1823.
BURKE, EDMUND, a writer, orator, and statesman, was born in Dublin, on the first January, in the year 1732. His father was an attorney, first in Limerick, and afterwards in Dublin. Young Burke received the first rudiments of his education at Ballytore, in the county of Kildare, under the tuition of Abraham Shackleton, a Quaker of considerable celebrity. Committed to the care of a master so admirably qualified for the important business of instruction, young Burke applied to his studies with commendable assiduity, and became one of the numerous examples that might be adduced, to demonstrate the falsehood of that popular but dangerous maxim, that young men of genius are always destitute of application.

In this seminary he laid the foundation of his knowledge in the languages of antiquity; whence he was hereafter to borrow the elegance of his taste, and the models and imagery of his eloquence. From this source was also, most probably, derived that love of liberty, which, germinating at certain periods in his bosom, so often pointed his oratory, inflamed his passions, and animated his sentiments; and which in his best days acquired him a reputation almost unequalled in our times.

At this respectable school several years of his life were spent: and the attachment of the master, and the gratitude of the pupil, reflect honour on both. The former lived to see his scholar attain a considerable degree of reputation; and he on his part was accustomed to spend a portion of his annual visit to Ireland at Ballytore.

From a provincial seminary Edmund was sent to the university of Dublin. Here, however, he does not appear to have distinguished himself either by application or talents. His character, as a student, was merely negative. He exhibited no symptoms of early genius, obtained no palms in the academic race, and departed even without a degree. During this period, however, he commenced author. His first essays were of a political nature.

Mr Burke now addicted himself to other pursuits, particularly logic and metaphysics; and is said to have planned a refutation of the systems of Berkeley and Hume. While thus employed in treasuring up the means of attaining a species of celebrity, which far different avocations prevented him afterwards from aspiring to, he was not inattentive to the grand object of obtaining a suitable settlement in life; for his family was not opulent, and he already panted after independence. He accordingly became a candidate for a vacant chair at the university of Glasgow. The immediate reason of his failure is not directly known; but on this he repaired to the metropolis, and enrolled his name as a student of the Inner Temple.

It appears from his speeches, his writings, and his conversation, that he studied the grand outline of our municipal jurisprudence with particular attention; but it may be doubted whether he ever entered into the minutiae. Indeed, the versatility of his talents, and his avocations, were but little calculated for that dull and plodding circuit which can alone lead to an intimate knowledge of our laws. Besides, if he had been gifted with the necessary application, both time and opportunity were wanting: for it is well known that at this period of his life the "res angusta domi" did not permit the student to dedicate his attention solely to this, or indeed to any other single object.

The exhausted state of his finances called frequently for a speedy supply; and, instead of pursuing the pages of Bracton, Fleta, Littleton, and Coke, he was obliged to write essays, letters, and paragraphs, for the periodical publications of the day. But if these pursuits diverted his attention from graver studies, they acquired him a facility of composition, and a command of style and of language, which proved eminently serviceable in the course of his future life.

His health, however, became at length impaired, and a nervous fever ensued. This circumstance induced him to call in the aid of Dr Nugent, one of his own countrymen, a medical man, whose manners were more amiable than his practice was extensive. This gentleman, who had travelled on the continent, and was an author himself, readily discovered the source of his malady, and, by removing him from books and business to his own house, soon effected a cure. That event is said to have been hastened, if not entirely completed, by a physician of another kind; the accomplished daughter of his host. This lady was destined to become his wife; a circumstance particularly fortunate for him, as her disposition was mild and gentle, and she continued through a long series of years, and many vicissitudes of fortune, to soothe and tranquillize passions always violent, and often tumultuous.

Our student seems at length to have determined once more to endeavour to distinguish himself as an auth

Digitized by Google
Burke, and he accordingly took advantage of the death of a celebrated peer to write a work after the manner of that nobleman. In which, by exaggerating his principles, he should be enabled to bring them into contempt: but this effort proved unsuccessful, for the treatise in question was for a long time consigned to oblivion, and would never have been heard of, had it not been resuscitated by his future fame. Another performance made ample amends: his "Essay on the Sublime and Beautiful" attracted a high degree of reputation, and acquired him considerable celebrity as a man of letters. In addition to the profits of the publication, he is said on this occasion to have received a present from his father of 300l. But his circumstances must have been greatly embarrassed about this time, as he was obliged to sell his books; and surely nothing but the extremity of distress could have forced a man of letters to such a measure.

The work has just mentioned, having an immediate relation to taste, excited a desire in Sir Joshua Reynolds, even then at the head of his profession, to become acquainted with Mr Burke; and a friendship ensued which continued uninterrupted during the life of the painter, and was unequivocally testified by a handsome bequest in his will. Dr Johnson also sought and obtained an intimacy with him, and he now became the constant frequenter of two clubs, composed of some of the most celebrated men of that day. One of these met at the Turk's Head tavern in Gerrard-street, and consisted of the following members: Dr Johnson, Mr (afterwards Sir Joshua) Reynolds, Dr Goldsmith, Mr Topham Beancere, Dr Nugent, Sir John Hawkins, Mr Bennet Langton, Mr Chamier, Mr Garrick, and Mr Burke.

The other assembled at the St James's coffee-house, and besides many of the above, was composed of the following members: Mr Cumberland, Dr Douglas bishop of Salisbury, Dr Bernard dean of Derry, Mr Richard Burke, Mr William Burke, Mr Hickey, &c. Dr Goldsmith, who was Mr Burke's contemporary at Dublin College, was a member of both, and wrote the epitaphs of those who composed the latter. That on Mr Burke has often been praised.

Here lies our good Edmund whose genius was such, We scarcely can praise it or blame it too much; Who, born for the universe, narrowed his mind, And to party gave up what was meant for mankind. Though fraught with all learning, yet straining his throat To persuade Tommy Townshend to lend him a vote; Who, too deep for his hearers, still went on refining, And thought of convincing while they thought of dining; Though equal to all things, for all things unfit; Too nice for a statesman, too proud for a wit; For a patriot too cool, for a drudge disobedient; And too fond of the right, to pursue the expedient. In short, 'twas his fate, unemployed, or in place, Sir, To eat mutton cold, and cut blocks with a razor.

A literary work on a new plan, first suggested in 1750, and by some attributed to the Dodeleys, and by others to Mr Burke, became, for some time, a considerable source of emolument to him. This was called the "Annual Register," a publication that soon obtained considerable celebrity, and of which he had the superintendence for several years.

He was at length called off from his literary labours by avocations of a far different kind. A gentleman who afterwards derived the cognomen of "single-speech Hamilton," from a celebrated oration, having been appointed secretary to the lord-lieutenant of Ireland, invited his friend Mr Burke to accompany him thither; this offer he readily complied with, and although he acted in no public station, and performed no public service while he remained in that country, he was rewarded with a pension of 300l. per annum, which he soon after disposed of for a sum of money.

On his return to England he amused himself, as usual, with literary composition. A series of essays, written by him in a newspaper, which, at one time, obtained great celebrity, attracted the notice of the late Marquis of Rockingham; and Mr Fitzherbert, a member of parliament, and father of the present Lord St Helen's, in consequence of this circumstance, introduced him to that nobleman. From this moment he was destined to become a public man, and to dedicate his studies, his eloquence, and his pen, to politics.

Lord Rockingham having proved more compliant than the Earl of Chatham, the former nobleman was brought into power, and seated on the treasury bench. On this occasion he selected Mr Burke as his private secretary, an office of no power and very little emolument, but which naturally leads to both. As it was now necessary he should have a seat in parliament, although it cannot be supposed that he was legally qualified in respect to property, he applied to Lord Verney, who was patron of Wendover, a borough at that time dependent on him, and principally occupied by his tenants.

Having thus obtained a seat in 1765, he prepared to fit himself for his new situation. He was already provided with all the necessary talents, and was only deficient in the forms of business, and the facility of expressing his sentiments before a public audience. The first of these was mastered by sedulous attention; and as to the second, if we are to give credit to those who pretend to be intimately acquainted with this period of his life, he overcame all difficulties by a previous initiation elsewhere. In short he had acquired celebrity at the "Robinhood," before he attempted to speak in the British senate, and vanquished an eloquent "baker" ere he began to cope with the great orators of the nation.

Holding a confidential place under the Rockingham administration, he of course supported all its measures. A former ministry, anxious to increase its influence by means of increased imposts, had conceived the idea of taxing America through the medium of a parliament in which she was not represented. Having attempted to carry this into effect by means of the famous stamp act, the Americans, alarmed at what they conceived to be a flagrant violation of every principle of the English constitution, made such a spirited resistance to the measure that it was abandoned, and the Rockingham party readily consented to the repeal. Under the pretext, however, of vindicating the honour of the crown, they unfortunately proposed and carried the declaratory
The city of Bristol, the merchants of which had become rich by the commerce with America, were likely to suffer by its interdiction. This consideration alone rendered many of them hostile to the proceed-

ings of the ministry; but nobler and more exalted motives actuated the bosoms of others, particularly the Quakers, Dissenters, and other sectaries who were moved by zeal against oppression, and a love of liberty imprinted on their minds by a constitution which had remained until then inviolate. Gratified by the exertions of Mr. Burke in behalf of civil and religious freedom, they put him in nomination for their city, and sent into Yorkshire, to request his immediate personal attendance. After consulting with his patron concerning an offer so flattering and unexpected, accompanied at the same time with assurances most punctually fulfilled, that he should be put to no expense whatever, he immediately set out for the west of England, and found that no less than three candidates had started before him. The first was Lord Clare, afterwards Lord Nugent, one of the former representatives, whose unpopularity was such, that he soon discovered the necessity of resigning all his pretensions; two, therefore (Mr. Cruger and Mr. Brickdale), only remained in the field, and the former of these, like Mr. Burke himself, was averse to a rupture with America.

The new candidate did not appear on the hustings until the afternoon of the sixth day's poll, on which occasion he addressed the electors in a very able speech, admirably calculated for the occasion. He began by expressing a modest deference of his own abilities, and a high opinion of the important trust they were assembled to confer. He then boldly declared himself hostile to a contest with America, and asserted, that England had been rendered flourishing by liberty and commerce, the first of which was dear to his heart, while the latter had been a favourite object of his studies, both in its principles and details. This harangue was well received by the electors; the contest proved propitious to his wishes; and when the sheriffs had notified, at the close of the poll, that he was elected, he made the most brilliant address on the occasion that had ever been heard within the walls of a city celebrated rather for its opulence than its eloquence.

Mr. Burke immediately returned from his new constituents to parliament, with increased vigour, reputation, and zeal. The Earl of Chatham, having failed, notwithstanding his reputation for wisdom, in an attempt to adjust the troubles of the colonies by means of a conciliatory bill introduced by him into the house of peers for that purpose, the obstinacy of the ministry now became apparent to every one. This circumstance, which would have appalled an inferior man, did not, however, discourage the member for Bristol from a similar attempt in another place; and accordingly, March 22, 1775, he brought forward his thirteen celebrated propositions, which were intended to close the fatal breach, and heal all the differences between the mother country and her colonies.

His plan, on this occasion, embraced not only an immediate conciliation, by a repeal of the late coercive acts, but also the creation of an independent judiciary, and the regulation of the courts of admiralty. The whole, however, was quashed by a large majority on the side of the minister, who moved the previous question.
Mr Burke had hitherto chiefly distinguished himself in opposition to the measures of others; but in 1780, he himself stood forth as the original author and proponent of a scheme which soon engaged the attention of the public, and actually appeared big with the most prosperous results. When he found ministers obstinately persisting in a disastrous war, and perceived that the people began to bend beneath the weight of the taxes for its support, it struck him as advantageous on one hand, and political on the other, to diminish the public burdens and the number of adherents to the court at the same time. Accordingly, on the 11th of February, he brought in a bill "for the regulation of his majesty's civil establishments, and of certain public offices; for the limitation of pensions, and the suppression of sundry useless, expensive, and inconvenient places, and for applying the monies saved thereby, to the public service."

This scheme was manifestly founded on the late reforms that had taken place in France; for by an edict of the king, registered in the parliament of Paris, it appeared that he had suppressed no less than 406 places in his household by one regulation. The orator, with great judgment, fastened upon this event, and endeavoured to make use of it as an incitement to a similar attempt here; nay, he called in national rivalry itself, by way of an inducement to consent to this sacrifice on the part of the crown.

To this bill the minority did not at first give much opposition. Indeed the mover of it contrived to soften those features that appeared harsh to them. Notwithstanding this, it did not prove successful during Lord North's administration; and when it was at length carried, it was much modified and altered.

Parliament was dissolved in 1780, but Mr Burke was not re-elected for Bristol, and this is said to have made a deep impression on the mind of the orator; but this must have been obliterated by the important events that speedily ensued; for the minister now tottered on the treasury bench, being abandoned by many of his staunchest supporters, and left little confident in his own schemes, all of which had proved eminently unsuccessful. The opposition, having by this time increased to a considerable degree, unceasingly assailed him, until at length, March 28, 1782, Lord North assured the house of commons that his administration was at an end.

The day had now arrived when the ministry and opposition were to change places, and the former to be arrayed in the spoils of the latter. Of this rich booty Mr Burke, whose services had been so conspicuous in hunting the enemy into the toils prepared for them, had his portion: for he was made a privy councilor, and invested with the lucrative appointment of paymaster-general of the forces. He was at length now enabled to enforce his plan of political economy, tendered before in vain; and the board of trade, the board of works, the offices of third secretary of state, treasurer of the chamber, cofferer of the household, the lords of police in Scotland, the master of the barriques, the master of the stag hounds, the six clerks of the board of green cloth, and the paymaster of the pensions, were abolished.

At length, the reins of government were confided to the hands of the Marquis of Lansdowne, then Earl Shelburne; and this event gave such offence to those who wished to place the duke of Portland at the head of affairs, that Mr Fox, Lord John Cavendish, and Mr Burke, immediately resigned.

In the mean time, the critical state of the English East India Company had long agitated the public mind, and become occasionally a subject of discussion in parliament. The seizure, imprisonment, and confinement of Lord Pigot, by a faction in the council of Madras; the conduct of Mr Hastings, in respect to several of the native powers; the grand question of sovereignty, relative to the territorial possessions of the company in Asia: all these subjects had, at different times, excited the attention of the nation.

No sooner did Mr Fox behold himself and his friends in possession of power, than he brought in a bill, to remedy the various abuses in the government of British India. Of this bill Mr Burke is well known to have been the principal penman, and upon this occasion he defended its principles and provisions with all the zeal of a parent. In a speech of considerable length he exhibited an able retrospect of the system, both political and commercial, of the company. He then proceeded to state the benefit likely to result from the plan under contemplation, which he considered as calculated to effect "the rescue of the greatest number of the human race that ever were so grievously oppressed, from the greatest tyranny that ever was exercised." In short, he contemplated it as a measure that would "secure the rice in his pot to every man in India." "I carry my mind (adds he) to all the people, and all the names and descriptions that, relieved by this bill, will bless the labours of this parliament, and the confidence which the best house of commons has given to him who best deserves it."

This celebrated bill, notwithstanding much opposition both within and without, was carried triumphantly through the house of commons: but in the house of peers it experienced a far different fate, and with it fell to the power and consequence of its authors, framers, and supporters.

In the course of the next year (February 28, 1783), he made a celebrated speech relative to the nabob of Arcot's debts; and depicted one of his creditors, who had taken an active share in the late elections, "as a criminal who long since ought to have fattened the region kite with his oil; the old betrayer, insulter, oppressor, and scourge of a country (Tanjore), which had for years been an object of an unremitted, but unhappily an unequal, struggle, between the bounties of Providence to renovate, and the wickedness of mankind to destroy."

But there appeared to Mr Burke to be a still greater delinquency, on whom he was determined to inflict all the wounds of his eloquence, and sacrifice, if possible, the powerful offender himself at the shrine of national vengeance. This was Mr Hastings; and soon after his arrival in England, the orator gave notice of his intentions. On the 17th of February, 1787, he opened the accusation by a most eloquent speech; in which he depicted him supposed crimes of the late governor-general, in the most glowing and animated colours. This trial, however, turned out in the event far
Burke.

for different from his hopes and expectations; while the length of it failed not to involve both himself and party in reproach.

During the debate on the commercial treaty with France (January 23, 1787), the member for Malton exhibited an undiminished versatility of talents, and pointed his ridicule with no common success at Mr Pitt, who, according to him, contemplated the subject with a narrowness peculiar to limited minds:—

"He seems to consider it (adds he) as an affair of two little compting-houses, and not of two great nations. He seems to consider it as a contention between the sign of the fleur-de-lis and the sign of the old red lion, for which should obtain the best custom."

The next public event of importance in which we find Mr Burke engaged, occurred in consequence of his majesty's indisposition. On this occasion he took an active part in the debates of the house of commons; and is supposed to have penned a letter for one, and a speech for another, branch of the royal family. When Mr Pitt moved his declaratory resolutions relative to the provisional exercise of the royal authority, he attacked him with much asperity of language, and was particularly severe on the manner in which the royal assent was to be given to all future acts of parliament. The men who held most of the high places under the government were treated as "jobbers, old backs of the court, and the supporters and betrayers of all parties; and it was a mock crown, a tinsel robe, and a sceptre from the theatre, laced over and unreal," which were about to be conferred on the prince of Wales.

The opposition, lessened indeed by a few occasional desertions, had hitherto acted as a great public body, supposed to be united in general principles, for the common welfare and prosperity of the state; but the French revolution thinned their ranks, dispelled their consequence, and, by sowing jealousy between the chiefs, spread consternation and dismay among their followers.

It was on the 2d of March 1790, when Mr Fox moved for leave to bring in a bill to repeal the corporation and test-acts, that this dissension became evident; and soon after this Mr Burke declared, "that his honourable friend and he were separated in their politics for ever."

The ministry now seemed anxious to provide for their new associate; and he, on his part, certainly appeared desirous of some remuneration at their hands, for he had abandoned all his old friends, and not a few of his old principles. In addition to this, his "Reflections on the Revolution in France," had afforded some degree of countenance, and even popularity, to the measures of administration; and, not content with his own exertions, he had enlisted his son on the same side, and even sent him to Coblenz. The royal munificence at length gratified his warmest wishes; for by a warrant, dated September 24, 1795, and made to commence January 5, 1793, he received a pension of $2000. for his own life, and that of his wife, on the civil list; while two other pensions of $2000. a-year for three lives, payable out of the four and a half per cent. fund, dated October 24, 1795, were made to commence from July 24, 1793. Honours as well as wealth now seemed to await him, for he was about to be ennobled, when the untimely death of an only child put an end to his dreams of ambition, and contributed not a little to hasten his own, which occurred at his house at Beaconsfield, July 8, 1797.

Thus died, in the 68th year of his age, Edmund Burke, one of the greatest orators, statesmen, and authors, of his age; one whose name will long continue to be celebrated; and who, had his fallen during the meridian of his fame and character, would have scarcely been considered as second to any man, either of ancient or modern times.

As a man of letters, he ranks high in point of genius, learning, and composition; and his works are attended with this peculiarity, that they are the production of almost the only orator of his day, who could wield his pen with as much facility as his tongue, and shine equally in the senate and the closet. His dissertation on the "Sublime and Beautiful" acquired him the applause of all, and secured him the friendship and assistance of many men of taste in the nation. His political tracts betoken much reading, deep thought, uncommon sagacity; and even those who may be disposed to object to his conduct, cannot but admire his various talents, his happy allusions, and his acute penetration. There is no species of composition which he has not attempted; no subject on which he has not occasionally treated: his first and his last days were equally dedicated to literature, and he disdained not any species of it, from the newspaper column, that supplied needful bread to his early youth, to the more elaborate performance that procured unnecessary opulence to his old age.

As an orator, notwithstanding some glaring defects, he stands almost unrivalled. His gesticulation was at times violent and repulsive, his manner harsh and over-bearing, his epithets coarse and disgusting; on many occasions he made use of assertions which were not bottomed in fact, and on one in particular, toward the latter end of his life, had recourse to stage trick and pantomime, instead of sense and argument. But on the other hand, no man was better calculated to arouse the dormant passions, to call forth the glowing affections of the human heart, and to "harrow up" the inmost recesses of the soul. Vehemence and meanness stood apace in his presence; he was dead to the feelings of his own conscience, was still alive to his animated reproaches; and corruption for a while became alarmed at the terrors of his countenance. His powers were never more conspicuous than on that memorable day on which he exposed the enormities of a subaltern agent of oriental despotism—on which he depicted the tortures inflicted by his orders, the flagrant injustice committed by his authority, the pollution that ensued in consequence of his sanction—when he painted agonizing nature vibrating in horrid suspense between life and destruction—when he described, in the climax of crimes, "death introduced into the very sources of life," the bosoms of his auditors became convulsed with passion, and those of more delicate organs and weaker frame actually swooned away. Nay, after the storm of eloquence had spent its force, and the captivated ear no longer listened to his voice, his features still spoke the purpose of his heart, his hand still seemed to threaten punishment, and his brow to meditate vengeance.

"The
BURKE [6] BURNE

Burlesque

Burke

Burlesque

Burlesque

Burkitt, William, a celebrated commentator on the New Testament, was born at Hitcham in Northamptonshire, July 25, 1620, and educated at Pembroke-hall, Cambridge. He entered young upon the ministry, being ordained by Bishop Reynolds: and the first employment which he had was at Milden in Suffolk, where he continued 21 years a constant preacher, first as a curate, and afterwards as rector of that church. In the year 1662, he had a call to the vicarage of Dedham in Essex, where he continued to the time of his death, which happened in the latter end of October 1703. He was a pious and charitable man. He made great collections for the French Protestants in the years 1687, &c. and by his great care, pains, and charges, procured a worthy minister to go and settle in Carolina. Among other charities, by his last will and testament, he bequeathed the house wherein he lived, with the lands thereunto belonging, to be a habitation for the lecturer that should be chosen from time to time to read the lecture at Dedham. Besides his commentary upon the New Testament, written in the same plain, practical, and affectionate manner in which he preached, he wrote a volume, entitled The poor man's help, and the rich man's guide.

Burlaw. See By-Law.

Burleigh. See Cecil.

Burlesque, a species of composition, which, though a great engine of ridicule, is not confined to that subject; for it is clearly distinguishable into burlesque that excites laughter merely, and burlesque that excites derision or ridicule. A grave subject, in which there is no impropriety, may be brought down by a certain colouring so as to be visible, as in Virgil's travestie; the author first laughs at every turn in order to make his readers laugh. The Latrin is a burlesque poem of the other sort, laying hold of a low and trifling incident to expose the luxury, indolence, and contentious spirit, of a set of monks. Boileau, the author, turns the subject into ridicule, by dressing it in the heroic style, and affecting to consider it as of the utmost dignity and importance. Though ridicule is the poet's aim, he always carries a grave face, and never once betrays a smile. The opposition between the subject and the manner of handling it, is what produces the ridicule; and therefore, in a composition of this kind, no image professedly ludicrous ought to have quarter, because such images destroy the contrast.

Though the burlesque that aims at ridicule produces its effects by elevating the style far above the subject, yet the poet ought to confine himself to such images as are lively, and readily apprehended. A strained elevation, soaring above the ordinary reach of fancy, makes not a pleasant impression. The mind is soon disgusted by being kept long on the stretch. Machinery may be employed in a burlesque poem, such as the Latrin, Dispensary, or Hudibras, with more success and propriety than in any other species of poetry. For burlesque poems, though they assume the air of history, give entertainment chiefly by their pleasant and ludicrous pictures: It is not the aim of such a poem to raise sympathy; and, for that reason, a strict imitation of nature is not necessary. And hence, the more extravagant the machinery in a ludicrous poem, the more entertainment it affords.

Burlington, a sea-port town in the east riding of Yorkshire, situated on the Germa ocean, about 37 miles north-east of York. E. Long. o. 10. and N. Lat. 54. 15. It gave the title of earl to a branch of the noble family of Boyle, but the earldom is now extinct. Population 3741 in 1811.

New Burlington, the capital of New Jersey, in North America; situated in an island of Delaware river, about 20 miles north of Philadelphia. W. Long. 74. o. N. Lat. 40. 40.

Burman, Francis, a Protestant minister, and learned professor of divinity at Utrecht, was born at Leyden in 1628; and died on the 10th of November 1679, after having published a course of divinity, and several other works.

He is not to be confounded with Francis Burman, his son; or with Peter Burman, a laborious commentator on Phaedrus, Lucan, Petronius, and other profane authors, who died in 1741.

Burn, in Medicine and Surgery, an injury received in any part of the body by fire. See Surgery.

Burnet, Gilbert, bishop of Salisbury in the latter end of the 17th century, was born at Edinburgh, in 1643, of an ancient family in the shire of Aberdeen. His father being bred to the law, was, at the restoration of King Charles II. appointed one of the lords of session, with the title of Lord Crimond, in reward for his constant attachment to the royal party during the troubles of Great Britain. Our author, the youngest son of his father, was instructed by him in the Latin tongue; at ten years of age he was sent to continue his studies at Aberdeen, and was admitted M. A. before he was 14. His own inclination led him to the study of the civil and feudal law; and he used to say, that it was from this study he had received more just notions concerning the foundations of civil society and government, than those which some divines maintain. About the year after, he changed his mind, and began to apply to divinity, to the great satisfaction.
Burnet. satiety of his father. He was admitted preacher before he was 18; and Sir Alexander Burnet, his cousin-german, offered him a benefice; but he refused to accept of it.

In 1653, about two years after the death of his father, he came into England; and after six months stay at Oxford and Cambridge, returned to Scotland; which he soon left again to make a tour for some months, in 1654, in Holland and France. At Amsterdam, by the help of a Jewish rabbi, he perfected himself in the Hebrew language; and likewise became acquainted with the leading men of the different persuasions tolerated in that country; as Calvinists, Arminians, Lutherans, Anabaptists, Brownists, Papists, and Unitarians; amongst each of which he used frequently to declare, he met with men of such unfeigned piety and virtue, that he became fixed in a strong principle of universal charity, and an invincible abhorrence of all severities on account of religious dissentions.

Upon his return from his travels, he was admitted minister of Salton: in which station he served five years in the most exemplary manner. He drew up a memorial, in which he took notice of the principal errors in the conduct of the Scots bishops, which he observed not to be conformable to the primitive institution; and sent a copy of it to several of them. This exposed him to their resentments: but, to show he was not actuated with a spirit of ambition, he led a retired course of life for two years; which so endangered his health, that he was obliged to abate his excessive application to study. In 1669, he published his "Modest and free conference between a conformist and non-conformist." He became acquainted with the duchess of Hamilton, who communicated to him all the papers belonging to her father and her uncle; upon which he drew up the "Memoirs of the dukes of Hamilton."

The duke of Lauderdale, hearing he was about this work, invited him to London, and introduced him to King Charles II. He returned to Scotland, and married the lady Margaret Kennedy, daughter of the earl of Cassilis; a lady of great piety and knowledge, highly esteemed by the Presbyterians, to whose sentiments she was strongly inclined. As there was some disparity in their ages, that it might remain past dispute that this match was wholly owing to inclination, and not to avarice or ambition, the day before their marriage our author delivered the lady a deed, whereby he renounced all pretensions to her fortune, which was very considerable, and most otherwise have fallen into his hand, she herself having no intention to secure it. The same year he published his "Vindication of the authority, constitution, and laws of the church and state of Scotland?" which at that juncture was looked upon as so great a service, that he was again offered a bishopric, and a promise of the next vacant archbishopric; but did not accept of it, because he could not approve of the measures of the court, the grand view of which he saw to be the advancement of Popery.

Mr Burnet's intimacy with the dukes of Hamilton and Lauderdale occasioned him to be frequently sent for by the king and the duke of York, who had conversations with him in private. But Lauderdale, conceiving a resentment against him on account of the freedom with which he spoke to him, represented at last to the king, that Dr Burnet was engaged in an opposition to his measures. Upon his return to London, he perceived that these suggestions had entirely thrown him out of the king's favour, though the duke of York treated him with greater civility than ever, and dissuaded him from going to Scotland. Upon this, he resigned his professorship at Glasgow, and staid at London. About this time the living at Cripplegate being vacant, the dean and chapter of St Paul's (in whose gift it was), hearing of his circumstances, and the hardships he had undergone, sent him an offer of the benefice; but, as he had been informed of their first intention of conferring it on Dr Fowler, he generously declined it. In 1675, at the recommendation of Lord Hollis, whom he had known in France, ambassador at that court, he was by Sir Herbottle Grimstone, master of the rolls, appointed preacher of the chapel there, notwithstanding the opposition of the court. He was soon after chosen a lecturer of St Clement's, and became one of the preachers that were most followed in town. In 1697, he published his History of the Reformation, for which he had the thanks of both houses of parliament. The first part of it was published in 1679, and the second in 1681. Next year, he published an abridgement of these two parts.

Mr Burnet about this time happened to be sent for to a woman in sickness, who had been engaged in an amour with the earl of Rochester. The manner in which he treated her during her illness, gave that lord a great curiosity for being acquainted with him. Whereupon, for a whole winter, he spent one evening in a week with Dr Burnet, who discoursed with him upon all those topics upon which sceptics and men of loose morals attack the Christian religion. The happy effects of these conferences occasioned the publication of his account of the life and death of that earl. In 1682, when the administration was changed in favour of the duke of York, being much resorted to by persons of all ranks and parties, in order to avoid returning visits, he built a laboratory, and went for above a year through a course of chemical experiments. Not long after, he refused a living of 300l. a-year offered him by the earl of Essex, on the terms of his not residing there, but in London. When the inquiry concerning the popish plot was on foot, he was frequently sent for and consulted by King Charles with relation to the state of the nation. His majesty offered him the bishopric of Chichester, then vacant, if he would engage in his interests; but he refused to accept it on these terms. He preached at the Rolls till 1684, when he was dismissed by order of the court. About this time he published several pieces.

On King James's accession to the throne, having obtained leave to go out of the kingdom, he first went to Paris, and lived in great retirement; till, contracting an acquaintance with Brigadier Stouppe, a Protestant gentleman in the French service, he made a tour with him into Italy. He met with an agreeable reception at Rome. Pope Innocent XI. hearing of our author's arrival, sent the captain of the Swiss guards to acquaint him he would give him a private audience in bed, to avoid the ceremony of kissing his holiness's slipper. But Dr Burnet excused himself as well as he could. Some disputes which our author had here concerning religion,
Burnet. religion, beginning to be taken notice of, made it proper for him to quit the city, which, upon an intimation given him by Prince Borghese, he accordingly did.

He pursued his travels through Switzerland and Germany. In 1668, he came to Utrecht, with an intention to settle in some of the seven provinces. There he received an invitation from the prince and princess of Orange (to whom their party in England had recommended him) to come to the Hague, which he accepted. He was soon made acquainted with the secret of their counsels, and advised the fitting out of a fleet in Holland sufficient to support their designs and encourage their friends. This, and the Account of his Travels, in which he endeavoured to blend Popery and tyranny together, and represent them as inseparable, with some papers reflecting on the proceedings of England, that came out in single sheets, and were dispersed in several parts of England, most of which Mr. Burnet owned himself the author of, alarmed King James, and were the occasion of his writing twice against him to the princess of Orange, and insisting, by his ambassador, on his being forbid the court; which, after much importunity, was done, though he continued to be trusted and employed as before, the Dutch minister consulting him daily. To put an end to these frequent conferences with the ministers, a prosecution for high treason was set on foot against him both in England and Scotland. But Burnet receiving the news thereof before it arrived at the States, he avoided the storm, by petitioning for, and obtaining without any difficulty, a bill of naturalization, in order to his intended marriage with Mary Scott, a Dutch lady of considerable fortune, who, with the advantage of birth, had those of a fine person and understanding.

After his marriage with this lady, being legally under the protection of Holland, when Mr. Burnet found King James plainly subverting the constitution, he omitted no method to support and promote the design the prince of Orange had formed of delivering Great Britain, and came over with him in quality of chaplain. He was soon advanced to the see of Salisbury. He declared for moderate measures with regard to the clergy who scrupled to take the oaths, and many were displeased with him for declaring for the toleration of nonconformists. His pastoral letter concerning the oaths of allegiance and supremacy to King William and Queen Mary, 1689, happening to touch upon the right of conquest, gave such offence to both houses of parliament, that it was ordered to be burnt by the hands of the common executioner. In 1698 he lost his wife by the small-pox; and as he was almost immediately after appointed preceptor to the duke of Gloucester, in whose education he took great care, this employment, and the tender age of his children, induced him the same year to supply her loss by a marriage with Mrs Berkley, eldest daughter of Sir Richard Blake, knight. In 1699 he published his Exposition of the 30 Articles; which occasioned a representation against him in the lower house of convocation in the year 1701; but he was vindicated in the upper house. His speech in the house of lords in 1704 against the bill to prevent occasional conformity was severely attacked. He died in 1715, and was interred in the church of St James, Clerkenwell, where he has a monument erected to him.

Burton, Thomas, a polite and learned writer in the end of the 17th century, was born in Scotland, but educated in Cambridge, under the tuition of Mr. John Tillotson, afterwards archbishop of Canterbury. In the beginning of 1685, he was made master of Sutton's hospital in London, after which he entered into holy orders. During the reign of King James, he made a noble stand in his post as master of the Charter-house against the encroachments of that monarch, who would have imposed one Andrew Popham, a Papist, as a pensioner upon the foundation of that house. In 1680 he published his Tulliusis theoria sacra, so universally admired for the purity of the style and beauty of the sentiments, that King Charles gave encouragement to a translation of it into English. This theory was, however, attacked by several writers. In 1692 he published his Archæologia philosophica, dedicated to King William, to whom he was clerk of the closet. He did in 1715. Since his death, hath been published his book De statu mortuorum et resurrectantium, and his treatise De fide et officiis Christianorum.

Burton, the Honourable James, Lord Monboddo, a senator of the college of justice in Scotland, was born about the year 1714. He was the son of Mr. Burnet of Monboddo in Kincardineshire. After passing through the usual course of school education, he prosecuted his studies at the universities of Aberdeen, Edinburgh, and Leyden, with distinguished reputation. He was admitted an advocate in 1737, and on the 12th of February 1767, he was raised to the bench by the title of Lord Monboddo, in the room of Lord Milton, appointed a judge the 4th of June 1742, and who had succeeded Sir John Launder of Fountainhall, admitted November 1689; being the third on the bench in succession since the Revolution.

He married Miss Farquharson, a very amiable woman, by whom he had a son and two daughters.

His private life was spent in the practice of all the social virtues, and in the enjoyment of much domestic felicity. Although rigidly temperate in his habits of life, he, however, delighted much in the convivial society of his friends, and among these he could number almost all the most eminent of those who were distinguished in Scotland for virtue, literature, or genuine elegance of conversation and manners. One of those who esteemed him the most was the late Lord Gardenstone, a man who possessed no mean portion of the same overflowing benignity of disposition, the same unimpeachable integrity as a judge, the same partial fondness for literature and the fine arts. His son, a very promising boy, in whose education he took great delight, was indeed, snatched away from his affections by a premature death. But, when it was too late for sorrow and anxiety to avail, the afflicted father stifled the emotions of nature in his breast, and wound up the energies of his soul to the firmest tone of stoical fortitude. He was, in like manner, bereaved of his excellent lady, the object of his dearest tenderness; and he endured the loss with a similar firmness, fitted to do honour
true, still continued to think Lord Monboddo what he called a prig in literature.

Lord Monboddo used frequently to visit London, to which he was allured by the opportunity that great metropolis affords of enjoying the conversation of a vast number of men of profound erudition. A journey to the capital became a favourite amusement of his periods of vacation from the business of the court to which he belonged; and, for a time, he made this journey once a year. A carriage, a vehicle that was not in common use among the ancients, he considered as an engine of effeminacy and sloth, which it was disgraceful for a man to make use of in travelling. To be dragged at the tail of a horse, instead of mounting upon his back, seemed, in his eyes, to be a truly ludicrous degradation of the genuine dignity of human nature. In all his journeys, therefore, between Edinburgh and London, he was wont to ride on horseback, with a single servant attending him. He continued this practice, without finding it too fatiguing for his strength, till he was upwards of eighty years of age. Within these few years, on his return from a last visit, which he made on purpose to take leave, before his death, of all his old friends in London, he became exceedingly ill upon the road, and was unable to proceed; and had he not been overtaken by a Scotch friend, who prevailed upon him to travel the remainder of the way in a carriage, he might, perhaps, have actually perished by the way side, or breathed his last in some dirty inn. Since that time, he did not again attempt an equestrian journey to London.

In London, his visits were exceedingly acceptable to all his friends, whether of the literary or fashionable world. He delighted to shew himself at court; and the king is said to have taken a pleasure in conversing with the old man, with a distinguishing notice that could not but be very flattering to him.

A constitution of body, naturally framed to wear well and last long, was strengthened to Lord Monboddo by exercise, guarded by temperance, and by a temper of mind too firm to be deeply broken in upon by those passions which consume the principles of life. In the country he always used much the exercises of walking in the open air, and of riding. The cold bath was a means of preserving the health, to which he had recourse in all seasons, amidst every severity of the weather, under every inconvenience of indisposition or business, with a perseverance invincible. He was accustomed, alike in winter and in summer, to rise at a very early hour in the morning, and, without loss of time, to betake himself to study or wholesome exercise. It is said, that he even found the use of what he called the air bath, or the practice of occasionally walking about, for some minutes, naked, in a room filled with fresh and cool air, to be highly salutary.

Lord Monboddo is well known to the world as a man of letters. His first publication was "A Dissertation on the Origina and Progress of Language," in 2 vols. 8vo. 1773; which were followed by four more vols. the last published not long before his death. In this work, intended chiefly to vindicate the honours of Grecian literature, he sacrifices the origin of alphabetical writing to the Egyptians; and strenuously maintains, that the orang-outang is a class of the human species, and that his want of speech is merely accidental. He al-
so endeavoured to establish the reality of the existence of
mermaids, and other fictitious animals. He was indu-
duced to undertake another work, for the purpose of de-
fining the cause of Oecelian philosophy; and publish-
ed, in five vols. 4to. a work entitled, " Ancient Meta-
physics," which, like the other, is remarkable for a
surprising mixture of erudition and genius, with the most
absurd whim and conceit.

As a judge, his decisions were sound, upright, and
learned, and marked with acute discrimination; and
free from those paradoxes and partialities which appear
in his writings. He attended his judicial duty with
indefatigable diligence till within a few days of his
death, which happened at his house in Edinburgh, May
26. 1799, at the advanced age of 85.

His eldest daughter married some years before his
death. His second daughter, in personal loveliness one
of the finest women of the age, was held in every
public place with general admiration, and was sought
in marriage by many suitors. Her mind was endowed
with all her father's benevolence of temper, and with all
his taste for elegant literature, without any portion of his
whim and caprice. It was her chief delight to be the
nurse and the companion of his declining age. Her pre-
sence contributed to draw around him, in his house, and
at his table, all that was truly respectable among the
youth of his country. She mingled in the world of fa-
sion, without sharing its follies; and heard those te-
stories which are addressed to youth and beauty, without
being betrayed to that light and selfish vanity which is
often the only sentiment that fills the heart of the high-
praised beauty. She delighted in reading, in literary
conversation, in poetry, and in the fine arts, without
contracting from this taste, any of that pedantic self-
conscious and affectation which usually characterize lite-
rary ladies, and whose presence often frightens away the
domestic virtues, the graces, the delicacies, and all the
more interesting charms of the sex. When Burns, the
well-known Scottish poet, first arrived from the plough
in Ayrshire to publish his poems in Edinburgh, there
was none by whom he was more zealously patronized
than by Lord Monboddo and his lovely daughter. No
man's feelings were ever more powerfully or exquisitely
alive than those of the rustic bard, to the emotions of
gratitude, or to the admiration of the good and fair.
In a poem which he at that time wrote, as a panegyri-
cal address to Edinburgh, he took occasion to cel-
britate the beauty and excellence of Miss Burnet, in
perhaps the finest stanza of the whole:

"Thy daughters bright thy walks adorn,
Gay as the gilded summer sky,
Sweet as the dewy milk-white thorn,
Dear as the raptured thrill of joy!
Fair Burnet strikes th' adoring eye:
Heaven's beauties on my fancy shine,
I see the Sire of Love on high,
And own his work, indeed, divine."

She was the ornament of the elegant society of the
city in which she resided, her father's pride, and the
comfort of his domestic life in his declining years.
Every amiable and noble sentiment was familiar to her
heart, every female virtue was exemplified in her life.
Yet, this woman, thus lovely, thus elegant, thus wise
and virtuous, was cut off in the flower of her age, and
left her father bereft of the last tender tie which bound
him to society and to life. She died about six years
before him, of a consumption; a disease that, in Scot-
land, proves too often fatal to the loveliest and most
promising among the fair and the young. Neither his
philosophy, nor the necessary terror of the feelings of
extreme old age, were capable of preventing Lord Mon-
boddo from being very deeply affected by a conso-

sion a loss ; and from that time he began to drop exceed-
ingly in his health and spirits. 

BURNET. See POTERIUM and SANGUISORBA, Bo-
TANY Index.

BURNHAM, a market town of Norfolk in Eng-
land, situated in E. Long. o. 50. N. Lat. 53. o.

BURNING, the action of fire on some pabulum or
fuel, by which the minute parts thereof are put into a
violent motion, and some of them assuming the nature
of fire themselves, fly off in orbe, while the rest are
dissipated in form of vapour, or reduced to ashes. See
Ignition.

Extraordinary Cases of Burning. We have in-
stances of persons burnt by fire kindled within their
own bodies. A woman at Paris, who used to drink
brandy to excess, was one night reduced to ashes by a
fire from within, all but her head and the ends of her
fingers. Signora Corn. Zangari, or, as others call her,
Corn. Banchi, an aged lady, of an unblemished life, near
Cesana in Romagna, underwent the same fate in March
1731. She had retired in the evening to her chamber
somewhat indisposed; and in the morning was found
in the middle of the room reduced to ashes, all except
her face, legs, skull, and three fingers. The stockings
and shoes she had on were not burnt in the least.
The ashes were light; and, on pressing between the fingers,
vanished, leaving behind a gross stinking moisture with
which the floor was smeared; the walls and furniture of
the room being covered with a moist cinerous
soot, which had not only stained the linen in the chests,
but had penetrated into the closet, as well as into the
room overhead, the walls of which were moistened with
the same viscous humour.---We have various other re-
lations of persons burnt to death in this unaccountable
manner.

Sig. Mondini, Bianchini, and Maffei, have written
treatises express to account for the cause of so ex-
traordinary an event: common fire it could not be, since
this would likewise have burnt the bed and the room; besides
that it would have required many hours, and a vast
quantity of fuel, to reduce a human body to ashes; and,
after all, a considerable part of the bones would have
remained entire, as they were anciently found after the
fercest funeral fires. Some attribute the effect to a mine
of sulphur under the house; others to a miracle; while
others suspect that art or villany had a hand in it. A
philosopher of Verona maintains, that such a conflagra-
tion might have arisen from the inflammable matters
wherewith the human body naturally abounds. Sig.
Bianchini accounts for the conflagration of the lady
above mentioned, from her using a bath or lotion of
camphorated spirit of wine when she found herself out
of order. Maffei supposes it owing to lightning, but
to lightning generated in her own body, agreeable to
his doctrine, which is, That lightning does not pro-
cede from the clouds, but is always produced in the
place where it is seen and its effects perceived. We
have
have had a late attempt to establish the opinion, that these destroying internal fires are caused in the entrails of the body by inflamed effluvia of the blood; by juices and fermentation in the stomach; by the many combustible matters which abound in living bodies for the purposes of life; and, finally, by the fiery evaporations which exhale from the settings of spirit of wine, brandies, and other hot liquors, in the tuscan villus of the stomach and other adipose or fat membranes; within which those spirits engender a kind of camphor, which, in the night time, in sleep, by a full respiration, are put in a stronger motion, and are more apt to be set on fire. Others ascribe the cause of such persons being set on fire to lightning; and their burning so entirely, to the greater quantity of phlegmas and other combustible matters they contained.—For our own part, we can, by no means pretend to explain the cause of such a phenomenon; but for the interests of humanity, we wish it could be derived from something external to the human body; for if, to the calamities of human life already known, we superadd a suspicion that we may unexpectedly, and without the least warning, be consumed by an internal fire, the thought is too dreadful to be borne.

Burning, or Brenning, in our old customs, denotes an infectious disease, got in the stews by conversing with lewd women, and supposed to be the same with what we now call the venereal disease.

In a manuscript of the vacation of John Bale to the bishopric of Ossey, written by himself, he speaks of Dr. Hugh Westoe, who was dean of Windsor in 1556, but deprived by Cardinal Pole for adultery, thus: "At this day is lecherous Westoe, who is more practised in the arts of brook-burning, than all the whomers of the stews. He not long ago burst a beggar of St. Botolph's parish. See Brews.

Burning, in antiquity, a way of disposing of the dead, much practised by the ancient Greeks and Romans, and still retained by several nations in the East and West Indies. The antiquity of this custom rises as high as the Teban war, where we are told of the great solemnity accompanying this ceremony at the pyre of Menenicus and Archemorus, who were contemporaries with Jair, the eighth judge of Israel. Homer abounds with funeral obsequies of this nature. In the inward regions of Asia, the practice was of very ancient date, and the continuance long: for we are told, that in the reign of Julian, the king of Chiosia burnt his son's body, and deposited the ashes in a silver urn. Coval almost with the first instances of this kind in the east, was the practice in the western provinces of the world. The Hermellia, the Getae, and the Thracians, had all along observed it; and its antiquity was as great with the Celtic, Sarmanitans, and other neighboring nations. The origin of this custom seems to have been out of friendship to the deceased; their ashes were preserved, as we preserve a lock of hair, a ring, or a seal, which had been the property of a deceased friend.

Kings were burnt in cloth made of the asbestos stone, that their ashes might be preserved pure from any mixture with the fuel and other matters thrown on the funeral pile. The same method is still observed with the princes of Tartary. Among the Greeks, the body was placed on the top of a pile, on which were thrown diverse animals, and even slaves and captives, besides ungents and perfumes. In the funeral of Patroclus we find a number of sheep and oxen thrown in, four horses, followed by two dogs, and lastly by 12 Trojan prisoners. The like is mentioned by Virgil in the funerals of his Trojans; where, besides oxen, swine, and all manner of cattle, we find eight youths condemned to the flames. The first thing was the fat of the beasts, wherewith the body was covered, that it might consume the sooner; it being reckoned great felicity to be quickly reduced to ashes. For the like reason, where numbers were to be burnt at the same time, care was taken to mix with the rest some of humid constitutions, and therefore more easily to be inflamed. Thus we are assured by Plutarch and Macrobius, that for every ten men it was customary to put in one woman. Soldiers usually had their arms burnt with them. The garments worn by the living were also thrown on the pile, with other ornaments and presents; a piece of extravagance which the Athenians carried to so great a height, that some of their lawgivers were forced to restrain them, by severe penalties, from defrauding the living by their liberality to the dead.—In some cases, burning was expressly forbidden among the Romans, and even looked upon as the highest impropriety. Thus infants, who died before the breeding of teeth, were entombed unburnt in the ground, in a particular place set apart for this purpose, called suggranumion. The like was practised with regard to those who had been struck dead with lightning, who were never to be burnt again. Some say that burning was denied to suicides. The manner of burning among the Romans was not unlike that of the Greeks; the corpse, being brought out without the city, was carried directly to the place appointed for burning it; which, if it joined to the sepulchre, was called bustus; if separate from it, ussutra; and there laid on the rogus or pyre, a pile of wood prepared on which to burn it, built in shape of an altar, but of different height, according to the quality of the deceased. The wood used was commonly from such trees as contain most pitch or resin; and if any other were used, they split it, for the more easy catching fire; round the pile they set cypress trees, probably to hinder the noisome smell of the corpse. The body was not placed on the bare pile, but on the couch or bed whereon it lay. This done, the next of blood performed the ceremony of lighting the pile; which they did with a torch; turning their faces all the while the other way, as if it were done with reluctance. During the ceremony, decurrions and games were celebrated; after which came the assilium, or gathering of the bones and ashes; also washing and anointing them, and reposing them in urns.

Burning, among surgeons, denotes the application of an actual cautery, that is, a red hot iron instrument to the part affected; otherwise denominated cæntiration. The whole art of physic among the Japanese lies in the choice of places proper to be burnt; which are varied according to the disease. In the country of the Mogul, the colic is cured by an iron ring applied red hot about the patient's navel. Certain it is, that some very extraordinary cures have been performed accidentally by burning. The following case is recorded in the Memoirs of the Academy of Sciences by M. Hemberg. A woman of about 33 became subject to a head-ach,
of cætropic or refracting burning-glasses, appears from a passage in Aristophanes’s comedy of The Clouds, which clearly treats of their effects. The author introduces Socrates as examining Strepsiades about the method he had discovered of getting clear of his debts. He replies, that “he thought of making use of a burning-glass which he had hitherto used in kindling his fire;” “for (says he) should they bring a writ against me, I’ll immediately place my glass in the sun at some little distance from it, and set it on fire.” Pliny and Laelius have also spoken of glasses that burn by refraction. The former calls them balls or globes of glass or crystal, which, exposed to the sun, transmit a heat sufficient to set fire to cloth, or corrode the dead flesh of those patients who stand in need of caustics; and the latter, after Clemens Alexandrinus, takes notice that fire may be kindled by interposing glasses filled with water between the sun and the object, so as to transmit the rays to it.

It seems difficult to conceive how they should know such glasses would burn without knowing they would magnify, which it is granted they did not, till towards the close of the 13th century, when spectacles were first thought on. For as to those passages in Plautus which seem to intimate the knowledge of spectacles, M. de la Hire observes, they do not prove any such thing; and he solves this, by observing, that their burning-glasses being spheres, either solid or full of water, their foci would be one-fourth of their diameter distant from them. If then their diameter were supposed half a foot, which is the most we can allow, an object must be at an inch and a half distance to perceive it magnified; those at greater distances do not appear greater, but only more confused through the glass than out of it. It is no wonder, therefore, the magnifying property of convex glasses was unknown, and the burning one known. It is more wonderful there should be 300 years between the invention of spectacles and telescopes.

Among the ancients, the burning mirrors of Archimedes and Proclus are famous: the former we have already noticed; of the other, the navy of Vitalius besieging Byzantium, according to Zonaras, was burnt to ashes.

Among the moderns, the most remarkable burning mirrors are those of Sattala, of Villette, of Tschirnhausen, of Buffon, of Trudaine, and of Parker.

Sattala, canon of Padua, made a parabolic mirror, which, according to Shotton, burnt pieces of wood at the distance of 15 or 16 paces. The following things are noted of it in the Acta Eruditorum. 1. Green wood taken fire instantaneously, so as a strong wind cannot extinguish it. 2. Water boils immediately; and eggs in it are presently edible. 3. A mixture of tin and lead, three inches thick, drops presently, and iron and steel plate becomes red hot presently, and a little after burns into holes. 4. Things not capable of melting, as stones, bricks, &c. become soon red hot, like iron. 5. Slate becomes first white, then a black glass. 6. Tiles are converted into a yellow glass, and shells into a blackish yellow one. 7. A pumice stone, emitted from a volcano, melts into white glass; and, 8. A piece of crocodile also vitrifies in eight minutes. 9. Bones are soon turned into an opaque glass, and earth into a black one. The breadth of this mirror is near three Leipsic ells, its focus two ells from it; it is made of copper, and...
and its substance is not above double the thickness of the back of a knife.

Villette, a French artist of Lyons, made a large mirror, which was bought by Tavernier, and presented to the king of Persia; a second, bought by the king of Denmark; a third, presented by the French king to the Royal Academy; a fourth has been in England, where it was publically exposed. The effects hereof, as found by Dr Harris, and Dr Desaguliers, are, that a silver sixpence, melted in 74°, a King George's halfpenny in 16°, and runs with a hole in 34°. Tin melts in 3°, cast iron in 16°, slate in 3°, a fossil shell calcines in 7°; a piece of Pompey's pillar at Alexandria vitrifies, the black part in 50°, the white in 54°; copper ore in 8°; bone calcines in 4°, vitrifies in 33°. An emerald melts into a substance like a turquoise stone; a diamond weighing four grains loses seven-eighths of its weight: the asbestos vitrifies; as all other bodies will do, if kept long enough in the focus; but when once vitrified, the mirror can no longer have them. This mirror is 47 inches wide, and is ground to a sphere of 76 inches radius; so that its focus is about 38 inches from the vertex. Its substance is a composition of tin, copper, and tin-glass.

Every lens, whether convex, plano-convex, or convexo-convex, collects the sun's rays, dispersed over its convexity, into a point by refraction; and is therefore a burning-glass. The most considerable of this kind is that made by M. de Tschirnhausen: as the diameters of his lenses are three and four feet, the focus at the distance of 12 feet, and its diameter an inch and a half. To make the focus the more vivid, it is collected a second time by a second lens parallel to the first, and placed in that point where the diameter of the cone of rays formed by the first lens is equal to the diameter of the second; so that it receives them all: and the focus, from an inch and a half, is contracted into the space of eight lines, and its force increased proportionally.

This glass vitrifies tiles, slate, pumice-stones, &c. in a moment. It melts sulphur, pitch, and all resins, under water; the ashes of vegetables, woods, and other matters, are transmitted into glass; and every thing applied to its focus is either melted, turned into a cals, or into smoke. Tschirnhausen observes, that it succeeds best when the matter applied is laid on a hard charcoal well burnt.

Sir Isaac Newton presented a burning-glass to the Royal Society, consisting of seven concave glasses, so placed as that all their foci join in one physical point. Each glass is about 11 inches and a half in diameter: six of them are placed round the seventh, to which they are all contiguous; and they form a kind of segment of a sphere, whose subtense is about 34 inches and a half, and the central glass lies about an inch farther in than the rest. The common focus is about 22 inches and a half distant, and about an inch in diameter. This glass vitrifies brick or tile in 1°, and melts gold in 30°.

It would appear, however, that glass quicksilvered is a more proper material for burning-glasses than metals; for the effects of that speculum whereby Mr Macquer melted the platinum seem to have been superior to those above mentioned, though the mirror itself was much smaller. The diameter of this glass was burning only 22 inches, and its focal distance 28. Black first, when exposed to the focus, being powdered to prevent its cracking and flying about, and secured in a large piece of charcoal, bubbled up and ran into transparent glass in less than half a minute. Hessian crucibles, and glass-house pots, vitrified completely in three or four seconds. Forged iron smoked, boiled, and changed into a vitreous scoria as soon as it was exposed to the focus. The pyramids of Montmartre, when the flat sides of the plates or leaves of which it is composed were presented to the glass, did not show the least disposition to melt; but, on presenting a transverse section of it, or the edges of the plates, it melted in an instant, with a hissing noise, into a brownish yellow matter. Calcereous stones did not completely melt: but there was detached from them a circle more compact than the rest of the mass, and of the size of the focus; the separation of which seemed to be occasioned by the shrinking of the matter which had begun to enter into fusion. The white calc of antimony, commonly called diephoric antimony, melted better than the calcereous stones, and changed into an opaque pretty glossy substance like white enamel. It was observed, that the whiteness of the calcereous stones and the antimonial calx was of great disadvantage to their fusion, by reason of their reflecting great part of the sun's rays; so that the subject could not undergo the full activity of the heat thrown upon it by the burning-glass. The case was the same with metallic bodies; which melted so much the more difficulty as they were more white and polished; and this difference was so remarkable, that in the focus of this mirror, so fusible a metal as silver, when its surface was polished, did not melt at all.

Plate CXXXI. fig. 1. represents M. Buffon's burning mirror, which he with great reason supposes to be of the same nature with that of Archimedes. It consists of a number of small mirrors of glass quicksilvered, all of which are held together by an iron frame. Each of these small mirrors is also moveable by a contrivance on the back part of the frame, that so their reflections may all coincide in one point. By this means they are capable of being accommodated to various heights of the sun, and to different distances. The adjusting them in this manner takes up a considerable time; but after they are so adjusted, the focus will continue unaltered for an hour or more.

Fig. 2. represents a contrivance of M. Buffon's for diminishing the thickness of very large refracting lenses. He observes, that in the large lenses of this kind, and which are most convenient for many purposes, the thickness of the glass in the middle is so great as very much to diminish their force. For this reason, he proposes to form a burning-glass of concentric circular pieces of glass, each resting upon the other, as represented in the figure. His method is to divide the convex arch of the lens into three equal parts. Thus, suppose the diameter to be 26 inches, and the thickness in the middle to be three inches: By dividing the lens into three concentric circles, and laying the one, over the other, the thickness of the middle piece needs be only one inch; at the same time that the lens will have the same convexity, and almost the same focal distance,
M. Trudaine, a French gentleman, constructed a burning lens on a new principle. It was composed of two circular segments of glass spheres, each four feet in diameter, applied with their concave sides towards each other. The cavity was filled with spirit of wine, of which it contained 40 pints. It was presented by the maker to the Royal Academy of Sciences, but was, not long after, broken by accident. The expense of constructing it amounted to about 10001. sterling. After all, it does not appear that the effects of this lens were very great. Mr Magellan informs us, that it could only congeal the particles of platina in 20 minutes, while Mr Parker’s lens entirely melted them in less than two.

A large burning lens, indeed, for the purpose of fusing and vitrifying such substances as resist the fires of ordinary furnaces, and especially for the application of heat in vacuo, and in other circumstances in which heat cannot be applied by any other means, has long been a desideratum among persons concerned in philosophical experiments: And it appears now to be in a great degree accomplished by Mr Parker. His lens is three feet in diameter, made of flint-glass, and which, when fixed in its frame, exposes a surface two feet eight inches and a half in the clear.

In the Elevation represented on Plate CXXXII, A is the lens of the diameter mentioned: thickness in the centre, three inches and one-fourth: weight, 212 pounds: length of the focus, six feet eight inches: diameter of ditto, one inch. B, a second lens, whose diameter in the frame is 16 inches, and shows in the clear 13 inches: thickness in the centre, one inch five-eighths: weight 21 pounds: length of focus 29 inches: diameter of ditto, three-eighths of an inch. When the two above lenses are compounded together, the length of the focus is five feet three inches: diameter of ditto, half an inch. C, a truncated cone, composed of 21 ribs of wood: at the larger end is fixed the great lens A; at the smaller extremity the lesser lens B: near the smaller end is also fixed a rack D, passing through the pillar L, movable by a pinion turning in the said pillar, by means of the handle E, and thus giving a vertical motion to the machine. F, a bar of wood, fixed between the two lower ribs of the cone at G; having, within a chased mortice in which it moves, an apparatus H, with the iron plate, I, fixed thereto; and this part turning on a ball and socket, K, a method is thereby obtained of placing the matter under experiment, so as to be acted upon by the focal rays in the most direct and powerful manner. L, a strong mahogany frame, moving on castors, MM. Immediately under the table N are three friction wheels, by which the machine moves horizontally. O, a strong iron bow, in which the lens and the cone hang.

Section. a, The great lens marked A in the elevation. b, The frame which contains the lens. c, The small lens marked B. d, The frame which contains the small lens. e, The truncated cone, marked C. f, The bar on which the apparatus marked F moves. g, The iron plate marked I. h, The cone of rays formed by the refraction of the great lens a, and falling on the lens c. i, The cone of rays formed by the refraction of the lens c. Front-view. k, The great burning-lens. l, The frame containing it. m, The strong iron bow in which it hangs.

From a great number of experiments made with this lens, in the presence of many scientific persons, the following are selected as specimens of its powers.

Burning Mountains. See AESNA, HECLA, VESUVIUS, and VOLCANO, with the plates accompanying them.

Burning Springs. Of these there are many in different parts of the world; particularly one in Daunphiny near Grenoble; another near Hermannstadt in Transylvania; a third at Chermay, a village near Switzerland; a fourth in the canton of Fribourg; and a fifth not far from the city of Cracow in Poland. There also is, or was, a famous spring of the same kind at Wigan in Lancashire, which, upon the approach of a lighted candle, would take fire and burn like spirit of wine for a whole day. But the most remarkable one of this kind, or at least that of which we have the most particular description, was discovered in 1711 at Brosely in Shropshire. The following account of this remarkable spring was given by the reverend Mr Mason, Woodwardian professor at Cambridge, dated February 18, 1746. "The well four or five feet deep is six or seven feet wide; within that is another less hole of like depth dug in the clay, in the bottom whereof is placed a cylindrical earthen vessel, of about four or five inches diameter at the mouth, having the bottom taken off, and the sides well fixed in the clay rammed..."
Burning, Burnisher.

RAMMED close about it. Within the pot is a brown water, thick as pudding, continually forced up with a violent motion beyond that of boiling water, and a rumbling hollow noise, rising or falling, by fits five or six inches; but there was no appearance of any vapourising, which perhaps might have been visible, had not the sun shone so bright. Upon putting a candle down at the end of a stick, at about a quarter of a yard distance, it took fire, darting and flashing after a very violent manner for about half a yard high, much in the manner of spirits in a lamp, but with great agitation. It was said that a tea-kettle had been made to boil in about nine minutes time, and that it had been left burning for 46 hours without any sensible diminution. It was extinguished by putting a wet mop upon it; which must be kept there for a little time, otherwise it would not go out. Upon the removal of the mop there arises a sulphurous smoke lasting about a minute, and yet the water is very cold to the touch. In 1755, this well totally disappeared by the sinking of a coal-pit in its neighbourhood.

The cause of the inflammable property of such waters is, with great probability, supposed to be their mixture with petroleum, which is a very inflammable substance, and has the property of burning on the surface of water.

Burning of Colours, among painters. There are several colours that require burning; as,

First, Lamp black, which is a colour so greasy a nature, that, except it is burnt, it will require a long time to dry. The method of burning, or rather drying, lamp black, is as follows: Put it into a crucible over a clear fire, letting it remain till it be red hot, or so near it that no manner of smoke arises from it.

Secondly, Umber, which, if it be intended for colour for a horse, or to be a shadow for gold, then burning fits it for both these purposes. In order to burn umber, you must put it into the naked fire, in large lumps, and not take it out till it is thoroughly red hot; if you have a mind to be more curious, put it into a crucible, and keep it over the fire till it be red hot.

Ivory also must be burnt to make black, thus: Fill two crucibles with shavings of ivory, then clap their two mouths together, and bind them fast with an iron wire, and lute the joints close with clay, salt, and horse-dung, well beaten together; then set it over the fire, covering it all over with coals: let it remain in the fire till you are sure that the matter enclosed is thoroughly red hot; then take it out of the fire, but do not open the crucibles till they are perfectly cold; for were they opened while hot, the matter would turn to ashes; and so it will be, if the joints are not luted close.

BURNISHER, a round polished piece of steel, serving to smooth and give a lustre to metals. Of these there are different kinds, of different figures, straight, crooked, &c. Half burnishers are used to solder silver, as well as to give a lustre.

Burnishers for gold and silver are commonly made of a dog's or wolf's tooth, set in the end of an iron or wooden handle. Of late, agates and pebbles have been introduced, which many prefer to the dog's tooth.

The burnishers used by engravers in copper, usually serve with one end to burnish, and with the other to Burnisher scope.

BURNISHING, the art of smoothing or polishing a metallic body, by a brisk rubbing of it with a burnisher.

Book-binders burnish the edges of their books, by rubbing them with a dog's tooth.

BURNLEY, a town of Lancashire in England, situated in W. Long. 2. 5. N. Lat. 52. 38.

BURNS, ROBERT, was a native of Ayrshire, one of the western counties of Scotland. He was the son of humble parents; and his father passed through life in the condition of a hired labourer, or of a small farmer. Even in this situation, however, it was not hard for him to send his children to the parish school, to receive the ordinary instruction in reading, writing, arithmetic, and the principles of religion. By this course of education young Robert profited to a degree that might have encouraged his friends to destine him to one of the liberal professions, had not his father's poverty made it necessary to remove him from school, as soon as he had grown up, to earn for himself the means of support as a hired ploughboy or shepherd.

The expence of education in the parish-schools of Scotland is so small, that hardly any parents who are able to labour want the means of giving to their children at least such education as young Burns received. From the spring labours of a ploughboy, from the summer employment of a shepherd, the peasant-youth often returns for a few months, eagerly to pursue his education at the parish-school.

It was so with Burns; he returned from labour to learning, and from learning went again to labour, till his mind began to open to the charms of taste and knowledge; till he began to feel a passion for books, and for the subjects of books, which was to give a colour to the whole thread of his future life. On nature he soon began to gaze with new discernment and with new enthusiasm: his mind's eye opened to perceive affecting beauty and sublimity, where, by the more gross peasant, there was nought to be seen but water, earth, and sky—but animals, plants, and soil.

What might perhaps first contribute to dispose his mind to poetical efforts, is one particular in the devotional piety of the Scottish peasantry. It is still common for them to make their children get by heart the Psalms of David, in the version of homely rhymes which is used in their churches. In the morning and in the evening of every day, or at least on the evening of every Saturday and Sunday, these Psalms are sung in solemn family devotion, a chapter of the Bible is read, and extemporary prayer is fervently uttered. The whole books of the sacred Scriptures are thus continually in the hands of almost every peasant. And it is impossible that there should not be occasionally some souls among them, awakened to the divine emotions of genius by that rich assemblage which those books present, of almost all that is interesting in incidents, or picturesque in imagery, or affectingly sublime or tender in sentiments and character. It is impossible that those rude rhymes, and the simple artless music with which they are accompanied, should not occasionally excite some ear to a fond perception of the melody of verse. That Burns had felt these impulses, will appear undeniable certain to whoever shall carefully peruse his Cot-
sents on his own level; but having got admission into
the fraternity of free-masons, he had the fortune, whe-
ther good or bad, to attract in the lodges the notice of
gentlemen better qualified than his more youthful
companions to call forth the powers of his mind, and to
show him that he was indeed a poet. A masonic song,
a satirical epigram, a rhyming epistle to a friend, at-
tempted with success, taught him to know his own
powers, and gave him confidence to try tasks more ar-
duous, and which should command still higher bursts of
applause.

The annual celebration of the sacrament of the Lord's
Supper, in the rural parishes of Scotland, has much in it
of those old Popish festivals, in which superstition, traffic,
and amusement, used to be strangely intermingled. Burns
saw, and seized in it one of the happiest of all subjects,
to afford scope for the display of that strong and pierc-
ing sagacity by which he could almost intuitively dis-
tinguish the reasonable from the absurd, and the becom-
ing from the ridiculous; of that picturesque power of
fancy, which enabled him to represent scenes, and per-
sons, and groups, and looks, attitudes, and gestures, in
a manner almost as lively and impressive, even in words,
as if all the artifices and energies of the painter had been
employed; of that knowledge which he had necessarily
acquired of the manners, passions, and prejudices of the
rustics around him, of whatever was ridiculous, no less
than of whatever was affectingly beautiful, in rural life.

A thousand prejudices of Popish, and perhaps too
of ruder Pagan superstition, have from time immemorial
been connected in the minds of the Scottish pea-
santry, with the annual recurrence of the Eve of the
Festival of all the Saints, or Hallowe'en. These were
all intimately known to Burns, and had made a power-
ful impression upon his imagination and feelings. He
chose them for the subject of a poem, and produced a
piece which is almost to frenzy the delight of those
who are best acquainted with its subject; and which
will not fail to preserve the memory of the prejudices
and usages which it describes, when they shall perhaps
have ceased to give one merry evening in the year to
the cottage fire-side.

The simple joys, the honest love, the sincere friend-
ship, the ardent devotion of the cottage; whatever in
the more solemn part of the rustic's life is humble and
artless, without being mean or unseemly—or tender and
dignified, without aspiring to stilted grandeur, or to un-
natural huskined pathos, had deeply impressed the im-
agination of the rising poet: had, in some sort, wrought
itself into the very texture of the fibres of his soul. He
tried to express in verse what he most tenderly felt,
what he most enthusiastically imagined; and produced
the Cotter's Saturday's Night.

These pieces, the true effusion of genius, informed
by reading and observation, and prompted by its own
native ardour, as well as by friendly applause, were
soon handed about amongst the most discerning of
Burns's acquaintance; and were by every new reader
perused and repurused, with an eagerness of delight
and approbation which would not suffer their author
long to withhold them from the press. A subscription
was proposed; was earnestly promoted by some gentle-
men, who were glad to interest themselves in behalf of
such signal poetical merit; was soon crowded with
the names of a considerable number of the inhabitants of
his poems was earnestly called for. He sold the copy-right for 100l.; but his friends at the same time suggested, and actively promoted, a subscription for an edition, to be published for the benefit of the author, ere the bookseller's right should commence. Those gentlemen who had formerly entertained the public of Edinburgh with the periodical publication of the papers of the Mirror, having again combined their talents in producing the Lounger, were at this time about to conclude this last series of papers; yet before the Lounger relinquished his pen, he dedicated a number to a commendatory criticism of the poems of the Ayrshire bard.

The subscription papers were rapidly filled; and it was supposed that the poet might derive from the subscription and the sale of his copy-right, a clear profit of at least 700l.

The conversation of even the most eminent authors is often found to be so unequal to the fame of their writings, that he who reads with admiration can listen with none but sentiments of profound contempt. But the conversation of Burns was, in comparison with the formal and exterior circumstances of his education, perhaps even more wonderful than his poetry. He affected no soft air or graceful motions of politeness, which might have ill accorded with the rustic plainness of his native manners. Conscious superiority of mind taught him to associate with the great, the learned, and the gay, without being overswayed into any such bashfulness as might have made him confused in thought, or hesitating in elocution. He possessed withal an extraordinary share of plain common sense or mother-wit, which prevented him from obtruding upon persons, of whatever rank, with whom he was admitted to converse, any of those effusions of vanity, envy, or self-conceit, in which authors are exceedingly apt to indulge, who have lived remote from the general practice of life, and whose minds have been almost exclusively confined to contemplate their own studies and their own works. In conversation he displayed a sort of intuitive quickness of judgment upon every subject that arose. The sensibility of his heart, and the vivacity of his fancy, gave a rich colouring to whatever reasoning he was disposed to advance; and his language in conversation was not at all less happy than in his writings. For these reasons, those who had met and conversed with him once, were pleased to meet and to converse with him again and again.

For some time he conversed only with the virtuous, the learned, and the wise; and the purity of his morals remained uncontaminated. But, alas! he fell, as others have fallen in similar circumstances. He suffered himself to be surrounded, by a race of miserable beings, who were proud to tell that they had been in company with Burns, and had seen Burns as loose and as foolish as themselves. He was not yet irrecoverably lost to temperance and moderation; but he was already almost too much captivated with their wanton rivals, to be ever more won back to a faithful attachment to their more sober charms. He now also began to contract something of new arrogance in conversation. Acquainted to be among his favourite associates what is vulgarly but expressly called the cock of the company, he could scarcely refrain from indulging in similar free-
BUR [ 18 ]

The subscription edition of his poems, in the mean time, appeared; and although not enlarged beyond that which came from the Kilmarnock press by any new pieces of eminent merit, did not fail to give entire satisfaction to the subscribers. He was now to close accounts with his bookseller and his printer, to retire to the country with his profits in his pocket, and to fix upon a plan for his future life. He talked loudly of independence of spirit, and simplicity of manners, and boasted his resolution to return to the plough; yet still he lingered in Edinburgh, week after week, and month after month, perhaps expecting that one or other of his noble patrons might procure him some permanent and competent annual income, which should set him above all necessity of future exertions to earn for himself the means of subsistence; perhaps unconsciously reluctant to quit the pleasures of that voluptuous town life to which he had for some time too willingly accustomed himself. An accidental dislocation or fracture of an arm or leg confining him for some weeks to his apartment, left him, during this time, leisure for serious reflection; and he determined to retire from the town without longer delay. None of all his patrons interposed to divert him from his purpose of returning to the plough, by the offer of any small pension, or any sinecure place of moderate emolument, such as might have given him competence without withdrawing him from his poetical studies. It seemed to be forgotten that a ploughman thus exalted into a man of letters was unfitted for his former toils, without being regularly qualified to enter the career of any new profession; and that it became incumbent upon those patrons who had called him from the plough, not merely to make him their companion in the hour of riot, not simply to fill his purse with gold for a few transient expenses, but to secure him, as far as was possible, from being ever overwhelmed in distress in consequence of the favour which they had shown him, and of the habits of life into which they had seduced him. Perhaps indeed the same delusion of fancy betrayed both Burns and his patrons into the mistaken idea, that, after all which had passed, it was still possible for him to return in cheerful content to the homely joys and simple toils of undissipated rural life.

In this temper of Burns’s mind, in this state of his fortune, a farm and the excise were the objects upon which his choice ultimately fixed for future employment and support. By the surgeon who attended him during his illness, he was recommended with effect to the commissioners of excise; and Patrick Miller, Esq. of Dalswinton, deceived, like Burns himself and Burns’s other friends, into an idea that the poet and exciseman might yet be respectable and happy as a farmer, generously proposed to establish him in a farm, upon conditions of lease, which prudence and industry might easily render exceedingly advantageous. Burns eagerly accepted the offers of this benevolent patron. Two of the poet’s friends from Ayrshire were invited to survey that farm in Dumfriesshire which Mr Miller offered. A lease was granted to the poetical farmer at that annual rent which his own friends declared that the due cultivation of his farm might easily enable him to pay. What yet remained of the profits of his publication was laid out in the purchase of farm stock; and Mr Miller might, for some short time, please himself with the persuasion that he had approved himself the liberal patron of genius; had acquired a good tenant upon his estate; and had placed a deserving man in the very situation in which alone he himself desired to be placed, in order to be happy to his wishes.

Burns, with his Jane, whom he now married, took up their residence upon his farm. The neighbouring farmers and gentlemen, pleased to obtain for an inmate among them the poet by whose works they had been delighted, kindly sought his company, and invited him to their houses. He found an inexpressible charm in sitting down beside his wife, at his own fireside; in wandering over his own grounds; in once more putting his hand to the plade and the plough; in forming his inclosures, and managing his cattle. For some months he felt almost all that felicity which fancy had taught him to expect in his new situation. He had been for a time idly; but his muscles were not yet unbraced for rural toil. He now seemed to find a joy in being the husband of the mistress of his affections, in seeing himself the father of her children, such as might promise to attach him for ever to that modest, humble, and domestic life, in which alone he could hope to be permanently happy. Even his engagements in the service of the excise did not, at the very first, threaten necessarily to debase him by association with the mean, the gross, and the profligate, to contaminate the poet, or to ruin the farmer.

But it could not be: it was not possible for Burns now to assume that sobriety of fancy and passions, that sedateness of feeling, those habits of earnest attention to gross and vulgar cares, without which success in his new situation was not to be expected. A thousand difficulties were to be encountered and overcome, much money was to be expended, much weary toil was to be exercised, before his farm could be brought into a state of cultivation, in which it might enrich the occupier. This was not a prospect encouraging to a man who had never loved labour, and who was at this time certainly not at all disposed to enter into agriculture with the enthusiasm of a projector. The business of the excise too, as he began to be more and more employed in it, distracted his mind from the care of his farm, led him into gross and vulgar society, and exposed him to many unavoidable temptations to drunken excess, such as he had no longer sufficient fortitude to resist. Amidst the anxieties, distractions, and seductions which thus arose to him, home became insensibly less and less pleasing; even the endeavours of his Jane’s affection began to lose their hold on his heart; he became every day less and less unwilling to forget in riot those gathering sorrows which he knew not to subside.

Mr Miller and some others of his friends would gladly have exerted an influence over his mind, which might have preserved him in this situation of his affairs, equally from despondency and from dissipation; but Burns’s temper pursed all control from his superior in fortune. He resented, as an arrogant encroachment upon his independence, that tenor of conduct by which Mr Miller wished to turn him from absolute conviviality, to that steady attention to the business of his farm, without which it was impossible to thrive in it. His
His crosses and disappointments drove him every day more and more into dissipation; and his dissipation tended to enhance whatever was disagreeable and perplexing in the state of his affairs. He sunk, by degrees, into the boon companion of mere existences; and almost every drunken fellow, who was willing to spend his money lavishly in the alehouse, could easily command the company of Burns. The care of his farm was thus neglected; waste and losses wholly consumed his little capital; he resigned his lease into the hands of his landlord; and retired, with his family, to the town of Dumfries, determining to depend entirely for the means of future support upon his income as an excise officer.

Yet during this unfortunate period of his life, which passed between his departure from Edinburgh to settle in Dumfriesshire, and his leaving the country in order to take up his residence in the town of Dumfries, the energy and activity of his intellectual powers appeared not to have been at all impaired. In a collection of Scotch songs, which were published (the words with the music) by Mr. Johnson, engraver in Edinburgh, in 4 vols. 8vo, Burns, in many instances, accommodated new verses to the old tunes with admirable felicity and skill. He assisted in the temporary institution of a small subscription library, for the use of a number of the well-disposed peasants in his neighbourhood. He readily aided, and by his knowledge of genuine Scotch phraseology and manners, greatly enlightened, the antiquarian researches of the late ingenious Captain Grose. He still carried on an epistolary correspondence, sometimes gay, sportive, humorous, but always enlivened by bright flashes of genius, with a number of his old friends, and on a very wide diversity of topics. At times, as it should seem from his writings of this period, he reflected, with inexpressible heart-bitterness, on the high hopes from which he had fallen; on the errors of moral conduct into which he had been hurried by the ardour of his soul, and in some measure by the very generosity of his nature; on the disgrace and wretchedness into which he saw himself rapidly sinking; on the sorrow with which his misconduct oppressed the heart of his Jane; on the want and destitute misery in which it seemed probable that he must leave her and their infants; nor amidst these agonizing reflections did he fail to look, with an indignation half invidious, half contemptuous, on those who, with moral habits not more excellent than his, with powers of intellect far inferior, yet basked in the sunshine of fortune, and were loaded with the wealth and honours of the world, while his felicity could not obtain pardon, nor his wants an honourable supply. His wit became from this time more openly sarcastical; and his conversation and writings began to assume something of a tone of misanthropical malignity, by which they had not been before, in any eminent degree, distinguished. But with all these failings, he was still that exalted mind which had raised itself above the depression of its original condition; with all the energy of the lion, pining to set free his hinder limbs from the yet encompassing earth, still appeared not less than archangel ruined!

His morals were not mended by his removal from the country. In Dumfries his dissipation became still more deeply habitual; he was here more exposed than in the country to be solicited to share the riot of the dissolute and the idle; foolish young men flocked eagerly about him, and from time to time pressed him to drink with them, that they might enjoy his wicked wit. The Caledonian Club, too, and the Dumfries-shire and Galloway Hunt, had occasional meetings in Dumfries after Burns went to reside there, and the poet was of course invited to share their conviviality, and hesitated not to accept the invitation.

In the intervals between his different fits of intemperance, he suffered still the keenest anguish of remorse, and horribly afflictive foresight. His Jane still behaved with a degree of maternal and conjugal tenderness and prudence, which made him feel more bitter by the evil of his misconduct, although they could not reclaim him. At last crippled, emaciated, having the very power of animation wasted by disease, quite broken-hearted by the sense of his errors, and of the hopeless miseries in which he saw himself and his family depressed; with his soul still tremblingly alive to the sense of shame, and to the love of virtue; yet even in the last feebleness and amid the last agonies of expiring life, yielding readily to any temptation that offered the semblance of intemperate enjoyment, he died at Dumfries, in the summer of 1796, while he was yet three or four years under the age of 40, furnishing a melancholy proof of the danger of suddenly elevating even the greatest mind above its original level.

After his death it quickly appeared that his failings had not effaced from the minds of his more respectable acquaintance either the regard which had once been won by his social qualities, or the reverence due to his intellectual talents. The circumstances of want in which his family were noticed by the government of Dumfries with earnest consideration. His funeral was celebrated by the care of his friends with a decent solemnity, and with a numerous attendance of mourners, sufficiently honourable to his memory. Several copies of verses were inserted in different newspapers upon the occasion of his death. A contribution, by subscription, was proposed, for the purpose of raising a small fund, for the decent support of his widow, and the education of his infant children.

From the preceding detail of the particulars of this poet's life, the reader will naturally and justly infer him to have been an honest, proud, warm-hearted man; of high passions and sound understanding, and a vigorous and excursive imagination. He was never known to descend to any act of deliberate meanness. In Dumfries he retained many respectable friends, even to the last. It may be doubted whether he has not, by his writings, exercised a greater power over the minds of men, and, by consequence, on their conduct upon their happiness and miseries, and upon the general system of life, than has been exercised by any half dozen of the most eminent statesmen of the present age. The power of the statesman is but shadowy, so far as it acts upon externals alone: the power of the writer of genius subdues the heart and the understanding, and having thus made the very spring of action its own, through them moulds almost all life and nature at its pleasure. Burns has not failed to command one remarkable sort of homage, such as is never paid but to great original geniuses; a crowd of poetasters started up to imitate him, by writing verses as he had done,
in the Scottish dialect, &c., *omitture*! servum pe-
cus! To persons whom the Scottish dialect, and the
customs and manners of rural life in Scotland, have no
charm, too much may appear to have been said about
Burns; by those who passionately admire him, a great
deal more, perhaps, was expected.

A complete edition of his works, in 4 vols. 8vo was
published under the superintendence of Dr. Carsie of
Liverpool, who drew up an elaborate and valuable ac-
count of the life of the poet, which is prefixed. From
the profits of this edition his widow and family have
received a handsome sum. The following letter from
Burns to the late Dr. Moore, gives so interesting an
account of the transactions of his early years, and affor-
des so good a specimen of vigour of thought and force
of expression in his prose composition, that we hope
it will prove acceptable to our readers.

*Macwianse*, August 2, 1787.—Sir, For some
months past I have been rambling up and down the
country, but I am now confined with some lingering
complaints, originating, as I take it, in the stomach.
To divert my spirits a little in this miserable fog of
*smoke,* I have taken a whim to give you a history of
myself. My name has made some little noise in this
country; you have done me the honour to interest
yourself very warmly in my behalf; and I think a
faithful account of what character of a man I am,
and how I came by that character, may perhaps amuse
you in an idle moment. I will give you an honest narra-
tive, though I know it will be often at my own ex-
pense; for I assure you, Sir, I have, like Solomon,
whose character, excepting in the trifling affair of
wisdom, I sometimes think I resemble, I have, I say,
like him turned my eyes to behold madness and folly,
and like him, too, frequently shaken hands with their
in
toxicating friendship. *

* Appendix 3

After you have perused these pages, should you think them
trifling and impertinent, I only beg leave to tell you,
that the poor author wrote them under some twitching qualms
of conscience, arising from a suspicion that he was do-
ing what he ought not to do; a predicament he has
more than once been in before.

I have not the most distant pretensions to assume
that character which the peo-coated guardians of es-
enteheons call, a gentleman. When at Edinburgh last
winter, I got acquainted in the heralds office, and look-
ing through that grany of honours, I there found al-
most every name of the kingdom; but for me,

—My ancient but ignoble blood
Has crept thro' scoundrels ever since the flood.

Gales, purpura, argent, &c. quite disowned me.

My father was of the north of Scotland, the son
of a farmer, and was thrown by early misfortunes on
the world at large; where, after many years wander-
ings and sojournings, he picked up a pretty large quan-
tity of experience, and experience, to which I am tri-
dept for most of my little pretensions to wisdom.—
I have met with few who understood men, their man-
ers, and their ways, equal to him; but stubborn
unpinned integrity, and headlong ungovernable irasci-
blity, are disqualifying circumstances; consequently I
was born a very poor man's son. For the first six or
seven years of my life, my father was a gardener to a
worthy gentleman of a small estate in the neighbour-
hood of Ayr. Had he continued in that station, I
must have marched off to be one of the little underlings
about a farm-house; but it was his dearest wish and
prayer to have it in his power to keep his children
under his own eye, till they could discern between
good and evil; so with the assistance of his generous
master, my father ventured on a small farm on his
estate. At these years I was by no means a favourite
with any body. I was a good deal noted for a reten-
tive memory, a stubborn sturdy something in my dis-
position, and an enthusiastic idiot piety. I say idiot
piety, because I was then but a child. Though it cost
the schoolmaster some thrashings, I made an excellent
English scholar; and by the time I was 10 or 12
years of age, I was a critic in substantives, verbs, and
particles. In my infant and boyish days too, I owed
much to an old woman who resided in the family, re-
markable for her ignorance, credulity, and superstition.
She had, I suppose, the largest collection in the coun-
try, of tales and songs concerning devils, ghosts, fairies,
brownies, witches, warlocks, spunkies, kelpies, elf-
candles, dead-lights, wraiths, apparitions, chariots,
giants, enchanted towers, dragons, and other trumpery.
This cultivated the latent seeds of poetry; but had so
strong an effect on my imagination, that to this hour,
in my nocturnal rambles, I sometimes keep a sharp
look-out in suspicious places; and though nobody can
be more sceptical than I am in such matters, yet it of-
ten takes an effort of philosophy to shake off these idle
terrors. The earliest composition that I recollect tak-
ing pleasure in, was the Vision of Mirza, and a hymn
of Addison's, beginning, 'How are thy servants blest,
O Lord?' I particularly remember one half-stanza
which was music to my boyish ear—

For though on dreadful whirls we hung
High on the broken wave—

I met with these pieces in Mason's English Collection,
one of my school-books. The two first books I ever
read in private, and which gave me more pleasure than
any two books I ever read since, were, The Life of Hannibal,
and The History of Sir William Wallace. Hannibal gave my young ideas such a turn, that I used
to strut in raptures up and down after the recruiting
song and bag-pipe, and wish myself tall enough to be
a soldier; while the story of Wallace poured a Scottish
prejudice into my veins, which will boil along there,
till the flood-gates of life shut in eternal rest.

*Polhemical divinity about this time was putting the
country half mad, and I, ambitious of shining in con-
versation parties on Sundays between sermons at fun-
erals, &c. used a few years afterwards to puzzle Cal-
vinism with so much heat and indiscretion, that I rais-
ed a hue and cry of heresy against me, which has not
ceased to this hour.

'Ve went on to Ayr was of some advantage to me.
My social disposition, when not checked by some in-
modifications of spirited pride, was, like our catechism
definition of infinitude, without bounds or limits. I
formed several connections with other young men who
possessed superior advantages; the youngling actors
who were busy in the rehearsal of parts in which they
were shortly to appear on the stage of life, where, alia! I was destined to drudge behind the scenes. It
is not commonly at this green age that our young
gentry
 gentrity have a just sense of the immense distance between them and their ragged play-fellows. It takes a few dashes into the world, to give the young great man that proper, decent, unnoticed disregard for the poor, insignificant, stupid devils, the mechanics and peasantry around him, who were perhaps born in the same village. My young superiors never insulted the clodhopper appearance of my plough-boy carcase, the two extremities of which were often exposed to all the inclemencies of all the seasons. They would give me stray volumes of books; among them, even then, I could pick up some observations, and one, whose heat I am sure not even the Munsey Begum scenes have tainted, helped me to a little French. Parting with these my young friends and benefactors, as they occasionally went off for the East or West Indies, was often to me a sore affliction, but I was soon called to more serious evils. My father's generous master died; the farm proved a ruinous bargain; and to clench the misfortune, we fell into the hands of a factor, who sat for the picture I have drawn of one in my tale of 'Two Dogs.' My father was advanced in life when he married. I was the middle of seven children and he, worn out by early hardships, was unfit for labour. My father's spirit was soon irritated, but not easily broken. There was a freedom in his lease in two years more, and to weather these two years, we retrenched our expenditures. We lived very poorly: it was a dexterous ploughman for my age; and the next oldest to me was a brother (Gilbert) who could drive the plough very well, and help me to thresh the corn. A novel writer might perhaps have viewed these scenes with some satisfaction, but so did not I; my indignation yet boils at the recollection of the factor's insolent threatening letters, which used to set us all in tears.

"This kind of life—the cheerless gloom of a hermit, with the unceasing moil of a galley-slave, brought me to my 16th year; a little before which period I first committed the sin of rhyme. You know our country custom of coupling a man and woman together as partners in the labours of harvest. In my 15th autumn, I was made a bewitching creature, a year younger than myself. My scarcity of English denotes me the power of doing her justice in that language, but you know the Scotch idiom; she was a bonnie, sweet, sassy lass. In short, she altogether, unwittingly to herself, initiated me in that delicious passion, which, in spite of acid disappointment, gin-horse prudence, and book-worm philosophy, I hold to be the first of human joys, our dearest blessing here below! How she caught the contagion I cannot tell: you medical people talk much of infection from breathing the same air, the touch, &c. but I never expressly said I loved her. Indeed I did not know myself why I liked so much to loiter behind with her, when returning in the evening from our labours; why the tones of her voice made my heart-strings thrill like an Æolian harp: and particularly why my pulse beat such a furious rate when I looked and lingered over her little hand to pick out the cruel nettles-stings and thistles. Among her other love-inspiring qualities, she sung sweetly; and it was her favourite reel to which I attempted giving an embodied vehicle in rhyme. I was not so presumptuous as to imagine that I could make verses like printed ones, composed by men who had Greek and Latin, but my girl sung a song which was said to be composed by a small country lad's son, on one of his father's masts, with whom he was in love, and I saw no reason why I might not rhyme as well as he; for excepting that he could smear sheep, and cast peats, his father living in the moorlands, he had no more scholar craft than myself.

"Thus with me began love and poetry; which at times have been my only, and, till within the last 12 months, have been my highest enjoyment. My father struggled on till he reached the freedom in his lease, when he entered on a larger farm, about ten miles farther in the country. The nature of the bargain he made was such as to throw a little ready money into his hands at the commencement of his lease, otherwise the affair would have been impracticable. For four years we lived comfortably here; but a difference commencing between him and his landlord as to terms, after three years toasting and whirling in the vortex of litigation, my father was just saved from the horrors of a jail, by a consumption, which, after two years promises, kindly stepped in, and carried him away, to 'where the wicked cease from troubling, and where the weary are at rest.'

"It is in the time that we lived on this farm, that my little story is most eventful. I was, at the beginning of this period, perhaps the most ungainly awkward boy in the parish—no solitary was less acquainted with the ways of the world. What I knew of ancient story was gathered from Salmon's and Guthrie's Geographical Grammars; and the ideas I had formed of modern manners, of literature, and criticism, I got from the Spectator. These, with Pope's Works, some plays of Shakespeare, Tull and Dickson on Agriculture, the Pantheon, Locke's Essay on the Human Understanding, Stackhouse's History of the Bible, Justice's British Gardener's Directory, Bayle's Lectures, Allan Ramsay's Works, Taylor's Scripture Doctrine of Original Sin, a Select Collection of English Songs, and Hervey's Meditations, had formed the whole of my reading. The collection of songs was most agreeable to me, on walking to labour, song by song, verse by verse; carefully noting the true tender, or sublimine, from affectation and fustian. I am convinced I owe to this practice much of my critic-craft, such as it is." (Month Mag. and Currie's Life of Burns).

BURNTISLAND. See Bruntisland.

BURNTWOOD, a town of Essex in England, situated on a hill, in E. Long. 0. 25. N. Lat. 51. 38.

BURR, the round knob of a horn next a deer's head.

BURRE, BOREE, or Boree, a kind of dance composed of three steps joined together in two motions, begun with a crotchit rising. The first couple contains twice four measures, the second twice eight. It consists of a balance and couppee.

BURR-PUMP, or Bilge-Pump, differs from the common pump, in having a staff, six, seven, or eight feet long, with a bar of wood, whereunto the leather is nailed, and this serves instead of a box. So two men standing over the pump, thrust down this staff, to the middle whereof is fastened a rope, for six, eight, or ten to bale by, thus pulling it up and down.

BURROCK, a small wier or dam, where wells are laid in a river, for the taking of fish.

BURROUGHS.
BURROUGHS’S MACHINE for grinding and polishing glass, invented by Mr. Burroughs of Southwark, and for which he received the society for the encouragement of arts a premium of 70l.

This machine consists of a cog-wheel A (fig. 3.), 12 feet in diameter, carrying 72 cogs; which turn a trunnels-head B, one foot four inches in diameter, and furnished with eight rounds; and also a horizontal spur-wheel C, of 12 cogs; and one foot eight inches in diameter. The trunnel-head B turns a spur-wheel D of 10 cogs, and two feet eight inches in diameter. This spur-wheel has two cranks, a, b, in its shaft; one of which, a, gives motion to a wooden frame, c, about 34 inches long and 19 broad. On the under side of this frame are fastened by screws 12 pieces of polished metal, each five inches and a half long, and three broad, covered with leather; and underneath these polishers a glass plate cemented in another frame is placed on the bench d, and polished with tripod by the motion given to the upper frame by the crank a. The nuts of the screws which fasten the polishers to the upper frame are not screwed close to the wood, in order to give the frame room to play; by which contrivance the perpendicular rise of the crank is avoided, and the motion of the polishers is always parallel and equal. The under frame may be moved by the hand in any direction without stopping the machine; by which means the plate, when larger than the polishing frame can cover in its motion, will be equally polished in every part.

The other crank b gives motion to two other polishers marked e, f, which have an alternate motion by the bending of the crank; they move upon the same plate, and have an equal number of polishers as that already described.

The same crank also gives motion to a contrivance represented at g for polishing spectacle-glasses. It consists of two segments of the same sphere; one concave and the other convex. On the latter the glasses are cemented; and polished by the former, which is moved by the crank b. The convex segment may be moved round by the hand without stopping the machine, so that all the glasses on its superfiicies will be equally polished.

The other spur-wheel C, by means of a crank in its shaft, gives motion to another frame g, employed in grinding the glass plates. The rod a, extended from the crank f to the frame g, is fastened to the latter by means of a pivot, in order to admit of a rotary motion, as well as that given by the crank in a longitudinal direction. This rotary motion is effected by means of a rod of iron h, called a trigger, sharp at the extremity next the frame, where it touches the teeth of a horizontal spur-wheel, or circular piece of wood, fixed on the grinding plate, while the other is extended three feet two inches to the centre of motion.

But this contrivance, in which the merit of the machine principally consists, will be much better conceived from a small delineation of it by itself (fig. 4.), where F is the crank marked f in fig. 3. and turned by the spur-wheel C in the same figure. G is the trigger, three feet two inches long. I, a roll fixed on the trigger for the rod to slide on. H, the horizontal spur-wheel, eleven inches in diameter, fixed on the grinding plate; the teeth of which are touched by the trigger; but with a very unequal force, as it will wholly depend upon the Burrough’s grinding-plate’s being farther from, or nearer to, the centre of motion of the trigger. By this simple contrivance, the grinding-plate has a very compound motion, never moving exactly in the same track, and therefore must grind the plates equally in every part. Several attempts have been made by others for producing the same effect, but without success; the grinding-plate always follows the same track, and consequently the plates are ground equally.

BURROW, Sir James, master of the crown office, was elected F. R. S. and F. A. S. 1751. On the death of Mr. West in 1772, he was prevailed on to fill the president’s chair at the Royal Society till the anniversary election, when he resigned it to Sir John Pringle; and August 10, 1773, when the society presented an address to his majesty, he received the honour of knighthood. He published two volumes of Reports in 1766; two others in 1771 and 1776; and a volume of Decisions of the Court of King’s Bench upon settlement cases from 1732 to 1772 (to which was subjoined An Essay of Punctuation), in three parts, 4to, 1768, 1772, 1776. The Essay was also printed separately in 4to, 1773. He published, without his name, “A few Anecdotes and Observations relating to Oliver Cromwell and his family, serving to rectify several errors concerning him,” published by Nicol. Comm. Papadopoli, in his Historia Gymnastis Patavini, 1753, 4to. He died in 1782.

BURROWS, holes in a Warren, serving as a covert for rabbits, &c. A coyney’s coming out of her burrow is called bolting. To catch coynes, they sometimes lay purse-nets over the burrows, then put in a terrier close muzzled, which making the creature bolt, she is caught in the net.

BURSA, or PRUSA, in Geography, the capital of Bithynia in Asia Minor, situated in a fine fruitful plain, at the foot of Mount Olympus, about 100 miles south of Constantinople. It is still a large town. E. Long. 29. 0. N. Lat. 40. 30.

BURSÆ-PASTORIS, in Botany. See Thlaspi.

BURSA, Burse, originally signifies a purse. In middle-age writers it is more particularly used for a little college or hall in a university, for the residence of students, called burseoles or bursarii. In the French universities it still denotes a foundation for the maintenance of poor scholars in their studies. The denomination to burses is in the hands of the patrons and founders thereof. The burses of colleges are not benefits, but mere places assigned to certain countries and persons. A burse becomes vacant by the burser’s being promoted to a cure.

BURSÆE MUCOSÆ. See Anatomy Index.

BURSAR, or BURSÆR, (Bursarius), is used in middle-age writers for a treasurers or cash-keeper. In this sense we meet with bursars of colleges. Conventual bursars were officers in monasteries, who were to deliver up their account yearly on the day after Michaelmas. The word is formed from the Latin bursa, whence also the English word purse; hence also the officer, who in a college is called bursar, in a ship is called purser.

Bursariæ, or Bursæriæ, (Bursarii), also denote those to whom stipends are paid out of a burse or fund appointed for that purpose.
BURBARY, the bursary, or exchequer of collegiate and conventual bodies; or the place of receiving, paying, and accounting by the bursar or bursars.

BURSE, in matters of commerce, denotes a public edifice in certain cities, for the meeting of merchants to negotiate bills, and confer on other matters relating to money and trade. In this sense, burse amounts to the same with what we otherwise call an exchange.

The first place of this kind to which the name Burse was given, Guiccardin assures us was at Bruges; and it took its denomination from a hotel adjoining to it, built by a lord of the family de la Bourse, whose arms, which are three purses, are still found on the crowning over the portal of the house. Catell’s account is somewhat different, viz. that the merchants of Bruges bought a house or apartment to meet in, at which was the sign of the purse. From this city the name was afterwards transferred to the like places in others, as in Antwerp, Amsterdam, Bergen in Norway, and London. This last, anciently known by the name of the common bourse of merchants, had the denomination since given it by Queen Elizabeth, of the royal exchange. The most considerable burse is that of Amsterdam, which is a large building, 230 feet long and 130 broad, round which runs a peristyle 20 feet wide. The columns of the peristyle, which are 46, are numbered, for the convenience of finding people. It will hold 4500 persons.

In the times of the Romans there were public places for the meeting of merchants in most of the trading cities in the empire; that built at Rome, in the 259th year after its foundation, under the consulate of Appius Claudius and Publius Servilius, was denominated the college of merchants; some remains of it are still to be seen, and are known by the modern Romans under the name legatio. The Hans Towns, after the example of the Romans, gave the name of colleges to their bourses.

BURSEMA. See Botany Index.

BURSTEN, denotes a person who has a rupture. See Rupture.

BURTHEN, See of a Ship. See Burden.

BURTON upon TRENT, a town of Staffordshire, in England. It had formerly a large abbey; and over the river Trent it now has a famous bridge of free stone, about a quarter of a mile in length, supported by 37 arches. It consists chiefly of one long street, which runs from the place where the abbey stood to the bridge, and contained 3979 inhabitants in 1811. Burton ale is reckoned the best of any brought to London. W. Long. x. 36. N. Lat. 52. 48.

BURTON, a town of Lincolnshire in England, seated on a hill near the river Trent. It is but a small place, and is situated in W. Long. 0. 30. N. Lat. 53. 40.

BURTON, a town of Westmoreland in England, seated in a valley near a large mill called Parleton-knot-hall. It is pretty well built, and lies on the great road from Lancaster to Carlisle. W. Long. 2. 35. N. Lat. 54. 10. 30.

BURTON, Robert, known to the learned by the name of Democritus junior, was younger brother to William Burton, who wrote “The Antiquities of Leicestershire,” and born of an ancient family at Lindley, in that county, upon the 8th of February 1576. He was educated in grammatical learning in the free school of Sutton Coldfield in Warwickshire; in the year 1593 was sent to Brazen-nose college in Oxford; and in 1599 was elected student of Christ-church. In 1616, he had the vicarage of St Thomas, in the west suburb of Oxford, conferred upon him by the dean and canons of Christ-church, to the parishioners of which, it is said, that he always gave the sacrament in wafers; and this, with the rectory of Segrave in Leicestershire, given him some time after by George Lord Berkeley, he held to the day of his death, which happened in January 1639.

He was a man of general learning; a great philosopher; an exact mathematician; and (what makes the peculiarity of his character) a very curious calculator of nativities. He was extremely studious, and of a melancholy turn; yet an agreeable companion, and very humorous. The anatomy of melancholy, by Democritus junior, as he calls himself, shows, that these different qualities were mixed together in his composition. This was printed first in 4to, afterwards in folio, in 1624, 1632, 1639, and 1652, the last at the request of the bookseller, who, as Mr. Wood tells us, got an estate by it. Some circumstances attending his death occasioned strange suspicions. He died in his chamber at or very near the time which, it seems, he had some years before predicted from the calculation of his nativity; and this exactness made it whispered about that for the glory of astrology, and rather than his calculation should fail, he became indeed a feo de se. This, however, was generally discredited; he was buried with due solemnity in the cathedral of Christ-church, and had a fair monument erected to his memory. He left behind him a very choice collection of books. He bequeathed many to the Bodleian library; and 100l. to Christ-church, the interest of which was to be laid out yearly in books for their library.

BURTON, John, D. D. a learned divine, was born in 1656, at Wembworth, in Devonshire, of which parish his father was rector. He was educated at Corpus Christi college, Oxford. In 1725, became preacher and master of the school, where he spoke a Latin oration before the determining bachelor, which is entitled “Heli; or, An Instance of a Magistrate’s erring through unseasonable Leziny;” written and published with a view to encourage the salutary exercise of academical discipline; and afterwards treated the same subject still more fully in four Latin sermons before the university, and published them with appendices. He also introduced into the schools, Locke, and other eminent modern philosophers, as suitable companions to Aristotle; and printed a double series of philosophical questions, for the use of the younger students; from which Mr Johnson of Magdalen college, Cambridge, took the hint of his larger work of the same kind, which has gone through several editions.

When the settling of Georgia was in agitation, Dr Bray, justly revered for his institution of parochial libraries, Dr Stephen Hales, Dr Berriman, and other learned divines, interested Mr Burton's pious assistance in that undertaking. This he readily gave, by preaching before the society in 1732, and publishing his sermon, with an appendix on the state of that colony; and he
he afterwards published an account of the designs of the associates of the late Dr Bray, with an account of their proceedings.

About the same time, on the death of Dr Edward Littleton, he was presented by Eton college to the vicarage of Maple-Derham, in Oxfordshire. Here a melancholy scene, which too often appears in the mansion of the clergy, presented itself to his view: a widow, with three infant daughters, without a home, without a fortune; from his compassion arose love, the consequence of which was marriage; for Mrs. Littleton was handsome, elegant, accomplished, ingenious, and had great sweetness of temper. In 1760, he exchanged his vicarage of Maple-Derham for the rectory of Worplesdon in Surrey. In his advanced age, finding his eyes begin to fail him, he collected and published, in one volume, all his scattered pieces, under the title of Opuscula micellanea; and soon after died, February 11th, 1771.

BURTON, in the sea-language, a small tackle consisting of two single blocks, and may be made fast anywhere at pleasure, for hoisting small things in and out.

BURY, is sometimes used to denote the hole or den of some animal under ground. In this sense we say the bury of a mole, a tortoise, or the like. The grillo-
talps, or mole-cricket, digs itself a bury with its fore-
feet, which are made broad and strong for that pur-
purpose. Naturalists speak of a kind of urchins in the island of Maraguan, which have two entries to their buries, one towards the north, the other towards the south, which they open and shut alternately, as the wind happens to lie.

Bury, or Geogrophy, a market town of Lancashire, about 8 miles south-east of Lancaster. It is a borough in the family of Albermarle. W. Long. 2° 20'. N. Lat. 53° 36'.

BURY St Edmund's, or St Edmund's Bury, the county town of Suffolk, about 12 miles east of Newmarket, and 70 north-east of London. Population 7986. E. Long. 0° 45'. N. Lat. 52° 20'.

BURYING, the same with interment or BURIAL.

Burying Alive was the punishment of a vestal who had violated her vow of virginity. The unhappy priestess was let down into a deep pit, with bread, water, milk, oil, a lamp burning, and a bed to lie on. But this was only for show; for the moment she was let down, they began to cast in the earth upon her till the pit was filled up. Some middle-age writers seem to make burying alive (defossio) the punishment of a woman thief.

Lord Bacon gives instances of the resurrection of persons who have been buried alive. The famous Don Scotus is of the number; who, having been seized with a catalepsy, was thought dead, and laid to sleep among his relations, but raised again by his servant, in whose absence he had been buried. Bartholin gives an account of a woman, who, on recovering from an apoplexy, could not be convinced but that she was dead, and solicited so long and so earnestly to be buried, that they were forced to comply; and performed the ceremonies, at least in appearance. The famous Emperor Charles V., after his abdication, took it into his head to have his burial celebrated in his lifetime, and assisted at it. See CHARLES V.

Burying Place. The ancients buried out of cities and towns; an usage which we find equally among Jews, Greeks, and Romans. Among the last, bury-
ing within the walls was expressly prohibited by a law of the 12 tables. The usual places of interment were in the suburbs and fields, but especially by the waysides. We have instances, however, of persons buried in the city; but it was a favour allowed only to a few of singular merit in the commonwealth. Plutarch says, those who had triumphed were indulged in it. Be this as it will, Val. Publicola, and C. Fabricius, are said to have had tombs in the forum: and Cicero adds Tubertas to the number. Lycurgus allowed his Lacedereonians to bury their dead within the city and round their temples, that the youth, being inveterate to such spectacles, might be the less terrified with the apprehension of death. Two reasons are alleged why the ancients buried out of cities: the first, an opinion that the sight, touch, or even neighbourhood, of a corpse, defiled a man, especially a priest; whose role in A. Ce-
lus, that the flamen dialis might not on any account enter a place where there was a grave: the second, to prevent the air from being corrupted by the stench of putrefied bodies, and the buildings from being endangered by the frequency of funeral fires.

Burying in churches was not allowed for the first 300 years after Christ; and the same was severely prohibited by the Christian emperors for many ages afterwards. The first step towards it appears to have been the practice of erecting churches over the graves of some martyrs in the country, and translating the relics of others into churches in the city; the next was, allowing kings and emperors to be buried in the atrium or church-porch. In the 6th century, the people began to be admitted into the church-yards; and some princes, founders, and bishops, into the church. From that time the matter seems to have been left to the discretion of the bishop.

BUSE, AUGER GISLEN, LORD OF, a person illustrious on account of his embassies, was born at Com-

mines in the year 1523; and educated at the most fa-
mous universities, at Louvain, at Paris, at Venice, at Bologna, and at Padua. He was engaged in several important employments and negotiations, and particularly was twice seat ambassador by the king of the Ro-

mans to the emperor Soliman. He collected inscrip-
tions; bought manuscripts; searched after rare plants; inquired into the nature of animals; and in his second journey to Constantinople, carried with him a painter, that he might be able to communicate to the curious the figures, at least, of the plants and animals that were not well known in the west. He wrote a Discourse of the State of the Ottoman Empire, and a Relation of his two Journeys to Turkey, which are much esteemed. He died in 1592.

BUSBY, Dr. Richard, son of a gentleman in Westminster, was born at Lutton in Lincolnshire, in 1606. He passed through the classes in Westminster school, as king's scholar; and completed his studies at Christ-church, Oxford. In 1640 he was appointed master of Westminster school; and by his skill and dil-

gence in the discharge of this important and laborious office, for the space of 55 years, bred up the greatest number of eminent men, in church and state, that ever at one time adorned any age or nation. He was exter-

mely severe in his school; though he applauded wit
BUSCHING, A. F. a celebrated German geographer. See Supplement.

BUSCH, Paul, the first bishop of Bristol, became a student in the university of Oxford about the year 1513, and in 1518 took the degree of bachelor of arts. He afterwards became a brother of the order called bonhoms: of which, after studying some time among the friars of St Austin (now Wadham college), he was elected provincial. In that station he lived many years; till at length King Henry VIII. being informed of his great knowledge in divinity and physic, made him his chaplain, and in 1542 appointed him to the new episcopal see of Bristol; but having in the reign of Edward VI. taken a wife, he was, on the accession of Mary, deprived of his dignity, and spent the remainder of his life in a private station at Bristol, where he died in the year 1558, aged 63, and was buried on the north side of the choir of the cathedral. Wood says, that while he was a student at Oxford, he was numbered among the celebrated poets of that university; and Pitt gives him the character of a faithful Catholic, his want of chastity notwithstanding. He wrote, 1. An Exhortation to Margaret Burgess, wife to John Burgess, clothier, of King’s Wood, in the county of Wills. London, printed in the reign of Edward VI. 8vo. 2. Notes on the Psalms. 3. Treatise in praise of the cross. 4. Answer to certain queries concerning the abuse of the mass. Records, No. 25. 5. Dialogues between Christ and the Virgin Mary. 6. Treatise of slaves and curing remedies. 7. A little treatise called The Extirpation of Ignorance. 8. Carmina diversa.

Bush, a term used for several shrubs of the same kind growing close together: thus we say, a furze-bush, bramble-bush, &c.

Bush is sometimes used, in a more general sense, for any assemblage of thick branches interwoven and mixed together.

Bush also denotes a coronated frame of wood hung out as a sign of taverns. It takes the denomination from hence, that; anciently, signs where wine was sold were bushes: chiefly of ivy, cypress, or the like plant, which keeps its verdure long. And hence the English proverb, “Good wine needs no bush.”

Burning-Bush, that bush wherein the Lord appeared to Moses at the foot of Mount Horeb, as he was feeding his father-in-law’s flocks. As to the person that appeared in the bush, the text says, “That the angel of the Lord appeared unto him in a flame of fire, out of the middle of the bush:” but whether it was a created angel, speaking in the person of God, or God himself, or (as the most received opinion is) Christ the son of God, has been matter of some controversy among the learned. Those who suppose it no more than an angel, seem to imply that it would be a diminution of the majesty of God, to appear upon every occasion, especially when he has such a number of celestial ministers, who may do the business as well. But considering that God is present everywhere, the notification of his presence by some outward sign in one determinate place (which is all we mean by his appearance), is in our conception less laborious (if any thing laborious could be conceived of God) than a delegation of angels upon every turn from heaven, and seems in the main to illustrate rather than debase the glory of his nature and existence. But however this be, it is plain that the angel here spoken of was not created being; from the whole context, and especially from his saying, “I am the Lord God, the Jehovah,” &c. since this is not the language of angels, who are always known to express themselves in such humble terms as these, “I am sent from God; I am thy fellow servant,” &c. It is a vain pretext to say, that an angel, as God’s ambassador, may speak in God’s name and person; for what ambassador of any prince ever yet said, “I am the king?” Since therefore no angel, without the guilt of blasphemy, could assume these titles; and since neither God the Father nor the Holy Ghost, are ever called by the name of angel, i.e. “messenger, or person sent,” whereas God the Son is called by the prophet Malachi (chap. iii. 1), “The angel of the covenant:” it hence seems to follow, that this angel of the Lord was God the Son, who might very properly be called an angel, because in the fulness of time he was sent into the world in our flesh, as a messenger from God, and might therfore make these his temporary apparitions. This is by some; presented to arise as forerunners, as it were, of his more solemn mission. The emblem of the burning-bush is used as the seal of the church of Scotland, with this motto: Nec tamen consummatur; i.e. “Though burning, is never consumed.”

BUSHEL, a measure of capacity for things dry; as grains, pulse, dry fruits, &c. containing four pecks, or eight gallons, or one-eighth of a quarter.

Du Cange derives the word from busellus, bustellus, or bisellus, a diminutive of bus, or bume, used in the corrupt Latin for the same thing; others derive it from busellus, an urn, wherein lots were cast; which seems to be a corruption from busulus. Busselius appears to have been first used for a liquid measure of wine, equal to eight gallons. Octo librae factiunt gal- nem vini, et octo galones vini factiunt busellum London, quae est octava pars quarti. It was soon after transferred to the dry measure of corn of the same quantity.—Ponchus octo librorum frumenti facti bus- sellum, de quibus octo constitutione quartierum. By 12 Henry VII. c. 5 a bushel is to contain 8 gallons of wheat; the gallon 8 pounds of wheat Troy weight; the pound 12 ounces Troy weight; the ounce 20 shillings; and the sterling 32 grains or corns of wheat, growing in the midst of the ear. This standard bushel is kept in the Exchequer; when being filled with common spring-water, and the water measured before the house of commons in 1696, in a regular paralleloiped, it was found to contain 214.56 solid inches; and the said water being weighed, amounted to 131. ounces and 14 penny-weights troy. Besides the standard or legal bushel, we have several local bushels, of different dimensions in different places. At Abington and Andover, a bushel contains nine gallons; at Appleby and Penrith, a bushel of pease, rye, and wheat, contains 16 gallons; of barley, big, malt, mixt malt, and oats, 20 gallons. A bushel contains, at Carlisle, 24 gallons; at Chester, a bushel of wheat, rye, &c. contains 32 gallons, and of oats 40; at Dorchester, a bushel of malt and oats con-
At Paris, the bushel is divided into 2 half-bushels; the half-bushel into 2 quarts; the quart into 2 half-quarts; the half-quart into 2 liters; and the liter into 2 half-liters. By a sentence of the provost of the merchants of Paris, the bushel is to be 2 inches in diameter and 10 inches in diameter; the quart 4 inches in diameter, and 10 inches in diameter; the liter 3 inches in diameter, and 6 inches in diameter; the bushel 9 inches in diameter, and 9 inches in diameter. Three bushels make a minot, 6 a mine, 12 a septier, and 144 a auid. In other parts of France the bushel varies: 14 1/2 bushels of Amboise and Tours make the Paris septier. Twenty bushels of Avignon make 3 Paris septiers. Twenty bushels of Blois make 1 Paris septier. Two bushels of Bourdeaux make 1 Paris septier. Thirty-two bushels of Rochel make 19 Paris septiers. Oats are measured in a double proportion to other grains; so that 24 bushels of oats make a septier, and 248 a auid. The bushel of oats is divided into 5 picotins, the picotin into 2 half-quarts, or 4 liters. For salt, 4 bushels make a minot, and 6 a septier. For coal, 8 bushels make a minot, 16 a mine, and 320 a auid. For lime, 3 bushels make a minot, and 28 a auid. Such were the measures by bushel before the revolution: for the changes that have since taken place, see MEASURE AND WEIGHT.

BUSIRIS, in Ancient Geography, a city of the Lower Egypt, to the south of Leontopolis, on that branch of the Nile called Busiris; built by Busiris, noted for his cruelty, and slain by Hercules (Ovid, Virgil, Diodorus Siculus). Strabo denies such a tyrant ever existed; Isocrates has written his panegyric. In this city stood a grand temple of Isis, which gave it the appellation of the city of Isis. It was destroyed on a revolt by Dioclesian.

BUSIRITICUS FLAVIUS, in Ancient Geography, that branch of the Nile which empties itself at the mouth called Ostium Patehmeticum, or Phaihetion (Ptolemy); also a part according to an ancient map at the Ostium Mindeanum; this river, or branch, dividing itself at Acropoli into two branches; called Busiris, from the city of Busiris, which stood on its left or west branch. It is the second branch of the Nile, reckoning from the east.

BUSIRITICUS NOMAS, in Ancient Geography, a prefecture, or division of the Lower Egypt; so called from the city Busiris, (Herodotus, Pliny, Ptolemy).

BUSITIS, in Ancient Geography, a district of Arabia Deserta; so called from Bus, or Buz, Nahor's second son; the country of Elinu, the fourth interlocutor in Job; called Bus他表示, by the Septuagint.

BUSKIN, a kind of shoe, somewhat in manner of a boot, and adapted to either foot, and worn by either sex. This part of dress, covering both the foot and mid- leg, was tied underneath the knee; it was very rich and fine, and principally used on the stage by actors in tragedy. It was of a quadrangular form; and the sole was so thick, as that, by means thereof, men of the ordinary stature might be raised to the pitch and elevation of the heroes they personated. The colour was generally purple on the stage; herein it was distinguished from the sock worn in comedy, that being only a low common shoe. The buskin seems to have been worn not only by actors but also by girls, to raise their height; travellers and hunters also made use of it, to defend themselves from the mire. In classic authors, we frequently find the buskin used to signify tragedy itself, in regard it was a mark of tragedy on the stage. It was also to be understood for a lofty strain or high style.

BUSSE, in maritime affairs, a small sea vessel, used by us and the Dutch in the herring-fishery, commonly from 48 to 60 tons burden, and sometimes more: a busse has two small sheds or cabins, one at the prow and the other at the stern; that at the prow serves for a kitchen. Every busse has a master, an assistant, a mate, and seamen in proportion to the vessel's size; the master commands in chief, and without his express order the nets cannot be cast or taken up; the assistant has the command after him; and the mate next, whose business is to see the seamen manage their rigging in a proper manner, to mind those who draw in their nets, and those who kill, gut, and cure the herrings as they are taken out of the sea: the seamen generally engage for a whole voyage in the lump. The provisions which they take on board the busse, consist commonly in biscuit, oatmeal, and dried or salt fish: the crew being content for the rest with what fresh fish they catch. See FISHERIES.

BUST, or BUSTO, in Sculpture, denotes the figure or portrait of a person in relief, showing only the head, shoulders, and stomach, the arms being lopped off: ordinarily placed on a pedestal or console.

In speaking of an antique, we say the bust is marble, and the bust porphyr, or bronze, that is, the stomach and shoulders. Palliarii observes, that though in painting, one may say a figure appears in busto, yet it is not properly called a bust, that word being confined to things in relief.

The bust is the same with what the Latins called Herma, from the Greek Hermes, Mercury, the image of that god being frequently represented in this manner amongst the Athenians.

Bust is also used, especially by the Italians, for the trunk of a human body, from the neck to the hips.

BUSTA GALlica, was a place in ancient Rome, wherein the bones of the Gauls, who first took the city, and were slain by Camillus, were deposited. It suffered from BUSTA Gallorum, a place on the Apennines, thus called by reason of many thousands of Gauls killed there by Fabius.

BUSTARD. See OTIS, ORNITHOLOGY INDEX.

BUSTUARIE MOCHIE, according to some, women that were hired to accompany the funeral and lament the loss of the deceased; but others are of opinion, that they were rather the more common prostitutes, that stood among the tombs, graves, and other such lonely places.

BUSTUARII, in Roman antiquity, gladiators who fought about the bustum or funeral pile of a person of distinction, that the blood which was spilt might serve as a sacrifice to the infernal gods; and render them more propitious to the master of the deceased. This custom was introduced in the room of the more inhum
BUT

man one of sacrificing captives at the bustum, or on the tomb of warriors.

BUSTUM, in antiquity, denotes a pyramid or pile of wood, whereon were anciently placed the bodies of the deceased, in order to be burnt.

The Romans borrowed the custom of burning their dead from the Greeks. The deceased, crowned with flowers, and dressed in his richest habits, was laid on the bustum. Some authors say, it was only called bustum after the burning, quasi bene bustum: before the burning it was more properly called pyra; during it roges; and afterwards bustum. When the body was only burnt there, and buried elsewhere, the place was not properly called bustum, but ustrina, or ustrinum.

BUSTUM, in the Campus Martius, was a structure whereon the emperor Augustus first, and after him the bodies of his successors, were burnt. It was built of white stone, surrounded with an iron palisade, and planted with rows of elder trees.

Bustum was also figuratively applied to denote any tomb. We hence those phrases, facere bustum, uivere bustum, &c.

Bustum of an Altar, was the hearth or place where the fire was kindled.

BUTCHER, a person who slaughters cattle for the use of the table, or who cuts up and retails the same.

Among the ancient Romans, there were three kinds of established butchers, whose office it was to furnish the city with the necessary cattle, and to take care of preparing and vending their flesh. The suarii provided hogs; the pecunari or boarish, other cattle, especially oxen; and under these was a subordinate class, whose office was to kill, called lamis and carnices.

To exercise the office of butcher among the Jews with dexterity, was of more reputation than to understand the liberal arts and sciences. They have a book concerning shambles-constitution; and in case of any difficulty, they apply to some learned rabbi for advice: nor was any allowed to practice this art, without a license in form; which gave the man, upon evidence of his abilities, a power to kill meat, and others to eat what he killed; provided he carefully read every week for one year, and every month the next year, and once a quarter during his life, the constitution above mentioned.

We have some very good laws for the better regulation and preventing the abuses committed by butchers. A butcher that sells swine's flesh mangled, or dead of the murrain, for the first offence shall be amerced; for the second, have the pillory: for the third, be imprisoned, and make fine; and for the fourth, abjure the town. Butchers not selling meat at reasonable prices shall forfeit double the value, by warrant of two justices of the peace. No butcher shall kill any flesh in his scalding-house, or within the walls of London, on pain to forfeit for every ox so killed 20., and for every other beast 8., to be divided between the king and the prosecutor.

Butcher-Bird. See Lanius, Ornithology Index.

Butcher-Broom. See Ruscus, Botany Index.

Butcher-Island, in the East Indies, a small island about two miles long and scarce one broad. It has its name from cattle being kept there for the use of Bona-

bay, from which it is about three miles distant. It has a small fort, but of very little consequence.

Bute, an island lying to the west of Scotland, being separated from Cowal, a district of Argyleshire, only by a narrow channel. In length it is about 18 miles; the broadest part from east to west is about five. Part of it is rocky and barren; but from the middle southwards, the ground is cultivated, and produces peas, oats, and barley. Here is a quarry of red stone, which the natives have used in building a fort and chapel in the neighbourhood of Rathsay, which is a very ancient royal borough, head town of the shire of Bute and Arran; but very thinly peopled, and maintained chiefly by the herring fishery, with the profits of which all the rents of this island are chiefly paid. On the north side of Rathsay, are the ruins of an ancient fort, with its drawbridge, chapel, and barracks. Here are likewise the remains of some Danish towers. The natives are healthy and industrious, speak the Erse and the dialect of the Lowlands indifferently, and profess the Protestant religion. The island is divided into two parishes, accompanied with four churches; and belongs chiefly to the earl of Bute, who possesses an elegant seat on the east side of the island. The name of this isle has by several authors, and in different periods, been very differently written, as Bote, Both, Bothe, Boot, but now generally Bute. Our ancient writers suppose that it derived its name from a cell erected therein by St Brendan, an Irish abbot who flourished in the 6th century, because in his language such a cell was called Both. It is however, probable, that this name was of great antiquity, since we find it denominated Botis by the anonymous geographer of Ravenna. It was from very early times part of the patrimony of the Stuarts: large possessions in it were granted to Sir John Stuart, son of Robert II. by his beloved mistress Elizabeth More; and it has continued in that line to the present time.

BUTESHIRE, comprehends the islands of Bute, Arran, the greater and lesser Combray, and Inish-marroc. This shire and that of Caithness send a member to parliament alternately. The earl of Bute is admiral of the county, by commission from his majesty, but no man dependent on the lord high admiral of Scotland so that if any maritime case occurs within this jurisdiction, (even crimes of as high a nature as murder or piracy), his lordship, by virtue of his powers as admiral, is sufficient judge, or he may delegate his authority to any deputies.

The following is a view of the population of this country at two different periods, taken from the Statistical history of Scotland.

Butcher, Island
BUTLER, the trivial name of a species of Falco.

BUTLER, Charles, a native of Wycomb in the county of Bucks, and a master of arts in Magdalen college, Oxford, published a book with this title: "The principles of music in singing and setting; with the twofold use thereof, ecclesiastical and civil." Quarto, London 1656. The author of this book was a person of singular learning and ingenuity, which he manifested in 'sundry' other works enumerated by Wood in the Athen Oxon. Among the rest is an English Grammar, published in 1633, in which he proposes a scheme of regular orthography, and makes use of characters, some borrowed from the Saxon, and others of his own invention, so singular, that we want types to exhibit them: and of this imagined improvement he appears to have been so fond, that all his tracts are printed in like manner with his grammar; the consequence whereof has been an almost general disgust to all that he has written. His Principles of Music is, however, a very learned, curious, and entertaining book; and, by the help of the advertisement from the printer to the reader, prefixed to it, explaining the powers of the several characters made use of by him, may be read to great advantage, and may be considered a judicious supplement to Morley's introduction.

BUTLER, Samuel, a celebrated poet, was the son of a respectable Worcestershire farmer, and was born in 1612. He passed some time at Cambridge, but was never matriculated in that university. Returning to his native country, he lived some years as clerk to a justice of peace; where he found sufficient time to apply himself to history, poetry, and painting. Being recommended to Elizabeth, Countess of Kent, he enjoyed in her house, not only the use of all kinds of books, but the conversation of the great Mr Selden, who often employed Butler to write letters, and translate for him. He lived also some time with Sir Samuel Luke, a gentleman of an ancient family in Bedfordshire, and a famous commander under Oliver Cromwell, and he is said to have been at this time to have wrote, or at least to have planned, his celebrated Hudibras; and under that character to have ridiculed the knight. The poem itself furnishes this key; where, in the first canto, Hudibras says,

"Tis sung, there is a valiant Masamuke
In foreign land yclep'd "

"To whom we oft have been compar'd
For person, parts, address, and beard."

After the Restoration, Mr Butler was made secretary to the earl of Carlyle, lord president of Wales, who appointed him steward of Ludlow castle, when the court was revived there. No one was a more generous friend to him than the earl of Dorset and Middletown, to whom it was owing that the court tasted his Hudibras. He had 'promises' of a good place from the earl of Glanfinan; but they were never accomplished; though the king was so much pleased with the poem, as often to quote it pleasantly in conversation. It is indeed said, that Charles ordered him the sum of 300l.; but the sum being expressed in figures, somebody that the duke heard the order passed, by cutting off a cipher reduced it to 300l. which, though it passed the offices without fees, proved not sufficient to pay what he then owed; so that Butler was not a shilling the better for the king's bounty. He died in 1680: Butlename, and though he met with many disappointments, was never reduced to any thing like want, nor did he die in debt. Mr Granger observes, that Butler "stands without rival in burlesque poetry. His Hudibras (says he) is in its kind almost as great an effort of genius as the Paradise Lost itself. It abounds with uncommon learning, new rhymes, and original thoughts. Its images are truly and naturally ridiculous. There are many strokes of temporary satire, and some characters and allusions which cannot be discovered at this distance of time."

BUTLER, Joseph, late bishop of Durham, a prelate distinguished by his piety and learning, was the youngest son of Mr Thomas Butler, a rich shopkeeper at Wantage in Berkshire, where he was born in the year 1602. His father, who was a Presbyterian, observing that he had a strong inclination to learning, after his being at a grammar-school, sent him to an academy in Gloucestershire, in order to qualify him for a dissenting minister; and while there, he wrote some remarks on Dr Clarke's first sermon at Boyle's lecture. Afterwards, resolving to conform to the established church, he studied at Oriel college, where he contracted an intimate friendship with Mr Edward Talbot, son of the bishop of Durham; and brother to the lord chancellor, who laid the foundation of his subsequent advancement. He was first appointed preacher at the Rolls, and rector of Haughton and Stanhope, two rich benefices in the bishopric of Durham. He quitted the Rolls in 1726; and published in 1740, a volume of sermons, preached at the chapel. After this he constantly resided at Stanhope, in the regular discharge of all the duties of his office, till the year 1733, when he was called to attend the Lord Chancellor Talbot as his chaplain, who gave him a prebend in the church of Rochester. In the year 1736, he was appointed clerk of the closet to Queen Caroline, whom he attended every day, by her majesty's special command, from seven to nine in the evening. In 1738 he was appointed to the bishopric of Bristol; and not long afterwards to the deanship of St Paul's, London. He now resigned his living of Stanhope. In the year 1746, he was made clerk of the closet to the king; and in 1750, was translated to Durham. This rich preferment he enjoyed but a short time: for he died at Bath, June 16, 1752. His corpse was interred in the cathedral at Bristol; where there is a monument, with an inscription, erected to his memory. He died a bachelor. His deep learning and comprehensive mind appear sufficiently in his writings, particularly in that excellent treatise entitled, The Anatomy of Religion, natural and revealed, to the Constitution and Course of Nature, published in 1740, 1756.

BUTLER, the name antiently given to an officer in the court of France, being the same as the grand escompt, or great cupbearer of the present times.

BUTLER, in the common acception of the word, is an officer in the houses of princes and great men, whose principal business is to look after the wine, plate, &c.

BUTLERAGE of wine, is a duty of 2s. for every ton of wine imported by merchant strangers; being a composition in lieu of the liberties and freedoms grant-
Butlerage was originally the only custom that was payable upon the importation of wines, and was taken and received by virtue of the royal prerogative, for the proper use of the crown. But for many years past, there having been granted by parliament subsidies to the kings of England, and the duty of butlerage not repealed, but confirmed, they have been pleased to grant the same grant to some noblemen, who, by virtue of such grant, are to enjoy the full benefit and advantage thereof, and may cause the same to be collected in the same manner that the kings themselves were formerly wont to do.

BUTMENTS. Butments of arches are the same with buttresses. They answer to what the Romans call substructio, the French colonnes et butées.

BUTMENTS, or Abutments, of a bridge, denote the two massive at the end of a bridge, whereby the two extreme arches are sustained and joined with the shore on either side.

BUTOMUS, the Flowering-rush, or Water-gauged. See Botany Index.

BUTRINTO, a port-town of Epirus, or Canina, in Turkey in Europe, situated opposite to the island of Corfu, at the entrance of the gulf of Venice. E. Long. 20. 40. N. Lat. 39. 45.

Butter is used for a vessel, or measure of wine, containing two hogheads, or 126 gallons; otherwise called pipe. A butt of arrants is from 1500 to 2200 pounds weight.

Butts, or Butt-ends, in the sea-language, are the fore ends of all planks under water, as they rise, and are joined one end to another.—Butt-ends in great ships are most carefully bolted; for if any one of them should spring or give way, the leak would be very dangerous and difficult to stop.

Butts, the place where archers meet with their bows and arrows to shoot at a mark, which is called shooting at the butts: (See Archery.)—Also butts are the short pieces of land in arable ridges and furrows.

Butter, a fat unctuous substance, prepared from milk by heating or churning.

It was late ere the Greeks appear to have had any notion of butter; their poets make no mention of it, and are yet frequently speaking of milk and cheese.

The Romans used butter no otherwise than as a medicine, never as a food.

According to Beckman, the invention of butter belongs neither to the Greeks nor the Romans. The former, he thinks, derived their knowledge of butter from the Seythians, the Thracians, and Phrygians; and the latter from the people of Germany.

The ancient Christians of Egypt burnt butter in their lamps instead of oil; and in the Roman churches, it was anciently allowed, during Christmas time, to burn butter instead of oil, on account of the great consumption of it otherwise.

Butter is the fat, oily, and inflammable part of the milk. This kind of oil is naturally distributed through all the parts of the milk in very small particles, which are interposed between the caseous and serous parts, amongst which it is suspended by a slight adhesion, but without being dissolved. It is in the same state in which oil is in emulsions; hence the same whiteness of milk and emulsions; and hence, by rest, the oily parts separate from both these liquors to the surface, and form a cream. See Emulsion.

When butter is in the state of cream, its proper oily parts are not yet sufficiently united together to form a homogeneous mass. They are still half separated by the interposition of a pretty large quantity of serous and caseous particles. The butter is completely formed by pressing out these heterogeneous parts by means of continued percussion. It then becomes an uniform soft mass.

Fresh butter which has undergone no change has scarce any smell; its taste is mild and agreeable; it melts with a weak heat, and none of its principles are disengaged by the heat of boiling water. These properties prove, that the oily part of butter is of the nature of the fat, fixed, and mild oils, obtained from many vegetable substances by expression. See Oils.—The half fluid consistence of butter, as of most other concrete oily matters, is thought to be owing to a considerable quantity of acid united with the oily part; which acid is so well combined, that it is not perceptible while the butter is fresh and has undergone no change; but when it grows old, and undergoes some kind of fermentation, then the acid is disengaged more and more; and this is the cause that butter, like oils of the same kind, becomes rancid by age.

Butter is constantly used in food, from its agreeable taste: but to be wholesome, it must be very fresh and free from ranidity, and also not fried or burnt; otherwise its acid and even caustic acid, being disengaged, disorders digestion, renders it difficult and painful, excites acid empyreumatic belchings, and introduces much animosity into the blood. Some persons have stomachs so delicate, that they are even affected with these inconveniences by fresh butter and milk. This observation is also applicable to butter, fat, chocolate, and in general to all oleaginous matters.

For the making of butter, see Agriculture Index.

The trade in butter is very considerable. Some compute 50,000 tons annually consumed in London. It is chiefly made within 40 miles round the city. Fifty thousand firkins are said to be sent yearly from Cambridge and Suffolk alone: each firkin containing 56 lbs. Uttoxeter, in Staffordshire, is a market famous for good butter, inasmuch that the London merchants have established a factory there for that article. It is bought by the pot, of a long cylindrical form, weighing 14 lb.

Sugar of Butter. Naturalists speak of showers and dew of a butyrous substance. In 1695, there fell in Ireland, during the winter and ensuing spring, a thick yellow dew, which had the medicinal properties of butter.

Butter, among chemists, a name given to several preparations, on account of their consistence resembling that of butter; as butter of antimony, &c. See Chemistry Index.

Butter-Bread. See Tussilago, Botany Index.

Butter-Milk, the milk which remains when the butter is produced by churning. Butter-Milk is esteemed an excellent food, in the spring especially, and is particu-

Method of preserving BUTTERFLIES. See Insects.

Method of making Pictures of BUTTERFLIES. "Take butterflies or field moths, either those caught abroad, or such as are taken in caterpillars and reared in the house till they be flies; clip off their wings very close to their bodies, and lay them on clean paper, in the form of a butterfly when flying; then have ready prepared gum arabic that has been some time dissolved in water, and is pretty thick; if you put a drop of ox gall into a spoonful of this, it will be better for the use; temper them well with your finger, and spread a little of it on a piece of this white paper, big enough to take both sides of your fly; when it begins to be clammy under your finger, the paper is in proper order to take the feathers from the wings of the fly; then lay the gummed side on the wings, and it will take them up; then double your paper so as to have all the wings between the paper; then lay it on a table, pressing it close with your fingers; and you may rub it gently with some smooth hard thing; then open the paper and take out the wings, which will come forth transparent: the down of the upper and under side of the wings, sticking to the gummed paper, form a just likeness of both sides of the wing in their natural shapes and colours. The nicety of taking off flies depends on a just degree of moisture of the gummed paper: for if it be too wet, all will be blotted and confused; and if too dry, your paper will stick so fast together, that it will be torn in separation. When you have opened your gummed papers, and they are dry, you must draw the bodies from the natural ones, and paint them in water colours: you must take paper that will bear in as well for this use; for sinking paper will separate with the rest, and spoil all."

BUTTERFLIES, in the manage, an instrument of steel, fitted to a wooden handle, wherewith they pare the foot, or cut off the hoof of a horse.

BUTOCK of a SHIP, is that part of her which is her breadth right astern, from the tack upwards; and a ship is said to have a broad or a narrow buttock, according as she is built broad or narrow at the transom.

BUTTON, an article in dress, whose form and use are too well known to need description. They are made of various materials, as mohair, silk, horse hair, metal, &c.

Method of making common BUTTONS. Common buttons are generally made of mohair; some indeed are made of silk, and others of thread; but the latter are of a very inferior sort. In order to make a button, the mohair must be previously wound on a bobbin; and the mould fixed to a board by means of a bodkin thrust through the hole in the middle of it. This being done, the workman wraps the mohair round the mould in three, four, or six columns, according to the button.

Horse-hair BUTTONS. The moulds of these buttons are covered with a kind of stuff composed of silk and hair; the warp being belladine silk, and the shoot horse hair. This stuff is woven with two selvages, in the same manner and in the same loom as ribbons. It is then cut into square pieces proportional to the size of the button, wrapped round the moulds, and the selvages stitched together, which form the under part of the button.

Cleaning of BUTTONS. A button is not finished when it comes from the maker's hands; the superfine hair and hubs of silk must be taken off, and the button rendered glossy and beautiful before it can be sold.

This is done in the following manner: A quantity of buttons are put into a kind of iron sieve, called by workmen a singeing box. Then a little spirit of wine being poured into a kind of shallow iron dish, and set on fire, the workman moves and shakes the singeing box, containing the buttons, briskly over the flame of the spirit, by which the superfine hairs, hubs of silk, &c. are burnt off, without damaging the buttons.

Great care, however, must be taken that the buttons in the singeing box be kept continually in motion; for if they are suffered to rest over the flame, they will immediately burn. When all these loose hairs, &c. are burnt off by the flame of the spirit, the buttons are taken out of the singeing box, and put, with a proper quantity of the crumbs of bread, into a leather bag, about three feet long, and of a conical shape; the mouth or smaller end of which being tied up, the workman takes one of the ends in one hand and the other in the other, and shakes the hand briskly with a particular jerk. This operation cleanses the buttons, renders them very glossy, and fits for sale.

Gold-twist BUTTONS. The mould of these buttons is first covered in the same manner with that of common buttons. This being done, the whole is covered with a thin plate of gold or silver, and then wrought over of different forms, with purple and gimp. The former is a kind of thread composed of silk and gold wire twisted together; and the latter, capillary tubes of gold or silver, about the tenth of an inch long. These are joined together by means of a fine needle, filled with silk, thrust through their apertures, in the same manner as beads or bugles.

The manner of making metal BUTTONS. The metal with which the moulds are intended to be covered is first cast into small ingots, and then flattened into thin plates or leaves, of the thickness intended, at the flattening mills; after which it is cut into small round pieces proportionable to the size of the mould they are intended to cover, by means of proper pincers on a block of wood covered with a thick plate of lead. Each piece of metal thus cut out of the plate is reduced into the form of a button, by heating it successively in several cavities, or concave moulds, of a spherical form, with a convex pincier of iron, always beginning with the shallowest cavity of the mould, and proceeding to the deeper, till the plate has acquired the intended form: and the better to manage so thin a plate, they form ten, twelve, and sometimes even twenty-four, to the cavities, or concave moulds, at once; often cementing the metal during the operation, to make it more ductile. This plate is generally called by workmen the cap of the button.

The form being thus given to the plates or caps, they
BUT, in Ancient Geography, a town of Lower Egypt, on the west side of the branch of the Nile, called Thermuthius; towards the mouth called Ostrum Schermysticum: in this town stood an oracle of Latona, (Strabo, Herodotus). Ptolemy places Butus in the Nomos Phethentes: it is also called Butus, &c. (Herodotus, Stephanus.) It had temples of Apollo and Diana; but the largest was that of Latona, where the oracle stood.

BUTZAW, a town of Lower Saxony, in Germany; it stands upon the river Varnow, on the road from Schwerin to Rostock, lying in E. Long. 13. 12. N. Lat. 54. 50.

BUVETTE, or BUVEZTE, in the French laws, an established place in every court, where the lawyers and counsellors may retire, warm themselves, and take a glass of wine by way of refreshment, at the king's charge. There is one for each court of parliament, but these are only for persons belonging to that body; there are others in the palaces, whither other persons also resort.

BUXENTUM, (Liv. Velleius, Ptolemy, Mel. Pliny); Pyrus, (Strabo, Pliny); a town of Lucania, first built by the people of Messina, but afterwards deserted, (Strabo). A Roman colony was sent thither, (Liv. Velleius); and when found still thin of inhabitants, a new colony was sent by a decree of the senate. Its name is from buxus, the box-tree, growing plentifully there. Strabo says, the name Ficus includes a promontory, port, and river, under one. New Petacbro, in the Hither Principato of Naples. E. Long. 15. 40. N. Lat. 40. 20.

BUXTON, a place in the Peak of Derbyshire, celebrated for its medicinal waters, and lying in W. Long. 0. 20. N. Lat. 53. 20.

It has been always believed by our antiquaries, that the Romans were acquainted with these wells, and had frequented them much, as there is a military way still visible, called the Bath-gate, from Buxh to this place. This was verified about 50 years ago, when Sir Thomas Delvy, of Cheshir, in memory of a cure he received here, caused an arch to be erected; in digging the foundation for which, they came to the remains of a solid...
solid and magnificent structure of Roman workmanship; and in other places of the neighbourhood, very spacious leaden vessels, and other utensils of Roman workmanship, have been discovered. These waters have always been reckoned inferior to those in Somersetshire; but seem never to have been totally disused. They are mentioned by Leland, as well known 200 years ago; but it is certain they were brought into greater credit by Dr. Jones in 1772, and by George earl of Shrewsbury, who erected a building over the bath, then composed of nine springs. This building was afterwards pulled down, and a more commodious one erected at the expense of the earl of Devonshire. In doing this, however, the ancient register of cures drawn up by the bath-warden, or physician attending the baths, and subscribed by the hands of the patients, was lost.

The warm waters of Buxton are, the bath, consisting of nine springs, as already mentioned, St. Ann’s, and St. Peter’s, or Bingham well. St. Ann’s well rises at the distance of somewhat more than 32 yards north-east from the bath. It is chiefly supplied from a spring on the north side, out of a rock of black limestone or bastard marble. It formerly rose into a stone basin, shut up within an ancient Roman brick wall, a yard square within, a yard high on three sides, and open on the fourth. But, in 1709, Sir Thomas Delves, as already mentioned, erected an arch over it, which still continues. It is 12 feet long, and as many broad, set round with stone steps on the inside. In the midst of this dome the water now springs up into a stone basin two feet square. St. Peter’s or Bingham well rises about 20 yards south-east of St. Ann’s. It is also called Leigh’s well, from a memorable cure received from it by a gentleman of that name. It rises out of a black limestone, in a very dry ground; and is not so warm as St. Ann’s well.

From the great resort of companies to the waters, this place has grown into a large straggling town, which is daily increasing. The houses are chiefly, or rather solely, built for the reception of invalids; and many of them are not only commodious, but elegant. The soil of Devonshire has lately erected a most magnificent building in the form of a crescent, with piazzas, under which the company walk in wet or cold weather. It is divided into different hotels, shops, &c. with a public coffee-room, and a very elegant room for assemblies and concerts.

The hot water resembles that of Bristol. It has a sweet and pleasant taste. It contains the calcareous earth, together with a small quantity of sea salt, and an incomconsiderable portion of a purging salt, but no iron can be discovered in it. This water taken inwardly is esteemed good in the diabetes; in bloody urine; in the bilious cholic; in loss of appetite, and coldness of the stomach; in inward bleedings; in atrophy; in contraction of the vessels and limbs, especially from age; in cramps and convulsions; in the dry asthma without a fever; and also in barrenness. Inwardly and outwardly, it is said to be good in rheumatic and scrobutic complaints; in the gout; in inflammation of the liver and kidneys, and in consumptions of the lungs; also in old straies; in hard callous tumours; in withered and contracted limbs; in the itch, scab,nodes, chalky swellings, ring worms, and other similar complaints. Besides the hot water, there is also a cold chalybeate water, with a rough irony taste: It resembles the Tunbridge water in virtues.

For the methods of composing artificial Buxton water, or of impregnating the original water with a greater quantity of its own gas or with other gases, see Waters, Medicinal.

Buxton, Jedediah, a prodigy with respect to skill in numbers. His father, William Buxton, was schoolmaster of the same parish where he was born in 1704: yet Jedediah’s education was so much neglected, that he was never taught to write; and with respect to any other knowledge but that of numbers, seemed always as ignorant as a boy of ten years of age. How he came first to know the relative proportions of numbers, and their progressive denominations, he did not remember; but to this he applied the whole force of his mind, and upon this his attention was constantly fixed, so that he frequently took no cognizance of external objects, and when he did, it was only with respect to their numbers. If any space of time was mentioned, he would soon after say it was so many minutes; and if any distance of way, he would assign the number of hair-breadths, without any question being asked, or any calculation expected by the company. When he once understood a question, he began to work with amazing facility, after his own method, without the use of a pen, pencil, or chalk, or even understanding the common rules of arithmetic as taught in the schools. He would stride over a piece of land or a field, and tell you the contents of it almost as exact as if you had measured it by the chain. In this manner he measured the whole lordship of Eltort, of some thousand acres, belonging to Sir John Rhodes, and brought him the contents, not only in acres, roods, and perches, but even in square inches. After this, for his own amusement, he reduced them into square hair-breadths, computing 48 to each side of the inch. His memory was so great, that while resolving a question he could leave off, and resume the operation again where he left off the next morning, or at a week, a month, or at several months, and proceed regularly till it was completed. His memory would doubtless have been equally retentive with respect to other objects, if he had attended to other subjects with equal diligence; but his perpetual application to figures prevented the smallest acquisition of any other knowledge. He was sometimes asked, on his return from church, whether he remembered the text, or any part of the sermon; but it never appeared that he brought away one sentence, his mind, upon a closer examination, being found to have been busied, even during divine service, in his favourite operation, either dividing some time, or some space, into the smallest known parts, or resolving some question that had been given him as a test of his abilities.

This extraordinary person living in laborious poverty, his life was uniform and obscure. Time, with respect to him, changed nothing but his age; nor did the seasons vary his employment, except that in winter he used a flail, and in summer a lint-hook. In the year 1754 he came to London, where he was introduced to the Royal Society, who, in order to prove his abilities, asked him several questions in arithmetick, and he gave them such satisfaction, that they dismissed him with a handsome gratuity. In this visit to the metropolis,
BUXUS, the only object of his curiosity, except figures, was his desire to see the king and royal family; but they being just removed to Kensington, Jedediah was disappointed. During his residence in London, he was taken to see King Richard III. performed at Drury-lane playhouse; and it was expected, either that the novelty and the splendour of the show would have fixed him in astonishment, or kept his imagination in a continual hurry; or that his passions would, in some degree, have been touched by the power of action, if he had not perfectly understood the dialogue. But Jedediah’s mind was employed in the playhouse just as it was employed in every other place. During the dance, he fixed his attention upon the number of steps; he declared, after a fine piece of music, that the innumerable sounds produced by the instruments had perplexed him beyond measure; and he attended even to Mr. Carrick, only to count the words that he uttered, in which he said he perfectly succeeded. Jedediah returned to the place of his birth, where, if his enjoyments were few, his wishes did not seem to be more. He applied to his labour, by which he subsisted, with cheerfulness; he regretted nothing that he left behind him in London; and it continued to be his opinion, that a slice of rusty bacon afforded the most delicious repast.

BUXTORF, JOHN, a learned professor of Hebrew at Basal, who, in the 17th century, acquired the highest reputation for his knowledge of the Hebrew and Chaldee languages. He died of the plague at Basel in 1629, aged 65. His principal works are, 1. A small but excellent Hebrew grammar; the best edition of which is that of Leyden in 1701, revised by Leusden. 2. A treasure of the Hebrew grammar. 3. A Hebrew concordance, and several Hebrew lexicoms. 4. Institutio epistolioris Hebraica. 5. De abbreviaturis Hebraevorum, &c.

BUXTORF, John, the son of the former, and a learned professor of the Oriental languages at Basal, distinguished himself, like his father, by his knowledge of the Hebrew language, and his rabbinical learning. He died in Basel in 1604, aged 65 years. His principal works are, 1. His translation of the More Nevuchim, and the Comiti. 2. A Chaldee and Syriac lexicon. 3. An anticritic against Cappel. 4. A treatise on the Hebrew points and accents, against the same Cappel.

BUXUS, the Box-tree. See Botany Index.

BUYING, the act of making a purchase, or of acquiring the property of a thing for a certain price.

Buying stands opposed to selling, and differs from borrowing or hiring, as in the former the property of the thing is alienated for perpetuity, which in the latter it is not. By the civil law persons are allowed to buy hope, specto precio emere, that is, to purchase the event or expectation of any thing; e. g. the fish or birds a person shall catch, or the money he shall win in gaming.

There are different species of buying in use among traders; as, buying on one's own account, opposed to buying on commission; buying for ready money, which is when the purchaser pays in actual specie on the spot; buying on credit, or for a time certain, is when the payment is not to be presently made, but in lieu thereof, an obligation given by the buyer for payment at a time future; buying on delivery, is when the goods purchased are only to be delivered at a certain time future.

BUYING the Plague, is giving money for the right or liberty of purchasing a thing at a fixed price in a certain time to come; chiefly used in dealing for shares in stock. This is sometimes also called by a cant name, buying the bear.

BUYING the Smallpox, is an appellation given to a method of procuring that disease by an operation similar to inoculation; frequent in South Wales, where it has obtained time out of mind. It is performed either by rubbing some of the pus taken out of a pustule of a variolous person on the skin, or by making a puncture in the skin with a pin dipped in such pus.

BUYS, a town of Dauphiny in France, situated on the borders of Provence. E. Long. 5° 20'. N. Lat. 44° 25'.

BUZANCOIS, a small town of Berry in France, situated on the borders of Touraine, in E. Long. 2° 20'. N. Lat. 46° 38'.

BUZBACH, a town of Germany, in Westerasia, and the county of Holmen, on the confines of Hanau. E. Long. 10° 51'. N. Lat. 50° 22'.

BUZET, a small town of France, in Languedoc, seated on the river Torne, in E. Long. 1° 45'. N. Lat. 43° 47'.

BUZZARD, the name of several species of the hawk kind. See Falco, Ornithology Index.

BYBLUS, in Ancient Geography, a town of Phoenicia, situated between Berytus and Botrys; it was the royal residence of Cinyras; sacred to Adonis. Pompey delivered it from a tyrant, whom he caused to be beheaded. It stood at no great distance from the sea, on an eminence (Strabo); near it ran the Adonis into the Mediterranean. Now in ruins.

BYCHOW, a small town of Lithuania in Poland, situated on the river Nieper, in E. Long. 30°. 2'. N. Lat. 53° 57'.

BY-LAWS, are laws made obiter, or by the by; such as orders and constitutions of corporations for the governing of their members, of court-keets, and courts baron, commoners, or inhabitants in villis, &c. made by common assent, for the good of those that made them, in particular cases whereunto the public law doth not extend; so that they bind further than the common or statute law; guilds and fraternities of trades, by letters patents of incorporation, may likewise make by-laws for the better regulation of trade among themselves or with others. In Scotland these laws are called laws of birlaw or burlaw: which are made by neighbours elected by common consent in the birlaw courts, wherein knowledge is taken of complaints betwixt neighbour and neighbour; which men so chosen are judges and arbitrators, and styled birlaw-men. And birlaws, according to Skene, are leges rusticorum, laws made by husbandmen, or townships, concerning neighbourhood among them. All by-laws are to be reasonable, and for the common benefit, not private advantage of particular persons, and must be agreeable to the public laws in being.

BYNG, GEORGE, Lord Viscount Torrington, was the son of John Byng, Esq. and was born in 1653. At the age of 15, he went volunteer to sea with the king's warrant. His early engagement in this course of life gave him little opportunity of acquiring learn-
BYNING or cultivating the polite arts; but by his abilities and activity as a naval commander, he furnished abundant matter for the pens of others. After being several times advanced, he was in 1702 raised to the command of the Nassau, a third rate, and was at the taking and burning the French fleet at Vigo; and the next year he was made rear-admiral of the red. In 1704 he served in the grand fleet sent to the Mediterranean under Sir Cuttsley Shovel, as rear-admiral of the red; and it was he who commanded the squadron that attacked, cannonaded, and reduced Gibraltar. He was taken prisoner at the battle of Malaga, which followed soon after; and for his behaviour in that action Queen Anne conferred on him the honour of knighthood. In 1705, in about two months time, he took 12 of the enemies largest privateers, with the Thetis, a French man of war of 44 guns; and also several merchant ships, most of them richly laden. The number of men taken on board was 2070, and of guns 334. In 1718 he was made admiral and commander in chief of the fleet, and was sent with a squadron into the Mediterranean for the protection of Italy, according to the obligation England was under by treaty, against the invasion of the Spaniards: who had the year before surprised Sardinia, and had this year landed an army in Sicily. In this expedition he dispatched Captain Walton in the Canterbury with five more ships, in pursuit of six Spanish men of war, with galleys, fire-ships, bomb-vessels, and store-ships, which separated from the main fleet, and stood in for the Sicilian shore. The captain's laconic epistle on this occasion is worthy of notice; which shewed that fighting was his talent as well as his admiral's, and not writing.

