, although at the height of 50 feet, and distance of 236. Our drawing we describe thus: A, fig. 14, is one of the blocks; $b, b, b$, are bars of wrought iron sunk into their grooves, B, fig. 15, is the hollow cross bar which joins the ribs in the manner as represented fig. 16, which shews two pieces joined, and bolted by the wrought iron bars, and the bolts represented at 1, 2, 3, and the two ribs joined by B, B, B, in which manner the whole bridge is connected; the front of the ribs in length is represented on fig. 9, by $a, a, a, a$, the other ribs by the different lines, which appear in the perspective; E is an arch, through which a road passes, and stretches along behind the three houses by the side of the hill. The blocks placed in a vertical position, in the same manner as in the front of the bridge, are to be considered as curvilinear, but the great extent of the radius could not be conveniently applied, and at that small distance would differ little from a right line when viewed separately. Fig. 17 is the support we proposed in point of:
Bridge.

of economy to supply the place of the circles, the branches resting and coinciding with the curvature of the arch, and all abutting with one another form a con-
verging arch, by which the blocks perhaps might be thought of sufficient strength, although somewhat less than five feet in height, the upright, of such height
along, as the beams of the road-way might rest at the distance of five feet, or thereby, from one another.

Our only doubt of the durability of iron bridges is,
that the water being blown in by storms, rests on the
flats of the iron, and tends to corrode it and waste its
parts; and what will be of the worst consequence, find
its way into the joints. Perhaps if between these, thin
plates of lead were placed, the two pieces might have
their joints closed, by abutting upon the lead, and the
same precaution being taken with the wrought iron,
where inserted into the grooves of the cast metal, the
water would be prevented from entering, or settling in
the interstice.

Two other bridges we find described, for both of
which patents are obtained, the one by Mr. Jordan for
a suspended bridge, inrolled in December 1756, the
patent obtained, and description January 1757, which
exhibits the principle of the invention with its advan-
tages, and a perspective drawing. It consists of two
suspended ribs, one on each side of the bridge, which
are to extend over the whole breadth of the river: if
this distance is thought to be too great for one stretch,
it is proposed to raise two other ribs on the opposite
side, to meet and abut upon one another; on this ac-
count a pier is required, upon which the two abutting
ends may rest, and as it bears only the perpendicular
pressure, it may be so thin, as to make little obstruction
to the current of the river. The suspending arch being
erected, is to be understood to be of such strength as
to bear the bridge suspended to it from the arch; bars
descend on each side to which cross beams or bars of
iron are fixed on each side of the bridge at proper
distances; along these others are extended in a direction
across the river, and covered in such a way as to form
a passage for carriages and passengers of every descrip-
tion. It has this particular advantage, that it admits
of a drawbridge.

The advantages proposed by the patentee are: That
the span may be greater by this than by other con-
structions, and that the distances between the abuttures
and intermediate pier, may be greater than heretofore,
or if more piers are requisite, between pier and pier:
more particularly, 1. A bridge of this construction re-
quires less time to execute, it not being subject to the
interruption of tides. 2. That it is done at less ex-
pense. 3. The ascent is easier. 4. They are not so li-
able to decay. 5. They may be repaired with more
certainty and facility, and at less expense. 6. They
will not be subject to the accidents which have de-
stroyed others. 7. They may be erected at any extent,
in regard to length and width. 8. They can be sec-
cured so as to form one entire piece. 9. They can be
preserved in their parts from decays of an accidental
nature, and assisted in their durability, by the applica-
tion of different preservatives. 10. And lastly, It is
clearly evident on inspection of the figure, that bridges
of this construction, whatever their length be, are in no
respect subject to the continual accidents which arise to
bridges on the common construction, from currents,
tides, swells, inundations, &c. &c.

In this bridge, there is much ingenuity displayed,
and very considerable advantages attached to the use
of it; as it is a level, the passage over it is easy; it
being well adapted for a draw-bridge where requisite,
renders it worthy of attention, and in several situations
it might be advisable to adopt it; but at the same
time, we are not certain, that so many advantages would
accrue from the use of it, as is proposed by the paten-
tee; for instance the suspending arch must be raised by
scaffolding as well as other arches; and this scaffolding,
we apprehend, must be preserved till the whole of the
bridge is finished. On the other hand, if piers are to
be raised, they may be slender, having only the perpen-
dicular weight to sustain, and will on that account be
little interruption to the course of the river.

The other patent is obtained by Mr. John Nash, ar-
chitect, Dover-street, London, for his invention of an
iron bridge, Feb. 7. 1797, on a new and improved con-
struction. What the patentee here proposes, is that in
forming the arches and piers for a bridge, in place of arch-
stones, that boxes of cast iron, or plate iron, be formed to
the size and figure of the arch stone; and that these boxes
be cast with a bottom, or that the bottom may be put
in before using. The piers are raised by like boxes,
the first row of boxes being laid for the found of the
bridge, and fixed to the bed of the river by piles
driven into the ground; the boxes are then filled with
clay, sand, sand mixed with lime, stone of any kind,
small or great, brick, with or without lime; being thus
filled, another row of boxes is placed, and bedded as
if stone; filled up in the same manner till prepared for
throwing the arch. The arch-boxes being prepared
as already mentioned, are placed in the same manner
as arch-stones are placed in an arch; and being filled
as before directed, the arch is completed and formed of
solid materials cased with iron; and that iron may
not abut on iron, he proposes plates of lead laid between
each box, and in this manner the bridge is finished,
forming one solid mass cased with iron.

In some parts of this, and other countries, the situa-
tion is such, that neither stone nor lime can be procured,
but at an enormous expense; in such a situation the in-
vention would be meritorious; as a bridge could be
erected forming a convenient passage, the boxes being
filled with such earthy or stony materials as the place
could supply, and if filled with small or round stones,
the interstices might be filled with mortar, to ren-
der them solid. In some places so situated, that al-
though stone is to be got in quantity and quality suffi-
cient, yet lime cannot easily be procured, the inven-
tion might succeed; but we suppose that when both
stone and lime can be procured, few would think of
casing it with iron, which is less durable than stone,
when constantly exposed to the air, in wet and dry.
A body of solid iron is very different from a thin
plate, exposed on both sides to materials different from
itself.

We come now to the description of the greatest un-
tertaking of this kind, that ever graced the British
annals, or was accomplished in Europe or the world,
that we have accounts of, except in China, as former-
ly mentioned. The London Bridge, which, though
crassly
Bridge, clumsily executed, and with no great judgment, has performed its service faithfully for near 600 years; but on account of the advances in trade, and necessary improvements, it must now be superseded by this noble fabric, that will even dazzle the eyes of the enlightened world.

This interesting project has so far engaged the attention of the legislature, that a select committee has been appointed of such members as were no ways concerned in any of the plans brought forward; they have made three valuable reports, that respecting this bridge being contained in the third report, viz. the rebuilding of London bridge, by which colliers, and coasting vessels, and all vessels of light burdens, are to be admitted to pass the new London bridge, and to ship and discharge goods immediately at wharfs, and warehouses, to be constructed along the banks of the river, and opposite to the centre of the city; for which purpose this new bridge is to be formed of cast iron 65 feet high, clear above high water, with inclined planes connecting it with the present streets, and such other improvements as may grow out of this alteration. The bed of the river is to be deepened, so as to admit ships of 200 tons lying aloft at low water; and that no encroachment may be made on the property of those connected with the shore, it is proposed to contract the course of the river to 600 feet, according to Mr Jesson's report, by which room will be procured for the inclined plane, or wharfs and warehouses. The plan of the bridge is projected by Messrs Telford and Douglas; the span 600 feet, equal to the width of the river when contracted, which is now accomplished, and we understand the plan is far advanced in the execution; but a plan of so great extent must be subject to many unavoidable interruptions.

A short account of the plan of the bridge will not be unacceptable to our readers, as it will enable them to form a more perfect judgment of this magnificent structure. The whole is of cast iron, which is less liable to corrode than hammered iron; the ribs are cast in large portions, as can conveniently be moulded; they are connected together by cross and diagonal tie-braces, in such a manner, that any of the pieces of the ribs or braces can be taken out, and replaced, without injuring the whole, or interrupting the passage, thus the bridge can be kept in repair with ease, and convenience; all the frames are so connected vertically and horizontally, from the soffit of the arch to the road way, that the whole will act as one solid frame; and are so disposed from the middle of the arch, to the abutment, as to give a greater width to the bridge at entrance from the shore, from the different inclined planes, which enter to the bridge from three different directions, by which the public will be accommodated by three different bridges, as to entrance and egress.

The inclined planes which afford entrance to the bridge from the shore, and streets, will give ample room for warehouses, vaults, and other conveniences for depositing the goods, before they can be put on board, or after they are unshipped, till they can be conveniently carried off by the proprietors.

We come now, as proposed, to ascertain the strength of an abutment that will support, or counteract the pressure of any number of arches, abutting upon one another, in the manner we have proposed. Throw up the contents of the number of feet in all the arch-stones, from the one end of the bridge to the other; divide this between the two abutments, and find what base is necessary to contain a number of feet equal to the half, upon each pier from the spring of the arch to the height of the road-way, with one-fourth or one-third added, for allowance made for superincumbent weight upon the bridge, or any default in equilibration or other ways, care being always taken to secure a proper found to abutments. To find the abutments of iron bridges, being of so great extent as those now raised, or may be raised; take a base that will contain a weight of stone, equal to half the weight of the bridge from the spring to the road-way, with what is thought necessary to add for extra weight upon the bridge; here it is still more necessary to attend to a proper found, and further it may be necessary in large arches of stone, or an iron arch, to bolt the stones together according to Mr Mylne's method; as the great pressure is laid upon them before the cement has fastened the stones, this may be the cause of the failure in the abutments in the Shropshire bridges, and also of others. Such magnificent structures are worthy of every attention.

We have already treated, and we hope with satisfaction to our readers, of the principles upon which this theory is founded. We shall now adduce some undeniable instances, from the practice of modern and ancient architects. First, upon a small scale, we find vaults thrown, of 8, 10, or more feet, of arches abutting upon one another, upon thin walls; some not exceeding 10 inches, and 6 feet in height; and arches from 18 to 20 feet, the supporting wall from which the arch springs not exceeding 14 inches, the arches below the semicircle, the main abutments being of sufficient strength. Upon a larger scale, in the Gothic architecture, it has universally been practised to support the arches by abutments on the outside of the wall, but not without exception, and where this exception has been made, we find the arch equally well secured, and with much superior grandeur and elegance. In that superb structure of Gothic architecture, St Giles's Church, commonly known by the name of the High Church, Edinburgh, the stones are laid upon four columns, not stronger in proportion to its weight than the six feet pier we propose for an arch of 75 feet span; this centre part of the building is supported by the parts to the east and west, and by arcades, forming aisles in the other direction, none of them exceeding half its height or thereby; it rises above them with its majestic head, adorned with an imperial crown; and for supporting the stately arches that form this crown, no outside abutments are prepared; in this, the exception above referred to consists; it seems as if by the artist intended for the support of our theory. The weight is laid upon the shoulder at the spring of the arch, but with so much elegance as if it were only intended to form an ornamental part of the proposed figure; and under the appearance of an ornament concealing its real use. Some of the arch-stones likewise are projected outward, in the horizontal direction, ornamented at their extremity, and, at the same time that they enrich the crown with an additional ornament, they are a counterpoise to the arch at that place. To complete the deception,
That these arches are as well protected by the weight placed at the spring of the arch, as any that are supported by abutments, we need only as a proof produce their stability, in resisting, notwithstanding of its great height and exposure in situation, the boisterous effects of the elements, and the concussion arising from the vibration of large bells, suspended in it, and so frequently rung.

From the principles formerly laid down, and the authority now adduced in support of our theory, we hope that it has received ample confirmation. And we venture to conclude, that we have pointed out a method to every mason, and engineer, how in drawing his plan, he may be able to ascertain the weight to be laid on the shoulder of his arch, to counterpoise the weight, according to the intended span, and what thickness he has occasion to make his pier, without encumbering it, not only with useless matter, but what is materially injurious to the strength of his bridge, by choking the current, and causing it to act with ten times more force upon it, than it otherwise would do, as we have formerly shown.

We cannot pass the instance of ancient architecture last mentioned, without observing what attention has been paid to the principles of equilibration; and, although the architects have not communicated the principles upon which they executed their plans, they give evident proofs of their having followed some regular theory. Can we suppose that the projector of St Giles's church, Westminster abbey, and innumerable others, could have produced such elegant and well-proportioned structures accidentally, without a well regulated principle to act upon, or that the projector of this imperial crown we have been describing, had not thoroughly digested all its parts and ornaments, before it began to be erected. The ancient architects have, however, thought proper to leave to posterity to collect their principles from the works that have been executed. The moderns are actuated with more liberality of sentiment, in laying down their principles, as well as executing their projects, many of which will do honour to the age, and leave posterity both principles and examples to follow and improve upon.

After having treated upon the rise and progress of bridges, from what we know, from the most early periods, it may appear somewhat awkward that the foundation is neglected, and the manner of preparing; but when it is considered that this must be regulated by the superstructure to be raised upon it; that although it must be the first part with which we begin, it must be the last in the plan, and in founding a bridge there is indeed much to be considered; and as we propose to offer some methods for founding, which so far as we know have not appeared, we will be attentive to lay them before our readers, under the article Foundation.

We have described bridges of different materials, but have mentioned none of wood; this will come properly to offer itself under the article Centre, in which we intend to offer some concise and simple construction, and some forms of wooden bridges, that in point of elegance and strength, may not only vie with, but supersede the use of iron bridges in many instances.
The houses in general are well built and finished, and their rents as high as such houses would let for in London. The wharfs and quays are well defended from the sea, and very convenient. The harbour is secured from the north-east wind, which is the constant trade wind there; and Carlisle bay is capable of containing 500 ships, and is formed by Needham and Pelican points. But what renders Bridge-town the finest and most desirable town in the West Indies, is its security against any attacks from foreign enemies. It is defended on the westward by James-fort, which mounts 18 guns. Near this is Willoughby's fort, which is built upon a tongue of land running into the sea, and mounts 12 guns. Needham's fort has three batteries, and is mounted with 32 guns; and St Anne's fort, which is the strongest in the island, stands more within land. In short, according to Mr Douglas, there is all along the lee-shore, a breastwork and trench, in which, at proper places, were 29 forts and batteries, having 308 cannon mounted, while the windward shore is secured by high rocks, steep cliffs, and foul ground. Such was the state of the fortifications in 1717; but since that time they have been much strengthened. Bridgetown is destitute of few elegancies or conveniences of life that any city of Europe can afford. The church of St Michael exceeds many English cathedrals in beauty, largeness, and convenience; and has a fine organ, bells, and clock. Here also is a free-school for the instruction of poor boys, an hospital, and a college. The latter was erected by the society for propagating the Christian religion, in pursuance of the will of Colonel Christopher Codrington, who left about 2000l. a year for its endowment, for maintaining professors and scholars to study and practise divinity, surgery, and physic. See CODRINGTON.