"Sir,

"We have taken and destroyed all the Spanish ships and vessels which were upon the coast, as per margin. Canterbury, off Syracuse, I am, &c.

August 16, 1718.

G. Walton."

From the account referred to, it appeared that he had taken four Spanish men of war, with a bomb-vessel and a ship laden with arms; and burned four, with a fire-ship and bomb-vessel. The king made the admiral a handsome present, and sent him plenipotentiary powers to negotiate with the princes and states of Italy as there should be occasion. He procured the emperor's troops free access into the fortresses that still held out in Sicily, sailed afterwards to Malta, and brought out the Sicilian galleys, and a ship belonging to the Turkey company. Soon after he received a gracious letter from the emperor Charles VI. written with his own hand, accompanied with a picture of his imperial majesty, set round with very large diamonds, as a mark of the grateful sense he had of his services. It was entirely owing to his advice and assistance that the Germans retook the city of Messina in 1719, and destroyed the ships that lay in the bay; which completed the ruin of the naval power of Spain. The Spaniards being much distressed, offered to quit Sicily; but the admiral declared, that the troops should never be suffered to quit the island till the king of Spain had acceded to the quadruple alliance. And to his conduct it was entirely owing that Sicily was subdued, and his Catholic majesty forced to accept the terms prescribed him by the quadruple alliance. After performing so many signal services, the king received him with the most gracious expressions of favour and satisfaction; made him rear-admiral of England, and treasurer of the navy, one of his most honourable privy-council, Baron BYNG of Southill in the county of Bedford, Viscount Torrington in Devonshire, and one of the knights companions of the Bath upon the revival of that order. In 1729, George II. on his accession to the crown, placed him at the head of his naval affairs, as first lord commissioner of the admiralty; in which high station he died January 15, 1733, in the 70th year of his age, and was buried at Southill in Bedfordshire.

BYNG, the Honourable George, the unhappy son of the former, was bred to sea, and rose to the rank of admiral of the blue. He gave many proofs of courage; but was at last shot, upon a dubious sentence, for neglect of duty, in 1757. See BRITAIN.

BYRLAW or BURLEW Laws in Scotland. See BY-LAWS.

BYROM, John, an ingenious poet of Manchester, born in 1691. His first poetical essay appeared in the Spectator, No. 603, beginning, "My time, O ye Muses, was happily spent;" which, with two humorous letters on dreams, are to be found in the eighth volume. He was admitted a member of the Royal Society in 1724; and having originally entertained thoughts of practising physic, to which the title of doctor is incident, that was the appellation by which he was always known: but reducing himself to narrow circumstances by a precipitate marriage, he supported himself by teaching a new method of writing shorthand, of his own invention; until an estate devolved to him by the death of an elder brother. He was a man of lively wit; of which, whenever a favourable opportunity tempted him to indulge it, he gave many humorous specimens. He died in 1763; and a collection of his miscellaneous poems was printed at Manchester, in 2 vols 8vo. 1773.

BYRHRUS. See ENTOMOLOGY Index.

BYSSUS. See BOTANY Index.

Byssus, or Byssum, a fine thready matter produced in India, Egypt, and about Elia in Achaia, of which the richest apparel was anciently made, especially that worn by the priests both Jewish and Egyptian. Some interpreters render the Greek Byssos, which occurs both in the Old and New Testament, by fine linen. But other versions, as Calvin's, and the Spanish printed both at Venice in 1556, explain the word by silk: and yet byssus must have been different from our silk, as appears from a multitude of ancient writers, and particularly from Jul. Pollux. M. Simon, who renders the word by fine linen, adds a note to explain it; viz. "that there was a fine kind of linen very dear, which the great lords alone wore in this country as well as in Egypt." This account agrees perfectly well with that given by Hesychius, as well as what is observed by Bochart, that the byssus was a finer kind of linen, which was frequently dyed of a purplish colour. Some authors will have the byssus to be the same with our cotton; others take it for the linen aestivum; and others for the lock or bunch of silky hair found adhering to the pinna marina, by which it fastens itself to the neighbouring bodies. Authors usually distinguish two sorts of byssus; that of Elia; and that of Judea, which
BYZANTIUM, an ancient city of Thrace, situated on the Bosporus. It was founded, according to Eusebius, about the 30th Olympiad, while Tullus Hostilius reigned in Rome. But, according to Diodorus Siculus, the foundations of this metropolis were laid in the time of the Argonauts, by one Byzas, who then reigned in the neighbouring country, and from whom the city was called Byzantium. This Byzas, according to Eustathius, arrived in Thrace a little before the Argonauts came into those seas, and settled there with a colony of Megarenses. Velleius Paterculus ascribes the founding of Byzantium to the Milesians, and Ammianus Marcellinus to the inhabitants of Attica. Some ancient medals of Byzantium, which have reached our times, bear the name and brand of Byzas, with the prow of a ship on the reverse. The year after the destruction of Jerusalem by Titus, Byzantium was reduced to the form of a Roman province. In the year 193 this city took part with Niger against Severus. It was strongly garrisoned by Niger, as being a place of the utmost importance. It was soon after invested by Severus; and as he was universally hated on account of his cruelty, the inhabitants defended themselves with the greatest resolution. They had been supplied with a great number of warlike machines, most of them invented and built by Periscus, a native of Nicomedia, and the greatest engineer of his age. For a long time they baffled all the attempts of the assailants, killed great numbers of them, crushed such as approached the walls with large stones; and when stones began to fail, they used the statues of their gods and heroes. At last they were obliged to submit, through famine, after having been reduced to the necessity of devouring one another. The conqueror put all the magistrates and soldiers to the sword; but spared the engineer Periscus. Before this siege, Byzantium was the greatest, most populous, and wealthiest city of Thrace. It was surrounded by walls of an extraordinary height and breadth, and defended by a great number of towers, seven of which were built with such art, that the least noise heard in one of them was immediately conveyed to all the rest. Severus, however, no sooner became master of it, than he commanded it to be laid in ashes. The inhabitants were stripped of all their effects, publicly sold for slaves, and the walls levelled with the ground. But by the chronicle of Alexander we are informed, that soon after this terrible catastrophe, Severus himself caused a great part of the city to be rebuilt, calling it Antonia from his son Caracalla, who assumed the surname of Byzantium. Antinous. In 262, the tyrant Galienus wreaked his fury on the inhabitants of Byzantium. He intended to besiege it; but on his arrival desisted of being able to make himself master of such a strong place. He was admitted the next day, however, into the city; and without any regard to the terms he had agreed to, caused the soldiers and all the inhabitants to be put to the sword. Trebellius Pollio says, that not a single person was left alive. What the reason was for such an extraordinary massacre, we are nowhere informed. In the wars between the emperors Licinius and Maximin the city of Byzantium was obliged to submit to the latter, but was soon after recovered by Licinius. In the year 323, it was taken from Licinius by Constantine the Great, who in 330 enlarged and beautified it, with a design to make it the second, if not the first, city in the Roman empire. He began with extending the walls of the ancient city from sea to sea; and while some of the workmen were busied in rearing them, others were employed in raising within them a great number of stately buildings, and among others a palace no way inferior in magnificence and extent to that of Rome. He built a capitol and amphitheatre, made a circus maximus, several forums, porticoes, and public baths. He divided the whole city into 14 regions, and granted the inhabitants many privileges and immunities. By this means Byzantium became one of the most flourishing and populous cities of the empire. Vast numbers of people flocked thither from Pontus, Thrace, and Asia, Constantine having, by a law, enacted this year (330), decreed, that such as had lands in those countries should not be at liberty to dispose of them, nor even leave them to their proper heirs at their death, unless they had a house in this new city. But however desirous the emperor was that his city should be filled with people, he did not care that it should be inhabited by any but Christians. He therefore caused all the idols to be pulled down, and all their churches consecrated to the true God. He built besides an incredible number of churches, and caused crosses to be erected in all the squares and public places. Most of the buildings being finished, it was solemnly dedicated to the Virgin Mary, according to Cedrenus, but according to Eusebius, to the God of Martyrs. At the same time Byzantium was equalled to Rome. The same rights, immunities, and privileges, were granted to its inhabitants, as to those of the metropolis. He established a senate and other magistrates, with a power and authority equal to those of old Rome. He took up his residence in the new city; and changed its name to Constantinople.

BZOVIUS, ABRAHAM, one of the most celebrated writers in the 17th century, with respect to the astonishing number of pieces composed by him. His chief work is the continuation of Baronius's Annals. He was a native of Poland, and a Dominican friar. Upon his coming to Rome, he was received with open arms by the Pope, and had an apartment assigned him in the Vatican. He merited that reception, for he has imitated Baronius to admiration, in his design of making all things conspire to the despotic power and glory of the Papal see. He died in 1630, aged 70.
C.

C, THE third letter, and second consonant, of the alphabet, is pronounced like k before the vowels a, o, and u; and like s, before e, i, and y. C is formed, according to Scaliger, from the = of the Greeks, by re-trenching the stem or upright line; though others derive it from the δ of the Hebrews, which has in effect the same form; allowing only for this, that the Hebrews reading backwards, and the Latins, &c. forwards, each have turned the letter their own way. However the C not being the same as to sound with the Hebrew 쑆, and it being certain the Romans did not borrow their letters immediately from the Hebrews or other orientals, but from the Greeks, the derivation from the Greek κ, is the more probable. Add, that F. Montfaucon, in his Palaeographia, gives us some forms of the Greek κ, which come very near to that of our C: thus, for instance, κι: and Guídas calls the C the Roman kappa. The second sound of C resembles that of the Greek Κ: and many instances occur of ancient inscriptions, in which Κ has the same form with our C.

All grammarians agree, that the Romans pronounced their Κ like our C, and their K like our K. F. Millot adds, that Charles the Great was the first who wrote his name with a C; whereas all his predecessors of the same name wrote it with a K; and the same difference is observed in their coins.

As an abbreviation, C stands for Cain, Caro, Cæsar, Constantine, &c. and CC for consultation.

As a numeral, C signifies 100, CC 200, &c.

C, in Music, placed after the clef, intimates that the music is in common time, which is either quick or slow, as it is joined with allegro, or adagio; if alone, it is usually adagio. If the C be crossed or turned, the first requires the six to be played quick, and the last very quick.

CAABA, or CAABAH, properly signifies a stone building: but is particularly applied by the Mahometans to the temple at Mecca, built, as they pretend, by Abraham and Ishmael his son.

Before the time of Mahomet, this temple was a place of worship for the idolatrous Arabs, and is said to have contained no less than 360 different images, equaling in number the days of the Arabian year. They were all destroyed by Mahomet, who sanctified the Caaba, and appointed it to be the chief place of worship for all true believers. The temple is in length from north to south about 24 cubits; its breadth from east to west, is 23, and its height 27. The door, which is on the east side, stands about four cubits from the ground; the floor being level with the bottom of the door. In the corner next this door is the black stone, so much celebrated among the Mahometans. On the north side of the Caaba, within a semicircular enclosure 50 cubits long, lies the white stone, said to be the sepulcher of Ishmael, which receives the rain water from the Caaba by a spout formerly of wood, but now of gold. The black stone, according to the Mahometans, was brought down from heaven by Gabriel at the creation of the world, and was originally of a white colour; but contracted the blackness that now appears on it from the guilt of those sins committed by the sons of men. It is set in silver, and fixed in the southeast corner of the Caaba, looking towards Barra, about seven spans from the ground. This stone, upon which there is the figure of a human head, is held in the highest estimation among the Arabs; all the pilgrims kissing it with great devotion, and some even calling it the right hand of God. Its blackness, which is only superficial, is probably owing to the kisses and touches of so many people. After the Karshams had taken Mecca, they carried away this precious stone, and could by no means be prevailed upon to restore it; but finding at last that they were unable to prevent the concourse of pilgrims to Mecca, they sent it back of their own accord, after having kept it 23 years.

The double roof of the Caaba is supported within by three octagonal pillars of siles wood; between which, on a bar of iron, hang some silver lamps. The outside is covered with rich black damask, adorned with an embroidered band of gold, which is changed every year, and was formerly sent by the caliphs, afterwards by the sultans of Egypt, and is now provided by the Turkish emperors. The Caaba, at some distance, is almost surrounded by a circular enclosure of pillars, joined towards the bottom by a low balustrade, and towards the top by bars of silver. Just without this inner enclosure, on the south, north, and west sides of the Caaba, are three buildings, which are the oratories or places where three of the orthodox sects assemble to perform their devotions. Towards the southeast stands an edifice which covers the well Zemzem, the treasury, and the cupola of Al Abbas. Formerly there was another cupola, that went under the name of the hemicycle or cupola of Judea; but whether or not any remains of that are now to be seen, is unknown; nor is it easy to obtain information in this respect, all Christians being denied access to this holy place. At a small distance from the Caaba, on the east side, is the station or place of Abraham; where is another stone much respected by the Mahometans; and where they pretend to shew the footsteps of the patriarch, telling us he stood on it when he built the Caaba. Here the fourth sect of Arabs, viz. that of Al Shafei, assemble for religious purposes.

The square colonnade, or great piazza, which at a considerable distance encloses these buildings, consists, according to Al Jannabi, of 488 pillars, and has no less than 38 gates. Mr Sale compares this piazza to that of the Royal Exchange at London, but allows it to be much larger. It is covered with small domes or cupolas, from the four corners of which rise as many minarets or steeples, with double galleries, and adorned with gilded spires and arrosettes after the Turkish manner; as are also the cupolas which cover the piazza and other buildings. Between the columns of both enclosures hang a great number of lamps, which are constantly...
Caballeros, or Cavalleros, are Spanish wolves, of which there is a pretty considerable trade at Bayonne in France.

Caballina, in Ancient Geography, a town of the Edui in Gallia Celtica; now Chalon sur Saone.

Caballinus, in Ancient Geography, a very clear fountain in Mount Helicon in Boetia; called Hippocrene by the Greeks, because opened by Pegasus on striking the rock with his hoof, and hence called Pegasis.

Caballio, or Cabellio, in Ancient Geography, a town of the Caures in Gallia Narbonensis, situated on the Druentia. One of the Latin colonies, in the Notitia called Civitas Cabellorum. Now Caillon in Provence.

Cabanis, P. J. G. a celebrated French medical writer. See Supplement.

Cabbage, in Botany. See Brassica; and Agriculture Index.

Cabbage-Tree, or True Cabbage-Palm. See Areca; Botany Index.

Cabbage-bark Tree. See Geoffrea, Botany Index.

Cabala, according to the Hebrew style, has a very distinct signification from that wherein we understand it in our language. The Hebrew cabala signifies tradition; and the rabbins, who are called cabalists, study principally the combination of particular words, letters, and numbers, and by this means pretend to discover what is to come, and to see clearly into the sense of many difficult passages of Scripture. There are no sure principles of this knowledge, but it depends upon some particular traditions of the ancients; for which reason it is termed cabbala.

The cabalists have abundance of names which they call sacred; these they make use of in invoking of spirits, and imagine they receive great light from them. They tell us, that the secrets of the Cabalists were discovered to Moses on Mount Sinai; and that these have been delivered to them down from father to son, without interruption, and without any use of letters; for to write them down, is what they are by no means permitted to do. This is likewise termed the oral law, because it passed from father to son, in order to distinguish it from the written laws.

There is another cabbala, called artificial, which consists in searching for abstruse and mysterious significations of a word in Scripture, from whence they borrow certain explanations, by combining the letters which compose it; this cabbala is divided into three kinds, the gemetric, the notaricon, and the temura or themura. The first whereof consists in taking the letters of a Hebrew word for cipher or arithmetical numbers, and explaining every word by the arithmetical value of the letters whereof it is composed. The second sort of cabbala, called notaricon, consists in taking every particular letter of a word for an entire diction; and the third, called themura, i.e. change, consists in making different transpositions or changes of.
of letters, placing one for the other, or one before the other.

Among the Christians, likewise, a certain sort of magic is, by mistake, called cabbala; which consists in using improperly certain passages of Scripture for magic operations, or in forming magic characters or figures with stars and talismans.

Some visionaries among the Jews believe, that Jesus Christ wrought his miracles by virtue of the mysteries of the cabbala.

CABALISTS, the Jewish doctors who profess the study of the cabbala.

In the opinion of these men, there is not a word, letter, or accent in the law, without some mystery in it. The Jews are divided into two general sects; the karaites, who refuse to receive either tradition or the talmud, or any thing but the pure texts of Scripture; and the rabbinists, or talmudists, who, besides this, receive the traditions of the ancients, and follow the talmud.

The latter are again divided into two other sects; pure rabbinists, who explain the Scripture in its natural sense, by grammar, history, and tradition; and cabalists, who, to discover hidden mystical senses, which they suppose God to have conched therein, make use of the cabbala, and the mystical methods above mentioned.

CABECA, or CABESS, a name given to the finest silks in the East Indies, as those from 1 to 20 per cent. inferior to them are called barina. The Indian workmen endeavour to pass them off one with another; for which reason, the more experienced European merchants take care to open the bales, and to examine all the skaines one after another. The Dutch distinguish two sorts of cabecas; namely, the Moor cabeca, and the common cabeca. The former is sold at Amsterdam for about 1s. 6d. schellinghen Flemish, and the other for about 1s. 4d.

CABECAS de Vina, a small sea port town of Alentejo, in Portugal, with good walls, and a strong castle. W. Long. 6° 43'. N. Lat. 39° 0'.

CABENDA, a sea port of Congo, in Africa, situated in E. Long. 12° 2'. S. Lat. 4° 5'.

CABES, or CABAS, a town of Africa in the kingdom of Tunis, seated on a river near the gulf of the same name. E. Long. 10° 35'. N. Lat. 33° 40'.

CABEZO, a province of the kingdom of Angola, in Africa; having Oacco on the north, Lubolo on the south, the Coaenzo on the north-east, and the Reina on the south-west. It is populous, and well stored with cattle, &c. and hath a mine of iron on a mountain, from thence called the iron mountain, which yields great quantities of that metal; and this the Portuguese have taught the natives to manufacture. This province is watered by a river called Rio Longo, and other small rivulets, lakes, &c. The trees here are vastly large; and they have one sort not unlike our apple trees, the bark of which being slashed with a knife, yields an odoriferous resin of the colour and consistency of wax; and very medicinal in its nature, only a little too hard for Europeans, unless qualified by some cooling drug.

CABIDOS, or CAVIDOS, a long measure used at Goa, and other places of the East Indies belonging to the Portuguese, to measure stuffs, linens, &c. and equal to 4ths of the Paris ell.

CABIN, a room or apartment in a ship where any of the officers usually reside. There are many of these in a large ship; the principal of which is designed for the captain or commander. In ships of the line this chamber is furnished with an open gallery in the ship's stern, as also a little gallery on each quarter. The apartments where the inferior officers or common sailors sleep and mess are usually called BIRTHS; which see.

The bed places built up for the sailors at the ship's side in merchantmen are also called cabina.

CABINDA, the chief port of the kingdom of Angola in Loango in Africa. It is situated at the mouth of a river of the same name, about five leagues north of Cape Palmerina, on the north side of the mouth of the river Zaire. The bay is very commodious for trade, wooding and watering.

CABINET, the most retired place in the finest part of a building, set apart for writing, studying, or preserving anything that is precious.

A complete apartment consists of a hall, antechamber, chamber, and cabinet, with a gallery on one side. Hence we say, a cabinet of paintings, curiosities, &c.

CABINET also denotes a piece of joiners workmanship, being a kind of press or chest, with several doors and drawers.

There are common cabinets of oak or of chestnut varnished, cabinets of China and Japan, cabinets of inlaid-work, and some of ebony, or the like scarce and precious woods. Formerly the Dutch and German cabinets were much esteemed in France; but are now quite out of date, as well as the cabinets of ebony which came from Venice.

CABINET is also used in speaking of the more select and secret councils of a prince or administration. Thus we say, the secrets, the cabinet.

To avoid the inconveniences of a numerous council, the policy of Italy and practice of France first introduced cabinet councils. King Charles I. is charged with first establishing this usage in England. Besides his privy council, that prince erected a kind of cabinet council, or jantio, under the denomination of a council of state; composed of Archbishop Laud, the earl of Strafford, and Lord Collington, with the secretaries of state. Yet some pretend to find the substance of a cabinet council of much greater antiquity, and even allowed by parliament, which anciently settled a quorum of persons most confided in, without whose presence no arduous matter was to be determined: giving them power to act without consulting the rest of the council.

As long since as the 28th of Henry III. a charter passed in assurance of the ancient rights of the kingdom; which provided, that four great men, chosen by common consent, who were to be conservators of the kingdom, among other things, should see to the disposing of moneys given by parliament, and appropriated to particular uses; and parliaments were to be summoned as they should advise. But even of these four, any two made a quorum: and even the chief justices of England and chancellor were of the number of the conservators. Matth. Par. 28. Henry III. In the first
CABINETS

CABIRI, a term in the theology of the ancient Pagans, signifying great and powerful gods; being a name given to the gods of Samothrace. They were also worshipped in other parts of Greece, as Lemnos and Thebes, where the Cabiria were celebrated in honour of them: these gods are said to be in number four, viz. Azieros, Axiocers, Axiocerus, and Casmilus.

CABIRIA, festivals in honour of the Cabiri, celebrated in Thebes and Lemnos, but especially in Samothrace, an island consecrated to the Cabiri. All who were initiated into the mysteries of these gods were thought to be secured thereby from storms at sea, and all other dangers. The ceremony of initiation was performed by placing the candidate, crowned with olive branches, and girded about the loins with a purple ribband, on a kind of throne, about which the priests and persons before initiated danced.

CABLE, a thick, large, strong rope, commonly of hemp, which serves to keep a ship at anchor.

There is no merchant ship, however weak, but has at least three cables; namely, the chief cable, or cable of the sheet anchor, a common cable, and a smaller one.

Cable is also said of ropes, which serve to raise heavy loads, by the help of cranes, pulleys, and other engines. The name of cable is usually given to such as are, at least, three inches in circumference; those that are less are only called ropes, of different names, according to their use.

Every cable, of whatsoever thickness it be, is composed of three strands; every strand of three ropes; and every rope of three twist: the twist is made of more or less threads, according as the cable is to be thicker or thinner.

In the manufacture of cables, after the ropes are made, they use sticks, which they pass first between the ropes of which they make the strands, and afterwards between the strands of which they make the cable, to the end that they may all twist the better, and be more regularly wound together; and also, to prevent them from entwining or entangling, they hang, at the end of each strand, and of each rope, a weight of lead or of stone.

The number of threads each cable is composed of is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained: thus, a cable of three inches circumference, or one inch diameter, ought to consist of 48 ordinary threads, and to weigh 192 pounds; and on this foundation is calculated the following table, very useful for all people engaged in marine commerce, who fit out merchantmen for their own account, or freight them for the account of others.

Sheet-Anchor Cable, is the greatest cable belonging to a ship.

Stream Cable, a hawser or rope, something smaller than the bower, and used to moor the ship in a river or haven, sheltered from the wind and sea, &c.

Sew or Plate the Cable, is to bind it about with ropes, clouts, &c. to keep it from galling in the hawse.

To splice a Cable, is to make two pieces fast together, by working the several threads of the rope the one into the other.

Pay more Cable, is to let more out of the ship.

Pay cheap the Cable, is to hand it out space. Very more Cable, is to let more out, &c.

Cable's Length, a measure of 120 fathoms, or of the usual length of the cable.

Cabled, in Heraldry, a term applied to a cross formed of the ends of a ship's cable; sometimes also to a cross covered over with round of rope; more properly called a cross bastard.

Cabled Plate, in Architecture, such flutes as are filled up with pieces in the form of a cable.

Cabo de Ilesia, the capital town of the province of Istris, in the Austro-Venetian territories; and the see of a bishop. It is seated on a small island in the gulf of Venice, and is joined to the mainland by drawbridges. E. Long. 14. 22. N. Lat. 45. 49.

Caboched, in Heraldry, is when the heads of beasts are borne without any part of the neck, full faced.

Caboletto, in commerce, a coin of the republic of Genoa, worth about 3d. of our money.

Cabot, Sebastian, the first discoverer of the continent of America, was the son of John Cabot, a Venetian. He was born at Bristol in 1477; and was taught by his father, arithmetic, geometry, and cosmography. Before he was 20 years of age he made several voyages. The first of any consequence seems to have been made with his father, who had a commission from Henry VII. for the discovery of a north-west passage to India. They sailed in the spring of 1499; and proceeded to the north-west they discovered land, which for that reason they called Primavalle, or Newfoundland. Another smaller island they called St John, from its being discovered on the feast of St John Baptist; after which, they sailed along the coast of America as far as Cape Florida, and then returned to England.
CABUL, or CABOUL, a city of Asia, and capital of the province of Cabulistan. It lies in E. Long. 68° 15', N. Lat. 33° 30', on the frontiers of Great Bukharia, on the south side of the mountains which divide the territories of Hindostan from that part of Great Tartary. It is one of the finest places in that part of the world; large, rich, and very populous. As it is considered as the key of the whole country on that side, great care is taken to keep its fortifications in repair, and a numerous garrison is maintained for its security. It lies on the road between Samarcand and Labor: and is much frequented by the Tartars, Persians, and Indians. The Usbec Tartars drive there a great trade in slaves and horses, of which it is said that no fewer are sold than 60,000 annually. The Persians bring black cattle and sheep, which renders provisions very cheap. They have also wine, and plenty of all sorts of eatables. The city stands on a little river which falls into the Indus, and thereby affords a short and speedy passage for all the rich commodities in the country behind it, which when brought to Cabul, are there exchanged for slaves and horses, and then conveyed by merchants of different countries to all parts of the world. The inhabitants are most of them Indian pagans, though the officers of the prince and most of the garrisons are Mahometans.

CABULISTAN, a province of Asia, formerly belonging to the Great Mogul; but ceded in 1739 to Kouli Khan, who at that time governed Persia. It is bounded on the north by Bukharia, on the east by Cashmicire, on the west by Zabulistan, and Candahar, and on the south by Moultan. It is 250 miles in length, 240 in breadth, and its chief town is Cabul. This country in general is not very fruitful; but in the vales they have good pasture lands. The roads are much infested with banditti; which obliges the natives to have guards for the security of travellers. The religion of the Cabulistantis is pagan; and their extraordinary time of devotion is the full moon in February, and continues for two days. At this time they are clothed in red, make their offerings, dance to the sound of the trumpet, and make visits to their friends in masquerade dresses. They say, their god Cusman killed a giant who was his enemy, and that he appeared like a little child; in remembrance of which, they cause a child to shoot at the figure of a giant. Those of the same tribe make bonfires, and feast together in a jovial manner. The moral part of their religion consists in charity; for which reason, they dig wells and build houses for the accommodation of travellers. They have plenty of provisions, mines of iron, myrobalans, aromatic woods, and drugs of many kinds. They carry on a great trade with the neighbouring countries; by which means they are very rich, and are supplied with plenty of all things.

CABRAS, a town of the kingdom of Tombut in Africa. It is a large town, but without walls; and is seated on the river Niger, about 12 miles from Tombut. The houses are built in the shape of bells; and the walls are made with stakes or hurdles, plastered with clay, and covered with reeds after the manner of thatch. This place is very much frequented by negroes who come here by water to trade. The town is very unhealthful, which is probably owing to its low situation. The colour of the inhabitants is black, and their religion a sort of Mahometanism. They have plenty of corn, cattle, milk, and butter; but salt is very scarce. The judge who decides controversies is appointed by the king of Tombut. E. Long. 5° 30'. N. Lat. 14° 27'.

CAC

the duke of Berwick, on the 7th of April 1706. E. Long. 6. 47. N. Lat. 39. 15.

CACHALOT. See Physetor, Cetology Index.

CACHAN, or CASHAN, a considerable town of Persia, in Isac Agemi, where they carry on an extensive trade in silks, silver, and gold brocades, and fine earthen ware. It is situated in a vast plain, 53 miles from Isaphahan. E. Long. 60. 2. N. Lat. 34. 10.

CACHAO, a province in the kingdom of Tongquin in Asia, situated in the heart of the kingdom, and surrounded by the other seven. Its soil is fertile, and in some places mountainous, abounding with a variety of trees, and particularly that of varnish. Most of these provinces carry on some branch of the silk manufacture, but this most of all. It takes on its name from the capital, which is also the metropolis of the whole kingdom, though in other respects hardly comparable to a Chinese town of the third rank.

CACHAO, a city of the province of that name, in the kingdom of Tongquin in Asia, situated in E. Long. 105. 31. N. Lat. 22. 10. at about 80 leagues distance from the sea. It is prodigiously crowded with people, so much that the streets are hardly passable, especially on market days. These vast crowds, however, come mostly from the neighbouring villages; upon which account these villages have been allowed their baths in particular parts of the city, where they bring and dispose of their wares. The town itself, though the metropolis of the whole Tongquin kingdom, hath neither walls nor fortifications. The principal streets are wide and airy, but the rest of them narrow and ill paved; and except the palace royal and arsenal, the town has little else worth notice. The houses are low and mean, mostly built of wood and clay, and not above one story high. The magazines and warehouses belonging to foreigners are the only edifices built of brick; and these, though plain, yet, by reason of their height and more elegant structure, make a considerable show among those rows of wooden butas. From the combustibility of its edifices, this city suffers frequent and dreadful conflagrations. These spread with such surprising velocity, that some thousands of houses are often laid in ashes before the fire can be extinguished. To prevent these and consequences, every house hath, either in its yard or even in its centre, some low building of brick, in form of an oven, into which the inhabitants, on the first alarm, convey their most valuable goods. Besides this precaution, which every family takes to secure their goods, the government obliges them to keep a cistern, or some other capacious vessel, always full of water, on the top of their house, to be ready on all occasions of this nature; as likewise a long pole and bucket, to throw water from the kennel upon the houses. If these two expedients fail of suppressing the flames, they immediately cut the straps which fasten the thatch to the walls, and let it fall in and waste itself on the ground. The king's palace stands in the centre of the city; and is surrounded with a stout wall, within whose cincture are seen a great number of apartments two stories high, whose fronts and portals have something of the grand taste. Those of the king and his wives are embellished with variety of carvings and gildings after the Indian manner, and all finely varnished. In the outer court are a vast number of sumptuous stables for the king's horses and elephants. The appearance of the inner courts can only be conjectured; for the avenues are not only shut to all strangers, but even to the king's subjects, except those of the privy council, and the chief ministers of state; yet we are told, that there are staircases by which people may mount up to the top of the wall, which are about 2 or 20 feet high; from whence they may have a distant view of the royal apartments, and of the fine parterres and fish ponds that are between the cincture and them. The front wall hath a large gate well ornamented, which is never opened but when the king goes in and out; but at some distance from it on each side there are two porters, at which the courtiers and servants may go in and out. This cincture, which is of a vast circumference, is faced with brick within and without, and the whole structure is terminated by wide spacious gardens: which, though stored with great variety of proper ornaments, are destitute of the grandeur and elegance observed in the palaces of European princes. Besides this palace, the ruins of one still more magnificent are to be observed, and are called Libatava. The circumference is said to have been but six and seven miles; some arches, porticoes, and other ornaments, are still remaining; from which, and some of its courts paved with marble, it may be concluded to have been as magnificent a structure as any of the eastern parts can show. The arsenals is likewise a large and noble building, well stored with ammunition and artillery. The English factory is situated on the north side of the city, fronting the river Song-kew. It is a handsome low-built house, with a spacious dining-room in the centre; and on each side are the apartments of the merchants, factors, and servants. At each end of the building are smaller houses for other uses, as storerooms, kitchen, &c. which form two wings with the square in the middle, and parallel with the river, near the bank of which stands a long flag-staff, on which they commonly display the English colours on Sundays and all remarkable days. Adjoining to it, on the south side, is the Danish factory, which is neither so large nor so handsome. On the same side of the river runs a long dike, whose timber and stones are so firmly fastened together, that no part of it can be stirred without moving the whole. This work was raised on those banks to prevent the river, during the time of their vast rains, from overflowing the city; and it has hitherto answered its end; for, though the town stands high enough to be in no danger from land floods, it might yet have been otherwise frequently dammed, if not totally laid under water, by the overflowing of that river. Some curious observations have been communicated to the Royal Society concerning differences between the tides of those seas and those of Europe, viz. that on the Tongquin coast ebbs and flows but once in 24 hours; that is, that the tide is rising during the space of 12 hours, and can be easily perceived during two of the moon's quarters, but can hardly be observed during the other two. In the springs tides, which last 14 days, the waters begin to rise at the rising of the moon; whereas, in the low tides, which continue the same number of days, the tide begins not till that planet has got below the horizon. Whilst it is passing through the six northern signs, the tides are observed to vary greatly, to rise sometimes very high, and other times...
CACAO

CACHOEO, a town of Negroland in Africa, seated on the river St Domingo. It is subject to the Portuguese, who have three forts there, and carry on a great trade in wax and slaves. W. Long. 14° 55'. N. Lat. 12° 0'.

CACHEXY, in Medicine, a vittous state of the humours and whole habit. See Medicine Index.

CACHRYX. See Botany Index.

CACHUNDE, the name of a medicine, highly celebrated among the Chinese and Indians, and made of several aromatic ingredients, the perfumes, medicinal earth, and precious stones; they make the whole into a stiff paste, and form out of it several figures according to their fancy, which are dried for use; these are principally used in the East Indies, but are sometimes brought over to Portugal. In China, the principal persons usually carry a small piece in their mouths, which is a continued cordial, and gives their breath a very sweet smell. It is a highly valuable medicine, also, in all nervous complaints; and is esteemed a prolonger of life, and a provocative to venery, the two great intentions of most of the medicines in use in the East.

CACOCHYLIA, or CACOCHYMIA, a vitious state of the vital humours, especially of the mass of blood; arising either from a disorder of the secretions or excretions, or from external contagion. The word is Greek, compounded of κακὸς ill, and χοῦνος juice.

CACOPHONIA, in Grammar and Rhetoric, the meeting of two letters, or syllables, which yield an uncoath and disagreeable sound. The word is compounded of κακός evil, and φωνή voice.

CACOPHONY, in Medicine, denotes a vice or depravation of the voice or speech; of which there are two species, aphonia and dyspnoia.

CACUS. See Botany Index.

The cactus is a plant of a singular structure, but especially the larger kinds of them; which appear like a large, flesy, green melon, with deep ribs, set all over with strong thorns, and, when the plants are cut through the middle, their inside is a soft, pale-green, flesy substance, very full of moisture. The fruit of all the species is frequently eaten by the inhabitants of the West Indies. The fruits are about three quarters of an inch in length, of a taper form, drawing to a point at the bottom toward the plant, but blunt at the top where the empalment of the flower was situated. The taste is agreeably acid, which in a hot country must render the fruit more grateful.

The cochineal animals are supported on a species called cactus cochenillifer. The flower of the cactus grandiflora (one of the creeping cereuses) is said to be as grand and beautiful as any in the vegetable system. It begins to open in the evening about seven o'clock, is in perfection about eleven, and fades about four in the morning; so that the same flower only continues in perfection about six hours. The calyx when expanded is about a foot in diameter, of a splendid yellow within, and a dark brown without; the petals are many, and of a pure white; and the great number of recurved stamens, surrounding the style in the centre of the flower, make a grand appearance, to which may be added the fine scent, which perfumes the air to a considerable distance. It flowers in July.

CACUS, in fabulous history, an Italian shepherd upon Mount Aventine. As Hercules was driving home the herd of King Geryon whom he had slain, Cacus robbed him of some of his oxen, which he drew backward into his den lest they should be discovered. Hercules at last finding them out by their lowing, or the robbery being discovered to him, killed Cacus with his club. He was Vulcan's son, of prodigious bulk, and half man half satyr.

CADAN, a town of Bohemia, in the circle of Zate, seated on the northern bank of the river Egra, in E. Long. 13° 34'. N. Lat. 50° 20'.

KADARI, or KADARI, a sect of Mahometans, who assert free will; attribute the actions of men to men alone, not to any secret power determining the will; and deny all absolute decrees, and predestination. The author of this sect was Maseb ben Kaled al Giboni, who suffered martyrdom for it. The word comes from the Arabic, چیک, cadara, "power." Ben Ám calls the Kadarians the Magi or Manichees of the Mussulmans.

CADE, a cag, case, or barrel. A cado of herrings is a vessel containing the quantity of 500 red herrings, or 1000 sprats.

CADE Lamb, a young lamb weaned, and brought up by hand, in a house; called, in the North, pet lamb.

CADE Oil, in the Materia Medica, a name given to an oil much in use in some parts of France and Germany. The physicians call it oleum cadar, or oleum de cado. This is supposed by some to be the pinnaxium of the ancients, but improperly; it is made of the fruit of the oxycedrus, which is called by the people of these places cado.

CADE Worms, in Zoology, the maggot or worm of a fly called phrygumen. It is used as a bait in angling. See Phryganea, Entomology Index.

CADEA, OR THE LEADER OF THE HOUSE OF GOD, is one of those that compose the republic of the Gri-

CADE, in Reading, is a falling of the voice below the key note at the close of every period. In reading, whether prose or verse, the certain tone is assumed which is called the key-note: and in this tone the bulk of the words are sounded; but this note is generally lowered towards the close of every sentence.

CADENCE,
CADENNE, one of the sorts of carpets which the Europeans import from the Levant. They are the worst sort of all, and are sold by the piece, from one or two piastres per carpet.

CADENET, a town of France, in the department of Vaucluse, on the river Durance. E. Long. 5° 30'. N. Lat. 43° 40'.

CADES, or KADESH, in Ancient Geography, a town in the wilderness of Zion, in Arabia Petraea: the first encampment of the Israelites, after their departure from Egypt; and from which the wilderness of Zion was called Cades; the burial place of Miriam, with the rock and water of Meribah in it. Another Cades, a town of the tribe of Judah, Joshua xv. 23. Cadesbarnea, called also Cades.

CADES BARNEA, in Ancient Geography, a town of the wilderness of Paran, on the confines of Canaan, from which the spies were sent out; sometimes simply called Cades, but distinct from the Cades in the wilderness of Zion.

CADET, the younger son of a family, is a term naturalized in our language from the French. At Paris, among the citizens, the cadets have an equal patrimony with the rest. At Caen, in Normandy, the custom, as with us, is to leave all to the eldest, except a small portion to the cadets. In Spain, it is usual for one of the cadets in great families to take the mother's name.

CADET is also a military term, denoting a young gentleman who chooses to carry arms in a marching regiment as a private man. His views are, to acquire some knowledge in the art of war, and to obtain a commission in the army. Cadet differs from volunteer, as the former takes pay, whereas the latter serves without pay.

CADJI, or CADI, a judge of civil affairs in the Turkish empire. It is generally taken for the judge of a town; judges of provinces being distinguished by the appellation of moulas.

We find numerous complaints of the avarice, iniquity, and extortion, of the Turkish cadis; all justice is here venal; the people bribe the cadis, the cadis bribe the moulas, the moulas the cadillescher, and the cadillescher the muftis. Each cadis has his serjeants, who are to summon persons to appear and answer complaints. If the party summoned fails to appear at the hour appointed, a sentence is passed in favour of his adversary. It is usually in vain to appeal from the sentences of the cadis, since the affair is never heard anew, but judgment is passed on the case as stated by the cadis. But the cadis are often cashiered and punished for crying injustice with the bastinado and mutila; the law, however, does not allow them to be put to death. Constantineople has had cadis ever since the year 1350, when Bajazet I. obliged John Paleologus, emperor of the Greeks, to receive cadis into the city to judge all controversies happening between the Greeks and the Turks settled there. In some countries of Africa, the cadis are also judges of religious matters. Among the Moore cadis is the denomination of their higher order of priests or doctors, answering to the rabbins among the Jews.

CADJACI, the Turkish name of Chalcedon. See CHALCEDON.

CADILESCHER, a capital officer of justice among the Turks, answering to a chief justice among us.

It is said, that this authority was originally confined to the soldiery; but that at present it extends itself to the determination of all kinds of law-suits; yet it is nevertheless subject to appeals.

There are but three cadilleschers in all the grand signor's territories; the first is that of Europe; the second, of Natolia; and the third resides at Grand Cairo. This last is the most considerable: they have their seats in the divan next to the grand vizir.

CADILLAC, a town of France in Guienne, now in the department of Gironde, near the river Garonne, with a handsome castle, situated in W. Long. 0° 15'. N. Lat. 44° 37'.

CADIZ, a city and port town of Andalusia in Spain, situated on the island of Leon, opposite to Port St Mary on the continent, about 60 miles south-west of Seville, and 40 north-west of Gibraltar. W. Long. 6° 40'. N. Lat. 36° 30'.

It occupies the whole surface of the western extremity of the island, which is composed of two large circular parts, joined together by a very narrow bank of sand, forming altogether the figure of a chain-shot. At the south-east end, the ancient bridge of Suscu, thrown over a deep channel or river, affords a communication between the island and the continent; a strong line of works defends the city from all approaches along the isthmus; and, to render them still more difficult, all the gardens and little villas on the beach were in 1762 cleared away, and a dreary sandy glais left in their room, so that now there is scarce a tree on the whole island.

Except the Calle Ancha, all the streets are narrow, ill paved, and insufferably stinking. They are all drawn in straight lines, and most of them intersect each other at right angles. The swarms of rats that in the nights run about the streets are innumerable; whole droves of them pass and repass continually, and these in their midnight revels are extremely troublesome to such as walk late. The houses are lofty, with each a vestibule, which being left open till night, serves passengers to retire to; this custom, which prevails throughout Spain, renders these places exceedingly offensive. In the middle of the house is a court like a deep well, under which is generally a cistern, the breeding place of gnats and mosquitoes; the ground floors are warehouses, the first stories containing houses and the principal apartment up two pair of stairs. The roofs are flat, covered with an impenetrable cement, and few are without a mirador or turret for the purpose of commanding a view of the sea. Round the parapet-wall at top are placed rows of square pillars, meant either for ornament according to some traditional mode of decoration, or to fix awnings to, that such as sit there for the benefit of the sea breeze may be sheltered from the rays of the sun; but the most common use made of them, is to fasten ropes for drying linen upon. High above all these pinnacles, which give Cadiz a most singular appearance, stands
the tower of signals. Here flags are hung out on the first sight of a sail, marking the size of the ship, the nation it belongs to, and, if a Spanish Indianan, the port of the Indies it comes from. The ships are acquainted with the proper signals to be made, and these are repeated by the watchmen of the tower: as painted lists are in every house, persons concerned in commerce soon learn the marks.

The city is divided into 24 quarters, under the inspection of as many commissioners of police; and its population is reckoned at 70,000 inhabitants, of which part are French, and part also Italians. The square of Saint Antonia is large, and tolerably handsome, and there are a few smaller openings of no great note. The public walk, or Alameda, is pleasant in the evening: it is fenced off the coach-road by a marble rail. The sea air prevents the trees from thriving, and destroys all hopes of future shade.

From the Alameda, continuing your walk westwardly, you come to the Casamento, a large esplanade, the only airying place for coaches; it turns round most part of the west and south sides of the island, but the buildings are straggling and ugly: the only edifice of any show is the new orphan house. Opposite to it is the fortress of St Sebastian, built on a neck of land running out into the sea. The round tower at the extremity is supposed to have saved the city, in the great earthquake of 1755, from being swept away by the fury of the waves. The building proved sufficiently solid to withstand the shock, and break the immense volume of water that threatened destruction to the whole island. In the narrow part of the isthmus the surge beat over with amazing impetuosity, and bore down all before it; among the rest, the grandson of the famous tragic poet Racine, who strove in vain to escape, by urging his horse to the utmost of his speed. On St Sebastian's feast, a kind of wake or fair is held in the fort; an astonishing number of people then passing and repassing, on a string of wooden bridges laid from rock to rock, makes a very lively movable picture.

From hence to the wooden circus where they exhibit the bull feasts, you keep turning to the left close above the sea, which on all this side dashes over large ledges of rock: the shore seems here absolutely inaccessible. On this shore stands the cathedral, a work of great expense, but carried on with so little vigour, that it is difficult to guess at the term of years it will require to bring it to perfection. The vaults are executed with great solidity. The arches, that spring from the clustered pilasters to support the roof of the church, are very bold; the minute sculpture bestowed upon them seems superfluous, as all the effect will be lost from their great height, and from the shade that will be thrown upon them by the filling up of the interstices. From the sea, the present top of the church resembles the carcass of some huge monster cast upon its side, rearing its gigantic blanched ribs high above the buildings of the city. The outward casings are to be of white marble, the bars of the windows of bronze.

Next, crossing before the land gate and barracks, a superb edifice for strength, convenience, and cleanliness, you come down to the ramparts that defend the city on the side of the bay. If the prospect to the ocean is solemn, that towards the main land is animating in the highest degree: the men of war ride in the eastern bosom of the bay; lower down the merchantmen are spread far and near; and close to the town an incredible number of barges, of various shapes and sizes, cover the surface of the water, some motion and some in motion, carrying goods to and fro. The opposite shore of Spain is studded with white houses, and enlivened by the town of St Mary's, Part-real, and others, behind which, eastward, on a ridge of hills, stands Medina Sidonia, and further back rise the mountains of Granada. Westward, Rota closes the horizon, near which was anciently the island and city of Tartessus, now covered by the sea, but at low water some part of the ruins are still to be discerned. In a large bastion, jutting out into the bay, they have built the custom-house, the first story of which is level with the walk upon the walls. When it was resolved to erect a building so necessary to this great emporium of trade, the marquis di Sevillice gave orders that no expense should be spared, and the most intelligent architects employed, in order to erect a monument, which by its taste and magnificence might excite the admiration of posterity: the result of these precautions proved a piece of vile architecture, composed of the worst of materials.

The stir here is prodigious during the last months of the stay of the flota. The packers possess the art of pressing goods to great perfection; but, as they pay the freight according to the cubic palms of each bale, they are apt to squeeze down the clothes and linens so very close and hard, as sometimes to render them unfit for use. Every commercial nation has a consul resident at Cadiz; those of England and France are the only ones not allowed to have any concern in trade.

In 1556, Cadiz was taken, pillaged, and burnt by the English; but in 1702 it was attempted, in conjunction with the Dutch, without success. It was bombarded by the English in 1805; and was blockaded by the French while the Cortes held its sittings there in 1810, till the blockade was raised after the battle of Salamanca in 1812.

CADIZADELITEs, a sect of Mahometans very like the ancient Stoics. They shun feasts and diversions, and affect an extraordinary gravity in all their actions; they are continually talking of God, and some of them make a jumble of Christianity and Mahometanism; they drink wine, even in the fast of the Ramadan; they love and protect the Christians; they believe that Mahomet is the Holy Ghost, practise circumcision, and justify it by the example of Jesus Christ.

CADMEAN LETTERS, the ancient Greek or Ionic characters, such as they were first brought by Cadmus from Phoenicia: whence Herodotus also calls them Phoenician letters. According to some writers, Cadmus was not the inventor, nor even importer of the Greek letters, but only the modeller and reformer thereof; and it was hence they acquired the appellation Cadmean or Phoenician letters; whereas before that time they had been called Pelasgian letters.

CADMIA. See CALAMITI.

CADMIUS, in fabulous history, king of Thebes, the son of Agenor king of Phoenicia, and the brother of Phoenix, Cilix, and Europa. He carried into Greece the 16 simple letters of the Greek alphabet; and there built Thebes, in Boeotia. The poets say, that
that he left his native country in search of his sister Europe, whom Jupiter had carried away in the form of a bull: and that, inquiring of the Delphic oracle for a settlement, he was answered, that he should follow the direction of a cow, and build a city where she lay down. Having arrived among the Phocenses, he was met by a cow, who conducted him through Boeoctia to the place where Theseus was afterwards built; but as he was about to sacrifice his guide to Pallus, he sent two of his company to the fountain Dirce for water; when they being devoured by a serpent or dragon, he slew the monster, and afterwards, by the advice of Pallus, sworl his teeth, when there sprang up a number of armed soldiers, who prepared to revenge the death of the serpent; but on his casting a stone among these upstart warriors, they turned their weapons against each other with such animosity, that only five survived the combat, and these assisted Cadmus in founding his new city. Afterwards, to redeem the labour of the gods, gave him Harmonia; or Harmonne, the daughter of Mars and Venus; and honoured his nuptials with presents and peculiar marks of favour. But at length resigning Theseus to Pentheus, Cadmus and Harmonne went to govern the Eceolians: when grown old, they were transformed into serpents; or, as others say, sent to the Elysian fields, in a chariot drawn by serpents. See THESES.

Cadmus of Milesia, a celebrated Greek historian, was, according to Pliny, the first of the Greeks who wrote history in prose. He flourished about 550 before Christ.

Cadore, or Pieve de Cadore, a town of Italy, in the territory of Venice, and capital of a district called Cadori; famous for the birth of Titian the painter. E. Long. 13. 45. N. Lat. 40. 25.

Cadorino, a province of Italy, in the territory of Venice; bounded on the east by Friuli Proper, on the south and west by the Bellunese, and by the bishopric of Brixen on the north. It has a very mountainous country, but pretty populous. The only town is Pieve de Cadore.

Cadrites, a sort of Mahometan friars, who once a-week spend a great part of the night in turning round, holding each others hands, and repeating incessantly the word hai, which signifies living, and is one of the attributes of God; during which one of them plays on a flute. They never cut their hair, nor cover their heads; and always go bare-footed: they have liberty to quit their convent when they please, and to marry.

Cadsand, an island on the coast of Dutch Flanders, situated at the mouth of the Scheldt, whereby the Dutch command the navigation of that river.

Caduceus, in antiquity, Mercury's rod or sceptre, being a wand entwined by two serpents, borne by that deity as the ensign of his quality and office, given him, according to the fable, by Apollo, for his miraculous harp. Wonderful properties are ascribed to this rod by the poets; as laying men asleep, raising the dead, &c.

It was also used by the ancients as a symbol of peace and concord: the Romans sent the Carthaginians a javelin and a caduceus, offering them their choice either of war or peace. Among that people, those who denounced war were called societes; and those who went to demand peace, caduceatores, because they bore a Caduceus caduceus in their hand.

The caduceus found on medals is a common symbol, signifying good conduct, peace, and prosperity. The rod expresses power, the two serpents prudence, and the two wings diligence.

Caduci, (from cadus, "to fall"); the name of a class in Linnaeus's "calycia", consisting of plants whose calyx is a simple perianthium, supporting a single flower or fructification, and falling off either before or with the petals. It stands opposed to the "classes persistentes" in the same method, and is exemplified in mustard and raunculus.

Cadurci, Cadurcum, Caducus, and Cadura, in Ancient Geography, a town of the Cadurci, a people of Aquitania; situated between the rivers Olusses and Tarn river, and reaching to the Caspian sea; between whom and the Medes perpetual war and enmity continued down to the time of Cyrus.

CÆCILIA, in Zoology, a genus of serpents belonging to the amphibia class. The cæcilia has no scales: it is smooth, and moves by means of lateral rugæ or prickles. The upper lip is prominent, and furnished with two tentacula. It has no tail. There are but two species of this serpent, viz. 1. The tentaculata, has 15 rugæ. It is about a foot long, and an inch in circumference, preserving an uniform cylindrical form from the one end to the other. The teeth are very small. It has such a resemblance to an eel, that it may easily be mistaken for one; but as it has neither fins nor gills, it cannot be classed with the fishes. It is a native of America, and its bite is not poisonous. 2. The gluttonia, has 340 rugæ or prickles above, and 10 below, the anus. It is of a brownish colour, with a white line on the side, and is a native of the Indies.

Cæcum, or Coecum, the blind gut. See Anatomy Index.

Cælius, in Ancient Geography, an inland town of Peucetia, a division of Apulia; a place four or five miles above Barium or Bari, and which still retains that name.

Cælium, (Itinerary) a town of Vindelicia, on the right or west side of the Iliarus. Now Kalymnus, a small town of Susaria, on the Iler.

Cælius Mons at Rome. See Coelius.

Célius, Aurelianus, an ancient physician, and the only one of the sect of the Methodists of whom we have any remains. He was of Sicca, a town of Numidia; but in what age he lived, cannot be determined: it is probable, however, that he lived before Galen; since, though he carefully mentions all the physicians before him, he takes no notice of Galen. He had read over very diligently the ancient physi-
CAE

CAE, a handsome and considerable town of France, capital of Lower Normandy, and of the department of Calvados. It contains 60 streets, and 12 parishes, and in 1815 had 36,000 inhabitants. It has a castle with four towers, which were built by the English. The town-house is a large building with four great towers. The royal square is the handsomest in all Normandy, and has fine houses on three sides of it; and in the middle is the statue of Louis XIV. in a Roman habit, standing on a marble pedestal, and surrounded with an iron ballustrade. It is seated in a pleasant country on the river Orne, about eight miles from the sea. William the Conqueror was buried here, in the abbey of St Stephen, which he founded. W. Long. 0. 27. N. Lat. 49. 11.

CAERE, in Ancient Geography, a town of Etruria, the royal residence of Mezentius. Its ancient name was Argylla. In Strabo's time not the least vestige of it remained, except the baths called caeretana. From this town the Roman censor's tables were called cercites tabulae. In these were entered the names of such as for some misdeemance forfeited their right of suffrage, or were degraded from a higher to a lesser honourable tribe. For the people of Cære hospitably receiving those Romans who, after the taking of Rome by the Gauls, fled with their gods and the sacred fire of Vesta, were, on the Romans recovering themselves from this disaster, honoured with the privilege of the city, but without a right to the baths.

CERCITAE TABULAE. See the preceding article.

CAERFILLY, a town of Glamorganshire in South Wales, seated between the rivers Taff and Rumney, in a moorish ground among the hills. It is thought the walls, now in ruins, were built by the Romans; there being often Roman coins dug up there. W. Long. 3. 12. N. Lat. 51. 25.

CAELON, a town of Monmouthshire in England, and a place of great antiquity. It was a Roman town, as is evident from the many Roman antiquities found here. It is commodiously situated on the river Usk, over which there is a large wooden bridge. The houses are generally built of stone, and there are the ruins of a castle still to be seen. W. Long. 3. 0. N. Lat. 51. 40.

CAERMARTHENSHIRE, a county of Wales, bounded on the north by the Severn sea or St George's channel, Cardiganshire on the south, the shires of Brecknock and Glamorgan on the east, and Pembroke on the west. Its greatest length is between 30 and 40 miles, and its breadth upwards of 20, and it contained 77,217 inhabitants in 1811. The soil is less rocky and mountainous than some other parts of Wales, and consequently is proportionately more fertile both in corn and pasture. It has also plenty of wood, coal, and limestone. The most considerable rivers are the Towy, the Cothy, and the Tawe; of which, the first abounds with excellent salmon. The principal towns are Caermarthen the capital, Kidwelly, Llanidloes, &c. This county abounds with ancient forts, camps, and tumuli or barrows. Near to Caermarthen, towards the east, may be seen the ruins of Kastell Karrey, which was situated on a steep and inaccessible rock; and also several vast caverns, supposed to have been copper mines of the Romans. Near this spot is a fountain which ebbs and flows twice in 24 hours like the sea. See CAERMAERTHENSHIRE, Supplement.

CAERMARTHEN, a town of Wales, and capital of the county of that name. It is situated on the river Towy, over which it has a fine stone bridge. It is of great antiquity, being the Maridunum of Taliarie. It is a thriving place, and many of the neighbouring gentry reside there in the winter. It is a corporation and county of itself, with power to make by-laws. Here the great number of the courts of chivalry are said to sit. For South Wales, till the whole was united in England in the reign of Henry VIII. Here was born the famous conjuror Merlin; and near the town is a wood called Merlin's Grove, where he is said to have often retired for contemplation. Many of his pretended prophecies are still preserved in the country. The town gives the title of marquis to the duke of Leeds. It sends one member to parliament, and the county another. Population 7,725.

CAERNARVONSHIRE, a county of Wales, bounded on the north and west by the sea, on the south by Merionethshire, and on the east divided from Denbighshire by the river Conway. It is about 40 miles in length, and 20 in breadth; and sends one member to parliament for the shire, and another for the borough of Caernarvon. The air is very piercing; owing partly to the snow, that lies seven or eight months of the year upon some of the mountains, which are so high that they are called the British Alps, and partly to the great number of lakes, which are not to be fewer than 50 or 60. The soil in the valleys on the side next Ireland is pretty fertile, especially in barley; great numbers of black cattle, sheep, and goats, are fed on the mountains. The population in 1811 was 49,336. The highest mountains in the county are those called Snowdon Hills, and Penmaen-mawr, which last hangs over the sea. There is a road cut out of the rock on the side next the sea, guarded by a wall running along the edge of it on that side; but the traveller is sometimes in danger of being crushed by the fall of pieces of the rock from the precipices above. The river Conway, though its course from the lake out of which it issues to its mouth is only 12 miles, yet is so deep, in consequence of the many brooks it receives, that it is navigable by ships of good burden for eight miles. Pearls are found in large black musles taken in this river. The principal towns are Bangor, Caernarvon the capital, and Conway. In this county is an ancient road said to have been made by Helena, the mother of Conatime the Great; and Maethol, the grandson of Constantine the Great, founded a monastery called Cantia, which was afterwards called Caernarfon, and is now called Caer. The body of Constantius, father of Constantine, was found at Caernarvon in the year 1283, and interred in the parish church by order of Edward I. See CAERNARVONSHIRE, Supplement.

CAERNARVON, a town of Wales, and capital of the county of that name. It was built by Edward I. near the site of the ancient Segontium, after his conquest of the country in 1283, the situation being well adapted to overlook his new subjects. It had natural requisitions for strength; being bounded on one side by the arm of the sea called the Menai; by the estuary of the Sciont.
The largest remaining are not above two inches in Casalpinia thickness, and eight or nine feet in height. The branches are slender and full of small prickles; the leaves are pinnate; the leaves growing opposite to one another, broad at their ends, with one notch. The flowers are white, papilionaceous, with many stamens and yellow spines growing in a pyramidal spike, at the end of a long slender stalk: the pods enclosed several small round seeds. The colour produced from this wood is greatly improved by solution of tin in aqua regia. See Coeur

The second sort is a native of the same countries with the first, but is of a larger size. It sends out many weak irregular branches, armed with short, strong, upright thorns. The leaves branch out in the same manner as the first; but the lobes, or small leaves, are oval and entire. The flowers are produced in long spikes like those of the former, but are variegated with red. These plants may be propagated from seeds, which should be sown in small pots filled with light rich earth early in the spring, and plunged in a bed of tanner's bark. Being tender, they require to be always kept in the stove, and to be treated in the same manner as other exotics of that kind.

C/SALPINUS of Arezzo, professor at Pisa, and afterwards physician to Pope Clement VIII one of the capital writers in botany. See Supplement.

CÆSAR, JULIUS, the illustrious Roman general and historian, was of the family of the Julii, who pretended they were descended from Venus by Aeneas. The descendants of Ascanius, son of Aeneas and Creüsa, and surnamed Julius, lived in Alba till that city was ruined by Tullus Hostilius king of Rome, who carried them to Rome, where they flourished. We do not find that they produced more than two branches. The first bore the name of Tullius, the other that of Cæsar. The most ancient of the Cæsars were those who were in public employments in the 12th year of the first Punic war. After that time we find there was always some of that family who enjoyed public offices in the commonwealth, till the time of Caius Julius Cæsar, the subject of this article. He was born at Rome the 12th of the month Quintilius, year of the city 633, and lost his father An. 665. By his valour and eloquence he soon acquired the highest reputation in the field of the senate. Beloved and respected by his fellow citizens he enjoyed successively every magisterial and military honour the public could bestow consistent with its own free constitution. But at length having subdued Pompey, the great rival of his growing power, his boundless ambition exposed the glory of his former actions: for, pursuing his favourite maxim, 'that he had rather be first man in a village than the second in Rome,' he procured himself to be chosen perpetual dictator; and, not content with this unconstitutional power, his faction had resolved to raise him to the imperial dignity; when the friends of the civil liberties of the republic rashly assassinated him in the senate-house, where they should only have seized him and brought him to a legal trial for usurpation. By this impolitic measure they defeated their own purpose, involving the city in consternation and terror, which produced general anarchy, and paved the way to the revolution they wanted to prevent: the monarchical government being absolutely founded on the murder of Julius Cæsar. He fell in the 56th year of his age, 43 years before
Cæsar. His commentaries contain a history of his principal voyages, battles, and victories. The London edition in 1722, in folio, is preferred.

The detail of Cæsar's transactions (so far as is consistent with the limits of this work) being given under the article Rome, we shall here only add a portrait of him as drawn by a philosopher:

"If, after the lapse of 18 centuries, the truth may be published without offence, a philosopher might, in the following terms, censure Cæsar without calumniating him, and applaud him, without exciting his blushes.

"Cæsar had one predominant passion: it was the love of glory; and he passed 40 years of his life in seeking opportunities to foster and encourage it. His soul, entirely absorbed in ambition, did not open itself to other impulses. He cultivated letters; but he did not love them with enthusiasm, because he had not leisure to become the first orator of Rome. He corrupted the one half of the Roman ladies, but his heart had no concern in the fiery ardours of his senses. In the arms of Cleopatra, he thought of Pompey; and this singular man, who disdained to have a partner in the empire of the world, would have blushed to have been for one instant the slave of a woman.

"We must not imagine that Cæsar was born a warrior, as Sophocles and Milton were born poets. For, if nature had made him a citizen of Sybaris, he would have been the most voluptuous of men. If in our days he had been born in Pennsylvania, he would have been the most inoffensive of Quakers, and would not have disturbed the tranquillity of the new world.

"The moderation with which he conducted himself after his victories, has been highly extolled; but in this he showed his penetration, not the goodness of his heart. Is it not obvious, that the display of certain virtues is necessary to put in motion the political machine? It was requisite that he should have the appearance of clemency, if he inclined that Rome should forgive him his victories. But what greatness of mind is there in a generosity which follows on the usurpation of the supreme power?

"Nature, while it marked Cæsar with a sublime character, gave him also that spirit of perseverance which renders it useful. He had no sooner begun to reflect, than he admired Sylla; hated him, and yet wished to imitate him. At the age of 15, he formed the project of being dictator. It was thus that the president Montesquieu conceived, in his early youth, the idea of the Spirit of Laws.

"Physical qualities as, well as moral causes, contributed to give strength to his character. Nature, which had made him for command, had given him an air of dignity. He had acquired that soft and insinuating eloquence, which is perfectly suited to seduce vulgar minds, and has a powerful influence on the most cultivated. His love of pleasure was a merit with the fair sex; and women, who even in a republic can draw to them the suffrages and attention of men, have the highest importance in degenerate times. The ladies of his age were charmed with the prospect of having a dictator whom they might subdue by their attractions.

"In vain did the genius of Cato watch for some time to sustain the liberty of his country. It was unequal to contend with that of Cæsar. Of what avail were the eloquence, the philosophy, and the virtue of this republican, when opposed by a man who had the address to debase the wife of every citizen whose interest he meant to engage; who, possessing an enthusiasm for glory, went, because, at the age of 70, he had not conquered the world like Alexander; and who, with the haughty temper of a despot, was more desirous to be the first man in a village than the second in Rome.

"Cæsar had the good fortune to exist in times of trouble and civil commotions, when the minds of men are put into a ferment; when opportunities of great actions are frequent; when talents are every thing, and those who can only boast of their virtues are nothing. If he had lived an hundred years sooner, he would have been no more than an obscure villain; and, instead of giving laws to the world, would not have been able to produce any confusion in it.

"I will here be bold enough to advance an idea, which may appear paradoxical to those who weakly judge of men from what they achieve, and not from the principle which leads them to act. Nature formed in the same mould Cæsar, Mahomet, Cromwell, and Kouli Khan. They all of them united to genius that profound policy which renders it so powerful. They all of them had an evident superiority over those with whom they were surrounded; they were conscious of this superiority; and they made others conscious of it. They were all of them born subjects, and became fortunate usurpers. Had Cæsar been placed in Persia, he would have made the conquest of India; in Arabia, he would have been the founder of a new religion; in London, he would have stabbed his sovereign, or have procured his assassination under the sanction of the laws. He reigned with glory over men whom he had reduced to be slaves; and, under one aspect, he is to be considered as a hero; under another, as a monster. But it would be unfortunate, indeed, for society, if the possession of superior talents gave individuals a right to trouble its repose. Usurpers accordingly have flatterers, but no friends; strangers respect them; their subjects complain and submit; it is in their own families that humanity finds her avengers. Cæsar was assassinated by his son, Mahomet was poisoned by his wife, Kouli Khan was massacred by his nephew, and Cromwell only died in his bed because his son Richard was a philosopher.

"Cæsar, the tyrant of his country; Cæsar, who destroyed the agents of his crimes, if they failed in address; Cæsar, in fine, the husband of every wife, and the wife of every husband, has been accounted a great man by the mob of writers. But it is only the philosopher who knows how to mark the barrier between celebrity and greatness. The talents of this singular man, and the good fortune which constantly attended him till the moment of his assassination, have concealed the enormity of his actions."

Cæsar, in Roman antiquity, a title borne by all the emperors, from Julius Cæsar to the destruction of the empire. It was also used as a title of distinction for the intended or presumptive heir of the empire, as King of the Romans is now used for that of the German empire.

This
This title took its rise from the surname of the first emperor C. Julius Caesar, which, by a decree of the senate, all the succeeding emperors were to bear. Under his successor, the appellation of Augure was appropriated to the emperors, in compliment to that prince; the title Caesar was given to the second person in the empire, though still it continued to be given to the first; and hence the difference between Caesar used simply, and Caesar with the addition of Imperator Augustus.

The dignity of Caesar remained to the second of the empire, till Alexius Comnenus having elected Nicaphorus Melissenus Caesar by contract; and it being necessary to confer some higher dignity on his own brother Isaacius, he created him Sebastocrator with the precedence over Melissenus; ordering, that in all acclamations, &c. Isaacius Sebastocrator should be named the second, and Melissenus Caesar the third.

Historically, Sir Julius, a learned civilian, was descended from the family line from the dukedom of Cesarini in Italy; and was born near Tottenham in Middlesex, in the year 1557. He was educated at Oxford, and afterwards studied in the university of Paris, where, in the year 1575, he was created doctor of the civil law, and two years after was admitted to the same degree at Oxford, and also became doctor of the canon law. He was advanced to many honourable employments, and for the last 20 years of his life was master of the rolls. He was remarkable for his extensive bounty and charity to all persons of worth, so that he seemed to be the almoner-general of the nation. He died in 1659, in the 79th year of his age. It is very remarkable that the manuscripts of this lawyer were offered (by the executors of some of his descendants) to a cheesemonger for waste paper; but being timely inspected by Mr. Samuel Paterson, this gentleman discovered their worth, and had the satisfaction to find his judgment confirmed by the profession, to whom they were sold in lots for upwards of 500l. in the year 1757.

Cesar Augustus, or Cæsarea Augustana, in Ancient Geography, was a Roman colony situated on the river Lorus in the Herer Spain, before called Salceda, in the territories of the Edetani. Now commonly thought to be Saragossa.

Cæsarea, the name of several ancient cities, particularly one on the coast of Phocasia. It was very conveniently situated for trade; but had a very dangerous harbour, so that no ships could be safe in it when the wind was at south-west. Herod the Great, king of Judaea, remedied this inconvenience at an immense expense and labour, making it one of the most convenient havens on that coast. He also beautified it with many buildings, and bestowed 23 years on the finishing and adorning it.

Cæsarean operation. See Midwifery.

Cæsarians, Cæsareenses, in Roman antiquity, were officers or ministers of the Roman emperors: They kept the account of the revenues of the emperors; and took possession, in their name, of such things as devolved or were confiscated to them.

Cæsabudunum, in Ancient Geography, a town of the Trinobantes in Britain; by some supposed to be Kelmsford, by others Brentford, and by others Purfleet.

Cæsena, in Ancient Geography, a town of Gallia Cispadana, situated on the river Isapia and Rubicon; now Cessen, which see.

Cæsia Sylva, in Ancient Geography, a wood in Germany, part of the great Sylva Hercynia, situated partly in the duchy of Cleves, and partly in Westphalia, between Wesel and Kaisfield.

Cæsones, a denomination given to those cut out of their mothers wombs. Pliny ranks this as an auspicious kind of birth; the elder Scipio Africanus, and the first of the family of Cæsars, were brought into the world in this way.

Cæstus, in antiquity, a large gauntlet made of raw hide, which the wrestlers made use of when they fought at the public games. This was a kind of leathern strap, strengthened with lead or plates of iron, which encompassed the hand, the wrist, and a part of the arm, as well to defend these parts as to enforce their blows.

Cæstus, or Cæstum, was also a kind of girdle, made of wool, which the husband untied for his spouse the first day of marriage, before they went to bed.

This relates to Venus's girdle, which Juno borrowed of her to entice Jupiter to love her. See Cæstus.

Cæsiura, in the ancient poetry, is when, in the scanning of a verse, a word is divided so, as one part seems cut off, and goes to a different foot from the rest:

\[ \text{Mentiri \ nolite, munquam mens\ dacie prorsunt.} \]

Where the syllables \( n \), \( iu \), \( quam \), and \( men \), are cæsiuras.

Cæsiura, in the modern poetry, denotes a rest or pause towards the middle of an Alexandrian verse, by which the voice and pronunciation are aided, and the verse, as it were, divided into two hemistichs. See Pause.

Cæsteris paribus, a Latin term in frequent use among mathematical and physical writers. The words literally signify, the rest (or other things) being alike or equal. Thus we say the heavier the bullet, cæteris paribus, the greater the range, e. by how much the bullet is heavier, if the length and diameter of the piece and strength of the powder be the same, by so much will the utmost range or distance of a piece of ordnance be the greater. Thus also, in a physical way, we say, the velocity and quantity circulating in a given time through any section of an artery, will, cæteris paribus, be according to its diameter, and nearness to or distance from the heart.

Cætobrix, in Ancient Geography, a town of Lusitania, near the mouth of the Tagus, on the east side; now extinct. It had its name from its fishery; and there are still extant fish ponds on the shore done with plaster of Paris, which illustrate the name of the ruined city.

Caffa, in commerce, painted cotton cloths manufactured in the East Indies, and sold at Bengal.

Caffa, or Caffa, a city and port town of Crim Tartary, situated on the south-east part of that peninsula. E. Long. 37° 0'. N. Lat. 44° 35'. It is the most considerable town in the country, and gives
gives name to the straits of Caffa, which run from the Euxine or Black sea, to the Palus Mecotis, or sea of Asoph.

CAFFILA, a company of merchants or travellers, who join together in order to go with more security through the dominions of the Great Mogul, and through other countries on the continent of the East Indies.

The caffila differs from a caravan, at least in Persia; for the caffila properly belongs to some sovereignty, or to some powerful company in Europe; whereas a caravan is a company of particular merchants, each trading upon his own account. The English and Dutch have each of them their caffila at Gambia. There are also such caffilas, which cross some parts of the deserts of Africa, particularly that called the sea of sand, which lies between the kingdom of Morocco and those of Tombut and Giago. This is a journey of 400 leagues; and takes up two months in going, and as many in coming back; the caffila travelling only by night, on account of the excessive heat of that country. The chief merchandise they bring back consists in gold dust, which they call atibar, and the European tsibir.

CAFFILA, on the coast of Guzerat or Cambaya, signifies a small fleet of merchant ships.

CAFFRAMIA, the country of the Caffres or Hotentots, in the most southerly parts of Africa, lying in the form of a crescent about the inland country of Monomotapa, between 35° south latitude and the tropic of Capricorn; and bounded on the east, south, and west, by the Indian and Atlantic oceans. Sea Hotentots.

Most of the sea coasts of this country are subject to the Dutch, who have built a fort near the most southern promontory called the Cape of Good Hope.

CAG, or KEG, a barrel or vessel that contains some four or five gallons.

CAGANUS, or CAGANUS, an appellation anciently given by the Huns to their kings. The word appears also to have been formerly applied to the princes of Muscovy, now called czar. From the same also, probably, the Tartar title cham or com, had its origin.

CAGE, an enclosure made of wire, wicker, or the like, interwoven lattice-wise, for the confinement of birds or wild beasts. The word is French, cage, formed from the Italian gaggià, of the Latin cavea, which signifies the same: i.e., a cavea theatralibus in quibus include-bastur ferae.

Beasts were usually brought to Rome shut up in oakens or beechen cages artfully formed, and covered or shaded with boughs, that the creatures, deceived with the appearance of a wood, might fancy themselves in their forest. The fiercer sorts were kept in iron cages, lest wooden prisons might be broken through. In some prisons there are iron cages for the closer confinement of criminals. The French laws distinguish two sorts of birds cages; viz., high or singing cages, and low or dumb cages; those who expose birds to sale are obliged to put the birds in the latter, and the cocks in the former, that persons may not be imposed on by buying a hen for a cock.

CAVES (caveae), denote also places in the ancient amphitheatres, wherein wild beasts were kept, ready to be let out for sport. The caveae were a sort of iron cages, different from dens, which were under ground and dark; whereas the caveae being airy and light, the beasts rushed out of them with more alacrity and ferocity than if they had been pent under ground.

CAG, in carpentry, signifies an outer work of timber, inclosing another within it. In this sense we say, the cage of a wind-mill. The cage of a staircase denotes the wooden sides or walls which enclose it.

CAGEAN, or CAGAYAN, a province of the island of Luzon, or Manilla, in the East Indies. It is the largest in the island, being 80 leagues in length and 40 in breadth. The principal city is called New Segovia, and 15 leagues eastward from this city lies Cape Bajador. Doubling that cape, and coasting along 20 leagues from north to south, the provinces of Cagayan ends, and that of Ilocos begins. The peaceable Cagayans who pay tribute are about 9000; but there are a great many not subdued. The whole province is fruitful; the men apply themselves to agriculture, and are of a martial disposition; and the women apply to several works in cotton. The mountains afford food for a vast number of bees; in consequence of which wax is so plentiful, that all the poor burn it instead of oil. They make their candles after the following manner; they leave a small hole at each end of a hollow stick for the wick to run through, and then, stopping the bottom, fill it with wax at the top; when cold, they break the mould and take out the candle. On the mountains there is abundance of brasil, ebony, and other valuable woods. In the woods are store of wild beasts, as bears; but not so good as those of Europe. There are also abundance of deer, which they kill for their skins and horns to sell to the Chinese.

CAGLIARI, an ancient episcopal town of Italy, in the duchy of Urbino, situated at the foot of the Apennine mountains. E. Long. 11° 36' W. Lat. 43° 30'.

CAGLIARI, PAOLO, called Paulo Feroneus, an excellent painter, was born at Verona in the year 1532. Gabriel Cagliari his father was a sculptor, and Antonio Badile his uncle was his master in painting. He was not only esteemed the best of all the Lombard painters, but for his extensive talents in the art was peculiarly styled Il pittor felice, the happy painter; and there is scarcely a church in Venice where some of his performances are not to be seen. De Pile says that "his picture of the marriage at Cana, in the church of St George, is to be distinguished from his other works, as being not only the triumph of Paul Veronese, but also the triumph of painting itself." When the senate sent Grimani, procurator of St Mark, to be their ambassador at Rome, Paul attended him, but did not stay long, having left some pieces at Venice unfinished. Philip II, king of Spain, sent for him to paint the Escorial, and made him great offers; but Paul excused himself from leaving his own country, where his reputation was so well established, that most of the princes of Europe ordered their several ambassadors to procure something of his hand at any rate: He was indeed highly esteemed by all the principal men in his time; and so much admired by the great masters, as well his contemporaries, as those who succeeded him, that Titian himself used to say, he was the ornament of his profession. And Guido Reni being asked which of the masters his predecessors would
would choose to be, were it in his power, after Raphael and Corregio, named Paul Veroneo; whom he always called his Paolo. He died of a fever at Venice in 1588, and had a tomb and a statue of brass erected to his memory in the church of St. Sebastian. He left great wealth to his two sons Gabriel and Charles, who lived happily together, and joined in finishing several of their father’s imperfect pieces with good success.

Cagliari, an ancient, large, and rich town, capital of the island of Sardinia in the Mediterranean. It is seated on the declivity of a hill; is an university, an archbishopric, and the residence of the viceroy. It has an excellent harbour, and a good trade; but is a place of no great strength. It was taken, with the whole island, by the English in 1708, who transferred it to the emperor Charles VI.; but it was retaken by the Spaniards in 1717, and about two years afterwards ceded to the duke of Savoy in lieu of Sicily, and hence he bore the title of King of Sardinia. E. Long. 9. 14. N. Lat. 35. 12.

CACUI, in Zoology, a synonyme of two species of monkeys, viz. the jacchus and cædipus. See Simia, Mammalia Index.

Cahors, a considerable town of France in Guienne, now in the department of Lot. It is seated on a peninsula made by the river Lot, and built partly on a craggy rock. The principal street is very narrow; and terminates in the market place, in which is the town house. The cathedral is a Gothic structure, and has a large square steeple. The fortifications are regular, and the town contained 10,136 inhabitants in 1815. E. Long. 1. 6. N. Lat. 44. 25.

Cahys, a dry measure for corn, used in some parts of Spain, particularly at Seville and Cadiz. It is near a bushel of our measure.

Cajamarca, the capital of the province of Cajamarca or East Bolivia in Sweden, situated on the north-east point of the lake Cajamarca, in E. Long. 27. 0. N. Lat. 55. 50.

Cajaphas, high priest of the Jews after Simon, condemned Christ to death; and was put out of his place by the emperor Vitellius, for which disgrace he made away with himself.

Cajazzo, a town of the province of Lavoro in the kingdom of Naples, situated in E. Long. 15. 0. N. Lat. 41. 15.

Caycos, the name of some American islands to the north of St Domingo, lying from W. Long. 112. 10. to 113. 16. N. Lat. 21. 40.

Cajepu, an oil brought from the East Indies, resembling that of cardamom. See Melaleuca.

Caieta, in Ancient Geography, a port and town of Latium, so called from Æneas's nurse; now Gaeta, which see.

Cajetan, Cardinal, was born at Cajeta in the kingdom of Naples in the year 1469. His proper name was Thomas de Viti: but he adopted that of Cajetan from the place of his nativity. He defended the authority of the pope, which suffered greatly at the council of Nice, in a work entitled Of the power of the Pope; and for this work he obtained the bishopric of Cajeta. He was afterwards raised to the archiepiscopal see of Palermo, and in 1517 was made a cardinal by Pope Leo X. The year after, he was sent as legate into Germany, to quiet the commotions raised against indulgences by Martin Luther: but Luther, under protection of Frederick elector of Saxony, set him at defiance; for though he obeyed the cardinal's summons, in repairing to Augsburg, yet he rendered all his proceedings ineffectual. Cajetan was employed in several other negotiations and transactions, being as ready at business as at letters. He died in 1534. He wrote Commentaries upon Aristotle's philosophy, and upon Thomas Aquinas's theology; and made a literal translation of the Old and New Testaments.

Caiifong, a large, populous, and rich town of Asia, in China, seated in the middle of a large and well cultivated plain. It stands in a bottom; and when besieged by the rebels in 1642, they ordered the dykes of the river Hoang-bo to be cut, which drowned the city and destroyed 300,000 of its inhabitants. E. Long. 113. 37. N. Lat. 35. 0.

Caille, Nicholas Louis de la, an eminent mathematician and astronomer, was born at a small town in the diocese of Rheims in 1713. His father had served in the army, which he quit, and in his retirement studied mathematics; and amused himself with mechanic exercises, wherein he proved the happy author of several inventions of considerable use to the public. Nicholas, almost in his infancy, took a fancy to mechanics, which proved of signal service to him in his maturing years. He was sent young to school at Mantes-sur-Seine, where he discovered early tokens of genius. In 1729, he went to Paris; where he studied the classics, philosophy, and mathematics. Afterwards he went to study divinity at the college de Navarre, proposing to embrace an ecclesiastical life. At the end of three years he was ordained a deacon, and officiated as such in the church of the college de Mazarin several years; but he never entered into priest's orders, apprehending that his astronomical studies, to which he became most assiduously devoted, might too much interfere with his religious duties. In 1739, he was associated with M. de Thury, son to M. de Cassini, in verifying the meridian of the royal observatory through the whole extent of the kingdom of France. In the month of November the same year, whilst he was engaged day and night in the operations which this grand undertaking required, and at a great distance from Paris, he was, without any solicitation, elected into the vacant mathematical chair which the celebrated M. Varignon had so worthily filled. Here he began to teach about the end of 1740; and an observatory was ordered to be erected for his use in the college, and furnished with a suitable apparatus of the best instruments. In May 1741, M. de la Caille was admitted into the Royal Academy of Sciences as an adjoint member for astronomy. Besides the many excellent papers of his dispersed up and down in their Memoirs, he published Elements of Geometry, Mechanics, Optics, and Astronomy. Moreover, he carefully computed all the eclipses of the sun and moon that had happened since the Christian era, which were inserted in a book published by two Benedictines, entitled l' Art de Vériyer les Dates, &c. Paris, 1750, in 4to. Besides these he compiled a volume of astronomical ephemerides for the years 1745 to 1755; another for the years 1755 to 1765; a third for the years 1765 to 1775; an excellent work entitled Astronomica Funda-menta
C A I

Caulle.

Caulle, enmenta novissimae solis et stellarum observationibus stabili-

Caulle, tatis: et the most correct solar tables that ever appear-

Caulle, ed. by the academy, and by the prime minister Comte de

Caulle, Argyronum, and very readily agreed to by the states of

Caulle, Holland. Upon this he drew up a plan of the method

Caulle, to be proposed to pursue in his southern observations;

Caulle, setting forth, that, besides settling the places of the

Caulle, fixed stars, he proposed to determine the parallax of

Caulle, the moon, Mars, and Venus. But whereas this re-

Caulle, required correspondent observations to be made in the

Caulle, northern parts of the world, he sent to those of his cor-

Caulle, responding correspondents who were expert in practical astronomy pre-

Caulle, vious notice in print, what observations he designed to

Caulle, make at such and such times for the said purpose. At

Caulle, length, on the 21st of November 1750, he sailed for

Caulle, the Cape, and arrived there on the 19th of April 1751.

Caulle, He forsooth got his instruments on shore: and, with

Caulle, the assistance of some Dutch artificers, set about building

Caulle, an astronomical observatory, in which his apparatus of

Caulle, instruments was properly disposed of as soon as it was

Caulle, in a fit condition to receive them.

Caulle, The sky at the Cape is generally pure and serene,

Caulle, unless when a south-east wind blows: But this is often

Caulle, the case, and when it is, it is attended with some

Caulle, strange and terrible effects. The stars look bigger,

Caulle, and seem to caper; the moon has an undulating tre-

Caulle, mor; and the planets have a sort of beam like comets.

Caulle, Two hundred and twenty-eight nights did our astro-

Caulle, nomer survey the face of the southern heavens: during

Caulle, which space, which is almost incredible, he observed

Caulle, more than 10,000 stars; and whereas the ancients fil-

Caulle, led the heavens with monsters and old wives tales, the

Caulle, Abbé de la Caille, chosen as one of the astronomers,

Caulle, with the instruments and machines which modern philosophy

Caulle, has made use of for the conquest of nature. With

Caulle, no less success did he attend to the parallax of the

Caulle, moon, Mars, Venus, and the sun. Having thus exe-

Caulle, cuted the purpose of his voyage, and no present oppor-

Caulle, tunity offering for his return, he thought of employing

Caulle, the vacant time in another arduous attempt; no less

Caulle, than that of taking the measure of the earth, as he had

Caulle, already done that of the heavens. This, indeed, had,

Caulle, through the munificence of the French king, been

Caulle, done before by different sets of learned men, both in

Caulle, Europe and America; some determining the quantity

Caulle, of a degree under the equator, and others under the

Caulle, arctic circles; but it had not as yet been decided whe-

Caulle, ther in the southern parallels of latitude the same di-

Caulle, mensions obtained as in the northern. His labours

Caulle, were rewarded with the satisfaction he wished for; hav-

Caulle, ing determined a distance of 410,814 feet from a

Caulle, place called Kip Fontys to the Cape, by means of a

Caulle, barrel of 58,203 feet, three times actually measured:

Caulle, whence he discovered a new secret of nature, namely,

Caulle, that the radius of the parallels in south latitude are not

Caulle, the same as those of the corresponding parallels in north

Caulle, latitude. About the 29th degree of south latitude he

Caulle, found a degree on the meridian to contain 342,232

Caulle, Paris feet. He returned to Paris the 27th of Septem-

Caulle, ber 1754; having, in his almost four years absence, ex-

Caulle, panded no more than 9144 livres on himself and his

Caulle, companion; and at his coming into port, he refused a

Caulle, bribe of 100,000 livres, offered by one who thirsted

Caulle, less after glory than gain, to be sharer in his immuni-

Caulle, ty from customhouse searches.

Caulle, After receiving the congratulatory visits of his more

Caulle, intimate friends and the astronomers, he first of all

Caulle, thought fit to draw up a reply to some strictures which

Caulle, Professor Euler had published relative to the meridian,

Caulle, and then he settled the results of the comparison of his

Caulle, own with the observations of other astronomers for the

Caulle, parallaxes. That of the sun he fixed at 9°; of the

Caulle, moon at 35° 55'; of Mars in his opposition, 36°; of

Caulle, Venus, 39°. He also settled the laws whereby astro-

Caulle, nomical refractions are varied by the different density or

Caulle, rarity of the air, by heat or cold, and dryness or

Caulle, moisture. And, lastly, he showed an easy, and by

Caulle, common navigators practicable, method of finding the

Caulle, longitude at sea by means of the moon, which he

Caulle, illustrated by examples selected from his own observa-

Caulle, tions during his voyages. His fame being now estab-

Caulle, lished upon so firm a basis, the most celebrated academ-

Caulle, ies of Europe claimed him as their own: and he was

Caulle, unanimously elected a member of the royal society at

Caulle, London; of the institute of Bologna; of the imperial

Caulle, academy at Petersburgh; and of the royal academies

Caulle, at Berlin, Stockholm, and Gottingen. In the year

Caulle, 1760, M. de la Caille was attacked with a severe fit of

Caulle, the gout; which, however, did not interrupt the

Caulle, course of his studies; for he then planned out a new

Caulle, and immense work; no less than the history of astro-

Caulle, nomy through all ages, with a comparison of the an-

Caulle, cient and modern observations, and the construction

Caulle, and use of the instruments employed in making them.

Caulle, In order to pursue the task he had imposed upon him-

Caulle, self in a suitable retirement, he obtained a grant of

Caulle, 5000 florins from the queen of Poland; and whilst

Caulle, his astronomical apparatus was erected there, he began

Caulle, printing his Catalogue of the Southern Stars, and the

Caulle, third volume of his Ephemerides. The state of his

Caulle, health was, towards the end of the year 1763, greatly

Caulle, reduced. His blood grew inflamed; he had pains of

Caulle, the head, obstructions of the kidneys, loss of appetite,

Caulle, with a fulness of the whole habit. His mind remained

Caulle, unaffected, and he resolutely persisted in his studies as

Caulle, usual. In the month of March, medicines were ad-

Caulle, ministered to him, which rather aggravated than allevi-

Caulle, ated his symptoms; and he was now sensible, that the

Caulle, same distemper which in Africa, ten years before,

Caulle, yielded to a few simple remedies, did in his native coun-

Caulle, try bid defiance to the best physicians. This induced

Caulle, him to settle his affairs: his manuscripts he committed

Caulle, to the care and discretion of his esteemed friend M.

Caulle, Maraldi. It was at last determined that a vein should

Caulle, be opened; but this brought on an obstinate lethargy,

Caulle, of which he died, aged 49.

Caulle, CAIMACAN, or CAICACAM, in the Turkish affairs,

Caulle, a dignity in the Ottoman empire, answering to lieuten-

Caulle, ant, or rather deputy, amongst us.

Caulle, There are usually two caimacans; one residing at

Caulle, Constantinople, as governor thereof; the other at-

Caulle, tends the grand vizir in quality of his lieutenant,

Caulle, secretary of state, and first minister of his council, and

Caulle, gives audience to ambassadors. Sometimes there is a

CAI [53] CAI

CAIMAN or CAYMAN ISLANDS, certain American islands lying south of Cuba and north-west of Jamaica, between 81° and 86° of west longitude, and in 21° of north latitude. They are most remarkable on account of the fishery of tortoises, which the people of Jamaica catch here and carry home alive, keeping them in pens for food, and killing them as they want them.

CAIN, eldest son of Adam and Eve, killed his brother Abel; for which he was condemned by God to banishment and a vagabond state of life. Cain retired to the land of Eden, on the east of Eden; and built a city, to which he gave the name of his son Enoch.

CAINTES, a sect of heretics in the 2d century, so called on account of their great respect for Cain. They pretended that the virtuous which produced Abel was of an order inferior to that which had produced Cain, and that this was the reason why Cain had the victory over Abel and killed him; for they admitted a great number of genii, which they called virtures, of different ranks and orders. They made profession of honouring those who carry in Scripture the most visible marks of reprobation; as the inhabitants of Sodom, Esan, Korah, Dathan, and Abiram. They had, in particular, a very great veneration for the traitor Judas, under pretence that the death of Jesus Christ had saved mankind. They had a forged gospel of Judas, to which they paid great respect.

CAIRNE, or CARNES, the vulgar name of those heaps of stones which are to be seen in many places of Britain, particularly Scotland and Wales. They are composed of stones of all dimensions thrown together in a conical form, a flat stone crowning the apex; (see Plate CXXXV.)

Various causes have been assigned by the learned for these heaps of stones. They have supposed them to have been, in times of inauguration, the places where the chiefman elect stood to show himself to best advantage to the people; or the place from whence judgement was pronounced; or to have been erected on the road-side in honour of Mercury; or to have been formed in memory of some solemn compact, particularly where accompanied by standing pillars of stones; or for the celebration of certain religious ceremonies. Such might have been the reasons, in some instances, where the evidences of stone chests and urns are wanting; but these are so generally found that they seem to determine that the most usual purpose of the piles in question to have been for sepulchral monuments. Even this supposition might render them suitable to other purposes; particularly religious, to which by their nature they might be supposed to give additional solemnity. According to Toland, fires were kindled on the tops of flat stones, at certain times of the year, particularly on the eves of the 1st of May and the 1st of November, for the purpose of sacrificing; at which time all the people having extinguished their domestic hearths, rekindled them from the sacred fires of the cairns. In general, therefore, these accumulations appear to have been designed for the sepulchral protection of heroes and great men. The stone chests, the repository of the urns and ashes, are lodged in the earth beneath; sometimes only one, sometimes more, are found thus deposited; and Mr Pennant mentions an instance of 17 being discovered under the same pile.

Cairns are of different sizes, some of them very large. Mr Pennant describes one in the island of Arran, 114 feet over, and of a vast height. They may justly be supposed to have been proportioned in size to the rank of the person, or to his popularity; the people of a whole district assembled to show their respect to the deceased; and, by an active honouring of his memory, soon accumulated heaps equal to those that astonish us at this time. But these honours were not merely those of the day; as long as the memory of the deceased endured, not a passenger went by without adding a stone to the heap: they supposed it would be an honour to the dead, and acceptable to his manes.

Quoniam festinas, non est moris longa: licebit.
Injicta ter pulvere, currit.

To this moment there is a proverbial expression among the Highlanders allusive to the old practice; a suppliant will tell his patron, Carri mi echch er do charne, "I will add a stone to your cairn?" meaning, when you are no more, I will do all possible honour to your memory.

Cairns are to be found in all parts of our islands, in Cornwall, Wales, and all parts of North Britain; they were in use among the northern nations; Dahlgren, in his xx3d plate, has given the figure of one. In Wales they are called carneddau, but the proverb taken from them there, is not of the complimentary kind; Earm or dy ben, or, "A cairn on your head," is a token of imprecation.

CAIRO, or GRAN CAIRO, the capital of Egypt, situated in a plain at the foot of a mountain, in E. Long. 32° 0'. N. Lat. 30° 0'. It was founded by Jawhar, a Magrebian general, in the year of the Hegira 358. He had laid the foundation of it under the horoscope of Mars; and for that reason gave his new city the name of Al Cahir, or the Victorious, an epi- thet applied by the Arab astronomers to that planet. In 362 it became the residence of the caliphs of Egypt, and of consequence the capital of that country, and has ever since continued to be so. It is divided into the New and Old cities. Old Cairo is on the eastern side of the river Nile, and is now almost uninhabited. The new, which is properly Cairo, is seated in a sandy plain about two miles and a half from the old city. It stands on the western side of the Nile, from which it is not three quarters of a mile distant. It is extended along the mountain on which the castle is built, for the sake of which it was removed hither, under, as some pretend, to be under its shadow. However, the change is much for the worse, as well with regard to air as water, and the pleasantness of the prospect. Bulack may be called the port of Cairo; for it stands on the bank of the Nile, about a mile and a half from it, and all the corn and other commodities are landed there before they are brought to the city. Some travellers have made Cairo of a most enormous magnitude, by taking in the old city, Bulack, and the new; the real circumference of it, however, is not above ten miles, but it is extremely populous. The first thing that strikes a traveller is the narrowness of the streets,
Cairo. streets, and the appearance of the houses. These are so daubed with mud on the outside, that you would think they were built with nothing else. Besides, as the streets are unpaved, and always full of people, the walking in them is very inconvenient, especially to strangers. To remedy this, there are a great number of asses, which always stand ready to be hired for a trifle, that is, a penny a mile. The owners drive them along, and give notice to the crowd to make way. And here it may be observed, that the Christians in this as well as other parts of the Turkish dominions, are not permitted to ride upon horses. The number of the inhabitants can only be guessed at. Volney thinks it may amount to 200,000; but some later travellers estimate it as high as 300,000 or 400,000. The houses are from one to two or three stories high, and flat at the top; where they take the air, and often sleep all night. The better sort of these have a court on the inside like a college. The common run of houses have very little room, and even among great people it is usual for 20 or 30 to lie in a small hall. Some houses will hold 300 persons of both sexes, among whom are 20 or 30 slaves; and those of ordinary rank have generally three or four.

There is a canal, called khabs, which runs along the city from one end to the other, with houses on each side, which makes a large straight street. Besides this, there are several lakes, which are called birks in the language of the country. The principal of these, which is near the castle, is 500 paces in diameter. The most elegant houses in the city are built on its banks; but what is extraordinary, eight months in the year it contains water, and the other four it appears with a charming verdure. When there is water sufficient, it is always full of gilded boats, barges, and barques, in which people of condition take their pleasure towards night, at which time there are curious fire-works, and variety of music.

New Cairo is surrounded with walls built with stone, on which are handsome battlements, and at the distance of every hundred paces there are very fine towers, which have room for a great number of people. The walls were never very high, and are in many places gone to ruin. The basha lives in the castle, which was built by Saladine 700 years ago. It stands in the middle of the famous mountain Moketa, which terminates in this place, after it had accompanied the Nile from Ethiopia hither. This castle is the only place of defence in Egypt; and yet the Turks take no notice of its falling, inasmuch that in process of time it will become a heap of rubbish. The principal part in it is a magnificent hall, environed with 12 columns of granite, of a prodigious height and thickness, which sustain an open dome, under which Saladine distributed justice to his subjects. Round this dome there is an inscription in relief, which determines the date and by whom it was built. From this place the whole city of Cairo may be seen, and above 30 miles along the Nile, with the fruitful plains that lie near it, as well as the mosques, pyramids, villages, and gardens, with which these fields are covered. These granite pillars were the work of antiquity, for they were got out of the ruins of Alexandria. There are likewise in the mosques and in the principal houses no less than 40,000 more, besides great magazines, where all kinds are to be had at very low rates. A janizary happened to find five in his garden, as large as those in the castle; but could not find any machine of strength sufficient to move them, and therefore had them sawed in pieces to make milestones. It is believed that there have been 30 or 40,000 of these pillars brought from Alexandria, where there are yet many more to be had. The gates of Cairo are three, which are very fine and magnificent.

There are about 300 public mosques in this city, some of which have six minarets. The mosque of Ashur has several buildings adjoining, which were once a famous university, and 14,000 scholars and students were maintained on the foundation; but it has now not above 1400, and those are only taught to read and write. All the mosques are built upon the same plan, and differ only in magnitude. The entrance is through the principal gate into a large square, open on the top, but well paved. Round this are covered galleries, supported by pillars, under which they say their prayers, in the shade. On one side of the square there are particular places with basins of water for the convenience of performing the ablutions enjoined by the Koran. The most remarkable part of the mosque, besides the minaret, is the dome. This is often bold, well proportioned, and of a astonishing magnitude. The inside stones are carved like lace, flowers, and melons. They are built so firm, and with such art, that they will last 600 or 700 years. About the outward circumference there are large Arabic inscriptions in relief, which may be read by those who stand below, though they are sometimes of a wonderful height.

The khanes or caravanseras are numerous and large, with a court in the middle, like their houses. Some are several stories high, and are always full of people and merchandise. The Nubians, the Abyssinians, and other African nations, which come to Cairo, have one to themselves, where they always meet with lodging. Here they are secure from insults, and their effects are all safe. Besides these, there is a bazar, or market, where all sorts of goods are to be sold. This is in a long broad street; and yet the crowd is so great, you can hardly pass along. At the end of this street is another short one, but pretty broad, with shops full of the best sort of goods and precious merchandise. At the end of this short street there is a great khan, where all sorts of white slaves are to be sold. Farther than this is another khan, where a great number of blacks, of both sexes, are exposed to sale. Not far from the best market place is a mosque, and an hospital for mad people. They also receive and maintain sick people in this hospital, but they are poorly looked after.

Old Cairo has scarce any thing remarkable but the granaries of Joseph; which are nothing but a high wall, lately built, which includes a square spot of ground where they deposit wheat, barley, and other grain, which is a tribute to the basha, paid by the owners of land. This has no other covering but the heavens, and therefore the birds are always sure to have their share. There is likewise a tolerably handsome church, which is made use of by the Copts, who are Christians, and the original inhabitants of Egypt.
Joseph's well is in the castle, and was made by King Mohammed about 700 years ago. It is called Joseph's well, because they attribute everything extraordinary to that remarkable person. It is out in a rock, and is 285 feet in depth. The water is drawn up to the top by means of oxen, placed on platforms at proper distances, which turn about the machines that raise it. The descent is so sloping, that, though there are no steps, the oxen can descend and ascend with ease.

The river Nile, to which not only Cairo, but all Egypt is so much indebted, is now known to have its rise in Abyssinia. The increase of the Nile generally begins in May, and in June they commonly proclaim about the city how much it is risen. Over against old Cairo the basha has a house, wherein the water enters to a column, which has lines at the distance of every inch, and marks at every two feet as far as 30. When the water rises to 22 feet, it is thought to be of a sufficient height; when it rises much higher, it does a great deal of mischief. There is much pomp and ceremony used in letting the water into the canal above mentioned. See Egypt.

The inhabitants of Cairo are a mixture of Moors, Turks, Jews, Greeks, and Copts or Coptic. The only difference between the habit of the Moors and Copts is their turbans; those of the Moors being white, and of the Copts white striped with blue. The common people generally wear a long black loose frock, sewed together all down before. The Jews wear a frock of the same fashion, made of cloth; and their caps are like a high-crowned hat, without brims, covered with the same cloth, but not so taper. The Jewish women's are not very unlike the men's, but more light and long. The Greeks are habited like the Turks, only their turbans differ.

Provisions of all kinds are exceedingly plenty; for 20 eggs may be bought for a paras or penny, and bread is six times as cheap as with us. They have almost all sorts of flesh and fish; and in particular have tame buffaloes which are very useful. They bring goats into the streets in great numbers to sell their milk. Their gardens are well stocked with fruit trees of various kinds, as well as roots, herbes, melons, and cucumbers. The most common flesh meat is mutton. The goats are very beautiful, and have ears two feet in length; but their flesh is in great esteem. See farther the article Egypt.

Cairo, or CAIRWAN, a city of Africa, in the kingdom of Tunis, seated in a sandy barren soil, about five miles from the gulf of Cairo. It has neither spring, well, nor river; for which reason they are obliged to preserve rain water in tanks and cisterns. It was built by the Aglabites; and is the ancient Cyrene, but now lost its splendour. There is still, however, a very superb mosque, and the tombs of the kings of Tunis are yet to be seen. E. Long. 9. 12'; N. Lat. 35° 40'.
dead in the water. Much limestone is found in this county, which when burnt is made into a compost with turf and sea plants.

The discovery of coal has long been an object of great importance in this part of Scotland. In the years 1801 and 1802 some attempts were made for this purpose at the expense of government. But although the business was conducted by persons well skilled in such matters, and long persevered in, it has entirely failed, which leaves little hope of future success.

The following is the population of the county of Caithness, according to the parishes, taken at two different periods, namely in 1755 and in 1798, and extracted from the Statistical History of Scotland.

See Caithness Supplement.

Caicus, Kaye, or Keye, Dr John, the founder of Caius College in Cambridge, was born at Norwich in 1510. He was admitted very young a student in Gonville Hall in the above-mentioned university; and at the age of 21 translated from Greek into Latin some pieces of divinity, and into English Erasmus's paraphrase on Jude, &c. From these his juvenile labours, it seems probable that he first intended to prosecute the study of divinity. Be that as it may, he travelled to Italy, and at Padua studied physic under the celebrated Montanus. In that university he continued some time, where we are told he read Greek lectures with great applause.

In 1543, he travelled through part of Italy, Germany, and France; and returning to England commenced doctor of physic at Cambridge. He practised first at Shrewsbury, and afterwards at Norwich; but removing to London, in 1547, he was admitted fellow of the college of physicians, to which he was several years president. In 1557, being then physician to Queen Mary, and in great favour, he obtained a licence to advance Gonville-Hall, where he had been educated, into a college; which he endowed with several considerable estates, adding an entire new square at the expense of 18,441. Of this college he accepted the mastership, which he kept till within a short time of his death. He was physician to Edward VI, Queen Mary, and Queen Elizabeth. Towards the latter end of his life he retired to his own college at Cambridge; where, having resigned the mastership to Dr Le Cange of Norwich, he spent the remainder of his life as a fellow commoner. He died in July 1573, aged 63; and was buried in the chapel of his own college. Dr Caius was
a learned, active, benevolent man. In 1557, he erected a monument in St Paul's to the memory of the famous Linacre. In 1563, he obtained a grant for the college of physicians to take the bodies of two malefactors annually for dissection; and he was the inventor of the insignia which distinguish the president from the rest of the fellows. He wrote, 1. Annals of the college from 1555 to 1572. 2. Translation of several of Galen's works; printed at different times abroad. 3. Hippocrates de Medecinamentis; first discovered and published by an author; also De ratione victus, Lov. 1536, Svo. 4. De Medicamento Methodo, Basili, 1534, Lond. 1536, Svo. 5. Account of the sweating sickness in England. Lond. 1536, 1537. It is entitled De epidemica Britannica. 6. History of the university of Cambridge. Lond. 1568, 8vo. 1574, 4to. in Latin. 7. De thernes Britannicae. Doubtful whether ever printed. 8. Of some rare plants and animals. Lond. 1570. 9. De consibus Britannicis, 1570, 1579. 10. De pronunciacione Graece et Latinae Linguae. Lond. 1574. 11. De libris propriis. Lond. 1570. Besides many other works which never were printed.

CAKE, a finer sort of bread, denominated from its flat round figure.

We meet with different compositions under the name of cakes; as seed-cakes, made of flour, butter, cream, sugar, coriander, and caraway seeds, mace, and other spices and perfumes, baked in the oven; plum-cakes, made much after the same manner, only with fewer seeds, and the addition of currants: pan-cakes, made of a mixture of flour, egg, &c., fried; cheese-cakes, made of cream, egg, and flour; with or without cheese-curd, butter, almonds, &c.; oat-cakes, made of fine oat flour, mixed with yeast and sometimes without, rolled thin, laid on an iron or stone to bake over a slow fire; sugar-cakes, made of fine sugar beaten and scoured with the finest flour, adding butter, rose-water, and spices; rose-cakes, (placentae rosatae), are leaves of roses dried and pressed into a mass, sold in the shops for ephemera.

The Hebrews had several sorts of cakes, which they offered in the temple. They were made of the meal either of wheat or barley; they were kneaded sometimes with oil and sometimes with honey. Sometimes they only rubbed them over with oil when they were baked, or fried them with oil in a frying-pan upon the fire. In the ceremony of Aaron's consecration, they sacrificed a calf and two rams, and offered unleavened bread, and cakes unleavened, tempered with oil, and wafer unleavened, anointed with oil; the whole made of fine wheaten flour. Ex. xxix. 2. 2.

CAKET, a town of Asia, in Persia, in the province of Caucasus, on the coast of the Caspian Sea. Its trade consists chiefly in silk. E. Long. 46° 15' N. Lat. 43° 32'.

CALABASH, in Commerce, a light kind of vessel formed of the shell of a gourd, emptied and dried, serving to put divers kinds of goods in, as pitch, resin, and the like. The word in Spanish, calabaza, which signifies the same. The Indians also, both of the North and South sea, put the pearls they have fished in calabashes, and the negroes on the coast of Africa do the same by their gold dust. The smaller calabashes are also frequently used by these people as a measure, by which they sell these precious commodities to the Europeans. The same vessels likewise serve for putting liquors in, and do the office of cups, as well as bottles, for soldiers, pilgrims, &c.

CALABASH-Tree. See Cressentia, Botany Index. African Calabash-Tree. See Andamania, Botany Index.

CALABRIA, a country of Italy, in the kingdom of Naples, divided into Calabria Ultra and Calabria Citra, commonly called Ulterior and Citerior, or Further and Either Calabria. Calabria Citerior is one of the 12 provinces of the kingdom of Naples; and bounded on the south by Calabria Ultra, on the north by Basilicata, and on the west and east by the sea: Ca-sessus is the capital. Calabria Ultra is washed by the Mediterranean sea on the east, south, and west, and bounded by Calabria Citra on the north. Reggio is the capital town.

This country has been almost entirely desolated by the earthquakes of 1783. The reiterated shocks extended from Cape Spartivento to Amantea above the gulf of St Eufemia, and also affected that part of Sicily which lies opposite to the southern extremity of Italy. Those of the 7th and 9th of February, and of the 28th of March, were the most violent, and completed the destruction of every building throughout the above-mentioned space. Not one stone was left upon another south of the narrow isthmus of Squillace: and what is more disastrous, a very large proportion of the inhabitants was killed by the falling of their houses, near 40,000 lives being lost. Some persons were dug out alive after remaining a surprising length of time buried among the rubbish. Messina became a mass of ruins; its beautiful palazzata was thrown in upon the town, and its quay cracked into ditches full of water. Reggio was almost destroyed; Tropaeum greatly damaged; and every other place in the province levelled to the ground.

Before and during the concussion the clouds gathered, and then hung immovable and heavy over the earth. At Palmi the atmosphere wore so fiery an aspect, that many people thought part of the town was burning. It was afterwards remembered that an unusual heat had affected the skins of several persons just before the shock; the rivers assumed a muddy ash-coloured tinge, and a sulphureous smell was almost general. A frigate passing between Calabria and Lipari felt so severe a shock, that the steersman was thrown from the helm, and the cannons were raised upon their carriages, while, all around, the sea exhaled a strong smell of brimstone.

Stupendous alterations were occasioned in the face of the country; rivers, choked up by the falling in of the hills, were converted into lakes, which if not speedily drained by some future convulsion, or opened by human hands, will fill the air with pestilential vapours, and destroy the remnants of population. Whole acres of ground, with houses and trees upon them, were broken off from the plains, and washed many furlongs down the deep hollows which the course of the rivers had worn; there, to the astonishment and terror of beholders, they found a new foundation to fix upon, either in an upright or an inclining position. In short, every species of phenomenon, incident to these destructive commotions of the earth, was to be seen in its utmost extent and variety in this desolated country. Their Sicilian majesty's, with the utmost expedition, dis-
CALAIS, in the manège, the descent or sloping declivity of a rising manage ground, being a small semicircular enceinte upon which we ride down a horse several times, putting him to a short gallop, with his fore hams in the air, to learn him to plyć or bend his branches, and form his step upon the sides of the calves of the legs, the stay of the bridge, and the cavesson seasonably given.

CALAGORINA, or CALAGURIS, distinguished by the surname Nasica, in Ancient Geography, a city of the Vascones in the Hither Spain: now Calahorra.

CALAHORRA, an episcopal town of Spain, in Old Castile, seated on a fertile soil, on the side of a hill which extends to the banks of the river Ebro. W. Long. 2° 7'. N. Lat. 42° 12'.

CALAIS, a strong town of France, in Lower Picardy, now called the department of the Straits of Calais, which has a citadel and a fortified harbour. It is built in the form of a triangle, one side of which is towards the sea. The citadel is as large as the town, and has but one entrance. It is a trading place, with handsome streets, and several churches and monasteries; the number of inhabitants in 1813 was 7600.

Calais was taken by Edward III. in 1347. Hither he marched his victorious army from Cressy, and invested the town on the 8th of September. But finding that it could not be taken by force without the destruction of great multitudes of his men, he turned the siege into a blockade; and having made strong intrenchments to secure his army from the enemy, put to protect them from the inclemency of the weather, and stationed a fleet before the harbour to prevent the introduction of provisions, he resolved to wait with patience till the place fell into his hands by famine. The besieged, discovering his intention, turned seventeen hundred women, children, and old people, out of the town, to save their provisions; and Edward had the goodness, after entertaining them with a dinner, and giving them two-pence a piece, to suffer them to pass. The garrison and inhabitants of Calais having at length consumed all their provisions, and even eaten all the horses, dogs, cats, and vermin in the place, the governor John de Vienne appeared upon the walls, and offered to capitulate. Edward greatly increased at their obstinate resistance, which had detained him eleven months under their walls, at an immense expense both of men and money, sent Sir Walter Mauny, an illustrious knight, to acquaint the governor that he would grant them no terms; but that they must surrender at discretion. At length, however, at the spirited remonstrances of the governor, and the persuasions of Sir Walter Mauny, Edward consented to grant their lives to all the garrison and inhabitants, except six of the principal burgesses, who should deliver to him the keys of the city, with ropes about their necks. When these terms were made known to the people of Calais, they were plunged into the deepest distress; and after all the miseries they had suffered, they could not think without horror of giving up six of their fellow citizens to certain death. In this extremity, when the whole people were drowned in tears, and uncertain what to do, Eustace de St Pierre, one of the richest merchants in the place, stepped forth, and voluntarily offered himself to be one of these six devoted victims. His noble act was soon imitated by other five of the most wealthy citizens. These true patriots, barefooted and bareheaded, with ropes about their necks, were attended to the gates by the whole inhabitants with tears, blessings, and prayers for their safety. When they were brought into Edward's presence, they laid the keys of the city at his feet, and falling on their knees, implored his mercy in such moving strains, that all the noble spectators melted into tears. The king's resentment was so strong for the many toils and losses he had suffered in this tedious siege, that he was in some danger of forgetting his usual humanity; when the queen, falling upon her knees before him, earnestly begged and obtained their lives. This great and good princess conducted these virtuous citizens, whose lives she had saved, to her own apartment, entertained them honourably, and dismissed them with presents. Edward took possession of Calais, August 4.; and in order to secure a conquest of so great importance, and which had cost him so dear, he found it necessary to leave all the ancient inhabitants, who had discovered so strong an attachment to their native prince, and to people it with English.

Calais remained in subjection to England till the reign of Queen Mary, when it was retaken by the duke of Guise. This general began the enterprise by ordering the privates of Normandy and Bretagne to cruise in the Channel, more especially in the very straits of Calais; he then detached the duke of Nevers with
CAL

a considerable army towards the country of Luxembourg; a motion which drew the attention of the Spaniards that way; when all things were ready, he proceeded an application from the people of Boulange, for a body of troops to secure them against the incursions of the Spaniards; he sent a strong detachment at their request, which was followed by another, under colour of supporting them; then repaired thither in person, secure that his officers would follow his instructions: and thus, on the first day of the new year, 1557, Calais was invested. He immediately attacked Fort St Agatha, which the garrison quitted and retired into the fort of Nicolai, which, together with the Ribank, the besiegers attacked at the same time, granted good terms to the officer who commanded in the former, but obliged the garrison of the latter to surrender prisoners of war. By these means he opened a communication with the sea: and having received from on board the ships an immense quantity of hurdles, his infantry, by the help of them, passed the moat of the town. He then made a false attack at the water-gate, which drew the attention of the garrison, who fatigued themselves exceedingly in making intrenchments behind the breach; but when they had finished their work, he began to fire upon the castle, where the walls were very old, and had been neglected on account of the breadth of the ditch, which was also very deep when the tide was in; but a great breach being made, the duke caused it to be attacked in the night, and during the ebb, the soldiers passing almost up to the shoulders. The place was easily carried, though the governor made three vigorous attacks before the break of day, in order to dislodge them; but the French, though they lost a considerable number of men, kept their posts. The governor then saw that it was impracticable to defend the place any longer, and therefore made the best terms for himself that he could obtain, which, however, were not very good: and thus, in eight days, the duke of Guastre recovered the fortress which cost the victorious Edward III. a whole war's siege, and which had been now 210 years in the possession of the English, without so much as a single attempt to retake it. There are very different accounts given of this matter. Some English historians say, that King Philip penetrates the design of the French upon this fortress, gave notice of it in England, and offered to take the defence of it upon himself; but that this, out of jealousy, was refused, it being believed to be only an artifice to get a place of such consequence into his own hands. The truth of the matter seems to be this: The strength of Calais consisted in its situation and outworks, which required a very numerous garrison; but this being attended with a very large expense, the best part of the troops had been sent to join Philip's army, so that the governor had not above 500 men, and there were no more than 230 of the townsmen able to bear arms. As to ammunition, artillery, and provisions, the French found there abundance: but with so slender a garrison, it was impossible to make a better defence; and therefore when the Lord Wentworth, who was governor, and whom the French call Lord De Morthe, was tried by his peers for the loss of this place, he was acquitted. The duke obliged all the English inhabitants to quit Calais; and bestowed the government of it upon Des Toumes, who was soon after made a marshal of France.

The fortifications of Calais are good; but its greatest strength is its situation among the marshes, which may be overflowed at the approach of an enemy. The harbour is not so good as formerly, nor will it admit vessels of any great burden. In times of peace, there are packet boats going backward and forward twice a week from Dover to Calais, which is 21 miles distant. E. Long. 2. 6. N. Lat. 50. 58.

CALAIS and Zetes, in fabulous history, sons of Boreas and Orythia, to whom the poets attributed wings: they went on the voyage to Colchis with the Argonauts; delivered Phineus from the harpies; and were slain by Hercules.

CALAMANCO, a sort of woollen stuff manufactured in England and Brabant. It has a fine gloss; and is checkered in the warp, whence the checks appear only on the right side. Some calamancos are quite plain; others have broad stripes adorned with flowers, some with plain broad stripes, some with narrow stripes, and others watered.

CALAMARIS, in Botany, an order of plants in the Fragmenta methodi naturalis of Linnaeus; in which he has the following generas, viz. bobartia, acipyra, cyperus, ciriophorus, carex, setaria, flagellaria, juncus. See BOTANY.

CALAMATA, a considerable town of Turkey in Europe, in the Mese, and province of Belvedera. It was taken by the Venetians in 1685; but the Turks retook it afterwards with all the Mese. It stands on the river Spinara, eight miles from the sea. E. Long. 22. 15. N. Lat. 37. 3.

CALAMINE, CALAMY, Lapis Calaminaris or Cadmia Fossita, a sort of stone or mineral containing zinc, iron, and sometimes other substances. It is considerably heavy; moderately hard and brittle, or of a consistence betwixt stone and earth: the colour sometimes whitish or grey; sometimes yellowish, or of a deep yellow; sometimes red; sometimes brownish black. It is pleasant in several places of Europe, Hungary, Transylvania, Poland, Spain, Sweden, Bohemia, Saxony, Goslav, France, and England, particularly in Derbyshire, Gloucestershire, Nottinghamshire, and Somersetshire, as also in Wales. The calamine of Hanover, however, is by the best judges allowed to be superior in quality to that of most other countries. It seldom lies very deep, being chiefly found in clayey grounds near the surface. In some places it is mixed with lead ores. It is a true ore of zinc, and is used as an ingredient in making of brass.—Newman relates various experiments with this mineral, the only result of which was to show that it contained iron as well as zinc. The most remarkable are the following: A saturated solution of calamine in the marine acid, concentrated by evaporating part of the liquor, exhibits in the cold an appearance of fine crystals, which on the application of warmth dissolve and disappear. A little of this concentrated solution tinged a large quantity of water of a bright yellow colour; and at the same time deposits by degrees a fine, spongy, brownish precipitate. Blue dissolved in this solution, and afterwards insinuated, forms an extremely slippery tenacious mass, which does not become dry, and, were it not too expensive, might be of use for entangling flies, caterpillars, &c. Sulphur boiled in this solution seems to acquire some degree of transparency.
CALAMINT. See Melissa and Mentha, Botany Index.

CALAMUS. See Botany Index. There is but one species, the rotag. The stem is without branches, has a crown at top, and is everywhere beset with straight spines. This is the true Indian cane, which is not visible on the outside; but the bark being taken off discovers the smooth stick, which has no marks of spine on the bark, and is exactly like those which the Dutch sell us, keeping this matter very secret, lest travelers going by should take as many canes out of the woods as they please. Sumatra is said to be the place where most of these sticks grow. Such are to be chosen as are of proper growth between two joints suitable to the fashionable length of canes as they are then worn; but such are scarce. The calamus rotag is one of several plants from which the drug called dragons blood is obtained.

Calamus, in the ancient poets, denotes a simple kind of pipe or flauta, the musical instrument of the shepherds and herdsmen; usually made either of an eaten stalk or a reed.

Calamus Aromaticus, or Sweet-scented Flag, in the materia medica, a species of flag called Acorus by Linnaeus. See Acorus, Botany Index.

Calamus Scripturis, in antiquity, a reed or rush to write with. The ancients made use of styles to write on tables covered with wax; and of reed or rush, to write on parchment, or Egyptian paper.

CALAMY, EDMUND, an eminent Presbyterian divine, born at London in the year 1600, and educated at Pembroke-hall, Cambridge, where his attachment to the Armenian party excluded him from a fellowship. Dr Felton, bishop of Ely, however, made him his chaplain; and in 1639, he was chosen minister of St Mary Aldermanry, in the city of London. Upon the opening of the long parliament, he distinguished himself in defence of the presbyterian cause; and had a principal hand in writing the famous Sectioymnus, which, himself says, gave the first deadly blow to Episcopacy. The authors of this tract were five, the initials of whose names formed the name under which it was published; viz. Stephen Marsham, Edmund Calamy, Thomas Young, Mathew Newcomen, and William Sparrow. He was after that an active member in the assembly of divines, was a strenuous opposer of sectaries, and used his utmost endeavours to prevent those violence committed after the king was brought from the isle of Wight. In Cromwell's time he lived privately, but was assiduous in promoting the king's return; for which he was afterwards offered a bishopric, but refused it. He was ejected for nonconformity in 1662; and died of grief at the sight of the great fire of London.

Calamy, Edmund, grandson to the preceding, (by his eldest son, Mr Edmund Calamy, who was ejected from the living of Morston in Essex on Mr Barthesmew's day 1662) was born in London, April 5, 1671. After having learned the languages, and gone through a course of natural philosophy and logic at a private academy in England, he studied philosophy and civil law at the university of Utrecht, and attended the lectures of the learned Gravius. Whilst he resided here, an offer of a professor's chair in the university of Edinburgh was made him by Mr Carstairs, principal of that university, sent over on purpose to find a person properly qualified for such an office. This he declined; and returned to England in 1691, bringing with him letters from Gravius to Dr Pococke, canon of Christchurch, and regius professor of Hebrew, and to Dr Bernard, Savilian professor of astronomy, who obtained leave for him to prosecute his studies in the Bodleian library. Having resolved to make divinity his principal study, he entered into an examination of the controversy between the controversyists, and which determined him to join the latter; and coming to London in 1692, he was unanimously chosen assistant to Mr Matthew Sylvester at Blackfriars; and in 1694, he was ordained at Mr Annesley's meeting-house in Little St Helena, and soon after was invited to become assistant to Mr Daniel Williams in Hand-Alley. In 1702, he was chosen to be one of the lectorers in Salters-hall; and in 1703, succeeded Mr Vincent Alsop as pastor of a great congregation in Westminster. He drew up the table of contents to Mr Baxter's history of his life and times, which was sent to the press in 1696; made some remarks on the work itself, and added to it a index; and, reflecting on the usefulness of the book, he saw the expediency of continuing it, for Mr Baxter's history came no lower than the year 1684. Accordingly he composed an abridgement of it, with an account of many other ministers who were ejected after the restoration of Charles II. Their apology, containing the grounds of their non-conformity and practice, as to state and occasional communion with the church of England; and a continuation of their history till the year 1691. This work was published in 1704. He afterwards published a moderate defence of nonconformity, in three tracts, in answer to some tracts of Dr Hodgson. In 1709 Mr Calamy made a tour to Scotland; and had the degree of doctor of divinity conferred on him by the universities of Edinburgh, Aberdeen, and Glasgow. In 1713, he published a second edition of his Abridgement of Mr Baxter's history of his life and times; in which, among other additions, there is a continuation of the history through King William's reign, and Queen Anne's, down to the passing of the occasional bill; and in the close is subjoined the reformed liturgy, which was drawn.
drawn up and presented to the bishops in 1661, "that
the world may judge (he says in his preface) how fair-
ly the ejected ministers have been often represented as
irreconcilable enemies to all liturgies." In 1718, he
wrote a vindication of his grandfather, and several
other persons, against certain reflections cast upon
them by Mr. Archdeacon Echard in his History of
England; and in 1728 appeared his Continuation of
the account of the ministers, lecturers, masters,
and fellows of colleges, and schoolmasters, who were
ejected, after the Restoration in 1660, by or before
the act of uniformity. He died June 3, 1732, greatly
regretted not only by the dissenters, but also by
the moderate members of the established church, both
clergy and laity, with many of whom he lived in
great intimacy. Besides the pieces already men-
cioncd, he published a great many sermons on several
subjects and occasions. He was twice married, and had
73 children.

CALANDRE, a name given by the French writers
to an insect that does vast mischief in granaries.
It is properly of the scarab or beetle class; it has two
antennae or horns formed of a great number of round
joints, and covered with a soft and short down; from
the anterior part of the head there is thrust out a
trunk, which is so formed at the end, that the crea-
ture easily makes way with it through the coat or skin
that covers the grain, and gets at the meal or farina
on which it feeds; the inside of the grains is also the
place where the female deposits her eggs, that the
young progeny may be born with provision about them.
When the female has pierced a grain of corn for this
purpose, she deposits in it one egg, or at the utmost
two, but she most frequently lays them single: these
eggs hatch into small worms, which are usually found
with their bodies rolled up in a spiral form, and after
eating till they arrive at their full growth, they are
changed into chrysalids, and from these in about a
fortnight come out the perfect calandre. The fe-
male lays a considerable number of eggs; and the in-
crease of these creatures would be very great, but na-
ture has so ordered it, that while in the egg state, and
even while in that of the worm, they are subject to be
eaten by mites; these little vermin are always very
plentiful in granaries, and they destroy the far greater
number of these larger animals.

CALAS, JOHN, the name of a most unfortunate
Protestant merchant at Toulouse, inhumanly butchered
under forms of law cruelly prostituted to shelter the
sanguinary dictates of ignorant Popish zeal. He had
lived 40 years at Toulouse. His wife was an English
woman of French extraction; and they had five sons;
one of whom, Lewis, had turned Catholic through
the persuasions of a Catholic maid who had lived 30
years in the family. In October 1671, the family con-
sisted of Calas, his wife, Mark Antony their son,
Peter their second son, and this maid. Antony was
educated in the best, but being of a melancholy turn
of mind, was continually dwelling on passages from
authors on the subject of suicide, and one night in
that month hanged himself on a bar laid across two
folding doors in their shop. The crowd collected by
the confusion of the family on so shocking a discovery,
took it into their heads that he had been strangled by
the family to prevent his changing his religion, and
that this was a common practice among Protestants.
The officers of justice adopted the popular tale, and
were supplied by the mob with what they accepted as
evidences of the fact. The fraternity of White Peni-
tents got the body, buried it with great ceremony,
and performed a solemn service for him as a martyr:
the Franciscans did the same; and after these formal-
ties no one doubted the guilt of the devoted heretical
family. They were all condemned to the torture, to
bring them to confession: they appealed to the parlia-
ment; who, as weak and as wicked as the subordinate
magistrates, sentenced the father to the torture, ordi-
nary and extraordinary, to be broken alive upon the
wheel, and then to be burnt to ashes. A diabolical
decree! which, to the shame of humanity, was actu-
ally carried into execution. Peter Calas, the other
son was banished for life; and the rest were acquitted.
The distracted widow found some friends, and among
the rest M. Voltaire, who laid her case before the
council of state at Versailles, and the parliament of
Toulouse was ordered to transmit the proceedings.
These the king and council unanimously agreed to an-
nul; the capitol or chief magistrate of Toulouse was
degraded and fined; old Calas was declared to have
been innocent; and every imposition of guilt was re-
moved from the family, who also received from the
king and clergy considerable gratuities.

CALASH, or CALESH, a small light kind of cha-
riot or chair, with very low wheels, used chiefly for
taking the air in parks and gardens. The calash is for
the most part richly decorated, and open on all sides
for the convenience of the air and prospect, or at most
enclosed with light mantlets of wax-cloth to be opened
and shut at pleasure. In the Philosophical Transac-
tions we have a description of a new sort of calash go-
ing on two wheels, not hung on traces, yet easier than
the common coaches, over which it has this further
advantage, that whereas a common coach will over-
turn if one wheel go on a separate foot and a half
higher than the other, this will admit of a difference
of 33 feet without danger of overturning. Add, that
it would turn over and over; that is, after the spokes
being so turned as that they are parallel to the ho-
rizon, and one wheel flat over the head of him that
rides in it, and the other flat under him, it will turn
once more, by which the wheels are placed in status
quo, without any disorder to the horse or rider.

CALASIO, MARIUS, a Franciscan, and professor
of the Hebrew language at Rome, of whom there is
very little to be said, but that he published there, in
the year 1621, a Concordance of the Bible, which
consisted of four great volumes in folio. This work
has been highly approved and commended both by
Protestants and Papists, and is indeed a most admi-
rable work. For besides the Hebrew words in the
Bible, which are in the body of the book, with the
Latin version over against them; there are, in the mar-
gin, the differences between the Septuagint version
and the Vulgate; so that at one view may be seen
wherein the three Bibles agree, and wherein they dif-
fer. Moreover, at the beginning of every article there
is a kind of dictionary, which gives the signification
of each Hebrew word; affords an opportunity of com-
paring it with other oriental languages, viz. with the
Syriac, Arabic, and Chaldee; and is extremely useful.
for determining more exactly the true meaning of the Hebrew words.

CALASIRIS, in antiquity, a linen tunic fringed at the bottom, and worn by the Egyptians under a white woollen garment; but this last they were obliged to pull off when they entered the temples, being only allowed to appear there in linen garments.

CALATAJUD, a large and handsome town of Spain, in the kingdom of Arragon; situated at the confluence of the rivers Xalon and Xilona, at the end of a very fertile valley, with a good castle on a rock.
W. Long. 2. 9'. N. Lat. 41. 22.

CALATHUS, in antiquity, a kind of hand basket made of light wood or rushes; used by the women sometimes to gather flowers, but chiefly after the example of Minerva to put their work in. The figure of the calathus, as represented on ancient monuments, is narrow at the bottom, and widening upwards like that of a top. Pliny compares it to that of a lily. The calathus or work basket of Minerva is no less celebrated among the poets than her distaff.

CALATHUS was also the name of a cup for wine used in sacrifices.

CALATOR, in antiquity, a crier, or officer appointed to publish something aloud, or call the people together. The word is formed from calavos, voco, "I call." Such ministers the pontificates had, whom they used to send before them when they went to sacrifice on ferias or holidays, to advertise the people to leave off work. The magistrates also used calatoras, to call the people to the comitia, both curiata and centuriata. The officers in the army also had calatoras; as had likewise many private families, to invite their guests to entertainments.

CALATRAVA, a city of New Castile, in Spain, situated on the river Guadiana, 45 miles south of Toledo. W. Long. 4. 20'. N. Lat. 39. 0.

Knights of Calatrava, a military order in Spain, instituted by Sancho III. king of Castile, upon the following occasion: When that prince took the strong fort of Calatrava from the Moors of Andalusia, he gave it to the Templars, who, wanting courage to defend it, returned it him again. Then Don Raymond of the order of the Cistercians, accompanied with several persons of quality, made an offer to defend the place, which the king therupon delivered up to them, and instituted that order. It increased so much under the reign of Alphonso, that the knights desired they might have a grand master, which was granted. Ferdinand and Isabella afterwards, with the consent of Pope Innocent VIII. reunited the grand mstership of Calatrava to the Spanish crown; so that the kings of Spain are now become perpetual administrators thereof.

The knights of Calatrava bear a cross goles, fleur-de-lis with green, &c. Their rule and habit was originally that of the Cistercians.

CALAURIA, in Ancient Geography, an island of Greece in the Saronic bay, over against the port of Troezen, at the distance of 40 stadia. Hither Demosthenes twice into banishment; and there he died. Neptune was said to have accepted this island from Apollo, in exchange for Delos. The city stood on a high ridge nearly in the middle of the island, commanding an extensive view of the gulf and its coasts. There was his holy temple. The priestess was a virgin, who was dismissed when marriageable. Seven of the cities near the island held a congress at it, and sacrificed jointly to the deity. Athens, Aegina, and Epidaurus, were of this number, with Nauplia, for which place Argos contributed. The Macedonians, when they had reduced Greece, were afraid to violate the sanctuary, by forcing from it the fugitives, his suppliants. Antipater commanded his general to bring away the orators, who had offended him, alive; but Demosthenes could not be prevailed on to surrender. His monument remained in the second century, within the enclosure of the temple. The city of Calauria has been long abandoned. Traces of buildings and of ancient walls appear nearly level with the ground; and some stones, in their places, each with a seat and back forming a little circle, once perhaps a bath. The temple, which was of the Doric order, and not large, as may be inferred from the fragments, is reduced to an inconsiderable heap of ruins. The island is now called Poros. It stretches along before the coast of the Morea in a lower ridge, and is separated from it by a canal only four stadia, or half a mile wide. This, which is called Poros or the Ferry, in still weather may be passed on foot, as the water is not deep. It has given its name to the island; and also to the town, which consists of about 200 houses, mean and low, with flat roofs; rising on the slope of a bare disagreeable rock.

CALCADA or Si Domingo Calcalda, a town of Spain, situated in W. Long. 3. 5'. N. Lat. 42. 36.

CALCAR, a very strong town of Germany, in the circle of Westphalia, and duchy of Cleves. It belongs to the king of Prussia, and is seated near the Rhine, in E. Long. 5. 51'. N. Lat. 41. 45.

CALCAR, in glass-making, the name of a small oven or reverberatory furnace, in which the first calcination of sand and salt of potashes is made for the turning them into what is called frit. This furnace is made in the fashion of an oven, ten feet long, seven broad in the widest part, and two feet deep. On one side of it is a trench six inches square, the upper part of which is level with the calcar, and separated only from it at the mouth by bricks nine inches wide. Into this trench they put sea-coal, the flame of which is carried into every part of the furnace, and is reverberated from the roof upon the frit, over the furnace of which the smoke flies very black, and goes out at the mouth of the calcar; the coals burn on iron grates, and the ashes fall through.

CALCAREUS, something that partakes of the nature and qualities of calx, or lime. We say, a calcareaeous earth, calcareaous stone. See CHEMISTRY Index.

CALCEARIUM, in antiquity, a donative, or largesse.
Calculation, primarily denotes a little stone or pebble, anciently used in making computations, taking of suffrages, playing at tables, and the like. In after times, pieces of ivory, and counters struck of silver, gold, and other matters, were used in lieu thereof, but still retaining the ancient names. Computators were by the lawyers called calculoes, when they were either slaves or newly freed men; those of a better condition were named calculatores or numerarii; ordinarily there was one of those in each family of distinction. The Roman judges anciently gave their opinions by calculi, which were white for absoluto, and black for condemnation. Hence calculus albus, in ancient writers, denotes a favourable vote, either in a person to be absolved and acquitted of a charge, or elected to some dignity or post; as calculus nigio did the contrary. This usage is said to have been borrowed from the Thracians, who marked their happy or prosperous days by white, and their unhappy by black, pebbles, put each night into an urn.

Besides the diversity of colour, there were some calculi also which had figures or characters engraved on them, as those which were in use in taking the suffrages both in the senate and at assemblies of the people. These calculi were made of thin wood, polished and covered over with wax. Their form is still seen in some medals of the Cassian family; and the manner of casting them into the urns, in the medals of the Lici- nian family. The letters marked upon these calculi were U. R. for uti rogau; A. for antiquo; the first of which expressed an approbation of the law, the latter a rejection of it. Afterwards the judges who sat in capital causes used calculi marked with the letter A. for absolu.; C. for condemnu.; and N. L. for novi luet, signifying that a more full information was required.

Calculation is also used in ancient geometric writers for a kind of weight equal to two grains of cicer. Some make it equivalent to the siliqua, which is equal to three grains of barley. Two calculi made the cerasium.

Calculation, in Mathematics, is a certain method of performing investigations and resolutions, particularly in mechanical philosophy. Thus there is the Differential calculus, the Exponential, the Integral, the Literal, and the Antecedental.

Calculation Differentialis, is a method of differentiating quantities, or of finding an infinitely small quantity, which being taken infinite times, shall be equal to a given quantity; or, it is the arithmetic of the infinitely small differences of variable quantities.

The foundation of this calculation is an infinitely small quantity, or an infinitesimal, which is a portion of a quantity incomparable to that quantity, or that is less than any assignable one, and therefore accounted as nothing; the error accruing by omitting it being less than any assignable one. Hence two quantities, only differing by an infinitesimal, are reputed equal. Thus, in astronomy, the diameter of the earth is an infinitesimal, in respect of the distance of the fixed stars; and the same holds in abstract quantities. The term, infinitesimal, therefore, is merely respective, and involves a relation to another quantity; and does not denote any real ens or being. Now infinitesimals are called differentials, or differential quantities, when they are considered as the differences of two quantities. Sir Isaac Newton calls them moments; considering them as the momentary increments of quantities, v. g. of a line generated by the flux of a point, or of a surface by the flux of a line. The differential calculus, therefore, and the doctrine of fluxions, are the same thing under different names; the former given by M. Leibnitz, and the latter by Sir Isaac Newton: each of whom lays claim to the discovery. There is, indeed, a difference in the manner of expressing the quantities resulting from the different views wherein the two authors consider the infinitesimals: the one as moments, the other as differences. Leibnitz, and most foreigners, express the differentials of quantities by the same letters as variable ones, only prefixing the letter d: thus the differential of x is called dx: and that of y, dy: now dx is a positive quantity, if x continually increases; negative, if it decrease.

The English, with Sir Isaac Newton,
Newton, instead of \( dx \) write \( x \) (with a dot over it), for \( dy, y, &c. \) which foreigners object against, on account of that confusion of points, which they imagine arises when differentials are again differentiated; besides, that the printers are more apt to overlook a point than a letter. Stable quantities are always expressed by the first letters of the alphabet \( d \alpha \equiv a, d \beta = b, d \epsilon = c \); wherefore \( d (x+y-a) = dx + dy \), and \( d (x-y+a) = dx - dy \). So that the differentiating of quantities is easily performed by the addition or subtraction of their compounds.

To difference quantities that multiply each other; the rule is, first, multiply the differential of one factor into the other factor, the sum of the two factors is the differential sought: thus, the quantities being \( x, y \), the differential will be \( x dy + y dx \), i.e. \( d(xy) = x dy + y dx \). Secondly, if there be three quantities mutually multiplying each other, the product of the two must then be multiplied into the differential of the third; thus suppose \( uvx \); let \( u = v \), then \( d(ux) = udv + vdx \); consequently \( d(vx) = x dy + y dx \); but \( d(vx) = dvx + dxv \). These values, therefore, being substituted in the antecedent differential, \( t dy + y dt \), the result is, \( d(vx) = x dv + y dx \). Hence it is easy to apprehend how to proceed where the quantities are more than three. If one variable quantity increase, while the other decreases, it is evident \( y dx = -x dy \) will be the differential of \( xy \).

To difference quantities that mutually divide each other; the rule is, first, multiply the differential of the divisor into the dividend; and, on the contrary, the differential of the dividend into the divisor: subtract the last product from the first, and divide the remainder by the square of the divisor, the quotient is the differential of the quantities mutually dividing each other. See Fluxions.

**Calculus Exponentialis**, is a method of differentiating exponential quantities, or of finding and summing up the differentials or moments of exponential quantities; or at least bringing them to geometrical constructions.

By exponential quantity, is here understood a power, whose exponent is variable; v.g. \( x^2 \), \( x^n \), where the exponent \( x \) does not denote the same in all the points of a curve, but in some stands for \( 2 \), in others for \( 3 \), in others for \( 5 \), &c.

To difference an exponential quantity; there is nothing required but to reduce the exponential quantities to logarithmic ones; which done, the differencing is managed as in logarithmic quantities. Thus, suppose the differential of the exponential quantity \( x^n \) required, let

\[
x^n = x^{n-1}
\]

Then will \( y \) be \( x = \frac{dy}{dx} \)

\[
x dx + \frac{y dy}{dx} = dx
\]

\[
x \frac{y dx}{x} = \frac{dx}{x}
\]

That is, \( w = \frac{1}{x} \).

**Calculus Integralis, or Summatorius**, is a method of integrating, or summing up moments, or differential quantities; i.e. from a differential quantity given, to calculate and find the quantity from whose differentiating the given differential results.

The integral calculus, therefore, is the inverse of the differential one; whence the English, who usually call the differential method fluxions, give this calculus, which ascends from the fluxions, to the flowing or variable quantities; or, as foreigners express it, from the differences to the sum, by the name of the inverse method of fluxions.

Hence, the integration is known to be justly performed, if the quantity found, according to the rules of the differential calculus, being differented, produce that proposed to be summed.

Suppose \( s \) the sign of the sum, or integral quantity, then \( s y dx \) will denote the sum, or integral of the differential \( y dx \).

To integrate, or sum up a differential quantity: it is demonstrated, first, that \( s dx \equiv x \); secondly, \( s (dx + dy) \equiv s + y \); thirdly, \( s (y dx + y dx) \equiv 2y \); fourthly, \( s (m dx) \equiv m \); fifthly, \( s (n : m) \equiv n \)

sixthly, \( s (y dx - y dy) \equiv y \). Of these, the fourth and fifth cases are the most frequent, wherein the differential quantity is integrated, by adding a variable unity to the exponent, and dividing the sum by the new exponent multiplied into the differential of the root; v.g. the fourth case, by \( m \equiv (1+1) dx \), i.e. by \( m dx \).

If the differential quantity to be integrated doth not come under any of these formulas, it must either be reduced to an integral finite, or an infinite series, each of whose terms may be summed.

It may be here observed, that, as in the analysis of the finite quantities, any quantity may be raised to any degree of power: but vice versa, the root cannot be extracted out of any number required; so in the analysis of the infinite quantities, any variable or flowing quantity may be differented; but vice versa, any differential cannot be integrated.

And, as, in the analysis of the finite quantities, we are not yet arrived at a method of extracting the roots of all equations, so neither has the integral calculus arrived at its perfection; and as in the former we are obliged to have recourse to approximation, so in the latter we have recourse to infinite series, where we cannot attain to a perfect integration.

**Calculus Literalis**, or Literal Calculus, is the same with speicous arithmetic, or algebra, so called from its using the letters of the alphabet, in contradistinction to numeral arithmetic, which uses figures. In the literal calculus given quantities are expressed by the first letters, \( a, b, c, d \); and quantities sought by the last, \( x, y, z \), &c. Equal quantities are denoted by the same letters.

**Calculus Antecedental**, a geometrical method of remaining invented by Mr. Glaser, which, without any consideration of notion or velocity, is applicable to all the purposes of fluxions. In this method, says Mr. Glaser, "every expression is truly and strictly geometrical, is founded on principles frequently made use of by the ancient geometers, principles admitted into the very first elements of geometry, and repeatedly used by Euclid himself. As it is a branch of general geometrical proportion, or universal comparison, and is derived from an examination of the antecedents of ratios, having
by accident: an instance of which is related by Dr. Calculus, Percival. A bongie had unfortunately slipped into the bladder, and upon it a stone of considerable size was formed in less than a year. This stone had so much the appearance of chalk, that the doctor was induced to try whether it could be converted into quicklime. His experiment succeeded, both with that and some other calculi; from which he conjectures, that hard waters which contain calcareous earth may contribute towards the formation of the calculus.

CALCUTTA, the capital of the province of Bengal, and of all the British possessions in the East Indies, is situated on the river Hooghly, a branch of the Ganges, about 150 miles from the sea, in N. Lat. 23. and Long. 88. 28. E. from Greenwich. It is but a modern city, built on the site of a village called Gouindour. The English first obtained the Mogul's permission to settle in this place in the year 1690; and Mr. Job Charnock, the company's agent, made choice of the spot on which the city stands, on account of a large shady grove which grew there; though in other respects it was the worst he could have pitched upon; for three miles to the north coast, there is a salt water lake, which overflows in September, and when the flood retires in December leaves behind such a quantity of fish and other putrescent matter, as renders the air very unhealthy. The custom of the Gentoos throwing the dead bodies of their poor people into the river is also very disgusting, and undoubtedly contributes to render the place unhealthy, as well as the cause already mentioned.

Calcula is now become a large and populous city, being supposed at present to contain 500,000 inhabitants. It is elegantly built, at least the part inhabited by the English; but the rest, and that the greatest part, is built after the fashion of the cities of India in general. The plan of all these is nearly the same; their streets are exceedingly confined, narrow, and crooked, with a vast number of ponds, reservoirs, and gardens interspersed. A few of the streets are paved with brick. The houses are built, some with brick, others with mud, and a still greater number with bamboo and mats; all which different kinds of fabrics standing intermixed with one another, form a very uncouth appearance. The brick houses are seldom above two stories high, but those of mud and bamboos are only one, and are covered with thatch. The roofs of the brick houses are flat and terraced. These, however, are much fewer in number than the other two kinds; so that fires, which often happen, do not sometimes meet with a brick house to obstruct their progress in a whole street. Within these 20 or 25 years Calcutta has been greatly improved both in appearance and in the salubrity of its air; the streets have been properly drained, and the ponds filled; thereby removing a vast surface of stagnant water, the exhalations of which were particularly hurtful. The citadel is named Fort William, and is superior as a fortress to any in India; but is now on too extensive a scale to answer the purpose for which it was intended, viz. the holding a post in case of extremity. It was begun on this extended plan by Lord Clive immediately after the battle of Plassey. The expense attending it was supposed to amount two millions sterling.

Calcutta is the emporium of Bengal, and the resi-

dence of the governor-general of India. Its flourishing state may in a great measure be supposed owing to the unlimited toleration of all religions allowed here; the Pagans being suffered to carry their idols in procession, the Mahommedans not being discomfited, and the Roman Catholics being allowed a church.

At about a mile's distance from the town is a plain where the natives annually undergo a very strange kind of penance on the 9th of April; some for the sins they have committed, others for those they may commit, and others in consequence of a vow made by their parents. This ceremony is performed in the following manner: Thirty bamboo, each about the height of 20 feet, are erected in the plain above mentioned. On the top of these they contrive to fix a swivel, and another bamboo of 30 feet or more crosses it, at each end of which hangs a rope. The people pull down one end of this rope, and the devotee placing himself under it, the brahmans pinches up a large piece of skin under both the shoulder-blades, sometimes in the breasts, and thrusts a strong iron hook through each. These hooks have lines of Indian grass hanging to them, which the priest makes fast to the rope at the end of the cross bamboo, and at the same time puts a cloth round the body of the devotee, having it loosely in the hollow of the bamboo's leaf, by the skin's giving way, be should fall to the ground. When this is done, the people haul down the other end of the bamboo; by which means the devotee is immediately lifted up 30 feet or more from the ground, and they run round as fast as their legs can carry them. Thus the devotee is thrown out the whole length of the rope, where, as he swings, he plays a thousand antics tricks; being painted and dressed in a very particular manner, on purpose to make him look more ridiculous. Some of them continue swinging half an hour, others less. The devotees undergo a preparation of four days for this ceremony. On the first and third they abstain from all kinds of food; but eat fruit on the other two. During this time of preparation they walk about the streets in their fantastical dresses, dancing to the sound of drums and horns; and some to express the greater ardour of devotion, run a rod of iron quite through their tongues, and sometimes through their cheeks also.

Before the war of 1755, Calcutta was commonly garrisoned by 300 Europeans, who were frequently employed in conveying the company's vessels from Patna, loaded with saltpetre, piece goods, opium, and raw silk. The trade of Bengal alone supplied rich cargoes for 50 or 60 ships annually, besides what was carried on in small vessels to the adjacent countries. It was this flourishing state of Calcutta that probably was one motive for the nabob Surajah Dowlas to attack it in the year 1756. Having had the fort of Cassimbazar delivered up to him, he marched against Calcutta with all his forces, amounting to 70,000 horse and foot, with 400 elephants, and invested the place on the 15th of June. Previous to any hostilities, however, he wrote a letter to Mr. Drake the governor, offering to withdraw his troops, on condition that he would pay him his duty on the trade for 15 years past, defray the expense of his army, and deliver up the black merchants who were in the fort. This being refused, he attacked one of the redoubts at the entrance of the town; but was repulsed with great slaughter. On the 16th he attacked another advanced post, but was likewise repulsed with great loss. Notwithstanding this disappointment, however, the attempt was renewed on the 18th, when the troops abandoned these posts, and retreated into the fort; on which the nabob's troops entered the town, and plundered it for 24 hours. An order was then given for attacking the fort; for which purpose a small breastwork was thrown up, and two twelve-pounders mounted upon it; but without firing oftener than two or three times an hour. The governor then called a council of war, when the captain of the train informed them, that there was not ammunition in the fort to serve three days; in consequence of which the principal ladies were sent on board the ships lying before the fort. They were followed by the governor, who declared himself a Quaker, and left the place to be defended by Mr. Holwell the second in council. Besides the governor, four of the council, eight gentlemen of the company's service, four officers, and 100 soldiers, with 25 free merchants, captains of ships, and other gentlemen, escaped on board the ships, where were also 59 ladies, with 33 of their children. The whole number left in the fort was about 250 effective men, with Mr. Holwell four captains, five lieutenants, six ensigns, and five serjeants; as also 14 sea captains, and 20 gentlemen of the factory. Mr. Holwell then having held a council of war, divided three chests of treasure among the discontented soldiers, making them large promises also, if they behaved with courage and fidelity; after which he boldly stood on the defence of the place, notwithstanding the immense force which opposed him. The attack was very vigorous; the enemy having got possession of the houses, galled the English from thence, and drove them from the bastions; but they themselves were several times dislodged by the fire from the fort, which killed an incredible number, with the loss of only five English soldiers the first day. The attack, however, was continued till the afternoon of the 20th, when many of the garrison being killed and wounded, and their ammunition almost exhausted, a flag of truce was hung out. Mr. Holwell intended to have availed himself of this opportunity to make his escape on board the ships, but they had fallen several miles down from the fort, without leaving even a single boat to facilitate the escape of those who remained. In the mean time, however, the back-gate was betrayed by the Dutch guard, and the enemy, entering the fort, killed all they first met, and took the rest prisoners.

The fort was taken before six in the evening; and, in an hour after, Mr. Holwell had three audiences of the nabob, the last being in the durbar or council. In all of these the governor had the most positive assurances that no harm should happen to any of the prisoners; but he was surprised and enraged at finding only 5000l. in the fort instead of the immense treasures he expected; and to this, as well as perhaps to the resentment of the jemmidsars or officers, of whom many were killed in the siege, we may impute the catastrophe that followed.

As soon as it was dark, the English prisoners, to the number of 146, were directed by the jemmidsars who guarded them, to collect themselves into one body, and sit down quietly under the arched verandah,
C A L

or piazza, to the westward of the Black Hole prison. Besides the guard over them, another was placed at the south end of this veranda, to prevent the escape of any of them. About 500 gunnies, with lighted matches, were drawn up on the parade; and soon after the factory was in flames to the right and left of the prisoners, who had various conjectures on this appearance. The fire advanced with rapidity on both sides; and it was the prevailing opinion of the English, that they were to be suffocated between the two fires. On this they soon came to a resolution of rushing on the guard, seizing their scimitars, and attacking the troops upon the parade, rather than be thus tamely roasted to death: but Mr Holwell advanced, and found the Moors were only searching for a place to confine them in. At this time Mr Holwell might have made his escape, by the assistance of Mr Leech, the company's smith, who had escaped when the Moors entered the fort, and returned just as it was dark, to tell Mr Holwell he had provided a boat, and they would ensue his escape, if he would follow him through a passage few were acquainted with, and by which he then entered. This might easily have been accomplished, as the guard took little notice of it; but Mr Holwell told Mr Leech, he was resolved to share the fate of the gentlemen and the garrison; to which Mr Leech gallantly replied, that "then he was resolved to share Mr Holwell's fate, and would not leave him."

The guard on the parade advanced, and ordered them all to rise and go into the barracks. Then, with their muskets presented, they ordered them to go into the Black Hole prison; while others, with clubs and scimitars pressed upon them so strong, that there was no resisting it; but, like one agitated wave impelling another, they were obliged to give way and enter: the rest following like a torrent. Few among them, the soldiers excepted, had the least idea of the dimensions or nature of a place they had never seen; for if they had, they should at all events have rushed upon the guard, and been cut to pieces by their own choice as the lesser evil.

It was about eight o'clock when these 146 unhappy persons, exhausted by continual action and fatigue, were thus crammed together into a dungeon about eighteen feet square, in a close sultry night in Bengal; shut up to the east and south, the only quarters from whose air could reach them, by dead walls, and by a wall and door to the north; open only to the west by two windows, strongly barred with iron, from which they could receive scarcely any circulation of fresh air.

They had been but few minutes confined before every one fell into a perspiration so profuse, that no idea can be formed of it. This brought on a raging thirst, which increased in proportion as the body was drained of its moisture. Various expedients were thought of to give more room and air. Every man was stripped, and every hat put in motion: they several times and down on their hands; but at each time several of the poor creatures fell, and were instantly suffocated or trampled to death.

Before nine o'clock every man's thirst grew intolerable, and respiration difficult. Efforts were again made to force the doors; but still in vain. Many insurgents were used to the guards, to provoke them to fire in upon the prisoners, who grew outrageous, and many delirious. "Water, water," became the general cry. Some water was brought: but these supplies, like sprinkling water on fire, only served to raise and feed the flames. The confusion became general and horrid from the cries and ravings for water; and some were trampled to death. This scene of misery proved entertainment to the brutal wretches without, who supplied them with water, that they might have the satisfaction of seeing them fight for it, as they phrased it; and held up lights to the bars, that they might lose no part of the inhuman diversion.

Before eleven o'clock, most of the gentlemen were dead, and one-third of the whole. Thirst grew intolerable: but Mr Holwell kept his mouth moist by sucking the perspiration out of his shirt sleeves, and catching the drops as they fell, like heavy rain, from his head and face. By half an hour after eleven, most of the living were in an outrageous delirium. They found that water heightened their unseasonableness; and "Air, air," was the general cry. Every insult that could be devised against the guard; all the opprobrious names that the viceroy and his officers could be loaded with, were repeated, to provoke the guard to fire upon them. Every man had eager hopes of meeting the first shot. Then a general prayer to heaven, to hasten the approach of the flames to the right and left of them, and put a period to their misery. Some expired on others; while a steam arose as well from the living as the dead, which was very offensive.

About two in the morning, they crowded so much to the windows, that many died standing, unable to fall by the strong and equal pressure round. When the day broke, the stench arising from the dead bodies was insufferable. At that juncture, the sepoys, who had received an account of the havoc death had made among them, sent one of his officers to enquire if the chief survived. Mr Holwell was sent to him; and near six an order came for their release.

Thus they had remained in this infernal prison from sight at night until six in the morning, when the poor remains of 146 souls, being only 23, came out alive; but most of them in a high putrid fever. The dead bodies were dragged out of the hole by the soldiers, and thrown promiscuously into the ditch of an unfinished ravine, which was afterwards filled with earth.

The injuries which Calcutta suffered at this time, however, were soon repaired. The place was retaken by Admiral Watson and Colonel Clive, early in 1757; Surajah Dowla was defeated, deposed, and put to death; and Meer Jaffier, who succeeded him in the nabobship, engaged to pay an immense sum for the indemnification of the inhabitants. Since that time, the immense acquisition of territory by the British in this part of the world, with the constant state of security enjoyed by this city, have given an opportunity of embellishing and improving it greatly beyond what it was before. Among these improvements we may reckon that of Sir William Jones, who on the 1st of January, 1784, instituted a society for inquiring into the history, civil and natural, the antiquities, arts, sciences, and literature of Asia; and thus the literature...
of Europe, and along with it, it is to be hoped, the arts of humanity, benevolence, and peace, have at length obtained a footing in the rich empire of Indostan, so long a prey to the rapine and violence of tyrants. See Calcutta, Supplement.

Cal'darium, in the ancient baths, denoted a brazen vessel or cistern, placed in the hypocaustum, full of hot water, to be drawn thence into the piscina or bath, to give it the necessary degree of heat. In this sense the cal'darium stood contrasted from the tepidarium and frigidarium.

Cal'darium, also denoted the stove, or sudatory, being a close vaulted room, wherein, by hot durnes, without water, people were brought to a profuse sweat. In which sense, cal'darium was the same with what was otherwise denominated euporarium, sudatorium, and la'cunum; in the Greek baths, hypocaustum, byzmaeum.

Cal'derinus, Dom'i tus, a learned critic, born at Cal'deria near Verona. He read lectures upon polite literature at Rome with great reputation; and was the first who ventured to write upon the most difficult of the ancient poets. He died very young in 3477.

Cal'deron, de la Bar'ca, Don' Pedro, a Span' ish officer, who after having signalized himself in the military profession, quitted it for the ecclesiastical, and then commenced dramatic writer. His dramatic works make 9 vols. in 4to. and some Spanish authors have compared him to Shakspeare. He flourished about the year 1640.

Cal'derwood, David, a famous divine of the church of Scotland, and a distinguished writer in behalf of the Presbyterians, was descended of a good family in that kingdom; and being early designed for the ministry, he applied with great diligence to the study of the Scriptures in their original tongues, the works of the fathers, the councils, and the best writers on church history. He was settled about the year 1654 at Creling near Jedburgh. King James I. of Great Britain, being desirous of bringing the church of Scotland nearer to a conformity with that of England, laboured earnestly to restore the episcopal authority; and enlarge the powers of the bishops who were then in Scotland. This design was very warmly opposed by many of the ministers, and particularly by Mr David Calderwood; who, when Mr James Law, bishop of Orkney, came to visit the presbyteries of Meroe and Tiviotdale, declined his jurisdiction by a paper under his hand, dated May 5, 1658. But the king having his success much at heart, sent the earl of Dunbar, the high-treasurer of Scotland, with Dr Abbot, afterward archbishop of Canterbury, and two other divines, into that kingdom, with instructions to employ every method to persuade both the clergy and laity of his majesty's sincere desire to promote the good of the church, and of his zeal for the Protestant religion.

Mr Calderwood did not assist at the general assembly held at Glasgow, June 8, 1650, in which Lord Dunbar presided as commissioner; and it appears from his writings, that he looked upon every thing transacted in it as null and void. In May following, King James went to Scotland; and on the 19th of June held a parliament at Edinburgh. At that time the clergy met in one of the churches, to hear and advise with the bishops, which kind of assembly, it seems, was contriv'd in order to resemble the English convocation. Mr Calderwood was present at it, but declared publicly that he did not take any such meetings to resemble a convocation; and being opposed by Dr Whitford and Dr Hamilton, who were friends to the bishops, he took his leave of them in these words: "It is absurd to see men sitting in silks and satins, and to cry poverty in the kirk, when purity is departing." The parliament proceeded in the meanwhile in the dispatch of business; and Mr Calderwood, with several other ministers, being informed that a bill was depending to empower the king, with the advice of the archbishops, bishops, and such a number of the ministry as his majesty should think proper, to consider and conclude as to matters decent for the external policy of the church, not repugnant to the word of God; and that such conclusions should have the strength and power of ecclesiastical laws; against this they protested, for four reasons: 1. Because their church was so perfect, that, instead of needing reformation, it might be a pattern to others. 2. General assemblies, as now established by law, and which ought always to continue, might by this means be overthrown. 3. Because it might be a means of creating schism, and disturb the tranquillity of the church. 4. Because they had received assurances, that no attempt should be made to bring them to a conformity with the church of England. They desired, therefore, that, for these and other reasons, all thoughts of passing such a law might be laid aside: but in case this be not done, they protest for themselves and their brethren who shall adhere to them, that they can yield no obedience to this law, when it shall be enacted, because it is destructive of the liberty of the church; and therefore shall submit to such penalties, and think themselves obliged to undergo such punishments, as may be inflicted on them for disobeying that law. This protest was signed by Mr Archibald Simson on behalf of the members, who subscribed another separate roll, which he kept for his justification. This protest was presented to the clerk register, who refused to read it before the states in parliament. However, though not read, it had its effect; for although the bill had the consent of parliament, yet the king thought fit to cause it to be laid aside, and not long after called a general assembly at St Andrew's. Soon after the parliament was dissolved, and Mr Calderwood was summoned to appear before the high commission court at St Andrew's, on the 8th of July following, to answer for his tumultuous and seditious behaviour. July 10th, the king came to that city in person; when Mr Calderwood, being called upon, and refusing to comply with what the king in person required of him, was committed to prison. Afterwards the privy council, according to the power exercised by them at that time, directed him to banish himself out of the king's dominions before Michaelmas next; and not to return without licence. Having applied to the king for a prorogation of his sentence without success, because he would neither acknowledge his offence, nor promise conformity for the future, he retired to Holland, where, in 1652, he published his celebrated piece entitled Altare Damascens. Mr Calderwood having in the year 1624 been afflicted with a long fit of sickness, and nothing having been heard of him for some time, one Mr Patrick Scott, as Calderwood himself informs us, took it for granted that he
he was dead; and thereupon wrote a recantation in his name, as if, before his decease, he had changed his sentiments. This imposture being detected, Scott went over to Holland, and stayed three weeks at Amsterdam, where he made a diligent search for the author of Alter Damascenum, with a design to have dispatched him. But Calderwood had privately retired into his own country, where he lived several years. Scott gave out that the king had furnished him with the matter for the pretended recantation, and that he only put it in order. During his retirement, Mr Calderwood collected all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the reformation there down to the death of King James, which collection is still preserved in the university library of Glasgow; that which was published under the title of "The True History of Scotland," is only an extract from it. In the advertisement prefixed to the last edition of his Alter Damascenum this mention is made of his being minister of Pencaitland near Edinburgh in 1629, but we find nothing said there, or anywhere else, of his death.

CALDRON, a large kitchen utensil, commonly made of copper; having a movable iron handle, whereby to hang it on the chimney hook. The word is formed from the French chaudron, or rather the Latin caldarium.

Boiling in Caldrons (caldariis decoquere), is a capital punishment spoken of in the middle-age writers, decreeed to divers sort of criminals, but chiefly to desirers of the coin. One of the torments inflicted on the ancient Christian martyrs, was boiling in caldrons of water, oil, &c.

Caldwell, Richard, a learned English physician, born in Staffordshire about the year 1572. He studied physic in Brazen-nose College, Oxford; and was examined, admitted into, and made censor of, the College of Physicians at London, all in one day. Six weeks later he was chosen one of the electors; and in the year 1579, he was made president of that college. Mr Wood tells us, that he wrote several pieces in his profession; but he does not tell us what they were, only that he translated a book on the art of surgery, written by one Horatio More, a Florentine physician. We learn from Camden, that Caldwell founded a chirurgical lecture in the College of Physicians, and endowed it with a handsome salary. He died in 1585.

Calea. See Botany Index.

Caleb, one of the deputies sent by the Israelites to take a view of the land of Canaan. He made a good report of the country, and by this means revived the spirits of the dejected people; on which account, he and Joshua were the only persons who, after their leaving Egypt, settled in the land of Canaan. Caleb had for his share the mountains and the city of Hebron, from which he drove three kings. Othniel his nephew having taken the city of Debir, Caleb gave him his daughter Achsah in marriage; and died, aged 114.

Caledonia, the ancient name of Scotland. From the testimonies of Tacitus, Dio, and Solinus, we find, that the ancient Caledonia comprehended all that country lying to the north of the rivers Forth and Clyde. In proportion as the Britures or Cimbri advanced towards the north, the Caledonians being circumscribed within narrower limits, were forced to transmigrate into the islands which crowd the western coasts of Scotland. It is in this period, probably, we ought to place the first great migration of the British Gaels into Ireland; that kingdom being much nearer to the promontory of Galloway and Cantire than many of the Scottish islands are to the continent of North Britain.

To the country which the Caledonians possessed, they gave the name of Caed-doch; which is the only appellation the Scots, who speak the Gaelic language, know for their own division of Britain. Caed-doch is a compound, made up of Geal or Caed, the first colony of the ancient Gauls who transmigrated into Britain, and doch, a district or division of a country. The Romans, by transposing the letter t in Caed, and by softening into a Latin termination the ch of doch, formed the well-known name of Caedonia.

When the tribes of North Britain were attacked by the Romans, they entered into associations, that, by uniting their strength, they might be more able to repel the common enemy. The particular name of that tribe, which either its superior power or military reputation placed at the head of the association, was the general name given by the Romans to all the confederates. Hence it is that the Medics, who with other tribes inhabited the districts of Scotland lying southward of the frith, and the Caledonians, who inhabited the west and north-west, parts, have engrossed all the glory which belonged in common, though in an inferior degree, to all the other nations settled of old in North Britain. It was for the same reason that the name of Macens was entirely forgotten by foreign writers after the third century, and that of the Caledonians themselves but seldom mentioned after the fourth.

Britons, Caledonians, Macens, Barbarians, are the names constantly given to the old inhabitants of North Britain, by Tacitus, Herodias, Dio, Spartan, Yopiscus, and other ancient writers. The successors of these Britons, Caledonians, Macens, and barbarians, are called Picts, Scots, and Atacatas, by some Roman writers of the fourth century.

The origin of the appellations Scots and Picts, introduced by later Roman authors, has occasioned much controversy among the antiquarians of these days. The dispute seems now to be fully decided by some learned critics of the present century, whose knowledge of the Gaelic language assisted their investigation. See Scotland, Picts, and Highlanders.

Caledonia, the name of a settlement made by the Scots on the west side of the gulf of Darien, in 1698; out of which they were starved at the request of the East India Company; for the English government prohibited the other colonies sending them any provisions; so they were obliged to leave it in 1700.

New Caledonia, an island in the South sea, lately discovered by Captain Cook, and next to New Holland and New Zealand, is the largest island that hath yet been discovered in that sea. It extends from 19° 37' to 22° 30'. Lat. and from 163° 37' to 167° 14' Long. Its length from north-west to south-east is about 80 leagues; but its greatest breadth does not exceed ten leagues. This island is diversified with hills and valleys of various size and extent. From the hills issue abundance of rivulets, which contribute to fertilize the plains.
plains. Along its north-east shore the land is flat; and being well watered, and cultivated by the inhabitants after their manner, appeared to great advantage to Captain Cook’s people. Was it not, indeed, for those fertile spots on the plains, the whole country might be called a dreary waste: the mountains and higher parts of the land are in general incapable of cultivation. They consist chiefly of rocks, many of which are full of mordic; the little soil that is upon them is scorched and burnt up by the sun: it is, however, covered with coarse grass and other plants, and here and there covered with trees and shrubs. The country in general bears a great resemblance to those parts of New South Wales which lie under the same parallel of latitude. Several of its natural productions are the same, and the woods are without underwood as well as in that country. The whole coast seems to be surrounded by reefs and shoals, which render all access to it extremely dangerous; but at the same time guard the coasts against the attacks of the wind and sea; rendering it easily navigable along the coast by canoes, and causing it abound with fish. Every part of the coast seems to be inhabited; the plantations in the plains are laid out with great judgment, and cultivated with much labour. They begin their cultivation by setting fire to the grass, &c. with which the ground is covered, but have no notion of preserving its vigour by manure; they, however, recruit it by letting it lie for some years untouched.

On the beach was found a large irregular mass of rock, not less than a cube of ten feet, consisting of a close grained stone speckled full of granites somewhat bigger than pins heads, from whence it seems probable that some valuable minerals may be found on this island. It differs from all the other islands yet discovered in the South sea, by being entirely destitute of volcanic productions. Several plants of a new species were found here; and a few young bread fruit trees, not then sufficiently grown to bear fruit, seemed to have come up without culture; plantains and sugar canes are here in small quantity, and the cocoa-nut trees are small and thinly planted. A new species of passion flower was likewise met with, which was never known to grow wild anywhere but in America. Several Capucis (Melaleuca) trees were also found in flower. Musquito here are very numerous. A great variety of birds was seen of different classes, which were for the most part entirely new; particularly a beautiful species of parrot before unknown to zoologists. A new species of fish, of the genus called by Linnaeus tetraodon, was caught here; and its liver, which was very large, presented at supper. Several species of this genus being reckoned poisonous, and the present species being remarkably ugly, Mears Fosters hinted their suspicions of its quality; but the temptations of a fresh meal, and the assurances of Captain Cook that he had formerly eaten this identical sort of fish, without harm, got the better of their scruples, and they ate of it. Its sallness, however, though it had no other bad taste than what proceeded from this, prevented them from taking more than a morsel or two. In a few hours after they had retired to rest they were awakened by very alarming symptoms, being all seized with an extreme giddiness; their hands and feet were numbed, so that they were scarcely able to crawl; and a violent languor and oppression seized them. Emetics were administered with some success, but sudorifics gave the greatest relief. Some dogs who had eaten the remainder of the liver were likewise taken ill; and a pig which had eaten the entrails died soon after, having swelled to an unusual size. The effects of this poison on the gentlemen did not entirely go off in less than six weeks. Abundance of turtle was seen here. The natives had not the least notion of goats, hogs, dogs, or cats, and had not even a name for any of them.

The inhabitants are very stont, tall, and in general well proportioned; their features mild; their beards and hair black, and strongly frizzled, so as to be somewhat woolly in some individuals: their colour is swarthy, or a dark chestnut brown. A few were seen who measured six feet four inches. They are remarkably courteous, not at all addicted to pilfering and stealing; in which character of honesty they are singular, all the other nations in the South sea being remarkably thievish. Some wear their hair long, and tie it up to the crown of their heads: others suffer only a large lock to grow on each side, which they tie up in clubs; many others, as well as all the women, wear it cropped short. They make use of a kind of comb made of sticks or hard wood, from seven to nine or ten inches long, and about the thickness of knitting needles; a number of these, seldom exceeding 20, but generally fewer, are fastened together at one end, parallel to and near one-tenth of an inch from each other: the ends, which are a little pointed, will spread out or open like the sticks of a fan. These combs they always wear in their hair on one side of their head. Some had a kind of concave cylindrical shift black cap, which appeared to be a great ornament among them, and was supposed to be worn only by the chiefs and warriors. A large sheet of strong paper, whenever they got one in exchange, was commonly applied to this purpose. The men go naked; only tying a string round their middle, and another round their neck. A little piece of a brown cloth made of the bark of a fig tree, sometimes tuck’d up to the belt, and sometimes pendulous, scarcely deserves the name of a covering; nor indeed does it seem at all intended for that purpose. This piece of cloth is sometimes of such a length, that the extremity is fastened to a string round the neck; to this string they likewise hang small round beads of a pale green nephritic stone. Coarse garments were seen among them made of a sort of matting; but they seemed never to wear them, except when in their canoes and unemployed. The women seemed to be in a servile state: they were the only persons of the family who had any employment, and several of them brought bundles of sticks and fuel on their backs: those who had children carried them on their backs in a kind of satchel. The women also were seen to dig up the earth in order to plant it. They are in general of a dark chestnut, and sometimes sallow brown; their stature middle-sized, some being rather tall, and their whole form rather stout and somewhat clumsy. Their dress is the most disfiguring that can be imagined, and gives them a thick squat shape; it is a short petticoat or fringe, consisting of filaments or little cords, about eight inches long, which are fastened to a very long string, which they have tied several times round their waist. The filaments, or little ropes, therefore, lie above each other in several layers, forming a kind of thick
Caledonia. thick thatch all round the body, but which does not
near cover the thigh; these filaments were sometimes
dyed black; but frequently those on the outside only
were of that colour, the rest being of a dirty grey.
There was not a single instance, during the ship's stay
in this island, of the women permitting any indecent
familiarity with an European; they took pleasure in
practising the arts of a jilting coquette, but never be-
came absolute wantons. The general ornaments of
both sexes are ear-rings of tortoise shells; necklaces,
or amulets, made of both shells and stones; and brace-
lets made of large shells, which they wear above the
ebows.

The houses, or huts, in New Caledonia, are cir-
cular, something like beehives, and full as close and
warm; the entrance is by a small door, or long square
hole, just big enough to admit a man bent double:
the sides are about four feet and a half high; but the roof is lofty, and peaked to a point at the top,
above which is a post or stick of wood, which is gen-
erally ornamented either with carving or shells, or both.
The framing is of small spars, reeds, &c. and both
sides and roof are thick, and close covered with thatch
made of coarse long grass. In the inside of the house
are set up posts, to which cross spars are fastened, and
platforms made for the convenience of laying any thing
on. Some houses have two floors, one above another;
the floor is laid with dried grass, and here and there
mats are spread for the principal people to sit or sleep
on. In these houses there was no passage for the smoke
but through the door: they were intolerably smoky,
and so hot as to be insupportable to those unaccustom-
ted to them: probably the smoke is intended to drive
out the musquesots which swarm here. They commonly
erect two or three of these huts near each other under
a cluster of lofty fig trees, whose leaves are impervious
to the rays of the sun.

The canoes used here are very heavy clumsy vessels;
they are made of two trees hollowed out, having a
raised gunnel about two inches high, and closed at each
end with a bulk head of the same height; so that the
whole is like a long square trough about three feet
shorter than the body of the canoe. Two canoes thus
fitted are fastened to each other about three feet as
under, by means of cross spars, which project about a
foot over each side. Over these is laid a deck or heavy
platform made of plank and small round spars, on which
they have a fire-hearth, and generally a fire burning;
they are navigated by one or two latteen sails, extended
to a small latteen yard, the end of which is fixed in a
notch or hole in the deck.

Notwithstanding the inoffensive disposition of the
inhabitants of New Caledonia, they are well provided
with offensive weapons; as clubs, spears, darts, and
slings for throwing stones. Their clubs are perhaps two
feet in a half long, and variously formed; some like
a scythe, others like a pick-axe; some have a head like
a hawk, and others have round heads; but all are
neatly made; many of their darts and spears are no less
neat, and ornamented with carvings. The slings are
as simple as possible; but they take some pains to form
the stones that they use into a proper shape, which is
something like an egg, supposing both ends to be
like the small one. They drive the dart by the assis-
tance of short cords, knobbed at one end and looped
at the other, called by the seamen becketts. These con-
tain a quantity of red wool taken from the vampyre,
or great Indian bat. Bows and arrows are wholly un-
known among them.

Their language bears no affinity to that spoken in
the other South sea islands, the word arrëkee and
one or two more excepted. This is the more extra-
ordinary, as different dialects of one language were
spoken not only in the easterly islands, but at New
Zealand.

A musical instrument, a kind of whistle, was pro-
cured here. It was a little polished piece of brown
wood about two inches long, shaped like a kind of bell,
thought apparently solid, with a rope fixed at the small
end; two holes were made in it near the base, and an-
other near the insertion of the rope, all which commu-
nicated with each other; and by blowing in the up-
permost, a shrill sound like whistling was produced:
no other instrument was seen among them that had the
least relation to music.

Many of the New Caledonians were seen with pro-
digiously thick legs and arms, which seemed to be af-
fected with a kind of leprosy; the swelling was found
to be extremely hard, but the skin was not alike harsh
and scaly in all those who were afflicted with the dis-
order. The preternatural expansion of the arm or leg
did not appear to be a great inconvenience; and they
seemed to intimate that they very rarely felt any pain
in it; but in some the disorder began to form blisters,
which are marks of a great degree of virulence. This
disease is probably elephantiatis.

Here they bury their dead in the ground. The
grave of a chief who had been slain in battle here re-
ssembled a large mole-hill, and was decorated with
spears, darts, paddles, &c. all stuck upright in the
ground round about it.

CALEDONIAN CANAL, a canal extending across
the Highlands of Scotland, in a north-east and south-
west direction, from Fort William to Inverness. It
was begun in 1803, and is expected to be completed in
1821. See CALEDONIAN CANAL, SUPPLEMENT.

CALEFACTION, the production of heat in a body
from the action of fire, or that impulse impressed by a
hot body on others around it. This word is used in
pharmacy, by way of distinction from coction, which im-
plies boiling; whereas calefaction is only heating a thing.

CALENBERG, a castle of Germany, in the duchy
of Brunswick and principality of Calenberg. It is
seated on the river Leine, and is 15 miles south of
Hanover. It is subject to the duke of Brunswick Lu-
enburg, elector of Hanover, and king of Great Brit-
ain. E. Long. 9. 43. N. Lat. 52. 20.

CALENBERG, a principality of Lower Saxony, and
one of the three parts of the duchy of Brunswick, is
situated between the Vechte, on the west, and the
empire by the principality of Zell, on the south by the
principalities of Grubenhausen and Wolfenbuttle, and
on the west by Westphalia. It belongs to the elector
of Hanover.

containing an exact register of the respective times in which the plants of any given province or climate germinate, expand, and shed their leaves and flowers, or ripen and disperse their seeds. For particulars on this curious subject, see the articles DeFoliatioN, EPPLO

Rescntia, FRONDENTIA, FructesCenTia, and GeRMINATIO.

CaLaNDER, a machine used in manufactories to press certain woollen and silk stuffs and linens, to make them smooth, even, and glossy, or to give them waves, or water them, as may be seen in mohairs and tabbies. This instrument is composed of two thick cylinders, or rollers, of very hard and well polished wood, round which the stuffs to be calendered are wound: these rollers are placed cross-wise between two very thick boards, the lower serving as a fixed base, and the upper moveable by means of a thick screw with a rope fastened to a spindle, which makes its axis: the uppermost board is loaded with large stones weighing 20,000 lb. or more. At Paris they have an extraordinary machine of this kind, called the royal calender, made by order of M. Colbert. The lower table or plank is made of a block of smooth marble, and the upper is lined with a plate of polished copper. The alternate motion of the upper board sometimes one way and sometimes another, together with the prodigious weight laid upon it, gives the stuffs their gloss and smoothness; or gives them the waves, by making the cylinders on which they are put roll with great force over the undermost board. When they would put a roller from under the calender, they only incline the undermost board of the machine. The dressing alone, with the many turns they make the stuffs and linens undergo in the calender, gives the waves, or waters them, as the workmen call it. It is a mistake to think, as some have asserted, that they use rollers with a shallow indenter or engraving cut in them. See Calendar and Suplement.

CaLenaDer of Monteith, a district in the south-west corner of Perthshire in Scotland, from which a branch of the ancient family of Livingstone had the title of earl. The chief seat of the family near Falkirk is also called Calender. Both estate and title were forfeited in consequence of the possessor being engaged in the rebellion 1715.

CaLenDERS, a sort of Mahometan friars, so called from Santon Calendieri their founder. This Santon went bareheaded, without a shirt, and with the skin of a wild beast thrown over his shoulders. He wore a kind of apron before, the strings of which were adorned with counterfeit precious stones. His disciples are rather a sect of episcopics than a society of religious. They honour a tavern as much as they do a mosque; and think they pay as acceptable worship to God by the free use of his creatures, as others do by the greatest austerities and acts of devotion. They are called, in Persia and Arabia, Abdats, or Abdallah, i.e. persons consecrated to the honour and service of God. Their garment is a single coat, made up of a variety of pieces, and quilted like a rug. They preach in the market places, and live upon what their auditors bestow on them. They are generally very vicious persons: for which reason they are not admitted into any houses.

CALENDS, in Latin antiquity, See Kalends.

CALENDULA, the MARIGOLD. See Botany Index.

CAMELUS, Elisius, a Neapolitan poet and prose author. He was preceptor to Frederick the son of Ferdinand king of Naples, and the earliest writer on the illegality of putting criminals to death, except for murder. He died in 1503.

CALENTERE, a feverish disorder incident to sailors in hot countries; the principal symptom of which is their imagining the sea to be green fields; hence, attempting to walk abroad in these imaginary places of delight, they are frequently lost. Vomiting, bleeding, a spare diet, and the neutral salts, are recommended in this disorder; a single vomit commonly removing the delirium, and the cooling medicines completing the cure.

CALEPIN, Ambrosius, an Augustine monk of Calpeio, whence he took his name, in the 6th century. He is author of a dictionary of eight languages, since augmented by Passerat and others.

CALES, in Ancient Geography, a municipal city of some note in Campania, at no great distance from Casilimnum. The epithet Calesus is by Horace and Juvenal applied to a generous wine which the territory produced.

CALETES, in Ancient Geography, a people of Gallia Celtica, on the confines of Belgica, situated between the sea and the Sequana. Now called la Plaine de Caunes, in Normandy.

CALETUS, a fort on the island of Ceylon, at the mouth of a river of the same name. The Dutch became masters of it in 1655; but were afterwards obliged to leave it. E. Long. 80. 51. N. Lat. 6. 38.

CALF, in Zoology, the young of the ox kind.

There are two ways of breeding calves that are intended to be reared. The one is to let the calf run about with its dam all the year round; which is the method in the cheap breeding countries, and is generally allowed to make the best cattle. The other is to take them from the dam after they have sucked about a fortnight: they are then to be taught to drink flat milk, which is to be made but just warm for them, it being very dangerous to give it them too hot. The best time of weaning calves is from January to May: they should have milk for 12 weeks after; and a fortnight before that is left off, water should be mixed with the milk in larger and larger quantities. When the calf has been fed on milk for about a month, little wisps of hay should be placed all about him in cleft sticks to induce him to eat. In the beginning of April they should be turned out to grass; only for a few days they should be taken in for the night, and have milk and water given them: the same may also be given them in a pail sometimes in the field, till they are so able to feed themselves that they do not regard it. The grass they are turned into must not be too rank, but short and sweet, that they may like it, and yet get it with some labour. Calves should always be weaned at grass; for if it be done with hay and water, they often grow big-bellied on it, and are apt to rot. When those among the males are selected which are to be kept as bulls, the rest should be gelt for oxen: the sooner the better. Between 10 and 20 days is a proper
CAL

CAL. [73]

CAL.

per age. About London almost all the calves are fattened for the butcher. The reason of this is, that there is a good market for them: and the lands are not so profitable to breed upon as in cheaper countries.

The way to make calves fat and fine, is the keeping them very clean; giving them fresh litter every day; and the hanging a large chalk stone in some corner where they can easily get at it to lick it, but where it is out of the way of being fouled by their dung and urine. The coops are to be placed so as not to have too much sun upon them, and so high above the ground that the urine may run off. They also bleed them once when they are a month old, and a second time before they kill them; which is a great addition to the beauty and whiteness of their flesh; the bleeding is by some repeated much oftener, but this is sufficient. Calves are very apt to be loose in their bowels; which wastes and very much injures them. The remedy is to give them chalk scraped among milk, pouring it down with a horn. If this does not succeed, they give them bate armenic in large doses, and use the cold bath of the morning. If a cow will not let a strange calf suck her, the common method is to rub both her nose and the calf's with a little brandy; this generally reconciles them after a few smellings.

Golden CALF, an idol set up and worshipped by the Israelites at the foot of Mount Sinai, in their passage through the wilderness to the land of Canaan. Our version makes Aaron fashion this calf with a graving tool after he had cast it in a mould; the Geneva translation makes him engrave it first, and cast it afterwards. Others, with more probability, render the whole verse thus: "And Aaron received them (the golden earrings), and tied them up in a bag, and got them cast into a molten calf," which version is authorised by the different senses of the word treason, which signifies to tie up or bind, as well as to shape or form; and of the word chereret, which is used both for a graving tool and a bag. Some of the ancient fathers have been of opinion that this idol had only the face of a calf, and the shape of a man from the neck downwards, in imitation of the Egyptian Isis. Others have thought it was only the head of an ox without a body. But the most general opinion is, that it was an entire calf in imitation of the Apis worshipped by the Egyptians; among whom, no doubt, the Israelites had acquired their propensity to idolatry. This calf Moses is said to have burnt with fire, reduced to powder, and strewn upon the water which the people were to drink. How this could be accomplished hath been a question. Most people have thought that as gold is indestructible, it could only be burnt by the miraculous power of God; but M. Stahl conjectures that Moses dissolved it by means of liver of sulphur. The Rabbins tell us that the people were made to drink of this water in order to distinguish the idolaters from the rest; for that as soon as they had drunk of it, the beards of the former turned red. The Cabbalists add, that the calf weighed 125 quintals; which they gather from the Hebrew word massahah, whose numerical letters make 125.

CALF, Skin, in the leather manufacture, are prepared and dressed by the tanners, skinners, and curriers, who sell them for the use of the shoemakers, saddlers, bookbinders, and other artificers, who employ them in their several manufactures.

CALF-Skin dressed in sumach, denotes the skin of this animal carried black on the hair side, and dyed of an orange colour on the flesh side, by means of sumach, chiefly used in the making of belts.

The English calf-skin is much valued abroad, and the commerce thereof very considerable in France and other countries; where divers attempts have been made to imitate it, but hitherto in vain. What is like to baffle all endeavours for imitating the English calf in France is, the smallness and weakness of the calves about Paris; which at 15 days old are not so big as the English ones when they come into the world.

See CALF. See PHOCA, MAMMALIA INDEX.

CALI, a town of Popayan in South America, seated in a valley of the same name on the river Cauca. The governor of the province usually resides there. W. Long. 78. S. Lat. 3. 15.

CALIBER, or CALLIPER, properly denotes the diameter of any body; thus we say, two columns of the same caliber, the calibers of the bore of a gun, the caliber of a bullet, &c.

Caliber compasses, a sort of compasses made with arched legs to take the diameter of round or swelling bodies. See COMPASSES.

Caliber compasses are chiefly used by gunners for taking the diameters of the several parts of a piece of ordnance, or of bombs, bullets, &c. Their legs are therefore circular, and move on an arch of brass, whereon is marked the inches and half inches, to show how far the points of the compasses are opened. Some are also made for taking the diameter of the bore of a gun or mortar.

The gaugers also sometimes use callibers, to embrace the two heads of any caulk, in order to find its length.

The caliber used by carpenters and joiners, is a piece of board notched triangular-wise in the middle for the taking of measure.

Caliber Rule, or Gunners Calipers, is an instrument wherein a right line is so divided as that the first part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the first as the diameters of balls of two, three, four, &c. pounds are to the diameter of a ball of one pound. The caliber is used by engineers, from the weight of the ball given, to determine its diameter or caliber, or vice versa.

The gunners calipers consist of two thin plates of brass joined by a rivet, so as to move quite round each other: its length from the centre of the joint is between six inches and a foot, and its breadth from one to two inches; that of the most convenient size is about nine inches long. Many scales, tables, and proportions, &c. may be introduced on this instrument; but none are essential to it, except those for taking the caliber of shot and cannon, and for measuring the magnitude of salient and entering angles. The complete callipers is exhibited Plate CXXXIII., the furniture and use of which we shall now briefly describe. Let the four faces of this instrument be distinguished by the letters A, B, C, D: A and D consist...
of a circular head and leg; B and C consist only of a leg.

On the circular head adjoining to the leg of the face A are divisions denominated shot diameters: which show the distance in inches and tenths in the points of the callipers when they are opened; so that if a ball not exceeding ten inches be introduced between them, the bevel edge E marks its diameter among these divisions.

On the bevel part E of the face B is a scale of divisions distinguished by lb. weight of iron shot. When the diameter of any shot is taken between the points of the callipers, the inner edge of the leg A shows its weight in avoirdupois pounds, provided it be lib. \( \frac{1}{16} \), 1, 1/8, 2, 3, 4, 5/8, 6, 8, 9, 12, 16, 18, 24, 26, 32, 36, or 42; the figures nearest the bevel edge answering to the short lines in the scale, and these behind them to the longer strokes. This scale is constructed on the following geometrical theorem, viz.: that the weights of spheres are as the cubes of their diameters.

On the lower part of the circular head of the face A is a scale of divisions marked bores of guns; for the use of which, the legs of the callipers are slipped across each other, till the steel points touch the concave surface of the gun in its greatest breadth; then the bevel edge F of the face B will cut a division in the scale showing the diameter of the bore in inches and tenths.

Within the scales of shot and bore diameters on the circular part of A, are divisions marked pounders: the inner figures 1, 1/2, 3, 5/2, 6, 8, 12, 18, 26, 36, correspond to the longest lines; and the figures, 1, 2, 4, 6, 9, 16, 24, 32, 43, to the short strokes. When the bore of a gun is taken between the points of the callipers, the bevel edge F will either cut or be near one of these divisions, and show the weight of iron shot proper for that gun.

On the upper half of the circular head of the face A are three concentric scales of degrees; the outer scale consisting of 180 degrees numbered from right to left, 10, 20, &c. the middle numbered the contrary way, and the outer scale beginning at the middle, with 0, and numbered on each side to 90 degrees. These scales serve to take the quantity of an angle, either entering or salient. For an entering or internal angle, apply the legs of the callipers so that its outward edges coincide with the legs of the given angle, the degree cut by the bevel edge F in the outer scale shows the measure of the angle sought; for a salient or external angle, slip the legs of the callipers across each other, so that their outward edges may coincide with the legs forming the angle, and the degree marked on the middle scale by the bevel edge E will show the measure of the angle required. The inner scale will serve to determine the elevation of cannon and mortars, or of any oblique plane. Let one end of a thread be fixed into the notch on the plate B, and any weight tied to the other end: apply the straight side of the plate A to the side of the body whose inclination is sought; hold it in this position, and move the plate B, till the thread falls upon the line near the centre marked pert. Then will the bevel edge F cut the degrees on the inner scale, showing the inclination of that body to the horizon.

On the face C near the point of the callipers is a little table showing the proportion of true and avoirdupois weights, by which one kind of weight may be easily reduced into another.

Near the extreme of the face D of the callipers are two tables showing the proportion between the pounds weight of London and Paris, and also between the lengths of the foot measure of England and France.

Near the extreme on the face A is a table containing, near the rules of the circle and sphere; and geometrical figures with numbers annexed to them: the first is a circle including the proportion in round numbers of the diameter to its circumference; the second is a circle, inscribed in a square, and a square within that circle, and another circle in the inner square: the numbers 28, 22, above this figure, exhibit the proportion of the outward square to the area of the inscribed circle: and the numbers 14, 11, below it, show the proportion between the area of the inscribed square and the area of its inscribed circle. The third is a cube inscribed in a sphere; and the number 89\(\frac{1}{5}\) shows that a cube of iron, inscribed in a sphere of 12 inches in diameter, weighs 89\(\frac{1}{5}\) lb. The fourth is a sphere in a cube, and the number 243 expresses the weight in pounds, of a sphere inscribed in a cube whose side is 12 inches: the fifth represents a cylinder and cone of one foot diameter and height: the number in the cylinder shows, that an iron cylinder of that diameter and height weighs 364.5 lb. and the number 121.5 in the cone expresses the weight of a cone whose base is 12 inches, and of the same height: the sixth figure shows that an iron cube, whose side is 12 inches, weighs 459 lb. and that a square pyramid of iron, whose base is a square foot, and height 12 inches, weighs 154.5 lb. The numbers which have been hitherto fixed to the four last figures were not strictly true; and therefore they have been corrected in the figure here referred to; and these figures on any instrument of this kind should be corrected likewise.

On the leg B of the callipers, is a table showing the weights of a cubic inch or foot of various bodies in pounds avoirdupois.

On the face D of the circular head of the callipers is a table contained between five concentric segments of rings: the inner one marked Guns shows the nature of the gun, or the weight of ball it carries; the two next rings contain the quantity of powder used for proof and service to brass guns, and the two outermost rings show the quantity for proof and service in iron cannon.

On the face A is a table exhibiting the method of computing the number of shot or shells in a triangular, square, or rectangular pile. Near this is placed a table containing the principal rules relative to the full of bodies, expressed in an algebraic manner: nearer the centre we have another table of rules for raising water, calculated on the supposition, that one horse is equal in this kind of labour to five men, and that one man will raise a hoghead of water to eight feet of height in one minute, and work at that rate for some hours. N. B. Hogheads are reckoned at 60 gallons.

Some of the leading principles in gunnery, relating to shooting in cannon and mortars, are expressed on the face B of the callipers. Besides the articles already enumerated,
CALIBER RULE.

Calidus plantae. (from color, heat) = plants that are native to warm climates. Such are those of the East Indies, South America, Egypt, and the Canary Islands. These plants, e.g. Lianeus, will bear a degree of heat which is no 40 on a scale in which the freezing point is 0, and 100 the heat of boiling water.

In the 10th degree of cold they cease to grow, lose their leaves, become barren, are suffocated, and perish.

Caliduct, in antiquity, a kind of pipes or canal disposed along the walls of houses or apartments, used by the ancients for conveying heat to several remote parts of the house from one common furnace.

California, the most northerly of all the Spanish dominions on the continent of America, is sometimes distinguished by the name of New Albion, and the Isla Cariburas: but the most ancient appellation is California; a word probably owing to some accident, or to some words spoken by the Indians and misunderstood by the Spaniards. For a long time California was thought to be an island; but Father Cino, a German Jesuit, discovered it to be a peninsula joining to the coast of New Mexico and the southern parts of America. The peninsula extends from Cape St Sebastian, lying in north latitude 43. 30. to Cape St. Lucar, which lies in north latitude 22. 32. It is divided from New Mexico by the gulf, or as some call it the lake, of California, or Vermilion sea, on the east; on the north, it is that part of the continent by which America is least known; and on the west and south, by the Pacific Ocean or great South sea. The coasts, especially towards the Vermilion sea, are covered with inhabited islands, on some of which the Jesuits have established settlements, such as St. Clement, Pataros, St. Anne, Cedars (so called from the great number of these trees it produces), St. Joseph, and a multitude of others. But the islands best known are three lying off Cape St. Lucar towards the Mexican coast. These are called Les Tres Marias, “the three Maries.” They are small, but have good wood and water, salt pits, and abundance of game; therefore the English and French pirates have sometimes wintered there, when bound on cruises in the South seas.

As California lies altogether within the temperate zone, the natives are neither chilled with cold nor scorched with heat; and indeed the improvements in agriculture made by the Jesuits afford strong proofs of the excellency of the climate. In some places the air is extremely hot and dry; but the earth wild, rugged, and barren. In a country stretching about 800 miles in length, there must be considerable variations of soil and climate; and indeed we find, from good authority, that California produces some of the most beautiful lawns, as well as many of the most inhospitable deserts, in the universe. Upon the whole, although California is rather rough and craggy, we are assured by the Jesuit Vinegars, and other good writers, that with due culture it furnishes every necessary and conveniency of life; and that, even where the atmosphere is hottest, vapours rising from the sea, and dispersed by pleasant breezes, render it of a moderate temperature.

The peninsula of California is now stocked with all sorts of domestic animals known in Spain and Mexico. Horses, mules, asses, oxen, sheep, hogs, goats, and all other quadrupeds imported, thrive and increase in this country. Among the native animals is a species of deer of the size of a young heifer, and greatly resembling it in shape; the head is like that of a deer, but the horns thick and crooked like those of a ram. The head of the animal is large, round, and cloven, the skin spotted, but

K a
the hair thinner, and the tail sharper than those of a
deer. Its flesh is greatly esteemed. There is another
animal peculiar to this country, larger and more bulky
than a sheep, but greatly resembling it in figure, and,
like it, covered with a fine black or white wool.
The flesh of this animal is nourishing and delicious; and,
happily for the natives, it is so abundant, that nothing
more is required than the trouble of hunting, as these
animals wander about in droves in the forests and on
the mountains. Father Torquemado describes a crea-
ture, which he calls a species of large bear, something
like a buffalo, of the size of a steer, and nearly of the
figure of a stag. Its hair is a quarter of a yard in
length, its neck long and awkward, and on its forehead
are horns branched like those of a stag. The tail is a
yard in length, and half a yard in breadth; and the
hoofs clenched like those of an ox. With regard to
birds we have but an imperfect account; only, in gen-
eral, Father Viniega tells us that the coast is plen-
tifully stored with peacocks, bustards, geese, cranes,
and most of the birds common in other parts of the
world. The quantity of fish which resort to these
coasts is incredible. Salmon, turbot, barbel, skate,
mackerel, &c. are caught here with very little trou-
ble; together with pearl oysters, common oysters,
lobsters, and a variety of exquisite shell fish. Plen-
ty of turtle are also caught on the coasts. On the
South sea coasts are some shell fish peculiar to it, and
perhaps the most beautiful in the world; their lustre
surpassing that of the finest pearls, and darting their
rays through a transparent varnish of an elegant vivid
blue, like the lapis lazuli. The fame of California
for pearls soon drew forth great numbers of adventur-
ers, who searched every part of the gulf, and are still
employed in that work, notwithstanding fashion has
greatly diminished the value of this elegant natural
production. Father Torquemado observes that the sea
of California affords very rich pearl fisheries; and that the
hostias, or beds of oysters, may be seen in three or four
fathom water, almost as plain as if they were on the
surface.

The extremity of the peninsula towards Cape St
Lucar is more level, temperate, and fertile, than the
other parts, and consequently more woody. In the
more distant parts, even to the farthest missions on the
east coast, no large timber hath yet been disco-
vered. A species of manna is found in this country,
which, according to the accounts of the Jesuits, has all
the sweetness of refined sugar, without its whiteness.
The natives firmly believe that this juice drops from
heaven.

The Californians are well made, and very strong.
They are extremely pusillanimous, inconstant, stupid,
and even insensible, and seem extremely deserving of
the character given to the Indians in general, under the
article AMERICA. Before the Spaniards pro-
truded into California, the natives had no form of reli-
gion. The missionaries indeed tell us many tales con-
cerning them, but they so evidently bear the marks of
surgery, as not to be worth repeating. Each nation was
then an assemblage of several cottages more or less nu-
merous, that were all mutually considered by alli-
ances, but without any chief. They were strangers
even to filial obedience. No kind of dress was used by
the men; but the women made use of some coverings,
and were even fond of ornamenting themselves with
pearls, and such other trinkets as the country afforded.

What most displayed their ingenuity was the con-
struction of their fishing nets, which are said by the
Jesuits to have even exceeded in goodness those made
in Europe. They were made by the women, of a
course kind of flax procured from some plants which
grow there. Their houses were built of branches and
leaves of trees; nay, many of them were only enclo-
sures of earth and stone, raised half a yard high, with-
out any covering; and even these were so small, that
they could not stretch themselves at length in them.
In winter they dwelt under ground, in caves either
natural or artificial.

In 1526 Ferdinand Cortez having reduced and set-
tled Mexico, attempted the conquest of California; but
was obliged to return, without even taking a survey
of the country, a report of his death having disposed
the Mexicans to a general insurrection. Some other
attempts were made by the officers of Cortez, but there
were also unsuccessful; and this valuable coast was
long neglected by the Spaniards, who, to this day,
have but one settlement upon it. In 1595 a galleon
was sent to make discoveries on the Californian shore;
but the vessel was unfortunately lost. Seven years
after, the Count de Monterey, then viceroy of New
Spain, sent Sebastian Biscayno on the same design with
two ships and a tender; but he made no discovery of
importance. In 1684 the Marquis de Laguna, also
vicerey of New Spain, dispatched two ships with a
tender to make discoveries on the lake of California.
He returned with an indifferent account, but was
among the first who asserted that California was not
an island; which was afterwards confirmed by Father
Gino, as already related. In 1699, the Spaniards
being discouraged by their losses and disappointments,
the Jesuits solicited and obtained permission to under-
take the conquest of California. They arrived among
the savages with curiosities that might amuse them,
corn for their food, and clothes for which they could
not but perceive the necessity. The hatred these
people bore the Spanish name could not support itself
against these demonstrations of benevolence. They
 testified their acknowledgments as much as their want
of sensibility and their inconstancy would permit them.
These faults were partly overcome by the religious in-
itutors, who pursued their project with a degree of
warmth and resolution peculiar to the society. They
made themselves carpenters, masons, weavers, and busi-
nessmen; and by these means succeeded in imparting
knowledge, and in some measure a taste for the useful
arts, to this savage people, who have been all success-
ively formed into one body. In 1745 they composed
43 villages, separated from each other by the barren-
ness of the soil and the want of water. The inhabitants
of these small villages subsist principally on corn and
pulses, which they cultivate; and on the fruits and
domestic animals of Europe, the breeding of which
last is an object of continual attention. The Indians
have each their field, and the property of what they
reap; but such is their want of foresight, that they
would squander in a day what they had gathered, if
the missionary did not take upon himself to distribute
it to them as they stand in need of it. They manu-
facture some coarse stuffs; and the necessities they are
in
CALIGA, in Roman antiquity, was the proper soldier's shoe, made in the sandal fashion, without upper leather to cover the superior part of the foot, though otherwise reaching to the middle of the leg, and fastened with thongs. The sole of the caliga was of wood, like the sabot of the French peasants, and its bottom stuck full of nails; which clavi are supposed to have been very long in the shoes of the scouts and sentinels, whereas these were called by way of distinction, caliga speculatioria; as if, by mounting the wearer to a higher pitch, they gave a greater advantage to the sight; though others will have the caliga speculatioria to have been made soft and woollen, to prevent their making a noise. From these caligae it was that the emperor Caligula took his name, as having been born in the army, and afterwards bred up in the habit of a common soldier.

According to Du Cange, a sort of caliga was also worn by monks and bishops, when they celebrated mass pontifically.

CALIGATI, an appellation given by some ancient writers to the common soldiers in the Roman armies, by reason of the caliga which they wore. The caliga was the badge or symbol of a soldier; whence to take away the caliga and belt, imported a dismission or cashiering.

CALIGO, or CALIGATIO, in Medicine, an opacity, or cloudiness of the anterior surface of the crystalline lens of the eye, causing a dimness or suffusion of sight.

CALIGULA, the Roman emperor and tyrant, A.D. 37, began his reign with every promising appearance of becoming the real father of his people; but at the end of eight months he was seized with a fever, which it is thought left a frenzy on his mind: for his disposition totally changed, and he committed the most atrocious acts of impiety, cruelty, and folly; such as proclaiming his horse consul, feeding it at his table, introducing it to the temple in the vestments of the priests of Jupiter, &c. and causing sacrifices to be offered to himself, his wife, and the horse. After having murdered many of his subjects with his own hand, and caused others to be put to death without any just cause, he was assassinated by a tribune of the people as he came out of the amphitheatre, A.D. 41, in the 29th year of his age, and 4th of his reign.

CALIN, a compound metal, whereof the Chinese make tea canisters, and the like. The ingredients seem to be lead and tin.

CALIPH, or KHALIF, the supreme ecclesiastical dignity among the Saracens: or, as it is otherwise defined, sovereign dignity among the Mahometans, vested with absolute authority in all matters relating both to religion and policy. In the Arabic it signifies successor or war; the caliphs bearing the same relation to Mahomet that the popes pretend they do to Jesus Christ or St Peter. It is at this day one of the Grand Signior's titles, as successor of Mahomet; and of the Sibhi of Persia, as successor of Ali. One of the chief functions of the caliph, in quality of imam or chief priest of Musulmanism, was to begin the public prayers every Friday in the chief mosque, and to deliver the khodhak or sermon. In after times, they had assistants for this latter office; but the former the caliphs always performed in person. The caliph was also obliged to lead the pilgrims to Mecca in person, and to march at the head of the armies of his empire. He granted investiture to princes; and sent swords, standards, gowns, and the like, as presents to princes of the Mahometan religion; who, though they had thrown off the yoke of the caliphate, nevertheless held of it as vassals. The caliphs usually went to the mosque mounted on mules; and the sultans Ciliciudes, though masters of Baghdad, held their stirrup, and led these mules by the bridle some distance on foot, till such time as the caliph gave them the sign to mount on horseback. At one of the windows of the caliph's palace there always hung a piece of black velvet 20 cubits long, which reached to the ground, and was called the caliph's sleeve: which the grandees of his court never failed to kiss every day, with great respect. After the destruction of the caliphate by Hulaku, the Mahometan princes appointed a particular officer, in their respective dominions, who sustains the sacred authority of caliph. In Turkey, he goes under the denomination of mufis, and in Persia under that of sadate.

CALIPHATE, the office or dignity of Caliph: See the preceding article. The successions of caliphs continued from the death of Mahomet till the 65th year of the Hegira, when the city of Bagdad was taken by the Tartars. After this, however, there were persons who claimed the caliphate, as pretending to be of the family of the Abbasides, and to whom the sultans of Egypt rendered great honours at Cairo, as the true successors of Mahomet; but this honour was merely titular, and the rights allowed them only in matters relating to religion; and though they bore the sovereign title of calipha, they were nevertheless subjects and dependents of the sultans. In the year of the Hegira 365, a kind of caliphate was erected by the Fatemites of Africa, and lasted till it was superseded by Saladin. Historians also speak of a third caliphate in Yemen or Arabia Felix, erected by some princes of the family of the Jobites. The emperors of Morocco assume the title of grand sherifs; and pretend to be the true caliphs, or successors of Mahomet, though under another name.

CALIPHIC PERIOD, in Chronology, a series of seventy-six
seventy-six years, perpetually recurring; which elapsed, the middle of the new and full moons, as its inventor, Calippus, an Athenian, imagined, return to the same day of the solar year. Meton, a hundred years before, had invented the period, or cycle, of nineteen years; assuming the quantity of the solar year 365. 64. 18. 56. 50. 41. 34. 20. 12. 25. 47. 29. 68. 48. 32. But Calippus, considering that the Metonic quantity of the solar year was not exact, multiplied Meton's period by 4, and thence arose a period of 76 years, called the Calippic. The Calippic period, therefore, contains 27,759 days: and since the lunar cycle contains 235 lunations, and the Calippic period is quadruple of this, it contains 940 lunations. This period began in the third year of the 112th Olympiad, or the 438th of the Julian period. It is demonstrated, however, that the Calippic period itself is not accurate; that it does not bring the new and full moons precisely to their places; 365. 5. 25. 60. being the excess of 940 lunations, above 76 solar years; but brings them too late, by a whole day in 225 years.

CALLIA, the fabulous history, the daughter of Lycon, king of Arcadia, and one of the nymphs of Diana. Being beloved by Jupiter, that god assumed the form of the goddess of chastity, by which means he debauched her; but her disgrace being revealed, as she was bathing with her patroness, the incensed deity turned her and the son with which she was pregnant into bears; when Jupiter, in compassion to her sufferings, took them up into the heavens, and made them the constellations Ursa Major and Ursa Minor.

CALLIX. See CAlYX.

CALLIXTUS, a name given to those, among the Lutherans, who follow the sentiments of George Callixtus, a celebrated divine, and professor at Helmstadt in the duchy of Brunswick, who died in 1556: he opposed the opinion of St Augustin, on predestination, grace, and free will, and endeavoured to form an union among the various members of the Romish, Lutheran, and reformed churches; or rather, to join them in the hands of mutual forbearance and charity.

CALLIXTUS also denotes a sect in Bohemia, derived from their name, about the middle of the 15th century, who asserted the use of the cup as essential to the eucharist. And hence their name; which is formed from the Latin calyx, a cup.

The Callixtins are not ranked by Romanists in the list of heretics, since in the main they still adhered to the doctrine of Rome. The reformation they aimed at terminated in the four following articles. 1. In restoring the cup to the laity. 2. In subjecting the criminal clerks to the punishment of the civil magistrate. 3. In stripping the clergy of their lands, lordships, and all temporal jurisdiction. 4. In granting liberty to all capable priests to preach the word of God.

CALLA, a kingdom of Tartary, in Asia, to the east of Siberia.

CALLING. See CALLECTING.

CALLING, the prominent parts at the extremities of a horse shoe, bent downwards, and forged to a sort of point.

Calkins are apt to make horses trip; they also occasion blisters, and ruin the back sinews. If fashioned in form of a hen's ear, and the horn of a horse's heel be pared a little low, they do little damage; whereas the great square callkins quite spoil the foot. Calkins are either single or double, that is, at one end of the shoe, or at both; these last are deemed less hurtful, as the horses can tread more even.

CALL, among hunters, a lesson blown upon the horn, to comfort the hounds.

CALL, an English name for the mineral called tungsten or wolfram by the Germans.

CALL, among sailors, a sort of whistle or pipe, of silver or brass, used by the boatswain and his mates to summon the sailors to their duty, and direct them in the different employments in the ship. As the call can be sounded to various strains, each of them is appropriated to some particular exercise; such as hoisting, heaving, lowering, veering away, baying, letting go a tackle, &c. The act of winding this instrument is called piping, which is as attentively observed by sailors as the beat of the drum to marches, retreat, rally, charge, &c. is obeyed by soldiers.

CALL, among fowlers, the noise or cry of a bird, especially to its young, or to its mate in coupling time. One method of catching partridges is by the natural call of a hen, arranged for the purpose, which drawing the cocks to her, they are entangled in a net. Different birds require different sorts of calls; but they are most of them composed of a pipe or reed, with a little leathern bag or purse, somewhat in form of a bellows; which, by the motion given thereto, yields a noise like that of the species of bird to be taken. The call for partridges is formed like a boat bored through, and fitted with a pipe or swan's quill, &c. to be blown with the mouth, to make the noise of the cock partridge, which is very different from the call of the hen.

Calls for quirole, &c. are made of a leathern purse in shape like a pear, stuffed with horse hair, and fitted at the end with the bone of a cat's, harp's, or coney's leg, formed like a flageolet. They are played, by squeezing the purse in the palm of the hand, at the same time striking on the flageolet part with the thumb, to counterfeit the call of the hen quill.

CALL of the House. See CALLING.

CALLA, WAKE-ROBIN, or ETHIOPIAN ARUM. See BOUNTY INDIES.

CALLA SOLOMIS, a town of Asia, in the island of Bouton in the East Indies. It is seated about a mile from the sea, on the top of a small hill surrounded with cocoa-nut trees. See BOUTON.

CALLA, a strong town of South America, in Peru. It is the port of Lima, from which it is distant about five miles. The town is built on a low flat point of land on the sea shore. It is fortified; but the fortifications were much damaged by the last great earthquake, and have not since been repaired. The town is not above nine or ten feet above the level of high water mark; but the tide does not commonly rise or fall above five feet. The streets are drawn in a line; but are full of dust, which is very troublesome. In a square near the sea side are the governor's house, the vicerey's palace, the parish church, and a battery of three pieces of cannon. On the north side are the warehouses for the merchandise brought from Chili, Mexico, and other parts of Peru. The natural woods are built with reeds, and covered with timber or clay, but they look tolerably neat. There are five monasteries,
ries and an hospital, though the number of families does not exceed 400. The trade of Callao is considerable. From Chili they bring cordage, leather, tallow, dried fish, and corn; from Chiloe, cedar planks, woolen manufactures, and carpets; from Peru, sugars, wines, brandy, masts, cordage, timber for shipping, cacao, tobacco, and melasses; from Mexico, pitch, tar, woods for dyeing, sulphur, balsam of Peru, both white and brown, as well as commodities from China. At the port of Callao the watering is easy, but the wood is a mile or two distant. Earthquakes are very frequent in these parts, which have done vast mischief to Lima and Callao. W. Long. 76° 15'. S. Lat. 12° 29'.

CALLE, in Ancient Geography, a town of Hither Spain, situated on an eminence which hangs over the river Durius; whose port was at the mouth of the river. Now Porto, Oporto, or Port a Port.

CALLEN, a town of Ireland, in the county of Kilkenny and province of Leinster, about ten miles south-west of Kilkenny. W. Long. 7° 22'. N. Lat. 52° 25'.

CALCICARPA. See Johnstonia.

CALLICO, in commerce, a sort of cloth resembling linens made of cotton. The name is taken from that of Callico, a city on the coast of Malabar, being the first place at which the Portuguese landed when they discovered the India trade. The Spaniards still call it culline.

Callicos are of different kinds, plain, printed, painted, stained, dyed, shirtings, muslins, and the like, all included under the general denomination of callicos. Some of them are painted with various flowers of different colours; others are not stained, but have a stripe of gold and silver quite through the piece, and at each end is fixed a tissue of gold, silver, and silk, intermixed with flowers. The printing of callicos was first set on foot in London about the year 1676.

CALLICRATES, an ancient sculptor, who engraved some of Homer's verses on a grain of millet, made an ivory chariot that might be concealed under the wing of a fly, and an ast of ivory in which all the members were distinct: but Pllan justly blames him for compassing genius and talents in things so useless, and at the same time so difficult. He flourished about the year 472 before Christ.

CALLIGONUM. See Botany Index.

CALLIGRAPHUS, anciently denoted a copyist, or scribe, who transcribed fair, and at length, what the notaries had taken down in notes or minutes. The word is compounded of callo, beauty, and graphe, I write. The minutes of acts, &c. were always taken in a kind of cypther, or short hand; such as the notes of Tyro in Gruter: by which means the notaries, as the Latins called them, or the ephorographi and phorographi, as the Greeks called them, were enabled to keep pace with a speaker or person who dictated. These notes, being understood by few, were copied over fair, and at length, by persons who had a good hand, for sale, &c. These persons were called calligraphi; a name frequently met with in the ancient writers.

CALLIGRAPHY, the art of fair writing. Calligraphus is said to have written an elegant distich on a sesamum seed. Junius speaks of a person, as very extraordinary, who wrote the apostles creed, and beginning of St John's Gospel, in the compass of a farthing.

What would be said of our famous Peter Bale, who in 1575 wrote the Lord's prayer, creed, ten commandments, and two short prayers in Latin, with his name, motto, day of the month, year of the Lord, and reign of the queen, in the compass of a single penny, embossed in a ring and border of gold, and covered with a crystal, all so accurately wrought as to be very legible?

CALLIMACHUS, a celebrated architect, painter, and sculptor, born at Corinth, having been seen by accident a vessel about which the plant called acanthus had raised its leaves, conceived the idea of forming the Corinthian capital; hence the Corinthian order of architecture. The ancients assure us, that he worked in marble with wonderful delicacy. He flourished about 540 B.C.

CALLIMACHUS, a celebrated Greek poet, native of Cyrene in Libya, flourished under Ptolemy Philadelphus and Ptolemy Euergetes, kings of Egypt, about 280 years before Christ. He passed, according to Quintilian, for the prince of the Greek elegiac poets. His style is elegant, delicate, and poetical. He has a great number of small poems, of which we have only some hymns and epigrams remaining. Catullus has closely imitated him, and translated into Latin verses of his small poems on the locks of Berenice. Callimachus was also a good grammarian and a learned critic. There is an edition of his remains, by Mes. le Fevre, quart; and another in two volumes 8vo. with notes by Spanheim, Gregius, Bentley, &c.

CALLING the House, in the British Parliament, is the calling over the members names, every one answering to his own, and going out of the house, in the order in which he is called; this they do in order to discover whether there be any person there not returned by the clerk of the crown, or if any member be absent without the leave of the house.

CALLINICUS of Heliopolis, inventor of a composition to burn in the water, called the Greek, and since Wild-fire. See Grecian Fire.

CALLINUS of Ephesus, a very ancient Greek poet, inventor of elegiac verse; some specimens of which are to be found in the collection of Stobaeus. He flourished about 776 years before Christ.

CALLIONYMUS, the Dragonet. See Ichthyology Index.

CALLIOPE, in the Pagan mythology, the Muse who presides over eloquence and heroic poetry. She was thus called from the sweetness of her voice, and was reckoned the first of the nine sisters. Her distinguishing office was to record the worthy actions of the living; and accordingly she is represented with tablets in her hand.

CALLIPÆDIA, the art of getting or breeding fine and beautiful children. We find divers rules and practices relating to this art, in ancient and modern writers. Among the Magi, a sort of medicine called ermesio was administered to pregnant women, as a means of producing a beautiful issue. Of this kind were the kernels of pine nuts ground with honey, myrrh, saffron, palm wine, and milk. The Jews are said to have been so solicitous about the beauty of their children, that care was taken to have some very beautiful child placed at the door of the public bath, that the women at
CALLIPEDA at going out being struck with his appearance, and retaining the idea, might all have children as fine as he. The Chinese take still greater care of their breeding women, to prevent uncouth objects of any kind from striking their imagination. Musicians are employed at night to entertain them with agreeable songs and odes, in which are set forth all the duties and comforts of a conjugal and domestic life; that the infant may receive good impressions even before it is born, and not only come forth agreeably formed in body, but well disengaged in manners. Callipeda, who is named after the fictitious name of Callipeda, has published a fine Latin poem in four books, under the title of Callipedia, seu de pulchra proli habenda ratione; wherein are contained all the precepts of that new art. There is a translation of it into English verse by Mr. Rowe.

CALLIPOLIS, in Ancient Geography, the name of several cities of antiquity, particularly one upon the Hellespont, next the Propontis, and opposite to Lampsaucus in Asia. Now GALLIPOLI.

CALLIPIC PERIOD. See Callipic.

CALLIRRHOE, in Ancient Geography, surnamed ENNEACRUNE, from its nine springs or channels; a fountain not far from Athens, greatly adorned by Pissistratus, where there were several wells, but this the only running spring. Callirrhoe was also the name of a very fine spring of hot water beyond Jordan near the Dead sea, into which it empties itself.

CALLISTIA. See Botany Index.

CALLISTEA, in Grecian antiquity, a Lesbian festival, wherein the women presented themselves in Juno’s temple, and the prize was assigned to the fairest. There was another of these contentions at the festival of Ceres Eleusinorum among the Parthasians, and another among the Eleans, where the most beautiful man was presented with a complete suit of armour, which he consecrated to Minerva, to whose temple he walked in procession, being accompanied by his friends, who adorned him with ribbons, and crowned him with a garland of myrtle.

CALLISTHENES the philosopher, disciple and relation of Aristotle, by whose desire he accompanied Alexander the Great in his expeditions; but proving too severe a censorer of that hero’s conduct, he was by him put to the torture (on a suspicion of a reasonable conspiracy), and died under it, 328 years before Christ.

CALLISTRATUS, an excellent Athenian orator, was banished for having obtained too great an authority in the government. Demosthenes was so struck with the force of his eloquence, and the glory it procured him, that he abandoned Plato, and resolved from henceforward to apply himself to oratory.

CALLITRICHE, or star-grass, in Botany, a genus of the digynia order, belonging to the monandria class of plants; and in the natural method ranking under the 12th order, Holospermeae. There is no calix, but two petals, and the capsule is bilocular and tetraspermous.

CALLOO, a fortress in the Netherlands, in the territory of Waes, on the river Scheldt, subject to the house of Austria. The Dutch were defeated here by the Spaniards in 1638. E. Long. 4° 10. N. Lat. 51° 15'.
presented dancing: This is one of the scarcest of Callot's prints; and it is very difficult to meet with a fine impression of it; for the distances and other parts of the plate failed in the setting with the aquafortis. 10. The sitting, or the new street at Nancy, a middling sized plate, lengthwise. 11. The Garden of Nancy, where young men are playing with a balloon, the same. 12. View of the Pont Neuf, a small plate, lengthwise. 13. View of the Louvere, the same. 14. Four landscapes, small plates, lengthwise.

CALLUS, or CALLUSITY, in a general sense, any cutaneous, corneous, or obsolescent hardness, whether natural or preternatural; but most frequently it means the callus generated about the edges of a fracture, provided by nature to preserve the fractured bones, or divided parts, in the situation in which they are replaced by the surgeon. A callus, in this last sense, is a sort of jelly, or liquid viscid matter, that sweats out from the small arteries and bony fibres of the divided parts, and fills up the chinks or cavities between them. It first appears of a cartilaginous substance; but at length becomes quite bony, and joins the fractured part so firmly together, that the limb will often make greater resistance to any external violence, with this part than with those which were never broken.

CALM, the state of rest which appears in the air and sea when there is no wind stirring. A calm is more dreaded by a seafaring man than a storm, if he has a strong ship and sea room enough; for under the line excessive heat sometimes produces such dead calms, that ships are obliged to stay two or three months without being able to stir one way or other. Two opposite winds will sometimes make a calm. This is frequently observed in the Gulf of Mexico, at no great distance from the shore, where some gust or land wind will so poise the general easterly wind, as to produce a perfect calm.

Calmes are never so great on the ocean as on the Mediterranean, because the flux and reflux of the
former keep the water in a continual agitation, even where there is no wind; whereas there being no tides in the latter, the calm is sometimes so deep, that the face of the water is as clear as a looking glass; but such calms are almost constant presages of an approaching storm. On the coasts about Smyrna, a long calm is reputed a prognostic of an earthquake.

It is not uncommon for the vessels to be calmed, or becalmed, as the sailors express it, in the road of the constant Levantine winds, in places where they ride near the land. Thus between the two capes of Cartoche towards the main, and Cape Antonio in Cuba, the sea is narrow, and there is often a calm produced by some gust of a land wind, that poises the Levantine wind, and renders the whole perfectly still for two or three days. In this case, the current that runs here is of use to the vessels, if it sets right; when it sets easterly, a ship will have a passage in three or four days to the Havana; but if otherwise, it is often a fortnight or three weeks sail, the ship being embayed in the gulf of Mexico.

When the weather is perfectly calm, no wind at all stirring, the sailors try which way the current sets, by means of a boat which they send out, and which will ride at anchor, though there is no bottom to be found, as regularly and well as if fastened by the strongest anchor to the bottom. The method is this: they row the boat a little distance from the ship, and then throw over their plummet, which is about forty pounds weight; they let this sink to about two hundred fathoms; and then, though it never reaches the bottom, the boat will turn head against the current, and ride as firmly as can be.

CALM LATITUDES, in sea language, are situated in the Atlantic ocean, between the tropic of Cancer and the latitude of 29°N. or they denote the space that lies between the trade and variable winds, because it is frequently subject to calms of long duration.

CALMAR, a strong sea port of Sweden, in the province of Smaland, divided into two towns, the old and the new; but of the former there remains only the church and a few houses. The new town is built a little way from the other, and has large handsome houses. E. Long. 16. 15. N. Lat. 56. 49.

CALMET, AUGUSTINE, one of the most learned and laborious writers of the 18th century, was born at Mersil le Horgne, a village in the diocese of Toul in France, in the year 1672, and took the habit of the Benedictines in 1698. Among the many works he published are, 1. A literal exposition, in French, of all the books in the Old Testament, in nine volumes folio. 2. An historical, critical, chronological, geographical, and literal dictionary of the Bible, in four vols folio, enriched with a great number of figures of Jewish antiquities. 3. A civil and ecclesiastical history of Lorraine, three vols folio. 4. A history of the Old and New Testament, and of the Jews, in two volumes folio, and seven volumes duodecimo. 5. An universal sacred and profane history, in several volumes quarto. He died in 1757.

CALMUCKS. See KALMUCKS.

CALNEH, in Ancient Geography, a city in the land of Shinar, built by Nimrod, and the last city mentioned (Gen. x. 10.) as belonging to his kingdom. It is believed to be the same with Calno, mentioned in Isaiah (x. 9.) and with Cannah in Ezekiel (xxvii. 23.) with still greater variation. It is observed, that it must have been situated in Mesopotamia, since these prophets join it with Haran, Eden Assyrian, and Chilmad, which carried on a trade with Tyre. It is said by the Chaldean interpreters, as also by Eusebius and Jerome, to be the same with Ctesiphon, standing upon the Tigris, about three miles distant from Seleucia, and that for some time it was the capital city of the Parthians.

CALOGERI, in church history, monks of the Greek church, divided into three degrees: the novices, called archari; the ordinary professed, called microchemi; and the more perfect, called megachemis: they are likewise divided into cencerites, anchorets, and reclusees. The cencerites are employed in recting their offices from midnight to sunset, they are obliged to make three genuflexions at the door of the choir, and, returning, to bow to the right and to the left, to their bre-
The anchorites rise from the conversation of
the world, and live in hermitages in the neighbour-
hood of the monasteries; they cultivate a little spot
of ground, and never go out but on Sundays and holi-
days to perform their devotions at the next monastery.
As for the recluse, they shut themselves up in groves
and caverns on the tops of mountains, which they never
get out of, abandoning themselves entirely to Provi-
dence: they live on the alms sent them by the neigh-
bouring monasteries.

CALOMEL, or dulciulis sublimate of mercury, is a
combination of mercury with the muriatic acid, in the
present nomenclature called a sub-muriate of mercury.
See PHARMACY and CHEMISTRY INDEX.

CALOPHYLLUM. See BOTANY INDEX.

CALOTTE, a cap or coif of hair, satin, or other
stuff; an ecclesiastical ornament in most Popish coun-
tries. See CAP.

CALOTTE, in Architecture, a round cavity or de-
pression, in form of a cap or cup, lathed and plastered,
used to diminish the rise or elevation of a moderate cha-
pel, cabinet, alcove, &c., which without such an ex-
pedient would be too high for other pieces of the apart-
ment.

CALPE, a mountain of Andalusia in Spain; at
the foot of which, towards the sea, stands the town of
Gibraltar. It is half a league in height towards the
land, and so steep that there is no approaching it on
that side.

CALPURNIUS, Titus, a Latin Sicilian poet,
lived under the emperor Carus and his son. We have
seven of his elegues remaining.

CALQUING, or CALMING, a term used in paint-
ing, &c., where the back side of any thing is covered
over with a black or red colour, and the strokes or lines
traced through on a waxed plate, wall, or other mat-
ter, by passing lightly over each stroke of the design
with a point, which leaves an impression of the colour
on the plate or wall.

CALTHA. See BOTANY INDEX.—There is only
one species known, which grows naturally in moist
boggy lands in many parts of England and Scotland.
The flowers gathered before they expand, and pre-
served in salted vinegar, are a good substitute for cap-
ers. The juice of the petals, boiled with a little alum,
stains paper yellow. The remarkable yellow-
ess of the butter in spring is supposed to be caused by
this plant: but cows will not eat it, unless compell-
ed by extreme hunger; and then, Boerhaave says, it
occasions such an inflammation, that they generally die.
Upon May-day, the country people strew the flowers
upon the pavement before their doors. Goats and sheep
eat this plant; horses, cows, and swine, refuse it.

CALTROP. See TRIBULUS, BOTANY INDEX.

CALTROP, in military affairs, an instrument
with four iron points, disposed in a triangular form, so that
three of them are always on the ground, and the fourth
in the air. They are scattered over the ground where
the enemy's cavalry is to pass, in order to embarrass
them.

CALVARIA, in Anatomy, the hairy scalp or upper
part of the head, which, either by disease or old age,
grows bald first.

CALVERT, Dennis, a celebrated painter, was
born at Antwerp in 1552; and had for his masters
Prospero Fontana and Lorenzo Sabbatini. He opened
a school at Bologna, which became celebrated; and
from which proceeded Guido, Alabani, and other gal-
nasters. Calvert was well skilful in architecture, per-
spective, and anatomy, which he considered as neces-
sary to a painter, and taught them to his pupils. His
principal works are at Bologna, Rome, and Reggio.
He died at Bologna in 1619.

CALVARY, a term used in Catholic countries for
a kind of chapel of devotion raised on a hillock near a
city, in memory of the place where Jesus Christ was
crucified near the city of Jerusalem. The word comes
from the Latin calvarium; and that from calvaria, hard,
in regard to the top of that hillock was bare and destitute
of verdure; which is also signified by the Hebrew word
gevilsha. Such is the Calvary of St. Valerian near Paris,

CALVIN, in Heraldry, a cross so-called, because it
resembles the cross on which our Saviour suffered.
It is always set upon steps.

CALVERT, George, afterwards Lord Baltimore,
was born at Kipling in Yorkshire about the year 1659,
and educated at Oxford, where he took the degree of
bachelor of arts, and afterwards travelled. At his re-
turn, he was made secretary to Sir Robert Cecil: he
was afterwards knighted, and in 1618 appointed one
of the principal secretaries of state. But after he had
enjoyed that post about five years, he willingly resigned
it; freely owning to his majesty that he was become a
Roman Catholic, so that he must either be wanting to
his trust, or violate his conscience in discharging his
office. This ingenious confession so affected King
James, that he continued him privy counsellor all his
reign, and the same year created him Baron of Balti-
more in the kingdom of Ireland. He had before
obtained a patent for him and his heirs, for the pro-
vince of Avalon in Newfoundland: but that being
exposed to the insults of the French, he abandon-
ed it, and afterwards obtained the grant of a country
on the north part of Virginia, where he called the
Maryland, in honour of his queen: but he died in
April 1632 (aged 50), before his patent was made
out. It was, however, filled up to his son Cecil Cal-
vert Lord Baltimore; and bears date June 20 1632.
It is held from the crown as part of the manor of
Windsor, on one very singular condition, viz., to pre-
sent two Indian arrows yearly, on Easter Tuesday, at
the castle, where they are kept and shown to visitors.—
His lordship wrote, 1. A Latin poem on the death of
Sir Henry Upton. 2. Speeches in parliament. 3. Var-
ious letters of state. 4. The answer of Tom Tell-truth.
5. The Practice of Princes. And, 6. The Lamentation
of the Kirk.

CALVI, a town of the province of Laveo, in the
kingdom of Naples, situated near the sea, about fifteen
miles north of the city of Naples. E. Long. 14° 45'.
N. Lat. 41° 15'.

CALVI is also the name of a sea port in the island of
Corse, situated on a bay, on the west side of the
island, about 40 miles southwest of Bastia. E. Long.
9° 5'. N. Lat. 42° 16'.

CALVIN, John, the celebrated reformer of the
Christian church from Lutheran superstitions and doctrin-
Calvin was born in 1509. He was the son of a cooper of Noyon in Picardy; and his real name was John Calvin, which he chose to latinize into Calvinus, styling himself in the title page to his first work (a Commentary on Seneca de Clementia), "Lucius Calvinus, Civis Romanus," an early proof of his pride, at about 22 years of age. In 1529, he was rector of Post l'Eveque; and in 1534 he threw up this benefice, separating himself entirely from the Roman church. The persecution against the Protestants in France (with whom he was now associated) obliged him to retire to Basel in Switzerland; here he published his famous Institutes of the Christian religion in 1535. The following year he was chosen professor of divinity, and one of the ministers of the church at Geneva. The next year, viz. 1537, he made all the people solemnly swear to a body of doctrines; but finding that religion had not yet had any great influence on the morals of the people, he, assisted by other ministers, declared, that since all their admonitions and warnings had proved unsuccessful, they could not celebrate the holy sacrament as long as these disorders reigned; he also declared, that he could not submit to some regulations made by the synod of Berne. Upon which the synods having summoned the people, it was ordered that Calvin and two other ministers should leave the city within two days. Upon this Calvin retired to Strasbourg, where he established a French church, of which he was the first minister, and was also chosen professor of divinity there. Two years after he was chosen to assist at the diet appointed by the emperor to meet at Worms and at Ratisbon in order to appease the troubles occasioned by the difference of religion. He went with Beza, and entered into a conference with Melancthon. The people of Geneva now entreated him to return; to which he consented, and arrived at Geneva, September 13, 1541. He began with establishing a form of ecclesiastical discipline, and a consistorial jurisdiction, with the power of inflicting all kinds of canonical punishments. This was greatly disliked by many persons, who imagined that the papal tyranny would soon be revived. Calvin, however, asserted on all occasions the rights of his consistory with inflexible strictness; and he caused Michael Servetus to be burnt at the stake for writing against the doctrine of the Trinity. But though the rigour of his proceedings sometimes occasioned great tumults in the city, yet nothing could shake his steadiness and inflexibility. Amongst all the disturbances of the commonwealth, he took care of the foreign churches in England, France, Germany, and in Poland; and did more by his pen than his presence, sending his advice and instructions by letter, and writing a greater number of books. This great reformer died on the 27th of May 1564, aged 55. His works were printed together at Amsterdam in 1671, in nine volumes folio; the principal of which are his Institutes, in Latin, the best edition of which is that of Robert Stephens in 1553, in folio; and his Commentaries on the Holy Scriptures.—Calvin is universally allowed to have had great talents, an excellent genius and profound learning. His style is grave and polite. Independent of his spiritual pride, his morals were exemplary; for he was pious, sober, chaste, laborious, and disinterested. But his memory can never be purged from the stain of burning Servetus; it ill became a reformer, to adopt the most odious practice of the corrupt church of Rome.

CALVINISM, the doctrine and sentiments of Calvin and his followers. Calvinism subsists in its greatest purity in the city of Geneva; and from thence it was first propagated into Germany, France, the United Provinces, and England. In France it was abolished by the revocation of the edict of Nantes in 1685. It has been the prevailing religion in the United Provinces ever since the year 1571. The theological system of Calvin was adopted, and made the public rule of faith in England, under the reign of Edward VI., and the church of Scotland was modelled by John Knox, the disciple of Calvin, agreeably to the doctrine, rites, and form of ecclesiastical government, established at Geneva. In England, it has declined since the time of Queen Elizabeth; though it still subsists, some say a little decayed, in the articles of the established church; and in its rigor in Scotland.

The distinguishing theological tenets of Calvinism, as the term is now generally applied, respect the doctrines of Predestination and Reprobation, Original Sin, particular Redemption, effectual, or, as some have called it, irresistible Grace in regeneration, Justification by faith, Perseverance, and the Trinity. See each of these articles.

Besides the doctrinal part of Calvin's system, which, so far as it differs from that of other reformers of the same period, principally regarded the absolute decree of God, whereby the future and eternal condition of the human race was determined out of mere sovereign pleasure and free will; it extended likewise to the discipline and government of the Christian church, the nature of the Eucharist, and the qualification of those who were entitled to the participation of it. Calvin considered every church as a separate and independent body, invested with the power of legislation for itself. He proposed that it should be governed by presbyteries and synods, composed of clergy and laity, without bishops, or any clerical subordination; and maintained, that the province of the civil magistrate extended only to its protection and outward accommodation. In order to facilitate an union with the Lutheran church, he acknowledged a real, though spiritual, presence of Christ, in the Eucharist, that true Christians were united to the man Christ in this ordinance, and that divine grace was conferred upon them, and sealed to them, in the celebration of it; and he confined the privilege of communion to pious and regenerate believers. In France the Calvinists are distinguished by the name of Huguenots; and, among the common people, by that of Paraisyts. In Germany they are conjoined with the Lutherans, under the general title Protestants; only sometimes distinguished by the name Reformed.

CALVINISTS, in church history, those who follow the opinions of Calvin. See the two preceding articles.

Crypto-Calvinists, a name given to the followers of Calvinism in Saxony, on account of their secret attachment to the Genevan doctrine and discipline. Many of them suffered by the decrees of the convocation of Torgau, held in 1576. The Calvinists in their progress
CALVINISTs, have divided into various branches, or lesser sects.

CALVINISUS, Seth, a celebrated German chronologist in the beginning of the 17th century. He wrote Blenckus calendaris Gregoriani, et duplex calendarii melioris forma, and other learned works, together with some excellent treatises on music. He died in 1671, aged 61.

CALVITIES, or CALVITIUM, in Medicine, baldness, or a want of hair, particularly on the scalp, occasioned by the moisture of the head, which should feed it, being dried up, by some diseases, old age, or the immoderate use of powder, &c. See Alopecia.

CALUMET, a symbolical instrument of great importance among the American Indians. It is nothing more than a pipe, whose bowl is generally made of a soft red marble; the tube of a very long reed, ornamented with the wings and feathers of birds. No affair of consequence is transacted without the calumet. It ever appears in meetings of commerce or exchanges; in congresses for determining of peace or war; and even in the very fury of a battle. The acceptance of the calumet is a mark of concurrence with the terms proposed; as the refusal is a certain mark of rejection. Even in the rage of a conflict this pipe is sometimes offered; and if accepted, the weapons of destruction instantly drop from their hands, and a truce ensues. It seems the sacrament of the savages; for no compact is ever violated which is confirmed by a whip from this holy reed. When they treat of war, the pipe and all its ornaments are usually red, or sometimes red only on one side. The size and decorations of the calumet are for the most part proportioned to the quality of the persons to whom they are presented, and to the importance of the occasion. The calumet of peace is different from that of war. They make use of the former to seal their alliances and treaties, to travel with safety, and to receive strangers; but of the latter to proclaim war. It consists of a red stone, like marble, formed in a cavity resembling the head of a tobacco pipe, and fixed to a hollow reed. They adorn it with feathers of various colours; and name it the calumet of the sun, to which luminary they present it, in expectation of thereby obtaining a change of weather as often as they desire. From the winged ornaments of the calumet, and its conciliating use, writers compare it to the caduceus of Mercury, which was carried by the caduceators, or messengers of peace, with terms to the hostile states. It is singular, that the most remote nations, and the most opposite in their other customs and manners, should in some things have, as it were, a certain consent of thought. The Greeks and the Americans had the same idea, in the invention of the caduceus of the one, and the calumet of the other.

Dance of the Calumet, is a solemn rite among the Indians on various occasions. They dare not wash themselves in rivers in the beginning of summer, nor taste of the new fruits, without performing it; and the same ceremony always confirms a peace or precedes a war. It is performed in the winter time in their cabins, and in summer in the open fields. For this purpose, they choose a spot among trees to shade them from the heat of the sun, and lay in the middle a large mat, as a carpet, upon which the monitor, or god, of the chief of the company. On the right hand of this image, they place the calumet, as their great deity, erecting around it a kind of trophy with their arms. Things being thus disposed, and the hour of dancing come, those who are to sing take the most honourable seats under the shade of the trees. The company is then ranged round, every one, before he sits down, saluting the monitor, which is done by blowing upon it the smoke of their tobacco. Each person next receives the calumet in rotation, and holding it with both hands, dances to the cadence of the vocal music, which is accompanied with the beating of a sort of drum. During this exercise, he gives a signal to one of their warriors, who takes a bow, arrow, and axe, from the trophies already mentioned, and fight him; the former defending himself with the calumet only, and both of them dancing all the while. This mock engagement being over, he who holds the calumet makes a speech, in which he gives an account of the battles he has fought, and the prisoners he has taken, and then receives a cloak, or some other present, from the chief of the ball. He then resigns the calumet to another, who, having acted a similar part, delivers it to a third, who afterwards gives it to his neighbours, till at last the instrument returns to the person that began the ceremony, who presents it to the nation invited to the feast, as a mark of their friendship, and a confirmation of their alliance; and when this is the occasion of the entertainment.

CALUMNY, the crime of accusing another falsely, and knowingly so, of some heinous offence.

Oath of Calumny, Juramentum (or rather Jugum-rondum) Calumnie, among civilians and canonists, was an oath which both parties in a cause were obliged to take; the plaintiff that he did not bring his charge, and the defendant that he did not deny it, with a design to abuse each other, but because they believed their cause was just and good; that they would not deny the truth, nor create unnecessary delays, nor offer the judge or evidence any gifts or bribes. If the plaintiff refused this oath, the complaint or libel was dismissed; if the defendant, it was taken pro confesso. This custom was taken from the ancient athletes; who, before they engaged, were to swear that they had no malice, nor would use any unfair means for overcoming each other. The Juramentum calumnie is much disused, as a great occasion of perjury. Anciently the advocates and proctors also took this oath; but of late it is dispensed with, and thought sufficient that they take it once for all at their first admission to practice. See also Law, Part III. No. cclxxiv. 7.

CALVUS, Cornelius Licinius, a celebrated Roman orator, was the friend of Catullus; and flourished 64 B. C. Catullus, Ovid, and Horace, speak of him.

CALX properly signifies dust, but has been used by chemists and physicians for a fine powder remaining after the calcination of metals. All metallic calces are found to weigh more than the metal from which they were originally produced. This arises from the metal having combined with oxygen during the process of calcination or burning; and hence in the present chemical nomenclature they are called oxides.

Calx Natrix, in Natural History, a kind of marly earth, of a dead whitish colour, which, if thrown into water,
water, makes a considerable bubbling and hissing noise, and has, without previous burning, the quality of making a cement like lime or plaster of Paris.

CALKS FINE or Quicklime, that whereas no water has been cast; in contradiction to lime which has been skated by pouring water on it.

CALYBITES, the inhabitants of a cottage, an appellation given to divers saeons on account of their long residence in some hut by way of mortification.

The word is formed from μαλης, τογα, Ι κρινα; whence μαλης, a little cot. The Roman church commemorates St John the Calybites on the 15th of December.

CALYCANTHEMÆ, in Botany, an order of plants in the Fragmenta methodi naturalis of Linneus, in which are the following genera, viz. epilobium, ornithica, jussima, ludwigi, oldenlandia, isarida, &c. See Botany, Natural Orders.

CALYCANTHUS. See Botany Index.

CALYCIFLORÆ, in Botany, the 10th order in Linneus's Fragmenta methodi naturalis, consisting of plants which, as the title imports, have the stamina (the flower) inserted into the calyx. This order contains the following genera, viz. cleaunus, hippophae, osyris, and trophias. See Botany.

CALYCTUS, (from calyx, the flower-cup), systematic botanists, so named by Linneus, who have arranged all vegetables from the different species, structure, and other circumstances, of the calyx or flower-cup. The only systems of this kind are the Character Plantarum Novum, a posthumous work of Magnolius, professor of botany at Montpellier, published in 1725; and Linneus's Methodus Calycina, published in his Classes Plantarum, at Leyden, in 1738. See Botany, History.

CALYDON, in Ancient Geography, a town of Αἰτωλια, situated seven miles and a half from the sea, and divided by the river Evenus; the country was anciently called Αἰτωλία, from the Αἰτωλία its inhabitants. This country was famous for the story of Meleager and the Calydonian boar.

CALYPSEO, in fabulous history, a goddess who was the daughter of Ocebus and Tethys, or, as others say, of Atlas. She was queen of the island of Ogygia, which from her was called the island of Calypso. According to Homer, Ulysses suffered shipwreck on her coast, and staid with her several years.

CALYPTRA, among botanists, a thin membranaceous involucrum, usually of a conic figure, which covers the parts of fructification. The capsules of most of the mosses have calyptra.

CALYX, among botanists, a general term, expressing the cup of a flower, or that part of a plant which surrounds and supports the other parts of the flower. The cups of flowers are very various in their structure, and on that account distinguished by several names, as perianthium, involucrum, spathe, gluma, &c. See Botany.

CALZADA, a town of Old Castile in Spain, seated on the river Leglera. W. Long. 2. 47. N. Lat. 42. 12.

CAMEA, in Natural History, a genus of the semipellucid gems, approaching to the onyx structure, being composed of zones, and formed on a crystalline basis; but having their zones very broad and thick, and laid alternately one on another, with no common matter between; usually less transparent, and more denser with earth, than the onyx.

1. One species of the cameo is the dull-looking onyx, with broad, black, and white zones; and is the cameo of the moderns, and the Arabian onyx. This species is found in Egypt, Arabia, Persia, and the East Indies. 2. Another species of the cameo is the dull broad-zoned, green and white cameas, or the jaspe-cameas of the Italians: it is found in the East Indies, and in some parts of America. 3. The third is the hard cameo, with broad white and chestnut-coloured veins. 4. The hard cameas, with bluish, white, and flesh-coloured broad veins, being the sardonyx of Pliny's time, only brought from the East Indies.

CAMAIEU, or CAMAYEU, a word used to express a peculiar sort of onyx: also by some to express a stone, whereon are found various figures, and representations of landscapes, &c. formed by a kind of inus natura, so as to exhibit pictures without painting. The word comes from camanimus, a name the Orientals give to the onyx, when they find, in preparing it, another colour; as who should say, a second stone. It is of these camameus Pliny is to be understood when he speaks of the manifold picture of gems, and the party-coloured spots of precious stones: Gemmatorum pictura tam multiplex lapidumque tam discesores macule.

Camaieu is also applied by others to those precious stones, as onyxes, cornelians, and agates, whereas the lapidaries employ their art to aid nature, and perfect these representations. See Camæa.

Camaieu is also frequently applied to any kind of gem, whereon figures may be engraved either indentely or in relievo. In this sense the lapidaries of Paris are called in their statutes, cutters of camayeus.

A society of learned men at Florence undertook to procure all the camoes or camayeus and intaglios in the great duke's gallery to be engraved; and began to draw the heads of divers emperors in camoes.

Camaieu is also used for a painting, wherein there is only one colour; and where the lights and shadows are of gold, wrought on a golden or azure ground. When the ground is yellow, the French call it cirage; when gray, grisaille. This kind of work is chiefly used to represent baso relieves: the Greeks call pieces of this sort monographeus.

CAMALDULITANS, CAMALDULANS, or CAMALDULITES, an order of religious, founded by Romuald, an Italian fanatic, in 1023, in the horrible desert of Camaldoli, otherwise called Campo Maldoli, situated in the state of Florence, on the Apennines. Their rule is that of St Benedict; and their houses, by the statutes, are never to be less than five leagues from cities. The Camalduliani have not borne that title from the beginning of their order; till the close of the eleventh century they were called Romualdites, from the name of their founder. Till that time, Camaldulian was a particular name for those of the desert Camaldoli; and D. Grandi observes, was not given to the whole order in regard it was in this monastery that the order commenced, but because the regulation was best maintained here.

Guido Grandi, mathematician of the grand duke of Tuscany,
Camaldulæans, of which the one were Coenobites, and the other Eremites.

Camalodunum, in Ancient Geography, a town of the Triobantes, the first Roman colony in Britain, of veterans under the emperor. From the Itineraries it appears to have stood where now Malden stands. It continued to be an open place under the Romans; a place of pleasure rather than strength; yet not unadorned with splendid works, as a theatre and a temple of Claudius: which the Britons considered as badges of slavery, and which gave rise to several seditions and commotions. It stands on a bay of the sea, at the mouth of the Chelmer, in the county of Essex: the modern name is curtailed from the ancient.

Camara, an island of Arabia, in the Red Sea, whose inhabitants are little and black. It is the best of all the islands in this sea, and here they fish for coral and pearls. N. Lat. 15°.

Camassei, or Camace, Andrea, painter of history and landscape, was born at Bevagna, and at first learned the principles of design and colouring from Domenichino; but afterwards be studied in the school of Andrea Sacchi, and proved a very great painter. He was employed at St Peter's at Rome, as also at St John Lateran; and his works are extremely admired, for the sweetness of his colouring, the elegance of his thoughts and design, and likewise for the delicacy of his pencil. Sandrart laments that the world was deprived of so promising a genius, in the very bloom of life, when his reputation was daily advancing. He died in 1657. At St John Lateran are to be seen, the Battle of Constantine and Maxentius; and the Triumph of Constantine; which are noble and grand compositions; and they afford sufficient proofs of the happiness of his invention, and the correctness of his execution. Also at Wilton, the seat of the earl of Pembroke, there is a picture of Venus with the Graces, said to be by the hand of Camassei.

Cambricum, in Ancient Geography, the capital of the Nervii, a people of Gallia Belgica. (Antonius, Pentinger); before whose time no mention was made of it. Now Cambrai, capital of the Cambresia, in French Flanders. E. Long. 1° 15'. Lat. 50° 15'.

Camarinæ, in Ancient Geography, a city of Sicily, built by the Syracusans on an eminence near the sea, in the south of Sicily, to the west of the promontory Pachynum, between two rivers, the Hippariss and Oanus. Of so famous a city nothing now remains but its name and ancient walls, a mile and a half in compass, with the slight remains of houses: now called Camarina.

Camarina Polus, a marsh or lake near the city Camarina, and from which it took its name. In a time of drought, the stench of the lake produced a pestilence; upon which the inhabitants consulted the oracle, whether they should not quite drain it. The oracle dissuaded them: they notwithstanding drained it, and opened a way for their enemies to come and plunder their city: hence the proverb No morosus Camarinae, that is, not to remove one evil to bring on a greater.

Lago di Camarina, situated in a beautiful plain, under the very walls of Camarina, and of a triangular form.

Camaicus, or Cumaicus, a town of Asia, in India, and in the peninsula on this side the Ganges; capital of a province of the same name; but more commonly called Cunaeæ. It is seated at the bottom of a gulf of the same name, on a small river; is a large place with high walls, and has a pretty good trade. The product and manufactures are inferior to few towns in India, for it abounds in corn, cattle, and silk; and cornelian and agate stones are found in its rivers. The inhabitants are noted for embroidery; and some of their quilts have been valued at 401. It came into the possession of the British in 1802. E. Long. 72° 15'. N. Lat. 22° 30'.

Cumbayes, in commerce, cotton cloths made at Bengal, Madras, and some other places on the coast of Coromandel. They are proper for the trade of Marseilles, whether the English at Madras send great numbers of them. Many are also imported into Holland.

Cambert, according to our monkish historians, one of the three sons of Brute, who, upon his father's death, had that part of Britain assigned him for his share, called from him Cambria, now Wales.

Cambium, among builders, a piece of timber in an edifice cut ashwise, or with an obtuse angle in the middle, commonly used in platforms, as church leads, and on other occasions where long and strong beams are required.

Cambred decks, among ship-builders. The deck or flooring of a ship is said to be cumbered, or to lie cumbering, when it is higher in the middle of the ship's length, and droops towards the stem and stern, or the two ends. Also when it lies irregular; a circumstance which renders the ship very unfit for war.

Cambert, a French musician in the 17th century, was at first admired for the manner in which he touched the organ, and became superintendent of the choir to Anne of Austria the queen-mother. The Abbé Perrin associated him in the privileges he obtained of his majesty, of setting up an opera in 1669. Cambert set to music two pastorals, one entitled Pomone, the other Ariadne, which were the first operas given in France. He also wrote a piece entitled The pains and pleasures of love. These pieces pleased the public; yet in 1672, Lally obtaining the privilege of the opera, Cambert was obliged to come to England, where he became superintendent of the music to King Charles II. and died there in 1677.

Cambio, an Italian word which signifies exchange, commonly used in Provence, and in some other countries, particularly Holland.

Cambist, a name given in France to those who trade in notes and bills of exchange. The word cambist, though a term of antiquity, is even now a technical word, of some use among merchants, traders, and bankers. Some derive it from the Latin cambium, or rather cambio.

Camblet, or Chamblet, a stuff sometimes of wool, sometimes silk, and sometimes hair, especially that of goats, with wool or silk: in some, the warp
CAMBRASINES, in commerce, fine linen made in Egypt, of which there is a considerable trade at Cairo, Alexandria, and Rosetta, or Raschit. They are called cambrasines from their resemblance to cambric.

CAMBRAY, an archiepiscopal city, the capital of the Cambresis, in the Low Countries, seated on the Scheldt. It is defended by good fortifications, and has a fort on the side of the river; and as the land is low on that side, they can lay the adjacent parts under water by means of sluices. Its streets are large and deep, and those of the circondale are cut into a rock. Clodion became master of Cambray in 445. The Danes burnt it afterwards; since which time it became a free imperial city. It has been the subject of contest between the emperors, the kings of France, and the earls of Flanders. Francis I. let it remain neutral during the war with Charles V., but this last took possession of it in 1549. After this it was given to John of Montclare by Henry III. of France, whom he created prince of Cambray; but the Spaniards took it from Montclare in 1553, which broke his heart. It continued under the dominion of the house of Austria till 1677, when the king of France became master of it, in whose hands it has continued ever since.

The buildings of Cambray are tolerably handsome, and the streets fine and spacious. The place or square fronted is of an extraordinary largeness, and capable of receiving the whole garrison in order of battle. The cathedral dedicated to the Virgin-Mary is one of the finest in Europe. The body of the church is very large, and there are rich chapels, the pillars of which are adorned with marble tombs that are of exquisite workmanship, and add greatly to the beauty of the place.

There are two galleries, one of which is of copper, finely wrought. The door of the choir is of the same metal, and well carved. The steeple of this church is very high, and built in the form of a pyramid; and from its top you have a view of the city, which is one of the finest and most agreeable in the Low Countries. There are nine parishes, four abbeys, and several convents for both sexes. The citadel is very advantageously situated on the high ground, and commands the whole city. Cambray is one of the most opulent and commercial cities in the Low Countries; and makes every year a great number of pieces of cambric, with which the inhabitants drive a great trade. E. Long. 3. 20. N. Lat. 50. 37. IT.

CAMBRAY, M. de Femelon, archbishop of. See FENELON.

CAMBRESIS, a province of France, in the Netherlands, about 25 miles in length. It is bounded on the north and east by Hainault, on the south by Picardy, and on the west by Artois. It is a very fertile and populous country; and the inhabitants are industrious, active, and ingenious. The trade consists principally in corn, sheep, very fine wool, and fine linen cloth. Cambray is the capital town.

CAMBRIA, a name for the principality of Wales.

CAMBRIC, in commerce, a species of linen made of flax, very fine and white; the name of which was originally derived from the city of Cambray, where they were first manufactured. They are now made at other places in France.

The
The manufacture of cambrics hath long since proved of extraordinary advantage to France. For many years it appeared that England did not in this article contribute less than 200,000l. per annum to the interest of France. This proved motive sufficient to induce the parliament of Great Britain to enact many salutary laws to prevent this great loss of our wealth. See 18 Geo. II. c. 36, and 21 Geo. II. c. 26. See also stat. 32 Geo. II. c. 32, and 3 Geo. III. c. 37, which regulates the cambric manufacture, not long since introduced into Winchelsea in Sussex; but very soon abolished. The cambrics now allowed in this country are manufactured in Scotland and Ireland. Any persons convicted of wearing, selling (except for exportation), or making up for hire any cambric or French lawns, are liable to a penalty of 5l. by the two first statutory cited above.

CAMBRIDGE, a town of England, and capital of the county of that name. It takes the name of Cambridge from the bridge over the Cam, which divides the town into two parts. Either it or a place in the neighbourhood was styled Camboritum, in the time of the Romans. It suffered much during the wars with the Danes. Here was a castle built by William the Conqueror, of which the gatehouse yet remains, and is now the county gaol. By Doomsday-book it appears that it had ten wards, containing 367 houses. In William Rufus’s reign it was quite destroyed by Roger de Montgomery; but Henry I. bestowed many privileges upon it to encourage its restoration, particularly an exemption from the power of the sheriffs, on condition of its paying yearly into the exchequer 100 marks (equivalent to 1000 pounds now), and from tolls, lastage, pontage, passage, and stallage, in all fairs of his dominions. It was afterwards often plundered in the baronous wars by the outlaws from the isle of Ely, till Henry III. secured it by a deep ditch. In 1388, Richard II. held a parliament there. In the rebellion of Wat Tyler and Jack Straw against that prince, the university records were taken and burnt in the market place.

The modern town is about one mile long from south to north, and about half a mile broad in the middle, diminishing at the extremities. It has 14 parish churches, of which two are without any towers. It contained 11,108 inhabitants in 1811; but the private buildings are neither elegant nor large, owing chiefly to their being held on college leases. It is governed by a mayor, high steward, recorder, 13 aldermen and 24 common council men, a town clerk, &c. Its chief trade is water carriage from hence to Downham, Lynn, Ely, &c. The Jews, being encouraged to settle in England by William I. and II. were very populous here for several generations, and inhabited that street now called the Jewry. They had a synagogue, since converted to a parish church, called from the shape of its tower Round Church; though others are of opinion that it was built by the Knights Templars, it bearing a resemblance to the Temple church in London. The market place is situated in the middle of the town, and consists of two spacious oblong squares united together; at the top of the angle stands the shire hall, lately erected at the expense of the county. At the back of the shire hall is the town hall and gaol. In the market place, fronting the shire hall, is a remarkably handsome stone conduit, to which water is conveyed by an aqueduct, which was the benefaction of the celebrated Hobson, a carrier in the reign of James I. who was a native of this town. A fine road for the benefit of the inhabitants and students was made a few years since for four miles, from this town to Gogmagog hills, pursuant to the will of Mr Worts. The late Dr Ad- denbrooke also left it 4000l. towards building and furnishing an hospital for the cure of poor diseased people gratis; of which charity the master of Catharine hall is a trustee; which hospital has been erected at the south-east end of the town. At a little distance from Bennet college is the botanic garden of five acres, and a large house for the use of the governors and the residence of the curator, given to the university by the late Dr Walker, who settled an estate on it towards its support, to which the late Mr Edward Betham added a very considerable benefaction. The town has fairs on June 24, and August 14.

The glory of Cambridge is its university; but when it had its beginning is uncertain. At first there was no public provision for the accommodation or maintenance of the scholars; but afterwards mones began to be erected by pious persons for their reception, and in the time of Edward I. colleges began to be built and endowed. This university, not inferior to any in Christendom, consists of 12 colleges and 4 halls, which have the same privileges as the colleges. The whole body, which is commonly about 3500, enjoys very great privileges granted by several of our sovereigns; but it was James I. who empowered it to send two members to parliament, as the town had done from the first. The university is governed, 1. By a chancellor, who is always some nobleman, and may be changed every three years, or continued longer by the tacit consent of the university. 2. By a high steward, chosen by the senate, and holding his place by patent from the university. 3. By a vice-chancellor, who is the head of some college or hall, and chosen yearly by the body of the university, the heads of the colleges naming two. 4. By two proctors chosen every year, according to the cycle of colleges and halls; as are two taxors, who with the proctors regulate the weights and measures, as clerks of markets. The proctors also inspect the behaviour of the scholars, who must not be out of their colleges after nine at night. Here are also 2 moderators, 2 curators, a commissary, public orator, 2 librarians, a register, a school-keeper, 3 esquire beadle and a yeoman beadle, 16 professors, and the caput, consisting of the vice-chancellor, a doctor of divinity, a doctor of laws, a doctor of physic, a regent and a non-regent master of arts. Henry VI. granted it the power to print all books of any kind within itself, a privilege which Oxford had not. The senate house of the university is an elegant building of the Corinthian order, cost near 16,000l. building; in which on the north side is a fine statue of George I. erected in 1739 at the expense of the late Lord Townshend; opposite to this on the south side is another of George II. erected in 1765 at the expense of the late duke of Newcastle: at the east end, on each side of the entrance, are two others; one, the late duke of Somerset, after the Vandyke taste; the other, an Italian emblematical figure of Gloria. This is allowed to be the most superb room in England, being 101 feet long.
old building, 14 feet long, 27 broad, and 27 high. Cambridge. This college was founded in 1357. There are three colleges in Oxford, which dispute the antiquity with this. Cambridge and Oxford were universities long before they were possessed of any colleges in their own right, the students then lodging and boarding with the townsmen, and they then hired hotels for their exercises and disputations. A hotel or hall, now denominated Pythagoras's school, situated on the west side of the river, is one of the ancient hotels that remain undemolished, and in which Erasmus read his first Greek lectures in England. 2. Clare hall, on the brink of the river, over which it has an elegant stone bridge, was founded in 1326, consisting of one grand court, 130 feet long, and 111 broad. The front of this building that faces the fields has the appearance of a palace. To this college a new chapel has been added. 3. Pembroke hall is near St Peter's college, and was founded in 1343; it consists of two courts. It has an elegant chapel, built by Sir Christ. Wren. 4. Corpus Christi or Bennet college, founded in 1350, has but a mean appearance, but is possessed of a remarkably large collection of valuable and curious ancient manuscripts. 5. Trinity hall, on the north of Clare hall, near the river, was founded in 1351; it is a small but remarkably neat building. 6. Gonville and Caius college is near the middle of the town, north of the senate house, and has three courts. It was founded in 1348, and augmented in 1527. 7. King's college, the most noble foundation in Europe, was first endowed by Henry VI. The old court resembles a decayed castle, more than a college. The new building is very magnificent, near 300 feet long. The chapel is one of the finest pieces of Gothic architecture now remaining in the world. It is 304 feet long, 73 broad on the outside, and 40 within, and 91 high; and yet not a single pillar to sustain its ponderous roof, of which it has two: the first is of stone, most curiously carved, and covered with wood, covered with lead, on which is a vacancy of 10 feet. There is such a profusion of carvings, both within and without, as is nowhere to be equalled.

Henry VII. enlarged it 188 feet in length, and Henry VIII. gave the elegant stalls and organ gallery, with its inimitable carvings, where are the coats of arms of that king and those of Anne Boleyn quartered. He gave also the elegant painted glass windows, which are in fine preservation, and were permitted by Cromwell to be preserved when almost every other in England was destroyed, as he had a particular regard for this university, where he had his education, and for the town which he had represented in parliament. A new altar has been lately erected, which corresponds with the architecture of the building, embellished with an antique painting of Christ taken down from the cross, purchased in Italy, and presented to the college by the earl of Carlisle. In this chapel are put up the Spanish colours taken at the reduction of Maastricht by Colonel Draper, a member of this college. This college has an ancient stone bridge over the Cam. 8. Queen's college, near the river, south of King's, was founded in 1448, and consists of two courts, with a fine grave, and gardens on both sides of the river, connected with each other and the college by two wooden bridges, one of which is of a curious structure. 9. Catherine hall is east of Queen's, and its principal front on the west,
CAMBRIDGE, west, the most extensive and regular in the university.

It contains only one court, 180 feet long, and 120 broad. and was founded in 1475. 10. Jesus college is at the east end of the town, surrounded by groves and gardens. The principal front faces the south, 180 feet long, regularly built and sashed: it was originally a Benedictine convent, and converted to the present use in 1576. 11. Christ's college is opposite to St Andrew's church, on the east side of the town; and was founded by Henry VIII's mother, in 1505. It has lately had a thorough repair, and is now a neat and beautiful structure. 12. St John's college was founded by the same lady, in 1509, on the site of a dissolved priory. It consists of three courts, and has a large library filled with scarce and valuable books. To this college belongs a fine stone bridge over the river, which leads to their grand walks. 13. Magdalene college, the only one that stands on the north side of the river, near the great bridge, consists of two courts, and was founded in 1519. 14. Trinity college is east of the river, having St John's college on the north, and Caius's college and Trinity hall on the south. It contains two large quadrangles, the first of which is 344 feet long, and 280 broad. It has two noble entrances; and on the north side of it is the chapel, 204 feet long, 34 broad, and 44 high. It has every grand ornament, and the much admired statue of Sir Isaac Newton, who was a student in this college. The hall is above 100 feet long, 40 broad, and 50 high. The inner court is esteemed the finest in the university, and surpasses any in Oxford. It is very spacious, and has an elegant cloister of stone pillars, supporting grand apartments: on the west is the library, the most elegant structure of the kind in the kingdom, 190 feet long, 40 broad, and 38 high within. Its entrance is by a staircase, the steps black marble, and the walls incrusted with ancient Roman monuments. The entrance into the library is by folding doors at the north end. Its inside appearance is inexpressibly grand, having at the south end (lately erected) a beautiful painted glass window of his present majesty in his robes; and the classes are large, beautiful, and noble, well stocked with books, manuscripts, &c. Its outside has every suitable embellishment, and was erected by Sir Christopher Wren, at the expense of near 20,000l. Under this building is a spacious piazza of equal dimensions; out of which open three gates to a lawn that leads to the river, over which is a new elegant cycloidal bridge of three arches, leading to extensive walks. In the middle is a remarkable vista. This college was founded on the site of two other colleges and a hall in 1546, by Henry VIII. 15. Emmanuel college is at the south-east end of the town; consists of two courts, the principal of which is very neat; and was built on the site of a Dominican convent. It has been handsomely and in part rebuilt and elegantly embellished. 16. Sidney Sussex college is in Bridge-street. Its hall is elegant, but the chapel remarkable only for standing north and south, as others do east and west. The number of inhabitants in the town of Cambridge in 1801, was 10,087.

CAMBRIDGESHIRE, an inland county of England, bounded on the east by Norfolk and Suffolk, on the south by Essex and Hertfordshire, on the west by Bedfordshire and Huntingdonshire, and on the north Cambridgeshire. Prior to the arrival of the Romans it was included in the ancient division of the Iceni; and after their conquest, in the third province of Flavia Caesariensis, which reached from the Thames to the Humber. During the Heptarchy it belonged to the kingdom of the East Angles, the sixth kingdom, which began in 575, and ended in 792, having had 14 kings; and it is now included in the Norfolk circuit, the diocese of Ely, and province of Canterbury, except a small part which is in the diocese of Norwich. It is about 40 miles in length from north to south, and 25 in breadth from east to west, and is 150 miles in circumference, containing near 570,000 acres. It has about 17,400 houses, 140,000 inhabitants; is divided into 17 hundreds, in which are one city, Ely; 8 market towns, viz. Cambridge, which is the shire town, and a celebrated university, Caxton, Linton, Merch, Newmarket, Soham, Wisbeach, Thorney, and part of Royston; 220 villages, 64 parishes: sends 2 members to parliament (exclusive of 2 for the town, and 2 for the university), pays one part of the land tax, and provides 480 men in the militia. Its only rivers are the Cam, the Nene, and the Ouse. A considerable tract of land in this county is distinguished by the name of the Isle of Ely. It consists of fenny ground, divided by innumerable channels and drains: and is part of a very spacious level, containing 300,000 acres of land, extending into Norfolk, Suffolk, Huntingdonshire, and Lincolnshire. The Isle of Ely is the north division of the county, and extends south almost as far as Cambridge. The whole level of which this part is, is bounded on one side by the sea, and on the others by uplands; which, taken together, form a rude kind of semicircle, resembling a horse shoe. The air is very different in different parts of the county. In the fens it is moist and foggy, and therefore not so wholesome; but in the south and east parts it is very good, these being much drier than the other; but both, by late improvements, have been rendered very fruitful, the former by draining, and the latter by cinquefoil: so that it produces plenty of corn, especially barley, saffron, and hemp, and affords the richest pastures. The rivers abound with fish, and the fens with wild fowl. The principal manufactures of the county are malt, paper, and baskets. As the above tract appears to have been dry land formerly, the great change it has undergone must have been owing either to a violent breach and inundation of the sea, or to earthquakes. As the towns in and about the fens were great sufferers by the stagnation of the waters in summer, and want of provisions in winter, many attempts were made to drain them, but without success, until the time of Charles I. in which, and that of his son, the work was happily completed, and an act of parliament passed, by which a corporation was established for its preservation and government. By the same act, 83,000 acres were vested in the corporation, and 10,000 in the king. In these fens are a great many decoys, in which incredible numbers of ducks, and other wild fowl, are caught during the season. The population of Cambridgeshire in 1811 amounted to 100,109 persons. See CAMBRIDGESHIRE, Supplement.

New CAMBRIDGE, a town of New England, about three
CAMDEN

Cambridge three miles from Boston, remarkable for an university consisting of three colleges. W. Long. 75. 4. N. Lat. 42. 0.
Camden.

CAMBRIDGE Manuscript, a copy of the Gospels and Acts of the Apostles, in Greek and Latin. Beza found it in the monastery of Irenaeus at Lyons in the year 1562, and gave it to the university of Cambridge in 1582. It is a quarto size, and written on vellum; 66 leaves of it are much torn and mutilated, ten of which are supplied by a later transcriber. Beza conjectures, that this manuscript might have existed so early as the time of Irenaeus: Wetstein apprehends that it either returned or was first brought from Egypt into France: that it is the same copy which Druthmar, an ancient expositor who lived about the year 840, had seen, and which, he observed, was ascribed to St. Hilary: and that R. Stephens had given a particular account of it in his edition of the New Testament in 1550. It is usually called Stephen's second Manuscript. Mill agrees with F. Simon in opinion, that it was written in the western part of the world by a Latin scribe, and that it is to a great degree interpolated and corrupted: he observes that it agrees as much with the Latin Vulgate, as to afford reason for concluding, that it was corrected or formed upon a corrupt and faulty copy of that translation. From this and the Clermont copy of St. Paul's Epistles, Beza published his larger Annotations in 1582.

CABELS. See (History of) Persia.

CAMDEN, William, the ancient antiquarian, was born in London in the year 1551. His father was a native of Lichfield in Staffordshire, who settling in London, became a member of the company of paper-stainers, and lived in the Old Bailey. His mother was of the ancient family of Curwen, of Workington, in Cumberland. He was educated first at Christ's hospital, and afterwards at St. Paul's school: from thence he was sent, in 1566, to Oxford, and entered servitor of Magdalen college; but being disappointed of a deacon's place, he removed to Broadgate hall, and somewhat more than two years after to Christ-church, where he was supported by his kind friend and patron Dr. Thornton. About this time he was a candidate for a fellowship of All-souls college, but lost it by the intrigues of the Popish party. In 1570, he supplicated the regents of the university to be admitted Bachelor of arts; but in this also he was miscarried. The following year Mr. Camden came to London, where he prosecuted his favourite study of antiquity, under the patronage of Dr Goodman, dean of Westminster, by whose interest he was made second master of Westminster school in 1575. From the time of his leaving the university to this period, he took several journeys to different parts of England, with a view to make observations and collect materials for his Britannia, in which he was now deeply engaged. In 1581 he became intimately acquainted with the learned President Brisson, who was then in England; and in 1586 he published the first edition of his Britannia; a work which, though much enlarged and improved in future editions, was even then esteemed an honour to its author, and the glory of his country. In 1593 he succeeded to the head mastership of Westminster school on the resignation of Dr. Grant. In this office he continued till 1597, when he was promoted to be Clarenceux king at arms. In the year 1600 Mr. Camden made a tour to the north, as far as Carlisle, accompanied by his friend Mr. (afterwards Sir Robert) Cotton. In 1606 he began his correspondence with the celebrated President de Thou, which continued to the death of that faithful historian. In the following year he published his last edition of the Britannia, which is that from which the several English translations have been made; and in 1608, he began to digest his materials for a history of the reign of Queen Elizabeth. In 1609, after recovering from a dangerous illness, he set out for Chislehurst in Kent, where he continued to spend the summer months during the remainder of his life. The first part of his annals of the queen did not appear till the year 1615; and he determined that the second volume should not appear till after his death (a). The work was entirely finished in 1617; and from that time he was principally employed in collecting more materials for the further improvement of his Britannia. In 1622, being now upwards of 70, and finding his health decline apace, he determined to lose no time in executing his design of founding a history lecture in the university of Oxford. His will was accordingly transmitted by his friend Mr. Heather to Mr. Gregory Wheare, who was, by himself, appointed his first professor. He died at Chislehurst in 1633, in the 73rd year of his age; and was buried with great solemnity in Westminster Abbey, in the south aisle, where a monument of white marble was erected to his memory. Camden was a man of singular modesty and integrity; profoundly leamed in the history and antiquities of this kingdom, and a judicious and conscientious historian. He was reverenced and esteemed by the literati of all nations, and will be ever remembered as an honour to the age and country where he lived. Besides the works already mentioned, he was author of an excellent Greek grammar, and of several tracts in Hearne's collection. But his great and most useful work, the Britannia, is that upon which his fame is chiefly built. The edition above mentioned, to which he put his last hand, was correctly printed in folio, much augmented, amended where it was necessary, and adorned with maps. It was first translated into English, and published in folio at London, in 1611, by the laborious Dr. Philesion Holland, a physician of Coventry, who is thought to have consulted our author himself; and therefore great respect has been paid to the additions and explanations that occur

(a) The reign of Queen Elizabeth was so recent when the first volume of the Annals was published, that many of the persons concerned, or their dependents, were still living. It is no wonder, therefore, that the honest historian should offend those whose actions would not bear inquiry. Some of his enemies were clamorous and troublesome; which determined him not to publish the second volume during his life; but, that posterity might be in no danger of disappointment, he deposited one copy in the Cotton library, and transmitted another to his friend Dupuy at Paris. It was first printed at Leyden in 1625.
CAMER A ZOLIA, a contrivance for blowing the fire, for the fusion of ores, without bellows, by means of water falling through a funnel into a close vessel, which sends from it so much air or vapor as continually blows the fire; if there be the space of another vessel for it to expiate in, by the way, it there let fall its humidity, which otherwise might hinder the work. This contrivance was named camera zolia by Kircher.

CAMERA LUCIDA, a contrivance of Dr. Hook for making the image of any thing appear on a wall in a light room, either by day or night. Opposite to the place or wall where the appearance is to be, make a hole of at least a foot in diameter, or if there be a high window with a casement of this dimension in it, this will do much better without such hole or casement opened.

At a convenient distance, to prevent its being perceived by the company in the room, place the object or picture intended to be represented, but in an inverted situation. If the picture be transparent, reflect the sun's rays by means of a looking glass, so that they may pass through it towards the place of representation; and, to prevent any rays from passing aside it, let the picture be encompassed with some board or cloth. If the object be a statue, or a living creature, it must be much enlightened by casting the sun's rays on it, either by reflection, refraction, or both. Between this object and the place of representation, put a broad convex glass, ground to such a convexity as that it may represent the object distinctly in such place. The nearer this is situated to the object, the more will the image be magnified on the wall, and the further the less: such diversity depending on the difference of the spheres of the glasses. If the object cannot be conveniently inverted, there must be two large glasses of proper spheres, situated at suitable distances, easily found by trial, to make the representations erect. This whole apparatus of object, glasses, &c. with the persons employed in the management of them, are to be placed without the window or hole, so that they may not be perceived by the spectators in the room.

CAMERA OBSCURA, or Dark Chamber, in Optics, a machine, or apparatus, representing an artificial eye; whence the images of external objects, received through a double convex glass, are exhibited distinctly, and in their native colours, on a white matter placed within the machine, in the focus of the glass.

The first invention of this instrument is ascribed to Baptista Porta. See his Magia Naturalis, lib. xvii. cap. 6. first published at Frankfurt about the year 1589 or 1591; the first four books of this work were published at Antwerp in 1560.

The camera obscura affords very diverting spectacles; both by exhibiting images perfectly like their objects, and each clothed in their native colours; and by expressing, at the same time, all their motions; which latter no other art can imitate. By means of this instrument, a person unacquainted with designing will be able to delineate objects with the greatest accuracy and justness, and another well versed in painting will find many things herein to perfect his art. See the construction under DIOPTRIS.

CAMERARIA.
CAMERARIA. See Botany Index.

CAMERARIUS, Joachim, one of the most learned writers of his time, was born in 1500, at Bamberg, a city of Franconia; and obtained great reputation by his writings. He translated into Latin Herodotus, Xenophon, Euclid, Homer, Theocritus, Sophocles, Lucian, Theodoret, Nicephorus, &c. He published a catalogue of the bishops of the principal sees; Greek epistles; Accounts of his journeys, in Latin verse; a Commentary on Plautus; the Lives of Helias Eobanus Hessus, and Philip Melancthon, &c. He died in 1574.

CAMERARIUS, Joachim, son of the former, and a learned physician, was born at Nuremberg in 1534. After having finished his studies in Germany, he went into Italy, where he obtained the esteem of the learned. At his return he was courted by several princes to live with them; but he was too much devoted to books, and the study of chemistry and botany, to comply. He wrote a Hortus Medicus, and several other works. He died in 1598.

CAMERATE, among builders, the same with vaulted or arched.

CAMERET, a small river in the province of Brittany in France, forms the harbour of Brest. See BREST.

CAMERINO, a town of the Ecclesiastical State in Italy, situated in E. Long. 13° 7', N. Lat. 45° 5'.

CAMELINGO, according to Du Cange, signifies formerly the pope's or emperor's treasurer: at present, camelingo is nowhere used but at Rome, where it denotes the cardinal who governs the Ecclesiastical State, and administers justice. It is the most eminent office at the court of Rome, because he is at the head of the treasury. During a vacation of the papal chair, the cardinal camelingo publishes edicts, coins money, and exerts every other prerogative of a sovereign prince; he under him a treasurer-general, auditor-general, and 12 prelates called clerks of the chamber.

CAMERON, John, one of the most famous divines among the Protestants of France in the 17th century, was born at Glasgow in Scotland, where he taught the Greek tongue, and had read lectures upon that language for about a year, travelled, and became professor at several universities, and minister at Bourdeaux. He published, 1. Theological lectures; 2. Icon Johannis Cameronis; and some miscellaneous pieces. He died in 1629, aged 60.

CAMERONIAN, a sect or party in Scotland, who separated from the Presbyterians in 1666, and continued to hold their religious assemblies in the fields.

The Cameronians took their denomination from Richard Cameron, a famous field preacher, who refusing to accept the indulgences to tender consciences, granted by King Charles II. as such an acceptance seemed an acknowledgment of the king's supremacy, and that he had before a right to silence them, made a declension from his brethren, and even headed a rebellion, in which he was killed. His followers were never entirely reduced till the Revolution, when they voluntarily submitted to King William.

The Cameronians adhered rigidly to the form of government established in 1648.

CAMERONITES, or Camerounites, is also the denomination of a party of Calvinists in France, who asserted that the will of a man is only determined by the practical judgment of the mind; that the cause of men's doing good or evil proceeds from the knowledge which God imparts into them; and that God does not move the will physically, but only morally, in virtue of its dependence on the judgment of the mind. They had this name from John Cameron, a famous professor, first at Glasgow, where he was born, in 1580, and afterwards at Bourdeaux, Sedan, and Saumur; at which last place he broached his new doctrine of grace and free will, which was formed by Amyraut, Cappel, Bechart, Daille, and others of the more learned among the reformed ministers, who judged Calvin's doctrines on these points too harsh. The Cameronians are a sort of mitigated Calvinists, and approach to the opinion of the Arminians. They are also called Universalists, as holding the universality of Christ's death; and sometimes Amyraldists. The rigid adherents to the synod of Dort accused them of Pelagianism, and even of Manichæism. The controversy between the parties was carried on with a zeal and subtlety scarce conceivable; yet all the question between them was only, Whether the will of man is determined by the immediate action of God upon it, or by the intervention of a knowledge which God imparts into the mind? The synod of Dort had defined that God not only illuminates the understanding, but gives motion to the will by making an internal change therein. Cameron only admitted the illumination, whereby the mind is morally moved; and explained the sentiment of the synod of Dort so as to make the two opinions consistent.

CAMES, a name given to the small slender rods of cast lead of which the glaziers make their turned lead.

Their lead being cast into slender rods of twelve or fourteen inches long each, is called the came: sometimes also they call each of these rods a came, which being afterwards drawn through their vice, makes their turned lead.

CAMILUS, Marcus Furius, was the first who rendered the family of Furius illustrious. He triumphed four times, was five times dictator, and was honoured with the title of the second founder of Rome. In a word, he acquired all the glory a man can gain in his own country. Lucius Apuleius, one of the tribunes, prosecuted him to make him give an account of the spoils taken at Veii. Camillus anticipated judgment, and banished himself voluntarily. During his banishment, instead of rejoicing at the devastation of Rome by the Gauls, he exerted all his wisdom and bravery to drive away the enemy; and yet kept with the utmost strictness the sacred law of Rome, in refusing to accept the command, which several private persons offered him. The Romans who were besieged in the capital, created him dictator in the year 363; in which office he acted with so much bravery and conduct, that he entirely drove the army of the Gauls out of the territories of the commonwealth. He died in the 81st year of his age, 365 years before the Christian era.

CAMILLI and CAMELLE, in antiquity, boys and girls of ingenious birth, who ministered in the sacrifices of the gods; and especially those who attended the flamens dialisi, or priest of Jupiter. The word seems borrowed.
borrowed from the language of the ancient Hetrurians, where it signified minister, and was changed from cas-
willius. The Tuscans also gave the appellation Camil-
lus to Mercury, in quality of minister of the gods.

CAMINHA, a maritime town of Portugal, in the
province of Entre-Duero-o-Minho, with the title of a
duchy. It is situated at the mouth of the river Min-
ho, in W. Long. 9° 15'. N. Lat. 41° 14'.

CAMIS, or CAMIS, in the Japanese theology, de-
ote note deified souls of ancient heroes, who are supposed
still to interest themselves in the welfare of the people
whom they anciently commanded.

The camis answer to the heroes in the ancient Greek
and Roman theology, and are venerated like the saints
in the modern Roman church.

Besides the heroes or camis beatified by the consent
of antiquity, the mikadoos, or pontiffs, have deified
many others, and continue still to grant the apotheosis
to new worthies; so that they swarm with camis: the
principal one is Tenshi Dai Sin, the common father of
Japan, to whom are paid devotions and pilgrimages ex-
travagant.

CAMSAD, in the art of war, an attack by sur-
prise in the night, or at the break of day, when the
enemy is supposed to be a-bed. The word is said to
have its rise from an attack of this kind; where-
in, as a badge or signal to know another by, they
bore a shift, in French called chemise, or chambit, over
their arms.

CAMISARDS, a name given by the French to the
Calvinists of the Cevennes, who formed a league, and
took up arms in their own defence, in 1688.

CAMLETINE, a slight stuff, made of hair and
course silk, in the manner of camblet. It is now out of
fashion.

CAMMA, and GOBI, two provinces of the king-
dom of Loango in Africa. The inhabitants are contin-
ually at war with each other. The weapons they
formerly used in their wars were the short pike, bows
and arrows, sword and dagger; but since the Euro-
picans have become acquainted with that coast, they
have supplied them with fire-arms. The chief town
of Goib lies about a day's journey from the sea.
Their rivers abound with a variety of fish; but are in-
fested with sea-horses, which do great mischief both by
land and water. The principal commerce with the
natives is in logwood, elephants teeth and tails, the
hair of which is highly valued, and used for several
curious purposes.

CAMMIN, a maritime town of Germany, in Bran-
denburg Pomerania, situated in E. Long. 15° 15'. N. Lat.
54°.

CAMOENS, Louis DE, a famous Portuguese poet,
the honour of whose birth is claimed by different cities.
But according to N. Antonio, and Manual Correa, his
intimate friend, this event happened at Lisbon in 1547.
His family was of considerable note, and originally
Spanish. In 1570, Vasco Perez de Camoes was dis-
gusted at the court of Castile, fled to that of Lisbon, where
King Ferdinand immediately admitted him into his
council, and gave him the lordships of Sardoal, Fun-
nete, Marano, Amendo, and other considerable lands;
a certain proof of the eminence of his rank and abili-
ties. In the war for the succession, which broke out
on the death of Ferdinand, Camoens sided with the
king of Castile, and was killed in the battle of Alja-
barota. But though John I. the victor, seized a great
part of his estate, his widow, the daughter of Goncalo
Terwyo, grand master of the order of Christ, and gen-
eral of the Portuguese army, was not reduced beneath
her rank. She had three sons, who took the name of
Camoaes, The family of the eldest internarried with
the first nobility of Portugal; and even, according to
Castera, with the blood royal. But the family of the
second brother, whose fortune was slimmer, had the su-
perior honour to produce the author of the Lusiad.

Early in his life the misfortunes of the poet began.
In his infancy, Simon Vaz de Camoens, his father,
commander of a vessel, was shipwrecked at Goa, where,
with his life, the greatest part of his fortune was lost.
His mother, however, Anne de Macedo of Santarene,
provided for the education of her son Louis at the uni-
versity of Coimbra. What he acquired there, his
works discover; an intimacy with the classics, equal to
that of a Scaliger, but directed by the taste of a Mit-
ton or a Pope.

When he left the university, he appeared at court.
He was handsome; had speaking eyes, it is said, and
the finest complexion. Certain it is, however, he was
a polished scholar, which, added to the natural arour
and gay vivacity of his disposition, rendered him an
accomplished gentleman. Courts are the scenes of in-
nigue; and intrigue was fashionable at Lisbon. But
the particulars of the amours of Camoens rest un-
known. This only appears: he had aspired above his
rank, for he was banished from the court; and in se-
veral of his sonnets he ascribes this misfortune to
love.

He now retired to his mother's friends at Santarene.
Here he renewed his studies, and began his poem on
the discovery of India. John III. at this time prepa-
red an armament against Africa. Camoens, tired of
his inactive obscure life, went to Ceuta in this expedi-
tion, and greatly distinguished his valour in several
encounters. In a naval engagement with the Moors
in the straits of Gibraltar, in the conflict of boarding,
he was among the foremost, and lost his right eye.
Yet neither hurry of actual service nor the dissipation
of the camp could stifle his genius. He continued his
Lusitana, and several of his most beautiful sonnets were
written in Africa, while, as he expressed it,

One hand the pen, and one the sword, employ'd.

The fame of his valour had now reached the court,
and he obtained permission to return to Lisbon. But,
while he solicited an establishment which he had mer-
ited in the ranks of battle, the malignity of evil tongues,
as he calls it in one of his letters, was injuriously pour-
ed upon him. Though the bloom of his early youth
was effaced by several years residence under the scor-
ching heavens of Africa, and though altered by the loss
of an eye, his presence gave uneasiness to the gentle-
men of some families of the first rank where he had
formerly visited. Jealousy is the characteristic of the
Spaniards and Portuguese; its resentment knows no
bounds, and Camoens now found it prudent to banish
himself from his native country. Accordingly, in
1559, he sailed for India, with a resolution never to
return. As the ship left the Tagus, he exclaimed, in
the words of the sepulchral monument of Seipio Afri-
caus,
Ingrata patria, non possidebis causa men! "Ungrateful country, thou shalt not possess my bones!"

But he knew not what evils in the east would awake the remembrance of his native fields.

When Camoens arrived in India, an expedition was ready to sail to revenge the king of Cochin on the king of Pimenta. Without any rest on shore after his long voyage, he joined this armament, and in the conquest of the Alagada islands displayed his usual bravery.

In the year following, he attended Manuel de Vasconcello in an expedition to the Red sea. Here, says Faria, as Camoens had no use for his sword, he employed his pen. Nor was his activity confined to the fleet or camp. He visited Mount Felix and the adjacent inhospitable regions of Africa, which he so strongly pictures in the Lusiad, and in one of his little pieces where he laments the absence of his mistress.

When he returned to Goa, he enjoyed a tranquillity which enabled him to bestow his attention on his epic poem. But this serenity was interrupted perhaps by his own imprudence. He wrote some satires which gave offense; and by order of the viceroy Francisco Barreto, he was banished to China.

The accomplishments and manners of Camoens soon found him friends, though under the disgrace of banishment. He was appointed commissary of the defunct in the island of Macao, a Portuguese settlement in the bay of Canton. Here he continued his Lusiad; and here also, after five years residence, he acquired a fortune, though small, yet equal to his wishes. Don Constantino de Braganza was now viceroy of India; and Camoens, desirous to return to Goa, resigned his charge. In a ship, freighted by himself, he set sail; but was shipwrecked in the gulf near the mouth of the river Mebon, on the coast of China. All he had acquired was lost in the waves; his poems, which he held in one hand, while he swammed with the other, were all he found himself possessed of when he stood friendless on the unknown shore. But the natives gave him a most humane reception: this he has immortalized in the prophetic song in the tenth Lusiad; and in the seventh, he tells us, that here he lost the wealth which satisfied his wishes.

Agora da esperança ja adquirida, &c.

Now blest with all the wealth fond hope could crave,
Soon I beheld that wealth beneath the wave
For ever lost——

My life, like Judah's heaven-doomed king of yore,
By miracle prolong'd——

On the banks of the Mebon he wrote his beautiful paraphrase of the psalm, where the Jews, in the finest strain of poetry, are represented as hanging their harps on the willows, by the rivers of Babylon, and weeping their exile from their native country. Here Camoens continued some time, till an opportunity offered to carry him to Goa. When he arrived at that city, Don Constantino de Braganza, the viceroy, whose characteristo was politeness, admitted him into intimate friendship, and Camoens was happy till Count Redondo assumed the government. Those who had formerly procured the banishment of the satirist, were silent while Constantino was in power; but now they exerted all their arts against him. Redondo, when he entered on office, pretended to be the friend of Camoens; yet, with all that unfeeling indifference with which he made his most horrible vituperation on the Zamorin, he suffered the innocent man to be thrown into the common prison. After all the delay of bringing witnesses, Camoens, in a public trial, fully refuted every accusation of his conduct while commissary at Macao, and his enemies were loaded with ignominy and reproach. But Camoens had some creditors, and these detained him in prison a considerable time, till the gentlemen of Goa began to be ashamed that a man of his singular merit should experience such injustice. He was set at liberty; and again he assumed the profession of arms, and received the allowance of a gentleman volunteer, a character at this time common in Portuguese India. Soon after, Pedro Barreto, appointed governor of the fort at Sofala, by high promises, allureed the poet to attend him thither. The governor of a distant fort, in a barbarous country, shares in some measure the fate of an exile. Yet, though the only motive of Barreto was, in this unpleasant situation, to retain the conversation of Camoens at his table, it was his least care to render the life of his guest agreeable. Chagrined with his treatment, and a considerable time having elapsed in vain dependence upon Barreto, Camoens resolved to return to his native country. A ship, on the homeward voyage, at this time touched at Sofala, and several gentlemen who were on board were desirous that Camoens should accompany them. But this the governor ungenerously endeavoured to prevent, and charged him with a debt for board. Anthony de Calva, however, and Hector de Sylveira, paid the demand; and Camoens, says Faria, and the honour of Barreto, were sold together.

After an absence of 16 years, Camoens, in 1569, returned to Lisbon, unhappy even in his arrival, for the pestilence then raged in that city, and prevented his publication for three years. At last, in 1572, he printed his Lusiad, which, in the opening of the first book, in a most elegant turn of compliment, he addressed to his prince, King Sebastian, then in his 18th year. The king, says the French translator, was so pleased with his merit, that he gave the author a pension of 4000 reals, on condition that he should reside at court. But this salary, says the same writer, was withdrawn by Cardinal Henry, who succeeded to the crown of Portugal, lost by Sebastian at the battle of Alcazar.

Though the great patron of one species of literature, a species the reverse of that of Camoens, certain it is, that the author of the Lusiad was utterly neglected by Henry, under whose inglorious reign he died in all the misery of poverty. By some, it is said, he died in an alms-house. It appears, however, that he had not even the certainty of subsistence which these houses provide. He had a black servant, who had grown old with him, and who had long experienced his master's humanity. This grateful Indian, a native of Java, who, according to some writers, saved his master's life in the unhappy shipwreck where he lost his effects, begged in the streets of Lisbon for the only man in Portugal on whom God had bestowed those talents which have a tendency to erect the spirit of a downward age. To the eye of a faithful observer, the fate of Camoens throws
CAM [ 96 ]

CAMCOMMON

threws great light on that of his country, and will appear strictly connected with it. The same ignorance, the same degenerated spirit, which suffered Camoens to depend on his share of the alms begged in the streets by his old hoary servant, the same spirit which caused him to sink the kingdom of Portugal into the most abject vassalage ever experienced by a conquered nation. While the grandees of Portugal were blind to the ruin which impended over them, Camoens beheld it with a pang of grief which hastened his exit. In one of his letters he has these remarkable words: Em fins occuro no vaid, e verrum todos que fui eficienta a minha patria, &c. "I am ending the course of my life; the world will witness how I have loved my country. I have returned, not only to die in her bosom, but to die with her."

In this unhappy situation, in 1599, in his 62d year, the year after the fatal defeat of Don Sebastian, died Louis de Camoens, the greatest literary genius ever produced by Portugal; in martial courage and spirit of honour nothing inferior to her greatest heroes. And in a manner suitable to the poverty in which he died, was he buried.

CAMOMILE. See ANTHEMIS, BOTANY INDIAN.

CAMP, the ground on which an army pitch their tents. It is marked out by the quartermaster general, who appoints every regiment their ground.

The chief advantages to be minded in choosing a camp for an army, are to have it near the water, in a country of forage, where the soldiers may find wood for dressing their victuals; that it have a free communication with garrisons, and with a country from whence it may be supplied with provisions; and, if possible, that it be situated on a rising ground, in a dry gravelly soil. Besides, the advantages of the ground ought to be considered, as marshes, woods, rivers, and enclosures; and if the camp be near the enemy, with no river or marsh to cover it, the army ought to be intrenched. An army always encamps fronting the enemy; and generally in two lines, running parallel, about 500 yards distance; the horse and dragoons, on the wings; and the foot, in the centre; sometimes a body of two, three, or four brigades, is encamped behind the two lines, and is called the body of reserve. The artillery and bread-wagons are generally encamped in the rear of the two lines. A battalion of foot is allowed 80 or 100 paces for its camp; and 30 or 40 for an interval between two battalion and another. A squadron of horse is allowed 30 for its camp, and 30 for an interval, and more if the ground will allow it.

Where the grounds are equally dry, those camps are always the most healthful that are pitched on the banks of large rivers; because, in the hot season, situations of this kind have a stream of fresh air from the water, serving to carry off the moist and putrid exhalations. On the other hand, next to marshes, the worst encampments are on low grounds close beset with trees; for then the air is not only moist and bristful in itself, but by stagnating becomes more susceptible of corruption. However, let the situation of camps be ever so good, they are frequently rendered infectious by the putrid effluvia of rotten straw, and the privies of the army, more especially if the bloody flux prevails; in which case, the best method of preventing a general infection, is to leave the ground with the privies, foul straw, and other filth of the camp, behind. This must be frequently done, if consistent with the military operations; but when these render it improper to change the ground often, the privies should be made deeper than usual, and once a-day a thick layer of earth thrown into them till the pits are near full; and then they are to be well covered, and supplied by others. It may also be a proper caution to order the pits to be made either in the front or the rear, as the then stationary winds may best carry off their effluvia from the camp. Moreover, it will be necessary to change the straw frequently, as being not only apt to rot, but to retain the infectious stems of the sick. But if fresh straw cannot be procured, more care must be taken in airing the tents, as well as the old straw.

The disposition of the Hebrew encampment was at first laid out by God himself. Their camp was of a quadrangular form, surrounded with an enclosure of the height of 10 hands-breadth. It made a square of 12 miles in compass about the tabernacle; and within this was another called the Levites' camp.

The Greeks had also their camps, fortified with gates and ditches. The Lacedemonians made their camp of a round figure, looking upon that as the most perfect and defensible of any form: we are not, however, to imagine, that they thought this form so essential to a camp, as never to be dispensed with when the circumstances of the place required it. Of the rest of the Grecian camps, it may be observed, that the most valiant of the soldiers were placed at the extremities, the rest in the middle. Thus we learn from Homer, that Achilles and Ajax were posted at the ends of the camp before Troy, as bulwarks on each side of the rest of the princes.

The figure of the Roman camp was a square divided into two principal parts: in the upper part were the general's pavilion, or praetorium, and the tents of the chief officers; in the lower, those of inferior degree were placed. On one side of the praetorium stood the quaestorium, or apartment of the treasurer of the army: and near this the forum, both for a market place and the assembling of councils. On the other side of the praetorium were lodged the legati; and below it the tribunes had their quarters, opposite to their respective legions. Aside of the tribunes were the prefects of the foreign troops, over against their respective wings; and behind these were the lodgments of the evocati, then those of the extraordinarii and abscerti equites, which concluded the higher part of the camp. Between the two partitions was a spot of ground called principia, for the altars and images of the gods, and probably also for the chief ensigns. The middle of the lower partition was assigned to the Roman horse: next to them were quartered the triarii; then the principes, and close by them the hastati; afterwards the foreign horse, and lastly, the foreign foot. They fortified their camp with a ditch and parapet, which they termed fossa et castrum: in the latter some distinguish two parts, viz. the agger or earth, and the stipes or wooden stakes driven in to secure it. The camps were sometimes surrounded by walls made of hewn stone; and the tents themselves formed of the same material.

In the front of the Turkish camp are quartered the janizaries and other foot, whose tents encompass their aga: in the rear are the quarters of the saphis and other
The body of the camp is possessed by the stately tents or pavilions of the viceroy or governor, rais eftendi or chancellor, khaija or steward, the tesdinar bashaw or lord treasurer, and kapilar khaniser or master of the ceremonies. In the middle of these tents is a spacious field, wherein are erected a building for the divan, and a hafsa or treasury. When the ground is marked out for a camp, all wait for the pitching of the tent halan, the place where the courts of justice are held, it being the discretion of this that is to regulate all the rest.

The Arabs still live in camps, as the ancient Sasanites did. The camp of the Aasyne Emir, or king of the country about Taxmür, is described, by a traveller who viewed it, as spread over a very large plain, and possessing so vast a space, that though he had the advantage of a rising ground, he could not see the utmost extent of it. His own tent was near the middle; scarce distinguishable from the rest, except that it was bigger, being made, like the others, of a sort of hair-cloth.

Camp, is also used by the Siamese, and some other nations in the East Indies, as the name of the quarters which they assign to foreigners who come to trade with them. In these camps, every nation forms, as it were, a particular town, where they carry on all their trade, not only keeping all their warehouses and shops there, but also living in those camps with their whole families. The Euroopans, however, are so far indulged, that at Siam and almost everywhere else, they may live either in the cities or suburbs, as they shall judge most convenient.

Camp-fight, or Komp-fight, in law-writers, denotes the trial of a cause by duel, or a legal combat of two champions in the field, for decision of some controversy. In the trial by camp-fight, the accuser was, with the peril of his own body, to prove the accused guilty; and by offering him his glove, to challenge him to this trial, which the other must either accept of, or acknowledge himself guilty of the crime whereof he was accused.

If it were a crime deserving death, the camp-fight was for life and death: if the offence deserved only imprisonment, the camp-fight was accomplished when one combatant had subdued the other, so as either to make him yield or take him prisoner. The accused had liberty to choose another to fight in his stead, but the accuser was obliged to perform it in his own person, and with equality of weapons. No women were permitted to be spectators, nor men under the age of thirteen. The priest and the people who looked on were engaged silently in prayer, that the victory might fall to him who had right. None might cry, shriek, or give the least sign; which in some places was executed with so much strictness, that the executioner stood ready with an axe to cut off the right hand or foot of the party that should offend herein. He that, being wounded, yielded himself, was at the other’s mercy either to be killed or suffered to live. But if life were granted, he was declared infamous by the judge, and disabled from ever bearing arms, or riding on horseback.

CAMPAIGNS. See CAMPAIGN.

CAMPAIGN, in the art of war, denotes the space of time that an army keeps the field, or is encamped. Campaigns are at different times, after the first fortnight or three weeks encampment, the sickness decreases daily; the most infirm being by that time in the hospitaIs, and the weather daily growing warmer. This healthy state continues throughout the summer, unless the men get wet clothes or wet beds; in which case, a greater or less degree of the dysentery appears in proportion to the preceding heats. But the most sickly part of the campaign begins about the middle or end of August, whilst the days are still hot, but the nights cool and damp, with fogs and dews: then, and not sooner, the dysentery prevails: and though its violence is over by the beginning of October, yet the remitting fever gaining ground, continues throughout the rest of the campaign, and never entirely ceases, even in winter-quarters, till the frost begins. At the beginning of a campaign the sickness is so uniform, that the number may be nearly predicted; but for the rest of the season, as the diseases are then of a contagious nature, and depend so much upon the heats of summer, it is impossible to foresee how many may fall sick from the beginning to the end of autumn. It is also observed, that the last fortnight of a campaign, if protracted till the beginning of winter, is attended with more sickness than the first two months encampment; so that it is better to take the field a fortnight sooner, in order to return into winter-quarters so much the earlier. As to winter expeditions, though severe in appearance, they are attended with little sickness, if the men have strong shoes, quarters, fuel, and provisions. Long marches in summer are not without danger, unless made in the night, or so early in the morning as to be over before the heat of the day.

CAMPANAŒÆ, in Botany, an order of plants in the Fragmenta methodi naturalis of Linneaus, in which are the following genera, viz. convolvulus, ipomea, polemonium, campanula, roella, viola, &c. CAMPANELLA, Thomas, a famous Italian philosopher, born at Stilo in Calabria, in 1568. He distinguished himself by his early proficiency in learning: for at the age of 13 he was a perfect master of the ancient orators and poets. His peculiar inclination was to philosophy, to which he at last confined his whole time and study. In order to arrive at truth, he shook off the yoke of authority: by which means the novelty of some of his opinions exposed him to many inconveniences; for at Naples he was thrown into prison, in which he remained 27 years, and during this confinement wrote his famous work entitled Atheneus triumphatus. Being at length set at liberty, he went to Paris, where he was graciously received by Louis XIII. and Cardinal Richelieu; the latter procured him a pension of 2000 livres, and often consulted him on the affairs of Italy. Campanella passed the remainder of his days in a monastery of Dominicans at Paris, and died in 1639.

CAMPAINT, Matthew, of Spoleto, erate at Rome, wrote a curious treatise on the art of cutting glasses for spectacles, and made several improvements in optics, assisted by his brother and pupil Joseph. He died after 1678.

CAMPANIA, a town of Italy; in the kingdom of Naples,
Naples, and in the Farther Principato, with a bishop's see. E. Long. t. 5. 30. N. Lat. 42. 40.

Campania, or Campagna di Roma, an ancient Latium, a province of Italy, bounded on the west by the Tiber and the sea, on the south-west by the sea, on the south by Terra di Lavoro, on the east by Abruzzo, and on the north by Sabina. Though the soil is good, it produces little or nothing, on account of the heavy duties on corn; and though the waters are good, the air is unwholesome. It is subject to the Pope, and is about 60 miles in length, on the Mediterranean sea.

It has been generally thought that the air of this country hath something in it peculiarly noxious during the summer time; but M. Condamine is of opinion that it is not more unhealthy than any other marshy country. His account follows: "It was after the invasion of the Goths in the fifth and sixth centuries that this corruption of the air began to manifest itself. The bed of the Tiber being covered by the accumulated ruins of the edifices of ancient Rome, could not but raise itself considerably. But what permits us not to doubt of this fact is, that the ancient and well-preserved pavement of the Forum and its portico is overflowed every winter; that the water even rises there sometimes to the height of eight or ten feet; and that it is not possible to suppose that the ancient Romans should have built a temple in a place so low as to be covered with the waters of the Tiber on the least inundation. It is evident, then, that the level of the bed of this river is raised several feet; which could not have happened without forming there a kind of dikes or bars. The choking up of its canal necessarily occasioned the overflow and reflux of its waters in such places as till then had not been subject to inundations: to these overflows of the Tiber were added all the waters that escaped out of the ancient aqueducts, the ruins of which are still to be seen, and which were entirely broken and destroyed by Totila. What need, therefore, of any thing more to infect the air, in a hot climate, than the exhalations of such a mass of stagnating waters deprived of any discharge, and become the receptacle of a thousand impurities, as well as the grave of several millions both of men and animals? The evil could not but increase from the same causes while Rome was exposed to the incursions and devastations of the Lombards, the Normans, and the Saracens, which lasted for several centuries. The air was become so infectious there at the beginning of the 15th century, that Pope Innocent III. wrote, that few people at Rome arrived at the age of forty years, and that nothing was more uncommon than to see a person of sixty. A very short time after the popes transferred the seat of their residence to Avignon; during the seventy-two years they remained there, Rome became a desert; the monasteries in it were converted into stables; and Gregory XI. on his return to Rome, in 1376, hardly counted there 30,000 inhabitants. At his death began the troubles of the great schism in the west, which continued for upwards of 50 years. Martin V. in whom this schism ended in the year 1429, and his first successors, were able to make but feeble efforts against so invertebrate an evil. It was not till the beginning of the 17th century, that Leo X. under whom Rome began to resume her wonted splendour, gave himself some trouble about re-establishing the salubrity of the air: but the city being shortly after besieged twice successively by the emperor Charles V. saw itself plunged again into all its old calamities; and from 85,000 inhabitants, which it contained under Leo X. it was reduced under Clement VIII. to 32,000. In short, it is only since the time of Pius V. and Sixtus V. at the end of the 16th century, that the popes have constantly employed the necessary methods for purifying the air of Rome and its environs, by procuring proper discharges for the waters, drying up the humid and marshy grounds, and covering the banks of the Tiber and other places replete with unwholesome and superabundant edifices. Since that time, a person may dwell at Rome, and go in or out of it at all seasons of the year. At the beginning, however, of the present century, they were still afraid to lie out of the city in summer, when they had resided there; as they were also to return to it, when once they had quitted it. They never ventured to sleep at Rome, even in broad day, in any other house than their own. They are greatly relieved at present from these ancient scruples: I have seen cardinals, in the months of July and August, go from Rome to live at Frascati, Tivoli, Albanò, &c. and return the next or the following day to the city, without any detriment to their health: I have myself tried all these experiments, without suffering the least inconvenience from them; we have even seen, in the last war in Italy, two armies encamped under the walls of Rome at the time when the heats were most violent. Yet, notwithstanding all this, the greater part of the country people dare not still venture to lie during that season of the year, nor even so much as sleep in a carriage, in any part of the territory comprehended under the name of the Campagna of Rome."

Campaniform, or Campanulate, an appellation given to flowers resembling a bell.

Campaninus, a name given to an Italian marble dug out of the mountains of Carrara, because, when it is worked, it sounds like a bell.

Campanula, or Bell-flower. See Botany Index.

Campbell, Archibald, Earl and Marquis of Argyle, was the son of Archibald earl of Argyle, by the Lady Anne Douglas, daughter of William earl of Morton. He was born in the year 1598, and educated in the profession of the Protestant religion, according to the strictest rules of the church of Scotland, as it was established immediately after the Reformation. During the commonwealth he was induced to submit to its authority. Upon the Restoration, he was tried for his compliance; a crime common to him with the whole nation, and such a one as the most loyal and affectionate subject might frequently by violence be induced to commit. To make this compliance appear the more voluntary and hearty, there were produced in court letters which he had wrote to Albermarle, while that general governed Scotland, and which contained expressions of the strictest attachment to the established government. But, besides the general indignation excited by Albermarle's discovery of this private correspondence, men thought, that even the highest demonstrations of affection might, during jealous times, be exacted as a necessary mark of compliance from a person of such distinction as Argyle; and could not, by any equitable construction, imply the crime of treason.
son. The parliament, however, scrupled not to pass sentence upon him, and he suffered with great constancy and courage.

CAMPBELL, Archibald, earl of Argyle, son to the former, had from his youth distinguished himself by his loyalty and his attachment to the royal family. Though his father was head of the covenanters, he himself refused to concur in any of their measures; and when a commission of colonel was given him by the convention of states, he forbore to act upon it till it should be ratified by the king. By his respectful behaviour, as well as by his services, he made himself acceptable to Charles when that prince was in Scotland; and even after the battle of Worcester, all the misfortunes which attended the royal cause could not engage him to desert it. Under Middleton he obstinately persevered to harass and infest the victorious English; and it was not till he received orders from that general, that he would submit to accept of a capitulation. Such jealousy of his loyal attachments was entertained by the commonwealth and protector, that a pretence was soon afterfallen upon to commit him to prison; and his confinement was rigorously continued till the Restoration. The king, sensible of his services, had remitted to him his father's forfeiture, and created him earl of Argyle; and when a most unjust sentence was passed upon him by the Scots parliament, Charles had soon remitted it. In the subsequent part of this reign Argyle behaved himself dutifully; and though he seemed not disposed to go all lengths with the court, he always appeared, even in his opposition, a man of mild dispositions and peaceable deportment.

A parliament was summoned at Edinburgh in summer 1681, and the duke was appointed commissioner. Besides granting money to the king, and voting the indefeasible right of succession, this parliament enacted a test, which all persons possessed of offices, civil, military, or ecclesiastical, were bound to take. In this test the king's supremacy was asserted, the covenant denounced, passive obedience assented to, and all obligations disclaimed of endeavouring any alteration in civil or ecclesiastical establishments. This was the state of the test as proposed by the courtiers; but the country party proposed also a clause of adherence to the Protestant religion, which could not with decency be rejected. The whole was of an enormous length, considered as an oath; and, what was worse, a confession of faith was there ratified which had been imposed a little after the Reformation, and which contained many articles altogether forged by the parliament and nation. Among others, the doctrine of resistance was inculcated; so that the test being voted in a hurry, was found on examination to be a medley of absurdity and contradiction. Though the courtiers could not reject the clause of adhering to the Protestant religion, they proposed, as a requisite mark of respect, that all princes of the blood should be exempted from taking that oath. This exception was zealously opposed by Argyle: who observed that the sole danger to be dreaded for the Protestant religion must proceed from the perversion of the royal family. By insisting on such topics, he drew on himself the secret indignation of the duke of York, of which he soon felt the fatal consequences.