BRIDGENORTH, a town of Shropshire in England, seated on the river Severn, which divides it into two parts; but they are united by a handsome stone bridge, and these are called the upper and the lower town. It is said to have been built by Ethelfleda, widow of Etheldred king of the Mercians, about the year 675. Robert de Belizma, son of Robert de Montgomery, built the castle, and maintained it against King Henry I. by which means it was forfeited to the crown, and remained so till the reign of Richard III. who gave it to John Sutton Lord Dudley. This town has undergone several sieges; and in the civil war it suffered very much, many fine buildings, and the whole town, being almost destroyed by fire, when Sir Lewis Kirke defended the citadel for King Charles. There are now no other remains of the castle than a small part of the towers, and a place yet called the castle, within the walls of the old one; within which stands one of the churches, dedicated to St Mary Magdalen, which was made a free chapel, and exempted from episcopal jurisdiction. The other church is at the north end of the town, on the highest part of the hill, near to whose churchyard stood a college, which was destroyed by fire when the civil wars were going on. Much of the church has been mentioned; which has been since rebuilt by the inhabitants. In this town is a free-school which sends and maintains eighteen scholars at the university of Oxford. On the west banks of the river are the remains of an ancient and magnificent convent, under which were several remarkable vaults and caverns running to a great length.
length. Part of the Cowgate street is a rock, rising perpendicularly, in which are several houses and tenements that form a very agreeable though grotesque group. In many other places there are also caves and dwellings for families in the rocks; and indeed the whole town has a very singular appearance. This town sends two members to parliament. Population 4179 in 1811. W. Long. 2. 30. N. Lat. 52. 40.

BRIDGEWATER, a town of Somersetshire in England, seated on the river Parrett, over which there is a stone-bridge, near which ships of 100 tons burden may ride with ease. It is a large well frequented place, with the title of a duchy, and sends two members to parliament. There are in it several large inns, and the market is well supplied with provisions. Population 4911 in 1811. W. Long. 3. 0. N. Lat. 51. 15.

BRIDLE, in the manage, a contrivance made of straps or thongs of leather and pieces of iron, in order to keep a horse in subjection and obedience.

The several parts of a bridle are the bit or snaffle; the head-stall, or leathern from the top of the head to the rings of the bit; the fillet, over the fore-head and under the fore-top; the throat-band, which buttons from the head-band under the throat; the reins, or long thongs of leather that come from the rings of the bit, and being cast over the horse's head, the rider holds them in his hand; the nose-band, going through loops at the back of the head-stall, and buckled under the cheecks; the trench; the cavesen; the martingale; and the check-halter.

Pliny assures us that one Pteleonius first invented the bridle and saddle; though Virgil ascribes the invention to the Lapithae, to whom he gives the epithet Pteleonius, from a mountain in Thessaly named Pteleonius, where horses were first begun to be broken.

The first horsemen, not being acquainted with the art of governing horses with bridles, managed them only with a rope or a switch, and the accent of the voice. This was the practice of the Numidians, Getulians, Libyans, and Massilians. The Roman youth also learned the art of fighting without bridles, which was an exercise or lesson in the manage; and hence it is, that on Trajan's column, soldiers are represented riding at full speed without any bridles on.

Saddling Bridle. See Blank.

BRIDINGTON, a sea-port town in the east riding of Yorkshire in England. It is seated on a creek of the sea near Flamborough-head, having a commodious quay for ships to take in their lading. It has a safe harbour, and contained 3741 inhabitants in 1811. It is more generally known by the name of Burton, as it gave title to an earl of that name, though the earldom is now extinct. E. Long. 0. 10. N. Lat. 54. 15.

BRIDON, or Snaffle, after the English fashion, is a very slender bit-mouth without any branches. The English make great use of them, and scarcely use any true bridles except in the service of war. The French call them bridons, by way of distinction from bridles.

BRIDPORT, a seaport town of Dorsetshire in England. It has a low situation between two rivers, which unite a little lower down, and fall into the sea. Its inhabitants amounted to 3665 in 1814. It sends two members to parliament, who are chosen by the inhabitants who are house-keepers. It is noted for making of ropes and cables for shipping; whence arises a proverb of a man that is hanged, that he is stabbed with a Bridport dogger. W. Long. 3. 0. N. Lat. 50. 40.

BRIEF, in Law, an abridgement of the client's case, made out for the instruction of counsel on a trial at law, wherein the case of the plaintiff, &c. is to be briefly but fully stated; the proofs must be placed in due order, and proper answers made to whatever may be objected to the client's case by the opposite side; and herein great care is requisite, that nothing be omitted, to endanger the case.

BRIEF, in Scots Law, a writ issued from the chancery, directed to any judge-ordinary, commanding and authorizing that judge to call a jury to inquire into the case mentioned in the brief, and upon their verdict to pronounce sentence.

Apostolical Briefs, letters which the pope dispatches to princes, or other magistrates, relating to any public affair.—These briefs are distinguished from bulls, in regard the latter are more ample, and always written on parchment, and sealed with lead or green wax; whereas briefs are very concise, written on paper, sealed with red wax, and with the seal of a fisherman, or St Peter in a boat.

BRIEG, a town of Silesia in Germany, situated in E. Long. 17. 35. N. Lat. 50. 40. It might have passed for a handsome place before the last siege; the castle, the college, and the arsenal, being very great ornaments, and most of the houses very well built. But the Prussians, who besieged it in 1744, threw 2172 bombs into it, and 4714 cannon balls, which reduced a great part of the town to ashes, and quite ruined a wing of the castle. It was obliged to surrender, after sustaining seven days continual fire. The Prussians, to whom this place was ceded by the peace, have augmented the fortifications, and built a new suburb.—The town stands upon the Oder; on the other side of which there are plenty of fallow-deer, and large forests of beech and oak trees. They have a yearly fair, at which they sell above 12,000 horned cattle. Since 1728, they have begun to manufacture fine cloth.

BRIEL, a maritime town of the United Provinces, and capital of the island of Voorn: It was one of the cautionary towns which were delivered into the hands of Queen Elizabeth, and garrisoned by the English during her reign and part of the next. The Dutch took it from the Spaniards in 1572, which was the foundation of their republic. It is seated at the mouth of the river Meuse, in E. Long. 3. 36. N. Lat. 52. 53.

BRIECSIA, a patriciate in the duchy of Lithuania, in Poland. The name given to it by some is Potenza. It is bounded on the north by Novograde, and Troki; on the west, by those of Biskoe and Lablin; on the south by that of Chelm and Upper Volhina; and on the east, by the territory of Raczicza. This province is of considerable extent from east to west, and is watered by the rivers Bug and Pripose: it is full of woods and marshes; and there are lakes that yield large quantities of fish, that are salted by the inhabitants, and sent into the neighbouring provinces.

BRIEUX, Seine, a town of France, in Upper Brittany, now called the department of the North Coast, with a bishop's see. It is seated in a bottom surrounded with mountains, which depreve it of a prospect of the sea, though it is not above a mile and a quarter from...
It took its name either from the Brigantium, the people brigantinus
inhabiting on it, or from the adjoining town. Now
the lake of Constance or Bodensee.

BRIGANTINUS Portus, in Ancient Geography, a port
of the Iberian Peninsula, so called from Flavium Brigan-
tium. Now El Puerto de la Ceruina, commonly the
Groyne.

BRIGG, by some called Clamford Bridges, a town
of England, in Lincolnshire, seated on the river Anakam.

BRIGGS, Henry, one of the greatest mathematici-
s in the 16th century, was born at Warley Wood in
the parish of Halifax in Yorkshire, in 1556. In
1592, he was made examiner and lecturer in mathem-
tics, and soon after reader of the physico lecture
founded by Dr Linacre. When Gresham college in
London was established, he was chosen the first pro-
fessor of geometry there, about the beginning of March
1596. In 1605, Mr Briggs contracted an intimacy
with the learned Mr James Usher, afterwards archbishop
of Armagh, which continued many years by letters,
two of which, written by our author, are yet extant.
In one of these letters, dated in August 1610, he tells
his friend he was engaged in the subject of eclipses;
and in the other, dated March 10, 1615, he acquaints
him with his being wholly employed about the noble
invention of logarithms, then lately discovered, in the
improvement of which he had afterwards a large share.

In 1599, he was made Savilian professor of geometry
at Oxford; and resigned his professorship of Gresham
college on the 31st of July 1620. Soon after his going
to Oxford, he was incorporated master of arts in that
university; where he continued till his death, which
happened on the 24th of January 1630. Dr Smith
gives him the character of a man of great probity; a
contemner of riches, and contented with his own station;
preferring a studious retirement to all the splendid
circumstances of life. He wrote, 1. Logarithmorum
chilias prima. 2. Arithmetica logarithmatica. 3. Tri-
gonometria Britannica. 4. A small tract on the north-
west passage; and some other works.

BRIGGS, William, an eminent physician in the
latter end of the 17th century, was the son of Augustin
Briggs, Esq. four times member for the city of Nor-
wich, where our author was born. He studied at the
university of Cambridge; and his genius leading him
to the study of physic, he travelled into France, where
he attended the lectures of the famous anatomist M.
Vieussens at Montpellier. After his return, he pub-
lished his Ophthalmographia in 1676. The year fol-
lowing he was created doctor of medicine at Cambridge,
and soon after was made fellow of the college of phys-
cians at London. In 1682, he quit his fellowship
ship to his brother; and the same year, his Theory of
Vision was published by Hook. The ensuing year he
sent to the Royal Society a continuation of that discourse,
which was published in their Transactions; and the same
year, he was by King Charles II. appointed physician
at St Thomas's hospital. In 1684, he communicated
to the Royal Society two remarkable cases relating to
vision, which were likewise printed in their Transac-
tions; and in 1685 he published a Latin version of his
Theory of Vision, at the desire of Mr Newton, after-
wards Sir Isaac, professor of mathematics at Cam-
bidge, with a recommendatory epistle from him pre-

...
BRIGG, a town of Lincolnshire, is situated near the Trent. He was afterwards made physician in ordinary to King William, and continued in great esteem for his skill in his profession till he died, September 4th 1704.

BRIGHTHELMSTONE, a sea-port town of Sussex in England. It is a large and populous town, has a pretty good harbour, and contained 12,012 inhabitants in 1811. W. Long. 0. 10. N. Lat. 50. 50. It was at this place King Charles II. embarked for France in 1657, after the battle of Worcester. It has lately been considerably extended and embellished, in consequence of its having become a place of great resort for sea-bathing. It is a favourite residence of the present king.

BRIGITTINS, or BRIDGETS, as properly Brigittina, a religious order, denominated from their founder, St. Bridget or Birgit, a Swedish lady in the 14th century; whom some represent as a queen; but Fabricius, on better grounds, as a princess, the daughter of King Birgenes, legislator of Upland, and famous for her revelations. The Brigittins are sometimes also called the Order of our Saviour; it being pretended, that Christ himself dictated the rules and constitutions observed by them to St. Bridget. In the main, the rule is that of St. Augustin; only with certain additions supposed to have been revealed by Christ, whence they also denominate it the Rule of our Saviour. — The first monastery of the Bridgetin order was erected by the foundress about the year 1344, in the diocese of Lincopon; on the model of which all the rest were formed. The constitution of these houses was very singular: though the order was principally intended for nuns, who were to pay a special homage to the holy Virgin, there are also many friars of it, to minister to them spiritual assistance. The number of nuns is fixed at 60 in each monastery, and that of friars to 18, answerable to the number of apostles, of whom St. Paul made the 18th; besides which there are to be four deacons, to represent the four doctors of the church, St. Ambrose, St. Augustin, St. Gregory, and St. Jerome; and eight lay-brothers; making together, says our author, the number of Christ's 72 disciples. — The order being instituted in honour of the Virgin, the direction is committed to an abbes, who is superior not only of the nuns, but also of the friars, who are obliged to obey her. Each house consists of two convents or monasteries, separately enclosed, but having one church in common; the nuns being placed above, and the friars on the ground. The Brigittins profess great mortification, poverty, and self-denial, as well as devotion; and they are not to possess anything they can call their own, not so much as a half-penny; nor even to touch money on any account. This order spread much through Sweden, Germany, the Netherlands, &c. In England we read but of one monastery of Brigittins, and this built by Henry V. in 1415, opposite to Richmond, now called Snow house; the ancient inhabitants of which, since the dissolution, are settled at Lisbon. These nuns were reckoned at 14951. per annum.

BRIGNOLES, a town of France, in the department of Var, formerly Provence, famous for its prunes. It is seated among mountains, in a pleasant country, 275 miles S. E. of Paris, and had 9000 inhabitants in 1811. E. Long. 6. 15. N. Lat. 43. 24.

BRIHUEGA, a town of Spain, in New Castle, where General Stanhope with the English army were taken prisoners, after they had separated themselves from that commanded by Count Staremburg. It is seated at the foot of the mountain Tajuna; 43 miles north-east of Madrid. W. Long. 3. 20. N. Lat. 42. 0. BRILL, MATTHEW and PAUL, natives of Antwerp, and good painters. — Matthew was born in the year 1550, and studied for the most part at Rome. He was eminent for his performances in history and landscape, in the galleries of the Vatican; where he was employed by Pope Gregory XIII. He died in 1594, being no more than 36 years of age. — Paul was born in 1554; followed his brother Matthew to Rome: painted several things in conjunction with him; and, after his decease, brought himself into credit by his landscapes, but especially by those which he composed in his latter time. The invention of them was more pleasing, pleasant, the disposition more noble, all the parts more con- stant and agreeable, and painted with a better gusto than his earlier productions in this way; which was owing to his having studied the manner of Hannibal Carrache, and copied some of Titian's works in the same kind. He was much in favour with Pope Sixtus V.; and for his successor Clement VIII. painted the famous piece, about 63 feet long, wherein the saint of that name is represented cast into the sea with an anchor' about his neck. He died at Rome the year 1626, aged 72.