When Argyle took the test as a privy counsellor, he subjoined, in the duke's presence, an explanation which he had beforehand communicated to that prince, and which he believed to have been approved by him. It was in these words. "I have considered the test, and am very desirous of giving obedience as far as I can. I am confident that the parliament never intended to impose contradictory oaths: therefore I think no man can explain it but for himself. Accordingly I take it as far as it is consistent with itself and the Protestant religion. And I do declare that I mean not to bind myself, in my station, and in a lawful way, from wishing and endeavouring any alteration, which I think to the advantage of church or state, and not repugnant to the Protestant religion and my loyalty; and this I understand as a part of my oath." The duke, as was natural, heard it with great tranquillity: no one took the least offence: Argyle was admitted to sit that day in council; and it was impossible to imagine that a capital offence had been committed where occasion seemed not to have been given so much as for a frown or reprimand.

Argyle was much surprised a few days after, to find that a warrant was issued for committing him to prison; that he was indicted for high treason, leasing-making, and perjury; and that from the innocent words above mentioned an accusation was extracted, by which he was to forfeit life, honours, and fortune. It is needless to enter into particulars, where the iniquity of the whole is so evidently apparent. Though the sword of justice was displayed, even her semblance was not put on; and the forms of law were preserved to sanctify, or rather aggravate, the oppression. Of five judges, three did not scruple to find the guilt of treason and leasing-making to be incurred by the prisoner: a jury of 15 noblemen gave verdict against him; and the king being consulted, ordered the sentence to be pronounced, but the execution of it to be suspended till further orders. Argyle, however, saw no reason to trust to the justice or mercy of such enemies: He made his escape from prison, and till he could find a ship for Holland he concealed himself during some time in London. The king heard of his lurking place, but would not suffer him to be arrested. All the parts, however, of his sentence, so far as the government in Scotland had power, were rigorously executed; his estate confiscated, his arms reversed and torn. Having got over to Holland, he remained there during the remaining part of the reign of Charles II. But thinking himself at liberty, before the coronation of James II. to exert himself in order to recover the constitution by force of arms, he concerted measures with the duke of Monmouth, and went into Scotland, to assemble his friends: but not meeting with the success he expected, he was taken prisoner; and being carried to Edinburgh, was beheaded upon his former unjust sentence, June 30. 1685. He showed great constancy and courage under his misfortunes; on the day of his death he ate his dinner very cheerfully; and, according to custom, slept after it a quarter of an hour or more, very soundly. At the place of execution, he made a short, grave, and religious speech; and, after solemnly declaring that he forgave all his enemies, submitted to death with great firmness.

CAMPBELL, Archibald, first duke of Argyle, son to the preceding, was an active promoter of the revolution.

Campbell. He came over with the prince of Orange; was admitted into the convention as earl of Argyle, though his father's attainder was not reversed; and in the claim of rights the sentence against him was declared to be, what most certainly it was, a reproach upon the nation. The establishment of the crown upon the prince and princess of Orange being carried by a great majority in the Scottish convention, the earl was sent from the nobility, with Sir James Montgomery and Sir John Dalrymple from the barons and boroughs, to offer the crown, in the name of the convention, to their majesties, and tendered them the coronation oath; for which, and many other eminent services, he was admitted a member of the privy council, and, in 1690, made one of the lords of the treasury. He was afterwards made a colonel of the Scots horse guards; and, in 1694, one of the extraordinary lords of session. He was likewise created duke of Argyle, marquis of Kintyre and Lorn, earl of Campbell and Cowal, viscount of Lochow and Glenila, Lord Inveraray, Mull, Morvern, and Terrey, by letters-patent, bearing date at Kensington the 3d of June, 1702. He sent over a regiment to Flanders for King William. In service, the officers of which were chiefly of his own name and family, who bravely distinguished themselves throughout the whole course of the war. He married Elizabeth, daughter of Sir Lionel Talma of Helmingham in the county of Suffolk, by Elizabeth, duchess of Lauderdale, his wife, daughter and heiress of William Murray, earl of Dysart, by whom he left issue two sons and a daughter; namely, John, duke of Argyle, the subject of the next article; Archibald, who succeeded his brother as duke of Argyle; and Lady Anne, married to James Stuart, second earl of Bute, by whom she had a son, afterwards earl of Bute.

Campbell, John, second duke of Argyle, and also duke of Greenwich and baron of Chatham, son to the subject of the preceding article, was born on the 10th of October, 1680; and, on the very day when his grandfather suffered at Edinburgh, fell out of a window three pair of stairs high, without receiving any hurt. At the age of 15, he had made a considerable progress in classical learning. His father then perceived and encouraged his military disposition, and introduced him to King William, who appointed him to the command of a regiment. In this situation he remained till the death of his father in 1703; when becoming duke of Argyle, he was soon after sworn of Queen Anne's privy council, made captain of the Scots horse guards, and appointed one of the extraordinary lords of session. In 1704, her majesty reviving the Scottish order of the Thistle, his grace was installed one of the knights of that order, and was soon after appointed high-commissioner to the Scotch parliament; where, being of great service in promoting the intended union, he was on his return created a peer of England, by the titles of baron of Chatham and earl of Greenwich, and in 1712 was made knight of the Garter. His grace first distinguished himself in his military capacity at the battle of Oudenarde; where he commanded as brigadier-general, with all the bravery of youth and the conduct of a veteran officer. He was present under the duke of Marlborough at the siege of Ghent, and took possession of the town. He had also a considerable share in the victory obtained over the French at the battle of Mauplaquet, by dislodging them from the wood of Sart, and gaining a post of great consequence.

In this sharp engagement, several musket-balls passed through the duke's clothes, hat, and periuke. Soon after this hot action, he was sent to take the command in Spain; and after the reduction of Port Mahon he returned to England. His grace having now a seat in the house of lords, he assured the measures of the ministry with such freedom, that all his places were disposed of to other noblemen: but at the accession of George I. he recovered his influence. At the breaking out of the rebellion in 1715, he was made commander-in-chief of his majesty's forces in North Britain; and was the principal means and cause of the total extinction, at that time, of the rebellion in Scotland, without much bloodshed. In direct opposition to him, or that part of the army he commanded, at the head of all his Campbells was placed Campbell, earl of Braidalbin, of the same family and kindred, by some fatal error that ever misguided and misled that unhappy family of the Stuarts and all its adherents. The consequence was, that both sets of Campbells, from family affection, rivalry, to strive a stroke, and retired out of the battle. He arrived at London March 6th, 1716, and was in high favour: but, to the surprise of people of all ranks, he was in a few months divested of all his employments; and from this period to the year 1718, he signalized himself in a civil capacity, by his uncorrupted patriotism and manly eloquence. In the beginning of the year 1719, he was again admitted into favour, appointed lord-steward of the household, and in April following was created duke of Greenwich. He continued in the administration during all the remaining part of that reign; and, after his late majesty's accession, till April 1740; when he delivered a speech with such warmth, that the ministry being highly offended, he was again dismissed from his employments. To these, however, on the change of the ministry, he was soon restored; but not approving of the measures of the new ministry more than those of the old, he gave up all his posts for the last time, and never after engaged in affairs of state. He now enjoyed privacy and retirement; and died of a paralytic disorder on the 4th of October 1743. To the memory of his grace a very noble monument was erected in Westminster Abbey, executed by the ingenious Roublanc.

The duke of Argyle, though never first minister, was a very able statesman and politician, most steadily fixed in those principles he believed to be right, and not to be shaken or changed. His delicacy and honour were so great, that it hurt him to be even suspected; witness that application said to be made to him by one of the adherents of the Stuart family before the last rebellion in order to gain his interest, which was considerable both in Scotland and England. He immediately sent the letter to the secretary of state; and it vexed him much even to have an application made him, lest any person should think him capable of acting a double part. When he thought measures wrong or corrupt, he cared not who was the author, however great or powerful he might be; witness his boldly attacking the great duke of Marlborough in the house of lords, about his forage and army contracts in Flanders, in the very zenith of his power and popularity.
CAM [101] CAM

Campbell. Popularity, though in all other respects he was the most able general of his time. The duke of Argyle on all occasions spoke well, with a firm, manly, and noble eloquence; and seems to deserve the character given of him by Pope:

Argyle the state's whole thunder born to wield,
And shake alike the senate and the field.

In private life, the duke's conduct was highly exemplary. He was an affectionate husband and an indolent master. He seldom parted with his servants till age had rendered them incapable of their employments; and then he made provision for their subsistence. He was liberal to the poor, and particularly to persons of merit in distress: though he was ready to patronise deserving persons, he was extremely cautious not to deceive any by lavish promises or leading them to form vain expectations. He was a strict economist, and paid his tradesmen punctually every month; and though he maintained the dignity of his rank, he took care that no part of his income should be wasted in empty pomp or unnecessary expenses. He was twice married, and left five daughters, but no male issue. The titles of duke and earl of Greenwich and baron of Chatham became extinct at his death; but in his other titles he was succeeded by his brother Archibald earl of Isla, the subject of the next article.

Campbell, Archibald, third duke of Argyle, brother to the subject of the preceding article, was born at Hambourg, in England, in June 1682, and was educated at the university of Glasgow. He afterwards applied himself to the study of the law at Utrecht; but, upon his father's being created a duke, he betook himself to a military life, and served some time under the duke of Marlborough. Upon quitting the army, in which he did not long remain, he applied to the acquisition of that knowledge which would enable him to make a figure in the political world. In 1705, he was constituted treasurer of Scotland, and made a considerable figure in parliament, though he was not more than 23 years of age. In 1706, he was appointed one of the commissioners for treating of the Union; and the same year was created Lord Oronsay, Dunoon, and Arrochar, viscount and earl of Isla. In 1708, he was made an extraordinary lord of session; and when the Union was effected, he was chosen one of the Sixteen Peers for Scotland, in the first parliament of Great Britain; and was constantly elected to every future parliament till his death, except the fourth. In 1710, he was made justice-general of Scotland. In 1711, he was called to the privy council; and upon the accession of George I, he was nominated lord registrar of Scotland. When the rebellion broke out in 1715, he again betook himself to arms, in defence of the house of Hanover, and by his prudent conduct in the West Highlands, he prevented General Gordon, at the head of three thousand men, from penetrating into the country and raising levies. He afterwards joined his brother at Stirling, and was wounded at the battle of Dunblain. In 1725, he was appointed keeper of the privy seal; and from this time, he was entrusted with the management of Scotch affairs. In 1734, upon his resigning the privy seal, he was made keeper of the great seal, which office he enjoyed till his death. Upon the decease of his brother, he became duke of Argyle, hereditary justice-general, lieutenant, sheriff, and commissary of Argyleshire and the Western Isles, hereditary great master of the household, hereditary keeper of Dunstaffnage, Carrick, and several other castles. He was also chancellor of the university of Aberdeen; and laboured to promote the interest of that, as well as of the other universities of Scotland. He particularly encouraged the school of physic at Edinburgh, which has now acquired so high a reputation. Having the chief management of Scotch affairs, he was also extremely attentive to promote the trade, manufactures, and improvements of his country. It was by his advice that, after the rebellion in 1745, the Highlanders were employed in the royal army. He was a man of great endowments, both natural and acquired, well versed in the laws of his country, and possessed considerable parliamentary abilities. He was likewise eminent for his skill in human nature, had great talents for conversation, and had collected one of the most valuable private libraries in Great Britain. He built himself a very magnificent seat at Inverary. The faculties of his mind continued sound and vigorous till his death, which happened suddenly on the 7th of April 1762, in the 79th year of his age. He was married, but had no issue; and was succeeded in his titles and the estates of the family by John Campbell, fourth duke of Argyle, son of the honourable John Campbell of Mammore, who was the second son of Archibald the ninth earl of Argyle.

The family of Argyle were hereditary justice generals for Scotland till abolished by the jurisdiction act. They are still hereditary masters of the king's household in Scotland, and keepers of Dunstaffnage and Carrick.

Campbell, John, an eminent historical, biographical, and political writer, was born at Edinburgh, March 8, 1707-8. His father, Robert Campbell, of Glenlyon, Esq. was captain of horse in a regiment commanded by the then earl of Hyndford; and his mother, Elizabeth, daughter of Smith, Esq. of Windsor in Berkshire, had the honour of claiming a descent from the poet Waller. Our author, their fourth son, was at the age of five years carried from Scotland to Windsor, where he received the first principles of his education; and at a proper age, he was placed out as clerk to an attorney, being intended for the law. This profession, however, he never followed; but by a close application to the acquisition of knowledge of various kinds, became qualified to appear with great advantage in the literary world. In 1736, before he had completed his 30th year, he gave to the public, in two volumes folio, "the Military History of Prince Eugene and the duke of Marlborough," enriched with maps, plans, and cuts. The reputation hence acquired, occasioned him soon after to be solicited to take a part in the "Ancient Universal History." Whilst employed in this capital work, Mr Campbell found leisure to entertain the world with other productions. In 1739, he published the "Travels and Adventures of Edward Brown, Esq." Svo. In the same year appeared his "Memoirs of the Bashaw Duke de Bippards," Svo. reprinted, with improvements, in 1740. These memoirs were followed,
followed, in 1741, by the "Concise History of Spanish America," 8vo. In 1742, he was the author of "A Letter to a friend in the Country, on the Publication of Thoole's State Papers," giving an account of their discovery, importance, and utility. The same year was distinguished by the appearance of the 1st and 2d volumes of his "Lives of the English Admirals, and other eminent British Seamen." The two remaining volumes were completed in 1744; and the whole, not long after, was translated into German. This was the first of Mr Campbell's works to which he prefixed his name; and it is a performance of great and acknowledged merit. In 1743, he published "Hermippus revived;" a second edition of which, much improved and enlarged, came out in 1749, under the following title: "Hermippus Redivivus: or, the Sage's Triumph over Old Age and the Grave." Wherin a method is laid down for prolonging the life and vigour of man. Including a Commentary upon an ancient inscription, in which this great secret is revealed; supported by numerous authorities. The whole interspersed with a great variety of remarkable and well attested relations." This extraordinary tract had its origin in a foreign publication; but it was wrought up to perfection by the additional ingenuity and learning of Mr Campbell. In 1744 he gave to the public, in two volumes folio, his "Voyages and Travels," on Dr Harris's plan, being a very distinguished improvement of that collection which had appeared in 1705. The time and care employed by Mr Campbell in this important undertaking did not prevent his engaging in another great work, the "Biographia Britannica," which began to be published in weekly numbers in 1745, and extended to seven volumes folio: but our author's articles were only in the first four volumes; of which Dr Kippis observes, they constitute the prime merit.

When the late Mr Dodgson formed the design of "The Preceptor," which appeared in 1746, Mr Campbell was to assist in the undertaking; and the parts written by him were the Introduction to Chronology, and the Discourse on Trade and Commerce, both of which displayed an extensive fund of knowledge upon the subject. In 1750 he published the first separate edition of his "Prentice State of Europe," a work which had been originally begun in 1746, in the "Museum," a very valuable periodical performance, printed for Dodgson. There is no production of our author's that hath met with a better reception. It has gone through six editions, and fully deserved this encouragement. The next great undertaking which called for the exertion of our author's abilities and learning, was "The Modern Universal History." This extensive work was published, from time to time, in detached parts, till it amounted to 16 volumes folio; and a second edition of it, in 8vo. began to make its appearance in 1759. The parts of it written by Mr Campbell were, the histories of the Portuguese, Dutch, Spanish, French, Swedish, Danish, and Ostend Settlements in the East Indies; and the histories of the Kingdoms of Spain, Portugal, Algarve, Navarre, and that of France, from Clovis to 1656. As our author had thus distinguished himself in the literary world, the degree of LL.D. was very properly and honourably conferred upon him, June 18. 1754, by the University of Glasgow.

His principal and favourite work was, "A Political Survey of Great Britain," a vol. 4to, published a short time before his death; in which the extent of his knowledge, and his patriotic spirit, are equally conspicuous. Dr Campbell's reputation was not confined to his own country, but extended to the remotest parts of Europe. As a striking instance of this, it may be mentioned, that in the spring of 1774, the empress of Russia was pleased to honour him with the present of her picture, drawn in the robes worn in that country in the days of John Basiliwitz, grand duke of Muscovy, who was contemporary with Queen Elizabeth. To manifest the doctor's sense of her imperial majesty's goodness, a set of the "Political Survey of Britain," bound in Morocco, highly ornamented, and accompanied with a letter descriptive of the triumphs and felicities of her reign, was forwarded to St Peterburgh, and conveyed into her hands by Prince Orloff, who had resided some months in this kingdom.

Dr Campbell in 1736 married Elizabeth, daughter of Benjamin Vobe, of Leominster, in the county of Hereford, gentleman, with whom he lived nearly 40 years in the greatest conjugal harmony and happiness. So wholly did he dedicate his time to books, that he seldom went abroad: but to relieve himself as much as possible from the inconveniences incident to a sedentary life, it was his custom, when the weather would admit, to walk in his garden; or otherwise in some room of his house, by way of exercise. By this method, united with the strictest temperance in eating, and an equal abstemiousness in drinking, he enjoyed a good state of health, though his constitution was delicate. His domestic manner of living did not preclude him from a very extensive and honourable acquaintance. His house, especially on a Sunday evening, was the resort of the most distinguished persons of all ranks, and particularly of such as had rendered themselves eminent by their knowledge or love of literature. He received foreigners, who were fond of learning, with an affability and kindness which excited in them the highest respect and veneration; and his instructive and cheerful conversation made him the delight of his friends in general. He was, during the latter part of his life, agent for the province of Georgia in North America; and died at the close of the year 1775, in the 67th year of his age. The doctor's literary knowledge was by no means confined to the subjects on which he more particularly treated as an author; he was well acquainted with the mathematics, and had read much in medicine. It had been with great reason believed, that if he had dedicated his studies to this last science, he would have made a very conspicuous figure in the medical profession. He was eminently versed in the different parts of sacred literature; and his acquaintance with the languages extended not only to the Hebrew, Greek, and Latin, among the ancient, and to the French, Italian, Spanish, Portuguese, and Dutch, among the modern; but likewise to the oriental tongues. He was particularly fond of the Greek language. His attainment of such a variety of knowledge was exceedingly assisted by a memory surprisingly retentive, and which indeed astonished
Campbell finished every person with whom he was conversant. In communicating his ideas, he had an uncommon readiness and facility; and the style of his works, which had been formed upon the model of that of the celebrated Bishop Sprat, was perspicuous, easy, flowing, and harmonious. To all these accomplishments of the understanding, Dr. Campbell joined the more important virtues of a moral and pious character. His disposition was gentle and benevolent, and his manners kind and obliging. He was the tenderest of husbands, a most indulgent parent, a kind master, a firm and sincere friend. To his great Creator he paid the constant and ardent tribute of devotion, duty, and reverence; and in his correspondences he showed that a sense of piety was always nearest his heart.

Campbell, George, D. D. was born at Aberdeen in December 1719. He was educated at the grammar school in the same town, and intended for the employment of signet-writer, an occupation similar to that of an English attorney, in which he was bound an apprentice. The love of study, however, prevailed over every opposition: in 1741 he attended divinity lectures at Edinburgh before the term of his apprenticeship was fully completed, and soon after became a regular student in the university of Aberdeen, attending the lectures of Professor Lumsden in King's, and Professor Chalmers in Marischal college. In 1746 he was licensed to preach by the presbytery of Aberdeen. In 1748 he obtained the living of Banchory Ternan, in which situation he became a married man, and was fortunate in possessing a lady "remarkable for the sagacity of her understanding, the integrity of her heart, the general propriety of her conduct, and her skill in the management of domestic economy." Mutual happiness was the consequence of this union, which was not terminated till her death in 1792. In 1757 he was translated to Aberdeen, to be one of the ministers of that town, and in 1759 was presented to the office of principal of Marischal college.

Mr. Hume's Treatise on Miracles gave the new principal an opportunity of evincing that he was not unworthy of his office. He opposed it in a sermon preached before the provincial synod of Aberdeen, in 1760, which he was requested to publish; but he preferred the form of a dissertation, and in that state sent the manuscript to Dr. Blair, to be by him communicated to the metaphysician. Availing himself then of the remarks of his friends, and his opponent, he gave it to the world in 1763, with a dedication to Lord Bute: but however desirable the patronage of the minister might be in other respects, it was of very little assistance in giving circulation, in the literary world, to an essay which, from the favourable impressions of Blair and Hume, was eagerly read, and universally admired.

In 1771 he was elected professor of divinity in Marischal college, on which he resigned his office as one of the ministers of Aberdeen: but as "minister of Gray Friars, an office conjoined to the professorship about a century ago, he was obliged to preach once every Sunday in one of the established churches." Few persons seem to have entertained truer notions of the office of a teacher in an university than our new professor; and the plan he had in view, on entering upon his lectures, though expressed in rather too strong language, may be recommended to every one who undertakes a similar employment.

"Gentlemen (he thus addresses his pupils), the nature of my office has been much misunderstood. It is supposed, that I am to teach you everything connected with the study of divinity. I tell you honestly, that I am to teach you nothing. Ye are not school-boys. Ye are young men, who have finished your courses of philosophy, and ye are no longer to be treated as if ye were at school. Therefore, I repeat it, I am to teach you nothing; but, by the grace of God, I will assist you to teach yourselves every thing." In 1771 he published his excellent sermon on the Spirit of the Gospel; and, in 1776, his Philosophy of Rhetoric. In this latter year, also, he acquired the friendship of Dr. Tucker by a sermon, then much admired, and very generally read, on the Duty of Allegiance, in which he endeavours to show "that the British colonies in America had no right, either from reason or from Scripture, to throw off their allegiance;" and he uses those vulgar arguments, which, as being purely political, and more especially adapted to the sentiments of the majority of that day, were very improper topics for the pulpit. It is so much the fashion for divines to make the varying politics of the hour the subject of their discourses, and in them to follow the sentiments of those whose patronage is deemed most advantageous, that we must not be very severe in our animadversions on the present occasion. In 1777 he chose a better subject for a discourse, which he published at the request of the Society for propagating Christian Knowledge, and in which the success of the first publishers of the Gospel is aby treated as a proof of its truth. In 1779, when many of his countrymen, led away by the madness of enthusiasm and fanaticism, were rushing headlong into the most antichristian practice of persecution, he published a very seasonable address to the people of Scotland, on the alarms which had been raised by the bill in favour of the Roman Catholics.

In the same year, also, he published a sermon on the Happy Influence of Religion on Civil Society. The last work which he lived to bring before the public was his Translation of the Four Gospels, with preliminary dissertations, and explanatory notes, of which it is unnecessary to say any thing further in this place than that it is worthy of his talents and character.

In 1795 he resigned his professorship, in a letter to the moderator of the presbytery of Aberdeen, which they voted to be inserted in their records. Soon after the resignation of his professorship, he resigned also the principaship, on a pension of 300l. a-year being conferred on him by government, but this pension he possessed for a very short time; for, on the 21st of March, 1796, his last illness seized him, and on the next morning it was followed by a paroxysm of the palsy, which destroyed his faculty of speech, and under which he languished till he died. His funeral sermon was preached on the 17th of April by Dr. Brown, who had succeeded him in the offices of principal and professor.

His character, very justly drawn by the same gentleman, we shall now lay before our readers. "Dr. Campbell, as a public teacher, was long admired for the clearness and copiousness with which he illustrated
Campbell. ed the great doctrines and precepts of religion, and
the strength and energy with which he enforced them.
Intimately persuaded of the truth and infinite con-
sequence of what revelation teaches, he was strongly de-
sirous of carrying the same conviction to the minds of
his hearers, and delivered his discourses with that zeal
which flows from strong impressions, and that power
of persuasion which is the result of sincerity of heart,
combined with clearness of understanding. He was
satisfied, that the more the pure dictates of the gospel
were studied, the more they would approve them-

selves to the mind, and bringing forth, in the affections
and conduct, all the peaceable fruits of righteousness. Th
unadulterated dictates of Christianity, he was, there-
fore, only studious to recommend and inculcate; and
knew perfectly to discriminate them from the inven-
tions and traditions of men. His chief study ever was,
to direct belief to the great objects of practice; and,
without these, he viewed the most orthodox profession
as "a sounding brass, and a tinkling cymbal." But,
besides the character of a preacher of righteousness,
he had also that of a teacher of the science of divi-
nity to sustain. How admirably he discharged this
duty, and with what effect he conveyed the soundest
and most profitable instruction to the minds of his schol-
sars, let those declare who are now in various congre-
gations of this country, communicating to their fellow
Christians the fruits of their studies under so able and
judicious a teacher. Discarding all attachment to
human systems, merely considered as such, he tied his
faith to the Word of God alone, possessed the happiest
talent in investigating its meaning, and communicated
to his hearers the result of his own inquiries, with a
precision and perspicuity which brought light out of
obscurity, and rendered clear and simple what appeared
intricate and perplexed. He exposed, without reserve,
the corruptions which ignorance, craft, and hypocrisy
had introduced into religion, and applied his talent for
ridicule to the best of all purposes, to hold up to con-
tempt the absurdities with which the purest and su-
blimest truths had been loaded.

"Placed at the head of a public seminary of learn-
ing, he felt all the importance of such a situation, and
uniformly directed his influence to public utility. His
enlarged and enlightened mind justly appreciated the
extensive consequence of the education of youth. He
anticipated all the effects resulting to the great com-
unity of mankind, from numbers of young men issuing,
in regular succession, from the university over which
he presided, and occupying the different departments
of social life.

"His benevolent heart delighted to represent to
itself the students under his direction usefully and
honourably discharging the respective duties of their
different professions, and some of them, perhaps, filling
the most distinguished stations of civil society. With
these prospects before him, he constantly directed his
public conduct to their attainment. He never suffered
his judgment to be warped by prejudice or partiality,
or his heart to be seduced by passion or private interest.
Those mean and ignoble motives by which many are
actuated in the discharge of important trusts, approach-
not his mind. A certain honourable pride, if pride
it may be called, diffused an uniform dignity over the
whole of his behaviour. He felt the man degraded
by the perversion of public character. His understand-
ing also clearly shewed him even personal advantage at-
tached to such principles and practice, as he adopted
from a sense of obligation, and those elevated concep-
tions of real worth which were so congenial to his soul.
He saw, he experienced, esteem, respect, and influence,
following in the train of integrity and beneficence; but
contempt, disgrace, aversion, and complete insignifi-
cance, closely linked to corruption and selfishness. Lit-
tle minds are seduced and overpowered by selfish con-
 siderations, because they have not the capacity to look
beyond the present advantage, and to extend to the mi-
 sery that stands on the other side of it. The same cir-
cumstance that betrays the perversity of their hearts,
even evinces the weakness of their judgments.

"His reputation as a writer is as extensive as the
present intercourse of letters; not confined to his own
country, but spread through every civilized nation. In
his literary pursuits, he aimed not, as is very often the
case, with men of distinguished literary abilities, mere-
ly at establishing his own celebrity, or increasing
his fortune; but had chiefly at heart the defence of
the great cause of Religion, or the elucidation of her
dictates.

"At an early period he entered the lists as a cham-
pion for Christianity against one of its scietest oppo-
sents. He not only triumphantly refuted his argu-
ments, but even consolidated his respect by the handsom-
e and dexterous manner in which his defence was conduct-
ed. While he refuted the infidel, he spared the man,
and exhibited the uncommon spectacle of a polemical
writer possessing all the moderation of a Christian. But
while he defended Christianity against its enemies, he
was desirous of contributing his endeavours to increase
among its professors, the knowledge of the sacred writ-
ings. Accordingly, in the latter part of his life, he
favoured the world with a work, the fruit of copious
erudition, of unvaried application for almost thirty
years, and of a clear and comprehensive judgment. We
have only to regret, that the other writings of the New
Testament have not been elucidated by the same pen
that translated the Gospels. Nor were his literary me-
rts confined to theology, and the studies more immedi-
cately connected with it. Philosophy, and the fine arts,
are also indebted to his genius and labours; and in him
the polite scholar was eminently joined to the deep and
liberal divine.

"Political principles will always be much affected
by general character. This was also the case with Dr
Campbell. In politics, he maintained that moderation
which is the surest criterion of truth and rectitude, and
was equally distant from those extremes into which men
are so apt to run in great political questions. He
cherished that patriotism which consists in wishing and
devouring to promote, the greatest happiness of his
country, and is always subordinate to universal benevo-
ence. Firmly attached to the British constitution, he
was animated with that genuine love of liberty which
it inspires and invigorates. He was equally averse to
despotism and to popular anarchy; the two evils into
which political parties are so frequently hurried, to the
destruction of all that is valuable to government. Par-
ty-spirit, of whatever description, he considered as hav-
ing an unhappy tendency to pervert, to the most per-
nicious purposes, the best principles of the human mind,
and to clothe the most iniquitous actions with the most specious appearances. Although tenacious of those sentiments, whether in religion or politics, which he was convinced to be rational and just, he never suffered more difference of opinion to impair his good will, to obstruct his good offices, or to cloud the cheerfulness of conversation. His own conversation was enlivened by a vein of the most agreeable pleasantry."

CAMBELTOWN, a parish town of Argyllshire in Scotland, seated on the eastern shore of the peninsula of Kintry or Cantyre, of which it is the capital. It hath a good harbour; and is now a very considerable place, though within these 50 years only a petty fishing town. It has in fact been created by the fishery: for it was appointed the place of rendezvous for the busses; and above 250 have been seen in the harbour at once. The inhabitants amounted to 6000 in 1811. W. Long. 5. 10. N. Lat. 34.

CAMPEACHY, a town of Mexico in South America, seated on the east coast of a bay of the same name, on the west of the province of Yucatan. It is defended by a good wall and strong fort; but is neither so rich, nor carries on such a trade, as formerly; it having been the port for the sale of logwood, the place where it is cut being about 30 miles distant. It was taken by the English in 1566; by the Bucaeneers in 1678; and by the Flibusters of St Domingo in 1685, who set on fire and blew up the citadel. W. Long. 93. 7. N. Lat. 10. 20.

CAMPSCHAT WOOD. See HEMATOXYLUM, BOTANY INDEX.

CAMPEN, a strong town in Overassell in the United Provinces. It hath a citadel and a harbour; but the latter is almost choked up with sand. It was taken by the Dutch in 1578, and by the French in 1672. E. Long. 5. 35. N. Lat. 52. 38.

CAMPEN PETER, an eminent Dutch writer on medicine and physiology. See SUPPLEMENT.

CAMPESTHE, in antiquity, a sort of cover for the privities, worn by the Roman soldiers in their field exercises; being girt under the navel, and hanging down to the knees. The name is supposed to be formed from CAMPUS, the field or place where the Roman soldiers performed their exercises.

CAMPHORA, or CAMPHIRE, a solid concrete substance extracted from the wood of the laurus camphora. See CHEMISTRY, and MATERIA MEDICA INDEX.

Pure camphire is very white, pellucid, somewhat unctuous to the touch; of a bitterish aromatic taste, yet accompanied with a sense of coolness; of a very fragrant smell, somewhat like that of rosemary, but much stronger. It has been very long esteemed one of the most efficacious diaphoretics; and has been celebrated in fevers, malignant and epidemic distempers. In deliria, also, where opium could notprocure sleep, but rather aggravated the symptoms, this medicine has often been observed to procure it. All these effects, however, Dr Collen attributes to its sedative property, and denies that camphire has any other medicinal virtue than those of an antispasmodic and sedative. He allows it to be very powerful, and capable of doing much good or much harm. From experiments made on different brute creatures, camphire appears to be poisonous to every one of them. In some it produced sleep followed by death, without any other symptom. In others, before death, they were awakened into convulsions and rage. It seems, too, to act chiefly on the stomach; for an entire piece swallowed, produced the above-mentioned effects with very little diminution of weight.

CAMPHYSSEN, DIRK THEODOR RAPHAEL, an eminent painter, was born at Gorkum in 1586. He learned the art of painting from Diederic Goveere; and by a studious application to it, he very soon not only equalled, but far surpassed his master. He had an uncommon genius, and studied nature with care, judgment, and assiduity. His subjects were landscapes, mostly small, with ruinous buildings, huts of peasants, or views of villages on the banks of rivers, with boats and boys, and generally painted in a broad light. His pencil is remarkably tender and soft, his colouring true nature and very transparent, and his expertness in perspective is seen in the proportional distances of his objects, which are excellently contrived, and have a surprising degree of nature and truth. As he left off painting at an age when others are scarcely qualified to commence artists, few of his works are to be met with, and they bring considerable prices: as they cannot but give pleasure to the eye of every observer. He painted his pictures with a thin body of colour, but they are handled with singular neatness and spirit. He practised in his profession only till he was 18 years of age, and being then recommended as a tutor to the sons of the Lord of Nieuport, he undertook the employment, and discharged it with so much credit, that he was appointed secretary to that nobleman. He excelled in drawing with a pen; and the designs which he finished in that manner are exceedingly valued.

CAMPUS EDMUN, an English Jesuit, was born at London, of indigent parents, in the year 1540, and educated at Christ's hospital, where he had the honour to speak an oration before Queen Mary on her accession to the throne. He was admitted a scholar of St John's college in Oxford at its foundation, and took the degree of master of arts in 1564. About the same time he was ordained by a bishop of the church of England, and became an eloquent Protestant preacher. In 1566, when Queen Elizabeth was entertained by the university of Oxford, he spoke an elegant oration before her majesty, and was also respondent in the philosophy at St Mary's church. In 1568, he was junior proctor of the university. In the following year, he went over to Ireland, where he wrote a history of that kingdom, and turned Papist; but being found rather too assiduous in persuading others to follow his example, he was committed to prison. He soon, however, found means to make his escape. He landed in England in 1771; and thence proceeded to Douay in Flanders, where he publicly recanted his former heresy, and was created bachelor of divinity. He went soon after to Rome, where, in 1773, he was admitted of the society of Jesus, and was sent by the general of that order to Vienna, where he wrote his tragedy called
led Nectar et Ambrosia, which was acted before the emperor with great applause.

From Vienna he went to Prague in Bohemia, where he resided in the Jesuits college about six years, and then returned to Rome. From thence, in 1582, he was sent by Pope Gregory XIII, with the celebrated Father Parsons, to convert the people of England. From Pitts we learn, that, some time before, several English priests, inspired by the Holy Ghost, had undertaken to convert their countrymen; that 80 of these from foreign seminaries, besides several others who, by God's grace, had been converted in England, were actually engaged in the pious work with great success; that some of them had suffered imprisonment, chains, tortures, and ignominious death, with becoming constancy and resolution; but seeing at last that the labour was abundant, and the labourers few, they solicited the assistance of the Jesuits, requesting, that though not early in the morning, they would at least in the third, sixth, or ninth hour, send labourers into the Lord's vineyard. In consequence of this solicitation, the above two were sent to England. They arrived in an evil hour for Campion, at Dover; and were next day joyfully received by their friends at London. He had not been long in England, before Walsingham, the secretary of state, being informed of his uncommon assiduity, in the cause of the church of Rome, used every means in his power to have him apprehended, but for a long time without success. However, he was at last taken by one Elliot, a noted priest-taker, who found him in the house of Edward Yates, Esq. at Lyford, in Berkshire, and conducted him in triumph to London, with a paper on his hat, on which was written Campian the Jesuit. He was imprisoned in the Tower, where Wood says, "he did undergo many examinations, abuses, wrackings, tortures." *exquisitissimus cruciatibus tortus*, says Pitts. It is hoped, for the credit of our reformers, this torturing part of the story is not true. The poor wretch, however, was condemned on the statute 25 Ed. III. for high treason; and butchered at Tyburn, with two or three of his fraternity. Howsoever criminal is the eye of the law, or of the English gospel, might be the zeal of this Jesuit for the salvation of the poor heretics of this kingdom, biographers of each persuasion unite in giving him a great and amiable character. "All writers (says the Oxford antiquary), whether Protestants or Popish, say, that he was a man of admirable parts; an elegant orator, a subtle philosopher and disputant, and an exact preacher whether in English or the Latin tongue; of a sweet disposition, and a well-polished man." Fuller, in his church history, says, "he was of a sweet nature, constantly carrying about him the charms of a plausible behaviour, of a fluent tongue, and good parts." His History of Ireland, in two books, was written in 1570; and published, by Sir James Ware, from a manuscript in the Cotton library, Dublin, 1633, folio. He wrote also *Chronologia Universalis*, a very learned work, and various other tracts.

CAMPUS MARTIUS, a large plain in the suburbs of ancient Rome, lying between the Quirinal and Capitoline mounts and the Tiber; thus called because consecrated to the god Mars, and set apart for military sports and exercises to which the Roman youth were trained, as the use and handling of arms, and all manner of feats of activity. Here were the races run, either with chariots or single horses; here also stood the villa publica, or palace for the reception of ambassadors, who were not permitted to enter the city. Many of the public comitia were held in the same field, part of which was for that purpose cantoned out. The place was also nobly decorated with statues, arches, columns, porticoes, and the like structures.

CAMPUS SECATORIUS, a place without the walls of ancient Rome, where the Vestals, who had violated their vows of virginity were buried alive.

CAMPUS, a town of Asia, on the eastern extremity of the kingdom of Ciusus, on the frontiers of Tangut. E. Long. 98. 5. N. Lat. 97. 15.

CAMUS; a person with a low flat nose, hollowed in the middle.
The Tartars are great admirers of camus beauties. Rubraquis observes, that the wife of the great Jenghiz Khan, a celebrated beauty, had only two holes for a nose.

*Camus, John Peter,* a French prelate, born in 1582. He was author of a number of pious romances (the taste of his time), and other theological works, to the amount of 200 vols. His definition of politics is remarkable; *Are non tam regendi, quam fallendi, homines: 'The art not so much of governing, as of deceiving mankind.'* He died in 1652.

*Can.,* in the sea-language, as *can-pump,* a vessel wherein seamen pour water into the pump to make it go.

*Can-Buoy.* See Buoy.

*Can-Hand,* an instrument used to sling a cask by the end of the staves: it is formed by fixing a broad and flat hook at each end of a short rope; and the tackle by which the cask so slung may be hoisted or lowered, is hooked to the middle of the rope.

*Canana, in Ancient Geography,* a town on the confines of the Upper and Lower Galilæ; memorable for the turning water into wine (John). The birthplace of Simeon, called the Canaanite from this place, and of Nathanael.

*Canaan,* the fourth son of Ham. The irreverence of Ham towards his father Noah is recorded in Gen. ix. Upon that occasion the patriarch cursed him in a branch of his posterity: *'Cursed,' says he, 'be Canaan; a servant of servants shall he be unto his brethren.'* This curse being pronounced, not against Ham the immediate transgressor, but against his sons, who does not appear, from the words of Moses, to have been anywise concerned in the crime, hath occasioned several conjectures. Some have believed that Noah cursed Canaan, because he could not well have cursed Ham himself, whom God had not long before blessed. Others think Moses's chief intention in recording this prediction was to raise the spirits of the Israelites, then an entire people of Canaanites, and to show them that as they were the seed of the children of Canaan, by the assurance, that, in consequence of the curse, that people were destined by God to be subdued by them. For the opinion of those who imagine all Ham's race were here accursed, seems repugnant to the plain words of Scripture, which confines the maladiction to Canaan and his posterity: and is also contrary to fact. Indeed the prophecy of Noah that *'Canaan should be a servant of servants to his brethren,'* seems to have been wholly accomplished in him. It was completed with regard to Shem, not only in that a considerable part of the seven nations of the Canaanites were made slaves to the Israelites, when they took possession of their land, as part of the remainder of them were afterwards enslaved by Solomon; but also by the subsequent expeditions of the Assyrians and Persians, who were both descended from Shem; and under whom the Canaanites suffered subjection, as well as the Israelites; not to mention the conquest of part of Canaan by the Elamites, or Persians, under Chosroes, prior to them all. With regard to the conquerors, we find a completion of the prophecy, in the successive conquests of the Greeks and Romans in Palestine and Phœnicia, where the Canaanites were subdued; but especially in the total subversion of the Carthaginian power by the Romans; besides some invasions of the northern nations, as the posterity of Thogarma and Magoz; wherein many of them, probably, were carried away captive.

The posterity of Canaan were very numerous. His eldest son was Sidon, who at least founded and peopled the city of Sidon, and was the father of the Sidonians and Phœnicians. Canaan had besides ten sons, who were the fathers of so many peoples, dwelling in Palestine, and in part of Syria; namely, the Hittites, the Jebusites, the Amorites, the Girgasites, the Hathites, the Arkites, the Senites, the Arvadites, the Zemarites, and Hamathites.

*Land of Canaan,* the country so named from Canaan the son of Ham. It lies between the Mediterranean sea and the mountains of Arabia, and extends from Egypt to Phœnicia. It is bounded to the east by the mountains of Arabia; to the south by the wilderness of Paran, Idumeæ, and Egypt; and to the west by the Mediterranean, called in Hebrew the Great Sea; to the north by the mountains of Libanus. Its length from the city of Dan (since called Cesarea Philippi, or Paneas, which stands at the foot of these mountains) to Beersheba, is about 70 leagues; and its breadth from the Mediterranean sea to the eastern borders, is in some places 30. This country, which was first called Canaan, from Canaan the son of Ham, whose posterity possessed it, was afterwards called Palestine, from the people which the Hebrews call Philistines, and the Greeks and Romans corruptly Pales-tines, who inhabited the sea coasts, and were first known to them. It likewise had the name of the *Land of Promise,* from the promise God made to Abra-ham of giving it to him; that of the *Land of Israel,* from the Israelites having made themselves masters of it; that of Judah, from the tribe of Judah, which was the most considerable of the twelve; and lastly, the happiness it had of being sanctified by the presence, actions, miracles, and death of Jesus Christ, has given it the name of the *Holy Land,* which it retains to this day.

The first inhabitants of this land therefore were the Canaanites, who were descended from Canaan, and the eleven sons of that patriarch. Here they multiplied extremely: trade and war were their first occupations; these gave rise to their riches, and the several colonies scattered by them over almost all the islands and maritime provinces of the Mediterranean. The measure of their idolatry and abominations was completed, when God delivered their country into the hands of the Israelites. In St Athanasius's time, the Africans still said they were descended from the Canaanites; and it is said, that the Punic tongue was almost entirely the same with the Canaanitish and Hebrew language. The colonies which Cadmus carried into Thessalonica, and his brother Cilix into Cilicia, came from the stock of Canaan. The islands of Sicily, Sardinia, Malta, Cyprus, Corfu, Majorca and Minorca, Gades and Ebusus, are thought to have been peopled by the Canaanites. Bochart, in his large work entitled *Canaan,* has set all this matter in a good light.

Many of the old inhabitants of the north-west of the land of Canaan, however, particularly on the coast or territories of Tyre and Sidon, were not driven out by the children of Israel, whence this tract seems to have retained the name of Canaan a great while after...
these other parts of the country, which were better inhabited by the Israelites, had lost the said name. The Greeks called this tract, inhabited by the old Cannanites along the Mediterranean sea, Phœnicia; the more inland parts, as being inhabited partly by Cannanites, and partly by Syracous, Syrophenician; and hence the woman said by St Matthew (xv. 22.) to be a woman of Canaan, whose daughter was cursed, is said by St Mark (viii. 26.) to be 'Syrophenician by nation; for as she was a Greek by religion and language.'

CANABAC, an island which lies contiguous to Bulaam on the western coast of Africa, and is inhabited by a fierce people, governed by two kings or chiefs. It would appear that the Canabac had been very troublesome to their neighbours; for the inhabitants of some other islands in that cluster rejoiced at the settlement of the English in Balam, hoping to find in them a defence against the usurpations of this people.

CANADA, an extensive country of North America; bounded on the north-east by the gulf of St Lawrence, and St John's river; on the south-west, by the great lakes of Erie, Huron, and Superior; on the south, by the province of Nova Scotia, and the territories of the United States; and on the north-west, by Indian nations. Under the name of Canada, the French comprehended a very large territory; taking into their claim part of New Scotland, New England, and New York on the east; and extending it on the west as far as the Pacific ocean. That part, however, which is occupied or claimed by the British at present lies between 65 and 52 of west longitude, and 42 and 5 of north latitude, and is divided into Upper and Lower Canada. The climate is not very different from that of the United States; but as it is much farther from the sea, and more to the northward, than most of those provinces, it has a much severer winter, though the air is generally clear; and, like most of those American tracts that do not lie too far to the northward, the summers are very hot, and exceeding pleasant. The soil is generally very good, and in many parts extremely fertile; producing many different sorts of grains, fruits, and vegetables. The meadow grounds, which are well watered, yield excellent grass, and breed vast numbers of great and small cattle. The uncultivated parts are a continued wood, composed of prodigiously large and lofty trees, of which there is such a variety of species, that even of those who have taken most pains to know them, there is not perhaps one that can tell half the names. Canada produces, among others, two sorts of pines, the white and the red; four sorts of fir; two sorts of cedar and oak, the white and the red; the oak and female maple; three sorts of aspen trees, the tace, the magnol, and the bastard; three sorts of walnut-trees, the hard, the soft, and the smooth; vast numbers of beech-trees and white wood; white and red elms, and poplars. The Indians bow the red elms into canoes, some of which made out of one piece will contain 60 persons: others are made of the bark, the different pieces of which they sew together with the inner skin, and daub over the seams with pitch, or rather a bituminous matter resembling pitch, to prevent their leaking; the ribs of these canoes are made of boughs of trees. In the hollow elms, the bears and wild cats take up their lodging from November to April. The country produces also a vast variety of other vegetables, particularly tobacco, which thrives well. Near Quebec is a fine lead mine, and many excellent ones of iron have been discovered. It hath also been reported that silver is found in some of the mountains. The rivers are extremely numerous, and many of them very large and deep. The principal are, the Ouatansin, St John's, Seguiny, Desmains, and Trois Riviers; but all these are navigable up by the great river St Lawrence. This river issues from Lake Ontario; and, taking its course north-east, washes Montreal, where it receives the Ouatansin, and forms many fertile islands. It continues the same course, and meets the tide upwards of 400 miles from the sea, where it is navigable for large vessels; and below Quebec, 320 miles from the sea, it becomes so broad and so deep, that ships of the line contributed to the last war to reduce that city. After receiving in its progress innumerable streams, it at last falls into the ocean at Cape Rosiers, where it is 90 miles broad, and where the cold is intense and the sea boisterous. The most considerable settlements are upon the river and its smaller branches, and upon Lake Ontario, though a few settlers have fixed themselves also on Lake Erie, and the fur traders have stations far beyond Lake Superior. Here are five lakes, the least of which is of greater extent than the fresh-water lakes to be found in any other part of the world; these are Lake Ontario, which is not less than 200 leagues in circumference; Erie, or Oswego, longer, but not so broad, is about the same extent. That of the Huron spreads greatly in width, and is about 300 leagues in circuit; as also is that of Michigan, though, like Lake Erie, it is rather long, and comparatively narrow. But Lake Superior is larger than any of these, being not less than 500 leagues in circumference. All these are navigable by any vessels, and they all communicate with each other; but the passage between Erie and Ontario is interrupted by a most stupendous fall or cataract, called the falls of Niagara. The river St Lawrence, as already observed, is the outlet of these lakes, by which they discharge themselves into the ocean. The French built forts at these several straits, by which the lakes communicate with one another, and on that where the last of them communicates with the river. By these, while the country was in their possession, they effectually secured to themselves the trade of the lakes, and preserved an influence over all the Indian nations that lie near them.

The most curious and interesting part of the natural history of Canada is the animals there produced. These are stags, elks, deer, bears, foxes, martens, wild cats, ferrets, weasels, large squirrels of a grayish hue, hares and rabbits. The southern parts, in particular, breed great numbers of wild bulls, divers sorts of roebucks, goats, wolves, &c. The marshes, lakes, and ponds, with which this country abounds, swarm with otters and beavers, of which the white are highly valued, as well as the right black kind. A vast variety of birds are also to be found in the woods; and the river St Lawrence abounds with such quantities of fish, that it is affirmed by some writers, this would be a more profitable article than even the fur-trade. There are in
in Canada a multitude of different Indian tribes: but
there are observed to decrease in number when the
Europeans are most numerous; owing chiefly to the
immoderate use of spirituous liquors, of which they
are excessively fond. Their manners and way of living
we have already particularly described*. The principal
towns are Quebec, Trois Rivieres, Montreal, and York.
The commodities required by the Canadians from Europe
are, wine, or rather rum; cloths, chiefly coarse; linens,
and wrought iron. The Indian trade requires rum,
tobacco, a sort of duffle blankets, guns, powder, balls,
and flints, kettle, hatchets, toys, and trinkets of all
kinds. While the country was in possession of the
French, the Indians supplied them with poultry; and
the French had traders, who, like the original inhabi-
tants, traversed the vast lakes and rivers in canoes,
with incredible industry and patience, carrying their
goods into the remotest parts of America, and nations
entirely unknown to us. These again brought the
furs, &c. home to them, as the Indians were there-
habituated to trade with them. For this purpose,
people from all parts, even from the distance of 1000
miles, came to the French fair at Montreal, which
began in June, and sometimes lasted three months.
Since Canada came into the possession of Great Britain, its
progress has been extremely rapid. Its population
in 1759, when the French lost it, amounted to 70,000.
In 1814 the inhabitants of Lower Canada amounted to
335,000, and those of Upper Canada to 95,000; but
a part of this increase may be attributed to the great
influx of emigrants from Britain. The agriculture and
commerce of Canada have also been vastly extended.
In 1769 the value of the produce exported amounted
to £63,105, and it employed 70 vessels belonging to
Britain and the colonies. But in 1812 the value of
the goods imported into Britain, from Canada, Nova
Scotia, and Newfoundland, amounted to £1,999,689.
Since heavy duties were laid on Baltic timber, a vast
quantity has been imported from Canada; but the quan-
tity is found to be very inferior to what is procured
from Norway.

The greatest obstruction to the trade of Canada
arises from the rigour of the climate. This is so ex-
cessive from December to April, that the broadest
rivers are frozen over, and the snow lies commonly
from four to six feet deep on the ground, even in those
parts of the country which lie three degrees south
of London, and in the temperate latitude of Paris. Our
communication therefore with Canada, and the im-
ense regions beyond it, will always be interrupted
during the winter season, until roads are formed that
can be travelled without danger from the Indians. For
these savage people often commit hostilities against
us without any previous notice; and frequently, with-
out any provocation, they commit the most horrid en-
vages for a long time with impunity.

Canada was undoubtedly discovered by Sebastian
Cabet, the famous Italian adventurer, who sailed un-
der a commission from Henry VII. But though the
English monarch did not think proper to make any use
of this discovery, the French quickly attempted it; we
have an account of their fishing for cod on the banks of
Newfoundland, and along the sea-coast of Canada, in
the beginning of the 16th century. About the year
1568, one Denys, a Frenchman, drew a map of the
gulf of St Lawrence; and two years after, one Aub-
ort, a shipmaster of Dieppe, carried over to France
some of the natives of Canada. As the new country,
however, did not promise the same amazing quantities
of gold and silver produced by Mexico and Peru, the
French for some years neglected the discovery. At
last, in the year 1553, Francis I. a sensible and en-
terprising prince, sent four ships, under the command
of Vermaz, a Florentine, to prosecute discoveries in
that country. The particulars of this man's first ex-
pedition are not known. All we can learn is, that
he returned to France, and next year he undertook a
second. As he approached the coast, he met with a vi-
olent storm; however, he came so near as to perceive the
natives on the shore, making friendly signs to him to
land. This being found impracticable by reason of the
surf upon the coast, one of the sailors threw himself into
the sea; but, endeavouring to swim back to the ship,
a surge threw him on shore without signs of life. He
was, however, treated by the natives with much care
and humanity, that he recovered his strength, and was
allowed to swim back to the ship, which immediately
returned to France. This is all we know of Ver-
ma's second expedition. He undertook a third, but
was no more heard of, and it is thought that he and all
his company perished before he could form any colony.
In 1554, one Jacques Cartier of St Malo set sail under
a commission from the French king, and on the 10th
of May arrived at Cape Bonavista in Newfoundland.
He had with him two small ships besides the one in
which he sailed. He cruised along the coast of that
island, on which he discovered inhabitants, probably
the Eskimos. He landed in several places along the
coast of the gulf, and took possession of the country in
the king's name. On his return, he was again sent
out with a commission, and a pretty large force; he re-
turned in 1555, and passed the winter at St Loix; but
the season proved so severe, that he and his companions
must have died of the scurvy, had they not, by the ad-
vice of the natives, made use of the decoction of the
tops and bark of the white pine. As Cartier, how-
ever, could produce neither gold nor silver, all that
he could say about the utility of the settlement was dis-
garded; and in 1540, he was obliged to become pilot
for one M. Robert, who was by the French king ap-
pointed viceroy of Canada, and who sailed from France
with five vessels. Arriving at the gulf of St. Lawrence,
they built a fort; and Cartier was left to command the
garrison in it, while Robert returned to France for
additional recruits to his new settlement. At last, hav-
ing embarked in 1549, with a great number of adven-
turers, neither he nor any of his followers were heard
of more.

This fatal accident so greatly discouraged the court
of France, that for 50 years, no measures were taken
for applying with necessity to the settlers that were left.
At last, Henry IV. appointed the marquis de la
lietenant-general of Canada and the neighbouring
countries. In 1593, he landed on the isle of Sable,
which he absurdly thought to be a proper place for a
settlement, though it was without any port, and with-
out product except berries. Here he left about 40 ma-
ufacturers, the refuse of the French jails. After crusin-
for some time on the coast of Nova Scotia, without being able to relieve the poor wretches, he returned to France, where he died of a broken heart. His colony must have perished, had not a French ship been wrecked on the island, and a few sheep driven upon it at the same time. With the boards of the ship they erected huts; and while the sheep lasted they lived on them, feeding afterwards on fish. Their clothes wearing out, they made coats of seal-skin; and in this miserable condition they spent seven years, when Henry ordered them to be brought to France. The king had the curiosity to see them in their seal-skin dresses, and was so moved with their appearance, that he forgave them all their offences, and gave each of them 50 crowns to begin the world anew.

In 1600, one Chauvin, a commander in the French navy, attended by a merchant of St Malo, called Pontgrave, made a voyage to Canada, from whence he returned with a very profitable quantity of furs. Next year he repeated the voyage with the same good fortune, but died while he was preparing for a third. The many specimens of profit to be made by the Canadian trade, at last induced the public to think favourably of it. An armament was equipped, and the command of it given to Pontgrave, with power to extend his discoveries up the river St Lawrence. He sailed in 1603, having in his company Samuel Champlain, who had been a captain in the navy, and was a man of parts and spirit. It was not, however, till the year 1608, that the colony was fully established. This was accomplished by founding the city of Quebec, which from that time commenced the capital of all the settlements in Canada. The colony, however, for many years continued in a low way, and was often in danger of being totally exterminated by the Indians. As the particulars of these wars, however, could neither be entertaining, nor indeed intelligible to many of our readers, we choose to omit them, and in general observe, that the French not only concluded a permanent peace with the Indians, but so much ingratiated themselves with them, that they could with the greatest ease prevail upon them at any time to murder and scalp the English in their settlements. These practices had a considerable share in bringing about the last war with France, when the whole country was conquered by the British in 1765. The most remarkable transaction in this conquest was the siege of Quebec. See Quebec; see also Canada, Supplement. And for the transactions here during the late American war, see America (United States of).

CANAL of COMMUNICATION, an artificial cut in the ground, supplied with water from rivers, springs, &c. in order to make a navigable communication between one place and another.

The particular operations necessary for making artificial navigations depend upon a number of circumstances. The situation of the ground; the vicinity or connection with rivers; the ease or difficulty with which a proper quantity of water can be obtained; these and many other circumstances necessarily produce great variety in the structure of artificial navigations, and augment or diminish the labour and expense of executing them. When the ground is naturally level, and unconnected with rivers, the execution is easy, and the navigation is not liable to be disturbed with floods; but, when the ground rises and falls, and cannot be reduced to a level, artificial methods of raising and lowering vessels must be employed; which likewise vary according to circumstances.

A kind of temporary sluices are sometimes employed for raising boats over falls or shoals in rivers by a very simple operation. Two posts or pillars of mason-work, with grooves, are fixed, one on each bank of the river, at some distance below the shoal. The boat having passed these posts, planks are let down across the river by pulleys into the grooves, by which the water is dammed up to a proper height for allowing the boat to pass up the river over the shoal.

The Dutch and Flemings at this day sometimes, when obstructed by cascades, form an inclined plane or rolling-bridge upon dry land, along which their vessels are drawn from the river below the cascade into the river above it. This, it is said, was the only method employed by the ancients, and is still used by the Chinese, who are said to be entirely ignorant of the nature and utility of locks. These rolling-bridges consist of a number of cylindrical rollers which turn easily on pivots, and a mill is commonly built near by, so that the same machinery may serve the double purpose of working the mill and drawing up vessels.

A LOCK is a basin placed lengthwise in a river or canal, lined with walls of masonry on each side, and terminated by two gates, placed where there is a cascade or natural fall of the country; and so constructed, that the basin being filled with water by an upper sluice to the level of the waters above, a vessel may ascend through the upper gate; or the water in the lock being reduced to the level of the water at the bottom of the cascade, the vessel may descend through the lower gate; for when the waters are brought to a level on either side, the gate on that side may be easily opened. But, as the lower gate is strained in proportion to the depth of water it supports, when the perpendicular height of the water exceeds 12 or 13 feet, more locks than one become necessary. Thus, if the fall be 17 feet, two locks are required, each having 8 ½ feet fall; and if the fall be 26 feet, three locks are necessary, each having 8 feet 3 inches fall. The side walls of a lock ought to be very strong. Where the natural foundation is bad, they should be founded on piles and platforms of wood: they should likewise slope outwards, in order to resist the pressure of the earth from behind.

Plate CXXXIV. fig. 1. A perspective view of part of a canal: the vessel L, within the lock AC.—Fig. 2. Section of an open lock; the vessel L about to enter.—Fig. 3. Section of a lock full of water; the vessel L raised to a level with the water in the superior canal.—Fig. 4. Ground section of a lock. L, a vessel in the inferior canal. C, the under gate. A, the upper gate. GH, a subterraneous passage for letting water from the superior canal run into the lock. KF, a subterraneous passage for water from the lock to the inferior canal.

X and Y, (fig. 1.) are the two floodgates, each of which consists of two leaves, resting upon one another, so as to form an obtuse angle, in order the better to resist the pressure of the water. The first (X) prevents the water of the superior canal from falling into the lock; and the second (Y) dams up and sustains
C A N [ III ]

C A N

Canal.

stains the water in the lock. These flood-gates ought to be very strong, and to turn freely upon their hinges.

In order to make them open and shut with ease, each leaf is furnished with a long lever A b, A b; C b, C b.

They should be made very tight and close, that as little water as possible may be lost.

By the subterraneous passage GH (fig. 2, 3, and 4.) which descends obliquely, by opening the sluice G, the water is let down from the superior canal D into the lock, where it is stoped and retained by the gate C when shut, till the water in the lock comes to be on a level with the water in the superior canal D; as represented, fig. 3. When, on the other hand, the water contained by the lock is to be let out, the passage GH must be shut by letting down the sluice G; the gate A must be also shut, and the passage KE opened by raising the sluice K: a free passage being thus given to the water, it descends through KE, into the inferior canal, until the water in the lock is on a level with the water in the inferior canal B; as represented, fig. 2.

Now, let it be required to raise the vessel L (fig. 2.) from the inferior canal B to the superior one D; if the lock happens to be full of water, the sluice G must be shut, and also the gate A, and the sluice K opened, so that the water in the lock may run out till it is on a level with the water in the inferior canal B. When the water in the lock comes to be on a level with the water at B, the leaves of the gate C are opened by the levers C C, which is easily performed, the water on each side of the gate being in equilibrio; the vessel then sails into the lock. After this the gate C and the sluice K are shut, and the sluice G opened, in order to fill the lock, till the water in the lock, and consequently the vessel, be upon a level with the water in the superior canal D; as is represented in fig. 3. The gate A is then opened, and the vessel passes into the canal D.

Again, let it be required to make a vessel descend from the canal D into the inferior canal B. If the lock is empty, as in fig. 2. the gate C and sluice K must be shut, and the upper sluice G opened, so that the water in the lock may rise to a level with the water in the upper canal D. Then open the gate A, and let the vessel pass through into the lock. Shut the gate A and the sluice G; then open the sluice K, till the water in the lock be on a level with the water in the inferior canal; then the gate C is opened, and the vessel passes along into the canal B, as was required.

Scarcity of water becomes a very serious inconvenience to navigation in those places where locks are necessary, as without a sufficient supply, it must be frequently interrupted. To save water, therefore, has been an important consideration in the construction of locks. Various attempts have been made for this purpose. We shall here give an account of one which has been proposed by Mr Playfair, architect in London. The nature and principle of this manner of saving water (says the inventor), consists in letting the water which has served to raise or fall a boat or barge from the lock, pass into reservoirs or cisterns, whose apertures of communication with the lock are upon different levels, and which may be placed or constructed at the side or sides of the lock with much

they communicate, or in any other contiguous situations that circumstances may render eligible; which apertures may be opened or shut at pleasure, so that the water may pass from the lock to each reservoir of the canal, or from each reservoir to the lock, in the following manner: The water which fills the lock, when a boat is to ascend or descend, instead of being passed immediately into the lower part of the canal, is let pass into these cisterns or reservoirs, upon different levels; then their communications with the lock being shut, they remain full until another vessel is wanted to pass; then, again, the cisterns are emptied into the lock, which is thereby nearly filled, so that only the remainder which is not filled is supplied from the higher part of the canal. Each of these cisterns must have a surface not less than that of the lock, and must contain half as much water as is meant to be expended for the passing of each vessel. The cistern the most elevated is placed twice its own depth (measuring by the aperture, or communicating opening of the cisterns) under the level of the water in the higher part of the canal. The second cistern is placed once its own depth under the first, and so on are the others, to the lowest; which last is placed once its own depth above the level of the water in the lower part of the canal. The apertures of the intermediate cisterns, whatever their number may be, must all be equally divided into different levels; the surface of the water in the one being always on the level of the bottom of the aperture of the cistern which is immediately above. As an example of the manner and rule for constructing these cisterns, suppose that a lock is to be constructed twelve feet deep, that is, that the vessel may ascend or descend twelve feet in passing. Suppose the lock sixty feet long and six feet wide, the quantity of water required to fill the lock, and to pass a boat, is 4320 cubic feet; and suppose that, in calculating the quantity of water that can be procured for supplying the canal, after allowing for the waste, it is found (according to the number of boats that may be expected to pass) that there must be above 800 cubic feet for each; then it will be necessary to save five sixths of the whole quantity that in the common case would be necessary, to do which ten cisterns must be made (the mode of placing which is expressed in the drawing, fig. 5. Plate CXXXIV.) each of which must be one foot deep, or deeper at pleasure, and each must have a surface of 360 feet square, equal to the surface of the lock. The bottom of the aperture of the lowest cistern must be placed one foot above the level of the water in the lower part of the canal, or eleven feet under the level of the high water; the second cistern must be two feet above the level of the low water; the third three feet, and so on of the others; the bottom of the tenth, or uppermost cistern, being ten feet above the low water, and two feet lower than the high water; and, as each cistern must be twelve inches in depth, the surface of the water in the higher cistern will be one foot under the level of the water in the upper part of the canal. The cisterns being thus constructed, when the lock is full, and the boat to be let down, the communications between the lock and the cisterns, which until then have all been shut, are to be opened in the following manner; first, the communication with the higher cistern is opened, which, being at bottom two feet under the level of the water in the lock,
lock, is filled to the depth of one foot, the water in the
lock descending one foot also at the same time: that
communication is then shut, and the communication be-
tween the lock and the second cistern is opened; one
foot more of the water then passes into that cistern from
the lock, and fills it; the opening is then shut: the
same is done with the third, fourth, fifth, sixth, seventh,
eighth, ninth, and tenth cisterns, one by one, until
they are all filled; and, when the tenth, or lowermost
cistern, is filled, there remains but two feet depth of wa-
ter in the lock. The communication between the lock
and the lower part of the canal is then opened, and the
last two feet depth of water is emptied into the lower
part of the canal. By this means, it is evident, that
instead of twelve feet depth of water being let descend
into the lower part of the canal, there is only two feet
depth that descends, or one-sixth of the whole; there-
fore, instead of 4320 cubic feet being used, there are
only 720 cubic feet used: the remainder of the water
in the cisterns being used as follows: When another
boat is to mount, the sluices being then shut, and the
boat in the lock, the tenth or lowermost cistern is
emptied into the lock, which it fills one foot; the com-
munication being then shut, the next lower cistern, or
the ninth, is emptied into the lock, which is thereby
filled another foot; and so in like manner, all the other
cisterns are emptied, one after another, until the higher
cistern being emptied, which fills the tenth foot of wa-
ter in the lock, there remains but two feet of water to
fill, which is done from the upper part of the canal, by
opening the higher sluice to pass the boat; by that
means the same quantity of water descends from the
upper part of the canal into the lock, that in the other
case descended from the lock into the lower part of
the canal; so that, in both cases, the same quantity of wa-
ter is saved, that is, five-sixths of what would be neces-
sary were there no cisterns. Suppose again that, upon
the same canal, and immediately after the twelve feet
lock, it would be advantageous to construct one of
eighteen feet; then, in order not to use any greater
quantity of water, it will be necessary to have sixteen
cisterns, upon different levels, communicating with
the lock in the same manner. Should, again, a lock of
only six feet be wanted, after that of eighteen, then it
will only be necessary to have four cisterns on different
levels, and so of any other height of lock. The rule
is this: for finding the number and size of the cisterns,
each cistern being the same in superficials with the lock,
its depth must be such as to contain one half the quan-
tity of water meant to be used in the passing of one
boat. The depth of the lock, divided by the depth
necessary for such a cistern, will give, in all cases, the
whole number of cisterns, and two more: deduct the
number two, therefore, from the number which you
find by dividing the depth of the lock by the depth of
one cistern, and you have always the number of cis-
terns required; which are to be placed upon different
levels, according to the rule already given. The above
is the principle and manner of using the lock, for sav-
ing water in canals, and for enabling engineers to con-
struct locks of different depths upon the same canal,
without using more water for the deep locks than for
the shallow ones. With regard to the manner of dis-
posing the cisterns, the circumstances of the ground,
the declivity, &c. will be the best guide for the en-
gineer.

But even when water is abundant, if the declivity of a
country be such as to require numerous locks, naviga-
tion suffers great interruption from them. A method
by which boats could be raised and lowered with
greater facility, or in a shorter time than can be done
by means of locks, is still a very desirable object of im-
provement in inland navigation. For this purpose the
inclined plane has been often resorted to, and par-
cularly in China, where water carriage is more generally
employed than in any country of Europe. But this
method requires very powerful machinery or a great
number of hands, which has prevented it from being
much practised in this country. Other contrivances to
obviate the use of locks have been proposed. Dr
Anderson, in his Agricultural Survey of the County
of Aberdeen, has described one, of which we shall give
an account in his own words. This contrivance, he
observes, "in the opinion of very good judges of mat-
ters of this sort, to whom the plan has been shewn,
have been deemed fully adequate to the purpose of rais-
ing and lowering boats of a moderate size, that is, of 20
tons, or downwards; and it is the opinion of most men
with whom I have conversed, who are best acquainted
with the inland navigations, that a boat of from 10 to 15
tons is better than those of a larger size. When se-
veral are wanted to be sent at once, they may be affixed
to one another, as many as the towing-horse can con-
veniently draw. Were boats of this size adopted, and
were all the boats on one canal to be of the same di-
mensisons, it would prove a great convenience to a
county in a state of beginning improvements; because
the expence of such a boat would be so trifling, that
every farmer could have one for himself, and might of
course make use of it when he pleased, by the aid of
his own horse, without being obliged to have any de-
pendence on the time that might suit the convenience
of his neighbour; and if two or more boats were going
from the same neighbourhood, one horse could serve
the whole.

Suppose that fig. 6. Plate CXXXIV. represents a bird's eye view of this simple apparatus, as
seen from above. A is supposed to be the upper reach
of the canal, and B the lower reach, with the apparatus
between the two. This consists of three divisions; the
middle one, extending from C to D, is a solid piece of
masonry, raised from a firm foundation below the level
of the bottom of the second reach; this is again divid-
ed into five parts, viz. d d d d d, where the wall rises
only to the height of the water in the upper reach, and e e,
two pillars, raised high enough to support the pivots of a
wheel or pulley y, placed in the position there marked.

The second division A consists of a wooden coffer,
of the same depth nearly as the water in the upper
reach, and of a size exactly fitted to contain one of
the boats. This communicates directly with the upper
reach, and being upon the same plane with it, and so
connected with it as to be water-tight, it is evident,
from inspection, that nothing can be more easy than to
float a boat into this coffer from the upper reach, the
part of the wheel that projects over it being at a suf-
cient height above it, so as to occasion no sort of in-
terruption.

Fig. 8.
Third division. At s is represented another coffer, precisely of the same dimensions with the first. But here two sluices, which were open in the former, and only, represented by dotted lines, are supposed to be shut, so as to cut off all communication between the water in the canal and that in the coffer. As it was impossible to represent this part of the apparatus on so small a scale, for the sake of illustration it is represented more at large in fig. 9, where A, as before, represents the upper reach of the canal, and a and c one of the coffers. The sluice k goes into two cheeks of wood, joined to the masonry of the dam of the canal, so as to fit perfectly close; and the sluice j fits, equally close, into cheeks made in the side of the coffer for that purpose; between these two sluices is a small space o. The coffer, and this division o, are to be supposed full of water, and it will be easy to see that these sluices may be let down, or drawn up at pleasure, with much facility.

Fig. 10 represents a perpendicular section of these parts in the same direction as in fig. 9, and in which the same letters represent the same parts.

Things being thus arranged, you are to suppose the coffer A to be suspended, by means of a chain passed over the pulley, and balanced by a weight that is sufficient to counterpoise it, suspended at the opposite end of the chain. Suppose, then, that the counterpoise be made somewhat lighter than the coffer with its contents, and that the line m n (fig. 10.) represents a division between the solid sides of the dam of separation, which terminates the upper reach and the wooden coffer, which had been closed only by the pressure of its own weight (being pushed a very little from A towards B, beyond its precise perpendicular swing), and that the joining all round is covered with laths of cloth put upon it for that purpose; it is evident that, so long as the coffer is suspended to this weight, the joining must be water-tight; but no sooner is it lowered down a little than this joining opens, the water in the small division o is allowed to run out, and an entire separation is made between the fixed dam and this moveable coffer, which may be lowered down at pleasure without losing any part of the water it contained.

Suppose the coffer now perfectly detached, turn to fig. 7, which represents a perpendicular section of this apparatus, in the direction of the dotted line p q (fig. 6.). In fig. 7. A represents an end view of the coffer, indicated by the same letter as in fig. 6. suspended by its chain, and now perfectly detached from all other objects, and balanced by a counterpoise s, which is another coffer exactly of the same size, as low down as the level of the lower reach. From inspection only it is evident, that is, proportion as the one of these weights rises, the other must descend. For the present, then, suppose that the coffer A is by some means rendered more weighty than s, then it will descend, while the other rises, and they will thus continue till A comes down to the level of the lower reach, and t rises to the level of the higher one.

Fig. 8. represents a section in the direction AB (fig. 6.), in which the coffer d (open in both situations) is supposed to have been gradually raised from the level of the lower reach B to that of the higher one, where it now remains stationary, while the coffer A (which is concealed behind the masonry) has descended in the mean time to the level of the lower reach, where it closes by means of the juncture p, s, fig. 10. (which juncture is covered with laths of cloth, as before explained at m n, and is of course become water-tight), where, by lifting the sluices k, and the corresponding sluices at the end of the canal, a perfect communication by water is established between them. If then, instead of water only, this coffer had contained a boat, floated into it from the upper reach, and then lowered down, it is very plain, that when these sluices were removed, after it had reached the level of the lower reach, that boat might have been floated out of the coffer with as much facility as it was let into it above. Here then we have a boat taken from the higher into the lower canal; and by reversing this movement, it is very obvious that it might be, with equal ease, raised from the lower into the higher one. It now only remains that I should explain by what means the equilibrium between these counter-balancing weights can be destroyed at pleasure, and the motion, of course, produced.

It is very evident, that if the two corresponding coffers are precisely of the same dimensions, their weight will be exactly the same when they are both filled to the same depth of water. It is equally plain, that should a boat be floated into either or both of them, whatever its dimensions or weight may be, so that it can be contained aloft in the coffer, the weight of the coffer and its contents will continue precisely the same, as when it was filled with water only; hence, then, supposing one boat to be lowered, or one to be raised at a time, or supposing one to be raised and another lowered at the same time—they remain perfectly in equilibrium in either place, till it is your pleasure to destroy that equilibrium. Suppose, then, for the present, that both coffers are loaded with a boat in each; the double sluices both above and below closed; and suppose also that a stopcock is, in the upper edge of the side of the lower coffer (fig. 8., and 10.), is opened, some of the water which served to float the boat in the coffer will flow out of it, and consequently that coffer will become lighter than the higher one; the upper coffer will of course descend, while the other mounts upwards. When a gentle motion has been thus communicated, it may be prevented from accelerating merely by turning the stopcock so as to prevent the loss of more water, and thus one coffer will continue to ascend, and the other to descend, till they have assumed their stations respectively; when, in consequence of a stop below, and another above, they are rendered stationary at the level of the respective canals (a).

Precisely the same effect will be produced when the coffers are filled entirely, with water, and are then to be raised in the same manner.

It is unnecessary to add more to this explanation, except to observe, that the space for the coffer to descend into must be deeper than the bottom of the lower canal,
Canal. In order to allow a free descent for the coffer to the requisite depth; and of course it will be necessary to have a small conduit to allow the water to get out of it. Two or three inches free, below the bottom of the canal, is all that would be necessary.

"Where the height is inconsiderable, there will be no occasion for providing any counterpoise for the chain, as that will give only a small addition to the weight of the undermost coffer, so as to make it preponderate, in circumstances where the two coffers would otherwise be in perfect equilibrium; but, where the height is considerable, there will be a necessity for providing such a counterpoise; as, without it, the chain, by becoming more weighty every foot it descended, would tend to destroy the equilibrium too much, and accelerate the motion to an inconvenient degree. To guard against this inconvenience, let a chain of the same weight per foot, be appended at the bottom of each coffer, of such a length as to reach within a few yards of the ground where the coffer is at its greatest height (see fig. 7); it will act with its whole weight upon the highest coffer while in this position; but, as that gradually descended, the chain would reach the ground, and, being there supported, its weight would be diminished in proportion to its descent; while the weight of the chain on the opposite side would be augmented in the same proportion, so as to counterpoise each other exactly, in every situation, until the uppermost chain was raised from the ground. After which it would increase its weight no more; and, of course, would then give the under coffer that preponderance which is necessary for preserving the machine steady. The under coffer, when it reached its lowest position, would touch the bottom on its edges, which would then support it, and keep every thing in the same position, till it was made lighter for the purpose of ascending.

"What constitutes one particular excellence of the apparatus here proposed is, that it is not only unlimited as to the system of the rise and depression of which it is susceptible (for it would not require the expenditure of one drop more water to lower it 100 feet than one foot); but it would also be easy to augment the number of pulleys at any one place as to admit of two, three, four, or any greater number of boats being lowered or elevated at the same time; so that let the succession of boats on such a canal be nearly as rapid as that of carriages upon a highway, none of them need be delayed one moment to wait an opportunity of passing: a thing that is totally impracticable where water-locks are employed; for the intercourse, on every canal constructed with water-locks, is necessarily limited to a certain degree, beyond which it is impossible to force it.

"For example: suppose a hundred boats are following each other, in such a rapid succession as to be only half a minute behind each other. By the apparatus here proposed, they would all be elevated precisely as they came; in the other, let it be supposed that the lock is so well constructed as that it takes no more than five minutes to close and open it; that is, ten minutes in the whole to each boat (for the lock, being once filled, must be again emptied before it can receive another in the same direction); at this rate, six boats only could be passed in an hour, and of course it would take sixteen hours and forty minutes to pass the whole hundred; and as the last boat would reach the lock in the space of fifty minutes after the first, it would be detained fifteen hours and fifty minutes before its turn would come to be raised. This is an immense detention; but if a succession of boats, at the same rate, were to follow continually, they never could pass at all. In short, in a canal constructed with water-locks, not more than six boats, on an average, can be passed in an hour, so that beyond that extent all commerce must be stopped; but, on the plan here proposed, sixty, or six hundred, might be passed in an hour, if necessary, so as to occasion no sort of interruption whatever. These are advantages of a very important nature, and ought not to be overlooked in a commercial country.

"This apparatus might be employed for innumerable other uses as a moving power, which it would be foreign to our present purpose here to specify. Nor does its power admit of any limitation, but that of the strength of the chain, and of the coffers which are to support the weights. All the other parts admit of being made so immovably firm as to be capable of supporting almost any assignable weight.

"I will not enlarge on the benefits that may be derived from this very simple apparatus: its cheapness, when compared with any other mode of raising and lowering vessels that has ever yet been practised, is very obvious; the waste of water it would occasion is next to nothing; and when it is considered that a boat might be raised or lowered fifty feet nearly with the same ease as five, it is evident that the interruptions which arise from frequent locks would be avoided, and an immense saving be made in the original expense of the canal, and in the annual repairs.

"It is also evident, that an apparatus, on the same principle, might be easily applied for raising coals or metals from a great depth in mines, wherever a very small stream of water could be commanded, and where the mine was level-free.

"It is almost needless to spend time in enumerating the many advantages which necessarily result from artificial navigations. Their utility is now so apparent, that most nations in Europe give the highest encouragement to undertakings of this kind wherever they are practicable. The advantages of navigable canals did not escape the observation of the ancients. From the most early accounts of society we read of attempts to cut through large isthmuses, in order to make a communication by water, either between different nations, or distant parts of the same nation, where land-carryage was long and expensive. Herodotus relates, that the Cnidians, a people of Caria in Asia Minor, designed to cut the isthmus which joins that peninsula to the continent; but were superstitious enough to give up the undertaking, because they were interdicted by an oracle. Several kings of Egypt attempted to join the Red sea to the Mediterranean by a canal. It was begun by Neco the son of Psammaticus, and completed by Ptolemy II. After his reign it was neglected, till it was opened in 635 under the caliphate of Omar, but was again allowed to fall into disrepair; so that it is now difficult to discover any traces of it. Both the Greeks and Romans intended to make a canal across the isthmus of Corinth, which joins the Morea and Achaia, in order to make a navigable passage by the Ionian sea into the Archipelago. Demetrius,
metrius, Julius Caesar, Caligula, and Nero, made several unsuccessful efforts to open this passage. But, as the ancients were entirely ignorant of the use of waterlocks, their whole attention was employed in making level cuts, which is probably the principal reason why they so often failed in their attempts. Charlesmagne formed a design of joining the Rhine and the Danube, in order to make a communication between the ocean and the Black sea, by a canal from the river Almutz which discharges itself into the Danube, to the Reditz, which falls into the Main, and this last falls into the Rhine near Mayence; for this purpose he employed a prodigious number of workmen; but he met with so many obstacles from different quarters, that he was obliged to give up the attempt.

The French at present have many fine canals: that of Briare was begun under Henry IV. and finished under the direction of Cardinal Richelieu in the reign of Louis XIII. This canal makes a communication between the Loire and the Seine by the river Loing. It extends 11 French great leagues from Briare to Montereau. It enters the Loire a little above Briare, and terminates in the Loing at Cepoi. There are 42 locks on this canal.

The canal of Orleans, for making another communication between the Seine and the Loire, was begun in 1675, and finished by Philip of Orleans, regent of France, during the minority of Louis XV. and is furnished with 20 locks. It goes by the name of the canal of Orleans; but it begins at the village of Combleux, which is a short French league from the town of Orleans.

But the greatest and most useful work of this kind is the junction of the ocean with the Mediterranean by the canal of Languedoc. It was proposed in the reigns of Francis I. and Henry IV. and was undertaken and finished under Louis XIV. It begins with a large reservoir 4000 paces in circumference, and 24 feet deep, which receives many springs from the mountain Noire. This canal is about 64 leagues in length, is supplied by a number of rivulets, and is furnished with 104 locks, of about eight feet rise each. In some places it passes over bridges of vast height; and in others it cuts through solid rocks for 1000 paces. At one end it joins the river Garonne near Toulouse, and terminates at the other end in the lake Tau, which extends to the port of Certe. It was planned by Francis Riquet in the 1666, and finished before his death, which happened in the 1680.

In the Dutch, Austrian, and French Netherlands, there is a very great number of canals; that from Bruges to Ostend carries vessels of 200 tons.

The Chinese have also a great number of canals; that which runs from Canton to Pekin extends about 825 miles in length, and was executed about 800 years ago.

It would be an endless task to describe the numberless canals in Holland, Russia, Germany, &c. We shall therefore confine ourselves to some of the more important in our own country.

As the promoting of commerce is the principal intention of making canals, it is natural to expect that their frequency in any nation should bear some proportion to the trade carried on in it, providing the situation of the country will admit of them. The present state of England and Scotland confirms this observation. Though the Romans made a canal between the Tyne, a little below Peterborough, and the Witham, three miles below Lincoln, which is now almost entirely filled up, yet it is not long since canals were revived in England. They are now however become very numerous, particularly in the counties of York, Lincoln, and Cheshire. Most of the counties between the mouth of the Thames and the Bristol channel are connected together either by natural or artificial navigation; those upon the Thames and Isis being now connected with those upon the Severn. The duke of Bridgewater's canal in Cheshire runs 27 miles on a perfect level; but at Barton it is carried by a very high aqueduct bridge over the Irwell, a navigable river; so that it is common for vessels to be passing at the same time both under and above the bridge. It is likewise cut some miles into the hills, where the duke's coal-mines are wrought.

A navigable canal betwixt the Forth and Clyde in Scotland, and which divides the kingdom in two parts, was first thought of by Charles II. for transporting small ships of war; the expense of which was to have been 700,000£, a sum far beyond the abilities of his reign. It was again projected in the year 1722 and 1723, and a survey made; but nothing more done till 1761, when the then Lord Napier, at his own expense, caused a survey, plan, and estimate, on a small scale, to be made. In 1764, the trustees for fisheries, &c. in Scotland, caused to make another survey, plan, and estimate, of a canal five feet deep, which was to cost 79,000£. In 1766, a subscription was obtained by a number of the most respectable merchants in Glasgow, for making a canal four feet deep and twenty four feet in breadth; but when the bill was nearly obtained in parliament, it was given up on account of the smallness of the scale, and a new subscription set on foot for a canal seven feet deep, estimated at 150,000£. This obtained the sanction of parliament; and the work was begun in 1768 by Mr Smollett the engineer. The extreme length of the canal from the Forth to the Clyde is 35 miles, beginning at the mouth of the Caron, and ending at Dalmarie Burnfoot on the Clyde, six miles below Glasgow, rising and falling by means of 20 locks, 20 on the east side of the summit, and 10 on the west, as the tide does not ebb so low in Clyde as by the Forth by nine feet. Vessels drawing eight feet water, not exceeding nineteen feet beam and seventy-three feet in length, pass with ease, the canal having afterwards been deepened to upwards of eight feet. The whole enterprise displays the art of man in a high degree. The carrying the canal through moss, quicksand, gravel, and rocks, up precipices and over valleys, was attended with inconceivable difficulties. There are eighteen draw-bridges and fifteen aqueduct bridges of note, besides small ones and tunnels. In the first three miles there are only six locks; but in the fourth mile there are no less than ten locks, and a very fine aqueduct bridge over the great road to the west of Falkirk. In the next six miles there are only four locks which carry you to the summit. The canal then runs eighteen miles on a level, and terminated by one branch about a mile from Glasgow. In this course, for a considerable way, the ground is banked about twenty feet high, and the water is sixteen feet deep.
and two miles of it is made through a deep moss. At Kirkintilloch, the canal is carried over the water of Logie on an aqueduct arch of ninety feet broad. This arch was thrown over in three stretches, having only a centre of thirty feet, which was shifted on small rollers from one stretch to another; a thing new, and never attempted before with an arch of this size; yet the joinings are as fast as with stone arches, and serve as a very fine piece of masonry. On each side there is a very considerable banking over the valley. This work was carried on till it came within six miles of its junction with the Clyde; when the subscription and a subsequent loan being exhausted, the work was stopt in 1775. The city of Glasgow, however, by means of a collateral branch, opened a communication with the Forth, which has produced a revenue of about 6000l. annually; and, in order to finish the remaining six miles, the government in 1784 gave 50,000l. out of the forfeited estates, the dividends arising from this sum to be applied to making and repairing roads in the Highlands of Scotland. The work was accordingly resumed; and by contract, under a high penalty, was to be entirely completed in November 1789. The aqueduct bridge over the Kelvin, which is supposed the greatest of the kind in the world, consists of four arches, and carries the canal over a valley 65 feet high, and 430 in length, exhibiting a very singular effort of human ingenuity and labour. To supply the canal with water was of itself a very great work. There is one reservoir of 50 acres 24 feet deep, and another of 70 acres 22 feet deep, in which many rivers and springs terminate, which it is thought will afford a sufficient supply of water at all times. This whole undertaking when finished cost about 200,000l. It is the greatest of the kind in Britain, and of great national utility; though it is to be regretted that it had not been executed on a still larger scale, the locks being too short for transporting large masts.

This canal was completed in July 1790. On the 28th of this month, a tract barge, belonging to the company of proprietors, sailed from the basin, near the city of Glasgow, to Bowling bay, where the canal joins the river Clyde. The committee of management, accompanied by the magistrates of Glasgow, were the first voyagers on the new canal. On the arrival of the vessel at Bowling bay, after descending from the last lock into the Clyde, the ceremony of the junction of the Forth and Clyde was performed by discharging into the river Clyde a hogshead of water taken up from the river Forth, as a symbol of joining the western and eastern seas together.

About the year 1801, a canal was finished between Loch Gilp to Loch Crinan in Argyllshire. The distance is about nine miles. This canal, which is called the Crinan canal, is intended to accommodate the trade of the Western islands and fisheries. The vessels employed in this trade will, by means of this canal, avoid the circuitous and dangerous navigation round the Mull of Cantire.

Another canal was begun in 1803, which is intended to open a communication between the Western sea, and the Murray firth, through Loch Ness. This canal, which is by far the most magnificent work of the kind in Britain, is expected to be finished in 1821. See Caledonian Canal, Supplement.
C A N A R Y  [ 1 1 7 ]

Canary contains 25,000 inhabitants. The houses are only one story high, and flat at the top; but they are well built. The cathedral is a handsome structure. W. Long. 15. 20° N. Lat. 28. 4.

Canary Islands are situated in the Atlantic ocean, over against the empire of Morocco in Africa. They were formerly called the Fortunate Islands, on account of the temperate healthy air, and excellent fruits. The land is very fruitful, for both wheat and barley produce 150 to one. The cattle thrive well, and the woods are full of all sorts of game. The Canary singing birds are well known all over Europe. There are here more grapes in great abundance, but the Spaniards first planted vines here, from whence we have the wine called Canary or Sack.

These islands were not entirely unknown to the ancients; but they were a long while forgot, till John de Batencourt discovered them in 1402. It is said they were first inhabited by the Phenicians, or Carthaginians, but on no certain foundation; nor could the inhabitants themselves tell from whence they were derived; on the contrary, they did not know there was any other country in the world. Their language, manners, and customs, had no resemblance to those of their neighbours. However, they were like the people on the coast of Barbary in complexion. They had no iron. After the discovery, the Spaniards soon got possession of them all, under whose dominion they are to this day, except Madeira, which belongs to the Portuguese. The inhabitants are chiefly Spaniards; though there are some of the first people remaining, whom they call Guanches, who are somewhat civilized by their intercourse with the island. Their chief food is goat's milk. Their complexion is tawny, and their noses flat. The population, according to Humboldt, in 1790, was 174,000. The Spanish vessels, when they sail for the West Indies, always rendezvous at these islands, going and coming. Their number is 12. 1. Alegranza; 2. Canaria; 3. Ferro; 4. Fuerteventura; 5. Gomera; 6. Gratiosa; 7. Lancerotta; 8. Madeira; 9. Palma; 10. Roca; 11. Salvages; 12. Teneriff. West longitude from 12. to 21. north latitude from 27. 30. to 29. 30. See Canary Islands, Supplement.

Canary-Bird. See Fringilla. These birds are much admired for their singing, and take their name from the place whence they originally came, viz. the Canary islands; but of late years there is a sort of birds brought from Germany, and especially from Tirol, and therefore called German Birds, which are much better than the others; though both are supposed to have originally come from the same place. The cocks never grow fat, and by some country persons cannot be distinguished from those commoner-birds; though the Canary-birds are much lustier, have a longer tail, and differ much in the bearing of the passages in the throat when they sing. These birds being so much esteemed for their song, are sometimes sold at a high price, according to the goodness and excellency of their notes; so that it will always be advisable to hear one sing before he is bought. In order to know whether he is in good health, take him out of the store-cage, and put him in a clean cage by himself; if he stand up boldly, without crouching or shrinking in his feathers, look with a brisk eye, and is not subject to clap his head under his wings, it is a sign that he is in good health; but the greatest matter is to observe his dunging: if he bolts his tail like a nightingale, after he has dunged, it is a sign he is not in good health, or at least that he will soon be sick; but if his dung be very thin like water, or of a slimy white without any blackness in it, it is a sign of approaching death. When in perfect health, his dung lies round and hard, with a fine white on the outside, dark within, and dries quickly; though a seed-bird seldom dung so hard, unless he is very young.

Canary-birds are subject to many diseases, particularly imposthumes, which affect the head, cause them to fall suddenly from the perch, and die in a short time, if not speedily cured. The most approved medicine is an ointment made of fresh butter and capon's grease melted together. With this the top of the bird's head is to be anointed for two or three days, and it will dissolve the imposthume: but if the medicine has been too long delayed, then, after three or four times anointing, see whether the place of his head be soft; and if so, open it gently, and let out the matter, which will be like the yolk of an egg; when this is done, anoint the place, and the bird will be cured. At the same time he must have figs with his other food, and in his water a slice or two of liquorice, with white sugar-candy.

Canary-birds are distinguished by different names at different times and ages: such as are about three years old are called runts; those above two are named crips; those of the first year under the care of the old ones, are termed branchers; those that are new-born, and cannot feed themselves, pushers; and those brought up by hand, nestlings.

The Canary-birds may be bred with us; and, if treated with proper care, they will become as vigorous and healthful as in the country from whence they have their name. The cages in which these birds are kept are to be made either of walnut-tree or oak, with bars of wire; because these, being woods of strength, do not require to be used in large pieces. The common shape of cages, which is cylindric, is very improper for these birds; for this allows little room to walk, and without that the birds usually become melancholy. The most proper of all shapes is the high and long, but narrow.

If these birds eat too much, they grow over-fat, lose their shape, and their singing is spoiled; or at least they become so idle, that they will scarce ever sing. In this case their victuals are to be given them in a much smaller quantity, and they will by this means be recovered by degrees to all their beauty, and will sing as at first.

At the time that they are about to build their nests, there must be put into their cages some hay, dried throughly in the sun; with this must be mixed some moss dried in the same manner, and some stag's hair; and great care is to be taken of breeding the young, in the article of food. As soon as the young birds are eight days old, or somewhat more, and are able to eat and pick up food of themselves, they are to be taken out of the cage in which they were hatched, and each put separately into another cage, and hung up in a room where it may never have an opportunity of hearing the voice of any other bird. After they have been kept thus about eight days, they are to be ex-

Cannele.

Cander.

Cited to sing by a bird-pipe; but this is not to be blown too much, or in too shrill a manner, lest they sing themselves to death.

For the first fifteen days the cages are to be covered with a black cloth, and for the fifteen days following with a green one. Five lessons in a day from the pipe are sufficient for these young creatures; and they must not be disturbed with several sounds at the same time, lest they confound and puzzle them; two lessons should be given them early in the morning, one about the middle of the day, and two more at night. The genius and temper of the several birds of this kind are very different. The males are almost always melancholy, and will not sing unless they are excited to it by hearing others continually singing about them. The male bird of this kind will often kill the female put to him for breeding; and when there are several females together with the males, they will often do the same to one another from jealousy. It is therefore not easy to manage the article of their breeding well in this particular, unless in this manner: let two female birds be put into one cage, and when they have lived together some time, they will have contracted a sort of love for one another, which will not easily be dissolved. Put a male bird into the cage with these two, and every thing will go well; their friendship will keep them from quarrelling about his favours, and from danger of his mischievous disposition; for if he attacks one of them, in order to kill her, the other will immediately take her part; and after a few of these battles, the male will find that they are together an over-match for him at fighting, and will then distribute his favours to them, and there will not fail of being a young breed or two, which are to be taken away from their parents, and educated as before directed. Some males watch the time of the females laying, and devour the eggs as fast as she deposits them; and others take the young ones in their beak as soon as hatched, and crush them to death against the sides of the cage, or some other way destroy them. When a male has been known once to have been guilty of this, he is to be shut up in a small cage, in the middle of the large one in which the female is breeding her young, and thus he will often comfort her with singing all day long, while she sits upon the eggs or takes care of the young ones; and when the time of taking away, to put them into separate cages, is come, the male is to be let out, and he will always after this live in friendship with the female.

If the male becomes sick during the time of the female's sitting or bringing up her young, he must be removed immediately, and only brought to the side of her cage at certain times that she may see him, till he is perfectly cured; and then he is to be shut up again in his cage in the middle.

Canary-birds are various in their notes; some having a sweet song, others a lowish note, others a long song, which is best, as having the greatest variety of notes; but they sing chiefly either the titlark or nightingale notes. See Songs of Birds.

Cancalle, a town of France, in the department of Ille and Vilaine, by the sea-side, where there is a road. Here the British landed in 1758, in their way to St Maloes, where they burnt a great number of ships in the harbour, and then retired without loss. This town was in their power; but they acted like generous enemies, and did no hurt to this nor any other on the coast. W. Long. o. 13. N. Lat. 48. 47.

Canclier, in falconry, is when a light brown hawk, in her stooping, turns two or three times upon the wing, to recover herself before she seizes.

Cancellari, a term used to denote lattice windows, or those made of cross bars disposed latticewise; it is also used for rails or ballusters inclosing the communicable, a court of justice, or the like, and for the network in the inside of hollow boxes.

Cancelling, in civil law, an act whereby a person consents that some former deed be rendered null and void. This is otherwise called recision. The word comes from the Latin cancellare, to encompass or pave a thing round. In the proper sense of the word, to cancel, is to deface an obligation, by passing the pen from top to bottom, or across it; which makes a kind of chequer lattice, which the Latins call cancelli.

Cancer, in Zoology, a genus of insects belonging to the order of Insecta aptera. This genus includes the lobster, the crab, the prawn, the shrimp, and the crawfish. See Entomology Index.

Cancer, in Medicine, a roundish, unequal, hard, and livid tumour, generally seated in the glandulous parts of the body, supposed to be so called, because it appears at length with turgid veins shooting out from it, so as to resemble, as it is thought, the figure of a crab-fish, or others say, because, like that fish, where it has once got, it is scarce possible to drive it away. See Medicine Index.

Cancer, in Astronomy, one of the twelve signs, represented on the globe in the form of a crab, and thus marked in books. It is the fourth constellation in the starry zodiac, and that from which one quadrant of the equatorial takes its denomination. The reason generally assigned for its name as well as figure, is a supposed resemblance which the sun's motion in this sign bears to the crab-fish. As the latter walks backwards, so the former, in this part of his course, begins to go backwards, or recede from us; though the disposition of stars in this sign is by others supposed to have given the first hint to the representation of a crab.

Tropic of Cancer, in Astronomy, a lesser circle of the sphere parallel to the equator, and passing through the beginning of the sign Cancer.

Cancherizante, or Cancherizato, in the Italian music, a term signifying a piece of music that begins at the end, being the retrograde motion from the end of a song, &c. to the beginning.

Cancrom, or Boat-Bill. See Ornithology Index.

Candahar, a province of Afghanistan, bounded on the north by the province of Balk; on the east, by that of Cabul; on the south, by Buchor and Babelstam; and on the west, by Sigestan. There have been bloody wars between the Indians and Persians on account of this province. In 1650 it fell to the Persians, but is now independent. The inhabitants, who are known by the name of Aghuans, or Afghans, are chiefly a migratory race of shepherds. The country is fertile. See Persia.

Candahar, the capital of the above province, is seated on a mountain; and being a place of great trade
trade has a considerable fortress. The caravans that travel from Persia and the parts about the Caspian sea to the East Indies, choose to pass through Candahar, because there is no danger of being robbed on this road, and provisions are very reasonable. The religion is Mahometanism, but there are many Banians and Guebres. E. Long. 65° 45'. N. Lat. 32° 40'.

CANDAULES, the last king of Lydia, of the family of the Heracleides. See LydIA.

CANDELARES, from candela, a candle), the name of order in the former editions of Linnaeus's Fragments of a Natural Method, consisting of these three genera, *rhizopora*, *nyssa*, and *minimus*. They are removed, in the later editions, into the order Horace.

CANDIA, the modern name of the island of Crete (see Crete). The word is a variation of *Khanda*, which was originally the Arabian name of the metropolis only, but in time came to be applied to the whole island.

Candia came into the possession of the Venetians, by purchase, in the year 1594, as related under the article Crete; and soon began to flourish under the laws of that wise republic. The inhabitants, living under the protection of a moderate government, and being encouraged by their masters, engaged in commerce and agriculture. The Venetian commanders readily afforded to those travellers who visited the island, that assistance which is necessary to enable them to extend and improve useful knowledge. Below, the naturalist, is lavish in praise of their elegant buildings, and describes the interesting manners, the flourishing state of that part of the island which he visited.

The seat of government was established at Candia. The magistrates and officers, who composed the council, resided there. The provisor-general was president. He possessed the chief authority; and his power extended over the whole principality. It continued in the possession of the Venetians for five centuries and a half. Cornaro held the chief command at the time when it was threatened with a storm, on the side of Constantinople. The Turks, for the space of a year, had been employed in preparing a vast armament. They deceived the Venetians, by assuring him that it was intended against Malta. In the year 1645, in the midst of a solemn peace, they appeared unexpectedly before Crete with a fleet of 400 sail, having on board 60,000 land forces, under the command of four pachas. The emperor Ibrahim, under whom this expedition was undertaken, had no fair pretext to offer in justification of his enterprise. He made use of all that perfidy which characterizes the people of the east, to impose on the Venetian senate. He loaded their ambassador with presents, directed his fleet to bear for Cape Matapan, as if they had been going beyond the Archipelago; and caused the governors of Tina and Cerigo to be solemnly assured that the republic had nothing to fear for her possessions. At the very instant when he was making those assurances, his naval armament entered the gulf of Canea; and, passing between that city and St Theodore, anchored at the mouth of Platanias.

The Venetians, not expecting this sudden attack, had made no preparations to repel it. The Turks landed without opposition. The island of St Theodore is but a league and a half from Canea. It is only three quarters of a league in compass. The Venetians had erected two forts there; one of which, standing on the summit of the highest eminence, on the coast of that little isle, was called Tuluri; the other, on a lower situation, was named St Theodore. It was an important object to the Musulmans to make themselves masters of that rock, which might annoy their ships. They immediately attacked it with ardour. The first of these fortresses, being defended by soldiers and cannon, was taken without striking a blow. The garrison of the other consisted of no more than 60 men. They made a gallant defence, and stood out till the last extremity; and when the Turks at last prevailed, their number was diminished to ten, to whom the captain-pacha cruelly caused to be beheaded.

Being now masters of that important post, as well as of Lazaret, an elevated rock, standing about half a league from Canea, the Turks invested the city by sea and land. General Cornaro was struck, as with a thunder-clap, when he learned the descent of the enemy. In the whole island there were no more than a body of 3500 infantry, and a small number of cavalry. The besieged city was defended only by 1000 regular troops, and a few citizens, who were able to bear arms. He made haste to give the republic notice of his distress; and posted himself off the road, that he might the more readily succour the besieged city. He threw a body of 250 men into the town before the lines of the enemy were completed. He afterwards made several attempts to strengthen the besieged with other reinforcements; but in vain. The Turks had advanced in bodies close to the town, had carried a half-moon battery, which covered the gate of Retimo; and were battering the walls night and day with their numerous artillery. The besieged defended themselves with resolute valour, and the smallest advantage which the besiegers gained cost them dear. General Cornaro made an attempt to arm the Greeks, particularly the Spachlotes, who boasted loudly of their valour. He formed a battalion of these. But the era of their valour was long past. When they beheld the enemy, and heard the thunder of the cannon, they took to flight; not one of them would stand fire.

When the senate of Venice were deliberating on the means to be used for relieving Canea, and endeavouring to equip a fleet, the Mahometan generals were sacrificing the lives of their soldiers to bring their enterprise to a glorious termination. In different engagements they had already lost 20,000 warriors; but, descending into the ditches, they had undermined the walls, and blown up the most impregnable forts with explosions of powder. They sprang one of those mines beneath the bastion of St Demetrius. It overturned a considerable part of the wall, which crushed all the defenders of the bastion. That instant the besiegers sprang up with their sabres in their hands, and taking advantage of the general consternation of the besieged on that quarter, made themselves masters of the post. The besieged, recovering from their terror, attacked them with unequalled intrepidity. About 400 men asailed 2000 Turks already firmly posted on the wall, and pressed upon them with such obstinate and dauntless valour, that they killed a great number, and drove the rest down into the ditch. In this extremity, every person
person in the city was in arms. The Greek monks took up muskets; and the women, forgetting the delicacy of their sex, appeared on the walls among the defenders, either supplying the men with ammunition and arms, or fighting themselves; and several of those daring heroines lost their lives.

For 30 days the city held out against all the forces of the Turks. If, even at the end of that time, the Venetians had sent a naval armament to its relief, the kingdom of Candia might have been saved. Doubtless, they were not ignorant of this well-known fact. The north wind blows steadily all the year round, and when it blows with a violent gale, the sea rages. It is then impossible for any squadron of ships, however numerous, to form in line of battle in the harbour, and to meet an enemy. If the Venetians had set out from Cephalonia with a fair wind, they might have reached Cana in five hours, and might have entered the harbour with full sails without being exposed to one cannon-shot; while none of the Turkish ships would have dared to appear before them; or if they had ventured, must have been driven back on the shore, and dashed in pieces among the rocks. But instead of thus taking advantage of the natural circumstances of the place, they sent a few galleys, which, not daring to double Cape Spada, coasted along the southern shore of the island, and failed of accomplishing the design of their expedition.

At last, the Caneans, despairing of relief from Venice, seeing three breaches made in their walls, through which the infidels might easily advance upon them, exhausted with fatigue, and covered with wounds, and reduced to the number of 300 men, who were obliged to scatter themselves round the walls, which were half a league in extent, and undermined in all quarters, demanded a parley, and offered to capitulate. They obtained very honourable conditions; and after a glorious defence of two months, which cost the Turks 20,000 men, marched out of the city with the honours of war. Those citizens who did not choose to continue in the city were permitted to remove; and the Ottomans, contrary to their usual practice, faithfully observed their stipulations.

The Venetians, after the loss of Cana, retired to Retimo. The captain-pacha laid siege to the citadel of the Sude, situated in the entrance of the bay, on a high rock, of about a quarter of a league in circumference. He raised earthen batteries, and made an ineffectual attempt to level the ramparts. At last, despairing of taking it by assault, he left some forces to block it up from all communication, and advanced towards Retimo. That city, being unvalued, was defended by a citadel, standing on an eminence which overlooks the harbour. General Cornaro had retired thither. At the approach of the enemy, he advanced from the city, and waited for them in the open field. In the action, inattentive to his own safety, he encouraged the soldiers, by fighting in the ranks. A glorious death was the reward of his valour; but his fall determined the fate of Retimo.

The Turks having landed additional forces on the island, they introduced the plague, which was almost a constant attendant on their armies. This dreadful pest rapidly advanced, and, like a devouring fire, wasting all before it, destroyed most part of the inhabitants. The rest, dying in terror before its ravages, escaped into the Venetian territories, and the island was left almost desolate.

The siege of the capital commenced in 1645, and was protracted much longer than that of Troy. Till the year 1648, the Turks scarcely gained any advantages before that city. They were often routed by the Venetians, and sometimes compelled to retire to Retimo. At that period Ibrahim was solemnly deposed, and his eldest son, at the age of nine years, was raised to the throne, under the name of Mahomet IV. Not satisfied with confining the sultan to the beloved and obscure of a dungeon, the partisans of his son strangled him on the 9th of August, in the same year. That young prince, who mounted the throne by the death of his father, was afterwards expelled from it, and condemned to pass the remainder of his life in confinement.

In the year 1649, Usein Pacha, who blockaded Candia, receiving no supplies from the Porte, was compelled to raise the siege, and retreat to Cana. The Venetians were then on the sea with a strong squadron. They attacked the Turkish fleet in the bay of Smyrna, burnt 12 of their ships and two galleys, and killed 6000 of their men. Some time after, the Ottomans having found means to land an army on Candia, renewed the siege of the city with great vigour, and made themselves masters of an advanced fort that was very troublesome to the besieged; which obliged them to blow it up.

From the year 1650 till 1658, the Venetians, continuing masters of the sea, intercepted the Ottoman ships every year in the straits of the Dardanelles, and fought them in four naval engagements; in which they defeated their numerous fleets, sunk a number of their caravels, took others, and extended the terror of their arms even to the walls of Constantinople. That capital became a scene of tumult and disorder. The Grand Signior, alarmed, and trembling for his safety, left the city with precipitation.

Such glorious success revived the hopes of the Venetians, and depressed the courage of the Turks. They converted the siege of Candia into a blockade, and suffered considerable losses. The sultan, in order to exclude the Venetian fleet from the Dardanelles, and to open to his own navy a free and safe passage, caused two fortresses to be built at the entrance of the straits. He gave orders to the pacha of Cana to appear again before the walls of Candia, and to make every possible effort to gain the city. In the mean time, the republic of Venice, to improve the advantages which they had gained, made several attempts on Cana. In 1665, that city was about to surrender to their arms, when the pacha of Rhodes, hastening to its relief, reinforced the defenders with a body of 2000 men. He happily doubled the extremity of Cape Malea, though within sight of the Venetian fleet, which was becalmed off Cape Spada, and could not advance one fathom to oppose an enemy considerably weaker than themselves.

Kiospulii, son and successor to the vixser of that name, who had long been the support of the Ottoman empire, knowing that the murmur of the people against the long continuance of the siege of Candia were rising to a height, and fearing a general revolt, which would
would be fatal to himself and his master; set out from Byzantium about the end of the year 1666 at the head of a formidable army. Having escaped the Venetian fleet, which was lying off Candia with a view to intercept him, he landed at Palio Castro, and formed his lines around Candia. Under his command were four peshnas, and the flower of the Ottoman forces. Those troops, being encouraged by the presence and the promises of their chiefs, and supported by a great quantity of artillery, performed prodigies of valour. All the exterior forts were destroyed. Nothing now remained to the besieged but the bare line of the walls, unprotected by fortresses; and these being battered by an incessant discharge of artillery, soon gave way on all quarters. Still, however, what posterity may perhaps regard as incredible, the Candians held out three years against all the force of the Ottoman empire.

At last they were going to capitulate, when the hope of assistance from France re-animated their valour, and rendered them invincible. The expected succours arrived on the 26th of June 1669. They were conducted by the duke of Noailles. Under his command were a great number of French noblemen, who came to make trial of their skill in arms against the Turks.

Next day after their arrival, the ardour of the French prompted them to make a general sally. The duke of Beaufort, admiral of France, assumed the command of the forlorn hope. He was the first to advance against the Mussulmans, and was followed by a numerous body of infantry and cavalry. They advanced furiously upon the enemy, attacked them within their trenches, forced the trenches, and, would have compelled them to abandon their lines and artillery, had not an unforeseen accident damped their courage. In the midst of the engagement a magazine of powder was set on fire; the foremost of the combatants lost their lives; the French ranks were broken; several of their leaders, among whom was the duke of Beaufort, disappeared for ever; the soldiers fled in disorder; and the duke of Noailles, with difficulty, effected a retreat within the walls of Candia. The French accused the Italians of having betrayed them; and on that pretext prepared to set off sooner than the time agreed upon. No intreaties of the commandant could prevail with them to delay their departure; so they re-embarked. Their departure determined the fate of the city. There were now not more than five hundred men to defend it. Morosini capitulated with Kiopruli, to whom he surrendered the kingdom of Crete, excepting only the Sude, Grabosa, and Spinosa. The grand-vizier made his entrance into Candia on the 4th of October 1670, and held eight months in that city, inspecting the repair of its walls and fortresses.

The three fortresses left in the hands of the Venetians by the treaty of capitulation remained long after in their possession. At last they were all taken, one after another. In short, after a war of 30 years continuance, in the course of which more than 200,000 men fell in the island, and it was deluged with streams of Christian and Moslem blood, Candia was entirely subdued by the Turks, in whose hands it still continues.

Of the climate of Candia travellers speak with rapture. The heat is never excessive; and in the plains violent cold is never felt. In the warmest days of summer the atmosphere is cooled by breezes from the sea. Winter properly begins here with December and ends with January; and during that short period snow never falls on the lower grounds, and the surface of the water is rarely frozen over. Most frequently the weather is as fine then as it is in Britain at the beginning of June. These two months have received the name of winter, because in them there is a copious fall of rain, the sky is obscured with clouds, and the north winds blow violently; but the rains are favorable to agriculture, the winds chase the clouds towards the summits of the mountains, where a reservoir is formed for those waters which are to fertilize the fields; and the inhabitants of the plain suffer no inconvenience from these transient blasts. In the month of February, the ground is overspread with flowers and rising crops. The rest of the year is almost one continued fine day. The inhabitants of Crete never experience any of those mortifying returns of piercing cold, which are so frequently felt in Britain and even more southern countries; and which, succeeding suddenly after the obstraining heats of spring, nip the blossoming flowers, wither the open buds, destroy half the fruits of the year, and are fatal to delicate constitutions. The sky is always unclouded and serene; the winds are mild and refreshing breezes. The radiant sun proceeds in smiling majesty along the azure vault, and ripens the fruits on the lofty mountains, the rising hills, and the plains. The nights are no less beautiful; their coolness is delicious. The atmosphere not being overloaded with vapours, the sky unfolds to the observer's view a countless profusion of stars; those numerous stars sparkle with the most vivid rays, and stroll the azure vault in which they appear fixed, with gold, with diamonds, and with rubies. Nothing can be more magnificent than this sight, and the Cretans enjoy it for six months in the year.

To the charms of the climate other advantages are joined which augment their value: There are scarce any morasses in the island; the waters here are never in a state of stagnation; they flow in numberless streams from the tops of the mountains, and form here and there large fountains or small rivers that empty themselves into the sea; the elevated situation of their springs causes them to dash down with such rapidity, that they never lose themselves in pools or lakes; consequently insects cannot deposit their eggs upon them, as they would be immediately hurried down into the sea; and Crete is not infested like Egypt with those clouds of insects which swarm in the houses, and whose sting is insufferably painful; nor is the atmosphere here loaded with those noxious vapours which rise from marshy grounds.

The mountains and hills are overspread with various kinds of thyme, savoury, wild thyme, and with a multitude of odoriferous and balmy plants; the rivulets which flow down the valleys are overspun with myrtles, laurel, and roses; clumps of orange, citron, and almond trees, are plentifully scattered over the fields; the gardens are adorned with tulips, of Arabian jasmines. In spring, they are beset with rosebushes with beds of violetas; some extensive plains are arrayed in clover; the existences of the rocks are fringed with sweet smelling dittany. In a word, from the hills, the valleys, and the plains,
G A N

plan; on all hands, there arise clouds of exquisite per-
fumes, which embalm the air, and render it a luxury to
breathe it.

As to the inhabitants, the Mahometan men are gen-
erally from five feet and a half to six feet tall. They
bear a strong resemblance to ancient statues; and it
must have been after such models that the ancient ar-
tists wrought. The women also are generally beauti-
ful. Their dress does not restrain the growth of any
part of their bodies, and their shape therefore assumes
those admirable proportions with which the hand of
the Creator has graced his fairest workmanship on
earth. They are not all handsome or charming; but
some of them are beautiful, particularly the Turkish
ladies. In general, the Cretan women have a rising
throat, a neck gracefully rounded, black eyes sparkling
with animation, a small mouth, a fine nose, and cheeks
delicately coloured with the fresh vermillion of health.
But the oval of their form is different from that of
Europeans, and the character of their beauty is pecu-
liar to their own nation.

The quadrupeds belonging to the island are not of
a ferocious temper. There are no lions, tigers, bears,
wolves, foxes, or indeed any dangerous animal here.
Wild goats are the only inhabitants of the forests that
overspread the lofty mountains; and these have no-
thing to fear but the ball of the hunter; hares inhabit
the hills and the plain; sheep graze in security on the
thyme and the heath; they are folded every night, and
the shepherd sleeps soundly without being disturbed
with the fear that wild animals may invade and ravage
his fold.

The Cretans are very happy in not being exposed
to the troublesome bite of noxious insects, the poison
of serpents, or the capacity of the wild beasts of the
desert. The ancients believed that the island enjoyed
these singular advantages, on account of its having
been the birth-place of Jupiter. "The Cretans (says
Ælian) celebrate in their songs the beneficence of Ju-
piter, and the favour which he conferred on their
island, which was the place of his birth and education,
by freeing it from every noxious animal, and even
rendering it unfit for nourishing those noxious ani-
mals that are introduced into it from foreign coun-
tries."

Dittany holds the first rank among the medicinal
plants which are produced in Crete. The praises be-
stowed on the virtues of this plant by the ancients are
altogether extravagant; yet we perhaps treat the me-
dicinal virtues of this plant with too much contempt.
Its leaf is very balsamic, and its flower diffuses around
it a delicious odour. At present the inhabitants of
the island apply it with success on various occasions.
The leaf, when dried and taken in an infusion with a
little sugar, makes a very pleasant drink, of a finer fla-
avour than tea. It is there an immediate cure for a
weak stomach, and enables it to recover its tone after
a bad digestion.

Diseases are very rare in a country whose atmos-
phere is exceedingly pure; and in Candia, epidemical
diseases are unknown. Fevers prevail here in summer,
but are not dangerous; and the plague would be wholly
unknown; had not the Turks destroyed the lazarets
that were established by the Venetians, for strangers to
do quarantine in. Since the period when these were
demolished, it is occasionally introduced by ships from
Smyrna and Constantinople. As no precautions are
taken against it, it gains ground, and spreads over the
island from one province to another; and as the colds
and fevers are never intertemperate, it sometimes con-
 tinues its ravages for six months at a time.

This fine country is infested with a disease somewhat
less dangerous than the plague, but whose symptoms
are somewhat more hideous than those of the leprosy.
In ancient times, Syria was the focus in which it raged
with most fury; and from Syria it was carried into
several of the islands of the Archipelago. It is infec-
tious, and is instantaneously communicated by con-
tact. The victims who are attacked by it, are driven
from society, and confined to little ruinous houses on
the highway. They are strictly forbidden to leave
these miserable dwellings, or hold intercourse with any
person. Those poor wretches have generally beside
their huts a small garden producing pulse, and feeding
poultry; and with that support, and what they obtain
from passengers, they find means to drag out a painful
life in circumstances of shocking bodily distress. Their
blasted skin is covered with a scaly crust, speckled with
red and white spots: which affect them with intolera-
table itchings. A hoarse and tremulous voice issues
from the bottom of their breasts. Their words are
scarce articulated; because their distemper inwardly
preys upon the organs of speech. These frightful
spectres gradually lose the use of their limbs. They
continue to breathe till such time as the whole mass of
their blood is corrupted, and their bodies entirely in a
state of putrefaction. The rich are not attacked by
this distemper; it confines itself to the poor, chiefly
to the Greeks. But those Greeks observe strictly their
four lents; and eat nothing during that time but salt
fish, botarga salted and smoked, pickled olives, and
cheese. They drink plentifully of the hot and muddy
wines of the island. The natural tendency of such a
regimen must be, to fire the blood, to thicken the
fluid part of it, and thus at length to bring on a le-
prosy.

Candia is at present governed by three pachas, who
reside respectively at Candia, Canca, and Retimo.
The first, who is always a pacha of three tails, may
be considered as viceroy of the island. He enjoys
more extensive powers than the others. To him the
inspection of the forts and arsenals is intrusted. He
nominates to such military employments as fall vacant,
as well as to the governments of the Sude, Grabusa,
Spina Longos, and Gira-petra. The governors of these
forts are denominated beyes. Each of them has a con-
stable and three general officers under him; one of
whom is commander of the artillery, another of the
cavalry, and the third of the janissaries.

The council of the pacha consists of a kyain, who is
the channel through which the pacha's orders are issued,
and all favours bestowed; an aga of the janissaries, colonel-
general of the troops, who has the chief care of the
regulation of the police; two tepigii bachii; a defter-
dar, who is treasurer-general for the imperial reve-
ues; a keeper of the imperial treasury; and the chief
officers of the army. This government is entirely mi-
itary, and the power of the pacha serasquier is absolu-
tate. The justice of his sentences is never called in
question; they are instantly carried into execution.

The
The people of the law are the muftis, who is the religious head, and the cadi. The first interprets those laws which regard the division of the patrimony among the children of a family, successions, and marriages,—in a word, all that are contained in the Koran; and he also decides on everything that relates to the ceremonies of the Musulman religion. The cadi cannot pronounce sentence on affairs connected with these laws, without first taking the opinion of the mufti in writing, which is named Fatwa. It is his business to receive the declarations, complaints, and donations of private persons; and to decide on such differences as arise among them. The pasha is obliged to consult those judges when he puts a Turk legally to death; but the pasha, who is dignified with three tails, sets himself above all laws, condemns to death, and sees his sentence executed, of his own proper authority. All the mosques have their imam, a kind of curate, whose duty is to perform the service. There are schoolmasters in the different quarters of the city. These persons are much respected in Turkey, and are honoured with the title of effendi.

The garrison of Candia consists of 46 companies, constituting a military force of about ten thousand men. All these forces do not reside constantly in the city, but they may be mustered in a very short time. They are all regularly paid every three months, excepting the janissaries, none of whom but the officers receive pay. The different gradations of this military body do not depend on the pasha. The council of each company, consisting of veterans, and of officers in actual service, has the power of naming them. A person can occupy the same post for no longer than two years; but the post of sorbaj, or captain, which is purchased at Constantinople, is held for life. The ousta, or cook, is also continued in his employment as long as the company to which he belongs is satisfied with him. Each company has its almoner, denominated mem.

The garrisons of Canea and Retimo, formed on a similar plan, are much less numerous. The first consists of about 3000 men, the other of 500; but as all the male children of the Turks are enrolled among the janissaries as soon as born, the number of these troops might be greatly augmented in time of war: but, to say the truth, they are far from formidable. Most of them have never seen fire, nor are they ever exercised in military evolutions.

The pachas of Canea and Retimo are not less absolute, within the bounds of their respective provinces, than the pacha of Candia. They enjoy the same privileges with him, and their council consists of the same officers. These governors chief object is to get rich as speedily as possible; and in order to accomplish that end, they practise all the arts and cruelties of oppression, to squeeze money from the Greeks. In truth, those poor wretches run to meet the chains with which they are loaded. Envoy, which always presys upon them, continually prompts them to take up arms. If some one among them happen to enjoy a decent fortune, the rest assiduously seek some pretence for accusing him before the pacha, who takes advantage of these discussions, to seize the property of both the parties. It is by no means astonishing, that under so barbarous a government, the number of the Greeks is daily diminished.

There are scarcely in the island, 65,000 of whom pay the carach.

The Turks have not possessed the island for more than 120 years; yet as they are not exposed to the same oppression, they have multiplied in it, and raised themselves upon the ruin of the ancient inhabitants. Their number amounts to 200,000 Turks.

The Jews, of whom there are not many in the island, amount only to 200.

Total is 310,200 souls.

This fertile country is in want of nothing but industrious husbandmen, secure of enjoying the fruits of their labours. It might maintain four times its present number of inhabitants.

Antiquity has celebrated the island of Crete as containing 100 populous cities; and the industry of geographers has preserved their names and situations. Many of these cities contained no fewer than 30,000 inhabitants; and by reckoning them, on an average, at 6000 each, we shall in all probability be rather within than beyond the truth. This calculation gives for 100 cities 600,000

By allowing the same number as inhabitants of the towns, villages, and all the rest of the island, 600,000

the whole number of the inhabitants of ancient Crete will amount to 1,200,000.

This number cannot be exaggerated. When Candia was in the hands of the Venetians, it was reckoned to contain nine hundred fourscore and sixteen villages.

It appears, therefore, that when the island of Crete enjoyed the blessing of liberty, it maintained to the number of 849,800 more inhabitants than it does at present. But since those happier times, she has been deprived of her laws by the tyranny of the Romans; has groaned under the destructive sway of the monarchs of the lower empire; has been exposed for a period of 120 years to the ravages of the Arabians; has next passed under the dominion of the Venetians; and has at last been subjected to the despotism of the Turks, who have produced a dreadful depopulation in all the countries which have been subdued by their arms.

The Turks allow the Greeks the free exercise of their religion, but forbid them to repair their churches or monasteries; and accordingly they cannot obtain permission to repair their places of worship, or religious houses, but by the powerful influence of gold. From this article the pachas derive very considerable sums. They have 15 bishops as formerly, the first of whom assumes the title of archbishop of Gortynia. He resides at Candia; in which city the metropolitan church of the island stands. He is appointed by the patriarch of Constantinople; and has the right of nominating to all the other bishoprics of the island; the names of which are, Gortynia, Cnoson, Mirbeba, Hyera, Gira-petra, Arcadia, Cherronee, Lamia, Milopotamo, Retimo, Canea, Gisamo. These bishoprics are nearly the same as under the reign of the Greek emperors.
The patriarch wears a triple tiara, writes his signature in red ink, and answers for all the debts of the clergy. To enable him to fulfil his engagements, he lays impositions on the rest of the bishops, and particularly on the monasteries, from which he draws very handsome contributions. He is considered as the head of the Greeks, whom he protects, as far as his slender credit goes. The orders of government are directed to him on important occasions; and he is the only one of all the Greeks in the island who enjoys the privilege of entering the city on horseback.

CANDIA, the capital of the above island, situated on its northern coast, in E. Long. 25° o. N. Lat. 35° 30'. It stands on the same situation which was formerly occupied by Heraclea, and is the seat of government under the Turks. Its walls, which are more than a league in compass, are in good repair, and defended by deep ditches, but not protected by any exterior fort. Towards the sea, it has no attacks to fear; because the shallowness of the harbour renders it inaccessible to ships of war.

The Porte generally commits the government of this island to a pacha of three tails. The principal officers, and several bodies of the Ottoman soldiery, are stationed here. This city, when under the Venetians, was opulent, commercial, and populous; but it has now lost much of its former strength and grandeur. The harbour, naturally a fine basin, in which ships were securely sheltered from every storm, is day by day becoming narrower and shallower. At present it admits only boats, and small ships after they have discharged a part of their freight. Those vessels, which the Turks freight at Candia, are obliged to go almost empty to the port of Standie, whither their cargoes are conveyed to them in barges. Such inconveniences are highly unfavourable to commerce; and as government never thinks of removing them, the trade of Candia is therefore considerably decayed.

Candia, which was embellished by the Venetians with regular streets, handsome houses, a fine square, and a magnificent cistern, contains at present but a small number of inhabitants, notwithstanding the vast extent of the area enclosed within its walls. Several divisions of the city are void of inhabitants. That in which the market-place stands is the only one which discovers any stir of business, or show of affluence. The Mabometans have converted most of the Christian temples into mosques; yet they have left two churches to the Greeks, one to the Armenians, and a synagogue to the Jews. The Capuchins possess a small convent, with a chapel in which the vice-consul of France hears mass. At present he is the only Frenchman who attends it, as the French merchants have taken up their residence at Canea.

West of the city of Candia is an extensive range of hills, which are a continuation of Mount Ida, and of which the extremity forms the promontory of Dion. On the way to Dion, we find Palio Castro, on the shore; a name which the modern Greeks give indiscriminately to all remains of ancient cities. Its situation corresponds to that of the ancient Pasarmus, which stood north-west from Heraclea.

The river which runs west of Candia was anciently known by the name of Triton; near the source of which Minerva sprung from the brain of Jove. Loxana is a little farther distant. About a league east of that city, the river Ceratus flows through a delightful vale. According to Strabo, in one part of its course it runs near by Gnossus. A little beyond that, is another river supposed to be Theramnus, on the banks of which, fable relates that Jupiter consummated his marriage with Juno. For the space of more than half a league round the walls of Candia there is not a single tree to be seen. The Turks cut them all down in the time of the siege, and laid waste the gardens and orchards. Beyond that extent, the country is pleasantly covered with corn and fruit trees. The neighbouring hills are overspread with vineyards, which produce the muscat of Mount Ida,—worthy of preference at the table of the most exquisite connoisseur in wines. That species of wine, though little known, has a fine flavour, a very pleasant relish, and is highly esteemed in the island.

CANDIAC, JOHN LEWIS, a premature genius, born at Candiac in the diocese of Nismes in France, in 1719. In the cradle he distinguished his letters: at 15 months, he knew them perfectly; at three years of age, he read Latin, either printed or in manuscript; at four, he translated from that tongue: at six, he read Greek and Hebrew; was master of the principles of arithmetic, history, geography, heraldry, and the science of medals; and had read the best authors on almost every branch of literature. He died of a complication of disorders, at Paris, in 1726.

CANDIDATE, a person who aspires to some public office.

In the Roman commonwealth, they were obliged to wear a white gown during the two years of their soliciting a place. This garment, according to Plutarch, they wore without any other clothes, that the people might not suspect they concealed money for purchasing votes, and also that they might more easily show to the people the scars of those wounds they had received in fighting for the defence of the commonwealth. The candidates usually declared their pretensions a year before the time of election, which they spent in making interest and gaining friends. Various arts of popularity were practised for this purpose, and frequent circuits made round the city, and visits and compliments to all sorts of persons, the process of which was called ambitus. See AMBITUS.

CANDIDATI MILITES, an order of soldiers, among the Romans, who served as the emperor’s bodyguards to defend him in battle. They were the tallest and strongest of the whole troops, and most proper to inspire terror. They were called candidati, because dressed in white, either that they might be more conspicuous, or because they were considered in the way of preferment.

CANDISH, a considerable province of Asia, in the dominions of the Great Mogul, bounded by Chythor and Maiva on the north, Orissa on the east, Decan on the south, and Guzerat on the west. It is populous and rich; and abounds in cotton, rice, and indigo. Brampore is the capital town.

CANDLE, a small taper of tallow, wax, or spermaceti; the wick of which is commonly of several threads of cotton, spun and twisted together. A tallow-candle, to be good, must be half sheep’s and half bullock’s tallow; for hog’s tallow makes the candle
Candle.

candle gutter, and always gives an offensive smell, with a thick black smoke. The wick ought to be pure, sufficiently dry, and properly twisted; otherwise the candle will emit an inconstant vibratory flame, which is both prejudicial to the eyes and insufficient for the distinct illumination of objects.

There are two sorts of tallow-candles; the one dipped, the other moulded: the former are the common candles; the others are the invention of the Sieur le Brege at Paris.

As to the method of making candles in general:

After the tallow has been weighed, and mixed in the due proportions, it is cut into very small pieces, that it may melt the sooner; for the tallow in lumps, as it comes from the butchers, would be in danger of burning or turning black, if it were left too long over the fire. Being perfectly melted and skinned, they pour a certain quantity of water into it, proportionable to the quantity of tallow. This serves to precipitate to the bottom of the vessel the impurities of the tallow which may have escaped the skimmer. No water, however, must be thrown into the tallow designed for the three first dips; because the wick, being still quite dry, would imbibie the water, which makes the candles crack and burnings, and renders them of bad use. The tallow, thus melted, is poured into a tub, through a coarse sieve of horse-hair, to purify it still more, and may be used after having stood three hours. It will continue fit for use 24 hours in summer and 15 in winter.

The wicks are made of spun cotton, which the tallow-chandlers buy in skains, and which they wind up into bottoms or cious; whence they are cut out, with an instrument conformed upon purpose, into pieces of the length of the candle required: then put on the sticks or broaches, or else placed in the moulds, as the candles are intended to be either dipped or moulded.

Wax-candles are made of a cotton or flaxen wick, slightly twisted, and covered with white or yellow wax. Of these, there are several kinds: some of a comical figure, used to illuminate churches, and in processions, funeral ceremonies, &c. (see Taper); others of a cylindrical form, used on ordinary occasions. The first are either made with a ladle or the hand. 1. To make wax-candles with the ladle. The wicks being prepared, a dozen of them are tied by the neck, at equal distances, round an iron circle, suspended over a large basin of copper tinned, and full of melted wax: a large ladle full of this wax is poured gently on the tops of the wicks one after another, and this operation continued till the candle arrive at its destined bigness; with this precaution that the three first ladles be poured on at the top of the wick, the fourth at the height of ⅔, the fifth at ⅔, and the sixth at ¾, in order to give the candle its pyramidal form. Then the candles are taken down, kept warm, and rolled and smoothed upon a walnut-tree table, with a long square instrument of box, smooth at the bottom.

2. The manner of making wax-candles by the hot water, contained in a narrow but broad tube; a piece of the wax is then taken out, which is rolled and little around the wick, in the wall, by the extremity opposite the wick, so that they begin with the big end, drawing still as they descend towards the neck. In other respects the method is nearly the same as in the former case. However, it must be observed, that, in the former case, water is always used to moisten the several instruments, to prevent the wax from sticking; and in the latter, oil of olives, or lard, for the bands, &c. The cylindrical wax-candles are either made as the former, with a ladle, or drawn. Wax-candles drawn, are so called, because actually drawn in the manner of wire, by means of two large rollers of wood, turned by a handle, which turning backwards and forwards several times, pass the wick through melted wax contained in a brass basin, and at the same time through the holes of an instrument like that used for drawing wire fastened at one side of the basin.

If any chandlers mix with their wares any thing deceitfully, &c. the candles shall be forfeited, by stat. 23 Eliz.; and a tax or duty is granted on candles, by 8 and 9 Anne, cap. 6. made for sale, of one penny a pound, besides the duty upon tallow, by 8 Anne, cap. 9. And by 24 Geo. III. cap. 11. an additional duty of a halfpenny a pound: and by the same an additional duty of a halfpenny a pound is laid upon all candles imported (except those of wax and spermacetum, for which see Wax-Candles), subject also to the two additional 5 per cents. imposed by 19 and 22 Geo. III. besides the duty of 2½d. formerly imposed by 2 W. sess. 2. cap. 4. 8 Anne, cap. 9. and 9 Anne, cap. 6. And every maker of candles, other than wax-candles, for sale, shall annually take out a licence at 1/. The maker of candles shall, in four weeks within the bills, and elsewhere in six weeks, after entry, clear off the duties on pain of double duty; nor sell any after default in payment, on pain of double value; 8 Anne, cap. 9. The makers of candles are not to use melting houses, without making a true entry, on pain of 100l. and to give notice of making candles to the excise officer for the duties; and of the number, &c. or shall forfeit 50l. stat. 11. Geo. I. cap. 30. See also 23 Geo. II. cap. 21. and 26 Geo. II. cap. 32. No maker of candles for sale shall begin to make candles, without notice first given to the officers, unless, from September 29. to March 25. yearly, between seven in the morning and five in the evening; and from March 25. to September 29. between five in the morning and seven in the evening, on pain of 10l. 10 Anne, cap. 26. The penalty of obstructing the officer is 20l. and of removing candles before they are surveyed 20l. 8 Anne, cap. 9. The penalty of privately making candles is the forfeiture of the same and utensils, and 100l. 5 Geo. III. cap. 43. And the penalty of mingling weighed with unweighed candles, of removing them before they are weighed, or of concealing them, is the forfeiture of 100l. 11 Geo. cap. 30. Candles, for which the duty hath been paid, may be exported, and the duty drawn back; but no drawback shall be allowed on the exportation of any foreign candles imported. 8 Anne, cap. 9. 23 Geo. II. cap. 21.

The Roman candles were at first little strings dipt in pitch, or surrounded with wax; though afterwards they made them of the papyrus, covered likewise with wax; and sometimes also of rushes, by stripping off the outer rind, and only retaining the pith. For religious offices, wax-candles were used; for vulgar uses,
Candle. Lord Bacon proposes candles of diverse compositions and ingredients, as of different sorts of wicks; with experiments of the degrees of duration, and light of each. Good housewives bury their candles in floor or bran, which it is said increases their lasting almost half.

Experiments to determine the real and comparative value of burning candles of different sorts and sizes.

N.B. The time that one candle lasted was taken from an average of several trials in each size.

It is observable, in opicas, that the flame of two candles joined, gives a much stronger light than both of them separate. The observation was suggested by Dr Franklin. Probably the union of the two flames produces a greater degree of heat, whereby the vapour is attenuated, and the particles of which light consists are more copiously emitted.

Mr Nicholson has made some interesting observations on the light afforded by lamps and candles, which we shall lay before our readers in his own words. "We are acquainted with no means (says he), unless we may except electricity, of producing light, but by combustion, and this is most probably of the same nature. The rude method of illumination consists in successively burning certain masses of such in the solid state. Common fumes answer this purpose in the apartments of houses, and in some lighthouses; small pieces of resinous wood, and the bituminous coal called kames coal, are in some countries applied to the same use; but the most general and useful method is that in which fat oil, of an animal or vegetable kind, is burned by means of a wick. These instruments of illumination are either lamps or candles. In the lamp, the oil must be one of those which retains its fluidity in the ordinary temperature of the atmosphere. The candle is formed of an oil, or other material, which is not fusible but at a temperature considerably elevated.

The method of measuring the comparative intensities of light is one of the first requisites in an inquiry concerning the art of illumination. Two methods of considerable accuracy are described in the Travels and Optique of Bouguer, of which an abridged account is given by Dr Priestley in his Optics. The first of these two methods has been used by others since that time, and probably before, from its very obvious nature, but particularly by Count Rumford, who has given a description and drawings of an instrument called the photometer, in the Philosophical Transactions for 1794. The principle it is grounded upon is, that if two lights shine upon the same surface at equal obliquities, and an opaque body be interposed, the two shadows it will produce must differ in blackness or intensity in the same degree. For the shadow formed by intercepting the greater light will be illuminated by the smaller light only, and reversely the other shadow will be illuminated by the greater light. That is to say, in short, the stronger light will be attended with a deeper shadow. But it is easy, by removing the greater light to a greater distance, to render the illumination it produces at the common surface equal to that afforded by the less. Experiments of this kind may be conveniently made by fastening a sheet of white paper against the wall of a room. The two lights or candles intended to be compared, must then be placed so that the ray of light from each shall fall with nearly the same angle of incidence upon the middle of the paper. By some experiments made in this way in the year 1785, I was satisfied that the degree of illumination could be thus ascertained to the 80th or 90th part of the whole.

By experiments of this kind many useful particulars may be shewn. Thus, for example, the light of a candle, which is so exceedingly brilliant when first snuffed, is very speedily diminished to one-half, and is usually not more than one-fifth or one-sixth before the meanness of the eye induces us to snuff it. Whence it follows, that if candles could be made so as not to require snuffing, the average quantity of light afforded by the same quantity of combustible matter would be more than doubled. In the same way, likewise, since the cost and duration of candles, and the consumption of oil in lamps, are easily ascertainable, it may be shewn whether more or less of light is obtained at the same expense during a given time, by burning a number of small candles instead of one of greater thickness. From a few experiments already made out of the numerous and useful series that presents itself, I have reason to think that there is very much waste in this expensive article of accommodation.

"In the lamp there are three articles which demand our attention, the oil, the wick, and the supply of air. It is required that the oil should be readily inflammable, without containing any fetid substance which may prove offensive, or mucilage, or other matter, to obstruct the channels of the wick. I do not know of any process for ameliorating oils for this purpose, excepting that of washing with water containing soda or alkali. Either of these is said to render the mucilage of animal oils more soluble in the water; but acid is preferred, because it is less disposed to combine with the oil itself. The office of the wick appears to be chiefly, if not solely, to convey the oil by capillary attraction to the place of combustion. As the oil is consumed and flies off, other oil succeeds, and in this way a continued current of oil and maintenance of the flame are effected. But as the wicks of lamps are commonly formed of
Candle

of combustible matter, it appears to be of some consequence what the nature and structure of this material may be. It is certain that the flame afforded by a wick of rush differs very considerably from that afforded by cotton; though perhaps this difference may, in a great measure, depend on the relative dimensions of each. And if we may judge from the different odour in blowing out a candle of each sort, there is some reason to suspect that the decomposition of the oil is not effected precisely in the same manner in each. We have also some obscure accounts of prepared wicks for lamps, which are stated to possess the property of facilitating the combustion of very impure oils, so that they shall burn for many hours without smoke or smell.

The access of air is of the last importance in every process of combustion. When a lamp is fitted up with a very slender wick, the flame is small, and of a brilliant white colour: if the wick be larger, the combustion is less perfect, and the flame is brown: a still larger wick not only exhibits a brown flame, but the lower internal part appears dark, and is occupied by a portion of volatilized matter, which does not become ignited until it has ascended towards the point. When the wick is either very large or very long, part of this matter escapes combustion, and shews itself in the form of coal or smoke. The different intensity of the ignition of flame, according to the greater or less supply of air, is remarkably seen by placing a lamp with a small wick beneath a shade of glass not perfectly closed below, and more or less covered above. While the current of air through the glass shade is perfectly free, the flame is white; but in proportion as the aperture above is diminished, the flame becomes brown, long, wavering, and smoky; it instantly recovers its original whiteness when the opening is again enlarged. The inconvenience of a thick wick has been long since observed, and attempts made to remove it: in some instances by substituting a number of small wicks instead of a larger one; and in others, by making the wick flat instead of cylindrical. The most scientific improvement of this kind, though perhaps less simple than the ordinary purposes of life demand, is the well-known lamp of Argand. In this the wick forms a hollow cylinder or tube, which slides over another tube of metal, so as to afford an adjustment with regard to its length. When this wick is lighted, the flame itself has the figure of a thin tube, to the inner as well as the outer surface of which the air has access from below. And a cylindrical shade of glass serves to keep the flame steady, and in a certain degree to accelerate the current of air. In this very ingenious apparatus many experiments may be made with the greatest facility. The inconvenience of a long wick, which supplies more oil than the volume of flame is capable of burning, and which consequently emits smoke, is seen at once by raising the wick; and on the other hand, the effect of a short wick, which affords a diminutive flame merely for want of a sufficient supply of combustible matter, is observable by the contrary process.

The most obvious inconvenience of lamps in general, arises from the fluidity of the combustible material, which requires a vessel adapted to contain it, and even in the best constructed lamps, is more or less liable to be spilled. When the wick of a lamp is once adjusted as to its length, the flame continues nearly in the same state for a very considerable time.

It is almost unnecessary to describe a thing so universally known as a candle. The article is formed of a consistent oil, which envelopes a porous wick of fibrous vegetable matter. The cylindrical form and dimensions of the oil are given, either by casting it in a mould, or by repeatedly dipping the wick into the fused ingredient. Upon comparing a candle with a lamp, two very remarkable particular are immediately seen. In the first place, the tallow itself, which remains in the unfused state, affords a cup or cavity to hold that portion of melted tallow which is ready to flow into the lighted part of the wick. In the second place, the combustion, instead of being confined, as in the lamp, to a certain determinate portion of the fibrous matter, is carried by a slow succession, through the whole length. Hence arises the greater necessity for frequent snuffing the candle; and hence also the station of the freezing point of the fat oil becomes of great consequence. For it has been shown that the brilliancy of the flame depends very much on the diameter of the wick being as small as possible; and this requisite will be most attainable in candles formed of a material that requires a higher degree of heat to fuse it. The wick of a tallow candle must be made thicker in proportion to the greater fusibility of the material, which would otherwise melt the sides of the cup, and run over in streams. The flame will therefore be yellow, smoky, and obscure, excepting for a short time immediately after snuffing. Tallow melts at the 92d degree of Fahrenheit's thermometer; spermaceti at the 133d degree; the fatty matter formed of flesh after long immersion in water melts at 127°; the pedia of the Chinese, at 145°; bees wax at 142°; and bleached wax at 150°. Two of these materials are well known in the fabrication of candles. Wax in particular does not afford so brilliant a flame as tallow: but, inasmuch of its fusibility, the wick can be made smaller; which not only affords the advantage of a clear perfect flame, but from its flexibility it is disposed to turn on one side, and come in contact with the external air which completely burns the extremity of the wick to white ashes, and thus performs the office of snuffing. We see, therefore, that the important object to society of rendering tallow candles equal to those of wax, does not at all depend on the combustibility of the respective materials, but upon a mechanical advantage in the cup, which is afforded by the inferior degree of fusibility in the wax; and that to obtain this valuable object, one of the following effects must be produced: Either the tallow must be burned in a lamp, to avoid the gradual progression of the flame along the wick; or some means must be devised to enable the candle to snuff itself, as the wax candle does; or, lastly, the tallow itself must be rendered less fusible by some chemical process. I have no great reason to boast of success in the endeavour to effect these; but my hope is, that the facts and observations here presented may considerably abridge the labour of others in the same pursuit.

The makers of thermometers and other small articles with the blow-pipe and lamp, give the preference to tallow instead of oil, because its combustion is more complete,
Candle complete, and does not blacken the glass. In this operation, the heat of the lamp melts the tallow which is occasionally brought into its vicinity by the workman. But for the usual purposes of illumination, it cannot be supposed that a person can attend to supply the combustible matter. Considerable difficulties arise in the project for affording this gradual supply as it may be wanted. A cylindrical piece of tallow was inserted into a metallic tube, the upper aperture of which was partly closed by a ring, and the central part occupied by a metallic piece nearly resembling that part of the common lamp which carries the wick. In this apparatus the piece last described was intended to answer the same purpose, and was provided with a short wick. The cylinder of tallow was supported beneath in such a manner that the metallic tube and other part of this lamp were left to rest with their whole weight upon the tallow at the ring or contraction of the upper aperture. In this situation the lamp was lighted. It burned for some time with a very bright clear flame, which, when compared with that of a candle, possessed the advantages of uniform intensity, and was much superior to the ordinary flame of a lamp in its colour, and the perfect absence of smell. After some minutes it began to decay, and very soon afterwards went out. Upon examination it was found, that the metallic piece which carried the wick had formed a sufficient quantity of tallow for the supply during the combustion; that part of this tallow had flowed beneath the ring, and to other remote parts of the apparatus, beyond the influence of the flame; in consequence of which, the tube, and the cylinder of tallow, were fastened together, and the expected progression of supply prevented. It seems probable, that in every lamp for burning consistent oils, the material ought to be so disposed that it may descend to the flame upon the principle of the fountain reservoir. I shall not hence state the obstacles which present themselves in the prospect of this construction, but shall dismiss the subject by remarking, that a contrivance of this nature would be of the greatest public utility.

The wick of a candle, being surrounded by the flame, is nearly in the situation of a body exposed to destructive distillation in a close vessel. After losing its volatile products, the carbonaceous residue retains its figure, until, by the descent of the flame, the external air can have access to its upper extremity. But, in this case, the requisite combustion, which might affect it, is not effected. For the portion of oil emitted by the long wick is not only too large to be perfectly burned, but also carries off much of the heat of the flame while it assumes the elastic state. By this diminished combustion and increased efflux of half-decomposed oil, a portion of coal or soot is deposited on the upper part of the wick, which gradually accumulates, and, at length, assumes the appearance of a fungus. The candle does not then give more than one-tenth of the light emitted in its best state. Hence it is that a candle of tallow cannot spontaneously snuff itself. It was not probable that the addition of a substance containing vital air or oxygen would supply that principle at the present period of time required; but, an experiment is the test of every probability of this nature. I soaked a wick of cotton in a solution of nitre, then dried it, and made a candle. When this came to be lighted, nothing remarkable happened for a short time; at the expiration of which a deceleration followed at the lower extremity of the flame, which completely divided the wick where the blackened part commences. The whole of the matter in combustion therefore fell off, and the candle was of course instantly extinguished. Whether this would have happened in all proportions of the salt or constructions of the candle, I did not try, because the smell of azote was sufficiently strong and unpleasant to forbid the use of nitre in the pursuit. From various considerations I am disposed to think that the spontaneous snuffing of candles made of tallow, or other fusible materials, will scarcely be effected, but by the discovery of some material for the wick which shall be voluminous enough to absorb the tallow, and at the same time sufficiently flexible to bend on one side.

"The most promising speculation respecting this most useful article, seems to direct itself to the exp which contains the melted tallow. The imperfection of this part has already been noticed, namely, that it breaks down by fusion, and suffers its fluid contents to escape. The Chinese have a kind of candle about half an inch in diameter, which, in the harbour of Canton, is called lobchock; but whether the name be Chinese, or the corruption of some European word, I am ignorant. The wick is of cotton, wrapped round a small stick or match of the bamboo cane. The body of the candle is white tallow; but the external part, to the thickness of perhaps one-thirtieth of an inch, consists of a waxy matter coloured red. This covering gives a considerable degree of solidity to the candle, and prevents its guttering, because less fusible than the tallow itself. I did not observe that the stick in the middle was either advantageous or the contrary; and, as I now write from the recollection of this object at so remote a period as 25 years ago, I can only conjecture that it might be of advantage in throwing up a less quantity of oil into the flame than would have been conveyed by a wick of cotton sufficiently stout to have occupied its place unsupported in the axis of the candle.

Many years ago I made a candle in imitation of the lobchock. The expedient to which I had recourse consisted in adapting the wick in the usual pewter mould: wax was then poured in, and immediately afterwards poured out: the film of wax which adhered to the inner surface of the mould soon became cool; and the candle was completed by filling the mould with tallow. When it was drawn out, it was found to be crooked longitudinally on its surface, which I attributed to the contraction of the wax, by cooling, being greater than that of the tallow. At present I think it equally probable that the cracking might have been occasioned by too sudden cooling of the wax before the tallow was poured in; but other avocations prevented the experiments from being varied and repeated. It is probable that the Chinese external coating may not be formed of pure hard bleached wax.

"But the most decisive remedy for the imperfection of this cheapest, and in other respects best material for candles, would undoubtedly be to diminish its fusibility. Various substances may be combined with tallow, either in the direct or indirect method. In the latter way, by the decomposition of soap, a number of experiments were made by Berthollet, of which an account
Candle

Candle.

count is inserted in the memoirs of the academy at
Paris for the year 1780, and copied into the 26th vo-
lume of the Journal de Physique. None of these point
directly to the present object; besides which, it is pro-
bable that the soap made use of by that eminent chem-
ist was formed not of tallow, but oil. I am not
aware of any regular series of experiments concerning the
mutual action of fat oils and other chemical agents,
more especially such as may be directed to this im-
portant object of diminishing its solubility; for which
reason I shall mention a few experiments made with
this view.

1. Tallow was melted in a small silver vessel. Solid
tallow sinks in the fluid, and dissolves without any re-
markable appearance. 2. Gum sandarac in tears was
not dissolved, but emitted bubbles, swelled up, became
brown, emitted fumes, and became crisp or friable.
No solution nor improvement of the tallow. 3. Shell-
lac swelled up with bubbles, and was more perfectly
fused than the gum sandarach in the former experi-
ment. When the tallow was poured off, it was thought
to congeal rather more speedily. The lac did not ap-
pear to be altered. 4. Benzoin bubbled without much
swelling, was fused, and emitted fumes of an agreeable
smell, though not resembling the flowers of benzoin.
A slight or partial solution seemed to take place. The
benzoin was softer and of a darker colour than before,
and the tallow less consistent. 5. Common resin unites
very readily with melted tallow, and forms a more
fusible compound than the tallow itself. 6. Camphor
melts easily in tallow, without altering its appearance.
When the tallow is near boiling, camphor fumes fly
off. The compound appeared more fusible than tal-
low. 7. The acid or flowers of benzoin dissolves in
great quantities without any ebullition or commotion.
Much smoke arises from the compound, which does
not smell like the acid of benzoin. Tallow alone does
not fuse at a low heat, though it emits a smell some-
thing like that of oil-alive. When the proportion of
the acid was considerable, small needles crystals ap-
ppeared as the temperature was diminished. The ap-
pearances of separation are different according to the
quantity of acid. The compound has the hardness and con-
sistency of firm soap, and is partially transparent. 8.
Vitriolated tartar, nitre, white sugar, cream of tartar,
crystallized borax, and the salt sold in the markets un-
der the name of salt of lemons, but which is supposed
to be the essential salt of sorrel, or vegetable alkali
 supersaturated with acid of sugar, were respectively
tried without any obvious mutual action or change of
properties in the tallow. 9. Calcined magnesia rendered
tallow opaque and turbid, but did not seem to dissolve.
Its effect resembled that of lime.

It is proposed to try the oxidated acetic acid,
or radical of vinegar; the acid of ants, of sugar, of borax,
of gall, the tanning principle, the serous and gelatin-
os animal matter, the fecula of vegetables, vegetable
gluten, bird lime, and other principles, either by direct
or indirect application. The object, in a commercial
point of view, is entitled to an extensive and assidious
investigation. Chemists in general suppose the hard-
ess or less fusibility of wax to arise from oxygen, and
to this object it may perhaps be advantageous to direct
a certain portion of the inquiry. The metallic salts
and calces are the combinations from which this prin-
ciple is most commonly obtained; but the combina-
tions of these with fat oils have hitherto afforded little
promise of the improvement here sought. The sub-
ject is however so little known, that experiments of
the loosest and most conjectural kind are by no means
to be despised."

Lighting a Candle by a small spark of electricity.
This method, which is an invention of Dr Ingenhousz,
is recorded in the Phil. Trans, vol. lxxii. It is done by
a small phial, having eight or ten inches of metallic
coating, or even less, charged with electricity, which
may be done at any time of the night by a person
who has an electric machine in his room. When I
have occasion to light a candle," says he, "I charge
a small coated phial, whose knob is bent outwards, so
as to hang a little over the body of the phial; then I
wrap some loose cotton over the extremity of a long
brass pin or a wire, so as to stick moderately fast to
its substance. I next roll this extremity of the pin
wrapped up with cotton in some fine powder of resin,
(which I always keep in readiness upon the table for
this purpose, either in a wide-mouthed phial or in a
loose paper;) this being done, I apply the extremity
of the pin or wire to the external coating of the
charged phial, and bring as quickly as possible the
other extremity wrapped round with cotton to the
knob; the powder of resin takes fire, and communicates
its flame to the cotton, and both together burn long
enough to light a candle. As I do not want more than
half a minute to light my candle in this way, I find it
a readier method than kindling it by a flint and steel,
or calling a servant. I have found that powder of
white or yellow resin lights easier than that of brown.
The sarina lycopersica may be used for the same purpose;
but it is not so good as the powder of resin, because it
does not take fire quite so readily, requiring a stronger
spark not to miss: besides, it is soon burnt away. By
dipping the cotton in oil of turpentine, the same ef-
fect may be as readily obtained, if you take a jar some-
what greater in size. This oil will inflame so much the
reader if you stew a few fine scales of brass upon it.
The brass dust is the best for this purpose: but as this
oil is scattered about by the explosion, and when kind-
led fills the room with much more smoke than the
powder of resin, I prefer the last."

Candle-Bombé, a name given to small glass bubbles,
having a neck about an inch long, with a very slender
bore, by means of which a small quantity of water is
introduced into them, and the orifice afterwards closed
up. This stalk being put through the wick of a burning
Candle, the vicinity of the flame soon rarifies the
water into steam, by the elasticity of which the glass
is broken with a loud crack.

Candle is also a term of medicine, and is reckoned
among the instruments of surgery. Thus the candle
fumake, or the candle pro suffusc odorata, is a mass of
an oblong form, consisting of odoriferous powders mix-
ed up with a third or more of the charcoal of willow
or lime tree, and reduced to a proper consistence with
a mucilage of gum tragacanth, labdanum, or turpen-
tine. It is intended to excite a grateful smell with-
out any flame, to correct the air, to fortify the brain,
and to excite the spirits.

Medicated Candle, the same with Bombe.

Candle. Bales or suction by inch of candle, is when
of the seven lamps were lighted every evening, and extinguished every morning. The lamps had their tongs or snuffers to draw the cotton in or out, and dishes underneath them to receive the sparks or droppings of the oil. This candlestick was placed in the antechamber of the sanctuary on the south side, and served to illuminate the altar of perfume and the tabernacle of the shew-bread. When Solomon had built the temple of the Lord, he placed in it ten golden candlesticks of the same form as that described by Moses, five on the north and five on the south side of the holy. But after the Babylonian captivity, the golden candlestick was again placed in the temple, as it had been before in the tabernacle by Moses. This vessel contains upon the destruction of the temple by the Romans, was lodged in the temple of Peace built by Vespasian; and the representation of it is still to be seen on the triumphal arch at the foot of Mount Palatine, on which Vespasian's triumph is delineated.

CANDY, a large kingdom of Asia, in the island of Ceylon. It contains about a quarter of the island; and as it is encompassed with high mountains, and covered with thick forests, through which the roads and paths are narrow and difficult, the king had them guarded to prevent his subjects from going into other countries. It is full of hills, from whence rivulets proceed which are full of fish; but as they run among the rocks, they are not fit for boats: however, the inhabitants are very dexterous in turning them to water their land, which is fruitful in rice, pulse, and hemp.

Since the island of Ceylon fell into the hands of the English, we have obtained fuller information respecting it. Mr. Percival, who has published an account of this island, mentions the jealousy, both of the Dutch and the natives, which has not been easily overcome by the English, while they remained subject to Holland. The interior of the island (he says), owing to the jealousy of the Dutch, has been little explored by Europeans; and any traveller who might have obtained the permission of the Dutch to visit it, could not have executed his purpose from the jealousy of the natives. Since the CANDIES have been driven by their invaders into the mountains of the interior, it has been their policy carefully to prevent any European from seeing those objects which might tempt the avarice of their countrymen, or from observing the approaches by which an army could penetrate their mountains. If an European by any accident were carried into their territories, they took every precaution to prevent him from escaping; and the guards, stationed everywhere at the approaches, joined to the wide and pathless woods which divide the interioe from the coast, rendered such an attempt almost completely desperate. When an ambassador was sent from any European government to the king of CANDY, he was watched with all that strictness and jealousy which the suspicious temper of uncivilized nations dictates. In an embassy which I attended to the court of that monarch, I had an opportunity of observing how careful the natives were to prevent strangers from making any observations. Mr. Boyd, who about twenty years ago went on a similar embassy, was watched with the same particular circumspection; and has therefore been able to add little to our stock of knowledge concerning the interior.

The dominions of the native prince are completely cut off on all sides from those of the Europeans, by almost impenetrable woods and mountains. The passes which lead through these to the coasts are extremely steep and difficult, and scarcely known even by the natives themselves. As soon as we advance from ten to twenty miles from the coasts, a country presents itself greatly differing from the sea-coast, both in soil, climate, and appearance. After ascending the mountains and passing the woods, we find ourselves in the midst of a country not advanced many stages beyond the
the first state of improvement, and which we are aston-
ished to find in the neighbourhood of the highly cul-
tivated fields which surround Columbus. As we advance
towards the centre of the island, the country gradually
rises, and the woods and mountains which separate the
several parts of the country become more steep and im-
pervious.

"It is in the midst of these fastnesses that the native
prince still preserves those remains of territory and
power which have been left him by successive invaders.
His dominions are now much reduced in size: for be-
sides the whole of the sea-coasts which were of any
value, the Dutch, in their various attacks during the
last century, have contrived to get into their power
every tract from which they could derive some enric-
ment or security. These provinces which still remain
to him, are Neoranta, and Hottemourly towards the
north and north-west; while Matula, comprehending
the districts of Jintana, Velas, and Pana, with a few
others, occupy those parts more to the eastward.
To the south-east lies Ouva, a province of some note,
and giving the king one of his titles. The western parts
are chiefly included in the provinces of Coteman, and
Hottemourly. These different provinces are subdivi-
sed into corons or districts, and entirely belong to
the native prince. It is needless to recount the names
of these divisions which stretch towards the sea-coast,
and are new chiefly in our possession.

"In the highest and most central part of the native
king's dominions, lie the corons or counties of Oudaor
and Tatanour, in which are situated the two principal
cities. These countries take the pre-eminence of all
the rest, and are both better cultivated, and more
populous, than any of the other districts, and are dis-
tinguished by the general name of Condé Uda; condé
or condé in the native language signifying a mountain,
and uda the greatest or highest.

Ceylon fell into the hands of the British in 1796;
and in 1802 a war originated with the Candians. The
British possession of the capital, and placed a
new prince on the throne; but the military force
being reduced by the climate, and the Candians being in
possession of the place, was given up by capitulation, in de-
ference to the advantages which the British had gained.
Another British force again reduced the capital in
1814, and in 1816 the kingdom was transferred
from the British to the British possessions. The Candians
revolted in 1818, but were subdued after a considerable
struggle.

CANDY, a town of Asia, and capital of a kingdom
of the same name, in the island of Ceylon. It has been
often burned by the Portuguese when they were masters
of these coasts. It is situated in E. Long. 79. 12. N.
Lat. 7. 35.

We have the following description of Candy by Mr
Pocock, whom we have already quoted, and who at-
tended an embassy to the king.

"In the district of Tatanour lies Candy, the royal
residence and the capital of the native prince's dom-
inions. It is situated at the distance of 80 miles from
Columbo, and is twice as far from Trincomalee, in the
midst of low and swampy ground covered with thick
jungles. The narrow and difficult passage by which it is
approached is intersected with thick hedges of thorn;
and hedges of the same sort are drawn across the hills
in the vicinity of Candy like lines of circumvallation.
Through them the only passage is by gates of the same
thorny materials, so contrived as to be drawn up and
let down by ropes. When the Candians are obliged
to retreat within these barriers, they cut the ropes, and
then it is impossible to force a passage except by burn-
down the gates, which, from their green state,
and the constant annoyance of the enemy sheltered
behind them, would prove an enterprise of time and
difficulty. These hedge-rows form the chief fortifica-
tions of Candy. The Malivagonga also nearly sur-
rounds the hill on which it stands: that river is here
broad, rocky, and rapid; a very strict guard is kept
on it, and every one who passes or repasses is closely
watched and examined.

"The city itself is a poor miserable-looking place,
surrounded by a mud wall of no strength whatever.
It has been several times burnt by Europeans, and
was once deserted by the king, who retired to a more
inaccessible part of his dominions. It is upon occasion
of the embassy of General Macdowall, that any infor-
mation concerning the present state of Candy has been
obtained; and even then it could be little more than
guessed at, as the ambassador and his suite were ad-
mitted only by torch-light, and always retired before
break of day. From what could then be observed,
the city consists of a long straggling street built on
the declivity of a hill; the houses mean and low, but
with their foundations raised in such a manner above
the level of the street, that they appear quite lofty to
passengers. The reason of this extraordinary taste is
to enable the king to hold his assemblies of the people,
and to have his elephant and buffalo fights in the
street, without interfering with the houses. When
the king passes along the street, none of the inhab-
"itants are allowed to appear before their houses,
or the paths on a level with them, as that would
be attended with the heinous indecorum of placing
a subject higher than the prince descended from the
sun.

"At the upper end of this street, stands the palace,
a poor mansion for the abode of a king. It is sur-
rrounded with high stone walls, and consists of two
squares, one within the other. In the inner of these
are the royal apartments, and it is there that the court
is held and audiences given. The exterior of the
palace and the rest of the city could be but very par-
tially observed by those who attended General Mac-
dowall, owing to the pressure of the crowd, and the
dazzling glare of the torches. By every account
indeed which I have heard, Candy contains nothing
worth of notice, and from the want of either wealth
or industry among the inhabitants, it is not indeed to
be expected that any thing could be met with in this
straggling village to attract the attention of the
traveller.

"CANDY, or Sugar-Candy, a preparation of sugar made
by melting and crystallizing it six or seven times over,
to render it hard or transparent. It is of three kinds,
white, yellow, and red. The white comes from the
leaf-sugar, the yellow from the cannico, and the red
from the muscovado.

CANDYING, the act of preserving simples in
substance, by boiling them in sugar. The perfor-

R. 2
CANEA. See Arundo and Calamus, BOTANY Index.

Cane, denotes also a walking-stick. It is customary to adorn it with a head of gold, silver, agate, &c. Some are without knots, and very smooth and even; others are full of knots about two inches distance from one another. These last have very little elasticity, and will not bend so well as the others.

Cana of Bengal are the most beautiful which the Europeans bring into Europe. Some of them are so fine, that people work them into bowls or vessels, which being varnished over on the inside, with black or yellow lacca, will hold liquors as well as glass or China ware does; and the Indians use them for that purpose.

Cane is also the name of a long measure, which differs according to the several countries where it is used. At Naples the cane is equal to 7 feet 3½ inches English measure. The cane of Thoulese and the Upper Languedoc, is equal to the value of Arragon and contains 5 feet 8½ inches; at Montpellier, Provence, Dauphinie, and the Lower Languedoc, to 6 English feet 3½ inches.

Canea, a considerable town of the island of Candia, where a bashaw resides. It was built by the Venetians, and occupies part of the site of the ancient Cydonia. It is not about two miles in compass; encircled on the land side with a single wall, extremely thick, and defended by a broad and deep ditch, cut through a bed of rock, which extends all around the wall. By cutting it still deeper, they might cause the sea to flow round its ramparts; on which they have raised high platforms, that their great guns might command a wider extent of the adjacent plain. The city has only one gate, the gate of Retimo, protected by a half-moon battery, which is the only exterior fort. The side which faces the sea is the best fortified. On the left of the harbour are four batteries, rising one above another, and planted with a number of large cannons of cast metal, marked with the arms of Venice. The first of these batteries stands close on the brink of the shore of the right side of the harbour, is defended only by a strong wall, extending along a chain of pointed rocks which it is dangerous for ships to approach. At the extremity of this wall, there is an old castle, falling into ruins. Beneath that castle, the Venetians had immense arsenals, vaulted with stone. Each of these vaults was of sufficient length, breadth, and height, to serve as a work-shop for building a ship of the line. The ground is sloping, and the outermost part of these capacious arsenals is on a level with the sea; so that it was very easy to launch the ships built there into the water. The Turks are suffering that magnificent work to fall into ruins.

The city of Cannae is laid out on a fine plan. The streets are large and straight; and the squares adorned with fountains. There are no remarkable buildings in it. Most of the houses are flat-roofed, and have only one story. Those contiguous to the harbour are adorned with galleries, from which you enjoy a delightful prospect. From the windows you discover the large bay formed between Cape Spada and Cape Melos, and all the ships that are entering or passing out. The harbour, at present, receives ships of 200 tons burden; and it might be enlarged so as to admit the largest frigates. Its mouth is exposed to the violence of the north winds, which sometimes swell the billows above the ramparts. But, as it is narrow, and the bottom is good, ships that are well-secured run no danger. At the time when Turnfort visited Crete, Canea did not contain more than five or six thousand inhabitants. But, at present, when the gates of Girna-Patra, Canali, and Retimo, are chocked up, the merchants have retired to Canea; and it is reckoned to contain 16,000 souls. The environs of the town are admirable; being adorned with forests of olive-trees mixed with fields, vineyards, gardens, and breaks bordered with myrtle-trees and laurel-rehes. The chief revenue of this town consists in olive. E. Long. 24. 15. N. Lat. 35. 28.

Canella. See BOTANY Index.

Canella, or Canex land, a large country in the island of Ceylon, called formerly the kingdom of Uva. It contains a great number of canex, now occupied by the English. The chief riches of this country consist in cinnamonum, of which there are large forests. There are five towns on the coast, some forts, and a great number of harbours. The rest of the country is inhabited by the natives, and there are several rich mines, from whence they get rubies, sapphires, topazes, cats eyes, and several other precious stones.

Caneophore, in Grecian antiquity, virgins who when they become marriageable, presented certain baskets full of little curiosities to Diana, in order to get leave to depart out of her train, and change their state of life.

Caneophoria, in Grecian antiquity, a ceremony which made part of a feast celebrated by the Athenian virgins on the eve of their marriage-day. At Athens the caneporia consisted in this, that the maid, conducted by her father and mother, went to the temple of Minerva, carrying with her a basket full of presents to engage the goddess to make the marriage state happy; or, as the scholar of Theocritus has it, the basket was intended as a kind of honourable amends made to that goddess, the protector of virginity, for abandoning her party; or as a ceremony to appease her wrath. Scilico calls it a festival in honour of Diana.

Caneoporia is also the name of a festival in honour of Bacchus, celebrated particularly by the Athenians, on which the young maids carried golden baskets full of fruit, which baskets were covered, to conceal the mystery from the uninitiated.

Caneb, in Egypt, and other eastern countries, a poor sort of buildings for the reception of strangers and travellers. People are accommodated in those with a room at a small price, but with no other necessaries; so that, excepting the room, there are no greater accommodations in these houses than in the deserts, only that there is a market near.

Cane Penatii, in Astronomy, the Greyhounds, two new constellations, first established by Hevelius, between the tail of the Great Bear and Bootes's arm, above the Coma Berenices. The first is called asterism, being that next the Bear's tail; the other chaos. They comprehend
CANE

CANE

comprehended 23 stars, of which Tycho only observed two. The longitude and latitude of each are given by Hevelius. In the British Catalogue they are 25.

CANETO, a strong town in Italy in the duchy of Mantua, seated on the river Oglio, which was taken by the Imperialists in 1701, by the French in 1702, afterwards by the Imperialists, and then by the French in 1705. E. Long. 10. 45. N. Lat. 45. 30.

CANGA, in the Chinese affair, a wooden clog borne on the neck, by way of punishment for divers offences. The canga is composed of two pieces of wood notched, to receive the criminal's neck; the load lies on his shoulders, and is more or less heavy according to the quality of his offences. Some cangas weigh 50 lb.; the generality from 50 to 60. The mandarins condemn to the punishment of the canga. Sentence of death is sometimes changed for this kind of punishment.

CANGE, Charles du Fresne, Sire du, one of the most learned writers of his time, was born at Aix-Mons in 1601, and studied at the Jesuits college in that city. Afterwards he applied himself to the study of the law at Orleans, and gained great reputation by his works; among which are 1. The history of the empire of Constantinople under the Greek emperors. 2. John Cianus's six books of the history of the affairs of John and Manuel Comnenus, in Greek and Latin, with historical and philological notes. 3. Glossarium ad scriptores medici et insulae Latins.

CANGI, Carni, or Cangi, anciently a people of Britain, concerning whose situations antiquaries have been much perplexed. They are all the same people. Camden discovered some traces of them in many different and distant places, as in Somersetshire, Wales, Derbyshire, and Cheshire; and he might have found as plain vestiges of them in Devonshire, Dorsetshire, Essex, Wiltshire, &c. Mr. Horsey and others are no less perplexed and determined in their opinions on this subject. But Mr. Baxter seems to have discovered the true cause of all this perplexity, by observing that the Cangi or Cangi were not a distinct nation seated in one particular place, but that the sort of the youth of many different nations as were employed in pastures, in feeding the flocks and herds of their respective tribes. Almost all the ancient nations of Britain had their cangis, their pasturists, the keepers of their flocks and herds, who ranged about the country in great numbers, as they were invited by the season and plenty of pasture for their cattle. This is the reason that vestiges of their name are to be found in so many different parts of Britain; but chiefly in those parts which are most fit for pasturage. These cangis of the different British nations, naturally brave, and rendered still more hardy by their way of life, were constantly armed for the protection of their flocks from wild beasts and these arms they occasionally employed in the defence of their country and their liberty.

CANGIAGIO, or Cambiasi Lodovico, one of the most eminent of the Genoese painters, was born in 1527. His works at Genoa are very numerous; and he was employed by the king of Spain to adorn part of the Escorial. It is remarked of him, that he was not only a most expeditious and rapid painter, but also that he worked equally well with both hands.

CANGIAGIO, and by his natural powers he excelled most of his contemporaries and finished more grand works with his own pencil in a much shorter time than most other artists could do with several assistants. He died in 1585.

In the royal collection, at Paris there is a Sleeping Cupid, as large as life, and likewise Judith with her attendant, which are painted by Cangiagio, and are an honour to that master. And in the Pembroke collection at Wilton is a picture, reputed the work of Cangiagio, representing Christ bearing his cross.

Canicula, is a name given to one of the stars of the constellation canis major, called also simply the dog star; by the Greeks Canis, Sirius. Canicula is the tenth in order in the Britannico catalogue; in Tycho's and Flamsteed's it is the second. It is situated in the body of the constellation and is of the first magnitude, being the largest and brightest of all the stars in the heavens. From the rising of this star not occasionally, or with the sun, but belliciously, that is, its appearance from the sun's rays, which now happens about the 11th day of August, the ancients reckoned their dice caniculares, or dog days. The Egyptians and Ethiopians began their year at the rising of the Canicula, reckoning to its rise again the next year, which is called annus canarius, or canicular year. This year consisted ordinarily of 365 days, and every fourth year of 366, by which it was accommodated to the civil year. The reason of their choice of the Canicula before the other stars, to compute their time by, was not only the superior brightness of that star, but because its bellicial rising was in Egypt a time of singular note, as falling on the greatest augmentation of the Nile, the reputed father of Egypt. Ephesians adds, that, from the aspect and colour of Canicula, the Egyptians drew prognostics concerning the rise of the Nile; and, according to Florus, predicted the future state of the year; so that the first rising of this star was annually observed with great attention.

Caniculum, or Caniculus, in the Byzantine antiquities, a golden standish or ink vessel, decorated with precious stones, wherein was kept the sacred consumptum, or red ink, wherein was kept the emperors signed their decrees, letters, &c. The word is of some derived from canus, or canis; alluding to the figure of a dog, which it represented, or rather because it was supported by the figures of dogs. The caniculum was under the care of a particular officer of state.

Canina, the north part of the ancient Epirus, a province of Greece, which now belongs to the Turks; and lies off the entrance of the gulf of Venice. The principal town is of the same name, and is seated on the sea coast, at the foot of the mountains of Chimera. E. Long. 19. 25. N. Lat. 40. 50.

Caninana, in Zoology, the name of a species of serpent found in America, and esteemed one of the less poisonous kinds. It grows to about two feet long; and is green on the back, and yellow on the belly. It feeds on eggs and small birds; the natives cut off the head and tail, and eat the body as a delicate dish.

Canine, whatever pertakes of, or has any relation to, the nature of a dog.

CANINE Teeth, are two sharp-edged teeth in each jaw, one on each side, placed between the incisors and molars.

CANINE, JOHN ANGELO and MARC ANTHONY, brothers and Romans, celebrated for their love of antiquities. John excelled in designs for engraving on stones, particularly heads: Marc engraved them. They were encouraged by Colbert to publish a succession of heads of the heroes and great men of antiquity, designed from medals, antique stones, and other ancient remains; but John died before his work was finished, and Marc completed it. They were issued in Italian in 1650.

The cats of this edition were engraved by Canini, Picard, and Vist; and a curious explanation is given, which discovers the skill of the Canis in his history and mythology. The French edition of Amsterdam, in 1721, is spurious.

CANNIS, or Dog. See Mammalia Indus.

CANNIS Major, the Great Dog, in Astronomy, a constellation of the southern hemisphere, below Orion's feet, though somewhat to the westward of him; whose stars Ptolomy makes 29; Tycho observed only 23; Hevelius 21; and in the British catalogue they are 31.

CANNIS Minor, the Little Dog, in Astronomy, a constellation of the northern hemisphere; called also by the Greeks Procyon, and by the Latins Antares and Coma Berenices. The stars in the constellation C. Minor, are in Ptolomy's catalogue, 23; in Tycho's 53; in Hevelius's, 13; and in the British catalogue, 14.

CANNIS, HENRY, a native of Nime根, and one of the most learned men of his time, was professor of canon law at Ingolstadt; and wrote a great number of books; the principal of which are, 1. Summa Juris Economici. 2. Antiquae Legiones, a very valuable work. He died in 1650.

CANNIS, the Baron of, a German poet and statesman, was of an ancient and illustrious family in Brandenburg, and born at Berlin in 1654, five months after his father's death. After his early studies, he travelled to France, Italy, Holland, and England; and upon his return to his country, was charged with important negotiations by Frederic II. Frederic II. occasionally used to admire the talents of, and was conversant in many languages, dead as well as living. His German poems were published for the tenth time, 1752, in 8vo. He is said to have taken Horace for his model, and to have written purely and deftly. But he did not content himself with barely cultivating the fine arts in himself; he gave all the encouragement he could to them in others. He died at Berlin, in 1699, privy counsellor of state, aged 45.

CANKER, a disease incident to trees, proceeding chiefly from the nature of the soil. It makes the bark rot and fall. If the canker be in a bough, cut it off; if on a large bough, at some distance from the stem; in a small one, close to it: but for over hot strong ground, the ground is to be cooled about the roots with pond water and cow dung.

CANKER, among settlers. See FARRIER Index.

CANNIS, INDIAN REED. See BOTANY Index.

CANNABIS, Hemp. See BOTANY Index.

From the leaves 'f hemp pounded and boiled in water, the natives of the East Indies prepare an intoxicating liquor of which they are very fond. The plant, when fresh, has a rank narcotic smell; the water in which the stalks are soaked, in order to separate the tough rind for mechanical uses, is said to be violently poisonous, and to produce its effects almost as soon as drank. The seeds also have some smell of the herb, and their taste is astringent and sweetish: they are recommended, boiled in milk, or triturated with water into an emulsion, against coughs, heat of urine, and the like. They are also said to be useful in incontinence of urine, and for restraining venereal appetites; but experience does not warrant their having any virtues of that kind.

CANNABIS, in Ancient Geography, a town of Aousios on the Adriatic, at the mouth of the river Aousios, rendered famous by a terrible overthrow which the Romans were at the Carthaginians under Hannibal. The Roman consul, AEmilius Paulus and Terentius Varro, being invited by the Senate to quit the defensive plan, and stakes the fortunes of the republic on the chance of a battle, marched from Carthage, and encompassed a few miles east, in two unequal divisions, with the Aousios between them. In this position they meant to wait for an opportunity of engaging to advantage; but Hannibal, whose critical situation in a disorganized country, without refuge or allies, could admit of no delay, found means to inflame the vanity of Varro by some trivial advantages in skirmishes between the light horse. The Romans, elected with this success, determined to bring matters to a speedy conclusion; but, finding the ground on the south side too confined for the operations of so large an army, crossed the river; and Varro resting his right wing upon the Aousios, drew out his forces in the plain. Hannibal, whose head-quarters were at Canaus, no sooner perceived the enemy in motion, than he forded the water below, and marshalled his troops in a line opposite to that of his adversaries.

The Romans were vastly superior in numbers to the Carthaginians; but the latter were superior in cavalry. The army of the former, consisting of 87,000 men, was drawn up in the usual manner; the AEmilii in the first line, the princeps in the second, and the bravos in the third. The cavalry were posted on the wings. On the right, the Roman knights flanked the legions; on the left, the cavalry of the allies covered their own infantry. The two consuls commanded the two wings; AEmilius the right, and Terentius the left; and the two proconsuls, Servilius and Attilus, the main body. On the other hand, Hannibal, whose army consisted of 40,000 foot and 10,000 horse, placed his Gaulish and Spanish cavalry in his left wing, to face the Roman knights; and the Numidian horse in his right, over against the cavalry of the allies of Rome. As to his infantry, he divided the African battalions into two bodies; one of which he posted near the Gaulish and Spanish horse, the other near the Numidians. Between these two bodies were placed on one side the Gaulish, on the other the Spanish infantry, drawn up in such a manner as to form an obtuse angle, projecting a considerable way beyond the two wings. Behind this line he drew up a second which had no protection. A centrifuge commanded the left wing; AEmilius the right; and Hannibal himself, with his banner
CAME.

Then the Roman cavalry in the right wing advanced against the Gaulish and Spanish on Hannibal's left. As they were shut in by the river Aspis on one side, and by their infantry on the other, they did not fight, as usual, by charging and wheeling off, and then returning to the charge; but continued fighting each man against his adversary, till one of them was killed or retired. After they had made prodigious efforts on both sides to overbear each other, they all on a sudden dismounted, and fought on foot with great fury. In this attack the Gauls and Spaniards soon prevailed; put the Romans to the route, and, pursuing them along the river, strewn the ground with the dead before them, killing no quarter. This action was scarce over, when the infantry on both sides advanced. The Romans first fell upon the Spaniards and Gauls, who, as already observed, formed a kind of triangle projecting beyond the two wings. These gave ground, and, pursuing to Hannibal's directions, sunk into the void space in their rear, by which means they sensibly brought the Romans into the centre of the African infantry; and then the fugitives rallying, attacked them in front, while the Africans charged them in both flanks. The Romans being, by this artful retreat, drawn into the snare and surrounded, no longer kept their ranks, but formed several plateaus in order to face every way. Amilcar, who was on the right-wing, seeing the danger of the main body, at the head of his legions acted the part both of a solder and general, penetrating into the heart of the enemy's battalions, and cutting great numbers of them in pieces. All the Roman cavalry that were left attended the brave consul on foot; and, encouraged by his example, fought like men in despair. But, in this mean time, Andróboal, at the head of a detachment of Gaulish and Spanish infantry brought from the centre, attacked Amilcar's legions with such fury, that they were forced to give ground and fly; the consul, being all covered with wounds, was at last killed by some of the enemy who did not know him. In the main body, the Romans, though invested on all sides, continued to pull their lives dear; fighting in plateaus, and making a great slaughter of the enemy. But being at length overpowered, and disheartened by the death of the two preceptors, Servilius and Attilius, who headed them, they dispersed and fled, some to the right, and others to the left, as they could find opportunity; but the Numidian horse cut most of them in pieces; the whole plain was covered with heaps of dead bodies, insomuch that Hannibal himself, thinking the butchery too terrible, ordered his men to put a stop to it.—There is a great disagreement among authors as to the number of Romans killed and taken at the battle of Canna. According to Livy, the republic lost 50,000 men, including the auxiliaries. According to Polybius, of 6000 Roman horse, only 70 escaped to Venusia with Terentius Varro, and 300 of the auxiliary horse. As

to the infantry, that writer tells us, that 70,000 of the Roman foot died in the field of battle fighting like brave men; and that 12,000 were made prisoners. According to Diodorus of Halicarnassus, of 6000 horse, only 370 escaped the general slaughter, and of 80,000 foot, 3000 only were left. The most moderate computation makes the number of Romans killed to amount to 45,000. The scene of action is marked out to posterity, by the name of Senna di Sangro, "Field of Blood."

The plains have more than once, since the Punic wars, afforded room for men to accomplish their mutual destruction. Melo of Barca, after raising the standard of revolt against the Greek emperors, and defeating their generals in several engagements, was at last routed here in 1019, by the Caesarianom. Dat of 250 Norman adventurers, the power of Melo's army, only ten escaped the slaughter of that day. In 1204, the archbishop of Palermo and his rebellious associates, and taken advantage of the monaster of Frederick of Swabia, were cut to pieces at Canna by Walter de Brienne, sent by the pope to defend the young king's dominions.

The traces of the town of Cannae are very faint, consisting of fragments of altars, cornices, gates, walls, vaults, and under-ground granaries. It was destroyed the year before the battle: but, being rebuilt, became an episcopal see in the infancy of Christianity. It was again ruined in the sixth century, but seems to have subsisted in a humble state many ages later; for we read of its contending with Basletu for the territory which till then had been enjoyed in common by them; and in 1284, Charles I. issued an edict for dividing the lands, to prevent all future litigation. The prosperity of the towns along the coast, which, increased in wealth and population by emigrations of the Crusades and by traffic, proved the annihilation of the great inland cities; and Cannae was probably abandoned entirely before the end of the thirteenth century.

CANEQUINS, in commerce, white-cotton cloths brought from the East Indies. They are a proper commodity for trading on the coast of Guinea, particularly about the rivers Sonegal and Gambia. These cloths are folded square-wise, and are about eight ells long.

CANNEL COAL. See MINERALOGY Index.

CANNES, a sea-port of France, in Provence, seated on the coast of the Mediterranean sea, with a castle. Bonaparte landed here on his return from Elba, 1. March 1815. E. Long. 7. 7. N. Lat. 43° 34'.

CANNIBAL, a modern term for an anthropophagus or man-eterer, more especially in the West Indies. See Anthropophagi.

CANNON, a military engine for throwing balls, &c. by the help of gunpowder.

The invention of brass cannon is by Lanzy ascribed to J. Owen: be says, that they were first known in England in the year 1335; but, yet acknowledges, that, in 1346, there were four pieces of cannon in the English army at the battle of Cressy, and that these were the first that were known in France. And Merty relates, that King Edward, by five or six pieces of cannon, struck terror into the French army, it being the first time they had seen any of these thundering.
CANNONADE, with letter-founders and printers, the name of the largest of letters they use.

CANNONADE, the application of artillery to the purposes of war, or the direction of its efforts against some distant object intended to be seized or destroyed, as a ship, battery, or fortress. See GUNNERY.

Since a large ship of war may be considered as a combination of floating batteries, it is evident that the parts of her artillery must be greatly superior to those of a fortress on the sea coast; that is to say, in general; because, on some particular occasions, her situation may be extremely dangerous, and her cannonading intellectual. Her superiority consists in several circumstances, as the power of bringing her different batteries to converge to one point; of shifting the line of her attack so as to do the greatest possible execution against the enemy, or to lie where she will be the least exposed to his shot; and chiefly because, by employing a much greater number of cannon against a fort than it can possibly return, the impression of her artillery against stone walls soon becomes decisive and irresistible. Besides these advantages in the attack, she is also greatly superior in point of defence; because the cannon shot, moving with rapidity through her sides, seldom do any execution out of the line of their flight, or occasion much mischief by their splinters; whereas they very soon shatter and destroy the faces of a parapet, and produce incredible havoc among the men by the fragments of the stones, &c.
A ship may also retreat when she finds it too dangerous to remain longer exposed to the enemy’s fire, or when her own fire cannot produce the desired effect. Finally, The fluctuating situation of a ship, and of the element on which she rests, renders the effects of bombs very uncertain, and altogether destroys the effect of the ricochet, or rolling and bounding shot, which is so pernicious and destructive in a fortress or land engagement. The chief inconveniency to which a ship is exposed, on the contrary, is, that the low-laid cannon in a fort near the brink of the sea, may strike her repeatedly on or under the surface of the water, so as to sink her before her cannonade can have any considerable efficacy.

CANO, a kingdom of Africa, in Negroseland, with a town of the same name. It is bounded by Sear on the north, by the river Niger on the south, the kingdom of Adeesa on the west, and that of Cashara on the east. Some of the inhabitants are herders, and others till the ground and dwell in villages. It produces corn, rice, and cotton. Here are also many deserts, and mountains covered with woods, in which are wild citrons and lemon trees. The walls and houses of the town are made of clay, and the principal inhabitants are merchants. E. Long. 16° 28’. N. Lat. 21° 5.’

CANGOBIA, a town of Italy, in the duchy of Milan, seated on the western bank of Lago Maggiore, or the Greater Lake. E. Long. 8° 47’. N. Lat. 45° 55’. CANOE, a sort of Indian boat or vessel, formed of the trunk of a tree hollowed, and sometimes of several pieces of the bark put together.
Canoes are of various sizes, according to the uses for which they may be designed, or the countries wherein they are formed. The largest are made of the cotton tree; some of them will carry between 20 and 30 hogsheads of sugar or molasses. Some are made to carry sail; and for this purpose are steered in water till they become pliant; after which their sides are extended, and strong beams placed between them, on which a deck is afterwards laid that serves to support their sides. The other sorts very rarely carry sail, unless when going before the wind; their sails are made of a sort of short silk grass or rushes. They are commonly rowed with paddles, which are pieces of light wood somewhat resembling a corn shovell; and, instead of rowing with it horizontally like an oar, they manage it perpendicularly. The small canoes are very narrow, having only room for one person in breadth, and seven or eight lengthwise. The rowers, who are generally American savages, are very expert in managing their paddles uniformly, and in balancing the canoes with their bodies; which would be difficult for a stranger to do, how well accustomed soever to the conducting of European boats, because the canoes are extremely light, and liable to be overturned. The American Indians, when they are under the necessity of landing to avoid a water-fall, or of crossing the land from one river to another, carry their canoes on their heads, till they arrive at a place where they can launch them again. This is the general construction of canoes, and method of managing them; but some nations have vessels going under the name of canoes, which differ considerably from the above; as the inhabitants of Greenland, Hudson’s Bay, Oatesbête, &c.

CANON, a person who possesses a prebend, or revenue allotted for the performance of divine service, in a cathedral or collegiate church.

Canons are of no great antiquity. Pasquier observes, that the name canon was not known before Charles Magnæ; at least the first we hear of are in Gregory de Tours, who mentions a college of canons instituted by Baldwin XVI. archbishop of that city, in the time of Clotharius I. The common opinion attributes the institution of this order to Chrodegangus, bishop of Metz, about the middle of the eighth century.

Originally canons were only priests, or inferior ecclesiastics, who lived in community; residing by the cathedral church, to assist the bishop; depending entirely on his will; supported by the revenues of the bishopric; and living in the same house, as his domestics, or counsellors, &c. They even inherited his possessions, till the year 817, when this was prohibited by the council of Aix-la-Chapelle, and a new rule substi-
sions of the rule of St. Augustine. This order of regular canons of St. Augustine was brought into England by Adelwald, confessor to Henry I., who erected a priory at Nettle in Yorkshire, and obtained for them the church of Carlisle as an episcopal see, with the privileges of choosing their own bishop. They were singularly protected and encouraged by Henry I., who gave them the priory of Dunsdale in 1107, and by Queen Matilda, who, in the following year, gave them the priory of the Holy Trinity in London. It appears, that under the reign of Edward I. they had fifty-three parishes.

Tertiary, Canons, those who had only the third part of the revenues of the canonicals.

Canon, in an ecclesiastical sense, is a law or rule, either of doctrine or discipline, enacted especially by a council, and confirmed by the authority of the same reign.

Canons are properly decisions of matters of religion; or regulations of the policy and discipline of a church, made by council, either general, national, or provincial. Such are the canons of the council of Nice, or Trent, &c.

There have been various collections of the canons of the eastern councils; but four principal ones, each smaller than the preceding. The first, according to Ussher, A.D. 988, containing only those of the first ecumenical council, and the first provincial ones: they were but 164 in number. To these, Dionysius Exiguus, in the year 520 added the 50 canons of the apostles, and those of the other general councils. The Greek canons in this second collection and with those of the council of Chalcedon; to which are subjoined those of the council of Sardica, and the African councils. The fourth and last collection comes down as low as the second council of Nice; and it is on this that Balemon and Zonaras have commented.

Apostolical canons are those which have been usually ascribed to St. Clement, Bellarmino, Barlaeus, &c. will have them to be genuine canons of the apostles; Catalerius observes, that they cannot be ascribed to the apostles or Clement, because they are not received with other books of Scripture, are not quoted by the writers of the first ages, and contain many things not ascribable to the apostolical times: Hucemer, De Marcia, Beveridge, &c. take them to be framed by the bishops who were the apostolic bishops in the second or third century; 8. Bensage is of opinion that they were collected by an anonymous writer in the fifth century; but Dailie, &c. maintain them to have been forged by some heretic in the sixth century; and 8. Bensage conjectures that some of them are ancient, and others not older than the seventh century. The Greek church allows only 85 of them, and the Latins only 50; though there are 84 in the edition given of them in the Corpus Juris Canonici.

Canon is also used for the authorized catalogue of the sacred writings. See Bible.

The ancient canon, or catalogue of the books of the Old Testament, was made by the Jews, and is ordinarily attributed to Ezra; who is said to have distributed them into the law, the prophets, and the hagiographa, to which our Saviour refers, Luke, chap. xxiv. ver. 44. The same division is also mentioned by Josephus, cont. Appian.
This is the canon allowed to have been followed by
the primitive church, till the council of Carthage;
and, according to St Jerome, this consisted of no more
than 32 books; answering to the number of the He-
brew alphabet; though at present they are classed into
24 divisions, containing Genesis, Exodus, Leviticus,
Numbers, Deuteronomy, Joshua, Judges, Samuel,
Kings, Isaiah, Jeremiah, Ezekiel, the twelve minor
prophets, the Psalms, the Proverbs, Job, Canticles,
Ruth, Lamentations, Ecclesiastes, Esther, Daniel,
Ezra, comprehending the book of Nehemiah and the
Chronicles. However, this order is not universally
observed either among Jews or Christians; nor were
all the books above enumerated admitted into the can-
on in Ezra’s time. It is most likely, says Dr Pri-
deaux, that the two books of Chronicles, Ezra, Ne-
hemiah, Esther, and Malachi, were added in the time
of Simon the Just, when the canon was completed.
But that council enlarged the canon very considerably,
taking into it the books which we call apocryphal;
which the council of Trent has further enforced, en-
joining all these to be received as books of Holy Scrip-
ture, upon pain of anathema, and being attainted of
heresy. The Romanists, in defence of this canon, say,
that it is the same with that of the council of Hippo,
held in 393; and with that of the third council of
Carthage, in 397, at which were present 46 bishops,
and, among the rest, St Augustine: who declared that
they received it from their fathers.
Their canon of the New Testament perfectly agrees
with ours. It consists of books that are well known;
some of which have been universally acknowledged;
such as the four Gospels, and acts of the Apostles,
13
thirteen Epistles of St Paul, one Epistle of St Peter,
and one Epistle of St John; and others, concerning
which doubts were entertained, but which were after-
wards received as genuine; such are the epistle to
the Hebrews, that of James, the second of Peter, the
second and third of John, that of Jude, and the Reve-
lation. These books were written at different times;
and they are authenticated, not by the decrees of coun-
cils, or infallible authority, but by such kind of evi-
dence as is thought sufficient in the case of any other
ancient writings. They were very extensively diffused;
they were read in every Christian society; they were
valued and preserved with care by the first Christians;
they were cited by Christian writers of the second,
third, and fourth century, as Irenaeus, Clement the
Alexandrian, Tertullian, Origen, Eusebius, &c. and
their genuineness is proved by the testimony of those
who were contemporaries with the apostles themselves,
and by tradition. The four Gospels, and most of the
other books of the New Testament, were collected
either by one of the apostles, or some of their disci-
plies and successors, before the end of the first century.
The catalogue of canonical books furnished by the
more ancient Christian writers, as Origen about the
year 210, Eusebius and Athanasius in 335, Epiphanius
in 370, Jerome in 382, Austin in 394, and many
others, agrees with that which is now received among
Christians. For the time of writing the several books
of the New Testament, see the titles of the books
themselves; as the Gospel of St Matthew, Mark,
&c.

Some of the fathers distinguish the inspired writings
into three classes; proto-canonical, deuter-canonical,
and apocryphal.

Pascal Canon, a table of the moveable feasts, show-
ing the day of Easter, and the other feasts depend-
ing on it, for a cycle of 19 years.
The paschal canon is supposed to be the calculation
of Eusebius of Cæsarea, and to have been done by or-
der of the council of Nice.

Canon, in monastic orders, a book wherein the re-
ligious of every convent have a fair transcript of the
rules of their order, frequently read among them as
their local statutes. This is also called regula, as con-
taining the rule and institution of their order.
The canon differs from the missale, martyrologium,
and necrologium.

Canon, again, is used for the catalogue of saints
acknowledged and canonized in the Romish church.

Canon, in the Roman church, is the title given to the
basilica, the throne, and the house of the Bishop.

Canon, in the ancient music, is a rule or method of
determining the intervals of notes.

Ptolemy, rejecting the Aristotelian way of measur-
ing the intervals in music, by the magnitude of a tone
(which was supposed to be formed by the difference
between a diapente and a diatessaron), thought that
musical intervals should be distinguished, according
to the ratios or proportions which the sounds terminating
those intervals bear to one another, when considered
according to their degree of acuteness or gravity;
which, before Aristoxenus, was the old Pythagorean
way. He therefore made the diapason consist in a
double ratio; the diapente, in a sesquialterate; the
diattessaron, in a sesquitertian; and the tone itself, in
a sesquioctave; and all the other intervals, according
to the proportion of the sounds that terminate them:
wherefore taking the canon (as it is called) for a de-
terminate line of any length, he shows how this can-
on is to be cut accordingly, so that it may represent
the respective intervals: and this method answers ex-
tactly to experiment, in the different lengths of musical
chords. From this canon, Ptolemy and his followers
have been called Canonists; as those of Aristoxenus
were called Musici.

Canon, in modern music, is a kind of fugue, which
they call a perpetual fugue, because the different parts
beginning one after another, repeat incessantly the
same air.

Formerly, says Zarlino, they placed, at the head of
perpetual fugues, particular directions which showed
how this kind of fugues was to be sung; and these di-
rections, being properly the rules by which perpetual
fugues were composed, were called canoni, rules or ca-
 nons. From this custom, others taking the title for the
thing signified, by a metonymy, termed this kind of
composition canon. Such canons as are composed with
the greatest facility, and of consequence most generally
used, begin the fugue either with the octave or the
unison; that is to say, that every part repeats in the
same tone the melody of the preceding. In order to
form
form a canon of this kind, it is only necessary for the composer to make an air according to his taste: to add in score as many parts as he chooses, where the voices in octave or unison repeat the same melody; then forming a single air from all these parts successively executed, to try whether this succession may form an entire piece, which will give pleasure as well in the harmony as the melody.

In order to execute such a canon, he who sings the first part begins alone, and continues till the air is finished; then recommences immediately, without any suspense of sound or interruption of time; as soon as he has ended the first couplet, which ought to serve for the perpetual subject upon which the whole canon has been composed, the second part begins and repeats the same couplet, whilst the first who had begun pursues the second: others in succession begin and proceed the same way, as soon as he who precedes has reached the end of the first couplet. Thus, by incessantly recommencing, an universal close can never be found, and the canon may be repeated as long as the singers please.

A perpetual fugue may likewise consist of parts which begin with the intervals of a fourth or fifth; in other words, every part may repeat the melody of the first, a fourth or a fifth higher or lower. It is then necessary that the whole canon should be invented di prima intensione, as the Italians say; and that sharps or flats should be added to the notes, whose natural gradations do not answer exactly, by a fourth or fifth, to the melody of the preceding part, and produce the same intervals with itself. Here the composer cannot pay the least regard to modulation; his only care is, that the melody may be the same, which renders the formation of a canon more difficult; for at every time when any part resumes the fugue, it takes a new key; it changes the tone almost at every note, and, what is still worse, no part is at the same time found in the same tone with another; hence it is that this kind of canons, in other respects far from being easy to be perused, never produce a pleasing effect, however good the harmony may be, and however proper it may be sung.

There is a third kind of canon, but very scarce, as well because it is extremely difficult, as because it is for the most part incapable of giving pleasure, and can boast no other merit but the pains which have been thrown away in its composition. This may be called a double canon inverted, as well by the inversions which are practised in it with respect to the melody of the parts, as by those which are found among the parts themselves in singing. There is such an artifice in this kind of canon, that, whether the parts be sung in their natural order, or whether the paper in which they are set be turned the contrary way, to sing them backward from the end to the beginning, in such a manner that the bass becomes the upper part, and the rest undergo a similar change, still you have pretty harmony and still a regular canon. The reader may consult Rousseau's Dictionary in this article, where he is referred to Plate D. fig. 11. for two examples of canons of this sort extracted from Bonfetti, who likewise gives rules for their composition. But he adds, that the true principle from which the rule is deduced will be found at the word sytteme, in his account of the system of Tartini, to which we must likewise once more refer the reader; as a quotation of such length must have protracted our article to an enormous extent.

To form a canon, in which the harmony may be a little varied, it is necessary that the parts should not follow each other in a succession too rapid, and that the one should only begin a considerable time after the other. When they follow one another so immediately as at a distance of a semibreve or a minim, the duration is not sufficient to admit a great number of chords, and the canon must of necessity exhibit a disagreeable monotony; but it is a method of composing, without much difficulty, a canon in as many parts as the composer chooses. For a canon of four bars only will consist of eight parts, if they follow each other at the distance of half a bar: and by each bar which is added, two parts will constantly be gained.

The emperor Charles VI. who was a great musician, and composed extremely well, took much pleasure in composing and singing canons. Italy is still replete with most beautiful canons composed for this prince, by the best masters in that country. To what has been said by Rousseau, we need only subjoin, that the English catch and the Italian canon are much the same; so any intelligent reader may perceive, from comparing the structure and execution of the English catch with the account of canons which has now been given.

Canon, in Geometry and Algebra, a general rule for the solution of all cases of a like nature with the present inquiry. Thus every last step of an equation is a canon; and, if turned into words, becomes a rule to solve all questions of the same nature with that proposed.

Canon Law, a collection of ecclesiastical laws, serving as the rule and measure of church-government.

The power of making laws was exercised by the church before the Roman empire became Christian. The canon law that obtained throughout the west, till the 12th century, was the collection of laws made by Dionysius Exiguus in 520, the capitularies of Charlemagne, and the decrees of the popes from Sincius to Anastasius.

The canon law, even when papal authority was at its height in England, was of no force when it was found to contradict the prerogative of the king, the laws, statutes and customs of the realm, or the doctrine of the established church.

The ecclesiastical jurisdiction of the see of Rome in England was founded on the canon law; and this created quarrels between kings and several archbishops and prelates who adhered to the papal usurpation.

Besides the foreign canons, there were several laws and constitutions made here for the government of the church: but all these received their force from the royal assent; and if, at any time, the ecclesiastical courts did, by their sentence, endeavour to enforce obedience to such canons, the courts at common law, upon complaints made, would grant prohibition. The authority vested in the church of England of making canons, was ascertained by a statute of Henry VIII. commonly called the act of the clergy's submission; by which they acknowledged, that the convocation had always been assembled by the king's writ; so that, though
Canon

Canonise, in the Romish church, a woman who enjoys a prebend, affixed, by the foundation, to maids, without their being obliged to renounce the world, or make any vows.

Canonica, in philosophical history, an appellation given by Epicurus to his doctrine of logic. It was called canonica, as consisting of a few canons or rules for directing the understanding in the pursuit and knowledge of truth. Epicurus's canonica is represented as a very slight and insufficient logic by several of the ancients, who put a great value on his ethos and physics. Laertius even assures us, that the Epicureans rejected logic as a superfetitious science; and Plutarch complains that Epicurus made an unskilful and posthumous use of syllogisms. But these censures seem too severe. Epicurus was not averse to the study of logic, but even gave better rules in this art than these philosophers who aimed at no glory but that of logic. He only seems to have rejected the dilemata of the Stoics, as full of vain subtleties and deceits, and fitted rather for parade and disputation than real use. The stress of Epicurus's canonica consists in his doctrine of the criteria of truth. All questions in philosophy are either concerning words or things: concerning words, we seek their truth; concerning things, their signification; things are either natural or moral; and the former are either perceived by sense or by the understanding. Hence, according to Epicurus, arise three criteria of truth: viz., sense, anticipation or premonition, and passion. The great canon or principle of Epicurus's logic is, that the senses are never deceived; and therefore, that every sensation or perception of an appearance is true.

Canonical, something that belongs to, or parts of, the nature of a rule or canon.

Canonical Hours, are certain stated times of the day, consigned, more especially by the Romish church, to the offices of prayer and devotion. Such are Matins, Lauds, Sixth, Ninth Hours. In our country the canonical hours are from eight to twelve in the forenoon, before or after which marriage cannot be legally performed in any parish church.

Canonical Obedience, is that submission which, by the ecclesiastical laws, the inferior clergy are to pay to their bishops, and religious to their superiors.

Canonical Sins, in the ancient church, those which were capital or mortal. Such especially were idolatry, murder, adultery, heresy, and schism.

Canonical Punishments, are those which the church may inflict; such as excommunication, degradation, and penance, in Roman Catholic countries; also fasting, aims, whipping, &c.

Canonical Life, the method or rule of living prescribed by the ancient clergy who lived in community. The canonical life was a kind of medium between the monastic and clerical lives. Originally the orders of monks and clerks were entirely distinct; but pious persons, in process of time, instituted colleges of priests and canons, where clerks, brought up for the ministry, as well as others already engaged therein, might live under a fixed rule, which, though somewhat more easy than the monastic, was yet more restrained, than the secular. This was called the canonical life, and those who embraced it canons. Authors are divided about the founder of the canonical life. Some will have it to be founded by the apostles; others ascribe it to Pope Urban I. about the year 1230, who is said to have ordered bishops to provide such of their clergy as were willing to live in community, with necessaries out of the revenues of their churches. The generality attribute it to St Augustine; who, having gathered a number of clerks to devote themselves to religion, instituted a monastery within the episcopal palace, where he lived in community with them. Onuphrius Panvinus, brings the institution somewhat lower; according to him, Pope Gelasius I. about the year 495, placed the first regular canons of St Augustine in the Lateran church.

Canonical Letters, in the ancient church, were a sort of testimonials of the orthodox faith, which the bishops and clergy sent each other to keep up the Catholic communion, and distinguish orthodox Christians from Arians and other heretics. They were denominated canonical, either as being composed according to a certain rule or form, or because they were given to the canonici, that is, those comprehended in the canon or catalogue of their church. When they had occasion to travel into other dioceses or countries, dimissory and recommendatory letters, also letters of peace, &c. were so many species of canonical letters.

Canonical is also an appellation given to those epistles in the New Testament, more frequently called catholic or general epistles.

Canonicon, in a general sense, denotes a tax or tribute or principle of canonism.

Canonicon is more particularly used in the Greek church for a fee paid by the clergy to bishops, archbishops, and metropolitans, for degrees and promotions.

Canonicon also denotes a due of first fruits, paid by the Greek laity to their bishops, or, according to Du Cange, to their priests. The canonicon is affected according to the number of houses or chimney's in a place.

The emperor Isaac Comnenus made a constitution for regulating the canonicon of bishops, which was confirmed by another made in 1086, by his nephew Alexis Comnenus. A village containing thirty fires, was to pay for its canonicon one piece of gold, two of silver, one sheep, six bushels of barley, six of wheat flour, six measures of wine, and thirty hens.

Canonist, a person skilled in or who makes profession of the study and practice of the canon law. Canonists and civilians are usually combined in the same persons: and hence the title of doctor juris ecclesiae, or doctor, usually expressed in abbreviaire, Dr. or J. D. or J. U. D.

Canonization,
CANONIZATION, a ceremony in the Roman church, by which persons deceased are ranked in the catalogue of the saints. It succeeds beatification.

Before a beatified person is canonized, the qualifications of the candidate are strictly examined into, in some consistories held for that purpose; after which, one of the consistorial advocates, in the presence of the pope and cardinals, makes the panegyric of the person who is to be proclaimed a saint, and gives a particular detail of his life and miracles; which done, the holy father decrees his canonization, and appoints the day.

On the day of canonization the pope officiates in white, and their eminences are dressed in the same colour. St. Peter's church is hung with rich tapestry, upon which the arms of the pope, and of the prince or state requiring the canonization, are embroidered in gold and silver. An infinite number of lights blaze all round the church, which is crowded with pious souls, who wait with devout impatience till the new saint has made his public entry as it were into paradise, that they may offer up their petitions to him without danger of being rejected.

The following maxim with regard to canonization is now observed, though it has not been followed above a century, viz. not to enter into the inquiries prior to canonization, till 50 years at least after the death of the person to be canonized. By the ceremony of canonization, it appears that this rite of the modern Romans has something in it very like the apotheosis or deification of the ancient Romans, and, in all probability, takes its rise from it; at least several ceremonies of the same nature are conspicuous in both.

CANONRY, the benefice filled by a canon. It differs from a prebend, in that the prebend may subsist without the canonize, whereas the canonize is inseparable from the prebend; again, the right of suffrages, and other privileges, are annexed to the canonize, and not to the prebend.

CANOPUS, in Astronomy, a star of the first magnitude in the rudder of Argo, a constellation of the southern hemisphere.

CANOPUS, in Pagan mythology, one of the deities of the ancient Egyptians; and, according to some, the god of water. It is said, that the Chaldeans, who worshipped fire, carried their fancied deity through other countries to try its powers, in order that, if it obtained the victory over the other gods, it might be acknowledged as the true object of worship; and it having easily subdued the gods of wood, stone, brass, silver and gold, its priests declared that all gods did it homage. This the priest of Canopus hearing, and finding that the Chaldeans had brought their god to contend with Canopus, they took a large earthen vessel, in which they bored several holes, which they afterwards stopped with wax, and having filled the vessel with water, painted it of several colours, and fitting the head of an idol to it, brought it out in order to contend with the Chaldean deity. The Chaldeans accordingly kindled their fire all round it; but the heat having melted the wax, the water rushed out through the holes, and extinguished the fire; and thus Canopus conquered the god of the Chaldeans.

CANOPUS, or Canobus, according to Strabo, had been Menelaus's pilot, and had a temple erected to him in a town called Canopus, near one of the mouths of the Nile. Dionysius mentions it:

Καὶ τιμᾶτος παράγοις ἄνθρωποι ἐν Κανοπείᾳ.

There stands Canobus's temple known to fame; the pilot who from fair Amycla came.

Vossius remarks, on this occasion, the vanity of the Greeks, who, as he conjectures, hearing of an Egyptian deity named Canopus, took from thence an opportunity of defying the pilot of Menelaus who bore the same name, and giving out that the Egyptian god Canopus had been a Greek. F. Montfaucon gives several representations of this deity. One, in allusion to the victory above-mentioned, throws out water on every side through little holes.

CANOPUS, or Canobus, in Ancient Geography, a town of the Lower Egypt, on the Mediterranean, a hundred and twenty stadia, or fifteen miles, to the east of Alexandria; as old as the war of Troy, Canopus, or Canobus, Menelaus's steerman, being there buried. Canopos the gentilicium name, famous for their luxury and debauchery (Strabo, Juvenal). See ABOUKIR.

CANOPY, in Architecture and Sculpture, a magnificent kind of decoration, serving to cover and crown an altar, throne, tribunal, pulpit, chair, or the like. The word is formed from the barbarous Latin canopeum, κανωπεῖον, a net spread over a bed to keep off the grates, from κανό, a grate.

Canopies are also borne over the head in processions of state, after the manner of umbrellas. The canopy of an altar is more peculiarly called ciborium.

The Roman grandees had their canopies, or spread veils, called themesæ, over their chairs; the like were also in temples over the statues of their gods. The modern cardinals still retain the use of canopies.

CANOSA, a town of Puglia in Italy, occupying part of the site of the ancient Canusium. The old city was founded by Diomedes, according to Strabo. It afterwards became a Roman colony, and one of the most considerable cities of this part of Italy for extent, population, and magnificence of building. The era of Teuton seems to have been that of its greatest splendour; but this pomp only served to mark it as a capital object for the avarice and fury of the Barbarians. Generic, Totila, and Anathias, treated it with extreme cruelty. The deplorable state to which this province was reduced in 590 is concisely but strongly painted by Gregory the Great in these terms: "On Sicily, every side we hear groans; on every side we behold crowds of mourners, cities burnt, castles razed to the ground, countries become waste, provinces become deserts, some citizens led away captive, and others inhumanly, massacred." No town in Puglia suffered more than Canosa from the outrages of the Saracens; the contests between the Greeks and Normans increased the measure of its woe, which was filled by a conflagration that happened when it was stormed by duke Robert. In 1090, it was assigned, by agreement, to Bohemund prince of Antioch, who died here in 1112. Under the reign of Ferdinand the Third, this estate belonged to the Grimaini. On their forfeiture, the Affiniti acquired it, and still retain the title of marquis, though the Capeti are the proprietors of the fief.
The ancient city stood in a plain between the hills and the river Osanto, and covered a large tract of ground. Many brick monuments, though degraded and stripped of their marble casing, still attest its ancient grandeur. Among them may be traced the fragments of aqueducts, tombs, amphitheatres, baths, military columns, and two triumphal arches, which, by their position, seem to have been two city gates. The present town stands above, on the foundations of the old citadel, and is a most pitiful remnant of so great a city, not containing above three hundred houses. The church of Sabinus, built, as is said, in the sixth century, is now without the enclosure. It is astonishing that any part of this ancient cathedral should have withstood so many calamities. Its altars and pavements are rich in marble; and in a small court adjoining, under an octagonal cupola, is the mausoleum of Bohemund, adorned in a minute Gothic style.

CANNO, a sea-port town of Nova Scotia, in North America, seated on a narrow strait which separates Nova Scotia from Cape Breton. It has two bays which afford safe anchorage. Near this town is a fine fishery for cod. W. Long. 62°. N. Lat. 48°.

CANTIGA, a town of Swabia, in Germany, in the kingdom of Wirtemberg, situated on the river Neckar, in E. Long. 9°. N. Lat. 48°. 51'.

CANT, a quaint affected manner of speaking, adapted chiefly to the lower sort. Skinner remarks his invention for the origin of this word; which he successively deduces from the German, Flemish, and Saxon tongues. According to the general opinion, Cant is originally the proper name of a Cameronian preacher in Scotland, who by exercise had attained the faculty of talking in the pulpit in such a tone and dialect as was understood by none but his own congregation: since Andrew Cant's time, the word has been extended to signify all sudden exclamations, and whining unmusical tones, especially in praying and preaching. But this origin of the word has been disputed by others: and perhaps the true derivation is from the Latin cantare "to sing."

CANT is also applied to words and phrases affected by particular persons or professions for low ends, and not authorized by the established language. The difference between cost and technical seems to be this: the former is restrained to words introduced out of folly, affectation, or imposture; the latter is applied to such as are introduced for the sake of clearness, precision, and significance.

CANT is also used to denote a sale by auction. The origin of the word in this sense is dubious; it may come, according to some, from quantum, how much; according to others, from cantare, to sing or cry aloud; agreeably to which, we sometimes also call it an outcry.

CANT, Timbers, in ship-building, those timbers which are situated at the two ends of a ship. They derive their name from being canted, or raised obliquely from the keel; in contradistinction from those whose planes are perpendicular to it. The upper ends of those on the bow, or fore part of the ship, are inclined to the stern; as those in the after or hind part, in line to the stern post above. See Joining Building.

CANTABRIA, in Ancient Geography, a district of Tarraconensis, on the Oceanus Cantabricus, or bay of Biscay; now BISCAY. The inhabitants were famous for their warlike character. In conjunction with the Asturians, they carried on desperate wars with the Romans; but were subdued by them about 25 years before Christ. Being impatient, however, of a foreign yoke, they in a few years revolted. Most of their youth had been already taken prisoners by the Romans, and sold for slaves to the neighbouring nations: but having found means to break their chains, they cut the throats of their masters; and returning into their own country, attacked the Roman garrisons with incredible fury. Agrrippa marched against them with great expedition; but on his arrival, met with so vigorous a resistance, that his soldiers began to despair of ever being able to reduce them. As the Cantabrians had waged war with the Romans for upwards of 200 years, they were well acquainted with their manner of fighting, no way inferior to them in courage, and were now become desperate; well knowing, that if they were conquered, after having so often attempted to recover their liberty, they must expect the most severe usage, and cruel slavery. Animated with this reflection, they fell upon the Romans with a fury hardly to be expressed; routed them in several engagements, and defended themselves when attacked by the enemy with such intrepidity, that Agrrippa afterwards vowed that he had never, either by sea or land, been engaged in a more dangerous enterprise. That brave commander was obliged to use entreaties, menaces, and to brand some of his legionaries with ignominy, before he could bring them to enter the lists with such a formidable enemy. But having at last, with much ado, prevailed upon them to try the chance of an engagement in the open field, he so animated them by his example, that after a most obstinate dispute, he gained a complete victory, which indeed cost him dear, but put an end to that destructive war. All the Cantabrians fit to bear arms were cut in pieces, their castles and strong holds taken and razed; and their women, children, and old men (none else being left alive,) were obliged to abandon the mountainous places, and settle in the plain.

Dr Wallis seems to make the Cantabrian the ancient language of all Spain: which, according to him, like the Gaulish, gave way to a kind of broken Latin called Romance, romanis; which by degrees was refined into the Castilian or present Spanish. But we can hardly suppose that so large a country, inhabited by such a variety of people, spoke all the same language. The ancient Cantabrian, in effect, is still found to subsist in the more barren and mountainous parts of the provinces of Biscay, Asturias, and Navarre, as far as Bayonne, as much as the British does in Wales; but the people only talk it; for writing, they use either the Spanish or French, as they happen to live under the one or the other nation. Some attribute this to a jealousy of foreigners learning the mysteries of their language; others to a poverty of words and expressions. The Cantabrian does not appear to have any affinity with any other known language, abating that some Spanish words have been adopted in it for things whose use the Biscayans were anciently unacquainted with. Its pronunciation is not disagreeable. The Lord's prayer, in the Cantabrian tongue, runs thus: Gere sita corvietian niesca, sanctifica bedi hire ssca, ether bedi hire renamn, again
CANTABRIA, in Botany, a synonyme of a species of Convulvulus.

CANTABRUM, in antiquity, a large kind of flag used by the Roman emperors, distinguished by its peculiar colour, and bearing on it some word or motto of good omen, to encourage the soldiers.

CANTACUZENUS, John, of Constantinople, a celebrated statesman, general, and historian, was born in that city, of a very ancient and noble family. He was bred to letters and to arms, and admitted to the highest offices in the state. The emperor Andronicus loaded him with wealth and honour; made him generalissimo of his forces; and was desirous of having him join him in the government, but this he refused. Andronicus dying in 1341, left to Cantacuzenus the care of the empire, till his son John Paleologus, who was then but nine years of age, should be fit to take it upon himself. This trust he faithfully discharged; till the empire dowager and her faction forming a party against him, declared him a traitor. On this the principal nobility and the army besought him to ascend the throne; and accordingly he was crowned on the 21st of May 1342. This was followed by a civil war, which lasted five years; when he admitted John a partner with him in the empire, and their union was confirmed by his giving him his daughter in marriage. Suspicious and enmities, however, soon arising, the war broke out again, and continued till John took Constantinople in 1355. A few days after, Cantacuzenus, unwilling to continue the effusion of blood, abdicated his share of the empire, and retiring to a monastery, took the habit of a monk, and the name of Joasaphus. His wife also retired to a nunnery, and changed her name of Irene for that of Eugenia. In this retirement he lived till the year 1411, when he was upwards of 100 years of age. Here he wrote a history of his own times, a Latin translation of which, from the Greek manuscript, was published by Pontanus at Ingolstadt, in 1603; and a splendid edition was printed at Paris in 1645, in three volumes folio, of the original Greek, and Pontanus’s Latin version. He also wrote an apology for the Christian religion against that of Mahomet, under the name of Christodulus.

CANTAL, a department of France, forming part of the ancient Auvergne. It contains 2300 square miles, and had 252,000 inhabitants in 1815. Aurillac is the chief town.

CANTALIVERS, in Architecture, pieces of wood framed into the front or sides of a house, to suspend the mouldings and eyes over it.

CANTAR, or Canton, an eastern weight, of different value in different places, equal at Aera in Turkey to 503 pounds, at Tunis and Tripoli to 114 pounds.

CANTAR is also an Egyptian weight, which is demarcated a quintal, and consists of a hundred or of an hundred and fifty rotolos, according to the goods they are to weigh.

CANTAR is also an Egyptian weight, which at Naples is equivalent to 15 pounds, at Genoa to 150 pounds. At Leghorn there are three kinds of canto-
CANTERBURY, a city of England, and capital of the county of Kent, situated in E. Long. 1. 15. N. Lat. 51. 16. It has the names of Durervum and Durervum given by the Romans, and Duroberrin by Bede, which are thought to be derived from Durobrum, signifying a rapid stream, such as the Stour, on which it stands, is. The Britons call it Caer Kent, i.e. the city of Kent; and its present English name is of the same import, derived from the Saxon. Modern writers in Latin call it Cantuaria. Its great antiquity appears not only from Antoninus's Itinerary, but from the military way which has been discovered here, and the causeways leading to Dover and Lymne, besides the coins and other curiosities found about it. The archiepiscopal and metropolitan dignity seems to have been settled here very early; and to prevent its being removed, an anathema was decreed against any who should attempt it. After that, the city flourished greatly; though it suffered in common with other towns during the Danish invasions, and at other times by the casualties of fire. The city was given entirely to the bishops by William Rufus, and was held in the utmost veneration in the Popish times, especially after the murder of Becket in the reign of Henry II. to whose shrine so great was the resort, and so rich were the offerings, that Erasmus, who was an eye-witness of its wealth, says the whole church and chapel in which he was interred glittered with jewels; and at the dissolution, the plate and jewels filled two great chests, each of which required eight strong men to carry out. The cathedral was granted by Ethelbert, king of Kent, upon his conversion, to Austin the Monk, together with his palace, and the royalty of the city and its territories. This Austin founded a monastery for monks, called from him Augustin. After the cathedral had been several times destroyed by fire and rebuilt, the present was begun about the year 1174, and augmented and embellished by the succeeding archbishops, till it was completed in the reign of Henry V. It is a noble Gothic pile, and before the Reformation had 37 altars. At great many Latvia, princes, cardinals, and archbishops, are buried in it. At the dissolution, Henry VIII, seized all the revenues both of the church and monastery, except what he allotted for the maintenance of a dean, 12 prebendaries, and six preachers, whom he established in place of the monks. During the grand rebellion, it suffered much; the usurper Cromwell having made a stable of it for his dragoons. After the Restoration, it was repaired, and made what it now appears.

Besides the cathedral and other churches, as well as a monastery, the city had an ancient castle on the south side, and strong walls, with towers, a ditch, and rampart; it had also a mint and an exchange. As to its government, it seems to have been entirely subject to the archbishop, both in spirituals and temporals; at least from the time that William Rufus gave it solely to Bishop Anselm, till the Reformation. It is now a county of itself: and the corporation consists of a mayor, recorder, 12 aldermen, a sheriff, 24 common council men, a mace-bearer, a sword-bearer, and four sergeants at mace. Every Monday a court is held at Godalming for civil and criminal causes; and every other Tuesday for the government of the city. Here were formerly 2000 or 3000 French Protestants employed in the silk manufacture; but this branch is now greatly decayed in the place, since Spitalfields became so flourishing. Besides the cathedral, it contains 15 parish churches, seven hospitals, a free school, a house of correction, a gaol for criminals, and sumptuous conduit for supplying the inhabitants with water. It consists of four streets, disposed in the form of a cross, and divided into six wards, which are about three miles in circumference. It is surrounded on all hands with hop grounds much to its advantage, and is famed for its excellent brawn. The population in 1811 was 10,300.

The diocese of Canterbury contains 257 parishes, besides chapels, in Kent, and about 100 more in other dioceses. These are called Peculiar: it being an ancient privilege of this see, that, whereas the archbishops had either manors or advowsons, the place was exempted from the jurisdiction of the bishop, where it was situated, and was deemed in the diocese of Canterbury. This see is valued in the king's books at 2816l. 17s. 9d. but is reckoned to produce a clear revenue of 8000l. a year. The clergy's tithes come to 615l. 18s. 2d. This see had many great privileges in the time of Popery, some of which it still retains. The archbishop is accounted primate and metropolitian of all England, and is the first peer in the realm; having the precedence of all dukes not of the blood-royal, and of all the great officers of state. In common speech he is styled His Grace, and he writes himself Divina Providentia; whereas other bishops style themselves Divina Pernussion. At coronations, he places the crown on the king's head; and, wherever the court may be, the king and queen are the proper domestic parishioners of the archbishop of Canterbury. The bishop of London is accounted his provincial dean, the bishop of Winchester his sub-dean, the bishop of Lincoln his chancellor, and the bishop of Rochester his chaplain. This see hath yielded to the church 18 saints; to the church of Rome, 9 cardinals; to the civil state of England, 13 lord chancellors, 4 lord treasurers, and 2 lord chief justices; and 9 canons to the university of Oxford. To this see belong only one archdeacon, viz. of Canterbury, and the cathedral belong an archbishop, a dean, a chancellor, an archdeacon, 12 prebends, 6 preachers, 6 minor canons, 6 substitutes, 12 lay clerks, 10 choristers, 2 massters, 50 scholars, and 12 almsmen.

CANTERBURY Bell, the English name of a species of Campanula. See Botany Index.

CANTERBUS, WILLIAM, an eminent linguist and philologer, was born at Utrecht, in 1541. He studied at Louvain and Paris; and gave surprising proofs of his progress in Greek and Latin literature. He afterwards visited the several universities of Germany and Italy; and died at Louvain, in 1575, aged 33. He understood six languages, besides that of his native country; and, notwithstanding his dying so young, wrote several philological and critical works, among which are, Notae, Scholae, Emendationes, et Explicationes, in Euripideum, Sophocleum, Eschyleum, Ciceroen, Propertium, Ausonium, &c. and many translations of Greek authors.

CANTHARIDES,
CANTHARIDES, in the Materia Medica, flies which are employed to produce blisters on the skin.

CANTHARIS, in Zoology, a genus of insects belonging to the order of insects coleoptera. Linnaeus enumerates 27 species of the cantharida, most of them to be found in different parts of Europe. The cantharida used in making blistering plasters is ranked under the genus Meloe. See Entomology Index.

CANTHI, in Anatomy, cavities at the extremities of the eye-lids, commonly called the corners of the eye: the greater of them, or the great canthus, is next the nose; the lesser of them, or the little canthus, lies towards the temple.

CANTICLES, a canonical book of the Old Testament, otherwise called the Song of Solomon; by the Jews the Song of Songs, Canticum Canticorum. The book of Canticles is usually supposed to be an epiphany of Solomon, on occasion of his marriage with the king of Egypt's daughter. But those who penetrate further into the mystery, find in it the marriage of Jesus Christ with human nature, the church, and good men. On this principle the Canticles is held to be a continued allegory, wherein, under the terms of a common wedding, a divine and spiritual marriage is expressed. This song contains the adventures of seven days and seven nights; the exact time allowed for the celebration of marriage among the Hebrews. The Jews themselves, apprehending the book liable to be understood in a gross and carnal manner, prohibited the reading of it before the age of 30, and the same usage anciently obtained in the Christian church. Among the ancients, Theodore Mopsutnus rejected the book of Canticles as not divine. Divers rabbin have also questioned its being written by inspiration. It is alleged, that the name of God is not once found in it. Mr Whiston has a discourse express to prove that the Canticles is not a sacred book of the Old Testament. He alleges it indeed to have been written by King Solomon the son of David; but asserts that it was composed at the time when that prince, blindness in his conscience, was sunk in lust and idola-

CANTIMARONS, or CATIMARONS, a kind of floats or rafts, used by the inhabitants of the coast of Coromandel to go a fishing in, and to trade along the coast. They are made of three or four small canoes, or trunks of trees dug hollow, and tied together with canoe ropes, with a triangular sail in the middle, made of mats. The persons who manage them are almost half in the water, there being only a place in the middle a little raised to hold their merchandise: which last particular is only to be understood of the trading cantimarons, and not of those that go a fishing.

CANTIN, CAPE, a promontory of the coast of Morocco, in Africa, situated in W. Long. 10° 2' N. Lat. 33° 9'.

CANTING, a sea phrase, denotes the act of turning anything about.

CANTING LANGUAGE or DIALECT, is a mysterious sort of jargon used by gypsies, thieves, and strolling beggars, to express their sentiments to each other, without being understood by the rest of mankind. This dialect is not founded on any rules; yet even out of that irregularity many words seem to retain something of scholarship; as toge, a gown, from tega in the Latin; pannam, bread, from panis; casam, cheese, from caseus, &c. It is observable, that even to ourselves, we have adopted some of their terms into our vulgar language; as bite and bit, to cheat; bounce, to vapour; bounce, strong drink; fitch, to steal; flog, to whip; fig, game or ridicule; roast, to rally; rhino, money. From the same source proceed the words sham, boner, bubble, bully, sharper, cutting, shuffling, palm-

CANTICUM, in Ancient Geography, a promontory of Britain, literally denoting a headland: giving name to a territory called Cowntia, now Kent, and to the people called Cantii (Cassii), commended for their great humanity and politeness. The promontory now the North Foreland. It is supposed that this was the first district in Britain which received a colony from the continent; and that it had frequently changed its masters, by new colonies coming over from time to time, and driving the inhabitants further north. In the midst of all these revolutions it still retained its ancient name (which was so agreeable to its shape and situation), and gave the same name to all the successive tribes by which it was inhabited. Those who possessed it at the time of the first Roman invasion were evidently of Belgic origin, and had come over so lately, that they differed in nothing from their countrymen on the continent. "The inhabitants of Kent (says Caesar) are the most civilized of all the Britons, and differ but very little in their manners from the Gauls." This great resemblance between the people of Kent and their neighbours on the continent, might be partly owing to the situation of their country, which being nearest to the continent, was most frequented by strangers from thence. It was this situation also which exposed them to the first assaults of the Romans. For Caesar, in both his expeditions into this island, landed in Kent; and therefore we may conclude,
that the Cantiu had a great share in the vigorous opposition that was made to his landing, and in the several battles and skirmishes which were fought against him after his landing; particularly, they made a very bold, but unsuccessful attempt, upon his naval camp. The Cantiu did not make the same vigorous resistance to the Romans on their next invasion in the reign of Claudius. For Aulus Plautius, the Roman general in that expedition, traversed their country without seeing an enemy; and as they now submitted to the power of Rome without a struggle, so they continued in a state of quiet submission to it to the very last. The situation of Cantiu occasioned its being much frequented by the Romans, who generally took their way through it in their marches to and from the continent.

Few places in Britain are more frequently mentioned by the Roman writers than Rutupia and Portus Rutupensis, most probably Richborough and Stenam. Rutupia was the same in those times that Dover is in ours; the usual place of embarking for, and landing from, the continent. Before the final departure of the Romans out of Britain, Portus Dubris, now Dover, had become a considerable place, and a well frequented harbour, where the third iter of Antoninus ends, and from whence they often embarked for Gaul. Portus Lemanus, supposed to be Lime near West Hythe, was also a noted sea-port in these times, and the termination of the fourth iter of Antoninus. Durobrivae and Durovernum, now Rochester and Canterbury, were both Roman towns and stations, and are often mentioned in the Itinerary and other books. Besides these, there were several other Roman stations, towns, and ports in Cantiu, which need not be particularly enumerated here. Cantiu, in the most perfect state of the Roman government, made a part of the province which was called Flavia Camarina.

CANTO, denotes a part or division of a poem, answering to what is otherwise called a book. The word is Italian, where it properly signifies song. Tasso, Ariosto, and several other Italians, have divided their longer or heroic poems into cantos. In imitation of them, Scarron has also divided his Gigantomachie, and Boilien his Lutrin, into chants or songs. The like usage has been adopted by some English writers, as Butler, who divides his Hudibras, and Dr. Garth his Dispensary, into cantos. A late translator of part of Virgil's Æneid has even subdivided a book of Virgil into several cantos.

CANTO, in the Italian music, signifies a song: hence canto simplice is where all the notes or figures are equal, and called also canto sermo; canto figurato, that where the figures are unequal, and express different motions. CANTO also signifies the treble part of a song; hence canto concertato, the treble of the little chorus; canto ripieno, the treble of the grand chorus, or what sings now only and then in particular places. Canto signifies the first treble, unless some other word be added to it, as secondo; in which case it denotes the second treble.

CANTON, in Geography, denotes a small district or country constituting a distinct government: such are the cantons of Switzerland.

CANTON, Quang-tong, or Koaonton, one of the southern provinces of China; bounded on the north-east by Fokien, on the north by Kiang-si, on the west by Quang-si and the kingdom of Taosking, and everywhere else by the sea. The country is diversified with hills and plains, and the soil in general so fertile that it produces two crops annually. Besides many of the fruits of Europe, and those common in other parts of the Indies, the province of Canton produces some peculiar to itself. Abundance of valuable aromatic woods is also to be met with in this province, as well as eagle wood, ebony, &c. and in the mineral kingdom the province furnishes gold, precious stones, tin, quicksilver, and copper. Silk and sugar are also cultivated here, and pearls are fished upon the coasts; so that every thing which can contribute to the pleasure or convenience of life is to be met with in Canton. 

One begins (says F. Premare) to have an idea of China, an entering the river Canton. Both sides of it present large fields of rice which resemble green meadows, and extend beyond the reach of sight. They are intersected by an infinite number of small canals, in such a manner that the banks which pass and repass in them seem at a distance, while the water which carries them is concealed, to glide along the grass. Further inland the country appears covered with trees, and cultivated along the valleys; and the whole scene is interspersed with villages, rural seats, and such a variety of delightful prospects, that one is never tired of viewing them, and regrets to be obliged to pass them so quickly.

All the coasts of this province abound with fish, and furnish vast numbers of crabs, oysters, and tartaroises of an immense size. The inhabitants keep a prodigious number of tame ducks, which they catch in ovens or dunghills, though it does not appear that they borrow this custom from the Egyptians. The docility of these creatures exceeds what we should be apt at first to imagine. The inhabitants load a number of small banks with them, and carry them in flacks to feed on the sea shore, where they find shrimps and other animals proper for their nourishment. But though the ducks from the different banks are thus undoubtedly mixed together in the day time, they are easily collected by only beating the flacks, on which they immediately collect themselves into different flacks, and each returns to its proper bank.

In this province the Chinese have also a method of preserving, not only the flesh of the ducks, in such a manner that it loses nothing of its original flavour, but their eggs also. The latter operation is performed by covering the eggs with a coat of clay mixed with salt. When mixed in this manner, it seems that the salt has the property of penetrating through the pores of the shell, and thus impregnating the substance in the egg, which it could not do by simple solution in water.

Canton, though it suffered much in the Chinese wars, is at present one of the most flourishing provinces of the empire; and being at a great distance from court, its government is one of the most important. A great number of fortresses, many of which are cities, provided with numerous garrisons, have been built along the coasts for the suppression of pirates and robbers; for which purpose also a certain number of troops are kept properly posted in different parts of the province. It is divided into ten districts, which contain as many cities of the first class, and 64 of the second and third. The air in general is warm but healthy,
CANTON.

healthy, and the people are very industrious. They possess in an eminent degree the talent of imitation; so that if they are only shown any European work, they can execute others like it with surprising exactness. The most remarkable cities in the province besides Canton the capital are, 1. Chao-techeou-fou, chiefly noted for a monastery of bonzes in its neighbourhood, to which the adjacent country belongs, and the origin of which is traced back for 800 or 900 years. It has under its jurisdiction six cities of the third class; near one of these grows a reed of which several instruments are made, which cannot be distinguished from real ebony. The air of Chao-techeou-fou, however, is unhealthy; and great numbers of the inhabitants are carried off annually by contagious distempers, which prevail from the middle of October to the beginning of December. 2. Kao-techeou-fou, situated in a delightful and plentiful country. In the neighbourhood is found a singular kind of stone much resembling marble, on which are natural representations of rivers, mountains, landscapes, and trees. These stones are cut into slabs, and made into tables, &c. Crabs are also abundant on the coast; white and very much resemble those of Europe; but, says Mr Grosier, they have this singularity, that when taken out of the water, they become petrified, without losing anything of their natural figure. 3. Kiu-techeou-fou, the capital of the island of Hai-nan. See Hai-nan.

CANTON, a large, populous, and wealthy city of China, capital of the province of that name, stands on the banks of the river Taa, or great river, which, near the city, is wide and spacious. The wall of the city is pretty high, and about six or seven miles in circumference, though not more than one third of the ground is occupied by buildings, the other parts being appropriated to pleasure grounds or to fish ponds. The country is extremely pleasant, and towards the east hilly, so as to command a beautiful prospect of the city and suburbs, the compass of which, together, is about ten miles.

The buildings of Canton are in general low, consisting of one story, and on the ground floor, which is covered with earth or red tiles in order to keep it cool; but the houses of the most respectable merchants and mandarins are comparatively lofty and well built. In different parts of the city and suburbs, there are houses or temples, in which are placed the images worshipped by the Chinese: before whom are placed, at particular seasons, a vast variety of sweetmeats, oranges, great plenty of food ready dressed, and also incense, which is kept perpetually burning.

The streets of Canton are long and narrow, paved with flat stones, adorned at intervals with triumphal arches, which have a pleasing effect, and much crowded with people. On both sides are shops as in London, appropriated to the sale of different commodities; and a kind of awning is extended from house to house, which prevents the sun's rays from incommoding either inhabitants or passengers. At the end of every street is a barrier, which, with the gates of the city, is shut in the evening. In China street, which is pretty long and considerably wider than the rest, reside the captains, whose trade, so far as respects goods, laced ware, fans, &c. is wholly confined to Europeans. Most of them speak the foreign languages tolerably well, or at least sufficiently intelligible to transact business. Besides these merchants there is a company of twelve or thirteen, called the Cohong; who have an exclusive right by appointment from authority to purchase the cargoes from the different ships, and also to supply them with tea, raw silks, &c. in return. The establishment of the Cohong, though injurious to private trade, is admirably well adapted for the security of the different companies with which they traffic; because each individual becomes a guarantee for the whole; so that if one fail, the others consider themselves as responsible. In Canton there are no carriages; all burdens are carried by porters across their shoulders on bamboo; as are also the principal people in sedan chairs, and the ladies always. The streets of Canton may be traversed from morning till evening without seeing a woman, those excepted who are Tartars, and even those but very seldom.

On the wharf of the river, which is commodious and pleasant, stand the factories of the different European nations, viz. the Dutch, French, Swedes, Danes, English, &c. In those reside the merchant who belong to their respective companies, who are appointed to dispose of the cargoes brought to market; to supply the ships with others from Europe in return, and during their absence, to contract with the merchants for such articles as may be judged necessary for the next fleet. Between the residences of the factories the most perfect cordiality subsists; in each a common and splendid table is kept at the company's expense, and visits are reciprocally exchanged; so that nothing is wanting to make residence at Canton agreeable to an European, but the pleasure naturally resulting from the society of women.

The side of the river next the city is covered with boats, which form a kind of town, or streets, in which live the poorer sort of the Chinese, or rather the descendants of the Tartars. Some of the men come on shore in the morning to their respective employment, and in those sampans, or boats which are not stationary, the women and also the men carry passengers from place to place in the same manner as do the wherries on the Thames. On this river live many thousand souls who never were permitted to come on shore; whose only habitation is their boat; in which they eat, drink, sleep, carry on many occupations, keep ducks, &c. and occasionally a hog.

The manufactures of Canton are principally carried on in the suburbs; though it has been frequently supposed that they were confined to the city; and this, by some writers, has been given as a reason why Europeans are not permitted to enter within the gates. But this is a mistake; and perhaps the true reason for this very singular restraint is, that the houses in which they keep their women are chiefly within the city.

At Wampoa, a large commodious place for anchorage, and which is about 12 or 14 miles from Canton, the European vessels lie and unload their cargoes, which are transmitted by lighters to the factories; and by the same conveyance receive their respective freights. Between this place and the city are three hoppo, or customs houses, at which the boats passing and re-passing are obliged to stop, and undergo, with their passengers, an examination, in order to prevent smuggling.
The lighters just mentioned, and also the captain’s pinnae, are, however, excepted; the former having proper officers on board for the purpose, and the latter being narrowly watched and examined at the landing.

The weather at Canton is, in summer, extremely hot, and in the months of December, January, and February, cold: the country is nevertheless pleasant and healthful, abounding with all the necessaries and delicacies of life, which may be procured on terms much cheaper than in Europe. The number of inhabitants has been estimated at one million; but later calculations have made the number considerably less. N. Lat. 23. 30. E. Long. 113. 20.

Canton, John, an ingenious natural philosopher, was born in Stroud, in Gloucestershire, in 1718; and was placed, when young, under the care of a Mr Davis of the same place, a very able mathematician, with whom, before he had attained the age of nine years, he had gone through both vulgar and decimal arithmetic. He then proceeded to the mathematics, and particularly to algebra and astronomy, wherein he had made a considerable progress, when his father took him from school, and put him to learn his own business, which was that of a broad-cloth weaver. This circumstance was not able to damp his zeal for the acquisition of knowledge. All his leisure time was devoted to the assiduous cultivation of astronomical science; and, by the help of the Caroline tables annexed to "Wing’s Astronomy," he computed eclipses of the moon and other phenomena. His acquaintance with that science he applied likewise to the constructing of several kinds of dials. But the studies of our young philosopher being frequently pursued to very late hours, his father, fearing that they would injure his health, forbade him the use of a candle in his chamber any longer than for the purpose of going to bed, and would himself often see that his injunction was obeyed. The son’s thirst of knowledge was, however, so great, that it made him attempt to evade the prohibition, and to find means of secreting his light till the family had retired to rest, when he rose to prosecute undisturbed his favourite pursuits. It was during this prohibition, and at those hours, that he computed, and cut upon stone, with no better an instrument than a common knife, the lines of a large upright sun dial, on which, besides the hour of the day, was shown the rising of the sun, his place in the ecliptic, and some other particulars. When this was finished, and made known to his father, he permitted it to be placed before the front of his house, where it excited the admiration of several gentlemen in the neighbourhood, and introduced young Mr Canton to their acquaintance, which was followed by the offer of the use of their libraries. In the library of one of these gentlemen, he found "Martin’s Philosophical Grammar," which was the first book that gave him a taste for natural philosophy. In the possession of another gentleman, a few miles from Stroud, he first saw a pair of globes: an object that afforded him uncommon pleasure, from the great ease with which he could solve those problems he had hitherto been accustomed to compute. The dial was beautified a few years ago at the expense of the gentlemen at Stroud, several of whom had been his schoolfellows, and who continued still to regard it as a very distinguished performance. Among other persons with whom he became acquainted in early life, was the late reverend and ingenious Dr Henry Miles of Tooting, a learned and respectable member of the Royal Society, and of approved eminence in natural knowledge. This gentleman perceiving that Mr Canton possessed abilities too promising to be confined within the narrow limits of a country town, prevailed on his father to permit him to come to London. Accordingly he arrived at the metropolis, March 4, 1737, and resided with Dr Miles at Tooting till the 6th of May following; when he articulated himself for the term of five years, as a clerk to Mr Samuel Watkins, master of the Academy in Spital-square. In this situation, his ingenuity, diligence, and good conduct, were so well displayed, that on the expiration of his clerkship in May 1742, he was taken into partnership with Mr Watkins for three years; which gentleman he afterwards succeeded in Spital-square, and there continued during his whole life. In 1744, he married Penelope, the eldest daughter of Mr Thomas Colbrooke, and niece to James Colbrooke, Esq. banker in London.

Towards the end of 1745, electricity, which seems early to have engaged Mr Canton’s notice, received a very capital improvement by the discovery of the famous Leyden Phial. This event turned the thoughts of most of the philosophers of Europe to that branch of natural philosophy; and our author, who was one of the first to repeat and to pursue the experiment, found his assiduity and attention rewarded by many capital discoveries. Towards the end of 1749, he was concerned with his friend, the late Mr Benjamin Robins, in making experiments in order to determine to what height rockets may be made to ascend, and at what distance their light may be seen. In 1750 was read at the Royal Society Mr Canton’s “Method of making artificial magnets, without the use of, and yet far superior to, any natural ones.” This paper procured him the honour of being elected a member of the society, and the present of their gold medal. The same year he was complimented with the degree of M. A. by the University of Aberdeen; and, in 1757, was chosen one of the council of the Royal Society.

In 1752, our philosopher was so fortunate as to be the first person in England who, by attracting the electric fire from the clouds during a thunder storm, verified Dr Franklin’s hypothesis of the similarity of lightning and electricity. Next year, his paper entitled, “Electrical Experiments, with an attempt to account for their several Phenomena,” was read at the Royal Society. In the same paper Mr Canton mentioned his having discovered, by a great number of experiments, that some clouds were in a convex, and some in a negative, state of electricity. Dr Franklin, much about the same time, made the like discovery in America. This circumstance, together with our author’s constant defence of the doctor’s hypothesis, induced that excellent philosopher, immediately on his arrival in England, to pay Mr Canton a visit, and gave rise to a friendship which ever after continued without interruption or diminution. In the “Lady’s Diary for 1756,” our author answered the prize question that had been proposed in the preceding year. The question
The next communication of our ingenious author to the Royal Society, which we shall take notice of in this place, was on Dec. 22. 1763; being "An easy method of making a Phosphorus that will imbibe and emit light like the Bolognian stone; with experiments and observations." When he first showed to Dr Franklin the instantaneous light acquired by some of this phosphorus from the near discharge of an electrified bottle, the doctor immediately exclaimed, "And God said, let there be light, and there was light." The dean and chapter of St. Paul's, hearing, in the course of the discussion to the president, dated March 5. 1763, requested the opinion of the Royal Society relative to the best and most effectual method of fixing electrical conductors to preserve that cathedral from damage by lightning, Mr. Canton was one of the committee appointed to take the letter into consideration, and to report their opinion upon it. The gentlemen joined with him in this business were, Dr. Watson, Dr. Franklin, Mr. Devalav and Mr. Wilson. Their report was made on the 8th of June following; and the mode recommended by them has been carried into execution. The last paper of our author's, which was read before the Royal Society, was on Dec. 21. 1763; and contained "Experiments to prove that the Luminousness of the Sea arises from the putrefaction of its animal substances." In the account now given of his communications to the public, we have chiefly confined ourselves to such as were the most important, and which threw new and distinguished light on various objects in the philosophical world. Besides these he wrote a number of papers both in earlier and in later life, which appeared in several different publications, and particularly in the Gentleman's Magazine.

The close and sedentary life of Mr. Canton, arising from an unremitting attention to the duties of his profession, and to the prosecution of his philosophical inquiries and experiments, probably contributed to shorten his days. The disorder into which he fell, and which carried him off, was a dropy. His death happened on March 22. 1772, in the 54th year of his age.

CANTONING, in the military art, is the allotting distinct and separate quarters to each regiment: the town where they are quartered being divided into as many cantons as there are regiments.

CANTRED, or CANTRETH, signifies a hundred villages. It is a British word, compounded of the adjective cant, i.e., hundred; and tref, a town or village. In Wales some of the counties are divided into cantreds, as in England into hundreds.

CANTYRE, from Cantieray, signifying a "headland;" the southern division of the shire of Argyll in Scotland. It is a peninsula, stretching 27 miles from north to south, and seven miles in breadth. It is mostly plain, arable, and populous; inhabited promiscuously by highlanders and lowlanders, the latter being permitted to settle in this place by the Argyll family, that the land might be the better cultivated. It gives the title of marquess to the duke, and is by Lochfyn divided from Argyll Proper. This loch is an inlet from the sea, about 60 miles in length and four in breadth, celebrated for its herring fishery. There are many paltry villages in this country, but no town of any consequence except Campbelltown.

Cantyre was granted to the house of Argyll after the suppression of a rebellion of the Macdonalds of the Isles (and it is supposed of this peninsula) in the beginning of the last century, and the grant was afterwards ratified by parliament. The ancient inhabitants were the Mac-donalds, Mac-enschans, Mac-kays, and Mac-naths.

Mall of Cantyre, the south cape or promontory of the peninsula. There is here a lighthouse 233 feet above the sea at high water, situated on the rocks called the Merchants. Lat. 55° 43' Long. 5° 44' west of London. The sound of Iala from the lighthouse bearing, by the compass, N. by E. distant 27 miles; the south end of Iala N. by W. distant 25 miles; the north end of Rathlin island, N. by W. distant 5 miles; the south end of Iala N. by W. distant 14 miles; Copland light, S. by W. half W. distant 14 miles.
The lanthorn is seen from N. N. E. 1-4th E. from S. by W. 1-4th W. and intermediate points of the compass N. of these two points.

CANTZ, a town of Silesia in Germany. E. Long. 16. 36. N. Lat. 51. 6.

CANVAS, in Commerce, a very clear unbleached cloth of hemp, or flax, woven regularly in little squares. It is used for working tapestry with the needle, by passing the threads of gold, silver, silk, or wool, through the intervals or squares.

Canvas is also a coarse cloth of hemp, unbleached, somewhat clear, which serves to cover women's stays, also to stiffen men's clothes, and to make some other of their wearing apparel, &c.

Canvas is also used among the French for the model or first words whereon an air or piece of music is composed, and given to a poet to regulate and finish. The canvas of a song contains certain notes of the composer, which shew the poet the measure of the verses he is to make. Thus Du Lot says, he has canvased ten sonnets against the Muses.

Canvas is also the name of a cloth made of hemp, and used for ship sails.

Canvas, among painters, is the cloth on which they usually draw their pictures; the canvas being smoothed over with a slick stone, then sized, and afterwards whitened over, makes what the painters called their primo cloth, on which they draw their first sketches with coal or chalk, and afterwards finish with colours.

CANULA, in Surgery, a tube made of different metals, principally of silver and lead, but sometimes of iron. They are introduced into hollow ulcers, in order to facilitate a discharge of pus or any other substance: or into wounds, either accidental or artificial, of the large cavities, as the thorax or abdomen; they are used in the operation of bronchotomy; and by some, after the cutting for the stone, as a drain for urine.

Other canvases are used for introducing cauteries, either actual or potential, into hollow parts, in order to guard the parts adjacent to that to be cauterized, from injury. They are also used for the figures; some being oval, some round, and some crooked.

CANUSAUM, in Ancient Geography, a town of Apulia, on the right or south side of the Ausius, to the west of Cannes, whether the Romans fled after the defeat sustained there. It was famous for its red shining wool; whence those who wore clothes made of it were called Cusсиннати. Now called Cusosa; which see.

CANUTE, the first Danish king of England after Ironside. He married Emma, widow of King Ethelred; and put to death several persons of quality who stood in his way to the crown. Having thus settled his power in England, he made a voyage to his other kingdom of Denmark, in order to resist the attacks of the king of Sweden; and he carried along with him a great body of the English under the command of the earl of Godwin. This nobleman had there an opportunity of performing a service by which he both reconciled the king's mind to the English nation, and gaining to himself the friendship of his sovereign, laid the foundation of that immense fortune which he acquired to his family. He was stationed next the Swedish camp; and observing a favourable opportunity which he was ob-
and ambition. From that time, it is said, he never would wear a crown. He died in the 20th year of his reign, and was interred at Winchester, in the old monastery.

CANZONE, in Music, signifies, in general, a song, where some little fugues are introduced; but it is sometimes used for a sort of Italian poem, usually pretty long, to which music may be composed in the style of a cantata. If this term be added to a piece of instrumental music, it signifies much the same as cantata; if placed in any part of a sonata, it implies the same meaning as allegro, and only denotes that the part to which it is prefixed is to be played or sung in a brisk and lively manner.

CANZONETTA, a diminutive of canzone, denoting a little short song. The canzonette Neapolitana has two strains, whereof one is sung twice over, as the vandelleys of the French. The canzonette Siciliana is a species of jig, the measure whereof is usually twelve eighths, and six eighths, and sometimes both, as rondos.

CAORLO, a small island in the gulf of Venice, on the coast of Friuli, 20 miles south-west of Aquileia, subject to Venice. It has a town of the same name, with a bishop's see.

CAOUTCHOUC, Elastic Resin, or India Rubber, a substance produced from the syringing tree of Cayenne and other parts of South America, and possessed of the most singular properties. No substance is yet known which is so pliable, and at the same time so elastic; and it is farther a matter of curiosity, as being capable of resisting the action of very powerful menstrua. From the account of M. de la Condamine, we learn that this substance oozes out, under the form of a vegetable milk, from incisions made in the tree; and that it is gathered chiefly in time of rain, because, though it may be collected at all times, it flows then most abundantly. The means employed to insipitate and harden it, M. de la Borde says, are kept a profound secret. M. Bomare, and others, affirm, that it thickens and hardens gradually by being exposed to the air; and as soon as it acquires a solid consistence it manifests a very extraordinary degree of flexibility and elasticity. Accordingly the Indians make boots of it which water cannot penetrate, and which, when smoked, have the appearance of real leather. Bottles are also made of it, to the necks of which are fastened hollow reeds, so that the liquor contained in them may be squirted through the reeds or pipes by pressure. One of these filled with water is always presented to each of the guests at their entertainments, who never fail to make use of it before eating. This whimsical custom led the Portuguese in that country to call the tree that produced the resin pau di serringa; and hence the name of serringa is given both to the tree and to its resinsial production. Flambeaux, an inch and a half in diameter, and two feet long, are likewise made of this resin, which give a beautiful light, have no bad smell, and burn twelve hours. A kind of cloth is also prepared from it, which the inhabitants of Qu brittle apply to the same purpose as our oil cloth and sail cloth. It is formed, in fine, by means of moulds, into a variety of figures for use and ornament; and the process is said to be this:—The juice, which is obtained by incision, is spread over pieces of clay formed into the desired shape; and as fast as one layer is dry, another is added, till the vessel be of the proper thickness; the whole is then held over a strong smoke of vegetables on fire, whereby it hardens into the texture and appearance of leather; and before the finishing, while yet soft, is capable of having any impression made on the outside, which remains for ever after. When the whole is done, the inside mould is picked out.

Since this resin has been known in Europe, its chemical qualities and other interesting properties have been very diligently investigated. In particular, it has been endeavoured to discover some method of dissolving it in such a manner that it would assume different figures, with equal ease as when in its original fluid state. In the memoirs of the Academy of Sciences for 1768, we have an account of several attempts for this purpose, and how it may be effected.—The state of vegetable milk in which the caoutchouc resin is found when it comes from the tree, led M. Macquer to imagine that it was composed of an oil and a watery matter. From its wanting aromatic flavour, from its little volatility, and from its being incapable of solution in spirit of wine, he concluded that the oil which entered its composition was not an essential, but a fatty one. Hence he thought it probable that it passed from a fluid to a solid form by the evaporation of the watery part, and that the oily solvents would reduce it to a soft state. The first trials he made for dissolving it were with linseed oil, essence of turpentine, and several others. But all he could obtain by means of these menstrua was a viscid substance, incapable of being hardened, and totally void of elasticity. The rectified essential oil of turpentine was employed seemingly with greater success. To separate from this menstruum the caoutchouc which it had dissolved, M. Macquer added spirit of wine; but the consequence was, that part only of the oil united with the spirit; the rest remaining obstinately attached to the resin which it had dissolved, and thus preventing it from assuming a solid consistence. The author next endeavoured to dissolve it by means of heat in Papin's digester. But neither water, nor spirit of wine, although in this way capable of dissolving the hardest bones, could produce any other effect upon it than to render it more firm than before. After this, he tried what effect the milky juice of other vegetables would have upon it. He used several kinds, particularly that of the fig. But, in this way, he could obtain no solution. From the great volatility of ether, he was next induced to try it as a menstruum; and, for this purpose, he prepared some with great attention. The caoutchouc, cut into little bits, and put into a proper vessel with so much ether as was sufficient to cover it, was perfectly dissolved without any other beat than that of the atmosphere. This solution was transparent and of an amber colour. It still preserved the smell of ether, but mixed with the disagreeable odour of the caoutchouc, and it is a little less fluid than pure ether. Upon its being thrown into water, no milky liquor was produced; but there arose to the surface a solid membrane, which possessed the greatest elasticity and other peculiar properties of the caoutchouc. He observes, however, that two pints of the best ether, obtained by rectifying eight or ten pints of the common ether by a gentle heat, must be used, in order to the success of the operation.
Caoutchouc.—The distinguishing properties of this substance, viz., its solidity, flexibility, and elasticity, and its quality of resisting the action of aqueous, spirituous, saline, oily, and other common solvents, render it extremely fit for the construction of tubes, catheters, and other instruments, in which these properties are wanted. In order to form this resin into small tubes, M. Macquer prepared a solid cylindrical mould of wax, of the desired size and shape; and then dipping a pencil into the ethereal solution of the resin, daubed the mould over with it, till he had covered it with a coat of resin of a sufficient thickness. The whole piece is then thrown into boiling water; by the heat of which the wax is soon melted, and rises to the surface, leaving the resinous tube completely formed behind.

Grossart informs us, that he has succeeded very well in employing the essential oils of turpentine and lavender as a solvent for the elastic gum, and thus forming it into tubes or giving it any shape that is wanted. When the elastic tube is prepared with oil of lavender, the latter may be separated by immersing the tube in alcohol, which charges itself with the oil, and becomes a good lavender water. Alcohol serves another purpose beside taking up the essential oil. It accelerates very much the drying of caoutchouc instruments which are thus formed. Oil of turpentine appeared always to have a kind of stickiness; and the smell which could not be got rid of, by any means yet discovered, was another inconvenience.

Grossart proposes another solvent, which is easily procured, and is not liable to the inconvenience just mentioned. This solvent is water. "I conceive (says he) it will appear strange to mention water as a solvent of elastic gum, that liquid having been always supposed to have no action upon it. I myself resisted the idea; but reflecting that ether, by being saturated with water, is the better enabled to act on caoutchouc, and that this gum when plunged into boiling water becomes more transparent at the edges, I presumed that this effect was not due simply to the dilatation of its volume by the heat. I thought that, at that temperature, some action might take place, and that a long continued ebullition might produce more sensible effects. I was not disappointed in my expectations, and one of those tubes was prepared without any other solvent than water and heat. I proceeded in the same manner as with ether: the elastic gum dilates but very little in boiling water; it becomes whitish, but recovers its colour again by drying it in the air and light. It is sufficiently prepared for use when it has been a quarter of an hour in boiling water: by this time its edges are somewhat transparent. It is to be turned spirally round the mould, in the manner we described before, and replunged frequently into the boiling water, during the time that is employed in forming the tube, to the end that the edges may be disposed to unite together. When the whole is bound with packthread, it is to be kept some hours in boiling water; after which it is to be dried, still keeping on the binding."

"If we wish to be more certain that the connexion is perfect, the spiral may be doubled; but we must always avoid placing the exterior surfaces of the slips upon the other, as those surfaces are the parts which most resist the action of solvents. This precaution is less necessary when ether is employed, on account of its great action upon the caoutchouc."

"It might be feared that the action of water upon caoutchouc would deprive us of the advantages which might otherwise be expected; but these fears will be removed, if we consider that the affinities differ according to the temperatures; that it is only at a very high temperature that water exercises any sensible action upon caoutchouc. I can affirm, that at 120° of Reaumur's thermometer (300° of Fahrenheit) this affinity is not such as that the water can give a liquid form to caoutchouc; and it does not appear that we have anything to fear in practice from a combination between these two bodies, which, though it really is a true solution, does not take place in any sensible degree but at a high temperature. It is therefore at present easy to make of caoutchouc whatever instruments it may be advantageous to have of a flexible, supple, and elastic substance, which is impermeable to water at the temperature of our atmosphere, and resists the action of acids as well as that of most other solvents. As to the durability of these instruments, few substances promise more than this, because it may be soldered fresh in a damaged part. Any woven substance may be covered with it; it is only required that the substance should be of a nature not to be acted upon during the preparation, either by ether or by boiling water; for these two agents are those which appear to me to merit the preference. Artists will frequently find an advantage in employing ether, as it requires less time; so that a person may make, in a single day, any tube he may have occasion for. The expense of ether is very little, since it is needful only to dispose the caoutchouc to adhere; and being brought into that state, the caoutchouc may be kept in a vessel perfectly well closed. It would also diminish the expense of the ether, if, instead of washing it with a large quantity of water, there should be added to it only as much water as it can take up."

A resin similar to this was some years ago discovered by M. Poiré, in the Isle of France; and there are various milky juices extracted from trees in America and elsewhere, which by previous mixtures and preparations are formed into an elastic resin, but of an inferior quality to that of Cayenne; such, for instance, are the juices obtained from the Cecropia peltata, the Ficus religiosa and Indico, &c.

Of the genuine trees, those growing along the banks of the river of the Amazonas are described by M. Condamine as attaining a very great height, being at the same time perfectly straight, and having no branches except at top, which is but small, covering no more than a circumference of ten feet. Its leaves bear some resemblance to those of the monaco: they are green on the upper part, and white beneath. The seeds are three in number, and contained in a pod consisting of three cells, not unlike those of the curcus or palme Christi; and in each of them there is a kernel, which being stripped and boiled in water, produces a thick oil or fat, answering the purpose of butter in the cookery of that country.

A method of dissolving this elastic gum without ether, for the purposes of a varnish or the like, is as follows: Take one pound of the spirit of turpentine, and
a pound of the gum cut into very small pieces; pour the turpentine into a long-necked matras, which must be placed in a sand-bath; throw in the gum, not all at once, but by little and little according as it is perceived to dissolve: When it is entirely dissolved, pour into the matras a pint of not linseed oil, or oil of poppies, rendered desiccative in the usual manner with litharge: Then let the whole boil for a quarter of an hour, and the preparation is finished. This would make an excellent varnish for air balloons, were it not so expensive on account of the price of the gum.

Another method, invented by Mr. Baldwin, is as follows. Take any quantity of the caoutchouc, as two ounces, wound upon a stick, and cut it into small bits, with a pair of scissors. Put a strong iron ladle (such as plumbbers and glaziers melt their lead in) over a common pit-coal or other fire. The fire must be gentle, glowing, and without smoke. When the ladle is hot, much below a red heat, put a single bit into the ladle. If black smoke issues, it will presently flame and disappear; or it will evaporate without flame: the ladle is then too hot. When the ladle is less hot, put in a second bit, which will produce a white smoke. This white smoke will continue during the operation, and evaporate the caoutchouc: therefore no time is to be lost; but little bits are to be put in, a few at a time, till the whole are melted. It should be continually and gently stirred with an iron or brass spoon. Two pounds, or one quart, of the best drying oil (or of raw linseed oil, which, together with a few drops of neat's foot oil, has stood a month, or not so long, on a lump of quicklime, to make it more or less drying) is to be put into the melted caoutchouc, and stirred till hot; and the whole poured into a glazed vessel, through a coarse gauze, or fine sieve. When settled and clear, which will be in a few minutes, it is fit for use, either hot or cold.

The Abbé Clavigero informs us, that the elastic gum is called by the Mexicans Ollín o Oli, and by the Spaniards of that kingdom Ule: That it distills from the olquahuitl, which is a tree of moderate size; the trunk of which is smooth and yellowish, the leaves pretty large, the flowers white, and the fruit yellow and rather round, but angular; within which there are kernels as large as filberts, and white, but covered with a yellowish pellicle: That the kernel has a bitter taste, and the fruit always grows attached to the bark of the tree: That when the trunk is cut, the urine which distils from it is white, liquid, and viscid; afterwards it becomes yellow; and lastly of a leaden colour, though rather blacker, which it always retains. The tree, he adds, is very common in the kingdom of Guatamal.

different trees, it would appear, yield the elastic gum. Aublet, in his Histoire des Plants de la Guiane (p. 871.), describes the tree, the fruit, and manner of collecting the juice; but never saw the flower: he calls it, however, Hevea Guianensis. In Jacquin's America, it is called Echites Corymbosa. The younger Linnaeus, in his Supplement Plantarum (p. 423), names it Jatropha Elastica; but acknowledges that he only gives this name from the structure of the fruit having most resemblance to that genus, his dry species wanting the flowers.

Of the above gum, it is said, the Chinese make Vol. V. Part L. 

elastic rings for lascivious purposes.—Among us it is used by surgeons for injecting liquids, and by painters for rubbing out black lead pencil marks, &c.

CAP, a part of dress made to cover the head, much in the figure thereof.

The use of caps and hats is referred to the year 1449, the first seen in these parts of the world being at the entry of Charles VII. into Rouen: from that time they began to take place of the hoods, or chapeaux, that had been used till then. When the cap was of velvet, they called it mortier; when of wool, simply bonnet. None but kings, princes, and knights, were allowed the use of the mortier. The cap was the head-dress of the clergy and graduates. Pasquier says, that it was anciently a part of the hood worn by the people of the robe; the skirts whereof being cut off as an encumbrance, left the round cap an easy commodious cover for the head; which round cap being afterwards assumed by the people, those of the gown changed it for a square one, first invented by a Frenchman, called Patronem: he adds, that the giving of the cap to the students in the universities, was to denote, that they had acquired full liberty, and were no longer subject to the rod of their superiors; in imitation of the ancient Romans, who gave a pileus, or cap, to their slaves, in the ceremony of making them free: whence the proverb, Vocare servos ad pileum. Hence, also, on medals, the cap is the symbol of Liberty, whom they represent holding a cap in her right hand, by the point.

The Romans were many ages without any regular covering for the head: when either the rain or sun was troublesome, the lappet of the gown was thrown over the head; and hence it is that all the ancient statues appear bareheaded, excepting sometimes a wreath, or the like. And the same usage obtained among the Greeks, where, at least during the heroic age, no caps were known. The sort of caps or covers of the head in use among the Romans, on divers occasions, were the pterus, pileus, cucullus, galerus, and palisularum; the differences between which are often confounded by ancient as well as modern writers.

The French clergy wear a shallow kind of cap, called cabotte, which only covers the top of the head, made of leather, satin, worsted, or other stuff. The red cap is a mark of dignity, allowed only to those who are raised to the cardinalate. The secular clergy are distinguished by black leathern caps, the regulars by knitting and worsted ones.

The French clergy wear a shallow kind of cap, called cabotte, which only covers the top of the head, made of leather, satin, worsted, or other stuff. The red cap is a mark of dignity, allowed only to those who are raised to the cardinalate. The secular clergy are distinguished by black leathern caps, the regulars by knitting and worsted ones.

Churcbmen, and the members of universities, students in law, physic, &c. as well as graduates, wear square caps. In most universities doctors are distinguished by peculiar caps, given them in assuming the doctorate. Wickhoff calls the canons of his time befrcusis, from their caps. Pasquier observes, that, in his time, the caps worn by the churchmen, &c. were called square caps; though, in effect, they were round yellow caps.

The Chinese have not the use of the hat, like us; but wear a cap of a peculiar structure, which the laws of civility will not allow them to put off: it is different for the different seasons of the year: that used in summer is in form of a cone, ending at top in a point. It is made of a very beautiful kind of mat, much valued in that country, and lined with satin; to this is added,
added, at top, a large lock of red silk, which falls all round as low as the bottom; so that, in walking, the silk fluctuating regularly on all sides, makes a graceful appearance: sometimes, instead of silk, they use a kind of bright red hair, the lastt whereof no weather effects. In winter they wear a plush cap, bordered with martlet’s or fox’s skin: as to the rest, like those for the summer. These caps are frequently sold for eight or ten crowns; but they are so short, that the ears are exposed.

The cap is sometimes used as a mark of infamy; in Italy the Jews are distinguished by a yellow cap; at Lucca by an orange one. In France, those who had been bankrupts were obliged ever after to wear a green cap, to prevent people from being imposed on in any future commerce. By several arrêts in 1584, 1622, 1628, 1688, it was decreed, that if they were at any time found without their green cap, their protection should be null, and their creditors empowered to cast them into prison: but the sentence is not now executed.

Cap of Maintenance, one of the regalia, or ornaments of state, belonging to the kings of England, before which it was carried at the coronation and other great solemnities. Caps of maintenance are also carried before the mayors of the several cities in England.

Cap and Button, are two small islands, lying in longitude 105° 48° 30” east; and in latitude, the former 5° 38° 30’; the latter 5° 49’ south. They are thus described by Sir George Staunton:

“At a little distance they might be mistaken for the remains of old castles, mouldering into heaps of ruins, with tall trees already growing upon the tops; but at a nearer view, they betrayed evident marks of a volcanic origin. Explosions from subterraneous fires, produce, for the most part, hills of a regular shape, and terminating in truncated cones; but when from a subaqueous volcano eruptions are thrown up above the surface of the sea, the materials, falling back into the water, are more irregularly dispersed, and generally leave the sides of the new creation naked and misshapen, as in the instance of Amsterdam, and of those smaller spots called, from some resemblance in shape, the Cap and Button.

“In the Cap were found two caverns, running horizontally into the side of the rock; and in these were a number of those birds nests so much prized by the Chinese epicures. They seemed to be composed of fine filaments cemented together by a transparent viscous matter, not unlike what is left by the foam of the sea upon stones alternately covered by the tide, or those gelatinous animal substances found floating on every coast. The nests adhere to each other, and to the sides of the cavern, mostly in rows, without any break or interruption. The birds that build these nests are small grey swallows, with bellies of a dirty white. They were flying about in considerable numbers; but they were so small and their flight so quick, that they escaped the shot fired at them. The same nests are said also to be found in deep caverns, at the foot of the highest mountains in the middle of Java, and at a distance from the sea, from which the birds, it is thought, derive no materials, either for their food or the construction of their nests; as it does not appear probable they should fly, in search of either, over the intermediate mountains, which are very high, or against the boisterous winds prevailing thereabouts. They feed on insects, which they find hovering over stagnated pools between the mountains, and for catching which their wide-opening beaks are particularly adapted. They prepare their nests from the best remnants of their food. Their greatest enemy is the kite, who often intercepts them in their passage to and from the caverns, which are generally surrounded with rocks of gray limestone or white marble. The nests are placed in horizontal rows at different depths, from 50 to 500 feet. The colour and value of the nests depend on the quantity and quality of the insects caught, and perhaps also on the situation where they are built. Their value is chiefly determined by the uniform fineness and delicacy of their texture; those that are white and transparent being most esteemed, and fetching often in China their weight in silver. These nests are a considerable object of traffic among the Javanese, and many are employed in it from their infancy. The birds having spent near two months in preparing their nests, lay each two eggs, which are hatched in about fifteen days. When the young birds become fledged, it is thought time to seize upon their nests, which is done regularly thrice a-year, and is effected by means of ladders of bamboo and reeds, by which the people descend into the cavern; but when it is very deep, rope ladders are preferred. This operation is attended with much danger; and several break their necks in the attempt. The inhabitants of the mountains generally employed in it begin always by sacrificing a buffalo; which custom is constantly observed by the Javanese on the eve of every extraordinary enterprise. They also pronounce some prayers, anoint themselves with sweet-scented oil, and smoke the entrance of the cavern with gum-benjamin. Near some of those caverns a tutelar goddess is worshipped, whose priest burns incense, and lays his protecting hands on every person preparing to descend into the cavern. A flambeau is carefully prepared at the same time, with a gum which exudes from a tree growing in the vicinity, and is not easily extinguished by fixed air or subterraneous vapours. The swallow, which builds those nests, is described as not having its tail feathers marked with white spots, which is a character attributed to it by Linneus; and it is possible that there are two species or varieties of the swallow, whose nests are alike valuable.”

Cap, in ship-building, a strong thick block of wood, used to confine two masts together, when one is erected at the head of the other in order to lengthen it. It is for this purpose furnished with two holes perpendicular to its length and breadth, and parallel to its thickness: one of these is square, and the other round: the former being solidly fixed upon the upper end of the lower mast, whilst the latter receives the mast employed to lengthen it, and secures it in this position.

CAPACIO, an episcopal town of Italy in the kingdom of Naples, and in the Hither Principato. E. Long. 15° 18. N. Lat. 40° 40.

CAPACITY, in a general sense, an aptitude or disposition to hold or retain any thing.

CAPACITY, in Geometry, is the solid contents of any body.
CAPARISON, or CAPARISON, the covering or clothing laid over a horse; especially a sumpter horse, or horse of state. The word is Spanish, being an augmentative of osa, osa, head.

Anciently the caparisons were a kind of iron armour, wherein horses were covered in battle.

CAPE, in Geography, a high land running out to a point into the sea, as Cape Nord, Cape Horn, the Cape of Good Hope, &c.

CAPE elk. See cervus, mammalia index.

CAPE Breton. See Bréton.

CAPE Coast Castle. See coast.

CAPE of Good Hope. See Good Hope.

CAPE verde. See verde.

CAPELL, EDWARD, a gentleman well known by his indefatigable attention to the works of Shakespeare, was a native of the county of Suffolk, and received his education at the school of St Edmund'sbury. In the dedication of his edition of Shakespeare, in 1763, to the duke of Grafton, he observes, that "his father and the grandfather of his grace were friends, and to the patronage of the deceased nobleman he owed the leisure which enabled him to bestow the attention of 20 years on that work." The office which his grace bestowed on Mr Capell was that of deputy-inspector of the plays, to which a salary is annexed of 200l. a year. So early as the year 1743, as Mr Capell himself informs us, he received at the instance of Mr Hamer's plan, he first projected and executed of Shakespeare, of the strictest accuracy, to be collated and published in due time, em fidé codicium. He immediately proceeded to collect and compare the oldest and scarcest copies; noting the original excellencies and defects of the rarest quartos, and distinguishing the improvements or variations of the first, second, and third folios: and after many years labour produced a very beautiful small octavo, in 10 volumes, with an "Introduction." There is not, the author of the Monthly Review observs, among the various publications of the present literary era, a more singular composition than that "Introduction." In style and manner it is more obsolete and antique than the age of which he treats. It is Lord Herbert of Cherbury, walking the new pavement in all the trappings of romance; but, like Lord Herbert, it displays many valuable qualities accompanying this air of extravagance, much sound sense, and appropriate erudition. In the title-page of "Mr William Shakespeare, his Comedies, Histories, and Tragedies," it was also announced and promulgated, "Whereunto will be added, in some other volumes, notes critical and explanatory, and a body of various readings entire." The "Introduction" likewise declared, that these "notes and various readings" would be accompanied with another work, disclosing the sources from which Shakespeare "drew the greater part of his knowledge in mythological and classical matters, his fable, his history, and even the seeming peculiarities of his language—to which," says Mr Capell, "we have given for title, The School of Shakespeare." Nothing surely could be more properly conceived than such designs; nor have we ever met with any thing better grounded on the subject of "the learning of Shakespeare," than what may be found in the long note to this part of Mr Capell's Introduction. It is more solid than even the popular "Essay" on this topic. Certain quintessences of style, and peculiarities of printing and punctuation, attended the whole of this publication. The outline, however, was correct; and the critic, with unremitting toil, succeeded in his undertaking. But while he was diving into the classics of Caxton (to continue the Reviewer's account), and working his way under ground, like the river Mole, in order to emerge with all his glories; while he was looking forward to his triumphs, certain other active spirits went to work upon his plan; and, digging out the promised treasures, laid them prematurely before the public, defeating the effect of our critic's discoveries by anticipation. Steevens, Malone, Farmer, Percy, Rees, and a whole host of literary ferrets, burrowed into every hole and corner of the warren of modern antiquity, and overrun all the country, whose map had been delineated by Edward Capell. Such a contingency nearly staggered the steady and unshaken perseverance of our critic, at the very eve of the completion of his labours, and as his editor informs us—for, alas! at the end of near 40 years, the publication was posthumous, and the critic himself no more!—he was almost determined to lay the work wholly aside. He persevered, however, by the encouragement of some noble and worthy persons; and to such their encouragement, and his perseverance, the public was, in 1763, indebted for three large volumes in 4to, under the title of "Notes and various readings of Shakespeare, together with the School of Shakespeare, or Extracts from divers English Books that were in print in the Author's time; evidently shewing from whence his several Fables were taken, and some parcel of his Dialogue. Also farther extracts, which contribute to a due understanding of his Writings, or give a light to the History of his Life, or to the Dramatic History of his Time. By Edward Capell."—Besides the works already mentioned, Mr Capell was the editor of a volume of ancient poems called "Prolusions;" and the alteration of "Anthony and Cleopatra," as acted at Drury Lane in 1758. He died January 24. 1781.

CAPELLA, in Astronomy, a bright fixed star in the left shoulder of the constellation Auriga.

CAPELE, a town of France, in Picardy, in the department of Aisne, eight miles from Guise. It was taken by the Spaniards in 1645; but retaken the year after. E. Long. 3. 59. N. Lat. 49. 58.

CAPELLETS. See farriery index.

CAPELLES, Lewis, a dissenting French Protestant divine, born at Sedan in Champagne about the year 1770. He was the author of some learned works, but is chiefly known from the controversy he engaged in with the younger Buxtorf concerning the antiquity of Hebrew points, which Capellus undertook to disprove. His Critical Sacra was also an elaborate work,
and excited some disputes. He died in 1658, having made an abridgement of his life in his work De Gentis Copeliani.

**CAPER.** See CAPRARIS, BOTANY INDEX.

Caper also denotes a vessel used by the Dutch for cruising and taking prizes from the enemy; in which sense, caper amounts to the same with privateer. Capers are commonly double officered, and crowded with hands even beyond the rates of ships of war, because the thing chiefly in view is boarding the enemies.

Capernum, a city celebrated in the Gospels, being the place where Jesus usually resided during the time of his ministry. This city is nowhere mentioned in the Old Testament under this or any other name like it; and therefore it is not improbable that it was one of those towns which the Jews built after their return from the Babylonish captivity. It stood on the sea coast, i.e. on the coast of the sea of Galilee, in the borders of Zebulon and Naphtali (Mat. iv. 15.), and consequently towards the upper part thereof. It took its name no doubt from an adjacent spring, of great repute for its clear and limpid water; and which, according to Josephus, was by the natives called Capernaum. At this spring might be some inducement to the building the town in the place where it stood, so its being a convenient watering place from Galilee to any part on the other side of the sea, might be some motive to our Lord for his moving from Nazareth, and making this the place of his most constant residence. Upon this account Capernaum was highly honoured, and said by our Lord himself to be exalted unto heaven; but because it made no right use of this signal favour, it drew from him the severe denunciation, that it should be brought down to hell (Matt. xi. 23.), which has certainly been verified: for, as Dr Wells observes, so far is it from being the metropolis of all Galilee, as it once was, that it consisted long since of no more than six poor fishermen's cottages, and may perhaps by now totally desolate.

Caperolana, a congregation of religious in Italy, so called from Peter Caperole their founder, in the 13th century.

The Milanese and Venetians being at war, the enmity occasioned thereby spread itself to the very cloisters. The superiority of the province to Milan of minor brothers, which extended itself as far as the territories of the republic of Venice, carried it so haughtily over the Venetians, that those of the convent of Brescia resolved to shake off a yoke which was grown insupportable to them. The superiors, informed of this, expelled out of the province those whom they considered as the authors of this design; the principal of whom were Peter Caperole, Matthew de Tharville, and Bonaventure of Brescia. Peter Caperole, a man of an enterprising genius, found means to separate the convents of Brescia, Bergamo, and Cremona, from the province of Milan, and subject them to the conventuals. This occasioned a law-suit between the vicar-general and these convents, which was determined in favour of the latter; and these convents, in 1475, by the authority of Pope Sextus IV. were erected into a distinct vicariate, under the title of that of Brescia. This not satisfying the ambition of Caperole, he obtained, by the interposition of the doge of Venice, that this vicariate might be erected into a congregation, which was called from him Caperolana.

This congregation still subsists in Italy, and is composed of 24 convents, situated in Brescia, Bergamo, and Cremona.

Capequin, a town of Ireland, in the county of Waterford, and province of Munster, situated on the river Blackwater. W. Long. 7. 50. N. Lat. 52. 5.

Capestan, a town of France, in Lower Languedoc, in the diocese of Narbonne, and near the royal canal. E. Long. 3. 5. N. Lat. 43. 35.

Caphe, a Jewish measure of capacity for things, estimated by Kimchi at the 30th part of the log, by Arbuthnot at the 40th part of the hin or 32d of the seal, amounting to five-eighths of an English pint. The caphe does not occur in Scripture, as the name of any measure.

Caphar, a duty which the Turks raised on the Christians who carry or send merchandises from Aleppo to Jerusalem and other places in Syria.

The duty of caphe was first imposed by the Christians themselves, when they were in possession of the Holy Land, for the maintenance of the troops which were planted in difficult passes to observe the Arabs and prevent their incursions. It is still continued, and much increased by the Turks, under pretence of defending the Christians against the Arabs; with whom, nevertheless, they keep a secret intelligence, favoring their excursions and plunders.

Caphtor, in Ancient Geography, a town or district of Higher Egypt; and hence the people called Caphtorim or Caphtori. Caphtor is an island of Egypt, Ai Caphtor (Jeremiah): probably one of those in the Nile. Dr Wells supposes it to be Coptos, which stood in a small island. Thence came the Caphtorim or Caphtori, in Palestine; who with the Philistines conspired to exterminate the Hebrews; and whose name was swallowed up in that of the Philistines.

Capi-Aga, or Capi-Agerari, a Turkish officer who is governor of the gates of the seraglio, or grand-master of the seraglio.

The capi-aga is the first dignity among the white eunuchs; he is always near the person of the grand signior: he introduces ambassadors to their audience; nobody enters or goes out of the grand signior's apartment but by his permission. His office gives him the privilege of wearing the turban in the seraglio, and of going everywhere on horseback. He accompanies the grand signior to the apartment of the sultanas, but stops at the door without entering. His appointment is very moderate; the grand signior bears the expense of his table, and allows him at the rate of about sixty French livres per day; but his office brings him in abundance of presents; no affair of consequence coming to the emperor's knowledge without passing through his hand. The capi-aga cannot be bashaw when he quits his post.

Capias, in Law, a writ of two sorts; one before judgment in an action, and the other after. That before judgment is called capias ad respondendum, where an original is issued out, to take the defendant, and make him answer the plaintiff. That after judgment is of divers kinds; as,

Capias ad Satisfactendum, a writ of execution, that issues on a judgment obtained, and lies where any person recovers in a personal action, as for debt, damages, &c.
C A P [ 157 ]

Capias, in which cases this writ issues to the sheriff, commanding him to take the body of him against whom the debt is recovered, who is to be kept in prison till he makes satisfaction.

Capias Pro Fine is a writ lying where a person is fined to the king, for some offence committed against a statute, and he does not discharge the fine according to the judgment; therefore his body shall be taken by this writ, and committed to gaol till the fine is paid.

Capias Ulegratum, a writ which lies against any one outlawed, upon any action personal or criminal, by which the sheriff is ordered to apprehend the party outlawed, for not appearing on the exigent, and keep him in safe custody till the day of return, when he is ordered to present him to the court, to be therewith ordered for his contempt.

Capias in Withermann, a writ that lies for cattle in esterharnam: that is, where a distress taken is driven out of the country, so that the sheriff cannot make delivery upon a repluvium; then this writ issues, commanding the sheriff to take as many beasts of the dismounts, &c.

Capici, a porter or doorkeeper of the Turkish seraglio. There are about five hundred capici or porters in the seraglio, divided into two companies: one consisting of three hundred, under a chief called Capici-Bassa, who has a stipend of three ducats per day; the other consists of two hundred, distinguished by the name of Cuccicapici, and their chief Cuccicapici-Bassa, who has two ducats. The capici have from seven to fifteen aspers per day; some more, others less. Their business is to assist the janizaries in the guard of the first and second gates of the seraglio; sometimes all together; as when the Turk holds a general council, receives an ambassador, or goes to the mosque; and sometimes only in part: being ranged on either side to prevent people entering with arms, any tumults being made, &c. The word, in its original, signifies gate.

Capillament, in a general sense, signifies a hair: whence the word is applied to several things, which, on account of their length or their fineness resemble hairs: as,

Capillaments of the Nerves, in Anatomy, the fine fibres or filaments, whereof the nerves are composed.

Capillary, in a general sense, an appellation given to things on account of their extreme fineness, or resembling hair.

Capillary Tubes in Physics, are small pipes of glass, whose canals are extremely narrow, their diameter being only a half, a third, or a fourth of a line.

The ascent of water, &c. in capillary tubes, is a phenomenon that has long embarrassed the philosophers; for let one end of a glass tube open at both extremities be immersed in water, the liquor within the tube will rise to a considerable height above the external surface: or if two or more tubes are immersed in the same fluid, one a capillary tube, and the other of a larger bore, the fluid will ascend higher in the former than in the latter; and this will be in a reciprocal ratio of the diameters of the tubes.

In order to account for this phenomenon, it will be necessary first to premise, that the attraction between the particles of glass and water is greater than the attraction between the particles of water themselves: for if a glass tube be placed in a position parallel to the horizon, and a drop of water be applied to the under side of the tube, it will adhere to it; nor will it fall from the glass till its bulk and gravity are so far increased, as to overcome the attraction of the glass. Hence it is easy to conceive how sensibly such a power must act on the surface of a fluid, not viscous, as water, contained within the small cavity or bore of a glass tube; as also that it will be proportionably stronger as the diameter of the bore is smaller; for it will be evident that the efficacy of the power is in the inverse proportion of the diameter, when it is considered that such particles only as are in contact with the fluid, and those immediately above the surface, can effect it.

Now these particles form a periphery contiguous to the surface, the upper part of which attracts and raises the surface, while the lower part, which is in contact with it, supports it: so that either the thickness or length of the tube is of any consequence here; the periphery of particles only, which is always proportionable to the diameter of the bore, is the only acting power. The quantity of the fluid raised will therefore be as the surface of the bore which it fills, that is, as the diameter; for otherwise the effect would not be proportional to the cause, since the quantities are always as the ratio of the diameters; the heights therefore to which the fluids will rise in different tubes, will be inversely as the diameters.

Some doubt whether the law holds throughout, of the ascent of the fluid being always higher as the tube is smaller: Dr Hook's experiments, with tubes almost as fine as cobwebs, seem to show the contrary. The water in these, he observes, did not rise so high as one would have expected. The highest he ever found it was at 21 inches above the level of the water in the bason; which is much short of what it ought to have been by the law above mentioned. See Copiedon.

Capillary Vessels. Many small vessels of animal bodies have been discovered by the modern invention of injecting the vessels of animals, with a coloured fluid, which upon cooling grows hard. But though most anatomists know the manner of filling the large trunks, few are acquainted with the art of filling the capillaries. Dr Monroe, in the Medical Essays, has given what, after many trials, he has found most successful. See Injektion.

Capillus Veneris, See Adiantum, Botany Index.

Capilipe, or Capillipes, Camillus, a native of Mantua, in the 16th century. He wrote a book, entitled The Stratagem; in which he relates not only what was perpetrated at Paris during the massacre on St Bartholomew's day, but also the artful preparations which preceded that horrid massacre. It is, however, blended with a great number of falsities.

Capilipe, Latius, an Italian poet, brother to the former, made himself famous by some Centos of Virgil. The manner in which he applied Virgil's expressions to represent things which the poet never dreamt of, is admired. His Cento against women is very ingenious, but too satirical. The poems of Capilipe are inserted in the Delicieux Poeterorum Italorum.

CAPISCOLUS,
CAPISCOLUS, or CAPISCHOLUS, in ecclesiastical writers, denotes a dignitary in certain cathedrals, who had the superintendency of the choir, or band of music, answering to what in other churches is called chanter or precentor. The word is also written cabisculus, and capitscolae, q. d. the head of the school, or band of music.

The capisculus is also called scholasticus, as having the instruction of the young clerks and choristers, how to perform their duty.

CAPITA, DISTRIBUTIO BY, in Law, signifies the appointing to every man an equal share of a personal estate, when all the claimants claim in their own rights, as in equal degrees of kindred, and not jure representa-
tionis.

CAPITAL, of the Latin caput "the head," is used, on various occasions, to express the relation of a head, chief or principal; thus:-

CAPITAL City, in Geography, denotes the principal city of a kingdom, state, or province.

CAPITAL Stock, among merchants, bankers, and traders, signifies the sum of money which individuals bring to make up the common stock of a partnership when it is first formed. It is also said of the stock which a merchant at first puts into trade for his account. It likewise signifies the fund of a trading company or corporation, in which sense the word stock is generally added to it. Thus we say, the capital stock of the bank, &c. The word capital is opposed to that of profit or gain, though the profit often increases the capital, and becomes of itself part of the capital, when joined with the former.

CAPITAL Crime, such a one as subjects the criminal to capital punishment, that is, to loss of life.

CAPITAL Picture in Painting, denotes one of the finest and most excellent pieces of any celebrated master.

CAPITAL Letters, in Printing, large or initial letters, wherein titles, &c. are composed; with which all periods, verses, &c. commence; and wherewith also all proper names of men, kingdoms, nations, &c. begin. The practice which, for some time, obtained among our printers, of beginning every substantive with a capital, is now justly fallen into disrepute; being a manifest perversion of the design of capitals, as well as an offence against beauty and distinctness.

CAPITAL, Succession by, where the claimants are next in degree to the ancestor, in their own right, and not by right of representation.

CAPITAL, in Architecture, the uppermost part of a column, or pilaster, serving as the head or crowning, and placed immediately over the shaft, and under the entablature. See Architecture.

CAPITANA, or CAPTAIN Galley, the chief or principally galley of a state, not dignified with the title of a kingdom. The capitana was anciently the denomination of the chief galley of France, which the commander went on board of. But since the suppression of the office of captain general of the galleys in 1669, there is no capitana, but the first galley is called reale, and the second parome.

CAPITANATA, one of the 12 provinces of the kingdom of Naples, in Italy, bounded on the north by the gulf of Venice, on the east by the Terra de Bari, on the south by the Basilicata and the Farther Pricipato, and on the west by the county di Mellese and a part of Hitherto Abruzzo. It is a level country, without trees, the soil sandy, the air hot; the land, however, near the rivers, is fertile in pastures. The capital town is Manfredonia.

CAPITANEATE, in a general sense, the same with capitania. Capitanates, in Prussia, are a kind of noble feuds or estates, which, besides their revenue, raise their owners to the rank of nobility. They are otherwise called starosties.

CAPITANEA, or CATANEA, in Italy, was a denomination given to all the dukeries, marquises, and counts, who were called capitani regi. The same appellation was also given to persons of inferior rank who were invested with fees, formerly distinguished by the appellation vassalores maiores.

CAPITANUS, in ancient law writers, denotes a tenant in capite or chief.

CAPITANUS Ecclesiae, the same with advocate.

CAPITANIA, in Geography, an appellation given to the 12 governments established by the Portuguese in the Brasiis.

CAPITATION, a tax or imposition raised on each person, in proportion to his labour, industry, office, rank, &c. It is a very ancient kind of tribute. The Latins call it tributum, by which taxes on persons are distinguished from taxes on merchandise, which were called vectigalia.

Capitations are never practised among us but in exigencies of state. In France the capitation was introduced by Louis XIV. in 1695; and is a tax very different from the taille, being levied from all persons, whether they be subject to the taille or not. The clergy pay no capitation, but the princes of the blood are not exempted from it.

CAPITE, in Law, (from caput, i.e. head; whence tenere in capite is to hold of the head, the head or lord paramount of all the lands in the kingdom); An ancient tenure of land, held immediately of the king, as of the crown, either by knight's service or by socage. It is now abolished. See TENURE.

CAPITARI CENSI, in antiquity, the lowest rank of Roman citizens, who in public taxes were rated the least of all, being such as never were worth above 36 s. They were supposed to have been thus called, because they were rather counted and marshalled by their heads than by their estates. The capite censi made part of the sixth class of citizens, being below the proletarii, who formed the other moiety of that class. They were not enrolled in the army, as being judged not able to support the expense of war; for in those days the soldiers maintained themselves. It does not appear that before Caius Marius any of the Roman generals listed the capite censi in their armies.

CAPITOL, Capitalion, in antiquity, a famous fort or castle, on the Mons Capitoline at Rome, where-in was a temple dedicated to Jupiter, thence also denominated Capitolius, in which the senate anciently assembled; and which still serves as the city-hall, or townhouse, for the meeting of the conservators of the Roman people. It had its name capital, from caput, "a man's head," said to have been found fresh, and yet bleeding, upon digging the foundation of the temple built in honour of Jupiter. Arnobius adds, that the man's name was Tolus, whence caput tolistum. The first foundations
The foundations of the capitol were laid by Tarquinius the Elder, in the year of Rome 159. His successor Servius raised the walls; and Tarquinius the Proud finished it in the year 227. But it was not consecrated till the third year after the expulsion of the kings, and establishment of the consulate. The ceremony of the dedication of the temple was performed by the consul Horatius in 246.

The capitol consisted of three parts; a nave sacred to Jupiter, and two wings, the one consecrated to Juno, the other to Minerva; it was ascended to by stairs; the frontispiece and sides were surrounded with galleries, in which those who were honoured with triumphs entertained the senate at a magnificent banquet, after the sacrifice had been offered to the gods.

Both the inside and outside were enriched with an infinity of ornaments, the most distinguished of which was the statue of Jupiter with his golden thunderbolt, his sceptre, and crown. In the capitol also were a temple to Jupiter, the Guardian, and another to Juno, the mint; and on the descent of the hill was the temple of Concord. This beautiful edifice contained the most sacred deposits of religion, such as the ancilia, the books of the Sibyls, &c.

The capitol was burnt under Vitellius, and rebuilt under Vespasian. It was burnt a second time by lightning under Titus, and restored by Domitian.

Anciently the name capitol was likewise applied to all the principal temples in most of the colonies throughout the Roman empire; as at Constantinople, Jerusalem, Carthage, Ravens, Capua, &c. — That of Toulouse has given the name of capitoul to the chevaliers and sheriff.

CAPITOLINE GAMES, annual games instituted by Camillus, in honour of Jupiter Capitolinus, and in commemoration of the capitol's not being taken by the Gauls. Plutarch tells us that a part of the ceremony consisted in the public criers putting up the Heturians to sale by auction; they also took an old man, and tying a golden bulla about his neck, exposed him to the public derision. Festus says they also dressed him in a pretexta. — There was another kind of Capitoline games, instituted by Domitian, wherein there were rewards and crowns bestowed on the poets, champions, orators, historians, and musicians. These last Capitoline games were celebrated every five years, and became so famous, that, instead of calculating time by lustra, they began to count by Capitoline games, as the Greeks did by Olympiads. It appears, however, that this custom was not of long continuance.

CAPITOLINUS, JULIUS, an historian in the beginning of the fourth age, under Dioclesian, to whom he inscribed the Lives of Verus, Antoninus Pius, Claudius Balbus, Macrinus, the Maximines, and the Gordians. He wrote other lives, which are most of them lost.

CAPITOUL, or CAPITOL, an appellation given to the chief magistrates of Toulouse, who have the administration of justice and policy both civil and mercantile in the city. The capitouls at Toulouse are much the same with the chevaliers at Paris, and with the consuls, bailiffs, burgomasters, mayors, and aldermen, &c. in other cities. In ancient acts they are called consules, capitularii, or capitoulis, and their body capitulium. From this last come the words capitularis and capitoulis. The appellative capitoulis arose hence, that capitol they have the charge and custody of the townhouse, which was anciently called capitol.

The office lasts only one year, and ennobles the bearers. In some ancient acts they are called capitulum nobilium Toulonae. Those who have borne it style themselves afterwards burgesses. They are called to all general councils, and have the jus imaginum; that is, when the year of their administration is expired, their pictures are drawn in the townhouse; a custom which they have retained from the ancient Romans, as may be seen in Sigerius.

CAPITULATE, an appellation given to the several quarters or districts of the city of Toulouse, each under the direction of a capitoul: much like the wards of London, under their aldermen. Toulouse is now divided into eight capitoulis, or quarters, which are subdivided into moulons, each of which has its tithingman, whose business is to inform the capitoul of what passes in his tithing, and to inform the inhabitants of the tithing of the orders of the capitoul.

CAPITULAR, or CAPITULAR, denotes an act passed in a chapter, either of knights, canons, or religious.

The capitularia or capitulars of Charlemagne, Charles the Bald, &c. are the laws, both ecclesiastical and civil, made by those emperors in the general councils or assemblies of the people; which was the way in which the constitutions of most of the ancient princes were made; each person present, though a plebeian, setting his hand to them.

Some distinguish these from laws; and say, they were only supplements to laws. They had their name, capitularia, because divided into capitula, chapters, or sections. In these capitularia did the whole French jurisprudence annually consist. In process of time, the name was changed for that of ordinances.

Some distinguish three kinds of capitularia, according to the difference of their subject-matter; those on ecclesiastical affairs are really canons, extracted from councils; those on secular affairs, real laws; those relating to particular persons, or occasions, private regulations.

CAPITULATION, in military affairs, a treaty made between the inhabitants or garrison of a place besieged and the besiegers, for the delivering up the place on certain conditions. The most honourable and ordinary terms of capitulation are to march out at the breach with arms and baggage, drums beating, colours flying, a match lighted at both ends, and some pieces of cannon, waggons, and convey for their baggage, and for their sick and wounded.

CAPITULATION, in the German polity, a contract which the emperor makes with the electors, in the name of all the princes and states of the empire, before he is declared emperor, and which he ratifies before he is raised to that sovereign dignity. The principal points which the emperor undertakes to observe are, 1. To defend the church and emperor, 2. To observe the fundamental laws of the empire. And, 3. To maintain and preserve the rights, privileges, and immunities of the electors, princes, and other states of the empire, specified in the capitulation. These articles and capitulations are presented to the emperor by the electors only, without the concurrence of the other states.
CAPADOCIA, an ancient kingdom of Asia, comprehending all that country which lies between Mount Taurus and the Euxine sea. It was divided by the Persians into two satrapies or governments; by the Macedonians into two kingdoms, the one called Capadocia ad Taurum; the other Capadocia ad Pontum, and commonly Pontus; for the history, &c. of which last, see the article Pontus.

Capadocia Magna, or Capadocia properly so called, lies between the 38th and 41st degrees of north latitude. It was bounded by Pontus on the north, Lycaonia and part of Armenia Major on the south, Galatia on the west, and by the Euphrates and part of Armenia Minor on the east. The first king of Capadocia we read of in history was Pharnaces, who was preferred to the crown by Cyrus king of Persia, who gave him his sister Atossa in marriage. This is all we find recorded of him, except that he was killed in a war with the Hyrcanians. After him came a succession of eight kings, of whom we know not a thing but that they continued faithful to the Persian interest. In the time of Alexander the Great, Capadocia was governed by Ariarathes II., who, notwithstanding the vast conquests and fame of the Macedonian monarchy, continued unshaken in his fidelity to the Persians. Alexander was prevented by death from invading his dominions; but Perdiccas, marching against him with a powerful and well-disciplined army, dispersed his forces, and having taken Ariarathes himself prisoner, crucified him with all those of the royal blood whom he could get into his power. Diodorus tells us that he was killed in the battle. He is said to have reigned 82 years. His son Ariarathes III. having escaped the general slaughter of the royal family, fled into Armenia, where he lay concealed till the civil dissensions which rose among the Macedonians gave him a fair opportunity of recovering his paternal kingdom. Amyntas, at that time the governor of Capadocia, opposed him; but being defeated in a pitched battle, the Macedonians were obliged to abandon all the strong holds. Ariarathes, after a long and pitiable reign, left his kingdom to his son Ariarathes II. He applied himself more to the arts of peace than war, in consequence of which Capadocia flourished greatly during his reign. He was succeeded by his son Ariarathes IV. who proved a very warlike prince, and, having overcome Arsaces, founder of the Parthian monarchy, considerably enlarged his own dominions.

He was succeeded by Ariarathes V. who, marrying the daughter of Antiochus the Great, entered into an alliance with that prince against the Romans; but Antiochus being defeated, the king of Capadocia was obliged to sue for peace, which he obtained, after having paid 200 talents by way of fine, for taking up arms against the people of Rome. He afterwards assisted the republic with men and money against Perseus king of Macedon, on which account he was by the senate honoured with the title of the friend and ally of the Roman people. He left the kingdom in a very flourishing condition to his son Mithridates, who, on his accession, took the name of Ariarathes VI.

This prince (surnamed Phalanger, from the filial respect and love he showed his father from his very infancy) immediately renewed the alliance with Rome. Out of mere good nature, he restored Mithrobazanes;
son to Laiarkides, king of the Lesser Armenia, to his father's kingdom, though he foresaw that the Armenians would lay hold of that opportunity to join Arta-

xias, who was then on the point of invading Cappa-
docia. These differences, however, were settled be-

fore they came to an open rupture by the Roman le-

gates; and Ariarathes seeing himself thus delivered from an

imminent war by the mediation of the republic,

presented the senate with a golden crown; and offered

his service in whatever they thought proper to employ

him. The senate in return sent him a staff, and chair

of ivory; which were presents usually bestowed on those

only whom they looked upon as attached to their

interest. Not long before this, Demetrius Soter, king of

Syria, had offered Ariarathes his sister in marriage, the

widow of Perseus king of Macedon: but this offer

the king of Cappadocia was obliged to decline for fear of

offending the Romans; and his so doing was in

the highest degree acceptable to the republic, who re-

nowned him among the chief of her allies. Demetrius,

however, being greatly incensed at the slight put upon

his sister, set up a pretender to the throne, one Orophernes,

a supposititious, or, as others call him, a natural son

of the deceased king. The Romans ordered Eume-

nes, king of Pergamus, to assist Ariarathes with all

his forces: which he did, but to no purpose; for the

confederates were overthrown by Demetrius, and Ari-

arathes was obliged to abandon the kingdom to his

rival. This happened about 230 years before Christ, and

the usurper immediately dispatched ambassadors
to Rome with a golden crown. The senate declined

accepting the present, till they heard his pretentious

pretensions to the kingdom; and made it appear so plain, that the senate decreed

that Ariarathes and he should reign as partners; but

next year Orophernes was driven out by Attalus, bro-

ther to Eumenes, and his successor to the kingdom of

Pergamus.

Ariarathes, being thus restored, immediately de-

manded of the Prienians 400 talents of gold which

Orophernes had deposited with them. They honestly

replied, that as they had been trusted with the mone-

y by Orophernes, they could deliver it to none but him-

self, or such as came in his name. Upon this, the king

took over his territories with an army, destroying all

with fire and sword. The Prienians, however, still

persevered in their integrity; and though their city was

besieged by the united forces of Ariarathes and At-

allas, not only made an obstinate defence, but found

means to restore the sum to Orophernes. At last they

applied to the Romans for assistance, who enjoined

the two kings to raise the siege, under pain of being de-

clared enemies to the republic. Ariarathes immediate-

ly obeyed; and marching his army into Assyria, joined

Alexander Epiphanes against Demetrius Soter, by

whom he had been formerly driven out of his kingdom.

In the very first engagement Demetrius was slain, and

his army entirely dispersed, Ariarathes having on that

crassus proconsul of Asia was taken, and the

Roman army cut in pieces. He left six sons by his

wife Laodice, on whom the Romans bestowed Lycas-

nia and Cilicia. But Laodice, fearing lest her chil-

dren, when they came to age, should take the govern-

ment out of her hands, poisoned five of them, the

youngest only having escaped her cruelty by being con-

veyed out of the kingdom. The queen herself was soon

after put to death by her subjects, who could not bear

her cruel and tyrannical government.

Laodice was succeeded by Ariarathes VII. who,

soon after his accession, married another Laodice,

daughter to Mithridates the Great, hoping to find in

this prince a powerful friend to support him against

Nicomedes king of Bithynia, with whom he was to part of

Cappadocia. But Mithridates, instead of assisting, pro-
cured one Gordius to poison his unhappy son-in-law,

and on his death, seized the kingdom, under pretence

of maintaining the rights of the Cappadocians against

Nicomedes, till the children of Ariarathes were in

a condition to govern the kingdom. The Cappadocians

at first fancied themselves obliged to their new pro-
tector: but, finding him unwilling to resign the king-

dom to the lawful heir, they rose up in arms, and driv-

ing out all the garrisons placed by Mithridates, placed

on the throne Ariarathes VIII. eldest son of their de-

ceased king.

The new prince found himself immediately engaged

in a war with Nicomedes; but, being assisted by Mi-

thridates, not only drove him out of Cappadocia, but

stripped him of a great part of his hereditary domi-

nions. On the conclusion of the peace, Mithridates,

seeking for some pretext to quarrel with Ariarathes,

inflamed upon his recalling Gordius, who had murdered

his father; which being rejected by suborning, by subor-

bined service to bewar

Mithridates took the field first, in hopes of

overrunning Cappadocia before Ariarathes could be in

a condition to make head against him; but, contrary

to his expectation, he was met on the frontiers by the

king of Cappadocia with an army no way inferior to his

own. Hereupon he invited Ariarathes to a con-

ference; and, in sight of both armies, stabbed him with

a dagger, which he had concealed under his garment.

This struck such terror into the Cappadocians, that

they immediately dispersed, and gave Mithridates an

opportunity of possessing himself of the kingdom with-

out the least opposition. The Cappadocians, however,

not able to endure the tyranny of his prefects, soon

shook off the yoke; and recalling the king's brother

who had fled into the province of Asia, proclaimed him

king. He was scarce seated on the throne, however,

before Mithridates invaded the kingdom at the head

of a very numerous army, and having drawn Ariara-

thes to a battle, defeated his army with great slaughter,

and obliged him to abandon the kingdom. The

unhappy prince soon after died of grief; and Mithri-

dates bestowed the kingdom on his son, who was then

but eight years old, giving him also the name of Aria-

rathes. But Nicomedes Philopater, king of Bithynia,

fearing lest Mithridates, having now got possession of

the whole kingdom of Cappadocia, should invade his

territories, subdued a youth to pass himself for the

third son of Ariarathes, and to present to them a peti-

tion in order to be restored to his father's kingdom.

With him he sent to Rome Laodice, sister of Mithri-

dates, whom he had married after the death of her for-

mer husband Ariarathes. Laodice declared before the

senate,
CAP [ 162 ]

Cappado-
cis, that she had three sons by Ariarathes, and that
the petitioner was one of them; but that she had
been obliged to keep him concealed, lest he should un-
dergo the same fate with his brothers. The senate as-
sured him that they would at all events reinstate him
in his kingdom. But in the mean time, Mithridates,
having notice of these transactions, dispatched Gordius
to Rome, to undersell the senate, and to persuade
them that the youth to whom he had resigned the
kingdom of Cappadocia was the lawful son of the late king,
and grandson to Ariarathes who had lost his life in the
service of the Romans against Aristeonicus. This un-
expected embassy put the senate upon inquiring more
narrowly into the matter, whereby the whole plot was
discovered; upon which Mithridates was ordered to
resign Cappadocia, and the kingdom was declared
free. The Cappodocians, however, in a short time
sent ambassadors to Rome, acquainting the senate that
they could not live without a king. This greatly
surprised the Romans, who had such an aversion to
royal authority; but they gave them leave to elect a
king of their own nation. As the family of Phar-
aces was now extinct, the Cappodocians chose Ariobar-
zanis; and their choice was approved by the senate,
he having on all occasions shown himself a steady friend
to the Romans.

Ariobarzanes had scarce taken possession of his king-
dom when he was driven out by Tigranes king of Ar-
menia, who resigned Cappadocia to the son of Mithr-
dates, in pursuance of an alliance previously con-
bined between the two parties. Ariobarzanes fled to Rome;
and having engaged the senate in his cause, he re-
turned into Asia with Sylla, who was enjoined to re-
store him to his kingdom. This was easily performed
by Sylla, who, with a small body of troops, routed
Gordius, who came to meet him on the borders of Cap-
padocia at the head of a numerous army. Sylla, how-
ever, had scarce turned his back, when Ariobarzanes
was again driven out by Ariarathes the son of Mithr-
dates, on whom Tigranes had bestowed the kingdom
of Cappadocia. This obliged Sylla to return into Asia,
where he was attended with his usual success, and
Ariobarzanes was again placed on the throne. After
the death of Sylla, he was the third time forced by
Mithridates to abandon his kingdom; but Pompey,
having entirely defeated Mithridates near Mount Stel-
la, restored Ariobarzanes to his throne, and rewarded
him for his services during the war, with the provinces
of Sophene, Gordiene, and great part of Cilicia. The
king, however, being now advanced in years, and de-
sirous of spending the remainder of his life in ease,
resigned the crown to his son Ariobarzanes, in pre-
sence of Pompey; and never afterwards troubled him-
self with affairs of state.