BRILLIANT, in a general sense, something that has a bright and lucid appearance.

BRILLIANT, in the Manager. A brisk, high-mettled stately horse is called brilliant, as having a raised neck, a fine motion, and excellent haunches, upon which he rises, though ever so little put on.

BRILLIANTS, a name given to diamonds of the finest cut. See DIAMOND.

BRIM, denotes the outmost verge or edge, especially of round things. The brims of vessels are made to project a little over, to hinder liquors, in pouring out, from running down the side of the vessel. The brimming of vessels was contrived by the ancient potters, in imitation of the supercilium or drip of the cornices of columnns: it is done by turning over some of the double matter when the work is on the wheel.

BRIM, in country affairs. A sow is said to brim, or to go to brim, when she is ready to take the bear.

BRIMSTONE. See SULPHUR, CHEMISTRY INDEX.

BRIMSTONE. Metalls, Figures, &c. may be cast in the following manner: Melt half a pound of brimstone over a gentle fire: with this mix half a pound of fine vermilion; and, when you have cleared the tap, take it off the fire, stir it well together, and it will dissolve like oil: then cast it into the mould, which should be first anointed with oil. When cool, the figure may be taken out; and in case it should change to a yellowish colour, you need only wipe it over with aquafortis, and it will look like the finest coral.

BRIN, a strong town of Bohemia, in Moravia. It is pretty large, and well built: the assembly of the town states is held alternately there and at Olmout. The castle of Spilberg is on an eminence, out of the town, and is its principal defence. It was invested by the king of Prussia in 1742, but he was obliged to raise the siege. It is near the river Svat, in E. Long. 7. S. Lat. 49. 8.

BRINDISI, an ancient celebrated town of Italy, in
Brindisi. in the Terra d'Otranto, and kingdom of Naples, with an archbishop's see. Its walls are still of great extent, but the inhabited houses do not fill above half the enclosure. The streets are crooked and rough; the buildings poor and ruinous; no very remarkable church or edifice. The cathedral, dedicated to St Theodore, is a work of King Roger, but not equal in point of architecture to many churches founded by that monarch, who had a strong passion for building. Little remains of ancient Brundisium, except innumerable broken pillars fixed at the corners of streets to defend the houses from carts; fragments of coarse mosaic, the floors of former habitations; the column of the lighthouse; a large marble basen, into which the water runs from brazen heads of deer; some inscriptions, ruins of aqueducts, coins, and other small furniture of an antiquary's cabinet. Its castle, built by the emperor Frederick II. to protect the northern branches of the harbour is large and stately. Charles V. repaired it. The port is double, and the finest in the Adriatic. The outer part is formed by two promontories, which stretch off gradually from each other as they advance into the sea, leaving a very narrow channel at the base of the angle. The island of St Andrew, on which Alphonse I. built a fortress, lies between the capes, and secures the whole road from the fury of the waves. In this triangular space, large ships may ride at anchor. At the bottom of the bay the hills recede in a semicircular shape, to leave room for the inner haven; which, as it were, clasps the city in its arms, or rather encircles it, in the figure of a stag's head and horns. This form is said to have given rise to the name of Brundisium, which, in the old Messapian language, signifies the head of a deer. In ancient days, the communication between the two havens was marked by lights placed upon columns of the Corinthian order, standing on a raising ground, in a direct line with the channel.

Of these one remains entire upon its pedestal. Its capital is adorned with figures of Syrens and Tritons, intermingled with the acanthus leaf, and upon it a circular vase, which formerly held the fire. A modern inscription has been cut upon the plinth. Near it is another pedestal of similar dimensions, with one piece of the shaft lying on it. The space between these pillars answered to the entrance of the harbour.

"The whole kingdom of Naples (says Mr Swinburne) cannot show a more complete situation for trade than Brindisi. Here goodness of soil, depth of water, safety of anchorage, and a central position, are all united; yet it has neither commerce, husbandry, nor populousness. From the obstructions in the channel which communicates with the two havens, arises the tribe of evils that afflict and desolate this unhappy town. Julius Cæsar may be said to have begun its ruin, by attempting to black up Pompey's fleet. He drove piles into the neck of land between the two ridges of hills; threw in earth, trees, and ruins of houses; and had nearly accomplished the block when Pompey sailed out and escaped to Greece. In the 15th century, the prince of Taranto sunk some ships in the middle of the passage, to prevent the rival states from entering the port, and thereby provided a resting place for sea weeds and sand, which soon accumulated, choked up the mouth, and rendered it impracticable for any vessels whatever. In 1752 the evil was increased, so as to hinder even the waves from beating through; and all communication was cut off, except in violent easterly winds, or rainy seasons, when an extraordinary quantity of fresh water raises the level. From that period the port became a fetid green lake, full of infection and noxious insects; no fish but eels could live in it, nor any boats ply except canoes made of a single tree. They can hold but one person, and overset with the least irregularity of motion. The low grounds at each end were overflowed and converted into marshes, the vapours of which created every summer a real pestilence; and in the course of very few years, swept off or drove away the largest portion of the inhabitants. From the number of eighteen thousand, they were reduced in 1766 to that of five thousand livid wretches, tormented with agues and malignant fevers. In 1775 above fifteen hundred persons died during the autumn; a woeful change of climate! Thirty years ago, the air of Brindisi was esteemed so wholesome and balsamic, that the convents of Naples were wont to send their consumptive friars to this city for the recovery of their health. This state of misery and destruction induced the remaining citizens to apply for relief to Don Carlo Demarco, one of the king's ministers, and a native of Brindisi. In consequence of this application, Don Vito Caravelli was ordered to draw up plans, and fix upon the means of opening the port afresh: Don Andrea Pigonati was last year sent to execute his projects; and, by the help of machines and the labour of galley-slaves, has succeeded in some measure. The channel has been partly cleared, and has now two fathom of water. It can admit large boats, a great step towards the revival of trade; but what is of more immediate importance, it gives a free passage to the sea, which now rushes in with impetuosity, and runs out again at each tide; so that the water of the inner port is set in motion, and once more rendered wholesome. The canal or gut is to be seven hundred yards long, and drawn in a straight line from the column. At present its parapets are defended by piles and fascines; but if the original plan be pursued, stone piers will be erected on both sides. When the canal shall be scooped out to a proper depth, and its piers solidly established, vessels of any burden may once more enter this land-locked port, which affords room for a whole navy. Docks wet and dry may be dog, goods may be shipped at the quay, and convenient watering-places be made with great ease. If merchants should think it a place of rising trade, and worthy of their notice, there is no want of space in the town for any factory whatever. Circulation of cash would give vigour to husbandry, and provisions would soon abound in this market. The sands at the foot of the hills, which form the channel, are to be laid out in beds for muscles and oysters. Some ecclesiastics are raising nurseries of orange and lemon trees; and other citizens intend introducing the cultivation of mulberry-trees, and breeding of silk-worms. The engineer would have done very little for the health of Brindisi, had he only opened a passage, and given a free course to the waters; the marshes at each extremity of the harbour would still have infected the air: he, therefore, at the expense of about a thousand ducats, had the files filled up with earth, and a dam raised to con-
n early water-engine at Clifton, in Lancashire, for the
purpose of draining coal-mines; and, in 1755, was em-
ployed to execute the larger wheels for a new silk mill,
at Congleton, in Cheshire. The potteries of Stafford-
shire were also, about this time, indebted to him for
several valuable additions in the mills used by them
for grinding flint-stones. In 1756, he undertook to
erect a steam-engine near Newcastle under Line upon
a new plan; and it is believed that he would have
brought this engine to a great degree of perfection, if
some interested engineers had not opposed him.

His attention, however, was soon afterwards called
off to another object, which, in its consequences, hath
proved of high importance to trade and commerce;
that is, the projecting and executing "Inland naviga-
tions." By these navigations the expense of car-
riage is lessened; a communication is opened from one
part of the kingdom to another, and from each of these
ports to the sea; and hence products and manufactures
are afforded at a moderate price. The duke of Bridge-
water’s bath, at Worsley, about seven miles from Man-
chester, a large estate abounding with coal, which had
hitherto lain useless, because the expense of land-car-
riage was too great to find a market for consumption.
The duke, wishing to work these mines, perceived the
necessity of a canal from Worsley to Manchester; up-
on which occasion Brindley, now become famous, was
consulted; and declaring the scheme practicable, an
act for this purpose was obtained in 1758 and 1759.
It being, however, afterwards discovered, that the na-
vigation would be more beneficial, if carried over the
river Irwell to Manchester, another act was obtained
to vary the course of the canal agreeably to the new
plan, and likewise to extend a side-branch to Long-
ford bridge in Stretford. Brindley, in the mean time,
had begun these great works, being the first of the
kind ever attempted in England, with navigable sub-
terranean tunnels and elevated aqueducts; and as, in
order to preserve the level of the water, it should be
free from the usual obstructions of locks, he carried
the canal over rivers, and many large and deep val-
leys. When it was completed as far as Barton, where
the Irwell is navigable for large vessels, he proposed
to carry it over that river, by an aqueduct of thirty-
nine feet above the surface of the water; and though
this project was treated as wild and chimerical, yet,
supported by his noble patron, he began his work in
Sept. 1760, and the first boat sailed over it in July
1761. The duke afterwards extended his ideas to Li-
verpool; and obtained, in 1762, an act for branch-
ing his canal to the tideway in the Mersey; this part
of the canal is carried over the rivers Mersey and Bol-
land, and over many wide and deep valleys.

The success of the duke of Bridgewater’s undertak-
ings encouraged a number of gentlemen and manufac-
turers in Staffordshire, to revive the idea of a canal-
navigation through that county; and Brindley was,
therefore, engaged to make a survey from the Trent
to the Mersey. In 1766, this canal was begun, and
conducted under Brindley’s direction as long as he li-
vied; but finished after his death by his brother-in-law
Mr Marshall, of whom he had a great opinion, in
May 1777. The proprietors called it, "the canal
from the Trent to the Mersey;" but the engineer,
more emphatically, "the Grand Trunk Navigation,"
in the midst of difficulties; when rivers and moun-
tains seem to thwart his designs, then appears his vast
capacity, by which he makes them subservient to his
will."

BRINE, or Pickle; water replete with saline par-
ticles.

Brine taken out of brine-pits, or brine-pans, used
by some for curing or pickling of fish, without boil-
ing the same into salt, and rock salt, without re-
fining it into white salt, are prohibited by 1 Ann.
cap. 27.

Brine is either native, as the sea-water, which by
cocction turns to salt; or factitious, formed by dissolv-
ing salt in water. In the salt-works at Upwick in
Worcestershire, there are found, at the same time, and
in the same pit, three sorts of brine, each of a different
strength. They are drawn by a pump; and that in
the bottom, first brought up, is called first man; the
next, middle man; and the third, last man.

Leach-Brine, a name given to what drops from the
corned salt in draining and drying, which they preserve
and boil again; being stronger than any brine in the
pit. There is sand found in all the Staffordshire brines
after cocction: but naturalists observe, it did not pre-
exist in the water, but rather is the product of the
boiling. Some steep their seed-wheat in brine to pre-
vent the smut. Brine is also commended as of efficacy
against gangrene.

Brine also denotes a pickle pregnant with salt,
wherein things are steeped to keep.

Brine Pans, the pits where the salt-water is retain-
ed, and suffered to stand, to bear the action of the sun,
whereby it is converted into salt. There are divers
sorts of salt pans, as the water-pans, second-pan, sun-
pan; the water being transferred only from one to
another.

Brine-Pit, in salt-making, the salt spring from
whence the water to be boiled into salt is taken. There
are of these springs in many places; that at Namp-
worth in Cheshire, is alone sufficient, according to the
account of the people of the place, to yield salt for the
whole kingdom; but it is under the government of
certain lords and regulators, who, that the market
may not be overstocked, will not suffer more than a
certain quantity of the salt to be made yearly. See the
next article.

Brine-Springs, are fountains which flow with salt-
water instead of fresh. Of these there are a good num-
ber in South Britain, but though not peculiar to this
island, are far from being common in the countries on
the continent. There are some of them in several dif-
ferent counties; and perhaps, on a due search, others
might be discovered. The most remarkable of these
already known are, one at East Chennock in Somer-
setshire, about 20 miles from the sea. Another at
Leamington in Warwickshire, very near the river
Leam; which, however, is but weak. Such a spring
likewise runs into the river Cherwell in Oxfordshire,
and several more in Westmoreland and Yorkshire: but
as they are but poor, and the fuel in most of those
counties scarce and dear, no salt is prepared from
them. At Borrowdale near Grange, three miles from Ken-
burn in Cumberland, a pretty strong spring rises in a
level near a moss, 16 gallons of the water of which
yield one of pure salt; which is the more remarkable,
when it is considered that the same quantity of salt cannot be obtained from less than 22 gallons of the waters of the German ocean. At a place called Salt-Water Hough, near Butterby, in the bishopric of Durham, there is a multitude of salt-springs which rise in the middle of the river Weare, for the space of about 40 yards in length and ten in breadth; but particularly one out of a rock, which is so strong that in a hot summer's day the surface will be covered with a pure white salt. At Weston, in Staffordshire, there are brine pits which afford about a ninth part of very fine white salt. There are others at Enson, St Thomas, and in the parish of Ingestre, but so weak that they are not wrought, though it is believed, that by boring, strong springs might be found in the neighbourhood. In Lancashire there are several salt springs, but (if we except that at Barton, which is as rich as the spring at Northwich) by no means so famous as those of Cheshire, called in general by the name of the witches. Nantwich on the river Weaver, has a noble spring not far from the river, which is so rich as to yield one-sixth part of pure white salt. At six miles distant stands Northwich, at the confluence of the Weaver and the Dan; where the brine is still richer, since they obtain six ounces of salt from 16 of water. There are, even at this day, some visible remains of a Roman causeway between these two towns. The inhabitants of Wales, who, before that country was incorporated into England, were supplied chiefly, if not solely, with that necessary commodity from these two towns, called the former Hellath Wen, and the latter Hellath Du; i.e. the white and black salt pit. In 1675, a rock of salt was discovered at a small distance from Northwich, which has been wrought to a great depth, and to a vast extent, so as to be justly esteemed one of the greatest curiosities in England; and it is highly probable, that there is an immense body of fossil salt in the bowels of the earth, under this whole county; since, upon boring, brine pits have been found in many places on both sides the river Weaver. This is the more likely, since at Middlewich, which stands at the confluence of the Croke and the Dan, there are salt springs with a fresh brook running between them. The brines from these pits are of unequal strength; but when mixed, they commonly obtain four ounces of salt from a pound of brine. Experience shows, that in these springs the water is strongest nearest the bottom, richer in dry weather than in wet, and when long drawn than when first wrought. But these are no rules in respect to other salt-springs, since in those of Franche Compte the brine is strongest in wet weather. There are several other bodies dissolved in these brines besides salt; in some a sulphurous substance, which sublimes as the brine heats; a sort of dirty ochre which discolors the brine, but if suffered to stand, speedily subsides; and in most brines a calcareous, or rather selenitic earth, which settles to the bottom of the pans.