Ariobarzanes II. proved no less faithful to the Ro-
mans than his father had been. On the breaking out
of the civil war between Cesar and Pompey, he sided
with the latter; but, after the death of Pompey, he
was received into favour by Cesar, who even bestowed
upon him great part of Armenia. While Cesar was
engaged in a war with the Egyptians, Pharnaces king
of Pontus invaded Cappadocia, and stripped Ariobar-
zanis of all his dominions; but Cesar, having defeated
Pharnaces, restored the king of Cappadocia, and ho-

sured him with new titles of friendship. After the Cappado-
cisian removal of Caesar, Ariobarzanes, having refused to join
Brutus and Cassius, was by them declared an enemy to
the republic, and soon after taken prisoner and put to
death. He was succeeded by his brother Ariobarzane
III. who was by Mark Antony deprived both of his
kingdom and his life; and in him ended the family of
Ariobarzanes.

Archelaus, the grandson of that general of the same
name who commanded against Sylla in the Mithridatic
war, was by Mark Antony placed on the throne of
Cappadocia, though nowise related either to the fa-
mily of Pharnaces or Ariobarzanes. His preferment
was entirely owing to his mother Glaphyra, a woman
of great beauty, but of loose behaviour, who, in re-
turn for her compliance with the desires of Antony,
attained the kingdom of Cappadocia for her son. In
the war between Augustus and Antony, he joined the
latter; but, at the intercession of the Cappodocians,
was pardoned by the emperor. He afterwards re-
ceived from him Armenia the Lesser, and Cilicia
Trachesa, for having assisted the Romans in clearing
the seas of pirates, who greatly infested the coasts of Asia.
He contracted a strict friendship with Herod the Great,
kings of Judaea; and even married his daughter Gla-
phyra to Alexander, Herod's son. In the reign of
Tiberius, Archelaus was summoned to appear before the
senate; for he had always been hated by that em-
peror, because in his retirement at Rhodes he had paid
him no sort of respect. This had proceeded from no
aversion in him to Tiberius, but from the warning
given by Archelaus to his friends at Rome. For Caius
Cesar, the presumptive heir to the empire, was then
alive, and had been sent to compose the differences of
the east; whence the friendship of Tiberius was then
looked upon as dangerous. But when he came to the
empire, Tiberius, remembering the disrespect shewn
him by Archelaus, enticed the latter to Rome by
means of letters from Livia, who promised him her son
Tiberius's pardon, provided he came in person to in-
quire it. Archelaus obeyed the summons, and hasten-
ed to Rome; where he was received by the emperor
with great wrath and contempt, and soon after accused
as a criminal in the senate. The crimes of which he
were accused were mere fictions; but his concern at
seeing himself treated as a malefactor was so great,
that he died soon after of grief; or, as others say, laid
violent hands on himself. He is said to have reigned
50 years.

On the death of Archelaus, the kingdom of Cappa-
docia was reduced to a Roman province, and governed
by those of the equestrian order. It continued subject
to the Romans till the invasion of the eastern empire
by the Turks, to whom it is now subject, but has no
distinctive name. It takes its name from Sivas, Trebisond, Maraistch, and
Cogut.

In the time of the Romans, the inhabitants of Cap-
padocia bore so bad a character, and were reputed so
vicious and lewd, that, among the neighbouring na-
tions, a wicked man was emphatically called a Cappa-
dociam. In after ages, however, their lewd disposition
was so corrected and restrained by the pure doctrines
of Christianity, that no country whatever has produced greater champions of the Christian religion, or given to the church prelates of more unblemished characters.

We have now no system of the Cappadocian laws, and scarce wherewithal to form any particular idea of them. As to their commerce, they carried on a considerable trade in horses, great numbers of which were produced in their country; and we read of them in Scripture as frequenting the fairs of Tyre with this commodity. As Cappadocia abounded with mines of silver, brass, iron, and alum, and afforded great store of alabaster, crystal, and jasper, it is probable that they might supply the neighbouring countries with these commodities.

The religion of the ancient Cappadocians was much the same with that of the Persians. At Comana there was a rich and stately temple dedicated to Bellona; whose battles the priests and their attendants used to represent on stated days, cutting and wounding each other as if seized with an enthusiastic fury. No less famous and magnificent were the temples of Apollo Catanaeus, and of Jupiter; the last of which had 3000 sacred servants, or religious votaries. The chief priest was next in rank to that of Comana; and, according to Strabo, had a yearly revenue of 15 talents. Diana Persica was worshipped in a city called Castaballa, where women, devoted to the worship of that goddess, were reported to tread barefooted on burning coals, without receiving any hurt. The temples of Diana at Diospolis, and of Anias at Zela, were likewise held in great veneration both by the Cappadocians and Armenians, who flocked to them from all parts. In the latter were tendered all oaths in matters of consequence; and the chief among the priests was no way inferior in dignity, power, and wealth, to any in the kingdom; having a royal attendance, and an unlimited authority over all the inferior servants and officers of the temple. The Romans, who willingly adopted all the superstitious and superstitions rites of the nations they subdued, greatly increased the revenues of this and other temples; conferring the priesthood on such as they thought most fit for carrying on their designs.—We are told that human sacrifices were offered at Comana; and that this barbarous custom was brought by Orestes and his sister Iphigenia from Taurica Scythica, where men and women were immolated to Diana. But this custom, if ever it obtained in Cappadocia, was abolished in the times of the Romans.

CAPPANUS, a name given by some authors to a worm that adheres to and gnaws the bottoms of ships; to which it is extremely pernicious, especially in the East and West Indies; to prevent this, several ships have lately been sheathed with copper; the first trial of which was made on his majesty’s frigate the Alarm.

CAPPARIS. See BOTANY INDEX.

The buds of this plant, pickled with vinegar, &c., are brought to Britain annually from Italy and the Mediterranean. They are supposed to excite appetite and assist digestion; and to be particularly useful as deters and speriments in obstructions of the liver and spleen.

CAPRA, or GOAT. See MAMMALIA INDEX.

CAPRA SALTIMBA, in Meteorology, a fiery meteor or exhalation sometimes seen in the atmosphere. It forms an inflected line, resembling in some measure the capers of a goat; whence it has its name.

CAPRALA, an isle of Italy, in the Tuscan sea, to the north-east of Corsica, on which it depends. It is pretty populous, and has a strong castle for its defence. It is about 15 miles in circumference. E. Long. 11. 5. N. Lat. 43. 15.

CAPRARIA. See BOTANY INDEX.

CAPRAROLA, one of the most magnificent places in Italy, seated on a hill, in Ronciglione, whose foot is watered by the river Tircia. It was built by Cardinal Farnese; and has five fronts, in the middle of which is a round court, though all the rooms are square, and well proportioned. It is 27 miles north-west of Rome.

CAPRÆ. See CAPRI.

CAPREOLUS, ELIAS, an excellent civilian, and learned historian, born at Brescia in Italy, wrote a history of Brescia, and other works; died in 1519.

CAPRI (anciently Caprons), a city and island at the entrance of the gulf of Naples, E. Long. 14. 50. N. Lat. 40. 45.—The island is only four miles long and one broad; the city is a bishop’s see, and situated on a high rock at the west end of the island. Capreolus was anciently famous for the retreat of the emperor Tiberius for seven years, during which he indulged himself in the most scandalous debaucheries. Before Tiberius came hither, Capri had attracted the notice of Augustus, as a most eligible retreat, though in sight of populous cities, and almost in the centre of the empire. His successor preferred it to every other residence; and in order to vary his pleasure, and enjoy the advantages as well as avoid the inconveniences of each revolving season, built 12 villas in different situations, dedicated to the 12 greater gods: the ruins of some of them are still to be seen: at Santa Maria are extensive vaults and reservoirs; and on an adjoining brow are the remains of a lighthouse; two broken columns indicate the entrance of the principal course. According to Dion Cassius, this island was wild and barren before the Caesars took it under their immediate protection: at this day a large portion of its surface is uncultivated and impracticable; but every spot that will admit the hoe is industriously tilled, and richly laden with the choicest productions of agriculture. The odium attached to the memory of Tiberius proved fatal to his favourite abode; scarce was his death proclaimed at Rome, when the senate issued orders for the demolition of every fabric he had raised on the island, which by way of punishment was consequently destined to be a state prison. The wife and sister of Commodus were banished to its inhospitable rocks, which were soon stained with their blood. In the middle ages Capri became an appendage of the Amalfi republic, and after the downfall of that state, belonged to the duchy of Naples. There stood a pharos on this island, which, a few days before the death of Tiberius, was overthrown by an earthquake.

CAPRIATA, PETRUS JOHN, a civilian and historian, was born at Genoa. He wrote, in Italian, the history of the wars of Italy; an English translation of which was printed in London in 1663.

CAPRICORN, in Astronomy, one of the 12 signs of the zodiac. See ASTRONOMY INDEX.
The ancients accounted Capricorn the tenth sign; and when the sun arrived there, it made the winter solstice with regard to our hemisphere: but the stars having advanced a whole sign towards the east, Capricorn is now rather the 11th sign; and it is at the sun’s entry into Sagittary that the solstice happens, though the ancient manner of speaking is still retained.

The sign is represented on ancient monuments, medals, &c. as having the forepart of a goat and the hind part of a fish, which is the form of an Egyptian; sometimes simply under the form of a goat.

The craticia of Capricorn, a lesser circle of the sphere, which is parallel to the equinoctial, and at 23° 30’ distance from it southwards; passing through the beginning of Capricorn.

Capricification, a method used in the Levant, for ripening the fruit of the domestic fig tree, by means of insects bred in that of the wild fig tree.

The most ample and satisfactory accounts of this curious operation, are those of Tournefort and Pontedra: the former, in his Voyage to the Levant, and in a Memoir delivered to the Academy of Sciences; the latter, in his Anthologia. The substance of Tournefort’s account follows: “Of the thirty species or varieties of the domestic fig tree which are cultivated in France, Spain, and Italy, there are but two cultivated in the Archipelago. The first species is called ornis, from the old Greek erinos, which answers to capricicus in Latin, and signifies a wild fig tree. The second is the domestic or garden fig tree. The former bears successively, in the same year, three sorts of figs, called craticia, ormis, and ornis; which, though not good to eat, are found absolutely necessary towards ripening those of the garden fig. These fruits have a sleek even skin; are of a deep green colour; and contain in their dry and mealy inside several male and female flowers placed upon distinct footstalks, the former above the latter. The craticia appear in August, and continue to November without ripening: in these are bred small worms, which turn to a sort of gnats, nowhere to be seen but about these trees. In October and November, these gnats themselves make a puncture into the second fruit, which is called craticia.

These do not show themselves till towards the end of September. The craticia gradually fall away after the gnats are gone; the craticia, on the contrary, remain on the tree till May, and enclose the eggs deposited by the gnats when they pricked them. In May, the third sort of fruit, called ornis, begins to be produced by the wild fig trees. This is much bigger than the other two; and when it grows to a certain size, and its bud begins to open, it is pricked on that part by the gnats of the craticia, which are strong enough to go from one fruit to another to deposite their eggs. It sometimes happens that the gnats of the craticia are slow to come forth in certain parts, while the ornis in those very parts are disposed to receive them. In this case, the husbandman is obliged to look for the craticia in another part, and fix them at the ends of the branches of those fig trees whose ornis are in a fit disposition to be pricked by the gnats. If they miss the opportunity, the ornis fall, and the gnats of the craticia fly away. None but those that are well acquainted with the culture know the critical moment of doing this; and in order to know it, their eye is perpetually fixed on the bud of the fig; for that part not only indicates the time that the prickers are to issue forth, but also when the fig is to be successfully pricked; if the bud is too hard and compact the gnats cannot lay their eggs; and the fig drops when the bud is too open.

The use of all these three sorts of fruit is to ripen the fruit of the garden fig tree, in the following manner: During the months of June and July, the peasants take the ornis, at the time their gnats are ready to break out, and carry them to the garden fig trees; if they do not stick the moment, the ornis fall; and the fruit of the domestic fig tree, not ripening, will in a very little time fall in like manner. The peasants are so well acquainted with these precious moments, that, every morning, in making their inspection, they only transfer to their garden fig trees such ornis as are well conditioned, otherwise they lose their crop. In this case, however, they have one remedy, though an indifferent one; which is, to strew over the garden fig trees another plant in whose fruit there is also a species of gnats which answer the purpose in some measure.”

The capricification of the ancient Greeks and Romans, described by Theophrastus, Plutarch, Pliny, and other authors of antiquity, corresponds in every circumstance with what is practised at this day in the Archipelago and in Italy. These all agree in declaring, that the wild fig tree, capricicus, never ripened its fruit, but was absolutely necessary for ripening that of the garden or domestic fig, over which the husbandmen suspended its branches. The reason of this success has been supposed to be, that by the punctures of these insects, the vessels of the fruit are lazered, and thereby a greater quantity of nutritious juice derived thither. Perhaps, too, in depositing their eggs, the gnats leave behind them some sort of liquor proper to ferment gently with the milk of the figs, and to make their flesh tender. The figs in Provence, and even at Paris, ripen much sooner for having their buds pricked with a straw dipped in olive oil. Plums and pears likewise, pricked by some insects, ripen much the faster for it; and the flesh round such puncture is better tasted than the rest. It is not to be disputed, that considerable changes happen to the contexture of fruits so pricked, just the same as to parts of animals pierced with any sharp instrument. Others have supposed that these insects penetrated the fruit of the tree to which they were brought, and gave a more free admission to the air and to the sun. Linnaeus explained the operation, by supposing that the insects brought the farina from the wild fig, which contained male flowers only, to the domestic fig, which contained the female ones. Hassequist, from what he saw in Palestine, seemed to doubt of this mode of fructification. M. Bernard, in the Memoirs of the Society of Agriculture, opposes it more decidedly. He could never find the insect in the cultivated fig; and, in reality, it appeared to leave the wild fig, after the stamens were mature, and their pollen dissipated; besides, he adds, what they may have brought on their wings must be rubbed away, in the little aperture which they would form for themselves. At Malta, where there are seven or eight varieties of the domestic fig, this operation is only performed on those which ripen latest; the former are of a proper size, fine flavour, and in great abundance without it; so that he thinks the capricification only hastens the ripening.
C A P S A was very populous, and abounded with stately mosques and other structures of superb and elegant workmanship: but at present it is occupied by a poor and indigent people, fleeced and oppressed by the Tunisian government. In the very centre of the city stands an enclosed fountain, which both supplies the people with drink, and affords them an agreeable bath. The adjacent country is now cultivated, and produces several kinds of fruits; but the climate is unhealthy. The inhabitants are remarkable for their peculiarity of temper. Both men and women dress handsomely, except their feet, which they cover with coarse shoes of bungling workmanship, and made of the rough skins of wild beasts, equally inconvenient and unbecoming.

E. Long. 9. 3. N. Lat. 33. 15.

CAPSARIUS, (from caps, satchel), in antiquity, a servant who attended the Roman youth to school, carrying a satchel with their books in it, sometimes also called liberarius.

CAPSARIUS was also an attendant at the baths, to whom persons committed the keeping of their clothes.

CAPSARIUS (from caps, "a chest,"') among the Roman bankers, was he who had the care of the money chest or coffer.

CAPSICUM, or Guina-pepper. See Botany Index.

The bell-pepper produces fruit for pickling; for which purpose they must be gathered before they arrive at the full size, when their rind is tender. They must be split down on one side to get out the seeds, after which they should be soaked two or three days in salt and water; when they are taken out of this and drained, boiling vinegar must be poured on them in a sufficient quantity to cover them, and closely stopped down for two months. Then they should be boiled in the vinegar to make them green; but they want no addition of any spice, and are the wholesome and best pickle in the world. Another species is used for making what is called cayan-butter or pepper-pots, by the inhabitants of America, and which they esteem the best of all the spices. The following is a receipt for making of a pepper-pot: "Take of the ripe seeds of this sort of capsicum, and dry them well in the sun; then put them into an earthen or stone pot, mixing flour between every stratum of pods; and put them next to an oven after the baking of bread, that they may be thoroughly dried: after which they must be well cleansed from the flour; and if any of the stalks remain adhering to the pods, they should be taken off, and the pods reduced to a fine powder; to every ounce of this add a pound of wheat flour, and as much leaven as is sufficient for the quantity intended. After this has been properly mixed and wrought, it should be made into small cakes, and baked in the same manner as common cakes of the same size; then cut them into small parts, and give them again, that they may be as dry and hard as baked; which being powdered and sifted, is to be kept for use." This is prodigiously hot and acrimonious, setting the mouth as it were on fire. It is by some recommended as a medicine for flatulencies; but it is greatly to be doubted whether all those hot and burning medicines are not productive of more harm than good, in this country at least. If the ripe pods of capsicum are thrown into the fire, they will raise strong, and noisome vapours, which occasion vehement sneezing.

CAPRIMULGUS, Goatsucker, or Fern-owl. See Ornithology Index.

CAPROLES, in the manger, leaps that a horse makes in the same place without advancing, in such a manner, that, when he is at the height of the leap, he jerks out with his hinder legs even and near. It is the most difficult of all the high manger. It differs from a croupade, in this, that in a croupade, a horse does not show his shoes; and from a balladade, because in this he does not jerk out. To make a horse work well at caprioles, he must be put between two pillars, and taught to raise first his fore quarters, and then his hind quarters while his fore ones are yet in the air; for which reason you must give him the whip and the poison.

CAPSA, in Ancient Geography, a large and strong town of Numidia, situated amidst vast deserts, waste, uncultivated, and full of serpents, where Jugurtha kept his treasure. In his time it was taken and razed, by Marius the Roman general, who put to death all the citizens capable of bearing arms, and sold the rest for slaves. It was, however, afterwards rebuilt by the Romans, and strongly fortified; but, on the decline of their empire, was taken and demolished a second time, by Occuba a famous Arab general. The walls of the citadel are still remaining, and are monuments of the ancient glory and strength of Capsa. They are 24 fathoms in height, and five in thickness, built of large square stones, and have now acquired the solidity and firmness of a rock. The walls of the town were erected by the inhabitants since their first demolition; but were afterwards destroyed by Jacob Almanzor, who sent a governor and troops into the province. In Marmol's
C A P

Capstans, or Capstern, are strong massive columns of timber, formed like a truncated cone, and having its upper extremity pierced with a number of holes to receive the bars or levers. It is let perpendicularly down through the decks of a ship; and is fixed in such a manner, that the men, by turning it horizontally with their bars, may perform any work which requires any extraordinary effort.

A capstern is composed of several parts, where A is the barrel, b the whelps, c the drumhead, and d the spindle. The whelps rise out from the main body of the capstern like buttresses, to enlarge the swell, so that a greater quantity of cable, or whatever rope encircles the barrel, may be wound about it at one turn, without adding much to the weight of the capstern. The whelps reach downwards from the lower part of the drumhead to the deck. The drumhead is a broad cylindrical piece of wood resembling a thistledown, and fixed immediately above the barrel and whelps. On the outside of this piece are cut a number of square holes parallel to the deck, to receive the bars. The spindle or pivot d, which is shod with iron, is the axis or foot upon which the capstern rests, and turns round in the sencer, which is a sort of iron socket let into a wooden stock or standard called the step, resting upon and bolted to the beams.

Besides the different parts of the capstern above explained, it is furnished with several appurtenances, as the bars, the pins, the pawls, the swifter, and the sancer, already described. The bars are long pieces of wood, or arms, thrust into a number of square holes in the drumhead all round, in which they are the radii of a circle, or the spokes in the nave of a wheel. They are used to heave the capstern round, which is done by the men setting their breasts against them, and walking about, like the machinery of a horse mill, till the operation is finished. The pins e, are little bolts of iron thrust perpendicularly through the holes of the drumhead, and through a corresponding hole in the end of the bar, made to receive the pins when the bars are fixed. They are used to confine the bars, and to prevent them from working out as the men heave, or when the ship labours. Every pin is fastened to the drumhead with a small iron chain; and that the bars may exactly fit their respective holes, they are all numbered. The pawls f, No. 1, are situated on each side the capstern, being two short bars of iron, bolted at one end through the deck to the beams close to the lower part of the whelps; the other end, which occasionally turns round on the deck, being placed in the intervals of the welshes, as the capstern turns round, prevents it from recoiling or turning back by any sudden jerk of the cable, as the ship rises on the sea, which might greatly endanger the men who heave. There are also hanging pawls g g, No. 3, used for the same purposes, reaching from the deck above to the drumhead immediately below it. The swifter is a rope passed horizontally through holes in the outer end of the bars, and drawn very tight; the intent of this is to keep the men steady as they walk round when the ship rocks, and to give room for a greater number to assist by pulling upon the swifter itself.

The most frequent use of the capstern is to heave in the cable, and thereby remove the ship or draw up the anchor. It is also used to wind up any weighty body, as the masts, artillery, &c. In merchant ships it is likewise frequently employed to discharge or take in the cargo, particularly when consisting of weighty materials that require a great exertion of mechanical powers to be removed.

There are commonly two capsterns in a man of war, the main and the gear capstern; the former of which has two drumheads, and may be called a double one. This is represented in No. 3. The latter is represented in No. 2.

Formerly the bars of the capstern went entirely through the head of it, and consequently were more than double the length of the present ones; the holes were therefore formed at different heights, as represented in No. 1. But this machine had several inconveniences, and has long been entirely disused in the navy. Some of the old set of capsterns, however, are still retained in merchant ships, and are usually designated crobs. The situation of the bars in a crab, as ready for heaving, is represented in No. 4.

To rig the Capstern, is to fix the bars in their respective holes, and thrust in the pins, in order to confine them. Surge the Capstern, is the order to slacken the rope heaved round upon it, of which there are generally two turns and a half about the barrel at once, and sometimes three turns. To heave the Capstern, is to go round with it heaving on the bars, and drawing in any rope of which the purchase is created. To come-up the Capstern, is to let go the rope upon which they had been heaving. To Poul the Capstern, is to fix the pawls to prevent it from recoiling during any pause of heaving.

CAPSULE, in a general sense, denotes a receptacle or cover in form of a bag.

Capsule, among botanists, a dry hollow seed-vessel or pericarpium, that cleaves or splits in some determinate manner. See Pericarpium, Botany Index.

This species of seed-vessel is frequently fleshy and succulent, like a berry, before it has attained maturity; but in ripening, becomes dry, and often so elastic as to dart the seeds from their departments with considerable velocity. This elasticity is remarkably conspicuous in wood sorrel; balsam, impatiens; African spiresa, dicaema; fuscina; justicia; rosella; lathraea; and many others. The general aptitude or disposition of this species of seed-vessel to cleave or separate for the purpose of dispersing its seeds, distinguishes it not less remarkably than its texture from the pulpy or succulent fruits of the apple, berry, and cherry kind. This opening of the capsule for discharging
ing its seeds when the fruit is ripe, is either at the
top, as in most plants; at the bottom, as in triglo-
chin; at the side, through a pore or small hole, as in
campanula and orchis; horizontally, as in plantain,
amaranthus, and anagallis; or longitudinally, as in
convolvulus. All fruit that is jointed, opens at every
one of the joints, each of which contains a single seed.
Capsules, in splitting, are divided, externally, into one
or more pieces, called by Linnaeus 

 tumultuosa: these, in point of number, are exceedingly di-
versified; some having only one cell, as the primrose;
and others many, as the water lily. Hence a capsule
is termed unilocular, bilocular, trilocular, etc., accord-
ing as it has one, two, three, &c. cells or cavities.

Capsula 
Astrabilica, called also glandula renales, and
renes succenturiati. See Anatomy Index.

CAPTAIN, a military officer whereof there are
several kinds, according to their commands.

Captain of a Troop or Company, an inferior officer
who commands a troop of horse or a company of foot,
under a colonel. The duty of this officer is to be
careful to keep his company full of able-bodied sol-
diers; to visit their tents and lodgings, to see what
is wanting; to pay them well; to cause them keep them-

selves neat and clean in their clothes, and their arms
bright. He has power in his own company of making
serjeants, corporals, and lanepesades.

In the horse and foot guards, the captains have the
rank of colonels.

Captain-General, he who commands in chief.

Captain-Lieutenant, he who, with the rank of cap-
tain, but the pay of lieutenant, commands a troop or
company in the name and place of some other person
who is dispensed with, on account of his quality, from
performing the functions of his post.

Thus the colonel being usually captain of the first
company of his regiment, that company is commanded
by his deputy under the title of Captain-Lieutenant.

So in England, as well as in France, the king,
queen, dauphin, princes, &c. have usually the title
of captain of the guards, gens d'armes, &c. the real du-
uty of which offices is performed by captain-lieuten-
ants.

Captain Reformed, one who, upon the reduction of
the forces, has his commission and company suppressed;
yet is continued captain, either as second to another, or
without any post or command at all.

Captain of a Ship of War, the officer who com-
mands a ship of the line of battle, or a frigate carry-
ing 20 or more cannon. The charge of a captain in
his majesty's navy is very comprehensive, in as much
as he is not only answerable for any bad conduct in
the military government, navigation, and equipment
of the ship he commands, but also for any neglect of
duty or ill management in his inferior officers, whose
several charges he is appointed to superintend and re-
gulate.

On his first receiving information of the condition
and quality of the ship he is appointed to command,
he must attend her constantly, and hase the necessary
preparations to fit her for sea. So strict, indeed, are
the injunctions laid on him by the lord high admir
al, or commissioners of the admiralty, that he is forbid
to lie out of his ship, from his arrival on board to
the day of his discharge, unless by particular leave.

He is enjoined to show a laudable example of honour
and virtue to the officers and men; and to discon-
trance all dissolve, immoral, and disorderly practices,
and such as are contrary to the rules of subordination
and discipline; as well as to correct those who are
guilty of such offences as are punishable according to
the usage of the sea. He is ordered particularly to
survey all the military stores which are sent on board,
and to return whatever is deemed unfit for service.

His diligence and application are required to pro-
cure his complement of men; observing carefully to enter
only such as are fit for the necessary duty, that the
government may not be put to unnecessary expense.

When his ship is fully manned, he is expected to keep
the established number of men complete, and superin-

tend the muster himself, if there is no clerk of the check
at the port. When his ship is employed on a cruising
station, he is expected to keep the sea the whole length
of time previously appointed; but if he is compelled
by some unexpected accident to return to port sooner
than the time limited, he ought to be very cautious in
the choice of a good situation for anchoring, ordering
the master or other careful officers to sound and dis-
cover the depths of water and dangers of the coast.

Previous to any possibility of an engagement with
the enemy, he is to quarter the officers and men to the ne-
cessary stations according to their office and abilities,
and to exercise them in the management of the artil-
illery, that they may be more expert in time of battle.

His station in the time of an engagement is on the

court; at which time he is expected to take all
opportunities of annoying his enemy, and improving
every advantage over him; to exhibit an example of
courage and fortitude to his officers and crew; and to
place his ship opposite to his adversary in such a pos-
ition as that every cannon shall do effectual execution.

At the time of his arrival in port, after his return
from abroad, he is to assemble his officers, and draw
up a detail of the observations that have been made
during the voyage, of the qualities of the ship as to
her trim, ballast, stowage, manner of sailing, for the
information and direction of those who may succeed

him in the command; and this account is to be signed
by himself and officers, and to be returned to the resi-
dent commissioner of the navy at the port where the
ship is discharged.

Captain of a Merchant-ship, he who has the direc-
tion of the ship, her crew, and lading, &c. In small
ships and short voyages, he is more ordinarily called the
master. In the Mediterranean, he is called the pas-
tron.—The proprietor of the vessel appoints the cap-
tain or master; and he is to form the crew, and choose
and hire the pilots, mates, and seamen; though, when
the proprietor and master reside on the same spot, they
generally act in concert together.

Captain Bashaw, or Cepondan Bashaw, in the po-

city of the Turks, signifies the Turkish high admiral.

He possesses the third office of the empire, and is in-
vested with the same power at sea that the vizier has
on shore. Soliman II. instituted this office in favour
of the famous Barbarossa, with absolute authority over
the officers of the marine and arsenal, whom he may
punish, cashier, or put to death, as soon as he is with-
out
CAPTIVITY, in general sense, the state or condition of a captive.

CAPTIVITY, in sacred history, a punishment which God inflicted upon his people for their vices and infidelities. The first of these captivities is that of Egypt, from which Moses delivered them; after which, are reckoned six during the government of the judges; but the greatest and most remarkable were those of Judah and Israel, which happened under the kings of each of these kingdoms. It is generally believed, that the ten tribes of Israel never came back again after their dispersion; and Josephus and St Jerome are of this opinion: nevertheless, when we examine the writings of the prophets, we find the return of Israel from captivity pointed out in a manner almost as clear as that of the tribes of Benjamin and Judah; see Hosea, i. 10, 11. Amos, ix. 14. The captivities of Judah are generally reckoned four; the fourth and last of which fell in the year of the world 3416, under Zedekiah; and from this period begins the 70 years captivity foretold by Jeremiah.

Since the destruction of the temple by the Romans, the Hebrews boast that they have always had their heads, or particular princes, whom they call princes of the captivity, in the east and west. The princes of the captivity in the east governed the Jews that dwelt in Babylon, Assyria, and Persia; and the princes of the captivity in the west governed those who dwelt in Judæa, Egypt, Italy, and in other parts of the Roman empire. He who resided in Judæa commonly took up his abode at Tiberias, and assumed the name of Roshchabbath, "head of the fathers or patriarchs." He presided in assemblies, decided in cases of conscience, levied taxes for the expenses of his visits, and had officers under him who were dispatched through the provinces for the execution of his orders. As to the princes of the captivity of Babylon, or the east, we know neither the original nor succession of them. It only appears that they were not in being before the end of the second century.

CAPTURE, a prize, or prey; particularly that of a ship taken at sea. Captures made at sea were formerly held to be the property of the captors after a possession of twenty-four hours; but the modern authorities require, that before the property can be changed, the goods must have been brought into port, and have continued a night insula presidia, in a place of safe custody, so that all hope of recovering them was lost.

CAPTURE also denotes an arrest or seizure of a criminal, debtor, &c. at land.

CAPUA, in Ancient Geography, a very ancient city of Italy, in Campania, and capital of that district. It is famous for the abode of Hannibal the Carthaginian general after the battle of Cannae, and where Livy accuses him, but unjustly, of having encamped himself with pleasures*. It still retains the name, and is the seat of an archbishop. It is seated on the river Voltur-thasgr. no. in E. Long. 15. 5. N. Lat. 41. 7. The history of Capua is thus shortly deduced by Mr Swinburne. "It was a settlement of the Oeci long before the foundation of Rome. As the magnificent fertility of the land and a lucrative commerce poured immense wealth upon its inhabitants, it became one of the most extensive and magnificent cities in the world. With riches excessive luxury crept in, and the Capuans grew insolent; but by their effeminacy they soon lost the power of repelling those neighbouring nations which their insolence had exasperated. For this reason Capua was continually exposed to the necessity of calling in foreign aid, and endangering its safety by the uncommon temptations it offered to needy auxiliaries. The Roman soldiers sent to defend Capua were on the point of making it their prey, and often the voice of the Roman people was loud for a removal from the barren unwholesome banks of the Tiber to the garden of Italy, near those of the Volturno. Through well-founded jealousy of the ambition of Rome, or, as Livy and other partial writers term it, natural inconstancy,
the Capuans warmly espoused the quarrel of Carthage; 
Hannibal made Capua his winter quarters after the

When through a failure of supplies from Carthage
Hannibal was under a necessity of remaining in Bruttium, and leaving the Capuans to defend themselves, this city, which had been long invested, was surren
dered at discretion to the consuls Appius Claudius and Q. Fulvius Flaccus. The senators were put to death, the nobles imprisoned for life, and all the citizens sold and dispersed. Vibi, the chief of Hannibal’s friends, avoided this ignominious fate, and escaped from the cruel vengeance of the Romans, by a voluntary death.

—When the mob insisted upon the gates being thrown open to the enemy, Vibi assembled his steady associ
ates, and sat down with them to a superb banquet, after which each of the guests swallowed a poisonous draught, and expired in full possession of their freedom. The buildings were spared by the victor; and Capua was left to be merely a harbour for the husbandmen of the plain, a warehouse for goods, and a granary for corn; but so advantageous a situation could not long be neglected; colonies were sent to inhabit it, and in process of time it regained a degree of importance.

“Genseric the Vandal was more cruel than the Ro
man conquerors had been; for he massacred the in
habitants, and burnt the town to the ground. Nurses rebuilt it; but in 841 it was totally destroyed by an army of Saracens, and the inhabitants driven into the mountains. Some time after the retreat of these savage invaders, the Lombards ventured down again into the plain; but not deeming their force adequate to the defence of so large a circuit as the old city, they built themselves a smaller one on the river, and called it Capua.—They chose the site of Castrinum, famous in the second Punic war, for the resistance made by its garrison against Hannibal. Since the foundation of the new city, Old Capua has remained in ruins.

In 886, Landulph formed here an independent earldom dismembered from the duchy of Benevento, and in the course of a few generations Capua acquired the title of a principality. In the 10th century, the Normans of Aversa expelled the Lombard race of princes, and Richard their chief became prince of Capua; the grandson of Tancred of Hauteville drove out the descendants of Richard, and united this state to the rest of his possessions.

“Capua is at present a neat little city, fortified ac
ccording to the rules of modern art, and may be consid
ered as the key of the kingdom; though far removed from the frontier, it is the only fortification that really covers the approach to the kingdom.”

CAPUCHINS, religions of the order of St Francis in its strictest observance; deriving their name from capuccio, or capuchon, a stuff cap, or cowl, wherewith they cover their heads. They are clothed with brown or gray; always barefooted; and never to go in a coach, nor ever shave their beard.—The Capuchins are a reform made from the order of Minors, commonly called Cordeliers, set on foot in the 16th century by Matthew Baschi, a religious observant of the monastery of Montefiascone; who, being at Rome, was advertised several times from heaven, to practise Capuchins the rule of St Francis to the letter. Upon this he made application to Pope Clement in 1525; who gave him permission to retire into a solitude, with as many others as chose to embrace the strict observance. In 1528, they obtained the pope’s bull. In 1529, the order was brought into complete form: Matthew was elected general, and the chapter made constitutions. In 1543, the right of preaching was taken from the Capuchins by the pope: but in 1545 it was restored to them again with honour. In 1578, there were already 17 general chapters in the order of Capuchins.

CAPUT, the head. See HEAD.

CAPUT baronis, the head of the barony, in ancient customs, denotes the ancient or chief seat or castle of a

CAPUT Lupinum. Anciently an outlawed felon was said to have caput lupinum, and might be knocked on the head like a wolf, by any one that should meet him; because, having renounced all law, he was to be dealt with as in a state of nature, when every one that should find him might slay him; yet now, to avoid such inhumanity, it is holden that no man is entitled to kill him wantonly and wilfully; but in so doing he is guilty of murder, unless it is done in the endeavour to apprehend him.

CAPUT Mortum, a Latin name given to fixed and exhausted residuums remaining in retorts after distilla
tions. As these residuums are very different, accord
ing to the substances distilled, and the degree of heat employed, they are by the more accurate modern chemists particularly specified by adding a term denoting their qualities; as earthy residuum, chary residuum, some residuum, &c.

CARABINE, a fire arm shorter than a musket, carrying a ball of 24 in the pound, borne by the light horse, hanging at a belt over the left shoulder. The barrel is two feet and a half long; and is sometimes furrowed spirally within, which is said to add to the range of the piece.

CARABINEERS, regiments of light horse, carrying longer carbines than the rest, and sometimes used on foot.

CARABUS. See ENTOMOLOGY Index.

CARACALLA, M. Antoninus Bassianus, em
peror after his father Severus in 211, put the physicians to death for not despatching his father, as he would have had them. He killed his brother Geta; and put Papinianus to death, because he would not defend nor excuse his paricide. In short, it is said that 20,000 persons were massacred by his order. He married Julia, his father’s widow. Going to Alexandria, he slew the inhabitants, and applied to the magicians and astro
logers. At last, going from Edessa to Mesopotamia,
one of his captains slew him, by order of Macrinus, who succeeded him. He died after he had reigned somewhat more than six years.

CARACALLA, in antiquity, a long garment, having a sort of capuchin, or hood a-top, and reaching to the heels; worn equally among the Romans by the men and the women, in the city and the camp. Spartan and Xiphiatia represent the emperor Caracalla as the inventor of this garment, and hence suppose the appellation Caracalla was first given him. Others, with more probability, make the caracalla originally a Gallic habit, and only brought to Rome by the emperor above mentioned, who first enjoined the soldiers to wear it. The people call it antoniusin, from the same prince, who had borrowed the name of Antoninus. The caracalla was a sort of casack, or surtout. Salmonia, Scaliger, and after them Du Cange, even take the name casaque to have been formed from that of caraque, for caracalla. This is certain from St Jerome, that the caracalla, with a retrenchment of the capuchin, became an ecclesiastical garment. It is described as made of several pieces cut and sewed together, and hanging down to the feet; but it is more than probable there were some made shorter, especially out of Rome, otherwise we do not see how it could have fitted the soldiers purpose.

CARACCAS, a district of Terra Firma in South America, belonging to the Spaniards. The coast is rocky and mountainous, interspersed with small fertile valleys; subject to certain seasons of the year to dry north-west winds, but blessed in general with a clear air and wholesome climate. A very great illicit trade is carried on by the English and Dutch with this province, notwithstanding all the vigilance of the Spaniards, who have scouts perpetually employed, and breastworks raised in all the valleys. A vast number of cacao trees are cultivated in this province; and it is reckoned that the crop of cacao produced here amounts to more than 100,000 fanegas of 110 pounds each. The country of Santa Fe consumes 20,000; Mexico a little more; the Canaries a small cargo; and Europe from 30 to 60,000. The cultivation of the plant employs 10 or 12,000 negroes. Such of them as have obtained their liberty have built a little town called Nireno, into which they will not admit any white people. The chief town is likewise called Caraccas, and is situated in N. Lat. 10° 10'. It stands at a considerable distance from the sea; contains 34,000 inhabitants, and is extremely difficult of access, by reason of the steep and craggy hills over which an enemy must take his route. The commerce of this town, to which the bay of Guaira at two leagues distance serves for a harbour, was for a long time open to all the subjects of the Spanish monarchy, and is still so to the Americans; but the Europeans are not so well treated. The Caraccas contain altogether, according to Depons, 728,000 inhabitants, of whom the whites form two-thirds, the slaves three-tenths, the descendants of freedmen four, and the Indians the remainder. An insurrection began in this country in 1810, which it is probable will end in its separation from Old Spain. See CARACCAS, SUPPLEMENT.

CARACCI, LEWIS, AUGUSTINE, and HANNIBAL, three celebrated painters of the Lombard school, all of Bologna. Lewis was born in 1555; and was connexion to Augustine and Hannibal, who were brothers, the sons of a tailor, who was yet careful to give them a liberal education. They were both disciples of their cousin Lewis. Augustine gained a knowledge of mathematics, natural philosophy, music, poetry, and most of the liberal arts; but, though painting was his principal pursuit, he learned the art of engraving from Cornelius Cort, and surpassed all the masters of his time. Hannibal, again, never deviated from his pencil. These three painters, as long, having reaped all the advantages they could by contemplation and practice, formed a plan of instruction, continued always together, and laid the foundation of that celebrated school which has ever since been known by the name of Caracci's academy. Here to all the young students, who had a view of becoming masters, resorted to be instructed in the rudiments of painting; and here the Caracci taught freely, and without reserve, all that came. Lewis's charge was to make a collection of antique statues and bas-reliefs. They had designs of the best masters, and a collection of curious books on all subjects relating to their art; and they had a skilful anatomist always ready to teach what belonged to the knitting and motions of the muscles, &c. There were often disputations in the academy; and not only painters, but men of learned professions, proposed questions, which were always decided by Lewis. Every body was well received; and though stated hours were allotted to treat of different matters, yet improvements might be made at all hours by the antiquities and the designs which were to be seen.

The fame of the Caracci reaching Rome, the cardinal Farnese sent for Hannibal thither, to paint the gallery of his palace. Hannibal was the more willing to go, because he had a great desire to see Raphael's works, with the antique statues and bas-reliefs. The gusto which he took there from the ancient sculpture, made him change his Bolognian manner for one more learned but less natural in the design and in the colouring.—Augustine followed Hannibal, to assist him in his undertaking of the Farnese gallery; but the brothers not rightly agreeing, Farnese sent Augustine to the court of the duke of Parma, where he died in the year 1602, being only 45 years of age. His most celebrated piece of painting is that of the Communion of St Jerome, in Bologna.

In the mean while, Hannibal continued working in the Farnese gallery at Rome; and, after inconceivable pains and care, finished the paintings in the perfection in which they are now to be seen. He hoped that the cardinal would have rewarded him in some proportion to the excellence of his work, and the time it took him up, which was eight years; but he was disappointed. The cardinal, influenced by an ignorant Spaniard, his domestic, gave him but a little above 200l. though it is certain he deserved more than twice as many thousands. When the money was brought him, he was so surprised at the injustice done him, that he could not speak a word to the person who brought it. This confirmed him in a melancholy to which his temper naturally inclined, and made him resolve never more to touch his pencil; which resolution he had undoubtedly kept, if his necessities had not compelled him to break it. It is said, that his melancholy gained so much upon him, that at certain times it deprived him of the use of his senses. It did not, however, put a stop to his amours; and his debauches at Naples, whether he had retired for the
the recovery of his health, brought a distemper upon
him of which he died in 1609, when he was 49 years
of age. His veneration for Raphael was so great, that
it was his deathbed request to be buried in the same
tomb with him; which was accordingly done, in the
Pantheon or Rotunda at Rome. There are extant sev-
eral prints of the blessed Virgin, and some other sub-
jects, etched by the hand of this incomparable artist.
He is said to have been a friendly, plain, honest, and
open-hearted man; very communicative to his schol-
ars, and so extremely kind to them, that he generally
kept his money in the same box with his colours,
where they might have recourse to either as they had
occasion.

While Hannibal Caracci worked at Rome, Lewis
was courted from all parts of Lombardy, especially by
the clergy, to make pictures in their churches: and we
may judge of his capacity and facility, by the great
number of pictures he made, and by the preference
that was given him to other painters. In the midst
of these employments Hannibal solicited him to come
and assist him in the Farnese gallery; and so ear-
nestly, that he could not avoid complying with his
request. He went to Rome; corrected several things
in that gallery; painted a figure or two himself; and
then returned to Bologna, where he died in 1619,
aged 64.

CARACOL, in the manage, the half turn which a
horseman makes, either to the right or left.—In the
army, the horse always makes a caracol after each dis-
charge, in order to pace the rear of the squadron.

CARACOL, in Architecture, denotes a staircase in a
halix or spiral form.

CARACOLI, a kind of metal of which the Carib-
beeans, or natives of the Lesser Antilles, make a sort of
ornament in the form of a crescent, which they also call
caracoli.—This metal comes from the main land; and
the common opinion is, that it is a compound of silver,
copper, and gold, something like the Corinthian brass
among the ancients. These metals are so perfectly
mixed and incorporated together, that the compound
which results from them, it is said, has a colour that
never wears, how long soever it remains in the sea or
under ground. It is somewhat brittle; and they who
work at it are, obliged to mix a large proportion of
gold with it, to make the compound more tough and
malleable.

CARACT, or CARAT, the name of that weight
which expresses the degree of fineness that gold is of.
The word is also written carract, carrat, karract, and
karrat. Its origin is contested: but the most prob-
able opinion is that of Kennet, who derives it from
caravis, a term which anciently denoted any weight,
and came not till of later days to be appropriated to
that which expresses the fineness of gold, and the gra-

dy of diamonds.

These carats are not real determinate weights, but
only imaginary. The whole mass, be the weight what
it will, is conceived to be divided into 24 carats; and
as many 24th parts as it contains of pure gold, it is
called gold of so many carats, or so many carats fine.
Thus, gold of 18 carats is a mixture, of which 18 parts
are pure gold, and the other six an inferior metal, &c.
This is the common way of reckoning in Europe, and
at the gold mines in the Spanish West Indies, but with
some variation in the subdivision of the carat; among
us, it is divided into four grains; among the Germans,
into 12 parts; and by the French, according to Mr.
Helot, into 32. The Chinese reckon by a different
division called touche, of which the highest number, or
that which denotes pure gold, is 100; so that 100
touches correspond to our 24 carats, &c.

CARACT is also a certain weight which goldsmiths
and jewellers use, whereby to weigh precious stones and
pearls.—In this sense, the word is by some supposed
to be derived from the Greek μετρον, a fruit which the
Latins call siiliga, and we carob bean; each of which
may weigh above four grains of wheat, whence the La-

tin siiliga has been used for a weight of four grains.
This caract weighs four grains, but they are sometimes
lighter than the grains of other weights. Each of these
grains is subdivided into ½, ¼, ⅛, &c.

CARACTACUS, a renowned king of the ancient
British people called Silures, living South Wales.
Having valiantly defended his country seven years
against the Romans, he was at length defeated; and
flying to Cartismunda, queen of the Brigantes (in-
habitants of Yorkshire), was by her treacherously deli-
vered up to the Romans, and led in triumph to the
emperor Claudius then at York; where his noble be-
haviour, and heroic but pathetic speech, obtained him
not only his liberty, but the esteem of the emperor,
A. D. 52.

CARAGROUTH, in commerce, a silver coin of
the empire, weighing nine drachms. It goes at
Constantinople for 120 aspers. There are four sorts
of them, which are all equally current and of the same
value.

CARAITES, in the ecclesiastical history of the
Jews, a religious sect among that people, wherein there
are still some subsisting in Poland, Russia, Constantin-
ople, Cairo, and other places of the Levant, whose dis-
tinguishing tenet and practice it is, to adhere closely
to the words and letter of the Scripture, exclusive of
allegories, traditions, and the like.

Leo of Modena, a rabbin of Venice, observes, that
of all the heresies among that people, before the de-
struction of the temple, there is now very left but that
of the Caraites, a name derived from Micro, which
signifies the pure text of the Bible, because of their
keeping to the Pentateuch, observing it to the letter,
and rejecting all interpretations, paraphrases, and con-
stitutions of the rabbins. Aben Ezra, and some other
rabbins, treat the Caraites as Sadducees; but Leo of
Juda calls them, more accurately, Sadducees reformed;
because they believe the immortality of the soul, para-
dise, hell, resurrection, &c. which the ancient Saddu-
cees denied. He adds, however, that they were doubt-
less originally real Sadducees, and sprung from among
them.

M. Simon, with more probability, supposes them to
have risen hence; that the more knowing among the
Jews opposing the dreams and severities of the rabbins,
and using the pure texts of Scripture to refute their
groundless traditions, had the name of Caraites given
them; which signifies as much as the barbarous Latin
Scripturaeva; i.e. people attached to the text of Scrip-
ture. The other Jews gave them the odious name Sad-
ducees, from their agreement with those sectaries on
the head of traditions. Stilling, Venetian, and Span-
ish,
Caraites, believe, rank the Caraites among the Sabæans, Magi, Manichees, and Mussulmans, but by mistake: Wolfson; Fabricius, &c. say the Sadducees and Esseni were called Caraites, in opposition to the Pharisees; others take them for the disciples of the law as mentioned in the Gospel; but these are all conjectures. Josephus and Philo make no mention of them; which shows them to be more modern than either of those authors. In all probability, this sect was not formed till after the collection of the second part of the Talmud, or the Gemara; perhaps not till after the compiling of the Mishna in the third century. The Caraites themselves pretend to be the remains of the ten tribes led captive by Shalmaneser. Wolfius, from the Memoirs of Mardochæus, a Caraita, refers their origin to a massacre among the Jewish doctors under Alexander Jannæus, their king, about 100 years before Christ: because Simon, son of Schetach, and the queen's brother, making his escape into Egypt, there forsook his pretended traditions; and, at his return to Jerusalem, published his visions; interpolating the law after his own fancy, and supporting his novelties on the notions which God, he said, had communicated by the mouth of Moses, whose depositary he was: he gained many followers; and was opposed by others, who maintained, that all which God had revealed to Moses was written. Hence the Jews became divided into two sects, the Caraites and Traditions: among the first Judæ, son of Tahba'i, distinguished himself; among the latter, Hillel. Wolfius reckons not only the Sadducees, but also the Scribes, in the number of Caraites. But the address of the Pharisees prevailed against them all; and the number of Caraites decreased: Anan, indeed, in the eighth century, retrieved their credit a little; and Rabbi Schalomou in the ninth. They succeeded pretty well till the fourteenth; but since that time they have been declining.

The Caraites are but little known; their works coming only into very few hands, even among the greatest Hebraists. Buxtorf never saw more than one; Seldén two; but Mr Trigland says, he has recovered enough to speak of them with assurance. He asserts, that soon after the prophets had ceased, the Jews became divided on the subject of works, and supererogation: some maintaining their necessity from tradition; whilst others, keeping close to the written law, set them aside; and it was from these last that Caraitism commenced. He adds, that after the return from the Babylonish captivity, the observation of the law being to be re-established, there were several practices found proper for that end; and these once introduced, were looked upon as essential, and appointed by Moses; which was the origin of Pharisaism: as a contrary party, continuing to keep close to the letter, founded Caraitism.

The modern Caraites, Leo of Modena observes, have their synagogues and ceremonies; they pretend to be the sole proper Jews, or observers of the laws of Moses; calling the rest by the term Rabbainam, or followers of the Rabbinis: these hate the Caraites mortally; refusing to ally or even to converse with them, and treating them as mansecios, bastardis; because of their rejecting the constitutions of the rabbinis relating to marriages, repudiations, purifications of women, &c. This assertion is so great, that if a Carait should become a Rabbinist, he would never be received by the other Jews.

The Caraites, however, do not absolutely reject all kinds of traditions; but only such as do not appear well grounded. Seldén, who is very severe on this, in his Usæ Horæsicæ, observes, that, besides the mere theology only seems to differ from that of the other Jews, in that it is purer, and clearer of superstitious; they give no credit to the explanations of the Cabalists, chimerical allegories, nor to any constitutions of the Talmud, but what are conformable to the Scripture, and may be drawn from it by just and necessary consequences.

Peringer observes of the Caraites in Lithuania, that they are very different, both in aspect, language, and manners, from the Rabbinists, wherewith the country abounds. Their mother tongue is the Turkish; and this they use in their schools and synagogues. In vantage they resemble the Mahometan Tartars. Their synagogues are placed north and south; and the reason they give for it is, that Shalmaneser brought them northward: so that, in praying, to look to Jerusalem, they must turn to the south. He adds, that they admit all the books of the Old Testament; contrary to the opinion of many of the learned, who hold that they reject all but the Pentateuch.

Caleb, a Caraita, reduces the difference between them and the Rabbinists to three points: 1. In that they deny the oral law to have come from Moses, and reject the Cabala. 2. In that they abhor the Talmud. 3. In that they observe the feasts, as the sabbaths, &c. much more rigorously than the Rabbins do. To this may be added, that they extend the degrees of affinity, wherein marriage is prohibited, almost to infinity.

Caramania, a considerable province of Turky in Asia, in the south part of Notalia. Bajazet united this province to his empire about the year 1488, and since that time it has continued in the possession of the Turks. Satania was the capital city, but is now much decayed.

Caramanta, a town of South America, and capital of the province of the same name in Terra Firme, and in the audience of Santa Fe. W. Long. 72° 35'. N. Lat. 5° 18'. The province of Caramanta is extended on both sides the river Cauca; and is bounded on the north by the district of Carthagena, on the east by New Granada, on the south by Popayan, and on the west by Popayan and by the audience of Panama. It is a valley surrounded on every side by very high mountains.

Caramoa, an inconsiderable island near Bombay in the East Indies. It affords nothing but some rice, fowls, and goats, for that market.

Cara, or Karama, a very scarce gum which comes from New Spain. It is said to possess many extraordinary medical virtues, but the present practice takes no notice of it.

Caranus, the first king of Macedon, and the seventh of the race of the Heraclides. See Macedonia.

Cara, a weight at Leghorn, and in other parts of Italy, used in the sale of mool and cod fish, equivalent to 60 pounds of that country.
CARAT. See CARACT.
CARAVAGGIO, MICHAEL ANGELO. See ANGELO.
CARAVAN, or KARAVANN, in the east, signifies a company or assembly of travellers and pilgrims, and more particularly of merchants, who, for their greater security, and in order to assist each other, march in a body through the deserts, and other dangerous places, which are infested with Arabs or robbers.

There are four regular caravans which go yearly to Meccah; the first from Damascus, composed of the pilgrims from Europe and Asia; the second from Cairo, from the Mahomedans of Barbary; the third from Zibith, a place near the mouth of the Red sea, where those of Arabia and India meet; the fourth from Babylon, where the Persians assemble. Most of the inland commerce of the east is carried on by caravans. The late Czar Peter the Great established a trade between Russia and China by means of a caravan. M. Bougon, geographer to the duke of Lorraine, has given a treatise of the caravans of merchants in Asia; wherein he shows what they are composed; how many sorts there are; the several uses of the different sorts of animals in them; the prices given for them; the officers and men appointed to conduct them, and the pay of each, with their manner of marching, halting, lighting, retreating, &c. Caravans of this kind are large convoys of armed men, merchants, and travellers, with divers sorts of animals for the carriage of their provisions. There are commonly four chief officers of a caravan, viz. the caravan bachi, or chief; the captain; the guide; captain of rest; and captain of distribution. The first has absolute command over all the rest; the second is absolute in the march; the office of the third only commences when the caravan stops and makes a stay; to the fourth it belongs to dispose of every part of the corps, in case of an attack or battle; he has also the inspection over the distribution of provisions, which is made under him by several distributors, who give security to the master of the caravan, and have each of them a certain number of persons, elephants, dromedaries, &c. to take care of at their own peril. The treasurer of the caravan makes a fifth officer, who has under him several agents and interpreters, who keep journals of all that passes, for the satisfaction of those concerned in fitting out the caravan.

Any dealer is at liberty to form a company, in order to make a caravan. He in whose name it is raised, is considered as the caravan bachi, or chief of the caravan, unless he appoint some other in his place. If there are several merchants equally concerned, they elect a caravan bachi; after which, they appoint officers to conduct the caravan, and decide all controversies that may arise during the journey.

There are also sea caravans; established on the same footing, and for the same purpose: such is the caravan of vessels from Constantinople to Alexandria.

CARAVANSERA, or KARAVANSERA, a place appointed for receiving and loading the caravans.

It is commonly a large square building, in the middle of which there is a very spacious court; and under the arches or piazzas that surround it there runs a bank, raised some feet above the ground, where the merchants, and those who travel with them in any capacity, take up their lodgings as well as their goods; the beasts of burden being tied to the foot of the bank. Over the gates that lead into the court, there are sometimes little rooms, which the keepers of the caravans let out at a very high price to such as have a mind to be private.

The caravanseras in the east are something of the nature of the inns in Europe; only that you meet with little accommodation either for man or beast, but are obliged to carry almost every thing with you: there is never a caravansera without a well, or spring of water. These buildings are chiefly owing to the charity of the Mahometans: they are esteemed sacred dwellings, where it is not permitted to insult any person, or to pillage any of the effects that are deposited there. There are also caravanseras where most things may be had for money; and as the profits of these are considerable, the magistrates of the cities to whose jurisdiction they belong take care to store them well. There is an inspector, who, at the departure of each caravan, fixes the price of the night's lodging, from which there is no appeal.

CARAVANSERASKIER, the steward or keeper of a CARAVANSERA. He keeps an account of all the merchandizes that are sold upon trust; and demands the payments of the sums due to the merchants for what has been sold in the caravanseras, on the seller's paying two per cent.

CARAVEL; thus they call a small vessel on the coast of France, which goes to fish for herring on the banks. They are commonly from 25 to 30 tons burden. Those which are designed for the same fishery in the British channel are called the French transquarts; these are from 12 to 15 tons burden.

CARAWAY. See CARUM, BOTANY INDEX.
CARBONADE, or CARBONADO, in cookery; flesh, fowl, or the like, seasoned and broiled on the coals.

CARBUNCLE, in Natural History, a very elegant gem, whose colour is deep red, with an admixture of scarlet.

This gem was known among the ancients by the name of anthrax. It is usually found pure and faultless, and is of the same degree of hardness with the sapphire: it is naturally of an angular figure; and is found adhering by its base, to a heavy and ferruginous stone of the emery kind: its usual size is near a quarter of an inch in length, and two-thirds of that in diameter in its thickest part: when held up against the sun, it loses its deep tinge, and becomes exactly of the colour of a burning charcoal, whereas the propriety of the name which the ancients gave it. It bears the fire unaltered, not parting with its colour, nor becoming at all the paler by it. It is found only in the East Indies, so far as is yet known; and there but very rarely.

CARBUNCULL, or Anthrax, in Medicine, an inflammation which arises, in time of the plague, with a vesicle or blister almost like that produced by burning.

CARBUNCLE, in Heraldry, a charge or bearing, consisting of eight radii, four whereof make a common cross, and the other four a saltire.

Some call these radii button, or staves, because round, and enriched with buttons, or pearled like pilgrim's staves, and frequently tipped or terminated with flowers.
CAR [174] CAR

Carbuncle de loces; others blazon them, royal sceptre, placed in saltier, pale and fesse.

Carcass, Carcasse, or Carcass, in the art of war, an iron case, or hollow capacity, about the bigness of a bomb, of an oval figure, made of ribs of iron, filled with combustible matters, as meal powder, saltpetre, sulphur, broken glass, shavings of horn, turpentine, tail-

tow, &c. It has two or three apertures out of which the fire is to blaze, and the design of it is to be thrown out of a mortar, to set houses on fire, and do other exec-

ution. It has the name carcass, because the circles which pass from one ring or plate to the other seem to represent the ribs of a human carcasse.

CARCASSONNE, an ancient city of France, in Lower Languedoc, with a bishop's see. It is divided into the upper and lower town. They are both sur-

rounded with walls; and though their situations are different, they are both watered by the river Aude. The upper town is seated on a hill, with a castle that com-

mands it as well as the lower town. It is strong, not only by its situation on a craggy rock, but also by several large towers which are joined to its walls, and which render it of difficult access. The cathedral church is remarkable for nothing but its antiquity. The lower town is large, and built after the modern taste. The streets are very straight, and lead to a large square in the middle, from whence may be seen the four gates of the town. It contained 15,200 inhabitants in 1815. The neighbouring country is full of olive-

trees; and in the mountains there is a fine marble, commonly called marble of Languedoc. E. Long. 2. 25. N. Lat. 43. 11.

This place bore a considerable share in that celebrated crusade undertaken against the Albigeoses in the beginning of the 13th century, and which forms one of the most astonishing instances of superstition and of atrocious barbarity to be found in the annals of the world. When the royal power was nearly annihilated, during the reigns of the last kings of the Carlovingian race in France, most of the cities of Languedoc erected themselves into little independent states, governed by their own princes. Carcassonne was then under the dominion of viscounts. At the time when Pope Innocent III. patronised and commanded the prosecution of hostilities against the Albigeoses for the crime of heresy, Raymond the reigning viscount was included in that prescription. Simon de Montfort, general of the army of the church, invested the city of Carcassonne in 1209. The inhabitants, terrified at the fate of se-

veral other places where the most dreadful massacres had been committed, demanded leave to capitulate; but this act of mercy was only extended to them under a condition equally cruel, incredible, and unparalleled in history, if we are not compelled to believe it by the unanimous testimony of all the contemporary writ-

ers. The people found in the place were all obdured, without distinction of rank or sex, to evacuate it in a state of nudity; and Agnes the viscountess was not ex-

empted, though young and beautiful, from this igno-

manious and shocking punishment. "On les fit sortir tout nus de la ville de Carcassonne (says an ancient author) afin qu'ils ressussissent de la honte, en montrant ces parties du corps que la pureté de la langue n'ex-

prime point, desquelles ils avoient abuse, et s'en etoient servis dans des crimes execrables." It seems by this

imputation that the Albigeoses were accused by their Carcassese enemies of some enormities, probably unjust, and similar to those which religious enmity and prejudice have attributed to the followers of Zinzendorf in the last century.

CARCERES, in the ancient Circassian games, were inclosures in the circus, wherein the horses were re-

strained till the signal was given for starting, when by an admirable contrivance, they all at once flew open.

CARCHEMISH, in Ancient Geography, a town lying upon the Euphrates, and belonging to the Assy-

rians. Nebcho king of Egypt took it from the king of Assyria, 2 Chron. xxx. 25. Nebcho left a garrison in it, which was taken and cut to pieces, in the fourth year of Jehoiachin king of Judah, by Nebuchadnezzar king of Babylom, 2 Kings xxiii. 29. Isaiah (x. 9.) speaks of Carchemish, and seems to say, that Tiglat-Phileser made a conquest of it, perhaps from the Egyptians. This is thought to be the same city with that called Circesium by the Greeks and Latins.

CARCINOMA, in Medicine; the same with CANCER. See Medicine and Surgery Index.

CARD, among artificers, an instrument consisting of a block of wood, beset with sharp teeth, serving to ar-

range the hairs of wool, flax, hemp, and the like; there are different kinds of them, as hand-cards, stock-cards, &c. They are made as follows:

A piece of thick leather, of the size intended for the card, is strained in a frame for that purpose; and then pricked full of holes, into which the teeth or pieces of iron wire are inserted. After which the leather is nailed by the edges to a flat piece of wood, in the form of an oblong square, about a foot in length, and half a foot in breadth, with a handle placed in the middle of one of the longer sides.

The teeth are made in the following manner. The wire being drawn of the size intended, a skin or num-

ber of wires are cut into proper lengths by means of a gauge, and then doubled in a tool contrived for that purpose; after which they are bent into the proper di-

rection by means of another tool; and then placed in the leather, as mentioned above.

CARDS, among gamesters, little pieces of fine thin pasteboard of an oblong figure, of several sizes; but most commonly in Britain, three inches and a half long and two and a half broad, on which are painted several points and figures.

The moulds and blocks for making cards are exactly like those that were used for the first printed books. They lay a sheet of wet or moist paper on the block, which is very slightly done over with a sort of ink made of lamp-black-diluted in water, and mixed with some starch to give it a body. They afterwards rub it off with a round list. The court-cards are coloured by means of several patterns, styled same-fils. These consist of papers cut through with a penknife; and in these apertures they apply several by the various colours, as red, black, &c. These patterns are painted with oil-colours, that the brushes may not wear them out; and when the pattern is laid on the pasteboard, they slightly pass over it a brush full of colour, which leaving it within the openings, forms the face or figure of the card.

Among sharpeners, divers sorts of false and fraudulent cards have been contrived; as, 1. Marked cards, where-
the aces, kings, queens, knaves, are marked on the corners of the backs with spots of different number and order, either with clear water or water tinted with pale Indian ink, that those in the secret may distinguish them. Aces are marked with single spots on two corners opposite diagonally: kings with two spots at the same corners: knaves with the same number transversed. 2. Breast cards, those which are longer or broader than the rest; chiefly used at whist and piquet. The broad cards are usually for kings, queens, knaves, and aces; the long for the rest. Their design is to direct the cuttings, to enable him in the secret to cut the cards disadvantageously to his adversary, and draw the person unacquainted with the fraud to cut them favourably for the sharper. As the pack is placed either endwise or sidewise to him that is to cut, the long or broad cards naturally lead him to cut them. Breast cards are sometimes made thus by the manufacturer; but, in defect of these, sharpeners may use all but the breviss with a penknife or razor. 3. Corner bend, denotes four cards turned down finely at one corner, to serve as a signal to cut by. 4. Middle bend, or Kingston-bridge, is where the tricks are bent two different ways, which causes an opening or arch in the middle, to direct likewise the cutting.

Cards were invented about the year 1390, to divert Charles VI. of France, who had fallen into a melancholy disposition. The inventor proposed, by the figures of the four suits or colours, as the French call them, to represent the four classes of men in the kingdom. By the coeurs (hearts) are meant the gens de coeur, choir-men, or ecclesiastics; and therefore the Spaniards, who certainly received the use of cards from the French, have copas, or chapels, instead of hearts. The nobility, or prime military part of the kingdom, are represented by the ends or points of lances or pikes; and our ignorance of the meaning or the resemblance of the figure induced us to call them spades: The Spaniards have espadas, swords, in lieu of pikes, which are of similar import. By diamonds are designed the order of citizens, merchants, or tradesmen, carreau, (square stones, tiles, or the like): The Spaniards have a coin, dineros, which answers to it: and the Dutch call the French word carreaux, "strenen," stones and diamonds, from frene, the trefoil-leaf, or clover-grass (corruptly called clubs), alludes to the husbardsmen and peasants. But how this suit came to be called clubs is not easily explained; unless borrowing the game from the Spaniards, who have bastos (staves or clubs) instead of the trefoil, we give the Spanish signification to the French figure.

The history of the four kings, which the French, in drollery, sometimes call the cards, are David, Alexander, Caesar, and Charles; which names were then, and still are on the French cards. Those respectable names represent the four celebrated monarchies of the Jews, Greeks, Romans, and Franks under Charlemagne. By the queens are intended Argine, Esther, Judith, and Pallas (names retained in the French cards), typical of birth, piety, fortitude, and wisdom, the qualifications residing in each person. Argine is an anagram for regina, queen by descent. By the knaves were designed the servants to the kings (for knave originally meant only servant); but French pages and valets, now indiscriminately used by various orders of persons, were formerly only allowed to persons of quality, esquires (esquires), shield or armour bearers. Others fancy that the knights themselves were designed by those cards; because Hogier and Labire, two names on the French cards, were famous knights at the time cards were supposed to have been invented.

Deceptions with Cards. See Leguerdemain, sect. i.

CARDAMINE, in Botany, a genus of the siliqua order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order Siliquoseae. The siliqua parts asunder with a spring, and the valves roll spirally backward; the stigma is entire, and the calyx a little gaping. Of this there are 15 species; but the most remarkable is the pratensis, with a large purplish flower. This grows naturally in many parts of Britain, and is also called cuckoo flower. There are four varieties, viz. the single, with purple and white flowers, which are frequently intermixed in the meadows; and the double, of both colours. The single sorts are not admitted into gardens; but the double deserve a place, as making a pretty appearance during the time they are in flower. They will thrive in a moist shady border; and are propagated by parting their roots, which is best performed in autumn. They delight in a soft loamy soil, not too stiff. By some the plant is reckoned antiscorbutic.

CARDAMOM, in the Materia Medica. See Amomum.

CARDAN, Jerom, one of the most extraordinary geniuses of his age, was born at Pavia on the 24th of September 1501. As his mother was not married, she tried every method to procure an abortion, but without effect. She was three days in labour, and they were at last obliged to cut the child from her. He was born with his head covered with black curled hair. When he was four years old, he was carried to Milan, his father being an advocate in that city. At the age of 20, he went to study at the university of that city; and two years afterwards he explained Euclid. In 1524, he went to Padua, and the same year he was admitted to the degree of master of arts: in the end of the following year, he took the degree of doctor of physic. He married about the year 1531. For ten years before, his impotency had hindered him from having knowledge of a woman, which was a great mortification to him. He attributed it to the evil influences of his planet under which he was born. When he enumerates, as he frequently does, the greatest misfortunes of his life, this ten years impotency is always one. At the age of 32, he became professor of mathematics at Milan. In 1539, he was admitted a member of the college of physicians at Milan; in 1543, he read public lectures of medicine in that city; and at Pavia the year following; but discontinued them because he could not get payment of his salary, and returned to Milan. In 1552, he went into Scotland, having been sent for by the archbishop of St. Andrew's who had in vain applied to the French king's physicians, and afterwards to those of the emperor of Germany. This prelate, then 90 years old, had for ten years been afflicted with a shortness of breath, which returned every eight years for the last twelve years. He lived sixty years from the moment that Cardan prescribed for him. Cardan took his leave of him at the end of six weeks and
and three days, leaving him prescriptions which in two years wrought a complete cure.

Cardan's journey to Scotland gave him an opportunity of visiting several countries. He crossed France in going thither; and returned through Germany, and the Low Countries, along the banks of the Rhine. It was on this occasion he went to London, and calculated King Edward's nativity. This tour took up about four months; after which, coming back to Milan, he continued there till the beginning of October 1552; and then went to Pavia, from whence he was invited to Bologna in 1562. He was taught in this last city in the year 1570; at which time he was thrown into prison; but some months after he was sent home to his own house. He left Bologna in 1571, and went to Rome, where he lived for some time without any public employment. He was, however, admitted a member of the college of physicians, and received a pension from the pope. He died at Rome on the 21st of September, 1575, according to Thuanus. This account might be sufficient to show the reader that Cardan was of a very fickle temper; but he will have a much better idea of his singular and odd turn of mind by examining what he himself has written concerning his own good and bad qualities. He paid himself congratulatory compliments for not having a friend in this world; but that in requital, he was attended by an aerial spirit, emanated partly from Saturn and partly from Mercury, who was the constant guide of his actions, and teacher of every duty to which he was bound. He declared, too, that he was so irregular in his manner of walking the streets, as induced all beholders to point at him as a fool. Sometimes he walked very slowly, like a man absorbed in profound meditation; then all on a sudden quickened his steps, accompanying them with very absurd attitudes. In Bologna his delighted to be drawn about in a mean vehicle with three wheels. When nature did not visit him with any pain, he would procure to himself that disagreeable sensation by biting his lips so wantonly, or pulling his fingers to such a vehement degree, as sometimes to force the tears from his eyes: and the reason he assigned for so doing, was to moderate certain impetuous sallies of the mind, the violence of which was to him by far more insupportable than pain itself; and that the sure consequence of such a severe discipline was the enjoying the pleasure of health. He says elsewhere, that, in the greatest tortures of soul, he used to whip his legs with rods, and bite his left arm; that it was a great relief to him to weep, but that very often he could not; that nothing gave him more pleasure than to talk of things which made the whole company uneasy; that he spoke on all subjects, in season and out of season; and he was so fond of games of chance, as to spend whole days in them, to the great prejudice of his family and reputation, for he even staked his furniture and his wife's jewels.

Cardan makes no scruple of owning that he was resentful, envious, treacherous, a dealer in the black-art, a backbiter, a calumniator, and addicted to all the foul and detestable excesses that can be imagined; yet notwithstanding (as one would think) so humbling a declaration, there was never perhaps a vainer mortal, or one that with less ceremony expressed the high opinion he had of himself, than Cardanus was known to do, as will appear by the following proofs. "I have been admired by many nations: an infinite number of panegyrics, both in prose and verse, have been composed to celebrate my fame. I was born to release the world from the manifold errors under which it groaned. What I have found out could not be discovered either by my predecessors or my cotemporaries; and that is the reason why those authors who write anything worthy of being remembered, scruple not to own that they are indebted to me for it. I have composed a book on the dialectic art, in which there is neither one superfluous letter nor one deficient. I finished it in seven days, which seems a prodigy. Yet where is there a person to be found, that can boast of his having become master of its doctrine in a year? And he that shall have comprehended it in that time, must appear to have been instructed by a familiar demon."

The same capriciousness observable in his outward conduct is to be observed in the composition of his works. We have a multitude of his treatises in which the reader is stopped almost every moment by the obscurity of his text, or his digressions from the point in hand. In his arithmetical performances there are several discourses on the motions of the planets, on the creation, and on the tower of Babel. In his dialectic work, we find his judgment on the historians and the writers of epistles. The only apology which he makes for the frequency of his digressions is, that they were purposely done for the sooner filling up of his sheets, his bargain with the bookseller being at so much per sheet: and that he worked as much for his daily support as for the acquisition of glory. The Lyons edition of his works, printed in 1663, consists of ten volumes in folio.

It was Cardanus who revived in latter times all the secret philosophy of the Cabbala or Cabbalists, which filled the world with spirits; a likeness to whom, he asserted, we might attain by purifying ourselves with philosophy. He chose for himself, however, notwithstanding such reveries, this fine device, Tempus mea possesso, tempus meus aget: "Time is my sole possession, and the only fund I have to improve."

In fact, when we consider the transcendent qualities of Cardan's mind, we cannot deny his having cultivated it with every species of knowledge, and his having made a greater progress in philosophy, in the medical art, in astronomy, in mathematics, &c. than the greatest part of his cotemporaries who had applied their minds but to one of those sciences.

Scaliger affirms, that Cardan, having fixed the time of his death, abstained from food, that this prediction might be fulfilled, and that his continuance to live might not discredit his art. Cardan's father, who was a doctor of medicine, and a professor of civil and canon law, died in the same manner in the year 1524, having abstained from all sustenance for nine days. His son tells us that he had white eyes, and could see in the night time.

CARDASS, a sort of card proper for carding flocks of silk, to make cappadine of it. It is also the name which the French give to those flocks of silk. CARDASS is also the name which, in the cloth manufactories of Languedoc, they give to a sort of large card, which is used for carding the dyed wool, designed for making cloth of mixed colours.
CARDERS, in the woollen manufactory, are persons who prepare wool, &c. for spinning, &c.

Carders, spinners, weavers, fullers, shearmen, and dyers, not performing their duty in their occupations, shall yield to the party grieved double damages; to be committed until payment. One justice to hear and determine complaints.

Carders, combers, sorters, spinners, or weavers, conveying away, embezelling, or detaining any wool or yarn, delivered by the clothier, or any other person, shall give the party grieved such satisfaction, as two justices, mayor, &c. shall think fit: if not able or willing to make satisfaction, for the first offence to be whipped, or set in the stocks in some market town, or in any other town where the offence is committed: the second offence to incur the like, or such further punishment by whipping, &c. as justices shall think proper. Conviction by one witness on oath, or confession.

CARDI, LUCIVITICO. See CVITIOL.

CARDIAC, in a general sense, signifies all medicines beneficial to the heart, whether internally or externally applied. The word comes from the Greek word καρδια, cor; the heart being reputed the immediate seat of their operation.

CARDIACS, in a more particular sense, denote medicines which raise the spirits and give present strength and cheerfulness; these amount to the same with what are properly called cardials. Cardiacs are medicines insinuated to exert themselves immediately in comforting and strengthening the heart: but the modern physicians rather suppose them to produce the effect by putting the blood into a gentle fermentation, whereby the springs, before decayed, are repaired and invigorated, and the tone and elasticity of the fibres of the vessels restored; the consequence of which is a more easy and brisk circulation.

CARDIALGIA, in Medicine, a violent sensation of heat or acrimony felt towards the upper or left orifice of the stomach, though seemingly at the heart; sometimes accompanied with palpitation of the heart, fainting, and a propensity to vomit: better known by the name of cardiac passion, or heart-burn. See Medicine Index.

CARDIFF, a town of Glamorganshire, in South Wales, seated on the river Tawe, in a rich and fruitful soil. It is a large, compact, well built town, having a castle, a wall, and four gates, built by Robert Fitzhamon, a Norman, about the year 1100. It is governed by the constable of the castle, 12 aldermen, 12 burgesses, &c. and sends one member to parliament. Here the assizes and sessions are held, besides several courts. There is a handsome bridge over the river, to which small vessels come to take in their lading. It has now only one church; St Mary's having been long since thrown down by the undermining of the river. The castle, though much decayed, makes a grand appearance at this time; and the walls of the town are very strong and thick. The church has a fine tower-steeple, and the town-hall is a good structure. The magistrates are elected every year by the majority of the burgesses. W. Long. 3° 32'. N. Lat. 51° 32'. Cardiff gives the title of a British baron to the family of Bute in Scotland. Population 24,577 in 1811.

CARDIGAN, the capital town of Cardiganshire, in South Wales, is seated near the mouth of the river Teivy, on the Irish channel. It contains three wards, one church, and the county gaol, and had 2,129 inhabitants in 1811. It is governed by a mayor, 12 aldermen, 12 common council men, &c. Here are the ruins of a castle which was built by Gilbert de Clare, about the year 1100. It sends one member to parliament; and has two markets, held on Tuesdays and Saturdays.

CARDIGANSHIRE, a county of South Wales, bounded on the north by Merionethshire and Montgomeryshire, on the east by Radnorshire and Brecknockshire, on the west by the Irish sea, and on the south by Caermarthenshire. Its length from north-west to south-east is about 44 miles, and its breadth near 20. The air, as in other parts of Wales, varies with the soil, which in the southern and western parts is more upon a level than this principality generally is, which renders the air mild and temperate. But as the northern and eastern parts are mountainous, they are consequently more barren and bleak. However, there are cattle bred in all parts; but they have neither wood nor coal. They have rich lead mines, and fish in plenty. The principal rivers are the Teivy, the Ridiol, and the Iswith. This county has five market towns, viz. Cardigan, Aberystwith, Llanbadarn-fawr, Llanbedr, and Tregaron, with 77 parishes; and was computed to have upwards of 320,000 acres of land. It sends two members to parliament; one for the county, and one for Cardigan, and contained 50,260 inhabitants in 1811. See CARDIGANSHIRE, Supplement.

CARDINAL, in a general sense, an appellation given to things on account of their pre-eminence. The word is formed of the Latin cardo, a hinge; it being on these fundamental points that all the rest of the same kind are suppose to turn. Thus, justice, prudence, temperance, and fortitude, are called the four cardinal virtues, as being the basis of all the rest.

CARDINAL Flower. See LOBELIA, BOTANY Index.

CARDINAL Points, in Cosmography, are the four intersections of the horizon with the meridian, and the prime vertical circle. Of these, two, viz. the intersections of the horizon and meridian, are called North and South, with regard to the poles they are directed to. The other two, viz. the intersections of the horizon and first vertical, are called East and West.

The cardinal points, therefore, coincide with the four cardinal regions of the heavens; and are 90° distant from each other. The intermediate points are called collateral points.

CARDINAL Points, in Astrology, are the rising and setting of the sun, the zenith, and nadir.

CARDINAL Signs, in Astronomy, are Aries, Libra, Cancer, and Capricorn.

CARDINAL Winds are those that blow from the cardinal points.

CARDINAL Numbers, in Grammar, are the numbers one, two, three, &c. which are indeclinable; in opposition to the ordinal numbers, first, second, third, fourth, &c.

CARDINAL, an ecclesiastical prince in the Romish church, being one who has a voice in the conclave at the election of a pope. Some say the cardinals were so called from the Latin inordinatio, which signifies...
Cardinal, the adoption in any church made of a priest of a foreign church, driven hence by misfortune: and add, that the use of the word commenced at Rome and Ravenna; the revenues of the church of which cities being very great, they became the common refuge of the unhappy priests of all other churches.

The cardinals compose the pope's council or senate. In the Vatican is a constitution of Pope John, which regulates the rights and titles of the cardinalis; and which declares, that as the pope represents Moses, so the cardinals represent the seventy elders, who, under the pontifical authority, decide private and particular differences.

Cardinals, in their first institution, were only the principal priests, or incumbents, of the parishes of Rome. In the primitive church, the chief priest of a parish, who immediately followed the bishop, was called presbyter cardinalis, to distinguish him from the other petty priests, who had no church nor preferment; the term was first applied to them in the year 150; others say, under Pope Silvester, in the year 300. These cardinal priests were alone allowed to baptize, and administer the eucharist. When the cardinal priests became bishops, their cardinalate became vacant; they being then supposed to be raised to a higher dignity.—Under Pope Gregory, cardinal priests, and cardinal deacons, were only such priests and deacons as had a church or chapel under their particular care: and this was the original use of the word. Leo IV., in the council of Rome, held in 832, calls them presbyteros sui cardinis; and their churches, parochias cardinalis.

The cardinals continued on this footing till the eleventh century; but as the grandeur and state of his holiness became then exceedingly augmented, he would have his council of cardinals make a better figure than the ancient priests had done. It is true, they still preserved their ancient title; but the thing expressed by it was no more. It was a good while, however, before they had the precedence over the bishops, or got the election of the pope into their hands: but when they were once possessed of those privileges, they soon had the red hat and purple; and growing still in authority, they became at length superior to the bishops, by the sole quality of being cardinals.

Du Cange observes, that originally there were three kinds of churches: the first or genuine churches were properly called parishes; the second decanates, which were chapels joined to hospitals, and served by deacons; the third were simple oratories, where private masses were said, and were discharged by local and resident chaplains. He adds, that to distinguish the principal or parish churches from the chapels and oratories, the name cardinalis was given to them. Accordingly, parish churches gave titles to cardinal priests; and some chapels also, at length, gave the title of cardinal deacon.

Others observe, that the term cardinal was given not only to priests, but also to bishops and deacons who were attached to certain churches, to distinguish them from those who only served them en passant, and by commission. Titular churches, or benefices, were a kind of parishes, i.e. churches, assigned each to a cardinal priest; with some stated district depending on it, and a feast for administering of baptism, in cases where the bishop himself could not administer it. These cardinals were subordinate to the bishops; and accordingly, in councils, particularly that held at Rome in 868, subscribed after them.

It was not, however, only at Rome, that priests bore this name; for we find there were cardinal priests in France: thus, the curate of the parish of St John de Vignes is called in old charters the cardinal priest of that parish.

The title of cardinal is also given to some bishops, quattuor bis, e.g., to those of Mentz and Milan: the archbishop of Bourges is also, in ancient writings, called cardinal; and the church of Bourges, a cardinal church. The abbot of Vendome calls himself cardinalis natus.

The cardinals are divided into three classes or orders, containing six bishops, fifty priests, and fourteen deacons; making in all seventy, which constitute what they call the sacred college. The cardinal bishops, who are, as it were, the pope's vicars, bear the titles of the bishoprics assigned to them: the rest take such titles as are given them: the number of cardinal bishops has been fixed; but that of cardinal priests and deacons, and consequently the sacred college itself, is always fluctuating. Till the year 1125, the college only consisted of fifty-two or fifty-three: the council of Constance reduced them to twenty-four; but Sixtus IV., without any regard to that restriction, raised them again to fifty-three, and Leo to sixty-five. Thus, as the number of cardinal priests was annually fixed to twenty-eight, new titles were to be established, in proportion as new cardinals were created. As for the cardinal deacons, they were originally no more than seven for the fourteenth quarters of Rome: but they were afterwards increased to nineteen, and after that were again diminished.

According to Onuphrius, it was Pope Pius IV. who first enacted, in 1562, that the pope should be chosen only by the senate of cardinals; whereas, till that time, the election was by all the clergy of Rome. Some say, the election of the pope rested in the cardinals, exclusive of the clergy, in the time of Alexander III. in 1156. Others go higher still, and say, that Nicholas II., having been elected at Sienna, in 1058, by the cardinals alone, occasioned the right of election to be taken from the clergy and people of Rome; only leaving them that of confirming him by their consent, which was at length, however, taken from them. See his decree for this purpose, issued in the Roman council of 1059, in Hardouin's Acta Conciliorum, tom. vi. pt. i. p. 1165. Whence it appears, that the cardinals who had the right of suffrage in the election of his successors, were divided by this pontiff into cardinal bishops, and cardinal clerus; meaning by the former the seven bishops who belonged to the city and territory of Rome; and by the latter, the cardinal presbyters, or ministers of the twenty-eight Roman parishes, or principal churches. To these were added, in process of time, under Alexander III. and other pontiffs, new members, in order to appease the tumults occasioned by the edict of Nicholas II.

At the creation of a new cardinal, the pope performs the ceremony of opening and shutting his mouth; which is done in a private consistory. The shutting his mouth implies the depriving him of the liberty of giving his opinion in congregations; and the opening
his mouth, which is performed 15 days after, signifies the taking off his restraint. However, if the pope happens to die during the time a cardinal's mouth is shut, he can neither give his voice in the election of a new pope, nor be himself advanced to that dignity.

The dress of a cardinal is a red soutane, a rochet, a short purple mantle, and a red hat.

The Cardinals began to wear the red hat at the council of Lyons, in 1243. The decree of Pope Urban VIII. whereby it is appointed, that the cardinals be addressed under the title of eminence, is of the year 1630; till then, they were called illustrissimi.

When cardinals are sent to the courts of princes, it is in quality of legates a latere; and when they are appointed governors of towns, their government is called by the name of legation.

CARDINAL has also been applied to secular officers. Thus, the prime ministers in the court of the emperor Theodosius, are called cardinales. Cassiodorus, lib. viii. formul. 31. makes mention of the cardinal prince of the city of Rome; and in the list of officers of the duke of Bretagne, in 1447, we meet with one Raoul de Thorel, cardinal of Quillart, chancellor, and servant of the viscount de Rohan: which shows it to have been an inferior quality.

CARDIOD, in the higher geometry, an algebraical curve, so called from its resemblance to a heart.

CARDIOSPERNUM. See Botany Index.

CARDIUM, or Cockle, in Zoology, a genus of insects belonging to the order of vormes testace. The shell consists of two equal valves, and the sides are equal. There are 23 species of this genus. Common on all sandy coasts, lodges a little beneath the sand; their place is marked by a depressed spot. They are wholesome and delicious food.

CARDONA, a handsome town of Spain, in Cataluonia, with a strong castle, and the title of a duky, and containing 2800 inhabitants. Near it is an inexhaustible mountain of salt of several colours, as red, white, carnation, and green: but when washed, it becomes white. There are also vineyards which produce excellent wine. It is seated on an eminence, near the river Cardenero. E. Long. 1. 26. N. Lat. 41. 42.

CARDUUS. See Botany Index.

CARDUIUS Benedictus, Blessed thistle. See Cnicus, Botany Index.

CAREERING, in the sea-language, the bringing a ship to lie down on one side, in order to trim and caulk the other side.

A ship is said to be brought to the careen, when the most of her lading being taken out, she is hulled down on one side, by a small vessel, as low as necessary; and there kept by the weight of the ballast, ordinance, &c. as well as by ropes, lest her masts should be strained too much; in order that her sides and bottom may be trimmed, seams nailed, or any thing that is faulty under water mended. Hence, when a ship lies on one side when she sails, she is said to sail on the careen.

CAREER, in the manage, a place enclosed with a barrier, wherein they run the ring.

The word is also used for the race or course of the horse itself, provided it do not exceed 200 paces.

In the ancient circus, the career was the space the Bige, or quadrigae, were to run at full speed, to gain the prize. See Circus.
In 1589, he was elected a member of the college of Antiquaries, a distinction to which he was entitled by his literary abilities and pursuits. What particularly engaged his attention was his native county, his "Survey" of which was published, in 4to at London, in 1602. It had been twice reprinted, first in 1723, and next in 1769. Of this work Camden hath spoken in high terms, and acknowledges his obligations to the author. In the present improved state of topographical knowledge, and since Dr Buriasse's excellent publications relative to the county of Cornwall, the value of Carew's "Survey" must have been greatly diminished. Mr Gough remarks, that the history and monuments of this country were faintly touched by Carew; but it is added, that he was a person extremely capable of describing them, if the infancy of those studies at that time had afforded light and materials. Another work of our author was a translation from the Italian, entitled, "The Examination of Men's Wits. In which, by discovering the variety of natures, it is shown for what profession each one is apt, and how far he shall profit therein." This was published at London in 1594, and afterwards in 1604; and though Richard Carew's name is prefixed to it, hath been principally ascribed by some persons to his father. According to Wood, Carew wrote also, "The true and ready way to learn the Latin tongue," in answer to a query, whether the ordinary method of teaching the Latin by the rules of grammar be the best mode of instructing youths in that language? This tract is involved in Mr Hartlib's book upon the same subject, and with the same title. It is certain that Carew was a gentleman of considerable abilities and literature, and that he was held in great estimation by some of the most eminent scholars of his time. He was particularly intimate with Sir Henry Spelman, who extols him for his ingenuity, virtue, and learning.

CAREW, George, brother to the subject of the last article, was educated in the university of Oxford, after which he studied the law in the inns of court, and then travelled to foreign countries for farther improvement. On his return to his native country, he was called to the bar, and after some time was appointed secretary to Sir Christopher Hatton, lord chancellor of England. This was by the special recommendation of Queen Elizabeth herself, who gave him a prothonotaryship in the chancery, and conferred upon him the honour of knighthood. In 1597, Sir George Carew, who was then a master in chancery, was sent ambassador to the king of Poland. In the next reign, he was one of the commissioners for treating with the Scotch concerning an union between the two kingdoms; after which he was appointed ambassador to the court of France, where he continued from the latter end of the year 1605 till 1609. During his residence in that country, he formed an intimacy with Thuanus, to whom he communicated an account of the transactions in Poland whilst he was employed there, which was of great service to that admirable author in drawing up the 121st book of his history. After Sir George Carew's return from France, he was advanced to the important post of master of the court of wards, which honourable situation he did not long live to enjoy; for it appears from a letter written by Thuanus to Camden in the spring 1613 that he was then lately deceased. Sir George Carew married Thomasine, daughter of Sir Francis Godolphin, great grandfather of the lord treasurer Godolphin, and had by her two sons and three daughters.

When Sir George Carew returned, in 1609, from his French embassy, he drew up, and addressed to James I. "A Relation of the State of France, with the characters of Henry IV. and the principal persons of that Court." The characters are drawn from personal knowledge and close observation, and might be of service to a general historian of that period. The composition is perspicuous and manly, and entirely free from the pedantry which prevailed in the reign of James I.; but this is the less surprising, as Sir George Carew's taste had been formed in a better era, that of Queen Elizabeth. The valuable tract we are speaking of lay for a long time in MS.; till happily falling into the hands of the earl of Hardwicke, it was communicated by him to Dr Birch, who published it, in 1749, at the end of his "Historical View of the Negotiations between the Courts of England, France, and Brussels, from 1592 to 1617." That intelligent and industrious writer justly observes, that it is a model upon which ambassadors may form and digest their notions and representations; and the late celebrated poet Mr Gray hath spoken of it as an excellent performance.

CAREX, SEDGE-GRASS. See BOTANY Index.

CAREY, Harry, a man distinguished by both poetry and music, but perhaps more so by a certain facetiousness, which made him agreeable to every body. He published in 1720 a little collection of poems; and in 1732, six cantatas, written and composed by himself. He also composed sundry songs for modern comedies, particularly those in the "Proved Husband;" he wrote a farce called "The Contrivances," in which were several little songs to very pretty airs of his own composition; he also made two or three little dramas for Goodman's-fields theatre, which were very favourably received. In 1729, he published by subscription his poems much enlarged: with the addition of one entitled "Namby Pamby," in which Ambrose Philips is ridiculed. Carey's talent, says his historian, lay in humour and unmalevolent satire; to ridicule the rant and bombast of modern tragedies he wrote one, to which he gave the strange title of "Chrononhotonthologus," acted in 1734. He also wrote a farce called "The Honest Yorkshireman." Carey was a thorough Englishman, and had an unsurmountable aversion to the Italian opera and the singers in it: he wrote a burlesque opera upon the subject of the "Dragon of Wantley;" and afterwards a sequel to it, entitled, "The Dragoness;" both which were esteemed a true burlesque upon the Italian opera. His qualities being of the entertaining kind, he was led into more expenses than his finances could bear, and thus was frequently in distress. His friends, however, were always ready to advance him by small subscriptions to his works; and encouraged by these, he republished, in 1740, all the songs he had ever composed, in a collection, entitled, "The Musical Century, in 100 English Ballads, &c." and, in 1743, his dramatic works, in a small volume, 4to. With all his mirth and good humour, he seems to have been at times deeply affected with the malevolence of some of his own profession, who, for reasons that no one can guess at,
Caribbean Islands

were his enemies, and this, with the pressure of his circumstances, is supposed to have occasioned his untimely end; for, about 1744, in a fit of desperation, he laid violent bands on himself, and, at his house in Warner-street, Cold-Bath Fields, put an end to a life, which, says Sir John Hawkins, had been led without reproach. It is to be noted, and it is somewhat singular in such a character, that in all his songs and poems on wine, love, and such kind of subjects, he seems to have manifested an inviolable regard for decency and good manners.

CARGADORS, a name which the Dutch give to those brokers whose business is to find freight for ships outward bound, and to give notice to the merchants, who have commodities to send by sea, of the ships that are ready to sail, and of the places for which they are bound.

CARGAPOL, or KARGAPOL, the capital of a territory of the same name, in the province of Dwina, in Muscovy. E. Long. 35. N. Lat. 63.

CARGO denotes all the merchandise and effects which are laden on board a ship.

Super-CARGO, a person employed by merchants to go a voyage, oversee the cargo, and dispose of it to the best advantage.

CARIOCA, in Ancient Geography, a country of the Hither Asia; whose limits are extended by some, while they are contracted by others. Mela and Pliny extend the maritime Caria from Iasus and Halicarnassus, to Calynda, and the borders of Lycia. The inland Caria Ptolemy extends to the Meander and beyond. Car, Cariates, Cariata, Carissa, and Caris, are the gentilicious names; Carusus and Caricus the epithets. In Care periculum, was a proverbial saying on a thing exposed to danger, but of no great value. The Cares being the Swiss of those days, were hired and placed in the front of the battle, (Cicero.) Cum Care Carissa, denoted the behaviour of clowns. The Cares came originally from the islands to the continent, being formerly subject to Minos, and called Legeis: this the Cretans affirm, and the Cares deny, making themselves aborigines. They are of a common original with the Myris and Lydi, having a common temple, of a very ancient standing, at Melassa, a town of Caris, called Jovis Carit Dehurum, (Herodotus.) Homer calls the Carians, barbarians in language.

CARIATI, a town of Italy, in the kingdom of Naples, and province of Hither Calabria, with a bishop's see, and the title of a principality. It is two miles from the gulf of Taranto, and 37 north-east of Coenanza. E. Long. 17. 19. N. Lat. 33. 30.

CARIBBEE ISLANDS, a cluster of islands situated in the Atlantic ocean between 59 and 63 degrees of west longitude, and between 11 and 18 degrees of north latitude. They lie in the form of a bow or semicircle, stretching almost from the coast of Florida north, to near the river Oroonoko. Those that lie nearest the east have been called the Windward Islands; the others the Leeward, on account of the winds blowing generally from the eastern point in those quarters. Abbé Raynal conjectures them to be the tops of very high mountains formerly belonging to the continent, which have been changed into islands by some revolution that has laid the flat country under water. The direction of the Caribbe islands, beginning from Tabago, is nearly north and N. N. W. This direction is continued, forming a line somewhat curved towards the north-west, and ending at Antigua. In this place the line becomes at once curved; and extending itself in a straight direction to the west and north-west, meets in its course with Porto-Rico, St Domingo, and Cuba, known by the name of the Leeward Islands, which are separated from each other by canals of various breadths. Some of these are 6, others 15 or 20 leagues broad, but in all of them the soundings are from 100 to 120 or 150 fathoms. Between Grenada and St Vincent's there is also a small archipelago of 30 leagues, in which the soundings are not above ten fathoms. The mountains in the Caribbe islands run in the same direction as the islands themselves. The direction is so regular, that if we were to consider the tops of these mountains only, independent of their bases, they might be looked upon as a chain of hills belonging to the continent, of which Martinico would be the most northerly promontory. The springs of water which flow from the mountains in the Windward islands, run all in the western parts of these islands. The whole eastern coast is without any running water. No springs come down from the mountains; and indeed they would have there been useless; for after having run over a very short tract of land, and with great rapidity, they would have fallen into the sea. In Porto Rico, St Domingo, and Cuba, there are a few rivers that discharge themselves on the northern side, and whose sources rise in the mountains running from east to west, that is, through the whole length of these islands. From the other side of the mountains facing the south, where the sea, flowing with great impetuosity, leaves behind it marks of its inundations, several rivers flow down, the mouths of which are capable of receiving the largest ships. The soil of the Caribbees consists mostly of a layer of clay or gravel of different thickness; under which is a bed of stone or rock. The nature of some of those soils is better adapted to vegetables than others. In those places where the clay is drier and more friable, and mixes with the leaves and remains of plants, a layer of earth is formed of greater depth than where the clay is moister. The sand or gravel has different properties according to its peculiar nature; wherever it is less hard, less compact, and less porous, small pieces separate themselves from it, which, though dry, preserve a certain degree of coolness useful to vegetation. This soil is called in America a pumice-stone soil. Wherever the clay and gravel do not go through such modifications, the soil becomes barren, as soon as the layer formed by the decomposition of the original plants is destroyed.—By a treaty concluded in January 1660, between the French and English, the Caribs were confined to the islands of St Vincent's and Dominica, where all the scattered body of this people were united, and at that time did not exceed in number 6000 men. See St Vincent's and Dominica.

As the Caribbe islands are all between the tropics, their inhabitants are exposed, allowing for the varieties resulting from difference of situation and soil, to a perpetual heat, which generally increases from the rising of the sun till an hour after noon, and then declines in proportion as the sun declines. The variations of the temperature of the air seem to depend rather on the wind than on the changes of the seasons. In those places
places where the wind does not blow, the air is excessively hot, and none but the easterly winds contribute to temper and refresh it; those that blow from the south and west afford little relief; but they are much less frequent and less regular than that which blows from the east. The branches of the trees exposed to the influence of the latter are forced round towards the west; but their roots are stronger, and more extended under the ground, towards the east than towards the west, and hence they are easily thrown down by strong west winds or hurricanes from that quarter. The easterly wind is scarce felt in the Caribbee islands before nine or ten o’clock in the morning, increases in proportion as the sun rises above the horizon, and decreases as it declines. Towards the evening it ceases entirely to blow on the coasts, but not on the open sea. It has also been observed, that it blows with more force and more regularity in the dog-days than at any other time of the year.

The rain also contributes to the temperature of the Caribbee islands, though not equally in them all. In those places where the easterly wind meets with nothing to oppose its progress, it dispels the clouds as they begin to rise, and causes them to break either in the woods or upon the mountains. But whenever the storms are too violent, or the blowing of the easterly wind is interrupted by the changeable and temporary effect of the southerly or westerly ones, it then begins to rain. In the other Caribbee islands, where this wind does not generally blow, the rains are so frequent and plentiful, especially in the winter season, which lasts from the middle of July to the middle of October, that, according to the most accurate observations, as much rain falls in one week as in our climates in a year. Instead of those mild refreshing showers which fall in the European climates, the rains of the Caribbee islands are torrents, the sound of which might be mistaken for hail, were not that almost totally unknown under so burning a sky. These showers indeed refresh the air; but they occasion a dampness, the effects of which are not less disagreeable than fatal. The dead must be interred within a few hours after they have expired. Meat will not keep sweet above 24 hours. The fruits decay, whether they are gathered ripe or before their maturity. The bread must be made up into biscuits, to prevent its growing mouldy. Common wines turn sour, and iron turns rusty, in a day’s time. The seeds can only be preserved by constant attention and care, till the proper season returns for sowing them. When the Caribbee islands were first discovered, the corn that was conveyed there for the support of the Europeans, was so soon damaged that it became necessary to send it out in the ears. This necessary precaution so much enhanced the price of it, that few were able to purchase it. Flour was then substituted in lieu of corn; which lowered indeed the expenses of transport, but had this inconvenience, that it was sooner damaged. It was imagined by a merchant, that if the flour were entirely separated from the bran, it would have the double advantage of being cheaper and keeping longer. He caused it therefore to be sifted, and put the finest flour into strong casks, and then it close together with iron hammers, till it became so close a body that the air could scarcely penetrate it. This method was found to answer the purpose; and if, by it, the flour cannot be preserved as long as in our dry and temperate climates, it may be kept for six months, a year, or longer, according to the degree of care taken in the preparation.

However troublesome these effects of the rain may be, it is attended with some others still more formidable, namely, frequent and dreadful earthquakes. These happening generally during the time or towards the end of the rainy season, and when the tides are highest, some ingenious naturalists have supposed that there might be a connexion between them. The waters of the sky and of the sea undermine, dig up, and ravage the earth in several different ways. Among the various shocks to which the Caribbee islands are exposed from the fury of the boisterous ocean, there is one distinguished by the name of eaux de meres, or coxhill-pool. It constantly happens once, twice, or thrice, from July to October, and always on the western coasts, because it takes place after the time of the westerly or southerly winds, or while they blow. The waves, which at a distance seem to advance gently within 400 or 500 yards, suddenly swell against the shore, as if acted upon in an oblique direction by some superior force, and break with the greatest impetuousity. The ships which are then upon the coast, or in the roads beyond it, unable either to keep their anchors or to put out to sea, are dashed to pieces against the land, and all on board most commonly perish. The hurricane is another terrible phenomenon in these islands, by which incredible damage is occasioned; but happily it occurs not often.

The produce of the Caribbee islands is exceedingly valuable to the Europeans, consisting of sugar, rum, molasses, indigo, &c. A particular account of which is given under the name of the respective islands as they occur in the order of the alphabet.

CARIBBIANA, or CARIBIANA, the north-east coast of Terra Firma, in South America, otherwise called New Andalusia.

CARICA, the Papaw. See Botany Index.

The fruit of one species is eaten by the inhabitants of the Caribbee islands, of which the European, and sugar as melons, but is much inferior to a melon in its native country; but those which have ripened in Britain were detestable: the only use to which Mr Miller says he has known them put was, when they were about half grown, to soak them in salt water to get out the acid juice, and then pickle them for oranges, to which they are a good substitute.

CARICATURA, in Painting, denotes the concealment of real beauties, and the exaggeration of blemishes; but still so as to preserve a resemblance of the object. The word is Italian; formed of carico, a load, burden, or the like.

CARICOUS, an epithet given to such tumours as resemble the figure of a fig. They are frequently found in the piles.

CARIES, the corruption or mortification of a bone. See Medicine and Surgery Index.

CARIGNANO, a fortified town of Piedmont, situated on the river Po, about seven miles south of Turin. E. Long. 7. 25. N. Lat. 44. 30. It was taken in 1544 by the French; who demolished the fortifications, but spared the castle. It was also taken, and retaken, in 1691.
CARILLONS, a species of chimes frequent in the Low Countries, particularly at Ghent, and Antwerp, and played on a number of bells in a belfry, forming a complete series or scale of tones and semitones, like those on the harpsichord and organ. There are pedals communicating with the great bells, upon which the carillonneur with his feet plays the bass to sprightly airs, performed with the two hands upon the upper species of keys. These keys are projecting sticks, wide enough to be struck with violence and velocity by either of the hands edgeways, without the danger of hitting the neighbouring key. The player is provided with a thick leather covering for the little finger of each hand, to guard against the violence of the stroke. These carillons are heard through a large town.

CARINA, a Latin term, properly signifying the keel of a ship; or that long piece of timber running along the bottom of the ship from head to stern, upon which the whole structure is built or framed.

CARINA is also frequently used for the whole capacity or bulk of a ship; containing the hull or all the space below the deck. Hence the word is also sometimes used by a figure for the whole ship.

CARINA is also used in the ancient architecture. The Romans gave the name carina to all buildings in form of a ship, as we still give the name nave to the middle or principal vault of our Gothic churches; because it has that figure.

CARINA, among anatomists, is used to denote the spina dorsii; as likewise for the fibrous rudiments or embryo of a chick appearing in an incubated egg. The carina consists of the entire vertebrae; as they appear after ten or twelve days incubation. It is thus called, because crooked in form of the keel of a ship. Botanists also, for the like reason, use the word carina to express the lower petalium of a papilionaceous flower.

CARINE were also weepers, or women hired among the ancient Romans, to weep at funerals: they were thus called from Caria, the country whence most of them came.

CARINOLA, an episcopal town of Italy, in the kingdom of Naples, and Terra di Lavoro. E. Long. 15° 5. N. Lat. 41° 15'.

CARINTHIA, a duchy of Germany, in the circle of Austria, bounded by the archbishopric of Salzburg on the north, and by Carniola and the Venetian territories on the south, on the west by Tyrol, and on the east by Stiria. A part of this country was anciently called Carnia, and the inhabitants Corni; but the former afterwards obtained the name of Carinthia, and the latter Carnotani or Carinthi. The air of this country is cold, and the soil in general mountainous and barren; but there are some fruitful dales and valleys in it, which produce wheat and other grain. The lakes, brooks, and rivers, which are very numerous, abound with fish; and the mountains yield lead and iron, and in many places are covered with woods. The river Drau, which runs across the country, is the most considerable in Carinthia. The inhabitants are partly descendants of the ancient Germans, and partly of the Slavonians or Wends. The states are constituted as in Austria, and their assemblies are held at Clagenfurt. The archbishop of Salzburg and the bishop of Bamberg have considerable territories in this country.

Carinthia was, planted here in the 7th century. The only profession tolerated at present is the Roman Catholic. The bishops are those of Gurk and Lavant, who are subject to the archbishop of Salzburg. This duchy was formerly a part of Bavaria. In the year 1282, the emperor Rudolph I gave it to Maynard count of Tyrol, on condition that when his male issue failed, it should revert to the house of Austria; which happened in 1331. The population of Carinthia in 1212 amounted to 283,454, or about 70 persons to the square mile. Of these 128,000 were males, of whom 500 were nobles, 5000 citizens, 21,500 mechanics, and 76,500 were tenants and peasants.

CARIP, a kind of cavalry in the Turkish army. The caripi to the number of about 1000 are not slaves, nor bred up in the seraglio, like the rest; but are generally Moors or renegado Christians, who having followed adventures, being poor, and having their fortune to seek by their dexterity and courage, have arrived at the rank of horse guards to the Grand Signior.

CARISSA. See Botany Index.

CARITAS. — The pocaum caritatis, or grace cup, was an extraordinary allowance of wine or other liquors, wherein the religious at festivals drank in commemoration of their founders and benefactors.

CARISBROOK CASTLE, a castle situated in the middle of the isle of Wight, where King Charles I. was imprisoned. W. Long. 1° 30'. N. Lat. 50° 40'.

CARISTO, an episcopal city of Greece, in the eastern part of the island of Nefropont, near Cape Lasso. E. Long. 24° 15'. N. Lat. 38° 6'.

CARKE, denotes the 30th part of a sarplan of water.

CARLE. See CHURL.

CARLETON, or CARLOS. See JUDY.

CARLETON, was born in Oxfordshire, 1573, and bred in Christ-church college. He went as secrety to Sir Ralph Winwood into the Low Countries, when King James resigned the cautionary towns to the States; and was afterwards employed for 20 years as ambassador to Venice, Savoy, and the United Provinces. King Charles created him Viscount Dorchester, and appointed him one of his principal secretaries of state; in which office he died in 1651. He was esteemed a good statesman, though an honest man; and published several political works.

CARLINA, the CARLINE THISTLE. See Botany Index.

CARLINO, or CARLINO THISTLE. See CARLINA. It is said to have been discovered by an angel to Charlemagne, to cure his army of the plague; whence its denomination.

CARLINO, or CORALINE, a silver coin current in the Napolitan dominions, and worth about 40. of our money.

CARLINGS, or CARLING, in a ship, two pieces of timber lying fore and aft, along from one beam to another, directly over the keel, serving as a foundation for the whole body of the ship. On these the lobbies rest, whereon the planks of the deck and other matters of carpentry are made fast. The carlings have their ends let into the beams called EWER-RAILWAYS.

CARLINGS Tree, are timbers going athwart the ship, from the sides to the hatchway, serving to sustain the deck on both sides.

CARLINGTONFORD, a port town of Ireland, seated...
CAR

CARLISLE, the capital city of the county of Cumberland, seated on the south of the river Eden, and between the Petteral on the east, and the Cade on the west. It is surrounded by a strong stone wall, and has a pretty large castle in the western part of it, as also a citadel in the eastern part, built by Henry VIII. It flourished in the time of the Romans, as appears from the antiquities that are to be met with here, and the Roman coins that have been dug up. At the departure of the Romans this city was ruined by the Scots and Picts; and was not rebuilt till the year 680, by Egfrid, who encompassed it with a wall, and repaired the church. In the 8th and 9th centuries, the whole country was again ruined, and the city laid desolate by the incursions of the Norwegians and Danes. In this condition it remained till the time of William Rufus; who repaired the walls and the castle, and caused the houses to be rebuilt. It was fortified by Henry I, as a barrier against Scotland; he also placed a garrison in it, and made it an episcopal see. It was twice taken by the Scots, and afterwards burnt accidentally in the reign of Richard II. The cathedral, the suburbs, and 1500 houses, were destroyed at that time. It is at present in a good condition; and has three gates, the English on the south, the Scotch on the north, and the Irish on the west. It has two parishes, and as many churches, St Cuthbert's and St Mary's, the last of which is the cathedral, and is separated from the town by a wall of its own. The eastern part, which is the newest, is a curious piece of workmanship. The choir with the aisles is 72 feet broad; and has a stately east window 48 feet high and 30 broad, adorned with curious pillars. The roof is elegantly vaulted with wood; and is embellished with the arms of England and France quartered; as also with Percy's, Lucy's, Warren's, Mowbray's, and many others. In the choir are the monuments of the bishops who were buried there. This see was erected in 1133 by King Henry I, and made suffragan to the archbishop of York. The cathedral church here had been founded a short time before by Walter, deputy in these parts for King William Rufus, and by him dedicated to the Virgin Mary. He likewise built a monastery, and filled it with canons regular of St Augustine. This foundation continued till the dissolution of monasteries, when its lands were added to the see, and the maintenance of a dean, &c. placed here in their room. The church was almost ruined by the usurper Cromwell and his soldiers; and has never since recovered its former beauty, although repaired after the Restoration. This diocese contains the greatest part of the counties of Cumberland and Westmoreland, in which are only 93 parishes; but these (as all the northern are) exceeding large; and of them 15 are impropieties. Here is one archdeacon, viz. of Carlisle. The see is valued in the king's books at 530l. 4s. 11d.; but is computed to be worth in reality 2800l. The clergy's tenths amount only to 161l. 13s. 7d. To this cathedral belong a bishop, a dean, a chancellor, an archdeacon, four prebendaries, eight minor canons, &c. and other inferior officers and servants.

The Picts wall, which was built across the country from Newcastle, terminates near this place. Carlisle was a fortified place, and still has its governor and lieutenant-governor, but no garrison. It was taken by the rebels, Nov. 15, 1745; and was retaken by the duke of Cumberland on the 10th of December following, and deprived of its gates. It is governed by a mayor, twelve aldermen, two bailiffs, &c. and has a considerable market on Saturdays. The manufactures of Carlisle are chiefly of printed linens, for which near 3000l. per annum is paid in duties. It is also noted for a great manufacture of whips, in which a great number of children are employed. Salmon appear in the Eden in numbers, so early as the months of December and January; and the London and even Newcastle markets are supplied with early fish from this river: but it is remarkable, that they do not visit the Eas in any quantity till April; notwithstanding the mouths of the two rivers are at a small distance from each other. Carlisle sends two members to parliament, and gives title of earl to a branch of the Howard family.

CARLOCK, in commerce, a sort of wisinglass, made with the sturgeon's bladder, imported from Archangel. The chief use of it is for clarifying wine, but is also used by the dyers. The best carlock comes from Astrakan, where a great quantity of sturgeon is caught.

CARLOSTAD, or CARLSTAD, a town of Sweden in Varmeland, seated on the lake Wermer, in E. Long. 14 4. N. Lat. 59 16.

CARLOSTAD, or CARLSTAD, a town of Hungary, capital of Croatia, and the usual residence of the governors of the province. It is seated on the river Rugh, in E. Long. 16 5. N. Lat. 45 34.

CARLOWITZ, a small town of Hungary, in Sclavonia, remarkable for a peace concluded here between the Turks and Christians in 1669. It is seated on the west side of the Danube, and contains 5562 inhabitants. E. Long. 19 5. N. Lat. 45 25.

CARLSCRONA, or CARLSCROON, a seaport town in the Baltic, belonging to Sweden. It derives its origin and name from Charles XI, who first laid the foundation of a new town in 1680, and removed the fleet from Stockholm to this place, on account of its advantageous situation in the centre of the Swedish seas, and the superior security of its harbour. The greatest part of Carlscrona stands upon a small rocky island, which rises gently in a bay of the Baltic; the suburbs extend over another small rock, and along the mole close to the bason where the fleet is moored. The way into the town, from the mainland, is carried over a dyke to an island, and from thence along two long wooden bridges joined by a barren rock. The town is spacious, and contains about 18,000 inhabitants. It is adorned with one or two handsome churches, and a few tolerable houses of brick; but the generality of the buildings are of wood. The suburbs are fortified towards the land, by a stone wall. The entrance into the harbour, which by nature is extremely difficult from a number of shoals and rocky islands, is still further secured from the attack of an enemy's fleet by two strong forts built on two islands, under the batteries of which all vessels must pass.

Formerly vessels in this port when careened and repaired, were laid upon their sides in the open harbour,
however, represent it as rather dry and barren; which perhaps may have happened from the neglect of agri-
culture so common in all parts of the Turkish empire, especially where they are exposed to the incursions of
the Arabs. Carmel is the name of the mountain, and of a city built on it; as well as of a heathen deity
worshipped in it, but without either temple or statue; though anciently there must have been a temple, as
we are told that this mountain was a favourite retreat of Pythagoras, who spent a good deal of time in the
temple, without any person with him. But what hath
rendered Mount Carmel most celebrated and revered
both by Jews and Christians, is its having been the
residence of the prophet Elijah, who is supposed to have
lived there in a cave (which is there shown), before he
was taken up into heaven.

**CARMELITES**, an order of religious, making one
of the four tribes of mendicants or begging friars;
and taking its name from Mount Carmel, formerly
inhabited by Elias, Elisha, and the children of the
prophets; from whom this order pretends to descend in
an uninterrupted succession. The manner in which
they make out their antiquity has something in it too
ridiculous to be rehearsed. Some among them pretend
they are descendants of Jesus Christ; others go further,
and make Pythagoras a Carmelite, and the ancient
druids regular branches of their order. Phocas, a
Greek monk, speaks the most reasonably. He says,
that in his time, 1185, Elias’s cave was still extant on
the mountain; near which were the remains of a
building which intimatted that there had been anciently
a monastery; that, some years before, an old monk, a
priest of Calabria, by renovation, as he pretended, from
the prophet Elias, fixed there, and assembled ten
brothers. In 1209, Albert, patriarch of Jerusalem, gave
the solitaries a rigid rule, which Papebroch has since
printed. In 1217, or, according to others, 1226, Pope
Honorious III. approved and confirmed it. This rule
contained 16 articles; one of which confined them to
their cells, and enjoined them to continue day and
night in prayer; another prohibited the brethren
having any property; another enjoined fasting from
the feast of the holy cross till Easter, except on
Sundays; abstinence at all times from flesh was enjoined
by another article; one obliged them to manual
labour; another imposed a strict silence on them from
vessers till the twilight the next day.

The peace concluded by the emperor Frederic II,
with the Saracens, in the year 1229, so disadvantage-
ous to Christendom, and so beneficial to the infidels,
occasioned the Carmelites to quit the Holy Land,
under Alan the fifth general of the Order. He first
sent some of the religious to Cyprus, who landed there
in the year 1226, and founded a monastery in the
forest of Fontania. Some Sicilians, at the same time,
leaving Mount Carmel, returned to their own country,
where they founded a monastery in the suburbs of
Messina. Some English departed out of Syria, in the
year 1240, to found others in England. Others of
Provence, in the year 1244, founded a monastery in
the desert of Aigualates, a league from Marseilles;
and thus, the number of their monasteries increasing,
they held their European general chapter in the year
1245, at their monastery of Aylesford in England.—
This order is so much increased, that it has, at present,
The word comes from the Latin carmināre, to card or teaze wool, and figuratively to attenuate and discuss wind or vapours, and promote their discharge by perspiration. Though Dr Quincy makes it more mysterious: He says it comes from the word carmen, taking it in the sense of an invocation or charm; and makes it to have been a general name for all medicines which operated like charms, i.e. in an extraordinary manner. Hence, as the most violent pains were frequently those arising from pent-up wind, which immediately cease upon dispersion, the term carminative became in a peculiar sense applied to medicines which gave relief in windy cases, as if they were cured by enchantment: but this interpretation seems a little too far strained.

CARMINE, a powder of a very beautiful red colour bordering upon purple, and used by painters in miniatures, though rarely, on account of its great price. The manner of preparing it is kept a secret by the colour-makers; neither do any of those receipts which have for a long time been published concerning the preparation of this and other colours, at all answer the purpose. See Colour-making.

CARMONA, a town of Italy in Friuli, and in the county of Goritz, seated on a mountain near the river Indri. It belongs to the house of Austria. E. Long. 5° 37'. N. Lat. 46° 15'.

CARMONA, an ancient town of Spain, in Andalusia. It is seated in a fertile country, 15 miles east of Seville. W. Long. 5° 37'. N. Lat. 37° 34'.

CARNATICK, a province of Hindostan. See Supplemen.

CARNATION. See DIANTHUS, BOTANY Index. CARNATION Colour, among painters, is understood of all the parts of a picture, in general, which represent flesh, or which are naked and without drapery. Titian and Correggio in Italy, and Rubens and Van dyke in Flanders, excelled in carinations.—In colouring for flesh, there is so great a variety, that it is hard to lay down any general rules for instructions wherein: neither are there any regarded by those who have acquired a skill this way; the various colouring for carinations may be easily produced, by taking more or less of red, blue, yellow, or brown, which in the first colouring or for the finishing, the colour for women should be bluish, for children a little red, both flesh and gay; and for men it should incline to yellow, especially if they are old.

CARNATION, among dyers. To dye a caronation, or red rose colour, it is directed to take liquor of wheat bran a sufficient quantity, alum three pounds, tartar two ounces; boil them, and enter 20 yards of broad cloth; after it has boiled three hours, cool and wash it: take fresh clear bran liquor a sufficient quantity, madder five pounds; boil and sodden according to art. —The Bow dyers know that the solution of tin, being put in a kettle to the alum and tartar, in another process, makes the cloth, &c. attract the colour into it, so that none of the cochineal is left, but the whole is absorbed by the cloth.

CARNEADES, a celebrated Greek philosopher, was a native of Cyrene in Africa, and founder of the third academy. He was so fond of study, that he not only avoided all entertainments, but forgot even to eat at his own table; his maid servant Melissa was obliged
CAR

Carnades ed to put the victuails into his hand. He was an antagonist of the Stoics; and applied himself with great eagerness to refute the works of Chrysippus, one of the most celebrated philosophers of their sect. The power of his eloquence was dreaded even by a Roman senate. The Athenians being condemned by the Romans to pay a fine of 500 talents for plundering the city of Oropus, sent ambassadors to Rome, who got the fine mitigated to 100 talents. Carnades the Academic, Diogenes the Stoa, and Critias the Peripatetic, were charged with this embassy. Before they had audience of the senate, they arranged to great multitudes in different parts of the city. Carnades' eloquence was distinguished from that of the others by its strength and rapidity. Cato the Elder made a motion in the senate that these ambassadors should be immediately sent back, because it was very difficult to discern the truth through the arguments of Carnades. The Athenian ambassadors (said many of the senators) were sent rather to force us to comply with their demands, than to solicit them by persuasion; meaning, that it was impossible to resist the power of that eloquence with which Carnades addressed himself to them. According to Plutarch, the youth at Rome were so charmed by the orations of this philosopher, that they forsook their exercises and other diversions, and were carried with a kind of madness to philosophy; the humour of philosophising spreading like enthusiasm. This grieved Cato, who was particularly afraid of the subtility of wit and strength of argument with which Carnades maintained either side of a question. Carnades harangued in favour of justice one day, and the next day against it, to the admiration of all who heard him, among whom were Galba and Cato, the greatest orators of Rome. This was his element; he delighted in demolishing his own work; because it served in the end to confirm his grand principle, that there are only probabilities or resemblances of truth in the mind of man; so that of two things directly opposite, either may be chosen indifferently. Quintilian remarks, that though Carnades argued in favour of injustice, yet he himself acted according to the strict rules of justice. The following was a maxim of Carnades: "If a man privately know that his enemy, or any other person whose death might be of advantage to him, would come to sit down on grass in which there lurked an asp, he ought to give him notice of it, though it were in the power of no person whatever to blame him for being silent." Carnades, according to some, lived to be 83 years old; others make him to be 90: his death is placed in the 4th year of the 162d Olympiad.

CARNEDDE, in British antiquity, denotes heaps of stones, supposed to be druidical remains, and thrown together on occasion of confirming and commemorating a covenant, Gen. xxxi. 46. They are very common in the isle of Anglesey, and were also used as sepulchral monuments, in the manner of tumuli; for Mr Bowland found a curious urn in one of these carnedd. Wherein it may be inferred, that the Britons had the custom of throwing stones on the deceased. From this custom is derived the Welsh proverb, Kerm ardyllen = Ill betide thee."

CARNELA, in antiquity, a festival in honour of Apollo, surnamed Carneus, held in most cities of Greece, but especially at Sparta, where it was first instituted.

The reason of the name, as well as the occasion of the institution, is controverted. It lasted nine days, beginning on the 13th of the month Carneus. The ceremonies were an imitation of the method of living and discipline used in camps.

CARNEL.—The building of ships first with their timbers and beams, and after bringing on their planks, is called carnel work, to distinguish it from clinch work.

Vessels also which go with mizen sails instead of main sails are by some called carnels.

CARNELIAN, in Natural History, a precious stone, of which there are three kinds, distinguished by three colours, a red, a yellow, and a white. The red is very well known among us; is found in roundish or oval masses, much like our common pebbles; and is generally met with between an inch and two or three inches in diameter; it is of a fine, compact, and close texture; of a glossy surface; and, in the several specimens, is of all the degrees of red, from the palest flesh-colour to the deepest blood-red. It is generally free from spots, clouds, or variegations: but sometimes it is veined very beautifully with an extremely pale red, or with white; the veins forming concentric circles, or other less regular figures, about a nucleus, in the manner of those of agates. The pieces of carnelian, which are all one colour, and perfectly free from veins, are those which our jewellers generally make use of for seals, though the variegated ones are much more beautiful. The carnelian is tolerably hard, and capable of a very good polish: it is not at all affected by acid menstrums: the fire divests it of a part of its colour, and leaves it of a pale red; and a strong and long-continued heat will reduce it to a pale dirty gray.

The finest carnelians are those of the East Indies; but there are very beautiful ones found in the rivers of Silesia and Bohemia; and we have some not despicable ones in England.

Though the ancients have recommended the carnelian as astringent, and attributed a number of fanciful virtues to it, we know of no other use of the stone than the cutting seals on it; to which purpose it is excellently adapted, as being not too hard for cutting, and yet hard enough not to be liable to accidents, to take a good polish, and to separate easily from the wax.

CARNERO, in Geography, a name given to that part of the gulf of Venice which extends from the western coast of Istria to the islands of Grossa and the coast of Morlachia.

CARNEO is likewise the name of the cape to the west of the mouth of the bay of Gibraltar.

CARNIFEX, among the Romans, the common executioner. By reason of the odiousness of his office, the carnifex was expressly prohibited by the laws from having his dwelling house within the city. In middle-age writers carnifex also denotes a butcher.

Under the Angle-Danish kings, the carnifex was an officer of great dignity; being ranked with the archbishop of York, Earl Goodwin, and the lord steward.

CARNIOLA, a duchy of Germany, bounded
on the south by the Adriatic sea, and that part of
Latium possessed by the republic of Venice; on the north, by
Carinthia and Stiria; on the east, by Salzburg and
Grafenau; on the west, by Friuli, the county of Gorz or
Gorizia, and a part of the gulf of Venice; extending
in length about 110 miles, and in breadth about 100.
Its area is about 4730 square miles, and it contained
409,524 inhabitants in 1807. It had its ancient name
Corinna as well as the modern one Carniola, from its
ancient inhabitants, the Carni, a tribe of Scythians,
otherwise called Japodits, whence this and the adjacent
countries were also called Japodits.

Carniola is full of mountains, some of which are cul-
tivated and inhabited; some covered with wood, others
naked and barren, and others continually buried in
snow. The valleys are very fruitful. Here are like-
wise mines of iron, lead, copper, and cinnabar; salt
must be had from the sovereign's magazines. There
are several rivers, besides many medicinal springs and
inland lakes. The common people are very hardy,
going barefooted in winter through the snow, with
open breasts, and sleeping on a hard bench without
bed or bolster. Their food is also very coarse and
mean. In winter, when the snow lies deep on the
ground, the mountaineers bind either small baskets, or
long thin narrow boards, like the Laphanders, to their
feet, on which, with the help of a stout staff or pole,
they descend with great velocity from the mountains.
When the snow is frozen, they make use of a sort of
sleds or skates. In different parts of the country the
inhabitants, especially the common sort, differ greatly
in their dress, language, and manners of living.
In Upper and Lower Carniola they wear long boards.
The languages chiefly in use are the Slavonian or
Wendish, and German; the first by the commonalty,
and the latter by people of fashion. The duchy is di-
vided into the Upper, Lower, Middle, and Inner
Carniola. The principal commodities exported hence
are: iron, lead, quicksilver, white and red wine,
oil of olives, cattle, sheep, cheese, linen, and a kind
of wooden stuff called maholem, Spanish leather, be-
nesy, walnuts, and timber; together with all manner
of wood work, as boxes, dishes, &c. Christianity was
first planted here in the eighth century. Lutheranism
made a considerable progress in it; but, excepting
the Wokians or Wokoes, who are of the Greek church,
and style themselves wavcenes, i.e. old believers, all
the inhabitants at present are Roman Catholics. Car-
niola was long a marquessate or margravate; but in the
year 1321 was erected into a duchy. Carniola was
ceded to France in 1809, but was restored to Austria
in 1814.

CARNEVAL, or CARNIVAL, a time of rejoicing,
a season of mirth, observed with great solemnity by
the Italians, particularly at Venice, holding from the
teasih day till Lent.

The word is formed from the Italian Carnevale, which
Mr. De Cange derives from Car"wala, by reason
the flesh then goes to peal, to make amends for the
season of abstinence then ensuing. Accordingly, in
the corrupt Latin, its derivative, it was called Carnale,
"the flesh," and Carnisprisivuscus, as the Spaniards still
denominatc it corner tallacada.

Feasts, balls, operas, concerts of music, intrigues,
marrriages, &c. are chiefly held in carnival time.
The carnival begins at Venice the second holiday in Christ-
mas. Then it is they begin to wear masks, and open
their playhouses and gaming houses; the place of St
Mark is filled with mousetheads, jack-puddings, ped-
dals, wheats, and such like moles, who fleece thither
from all parts. There have been no less that seven
sovereign princes and 30,000 foreigners here to partake
of these diversions.

CARNIVOROUS, an epithet applied to those ani-
mal which naturally seek and feed on flesh.

It has been a dispute among naturalists, whether
man is naturally carnivorous. Those who take the
negative side of the question, insist chiefly on the struc-
ture of our teeth, which are mostly incisors or mois-
tes; not such as carnivorous animals are furnished
with, and which are proper to tear flesh in pieces: to
which it may be added, that, even when we do feed
on flesh, it is not without a preparatory alteration by
boiling, roasting, &c. and even then that it is the
harshest of digestion of all foods. To these arguments
Dr. Wallis subjoins another, which is, that all quadru-
peds which feed on herbs or plants have a long colon,
with a cecum at the upper end of it, or somewhat equi-
valent, which conveys the food by a long and large
process, from the stomach downwards, in order to its
slower passage and longer stay in the intestines; but
that, in carnivorous animals, such cecum is wanting,
and instead thereof there is a more short and slender
gut, and a quicker passage through the intestines.

Now in man, the cecum is very visible: a strong
presumption that nature, who is still consistent with
herself, did not intend him for a carnivorous animal.
It is true, the cecum is but small in adults, and
seems of little or no use; but in a foetus it is much larger
in proportion: And it is probable, our customaty change
of diet, as we grow up, may occasion this shrinking.

But to these arguments Dr. Tyson replies, that if man
had been by nature designed not to be carnivorous,
there would doubtless have been found, somewhere on
the globe, people who do not feed on flesh; which is
not the case. Neither are carnivorous animals always
without a colon and cecum; nor are all animals carni-
vorous which have these parts; the opossum, for in-
stance, hath both a colon and cecum, and yet feeds
on poultry and other flesh; whereas the hedgehog,
which has neither colon nor cecum, and so ought to
be carnivorous, feeds only on vegetables. Add to
this, that hogs which have both, will feed upon flesh,
when they can get it; and rats and mice, which have
large cecums, will feed on bacon as well as bread and
cheese. Lastly, the human race are furnished with
teeth necessary for the preparation of all kinds of foods;
from whence it would seem that nature intended we
should live on all. And as the alimentary duct in the
human body is fitted for digesting all kinds of foods,
ought we not rather to conclude that nature did not
intend, to deny us any?

It is not less disputed whether mankind were carni-
vorous before the flood. St. Jerome, Chrysostome, The-
odor, and other ancients, maintain, that all animal
The population of North Carolina in 1810 was 555,500, including 168,824 slaves, and 10,365 free blacks. It is one of the most thinly peopled of the old states, having only about 11 persons to the square mile. The inhabitants are chiefly planters, who live on their plantations at a distance of two or three miles from each other. Marriages are made among them at an early age. They are hospitable and indolent in their habits, and are accused of being addicted to gambling, drinking, and horse racing. In the upper country, however, where few slaves are kept, the people are laborious, sober, and plain in their manners. The government is vested in a senate and house of commons. The former consists of a member for each county, chosen annually by persons who possess 50l. freehold. The house of commons consists of two representatives for each county, and one for each of six towns, chosen by all the freemen of mature age. There is no established church; the prevailing denominations are Presbyterians, Moravians, Quakers, Methodists, and Baptists. A public provision is made by the state for the support of schools and a university. The agricultural products are cotton, tobacco, rice, indigo, maize, wheat, barley, &c. The wheat harvest is early in June. The manufactures are chiefly domestic, and are but inconsiderable. The commerce of the state is also but small, the whole amount of the exports in 1817 being 936,580 dollars. The value of lands and houses in the state, as ascertained by a fiscal census in 1814, was 92,157,467 dollars, being three times as great as in 1799. Newbern, the largest town in the state, contained only 2467 inhabitants in 1810.

South Carolina is of a triangular form, and extends along the sea coast 760 miles. Its greatest length is 340 miles, and its area is 24,080 miles. In its general appearance, soil, climate, and productions, it resembles North Carolina, but has less mountain land. Snow seldom falls, and during seven years the thermometer never rose above 93° nor fell below 17°. The annual average of rain is about 49 inches. The chief rivers are the Savannah, which is navigable for sloops 250 miles; the Santee, navigable 150 miles; the Pee Dee, also navigable to a considerable distance; Ashley river, Cooper river, &c. The population of South Carolina in 1810 was 415,115, including 196,365 slaves, and 4554 free blacks. The whites are distinguished by politeness, hospitality, and a nice sense of honour. They are at the same time profuse in their habits, fond of gaming, and not free from the imputation of drunkenness. Horse races, hunting, dancing, and ball-playing, are favourite amusements. The legislative power is vested in a senate and house of representatives. The senate consists of 45 members elected for four years, and renewed by halves. The representatives, 124 in number, are chosen for two years. The electors consist of all the free white males of 21 years of age. The value of lands, houses, and slaves in this state in 1814 was 123,416,512 dollars. The exports in 1817 amounted to 10,372,613 dollars; but a great proportion of the trade is in the hands of the New Englanders, the shipping belonging to the state of New England, amounting only to 37,168 tons. There is no established church; the most numerous sects are the Presbyterians, Baptists, Methodists, Episcopalian, and Independents. Till a late period education was but little attended to. But since...
Carolina. Since 1725 two colleges, and a considerable number of academies and grammar schools have been established. In Charlestown, and some of the other towns, there are a number of societies of a philosophical, literary, or economical nature. The judges are appointed by the legislature during good behaviour, and are removable by impeachment. The judges of the different circuits, four in number, form the highest, or constitutional court, and meet once a year at Columbia, and at Charlestown, for the purpose of hearing and determining all motions for new trials, &c. The common and statute law of Great Britain is in force, and has been adapted by various modifications to the principles of the constitution.

Carolina was discovered by Sebastian Cabot about the year 1500, in the reign of Henry VII. But the settling of it being neglected by the English, a colony of French Protestants, by the encouragement of Admiral Coligny, were transported thither; and named the place of their first settlement Arc Carolina, in honour of their prince, Charles IX. of France; but in a short time that colony was destroyed by the Spaniards; and no other attempt was made by any European power to settle there till the year 1664, when 800 English landed at Cape Fear in North Carolina, and took possession of the country. In 1670, Cha. II. of Britain granted Carolina to the lords Berkeley, Clarendon, Albemarle, Craven, and Ashly, Sir George Carteret, Sir William Berkeley, and Sir John Colliton. The plan of government for this new colony was drawn up by the famous Mr. Locke, who very wisely proposed a universal toleration in religious matters. The only restriction in this respect was, that every person claiming the protection of that settlement, should, at the age of 21, register himself in some particular communion. To civil liberty, however, our philosopher was not so favourable; the code of Carolina gave to the eight proprietors who founded the colony, and to their heirs, not only all the rights of a monarch, but all the powers of legislation. The court, which was composed of this sovereign body, and called the Palatinate Court, was invested with the right of nominating to all employments and dignities, and even of conferring nobility; but with new and unprecedented titles. They were, for instance, to create in each county two caciques, each of whom was to be possessed of 24,000 acres of land; and a landgrave, who was to have 89,000. The persons on whom these honours should be bestowed were to compose the upper house, and their possessions were made unalienable. They had only the right of farming or letting out a third part of them at the most for three lives. The lower house was composed of the deputies from the several counties and towns. The number of this representative body was to be increased as the colony grew more populous. No tenant was to pay more than about a shilling per acre, and even this rent was redeemable. All the inhabitants, however, both slaves and freemen, were under an obligation to take up arms upon the first order from the Palatinate court.

It was not long before the defects of this constitution became apparent. The proprietary lords used every endeavour to establish an arbitrary government; and, on the other hand, the colonists exerted themselves with great zeal to avoid servitude. In consequence of this struggle, the whole province, distracted, with tumults and dissensions, became incapable of making any progress, though great things had been expected from its particular advantages of situation. Though a toleration in religious matters was a part of the original constitution, dissensions arose likewise on that account. In 1725, Carteret, now Lord Granville, who, as the eldest of the proprietors, was sole governor of the colony, formed a design of obliging all the non-conformists to embrace the ceremonies of the church of England; and this act of violence, though disavowed and rejected by the mother country, inflamed the minds of the people. In 1720, while this animosity was still subsisting, the province was attacked by several bands of savages, driven to despair by a continued course of the most atrocious violence and injustice. These unfortunate wretches were all put to the sword; but, in 1728, the lords proprietors having refused to contribute towards the expenses of an expedition, of which they were to share the immediate benefits, were deprived of their prerogative, except Lord Granville, who still retained his eighth part. The rest received a recompense of about 24,000l. The colony was taken under the immediate protection of the crown, and from that time began to flourish. The division into North and South Carolina now took place, and the settlement of Georgia commenced in 1733.

See Georgia.

Caroline. See Carline.

Caroline-books, the name of four books, composed by order of Charlemagne, to refute the second council of Nice. These books are couched in very harsh and severe terms, containing 120 heads of accusation against the council of Nice, and condemning the worship of images.

Carolostadians, or Carolotidians, an ancient sect or branch of Lutherans, who denied the real presence of Christ in the eucharist.

They were thus denounced from their leader Andrew Carolostadius, who having originally been archdeacon of Wittenberg, was converted by Luther, and was the first of all the reformed clergy who took a wife; but disagreeing afterwards with Luther, chiefly in the point of the sacrament, founded a sect apart. The Carolotidians are the same with what are otherwise denominated Sacramentarians, and agree in most things with the Zuinglians.

Carolus, an ancient English broad piece of gold struck under Charles I. Its value has of late been at 23s. sterling, though at the time it was coined it is said to have been rated at 20s.

Carolus, a small copper coin, with a little silver mixed with it, struck under Charles VIII. of France. The Carolus was worth 12 deniers when it ceased to be current. Those which are still current in trade in Lorraine, or in some neighbouring provinces, go under the name of French sols.

Carotides, in Anatomy, two arteries of the neck, which convey the blood from the aorta to the brain; one called the right, and the other the left, carotid.

Carp, in Ichthyology, the English name of a species of cyprinus. See Cyprinus, Ichthyology Index.

The carp is the most valuable of all kinds of fish for stocking of ponds. It is very quick in its growth, and brings forth the spawn three times a year, so that the increase is very great. The female does not begin
CARPENTRAS, an episcopal town of France, in Carpentras the department of Vauncluse, and capital of Venaissin. It is subject to the pope; and is seated on the river Auson, at the foot of a mountain. E. Long. 5. 6. N. Lat. 44. 4.

CARPENTRY, the art of cutting, framing, and joining large pieces of wood, for the uses of building. It is one of the arts subservient to architecture, and is divided into house-carpentry and ship carpentry: the first is employed in raising, roofing, flooring of houses, &c. and the second in the building of ships, barges, &c. See Ship-. &c. The rules in carpentry are much the same with those of Joinery: only carpentry is used in the larger and coarser work, and joinery in the smaller and curious. See Centres, Roof, and Strength of Materials. See also Carpentry, Supplement.

CARPENTUM, in Antiquity, a name common to divers sorts of vehicles, answering to coaches as well as wagons, or even carts, among us. The carpentum was originally a kind of car or vehicle in which the Roman ladies were carried; though in after times it was also used in war. Some derive the word from curro; others from Carmenta, the mother of Evander, by a conversion of the m into p.

CARPET, a sort of covering of stuff, or other materials, wrought with the needle or on a loom, which is part of the furniture of a house, and commonly spread over tables, or laid on the floor.

Persian and Turkey carpets are those most esteemed; though at Paris there is a manufactory after the manner of Persia, where they make them little inferior, not to say finer, than the true Persian carpets. They are velvety, and perfectly imitate the carpets which come from the Levant. There are also carpets of Germany, some of which are made of woollen stuffs, as serges, &c. and called square carpets: others are made of wool also, but wrought with the needle, and pretty often embellished with silk; and, lastly, there are some made of dog's hair. We have likewise carpets made in Britain, which are used either as floor-carpets, or to cover chairs, &c. It is true, we are not arrived at the like perfection in this manufacture with our neighbours the French; but may not this be owing to the want of a like public encouragement?

Carpet-Knights, a denomination given to gown-men and others, of peaceable professions, who, on account of their birth, office, or merits to the public, or the like, are, by the prince, raised to the dignity of knightly-ship.

They take the appellation carpet, because they usually receive their honours from the king's hands in the court, kneeling on a carpet. By which they are distinguished from knights created in the camp, or field of battle, on account of their military prowess. Carpet-knights possess a medium between those called truck or dunghill knights, who only purchase or merit the honour by their wealth, and knights-bachelors, who are created for their services in the war.

CARPI, a principality of Modena in Italy, lying about four leagues from that city. It formerly belonged to the house of Fio; the elder sons of which bore the title of princes of St Gregory. In the beginning of the 14th century, Marsby was the first prince of Carpi; but in the 16th, the emperor Charles V. gave the principality to Alfonzo duke of Ferrara.
was unknown. The word, he taught, was created by angels, vastly inferior to the first principle. He opposed the divinity of Jesus Christ; making him a mere man, begotten carnally on the body of Mary by Joseph, though possessed of uncommon gifts which set him above other creatures. He inoculated a community of women; and taught, that the soul could not be purified, till it had committed all kinds of abominations, making that a necessary condition of perfection.

CARPOLITI, or Fruit-Stone. Rocks of the Germans, are composed of a kind of jasper, of the nature of the amygdaloids, or almond-stones. Bertrand asserts that the latter are those which appear to be composed of elliptical pieces like petrified almonds, though, in truth, they are only small oblong pieces of calcareous stone rounded by attrition, and sometimes small mussel-shells connected by a stony cement. The name of Carpoliti, however, is given in general by writers on fossils to all sorts of stony concretions that have any resemblance to fruit of whatever kind.

CARPUS, the Wrist. See Anatomy Index.

CARR, a kind of rolling throne, used in triumphs, and at the splendid entries of princes. See CHARIOT.

The word is from the ancient Gaulish, or Celtic, Carr; mentioned by Caesar, in his Commentaries, under the name Carrus. Plutarch relates, that Camillus having entered Rome in triumph, mounted on a carr drawn by four white horses, it was looked on as too haughty an innovation.

Carr is also used for a kind of light open chariot. The carr, on medals, drawn either by horses, lions, or elephants, usually signifies either a triumph or an apotheosis: sometimes a procession of the images of the gods at solemn supplication, and sometimes of those of some illustrious family at a funeral. The carr covered, and drawn by mules, only signifies a consecration, and the honour done any one of having his image carried at the gates of the circus. See CONSECRATION, &c.

CARRAC, or CARRACA, a name given by the Portuguese to the vessels they send to Brasil and the East Indies, being very large, round built, and fitted for fight as well as burden. Their capacity lies in their depth, which is very extraordinary. They are narrower above than underneath, and have sometimes seven or eight floors; they carry about 2000 tons, and are capable of lodging 2000 men; but of late they are little used. Formerly they were also in use among the knights of Rhodes, as well as among the Genoese, and other Italians. It is a custom among the Portuguese, when the carracas return from India, not to bring any boat or sloop for the service of the ship beyond the island of St. Helena, at which place they sink them on purpose, in order to take from the crew all hopes or possibility of saving themselves, in case of shipwreck.

CARRARA MARBLE, among our artificers, the name of a species of white marble, which is called marmor lunense, and signum by the ancients: it is distinguished from the Parian, now called the statuary marble, by being harder and less bright.

CARRAWEIRA, a town of Turkey in Europe, with
CARRIÈRE, a person that carries goods for others for hire. A common carrier, having the charge and carriage of goods, is to answer for the same, or the value, to the owner. And where goods are delivered to a carrier, and he is robbed of them, he shall be charged and answer for them, because of the hire. If a common carrier, who is offered his hire, and who has convenience, refuses to carry goods, he is liable to an action, in the same manner as an innkeeper who refuses to entertain a guest. See Assumpsit.

One brought a box to a carrier, with a large sum of Jacob's money, and the carrier demanded of the owner what was in it; he answered, that it was filled with silks, and such like goods; upon which the carrier took it, and was robbed, and adjudged to make it good; but a special acceptance; as, provided there is no charge of money, would have excused the carrier. A person delivered to a carrier's book-keeper two bags of money sealed up, to be carried from London to Exeter, and told him that it was 200l. and took his receipt for the same, with promise of delivery for 10s. per cent. carriage and risk; though it be proved that there was 400l. in the bags, if the carrier be robbed, he shall answer only for 200l. because there was a particular undertaking for that sum and no more; and his reward, which makes him answerable, extends no farther. If a common carrier loses goods which he is intrusted to carry, a special action on the case lies against him, on the custom of the realm, and not trover; and so of a common carrier by boat. An action will lie against a porter, carrier, or barge-man, upon his bare receipt of the goods, if they are lost through negligence. Also a lighter-man spoiling goods he is to carry, by letting water come to them, action of the case lies against him, on the common custom.

CARRIÈRE-Pigeon, or Courier-pigeon, a sort of pigeon used, when properly trained, to be sent with letters from one place to another. See COLUMBA.

Though you carry these birds hooded, in 20, 30, or 50 miles, they will find their way in a very little time to the place where they were bred. They are trained to this service in Turkey and Persia; and are carried first, while young, short flights of half a mile, afterwards more, till at length they will return from the farthest part of the kingdom. Every bashaw has a basket of these pigeons bred in the seraglio, which, upon any emergent occasion, as an insurrection, or the like, he dispatches, with letters branded under the wings, to the seraglio; which proves a more speedy method, as well as a more safe one, than any other; he sends out more than one pigeon, however, for fear of accidents. Lithgow assures us, that one of these birds will carry a letter from Babylon to Aleppo, which is 30 days journey, in 48 hours. This is also a very ancient practice. Hirtius' and Brutus, at the siege of Modena, held a correspondence with one another by means of pigeons. And Ovid tells us, that Tarosthenes, by a pigeon stained with purple, gave notice to his father of his victory at the Olympic games, sending it to him at Aegina.

In modern times, the most noted were the pigeons of Alexan, which served as couriers at Alexandretta and Bagdad. But this use of them has been laid aside for the last 30 or 40 years, because the Curd robbers killed...
CARRON, a small but remarkable river in Scotland, rising about the middle of the isle of Forth and Clyde. Both its source and the place where it emptieth itself into the sea, are within the shire of Stirling; which it divides into two nearly equal parts. The whole length of its course, which is from west to east, is not above 14 miles. It falls into the frith of Forth about three miles to the north-east of Falkirk. The stream thereof is small, but clear of colour, and gently falls down to the sea; yet there is no river in Scotland, and fewer in the whole island of Britain, whose banks have been the scene of so many memorable transactions. When the Roman empire was in all its glory, and had its eastern frontiers upon the Euphrates, the banks of Carron were its boundaries upon the north-west; for the wall of Antoninus, which was raised to mark the limits of that mighty empire, stood in the neighbourhood of this river, and ran parallel to it for several miles.

Near the middle of its course, in a pleasant valley, stand two beautiful mountains, called the Hills of Dunipace, which are taken notice of by most of the Scotch historians as monuments of great antiquity. The whole structure of these mountains is of earth; but they are not both of the same form and dimensions. The most easterly one is perfectly round, resembling an oven, and about fifty feet in height; and that this is an artificial work does not admit of the least doubt; but it cannot answer the same, with equal certainty, of the other, though it has been generally supposed to be so. It bears no resemblance to the eastern one either in shape or size. At the foundation it is nearly of a triangular form; but the superstructure is quite irregular; nor does the height thereof bear any proportion to the extent of its base. These mountains are now planted with fir, which, with the parish-church of Dunipace standing in the middle between them, and the river running hard by, give this valley a very romantic appearance. The common account given of those mountains is, that they were erected as monuments of a peace concluded in that place between the Romans and the Caledonians; and that their name partakes of the language of both people; Dun, signifying a hill in the old language of this island, and Paw "peace," in the language of Rome. The compound word, Dunipace, signifies "the hills of peace." And we find in history, that no less than three treaties of peace were at different periods entered into between the Romans and Caledonians; the first by Severus about the year 210; the second soon after, by his son Caracalla; and the third, by the usurper Carus, about the year 280; but of which of these treaties Dunipace is a monument, we do not pretend to determine. If the concurring testimony of historians and antiquaries did not agree in giving this original to these mounts, we would be tempted to conjecture that they are sepulchral monuments. Human bones and urns have been discovered in earthen fabrics of this kind in many parts of this island, and the little mounds or barrows which are scattered in great numbers about Stonehenge in Salisbury plain are generally supposed to have been the sepulchres of the ancient Britons. See Barrows.

From the valley of Dunipace, the river runs for some time in a deep and hollow channel, with steep banks on both sides; here it passes by the foundations of the ancient Roman bridge; not far from which, as is generally thought, was the scene of the memorable conference between the Scotch patriot William Wallace and Robert Bruce, father to the king of that name, which first opened the eyes of the latter to a just view both of his own true interest and that of his country.

After the river has left the village and bridge of Larbert, it soon comes up to another smaller valley, through the midst of which it has now worn out to itself a straight channel, whereas, in former ages, it had taken a considerable compass, as appears by the track of the old bed which is still visible. The high and circling banks upon the south side give to this valley the appearance of a spacious bay; and, according to the tradition of the country, there was once an harbour here; nor does the tradition seem altogether groundless, pieces of broken anchors having been found here, and some of them within the memory of people yet alive. The stream tides would still flow near the place, if they were not kept back by the dam-head built across the river at Stenhouse; and there is reason to believe, that the frith flowed considerably higher in former ages than it does at present. In the near neighbourhood of this valley, upon the south, stand the ruins of ancient Camelot: which, after it was abandoned by the Romans, was probably inhabited, for some ages, by the natives of the country.

Another ancient monument, called Arthur's Oven, once stood upon the banks of the Carron: but was, with a spirit truly Gothic, entirely demolished about 40 years ago. The corner of a small inclosure between Stenhouse and the Carron iron-works, is pointed out as the place of its situation. This is generally supposed to have been a Roman work: though it is not easy to conceive what could be their motive for erecting such a fabric, at so great a distance from any other of their works, and in a spot which at that time must have been very remote and unfrequented. The form of it is said to have been perfectly round, and rising perpendicular for some yards at first, but afterwards gradually contracted, till it terminated in a narrow orifice at the top. Antiquaries are not agreed whether it had been a temple, or a trophy, or a mausoleum; but the most common opinion is, that it had been a temple, and Buchanan thinks, a temple of Terminus. Hector Boetius says, that there were benches of stone all around it upon the inside; and that there had been a large stone
stone for sacrificing upon, or an altar, upon the south side.

As the Carron extends over the half of the isthmus, and runs so near the ancient boundary of the Roman empire, the adjacent country fell naturally to be the scene of many battles and encounters. Historians mention a bloody battle fought near the river between the Romans and the confederate army of the Scots and Picts in the beginning of the 5th century. The scenes of some of Quintus's poems were, in the opinion of the translator, upon the banks of this river. Here Fingal fought with Carascal, the son of the king of the world, supposed to have been the same with Carascella, the son of the Roman emperor Severus. Here also young Oscar, the son of Ossian, performed some of his heroic exploits. Hereabout was the stream of Crona, celebrated in the ancient compositions of the Gaelic bard; possibly that now called the water of Bonny, which runs in the neighborhood of the Roman wall, and discharges itself into the Carron at Dunijpase. In those poems, mention is made of a green vale upon the banks of this river, with a tomb standing in the middle of it, where young Oscar's party and the warriors of Caros met. We only take notice of this as it strengthens the conjecture hazarded above, that the mounds of Dunijpase, especially the more easterly of them, were sepulchral monuments.—About the distance of half a mile from the river, and near the town of Falkirk, lies the field of that battle which was fought by William Wallace and the English in the beginning of the 14th century. It goes by the name of Graham's mower, from the valiant John Graham, who fell there, and whose grave-stone is still to be seen in the church-yard of Falkirk.

The river Carron, though it has long since ceased to roll its stream amidst the din of arms, still preserves its fame, by lending its aid to trade and manufactures; (see the next article.)—The river is navigable for some miles near its mouth, and a considerable trade is carried on upon it by small craft; for the convenience of which, its channel has of late years been straightened and much shortened, and the great Canal has its entrance from it.

CARRON-PRODUCTS, a large iron-foundery, two miles north from Falkirk in Scotland. They are conveniently situated on the banks of the Carron, three miles above its entry into the frith of Forth. Above 100 acres of land have been converted into reservoirs and pools, for water diverted from the river, by magnificent dams built above two miles above the works, which after turning 18 large wheels for the several purposes of the manufacture, falls into a tide-navigation that conveys their castings to the sea.

These works are among the greatest of the kind in Europe, and were established in 1760. At present, the buildings are of vast extent; and the machinery, constructed by Mr. Smekes, is the first in Britain, both in elegance and correctness: there are 2000 men employed, and there are about twenty furnaces which consume 200 tons of coal a-week; 6000 tons of iron are smelted annually from the mineral with pit-coal, and cast into cannon, cylinders, &c.—In the founding of cannon, those works have lately arrived at such perfection, that they make above 5000 pieces a year, many of which are exported to foreign states; and their guns of new construction are the lightest and neatest now in use, not excepting brass guns; the 32-pounder ship-gun weighing 42 hundred weight, the 6-pounder 8 hundred-weight and one-half, and the other calibers in proportion.

The present proprietors are a chartered company, with a capital of 150,000l. sterling, a common seal, &c., but their stock is confined to a very few individuals.

CARRONADE, a short kind of ordnance, capable of carrying a large ball, and useful in close engagements at sea. It takes its name from Carron, the place where this sort of ordnance was first made, or the principle applied to an improved construction. See the article GUNNERY.

CARROT. See DAucus, Botany Index.

Deadly Carrot. See Taphria, Botany Index.

CARRUSAL, a course of horses and chariots, or a magnificent entertainment exhibited by princes on some public rejoicing. It consists in a cavalcade of several gentlemen, richly dressed and equipped after the manner of ancient cavaliers, divided into squadrons, meeting in some public place, and practising jousts, tournaments, &c.—The last carrousals were in the reign of Louis XIV. The word comes from the Italian word carro, the diminutive of carro, a chariot.

Terrestrial assigns the invention of carrousals to Cæcine, and will have them instituted in honour of the Sun, her father, whence some derive the word from crurus, or crurus solis. The Moors introduced ciphers, livers, and other ornaments of their arms, with trappings, &c. for their horses. The Goths added crests, plumes, &c.