To BRING-ro, in Navigation, to check the course of a ship when she is advancing, by arranging the sails in such a manner, that they shall counteract each other, and prevent her either from retreating or moving forward. In this situation the ship is said to lie by, or to lie to; having, according to the sea-phrase, some of her sails aback, to oppose the force of those which are full; or having them otherwise shortened by being furled, or hauled up in the brails.

BRINGING-to, is generally used to detain a ship in any particular station, in order to wait the approach of some other that may be advancing towards her; or to retard her course occasionally near any port in the course of a voyage.

BRINGING-in a Horse, in the manege, the same as to say, keep down the nose of a horse that bores and tosses his nose in the wind: this is done by means of a branch.

BRINING of CORN, in husbandry, an operation performed on the wheat-seed, in order to prevent the smut. A liquor is to be prepared for this purpose, by putting 70 gallons of water into a tub (like a mash-tub used for brewing, and a corn-huskel of unskilled limestone. This is to be well stirred till the whole is dissolved, and left to stand for 30 hours; after which it is to be drained off into another tub, in the manner practised for beer. In this way a strong lime-water will be obtained, to which must be added three pecks of salt. The wheat must be steeped in this pickle, by running it gently, and in small quantities, into a broad-bottomed basket of about 24 inches in diameter, and 20 inches deep, and stirring it. The light seed that floats must be strained off with a strainer, and must not be sown. When the basket has been drawn up, and drained of the pickle, the wheat will be fit for sowing in two hours after the brining.

BRINING of hay-ricks, a practice common in America, of mixing salt with the hay as it is stacked.

BRIONNE, a town of France in Normandy, seated on the river Rille. E. Long. 0. 51. N. Lat. 49. 57.

BRIODUE, a town of France, in the department of Upper Loire, formerly Lower Auvergne. There are two Brioudes, three quarters of a mile from each other; the one is called Church Brioude, the other Old Brioude. The houses are built after the antique manner, and are badly disposed. The canons are all temporal lords and counts. It is in no diocese, but depends immediately on the pope. There are several convents; and, among the rest, the church of St Ferral, which is highly celebrated. Near the Old Town is a stone-bridge on the river Allier, which consists of one arch; this is esteemed a stupendous structure, and is thought to be a work of the Romans. The inhabitants, 5000 in number, have no manufactures. It is situated in E. Long. 3. 25. N. Lat. 45. 14.

BRIQUERAS, a town of Piedmont, seated in the valley of Lucern, three miles from the town of that name, and four south of Pigierol. It had a very strong castle towards the latter end of the 16th century; but when the French got footing in it, it was ruined, that is, before they delivered it up to the duke of Savoy in 1696. E. Long. 7. 24. N. Lat. 44. 47.

BRISACH, a town of Germany, and capital of Brisag, now in the territories of Baden. It was twice in the possession of the French; but restored to the house of Austria, by treaties of peace. It was a very strong place, but the fortifications have been demolished. It is seated on the Rhine, where there is a bridge of boats. E. Long. 7. 49. N. Lat. 48. 5.
Brisach, New, a town of France, in the department of the Upper Rhine, built by order of Louis XIV. over against Old Brisach, and fortified by Vauban. It is 32 miles south of Strasburg. E. Long. 7° 46' N. Lat. 48° 5'.

BRIESELS, or Hippodamia, in fabulous history, the wife of Myne of Lyrnessa. After Achilles had taken that city, and killed her husband, she became his captive. That hero loved her tenderly; but Agamemnon taking her from him, she became the incidental cause of bad disorders in the Grecian army.

BRIGS COUNTY, a territory of Germany, in the circle of Suabia, on the eastern bank of the Rhine, about 30 miles in length, and 30 in breadth, now subject to the grand duke of Baden. The principal places are Old Brisach, New Brisach, Freiburg, and Rhusmarck.

BRIGACUS MUNI, in Ancient Geography, a town on the right or east side of the Rhine. Now Brisach, situated on a round hill; a fortified town of Suabia, and distinguished by the name of Old Brisach. E. Long. 7° 15' N. Lat. 48° 10'.

BRISON, M. J. an eminent French naturalist. See Supplement.

BRISSOT, Peter, one of the ablest physicians of the 16th century, was born at Fontenai le Comte in Poitou. He studied at Paris; and, having taken his doctor's degree, bent his thoughts to the reforming of physic, by restoring the precepts of Hippocrates and Galen, and exploding the maxims of the Arabian doctors. For this purpose he publicly explained Galen's works, instead of those of Avicenna, Rhazes, and Mesue. He afterwards resolved to travel to acquire the knowledge of plants; and, going to Portugal, practised physic in the city of Evora. His new method of bleeding in pleurisy, on the side where the pleurisy was, raised a kind of civil war among the Portuguese physicians; it was brought before the university of Salamanca, who at last gave judgment, that the opinion ascribed to Brissot was the pure doctrine of Galen. The partisans of Decys, his opponent, appealed in 1529 to the emperor, to prevent the practice, as being attended with destructive consequences; but Charles III Duke of Savoy happening to die at this time of a pleurisy, after having been bled on the opposite side, the prosecution dropped. He wrote an Apology for his practice, but died before it was published, in 1552; but Anthony Luceus, his friend, printed it at Paris three years after. Renatus Moreau procured a new edition of it at Paris, in 1622; and annexed to it a treatise entitled De misione sunginum in pleuride, together with the Life of Brissot.

BRISSOT, John Peter, leader of the Brissotine party in the French revolution. See Supplement.

BRISTLE, a rigid glossy kind of hair, found on swine, and much used by brush-makers, &c.

BRISTOL, a city of England, inferior to none, except London, for wealth, trade, and number of inhabitants. Bristol is a corruption of Brightsow, as it was called by the Saxons. It is thought to have stood anciently altogether on the west or Somersetshire side of the Avon, before the bridge was built; but after that, it came to be partly in Somersetshire and partly in Gloucestershire, until it was made a county of itself, though even before that, in the parliament rolls, it was always placed in Somersetshire. At present, the east side is by much the largest and most populous. It had anciently a castle, built by Robert earl of Gloucester, natural son to Henry I. which was demolished by Cromwell; and the ground is now laid out into streets. The corporation consists of a mayor; recorder; twelve aldermen, of whom the recorder is one; two sheriffs; and twenty-eight common council men. The recorder is generally a sergeant at law, and sits as judge in capital and all other criminal causes. The mayor, to support his dignity, and defray his extraordinary expenses, is entitled to certain fees from ships, which a long time ago amounted to 500l. 500l. Bristol is a bishop's see, being one of the six erected by King Henry VIII. out of the spoils of the monasteries and religious houses which that monarch had got dissolved. The cathedral church was the church of the abbey of St Austin in Bristol, founded by Robert Fitz Harding son to a king of Denmark, once a citizen here, and by him filled with canons regular in the year 1148. At the reformation King Henry VIII. placed therein a dean and six prebendaries, which mode of government still continues. During a great part of Queen Elizabeth's reign, this see was held in commendam by the bishop of Gloucester. This diocese was formed chiefly out of the diocese of Salisbury, with a small part from the dioceses of Wells and Worcester. It contains most of the city of Bristol, and all the county of Dorset, in which are 236 parishes, of which 64 are inappropriate. It hath only one archdeaconry, viz. of Dorset; is valued in the king's books at £38 8s. 4d. and is computed to be annually worth 1300l. including its commendaments. The tithes of the clergy are 353l. 18s. 6d. This see hath yielded to the state the lord's privy seal. The revenues of the abbey of St Augustine, or St Austin, in Bristol, were valued at the dissolution at 6700l. 15s. 11d. when it was erected into a cathedral by King Henry VIII. by the name of the Cathedral Church of the Holy Trinity. To this cathedral belong a bishop, a dean, an archdeacon, a chancellor, six prebendaries, and other inferior officers and servants. Besides the cathedral, there are 18 parish-churches; and here are dissenters of all denominations, of whom the Quakers are very respectable both for their wealth and numbers. Of the parish-churches, St Mary Ratcliffe is reckoned one of the finest, not only here, but in the whole kingdom. In this church, besides two monuments of the founder William Cannings, who had been five times mayor of this city, one in the habit of a magistrate, and another in that of a priest (for in his latter days he took orders), there is one of Sir William Penn, father to the famous Quaker. The old bridge over the Avon consisted of four broad arches, with houses on both sides like those formerly on London bridge but this has been lately pulled down, and another erected in its place. No carriages or wagons are admitted into Bristol, for fear of damaging the vaults and gutters made under ground for carrying the filth of the city into the river. Queen's-square, in this city, is larger than any in London, except Lincoln's-Inn Fields, and has in the centre an equestrian statue of King William III. All the gates of the city remain entire, and a part of the walls; the rest were razed in the reign of William Rufus. It is almost as broad as London; and, including the out-parishes, is supposed to contain 100,000 inhabitants. Of the hospitals, the chief...
Bristol. 

...That called Queen Elizabeth's, in which 200 boys are taught reading, writing, arithmetic, and navigation; six of whom, when they go out, have 10l. and the rest 8l. 8s. to bind them apprentices: the master is allowed 450l. a-year, for the maintenance of the boys. 2. Colston's hospital; in which 100 boys are maintained for seven years, and taught and apprenticed, as in Queen Elizabeth's. 3. Another founded by the same gentleman in 1691, for 2 men and 12 women, with a allowance of 2s. per week, and 24 sacks of coals in the year. This charity cost the founder 25,000l. 4. Another founded partly by Mr Colston and partly by the merchants, in which 10 men on account of the merchants, and 12 men and women on account of Mr Colston, are maintained. 5. An infirmary, which was opened in 1736 for the sick, lame, and distressed poor of the city, which is maintained by subscription, besides 5000l. bequeathed to it by John Eldridge, Esq., formerly comptroller of the customs at this port. There are, besides these, a bridewell, several almshouses, and charity schools. There is also a guildhall for the sessions and assizes; the mayor's and sheriffs courts; a council-house, where the mayor and aldermen meet every day, except Sundays, to administer justice; a handsome new exchange, with three entrances, about two-thirds as large as that in London, and a quay half a mile in length, the most commodious in England for shipping and landing goods, for which purpose it is provided with several cranes. In College-green is a stately high cross, with the effigies of several kings round it. In Winch-street is a guard-house, with barracks for soldiers. As to the trade of this city, it was computed many years ago to be much greater in proportion, especially to America and the West Indies, than that of London. Fifty sail, some of them ships of considerable burthen, have arrived here at one time, or very near one another, from the West Indies. For this trade, and that to Ireland, it is much better situated than London, besides the great advantages it possesses of an inland navigation by the Wye and Severn. Their trade extends to the Baltic, Norway, Holland, Hampshire, Guinea, and the Straits. The largest ships are discharged at King-road, four miles below the city, and the goods are brought to the quay by lighters. For building, equipping, and repairing ships, there are docks, yards, rope-walks, and shipwrights. In 1809 various improvements were completed upon the harbour, which cost 500,000l. Here are some considerable woolen manufacturers; and no less than 35 glass-houses, for which Kingswood and Mendip furnish the coals. The city companies are 13: 1. The merchant adventurers. 2. The merchant tailors. 3. The mercers. 4. The soap boilers. 5. The tobacconists. 6. The butchers. 7. The barbers. 8. The tylers. 9. The holliers, who are the sled-men. 10. Shoemakers. 11. Cooperers. 12. Bakers. 13. Smiths. For supplying the city with water there are six public conduits. There are also stage coaches, which set out every day for Bath, London, and other places. A mile below the city, close by the river, is the hot well, whose waters are specific for the diabetes, and good in phthisical, scrobutic, and inflammatory disorders. Hither is a great resort in the summer of invalids, as well as other company; for whose accommodation and entertainment there is a pump-room, ball-room, coffee-house, with taverns, and a great number of elegant lodging-houses, both below on a level with the well, and above in the delightful village of Clifton, which is situated on the brow of a hill, from whence there are downs extending several miles, where the company ride out for exercise. Nothing can be more pure and salutary than the air of these downs, which afford a variety of the most romantic and agreeable prospects, comprehending King-road, with the ships at anchor, the mouth of the Severn, and the mountains of Wales. In the rocks above the well are found those six-cornered stones called Bristol-stones; but they are not so plentiful now as in Camden's day, when, he says, whole bushees might have been easily gathered. In this city is a theatre, where plays are acted almost every night during the recess of the comedians from the metropolis. There are two annual fairs, to which the concourse is so great, that the neighbouring farms have filled 100 beds a piece with their guests. In the winter season there is an assembly every Thursday for the gayer part of the citizens of both sexes. About half way betwixt Bristol and Bath, at a place called Warmly, a company of Bristol merchants have erected a noble manufacture of pins and other brass utensils, which employs a great number of hands, including about 300 children of both sexes from seven to twelve or thirteen years of age. All the different operations of melting, pinning, drawing, hammering, turning, &c. are performed by wheels worked with water, which is raised by two fire-engines of a very curious mechanism. The city of Bristol gives the title of earl to the family of Hervey, and sends two members to parliament. It is worth observing, that whoever marries a citizen's daughter becomes free of the city.

New-Bristol, the capital of the county of Bucks in Pennsylvania, situated on the river Delaware, about 20 miles north of Philadelphia, in W Long. 75. N Lat. 40. 45.