CARRUCA, in Antiquity, a splendid kind of cart, or chariot, mounted on four wheels, richly decorated with gold, silver, ivory, &c. in which the emperors, senators, and people of condition, were carried. The word comes from the Latin carrus, or British carv, which is still the Irish name for any wheel-carriage.

CARRUCA, or Carucus, is also used in middle-age writers for a plough.

CARRUCA, or Carucus, also was sometimes used for carrucata. See CARRUCATE.

CARRUCATE (carrucatum), a kind of tax anciently imposed on every plough, for the public service. See CARRUCATE and HIDAGE.

CARRUCAGE, Caruscage, or Caruscage, in husbandry, denotes the ploughing of ground, either ordinary, as for grain, hemp, and flax; or extraordinary, as for wood, dyers weed, rape, and the like.

CARRUCATE, (carrucata), in our ancient laws and history, denotes a plough land, as muchparable ground as can be tilled in one year with one plough.

In Doomsday Inquisition, the arable land is estimated in carrucates, the pasture in hides, and meadow in acres. Skene makes the carrucata the same with hilda, or hida terce; Littleton the same with scot.

The measure of a carrucate appears to have differed in respect of place as well as time. In the reign of Richard I. it was estimated at 50 acres, and in another charter of the same reign at 100 acres: in the time of Edward I. at 180 acres; and in the 2nd of Edward III. a carrucate of land in Burcester contained 112 acres, and in Middleton 105 acres.

By a statute under William III. for charging per-
CARRYING, in falconry, signifies a hawk's flying away with the quarry. Carrying is one of the ill-qualities of a hawk, which she acquires either by dislike of the falconer, or not being sufficiently brooked to the lure.

CARRYING, among huntsmen. When a hare runs on rotten ground (or even sometimes in a frost), and it sticks to her feet, they say she carries.

CARRYING, among riding-masters. A horse is said to carry low, when having naturally an ill-shaped neck, he lowers his head too much. All horses that arm themselves carry low, but a horse may carry low without arming. A French branch or gigot is prescribed as a remedy against carrying low.

A horse is said to carry well, when his neck is raised or arched, and he holds his head high and firm, without constraint.

CARRYING Wind, a term used by our dealers in horses to express such a one as frequently tosses his nose as high as his ears, and does not carry handsomely. This is called carrying wind; and the difference between carrying in the wind, and beating upon the hand, is this: that the horse who beats upon the hand, shakes the bridle and resists it, while he shakes his head; but the horse that carries in the wind puts up his head without shaking, and sometimes beats upon the hand. The opposite to carrying in the wind, is arming and carrying low; and even between these two there is a difference in wind.

CARS, or KARS, a considerable and strong town of Asia, in Armenia, seated on a river of the same name, with a castle almost impregnable. E. Long. 43° 50'. N. Lat. 41° 30'.

CARSE, or Carse of Gowry, a district of Perthshire in Scotland. It lies on the north side of the Tay, and extends 14 miles in length from Dunkeld to Perth, and is from two to four in breadth. It is a rich plain country, cultivated like a garden, and producing as good harvests of wheat as any in Great Britain. It abounds with all the necessaries of life: but, from its low damp situation, the inhabitants are subject to agues, and the commonalty are in great want of fire. In this district, not far from the Tay, stands the house of Heriot, which formerly belonged to the earls of that name, the chiefs of the ancient family of Hay, hereditary constables of Scotland.

CARSTAIRS, William, an eminent Scots divine, whose merit and good fortune called him to act in great scenes, and to associate with men to whose society and intercourse his birth gave him few pretensions to aspire. A small village in the neighbourhood of Glasgow was the place of his nativity. His father, of whom little is known, exercised the functions of a clergyman.

Young Carstairs turned his thoughts to the profession of theology; and the persecutions and oppressions of government, both in regard to civil and religious liberty, having excited his strongest indignation, it became a matter of prudence that he should prosecute his studies in a foreign university. He went accordingly to Utrecht; and his industry and attention being directed with skill, opened up and unfolded those faculties which he was about to employ with equal honour to his country and himself.

During his residence abroad, he became acquainted with Pensionary Fagel, and entered with warmth into the interest of the Prince of Orange. On his return to Scotland, to procure a licence to teach doctrines which he had studied with the greatest care, he became disgusted with the proud and insolent conduct of Archbishop Sharp, and prepared to revisit Holland; where he knew that religious liberty was respected, and where he hoped he might better his condition by the connections he had formed.

His expectations were not vain. His prudence, his reserve, and his political address, were strong recommendations of him to the Prince of Orange; and he was employed in personal negotiations in Holland, England, and Scotland. Upon the elevation of his master to the English throne, he was appointed the king's chaplain for Scotland, and employed in settling the affairs of that kingdom. William, who carried politics into religion, was solicitous that episcopacy should prevail there as universally as in England. Carstairs, more versant in the affairs of his native country, saw all the impropriety of this project, and the danger that would arise from the enforcing of it. His reasonings, his remonstrances, his entreaties, overcame the firmness of King William. He yielded to considerations founded alike in policy and in prudence; and to Carstairs Scotland is indebted for the full establishment of its church in the Presbyterian form of government.

The death of King William was a severe affliction to him; and it happened before the prince had provided for him with the liberality he deserved. He was continued, however, in the office of chaplain for Scotland by Queen Anne; and he was invited to accept the principality of the university of Edinburgh. He was one of the ministers of the city, and four times moderator of the General Assembly. Placed at the head of the church, he prosecuted its interest with zeal and with integrity. Nor were his influence and activity confined to matters of religion. They were exerted with success in promoting the culture of the arts and sciences. The universities of Scotland owe him obligations of the highest kind. He procured, in particular, an augmentation of the salaries of their professors; a circumstance to which may be ascribed their reputation, as it enabled them to cultivate with spirit the different branches of knowledge.

A zeal for truth, a love of moderation and order, prudence, and humility, distinguished Principal Carstairs in an uncommon degree. His religion had no mixture of austerity; his secular transactions were attended with no imputation of artifice; and the versatility of his talents made him pass with ease from a court to a college. He was among the last who suffered torture before the privy council, in order to make him divulge the secrets entrusted to him, which he firmly resisted; and after the Revolution, that human instrument the thumb-screw was given to him in a present by the council.—This excellent person died in 1713 and in 1744 his State papers and Letters, with an account of his life, were published in one vol. 4to, by the Rev. Dr McCormick.

CARSIOL,
CAR
CARSUCAI, BAINIER, a Jesuit, born at Citerna in Tuscany, in 1647, was the author of a Latin poem, entitled Ars bene scribendi, which is esteemed both for the elegance of the style and for the excellent precepts it contains. He also wrote some good epigrams. He died in 1709.

CARTAMA, a town of Spain in the kingdom of Grenada, formerly very considerable. It is seated at the foot of a mountain, near the river Guadala-Medina, in W. Long. 4. 28. N. Lat. 36. 40.

CART, a land carriage with two wheels, drawn commonly by horses, to carry heavy goods, &c. from one place to another. The word seems formed from the French charrette, which signifies the same, or rather the Latin carretta, a diminutive of carrus. See CARR.

In London and Westminster carts shall not carry more than twelve sacks of meal, seven hundred and fifty bricks, one child of coals, &c. on pain of forfeiting one of the horses. (6 Geo. I. cap. 6.) By the laws of the city, carmen are forbidden to ride either on their carts or horses. They are to load or drive them on foot through the streets, on the forfeiture of ten shillings. (Stat. 1. Geo. I. cap. 57.) Criminals used to be drawn to execution on a cart. Edwards and other malefactors are whipped at the cart's tail.

Scripture makes mention of a sort of cart or dray used by the Jews to do the office of threshing. They were supported on low thick wheels, bound with iron, which were rolled up and down on the sheaves, to break them, and force out the corn. Something of the like kind also obtained among the Romans, under the denomination of planus, of which Virgil makes mention. (Georg. I.)

Tardeque Eleusinae matris volventia planus, 
Trabalga, trakseque.—

On which Servius observes, that trakse denotes a cart without wheels, and tribala a sort of cart armed on all sides with teeth, chiefly used in Africa for threshing corn. The Septuagint and St Jerome represent these carts as furnished with saws, insomuch that their surface was beset with teeth. David having taken Rabbah, the capital of the Ammonites, ordered all the inhabitants to be crushed to pieces under such carts, moving on wheels set with iron teeth; and the king of Damascus is said to have treated the Israelites of the land of Gilead in the same manner.

Carte-Bote, in low, signifies wood to be employed in making and repairing instruments of husbandry.

Carts of War, a peculiar kind of artillery anciently in use among the Scots. They are thus described in an act of parliament, A. D. 1456: "It is thought speidfull, that the king may request to certain of the great burrous of the land that are of ony myght, to mak carts of weir, and in ilk cart two punnis, and ilk man to have two chalmers, with the remnant of the grait that effairs thereto, and an cunnaund man to shoot thame." By another act, A. D. 1474, the prelates and barons are commanded to provide such carts of war against their old enemies the English.

CARTE, THOMAS, the historian, was the son of Mr Samuel Carte, prebendary of Lichfield, and born in 1686. When he was reader in the abbey-church at Bath, he took occasion in a 30th of January ser-

mon, 1714, to vindicate Charles I. with respect to the Irish massacre, which drew him into a controversy with Mr Chandler the dissenting minister; and on the accession of the present royal family he refused to take the oaths to government, and put on a lay habit. He is said to have acted as a kind of secreta-

ry to Bishop Atterbury before his troubles; and in the year 1722, being accused of high treason, a re-

ward of 1000l. was offered for apprehending him; but Queen Caroline, the great patroness of learned men, obtained leave for him to return home in security. He published, 1. An edition of Thuanus, in seven volumes, folio. 2. The life of the first duke of Ormond, three volumes, folio. 3. The History of England, four volumes, folio. 4. A Collection of Original Letters and Papers concerning the affairs of England, two volumes octavo; and some other works. He died in April 1754. His History of England ends in 1654. His design was to have brought it down to the Revolution; for which purpose he had taken great pains in copying every thing valuable that could be met with in England, Scotland, France, Ireland, &c.—He had (as he himself says, p. 43. of his Vindica-

tion of a full answer to a letter from a bystander), and abundance of collected papers relating to the reign of King Charles II., and had in his power a series of me-

moirs from the beginning to the end of that reign, in which all those intrigues and turns at court, at the latter end of that king's life, which Bishop Burnet, with all his gout for tales of secret history, and all his genius for conjectures, does not pretend to account for, are laid open in the clearest and most convincing man-

ner by the person who was most affected by them, and had the best reason to know them."—At his death, all his papers came into the hands of his widow, who afterwards married Mr Jermyn, a member of the church of Rome. They are now deposited in the Bod-

leian library, having been delivered by Mr Jermyn to the university, 1778, for valuable consideration. Whilst they were in this gentleman's possession, the cart of Hardwick paid 200l. for the perusal of them. For a consideration of 300l. Mr Macpherson had the use of them; and from these and other materials, compiled his history and state papers. Mr Carte was a man of a strong constitution and indefatigable application. When the studies of the day were over, he would eat heartily; and in conversation was cheerful and enter-

taining.

CART Blanche, a sort of white paper signed at the bottom with a person's name, and sometimes also sealed with his seal, giving another person power to superscribe what conditions he pleases. Much like this is the French blanc signe, a paper without writing, except a signature at the bottom, given by con-

tending parties to arbitrators or friends, to fill up with the conditions they judge reasonable, in order to end the difference.

CARTEL, an agreement between two states for the exchange of their prisoners of war. CARTEL signifies also a letter of defiance or a challenge to decide a controversy either in a tournament or in a single combat. See DUEL.

CARTEL Ship, a ship commissioned in time of war to exchange the prisoners of any two hostile powers; also to carry any particular request or proposal from one to another.
C A R

Cartes, another: for this reason the officer who commands her is particularly ordered to carry no cargo, ammunition, or implements of war, except a single gun for the purpose of firing signals.

CARTEES, BENE DES, descended of an ancient family in Touraine in France, was one of the most eminent philosophers and mathematicians in the 17th century. At the Jesuits College at La Fleche, he made a very great progress in the learned languages and polite literature, and became acquainted with Father Marsenne. His father designed him for the army; but his tender constitution then not permitting him to expose himself to such fatigues, he was sent to Paris, where he launched into gaming, in which he had prodigious success. Here Marsenne persuaded him to return to study; which he pursued till he went to Holland, in May 1616, where he engaged as a volunteer among the Prince of Orange's troops. While he lay in garrison at Breda, he wrote a treatise on music, and laid the foundation of several of his works. He was at the siege of Rochelle in 1628; returned to Paris; and, a few days after his return, at an assembly of men of learning in the house of Monsignor Bagni, the pope's nuncio, was prevailed upon to explain his sentiments with regard to philosophy, when the nuncio urged him to publish his system. Upon this he went to Amsterdam, and from thence to Franeker, where he began his metaphysical meditations, and drew up his discourse on meteors. He made a short tour to England, and not far from London, made some observations concerning the declension of the magnet. He returned to Holland, where finished his treatise on the world.

His books made a great noise in France, and Holland thought of nothing but discarding the old philosophy, and following his. Vocation being chosen rector of the university of Utrecht, procured his philosophy to be prohibited, and wrote against him; but he immediately published a vindication of himself. In 1647, he took a journey into France, where the king settled a pension of 3000 livres upon him. Christina, queen of Sweden, having invited him into that kingdom, he went thither, where he was received with the greatest civility by her majesty, who engaged him to attend her every morning at five o'clock, to instruct her in philosophy, and desired him to revise and digest all his writings which were unpublished, and to form a complete body of philosophy from them. She likewise proposed to allow him a revenue, and to form an academy, of which he was to be the director. But these designs were broken off by his death in 1650. His body was interred at Stockholm, and 17 years afterwards removed to Paris, where a magnificent monument was erected to him in the church of St Genevive de Mont. The great Dr Halley, in a paper concerning optics observes, that though some of the ancients mention refraction as an effect of transparent mediums, Des Cartes was the first who discovered the laws of refraction, and reduced dioptrics to a science. As to his philosophy, Dr Keill, in his introduction to his examination of Dr Burnett's theory of the earth, says, that Des Cartes was so far from applying geometry to natural philosophy, that his whole system is one continued blunder on account of his negligence in that point; the laws observed by the planets in their revolutions round the sun not agreeing with his theory of vortices. His philosophy has accordingly given way to the more accurate discoveries and demonstrations of the Newtonian system.

CARTESIANS, a sect of philosophers, who adhered to the system of Des Cartes, founded on the following principles, the metaphysical, the other physical. The metaphysical one is, I think, therefore I am; the physical principle is, that nothing exists but substance. Substances he makes of two kinds; the one a substance that thinks, the other a substance extended; whence actual thought, and actual extension, are the essence of substance.

The essence of matter being thus fixed in extension, the Cartesians conclude that there is no vacuum nor any possibility thereof in nature; but that the universe is absolutely full; mere space is excluded by this principle; because extension being implied in the idea of space, matter is so too. Upon these principles the Cartesians explained mechanically how the world was formed, and how the present celestial phenomena came to take place. See Astronomy Index.

CARTHAGE, a famed city of antiquity, the capital of Africa Propris; and which for many years disputed with Rome the sovereignty of the world. According to Vellius Paterculus, this city was built when 65, according to Justin and Trogus 72, according to others 100 or 140 years, before the foundations of Rome were laid. It is on all hands agreed that the Phoenicians were the founders.

The beginning of the Carthagian history, like that of other nations, is obscure and uncertain. In the 7th year of Pygmalion king of Tyre, his sister Elisa, or Dido, is said to have fled, with some of her companions and vassals, from the cruelty and avarice of her brother, who had put to death her husband Sichæus in order to get possession of his wealth. She first touched at the island of Cyprus, where she met with a priest of Jupiter, who was desirous of attending her; to which she readily consented, and fixed the priesthood in his family. At that time it was a custom in the island of Cyprus, for the young women to go on certain stated days, before marriage, to the sea side, there to look for strangers, that might possibly arrive on their coasts, in order to prostitute themselves for gain, that they might thereby acquire a dowry. Out of these the Tyrians selected 80, whom they carried along with them. From Cyprus they sailed directly for the coast of Africa: and at last safely landed in the province called Africa Proprius, not far from Utica, a Phoenician city of great antiquity. The inhabitants received their countrymen with great demonstrations of joy, and invited them to settle among them. The common fable is, that the Phoenicians imposed upon the Africans in the following manner: They desired, for their intended settlement, only as much ground as an ox's hide would encompass. This request the Africans laughed at: but were surprised when, upon their granting it, they saw Elisa cut the hide into the smallest shreds, by which means it surrounded a large territory; in which she built the citadel called Byrsa. The learned, however, are now unanimous in explaining this fable: and it is certain that the Carthagians for many years paid an annual tribute to the Africans for the ground they possessed.

The new city soon became populous and flourishing,
Carthage, by the accession of the neighbouring Africans, who came thither at first with a view of traffic. In a short time it became so considerable, that Jerbas, a neighbouring prince, thought of making himself master of it without any effusion of blood. In order to this, he desired that an embassy of ten of the most noble Carthaginians might be sent him; and, upon their arrival, proposed to them a marriage with Dido, threatening war in case of a refusal. The ambassadors, being afraid to deliver this message, told the queen that Jerbas desired some person might be sent him who was capable of civilizing his Africans; but that there was no possibility of finding any of her subjects who would leave his relations for the conversation of such barbarians. For this they were reprehended by the queen: who told them that they ought to be ashamed of refusing to live in any manner for the benefit of their country. Upon this, they informed her of the true nature of their message from Jerbas: and that, according to her own decision, she ought to sacrifice herself for the good of her country. The unhappy queen, rather than submit to be the wife of such a barbarian, caused a funeral pile to be erected, and put an end to her life with a dagger.

This is Justin's account of the death of Queen Dido, and is the most probable; Virgil's story of her amours with Æneas being looked upon as fabulous, even in the days of Macrobius, as we are informed by that historian. How long monarchical government continued in Carthage, or what happened to this state in its infancy, we are altogether ignorant, by reason of the Punic archives being destroyed by the Romans; so that there is a chasm in the Carthaginian history for above 500 years. It however appears, that from the very beginning the Carthaginians applied themselves to maritime affairs, and were formidable by sea in the time of Cyrus and Cambyses. From Diodorus Siculus and Justin, it appears that the principal supporter of the Carthaginians were the mines of Spain, in which country they seem to have established themselves very early. By means of the riches drawn from these mines, they were enabled to equip such formidable fleets as we are told they fitted out in the time of Cyrus or Cambyses. Justin insinuates, that the first Carthaginian settlement in Spain happened when the city of Gades, now Cadiz, was but of late standing, or even its infancy. The Spanish finding this new colony begin to flourish, attacked it with a numerous army, insomuch that the inhabitants were obliged to call in the Carthaginians to their aid. The latter very readily granted their request, and not only repulsed the Spaniards, but made themselves masters of almost the whole province in which their new city stood. By this success, they were encouraged to attempt the conquest of the whole country: but having to do with very warlike nations, they could not push their conquests to any great length at first; and it appears, from the accounts of Livy and Polybius, that the greatest part of Spain remained unsubdued till the time of Hamilcar, Asdrubal, and Hannibal.

6

First treaty between Carthage and Rome.

About 503 years before the birth of Christ, the Carthaginians entered into a treaty with the Romans. It related chiefly to matters of navigation and commerce. From it we learn that the whole island of Sardinia, and part of Sicily, were then subject to Carthage; that they were very well acquainted with Carthage, the coasts of Italy, and had made some attempts upon them before this time: and that, even at this early period, a spirit of jealousy had taken place between the two republics. Some time near this period, the Carthaginians had a mind to discontinue the tribute they had hitherto paid the Africans for the ground on which their city stood. But, notwithstanding all their power, they were at present unsuccessful; and at last were obliged to conclude a peace, one of the articles of which was, that the tribute should be continued.

By degrees the Carthaginians extended their power over all the islands in the Mediterranean, Sicily excepted; and for the entire conquest of this, they made vast preparations, about 480 years before Christ. Their army consisted of 300,000 men; their fleet was composed of upwards of 2000 men of war, and 3000 transports; and with such an immense armament, they made no doubt of conquering the whole island in a single campaign. In this, however, they found themselves miserably deceived. Hamilcar their general having landed his numerous forces, invested Himera, a city of considerable importance. He carried on his attacks with the greatest assiduity; but was at last attacked in his trenches by Gelon and Theron, the tyrants of Syracuse and Agrigentum, who gave the Carthaginians one of the greatest overthrows mentioned in history. An hundred and fifty thousand were killed in the battle and pursuit, and all the rest taken prisoners; so that of so mighty an army not a single person escaped. Of the 2000 ships of war and 3000 transports, of which the Carthaginian fleet consisted, eight ships only, which then happened to be out at sea, made their escape: these immediately set sail for Carthage; but were all cast away, and every soul perished, except a few who were saved in a small boat, and at last reached Carthage with the dismal news of the total loss of the fleet and army. No words can express the consternation of the Carthaginians upon receiving the news of so terrible a disaster. Ambassadors were immediately dispatched to Sicily, with orders to conclude a peace upon any terms. They put to sea without delay; and landing at Syracuse, threw themselves at the conqueror's feet. They begged for peace, with many tears, to receive their city into favour, and grant them a peace on whatever terms he should choose to prescribe. He granted their request, upon condition that Carthage should pay him 2000 talents of silver to defray the expenses of the war; that they should build two temples, where the articles of the treaty should be lodged and kept as sacred; and that for the future they should abstain from human sacrifices. This was not thought a dear purchase of a peace for which there was such occasion; and to show their gratitude for Gelon's moderation, the Carthaginians complimented his wife Demetera with a crown of gold worth 100 talents.

From this time we find little mention of the Carthaginians for 70 years. Some time during this period, however, they had greatly extended their dominions in Africa, and likewise shaken off the tribute which gave them so much uneasiness. They had with the warm disputes with the inhabitants of Cyrene, the capital of Cyrenaica, about a regulation of the limits of...
Carthage of their respective territories. The consequence of these disputes was a war, which reduced both nations so low, that they agreed first to a cessation of arms, and then to a peace. At last it was agreed, that each state should appoint two commissioners, who should set out from their respective cities on the same day, and that the spot on which they met should be the boundary of both states. In consequence of this, two brothers called Phileni were sent out from Carthage, who advanced with great celerity, while those from Cyrene were much more slow in their motions. Whether this proceeded from accident or design, or persifly, we are not certainly informed; but be this as it will, the Cyrenians, finding themselves greatly outstripped by the Phileni, accused them of breach of faith, asserting that they had set out before the time appointed, and consequently that the convention between their principals was broken. The Phileni desired them to propose some expedient whereby their differences might be accommodated; promising to submit to it whatever it might be. The Cyrenians then proposed, either that the Phileni should retire from the place where they were, or that they should be buried alive upon the spot. With this last condition the brothers immediately complied, and by their death gained a large extent of territory to their country. The Carthaginians ever after celebrated this as a most brave and heroic action; paid them divine honours; and endeavoured to immortalize their names by erecting two altars there, with suitable inscriptions upon them.

About the year before Christ 412, some disputes happening between the Egestines and Selinonitines, inhabitants of two cities in Sicily, the former called in the Carthaginians to their assistance; and occasioned a new invasion of Sicily by that nation. Great preparations were made for this war: Hannibal, whom they had appointed general, was empowered to raise an army equal to the undertaking, and equip a suitable fleet. They also appointed certain funds for defraying all the expenses of the war, intending to exert their whole force to reduce the island under their subjection.

The Carthaginian general having landed his forces, immediately marched for Selinia. In his way he took Emporium, a town situated on the river Mazara; and having arrived at Selinia, he immediately invested it. The besieged made a very rigorous defence: but at last the city was taken by storm, and the inhabitants were treated with the utmost cruelty. All were massacred by the savage conqueror, except the women who fled to the temples; and these escaped, not through the merciful disposition of the Carthaginians, but because they were afraid, that if driven to despair they would set fire to the temples, and by that means consume the treasure they expected to find in those places. Sixteen thousand were massacred; 2250 escaped to Agrigentum; and the women and children, about 5000 in number, were carried away captives. At the same time the temples were plundered, and the city razed to the ground.

After the reduction of Selinia, Hannibal laid siege to Himera: that city he desired above all things to become master of, that he might revenge the death of his grandfather Hamilcar, who had been slain before it by Gelon. His troops, flushed with their late success, behaved with undaunted courage: but finding his battering engines not to answer his purposes sufficiently, he undermined the wall, supporting it with large beams of timber, to which he afterwards set fire, and thus laid part of it flat on the ground. Notwithstanding this advantage, however, the Carthaginians were several times repulsed with great slaughter; but at last they became masters of the place, and treated it in the same manner as they had done Selinia. After this, Hannibal, dismissing his Sicilian and Italian allies, returned to Africa.

The Carthaginians were now so much elated, that they meditated the reduction of the whole island. But as the age and infirmities of Hannibal rendered him incapable of commanding the forces alone, they joined in commission with him Imilcar, the son of Hanno, one of the same family. On the landing of the Carthaginian army, all Sicily was alarmed, and the principal cities put themselves into the best state of defence they were able. The Carthaginians immediately marched to Agrigentum, and began to batter the walls with great fury. The besieged, however, defended themselves with incredible resolution, in a sally burnt all the machines raised against their city, and repulsed the enemy with great slaughter. The Syracusans, in the mean time, being alarmed at the danger of Agrigentum, sent an army to its relief. On their approach they were immediately attacked by the Carthaginians; but after a sharp dispute the latter were defeated, and forced to fly to the very walls of Agrigentum, with the loss of 6000 men. Had the Agrigentine commanders now salivated, and fallen upon the fugitives, in all probability the Carthaginian army must have been destroyed; but, either through fear or corruption, they refused to stir out of the place, and this occasioned the loss of it. Immense booty was found in the city; and taken the Carthaginians behaved with their usual cruelty, putting all the inhabitants to the sword, not excepting even those who had fled to the temples. The next attempt of the Carthaginians was directed against the city of Gela; but the Gelaeans, being greatly alarmed, implored the protection of Syracuse; and, at their request, Dionysius was sent to assist them with 2000 foot and 400 horse. The Gelaeans were so well satisfied with his conduct, that they treated him with the highest marks of distinction; they even sent ambassadors to Syracuse to return thanks for the important services done them by sending him thither; and soon after he was appointed generalissimo of the Syracusan forces and those of their allies against the Carthaginians. In the mean time Imilcar, having razed the city of Agrigentum, made an incursion into the territories of Gela and Comarina; which having ravaged in a dreadful manner, he carried off such immense quantity of plunder, as filled his whole camp. He then marched against the city; but though Gela was it was but indifferently fortified, he met with a very vigorous resistance; and the place held out for a long time without receiving any assistance from its allies. At last Dionysius came to its assistance with an army of 50,000 foot and 1000 horse. With these he attacked the Carthaginian camp, but was repulsed with great loss; after which he called a council of war, the result of whose deliberations was, that since the enemy
Abandoned by its inhabitants.

Notwithstanding these successes, however, Imilcar finding his army greatly weakened, partly by the casualties of war, and partly by a plague, which broke out in it, sent a herald to Syracuse to offer terms of peace. His unexpected arrival was very agreeable to the Syracusans, and a peace was immediately concluded upon the following terms, viz. That the Carthaginians, besides their ancient acquisitions in Sicily, should cede to them the countries of the Silenian, the Selinuntines, the Himilcoans, and Agrigentines; that the people of Gela and Camarina should be permitted to reside in their respective cities, which yet should be dismantled, upon their paying an annual tribute to the Carthaginians; that all the other Sicilians should preserve their independency except the Syracusans, who should continue in subjection to Dionysius.

The tyrant of Syracuse, however, had concluded this peace with no other view than to gain time, and to put himself in condition to attack the Carthaginian territories with greater force. Having accomplished this, he acquainted the Syracusans with his design, and they immediately approved of it: upon which he gave up to the fury of the populace the persons and possessions of the Carthaginians who resided in Syracuse, and traded there on the faith of treaties. As there were many of their ships at that time in the harbour, laden with cargoes of great value, the people immediately plundered them; and, not content with this, ransacked all their houses in a most outrageous manner. This example was followed throughout the whole island; and in the mean time, Dionysius posted a herald to Carthage, with a letter to the senate and people, telling them, that if they did not immediately withdraw their garrisons from all the Greek cities in Sicily, the people of Syracuse would treat them as enemies. With this demand, however, he did not allow them to comply; for without waiting for any answer from Carthage, he advanced with his army to Mount Eryx, near which stood the city of Motya, a Carthaginian colony of great importance; and this he immediately invested. But soon after, leaving his bro-

plete his misfortunes, Dionysius attacked him unexpectedly, totally ruined his fleet, and made himself master of his camp.

Himilco, finding himself altogether unable to sustain another attack, was obliged to come to a private agreement with Dionysius; who for 300 talents consented to let him escape to Africa with the shattered remains of his fleet and army. The unfortunate general arrived at Carthage, clad in mean and sordid attire, where he was met by a great number of people bewailing their sad and inauspicious fortune. Himilco joined them in their lamentations; and, being unable to survive his misfortunes, put an end to his own life. He had left Mago in Sicily, to take care of the Carthaginian interests in the best manner he could. In order to this, Mago treated all the Sicilians subject to Carthage with the greatest humanity; and, having received a considerable number of soldiers from Africa, he at last formed an army with which he ventured a battle; in this he was defeated, and driven out of the field, with the loss of 800 men; which obliged him to desist from farther attempts of that nature.

Notwithstanding all these terrible disasters, the Carthaginians could not forbear making new attempts upon the island of Sicily; and about the year before Christ 302, Mago landed in it with an army of 80,000 men. This attempt, however, was attended with no better success than before: Dionysius found means to reduce him to such straits for want of provisions, that he was obliged to sue for peace. This continued for nine years, at the end of which the war was renewed with various success. It continued with little interruption till the year before Christ 376, when the Syracusan state being rent by civil dissensions, the Carthaginians thought it a proper time to exert themselves, in order to become masters of the whole island. They fitted out a great fleet, and entered into alliance with Ictetas, tyrant of Leontini, who pretended to have taken Syracuse under his protection. By this treaty, the two powers engaged to assist each other, in order to expel Dionysius II. after which they were to divide the island between them. The Syracusans applied for succours to the Corinthians: and they readily sent them a body of troops under the command of Timoleon, an experienced general. By a stratagem, he got his forces landed at Tauromenium. The whole of them did not exceed 1200 in number; yet with these he marched against Ictetas, who was at the head of 5000 men: his army he surprised at supper, put 300 of them to the sword, and took 600 prisoners. He then marched to Syracuse, and broke into one part of the town before the enemy had any notice of his approach: here he took post, and defended himself with such resolution, that he could not be dislodged by the united power of Ictetas and the Carthaginians.

In this place he remained for some time, in expectation of a reinforcement from Corinth; till the arrival of which he did not judge it practicable to extend his business. The Carthaginians, being apprised that the Corinthian succours were detained by tempestuous weather at Thurium, posted a strong squadron, under Hanno their admiral, to intercept them in their passage to Sicily. But that commander, not imagining the Corinthians would attempt a passage to Sicily in such a stormy season, left his station at Thurium, and ordering his seamen to crown themselves with garlands, and adorn their vessels with bucklers both of the Greek and Carthaginian form, sailed to Syracuse in a triumphant manner. Upon his arrival there, he gave the troops in the citadel to understand that he had taken the succours Timoleon expected, thinking by this means to intimidate them to surrender. But, while he thus trifled away his time, the Corinthians marched with great expedition to Rhegium, and, taking the advantage of a gentle breeze, were easily wafted over into Sicily. Mago, the Carthaginian general, was no sooner informed of the arrival of this reinforcement, than he was struck with terror, though the whole Corinthian army did not exceed 4000 men; and soon after, learning a revolt of his mercenaries, he weighed anchor, in spite of all the remonstrances of Ictetas, and set sail for Africa. Here he sooner arrived, than, overcome with grief and shame for his unparalleled cowardice, he laid violent hands on himself. His body was hung upon a gallows or cross, in order to deter succeeding generals from forfeiting their honour in so flagrant a manner.

After the flight of Mago, Timoleon carried all before him. He obliged Ictetas to renounce his alliance with the state of Carthage, and even deposed him, and continued his military preparations with the greatest vigour. On the other hand, the Carthaginians prepared for the ensuing campaign with the greatest alacrity. An army of 70,000 men was sent over with a fleet of 200 ships of war, and 1000 transports laden with warlike engines, armed chariots, horses, and all other sorts of provisions. This immense multitude, however, was overthrown on the banks of the Crimenes by Timoleon: 10,000 were left dead on the field of battle; and of these above 3000 were native Carthaginians of the best families in the city. Above 15,000 were taken prisoners; all their baggage and provisions, with 200 chariots, 1000 coats of mail, and 10,000 shields, fell into Timoleon's hands. The spoil, which consisted chiefly of gold and silver, was so immense, that the whole Sicilian army was three days in collecting it and stripping the slain. After this signal victory, he left his mercenary forces upon the frontiers of the enemy, to plunder and ravage the country; while he himself returned to Syracuse with the rest of his army, where he was received with the greatest demonstrations of joy. Soon after, Ictetas, grown weary of his private station, concluded a new peace with the Carthaginians; and, having assembled an army, ventured an engagement with Timoleon: but in this he was utterly defeated; and himself, with Eupolemus his son, and Euthymus general of his horse, were brought bound to Timoleon by their own soldiers. The two first were immediately executed as tyrants and traitors, and the last murdered in cold blood; Ictetas's wives and daughters were likewise cruelly put to death after a public trial. In a short time after, Marmocres, another of the Carthaginian confederates, was overthrown by Timoleon, with the loss of 2000 men.

These misfortunes induced the Carthaginians to conclude a peace on the following terms: That all the enclosed Greek cities should be set free; that the river Halys should be the boundary between the territories of both parties; that the natives of cities subject to the Carthaginians...
Carthage.

Carthaginians should be allowed to withdraw, if they pleased, to Syracuse or its dependencies, with their families and effects; and, lastly, that Carthage should not, for the future, give any assistance to the remaining tyrants against Syracuse.

About 310 years before Christ, we find the Carthaginians engaged in another bloody war with the Sicilians, on the following occasion: Sosistratus, who had usurped the supreme authority at Syracuse, having been forced by Agathocles to raise the siege of Rhegium, returned with his shattered troops to Sicily. But soon after this unsuccessful expedition he was obliged to abdicate the sovereignty and quit Syracuse. With him were expelled above 600 of the principal citizens, who were suspected of having formed a design to overturn the plan of government which then prevailed in the city. As Sosistratus and the exiles thought themselves ill treated, they had recourse to the Carthaginians, who readily espoused their cause. Hereupon the Syracusans, having recalled Agathocles, who had before been banished by Sosistratus, appointed him commander in chief of all their forces, principally on account of the known avarice he bore that tyrant. The war, however, did not then continue long; for Sosistratus and the exiles were quickly received again into the city, and peace was concluded with Carthage: The people of Syracuse, however, finding that Agathocles wanted to make himself absolute, exacted an oath from him, that he would do nothing to the prejudice of the democracy. But, notwithstanding this oath, Agathocles pursued his purpose, and by a general massacre of the principal citizens of Syracuse, raised himself to the throne. For some time he was obliged to keep the peace he had concluded with Carthage; but at last, finding his authority established, and that his subjects were ready to second his ambitious designs, he paid no regard to his treaties, but immediately made war on the neighbouring states, which he had expressly agreed not to do, and then carried his arms into the very heart of the island. In these expeditions he was attended with such success, that in two years time he brought into subjection all the Greek part of Sicily. This being accomplished, he committed great devastations in the Carthaginian territories, their general Hamilcar not offering to give him the least disturbance. This perfidious conduct greatly incensed the people of those districts against Hamilcar, whom they accused before the senate. He died, however, in Sicily; and Hamilcar the son of Gisco was appointed to succeed him in the command of the forces. The last place that held out against Agathocles was Messana, whither all the Syracuse exiles had retired. Passiphus, Agathocles's general, found means to cajole the inhabitants into a treaty: which Agathocles, according to custom, paid no regard to, but, as soon as he was in possession of the town, cut off all those who had opposed his government. For, as he intended to prosecute the war with the utmost vigour against Carthage, he thought it a point of good policy to destroy as many of his Sicilian enemies as possible.

The Carthaginians in the mean time having landed a powerful army in Sicily, an engagement soon ensued, in which Agathocles was defeated with the loss of 7000 men. After this defeat he was obliged to shut himself up in Syracuse, which the Carthaginians immediately invested, and most of the Greek states in the island submitted to them.

Agathocles, seeing himself stripped of almost all his dominions, and his capital itself in danger of falling into the hands of the enemy, formed a design, which, were it not attested by writers of undoubted authority, would seem absolutely incredible. This was, that he invades than to transfer the war into Africa, and lay siege to Africa. The enemy's capital, at a time when he himself was besieged, and only one city left to him in all Sicily. Before he departed, however, he made all the necessary preparations for the defence of the place, and appointed his brother Antandrus governor of it. He also gave permission to all who were not willing to stand the fatigues of a siege to retire out of the city. Many of the principal citizens, Justin says 1600, accepted of this offer; but they were no sooner got out of the place, than they were cut off by parties posted on the road for that purpose. Having seized upon their estates, Agathocles raised a considerable sum, which was intended in some measure to defray the expense of the expedition; however, he carried with him only 50 talents to supply his present wants, being well assured that he should find in the enemy's country whatever was necessary for his subsistence. As the Carthaginians had a much superior fleet, they for some time kept the mouth of the harbour blocked up; but at last a fair opportunity offered, and Agathocles hastening sail, by the activity of his rowers soon got clear both of the port and city of Syracuse. The Carthaginians pursued him with all possible expedition; but notwithstanding their utmost efforts, Agathocles got his troops landed with very little opposition.

Soon after his forces were landed, Agathocles burnt his fleet, probably that his soldiers might behave with his fleet.

The greater resolution, as they saw no possibility of flying from their danger. He first advanced to a place called the Great City. This, after a feeble resistance, he took and plundered. From hence he marched to Tunis, which surrendered on the first summons; and Agathocles levelled both places with the ground.

The Carthaginians were at first thrown into the greatest consternation; but, soon recovering themselves, the citizens took up arms with so much alacrity, that in a few days they had on foot an army of 40,000 foot and 1000 horse, with 2000 armed chariots. The command of this army they entrusted to Hanno and Bomilcar, two generals between whom there subsisted a great animosity. This occasioned the defeat of their Carthaginian army, with the loss of their camp, though all the forces of Agathocles did not exceed 14,000 in number. Among other rich spoil the conqueror found many chariots of curious workmanship, which carried 20,000 pair of sitters and manacles that the enemy had provided for the Sicilian prisoners. After this defeat the Carthaginians, supposing themselves to have fallen under the displeasure of their deities on account of their neglecting to sacrifice children of noble families to them, resolved to expiate this guilt. Accordingly 300 children of the first rank were sacrificed to their bloody gods, besides 300 other persons who voluntarily offered themselves to pacify the wrath of these deities.

After these expiatory, Hamilcar was recalled from Sicily.
When the messengers arrived, Hamilcar commanded them not once to mention the victory of Agathocles; but, on the contrary, to give out among the troops that he had been entirely defeated, his forces all cut off, and his fleet destroyed by the Carthaginians. This threw the Syracusans into the utmost despair; however, one Eurymion, an Etolian, prevailed upon Antandrus not to consent to a capitulation, but to stand a general assault. Hamilcar being informed of this, prepared his battering engines, and made all the necessary preparations to storm the town without delay. But while matters remained in this situation, a galley, which Agathocles had caused to be built immediately after the battle, got into the harbour of Syracuse, and acquainted the inhabitants with the certainty of Agathocles's victory. Hamilcar, observing that the garrison flocked down to the port on this occasion, and expecting to find the walls unguarded, ordered his soldiers to erect scaling ladders, and begin the intended assault. The enemy having left the ramparts quite exposed, the Carthaginians mounted them without being discerned, and had almost possessed themselves of an entire part lying between two towers, when the patroon discovered them. Upon this, a warm dispute ensued; but at last the Carthaginians were repulsed with loss. Hamilcar, therefore, finding it vain to continue the siege after such glad tidings had restored life and soul to the Syracusans, drew off his forces, and sent a detachment of 4000 men to reinforce the troops in Africa. He still entertained hopes, however, that he might oblige Agathocles to quit Africa, and return to the defence of his own dominions. He spent some time in making himself master of such cities as sided with the Syracusans; and, after having brought all their allies under subjection, returned again to Syracuse, hoping to surprise it by an attack in the night-time. But being attacked while advancing through narrow passes, where his numerous army had not room to act, he was defeated with great slaughter, and himself taken prisoner, carried into Syracuse, and put to death.

In the mean time the Agrigentines, finding that the Carthaginians and Syracusans had greatly weakened each other by this war, thought it a proper opportunity to attempt the sovereignty of the whole island. They therefore commenced a war against both parties; and prosecuted it with such success, that in a short time they wrested many places of note both out of the hands of the Syracusans and Carthaginians.

In Africa the tyrant carried every thing before him. He reduced most of the places of any note in the territory of Carthage, and hearing that Elymas king of Libya, had declared against him, he immediately entered Libya Superior, and in a great battle overthrew that prince, putting to the sword a good part of his troops, and the general who commanded them; after which he advanced against the Carthaginians with such expedition, that he surprised and defeated them with the loss of 2000 killed, and a great number taken prisoners. He next prepared for the siege of Carthage itself; and, in order thereto advanced to a post within five miles of that city. On the other hand, notwithstanding the great losses they had already sustained, the Carthaginians, with a powerful army, encamped between him and their capital. In this situation Agathocles received advice of the defeat of the Carthaginian forces before Syracuse, and the head of Hamilcar their general. Upon this he immediately rode up to the enemy's camp, and showing them the head, gave them an account of the total destruction of their army before Syracuse. This threw them into such consternation, that in all human probability Agathocles would have made himself master of Carthage, had not an unexpected mutiny arisen in his camp, which gave the Carthaginians an opportunity of recovering from their terror.

The year following an engagement happened, in which neither party gained any great advantage: but as soon as the tyrant, notwithstanding all his victories, found himself unable to carry on the war alone, and therefore endeavored to gain over to his interest Ophellas, one of the captains of Alexander the Great. In this he perfectly succeeded; and to succour his new ally the more effectually, Ophellas sent to Athens for a body of troops. Having finished his military preparations, Ophellas found his army to consist of 10,000 foot and 600 horse, all regular troops, besides 100 chariots, and a body of 10,000 men, attended by their wives and children, as though he had been going to plant a new colony. At the head of these forces he continued his march towards Agathocles for 18 days, and then encamped at Autocleia, a city about 5000 stadia distant from the capital of his dominions. From thence he advanced through the Regio Syricta; but found himself reduced to such extremities, that his army was in danger of perishing for want of bread, water, and other provisions. They were also greatly annoyed by serpents and wild beasts, with which that desert region abounded. The serpents made the greatest havoc among the troops; for, being of the same colour with the earth, and extremely venomous, many soldiers, who trod upon them without seeing them, were stung to death. At last, after a very fatiguing march of two months, he approached Agathocles, and encamped at a small distance from him, to the no small terror of the Carthaginians, who apprehended the most fatal consequences from this junction. Agathocles at first caressed him, and advised him to take all possible care of his troops that they might undergo so many fatigues; but soon after cut him off by treachery, and then by fair words and promises persuaded his troops to serve under himself.

Agathocles, now finding himself at the head of a numerous army, assumed the title of king of Africa, intending soon to complete his conquests by the reduction of Carthage. He began with the siege of Utica, which was taken by assault. After this he marched against Hippo Diarrbytus, the Biserta of the moderns, which was also taken by storm, and after this most of the people bordering upon the sea coasts, and even those who inhabited the inland parts of the country, submitted to him. But in the midst of this career of success, the Sicilians formed an association to return favour of liberty; which obliged the tyrant to return home, leaving his son Archagathus to carry on the war in Africa.

Archagathus, after his father's departure, greatly extended the African conquests. He sent Eunuchus Archagathus, at the head of a large detachment to invade some of the neighbouring provinces, while he himself, with the
Carthage, the greatest part of his army, observed the motions of the Carthaginians. Eumachus falling into Numidia, first took the great city of Tocas, and conquered several of the Numidian cantons. Afterwards he besieged and took Phlifina; which was attended with the submission of the Asphodelodonts, a nation, according to Diodorus, as black as the Ethiopians. He then reduced several cities; and being at last elated with such a run of good fortune, resolved to penetrate into the most remote parts of Africa. Here he at first met with success; but hearing that the barbarous nation were advancing in a formidable body to give him battle, he abandoned his conquests, and retreated with the utmost precipitation towards the sea coasts, after having lost abundance of men.

This unfortunate expedition made a great alteration for the worse in the affairs of Archagathus. The Carthaginians being informed of Eumachus's bad success, resolved to exert themselves in an extraordinary manner to repair their former losses. They divided their forces into three bodies: one of these they sent to the sea coasts, to keep the towns there in awe; another they dispatched into the Mediterranean parts, to preserve the allegiance of the inhabitants there; and the last body they ordered to the Upper Africa, to support their confederate in that country. Archagathus, being apprised of the motions of the Carthaginians, divided his forces likewise into three bodies. One of these he sent to observe the Carthaginian troops on the sea coasts, with orders to advance afterwards into the Upper Africa; another under the command of Euchrion, one of his generals, he posted at a proper distance in the heart of the country, to have an eye both on the enemy there and the barbarous nations; and with the last, which he led in person, he kept near Carthage, preserving a communication with the other two, in order to send them succours, or recall them, as the exigency of affairs should require. The Carthaginian troops sent into the heart of the country, were commanded by Hanno, a general of great experience, who being informed of the approach of Euchrion, laid an ambush for him, into which he was drawn, and cut off with 4,000 foot and 100 horse. Hilmelos, who commanded the Carthaginian forces in Upper Africa, having advice of Eumachus's march, immediately advanced against him. An engagement ensued, in which the Greeks were almost totally cut off, or perished with thirst after the battle; out of 8,000 foot only 30, and of 800 horse only 49, having the good fortune to make their escape.

Archagathus receiving the melancholy news of these two defeats, immediately called in the detachments he had sent out to harass the enemy, which would otherwise have been instantly cut off. He was, however, in a short time hemmed in on all sides, in such a manner as to be reduced to the last extremity for want of provisions, and ready every moment to be swallowed up by the numerous forces which surrounded him. In this deplorable situation Agathocles received an express from Archagathus, acquainting him of the losses he had sustained, and the scarcity of provisions he laboured under. Upon this the tyrant, leaving the care of the Sicilian war to one Leptines, by a stratagem got 18 Etruscan ships that came to his assistance out of the harbour; and then engaging the Carthaginian squadron which lay in its neighbourhood, took five of their ships, and made all their men prisoners. By this means he became master of the port, and secured a passage into it for the merchants of all nations, which soon restored plenty to that city, where the famine before had begun to make great havoc. Supplying himself, therefore, with a sufficient quantity of necessaries for the voyage he was going to undertake, he immediately set sail for Africa.

Upon his arrival in this country, Agathocles viewed his forces, and found them to consist of 6,000 men in Greece, as many Samnites, Celts, and Etruscans besides 10,000 Africans, and 1,500 horse. As he found his troops almost in a state of despair, he thought it a proper time for offering the enemy battle. The Carthaginians, however, did not think proper to accept the challenge; especially as, by keeping close in their camp, where they had plenty of every thing, they could starve the Greeks to a surrender without striking a stroke. Upon this Agathocles attacked the Carthaginian camp with great bravery, made a considerable impression upon it, and might perhaps have carried it, had not his mercenaries deserted him almost at the first onset. By this piece of cowardice he was forced to retire with precipitation to his camp, whither the Carthaginians pursued him very closely, doing great execution in the pursuit.

The next night, the Carthaginians sacrificed all the prisoners of distinction as a grateful acknowledgment to the Carthaginians for the victory they had gained. While they were employed in this inhuman work, the wind suddenly rising, carried the flames to the sacred taurobole near the altar, which was entirely consumed, as well as the general's tent, and those of the principal officers adjoining to it. A dreadful alarm took place through the whole camp, which was heightened by the great progress the fire made. For the soldiers tents consisting of very combustible materials, and the wind blowing in a most violent manner, the whole camp was almost entirely reduced to ashes; and many of the soldiers, endeavouring to carry off their arms, and the rich baggage of their officers, perished in the flames. Some of those who made their escape met with a fate equally unhappy; for, after Agathocles had received the last blow, the Africans deserted him, and were in that instant coming over to the Carthaginians. These, the persons who were flying from the flames took to be the whole Syracusan army advancing in order of battle to attack their camp. Upon this a dreadful confusion ensued. Some took to their heels; others fell down in heaps, one upon another; and others engaged their comrades, mistaking them for the enemy. Five thousand men lost their lives in this tumult, and the rest thought proper to take refuge within the walls of Carthage; nor could the appearance of daylight, for some time, dissipate their terrible apprehensions. In the mean time, also, the African deserters, observing the great confusion the Carthaginians were in, and not knowing Agathocles, the meaning of it, were so terrified, that they thought proper to return to the place from whence they came. The Syracusans, seeing a body of troops advancing towards them in good order, concluded that the enemy were.
Carthage were marching to attack them, and therefore immediately cried out, “To arms.” The flames ascending out of the Carthaginian camp into the air, and the lamentable outcries proceeding from thence, confirmed them in this opinion, and greatly heightened their confusion. The consequence was much the same as in the Carthaginian camp; for coming to blows with one another instead of the enemy, they scarce recovered their senses upon the return of light, and the intestine fray was so bloody that it cost Agathocles 4000 men.

The last disaster so disheartened the tyrant, that he immediately set about contriving means for making his escape privately; and this he at last, though with great difficulty, effected. After his departure, his two sons were immediately put to death by the soldiers, who, choosing a leader from among themselves, made peace with the Carthaginians upon the following conditions: 1. That the Greeks should deliver up all the places they held in Africa, receiving from them 300 talents; 2. That such of them as were willing to serve in the Carthaginian army should be kindly treated, and receive the usual pay; and, 3. That the rest should be transported to Sicily, and have the city of Selinus for their habitation.

From this time to that of their first war with the Romans, we find nothing remarkable in the history of the Carthaginians. The first Punic war, as it is commonly called, happened about 255 years before Christ. At that time the Carthaginians were possessed of extensive dominions in Africa; they had made considerable progress in Spain; were masters of Sardinia, Corsica, and all the islands on the coast of Italy; and had extended their conquests to a great part of Sicily. The occasion of the first rupture between the two republics was as follows: The Mamertines being vanquished in battle, and reduced to great straits by Hiero king of Syracuse, had resolved to deliver up Messina, the only city they now possessed, to that prince, with whose mild government and strict probity they were well acquainted. Accordingly, Hiero was advancing at the head of his troops to take possession of the city, when Hannibal, who at that time commanded the Carthaginian army in Sicily, prevented him by a stratagem. He came to meet Hiero, as it were, to congratulate him on his victory; and amused him, while some of the Carthaginian troops filed off towards Messina. Hereupon the Mamertines, seeing their city supported by a new reinforcement, were divided into several opinions. Some were for accepting the protection of Carthage; others were for surrendering to the king of Syracuse; but the greater part were for calling in the Romans to their assistance. Deputies were accordingly dispatched to Rome, offering the possession of the city to the Romans, and in the most moving terms imploring protection. This, after some debate, was agreed to; and the consul Appius Claudius received orders to attempt a passage to Sicily at the head of a powerful army. Being obliged to stay some time at Rome, however, one Caius Claudius, a person of great intrepidity and resolution, was dispatched with a few vessels to Rhegium. On his arrival there, he observed the Carthaginian squadron to be so much superior to his own, that he thought it would be little better than madness to attempt at that time to transport forces to Carthage. He crossed the straits, however, and had a conference with the Mamertines, in which he prevailed upon them all to accept of the protection of Rome; and on this he made the necessary preparations for transporting his forces. The Carthaginians, being informed of the resolution of the Romans, sent a strong squadron of galleys under the command of Hanno to intercept the Roman fleet; and accordingly the Carthaginian admiral, coming up with them near the coast of Sicily, attacked them with great fury. During the engagement, a violent storm arose, which drenched many of the Roman vessels against the rocks, and did a vast deal of damage to their squadron; by which means Claudius was forced to retire to Rhegium, and this he accomplished with great difficulty. Hanno restored all the vessels he had taken; but ordered the deputies sent with them to expostulate with the Roman general upon the infraction of the treaties subsisting between the two republics. This expostulation, however just, produced an open rupture: Claudius soon after Possessing himself of Messina.

Such was the beginning of the first Punic war, which is said to have lasted 24 years. The first year, Messana and the Carthaginians and Syracusans laid siege to Messana; but not acting in concert, as they ought to have done, were overthrown by the consul Appius Claudius; and this defeat so much disgusted Hiero with the Carthaginians, that he soon after concluded an alliance with the Romans. After this treaty, having no enemy to contend with but the Carthaginians, the Romans made themselves masters of all the cities on the western coast of Sicily, and at the end of the campaign carried back most of their troops with them to take up their winter quarters in Italy.

The second year, Hann the Carthaginian general fixed his principal magazine at Agrigentum this place was very strong by nature, had been rendered almost impregnable by the new fortification raised by the Carthaginians during the preceding winter, and was defended by a numerous garrison, commanded by one Hannibal, a general of great experience in war. For five months the Romans attempted to reduce the place by famine, and had actually brought the inhabitants to great distress, when a Carthaginian army of 50,000 foot, 6000 horse, and 60 elephants, landed at Lilybeum, and from thence marched to Heraclea, within 20 miles of Agrigentum. There the general received a deputation from some of the inhabitants of Erbesa, where the Romans had their magazines, offering to put the town into his hands. It was accordingly delivered up; and by this means the Romans became so much distressed, that they had certainly been obliged to abandon their enterprise, had not Hiero supplied them with provisions. But all the assistance he was able to give could not long have supported them, as their army was so much weakened by disorders occasioned by famine, that out of 100,000 men, of whom it originally consisted, scarce a fourth part remained fit for service, and could no longer subsist on such parsimonious supplies. But in the mean time Hannibal acquainted Hanno that the city was reduced to the utmost distress; upon which he resolved to venture an engagement, which he had before declined. In this the Romans were victorious, and the city surrendered.
rrendered at discretion, though Hannibal with the
greatest part of the garrison, made their escape. This
ended the campaign; and the Carthaginians being
greatly chagrined at their bad success, fired Hanno
of an immense sum of money, and deprived him of his
command, appointing Hamilcar to succeed him in the
command of the land army, and Hannibal in that of the
fleet.

The third year, Hannibal received orders to ravage
the coast of Italy; but the Romans had taken care
to post detachments in such places as were most pro-
per to prevent his landing, so that the Carthaginians
found it impossible to execute his orders. At the same
time the Italians, perceiving the advantages of being
masters of the sea, set about building 120 galleys.
While this was doing, they made themselves masters
of most of the inland cities, but the Carthaginians re-
duced or kept steady in their interest most of the mari-
time ones; so that both parties were equally successful
during this campaign.

The fourth year, Hannibal, by a stratagem made
himself master of 17 Roman galleys; after which he
committed great ravages on the coast of Italy, whether
he had advanced to take a view of the Roman fleet.
But he was afterwards attacked in his turn, lost the
greatest part of his ships, and with great difficulty
made his own escape. Soon after he was totally de-
fended by the consul Duilius, with the loss of 80 ships
taken, 13 sunk, 7000 men killed, and as many taken
prisoners. After this victory Duilius landed in Si-
cily, put himself at the head of the land forces, relieved
Segesta, besieged by Hamilcar, and made himself
master of Messana, though defended by a numerous
garrison.

The fifth year a difference arose between the Ro-
sicilians and the Cartha-
ginians at sea.

Sicilians defeated by men and their Sicilian allies, which came to such a
height that they encamped separately. Of this Hamilcar availed himself, and attacking the Sicilians in
their entrenchments, put 4000 of them to the sword.
He then drove the Romans from their posts, took se-
veral cities from them, and overran the greatest part
of the country. In the mean time, Hannibal, after
his defeat, sailed with the shattered remains of his fleet
to Carthage: but, in order to secure himself from pun-
nishment, he sent one of his friends with all speed,
before the event of the battle was known there, to ac-
quaint the senate, that the Romans had put to sea
with a good number of heavy ill-built vessels, each
of them carrying some machine, the use of which the
Carthaginians did not understand; and asked wheth-
er it was the opinion of the senate that Hannibal
should attack them? These machines were the corvi,
which were then newly invented, and by means of
which, chiefly, Duilius had gained the victory. The
senate were unanimous in their opinion that the Ro-
mans should be attacked; upon which the messenger
conquainted them with the unfortunate event of the
battles. As the senators had already declared them-
selves for the engagement, they spared their general's
life, and, according to Polybius, even continued him in
the command of the fleet. In a short time, being re-
forced by a good number of galleys, and attended by
some officers of great merit, he sailed for the coast of
Sardinia. He had not been long here before he was
surprised by the Romans, who carried off many of his
ships, and took great numbers of his men prisoners. Carthage.
This so incensed the rest, that they seized their unfor-
utune admiral, and crucified him; but who was his
immediate successor does not appear.

The sixth year, the Romans made themselves mas-
ters of the islands of Corsica and Sardinia. Hanno
Sardinia, removed by
who commanded the Carthaginian forces in the latter
province, defended himself at a city called Olbia with incredible
bravery; but being at last killed in one of the attacks,
the place was surrendered, and the Romans soon be-
came masters of the whole island.

The seventh year, the Romans took the town of the
Roman army towards Camarina, but in their way were surrounded
in a deep valley, and in the most imminent danger of
being cut off by the Carthaginian army. In this ex-
perience, a legionary tribune, by name M. Calpurnius
Flammeus, desired the general to give him 300 chosen of a legio-
men, promising, with this small company, to find
the enemy's employment as should oblige them to
leave a passage open for the Roman army. He per-
formed his promise with a bravery truly heroic; for
having seized, in spite of all opposition, an eminence,
trenched himself on it, the Carthaginians, jealous
of his success, flung from all quarters to drive
him from his post. But the brave tribune kept their
whole army in play, till the consul, taking advantage
of the diversion, drew his army out of the bad situa-
tion into which he had imprudently brought it. The
legions were no sooner out of danger, than they hast-
cened to the relief of their brave compatriot; but all
they could do was to save their bodies from the results
of their enemies; for they found them all dead on the
spot, except Calpurnius, who lay under a heap of dead
bodies all covered with wounds, but still breathing.
His wounds were immediately dressed, and it fortu-
nately happened that none of them proved mortal; and
for this glorious enterprise he received a crown of gra-
mem. After this the Romans reduced several cities,
and drove the enemy quite out of the territory of the
Agrigentines; but were repulsed with great loss be-
fore Lipara.

The eighth year, Regulus, who commanded the Cartha-
nians, was sent

and at sea

along the coast in disorder, sailed with a squadron of
by the Ro-
ten galleys, to observe their number and strength, or-
man.

The ninth year, the Romans made preparations for Regulus in-

invading Africa. Their fleet for this purpose consist-
ed of 300 galleys, each of them having on board 120
soldiers and 300 rowers. The Carthaginian fleet con-

sisted of 60 sail, and was much better manned than
that of the Romans. The two fleets met near Eemo-

nus; a promontory in Sicily; where, after a bloody
engagement, which lasted the greater part of the day,
the Carthaginians were entirely defeated, with the
loss of 30 galleys sunk, and 63 taken, with all their
men.
Carthage

The Romans lost only 24 galleys, which were all sunk. After this victory, the Romans having re-settled their fleet, set sail for the coast of Africa with all expedition. The first land they got sight of was Cape Hermaea, where the fleet lay at anchor for some time, waiting till the galleys and transports came up. From thence they coasted along till they arrived before Clupea, a city to the east of Carthage, where they made their first descent.

No words can express the consternation of the Carthaginians on the arrival of the Romans in Africa. The inhabitants of Clupea were so terrified, that, according to Zonaras, they abandoned the place, which the Romans immediately took possession of. Having left there a strong garrison to secure their shipping, and keep the adjacent territory in awe, they moved nearer Carthage, taking a great number of towns; they likewise plundered a prodigious number of villages, laid vast numbers of noblemen’s seats in ashes, and took above 20,000 prisoners. In short, having plundered and ravaged the whole country, almost to the gates of Carthage, they returned to Clupea loaded with the immense booty they had acquired in the expedition.

The seventh year, Regulus pushed on his conquests with great rapidity. To oppose his progress, Hamilcar was recalled from Sicily, and with him Postumus and Asdrubal were joined in command. Hamilcar commanded an army just equal to that of Regulus. The other two commanded separate bodies, which were to join him or act apart as occasion required. But, before they were in a condition to take the field, Regulus, pursuing his conquests, arrived on the banks of the Bagrada, a river which empties itself into the sea at a small distance from Carthage. Here he had a monstrous serpent to contend with, which, according to the accounts of those days, infected the waters of the river, poisoned the air, and killed all other animals with its breath alone. When the Romans went to draw water, this huge “dragon attached them; and twisting itself round their bodies, either squeezed them to death, or swallowed them alive. As its hard and thick scales were proof against their darts and arrows, they were forced to have recourse to the balistae, which they made use of in sieges to throw great stones, and to beat down the walls of besieged cities. With these they discharged showers of huge stones against this new enemy, and had the good luck with one of them, to break his backbone; which disabled him from twisting and winding his immense body, and by that means gave the Romans an opportunity of approaching and dispatching him with their darts. But his dead body corrupted the air and the water of the river; and spread so great an infection over the whole country, that the Romans were obliged to decamp. We are told that Regulus sent to Rome the skin of this monster, which was 120 feet long; and that it was hung up in a temple, where it was preserved to the time of the Numantine war.

Having passed this river, he besieged Adris, or Addo, not far from Carthage, which the enemy attempted to relieve; but as they lay encamped among hills and rocks, where their elephants, in which the main strength of their army consisted, could be of no use, Regulus attacked them in their camp, killed 17,000 of them, and took 5,000 prisoners, and 18 elephants. Upon Carthage, the fame of this victory, deputations came from all quarters, inasmuch that the conqueror in a few days became master of 80 towns; among which were the city and port of Utica. This increased the alarm at Carthage; which was reduced to despair, when Regulus laid siege to Tunis, a great city about nine miles from the capital. The place was taken in sight of the Carthaginians, who, from their walls, beheld all the operations of the siege, without making the least attempt to relieve it. And to complete their misfortunes, the Numidians, their neighbours, and implacable enemies, entered their territories, committing every where the most dreadful devastations, which soon occasioned a great scarcity of provisions in the city. The public magazines were soon exhausted; and, as the city was full of selfish merchants, who took advantage of the public distress, to sell provisions at an exorbitant price, a famine ensued, with all the evils which attend it.

In this extremity Regulus advanced to the very walls of Carthage; and, having encamped under them, sent deputies to treat of a peace with the senate. The deputies were received with inexpressible joy; but the conditions they proposed were such that the senate could not hear them without the greatest indignation. They were, 1. That the Carthaginians should relinquish all claims to Sardinia, Corsica, and Sicily. 2. That they should restore to the Romans all the prisoners they had taken from them since the beginning of the war. 3. That if they cared to redeem any of their own prisoners, they should pay so much a head for them as Rome should judge reasonable. 4. That they should for ever pay the Romans an annual tribute. 5. That for the future they should fit out but one man of war for their own use, and 50 triremes to serve in the Roman fleet, at the expense of Carthage, when required by any of the future consuls. These extravagant demands provoked the senators, who loudly and unanimously rejected them; the Roman deputies, however, told them that Regulus would not alter a single letter of the proposals, and that they must either conquer the Romans or obey them.

In this extreme distress, some mercenaries arrived Xanthippus from Greece; among whom was a Lacedemonian, by the name Xanthippus, a man of great valour and experience in war. This man having informed himself of the circumstances of the late battle, declared publicly, that their overthrow was more owing to their own misconduct than to the superiority of the enemy. This discourse being spread abroad, came at last to the knowledge of the senate; and by them, and even by the desire of the Carthaginian generals themselves, Xanthippus was appointed commander in chief of their forces. His first care was to discipline his troops in a proper manner. He taught them how to march, encamp, widen and close their ranks, and rally after the Lacedemonian manner under their proper colours. He then took the field with 12,000 foot, 4000 horse, and 100 elephants. The Romans were surprised at the sudden alteration they observed in the enemy’s conduct; but Regulus, elated with his last success, came and encamped at a small distance from the Carthaginian army in a vast plain, where their elephants and
The Romans utterly defeated, and Regulus taken.

The Carthaginians remained on the field of battle till they had stripped the slain; and then entered their metropolis, which was almost the only place left them, in great triumph. They treated all their prisoners with great humanity, except Regulus; but as for him, he had so insulted them in his prosperity, that they could not forbear showing the highest marks of their resentment. According to Zonaras and others, he was thrown into a dungeon, where he had only sustenance allowed him barely sufficient to keep him alive. Nay, his cruel masters, to heighten his other torments, ordered a huge elephant (at the sight of which animal, it seems, he was greatly terrified) to be constantly placed near him; which prevented him from enjoying any tranquility or repose.

The eleventh year of this war, the Carthaginians, elated with their victory over Regulus, began to talk in a very high strain, threatening Italy itself with an invasion. To prevent this, the Romans took care to garrison all their maritime towns, and fitted out a new fleet. In the mean time, the Carthaginians besieged Cœtea and Utica in vain, being obliged to abandon their enterprise upon hearing that the Romans were equipping a fleet of 350 sail. The Carthaginians having with incredible expedition re-fitted their old vessels, and built a good number of new ones, met the Roman fleet off Cape Hermae. An engagement ensued, in which the Carthaginians were utterly defeated; 144 of their ships being sunk, 50 taken, and 15,000 of their soldiers and rowers killed in the action. The Romans pursued their course to Cœtea, where they were no sooner landed, than they found themselves attacked by the Carthaginian army, under the two Hannos, father and son. But, as the brave Xanthippus no longer commanded their army, notwithstanding the Laodcean discipline he had introduced among them, they were routed at the very first onset, with the loss of 9000 men, and among them many of their chief lords.

Notwithstanding all their victories, however, the Romans found themselves now obliged, for want of provisions, to evacuate both Cœtea and Utica, and abandon Africa altogether. Being desirous of signaling the end of their consulate by some important conquest in Sicily, the consuls steered for that island, contrary to the advice of their pilots, who represented their danger, on account of the season being so far advanced. Their obstinacy proved the destruction of the whole fleet; for a violent storm arising, out of 370 vessels only 80 escaped shipwreck, the rest being swallowed up by the sea, or dashed against the rocks. This was by far the greatest loss that Rome had ever sustained; for besides the ships that were cast away with their crews, a numerous army was destroyed, with all the riches of Africa, which had been by Regulus amassed and deposited in Cœtea, and were now

---

VOL. V. PART I.

From thence transporting to Rome. The whole coast Carthage from Pachium to Cæmerina was covered with dead bodies and wrecks of ships; so that history can scarce afford an example of such a dreadful disaster.

The twelfth year, the Carthaginians hearing of this misfortune of the Romans, renewed the war in Sicily with fresh fury, hoping the whole island, which was now left defenceless, would fall into their hands. Carthalo, a Carthaginian commander, besieged and took Agrigentum. The town he laid in ashes, and demolished the walls, obliging the inhabitants to fly to the island of Cercyras, and march a strong body of forces into Mauritia and Numidia, to punish the people of those countries for showing a disposition to join the Romans. In Sicily the Romans possessed themselves of Cephalodium and Panormus, but were obliged by Carthalo to raise the siege of Drepanum with great loss.

The 13th year, the Romans sent out a fleet of 300 galleys, which appeared off Lilybaeum in Sicily; but finding this place too strong, they steered from thence to the eastern coast of Africa, where they made several descents, surprised some cities, and plundered several towns and villages. They arrived safe at Panormus, which is and in a few days set sail for Italy, having a fair wind again, till they came off Cape Palmarum, where so violent a storm overtook them, that 160 of their galleys and a great number of their transports were lost; upon which the Roman senate made a decree, that for the future no more than 50 vessels should be equipped; and that these should be employed only in guarding the coast of Italy, and transporting the troops into Sicily.

The 14th year, the Romans made themselves masters of Himera and Lipara in Sicily; and the Carthaginians conceiving new hopes of conquering that island, began to make fresh levies in Gaul and Spain, and to equip a new fleet. But their treasures being exhausted, they applied to Ptolemy king of Egypt, intreating him to lend them 2000 talents: but he, being resolved to stand neuter, refused to comply with their request; telling them that he could not, without breach of fidelity, assist one friend against another. However, the republic of Carthage making an effort, equipped a fleet of 200 sail, and raised an army of 30,000 men, horse and foot, and 140 elephants, appointing Asdrubal commander in chief both of the fleet and army. The Romans, then, finding the great advantages of a fleet, resolved to equip one, not only to withstand all former disasters; and while the vessels were building, two consuls were chosen, men of valour and experience, to supercede the acting ones in Sicily. Metellus, however, one of the former consuls, being continued with the title of proconsul, found means to draw Asdrubal into a battle on disadvantageous terms near Panormus, and then rallying out upon him, gave him a most terrible overpowered Carthagini twenty thousand of the enemy were killed, and 14000 of the Carthaginians utterly defeated.

A hundred and four elephants were taken with their leaders, and sent to Rome, where they were painted and put to death in the circus.

The 15th year, the Romans besieged Lilybaeum;
The Carthaginians were no sooner got out of this Carthage, bloody and expensive war than they found themselves engaged in another, which was like to have proved fatal to them. It is called by authors the Lycaon war, or the war with the mercenaries. The principal occasion of it was, that when Hamilcar returned mercenary to Carthage, he found the republic so much impoverished, that, far from being able to give those troops the largesses and rewards promised them, it could not pay them their arrears. He had committed the care of transporting them to one Gisco, who, being an officer of great penetration, as though he had foreseen what would happen, did not ship them off at all once, but in small and separate parties, that those who came first might be paid off and sent home before the arrival of the rest. The Carthaginians at home, however, did not act with the same prudence. As the state was almost entirely exhausted by the late war, and the immense sum of money, in consequence of the peace, paid to the Romans, they judged it would be a laudable action to save something to the public. They did not therefore pay off the mercenaries in proportion as they arrived, thinking it more proper to wait till they all came together, with a view of obtaining some remission of their arrears. But, being soon made sensible of their wrong conduct on this occasion, by the frequent disorders these barbarians committed in the city, they, with some difficulty prevailed upon the officers to take up their quarters at Sicca, and canton their troops in that neighbourhood. To induce them to this, however, they gave them a sum of money for their present subsistence, and promised to comply with their pretensions when the remainder of their troops arrived from Sicily. Here, being wholly immersed in idleness, to which they had long been strangers, a neglect of discipline ensued, and of course a petulant and licentious spirit immediately took place. They were now determined not to acquiesce in receiving their bare pay, but to insist upon the rewards Haminlar had promised them, and even to compel the state of Carthage to comply with their demands by force of arms. The senate being informed of the most impetuous disposition of the soldiers, dispatched Hannu, conduct of one of the sofites, to pacify them. Upon his arrival at Sicca, he expatiated largely upon the poverty of the state, and the heavy taxes with which the citizens of Carthage were loaded; and therefore, instead of answering their high expectations, he desired them to be satisfied with receiving part of their pay, and remit the remainder to serve the pressing exigencies of the republic. The mercenaries being highly provoked, that neither Hamilcar, nor any other of the principal officers, who commanded them in Sicily, and were the best judges of their merit, made their appearance on this occasion, but only Hannu, a person utterly unknown, and above all others utterly disagreeable to them, immediately had recourse to arms. Assembling therefore in a body, to the number of 20,000, they advanced to Tunis, and immediately encamped before that city.

The Carthaginians, being greatly alarmed at the approach of so formidable a body to Tunis, made large concessions to the mercenaries, in order to bring them back to their duty; but, far from being softened, they grew more insolent upon these concessions, taking
Carthage, taking them for the effects of fear; and therefore were altogether averse to thoughts of accommodation. The Carthaginians, making a virtue of necessity, showed a disposition to satisfy them in all points, and agreed to refer themselves to the opinion of some general in Sicily, which they had all along desired; leaving the choice of such commander entirely to them. Gisco was accordingly pitched upon to mediate this affair, the mercenaries believing Hamilcar to have been a principal cause of the ill-treatment they met with, since he never appeared amongst them, and, according to the general opinion, had voluntarily resigned his commission. Gisco soon arrived at Tunis with money to pay the troops; and, after conferring with the officers of the several nations, apart, he arranged them in such a manner, that a treaty was upon the point of being concluded, when Spendius and Mathos, two of the principal mutineers, occasioned a tumult in every part of the camp. Spendius was by nation a Campanian, who had been a slave at Rome, and had fled to the Carthaginians. The apprehensions he was under of being delivered to his old master, by whom he was sure to be hanged or crucified, prompted him to break off the accommodation. Mathos was an African, and free born; but as he had been active in raising the rebellion, and was well acquainted with the implacable disposition of the Carthaginians, he knew that a peace must infallibly prove his ruin. He therefore joined with Spendius, and insinuated to the Africans the danger of concluding a treaty at that juncture, which could not but leave them singly exposed to the rage of the Carthaginians. This so incensed the Africans, who were much more numerous than the troops of any other nation, that they immediately assembled in a tumultuous manner. The foreigners soon joined them, being inspired by Spendius with an equal degree of fury. Nothing was now to be heard but the most horrid oaths and imprecations against Gisco and the Carthaginians. Whoever offered to make any remonstrance, or lend an ear to temperate counsels, was stoned to death by the enraged multitude. Nay, many persons lost their lives barely for attempting to speak, before it could be known whether they were in the interest of Spendius or the Carthaginians.

In the midst of these commotions, Gisco behaved with great firmness and intrepidity. He left no methods untried to soften the officers and calm the minds of the soldiers; but the torrent of sedition was now so strong, that there was no possibility of keeping it within bounds. They therefore seized upon the military chest, dividing the money among themselves in part of their persons. Gisco was committed under arrest; and treated him as well as his attendants with the utmost indignity. Mathos and Spendius, to destroy the remotest hopes of an accommodation with Carthage, applauded the courage and resolution of their men, loaded the unhappy Gisco and his followers with iron, and formally declared war against the Carthaginians. All the cities of Africa, to whom they had sent deputies to exhort them to recover their liberty, soon came over to them, except Utica and Hippo Diarrhytus. By this means, their army being greatly increased, they divided it into two parts, with one of which they moved to wards Utica, whilst the other marched to Hippo, in order to besiege both places. The Carthaginians, in the mean time, found themselves ready to sink under the pressure of their misfortunes. After they had been harassed 24 years by a most cruel and destructive foreign war, they entertained some hopes of enjoying repose. The citizens of Carthage drew their particular subsistence from the rents or revenues of their lands, and the public expenses from the tribute paid from Africa; all which they were not only deprived of at once, but, what was worse, had it directly turned against them. They were destitute of arms and forces either by sea or land; had made no preparations for the sustaining of a siege, or the equipping of a fleet. They suffered all the calamities incident to the most ruinous civil war; and, to complete their misery, had not the least prospect of receiving assistance from any foreign friend or ally. Notwithstanding their deplorable situation, however, they did not despond, but pursued all the measures necessary to put themselves into a posture of defence. Hanno was appointed commander in chief of all their forces; and the most strenuous efforts were made, not only to repel all the attempts of the mutineers, but even to reduce them by force of arms.

In the mean time Mathos and Spendius laid siege to Utica and Hippocracia at once; but as they were carried on by detachments drawn from the army for that purpose, they remained with the main body of their forces at Tunis, and thereby cut off all communication between Carthage and the continent of Africa. By this means the capital was kept in a kind of blockade. The Africans likewise had armed them by perpetual alarms, advancing to the very walls of Carthage by day as well as by night, and treating with the utmost cruelty every Carthaginian that fell into their hands.

Hanno was dispatched to the relief of Utica with a body of forces, 100 elephants, and a large train of battering engines. Having taken a view of the enemy, he immediately attacked their intrenchments, and after an obstinate dispute forced them. The mercenaries lost a vast number of men; and consequently the advantages gained by Hanno were so great, that they might have proved decisive; had he not been a proper use of them: but becoming secure after his victory, and his troops being everywhere off, he in his turn defeated, fell upon him, cut off many of his men, forced the rest to fly into the town, retook and plundered the camp, and seized all the provisions, military stores &c., brought to the relief of the besieged. Nor was this the only instance of Hanno's military incapacity. Notwithstanding he lay encamped in the most advantageous manner near a town called Gomis, at which place he twice overthrew the enemy, and had it in his power to have totally ruined them, he yet neglected to improve those advantages, and even suffered the mercenaries to possess themselves of the isthmus which joined the peninsula on which Carthage stood, to the continent of Africa.

These repeated mistakes induced the Carthaginians to change once more to place Hamilcar Barca at the head of a body of forces to their forces. He marched against the enemy with command 20,000 men, horse and foot, being all the troops against Carthaginians them.
Carthage. Carthaginians could then assemble for their defence; a full proof of the low state to which they were at that time reduced. As Mathos, after he had possessed himself of the isthmus, had posted proper detachments in two passes on two hills facing the continent, and guarded the bridge over the Bagra, which through Hann's neglect he had taken, Hamilcar saw little probability of engaging him upon equal terms, or indeed of coming at him. Observing, however, that on the blowing of certain winds, the mouth of the river was choked up with sand, and, as to become passable, though with some difficulty, as long as the winds continued; he halted for some time at the river's mouth, without communicating his design to any person. As soon as the wind favoured his intended project, he passed the river privately by night, and immediately after his passage, he drew up the troops in order of battle; and advancing into the plain where his elephants were capable of acting, moved towards Mathos who was posted at the village near the bridge. This daring action greatly surprised and intimidated the Africans. However, Spendidus receiving intelligence of the enemy's motions, drew a body of 10,000 men out of Mathos's camp, with which he attended Hamilcar on one side, and ordered 15,000 from Utica to observe him on the other, thinking by this means to surround the Carthaginians, and cut them all off at one stroke. By feigning a retreat, Hamilcar found means to engage them at a disadvantage, and gave them a total overthrow, with the loss of 6000 killed and 2000 taken prisoners. The rest fled, some to the town at the bridge, and others to the camp at Utica. He did have them time to recover from their defeat, but pursued them to the town near the bridge before mentioned; which he entered without opposition, the mercenaries flying in great confusion to Tunis; and upon this many towns submitted of their own accord to the Carthaginians, whilst others were reduced by force.

Notwithstanding these disasters, Mathos pushed on the siege of Hippo with great vigour, and appointed Spendidus and Autaritius, commanders of the Gauls, with a strong body to observe the motions of Hamilcar. These two commanders, therefore, at the head of a choice detachment of 6000 men drawn out of the camp at Tunis, and 2000 Gallic horse, attended the Carthaginian general, approaching him as near as they could with safety, and keeping close to the skirts of the mountains. At last Spendidus, having received a strong reinforcement of Africans and Numidians, and possessing himself of all the heights surrounding the plain in which Hamilcar lay encamped, resolved not to let slip the opportunity of attacking him. Had a battle now ensued, Hamilcar and his army must in all probability have been cut off; but, by the descent of one Naravannus, a young Numidian nobleman, with 2000 men, he found himself enabled to offer his enemies battle. The fight was obstinate and bloody; but at last the mercenaries were entirely overthrown, with the loss of 10,000 men killed and 4000 taken prisoners. All the prisoners that were willing to enlist in the Carthaginian service Hamilcar received among his troops, supplying them with the arms of the soldiers who had fallen in the engagement. To the rest he gave full liberty to go where they pleased, upon condition that they should never for the future bear arms against the Carthaginians; informing them, at the same time, however, that as many violators of this agreement as fell into his hands must expect to find no mercy.

Mathos and his associates, fearing that this affected lenity of Hamilcar might occasion a defection among the troops, thought that the best expedient would be to put them upon some action, so execrable in its nature that no hopes of reconciliation might remain. By their advice, therefore, Gisco, and all the Carthaginian prisoners were put to death; and when Hamil- 

in the view of the besieged, and crucified near the walls. Mathos, however, observing that Hannibal did not keep so good a guard as he ought to have done, made a sally, attacked his quarters, killed many of his men, took several prisoners, among whom was Hannibal himself, and plundered his camp. Taking the body of Spendius from the cross, Mathos immediately substituted Hannibal in its room; and 30 Carthaginian prisoners of distinction were crucified around him. Upon this disaster, Hamilcar immediately decamped, and posted himself along the sea coast, near the mouth of the river Bagruda.

The senate, though greatly terrified by this unexpected blow, omitted no means necessary for their preservation. They sent 300 lictors, with Hanno at their head, to consult with Hamilcar about the proper measures for putting an end to this unnatural war, conjuring, in the most pressing manner, Hanno to be reconciled to Hamilcar, and to sacrifice his private resentment to the public benefit. This, with some difficulty, was effected; and the two generals came to a full resolution to act in concert for the good of the public. The senate, at the same time, ordered all the youth capable of bearing arms to be pressed into the service: by which means a strong reinforcement being sent to Hamilcar, he soon found himself in a condition to act offensively. He now defeated the enemy in all encounters, drew Mathos into frequent ambuscades, and gave him one notable overthrow near Leptis. This reduced the rebels to the necessity of hazarding a decisive battle, which proved fatal to them. The mercenaries fled almost at the first onset; most of their army fell in the field of battle, and in the pursuit. Mathos, with a few, escaped to a neighbouring town, where he was taken alive, carried to Carthage, and executed; and then by the resolution of the rebelled cities an end was put to this war, which, from the excesses of cruelty committed in it, according to Polybius, went among the Greeks by the name of the inscrutable war.

During the Libyan war, the Romans, upon some absurd pretences, wrested the island of Sardinia from the Carthaginians; which the latter, not being able to resist, were obliged to submit to. Hamilcar, finding his country not in a condition to enter into an immense war with Rome, formed a scheme to put it on a level with that haughty republic. This was by making an entire conquest of Spain, by which means the Carthaginians might have troops capable of coping with the Romans. In order to facilitate the execution of this scheme, he inspired both his son-in-law Asdrubal, and his son Hannibal with an implacable aversion to the Romans, as the great oppressors of his country’s grandeur. Having completed all the necessary preparations, Hamilcar, after having greatly enlarged the Carthaginian dominions in Africa, entered Spain, where he commanded nine years, during which time he subdued many warlike nations, and amassed an immense quantity of treasure, which he distributed partly amongst his troops, and partly amongst the great men at Carthage; by which means he supported his interests with those two powerful bodies. At last, he was killed in a battle, and was succeeded by his son-in-law Asdrubal. This general fully answered the expectations of his countrymen; greatly enlarged their dominions in Spain; and built the city of New Carthage, Cartagena. He made such progress in his conquests that the Romans began to grow jealous. They did not, however, choose at present to come to an open rupture, on account of the apprehensions they were under of an invasion from the Gauls. They judged it most proper, therefore, to have recourse to milder methods; and prevailed upon Asdrubal to conclude a new treaty with them. The articles of it were, Asdrubal’s

1. That the Carthaginians should not pass the Iberus with their armies.
2. That the Saguntines, a colony of Zacynthians, and a city situated between the Iberus and that part of Spain subject to the Carthaginians, as well as the other Greek colonies there, should enjoy their ancient rights and privileges.

Asdrubal, after having governed the Carthaginian He is murdered in Spain for eight years, was treacherously murdered by a Gaul, whose master he had killed to death.

Three years before this happened, he had written to Carthage, to desire that young Hannibal, then twenty-two years of age, might be sent to him. This request was complied with, notwithstanding the opposition of Hanno: and, from the first arrival of the young man in the camp, he became the darling of the whole army. The great resemblance he bore to Hamilcar rendered him extremely agreeable to the troops. Every talent and qualification he seemed to possess, that contributed towards forming a great man. After the death of Asdrubal, he was saluted general by the army with the highest demonstration of joy. He immediately put himself in motion; and in the first campaign conquered the Oicadas, a nation seated near the Iberus, who makes vast conquests. The next year he subdued the Vaccini, another nation in that neighbourhood. Soon after, the Carpoctani, in Spain, one of the most powerful nations in Spain, declared against the Carthaginians. Their army consisted of 100,000 men, with which they proposed to attack Hannibal on his return from the Vaccini; but by a stratagem they were utterly defeated, and the whole nation obliged to submit.

Nothing now remained to oppose the progress of the Carthaginian arms but the city of Saguntum. Hannibal, however, for some time, did not think proper to come to a rupture with the Romans by attacking that place. At last he found means to embroil some of the neighbouring cantons, especially the Tur. He attacks detani, or, as Appian calls them, the Torboletae, with Saguntum, the Saguntines, and thus furnished himself with a pretence to attack their city. Upon the commencement of the siege, the Roman senate dispatched two ambassadors to Hannibal, with orders to proceed to Carthage, in case the general refused to give them satisfaction. They were scarcely landed, when Hannibal, who was carrying on the siege of Saguntum with great vigour, sent them word that he had something else to do than to give audience to ambassadors. Last of all, however, he admitted them; and, in answer to their remonstrances, told them, that the Saguntines had drawn their misfortunes upon themselves, by committing hostilities against the allies of Carthage; and at the same time desired the deputies, if they had any complaints to make of him, to carry them to the senate of Carthage. On their arrival in that capital, they demanded that Hannibal might be delivered up to the Romans to be punished according to his deserts;
and this not being complied with, war was immediately declared between the two nations.

The Saguntines are said to have defended themselves for eight months with incredible bravery. At last, however, the city was taken, and the inhabitants were treated with the utmost cruelty. After this conquest, Hannibal put his African troops into winter quarters at New Carthage; but, in order to gain their affection, he permitted the Spaniards to retire to their respective homes.

He sets out for Italy.

The next campaign, having taken the necessary measures for securing Africa and Spain, he passed the Iberos, subdued all the nations betwixt that river and the Pyrenees, appointed Hanno commander of all the new conquered districts, and immediately began his march for Italy. Upon mustering his forces, after they had been weakened by sieges, desertion, mortality, and a detachment of 10,000 foot and 1000 horse, left with Hanno to support him in his new post, he found them to amount to 50,000 foot and 9000 horse, all veteran troops, and the best in the world. As they had left their heavy baggage with Hanno, and were all light-armed, Hannibal easily crossed the Pyrenees; passed by Ruscino, a frontier town of the Gauls, and arrived on the banks of the Rhone without opposition. This river he passed, notwithstanding some opposition from the Gauls; and was for some time in doubt whether he should advance to engage the Romans, who, under Scipio, were bending their march that way, or continue his march for Italy. But to the latter he was soon determined by the arrival of Magillus, prince of the Boii, who brought rich presents with him, and offered to conduct the Carthaginian army over the Alps. Nothing could have happened more favourable to Hannibal’s affairs than the arrival of this prince; since there was no room to doubt the sincerity of his intentions. For the Boii bore an implacable enmity to the Romans, and had even come to open rupture with them, upon the first news that Italy was threatened with an invasion from the Carthaginians.

It is not known with certainty where Hannibal began to ascend the Alps. As soon as he began his march, the petty kings of the country assembled their forces in great numbers; and, taking possession of the eminences over which the Carthaginians must necessarily pass, they continued harassing them, and were no sooner driven from one eminence than they seized on another, disputing every foot of land with the enemy, and destroyed great numbers of them by the advantage they had of the ground. Hannibal, however, having found means to possess himself of an advantageous post, defeated and dispersed the enemy, and soon after took their capital city; where he found the prisoners, horses, &c. that had before fallen into the hands of the enemy, and likewise corn sufficient to serve the army for three days. At last, after a most fatiguing march of nine days, he arrived at the top of the mountains. Here he encamped, and halted two days, to give his wearied troops some repose, and to wait for the stragglers. As the snow had lately fallen in great plenty, and covered the ground, this sight terrified the Africans and Spaniards, who were much affected with the cold. In order, therefore, to encourage them, the Carthaginian general led them to the top of the highest rock on the side of Italy, and thence gave them a view of the large and fruitful plains of Insurbria, acquainting them that the Gauls, whose country they saw, were ready to join them. He also pointed out to them the place whereabout Rome stood, telling them, that by climbing the Alps they had scaled the walls of that rich metropolis; and, having thus animated his troops, he decamped, and began to descend the mountains. The difficulties they met with in their descent were much greater than those that had occurred while they ascended. They had indeed no enemy to contend with, except some scattered parties that came to steal rather than to fight; but the deep snows, the mountains of ice, craggy rocks, and frightful precipices, proved more terrible than any enemy. After they had for some days marched through narrow, steep, and slippery ways, they came at last to a place which neither elephants, horses, nor men could pass. The way, which lay between two precipices, was exceeding narrow; and the declivity, which was very steep, had become more dangerous by the falling away of the earth. Here the guides stopped; and the whole army being terrified, Hannibal proposed at first to march round about, and attempt some other way; but all places round him being covered with snow, he found himself reduced to the necessity of cutting a way into the rock itself, through which his men, horses, and elephants, might descend. This work was accomplished with incredible labour; and then Hannibal, having spent nine days in ascending, and six in descending the Alps, gained at length Insurbria; and, notwithstanding all the disasters he had met with by the way, entered the country with all the boldness of a conqueror.

Hannibal, on his entry into Insurbria, reviewed his army; when he found that of the 50,000 foot, with whom he set out from New Carthage five months and 15 days before, he had now but 20,000, and that his 9000 horse were reduced to 6000. His first care, after he entered Italy, was to refresh his troops; who, after so long a march, and such inexpressible hardships, looked like as many skeletons raised from the dead, or savages born in a desert. He did not, however, suffer them to languish long in idleness; but, joining the Insurbrians, who were at war with the Tauriniacs, laid siege to Taurinum, the only city in the country, and in three days time became master of it, putting all who resisted to the sword. This struck the neighbouring barbarians with such terror, that of their own accord they submitted to the conqueror, and supplied his army with all sorts of provisions.

Scipio, the Roman general, in the mean time, who had gone in quest of Hannibal on the banks of the Rhone, was surprised to find his antagonist had crossed the Alps, and entered Italy. He therefore returned with the utmost expedition. An engagement ensued near the river Ticinus, in which the Romans were defeated. The immediate consequence was, that Scipio repassed that river, and Hannibal continued his march to the banks of the Po. Here he stayed two days, before he could cross that river over a bridge of boats. He then sent Mago in pursuit of the enemy, who, having rallied their scattered forces, and repassed the Po, were encamped at Placentia. Afterwards having concluded a treaty with several of the Gallic cantons,
Carthage. cantons, he joined his brother with the rest of the army, and again offered battle to the Romans: but this they thought proper to decline; and at last the consul being intimidated by the desolation of a body of Gauls, abandoned his camp, passed the Trebia, and posted himself on an eminence near that river. Here he drew lines round his camp, and waited the arrival of his colleague with the forces from Sicily.

Hannibal being apprised of the consul’s departure, sent out the Numidian horse to harass him on his march; himself moving with the main body to support them in case of need. The Numidians, arriving before the rear of the Roman army had quite passed the Trebia, put to the sword or made prisoners all the stragglers they found there. Soon after Hannibal coming up, encamped in sight of the Roman army on the opposite bank. Here having learned the character of the consul Sempronius, lately arrived, he soon brought him to an engagement, and entirely defeated him. Ten thousand of the enemy retired to Placentia; but the rest were either killed or taken prisoners. The Carthaginians pursued the flying Romans as far as the Trebia, but did not think proper to repass that river on account of the excessive cold.

Hannibal, after this action upon the Trebia, ordered the Numidians, Celtiberians, and Lusitani, to make inroads into the Roman territories, where they committed great devastations. During his state of inaction, he endeavoured to win the affections of the Gauls, and likewise of the allies of the Romans; declaring to the Gallic and Italian prisoners, that he had no intention of making war upon them, being determined to restore them to their liberty, and protect them against the Romans; and to confirm in them their good opinion of him, he dismissed them all without ransom.

Next year having crossed the Apennines, and penetrated into Etruria, Hannibal received intelligence that the new consul Flaminius lay encamped with the Roman army under the walls of Aretium. Having learned the true character of this general, that he was of a haughty, fierce, and rash disposition, he doubted not of being soon able to bring him to a battle. To inflame the impetuous spirit of Flaminiius, the Carthaginian took the road to Rome, and, leaving the Roman army behind him, destroyed all the country through which he passed with fire and sword; and as that part of Italy abounded with all the elegancies as well as necessaries of life, the Romans and their allies suffered an incredible loss on this occasion. The rash consul was inflamed with the utmost rage on seeing the ravages committed by the Carthaginians; and therefore immediately approached them with great temerity, as if certain of victory. Hannibal in the mean time kept on, still advancing towards Rome, having Crotona on the left hand, and the lake Trasymenum on the right; and at last, having drawn Flaminius into an ambuscade, entirely defeated him. The general himself, with 15,000 of his men, fell on the field of battle. A great number was likewise taken prisoners; and a body of 6000 men, who had fled to a town in Etruria, surrendered to Hannibal the next day. Hannibal lost only 1500 men on this occasion, most of whom were Gauls; though great numbers, both of his soldiers and of the Romans, died of their wounds. Being soon informed that the consul Servilius had detached a body of 4000, or, according to Appian, 8000 horse from Ariminum, to reinforce his colleague in Etruria, Hannibal sent out Maharbal, with all the cut to cavalry, and some of the infantry, to attack him.—pieces or The Roman detachment consisted of chosen men, and was commanded by Centenius a patrician. Maharbal had the good fortune to meet with him, and after a short dispute entirely defeated him. Two thousand of the Romans were killed on the spot, the rest, retreating to a neighbouring eminence, were surrounded by Maharbal’s forces, and obliged next day to surrender at discretion; and this disaster, happening within a few days after the defeat at the lake Trasymenum, almost gave the finishing stroke to the Roman affairs.

The Carthaginian army was now so much troubled with a scorbutic disorder, owing to the unwholesome encampments they had been obliged to make, and the morasses they had passed through, that Hannibal found it absolutely necessary to repress them for some time in the territory of Adrius, a most pleasant and fertile country. In his various engagements with the Romans he had taken a great number of their arms, with which he now armed his men after the Roman manner. Being now likewise master of that part of the country bordering on the sea, he found means to send an express to Carthage with the news of the glorious progress of his arms. The citizens received this news with the most joyful acclamations, at the same time coming to a resolution to reinforce their armies both in Italy and Spain, with a proper number of troops.

The Romans being now in the utmost consternation, Fabius, a man as cool and cautious as Sempronius and Flaminius were warm and impetuous. He set out with a design not to engage Hannibal, but only to watch his motions and cut off his provisions, which he knew was the most proper way to destroy him in a country so far from his own. Accordingly he followed him through Umbria and Picenum, into the territory of Adrius, and then through the territories of the Marucini and Freniani into Apulia. When the enemy marched he followed them: when they encamped, he did the same; but for the most part on eminences, and at some distance from their camp, watching all their motions, cutting off their stragglers, and keeping them in a continual alarm. This cautious method of proceeding greatly distressed the Carthaginians, but at the same time raised discontent in his own army. But neither these discontent, nor the ravages committed by Hannibal, could prevail upon Fabius to alter his measures. The former, therefore, entered Campania, one of the finest countries of Italy. The ravages he committed there raised such complaints in the Roman army, that the dictator, for fear of irritating his soldiers, was obliged to pretend a desire of coming to an engagement. Accordingly he followed Hannibal with more expedition than usual; but at the same time avoided, under various pretences, an engagement, with more care than the enemy sought it. Hannibal, finding he could not by any means bring the dictator to a battle,
resolved to quit Campania, which he found abounding more with fruit and wine than corn, and to 45,000 of them being left dead on the field of battle, and 10,000 taken prisoners in the action or pursuit. The night was spent in Hannibal’s camp in feasting and rejoicings, and next day in stripping the dead bodies of the unhappy Romans; after which the victorious general invested their two camps, where he found 4,000 men.

The immediate consequences of this victory, as Hannibal had foreseen, was a disposition of that part of this Italy called the Old Province, Magna Grecia, Tarren
tum, and part of the territory of Capua, to submit to him. The neighbouring provinces likewise discovered an inclination to shake off the Roman yoke, but wanted first to see whether Hannibal was able to protect them. His first march was into Samnium, being informed that the Hirpint and other neighbouring nations were disposed to enter into an alliance with the Carthaginians. He advanced to Capua, which opened its gates to him. In this place he left his heavy baggage, as well as the immense plunder he had acquired. After which he ordered his brother Mago, with a body of troops destined for that purpose, to possess himself of all the fortresses in Campania, the most delicious province of Italy. The humanity Hannibal had all along shown the Italian prisoners, as well as the fame of the complete victory he had lately obtained, wrought so powerfully upon the Lucani, Bruttii, and Apuliens, that they expressed an eager desire of being taken under his protection. Nay, even the Campanians themselves, a nation more obliged to the Romans than any in Italy, except the Latins, discovered an inclination to abandon their natural friends. Of this the Carthaginian general receiving intelligence, he sent his march towards Capua, not doubting but that, by means of the popular fiction there, he should easily make himself master of it; which accordingly happened. Soon after this place had made its submission, many cities of the Bruttii opened their gates to Hannibal, who ordered his brother Mago to take possession of them. Mago was then dispatched to Carthage, with the important news of the victory at Cannae, and the consequences attending it. Upon his arrival there, he acquainted the senate, that Hannibal had defeated six Roman generals, four of whom were consuls, one dictator, and the other general in chief of horse to the dictator: that he had engaged six consuls, the Carthaginian general was surrounded on every side, and would have been cut off with all his troops, had not Fabius hastened to his assistance, and relieved him. Then the two armies uniting, advanced in good order to renew the fight; but Hannibal, not caring to venture a second action, sounded a retreat, and retired to his camp; and Minucius, being ashamed of his rashness, resigned the command of the army to Fabius.

The year following the Romans augmented their army to 87,000 men, horse and foot, under the command of Æmilius Paulus and Tereutius Varro, the consuls for the year; and Hannibal being reduced to the greatest straits for want of provisions, resolved to leave Samnium, and penetrate into the heart of Apulia. Accordingly he decamped in the night; and by leaving fires burning, and tents standing in his camp, made the Romans believe for some time that his retreat was only feigned. When the truth was discovered, Æmilius was against pursuing him; but in this he was seconded by few besides Servilius, one of the consuls of the preceding year; Tereutius and all the other officers being obstinately bent on pursuing the enemy. They accordingly overtook them at Cannae, till this time an unknown village in Apulia. The battle ensued at this place, as memorable as any mentioned in history; in which the Romans, though almost double in number to the Carthaginians, were put to flight with most terrible slaughter; at least 45,000 of them being left dead on the field of battle, and 10,000 taken prisoners in the action or pursuit. The night was spent in Hannibal’s camp in feasting and rejoicings, and next day in stripping the dead bodies of the unhappy Romans; after which the victorious general invested their two camps, where he found 4,000 men.

Accordingly he decamped in the night; and by leaving fires burning, and tents standing in his camp, made
Carthage. there, three bushels and a half of gold rings, taken
from knights and senators who had been killed in the
various engagements.

Hitherto we have seen Hannibal surprisingly victo-
rious; and, indeed, if we consider what he had already
done, we shall find his exploits superior to those of
any other general, either ancient or modern. Other
commanders have been celebrated for victories gained
over barbarous and uncivilized nations. Alexander
the Great invaded and overran the empire of Persia;
but that kingdom was then sunk in sloth and effemi-
acy, so that it was easy to do as he pleased: but that
great commander turned his arms against the western
nations, who were of a more martial disposition, it is
more than probable he had not conquered so easily.
Hannibal, on the other hand, lived at a time when
the Romans were not only the most powerful, but the
most warlike nation in the whole world. That nation
he attacked with an army of only 26,000 men, with-\nout resources either for recruits, money, or provi-
sions, except what he could procure in the enemy's
country. With these he had for three years resisted
the Roman armies; which had been hitherto invinci-
ble by all other nations. Their armies had been com-
manded by generals of different temper, dispositions,
and abilities: the losses they sustained are by the
Roman writers imputed to the faults of the generals
themselves; but experience had abundantly shown,
that these commanders, with all their faults, were able
to conquer the most warlike nations, when command-
ed by another than Hannibal. In the battles fought
with the Romans he had destroyed 200,000 of their
men, and taken 50,000 prisoners; yet from the time
of the battle of Cannae, the affairs of this great man
totally declined. The reason of this is, by the Roman
historians, said to be, that when he put his army into
winter quarters in Capua, he so encumbered himself and
his army by debaucheries in that place, that he be-
came no longer capable of coping with the Roman
forces. But this seems by no means to have been the
case; for the Roman historians themselves own, that,
after the battle of Cannae, he gave their armies many
and terrible defeats, and took a great number of towns
in their sight.

The true reason of that reverse of fortune which
Hannibal now experienced, was his not having suf-
ficient resources for recruiting his army. On the first
news, indeed, of his success at Carthage, a body of
4000 Numidian cavalry, 40 elephants, and 1000 talents
of silver, were granted by the senate. A large de-
tachment of Spanish forces was also appointed to fol-
low them; and that these last might be ready in due
time, Massinissa set out immediately for Spain to raise
20,000 foot and 4000 horse there. But this ample
supply being sent with proper expedition, it is by no
means probable that the Romans would have had any
occasion to reflect upon Hannibal's conduct at Capua.
That general would undoubtedly have obliged the
haughty republic to submit to the superior force of his
arms the next campaign. But, notwithstanding the
influence of the Barcian faction at Carthage, Hanni-
bal and his adherents found means not only to retard
the march of the supplies intended, but even to diminish
their number. Massinissa, through the artifices of that
infatuated party, could obtain an order for only
12,000 foot and 3000 horse; and even with this in-
considerable body of troops he was sent into Spain.
Hannibal, being thus deserted by his country, found
himself obliged to act on the defensive; his army amount-
ing to no more now than 26,000 foot and 4000 horse.
But though obliged to act in this manner, he was
only hindered from conquering; the utmost efforts of
the whole Roman power not being able to drive this
small army out of Italy for more than 2 years.

The Romans, though greatly reduced, were not yet
exhausted. They were able still to send two com-
mon armies into the field, fully recruited and in good
order; and as neither the Gauls nor Italians were na-
tural allies of the Carthaginians, they did not fail to
abandon them on the first reverse of fortune. After
the Romans had recovered from the consternation in-
to which they were thrown by the defeat at Cannae,
they chose a dictator, and recalled Marcellus, the con-
queror of Syracuse, from Sicily. All the young Ro-
man, above 17 years of age, of what rank soever,
were obliged to enlist themselves; as were also those
who had already served their legal time. By this means
four legions and 10,000 horse were soon raised in the
city. The allies of Rome, the colonies, and the mu-
nicipia, furnished their contingents as usual. To these
were added 8000 of the youngest and strongest slaves
in the city. The republic purchased them of their
masters, but did not oblige them to serve without their
own consent, which they gave, by answering Vobis,
"I am willing!" whence they were called colonae, to
distinguish them from the other troops. As the Ro-
man, after the loss of so many battles, had no swords,
darts, or bucklers, left in their magazines, the colonae
were supplied with the arms which had been formerly
taken from the enemy, and hung up in the public
temples and porticoes. The finances of Rome were
no less exhausted; but this defect was supplied by the
liberality of her citizens. The senators shewing the
example, were followed first by the knights, and after-
wards by all the tribes; who stripping themselves of
all the gold they had, brought it to the public trea-
sury. The senators only reserved their rings, and the
bulles about their children's necks. As for the silver
coin, it was now, for the first time, alloyed with cop-
per, and increased in its value. Thus the finances
were put into a good condition, and a competent army
raised.

This was plainly the last effort the Romans could
make; and could Hannibal have procured a sufficient
supply of men and money to enable him to cope with
this army, and to break it as he had done the others
before, there could have been no more resistance made
on their part. He began, however, to be in want of
money; and, to procure it, gave the Roman prisoners
leave to redeem themselves. These unhappy men
agreed to send ten of their body to Rome to negotiate
their redemption; and Hannibal required no other
security for their return but their oath. Carthage was
sent at the head of them to make proposals of peace;
but upon the first news of his arrival, the dictator sent
a lictor to him, commanding him immediately to de-
part the Roman territory; and it was resolved not to
redeem the captives. Upon this Hannibal sent the
most considerable of them to Carthage; and of the rest
he made gladiators, obliging them to fight with one
Eo another,
Carthage another, even relations with relations, for the entertainment of the troops.

All this time Cneius and Publius Scipio had carried on the war in Spain with great success against the Carthaginians. Asdrubal had been ordered to enter Italy with his army to assist Hannibal; but being defeated by the Romans, was prevented. The dictator and senate of Rome, encouraged by this news, carried on the preparations for the next campaign with the greatest vigour; whilst Hannibal remained inactive at Capua. This inaction, however, seems to have proceeded from his expectation of succours from Africa, which never came, and which delay occasioned his ruin. The Roman dictator now released from prison all criminals, and persons confined for debt, who were willing to enlist themselves. Of these he formed a body of 6,000 foot, armed with the broadswords and bucklers formerly taken from the Gauls. Then the Roman army, to the number of about 25,000 men, marched out of the city under the command of the dictator; while Marcellus kept the remains of Varro's army, amounting to about 15,000 men, at Caesalnium, in readiness to march whenever there should be occasion.

Thus the Roman forces were still superior to those of Hannibal; and as they now saw the necessity of following the example of Fabius Maximus, no engagement of any consequence happened the first year after the battle of Cannae. Hannibal made a fruitless attempt upon Nola, expecting it would be delivered up to him; but this was prevented by Marcellus, who had entered that city, and rallying an unexpected force, forced the three gates upon the Carthaginians, obliged them to retire in great confusion, with the loss of 5000 men. This was the first advantage that had been gained by the Romans where Hannibal had commanded in person, and raised the spirits of the former not a little. They were, however, greatly dejected, on hearing that the consul Posthannius Albinus, with his whole army, had been cut off by the Boi, as he was crossing a forest. Upon this it was resolved to draw all the Roman forces out of Gaul and other countries, and turn them against Hannibal; so that the Carthaginian stood daily more and more in need of those supplies, which yet never arrived from Carthage. He reduced, however, the cities of Nuceris, Caesalnium, Petelia, Consentia, Crotona, Locri, and several others in Great Greece, before the Romans gained any advantage over him, except that before Nola, already mentioned. The Carthaginians, who had espoused the Carthaginian interest, raised an army of 14,000 of their own nation in favour of Hannibal, and put one Marius Albinus at the head of it; but he was surprised by the consul Sempronius, who defeated and killed him, with 2000 of his men. It was now found that Hannibal had concluded a treaty of alliance, offensive and defensive, with Philip king of Macedon: but, to prevent any disturbance from that quarter, a Roman army was sent to Macedon. Soon after this Marcellus defeated Hannibal in a pitched battle, having armed his men with long pikes used generally at sea, and chiefly in boarding of ships; by which means the Carthaginians were pierced through, while they were totally unable to hurt their adversaries with the short javelins they carried. Marcellus pursued them close; and before they got to their camp, killed 5000, and took 600 prisoners; losing himself about 1000 men, who were tried down by the Numidian horse, commanded by Hannibal in person. After this defeat the Carthaginian general found himself deserted by 1200 of his best party of horse, partly Spaniards, and partly Numidians, who had crossed the Alps with him. This touched him so sensibly, that he left Campania, and retired into Apulia.

The Romans still continued to increase their forces; and Hannibal, not having the same resources, found it impossible to act against so many armies at once. Fabius Maximus advanced into Campania, whither Hannibal was obliged to return, in order to save Capua. He ordered Hanno, however, at the head of 17,000 foot and 1700 horse, to seize Beneventum; but he was utterly defeated, scarce 2000 of his men being left alive. Hannibal himself, in the mean time, advanced to Nola, where he was again defeated by Marcellus. He now began to lose ground: the Romans retook and began to lose ground. The Romans then entered Campania, and ravaged the whole country, threatening Capua with a siege. The inhabitants immediately abandoned Hannibal with their danger; but he was so intent upon reducing the citadel of Tarentum, that he could not be prevailed upon to come to their assistance. In the mean time Hanno was again utterly defeated by Fulvius, his camp taken, and he himself forced to fly into Bruttium, with a small body of horse. The consul then advanced with a design to besiege Capua in form. But, in their way, Sempronius Gracchus, a man of great bravery, and an excellent general, was betrayed by a Lucanian and killed, which proved a very great detriment to the republic. Capua, however, was soon after invested on all sides; and the besieged once more sent to Hannibal, who now came to the Romans with his horse, his light-armed infantry, and 33 elephants. He found means to inform the besieged of the time he designed to attack the Romans, Hannibal ordering them to make a vigorous sally at the same in vain time. The Roman generals, Appius and Fulvius, attempts to upon the first news of the enemy's approach, divided their troops. Appius taking upon him to make head against the garrison, and Fulvius to defend the intrenchments against Hannibal. The former found no difficulty in repulsing the garrison, and would have entered the city with them, had he not been wounded at the very gate, which prevented him from pursuing his design. Fulvius found it more difficult to withstand Hannibal, whose troops behaved themselves with extraordinary resolution. A body of Spaniards and Numidians had even the boldness to pass the ditch, and, in spite of all opposition, climbing the ramparts, penetrated into the Roman camp; but, not being properly seconded by the rest, they were all to a man cut in pieces. The Carthaginian general was so disheartened at this, especially after the garrison was repulsed, that he sounded a retreat, which was made in good order. His next attempt for the relief of Capua was to march to Rome, where he hoped his approach would strike so much terror, that the armies would beset Rome called from before Capua; and that the Capuans might not be disheartened by his sudden departure, he found
Carthage means to acquaint them with his design. The news of his approach caused great consternation in the metropolis. Some of the senators were for calling all the armies in Italy into the neighbourhood of Rome, as thinking nothing less was able to resist the terrible Carthaginian. But Fabius told them that Hannibal's design was not to take Rome, but relieve Capua; upon which Fulvius was recalled to Rome with 15,000 foot and 1000 horse; and this obliged Hannibal again to retire. He then returned before Capua so suddenly that he surprised Appius in his camp, drove him out of it with the loss of a great number of men, and obliged him to intrench himself on some eminences, where he expected to be soon joined by his colleague Fulvius. As Hannibal, however, now expected to have all the Roman forces upon him, he could do nothing more for the relief of Capua; which was of consequence obliged to submit to the Romans.

A little before the surrender of Capua, Hannibal came up with a Roman army commanded by one M. Centenius Pennus, who had signified himself on many occasions as a centurion. This rash man, being introduced to the senate, had the assurance to tell them, that if they would trust him with a body of only 3000 men, he would give a good account of Hannibal. They gave him 8000, and his army was soon increased to double that number. He engaged the Carthaginians on Hannibal's first offering him battle; but, after an engagement of two hours, was defeated, himself and all his men being slain except about 1000. Soon after, having found means to draw the praetor Caccius Fulvius into an ambuscade, Hannibal cut in pieces almost his whole army, consisting of 18,000 men. In the mean time Marcellus was making great progress in Samnium. The city of Salapia was betrayed to him; but he took other two by assault. In the last of these he found 3000 Carthaginians, whom he cut to the sword; and carried off 240,000 bushels of wheat, and 110,000 of barley. This, however, was by no means a compensation for the defeat which Hannibal soon after gave the proconsul Fulvius Centumalus, whom he surprised and cut off, with 13,000 of his men.

After this defeat the great Marcellus advanced with his army to oppose Hannibal. Various engagements happened without anything decisive. In one of them the Romans are said to have been defeated, and in another Hannibal; but notwithstanding these, it was neither in the power of Marcellus, nor any other Roman general, totally to defeat or disperse the army commanded by Hannibal in person. Nay, in the eleventh year of the war, Hannibal found means to decry into an ambuscade and cut off the great Marcellus himself; the consequence of which was, that the Romans were obliged to raise the siege of Locri, with the loss of all their military engines.

Hitherto the Carthaginians, though no longer the favourites of fortune, had lost but little ground; but now they met with a blow which totally ruined their affairs. This was the defeat of Asdrubal, Hannibal's brother, who had left Spain, and was marching to his assistance. He crossed the Pyrenees, without any difficulty; and, as the silver mines had supplied him with a very considerable quantity of treasure, he not only prevailed upon the Gauls to grant him a passage through their territories, but likewise to furnish him with a considerable number of recruits. Meeting with many favourable circumstances to expedite his march, he arrived at Placentia sooner than the Romans or even his brother Hannibal expected. Had he continued to use the same expedition with which he set out, and hastened to join his brother, it would have been utterly impossible to have saved Rome; but, sitting down before Placentia, he gave the Romans an opportunity of assembling all their forces to attack him. At last he was obliged to raise the siege, and began his march for Umbria. He sent a letter to acquaint his brother of his intended motion; but the messenger was intercepted: and the two consuls, joining their armies, with united forces fell upon the Carthaginians. As the latter were inferior both in numbers and resolution, they were utterly defeated, and Asdrubal was killed. About the same time, Hannibal himself is said to have suffered several defeats, and was retired to Casinum; but, on the fatal news of his brother's defeat and death, he was filled with despair, and retired to the extremity of Bruttium; where, assembling all his forces, he remained for a considerable time in a state of inaction, the Romans not daring to disturb him; so formidable did they esteem him alone, though every thing about him went to wreck, and the Carthaginian affairs seemed not far from the verge of destruction. Livy tells us, that it was difficult to determine whether his conduct was more wonderful in prosperity or in adversity. Notwithstanding which, Bruttium being but a small province, and many of its inhabitants being either forced into the service, or forming themselves into parties of banditti, so that a great part of it remained uncultivated, he found it a difficult matter to subdue there, especially as no manner of supplies were sent him from Carthage. The people there were as solicitous about preserving their possessions in Spain, and as little concerned about the situation of affairs in Italy, as if Hannibal had met with an uninterrupted course of success, and no disaster befallen him since he first entered that country.

All their solicitude, however, about the affairs of Spain, was to no purpose; their generals, one after another, were defeated by the Romans. They had indeed cut off the two Scipios; but found a much more formidable enemy in the young Scipio Africanus. He overthrew them in conjunction with Masinissa king of Numidia; and the latter thereafter abandoned their interest. Soon after, Syphax king of the Massyli, was likewise persuaded to abandon their party. Scipio also gave the Spanish reguli a great overthrow, and reduced the cities of New Carthage, Gades, and many other important places. At last the Carthaginians began to open their eyes when it was too late. Mago was ordered to abandon Spain, and sail with all expedition to Italy. He landed on the coast of Liguria with an army of 12,000 foot and 2000 horse; where he surprised Genoa, and also seized upon the town and port of Sasso. A reinforcement was sent him to this place, and new levies went on very briskly in Liguria; but the opportunity was past, and could not be recalled. Scipio having carried all before him in Spain, passed Scipio lands over into Africa, where he met with no enemy capable of Africa.
The Carthaginian general was no sooner landed in Africa than he sent out parties to get provisions for the army, and buy horses to remount the cavalry. He entered into a league with the regulars of the Arcadice, one of the Numidian tribes. Four thousand of Syphax's horse came over in a body to him; but as he did not think proper to repose any confidence in them, he put them all to the sword, and distributed their horses among his troops. Vermina, one of Syphax's sons, and Macetulus, another Numidian prince, likewise joined him with a considerable body of horse. Most of the fortresses in Masinissa's kingdom either surrendered to him upon the first summons, or were taken by force. Narce, a city of considerable note there, he made himself master of by stratagem. Tychema, a Numidian regulus, and faithful ally of Syphax, whose territories were famous for an excellent breed of horses, reinforcing him also with 2000 of his best cavalry, Hannibal advanced to Zama, a town about five days journey distant from Carthage, where he encamped. He thence sent out spies to observe the posture of the Romans. These being brought to Scipio, he was so far from inflicting any punishment upon them, which he might have done by the laws of war, that he commanded them to be led about the camp, in order to take an exact survey of it, and then dismissed them. Hannibal, admiring the noble assurance of his rival, sent a messenger to desire an interview with him; which, by means of Masinissa, he obtained. The two generals, therefore, escorted by equal detachments of horse, met at Nadsara, where, by the assistance of two interpreters, they held a private conference. Hannibal flattered Scipio in the most refined and artful manner, and expatiated upon all those topics which he thought could influence that general to grant his nation a peace upon tolerable terms; amongst other things, that the Carthaginians would willingly confine themselves to Africa, since such was the will of the gods, in order to procure a lasting peace, whilst the Romans would be at liberty to extend their conquests to the remotest nations. Scipio answered, that the Romans were not prompted by ambition, or any sinister views, to undertake either the former or present war against the Carthaginians, but by justice and a proper regard for their allies. He also observed, that the Carthaginians had, before his arrival in Africa, not only made him the same proposals, but likewise agreed to pay the Romans 5000 talents of silver, restore all the Roman prisoners without ransom, and deliver up all their galleys. He insisted on the perfidious conduct of the Carthaginians, who had broke a truce concluded with them; and told him, that, so far from granting them more favourable terms, they ought to expect more rigorous ones; which if Hannibal would submit to, a peace would ensue; if not, the decision of the dispute must be left to the sword.

This conference betwixt two of the greatest generals the world ever produced, ending without success, they both retired to their respective camps; where they informed their troops, that not only the fate of Rome and Carthage, but that of the whole world, was to be determined by them the next day. An engagement ensued, in which, as Polybios informs us, the surprising military genius of Hannibal displayed itself in an extraordinary manner. Scipio likewise, according to Livy, passed a high escomium upon him, on account of his uncommon capacity in taking advantages, the excellent arrangement of his forces, and the manner in which he gave his orders during the engagement. The Roman general, indeed, not only approved his conduct, but openly declared that it was superior to his own. Nevertheless, being vastly inferior to the enemy in horse, and the state of the mountain obliging him to hazard a battle with the Romans at no small disadvantage, Hannibal was utterly routed, and his camp taken. He fled first to Thapsus, and afterwards to Adrumetum, from whence he was recalled to Carthage; where being arrived, he advised his countrymen to conclude a peace with Scipio on whatever terms he thought proper to prescribe.

Thus was the second war of the Carthaginians with the Romans concluded. The conditions of peace included were very humiliating to the Carthaginians. They were obliged to deliver up all the Roman deserters, fugitive slaves, prisoners of war, and all the Italians whom Hannibal had obliged to follow him. They also delivered up all their ships of war, except ten triremes, all their tame elephants, and were to train up no more of these animals for the service. They were not to engage in any war without the consent of the Romans. They engaged to pay to the Romans, in 50 years, 10,000 Euboic talents, at equal payments. They were to restore to Masinissa all they had usurped from him or his ancestors, and to enter into an alliance with him. They were also to assist the Romans both by sea and land, whenever they were called upon to do so, and never to make any levies either in Gaul or Liguria. These terms appeared so intolerable to the populace, that they threatened to plunder and burn the houses of the nobility; but Hannibal having assembled a body of 6000 foot and 300 horse at Maribuna, prevented an insurrection, and by his influence completed the accommodation.

The peace between Carthage and Rome was scarcely Carthaginian signed, when Masinissa unjustly made himself master of part of the Carthaginian dominions in Africa, under pretence that these formerly belonged to his family. The Carthaginians, through the villainous mediation of the Romans, found themselves under a necessity of ceding these countries to that ambitious prince, and of entering into an alliance with him. The good understanding between the two powers continued for many years afterwards; but at last Masinissa violated the treaties subsisting betwixt him and the Carthaginian.
Carthage, a Phoenician republic, and not a little contributed to its subversion.

After the conclusion of the peace, Hannibal still kept up his credit among his countrymen. He was instructed with the command of an army against some neighbouring nations in Africa: but this being disagreeable to the Romans, he was removed from it, and raised to the dignity of pretor in Carthage. Here he continued for some time, reforming abuses, and putting the affairs of the republic into a better condition: but this likewise being disagreeable to the Romans, he was obliged to fly to Antiochus king of Syria. After his flight, the Romans began to look upon the Carthaginians with a suspicious eye; though to prevent every thing of this kind, the latter had ordered two ships to pursue Hannibal, had confiscated his effects, razed his house, and by a public decree declared him an exile. Soon after, disputes arising between the Carthaginians and Masinissa, the latter, notwithstanding the manifest iniquity of his proceedings, was supported by the Romans. That prince, grasping at further conquest, endeavoured to embroil the Carthaginians with the Romans, by asserting that the former had received ambassadors from Perseus king of Macedon; that the senate assembled in the temple of Esculapius in the night time, in order to confer with them; and that ambassadors had been dispatched from Carthage to Perseus, in order to conclude an alliance with him. Not long after this, Masinissa made an irruption into the province of Tycsa, where he soon possessed himself of 70, or, as Appian will have it, 50 towns and castles. This obliged the Carthaginians to apply with great importunity to the Roman senate for redress, their hands being so tied up by an article in the last treaty, that they could not repel force by force, in case of an invasion, without their consent. Their ambassadors begged, that the Roman senate would settle once for all what dominions they were to have, that they might from henceforth know where they had to depend on. If, or, if their state had any way offended the Romans, they begged that they would punish them themselves, rather than leave them exposed to the insults and vexations of so merciless a tyrant. Then prostrating themselves on the earth, they burst out into tears. But, notwithstanding the impression their speech made, the matter was left undecided; so that Masinissa had liberty to pursue his rapines, as much as he pleased. But whatever villanous designs the Romans might have with regard to the republic of Carthage, they affected to show a great regard to the principles of justice and honour. They therefore sent Cato, a man famous for committing enormities under the specious pretence of public spirit, into Africa, to accommodate all differences betwixt Masinissa and the Carthaginians. The latter very well knew their fate, had they submitted to such a mediation; and therefore appealed to the treaty concluded with Scipio, as the only rule by which their conduct and that of their adversary ought to be examined. This unreasonable appeal so incensed the righteous Cato, that he pronounced them a detested people, and from that time resolved upon their destruction. For some time he was opposed by Scipio Nasica; but the people of Carthage, knowing the Romans to be their inveterate enemies, and reflecting upon the iniquitous treatment they had met with from them ever since the commencement of their disputes with Masinissa, were under great apprehensions of a visit from them. To prevent a rupture as much as possible, by a decree of the senate, they impeached Asdrubal, general of the army, and Carlculo, commander of the auxiliary forces, together with their accomplices, as guilty of high treason, for being the authors of the war against the king of Numidia. They sent a deputation to Rome, to discover what sentiments were entertained there of their late conduct, and to know what satisfaction the Romans required. These messengers meeting with a cold reception, others were dispatched, who returned with the same success. This made the unhappy citizens of Carthage believe that their destruction was resolved upon; which threw them into the utmost despair. And indeed they had but too just grounds for such melancholy apprehension, the Roman senate now discovering an inclination to fall in with Cat'o's measures. About the same time, the city of Utica, being the second in Africa, and famous for its immense riches, as well as its equally commodious and capacious port, submitted to the Romans. Upon the possession of so important a fortress, which, by reason of its vicinity to Carthage, might serve as a place of arms in the attack of that city, the Romans declared war against the Carthaginians without the least hesitation. In consequence of this declaration, the consuls M. Manlius, Nepos, and L. Marcianus Censorinus, were dispatched with an army and fleet to begin hostilities against Carthage, with the utmost expedition. The land forces consisted of 80,000 foot and 4000 chosen horse; and the fleet of 50 quinquagèmes, besides a vast number of transports. The consuls had secret orders from the senate not to conclude the operations but by the destruction of Carthage, without which, it was pretended, the republic could not but look upon all her possessions as insecure. Pursuant to the plan they had formed, the troops were first landed at Utica in Sicily, from whence, after receiving a proper refreshment, it was proposed to transport them to Utica.

The answer brought by the last ambassadors to Carthage had not a little alarmed the inhabitants of that city. But they were not yet acquainted with the resolutions taken at Rome. They therefore sent fresh ambassadors thither, whom they invested with full powers to act as they thought proper for the good of the republic, and even to submit themselves without reserve to the pleasure of the Romans. But the most sensible persons among them did not expect any great success from this condescension, since the early submission of the Uticans had rendered it infinitely more meritorious than it would have been before. However the Romans seemed to be in some measure satisfied with it, since they promised them their liberty, the enjoyment of their laws, and, in short, every thing that was dear and valuable to them. This threw them into a transport of joy, and they wanted words to express the moderation of the Romans. But the senate The Romans immediately dashed all their hopes, by acquainting them that this favouër was granted upon condition hostages, that they would send 300 young Carthaginian noblemen of the first distinction to the pretor Fabini at Lilybaeum, within the space of 30 days, and comply with all the orders of the consuls. These hard terms filled. 
Carthage filled the whole city with inexpressible grief: but the hostages were delivered; and as they arrived at Lilybaeum before the 30 days were expired, the ambassadors were not without hopes of softening their heartless enemy. But the consuls only told them, that upon their arrival at Utica they should learn the further orders of the republic. The ministers no sooner received intelligence of the Roman fleet appearing off Utica, than they repaired thither, in order to know the fate of their city. The consuls however did not judge it expedient to communicate all the commands of the republic at once, lest they should appear so harsh and severe, that the Carthaginians would have refused to comply with them. They first, therefore, demanded a sufficient supply of corn for the subsistence of their troops. Secondly, That they should deliver up into their hands all the triremes they were then masters of. Thirdly, That they should put them in possession of all their military machines. And, fourthly, That they should immediately convey all their arms into the Roman camp.

As care was taken that there should be a convenient interval of time betwixt every one of these demands, the Carthaginians found themselves ensnared, and could not reject any one of them, though they submitted to the last with the utmost reluctance and concern. Censorinus, now imagining them incapable of sustaining a siege, commanded them to abandon their city, or, as Zonaras will have it, to demolish it; permitting them to build another 50 stadia from the sea, but without walls or fortifications. This terrible decree threw the senate and every one else into despair; and the whole city became a scene of horror, madness, and confusion. The citizens cursed their ancestors for not dying gloriously in the defence of their country, rather than concluding such ignominious treaties of peace, that had been the cause of the deplorable condition to which their posterity was then reduced. As length, when the first commotion was a little abated, the senators assembled and resolved to sustain a siege. They were stripped of their arms and destined of provisions; but despair raised their courage, and made them find out expedients. They took care to shut the gates of the city; and gathered together on the ramparts great heaps of stones, to serve them instead of arms in case of a surprise. They took the malefactors out of prison, gave the slaves their liberty, and incorporated them in the militia. Asdrubal was recalled who had been sentenced to die only to please the Romans; and he was invited to employ 20,000 men he had raised against his country in defence of it. Another Asdrubal was appointed to command in Carthage; and all seemed resolved, either to save their city or perish in its ruins. They wanted arms; but, by order of the senate, the temples, porticoes, and all public buildings, were turned into workhouses, where men and women were continually employed in making arms. As they encouraged one another in their work, and lost no time in procuring to themselves the necessary of life, which were brought to them at stated hours, they every day made 144 bucklers, 300 swords, 10,000 darts, and 700 lances and javelins. As to bastin and catapultize, they wanted proper materials for them; but their industry supplied that defect. Where iron and brass were wanting, they made use of silver and gold, melting down the statues, vases, and even the utensils of private families; for, on this occasion, even the most covetous became liberal. As tow and flax were wanting to make cords for working the machines, the women, even those of the first rank, freely cut off their hair and dedicated it to that use. Without the walls, Asdrubal employed the troops in getting together provisions, and conveying them safe into Carthage; so that there was as great plenty there as in the Roman camp.

In the mean time the consuls delayed drawing near to Carthage, not doubting but the inhabitants, whom they imagined destitute of necessaries to sustain a siege, would, upon cool reflection, submit; but at length, finding themselves deceived in their expectation, they came before the place and invested it. As they were still persuaded that the Carthaginians had no arms, they flattered themselves that they should easily carry the city by assault. Accordingly they approached the walls in order to plant their scaling ladders; but to their great surprise they discovered a prodigious multitude of men on the ramparts, shining in the armour they had newly made. The legionaries were so terrified at this unexpected sight, that they drew back, and would have retired, if the consuls had not led them on to the attack; which, however, proved unsuccessful; the Romans, in spite of their utmost efforts, being obliged to give over the enterprise, and lay aside all thoughts of taking Carthage by assault. In the mean time, Asdrubal, having collected from all places subject to Carthage a prodigious number of troops, came and encamped within reach of the Romans, and soon reduced them to great straits for want of provisions. As Marcus, one of the Roman consuls, was posted near a marsh, the exhalations of the stagnating waters, and the heat of the season, infected the air, and caused a general sickness among his men. Marcus, therefore, ordered his fleet to draw as near the shore as possible, in order to transport his troops to a nearer place. Asdrubal being informed of this motion, ordered all the old banks in the harbour to be filled with faggots, tow, sulphur, bitumen, and other combustible materials; and then, taking advantage of the wind, which blew towards the enemy, let them drive upon their ships, which were for the most part consumed. After this disaster, Marcus was called home to preside at the elections; and the Carthaginians looking upon the absence of one of the consuls to be a good omen, made a brisk sally in the night; and would have surprised the consul's camp, had not Jemilius, with some squadrons, marched out of the gate opposite to the place where the attack was made, and, coming round, fell unexpectedly on their rear, and obliged them to return in disorder to the city.

Asdrubal had posted himself under the walls of a city named Nepheris, 24 miles distant from Carthage, and situated on a high mountain, which seemed inaccessible on all sides. From thence he made inroads into the neighbouring country, intercepted the Roman convoys, fell upon their detachments sent out to forage, and even ordered parties to insult the consular army in their camp. Hereupon the consul resolved to drive the Carthaginian from this advantageous post, and set out for Nepheris. As he drew near the hills, Asdrubal...

C A R

The consular army sustained the attack with great resolution; and Asdrubal retired in good order to his post, hoping the Romans would attack him there. But the consul, being now convinced of his danger, resolved to retire. This Asdrubal no sooner perceived, than he rushed down the hill, and falling upon the enemy's rear, cut off a great number of them in pieces. The whole Roman army was now saved by the bravery of Scipio Africanus. At the head of 300 horse, he sustained the attack of all the forces commanded by Asdrubal, and covered the legions, while they passed a river in their retreat before the enemy. Then he and his comrades threw themselves into the stream, and swam across it. When the army had crossed the river, it was perceived that four manipuli were wanting; and soon after they were informed that they had retired to an eminence, where they resolved to sell their lives as dear as possible. Upon this news, Scipio Africanus, taking with him a chosen body of horse, and provisions for two days, crossed the river, and flew to the assistance of his countrymen. He seized a hill over against that on which the four manipuli were posted; and, after some hours repose, marched against the Carthaginians who kept them invested; fell upon them at the head of his squadron with the boldness of a man determined to conquer or die; and, in spite of all opposition, opened a way for his fellow-soldiers to escape. On his return to the army, his companions, who had given him over for lost, carried him to his quarters in a kind of triumph; and the manipuli he had saved gave him a crown of gromes. By these and some other exploits, Scipio Africanus gained such reputation, that Cato, who is said never to have commended anybody before, could not refuse him the praises he deserved; and is said to have foretold that Carthage would never be reduced till Scipio Africanus was employed in that expedition.

The next year, the war in Africa fell by lot to the consul L. Calpurnius Piso; and he continued to employ Scipio Africanus in several important enterprises, in which he was attended with uncommon success. He took several castles; and in one of his excursions, found means to have a private conference with Phanenas, general, under Asdrubal, of the Carthaginian cavalry, and brought him over, together with 2200 of his horse, to the Roman interest. Under the consul Calpurnius Piso himself, however, the Roman arms were unsuccessful. He invested Clupea; but was obliged to abandon the enterprise, with the loss of a great number of men killed by the enemy in their sallies. From this place he went to vent his rage on a city newly built, and hence called Neapolis, which professors a strict neutrality, and had even a safeguard from the Romans. The consul, however, plundered the place, and stripped the inhabitants of all their effects. After this he laid siege to Hippagretta, which employed the Roman fleet and army the whole winter; and, on the approach of winter, the consul retired to Utica, without performing a single action worth notice during the whole campaign.

The next year Scipio Africanus was chosen consul, and ordered to pass into Africa; and, upon his arrival, the face of affairs was greatly changed. At the time of his entering the port of Utica, 3500 Romans were in great danger of being cut in pieces before Carthage. These had seized Megalia, one of the suburbs of the city; but, as they had not furnished themselves with provisions to subsist there, and could not retire, being closely invested on all sides by the enemy's troops, the praetor Mancinus, who commanded this detachment, seeing the danger into which he had brought himself, dispatched a light boat to Utica, to acquaint the Romans there with his situation. Scipio Africanus received this letter a few hours after his landing; and immediately flew to the relief of the besieged Romans, obliged the Carthaginians to retire within their walls, and safely conveyed his countrymen to Utica. Having them drawn together all the troops, Scipio Africanus applied himself wholly to the siege of the capital.

His first attack was upon Megalia; which he carried on with the most methodic of assault, the Carthaginian garrison retiring into the Asdrubal citadel of Byrsa. Asdrubal, who had commanded the Carthaginian forces in the field, and was now governor of the city, was so enraged at the loss of Megalia, that he caused all the Roman captives taken in the two years the war lasted to be brought upon the ramparts, and thrown headlong, in the sight of the Roman army, from the top of the wall; after having, with an excess of cruelty, commanded their hands and feet to be cut off, and their eyes and tongues to be torn out. He was of a temper remarkably inhuman; and it is said that he even took pleasure in seeing some of these unhappy men flayed alive. Scipio Africanus, in the mean time, was busy in drawing lines of circumvallation and contravallation across the neck of land which joined the isthmus on which Carthage stood to the continent. By this means, all the avenues on the land side of Carthage being shut up, the city could receive no provisions that way. His next care was to raise a mole in the sea, in order to block up the old port, the new one being already shut up by the Roman fleet; and this great work he effected with immense labour. The mole reached from the western neck of land, of which the Romans were masters, to the entrance of the port, and was 90 feet broad at the bottom, and 80 at the top. The besieged, when the Romans first began this surprising work, laughed at the attempt; but were no less alarmed than surprised, when they beheld a vast mole appearing above water, and by that means the port rendered inaccessible to ships, and quite useless. Prompted by despair, however, the Carthaginians, with incredible and almost miraculous industry, dug a new basin, and cut a passage into the sea, by wide basins, which they could receive the provisions that were sent them by the troops in the field. With the same diligence and expedition they fitted out a fleet of 50 triremes; which, to the great surprise of the Romans, appeared suddenly advancing into the sea through this new canal, and even ventured to give the enemy battle. The action lasted the whole day, with little advantage on either side. The day after, the consul endeavoured to make himself master of a terrace which covered the city on the side next the sea; and on this occasion the besieged signalized themselves in a most remarkable manner. Great numbers of them, naked and unarmed, they set into the water in the dead of the night, with fire to the lighted torches in their hands; and having, partly by swimming, partly by wading, got within reach of the Roman
Carthage. Roman engines, they struck fire, lighted their torches, and threw them with fury against the machines. The sudden appearance of these naked men, who looked like so many monsters started up out of the sea, so terrified the Romans who guarded the machines, that they began to retire with the utmost confusion. The consuls, who commanded the detachment in person, who had continued all night at the foot of the terrace, endeavoured to stop his men, and even ordered those who fled to be killed. But the Carthaginians, perceiving the confusion the Romans were in, threw themselves upon them like so many wild beasts; and having put them to flight only with their torches, they set fire to the machines, and entirely consumed them. This, however, did not discourage the consuls; he renewed the attack a few days after, carried the terrace by assault, and lodged 4000 men upon it. As this was an important post, because it pent in Carthage on the sea side, Æmilius took care to fortify and secure it against the sallies of the enemy; and when winter approaching, he suspended all further attacks upon the place till the return of good weather. During the winter season, however, the consuls was not inactive. The Carthaginians had a very numerous army under the command of one Diogenes, strongly encamped near Nephoris; whence convoys of provisions were sent by sea to the besieged, and brought into the new bason. To take Nephoris, therefore, was to deprive Carthage of her chief magazine. This Æmilius undertook, and succeeded in the attempt. He first forced the enemy's intrenchments, put 70,000 of them to the sword, and made 10,000 prisoners; all the inhabitants of the country, who could not retire to Carthage, having taken refuge in this camp. After this he laid siege to Nephoris, which was reduced in 22 days. Asdrubal being disheartened by the defeat of the army, and touched with the misery of the besieged, now reduced to the utmost extremity for want of provisions, offered to submit to what conditions the Romans pleased, provided the city was spared; but this was absolutely refused.

Early in the spring, Æmilius renewed the siege of Carthage; and in order to open himself a way into the city, be ordered Lelius to attempt the reduction of Cotho, a small island which divided the two ports. Æmilius himself made a false attack on the citadel, in order to draw the enemy thither. This stratagem had the desired effect: for the citadel being a place of the greatest importance, most of the Carthaginians hastened thither, and made the utmost efforts to repulse the aggressors; but in the mean time Lelius having, with incredible expedition, built a wooden bridge over the channel which divided Cotho from the isthmus, entered the island, scaled the walls of the fortress which the Carthaginians had built there, and made himself master of that important post. The consuls, who was engaged before Byrsa, no sooner understood, by the loud shouts of the troops of Lelius, that he had made himself master of Cotho, than he abandoned the false attack, and unexpectedly fell on the neighbouring gate of the city, which he broke down, notwithstanding the showers of darts that were incessantly discharged upon his men from the ramparts. As night coming on prevented him from proceeding farther, he made a lodgment within the gate, and waited there for the return of day, with a design to advance through the city to the citadel, and attack it on that side, which was but indifferently fortified. Pursuant to this design, at daybreak, he ordered 4000 fresh troops to be sent from his camp; and having solemnly devoted to the infernal gods the unhappy Carthaginian, he began to advance at the head of his men through the streets of the city, in order to attack the citadel. Having advanced to the market place, he found that the way to the citadel lay through three exceeding steep streets. The houses on both sides were very high, and filled with the Carthaginians, who overwhelmed the Romans as they advanced with darts and stones; so that they could not proceed till they had cleared them. To this end Æmilius in person, at the head of a detachment, attacked the first house and made himself master of it, sword in hand. His example was followed by the officers and soldiers, who went on from house to house, putting all they met with to the sword. As fast as the houses were cleared on both sides, the Romans advanced in order of battle towards the citadel; but met with a vigorous resistance from the Carthaginians, who on this occasion behaved with uncommon resolution. From the market place to the citadel, two bodies of men fought their way every step, one above on the roofs of the houses, the other below in the streets. The slaughter was inexpressibly great and dreadful. The air rung with shrieks and lamentations. Some were cut to pieces, others threw themselves down from the tops of the houses; so that the streets were filled with dead and mangled bodies. But the destruction was yet greater. Which is when the proconsul commanded fire to be set to that quarter of the town which lay next to the citadel. Incredulous multitude, who had escaped the swords of the enemy, perished in the flames, or by the fall of the houses. After the fire, which lasted six days, had demolished a sufficient number of houses, Æmilius ordered the rubbish to be removed, and a large area to be made, where all the troops might have room to act. Then he appeared with his whole army before Byrsa; which so terrified the Carthaginians, who had fled thither for refuge, that first of all 25,000 women, and then 30,000 men, came out of the gates in such a condition as moved pity. They threw themselves prostrate before the Roman general, asking no favour but life. This was readily granted, not only to them but to all that were in Byrsa except the Roman deserters, whose number amounted to 900. Asdrubal's cruelty, having enmity to the whole nation, and joined the suppliants, and carry with her to the proconsul her two sons, who were as yet very young, but the barbarian denied her request, and rejected her women with menaces. The Roman deserters, seeing themselves excluded from mercy, resolved to die sword in hand, rather than deliver themselves up to the vengeance of their countrymen. Then Asdrubal, finding them all resolved to defend themselves to the last breath, committed to their care his wife and children; after which, he in a most cowardly and mean-spirited manner, came and privately threw himself at the conqueror's feet. The Carthaginians in the citadel no sooner understood that their commander had abandoned the place, than they threw open the gates, and put the Romans in possession of Byrsa. They had now
birth of Christ; a city whose destruction ought to be attributed more to the intrigues of an abandoned faction, composed of the most profligate part of its citizens, than to the power of its rival. The treasure which Aemilianus carried off, even after the city had been delivered up to be plundered by the soldiers, was immense, Pliny making it to amount to 4,470,000 pounds weight of silver. The Romans ordered Carthage never to be inhabited again, denouncing dreadful imprecations against those who, contrary to this prohibition, should attempt to rebuild any part of it, especially Byrsa and Megalia. Notwithstanding this, however, about 24 years after, C. Gracchus, tribune of the people, in order to ingratiate himself with them, undertook to rebuild it; and to that end conducted thither a colony of 6000 Roman citizens. The workmen, according to Plutarch, were terrified by many unlucky omens at the time they were tracing the limits and laying the foundations of the new city; which the senate being informed of, would have suspended the attempt. But the tribune, little affected with such pressages, continued to carry on the work, and finished it in a few days. From hence it is probable that only a slight kind of huts were erected; but whether Gracchus executed his design, or the work was entirely discontinued, it is certain that Carthage was the first Roman colony ever sent out of Italy. According to some authors, Carthage was rebuilt by Julius Caesar; and Strabo, who flourished in the reign of Tiberius, affirms it in his time to have been equal, if not superior, to any other city in Africa. It was looked upon as the capital of Africa for several centuries after the commencement of the Christian era. Maxentius laid it in ashes about the sixth or seventh year of Constantine’s reign. Genseric, king of the Vandals, took it A.D. 496; but about a century afterwards it was re-annexed to the Roman empire by the renowned Belisarius. At last the Saracens, under Mohammed’s successors, towards the close of the seventh century, so stroyed by completely destroyed it, that there are now scarce any traces remaining.

At the commencement of the third Punic war, Carthage appears to have been one of the first cities in the world. It was seated on a peninsula 360 stadia or its ancient 45 miles in circumference, joined to the continent by a narrow isthmus 25 stadia or three miles and a furlong in breadth. On the west side there projected from it a long tract of land half a stadium broad; which shooting out into the sea, separated it from a lake or marsh, and was strongly fortified on all sides by rocks and a single wall. In the middle of the city stood the citadel of Byrsa, having on the top of it a temple sacred to Aesculapius, seated upon rocks on a very high hill, to which the ascent was by 60 steps. On the south side the city was surrounded by a triple wall, 30 cubits high, flanked all round by parapets and towers, placed at equal distances of 480 feet. Every tower had its foundation sunk 32 feet deep, and was four stories high, though the walls were but two: they were arched; and, in the lower part, corresponding in depth with the foundation above mentioned, were stalls large enough to hold 300 elephants, with their fodder, &c. Over these were stalls and other conveniences for 4000 horses; and there was likewise room for lodging 20,000 foot and 4000 cavalry, without
Carthage, in the least incommending the inhabitants. There were two harbours, so disposed as to have a communication with one another. They had one common entrance 70 feet broad, and shut up with chains. The first was appropriated to the merchants; and included in it a vast number of places of refreshment, and all kinds of accommodation for seamen. The second, on the island of Cotonuma, in the midst of it, was lined with large quays, in which were distinct receptacles for securing and sheltering from the weather 250 ships of war. Over these were magazines of all sorts of naval stores. The entrance into each of these receptacles was adorned with two marble pillars of the Ionic order; so that both the harbour and island represented on each side two magnificent galleries. Near this island was a temple of Apollo, in which was a statue of the god all of massy gold; and the inside of the temple all lined with plates of the same metal, weighing 1000 talents. The city was 23 miles in circumference, and at the time we speak of contained 700,000 inhabitants. Of their power we may have some idea, by the quantity of arms they delivered up to the Roman consuls. The whole army was astonished at the long train of carts loaded with them, which were thought sufficient to have armed all Africa. At least it is certain, that on this occasion were put into the hands of the Romans 250,000 complete suits of Roman armour, with an immeasurable quantity of swords, darts, javelins, arrows, and beams armed with iron, which were thrown from the ramparts by the baliste.

The character transmitted of the Carthaginians is extremely bad; but we have it only on the authority of the Romans, who, being their implacable enemies, cannot be much relied upon. As to their religion, manners, &c. being much the same with the Phoenicians, of which they were a colony, the reader is referred for an account of these things to the article Phoenicia.

On the ruins of Carthage there now stands only a small village called Melcha. The few remains of Carthage consist only of some fragments of walls, and 17 cisterns for the reception of rain water.

There are three eminences, which are so many masses of fine marbles pounded together, and were in all probability the sites of temples and other distinguished buildings. The present ruins are by no means the remains of the ancient city destroyed by the Romans; who, after taking it, entirely erased it, and ploughed up the very foundations; so truly they adhered to the well-known advice perpetually inculcated by Cato the Elder, Delenda est Carthago. It was again rebuilt by the Gracchi family, who conducted a colony to repopule it: and continually increasing in splendour, it became at length the capital of Africa under the Roman emperors. It subsisted near 700 years after its first demolition, until it was entirely destroyed by the Saracens in the beginning of the 7th century.

It is a singular circumstance that the two cities of Carthage and Rome should have been built just opposite one to the other; the bay of Tunis and the mouth of the Tiber being in a direct line.

Littora litoribus contraria, fluctibus undas,
Arma armis. VIRG. Æn. iv. 627.

New Carthage, a considerable town of Mexico, in the province of Costa Rica. It is a very rich trading place. W. Long. 86. 7. N. Lat. 9. 5.

CARTHAGENA, a province of South America, in the new kingdom of Guzman, bounded on the north by the Caribbean sea, on the south by the province of Antioquia, on the east by Santa Marta, and on the west by Darien. The principal city called likewise Carthagena, is situated in W. Long. 77. 7. N. Lat. 11. on a sandy island, by most writers called a peninsula; which, forming a narrow passage on the south-west, opens a communication with that called Tierra Bomba, as far as Boca Chica. The little island which joins them was formerly the entrance of the bay; but it having been filled up by orders of the court, Boca Chica became the only entrance: this, however, has been filled up since the attempt of Vernon and Wentworth, and the old passage again opened. On the north side the land is so narrow, that before the wall was begun, the distance from sea to sea was only 35 toises; but afterwards enlarging, it forms another island on this side; so that, excepting these two places, the whole city is entirely surrounded by salt water. To the eastward it has a communication, by means of a wooden bridge, with a large suburb called Xamoulli, built on another island, which is also joined to the continent by a bridge of the same materials. The houses of both the city and suburbs are built after the modern manner, and lined with freestone; and, in time of peace, the garrison consists of ten companies of 77 men each, besides militia. The city and suburbs are well laid out, the streets straight, broad, uniform, and well paved. All the houses are built of stone or brick, only one story high, well contrived, neat, and furnished with balconies and lattices of wood, which is more durable in that climate than iron, the latter being soon corroded by the astringent quality of the atmosphere. The climate is exceedingly unhealthy. The Europeans are particularly subject to the terrible disease called the black vomit, which sweeps off multitudes annually on the arrival of the galleons. It seldom continues above three or four days, in which time the patient is either dead or out of danger, and if he recovers, is never subject to a return of the same distemper.

This disease has hitherto polluted all the art of the Spanish physicians; as has also the leprosy, which is very common here. At Carthagena, like some, the painful tumour in the legs is occasioned by the entrance of the dracunculus or Guinea-worm, is very common and troublesome. Another disorder peculiar to this country, and to Peru, is occasioned by a little insect called migua, so extremely minute as scarce to be visible to the naked eye. This insect breeds in the dust, insinuates itself into the soles of the feet and the legs, piercing the skin with such subtilty, that there is no being aware of it, before it has made its way to the flesh. If it is perceived in the beginning, it is extracted with little pain; but having once lodged its head, and pierced the skin, the patient must undergo the pain of an incision, without which a nidus would be formed, and a multitude of insects engendered, which would soon overspread the foot and leg. The province contains about 60,000 whites, 13,000 Indians, and 7000 negro slaves. It has not been much concerned in the revolutionary movements which began in 1810, and still continue.
Many of the cartilaginous fish are viviparous, being excluded from an egg, which is hatched within. The egg consists of a white and yolk; and is lodged in a case formed of a thick tough substance, not unlike softened horn; such are the eggs of the ray and shark kinds. Some again differ in this respect, and are oviparous; such as the turbot, and others.

They breathe either through certain apertures beneath, as in the rays; on their sides, as in the sharks, &c.; or on the top of the head, as the pipe-fish: for they have not covers to their gills like bony fish.

CARTMEL, a town of Lancashire in England. It is seated among the hills called Cartmel-fells, not far from the sea, and near the river Kent; adorned with a very handsome church, built in the form of a cross like a cathedral. The market is well supplied with corn, sheep, and fish. Population 280 in 1811. W. Long. 2° 43' N. Lat. 54° 15'.

CARTON, or CARTOON, in Painting, a design drawn on strong paper, to be afterwards chalked through, and transferred on the fresh plaster of a wall, to be painted in fresco. It is also used for a design coloured, for working in mosaic, tapestry, &c. The word is from the Italian cartoni (carta, "paper," and eni, "large," denoting many sheets of paper pasted on canvas on which large designs are made, whether coloured or with chalks only. Of these many are to be seen at Rome, particularly at Domenichino. Those by Andrea Mantegna, which are at Hampton Court, were made for paintings in the old ducal palace at Mantua. But the most famous performances of this sort are...

The Cartoons of Raphael, so deservedly applauded throughout Europe by all authors of refined taste, and all true admirers of the art of design, for their various and matchless merit, particularly with regard to the invention, and to the great and noble expression of such a variety of characters, countenances, and most expressive attitudes, as they are differently affected and properly engaged, in every composition. These cartoons are seven in number, and form only a small part of the sacred historical designs executed by this great artist, while engaged in the chambers of the Vatican under the auspices of Popes Julius II. and Leo X. When finished, they were sent to Flanders, to be copied in tapestry, for adorning the pontifical apartments; which tapestries were not sent to Rome till several years after the decease of Raphael, and even in all probability were not finished and sent there before the terrible sack of that city in the time of Clement VII., when Raphael’s scholars had fled from thence, and some left to inquire after the original cartoons, which lay neglected in the store-rooms of the manufactury. The great revolution which followed in the Low Countries prevented their being noticed amidst the entire neglect of the works of art. It was therefore a most fortunate circumstance that these seven escaped the wreck of the others, which were torn in pieces and remained dispersed as fragments in different collections. These seven were purchased by Rubens for Charles I. and they have been so roughly handled from the first, that holes were pricked for the weavers to pounce the outlines, and other parts almost cut through in tracing also. In this state perhaps they as fortunately escaped the sale amongst the royal collection,

Brew. Zool. iii. 75.
CARUCATE. See CARUCATE.

CARVER, a cutter of figures or other devices in wood. See CARVING.

Carvers answer to what the Romans called sculptores, who were different from castratores, or engravers, as these last wrought in metal.

CARVER is also an officer of the table, whose business is to cut up the meat, and distribute it to the guests. The word is formed from the Latin corpor, which signifies the same. The Romans also called him carpenter, sometimes scissor, scindendi magister, and structor.

In the great families at Rome, the carver was an officer of some figure. There were masters to teach them the art regularly, by means of figures of animals cut in wood. The Greeks also had their carvers, called trepes, q. d. distributores, or distributore.

In the primitive times, the master of the feast carved for all his guests. Thus in Homer, when Agamemnon's ambassadors were entertained at Achilles's table, the hero himself carved the meat. Of latter times, the same office on solemn occasions was executed by some of the chief men of Sparta. Some derive the custom of distributing to every guest his portion, from those early ages when the Greeks first left off feeding on scorsus, and learned the use of corn. The new diet was so great a delicacy, that to prevent the guests from quarrelling about it, it was found necessary to make a fair distribution.

In Scotland, the king has a hereditary carver in the family of Anstruther.

CARI, or CARVI, in Botany. See CARUM, BOTANY Index.

CARVING, in a general sense, the art or act of cutting or fashioning a hard body, by means of some sharp instrument, especially a chisel. In this sense carving includes statuary and engraving, as well as cutting in wood.