Bristol Water. Of the four principal warm waters naturally produced in England, this is the least so. As the Bath waters are proper where the secretions are defective, so the Bristol water is of service where they exceed the requirements of health. The Bath water warms; the Bristol cools. Bath water helps the stomach, intestines, and nerves; the Bristol favours the lungs, kidneys, and bladder. Except a jaundice attend, the Bristol water may be of use in dropsey's by its drying and diuretic qualities. Dr Winter asserts, that there is no iron in Bristol water; and that its mineral contents are chalk, lapis calcaricus and calaminarum. Five gallons of this water, after evaporation, afforded only 3 iii. and gr. 2. of mineral substances. The diseases in which this water is useful are internal hemorrhages, immoderate menses, internal inflammations, spitting blood, dysentery, purulent ulcers of the viscera, consumption, dropsey, scurvy with heat, stone, gravel, strangury, habitual gout, atrophy, slow fever, scrofula, gleet, and diabetes, in which last it is a specific, and may be drank as freely as the thirst requires it. The hotter months are the best for using it. The Bristol and Malteck waters are of exactly the same qualities. Doctors Mead and Lane first established the reputation of Bristol waters in diseases of the kidneys and bladder.

BRITAIN,
BRITAIN.

BRITAIN, or GREAT BRITAIN, the most considerable of all the European islands, extends from the Lizard Point, in the latitude of about 50°, to Dounesbay-head, in latitude 58° 30′ N., or, taking it in a straight line from north to south, about eight degrees or 550 miles; and from Dover-head on the east to Land's-end on the west comprehends about seven degrees of latitude, which may be computed at about 250 miles; but the form being very irregular, and lengthening continually towards the north, proper allowances must be made in computing its dimensions.

The ancient name of this island was Albion, the name Britain being then common to all the islands round it. Hence Agathemerus, speaking of the British islands: "They are many in number (says he); but the most considerable among them are Hibernia and Albion." And Ptolemy, to the chapter wherein he describes the island now called Great Britain, prefixed the following title: "The situation of Albion, a British island." But as this far excelled the other British islands, the name of Albion in process of time was laid quite aside, and that of Britain used in its stead. By this name it was known in Pliny's time, and even in Caesar's. The origin of both these names is very uncertain. Some derive that of Albion from the Greek word αλπον, which, according to Festus, signifies white; others from the Hebrew αλπαν, white, or the Phoenician αλψ, high. The origin of the name Britain is no less uncertain than that of Albion. Nennius and some other British writers derive it from Brutus, whom they likewise call Brito, the fifth in descent from the celebrated Aeneas. Others derive it from the British words pryd cain, that is, a white form, softened by degrees into Britannia. Camden derives it from the word Brit, which, in the ancient language, of the island, signifies painted; and tania, importing, in Greek, a region or country: so that the word Britania, changed in process of time into Britannia, expresses what the Britons really were, that is, painted. Mr. Whitaker, in his History of Manchester, derives it from the word brith, Brit, bris, or brig, which, he says, signifies divided or striped. Against the first of these etymologies it may be objected, that it is founded on a fable; and against the other three lies one common and unanswerable objection; which is, that the name of Britain was given to the island by foreigners, who could not borrow it from the British tongue, with which they were in all likelihood unacquainted. That the island received the name of Britain from foreigners is evident, since the natives never styled themselves Britons, nor their country Britain; their true name being Cumri, or Cumbri; whence Cambria the name of Wales to this day among the Welsh.

The learned Bochart, speaking of the colonies and language of the Phoenicians, offers a conjecture which most of our modern writers have adopted as the most natural. The Phoenicians, according to that writer, called this island, and some others near it, Barat Anac, that is, the land or country of sin or lead, and more contractedly Bratanae; which name, passing from the Phoenicians to the Greeks, and from these to the Romans, might have been softened into that of Britannica, and Britannia. That the Phoenicians first discovered these islands, which were afterwards by the Greeks called Cassiterides, and are proved by Camden to be our Scilly islands, appears both from Strabo and Pliny; of whom the former tells us, that the Phoenicians first brought tin from the Cassiterides, which they sold to the Greeks, but kept the trade to themselves, and the place private; and the latter writes, that Medicoritus was the first who brought lead from the Cassiterides; where Bochart shows that we ought to read Metichartus, who is the Phoenician Hercules of Sambonitho, to whom that nation ascribes their first western discoveries. But notwithstanding the care of the Phoenicians to conceal these islands, the Greeks at last discovered them; and gave them the name of Cassiterides, which, in the Greek tongue, signifies the same with Barat Anac in the Phoenician. This name was at first given to the islands of Scilly already mentioned; but by degrees communicated to all the others lying in the same sea. Thus Bochart. But after all, his opinions, however plausible in appearance, may be as foreign to the purpose as any of the rest; many instances of names given to new discovered countries showing that the origin of such names is not always owing to reasons, but often to chance or caprice.

The general division of Britain is into ENGLAND, SCOTLAND, and WALES; for a particular description and history of which, see these articles.

In the year 1603, the kingdoms of Scotland and James VI. of England fell under the dominion of one sovereign, by the accession of James VI. of Scotland to the throne of the crown of England. He derived his title to the latter from being of England, the grandson of Margaret, eldest daughter to Henry VII. of that kingdom; and, on the failure of all the male line, his hereditary right remained incontestable. Queen Elizabeth, with her latest breath, had recognized him for her successor; so that few sovereigns ever ascended a throne with more approbation of their subjects, or greater hopes of a peaceable and happy reign.

These hopes, however, were soon blasted; and the history of this monarch's reign consists of little else than a detail of disputes and contentions between him and his parliament. A particular and minute account of such transactions could afford very little entertainment; but it is of importance to know their origin, as they are to be reckoned the ultimate causes of those succeeding events which make so conspicuous a figure in the annals of Britain.

In those barbarous ages which preceded the period we are now entering upon, the human mind, enervated state of the by superstition, and obscured by ignorance of every act and science, seemed to have given up all pretensions to that time liberty, either religious or civil. Unlimited and uncontrolled despotism prevailed everywhere; and though England suffered less in this respect than almost any other nation, the many examples of arbitrary power exerted by her sovereigns, Queen Elizabeth herself, James's immediate predecessor, not excepted, show that...
they were very far from being then a free people. An
incontestable proof of this, and an evidence how little
restraint at that time the people could lay upon the au-
thority of the sovereign, is, that the proceedings of
parliament were accounted, even by themselves, of so
little consequence, that they were not at the trouble to
keep journals of them. It was not till the year
1607, four years after the accession of James, that
parliamentary journals were kept, at the motion of
Sir Edwin Sandys, a member of great authority in
the house.
The proceedings of the parliament being at that time
of so little consequence, it is no wonder that the sessions
were not regular, or that little attention was paid to
the choice or continuance of the members. In the reign
of Elizabeth, and her predecessors, the sessions of par-
liament did not continue above the twelfth part so long
as the vacations. It was then usual, after parliament
had been prolonged beyond one session, for the chan-
celloor to exert a discretionary authority of issuing new
writs to supply the place of any members whom he
judged incapable of attending, either on account of
their employment, sickness, or other impediment. No
practice could be more dangerous to liberty than this,
as it gave the chancellor, and consequently the sove-
reign, an opportunity of garbling at pleasure the rep-
resentatives of the nation: yet so little was liberty at
that time understood, that the commons, of their own
accord, without the least court influence or intrigue, and
contrary to some former votes of their own, confirmed
the chancellor’s power in this respect in the 23d of E-
lizabeth. Nor did they proceed any farther in the as-
sertion of their privileges, than to vote, that “during
the sitting of parliament there do not, at any time, any
write go out for the choosing or returning any member
without the warrant of the house.”
Towards the end of the 16th or beginning of the
17th century, a great revolution took place, though insen-
sibly, throughout all Europe. Arts and sciences
began to flourish, commerce and navigation were greatly
extended, and learning of all kinds began to diffuse
itself. By more enlarged views, the love of freedom
began, in England especially, to take place in the
breasts of most people of birth and education; and this
was greatly promoted by an acquaintance with the an-
cient Greek and Latin historians. From the example
of the republics of Greece and Rome, whose members
had so often sacrificed their lives for the sake of liber-
ity, a patriotic spirit began to arise; and a desire of
circumscribing the excessive prerogative and arbitrary
proceedings of the crown began secretly to take place
throughout the nation.
Nor was the desire unreasonable, or without a solid
foundation. During the last years of Queen Elizabeth’s
reign, the commerce, navigation, and number of sea-
men in England, had sensibly decayed. A remonstrance
from the Trinity-house in 1602 says, that since 1588,
the number of seamen and shipping had decayed about
a third part. Every species of domestic industry was
fettered by monopolies; and by exclusive companies,
which are only another species of monopoly, almost all
foreign trade, except that to France, was brought into
the hands of a few rapacious engrossers, and all prospect
of future improvement in commerce was for ever sacri-
ficed to a little temporary advantage of the sovereign.

These companies, though arbitrarily erected, had car-
ried their privileges so far, that almost all the com-
merce of England centered in London; the customs of
that port alone amounted to 130,000 a year; while
those of all the kingdom besides amounted only to
17,000; nay, the whole trade of London was confined
to about 200 citizens, who were easily enabled, by
combining among themselves, to fix whatever price they
pleased both on the exports and imports of the nation.
Besides this, the subjects were burdened by wardships
and purveyances. The latter was an old prerogative
of the crown, by which the officers of the household were
empowered to take, without consent of the owners,
provisions for the king’s family, and carts and horses
for the removal of his baggage, upon paying a stated
price for them. The king had also a power of sending
any person, without his consent, on whatever message
he pleased; and thus he could easily force any indivi-
dual to pay him whatever money he chose, rather than
be sent out of the country on a disagreeable errand.
Money extorted from individuals, by this or any other
method, was called a benevolence.

These were some of the grievances under which the
nation at this time laboured, and these the rising spirit
of patriotism tended to redress. This disposition, how-
ever, the severe government of Elizabeth had confined
within very narrow bounds: but when James succeed-
et to the throne; a foreign prince, less drenched and
less beloved; symptoms of a more free and independent
genius immediately appeared. Happily James neither
perceived the alteration, nor had sufficient capacity to
check its early advances. He had established in his
own mind a speculative system of absolute government,
which few of his subjects, and none but traitors and
rebels, he thought, would make any scruple to admit.
He considered himself as entitled to equal prerogatives
with other European sovereigns, not considering the
military force with which their despotism was supported.
The almost unlimited power which, for upwards of a
century, had been exercised by the English sovereigns,
he considered as due to royal birth and title, not to the
prudence and spirit of those monarchs, or the con-
junctures of the times. In his person, therefore, he
imagined all legal power to be centered by an heredi-
tary and a divine right; nay, so fully was he persuaded
that he was the absolute proprietor of his subjects, that
in his speech to the parliament in 1621, he told them,
that he wished them to have said that their privileges
were derived from the grace and permission of him and
his ancestors.” And when the same parliament pro-
tested that “the liberties, franchises, privileges, and
jurisdictions of parliament, are the ancient and un-
doubted birthright and inheritance of the subjects of
England,” he was so enraged, that sending for the
journals of the commons, he, with his own hand, be-
fore the council, tore out this protestation; and order-
ed his reasons to be inserted in the council book.

Such were the opposite dispositions of the prince
and parliament, at the commencement of the Scottish
line; dispositions just beginning to exist and to appear
in parliament, but thoroughly established, and openly
avowed on the part of the king, throughout his whole
reign.

The consequence of such opposite dispositions pre-
vailing in the king and parliament was, that during this
reign
BRITAIN.

The reign of the crown were violently and openly attacked; but the chief grounds of discontent were money and religion. The king's high notions of the royal prerogative made him imagine he had a right to whatever sums he pleased to demand; and his profusion caused him to dissipate in a short time the scanty supplies he could extort from the parliament, who seem to have behaved as unreasonably on the one hand as James himself did on the other. With regard to religious matters, the nation was at that time greatly infected with puritanism. Though the severities of Elizabeth had almost totally suppressed the Papists, they had been otherwise with the Puritans. So much had they incensed by the very men whom had diminished the number of Catholics, that no less than 7,50 clergymen of that persuasion signed a petition to James on his succession. They hoped that the king, having received his education in Scotland, and having always professed an attachment to the church established there, would at least abate the rigour of the laws enacted against the Puritans, if he did not show them particular favour and encouragement. But in this they were mistaken. He had observed in their Scots brethren a violent turn towards republicanism, and a zealous attachment to civil liberty. In the capacities both of monarch and theologian, he had experienced the little complaisance they were disposed to show him. They controlled his commands; disputed his tenets; and to his face, before the whole people, cenured his conduct and behaviour. This superiority assumed by the presbyterian clergy, the monarchical pride of James could never digest. Though he had been obliged while in Scotland to court their favour, he treasured up on that account the stronger resentment against them; and was determined to make them feel in their turn the weight of his authority. He therefore not only rejected the petition of the 7,50 clergymen above mentioned, but throughout his whole reign refused to relax in the least the severity of the laws against Protestant nonconformists, though very often petitioned in their favour by his parliament.

The same principles which occasioned in James such an aversion to the Puritans, prompted him greatly to favour the Episcopalians, and even the Papists, as being greater friends to despotism. In his youth he had been suspected of a bias towards the religion of the latter; and when he ascended the throne of England, it is certain he often endeavoured to procure some mitigation of the laws against them, if not an absolute toleration. But in this he was constantly opposed by the parliament; and indeed the strong inclination shown by James to establish Episcopacy throughout every corner of his dominions, tended very much to alienate the minds of the generality of his subjects, especially in Scotland, entirely from him.

In May 1617, the king set out for Scotland, expressly with the design of establishing Episcopacy in that kingdom. He did not, however, propose to abolish Presbytery entirely, and set up absolute Episcopacy in its room. He designed to content himself with establishing the royal authority above the ecclesiastical, and introducing some ceremonies into the public worship, such as kneeling at the sacrament, private communion, private baptism, confirmation of children, and the observance of Christmas, &c. But as his design was fully seen from the beginning, every advance towards Episcopacy gave the greatest discontent, and those trivial ceremonies were rejected as so many mortal sins.

At this time the power of the Scot clergy was exceedingly great; and the gloomy enthusiastic spirit with the sect which they were actuated, prompted them to exercise it in such a manner as to make their tyranny insupportable to those who were of a different way of thinking from themselves. Every ecclesiastical court possessed the power of excommunication; which was then attended with some very serious temporal consequences, besides the spiritual ones which are supposed to flow from it. The person excommunicated was shunned by every one as profane and impious; his whole estate during his life-time, and all his moveables for ever, were forfeited to the crown. A sentence of excommunication was sometimes pronounced in a summary manner, by any ecclesiastical court, however inferior, against any person, whether he lived within the bounds of their jurisdiction or not. And by this means, the whole tyranny of the inquisition, though without its orders, was introduced into Scotland. But the clergymen were not satisfied with this unbounded authority in ecclesiastical matters; they assumed a censorial power over every part of administration; and in all their sermons and even prayers, mingling politics with religion, they inculcated the most seditious and turbulent principles.

One Black, a minister of St Andrew's, went so far as to pronounce in one of his sermons, that all kings were of some of the devil's children; and in his prayer for the queen he used these words, "We must pray for her for the fashion's sake, but we have no cause: she will never do us any good." Another minister preaching in the principal church of that capital, said, that the king was possessed with a devil; and that, one devil being expelled, seven worse had entered in his place. To which he added, that the subjects might lawfully rise, and take the sword out of the hands of their sovereign.

We can scarcely wonder that James should be desirous of subjugating such rebellious and turbulent spiris as these; and, on the other hand, considering the extreme weakness of this monarch's understanding, and that he imagined himself able to manage not only furious religionists, but even the most powerful foreign nations, with no other weapon than mere argumentation, we can as little wonder at his want of success. In short, so far was James from being able to establish his royal authority above the ecclesiastical, that he found himself unable to introduce a single ceremony. He returned therefore with the mortification not only of seeing his schemes entirely baffled with regard to Scotland, but of having disgusted even the few of that nation over whom religious prejudices did not prevail; for, considering the ceremonies so much insisted on by the king as trivial and insignificant, could not help thinking the national honour sacrificed by a servile imitation of the modes of worship practised in England, and that their sovereign betrayed equal narrowness of mind, though in an opposite manner, with those he so much condemned.

The like bad success attended James when he attempted some opposition to the puritanical innovations in England. He had observed in his progress through England, that...
To serve any good purpose (sage he), we must destroy, at one blow, the king, the royal family, the lords and commons; and bury all our enemies in one common ruin. Happily they are all assembled on the first meeting of parliament; and afford us the opportunity of glorious and useful vengeance. Great preparations will not be requisite. A few of us may run a mine below the hall in which they meet; and choosing the very moment when the king barasses both the houses, consign over to destruction those determined foes to all piety and religion. Meanwhile, we ourselves standing aloof, safe and unsuspected, shall triumph in being the instruments of divine wrath, and shall behold with pleasure those sacrilegious walls, in which were passed the edicts for proscribing our church and butchering her children, tossed into a thousand fragments; while their impious inhabitants, meditating perhaps still new persecutions against us, pass from flames above to flames below, there for ever to endure the torments due to their offences."

This terrible scheme being approved of, it was resolved to communicate it to a few more. One Thomas Wint was sent over to Flanders in quest of Fawkes, the execution of the plot. All the conspirators were bound by the most solemn oaths, accompanied with the sacrament; and to such a degree had superstition effaced every principle of humanity from their minds, that not one of them ever entertained the smallest compunction for the cruel massacre they were going to commit. Some indeed were startled at the thoughts of destroying a number of catholics who must necessarily be present as spectators, or attendants on the king, or as having seats in the house of peers. But Tem condol a Jesuit, and Garnet superior of that order in England, removed those scruples, by showing that the interest of religion required in this case the sacrifice of the innocent with the guilty.

This happened in the spring and summer of 1604; when the conspirators also hired a house in Percy’s name, adjoining to that in which the parliament was to assemble. Towards the end of that year they began to pierce through the wall of the house, in order to get in below that where the parliament was to sit. The wall was three yards thick, and consequently occasioned a great deal of labour. At length, however, they approached the other side, but were then startled by a noise for which they could not well account. Upon inquiry, they found that it came from a vault below the house of lords; that a magazine of coals had been kept there; and that the coals were then selling off, after which the vault would be let to the highest bidder. Upon this the vault was immediately hired by Percy; 36 barrels of powder lodged in it; the whole covered up with faggots and billets; the doors of the cellar boldly flung open; and every body admitted as if it contained nothing dangerous.

Being now, as they thought, assured of success, the conspirators began to plan the remaining part of their enterprise. The king, the queen, and Prince Henry, were expected to be present at the opening of the parliament. The duke, by reason of his tender age, would be absent, and it was resolved that Percy should seize or murder him. The princess Elizabeth, likewise a child, was kept at Lord Harrington’s house in Warwickshire; and some others of the conspirators engaged in
BRITAIN

Catesby, Percy, and the other criminals, on learning
that Fawkes was arrested, hurried away to Warwick-
shire; where Sir Edward Digby, imagining that his
confederates had succeeded, was already in arms to
seize the princess Elizabeth. She had escaped into
Coventry; and they were obliged to put themselves in
a posture of defence against the country-people, who
were raised from all quarters and armed by the sheriffs.
The conspirators, with all their attendants, never ex-
cceeded the number of 80 persons; and being sur-
rrounded on every side, could no longer have any hope
either of prevailing or escaping. Having therefore
confessed themselves, and received absolution, they
boldly prepared for death, and resolved to sell their
lives as dear as possible. But even this miserable con-
solation was denied them. Some of their powder took
fire and disabled them from defending themselves.
The people then rushed in upon them. Percy and Ca-
tesby were killed with one shot. Digby, Rookwood,
Winter, and others, being taken prisoners, were tried,
confessed their guilt, and died, as well as Garnet, by
the hands of the common executioner. The Lord
Stornton and Mordaunt, two catholics, were fined, the
former of 4000l. the latter of 20,000l. by the star-
chamber; because their absence from parliament had
occasioned a suspicion of their being made acquainted
with the conspiracy. The earl of Northumberland
was fined 30,000l. and detained several years a prisoner in
the Tower; because, not to mention other grounds of
suspicion, he had admitted Percy into the number of
gentleman pensioners, without his taking the requisite
oaths.

In 1612, James appears in his most advantageous
point of view, namely, as legislator of Ireland, and
the person who undertook to civilize the barbarous in-
habitants of that kingdom, and to render their subje-
dtion durable and useful to the crown of England. In
this work, James proceeded by a steady, regular,
and well-concerted plan. He began with abolishing
the ancient Irish customs which supplied the place of
laws, and which were exceedingly barbarous and absurd.
By the Brehon law, every crime however enormous
was punished, not with death, but by a fine. Murder
itself was compensated in this way. Every one had a value
affixed to him, called his eric; and whoever was able
to pay this, might kill him when he pleased. As for
such slight offences as oppression, extortion, or other
things of that nature, no penalty was affixed to them,
nor could any redress for them ever be obtained. By
the custom of govet Latinde, upon the death of any person,
his land was divided among all the males of the sept or
family, both bastard and legitimate: and after partition
made, if any of the sept died, his portion was not
shared out among his sons; but the chieftain at his
discretion made a new partition of all the lands be-
longing to that sept, and gave every one his share: as
so man, by reason of this custom, enjoyed the fixed
property of any land; to build, cultivate, or improve,
must have been so much lost labour. Their chieftains
were established by election, or, more properly speak-
ing, by force and violence. Their authority was ab-
solute; and, notwithstanding certain lands were assign-
ed to the office, its chief profit resulted from execu-
tions, duces, assessments, for which there was no fixed
law, and which were levied at pleasure.
After abolishing these customs, and substituting English law in their place; James having taken all the natives under his protection, and declared them free citizens, proceeded to govern them by a regular administration, military as well as civil. A sufficient army was maintained, its discipline inspected, and its pay transmitted from England, in order to prevent the soldiery from preying upon the country, as had been usual in former reigns. When O'Doghartie raised an insurrection, a reinforcement was sent over, and the rebellion immediately extinguished. All minds being first quieted by an universal indemnity, circuits were established, justice administered, and crimes of every kind severely punished. As the Irish had been universally engaged in a rebellion against Elizabeth, a resignation of all the rights formerly granted them to separate jurisdictions was rigorously exacted; a resignation to private estates was even required; and when they were restored, the proprietors received them under such conditions as might prevent all future tyranny and oppression over the common people. The whole province of Ulster having fallen to the crown by the attainder of rebels, a company was established in London for planting new colonies in that fertile country. The property was divided into moderate shares, the largest not exceeding 2000 acres; tenants were brought over from England and Scotland: The Irish were removed from the hills and fastnesses, and settled in the open country: Husbandry and the arts were taught them: and by these means Ulster, from being the most wild and disorderly province in Ireland, soon became the best cultivated and most civilized.

This year was also remarkable for the death of Henry prince of Wales, who died suddenly on the 6th of November, not without strong suspicions of poison, for which the king himself was blamed. On opening his body, however, no symptoms of poison appeared; but his death diffused an universal grief throughout the nation, he being reckoned a prince of extraordinary accomplishments.

The marriage of the princess Elizabeth with Frederic elector palatine, which was celebrated February 14. 1613, served to dissipate the grief which had arisen on account of Prince Henry's death. But this marriage, in the event, proved unhappy to the king as well as his son-in-law. The elector, trusting to so great an alliance, engaged in enterprises beyond his strength; and James, not being able, and indeed perhaps not willing to assist him in his distress, lost entirely what remained of the affections of his people.

These bad consequences did not begin to appear till the year 1619. At that time the states of Bohemia having taken arms against the emperor Matthias, in defence of the Protestant religion, and continuing their revolt against his successor Ferdinand II. and being alarmed at his mighty preparations against them, made an offer of their crown to the elector palatine. To this they were induced by the greatness of his connections, as being son-in-law to the king of England, and nephew to Prince Maurice, whose authority in the United Provinces was almost absolute; and the young palatine, stimulated by ambition, without consulting either James or Maurice, whose opposition he foresaw, immediately accepted the offer, and marched all his forces into Bohemia, in support of his new subjects.

The affairs of the new king were not long of coming to an unfortunate crisis. It was known almost and driven at one time in England, that Frederic being defeated out of his in the great and decisive battle of Prague, had fled dominions. with his family into Holland; and that Spinola the Spanish general had invaded the palatinate, where meeting with little resistance, except from one body of 2400 Englishmen commanded by the brave Sir Horace Vere, he had in a little time reduced almost the whole principality. In 1621, the ban of the empire was published against the unfortunate elector, and the execution of it was committed to the duke of Bavaria. The upper palatinate was in a little time conquered by that prince; and measures were taken in the empire for bestowing on him the electoral dignity of which the palatinate was despoiled. Frederic was now obliged to live with his numerous family in poverty and distress, either in Holland, or at Sedan, with his uncle the duke of Bouillon; and the new conquests of the Catholics throughout all Germany were attended with persecutions against the Protestants.

At this news the religious zeal of the English was inflamed to the highest degree; and they would have had war with the house of Austria, without reflecting in the least on the consequences that might ensue. The sufferings of their Protestant brethren in Germany were the only objects of consideration, and the neutrality and inactive spirit shown by James was loudly exclaimed against. But though James might have defended his pacific measures for not ascribing his motives for not ascribing to his enemies so plausible arguments, it is certain that some of his actions, and his motives were the most ridiculous that could be imagined, on his own wisdom, that he imagined himself capable of dissuading hostile nations by dint of argument; and that the whole power of Austria, though not awed by the power of England, would submit to his arbitration, merely out of respect to his virtue and moderation. So much also was he wedded to his opinion concerning the prerogative of kings, that he imagined, wherever there was a contention between any sovereign and his subjects, the latter behaved always to be in the wrong; and for this reason, from the very first he had denied his son-in-law the title of king of Bohemia, and forbade him to be prayed for in the churches under the appellation. Besides these reasons, James was on another He is desirous of a Spanish account extremely averse to come to a rupture with Spain. He had entertained an opinion peculiar to himself, which was, that any alliance below that of a king of Spain was unworthy a prince of Wales; and he never would allow any prince but a daughter of France or Spain to be mentioned as a match for his son. This piece of pride, which really implied meanness, as if he could have received honour from any alliance, gave Spain an opportunity of managing this monarch in his most important concerns. With a view to engage him to a neutrality with regard to the succession of Cleves, the elder daughter of the king of Spain had been indirectly offered during the life of Prince Henry. The bait, however, did not then take; James, in consequence of his alliance with the Dutch, marched 4000 men to the assistance of the Protestants, by which means the
BRITAIN.

with their advice, unless when he pleased to ask it, &c.

The commons in return framed the protestation already mentioned, which the king tore out of their journals, and soon after dissolved the parliament. The leading members of the house, Sir Edward Coke and Sir Robert Phillips, were committed to the Tower; three others, Selden, Pym, and Mallory, to other prisons; and, as a lighter punishment, some others were sent into Ireland to execute the king's business. Sir John Saville, however, a powerful man in the house of commons, and a zealous opposer of the court, was made comptroller of the household, a privy councillor, and soon after a baron. This event is memorable; as being the first instance in the English history, of any king's advancing a man on account of parliamentary interest, and of opposition to his measures.

This breach between the king and parliament soon Origin of made politics become a general subject of discourse, the factions and every man began to indulge himself in reasonings of Whigs and Tories.

35 Contention between the king and commons.

For five years, James continued the dupe of the court of Spain. Though firmly resolved to contract no alliance with a heretic, the king of Spain bad con- the court of Spain. He continued to procrastinate and invent one excuse after another, while he pretended to be very willing to conclude the match. At last the King of England, finding out what was really the matter, resolved to remove that obstacle if possible. He issued public orders for discharging all Popish recusants who were imprisoned; and it was daily apprehended that he would forbid, for the future, the execution of the penal laws against them. For this conduct he was obliged to apologize, and even pretend that it was done in order to procure from foreign princes a toleration for the Protestants; the severity of the English laws against Catholics, he said, having been urged as a reason against showing any favour to Protestants residing in catholic kingdoms.

These concessions in favour of the Catholics, however ill relished by his subjects, at last obtained James's end with regard to the marriage. The earl of Bristol, ambassador at the court of Spain, a minister of vigilance and penetration, and who had formerly opposed the alliance with Catholics, being now fully convinced of the Spanish sincerity, was ready to congratulate the king on the completion of his projects. The Spanish princess is represented as very accomplished; she was to bring with her a fortune of 600,000l.; and, what was more, not only Bristol considered this match as an infallible prognostic of the palatine's restoration, but the Spaniards themselves did the same. All things being therefore agreed upon between the parties, nothing was wanting but the dispensation from Rome, which might be considered as a matter of mere formality, greed upon. The king exulted in his pacific counsels, and boasted of his superior sagacity and penetration; when all his flattering
flattering prospects were blasted by the temerity of the duke of Buckingham, who governed both court and nation with almost unlimited sway.

This nobleman had suddenly been raised to the highest honours. Though possessed of some accomplishments of a courtier, he was utterly devoid of every talent of a minister; but at once partook of the insolence which attends a fortune newly acquired, and the impetuosity which belongs to persons born in high stations, and unacquainted with opposition. Among those who had experienced the arrogance of this overgrown favourite, the prince of Wales himself had not been entirely spared; and a great coldness, if not enmity, had for that reason taken place between them. Buckingham being desirous of putting an end to this coldness, and at the same time envious of the great reputation of the earl of Bristol, persuaded the prince to undertake a journey to Madrid; which, he said, would be an unexpected gallantry; would equal all the fiction of Spanish romance; and, uniting the amorous and enterprising character of that nation, must immediately introduce him to the princess under the agreeable character of a devoted lover and daring adventurer. Little persuasion was necessary to prevail with Prince Charles to undertake this journey; and the impetuosity of Buckingham having extorted a consent from James, our two adventurers set out, Prince Charles as the knight-errant, and Buckingham as the squire. They travelled through France in disguise, assuming the names of Jack and Tom Smith. They went to a ball at Paris, where the prince first saw the princess Henrietta, whom he afterwards married, who was then in the bloom of youth and beauty, and with whom the novelists of that time say, he then fell in love. On their arrival at Madrid, every body was surprised by a step so little usual among great princes. The Spanish monarch made Charles a visit, expressed the utmost gratitude for the confidence he reposed in him, and made warm protestations of a correspondent confidence and friendship. He gave him a golden key which opened all his apartments, that the prince might, without any introduction, have access to him at all hours: he took the left hand of him on every occasion, except in the apartments assigned to Charles; for there, he said, the prince was at home: Charles was introduced into the palace with the same pomp and ceremony which attended the kings of Spain on their coronation: the council received public orders to obey him as the king himself: Olivarez too, the prime minister, though a grandee of Spain, who has the right of being covered before his own king, would not put on his hat in the prince's presence; all the prisons of Spain were thrown open, and all the prisoners received their freedom, as if an event the most honourable and most fortunate had happened to the monarchy; and every sumptuary law with regard to apparel was suspended during Prince Charles's residence in Spain. The infanta, however, was only shown to her lover in public; the Spanish ideas of decency being so strict, as not to allow any farther intercourse till the arrival of the dispensation. The point of honour was carried so far by these generous people, that no attempt was made, on account of the advantage they had acquired by having the prince of Wales in their power, to impose any harder conditions of treaty: their pious zeal only prompted them on one occasion to desire more concessions in the religious articles; but, on the opposition of Bristol, they immediately desisted. The pope, however, hearing of Charles's arrival in Madrid, tackled some new clauses to the dispensation; and it became necessary to transmit the articles to London, that the king might ratify them. This treaty, which was made public, consisted of several articles, chiefly regarding the exercise of the Catholic religion by the infants; and, among these, nothing could reasonably be found fault with, except one article, in which the king promised that the children should be educated by the princess till they were ten years of age; which undoubtedly was insisted upon with a view of seapong their minds with Catholic principles. But, besides this public treaty, there were some private articles sworn to by James, which could not have been made public without grievous murmurs. A suspension of the penal laws against the English Catholics was promised, as likewise a repeal of them in parliament, and a toleration for the exercise of that religion in private houses. Meanwhile Gregory XV. who granted the dispensation, died; and Urban VIII. was chosen in his place. Upon this event, the nuncio refused to deliver the dispensation till it should be renewed by Urban. This the crafty pontiff delayed, in hopes that, during the prince's residence in Spain, some expedient might be fallen upon to effect his conversion. The prince king of England, as well as the prince, became impatient: but, on the first hint, Charles obtained leave to return; and Philip grazed his departure with all the circumstances of civility and respect which had attended his arrival. He even erected a pillar on the spot where they took leave of each other, as a monument of mutual friendship: and the prince, having sworn to the observance of all the articles, embarked on board the English fleet at St Andero.

The modest, reserved, and decent behaviour of Charles, together with his unparalleled confidence in them, and the romantic gallantry he had practised with regard to their princess, had endeared him to the whole court of Madrid. But in the same proportion that Charles was beloved and esteemed, was Buckingham despised and hated. His sallies of passion; his indecent freedoms with the prince; his dissolute pleasures; his arrogant impetuous temper, which he neither could nor would disguise; were to the Spaniards the objects of peculiar aversion. They lamented the infant's fate, who must be approached by a man whose temerity seemed to respect no laws divine or human. Buckingham, on the other hand, sensible how odious he was become to the Spaniards, and dreading the influence which that nation would naturally acquire after the arrival of the infanta, resolved to employ all his credit in order to prevent the marriage. By what arguments he could prevail on the prince to offer such an insult to the Spanish nation, from whom he had received such generous treatment; by what colours he could disguise the ingratitude and impudence of such a measure; these are totally unknown to us: certain it is, however, that when the prince left Madrid, he was firmly determined, in opposition to his most solemn promises, to break off the treaty with Spain. On their arrival at London, therefore, the prince and Buckingham assumed the entire direction of the negotiations; and it was
was their business to seek for pretences by which they could give a colour to their intended breach of treaty. At last, after many fruitless artifices were employed to delay or prevent the espousals, Bristol received positive orders not to deliver the proxy which had been left in his hands, or to finish the marriage, till security was given for the full restitution of the palatinate. Philip understood this language: but being determined to throw the whole blame of the rupture on the English, he delivered into Bristol's hand a written promise, by which he bound himself to procure the restitution of the palatinate either by persuasion or by every other possible means; and when he found that this concession gave no satisfaction, he ordered the infant to lay aside the title of princess of Wales, which she bore after the arrival of the dispensation from Rome, and to drop the study of the English language; and as he knew that such rash counsels as now governed the court of England would not stop at the breach of the marriage-treaty, he immediately ordered preparations for war to be made throughout all his dominions.

A match for Prince Charles was soon after negotiated with Henrietta, daughter of the great Henry IV. of France, and this met with much better success than the former. However, the king had not the same allurements in prosecuting this match as the former, the portion promised him being much smaller; but, willing that his son should not be altogether disappointed of a bride, as the king of France demanded only the same terms that had been offered to the court of Spain, James thought proper to comply. In an article of this treaty of marriage, it was stipulated, that the education of the children till the age of 13 should belong to the mother; and this probably gave that turn towards popery which has since proved the ruin of the unfortunate family of Stuart.

Jame now, being deprived of every other hope of relieving his son-in-law but by force of arms, declared war against Spain and the emperor, for the recovery of the palatinate; 6000 men were sent over into Holland to assist Prince Maurice in his schemes against those powers; the people were everywhere elated at the courage of their king, and were satisfied with any war which was to exterminate the Papists. This army was followed by another consisting of 12,000 men, commanded by Count Mansfeldt; and the court of France promised its assistance. But the English were disappointed in all their views: the troops being embarked at Dover, upon sailing to Calais, found no orders for their admission. After waiting for some time, they were obliged to sail towards Zealand, where no proper measures were yet consulted for their disembarkation. Meanwhile, a pestilential disorder crept in among them, so long cooped up in narrow vessels: half the army died while on board; and the other half weakened by sickness, appeared too small a body to march into the palatinate; and thus ended this ill-concerted and fruitless expedition.

Whether this misfortune had any effect on the king's constitution or not, is uncertain; but he was soon after seized with a tertian ague, which put an end to his life on the 25th of March 1625, after having lived 59 years, and reigned over England 22, and over Scotland almost as long as he lived.

James was succeeded by his son Charles I, who ascended the throne amidst the highest praises and encomiums of his subjects, for what was perhaps the most blame-worthy action of his life, namely, his breaking off the match with the Spanish princess, and procuring the rupture with the house of Austria. Being young, his affection and unexperienced, he regarded these praises as sighs for his censure: and therefore was so impatient to assemble the great council of the nation, that he would gladly, for the sake of despatch, have called together the same parliament which sat under his father, and which lay at that time under prorogation. But being told that such a measure would appear unusual, he issued proclamations for summoning a new parliament on the 7th of May; and it was not without regret that the arrival of the princess Henrietta, whom he had espoused by proxy, obliged him to delay, by repeated prorogations, their meeting till the 18th of June, when they assembled at Westminster for the despatch of business.

Charles inherited from his father great distress for his chancery, very high notions of the royal prerogative, and a violent attachment to Episcopacy. As to his character, he seems to have been obstinate, though not resolute; and therefore, though it was scarce ever possible to make him give up his point, he never could carry on his design with that spirit which was necessary for their success. In other respects, he appears to have possessed every virtue requisite to constitute the character of a good man. At present believing his subjects to be in perfect friendship with him, as he was with them, he resolved that their bounty to him should be entirely unmasked, and the genuine effect of mutual confidence and regard. Accordingly, his discourse to the parliament was full of simplicity and cordiality: his parliaments lightly mentioned the occasion he had for supplyment. He employed no intrigue to influence the suffrages of the members. He would not even allow the officers of the crown, who had seats in the house, to mention any particular sum which he had occasion for; but trusted entirely to the wisdom and affection of his parliament, who perfectly well knew his circumstances.

It is almost impossible to read without indignation their scandalous account of the return made by the commons to this dastardly profligate conduct of their sovereign. They knew not that all the money granted by the last parliament had been expended on military and naval preparations; and that great anticipations were likewise made on the revenues of the crown. They were not ignorant that Charles was loaded with a debt contracted by his father, who had borrowed money both from foreign princes, and from his own subjects. They had learned by experience, that the public revenues could with difficulty maintain the dignity of the crown, even under the ordinary charges of government. They were sensible that the present war was, very lately, the result of their own importunate applications and entreaties, and that they had solemnly engaged to support their sovereign in the management of it. They were acquainted with the difficulty of military enterprises directed against the whole house of Austria; against the king of Spain, possessed of the greatest riches and most extensive dominions of any prince in Europe; against the emperor Ferdinand, hitherto the most fortunate monarch of the age, who had subdued and astonishe
BRITAIN.

Although a vigorous offensive war were waged against these mighty potentates, ere they would resign the palatinate which they had now fully subdued, and which they held in secure possession by its being surrounded with all their other territories. To answer, therefore, all these great and important ends; to satisfy their young king in the first request he made them; to prove their sense of the many royal virtues, particularly economy, with which Charles was endowed; the commons thought proper to confer on the king a supply of 12,000l. To search for the reasons of such an extravagant piece of conduct would be needless; it is impossible they could be good.

It is not to be supposed that Charles, or any person of common sense, could be insensible of such treatment as this; he behaved, however; with great moderation. He represented in the most explicit manner the necessity there was for a large supply: he even condescended to use entreaties: he said that this request was the first he had ever made them; that he was young, and in the commencement of his reign; and if he now met with kind and dutiful usage, it would endanger him to the use of parliaments, and would for ever preserve an entire harmony between him and his people.—To these reasons and entreaties, the commons remained inexorable; they even refused the addition of two fifteenths to the former supply. Instead of this, they renewed their ridiculous complaints against the growth of Popery, which was now their only grievance. They showed their intolerant spirit by demanding a strict execution of the penal laws against the Catholics; and remonstrated against some late pardons granted to priests. They attacked Montague, one of the king’s chaplains, on account of a moderate book which he had lately composed, and which, to their great disgust, saved virtuous Catholics as well as other Christians from eternal torments. Charles gave them a gracious and compliant answer; but firmly resolved to abate somewhat of the rigorous laws against that unfortunate party, which his engagements with France absolutely required. No measure, however, throughout the whole reign of this prince, was more disgraceful to his bigotted subjects, or by its consequences more fatal to himself than this resolution. The Puritans had continued to gain ground during the whole reign of James, and now formed the majority of the house of commons; in consequence of which, petitions were presented to the king for placing such able clergymen as had been silenced for want of conformity to the ceremonies. They also enacted laws for the strict observance of Sunday, which they affected to call the sabbath, and which they sanctioned with the most melancholy indolence; and it is worthy of notice, that the different appellations of Sunday and Sabbath were at that time known symbols of the different parties. In consequence of this behaviour in Charles’s first parliament, it was dissolved on the 12th of August 1625, and a new one called on February 6. 1626.

During this interval Charles had been obliged to borrow from his subjects on privy seals; the advantage of which was but a small compensation for the disgust it occasioned. By means, however, of that supply, and some other expedients, he was enabled to equip his fleet, though with difficulty. It was designed against Spain, but performed nothing worth notice. and its bad success increased the clamours against the court.

Charles’s second parliament immediately adopted the same views with the former; however, they voted him a supply of three subsidies (158,000l.), and three fifteenths; but the passing this vote into a law was remitted until the end of the session, that in the mean time they might have an opportunity of forcing the king to make what concessions they pleased. This harsh and undutiful conduct was greatly resented by Charles; but he found himself obliged to submit, and wait the event with patience. In the mean time they attacked the duke of Buckingham, who was become generally obnoxious; and he was also impeached by the earl of Bristol, on account of his conduct with regard to the Spanish negociation. The earl’s impeachment, however, was entirely overlooked, and the commons were able to prove nothing otherwise of any consequence against him. The king imagining that Buckingham’s greatest crime was the having been so much in favour with his sovereign, commanded the house expressly not to meddle with his minister and servant, but to finish in a few days the bill they had begun for the subsidies; otherwise they must expect to sit no longer.

Suggestions of this kind had a bad effect; and when the commons disclaimed the king proceeded further to throw into prison two more disloyal members of the house who had managed the impeach- ment against Buckingham, the commons declared that they would proceed no further in business till they had satisfaction in their privileges. Charles alleged as the reason of this measure, certain seditious expressions, which, he said, had, in their accusation of the duke, dropped from these members. Upon inquiry it appeared that no such expressions had been used, and the members were accordingly released. Soon after, the house of lords, moved by the example of the commons, claimed liberty for the earl of Arundel, who had been lately confined in the Tower; and after many fruitless evasions, the king was obliged, though somewhat ungraciously, to comply.

The next attack made by the commons would have proved decisive, had it succeeded, and would have reduced the king to an absolute dependence on his parliament. They were preparing a remonstrance against the levying of tonnage and poundage without consent of parliament. This article, together with the new impositions laid on merchandise by James, constituted near one half of the crown revenues; and after having gained this point, they were to petition the king, which then would have been the same thing with commanding him, to remove Buckingham from his presence and councils. The king, however, being alarmed at parliament the yoke they were preparing for him, dissolved his parliament a second time, June 15. 1626.

Charles having thus made such a breach with his parliament as there was no hopes of repairing, was obliged to have recourse to the exercise of every branch of his prerogative in order to supply himself with money. A commission was openly granted to compound with the Catholics, and agree for dispensing with the penal laws enacted against them; and by this expedient the king, indeed, filled his coffers, but gave universal disgust to his subjects. From the nobility he desired assistance: from the city he required a loan of 100,000l. The
The former contributed slowly: but the latter, covering themselves under many pretences and excuses, gave at last a flat denial. In order to equip a fleet, a distribution by order of the council was made to all the maritime towns; and each of them was required, with the assistance of the adjacent counties, to arm as many vessels as were appointed them. The city of London was rated at 20 ships: and this is the first appearance, in Charles's reign, of ship-money; a taxation which had once been imposed by Elizabeth, but which, when carried some steps farther by Charles, produced the most violent discontents. These methods of supply were carried on with some moderation, till news arrived of the king of Denmark being totally defeated by Count Tilly the imperial general; but money then becoming more than ever necessary, it was suggested in council, that the most speedy, equal, and convenient method of supply was by a general loan from the subject, according as every man was assessed in the rolls of the last subsidy. That precise sum was required which each would have paid, had the vote of four subsidies been passed into a law: care, however, was taken, that the sums thus exacted were not to be called subsidies but loans; but it was impossible to avoid observing, that thus the liberty of the subject was entirely destroyed, and all parliaments rendered at once superfluous.

Many people throughout England refused these loans, and some were even active in encouraging their neighbours to insist upon their common rights and privileges. By warrant of the council, these were thrown into prison. Most of them patiently submitted to confinement, or applied by petition to the king, who commonly released them. Five gentlemen, however, Sir Thomas Darnel, Sir John Corbet, Sir Walter Earl, Sir John Heweningham, and Sir Edmond Hambden, demanded release, not as a favour from the court, but as their due by the laws of their country. No particular cause was assigned for their commitment. The special command of the king and council alone was pleaded. And it was alleged, that by law this was not sufficient reason for refusing bail or realeasement to the prisoners. The question was brought to a solemn trial before the court of king's bench; and the whole kingdom was attentive to the issue of the cause. By the debates on this subject it appeared, that personal liberty had been secured by no less than six different statutes, and by an article in magna charta itself. It appeared, that, in times of turbulence and sedition, the princes infringed upon these laws; and of this also many examples were produced. The difficulty then lay to determine when such violent measures were necessary; but of that the court pretended to be the supreme judge. As it was legal, therefore, that these five gentlemen should plead the statute, by which they might demand bail, so it was expedient in the court to remand them to prison, without determining on the necessity of taking bail for the present. This was a cruel evasion of justice; and, in fact, satisfied neither party. The court insisted that no bail could be taken: the country exclaimed that the prisoners ought to be set free.

While the king was thus embroiled with his parliament at home, and with powerful nations abroad, he rashly engaged in a war with France, a kingdom with which he had but lately formed the most natural alliance. All historians agree that this war proceeded from the rivalship of the duke of Buckingham and Cardinal Richelieu; both of whom were in love with the queen of France; and an inconstant enmity being thus produced between these favourites, they resolved to involve their respective nations in the dispute. However this be, war was declared against France; and Charles was taught to hope, that hostilities with that kingdom would be the surest means of procuring tranquillity at home. The success of this war was proportionable to the wisdom with which it was commenced. Buckingham was appointed commander; and he being entirely unacquainted both with sea and land service, managed matters so ill, that he lost two-thirds of his army, and returned in total discredit both as an admiral and general.

The discontents in England now rose to such a height, that there was reason to apprehend an insurrection or rebellion. Charles was also reduced to the greatest distress for want of money. That which he had levied by virtue of his prerogative came in very slowly, and it was dangerous to renew the experiment on account of the ill humour of the nation in general. A third parliament therefore was called, March 17, 1652; whom Charles plainly told at the beginning of the session, that "if they should not do their duties, in contributing to the necessities of the state, he must, in discharge of his conscience, use those other means which God had put into his hands, in order to save that which the follies of some particular men might otherwise put in danger." This parliament behaved in a much more reasonable manner than either of the two former ones. The nation was now really aggrieved by the late arbitrary proceedings. They began with voting against arbitrary imprisonments and forced loans; after which, five subsidies (280,000l.) were voted to the king. With this sum, though much inferior to his wants, Charles declared himself well satisfied; and even tears of affection started in his eye when informed of this concession: the commons, however, resolved not to pass this vote into a law, before they had obtained from the king a sufficient security that their liberties should be no longer violated as they had formerly been. They resolved to frame a law, which they were to call "a petition of right framed, in which they should collect all the arbitrary exactions of the prerogative which Charles had exposed to their view, and these they were to assault at once by their petition. The grievances now complained of were, forced loans, benevolences, taxes without consent of parliament, arbitrary imprisonments, billeting soldiers, and martial law. They pretended not, as they affirmed, to any unusual power or privileges; nor did they intend to infringe the royal prerogative in any respect: they aimed only at securing those rights and privileges derived from their ancestors.

The king, on his part, now began plainly to show, duplicity that he aimed at nothing less than absolute power of the king. This reasonable petition he did his utmost to evade, by repeated messages to the house, in which he always offered his royal word that there should be no more infringements on the liberty of the subject. These messages, however, had no effect on the commons: they knew how insufficient such promises were, without further security; and therefore the petition at last passed both houses, and nothing was wanting but the royal assent.
BRITAIN.

The king accordingly came to the house of peers, sent for the commons, and being seated in the chair of state, the petition was read to him. In answer to it, he said, "The king will, that right be done according to the laws and customs of the realm, and that the statutes be put into execution; that his subjects may have no cause to complain of any wrong or oppression contrary to their just rights and liberties, to the preservation whereof he holds himself in conscience as much obliged as of his own prerogative."

This unequivocal answer was highly resented. The commons returned in very ill humour. Their indignation would undoubtedly have fallen on the unfortunate Catholics, had not their petition against them already received a satisfactory answer. To give vent to their present wrath, therefore, they fell on Dr. Mannering, who had preached a sermon, and at the special command of the king, printed it; which was now found to contain doctrines subversive of all civil liberty. It taught, that though property was commonly lodged in the subject, yet, whenever any exigency required supply, all property was transferred to the sovereign; that the consent of parliament was not necessary for the imposition of taxes; and that the divine laws required compliance with every demand, however irregular, which the prince should make upon his subjects. For these doctrines Mannering was sentenced to be imprisoned during the pleasure of the house; to be fined £1,000 to the king; to make submission and acknowledgement for his offence; be suspended three years; be incapable of holding any ecclesiastical dignity or secular office; and that his book be called in and burnt.

No sooner, however, was the session ended, than Mannering received a pardon, and was promoted to a living of considerable value. Some years afterwards he was promoted to the see of St. Asaph. At last, the king, seeing it was impossible to carry his point, yielded to the importunities of parliament. He came to the house of peers, and pronouncing the usual form of words, "Let it be law as is desired," gave full sanction and authority to the petition. The house resound ed with acclamations, and the bill for five subsidies immediately passed.

The commons, however, were not yet satisfied; they began again to attack Buckingham, against whom they were implacable; they also asserted, that the levying of tonnage and poundage without consent of parliament was a palpable violation of the ancient liberties of the people, and an open infringement of the petition of right so lately granted. The king, in order to prevent a remonstrance on that subject, suddenly prorogued the parliament, on June 26, 1628.

The commons soon got rid of their enemy Buckingham; who was murdered on the 23rd of August this same year, by one Felton, who had formerly served under him as a lieutenant. The king did not appear much concerned at his death, but retained an affection for his family throughout his whole lifetime. He desired also that Felton might be returned in order to extort from him a discovery of his accomplices; but the judges declared, that though that practice had been formerly very common, it was altogether illegal.

In 1629, the usual contentions between the king and his parliament continued. The great article on which the commons broke with their sovereign, and which finally created in him a disgust at all parliaments, was their claims with regard to tonnage and poundage. The dispute was, whether this tax could be levied without consent of parliament or not. Charles, supported by multitudes of precedents, maintained that it might; and the parliament, in consequence of their petition of right, asserted that it could not.

The commons were resolved to support their rights; and the disputes concerning tonnage and poundage went hand in hand with some theological controversies; particularly concerning Arminianism, which the Puritans, who now formed the majority of the nation, opposed with the greatest violence, and which consequently crept in among those who professed Episcopacy, where it had still maintained its ground more than in any other party.

The commons began with summoning before them the officers of the custom-house, to give an account by what authority they had seized the goods of those merchants who had refused to pay the duties of tonnage and poundage. The barons of exchequer were questioned with regard to their decrees on that head. The sheriff of London was committed to the Tower for his activity in supporting the officers of the custom-house. The goods of Rolle, a merchant, and member of the house, being seized for his refusal to pay the duties, complaints were made of this violence, as if it were a breach of privilege. Charles, on the other hand, supported his officers in all these measures, and the quarrel between him and the commons became every day higher. Sir John Eliot framed a remonstrance against tonnage and poundage, which he offered to the clerk to read; but it was refused, and he then read it himself. The question being called for, Sir John Finch the speaker said, that he had a command from the king to adjourn, and to put no question; upon which he rose and left the chair. The whole house was in an uproar; the speaker was pushed back into the chair, and forcibly held in it, till a short remonstrance was formed, which was instantaneously passed by almost universal acclamation. Papists and Arminians were now declared capital enemies to the commonwealth. Those who levied tonnage and poundage were branded with the same epithet. And even the merchants, who should voluntarily pay these duties, were declared betrayers of English liberty, and public enemies. The doors being locked, the gentleman usher of the house of lords, who was sent by the king, could get no admittance till this remonstrance was finished. By the king's order he took the mace from the table, which put an end to their proceedings, and on the 10th of March the parliament was dissolved. Some of the members were imprisoned and fined; but this severity served only to increase the general discontent, and point out the sufferers as proper leaders for the popular party.

Charles being now disgusted with parliaments, resolved to call no more; but finding himself destitute of resources, was obliged to make peace with the two Spain powers with which he was at war. A treaty was signed with France on the 14th of April, and another with Spain on the 5th of November 1630, by which Charles bound himself to observe a neutrality with regard to the affairs on the continent. His conduct to his subjects cannot now appear entirely blameless, nor the general discontent
discontent altogether without foundation. As if, however, he had resolved to ruin himself, and to lose the small degree of affection which remained among his subjects, Charles now began to set about making innovations in religion. Archbishop Laud had obtained a prodigious ascendancy over the king; and, by his superstitious attachment to foolish ceremonies, led him into a conduct that proved fatal to himself and to the kingdom in general. The humour of the nation ran at that time in a channel perfectly the reverse of superstition. The ancient ceremonies which had been sanctified by the permission and practice of the first reformers, could scarce be retained in divine service. Laud chose this time, of all others the most improper, for renewing the ceremonies of the fourth and fifth century, when the Christian church, as is well known, was sunk into the superstitions which were afterwards continued and augmented by the policy of the church of Rome. So openly were these tenets espoused, that not only the discontented Puritans believed the church of England to be relapsing fast into the Romish superstition, but the court of Rome itself entertained hopes of regaining its authority in this island. To forward Laud's good intentions, an offer was twice made to him, in private, of a cardinal's hat; which he declined accepting. His answer was (as he says himself), that "something dwelt within him which would not suffer his compliance till Rome was other than it." It must be confessed, however, that though Laud deserved not the appellation of a Papist, the genius of his religion was, though in a less degree, the same with that of the Romish. The same profound respect was exacted to the sacerdotal character; the same submission to the creeds and decrees of synods and councils required; the same pomp and ceremony was affected in worship; and the same superstitious regard to days, postures, meats, and vestments. Orders were given, and rigorously insisted on, that the communion table should be removed from the middle of the area where it had hitherto stood in all churches except cathedrals. It was placed at the east end, railed in, and denominated an altar; as the clergyman who officiated commonly received the appellation of priest. All kinds of ornaments, especially pictures, were introduced. Some of these, upon inquiry, were found to be the very same that were to be met with in the mass-book. The crucifix too, that perpetual consolation of all pious Catholics, and terror to all sound Protestants, was not forgotten on this occasion.

In return for Charles's indulgence towards the church, Laud and his followers took care to magnify on every occasion the regal authority, and to treat with the utmost disdain or detestation all puritanical pretensions to a free and independent constitution. From this subsjection, however, they took care to exclude themselves, and insisted upon a divine and apostolical charter in preference to a legal and parliamentary one. The sacerdotal character was magnified as sacred and indefeasible; all right to spiritual authority, or even to private judgment in spiritual subjects, was refused to profane laymen: ecclesiastical courts were held by bishops in their own name, without any notice taken of the king's authority: and Charles, though extremely jealous of every claim in popular assemblies, seemed rather to encourage than repress those encroachments of his clergy.

The principles which exalted prerogative were put in practice during the whole time that Charles ruled without parliaments. He wanted money for the unpopular port of government; and he levied it, either by the re- grant of obsolete laws, or by violations of the privileges. Though humane and gentle in his nature, he gave way to severities in the star chamber and high commission, which seemed necessary in order to support the present mode of administration, and suppress the rising spirit of liberty throughout the kingdom. Tonnage and poundage were continued to be levied by royal authority alone. The former arbitrary impositions were still exacted; and even new impositions laid upon the different kinds of merchandise. The custom-house officers received orders from the council to enter into any house, warehouse, or cellar; to search any trunk or chest; and to break any bulk whatever, in default of the payment of customs. In order to exercise the militia, each county, by an edict of the council, was assessed in a certain sum for maintaining a muster-master appointed for that service. Compositions were openly made with recusants, and the Popish religion became a regular part of the revenue. A commission was granted for compounding with such as were possessed of crown-lands on defective titles; and on this pretence some money was exacted of the people, &c.