CARVING, in a more particular sense, is the art of engraving or cutting figures in wood. In this sense carving, according to Pliny, is prior both to statuary and painting.

To carve a figure or design, it must be first drawn or pasted on the wood ; which done, the rest of the block not covered by the lines of the design, is to be cut away with little narrow-pointed knives. The wood fittest for the use is that which is hard, tough, and close, as beech, but especially box: to prepare it for drawing the design on, they wash it over with white lead tempered in water; which better enables it either to bear ink or the crayon, or even to take the impression by chalking. When the design is to be pasted on the wood, this whitening is omitted, and they content themselves with seeing the wood well placed. Then wiping over the painted side of the figure with gum tragacanth dissolved in water, they clap it smooth on the wood, and let it dry: which done, they wet it slightly over, and fret off the surface of the paper gently, till all the strokes of the figure appear distinctly. This done, they fall to cutting or carving, as above.

CARUM. See BOTANY Index.

CARUNCULA, or CARUNCLE, in Anatomy, a term denoting a little piece of flesh, and applied to several parts of the human body. Thus,

CARUNCULE.
CARUNCULAE Myriformes, in Anatomy, fleshy knobs about the size of a myrtle berry, supposed to owe their origin to the breaking of the hymen. See Anatomy Index.

CARUNCULAE, in the urethra, proceeding from a gonorrhoea, or an ulceration of the urethra, may be reduced by introducing the Bougie.

CARUS, a sudden deprivation of sense and motion, affecting the whole body. See Medicine Index.

CARUS, Marcus Aurelius, was raised from a low station, by his great merit, to be emperor of Rome in 282. He shewed himself worthy of the empire; subdued his enemies; and gave the Romans a prospect of happy days, when he was unfortunately killed by lightning in 284.

CARWAR, a town of Asia, on the coast of Malabar in the East Indies, and where the East India Company have a factory, fortified with two bastions. The valleys about it abound in corn and pepper, which last is the best in the East Indies. The woods on the mountains abound with quadrupeds, such as tigers, wolves, monkeys, wild hogs, deer, elk, and a sort of beewes of a prodigious size. The religion of the natives is Paganism; and they have a great many strange and superstitious customs. E. Long. 73. 7. N. Lat. 15. 0.

CARY, Lucius, Lord Viscount Falkland, was born in Oxfordshire, about the year 1610; a young nobleman of great abilities and accomplishments. About the time of his father’s death in 1633, he was made gentleman of the privy chamber to King Charles I. and afterwards secretary of state. Before the assembling of the long parliament, he had devoted himself to literature, and every pleasure which a fine genius, a generous disposition, and an opulent fortune, could afford: when called into public life, he stood foremost in all attacks on the high prerogatives of the crown; but when civil convulsions came to an extremity, and it was necessary to choose a side, he tempered his zeal, and defended the limited powers that remained to monarchy. Still anxious, however, for his country, he seems to have dreaded equally the prosperity of the royal party, and that of the parliament; and among his intimate friends, often sadly reiterated the word power. This excellent nobleman freely passed his person for the king in all hazardous enterprises, and was killed in the 34th year of his age at the battle of Newberry. In Wellwood’s Memoirs we are told, that whilst he was with the king at Oxford, his majesty went one day to see the public library, where he was shown among other books a Virgil, nobly printed, and exquisitely bound. The Lord Falkland, to divert the king, would have his majesty make a trial of his fortune by the Sortes Virgilianae, an usual kind of divination in ages past, made by opening a Virgil. The king opening the book, the passage which happened to come up, was that part of Dido’s imprecation against Aeneas, iv. 615, &c. which is thus translated by Dryden:

"Oppress’d with numbers in th’ unequal field,
His men disconsol’d, and himself expell’d;
Let him for soconce sue from place to place,
Torn from his subjects and his son’s embrace." &c.

King Charles seeming concerned at this accident, the Lord Falkland, who observed it, would likewise try his own fortune in the same manner, hoping he might fall upon some passage that could have no relation to his case, and thereby divert the king’s thoughts from any impression the other might make upon him: but the place Lord Falkland stumbled upon was yet more suited to his destiny than the other had been to the king’s; being the following expressions of Evander, upon the untimely death of his son Pallas, Aen. xi. 152.

"O Pallas! thou hast fail’d thy plighted word;
To fight with caution, not to tempt the sword,
I warn’d thee, but in vain; for well I knew
What pangs youthful ardour would pursue;
That boiling blood would carry thee too far,
Young as thou wert in dangers, raw to war.
O curst essay of arms, disastrous doom,
Prelude of bloody fields and fights to come!"

He wrote several things both poetical and political; and in some of the king’s declarations, supposed to be penned by Lord Falkland, we find the first regular defusion of the English constitution that occurs in any composition published by authority. His predecessor, the first Viscount Cary, was emblazoned for being the first who gave King James an account of Queen Elizabeth’s death.

CARY, Robert, a learned English chronologer, born in Devonshire about the year 1615. On the Restoration, he was preferred to the archdeaconry of Exeter, but on some pretext was ejected in 1664, and spent the rest of his days at his rectory of Portland, where he died in 1689. He published Palæologia Chronica, a chronology of ancient times, in three parts, didactical, apodeictical, and canonical; and translated the hymns of the church into Latin verse.

CARYE, A. (Stephanus); Caryce, arum. (Pausanius); a town of Laconia, between Sparta and the borders of Messenia; where stood a temple of Diana, thence called Caryatis, -idis; whose annual festival, called Carye, -orum, was celebrated by Spartan virgins with dances. An inhabitant, Caryates, and Carytis, Carytis apis, a Laconian bee. (Stephanus).

CARYE, arum, in Ancient Geography, a place in Arcadia, towards the borders of Laconia. Whether from this Arcadia, or that of Messenia, the columnae Caryatides of Vitruvius and Pliny (which were statues of matrons in stoles or long robes) took the appellation, is disputed.

CARYTES, in antiquity, a festival in honour of Diana, surnamed Caryottes, held at Caryum, a city of Laconia. The chief ceremony was a certain dance said to have been invented by Castor and Pollux, and performed by the virgins of the place. During Xerxes’s invasion, the Laconians not daring to appear and celebrate the customary solemnity, to prevent incurring the anger of the goddess by such an intermission, the neighbouring swains are said to have assembled and sung pastoral or bucolismi, which is said to have been the origin of bucolic poetry.

CARYATIDES, or CARIATES. See Architecture.

CARYL, Joseph, a divine of the last century, bred at Oxford, and some time preacher to the society of Lincoln’s-inn, an employment he filled with much applause. He became a frequent preacher before the long parliament, a licensor of their books, one of the assembly.
assembly of divines, and one of the triers for the approbation of ministers; in all which capacities he showed himself a man of considerable parts and learning, but with great zeal against the king's person and cause. On the restoration of Charles II. he was silenced by the act of uniformity, and lived privately in London, where, besides other works, he distinguished himself by a laborious Exposition of the Book of Job; and died in 1672.

CARYLL, JOHN, a late English poet, was of the Roman Catholic persuasion, being secretary to Queen Mary the wife of James II. and one who followed the fortunes of his abdicating master; who rewarded him, first with knighthood, and then with the honorary titles of Earl Caryll and Baron Dartford. How long he continued in that service is not known; but he was in England in the reign of Queen Anne, and recommended the subject of the "Rape of the Lock" to Mr. Pope, who at its publication addressed it to him. He was also the intimate friend of Pope's "Unfortunate Lady." He was the author of two plays: 1. "The English Princess, or the Death of Richard III. 1667," 4to; 2. "Sir Salomon, or the Caustious Coxcomb, 1671," 4to; and in 1700, he published "The Psalms of David, translated from the Vulgate," 12mo. In Tonson's edition of Ovid's Epistles, the Cæsica to Achilles" is said to be by Sir John Caryll; and in Nichols's Select Collection of Miscellany Poems, vol. ii. p. 1, the first elegy of Virgil is translated by the same ingenious poet. He was living in 1717, and at that time must have been a very old man. See three of his letters in the "Additions to Pope," vol. ii. p. 114.

CARYOCAR, in Botany, a genus of the terebbi- nia order, belonging to the polyandria class of plants. The calyx is quinquepartite, the petals five, the styles more frequently four. The fruit is a plum, with numerous, and four furrows netted.

CARYOPHYLLÆ, in Botany, the name of a very numerous family or order in Linnaeus's Fragments of a Natural Method; containing, besides the class of the same name in Tournefort, many other plants, which from their general appearance seem pretty nearly allied to it. The following are the genera, viz. Agrostema, Cacabalis, Dianthus, Drypis, Gypsophila, Lychinis, Saponaria, Silene, Velaria, Alina, Arenaria, Bunonia, Cerastium, Cherleria, Clinus, Heliotis, Loeangina, Moehringia, Polyfarnen, Sagina, Spergula, Stellaria, Minuartia, Mullugo, Ortegia, Pharnaceum, Quercia. All the plants of this order are herbaceous, and mostly annual. Some of the creeping kinds do not rise an inch, and the tallest exceed not seven or eight feet. See Botany, Natural Orders.

CARYOPHYLLUS, the Pink, in Botany. See DIANTHUS

CARYOPHYLLUS, the Clove Tree. See Botany, Index.

The Caryophyllus aromaticus is a native of the Molucca islands, particularly of Ambon. where it is principally cultivated. The clove tree resembles in its bark the olive, and is about the height of the laurel, which it also resembles in its leaves. No verdure is ever seen under it. It has a great number of branches, at the extremities of which are produced vast quantities of flowers, that are first white, then green, and at last pretty red and hard. When they arrive at this degree of maturity, they are, properly speaking, cloves. As they dry, they become a dark yellowish cast; and when gathered, become of a deep brown. The season for gathering the cloves is from October to February. The boughs of the trees are then strongly shaken, or the cloves beat down with long reeds. Large cloches are spread to receive them, and they are gathered in the sun or in the smoke of the bamboo cane. The cloves which escape the notice of those who gather them, or are purposely left upon the tree, continue to grow till they are about an inch in thickness; and these falling off, produce new plants, which do not bear in less than eight or nine years. Those which are called mother cloves are inferior to the common sort; but are preserved in sugar by the Dutch; and in long voyages, eaten after their meals, to promote digestion.

The clove, to be in perfection, must be full sized, heavy, oily, and easily broken; of a fine smell, and of a hot aromatic taste, so as almost to burn the throat. It should make the fingers smart when handled, and leave an oily moisture upon them when press'd. In the East Indies, and in some parts of Europe, it is so much admired as to be thought an indispensable ingredient in almost every dish. It is put into their food, liquors, wines, and eaters likewise the composition of their perfumes. Considered as medicines, cloves are very hot stimulating aromatics, and possess in an eminent degree the general virtues of substances of this class. Their pungency resides in their resin; or rather in a combination of resin with essential oil: for the spirituous extract is very pungent; but if the oil and the resin contained in this extract are separated from each other by distillation, the oil will be very mild; and any pungency which it does retain, proceeds from some small portion of adhering resin, and the remaining resin will be insipid. No plant, or part of any plant, contains such a quantity of oil as cloves do. From 16 ounces Newman obtained by distillation two ounces and two drachms, and Hoffman obtained an ounce and a half of oil from two ounces of the spice. The oil is specifically heavier than water. Cloves acquire weight by imbibing water; and this they will do at some considerable distance. The Dutch, who trade in cloves, make a considerable advantage by knowing this secret. They sell them always by weight; and when a bag of cloves is ordered, they hang it, for several hours before it is sent in, over a vessel of water, at about two feet distance from the surface. This will add many pounds to the weight, which the unwary purchaser pays for on the spot. This is sometimes practised in Europe, as well as in the Spice islands; but the degree of moisture must be more carefully watched in the latter; for there a bag of cloves will, in one night's time, attract so much water, that it may be pressed out of them by squeezing them with the hand.

The clove tree is never cultivated in Europe. At Ambon they have allotted the inhabitants 4000 parcels of land, on each of which they were at first allowed, and about the year 1720 compelled, to plant about 125 trees, amounting in all to 500,000. Each of these trees produces annually, on an average, more than two pounds of cloves; and consequently the collective produce must weigh more than a million.
C A S

Caryophyllion. The cultivator is paid with the species that is constantly returned to the Company, and receives some unbleached cottons which are brought from Coromandel.

CARYOTA. See Botany Index.

CASA, in ancient and middle-age writers, is used to denote a cottage or house.

Casa Santa, denotes the chapel of the holy virgin at Loretto. The Santa Casa is properly the house, or rather chamber, in which the blessed virgin is said to have been born, where she was betrothed to her spouse Joseph, where the angel saluted her, the Holy Ghost overshadowed her, and by consequence where the Son of God was conceived or incarnated. Of this building the Catholics tell many wonderful stories too childish to transcribe. The Santa Casa, or holy chamber, consists of one room, forty-four spans long, eighteen bread, and twenty-three high. Over the chimney, in a niche, stands the image called the great Madonna or Lady, four feet high, made of cedar, and as they say, wrought by St Luke, who was a carver as well as a physician. The mantle or robe she has on, is covered with innumerable jewels of inestimable value. She has a crown, given her by Louis XIII. of France, and a little crown for her son.

CASAL, a strong town of Italy in Montserrat, with a citadel and a bishop's see. It was taken by the French from the Spaniards in 1640; and the duke of Mantua sold it to the French in 1661. In 1645 it was taken by the allies, who demolished the fortifications; but the French retake it, and fortified it again. The king of Sardinia became master of it in 1726, from whom the French took it in 1744; however the king of Sardinia got possession again in 1746. It is seated on the river Po, and contains 15,000 inhabitants. E. Long. 8° 37'. N. Lat. 45° 12'.

CASAI-MAGGIORE, a small strong town of Italy, in the duchy of Milan, seated on the river Po. E. Long. 11° 5'. N. Lat. 45° 6'.

CASA NOVA, MARC ANTONY, a Latin poet, born at Rome, succeeded particularly in epigrams. The poems he composed in honor of the illustrious men of Rome are also much esteemed. He died in 1527.

CASAN, a considerable town of Asia, and capital of a province of the same name in the Russian empire, with a strong castle, a citadel, and an archbishop's see. The country about it is very fertile in all sorts of fruits, corn, and pulse. It carries on a great trade in fur, and furnishes wood for the building of ships. The fortress is built of stone; but the town is of wood. The inhabitants amount to 17,500. Besides several schools, it has a university, founded in 1803. E. Long. 49° 25'. N. Lat. 55° 38'.

CASAS, BARTHOLOMOW DE LAS, bishop of Chiapa, distinguished for his humanity and zeal for the conversion of the Indians, was born at Seville in 1474: and went with his father who sailed to America with Christopher Columbus in 1493. At his return to Spain, he embraced the state of an ecclesiastic, and obtained a curacy in the island of Cuba: but some time after quitted his cure in order to procure liberty for the Indians, whom he saw treated by the Spaniards in the most cruel and barbarous manner; which naturally gave them an unconquerable aversion to Christianity. Bartholomew exerted himself with extraordinary zeal, for 50 years together, in his endeavours to persuade the Spaniards that they ought to treat the Indians with equity and mildness; for which he suffered a number of persecutions from his countrymen. At last the court, moved by his continual remonstrances, made laws in favour of the Indians, and gave orders to the governors to observe them, and see them executed. He died at Madrid in 1566, aged 92. He wrote several works, which breathe nothing but humanity and virtue. The principal of them are, 1. An account of the destruction of the Indies. 2. Several treatises in favour of the Indians, against Dr Sepulveda, who wrote a book to justify the inhuman barbarities committed by the Spaniards. 3. A very curious and now scarce work in Latin, on this question, whether kings or princes can, consistently with conscience, or in virtue of any right or title, alienate their subjects, and place them under the dominion of another sovereign.

CASATI, PAUL, a learned Jesuit, born at Piacenza in 1617, entered early among the Jesuits; and after having taught mathematics and divinity at Rome, was sent into Sweden to Queen Christina, whom he prevailed on to embrace the Popish religion. He wrote, 1. Vacuum proscriptum. 2. Terra machinis muta. 3. Mechanicorum libri octo. 4. De igne Dissertations, which is much esteemed. 5. De Angelis Dissertations. 6. Hydrostatica Dissertations. 7. Optics Dissertations. It is remarkable that he wrote this treatise on optics at 88 years of age, and after he was blind. He also wrote several books in Italian.

CASAUBON, ISAAC, was born at Geneva in 1559; and Henry IV. appointed him his library keeper in 1603. After this prince's death, he went to England with Sir Henry Wotton, ambassador from King James I. where he was kindly received, and engaged in writing against Baronius's annals. He died not long after this, in 1614; and was interred in Westminster abbey, where a monument was erected to him. He was greatly skilled in the Greek, and in criticism; published several valuable commentaries; and received the highest eulogiums from all his contemporaries.

CASAUBON, Meric, a son of the preceding, was born at Geneva in 1599. He was bred at Oxford, and took the degree of master of arts in 1621. The same year he published a book in defence of his father against the calumnies of certain Roman Catholics, which gained him the favour of King James I. and a considerable reputation abroad. He was made prebendary of Canterbury by Archbishop Laud. In the beginning of the civil war he lost all his spiritual promotions, but still continued to publish excellent works. Oliver Cromwell, then lieutenant-general of the parliament's forces, would have employed his pen in writing the history of the late war; but he declined it, owning that this subject would oblige him to make such reflections as would be ungrateful, if not injurious, to his lordship. Notwithstanding this answer, Cromwell, sensible of his worth, ordered three or four hundred pounds to be paid him by a bookseller in London, whose name was Cromwell, on demand, without requiring from him any acknowledgment of his benefactor. But this offer he rejected, though his circumstances were then mean. At the same time it was proposed by his friend Mr Grave,
CASE-SHOT, in the military art, musket balls, stones, old iron, &c. put into cases, and shot out of great guns.

CASEMENT, or CASEMATE, in Architecture, a hollow moulding, which some architects make one-sixth of a circle, and others one fourth.

CASEMENT is also used in building, for a little moveable window, usually within a larger, being made to open or turn on hinges.

CASENERN, in fortification, lodgings built in garrison towns, generally near the rampart, or in the waste places of the town for lodging soldiers of the garrison. There are usually two beds in each casern for six soldiers to lie, who mount the guard alternately; the third part being always on duty.

CASERTA, an episcopal town of Italy, in the kingdom of Naples, and in the Terra de Lavoro, with the title of a duchy, seated at the foot of a mountain of the same name, in E. Long. 15. 5. N. Lat. 41. 5.

CASES, PETER-JAMES, of Paris, the most eminent painter of the French school. The churches of Paris and of Versailles abound with his works. He died in 1754, aged 79.

CASH, in a commercial style, signifies the stock or ready money which a merchant or other person has in his present disposal to negotiate; so called from the French term *cassé*, i.e. "cheque or coffer," for the keeping of money.

M. Savary shows that the management of the cash of a company is the most considerable article, and that whereon its good or ill success depends.

CASH-BOOK. See BOOK-KEEPING.

CASHEL, or CASHEL, a town of Ireland in the county of Tipperary, and province of Munster, with an archbishop's see. The ruins of the old cathedral testify its having been an extensive as well as handsome Gothic structure, boldly towering on the celebrated rock of Cashel, which taken together form a magnificent object, and bear honourable testimony to the labour and ingenuity, as well as the piety and zeal, of its former inhabitants. It is seen at a great distance and in many directions. Adjoining it are the ruins of the chapel of Cormac McCullin, at once king and archbishop of Cashel, supposed to have been the first stone building in Ireland; and seems, by its rude imitation of pillars and capitals, to have been copied after the Grecian architecture, and long to have preceded that which is usually called Gothic. Cormac McCullin was a prince greatly celebrated by the Irish historians for his learning, piety, and valour. He wrote, in his native language, a history of Ireland, commonly called, the *Psalter of Cashel*, which is still extant, and contains the most authentic account we have of the annals of the country to that period, about the year 900. On the top of the rock of Cashel, and adjoining the cathedral, is a lofty round tower, which proudly defied the two successful attempts of Archbishop Price, who in this century unroofed and thereby demolished the ancient cathedral founded by St Patrick. In the choir are the monuments of Myler Magrath, archbishop of this see, in the reign of Queen Elizabeth, and some other curious remains of antiquity. Cashel was formerly the royal seat and metropolis of the kings of Munster; and on the ascent to the cathedral is a large stone on which
which every new king of Munster was, as the inhabitants report from tradition, formerly proclaimed. Cashel is smaller than it once was, containing only about 600 houses. The archbishop’s palace is a fine building. Here is a very handsome market house, a sessions house, the county infirmary, a charter school for twenty boys and the same number of girls, and a very good barracks for two companies of foot. Dr Agar finished a very elegant church which was begun by his predecessor. W. Long. 7. 56. N. Lat. 52. 16.

CASHEW NUT. See ANACARDIUM, BOTANY INDEX.

CASHIER, the cash-keeper; he who is charged with the receiving and paying the debts of a society. In the generality of foundations, the cashier is called treasurer.

CASHIERS of the Bank, are officers who sign the notes that are issued out, and examine and mark them when returned for payment.

CASHMIRE, a province of India, for a long time belonging to Hindostan, but now an appendage of Afghanistan. It is about 90 miles in length, and nearly of an oval form, situated chiefly between 34 and 35 degrees of north latitude, and between 73 and 76 degrees of east longitude. Being girt in by a zone of hills, and elevated very considerably above an arid plain, which stretches many miles around it, the scene which it exhibits are wild and picturesque. Rivers, bills, and valleys, charmingly diversify the landscape.

Here, Mr Sullivan informs us, a cascade rushes from a foaming precipice; there a tranquil stream glides placidly along; the tinkling rill, too, sounds amidst the groves; and the feathered choristers sing the song of love, close sheltered in the shade.

At what time Cashmere came under the dominion of the Mogul government, and how long and in what manner it was independent, before it was annexed to the territories of the house of Timur, are points that are beyond our present purpose. Though inconsiderable as to its revenues, it was uniformly held in the highest estimation by the emperors of Hindostan. Thither they repaired in the plenitude of their greatness, when the affairs of the state would admit of their absence; and there they divested themselves of form, and all the oppressive ceremony of state. The royal manner of travelling to Cashmere was grand, though tedious and unwieldy, and showed, in an eminent degree, the splendour and magnificence of an eastern potentate. Arrangiæ, we are told, seldom began his march to that country, for a march certainly it was to be called, without an escort of 80,000 or 100,000 fighting men, besides the gentlemen of his household, the attendants of his seraglio, and most of his officers of state. These all continued with him during the time he was on the road, which generally was a month; but no sooner was he arrived at the entrance of those aerial regions, than, with a select party of friends, he separated from the rest of his retinue, and with them ascended the defiles which led him to his Eden.

The temperature of the air of Cashmere, elevated as it is so much above the adjoining country, together with the streams which continually pour from its mountains, enables the husbandman to cultivate with success the soil he appropriates to agriculture; whilst the gardener’s labour is amply repaid in the abundant produce of his fruit. In short, nature wears her gayest clothing in this enchanting spot. The rivers supply the inhabitants with almost every species of fish; the plains yield sweet herbage for the cattle; the plains are covered with grain of different denominations; and the woods are stored with variety of game. The Cashmireans, according to our author, seem a race distinct from all the others in the east: Their persons are more elegant, and their complexions more delicate and more tinged with red.

On the decadence of the Mogul power in Hindostan, Cashmere felt some of the ravages of war. The inhabitants are sprightly and ingenious, and manufacture a beautiful species of shawls much valued in India. They are all Mahometans or idolaters. Cashmere is the capital town.

CASIMIR, the name of several kings of Poland. See (History of) Poland.

CASIMIR, Matthias Sobiesowski, a Polish Jesuit, born in 1587. He was a most excellent poet; and as, says M. Baillet, an exception to the general rule of Aristotle and the other ancients, which teaches us to expect nothing ingenious and delicate from northern climates. His odes, epodes, and epigrams, have been thought not inferior to those of the finest wits of Greece and Rome. Dr Watts has translated one or two of his small pieces, which are added to his Lyric Poems. He died at Warsaw in 1645, aged 43. There have been many editions of his poems, the best of which is that of Paris, 1759.

CASING of TIMBER WORK, among builders, is the plastering the house all over the outside with mortar, and then striking it while wet, by a ruler, with the corner of a trowel, to make it resemble the joints of freestone. Some direct it to be done upon heart-laths, because the mortar would, in a little time, decay the sap-laths; and to lay on the mortar in two thicknesses, viz. a second before the first is dry.

CASIRI, MICHAEL, a learned orientalist, a native of Syria. See SUPPLEMENT.

CASK, or CASQUE, a piece of defensive armour wherewith to cover the head and neck; otherwise called the head-piece and helmet*. The word is French, and from cassisum or cassisus, a diminutive of cassis mct.

"a helmet." Le Gendre observes, that anciently, in France, the gens d’armes all wore casques. The king wore a casque gilt; the dukes and counts silvered; gentlemen of extraction polished steel; and the rest plain iron.

The cask is frequently seen on ancient medals, where we may observe great varieties in the form and fashion thereof; as the Greek fashion, the Roman fashion, &c. F. Joubert makes it the most ancient of all the coverings of the head, as well as the most universal. Kings, emperors, and even gods themselves, are seen therewith. That which covers the head of Rome has usually two wings like those of Mercury; and that of some kings is furnished with horns like those of Jupiter Ammon; and sometimes barely bulls or rams horns, to express uncommon force.

CASK, in HERALDRY, the same with helmet. See HERALDRY, No. 45.

CASK, a vessel of capacity, for preserving liquors of divers kinds; and sometimes also dry goods, as sugar, Gg almonds,
almonds, &c.—A cask of sugar is a barrel of that commodity, containing from eight to eleven hundred weight. A cask of almonds is about three hundred weight.

CASKET, in a general sense, a little coffier or cabinet. See Cabinet.

Caskets, in the sea language, are small ropes made of sinnet, and fastened to gromets, or little rings upon the yards; their use is to make fast the sail to the yard when it is to be furled.

CASLON, WILLIAM, eminent in an art of the greatest consequence to literature, the art of letterfoundimg, was born in 1692, in that part of the town of Hales-Owen which is situated in Shropshire. Though he justly attained the character of being the Coryphæus in that employment, he was not brought up to the business; and it is observed by Mr. More, that this handiwork is so concealed among the artificers of it, that he could not discover that any one had taught it to another, but every person who had used it had learned it of his own genuine inclination. Mr. Caslon served a regular apprenticeship to an engraver of ornaments on gun barrels; and after the expiration of his term, carried on the trade in Vine-street, near the Minories. He did not, however, solely confine his ingenuity to that instrument, but employed himself likewise in making tools for the bookbinders, and for the chasing of silver plate. Whilst he was engaged in this business, the older Mr. Bowyer accidentally saw, in a bookseller's shop, the lettering of a book uncommonly neat; and inquiring who the artist was by whom the letters were made, was hence induced to seek an acquaintance with Mr. Caslon. Not long after, Mr. Bowyer took Mr. Caslon to Mr. James's foundry, in Bartholomew-close. Caslon had never before that time seen any part of the business; and being asked by his friend, if he thought he could undertake to cut types, he requested a single day to consider the matter; and then replied that he had no doubt but he could. Upon this answer, Mr. Bowyer, Mr. Bettenham, and Mr. Watts, had such a confidence in his abilities, that they lent him 500l. to begin the undertaking, and he applied himself to it with equal assiduity and success. In 1720, the society for promoting Christian knowledge, in consequence of a representation from Mr. Solomon Negri, a native of Damascus in Syria, who was well skilled in the oriental tongues, and had been professor of Arabic in places of note, deemed it expedient to print, for the use of the Eastern churches, the New Testament and Psalter, in the Arabic language. These were intended for the benefit of the poor Christians in Palestine, Syria, Mesopotamia, Arabia, and Egypt, the constitution of which countries did not permit the exercise of the art of printing. Upon this occasion Mr. Caslon was pitched upon to cut the type; in his specimens of which he distinguished it by the name of English Arabic. Under the further encouragement of Mr. Bowyer, Mr. Bettenham, and Mr. Watts, he proceeded with vigour in his employment; and he arrived at length to such perfection, that he not only freed us from the necessity of importing types from Holland, but in the beauty and elegance of those made by him he far exceeded the productions of the best artificers, that his workmanship was frequently exported to the continent. In short, his foundry became, in process of time, the most capital one that exists in this or in foreign countries. Having acquired some influence in the course of his employment, he was put into the commission of the peace for the county of Middlesex. Towards the latter end of his life, his eldest son being in partnership with him, he retired in a great measure from the active execution of business. His death happened in January 1766.

CASPÍAN SEA, a large lake of salt water in Asia, bounded by the province of Astrakan on the north, and by part of Persia on the south, east, and west. It is 646 miles in length, 265 in breadth, and 2350 in circumference, including gulfs and bogs. This sea embraces between Astrakan and Astrabad an incredible number of small islands. Its bottom is mud, but sometimes mixed with shells. At the distance of some German miles from land it is 500 fathoms deep; but on approaching the shore it is everywhere so shallow, that the smallest vessels, if loaded, are obliged to remain at a distance.

When we consider that the Caspian is enclosed on all sides by land, and that its banks are in the neighbourhood of very high mountains, we easily see why the navigation in it should be perfectly different from that in every other sea. There are certain winds that dominate over it with such absolute sway, that vessels are often deprived of every resource; and in the whole extent of it there is not a spot that can truly be called safe. The north, north-east, and east winds, blow most frequently, and occasion the most violent tempests. Along the eastern shore the east winds prevail; for which reason vessels bound from Persia to Astrakan always direct their course along this shore.

The surface of the Caspian sea is found to be 324 feet lower than the ocean. Although its extent is immense, the variety of its productions is exceedingly small. This undoubtedly proceeds from its want of communication with the ocean, which cannot impart to it any portion of its inexhaustible stores. But the animals which this lake nourishes multiply to such a degree, that the Russians, who alone are in condition to make them turn to account, justly consider them as a never-failing source of profit and wealth. It will be understood that we speak of the fish of the Caspian, and of its fisheries, which make the sole occupation and principal trade of the people inhabiting the banks of the Volga and of the Jaik. This business is distinguished into the great and lesser fisheries. The fish comprehended under the first division, such as the sturgeon and others, abound in all parts of the Caspian, as well as in the rivers that communicate with it, and which they ascend at spawning time. The small fishes, such as the salmon and many others, observe the general law of quitting the salt waters for the fresh; nor is there an instance of one of them remaining constantly in the sea.

Seals are the only quadrupeds that inhabit the Caspian; but they are there in such numbers as to afford the means of subsistence to many people in that country as well as in Greenland. The varieties of the species are numerous, diversified however only by the colour. Some are quite black, others quite white; there are some whitish, some yellowish, some of a mouse colour, and some streaked like a tiger. They crawl by means of their fore feet upon the islands, where they become the prey of the fishermen, who kill them.
them with long clubs. As soon as one is dispatched, he is succeeded by several who come to the assistance of their unhappy companion, but come only to share his fate. They are exceedingly tenacious of life, and endure more than thirty hard blows before they die. They will even live for several days after having received many mortal wounds. They are most terrified by fire and smoke; and as soon as they perceive them, retreat with the utmost expedition to the sea. These animals grow so very fat, that they look rather like oil bags than animals. At Astrakan is made a sort of gray soap with their fat mixed with pot-ashes, which is much valued for its property of cleansing and taking grease from woollen stuffs. The greatest numbers of them are killed in spring and autumn. Many small vessels go from Astrakan merely to catch seals.

If the Caspian has few quadrapeds, it has in proportion still fewer of those natural productions which are looked upon as proper only to the sea. There have never been found in it any zoophytes, nor any animal of the order of mollusca. The same may almost be said of shells; the only ones found being three or four species of cockles, the common mussel, some species of snails, and one or two others.

But to compensate this sterility, it abounds in birds of different kinds. Of those that frequent the shores, there are many species of the goose and duck kind, of the stork and heron, and many others of the water tribe. Of birds properly aquatic, it contains the grebe, the crested diver, the pelican, the cormorant, and almost every species of gull. Crows are so fond of fish, that they haunt the shores of the Caspian in prodigious multitudes.

The waters of this lake are very impure, the great number of rivers that run into it, and the nature of its bottom, affecting it greatly. It is true, that in general the waters are salt; but though the whole western shore extends from the 46th to the 35th degree of north latitude; and though one might conclude from analogy that these waters would contain a great deal of salt, yet experiments prove the contrary; and it is certain, that the saltness of this sea is diminished by the north, north-east, and north-west winds; although we may with equal reason conclude, that it owes its saltness to the mines of salt which lie along its two banks, and which are either already known, or will be known to posterity. The depth of these waters also diminishes gradually as you approach the shores, and their saltness in the same way grows less in proportion to their proximity to the land, the north winds not unfrequently causing the rivers to discharge into it vast quantities of troubled water impregnated with clay. These variations which the sea is exposed to are more or less considerable, according to the nature of the winds; they affect the colour of the river waters to a certain distance from the shore, till these mixing with those of the sea, which then resume the ascendancy, the fine green colour appears, which is natural to the ocean, and to all those bodies of water that communicate with it.

It is well known, that, besides its salt taste, all sea water has a sensible bitterness, which must be attributed not only to the salt itself, but to the mixture of different substances that unite with it, particularly to different sorts of alums, the ordinary effect of different combinations of acids. Besides this, the waters of the Caspian have another taste, bitter too, but quite distinct, which affects the tongue with an impression similar to that made by the bile of animals; a property which is peculiar to this sea, though not equally sensible at all seasons. When the north and north-west winds have raged for a considerable time, this bitter taste is sensibly felt; but when the wind has been south, very imperfectly. We shall endeavour to account for this phenomenon.

The Caspian is surrounded on its western side by the mountains of Caucasus, which extend from Derbent to the Black sea. These mountains make a curve near Astrakan, and direct their course towards the eastern shore of the Caspian, lose themselves near the mouth of the Intik, where they become secondary mountains, being disposed in strata. As Caucasus is an inexhaustible magazine of combustible substances, it consequently lodges an astonishing quantity of metals in its bowels. Accordingly, along the foot of this immense chain of mountains, we sometimes meet with warm springs, sometimes springs of naphtha of different quality; sometimes we find native sulphur, mines of vitriol, or lakes heated by internal fires. Now the foot of Mount Caucasus forming the immediate western shore of the Caspian sea, it is very easy to imagine that a great quantity of the constituent parts of the former must be communicated to the latter: but it is chiefly to the naphtha, which abounds so much in the countries which surround this sea, that we must attribute the true cause of the bitterness peculiar to its waters; for it is certain that this bitumen flows from the mountains, sometimes in all its purity, and sometimes mixed with other substances which it acquires in its passage through subterranean channels, from the most interior parts of these mountains to the sea, where it falls to the bottom by its specific gravity. It is certain, too, that the north and north-west winds detach the greatest quantities of this naphtha; whence it is evident that the bitter taste must be most sensible when these winds prevail. We may also comprehend why this taste is not so strong at the surface or in the neighbourhood of the shore, the waters there being less impregnated with salt, and the naphtha, which is united with the water by the salt, being then either carried to a distance by the winds, or precipitated to the bottom.

But it is not a bitter taste alone that the naphtha communicates to the waters of the Caspian: these waters were analysed by M. Gmelin, and found to contain, besides the common sea salt, a considerable proportion of Glauber salt, intimately united with the former, and which is evidently a production of the naphtha.

As the waters of the Caspian have no outlet, it has been supposed that they are discharged by subterranean canals; but this is shown to be incredible, by the lower level of this sea. The two great deserts which extend from it to the east and west are chiefly composed of a saline earth, in which the salt is formed by efflorescence into regular crystals, for which reason salt showers and dews are exceedingly common in that neighbourhood. The salt of the marshes at Astrakan, and that found in efflorescence in the deserts, is by no means pure sea salt, but much de-
based by the bitter Glauber salt we mentioned above. In many places indeed it is found with crystals of a lozenge shape, which is peculiar to it, without any cubical appearance, the form peculiar to crystals of sea salt.

A great deal has been written on the successive augmentation and decrease of the Caspian sea, but with little truth. There is indeed to be perceived in it a certain rise and fall of its waters; in which, however, no observation has ever discovered any regularity.

Many suppose (and there are strong presumptions in favour of the supposition), that the shores of the Caspian were much more extensive in ancient times than they are at present, and that it once communicated with the Black sea. It is probable, too, that the level of this last sea was once much higher than it is at present. If then it be allowed, that the waters of the Black sea, before it procured an exit by the straits of Constantine, rose several fathoms above their present level, which from many concurring circumstances may easily be admitted, it will follow, that all the plains of the Crimea, of the Kumak, of the Wolga, and of the Jaik, and those of Great Tartary beyond the lake of Aral, in ancient times formed but one sea, which embraced the northern extremity of Caucasus by a narrow strait of little depth; the vestiges of which are still obvious in the river Mantysch.

CASQUE, or CASK. See CASK.

CASSADA. See JATROPHAC; BOTANY Index.

CASSANA, NICOLò, called NICOLETTO, an eminent Italian painter, was born at Venice in 1659, and became a disciple of his father Giovanni Francesco Cassana, a Genoese, who had been taught the art of painting by Bernardino Strozzi. He soon distinguished himself, not only by the beauty of his colouring, but by the gracefulness of his figures in historical compositions, as well as in portrait. The most eminent personages solicited him to enrich their cabinets with some of his performances; and were more particularly desirous to obtain their portraits, because in that branch he excelled beyond competition. The grand duke of Tuscany, who was an excellent judge of merit in all professions, and as liberal an encourager of it, invited Nicolo to his court; and he there painted the portraits of the Grand Prince and the Princess Victoria of his consort. These performances procured him uncommon applause, as well as a noble gratuity, and he was employed and caressed by the principal nobility of Florence. Beside several historical subjects painted by this master while he resided in that city, one was a very capital design. The subject of it was the Conspicacy of Catiline; it consisted of nine figures as large as life, down to the knees; and the two principal figures were represented as with one hand joined in the presence of their companions, and in their other hand holding a cup of blood. Some of the English nobility on their travels sat to him for their portraits; which being sent to London, and highly admired, Nicolo was invited to England, with strong assurances of a generous reception; and on his arrival he experienced the kindness, the respect, and the liberality, so peculiar to the natives of that kingdom. He had the honour of being introduced to the presence of Queen Anne, and to paint her portrait: in which he succeeded so happily, that the Queen distinguished him by many marks of favour and honour; but he had not the Cassana happiness to enjoy his good fortune for any length of time, dying in London, universally regretted, in the year 1713.

CASSANA, Giovanni Agostino, called L'Abate Cassana, was brother to the preceding, and born in 1664. He was educated along with him by their father Francesco Cassana, and he finished his studies at Venice, where his brother Nicoli resided for some time. Although he composed and designed historical subjects with expertness, and with a correctness of outline equal to his brother; yet, from prudence and fraternal affection, he declined to interfere with him, and chose therefore to design and paint all sorts of animals and fruits. In that style he arrived at a high degree of excellence, imitating nature with exactness, beauty, and truth; expressing the various plumage of his birds, and the hair of the different animals, with such tenderness and delicacy as rendered them estimable to all judges and lovers of the art. His works were admitted into the collections of those of the first rank, and accounted ornaments of those repositories of what is curious or valuable. He also painted fruits of those kinds which were the most uncommon, or naturally of odd and singular colours; and such fishes as seemed worthy to excite admiration by their unusual form, colour, or appearance. But, besides those subjects, he sometimes painted the portraits of particular persons of distinction, which he designed, coloured, and touched, with the same degree of merit that was visible in all his other performances. At last he determined to visit Genoa, where his family had lived in esteem; and took with him several pictures which he had already finished. His intention was to display his generosity, and to appear as a person of more wealth, and of greater consequence than he really was; and, to support that character, he bestowed his pictures on several of the principal nobility of that city. But, unhappily, he experienced no grateful return for all that prodigal munificence; he reduced himself by that vain liberality to the most necessitous circumstances; was deprived of the means to procure for himself even the common necessities of life, and wasted away the remainder of his days in the bitterness of poverty, misery, and neglect.

CASSANDER, king of Macedon after Alexander the Great, was the son of Antipater. He made several conquests in Greece, abolished democracy at Athens, and gave the government of that state to the orator Demetrius. Olympias, the mother of Alexander, having caused Aridaeus and his wife Eurydice, with others of Cassander's party, to be put to death, he besieged Pydne, whither the queen had retired, took it by a stratagem, and caused her to be put to death. He married Thessalonica, the sister of Alexander the Great; and killed Roxana and Alexander, the wife and son of that conqueror. At length he entered into an alliance with Seleucus and Lysimachus, against Antigonus and Demetrius; over whom he obtained a great victory near Ipsus in Phrygia, 301 years before the Christian era, and died three years after, in the 70th year of his reign.

CASSANDRA, in fabulous history, the daughter of Priam and Hecuba, was beloved of Apollo, who promised to bestow on her the spirit of prophecy, provided
Cassandra seemed to accept the proposal; but had no sooner obtained that gift, than she laughed at the tempter, and broke her word. Apollo, being enraged, revenged himself, by causing no credit to be given to her predictions, hence she in vain prophesied the ruin of Troy. Ajax, the son of Oileus, having ravished her in the temple of Minerva, he was struck with thunder. She fell into the hands of Agammenon, who loved her to distraction; but in vain did she predict that he would be assassinated in his own country. He was killed, with her, by the intrigues of Clytemnestra; but their death was avenged by Orestes.

Cassano, a town of Italy in the duchy of Milan, rendered remarkable by an obstinate battle fought there between the Germans and French in 1705. It is subject to the house of Austria, and is seated on the river Adda, in E. Long. 10. 0. N. Lat. 45. 20.

Cassano, a town of Italy in Calabria Citerior, in the kingdom of Naples, with a bishop's see. E. Long. 16. 30. N. Lat. 39. 55.

Cassavel, or Cassada. See Jatropha, Botany Index.

Casel, a town of French Flanders, in the department of the North. It contains 3600 inhabitants, and is seated on a mountain; and from whence there is one of the finest prospects in the world; for one may see no less than 32 towns, with a great extent of the sea, from whence it is distant 15 miles. E. Long. 27. N. Lat. 50. 48.

Cassel, the capital city of the landgrave of Hesse Cassel, in the circle of the Upper Rhine in Germany; (see Hesse Cassel). It is divided into the Old, New, and High Towns. The New Town is best built, the houses being of stone, and the streets broad. The houses of the Old Town, which is within the walls, are mostly of timber; but the streets are broad, and the market places spacious. The place is strongly fortified, but the fortifications are not regular. It contained 20,300 inhabitants in 1810, and was the capital of the kingdom of Westphalia till 1814. There are several manufactories in the place, particularly in the woollen branch. It is seated on the declivity of a hill near the river Fulva, in E. Long. 9. 28. N. Lat. 51. 20.

Cassia. See Botany Index.

Cassia Lignea. See Larus.

Cassida. See Scutellaria, Botany Index. Cassida, in Zoology, a genus of insects belonging to the order of coleoptera. See Entomology Index.

Cassimer, or Cashimer, the name of a thin twilled woollen cloth, much in fashion for summer use.

Cassimire, or Cashmire. See Cassimire.

Cassine. See Botany Index. The Spaniards who live near the gold mines of Peru, are frequently obliged to drink an infusion of this herb in order to moisten their breasts; without which they are liable to a sort of suffocation, from the strong metallic exhalations that are continually proceeding from the mines. In Paraguay, the Jesuits make a great revenue by importing the leaves of this plant into many countries, under the name of Paraguay or South sea tea, which is there drank in the same manner as that of China or Japan is with us. It is with difficulty preserved in England.

Cassini, Johannes Dominicus, a most excellent astronomer, was born at Piedmont in 1625. His early proficiency in astronomy procured him an invitation to be mathematical professor at Bologna when he was not more than 15 years of age; and a comet appearing in 1652, he discovered that comets were not accidental meteors, but of the same nature, and probably governed by the same laws, as the planets. In the same year he solved a problem given up by Kepler and Bullialdus as insolvable, which was, to determine geometrically the apogee and eccentricity of a planet from its true and mean place. In 1663, he was appointed inspector general of the fortifications of the castle of Urbino, and had afterwards the care of all the rivers in the ecclesiastical state: he still, however, prosecuted his astronomical studies, by discovering the revolution of Mars round his own axis; and, in 1666, published his theory of Jupiter's satellites. Cassini was invited into France by Louis XIV. in 1669, where he settled as the first professor in the royal observatory. In 1677 he demonstrated the line of Jupiter's diurnal rotation; and in 1684 discovered four more satellites belonging to Saturn, Huygens having found one before. He inhabited the royal observatory at Paris more than forty years; and when he died in 1712, was succeeded by his son James Cassini.

Cassini, James, another celebrated astronomer, was the only son of the former. He was born at Paris, 18th February 1677. It would appear that his early studies were conducted in his father's house, where, from the pursuits and studies of his father, mathematics, and their application to astronomy, it is probable, were not neglected. He became a student afterwards at the Mazarine college, at the time that the celebrated Varignon was professor of mathematics. With the assistance of this eminent man young Cassini made such progress, that at 15 years of age he supported a mathematical thesis with great honour. At the age of 17 he was admitted a member of the Academy of Sciences; and the same year he accompanied his father in a journey to Italy, where he assisted him in the verification of the meridian at Bologna and other measurements. After his return he performed similar operations in a journey into Holland, and he discovered some errors in the measure of the earth by Snell, the result of which was communicated to the Academy in 1702. In 1696 he made also a visit to England, where he was made a member of the Royal Society. In 1712 he succeeded his father as astronomer royal at the observatory of Paris. In 1717 he gave to the Academy his researches on the distance of the fixed stars; in which he shewed that the whole annual orbit, of near 200 millions of miles diameter, is but as a point in comparison of that distance. The same year he communicated also his discoveries concerning the inclination of the orbits of the satellites in general, and especially of those of Saturn's satellites and ring; in 1724 he undertook to determine the cause of the moon's libration, by which she shews sometimes a little towards one side, and sometimes a little on the other, of that half which is commonly behind or hid from our view.

In 1732 an important question in astronomy engag-
Cassini, indeed, was of our author. His father had determined, by his observations, that the planet Venus revolved about her axis in the space of 23 hours; and M. Bianchini had published a work in 1729, in which he settled the period of the same revolution at 24 days 8 hours. From an examination of Bianchini's observations, which were upon the spots in Venus, he discovered that he had intermitted his observations for the space of three hours, from which cause he had probably mistaken new spots for the old ones, and so had been led into the mistake. He also determined the nature and quantity of the accelerations of the motion of Jupiter at half a second per year, and of that of the retardation of Saturn at two minutes per year; that these quantities would go on increasing for 2000 years, and then would decrease again. In 1740 he published his Astronomical Tables, and his Elements of Astronomy; very extensive and accurate works.

Astronomy was the principal object of our author's consideration, but he did not confine himself absolutely to that pursuit, but made occasional excursions into other fields. We owe to him Experiments on Electricity, Experiments on the Recoil of Fire-arms; Researches on the Rise of the Mercury in the Barometer at different Heights; Reflections on the perfection of Burning-glasses; and some other memoirs.

One of the most important objects of the French academy was the measurement of the earth. In 1669 Picard measured a little more than a degree of latitude to the north of Paris; but as that extent appeared too small from which to conclude the whole circumference with sufficient accuracy, it was resolved to continue that measurement on the meridian of Paris to the north and the south, through the whole extent of the country. Accordingly, in 1683, the late M. de la Hire continued that on the north side of Paris, and the older Cassini that on the south side. The latter was assisted in 1700 in the continuation of this operation by his son our author. The same work was farther continued by the same academicians; and finally, the part left unfinished by De la Hire in the north was finished in 1718 by our author, with the late Maraldi, and De la Hire the younger.

These operations produced a considerable degree of precision. From this measured extent of six degrees, it appeared also, that the degrees were of different lengths in different parts of the meridian; and our author concluded, in the volume published for 1718, that they decreased more and more towards the pole, and that therefore the figure of the earth was that of an oblong spheroid, or having its axis longer than the equatorial diameter. He also measured the perpendicular to the same meridian, and compared the measured distance with the differences of longitude as before determined by the eclipses of Jupiter's satellites; from which he concluded that the length of the degrees of longitude was smaller than it would be on a sphere, and that therefore again the figure of the earth was an oblong spheroid, contrary to the determination of Newton by the theory of gravity. Newton was indeed of all men the most averse from controversy; but the other mathematicians in Britain did not tamely submit to conclusions in direct opposition to the fundamental doctrine of this philosopher. The consequence was, that the French government sent two different sets of measurers, the one to measure a degree at the equator, the other at the polar circle; and the comparison of the whole determined the figure to be an oblate spheroid, contrary to Cassini's determination.

A long and laborious life, James Cassini died in April 1756, and was succeeded in the Academy and Observatory by his second son. He published, A Treatise on the Magnitude and Figure of the Earth; as also, the Elements or Theory of the Planets, with Tables; besides a great number of papers in the Memoirs of the Academy, from the year 1699 to 1755.

Cassini de Thury, Caesar Francois, a celebrated French astronomer, director of the observatory, and member of most of the learned societies of Europe, was born at Paris June 17, 1714. He was the second son of James Cassini, whose occupations and talents he inherited and supported with great honour. He received his first lessons in astronomy and mathematics from MM. Maraldi and Camus; and made such a rapid progress, that when he was not more than ten years of age he calculated the phases of a total eclipse of the sun. At the age of eighteen he accompanied his father in his two journeys undertaken for drawing the perpendicular to the observatory meridian from Strasbourg to Brest. A general chart of France was from that time devised; for which purpose it was necessary to traverse the country by several lines parallel and perpendicular to the meridian of Paris. Our author was charged with the conduct of this business; in which he was so scrupulous as to measure again what had been measured by his father. This great work was published in 1740, with a chart shewing the new meridian of Paris, by two different series of triangles, passing along the sea coasts by Bayonne, traversing the frontiers of Spain to the Mediterranean and Antilles, and thence along the eastern limits of France to Dunkirk, with parallel and perpendicular lines described at the distance of 6000 toises from one another, from side to side of the country.

Our author made a tour in 1747, in Flanders, in the train of the king. This gave rise, at his majesty's instance, to the chart of France; relative to which Cassini published different works, as well as a great number of the sheets of the chart itself. He undertook, in 1761, an expedition into Germany, for the purpose of continuing to Vienna the perpendicular of the Paris meridian; to unite the triangles of the chart of France with the points taken in Germany; to prepare the means of extending into that country the same plan as in France; and thus to establish successively for all Europe a most useful uniformity. Our author was at Vienna the 6th of June 1761, the day of the transit of the planet Venus over the sun, of which he observed as much as the state of the weather would permit him to do, and published the account of it in his Voyage en Allemagne.

Cassini, always meditating the perfection of his grand design, profited of the peace of 1783 to propose the joining of certain points taken upon the English coast with those which had been determined on the coast of France, and thus to connect the general chart of the latter with that of the British isles, as he had before united it with those of Flanders and Germany. The proposal was favourably received by the English government,
Between the years 1735 and 1770, M. Cassini published, in the volumes of Memoirs of the French Academy, a great number of pieces, consisting chiefly of astronomical observations and questions; among which are researches concerning the parallax of the sun, the moon, Mars and Venus; on astronomical refractions, and the effect caused in their quantity and laws by the weather; numerous observations on the obliquity of the ecliptic, and on the law of its variations. He cultivated astronomy for 50 years, the most important for that science that ever clasped for the magnitude and variety of objects; and in which he commonly sustained a principal share.

M. Cassini was of a very strong and vigorous constitution, which carried him through the many laborious operations in geography and astronomy which he conducted. An habitual retention of urine, however, rendered the last twelve years of his life very painful and distressing, till it was at length terminated by the smallpox the 4th of September 1784, in the 71st year of his age. He was succeeded in the academy, and as director of the observatory, by his only son, Joannes-Dominicus Cassini, the fourth in order of direct descent who has filled that honourable station. *Hutton's Math. Dict.*

CASSIODORUS, Marcus Aurelius, secretary of state to Theodoric of the Goths, was born at Squillace, in the kingdom of Naples, about the year 470. He was consul in 514, and was in great credit under the reigns of Athalaric and Vitige; but at 70 years of age retired into a monastery in Calabria, where he amused himself in making sun-dials, water-bour- glasses, and perpetual lamps. He also formed a library; and composed several works, the best edition of which is that of Father Garet, printed at Rouen in 1692. Those most esteemed are his Divine Institutions, and his Treatise on the Soul. He died about the year 562.

CASSIOPEIA, in fabulous history, wife to Cepheus, king of Ethiopia, and mother of Andromeda. She thought herself more beautiful than the Nereids, who desired Neptune to revenge the affront; so that he sent a sea monster into the country, which did much harm. To appease the god, her daughter Andromeda was exposed to the monster, but was rescued by Perseus; who obtained of Jupiter, that Cassiopeia might be placed after her death among the stars; hence the constellation of that name.

CASSIOPEIA, in Astronomy, one of the constellations of the northern hemisphere, situated next to Cepheus. In 1572, there appeared a new star in this constellation, which at first surpassed in magnitude and brightness Jupiter himself: but it diminished by degrees, and at last disappeared, at the end of eighteen months. It alarmed all the astronomers of that age, many of whom wrote dissertations on it; among the rest Tycho Brahe, Kepler, Maurolycus, Lyceum, Gramineus, &c. Both, the landgrave of Hesse, Ross, &c. wrote to prove it a comet, and the same which appeared to the Magi at the birth of Jesus Christ, and that it came to declare his second coming; they were answered on this subject by Tycho. The stars in the constellation Cassiopeia, in Ptolemy's catalogue, are 13; in Hevelius's, 33; in Tycho's, 46: But in the Britannic catalogue Mr Flamsteed makes them 55.

CASSIS, in antiquity, a plated or metalline helmet; different from the galea, which was of leather.

CASSITERIA, in the history of fossils, a genus of crystals, the figures of which are influenced by an admixture of some particles of tin.

The cassiteria are of two kinds; the whitish pellucid cassiterion, and the brown cassiterion. The first is a tolerably bright and pellucid crystal, and seldom subject to the common blemishes of crystal: it is of a perfect and regular form, in the figure of a quadrilateral pyramid; and is found in Devonshire and Cornwall principally. The brown cassiterion is like the former in figure: it is of a very smooth and glossy surface, and is also found in great plenty in Devonshire and Cornwall.

CASSITERIDES, in Ancient Geography, a cluster of islands to the west of the Land's End; opposite to Celiberia (Pliny); famous for their tin, which he calls candidium plumbum, formerly open to none but the Phoenicians, who alone carried on this commerce from Cadiz, concealing the navigation from the rest of the world (Strabo). The appellation is from Cassieros, the name for tin in Greek. Now thought to be the Scilly islands, or Sorling, (Camden).

CASSIUS, Surius, a renowned Roman general and consul, whose enemies accusing him of aspiring to royalty, he was thrown down from the Tarpeian rock 463 years before Christ; after having thrice enjoyed the consular dignity, been once general of the horse under the first dictator that was created at Rome, and twice received the honour of a triumph.

CASSIUS Longinus, a celebrated Roman lawyer, flourished 113 years before Christ. He was so inflexible a judge, that his tribunal was called the Rock of the impeached. It is from the judicial severity of this Cassius, that very severe judges have been called Cassiani.

CASSIUS, Caius, one of the murderers of Julius Caesar; after his defeat by Mark Antony at the battle of Philippi, he ordered one of his freedmen to put him to death with his own sword, 41 years before Christ. See Rome.

CASSOCK, or CASSULA, a kind of robe or gown, worn over the rest of the habit, particularly by the clergy. The word cassock comes from the French cassaque, a horseman's coat.

CASSONADE, in commerce, cask-sugar, or sugar put into casks or chests, after the first purification, but which has not been refined. It is sold either in powder or in lumps; the whitest, and that of which the lumps are largest, is the best. Many imagine it to sweeten more than loaf sugar; but it is certain that it yields a great deal more scum.

CASSOWARY. See STRUTHIO, Ornithology Index.

CASSUMAR, in the Materia Medica, a root resembling that of zedoary.

It is cardiax and sudorific, and famous in nervous cases; it is also an ingredient in many compositions, and is prescribed in powders, boluses, and infusions. Its dose is from five to fifteen grains.

CASSUMBAZAR,
CASSUMBAZAR, a town of India in Asia, situated on the river Ganges, in the province of Bengal. E. Long. 37° 0' and N. Lat. 24° 0'.

CAST, or Cast, is peculiarly used to denote a figure or small statue of bronze. See BRONZE.

CAST, among founders, is applied to tubes of wax fitted in divers parts of a mould of the same matter; by means of which, when the wax of the mould is removed, the melted metal is conveyed into all the parts which the wax before possessed.

CAST, also denotes a cylindrical piece of brass or copper, slitt in two, lengthwise, used by the founders in sand, to form a canal or conduit in their moulds, whereby the metal may be conveyed to the different pieces intended to be cast.

CAST, among plumbers, denotes a little brazen funnel at one end of a mould, for casting pipes without soldering, by means of which the melted metal is poured into the mould.

CAST or Caste, in speaking of the eastern affairs, denotes a tribe, or number of families, of the same rank or profession. The division of a nation into casts chiefly obtains in the dominions of the Great Mogul, kingdom of Bengal, island of Ceylon, and the great peninsula opposite thereto. In each of these there are, according to Father Martin, four principal casts, viz. the cast of the brahmins, which is the first and most noble; the cast of the rajus, or princes, who pretend to be descended from divers royal families; the cast of the chouvres, which comprehends all the artificers; and that of the parias, the lowest and most contemptible of all; though Henry Lord, it must be observed, divides the Indians about Surat into four casts, somewhat differently from Martin, viz. the brahmins, or priests; cutters, or soldiers; shuddery, which we call bawains, or merchants; and wage, the mechanics or artificers. Every art and trade is confined to its proper caste; nor is allowed to be exercised by any but those whose fathers professed the same. So that a tailor's son can never rise to be a painter, nor a painter's son fail to be a tailor; and though there are some employments that are proper to all the casts, e.g. every body may be a soldier or a merchant. There are also divers casts which are allowed to till the ground, but not all. The cast of parias is held infamous, insomuch that it is a disgrace to have any dealings or conversation with them; and there are some trades in the cast of chouvres, which debase their professors almost to the same rank. Thus shoemakers, and all artificers in leather, as also fishermen, and even shepherds, are reputed no better than paries. See CASTE, SUPPLEMENT.

CASTAGNO, ANDREA DAL, historical painter, was born at a small village called Castagno, belonging to the territory of Tuscany, in 1499; and being deprived of his parents, was employed by his uncle to attend the herds of cattle in the fields; but having accidentally seen an ordinary painter at work in the country, he observed him for some time with surprise and attention, and afterwards made such efforts to imitate him, as astonished all who saw his productions. The extraordinary genius of Andrea became at last a common topic of discourse in Florence; and so far excited the curiosity of Bernardetto de Medici, that he sent for Andrea; and perceiving that he had promising talents, he placed him under the care of the best masters who were at that time in Florence. Andrea diligently pursued his studies, devoted himself entirely to practice under the direction of his instructors, became particularly eminent in design, and in a few years made so great a progress, that he found as much employment as he could possibly execute. He painted only in distemper, and fresco, with a manner of colouring that was not very agreeable, being rather dry and hard, till he learned the secret of painting in oil from Domenico Venetiano, who had derived his knowledge of that new discovery from Antonello da Messina. Andrea was the first of the Florentine artists who painted in oil; but although he was in the highest degree indebted to Domenico for disclosing the secret, yet he secretly envied the merit of the man who taught him the art; and because his own works seemed to be much less admired than those of Domenico, he determined to assassinate his friend and benefactor. He executed his design with the utmost ingenuity and treachery (for Domenico at that time lived with him, and painted in partnership with him), and he stabbed him at a corner of a street so secretly, that he escaped, unobserved and unsuspected, to his own house, where he compositely sat down to work; and thither Domenico was soon after conveyed, to die in the arms of his murderer. The real author of so inhuman a transaction was never discovered, till Andrea, through remorse of conscience, disclosed it on his deathbed, in 1548. He finished several considerable works at Florence, by which he gained great riches, and as great a reputation; but when his villanous misconduct became public, his memory was ever after held in the utmost detestation. The most noted work of this master is in the hall of justice at Florence, representing the execution of the conspirators against the house of Medicis.

CASTALIAN SPRING. See CASTALUS.

CASTALIO, SEBASTIAN, was born at Chatillon, on the Rhone, in the year 1551. Calvin conceived such esteem and friendship for him, during the stay he made at Strasburg in 1540 and 1541, that he lodged him some days at his house, and procured him a regent's place in the college of Geneva. Castalio after continuing in this office near three years, was forced to quit it in the year 1544, on account of some particular opinions which he held concerning Solomon's Song, and Christ's descent into hell. He retired to Basil, where he was made Greek professor, and died in that place in 1564, aged 48. He incurred the high displeasure of Calvin and Theodore Beza, for differing with them concerning predestination and the punishment of heretics. His works are very considerable both on account of their quality and number. In 1545, he printed at Basil four books of dialogues, containing the principal histories of the Bible in elegant Latin; so that youth might thereby make a proficiency in piety and in the Latin tongue at the same time. But his principal work is a Latin and French translation of the Scripture. He began the Latin translation at Geneva in 1542, and finished it at Basil in 1550. It was printed at Basil in 1551, and dedicated by the author to Edward VI., king of England. The French version was dedicated to Henry II. of France.
CASTALIE, a town of France, and printed at Basel in 1555. The fault which has been most generally condemned in his Latin translation, is the affectation of using only classical terms.

CASTALIUS FONS (Strabo, Pausanias); CASTALIA, (Pindar, Virgil); a fountain at the foot of Mount Parnassus, in Phocis, near the temple of Apollo, or near Delphi; sacred to the Muses, thence called Castalides. Its murmures were thought prophetic. (Nonius, Lucian). See the articles DELPHI and PARNASSUS.

CASTANEA. See FAGUS, BOTANY INDEX.

CASTANETS, CASTAGNETTES, or CASTANETAS, a kind of musical instrument, whereon the Moors, Spaniards, and Bohemians, accompany their dances, sarabands, and guitars. It consists of two little round pieces of wood dried, and hollowed in the manner of a spoon, the concavities whereof are placed on one another, fastened to the thumb, and beat from time to time with the middle finger, to direct their motion and cadences. The castanets may be beat eight or nine times in the space of one measure, or second of a minute.

CASTANOVITZ, a town of Croatia, situated on the river Una, which divides Christendom from Turkey. E. Long. 17° 20', N. Lat. 45° 40'. It is subject to the house of Austria.

CASTEL, LEWIS BERTRAND, a learned Jesuit, was born at Montpelier in 1688, and entered among the Jesuits in 1703. He studied polite literature in his youth; and at length applied himself entirely to the study of mathematics and natural philosophy. He distinguished himself by writing on gravity; the mathematics; and on the music of colours, a very whimsical idea, which he took great pains to reduce to practice. His piece on gravity, entitled Traité de la Pensée Universelle, was printed at Paris in 1724. He afterwards published his Mathématique Universelle; which occasioned his being unanimously chosen a fellow of the Royal Society of London, without the least solicitations. He was also member of the academies of Bourdeaux and Rouen: but his Clavis oris made the most noise; and he spent much time and expense in making an harpsichord for the eye, but without success. He also wrote for and against Sir Isaac Newton, and published several other works; the principal of which are, Le plan du Mathématique abrégé, and a treatise entitled Optique des Couleurs. He led a very exemplary life, and died in 1757.

CASTELAMARA, a town of Italy, in the kingdom of Naples, and the Hither Principato, with a bishop's see, and a good harbour. E. Long. 14° 15', N. Lat. 41° 40'.

CASTEL-ARAGONNESE, a strong town of Italy, in the island of Sardinia, with a bishop's see, and a good harbour. It is seated on the N. W. coast of the island, in E. Long. 8° 57', N. Lat. 40° 56'.

CASTEL-BRANCO, a town of Portugal, and capital of the province of Beira; seated on the river Lyra, 35 miles N. W. of Alcantara. W. Long. 8° 5' N. Lat. 39° 35'.

CASTEL-FRANCO, a very small, but well fortified frontier town of the Bolognese, in Italy, belonging to the pope.

CASTEL-de-Vide, a small strong town of Alentejo.
CASTELLATIO, in middle-age writers, the art of building a castle, or of fortifying a house, and rendering it a castle. — By the ancient English law, castellation was prohibited without the king’s special license.

CASTELLI, BERNARD, an Italian painter, was born at Genoa in 1517; and excelled in colouring and in portraits. He was the intimate friend of Tasso, and took upon himself the task of designing and etching the figures of his Jerusalem Delivered. He died at Genoa in 1629.

Valerio Castelli, one of his sons, was born at Genoa in 1625, and surpassed his father. He particularly excelled in painting battles; which he composed with spirit, and executed them with so pleasing a variety, and so great freedom of hand, as gained him universal applause. His horses are admirably drawn, thrown into attitudes that are natural and becoming, full of motion, action, and life. In that style of painting he showed all the fire of Tintoretto, united with the fine taste of composition of Paolo Veronese. He died in 1659. The works of this master are not very frequent; but they are deservedly held in very high esteem. A greater number of his easel pictures are in the collections of the nobility and gentry of England.

CASTELLORUM OPERATIO, castle work, or service and labour done by inferior tenants for the building and upholding of castles of defence; towards which some gave personal assistance, and others paid their contributions. This was one of the three necessary charges to which all lands among the Anglo-Saxons were expressively subject.

CASTELVETRO, LEWIS, a native of Modena, of the 16th century, famous for his Comment on Aristotle’s Poetics. He was prosecuted by the inquisition for a certain book of Melancthon, which he had translated into Italian. He retired to Basil, where he died.

CASTI, GIAMBATTISTA, a modern Italian poet.

See Supplement.

CASTIGATION, among the Romans, the punishment of an offender by blows, or beating with a wand or switch. Castigation was chiefly a military punishment; the power of inflicting which on the soldiery was given to the tribunes. Some make it of two kinds; one with a stick or cane, called fustigatio: the other with rods, called flagellatio: the latter was the most dishonourable.

CASTIGATORY, for SCOLDS. A woman indicted for being a common scold, if convicted, shall be placed in a certain engine of correction, called the trebucket castigator; or bucking stool; which, in the Saxon language, signifies the bucking stool; though now it is frequently corrupted into the ducking stool; because the residue of the judgment is, that when she is placed therein, she shall be plunged in water for her punishment.

CASTIGLIONE, GIOVANNI BENVEDETTO, a celebrated painter, was born at Genoa in 1616. His first master was Gio-Battista Paggi. Afterwards he studied under Andrea Ferrari; and lastly perfected himself from the instructions of Anthony Vandyck, who at that time resided at Genoa. He painted portraits, historical pieces, landscapes, and castles; in the latter of which he is said chiefly to have excelled; as also in fairs, markets, and all kinds of rural scenes. By this master we have also a great number of etchings, which are all spirited, free, and full of grace. The effect is, in general, powerful and pleasing; and many of them have a more harmonized and finished appearance than is usual from the point, so justly admired by the gravier. His drawing of the naked figure, though by no means correct, is notwithstanding managed in a style that indicates the hand of the master.

His son, FRANCESCO, was bred under himself, and excelled in the same subjects; and it is thought that many good paintings which are ascribed to Benedetto, and are frequently seen at sales, or in modern collections, are copies after him by his son Francesco, or perhaps originals of the younger Castiglione.

CASTIGLIONE, a small but strong town of Italy, in Mantua, with a castle. It was taken by the Germans in 1701, and the French defeated the Imperialists near it in 1706. E. Long. 10. 29. N. Lat. 43. 23.

CASTIGLIONI, BALTHAZAR, an eminent Italian nobleman, descended from an illustrious and ancient family, and born at his own villa at Casalico in the duchy of Milan in 1478. He studied painting, sculpture, and architecture, as appears from a book he wrote in favour of these arts; and excelled so much in them, that Raphael Urbino, and Buonarotti, though incomparable artists, never thought their works complete, without the approbation of Count Castiglioni. When he was 26 years of age, Guido Ubaldino, duke of Urbino, sent him ambassador to Pope Julius II. He was sent upon a second embassy to Louis XII. of France, and upon a third to Henry VII. of England. After he had dispatched his business here, he returned, and began his celebrated work, entitled the Courtyer; which he completed at Rome in 1516. This work is full of moral and political instruction: and if we seek for the Italian tongue in perfection, it is said to be nowhere better found than in this performance. A version of this work, together with the original Italian, was published at London in 1729, by A. P. Castiglioni, a gentleman of the same family, who resided there under the patronage of Dr. Gibson, bishop of London. Count Castiglioni was sent by Clement VII. to the court of the emperor Charles V. in quality of legate, and died at Toledo in 1529.

CASTILE, NEW, or THE KINGDOM OF TOLEDO, a province of Spain, bounded on the north by Old Castile, on the east by the kingdoms of Arragon and Valencia, on the south by those of Murcia and Andalucia, and on the west by the kingdom of Leon. It is divided into three parts; Aragia to the north, Mancha to the east, and Sierra to the south. Madrid is the capital. Both these provinces are very well watered with rivers, and the air is generally pure and healthy; but the land is mountainous, dry, and uncultivated, through the laziness of the inhabitants. The north part produces fruits and wine, and the south good pastures and fine wool. The population of New Castile in 1787 amounted to 949,469 persons, including 14,000 priests, monks, and nuns.

CASTILE, OLD, a province of Spain, with the title of a kingdom. It is about 592 miles in length, and 115 in breadth; bounded on the south by New Castile, on the east by Arragon and Navarre, on the north by Biscay.
CASTILE, or CASTILLAN, a gold coin current in Spain, and worth fourteen reals and sixteen deniers.

CASTILLA, or CASTILLAN, is also a weight used in Spain for weighing gold. It is a hundredth part of a pound Spanish weight. What they commonly call a weight of gold in Spain is always understood of the castilla.

CASTILLARA, a town of the Mantuan in Italy, situated six miles north-east of the city of Mantua. E. Long. 11. 25. N. Lat. 45. 20.

CASTILLO, a town of France, in the department of Gironde, situated on the river Dordogne, 16 miles east of Bourdeaux. W. Long. 2. 40. N. Lat. 44. 50.

CASTING, in foundry, the running of metal into a mould, prepared for that purpose.

Casting of Metals, of Letters, Bells, &c. See the article FOUNDRY.

Casting in Sand or Earth, is the running of metals between two frames, or moulds, filled with sand or earth, wherein the figure that the metal is to take has been impressed en creux, by means of the pattern.

Casting, among sculptors, implies the taking of casts of figures, busts, medals, leaves, &c.

The method of taking of casts of figures and busts, is most generally by the use of plaster of Paris, i.e. alabaster calcined by a gentle heat. The advantage of using this substance preferably to others is, that notwithstanding a slight calcination reduces it to a polverine state, it becomes again a tenacious and cohering body, by being moistened with water, and afterwards suffered to dry; by which means either a concave or a convex figure may be given by a proper mould or model to it when wet, and retained by the hardness it acquires when dry: and from these qualities, it is fitted for the double purpose of making both casts, and moulds for forming those casts. The particular manner of making casts depends on the form of the subject to be taken. Where there are no projecting parts, it is very simple and easy; as likewise where there are such as form only a right or any greater angle with the principal surface of the body: but where parts project in lesser angles, or form a curve inclined towards the principal surface of the body, the work is more difficult.

The first step to be taken is the forming the mould. In order to this, if the original or model be a base relief, or any other piece of a flat form, having its surface first well greased, it must be placed on a proper table, and surrounded by a frame, the sides of which must be at such a distance from it as will allow a proper thickness for the sides of the mould. As much plaster as will be sufficient to cover and rise to such a thickness as may give sufficient strength to the mould, as also to fill the hollow betwixt the frame and the model, must be moistened with water, till it be just of such consistence as will allow it to be poured upon the model. This must be done as soon as possible; or the plaster would concret or set, so as to become more troublesome in the working, or unfit to be used. The whole must then be suffered to remain in this condition, till the plaster has attained its hardness; and then the frame being taken away, the preparatory cast or mould thus formed may be taken off from the subject entire.

Where the model or original subject is of a round or erect form, a different method must be pursued; and the mould must be divided into several pieces; or if the subject consists of detached and projecting parts, it is frequently most expedient to cast such parts separately, and afterwards join them together.

Where the original subject or mould forms a round, or spheroidal, or any part of such round or spheroidal, more than one half the plaster must be used without any frame to keep it round the model; and must be tempered with water to such a consistence, that it may be wrought with the hand like very soft paste; but though it must not be so fluid as when prepared for flat-figured models, it must yet be as moist as is compatible with its cohering sufficiently to hold together; and being thus prepared, it must be put upon the model, and compressed with the hand, or any flat instrument, that the parts of it may adapt themselves, in the most perfect manner, to those of the subject, as well as to be compact with respect to themselves. When the model is so covered to a convenient thickness, the whole must be left at rest till the plaster be set and firm, so as to bear dividing without falling to pieces, or being liable to be put out of its form by slight violence; and it must then be divided into pieces, in order to its being taken off from the model, by cutting it with a knife with a very thin blade; and being divided, must be cautiously taken off, and kept till dry: but it must be always carefully observed, before the separation of the parts be made, to notch them across the joints or lines of the division, at proper distances, that they may with ease and certainty be properly connected again; which would be much more precarious and troublesome without such directive marks. The art of properly dividing the moulds, in order to make them separate from the model, requires more dexterity and skill than any other thing in the art of casting; and does not admit of rules for the most advantageous conduct of it in every case. Where the subject is of a round or spheroidal form, it is best to divide the mould into three parts, which will then easily come off from the model: and the same will hold good of a cylinder or any regular curved figure.

The mould being thus formed, and dry, and the parts put together, it must be first greased, and placed in such a position that the hollow may lie backwards, and then filled with plaster mixed with water, in the same proportion and manner as was directed for the casting the mould: and when the cast is perfectly set and dry, it must be taken out of the mould, and repaired where it is necessary; which finishes the operation.

This is all that is required with respect to subjects where the surfaces have the regularity above mentioned: but where they form curves which intersect each other, the conduct of the operation must be varied with respect to the manner of taking the cast of...
CA  S  [ 244 ]

The mould from off the subject or model; and where there are long projecting parts, such as legs or arms, they should be wrought in separate casts. The operator may easily judge, from the original subjects, what parts will come off together, and what require to be separated; the principle of the whole consists only in this, that where under-workings, as they are called, occur, that is, wherever a straight line drawn from the basis or insertion of any projection, would be cut or crossed by any part of such projection, such part cannot be taken off without a division; which must be made either in the place where the projection would cross the straight line, or, as is done more frequently, the whole projection must be separated from the main body, and divided also lengthwise into two parts; and where there are no projections from the principal surfaces, but the body is so formed as to render the surface a composition of such curvatures, that a straight line being drawn parallel to the surface of one part would be cut by the outline, in one or more places, of another part, a division of the whole should be made, so as to reduce the parts of it into regular curves, which must then be treated as such.

In larger masses, where there would otherwise be a great thickness of the plaster, a core or body may be put within the mould, in order to produce a hollow in the cast; which both saves the expense of the plaster, and renders the cast lighter.

This core may be of wood, where the forming a hollow of a straight figure, or a conical one with the basis outward, will answer the end; but if the cavity require to be round, or of any curve figure, the core cannot be then drawn while entire; and consequently should be of such matter as may be taken out piece-meal. In this case, the core is best formed of clay, which must be worked upon wires to give it a tenacity, and suspended in the hollow of the mould by wires lying over the mouth; and when the plaster is sufficiently set to bear handling, the clay must be picked out by a proper instrument.

Where it is desired to render the plaster harder, the water with which it is tempered should be mixed with parchment size properly prepared, which will make it very firm and tenacious.

In the same manner, figures, busts, &c. may be cast of lead, or any other metal, in the mould of plaster; only the expense of plaster, and the tediousness of its becoming sufficiently dry, when in a very large mass, to bear the heat of melted metal, render the use of clay, compounded with some other proper materials, preferable where large subjects are in question. The clay, in this case, should be washed over till it be perfectly free from gravel or stones; and then mixed with a third or more of fine sand to prevent it cracking; or, instead of sand, cow-hides soaked fine may be used. Whether plaster or clay be employed for the casting in metal, it is extremely necessary to have the mould perfectly dry; as then the moisture, being removed, will make a separation that will blow the core out of the mould, and endanger the operator, or at least crack the mould in such a manner as to frustrate the operation.

Where the parts of a mould are larger, or project much, and consequently require a greater tenacity of the matter they are formed of to keep them together, blocks, of cloth, prepared like those designed for paper hangings, or fine cotton placed or cut till it is very short, should be mixed with the ashes or sand before they are added to the clay to make the composition for the mould. The proportion should be according to the degree of cohesion required; but a small quantity will answer the end, if the other ingredient of the composition be good, and the parts of the mould properly linked together by means of the wires above directed.

There is a method of taking casts in metals from small animals, and the parts of vegetables, which may be practised for some purposes with advantage: particularly for the decorating grotesques or rock works, where nature is imitated. The proper kinds of animals are lizards, snakes, frogs, birds, or insects; the casts of which, if properly coloured, will be exact representations of the originals.

This is to be performed by the following method: A coffin or proper chest for forming the mould being prepared of clay, or four pieces of boards fixed together, the animal or parts of vegetables must be suspended in it by a string; and the leaves, tendrils, or other detached parts of the vegetables, or the legs, wings, &c. of the animals, properly separated, and adjusted in their right position by a small pair of pincers: a due quantity of plaster of Paris and calcined talk, in equal quantities, with some alumnum plumoum, must then be tempered with water to the proper consistence for casting, and the subject from whence the cast is to be taken, also the sides of the coffin, moistened with spirit of wine. The coffin or chest must then be filled with the tempered composition of the plaster and talk, putting at the same time a piece of straight stick or wood to the principal part of the body of the subject, and pieces of thick wire to the extremities of the other parts, in order that they may form, when drawn out after the matter of the mould is properly set and firm, a channel for pouring in the melted metal, and vents for the air; which otherwise by the rarefaction it would undergo from the heat of the metal, would blow it out or burst the mould. In a short time the plaster and talk will set and become hard, when the stick and wires may be drawn out, and the frame or coffin in which the mould was cast taken away: and the mould must then be put first into a moderate heat, and afterwards, when it is as dry as it can be rendered by that degree, removed into a greater; which may be gradually increased till the whole be red hot. The animal or part of any vegetable, which was included in the mould, will then be burnt to a coal; and may be totally calcined to ashes, by blowing for some time gently into the channel and passages made for pouring in the metal, and giving vent to the air, which will, at the same time that it destroys the remainder of the animal or vegetable matter, blow out the ashes.

The mould must then be suffered to cool gently; and will be perfect; the destruction of the substance of the animal or vegetable having produced a hollow of a figure correspondent to it; but it may be nevertheless proper to shake the mould, and turn it outside a little, as also to blow with the bellows into each of the air vents, in order to free it wholly from any remainder of the ashes; or where there may be an opportunity of filling the hollow with quicksilver without expense, it will be found a very effectual method of clearing the cavity, as all dust, ashes, or small detached bodies, will necessarily
Casting. necessarily rise to the surface of the quicksilver, and be poured out with it. The moulding being thus prepared, it must be heated very hot when used, if the cast be made with copper or brass; but a less degree will serve for lead or tin; and the matter being poured in, the mould must be gently struck; and then suffered to rest till it is cold; at which time it must be carefully taken from the cast, but without the least force; for such parts of the matter as appear to adhere more strongly must be softened by soaking in water till they be entirely loosened, that none of the more delicate parts of the cast may be broken off or bent.

Where the alumen plasma, or salt, cannot easily be procured, the plaster may be used alone; but it is apt to be calcined by the heat used in burning the animal or vegetable from whence the cast is taken, and to become of too incohering and crumbly texture; or, for cheapness, Sturbridge or any other good clay, washed over, till it be perfectly fine, and mixed with an equal part of sand, and some flocks cut small, may be employed. Pounded pumice stone and plaster of Paris, taken in equal quantities, and mixed with washed clay in the same proportion, is said to make excellent moulds for this and parallel uses.

Casts of medals, or such small pieces as are of a similar form, may be made in plaster by the method directed for bass relieves.

Indeed there is nothing more required than to form a mould by laying them on a proper board, and having surrounded them by a rim made by the piece of a card or any other pasteboard, to fill the rim with soft tempered plaster of Paris; which mould, when dry, will serve for several casts. It is nevertheless a better method to form the mould of melted sulphur; which will produce a sharper impression in the cast, and be more durable than those made of plaster.

The casts are likewise frequently made of sulphur, which being melted must be treated exactly in the same manner as the plaster.

For taking casts from medals, Dr. Lewis recommends a mixture of flowers of brimstone and red lead: equal parts of these are to be put over the fire in a ladle, till they soften to the consistence of pap; then they are kindled with a piece of paper, and stirred for some time. The vessel being afterwards covered close, and continued on the fire, the mixture grows fluid in a few minutes. It is then to be poured on the metal, previously oiled and wiped clean. The casts are very neat; their colours sometimes a pretty deep black, sometimes a dark grey: they are very durable; and when soiled, may be washed clean in spirit of wine.

Dr. Lettsom recommends tin foil for taking off casts from medals. The thinnest kind is to be used. It should be laid over the subject from which the impression is to be taken, and then rubbed with a brush, the point of a skewer, or a pin, till it has perfectly received the impression. The tin foil should now be pared close to the edge of the medal, till it is brought to the same circumference: the medal must then be reversed, and the tin foil will drop off into a chip box or mould placed ready to receive it. Thus the concave side of the foil will be uppermost, and upon this plaster of Paris, prepared in the usual manner, may be poured. When dry, the whole is to be taken out, and the tinfoil sticking on the plaster will give a perfect representation of the medal, almost equal in beauty to silver. If the box or mould is a little larger than the medal, the plaster running round the tin foil will give the appearance of a white frame or circular border; whence the new made medal will appear more neat and beautiful.

Casts may be made likewise with iron, prepared in the following manner: "Take any iron bar, or piece of a similar form; and having heated it red hot, hold it over a vessel containing water, and touch it very slightly with a roll of sulphur, which will immediately dissolve it, and make it fall in drops into the water. As much iron as may be wanted being thus dissolved, pour the water out of the vessel; and pick out the drops formed by the melted iron from those of the sulphur, which contain little or no iron, and will be distinguishable from the other by their colour and weight." The iron will, by this means, be rendered so fusible, that it will run with less heat than is required to melt lead; and may be employed for making casts of medals, and many other such purposes, with great convenience and advantage.

Impressions of medals having the same effect as casts, may be made also of isinglass-glue, by the following means. Melt the isinglass, beat it, as when commonly used, in an earthen pipkin, with the addition of as much water as will cover it, stirring it gently till the whole is dissolved, then with a brush of camel's hair, cover the medal, which should be previously well cleansed and warmed, and then laid horizontally on a board or table, greased in the part around the medal. Let them rest afterwards till the glue be properly hardened; and then, with a pin, raise the edges of it; and separate it carefully from the medal: the cast will be thus formed by the glue as hard as horn; and so light, that a thousand will scarcely weigh an ounce. In order to render the relief of the medal more apparent, a small quantity of carmine may be mixed with the melted isinglass; or the medal may be previously coated with leaf gold by breathing on it, and then laying it on the leaf, which will by that means adhere to it: but the use of leaf gold is apt to impair a little the sharpness of the impression.

Impressions of medals may be likewise taken in putty; but it should be the true kind made of calx of tin, and drying oil. These may be formed in the moulds, previously taken in plaster or sulphur; or moulds may be made in its own substance, in the manner directed for those of the plaster. These impressions will be very sharp and hard; but the greatest disadvantage that attends them, is their drying very slowly, and being liable in the mean time to be damaged.

Impressions of prints, or other engravings, may be taken from copperplates, by cleansing them thoroughly, and pouring plaster upon them; but the effect in this way is not strong enough for the eye; and therefore the following method is preferable, where such impressions on plaster are desired.

Take vermilion, or any other coloured pigment, finely powdered, and rub it over the plate: then pass a folded piece of paper, or the flat part of the hand, over the
Coasting. the plate to take off the colour from the lights or parts where there is no engraving; the proceeding must then be the same as where no colour is used. This last method is also applicable to the making of impressions of copperplates on paper with dry colours; for the plate being prepared as here directed, and laid on the paper properly moistened, and either passed under the rolling press, or any other way strongly forced down on the paper, an impression of the engraving will be obtained.

Impressions may be likewise taken from copperplates, either on plaster or paper, by means of the smoke of a candle or lamp; if, instead of rubbing them with any colour, the plate be held over the candle or lamp till the whole surface become black, and then wiped off by the flat of the hand, or paper.

These methods are not, however, of great use in the case of copperplates, except where impressions may be desired on occasions where printing ink cannot be procured: but as they may be applied likewise to the taking impressions from snuff-boxes, or other engraved subjects, by which means designs may be instantly borrowed by artists or curious persons, they may in such instances be very useful.

The expedient of taking impressions by the smoke of a candle or lamp may be employed also for botanical purposes in the case of leaves, as a perfect and durable representation of not only the general figure, but the contexture and disposition of the larger fibres, may be extemporaneously obtained at any time. The same may be nevertheless done in a more perfect manner, by the use of linseed oil, either alone or mixed with a small proportion of colour, where the oil can be conveniently procured: but the other method is valuable on account of its being practicable at almost all seasons, and in all places, within the time that the leaves will keep fresh and plump. In taking these impressions it is proper to bruise the leaves, so as to take off the projections of the large ribs, which might prevent the other parts from plying to the paper.

Leaves, as also the petals, or flower leaves, of plants, may themselves be preserved on paper, with their original appearance, for a considerable length of time, by the following means.—Take a piece of paper, and rub it over with isinglass-glue treated as above directed for taking impressions from medals; and then lay the leaves in a proper position on the paper. The glue laid on the paper being set, brush over the leaves with more of the same; and that being dry likewise, the operation will be finished, and the leaves so secured from the air and moisture, that they will retain their figure and colour much longer than by any other treatment.

Butterflies, or other small animals of a flat figure, may also be preserved in the same manner.

Casting is also sometimes used for the quitting, laying, or throwing aside any thing; thus deer cast their horns, snakes their skins, lobsters their shells, hawks their feathers, &c. annually.

Casting of feathers is more properly called moulting or mewing.

A horse casts his hair or coat, at least once a-year, viz. in the spring, when he casts his winter coat; and sometimes, at the close of autumn, he casts his summer coat, in case he has been ill kept. Horses also sometimes cast their hoofs, which happens frequently to coach horses brought from Holland; these being bred in a moist marshy country, have their hoofs too diaboy; so that coming into a drier soil, and less juicy provender, their hoofs fall off, and others that are firmer succeed.

Casting a Colt, denotes a mare's proving abortive.

Casting Net, a sort of fishing net, so called, because it is to be cast or thrown out; which when exactly done, nothing escapes it, but weeds and every thing within its extent are brought away.

CASTLE, a fortress or place rendered defensible either by nature or art. It frequently signifies with us the principal mansion of noblemen. In the time of Henry II. there were no less than 1115 castles in England, each of which contained a manor.

CASTLES, walled with stone, and designed for residence as well as defence, are for the most part, according to Mr. Grose, of no higher antiquity than the Conquest; for although the Saxons, Romans, and even, according to some writers on antiquity, the ancient Britons, had castles built with stone; yet these were both few in number, and at that period, through neglect or invasions, neither destroyed or so much decayed, that little more than their ruins were remaining. This is asserted by many of our historians and antiquaries, and assigned as a reason for the facility with which William made himself master of this country.

This circumstance was not overlooked by so good a general as the Conqueror; who, effectually to guard against invasions from without, as well as to save his newly acquired subjects, immediately began to erect castles all over the kingdom, and likewise to repair and augment the old ones. Besides, as he had parcelled out the lands of the English amongst his followers, they, to protect themselves from the resentment of those so despoiled, built strongholds and castles on their estates. This likewise caused a considerable increase of these fortresses; and the turbulent and unsettled state of the kingdom in the succeeding reigns, served to multiply them prodigiously, every baron or leader of a party, building castles; insomuch that towards the latter end of the reign of King Stephen, they amounted to the almost incredible number of 1115.

As the feudal system gathered strength, these castles became the heads of baronies. Each castle was a manor; and its castellan, owner, or governor, the lord of that manor. Markets and fairs were directed to be held there; not only to prevent frauds in the king's duties or customs, but also as they were esteemed places where the laws of the land were observed, and as such a very particular privilege. But this good order did not last long; for the lords of castles began to arrogate to themselves a royal power, not only within their castles, but likewise its environs; exercising jurisdiction both civil and criminal, coining of money, and arbitrarily seizing forage and provision for the subsistence of their garrisons, which they afterwards demanded as a right; at length their insolvency and oppression grew to such a pitch, that, according to William of Newbury, "there were in England as many kings, or rather tyrants, as lords of castles," and Matthew Paris styles...
styles them very nests of devils, and dens of thieves.

Castles were not solely in the possession of the crown and the lay barons, but even bishops had these fortresses; though it seems to have been contrary to the canons, from a plea made use of in a general council, in favour of King Stephen, who had seized upon the strong castles of the bishops of Lincoln and Salisbury. This prohibition (if such existed) was, however, very little regarded; as in the following reigns many strong places were held, and even defended, by the ecclesiastics: neither was there more obedience afterwards paid to a decree made by the pope at Viterbo, the fifth of the kalends of June 1220, wherein it was ordained, that no person in England should keep in his hands more than two of the king's castles.

The licentious behaviour of the garrisons of these places becoming intolerable, in the treaty between King Stephen and Henry II. when only duke of Normandy, it was agreed, that all the castles built within a certain period should be demolished; in consequence of which many were actually wasted, but not the number stipulated.

The few castles in being under the Saxon government, were probably, on occasion of war or invasions, garrisoned by the national militia, and at other times slightly guarded by the domestics of the princes or great personages who resided therein; but after the Conquest, when all the estates were converted into baronies held by knight's service, castle guard coming under that denomination, was among the duties to which particular tenants were liable. From these services the bishops and abbots, who till the time of the Normans had held their lands in frank almoign, or free alms, were, by this new regulation, not excepted; they were not, indeed, like the laity, obliged to personal service, it being sufficient that they provided fit and able persons to officiate in their stead. This was, however, at first stoutly opposed by Anselm, archbishop of Canterbury; who being obliged to find some knights to attend King William Rufus in his wars in Wales, complained of it as an innovation and infringement of the rights and immunities of the church.

It was no uncommon thing for the Conqueror and the Kings of those days to grant estates to men of approved fidelity and valour, on condition that they should perform castle guard in the royal castles, with a certain number of men, for some specified time: and sometimes they were likewise bound by their tenures to keep in repair and guard some particular tower or bulwark, as was the case at Dover castle.

In process of time these services were commuted for annual rents, sometimes styled wardpenny, and wayfree, but commonly castlegate rents, payable on fixed days, under prodigious penalties called survises. At Rochester, if a man failed in the payment of his rent of castle guard, in the feast of St Andrew, his debt was doubled every tide during the time for which the payment was delayed. These were afterwards restrained by an act of parliament made in the reign of King Henry VIII. and finally annihilated, with the tenures by knight's service in the time of Charles II. Such castles as were private property were guarded either by mercenary soldiers, or the tenants of the lord or owner.

Castles which belonged to the crown, or fell to it either by forfeiture or escheat, (circumstances that frequently happened in the distracted reigns of the feudal times), were generally committed to the custody of some trusty person, who seems to have been indifferently styled governor and constable. Sometimes also they were put into the possession of the sheriff of the county, who often converted them into prisons. That officer was then accountable at the exchequer, for the farm or produce of the lands belonging to the places intrusted to his care, as well as all other profits; he was likewise, in case of war or invasion, obliged to victual and furnish them with munition out of the issues of his county; to which he was directed by writ of privy seal.

The materials of which castles were built, varied according to the places of their erection: but the manner of their construction seems to have been pretty uniform. The outsides of the walls were generally built with the stones nearest at hand laid as regularly as their shapes would admit; the inside weds were filled up with the like materials, mixed with a great quantity of fluid mortar, which was called by the workmen grout-work.

The general shape or plan of these castles depended entirely on the caprice of the architects, or the form of the ground intended to be occupied; neither do they seem to have confined themselves to any particular figure in their towers; square, round, and polygonal, oftentimes occurring in the original parts of the same building.

The situation of the castles of the Anglo-Norman kings and barons was most commonly on an eminence, and near a river; a situation on several accounts eligible. The whole site of the castle (which was frequently of great extent and irregular figure) was surrounded by a deep and broad ditch, sometimes filled with water, and sometimes dry, called the fosse. Before the great gate was an outwork, called a barbacan, or antemural, which was a strong and high wall, with turrets upon it, designed for the defence of the gate and drawbridge. On the inside of the ditch stood the wall of the castle, about eight or ten feet thick, and between 20 and 30 feet high, with a parapet, and a kind of embrasures called crennels on the top. On this wall, at proper distances, square towers of two or three stories high were built, which served for lodging some of the principal officers of the proprietor of the castle, and for other purposes; and on the inside were erected lodgings for the common servants or retainers, granaries, storehouses, and other necessary offices. On the top of this wall, and on the flat roofs of these buildings, stood the defenders of the castle, when it was besieged, and from thence discharged arrows, darts, and stones on the besiegers. The great gate of the castle stood in the course of this wall, and was strongly fortified with a tower on each side, and rooms over the passage, which was closed with thick folding doors of oak, often plated with iron, and with an iron portcullis or grate let down from above. Within this outward wall was a large open space or court, called, in the largest and most perfect castles, the outer bailey, or baileium, in which stood commonly a church or chapel. On the inside of this outer bailey was another ditch, wall, gate, and towers, inclosing the inner bailey or court, within which the chief tower or keep was built. This was a very large square fabric, four or five stories high,
high, having small windows in prodigious thick walls, which rendered the apartments within it dark and gloomy. This great tower was the palace of the prince, prelate, or baron, to whom the castle belonged, and the residence of the constable or governor. Under ground were dismal dark vaults, for the confinement of prisoners, which made it sometimes be called the dungeon. In this building also was the great hall, in which the owner displayed his hospitality, by entertaining his numerous friends and followers. At one end of the great halls of castles, palaces, and monasteries, there was a place raised a little above the rest of the floor, called the doz, where the chief table stood, at which persons of the highest rank dined. Though there were unquestionably great variations in the structure of castles, yet the most perfect and magnificent of them seem to have been constructed nearly on the above plan.

Such, to give one example, was the famous castle of Bedford, as appears from the following account of the manner in which it was taken by Henry III. A.D. 1224. The castle was taken by four assaults. "In the first was taken the barbacan; in the second the outer ballia; at the third attack, the wall by the old tower was thrown down by the miners, where, with great danger, they possessed themselves of the inner ballia, through a chink; at the fourth assault the miners set fire to the tower, so that the smoke burst out, and the tower itself was cloven to that degree, as to show visibly some broad chinks: whereupon the enemy surrendered." See a representation of a castle in Plate CXXXV. where f is the barbacan, 2 the ditch or moat, 3 the wall of the outer ballia, 4 the outer ballia, 5 the artificial mount, 6 the wall of the inner ballia, 7 the inner ballia, 8 the keep or dungeon.

Before the accession of James VI. to the throne of England, the situation of Scotland was such, that every baron's house was more or less fortified, according to the power or consequence of its lord, or according to the situation of the castle. Near Edinburgh or Stirling, where the inhabitants were more polished in their manners, and overawed by the seat of government, no more was necessary than towers capable of resisting the cursory attack of robbers and thieves, who never durst stop to make a regular investment, but plundered by surprise, and, if repulsed, instantly fled away. Such was Melville Castle. It anciently consisted of a strong built tower of three stories, embattled at the top, and was sufficiently strong to resist a sudden attack, unaided by artillery, or other engines of war. But, when further removed, as in Perthshire, Inverness-shire, or Aberdeenshire, then it was necessary to be better defended, and the aids of a peel or dungeon, with outer walls, moat, and wet ditch, barnakin, &c. added to enable the powerful lord to resist the formidable attack of his powerful adversary. The history of Scotland, so late as the reign of the Stuart family, affords a number of melancholy instances of invertebrate feuds among the greater and lesser barons of that period: by which every mode of fortification then in use was seldom adequate to the defence of the castle against the storm or blockade of the enraged chieftain. The castle of Doune seems to answer this description of fortification, and has made several gallant defences, in the annals of Scotland. The third kind of castles we meet with in Scotland are those situated on the borders of England, or on the sea coasts of the kingdom, and in the Western isles, and very remote places. Many of the old castles in Scotland were situated on an island, in a deep lake, or on a peninsula, which by a broad deep cut was made an island. Of this kind was Lochinaben, in the stewartry of Annandale, the castle of Closeburn in the shire of Nithsdale, the castle of the Rive, situated on the river Dee in the shire of Galloway, Lochleven castle, and many others.

This kind of fortress was only accessible in a hard frost, or by boats, which were not easily transported by a people destitute of good roads and wheel carriages. In fact, they could only be taken by surprise or blockade; the first very difficult, the second very tedious; so that, before the use of artillery, they might be deemed almost impregnable. On that account, their situation was very desirable in the inland parts of Scotland.

On the sea coasts of Scotland we generally find the strongest and most ancient, as well as the most impregnable castles. These had to defend themselves from the invasion of the foreign enemy, as well as the attacks of the domestic foe. Thus we find the barons, whose lands extended to the sea coast, perched, like the eagle, on the most inaccessible rocks that lay within their possessions. Of this kind were Slains castle, Tantallon and Dunottar, on the east coast, and Dunvegan in the isle of Skye, with Dunolly on the west coast. These must have been most uncomfortable retreats, except to a barbarous people, or when a pressing danger forced the baron to seek his safety in the only possible retreat left him.

CASTLE, in ancient writers, denotes a town or village surrounded with a ditch and wall, furnished with towers at intervals, and guarded by a body of troops. The word is originally Latin, castellum, a diminutive from castrum. Castellum originally seems to have signified a smaller fort for a little garrison: though Suetonius uses the word where the fortification was large enough to contain a cohort. The castella, according to Vegetius, were often like towns, built on the borders of the empire, and where there were constant guards and fences against the enemy. Horsey takes them for much the same with what were otherwise denominated stations.

CASTLE, or Castle-steed, is also an appellation given by the country people in the north to the Roman castella, as distinguished from the castra stative, which they usually call chesters. Horsey represents this as an useful criterion, whereby to discover or distinguish a Roman camp or station. There are several of these castella on Severus's wall: they are generally 60 feet square; their north side is formed by the wall itself, which falls in with them; the intervals between them are from six furlongs and a half to seven; they seem to have stood closest where the stations are widest. The neighboring people call them castles, or castle-steads, by which it seems probable that their ancient Latin name had been castellum. Some modern writers call them mile castles, or military castella; Horsey sometimes exploratory castles. In these castella the aedilis had their station, who were an order of men whose business was to make incursions into the enemy's country, and give intelligence of their motions.

CASTLE, in the sea language, is a part of the ship,
of which there are two: the forecastle, being the elevation at the prow, or the uppermost deck towards the mizen, the place where the kitchens are. Hindcastle is the elevation which reigns on the stern, over the last deck, where the officers cabins and pieces of assembly are.

CASTLE. Edmund. See CASTEL.

CASTLE-Baugh, a borough and market town, capital of the county of Mayo in Ireland, is a well-inhabited place, and carries on a brisk trade: it has a barracks for a troop of horse; and there is here a charter school capable of receiving 50 children, and endowed with two acres of land, rent free, by the right honourable Lord Lecon, who has also granted a lease of 20 acres more at a peppercorn yearly.

CASTLE-Carty, a remarkable Roman station about four miles west from Falkirk, on the borders of Stirling-shire in Scotland. It comprehends several acres of ground, as of a square form, and is surrounded with a wall of stone and mortar; all the space within the walls has been occupied by buildings, the ruins of which have raised the earth eight or ten feet above its natural surface; so that the fort now seems like a hill top surrounded with a sunk fence. In 1770, some workmen emplaced in searching for stones for the great canal, which passes very near it, discovered several apartments of stones, and in one of them a great number of stones about two feet in length, and standing erect, with marks of fire upon them, as if they had been employed in supporting some vessel, under which fire-escape put: in a hollow of the rock near this place, in 1771, a considerable quantity of wheat quite black with age was found, with some wedges and hammer supposed to be Roman.

CASTLE-Rising, a borough town of Norfolk in England, which sends two members to parliament. E. Long. 2° 40'. N. Lat. 52° 46'.

CASTLE-Wark, a service or labour done by inferior tenants for the building and upholding of castles of defence, toward which some gave their personal assistance, and others paid their contributions. This was one of the three necessary charges to which the Anglo-Saxons were excessively subject.

CASTLETOWN, the capital of the Isle of Man, seated on the south-west part of the island. It has a strong castle, but of no great importance, on account of its distance from the harbour. The number of houses is about 2,000. W. Long. 53° 59'. N. Lat. 53° 30'.

CASTOR, the BEAVER, in Zoology, a genus of quadrupeds, belonging to the order of gliridae. See MAMMALIA, INDEA.

CASTOR, in Astronomy, a society of the constellation Gemini, called also Apollo. Its latitude northwards, for the year 1700, according to Hevelius, was 10° 4' 23 1/2", and its longitude, of Cancer, 17° 4' 14". It is also called Razalenga, Apollo, Aphelion, Avellan, and Anaela.

CASTOR and POLLUX, in Pagan mythology: Jupiter having an apartment with Lidia, the wife of Tyndarus, king of Sparta, in the form of a swan, she brought forth two eggs, each containing twins. From that impregnated, by Jupiter, proceeded Pollux and Melena, who were both immortal; from the other Castor and Clytemnestra, who being begot by Tyndarus, were mortal. They were all, however, called by the common name of Tyndarides. These two brothers entered into an inviolable friendship; they went with the other noble youths of Greece in the expedition to Colchis, and on several occasions signalized themselves by their courage: But Castor being as length killed, Pollux obtained leave to share his own immortality with him; so that they are said to live and die alternately every day: for, being converted into deities, they form the constellation of Gemini, one of which stars rises as the other sets.

A martial dance, called the Pyrrhic or Cassian dance, was invented in honour of those deities, whom the Cephalenes placed among the Dios Magi, and offered to them white lambs. The Romans also paid them particular honours on account of the assistance they are said to have given them in their engagement with the Latins; in which, appearing mounted on white horses, they turned the scale of victory in their favour, for which a temple was erected to them in the forum.

CASTOR and POLLUX, a fiery meteor, which at sea appears sometimes sticking to a part of the ship, in form of one, two, or even three or four fire-balls: when one is seen aloft, it is more properly called Helena; two are denominated Castor and Pollux, and sometimes Tyndarides. Castor and Pollux are called by the Spaniards, San Elmo; by the French, St Elme; by the English, St Nicholas; by the Italians, Hermes; by the Dutch, Tree Vuuren.

Castor and Pollux are commonly judged to portend a cessation of the storm, and a future calm: being rarely seen till the tempest is nigh spent. Helena alone portends ill, and witnesses the severest part of the storm yet behind. When the meteor sticks to the masts, yards, &c., they conclude, from the ship's not having motion enough to dissipate this flame, that a profound calm is at hand; if it flatters about, it indicates a storm.

CASTOREUM, in the Materia Medica, Castor; the inguinal glands of the beaver. The ancients had a notion that it was lodged in the testicules; and that the animal when hard pressed, would bite them off, and leave them to its pursuers, as if conscious of what they wanted to destroy him for. The best sort of castor is what comes from Russia. So much is Russian castor superior to the American, that two guineas per pound are paid for the former, and only one. Du. for the latter. The Russian castor is in large large round cuds, which appear, when cut, full of a little red, liver-coloured substance, interspersed with membrane and fibres exquisitely interwoven. An inferior sort is brought from Danzig, and is generally fat and moist. The American castor, which is the worst of all, is in longish thin cuds. Russian castor has a strong disagreeable smell, and an acid, bitterish, and nauseous taste. Water extracts the nauseous part, with little of the finer bitter; rectified spirit extracts this last without much of the nauseous; proof spirit both water elevates the whole of its flavour in distilling; rectified spirit brings over paining. Castor is looked upon as one of the capital nervine and antispastic medicines; some celebrated practitioners, nevertheless, have doubted its virtues; and Neumann and Stahl, de-
Castration, in Surgery, the operation of gelding, i.e., of cutting off the testicles, and putting a male animal out of the capacity of generation.

Castration is much in use in Asia, especially among the Turks, who practise it on their slaves, to prevent any commerce with their women. The Turks often make a general amputation.

Castration also obtains in Italy, where it is used with a view to preserve the voice for singing. See EURIPIDES.

The Persians, and other eastern nations, have divers methods of making eunuchs, different from those which obtain in Europe; we say, of making eunuchs, for it is not always done among them by cutting, or even collision. Circums and other poisonous herbs do the same office, as is shown by Paulus Aegina. Those enucleated in this manner are called thístis. Besides which there is another sort, called thalassia, in whom the genitals are left entire, and only the veins which should feed them are cut; by which means the parts do indeed remain, but so lax and weak, as to be of no use.

Castration was for some time the punishment of adultery. By the laws of the Visigoths, sodomites underwent the same punishment.

By the civil law it is made penal in physicians and surgeons to castrate, even with consent of the party, who is himself included in the same penalty, and his effects forfeited. The offence of mayhem by castration is, according to our old writers, facies; though committed upon the highest provocation. See a record to this purpose of Henry III. transcribed by Sir Edward Coke, 3 Inst. 62. or Blackstone’s Com. vol. iv. p. 306.

Castration is sometimes found necessary on medicinal considerations, as in micturition, and some other diseases of the testicles, especially the sarcocele and caerroccele. Some have also used it in maniac cases.

Castration is also in some sort practised on women. Athenæus mentions that King Andromas was the first who castrated women. Hausschütz and Stuidersay Gyges did the same thing. Galen observes, that women cannot be castrated without danger of life; and Dalechamps, on the fore-mentioned passage of Athenæus, holds, that it is only to be understood of simple padlocking.

Castration, in respect of brutes, is called Gelding and Spaying.

Castration also denotes the art of retrouching, or cutting away any part of a thing from its whole.

Castrating a book, among booksellers, is the taking out some leaf, sheet, or the like, which renders it imperfect and unfit for sale. The term is also applied to the taking away particular passages, on account of their obscenity, too great freedom with respect to government, &c.

Castration, among botanists, a term derived from the fancied analogy between plants and animals. The castration of plants consists in cutting off the anthera, or tops of the stamens, before they have attained maturity and dispersed the pollen or fine dust contained within their substance. This operation has been frequently practised by the moderns, with a view to establish or confute the doctrine of the sexes of plants; the anthera or tops being considered by the naturalists as Castration, the male organs of generation. The experiment of castration succeeds principally on plants which, like the melon, have their male flowers detached from the female. In such as have both male and female flowers contained within the same covers, this operation cannot be easily performed without endangering the neighboring organs. The result of experiments on this subject by Linnaeus, Alston, and other eminent botanists, may be seen under the article BOTANY.

CASTREL, a kind of hawk resembling the leanner in size, but the hobby in size. The castr is also called kestrel, and is of a slow and cowardly kind; her game is in the gorse, though she will kill a partridge.

CASTRES, a city of Languedoc, in France, about 35 miles east of Toulouse, containing 22,400 inhabitants. E. Long. 2. 20. N. Lat. 43. 40.

CASTO, the capital of the island of Chili, on the coast of Chili in South America. W. Long. 82. 0. S. Lat. 43. 0.

CASTRO is also the capital of a duky of the same name in the pope’s territories in Italy, situated on the confines of Tuscany. E. Long. 12. 25. N. Lat. 42. 30.

CASTRO, Pietro de, a celebrated painter, who flourished about the middle of the 17th century. The subjects which this great artist chose to paint, were what are distinguished by the name of still life; vases, shells, musical instruments, gams, vessels of gold, silver, and crystal, books, and rich bracelets: and in those subjects his choice and disposition were elegant, and his execution admirable.

CASTRUCCIO CASTRUCCANI, a celebrated Italian general, was born (nobody knows of whom) at Lucca in Tuscany in 1284, and left in a vineyard covered with leaves, where he was found by Dianora, a widow lady, the sister of Antonio, a canon of St. Michael in Lucca, who was descended from the illustrious family of the Castrucci. The lady having no children, she resolved to bring him up, and educated him as carefully as he had been her own. She intended him for a priest; but he was scarcely 14 years old when he began to devote himself to military sports, and those violent exercises which suited his great strength of body. The factions named the Guelfs and Ghibelines then shared all Italy between them; divided the popes and the emperors; and engaged in their different interest not only the members of the same town, but even those of the same family. Francesco, a considerable person on the side of the Ghibelines, observing Castruccio's uncommon spirit and great qualities, prevailed with Antonio to let him turn soldiery; on which Castruccio soon became acquainted with every thing belonging to that profession, and was made a lieutenant of a company of foot by Francesco Guinigi. In his first campaign he gave such proofs of his courage and conduct as spread his fame all over Lombardy; and Guinigi, dying soon after, committed to him the care of his son and the management of his estate. Still distinguishing himself by his exploits, he filled his command in chief with such jealousy and envy, that he was imprisoned by strategems in order to be put to death. But the people of Lucca soon released him, and afterwards chose him for their sovereign prince.

The Ghibelines considered him as the chief of their party.
notes a catafalque, or a lofty tomb of state, erected in honour of some person of eminence, usually in the church where the body is interred; and decorated with arms, emblems, lights, and the like.

Ecclesiastical writers speak of a ceremony of consecrating a castrum doloris; the edifice was to be made to represent the body of the deceased, and the priest and deacon were to take their posts, and say the prayers after the same manner as if the corpse were actually present.

CASTS. See CASTING.

CASU CONSILI, in Law, a writ of entry granted where a tenant, by courtesy or for life, aliens either in fee, in tail, or for the term of another's life. It is brought by him in reversion against the person to whom such tenant does so alien to the prejudice of the reverence in the tenant's lifetime.

CASU Proviso, in Law, a writ of entry founded on the statute of Gloucester, where a tenant in dower aliens the lands he so holds in fee or for life; and lies for the party in reversion against the alliance.

CASUAL, something that happens fortuitously, without any design, or any measure taken to bring it to pass.

CASUAL RECEIVED, are those which arise from forfeitures, confiscations, deaths, attainders, &c.

CASUAL THEOLOGY, a denomination given to that which is more frequently called CASUISTRY.

CASUALTY, in a general sense, denotes an accident, or a thing happening by chance, not design. It is particularly used for an accident producing unnatural death.

CASUALTY, in Scots Law, Casualties of a superior, are those duties and emoluments which a superior has a right to demand out of his vassal's estate, over and besides the constant yearly duties established by the redendo of his charter upon certain casual events.

CASUALTY, in Metallurgy. See CASUALTY.

CASUIST, a person who proposes to resolve cases of conscience. Escobar has made a collection of the opinions of all the casuists before him. M. le Fere, preceptor of Louis XIII. called the books of the casuists the art of quibbling with God: which does not seem far from truth, by reason of the multitude of distinctions and subtleties they abound withal. Mayer has published a bibliography of casuists, containing an account of all the writers on cases of conscience, ranged under three heads; the first comprehending the Lutheran, the second the Calvinist, and the third the Romish casuists.

CASUISTRY, the doctrine and science of conscience and its cases, with the rules and principles of resolving the same; drawn partly from natural reason or equity; partly from the authority of Scripture, the canons of law, councils, fathers, &c. Its entry belongs to the decision of all difficulties arising about what a man may lawfully do or not do; what is sin or not sin; what things a man is obliged to do in order to discharge his duty, and what he may let alone without breach of it.

CASUS AMBITIONIS, in Scots Law. In actions proving the tenor of obligations inextinguishable by the debtor's retiring or censuring them, it is necessary for the person, before he be allowed a proof of the tenor, to descend upon such a cause ambitionis, or accident
CAT

which catches the ring of the anchor when it is to be CAT-Head drawn up.

CAT-Mint. See MINT, BOTANY INDEX.

CAT-Salt, a name given by our salt-workers to a very beautifully granulated kind of common salt. It is formed out of the bitter or brackish brine, which runs from the salt when taken out of the pan. When they draw out the common salt from the boiling pans, they put it into long wooden troughs, with holes bored at the bottom for the brine; the brine is poured into these troughs and across them, small sticks to which the cat-salt adheres itself, in very large and beautiful crystals. This salt contains some portion of the bitter purging salt, is very sharp and pungent, and is white when powdered, though pallid in the mass. It is used by some for the table, but the greatest part of what is made of it is used by the makers of hard soap.

CAT-Silver. See MICA.

CATACOUSTIC CURVES, in higher geometry, that species of caustic curves which are formed by reflection. See FLUXIONS.

CATACHRESIS, in Rhetoric, a trope which borrows the name of one thing to express another. Thus Milton, describing Raphael's descent from the empyreal heaven to paradise, says,

"Down thither prone in flight
He speeds, and through the vast ethereal sky
Sails between worlds and worlds."

CATACOMB, a grave, or subterraneous place for the burial of the dead.

Some derive the word catacomb from the place where ships are laid up, which the modern Latin and Greeks call cimbra. Others say, that cata was used for od, and cactumbras for cimbræs; accordingly, Dadin says, they anciently wrote catutumbras. Others fetch the word from the Greek, κοσμα, and τόπος, a hollow, cavity, or the like.

Anciently the word catacomb was only understood of the tombs of St Peter and St. Paul, and M. Chaustin, lain observes, that among the more knowing of the people of Rome, the word catacomb is never applied to the subterraneous burying-places hereafter-mentioned, but only to a chapel in St. Sebastian, one of the seven stational churches; where the ancient Roman calenders say the body of St Peter was deposited, under the consulate of Tuscus and Bassus, in 258.

CATACOMBS of Italy; a vast assemblage of subterraneous sepulchres about Rome, chiefly at about three miles from that city, in the Via Appia; supposed to be the sepulchre of the martyrs; and which are visited accordingly out of devotion, and relics thence taken and dispersed throughout the Catholic countries, after having been first baptized by the pope under the name of some saint. These catacombs are said by many to be caves or cells wherein the primitive Christians hid and assembled themselves together, and where they interred such among them as were martyred. Each catacomb is three feet broad, and eight or ten high, running in form of an alley or gallery, and communicating with others; in many places they extend within a league of Rome. There is no mausoleum or vaulting therein, but each supports itself; the two sides, which
Catacombs, which we may look on as the poritæ or walls, were the places where the dead were deposited; which were laid lengthwise, three or four rows over one another, in the same catacomb, parallel to the alley. They were commonly closed with large thick tiles, and sometimes pieces of marble, cemented in a manner, inimitable by the moderns. Sometimes, though very rarely, the name of the deceased is found on the tile: frequently a palm is seen, painted or engraved, or the cypser. Xp, which is commonly read pro Christo. The opinion held by many Protestant authors is, that the catacombs are heathen sepulchers, and the same with the pustulæ mentioned by Festus, Pompeius; maintaining, that whereas it was the practice of the ancient Romans to burn their dead, the custom was, to avoid expense, to throw the bodies of their slaves to rot in holes of the ground; and that the Roman Christians, observing at length the great veneration paid to relics, resolved to have a stock of their own: entering therefore the catacombs, they added what cyphers and inscriptions they pleased, and then shut them up again, to be opened on a favourable occasion. Those in the secrets, add they, dying or removing, the contrivance was forgot, till chance opened them at last. But this opinion has even less of probability than the former. Mr. Monro, in the Philosophical Transactions, supposes the catacombs to have been originally the common sepulchres of the first Romans, and dog in consequence of these two opinions, viz., that shade hate the light; and that they love to hover about the places, where the bodies are laid.

Though the catacombs of Rome have made the greatest noise of any in the world, there are such belonging to many other cities. Those of Naples, according to Bishop Burnet, are much more noble and spacious than the catacombs of Rome. Catacombs have also been discovered at Syracuse, and Catanea in Sicily, and in the island of Malta. The Roman catacombs take particular names from the churches in their neighbourhood, and seem to divide the circumference of the city without the walls between them, extending their galleries everywhere under, and a vast way from it; so that all the ground under Rome, and for many miles about it, some say 20, is hollow. The largest, and those commonly shown to strangers, are the catacombs of San Sebastiano, those of Saint Agnesæ, and the others in the fields a little off Saint Agnesæ. Women are only allowed to go into the catacombs in the churchyard of the Vatican on Whitson Monday, under pain of excommunication. There are men kept constantly at work in the catacombs. As soon as the labourers discover a grave, with any of the supposed marks of a saint upon it, attention is given to the cardinal camerlingo, who immediately sends men of reputation to the place, where finding the palm, the monogram, the coloured glass, &c. the remains of the body are taken up with great respect, and translated to Rome. After the labourers have examined a gallery, they stop up the entry that leads to it; so that most of them remain thus closed up; only a few being left open to keep up the trade of showing them to strangers. This, they say, is done to prevent people from losing themselves in these subterraneous labyrinths, which indeed have often happened; but more probably to deprive the public of the means of knowing whether catacombs, and how far the catacombs are carried.

The method of preserving the dead in catacombs seems to have been common to a number of the ancient nations. The catacombs of Egypt are still extant about nine leagues from the city of Grand Cairo, and two miles from the city of Zaccara. They extend from thence to the pyramids of Pharaohs, which are about eight miles distant. They lie in a field covered with a fine running sand, of a yellowish calopus. The country is dry and hilly; the entrance of the tombs is choked up with sand; there are many open, but more that are still concealed.

The bodies found in catacombs, especially those of Egypt, are called mummys; and as their flesh was formerly reckoned, an efficacious medicine, they were much sought after. In this work, the labourers were often obliged to clear away the sand, for weeks together, without finding what they wanted. Upon coming to a little square opening of about 18 feet in depth, they descend into it by holes for the feet placed at proper intervals; and there they are sure of finding a mummy. These caves, or mastra as they call them there, are hollowed out of a white free-stone, which is found in all this country a few feet below the covering of sand. When one gets to the bottom of these, which are sometimes 40 feet below the surface, there are several square openings on each side into passages of 10 or 15 feet wide; and these lead to chambers of 15 or 20 feet square. These are all hewn out in the rock; and in each of the catacombs are to be found several of these apartments communicating with one another. They extend a great way under ground, so as to be under the city of Memphis, and in a manner to undermine its environs. In some of the chambers the walls are adorned with figures and hieroglyphics; in others the mummys are found in tombs, round the apartment, hollowed out in the rock.

The Egyptians seem to have excelled in the art of embalming and preserving their dead bodies; as the mummys found in the Egyptian catacombs are in a better state than the bodies found either in the Italian catacombs or those of any other part of the world. See Embalming and Mummy.

Laying up the bodies in caves, is certainly the original way of disposing of the dead; and appears to have been propagated by the Phcenicians throughout the countries to which they sent colonies; their interest as we now do in the open air or in temples was first introduced by the Christians. When an ancient hero died, or was killed in a foreign expedition, as his body was liable to corruption, and for that reason unfit to be transported entire, they fell on the expedient of burning, in order to bring home the ashes, to oblige the muneis to follow; that so his country might not be destitute of the benefit of his tutelage. It was thus burning seems to have had its original; and by degrees it became common to all who could bear the expenses of it, and took place of the ancient burning; thus catacombs became disused among the Romans, after they had borrowed the manner of burning from the Greeks, and then none but slaves were laid in the ground. See Burial, &c.

CATALUNI, called also Durocataluni, a town
CAT [ 254 ]

N. Lat. 48. 55.

CATADRÔMUS, from καιρός and ὕδας, ιμπαρ, in antiquity, a stretched sloping rope in the theatres, down which the funambuli walked to show their skill. Some have taken the word to signify the hippodrome or decurcadium, wherein the Roman knights used to exercise themselves in running and fighting on horseback. But the most natural meaning is that of a rope fastened at one end to the top of the theatre, and at the other to the bottom, to walk or run down, which was the highest glory of the ancient saecubat, or funambuli. Elephants were also taught to run down the catafrochos. Scolasus speaks of the exploit of a Roman knight, who passed down the catafrochos mounted on an elephant’s back.

CAGACOGION, a heathen festival at Ephesus, celebrated on the 23rd of January, in which the devotees ran about the streets, dressed in divers antics and unseemly manners, with huge cudgels in their hands, and carrying with them the images of their gods; in which guise they ravished the women they met with, abused and often killed the men, and committed many other disorders, to which the religion of the day gave a sanction.

CATAGRAPHA, in antiquity, denote oblique figures or views of men’s faces; answering to what the moderns call profiles.

Catagraphe is said to be the invention of Simon Cleonese, who first taught painters to vary the looks of their figures, and sometimes direct them upwards, sometimes downwards, and sometimes sideways or backwards.

CATALEPSIA, or CATALEPSY, in Medicine, a kind of apoplexy, or drowsy disease, wherein the patient is taken speechless, senseless, and fixed in the same posture wherein the disease first seized him; his eyes open without seeing or understanding. See Medicine. Index.

CATALOGUE, a list or enumeration of the names of several books, men, or other things, disposed according to a certain order.

Catalogues of books are digested in different manners, some according to the order of the times when the books are printed, as that of Mattei; others according to their form and size, as the common booksellers catalogues; others according to the alphabetical order of the authors names, as Hyde’s catalogue of the Bodleian library; others according to the alphabetical order of matters or subjects, which are called real or classical catalogues, as those of Lepin and Dravidus; lastly, others are digested in a mixed method, partaking of several of the former, as De Beine’s catalogue of Cardinal Sultius’s library, which is first divided according to the subjects or sciences, and afterwards the books in each are recited alphabetically.

The most applauded of all catalogues is that of Thuanus’s library, in which are united the advantages of all the rest. It was first drawn up by the two Putani in the alphabetical order, then digested according to the sciences and subjects by Isham Bulliédus, and published by F. Queesnel at Paris in 1679; and reprint
ed, though incorrectly, at Hamburg, in 1704. The books are here ranged with justness under their several sciences and subjects, regard being still had to the nation, sect, age, &c. of every writer. Add, that only the best and choicest books on every subject are found here, and the most valuable editions. Yet the catalogue of M. le Telliers archbishop of Rheims’s library, made by M. Clement, is not inferior to any published in our age, either on account of the number and choice of the books, or the method of its disposition. One advantage peculiar to this catalogue is, the multitude of anonymous and pseudonymous authors detected in it, scarce to be met with elsewhere. Some even prefer it to Thuanus’s catalogue, as containing a greater variety of classes and books on particular subjects.

The conditions required in a catalogue are, that it indicate at the same time the order of the authors and of the matters, the form of the book, the number of volumes, the chronological order of the editions, the language it is written in, and its place in the library; so as that all these circumstances may appear at once in the shortest, clearest, and exactest manner possible. In this view all the catalogues yet made will be found to be defective.

An anonymous French writer has laid down a new plan of a catalogue, which shall unite all the advantages, and avoid all the inconveniences of the rest.

The Jesuits of Antwerp have given us a catalogue of the popes; which makes what they call their Prolaeum.

CATALOGUE of the Stars, is a list of the fixed stars, disposed in their several constellations; with the longitudes, latitudes, &c. of each; or according to their right ascensions, that is, the order of their passing over the meridian.

The first who undertook to reduce the fixed stars into a catalogue was Hipparchus Rhodos, about 120 years before Christ; in which he made use of the observations of Timocletis and Aristyllus for about 180 years before him. Ptolemy retained Hipparchus’s catalogue containing 1026 fixed stars; though he himself made abundance of observations, with a view to a new catalogue, A. D. 140. About the year of Christ 880, Albategni, a Syrian, brought down the same to his time. Anno 1437, Ulug Beigh, king of Parthia and India, made a new catalogue of 1022 fixed stars, since translated out of Persian into Latin by Dr Hyde. The third who made a catalogue from his own observations was Tycho Brahe, who determined the places of 777 stars for the year 1600, which Kepler from other observations of Tycho afterwards increased to the number of 1000 in the Rudolphine tables; adding those of Ptolemy omitted by Tycho, and of other authors; so that his catalogue amounts to above 1100. At the same time, William, landgrave of Hesse, with his mathematicians, Christopher Rothmanns and Justus Byrgius, determined the places of 400 fixed stars by his own observations, with their places rectified for the year 1083; which Hevelius prefers to those of Tycho’s. Riccioli, in his Astronomia Reformata, determined the places of 101 stars for the year 1700, from his own observations; for the rest he followed Tycho’s catalogue, altering it where he thought fit. Anno 1667, Dr Halley, in the island of St Helens, observed
observed 350 southern stars not visible in our horizon.
The same labour was repeated by F. Noel in 1710, who published a new catalogue of the same stars
constructed for the year 1687.

Bayer, in his Uranometria, published a catalogue of 1160 stars, compiled chiefly from Ptolemy and Tycho,
in which every star is marked with some letter of the Greek alphabet; the big letters in any constellation
being kept in the first letter, the stars by the second, &c. and if the number exceeds the Greek alphabet,
the remaining stars are marked by letters of the Roman alphabet, which letters are preserved by
Flamsteed, and by Senex on his globes. The celebrated Hevelius composed a catalogue of 1888 stars, 1553
of which were observed by himself; and their places are computed for the year 1660.

The host and greatest is the Britannic catalogue, compiled from the observations of the accurate Mr
Flamsteed; who for a long series of years devoted himself wholly thereto. As there was nothing wanting
either in the observer or apparatus, we may look on this as a perfect work so far as it goes. It is to
be regretted the impression had not passed through his own hands: that now exist was published by authority,
but without the author’s consent; it contains 3734 stars. There was another published in 1725, pursuant to his testament; containing no less than 3000
stars, with their places rectified for the year 1660: to which is added Mr Sharp’s catalogue of the southern stars not visible in our hemisphere, adapted to the year 1726.

The first catalogue, we believe, that was printed in the new or second form, according to the order of the
right ascension, is that of De la Caille, given in his Ephemerides for the ten years between 1755 and 1765,
and printed in 1755. It contains the right ascensions and declinations of 307 stars, adapted to the begin-
ing of the year 1750. In 1757 De la Caille published his Astronomia Fundamenta, containing a catalogue of the right ascensions and declinations of 398 stars, likewise adapted to the beginning of 1750. And in 1759, the year after his death, was published the Cosmum Austrole Stelliferum of the same author; containing a catalogue of the places of 1942 stars, all situated to the southward of the tropic of Capricorn, and observed by him, while he was at the Cape of Good
Hope in 1751 and 1752; their places being also adapted to the beginning of 1750. In the same year was published his Ephemerides for the ten years be-
tween 1765 and 1775; in the introduction to which are given the places of 217 zodiacal stars, all deduced from the observations of the same author; the places adapted to the beginning of the year 1765.

In the Nautical Almanack for 1773, is given a catalogue of 387 stars, in right ascension, declination,
longitude and latitude, derived from the observations of the late celebrated Dr Bradley, and adjusted to the
beginning of the year 1760. This small catalogue, and the results of about 200 observations of the moon,
are all that the public have yet seen of the multiplied labours of this most accurate and indefatigable observer, although he has now (1798) been dead upwards of 36 years.

In 1775 was published a thin volume, entitled, Opera Im militia, containing several papers of the late Tobias
Mayer, and among them a catalogue of the right ascen-
sions and declinations of 958 stars, which may be oc-
culted by the moon and planets; the places being adapted to the beginning of the year 1756.

At the end of the first volume of "Astronomical Ob-
servations made at the Royal Observatory at Green-
wich," published in 1776, Dr Maskelyne, the present
Astronomer royal, has given a catalogue of the places
of 33 principal stars, in right ascension and north polar
distance, adapted to the beginning of the year 1750.

These, being the result of several years repeated
observations, made with the utmost care, and the best
instruments, it may be presumed, are exceedingly ac-
curate.

In 1782 M. Bode of Berlin published a very extensive
catalogue of 5038 of the fixed stars, collected from the
observations of Flamsteed, Bradley, Hevelius, Mayer,
de la Caille, Messier, Monnier, D’Arquier, and other
astronomers; all adapted to the beginning of the year
1780; and accompanied with a celestial atlas or set of
maps of the constellations, engraved in a most delicate
and beautiful manner.

To these may be added Dr Herschel’s catalogue of
double stars, printed in the Phil. Trans. for 1782 and
1783; Messier’s nebula and clusters of stars, published in the Connaissance des Temps for 1784; and Her-
schel’s catalogue of the same kind given in the Phil.
Trans. for 1786.

In 1790 Mr Francis Wollaston published "A Spec-
imen of a General Astronomical Catalogue, in Zones
of North-polar Distance, and adapted to January 1.
1790." These stars are collected from all the catalogues
before-mentioned, from that of Hevelius downwards.
This work contains five distinct catalogues; viz. Dr
Maskelyne’s new catalogue of 36 principal stars; a
general catalogue of all the stars, in zones of north-polar
distance; an index to the general catalogue; a
catalogue of all the stars in the order in which they
pass the meridian; and a catalogue of zodiacal stars, in
longitude and latitude.

Finally, in 1792, Dr Zach published at Gottha, Ta-
bula Motuum Solis; to which is annexed a new catalogue of the principal fixed stars, from his own observations
made in the years 1787, 1788, 1789, 1790. This cata-
logue contains the right ascensions and declinations of 681 principal stars, adapted to the beginning of the

Besides these two methods of forming catalogues of
the stars, Dr Herschel has proposed a new one, in
which the comparative brightness of the stars is accu-
rately expressed. It is long since astronomers were first
led to arrange the stars in classes of different magni-
tudes by their various degrees of brilliancy or lustre.
Brightness and size have at all times been considered
as synonymous terms; so that the brightest stars have
been referred to the class comprehending those of the
first magnitude; and as the subsequent orders of stars
have been supposed to decrease in lustre, their magni-
tude has been determined in the same decreasing pro-
gression; but the want of some fixed and satisfactory
standard of lustre has been the source of considerable
confusion and uncertainty in settling the relative mag-
nitude of the stars. A star marked 1.23m. is supposed
to be between the first and second magnitude; but
2.3m. estimates, that the star is nearly of the second magnitude,
to mistake a change of brightness in D, when every member of the series is found in its proper order except D.

In the author's journal or catalogue, in which the order of the lustre of the stars is fixed, each star bears its own proper name or number, e.g. the brightness of the star ζ Leonis may be expressed by ζ Λ Leonis, or better by 94—68—7 Leonis; those being the numbers which the three of the stars bear in the British catalogue of fixed stars. This method of arrangement occurred to Dr Herschel so early as the year 1782; but he was diverted from the regular pursuit of it by a variety of other astronomical engagements. After many trials, he proposed, in the Transactions of the Royal Society of London for 1796, the plan which appeared to him the most eligible. It is as follows:—Instead of denoting particular stars by letters, he makes use of numbers; and in the choice of the stars which are to express the lustre of any particular one, he directs his first view to perfect equality. When two stars seem to be similar both in brightness and magnitude, he puts down their numbers together, separated merely by a point, as 30.24 Leonis; but if two stars, which—at first—seemed alike in their lustre, appeared on a longer inspection to differ, and the preference should be always decided in favour of the same star, he separates these stars by a comma, thus, 41.94 Leonis. This order must never be varied; and can three such stars, as 29, 39, 35 Librae, be substituted of a different arrangement. If the state of the heavens should be such as to require a different order in these numbers, we may certainly infer that a change has taken place in the lustre of one or more of them. When two stars differ very little in brightness, but so that the preference of the one to the other is indiscernible, the numbers that express them are separated by a short line, as 17—70 Leonis, or 68—17—70 Leonis. When two stars differ so much in brightness, that one or two other stars might be interpolated between them, and still leave sufficient room for distinction, they are distinguished by a line and comma, thus, —,—, or by two lines, as 32,—4x Leonis. A greater difference than this is denoted by a broken line, thus, —,—20 Bootis: On the whole, the author observes, the marks and distinctions which he has adopted cannot possibly be mistaken; a point denoting equality of lustre, a comma indicating the least perceptible difference; a short line to mark a decided but small superiority; a line and comma, or double line, to express a considerable and striking excess of brightness; and a broken line to mark any other superiority which is to be looked upon as of no use in estimations that are intended for the purpose of directing changes.

The difficulties that attend this arrangement are not disguised; but the importance and utility of it more than compensate for the labour which it must necessarily require. By a method of this kind, many discoveries of changeable and periodical stars might probably have been made, which have escaped the most diligent and accurate observers. We might there, as the author suggests, be enabled to resolve a problem in which we are all immediately concerned.

Who, for instance, would not wish to know what degree of permanency we ought to ascribe to the lustre of our sun? Not only the stability of our climates, but
CATALINA, a province of Spain, bounded on the north by the Pyrenean mountains, which divide it from France; by the kingdom of Aragon and Valencia on the west; and by the Mediterranean sea on the south and east. It is 155 miles in length, and 100 in breadth. It is watered by a great number of rivers; the principal of which are the Lobregat, the Ter, and the Segre. The air is temperate and healthy; but the land is mountainous, except in a few places. It produces, however, corn, wine, oil, pulse, flax, and hemp, sufficient for the inhabitants. The mountains are covered with large forests of tall trees, such as the oak, the ever-green oak, the beech, the pine, the fir, the chestnut, and many others; with cork trees, shrubs, and medicinal plants. There are several quarries of marble of all colours, crystal, alabaster, amethysts, and jasper. Gold dust has been found among the sands of one or two of the rivers; and there are mines of tin, iron, lead, alum, vitriol, and salt. They likewise fish for coral on the eastern coast. The inhabitants are hardy, courageous, active, vigorous, and good soldiers. Catalonia is the most industrious province in Spain. It has considerable manufactures of cottons, woollens, and silk, and carries on an extensive commerce. The population of the whole province in 1788 was 41,400, of whom 12,400 were ecclesiastics, secular or regular. In the agriculture of the country, irrigation is practised to a great extent. There are in the province, one university, one archiepiscopal, one grand priory, seven bishoprics, sixteen commanderies of the order of Malta, and about 300 religious establishments. The principal towns are Barcelona the capital, Tarragona, Tortosa, Lerida, Solsona, Cardona, Vich, Girona, Sén d'Urgel, Pui Cerda, and Cervera. Catalonia was the last province in Spain which submitted to Philip in the succession war. CATAMENIA, in Meditaine. See MENSIS.

CATAMITE, a boy kept for sodomitical practices.

CATANA, or CATINA, in Ancient Geography, a town of Sicily, situated opposite to Etna, to the south-east; one of the five Roman colonies: anciently built by the people of Naxus seven years after the building of Syracuse, 728 years before Christ. It was the country
of Charondas the famous lawgiver. The town is still called Catania. See CATANIA.

CATANANCHE, CANDIA LIONS-FOOT. See BOTANY INDEX.

CATANEA, or CATANIA, a city of Sicily, seated on a gulf of the same name, near the foot of Mount Etna, or Citel. It was founded by the Chalcidians soon after the settlement of Syracuse, and enjoyed great tranquillity till Hiero I. expelled the whole body of citizens; and after repopulating the town with a new stock of inhabitants, gave it the name of Etna: immediately after his decease, it regained its ancient name, and its citizens returned to their abodes. Catania fell into the bands of the Romans, among their earliest acquisitions in Sicily, and became the residence of a pretor. To make it worthy of such an honour, it was adorned with sumptuous buildings of all kinds, and every convenience was procured to supply the natural and artificial wants of life. It was destroyed by Pompey's son, but restored with superior magnificence by Augustus. The reign of Decius is famous in the history of this city, for the martyrdom of its patroness St Agatha. On every emergency her intercession is implored. She is piously believed to have preserved Catania from being overwhelmed by torrents of lava, or shaken to pieces by earthquakes; yet its ancient edifices are covered by repeated streams of volcanic matter; and almost every house, even her own church, has been thrown to the ground. In the reign of William the Good, 20,000 Cataniacs, with their pastor at their head, were destroyed before the sacred veil could be properly placed to check the flames. In the last century the eruptions and earthquakes raged with redoubled violence, and Catania was twice demolished. See Etna.

The present prince of Biscari has been at infinite pains, and spent a large sum of money, in working down to the ancient town, which, on account of the numerous torrents of lava that have flowed out of Mount Etna for these last thousand years, is now to be sought for in dark caverns many feet below the present surface of the earth. Mr Swinburne informs us that he descended into baths, sepulchres, an amphitheatre, and a theatre, all very much injured by the various catastrophes that have befallen them. They were erected upon old beds of lava, and even built with square pieces of the same substance, which in no instance appears to have been fused by the contact of new lavas: The sciastra, or stones of cold lava, have constantly proved as strong a barrier against the flowing torrent of fire as any other stone could have been, though some authors were of opinion that the hot matter would melt the old mass and incorporate with it.

This city has been frequently defended from the burning streams by the solid mass of its own ramparts, and by the air compressed between them and the lava; as appears by the torrent having stopt within a small distance of the walls, and taken another direction. But when the walls were broken or low, the lava collected itself till it rose to a great height, and then poured over in a curve. A similar instance is seen at the Torre del Greco near Naples, where the stream of liquid fire from Vesuvius divided itself into two branches, and left a church uptouched in the middle. There is a well at the foot of the old walls of Catania, where the lava, after running along the parapet, and then falling forwards, has produced a very complete lofty arch over the spring.

The church here is a noble fabric. It is accounted the largest in Sicily, though neither a porch nor cupola has been erected, from a doubt of the solidity of the foundations, which are no other than the bed of lava that ran out of Etna in 1669, and is supposed to be full of cavities. The organ is much esteemed by connoisseurs in musical instruments.

Catania, according to Mr Swinburne's account, is reviving with great splendour. "It has already (he says) much more the features of a metropolis and royal residence than Palermo: the principal streets are wide, straight, and well paved with lava. An obelisk of red granite, placed on the back of an antique elephant of touchstone, stands in the centre of the great square, which is formed by the townhall, seminary, and cathedral. The cathedral erected by the abbot Angerius in the year 1004, was endowed by Earl Roger with the territories of Catania and Etna, for the usual acknowledgment of a glass of wine and a loaf of bread offered once a-year. It has suffered so much by earthquakes, that little of the original structure remains, and the modern parts have hardly any thing except their materials to recommend them. The other religious edifices of the city are profusely ornamented, but in a bad taste. The spirit of building seems to have seized upon the people, and the prince of Biscari's example adds fresh vigour. It were natural to suppose men would be backward in erecting new habitations, especially with any degree of luxury, on ground so often shaken to its centre, and so often buried under the ashes of a volcano; but such is their attachment to their native soil, and their contempt of dangers they are habituated to, that they rebuild their houses on the warm, cinders of Vesuvius, the quaking plains of Calabria, and the black mountains of Sciarra at Catania: it is, however, surprising to see such embalmments preserved in so dangerous a situation. There is a great deal of activity in the disposition of this people: they know by tradition that their ancestors carried on a flourishing commerce; and that before the fiery river filled it up, they had a spacious convenient harbour, where they now have scarce a creek for a felucca; they therefore wish to restore those advantages to Catania, and have often applied to government for assistance towards forming a mole and port, an undertaking their strength alone is unequal to; but whether the refusal originates in the deficiencies of the public treasury or the jealousy of the other cities, all the projects have ended in fruitless applications. The number of inhabitants dwelling in Catania has been estimated at 50,000: A considerable portion of this number appertains to the university, the only one in the island, and the nursery of all the lawyers." E. Long. 15. 19. N. Lat. 37. 30.

CATANZARO, a city in the kingdom of Naples, the capital of Calabria Ulterior, with a bishop's see. It is the usual residence of the governor of the province, and is seated on a mountain, in E. Long. 20. N. Lat. 38. 38.

CATAPHONICS, the science which considers the properties of reflected sounds. See ACOUSTICS.

CATAPHORA, in Medicine, the same as COMA.

CATAPHRACTA,
CATAPHRACTA, (from σταυρός, and ἐφορεῖν, I fortify or arm), in the ancient military art, a piece of heavy defensive armour, formed of cloth or leather, fortified with iron scales or links, where with sometimes only the breast, sometimes the whole body, and sometimes the horse too, was covered. It was in use among the Sarmatians, Persians, and other barbarians. The Romans also adopted it early for their foot; and, according to Vegetius, kept it till the time of Gratian, when the military discipline growing remiss, and field exercises and labour discontinued, the Roman foot thought the cataphracta as well as the helmet too great a load to bear, and therefore threw both by, choosing rather to march against the enemy bare-breasted; by which, in the war with the Goths, multitudes were destroyed.

CATAPHRACTA. NAVAL, ships armed and covered in fight, so that they could not be easily damaged by the enemy. They were covered over with boards or planks, on which the soldiers were placed to defend them; the rowers sitting underneath, thus screened from the enemy's weapons.

CATAPHRACUM, a thing defended or covered on all sides with armour. CATAPHRACUS, or Cataphractarius, more particularly denotes a horseman, or even horse, armed with a cataphracta. The cataphracti equites were a sort of cuirassiers, not only fortified with armour themselves, but having their horses guarded with solid plates of brass or other metals, usually lined with skins, and wrought into plumes or other forms. Their use was to bear down all before them, to break in upon the enemy's ranks, and spread terror and havoc, wherever they came, as being themselves invulnerable and secure from danger. But their disadvantage was their unwieldiness, by which, if once unhorsed, or on the ground, they were unable to rise, and thus fell a prey to the enemy.

CATAPHRYGANS, a sect in the second century, so called as being of the country of Phrygia. They were orthodox in every thing, setting aside this, that they took Montanus for a prophet, and Priscilla and Maximilla for true prophets, to be consulted in every thing relating to religion; as supposing the Holy Spirit had abandoned the church. See MONTANIST.

CATAPLASMA, a poultice; from ὑδατοθεύω, illino, to spread like a plaster. Cataplasms take their name sometimes from the part to which they are applied, or effects they produce; so are called anacollemma, frontale, epicarpium, epispasticum, oesicotarium; and when mustard is an ingredient, they are called sinoptim.

These kinds of applications are softer and more easy than plasters or ointments. They are formed of some vegetable substances, and applied of such a consistence as neither to adhere nor run; they are also more useful when the intention is effected by the perpetuity of the heat or cold which they contain, for they retain them longer than any other kind of composition.

When designed to relax, or to promote suppuration, they should be applied warm. Their warmth, moisture, and the obstruction they give to perspiration, is the method of their answering that end. The proper heat, when applied warm, is no more than to promote a kindly pleasant sensation; for great heat prevents the design for which they are used. They Cataplasm should be renewed as often as they cool. For relaxing and suppurating, none excel the white bread poultice, Catapulpa, made with the crumb of an old loaf, a sufficient quantity of milk to boil the bread in until it is soft, and a little oil; which last ingredient, besides preventing the poultice from drying and sticking to the skin, also retains the heat longer than the bread and milk alone would do. To preserve the heat longer, the poultice, when applied, may be covered with a strong oxtail bladder.

When designed to repel, they should be applied cold, and ought to be renewed as oft as they become warm. A proper composition for this end is a mixture of oatmeal and vinegar.

CATAPULTA, in antiquity, a military engine contrived for the throwing of arrows, darts, and stones upon the enemy. — Some of these engines were of such force that they would throw stones of an hundred weight. Josephus takes notice of the surprising effects of these engines, and says, that the stones thrown out of them beat down the battlements, knocked off the angles of the towers, and would level a whole file of men from one end to the other, was the phalanx ever so deep. This was called the Battering Catapulta, and is represented on Plate CXXXV. This catapult is supposed to carry a stone, &c. of an hundred weight; and therefore a description of it will be sufficient to explain the doctrine of all the rest; for such as threw stones of 500 and upwards, were constructed on the same principles.

The base is composed of two large beams, 2, 3. The length of these beams is fifteen diameters of the bore of the capitals 9. At the two extremities of each beam, two double mortises are cut to receive the eight tenons of two cross beams, each of them four of the diameters in length. In the centre of each of the beams of the base, and near two-thirds of their length, a hole, perfectly round, and 16 inches in diameter, should be bored; these holes must be exactly opposite to each other, and should increase gradually to the inside of the beams, so that each of them, being 16 inches on the outside towards the capitals 9, should be 17 1/2 at the opening on the inside, and the edges carefully rounded off. The capitals 9 are, in a manner, the soul of the machine, and serve to twist and strain the cordage, which forms its principle or power of motion.

The capitals are either of cast brass or iron; each consisting of a wheel with teeth, C 10, of 2 1/4 inches thick. The hollow or bone of these wheels should be 1 1/4 inches in diameter, perfectly round, and the edges smoothed down. As the friction would be too great if the capitals rubbed against the beams by the extreme straining of the cordage, which draws them towards these beams, that inconvenience is remedied by the means of eight friction wheels, or cylinders of brass, about the 13th of an inch in diameter, and an inch and one sixth in length, placed circularly, and turning upon axles, as represented at D 13, B 12. One of these friction wheels at large, with its screw, by which it is fastened into the beam, is represented at A.

Upon this number of cylindrical wheels the capitals 9 must be placed in the beams 2, 3, so that the cylin-

K k 2

K k 2
CATAPULTA. Catapults do not extend to the teeth of the wheels, which must receive a strong pinion 14. By means of this pinion the wheel of the capital is made to turn for straining the cordage with the key 15. The capital wheel has a strong catch 16, and another of the same kind may be added, to prevent any thing from giving way through the extreme and violent force of the strained cordage.

The capital piece of the machine is a nut or cross pin of iron, seen at C, and hammered cold into its form. It divides the bore of the capitals exactly in two equal parts, and fixed in grooves about an inch deep. This piece, or nut, ought to be about two inches and one-third thick at the top 18, as represented in the section at B; and rounded off and polished as much as possible, that the cords folded over it may not be hurt or cut by the roughness or edges of the iron. Its height ought to be eight inches, decreasing gradually in thickness to the bottom, where it ought to be only one inch. It must be very exactly inserted in the capitals.

After placing the two capitals in the holes of the two beams in a right line with each other, and fixing the two cross diametrical nuts or pieces over which the cordage is to wind, one end of the cord is receved through a hole in one of the capitals in the base, and made fast to a nail within side of the beam. The other side of the cord is then carried through the hole in the opposite beam and capital, and so wound over the cross pieces of iron in the centre of the two capitals, till they are full, the cordage forming a large skain. The tension or straining of the cordage ought to be exactly equal, that is, the several foldings of the cord over the capital pieces should be equally strained, and so near each other as not to leave the least space between them. As soon as the first folding or skain of cord has filled up one whole space or breadth of the capital pieces, another must be carried over it; and so on, always equally straining the end till no more will pass through the capitals, and so the knaps of cordage entirely fills them, observing to rub it from time to time with soap.

At three or four inches behind the cordage, thus wound over the capital pieces, two very strong upright beams 21 are raised; these are posts of oak 14 inches thick, crossed over at top by another of the same solidity. The height of the upright beams is 7½ diameters; each supported behind with very strong props 25; fixed at bottom in the extremities of the base 2, 3. The cross beam 24 is supported in the same manner by a prop in the centre.

The tree, arm or stylus 22, should be of sound ash. Its length is from 15 to 16 diameters of the bore of the capitals. The end at the bottom, or that fixed in the middle of the skain, is 10 inches thick, and 14 broad. To strengthen the arm or tree, it should be wrapped round with a cloth dipped in strong glue like the tree of a saddle, and bound very hard with waxed thread of the sixth of an inch in diameter, from the large end at bottom, almost to the top, as represented in the figure.

At the top of the arm, just under the iron hand or receiver 27, a strong cord is fastened, with two loops twisted one within another, for the greater strength. Into these two loops the book of a brass pulley 28 is put. The cord 29 is then reeved through the pulley, and fastened to the roll 30. The cock or trigger 31, which serves as a stay, is then brought to it, and made fast by its hook to the extremity of the hand 27, in which the body to be discharged is placed. The pulley at the neck of the arm is then unhooked; and when the trigger is let off, a stroke must be given upon it with an iron bar or crow of about an inch in diameter; on which the arm flies up with a force almost equal to that of a modern mortar. The cushion or stomacher 33, placed exactly in the middle of the cross-beam 24, should be covered with tanned ox-hide, and stuffed with hair, the arm striking against it with inconceivable force. It is to be observed, that the tree or arm 22 describes an angle of 90 degrees, beginning at the cock, and ending at the stomacher or cushion.

CATAPULTA for Arrows, Spears, or Darts. Some of the spears, &c. thrown by these engines, are said to have been 18 feet long, and to have been thrown with such velocity as to take fire in their course.

ABCD is the frame that holds the darts or arrows, Fig. 2. which may be of different numbers, and placed in different directions. EF is a large and strong iron spring, which is bent by a rope that goes over three pulleys, I, K, L, and is drawn by one or several men; this rope may be fastened to a pin at M. The rope, therefore, being set at liberty, the spring must strike the darts with great violence, and send them, with surprising velocity, to a great distance. This instrument differs in some particulars from the description we have of that of the ancients; principally in the throwing of several darts at the same time, one only being thrown by theirs.

CATARACT, in Hydrography, a precipice in the channel of a river, caused by rocks, or other obstacles, stopping the course of the stream, from whence the water falls with greater noise and impetuosity. The word comes from στραβος, "I tumble down with violence;" compounded of στραβωμα, "down," and στραβωμαι, "thrust down."—Such are the cataracts of the Nile, the Danube, Rhine, &c. In that of Niagara, the perpendicular fall of the water is 137 feet; and in that of Pistil Rhinastr, in North Wales, the fall of water is near 240 feet from the mountain to the lower pool.

Strabo calls that a cataract which we call a cascade: and what we call a cataract, the ancients usually called a cataraph. Herminius has an express dissertation, "De admirandis mundi Cataractis supra et subterraneis;" where he uses the word in a new sense; signifying by cataract, any violent motion of the elements.

CATARACT, in Medicine and Surgery, a disorder of the humours of the eye, by which the pupilla, that ought to appear transparent and black, looks opaque, blue, gray, brown, &c. by which vision is variously impeded, or totally destroyed. See Surgery.

CATARA, a town of Dalmatia, and capital of the territory of the same name, with a strong castle, and a bishop's see. It is subject to Venice, and is seated on a gulf of the same name. E. Long. 19. 15. N. Lat. 42. 25.

CATARACTES, the trivial name of a species of Larus. See Ornithology Index.
CATARRH, in Medicine, a distillation or defluxion from the head upon the mouth and aspers arteria, and through them upon the lungs. See Medicine Index.

CATASTASIS, in Poetry, the third part of the ancient drama; being that wherein the intrigue, or action, set forth in the epiphase, is supported, carried on, and heightened, till it be ripe for the unravelling in the catastrophe. Scaliger defines it, the full growth of the fable, while things are at a stand in that confusion to which the plot has brought them.

CATASTROPE, in Dramatic Poetry, the fourth and last part in the ancient drama; or that immediately succeeding the catastasis: or, according to others, the third only; the whole drama being divided into protasis, epiphase, and catastrophe; or in the terms of Aristotle, prologue, epilogue, and exode.

The catastrose clears up every thing, and is nothing else but the discovery or winding up of the plot. It has its peculiar place: for it ought entirely to be contained, not only in the last act, but in the very conclusion of it; and, when the plot is finished, the play should be so also. The catastrophe ought to turn upon a single point, or start up on a sudden.

The great art in the catastrophe is, that the clearing up of all difficulties may appear wonderful, and yet easy, simple, and natural.

It is a very preposterous artifice in some writers to show the catastrophe in the very title of the play. Mr Dryden thinks that a catastrophe resulting from a mere change in the sentiments and resolutions of a person, without any other machinery, may be so managed as to be exceedingly beautiful.

It is a dispute among the critics, whether the catastrophe should always fall out favourably on the side of virtue or not. The reasons on the negative side seem the strongest. Aristotle prefers a shocking catastrophe to a happy one. — The catastrophe is either simple or complex. The first is that in which there is no change in the state of the principal persons, nor any discovery or unravelling, the plot being only a mere passage out of agitation into quiet repose. In the second, the principal persons undergo a change of fortune, in the manner already defined.

CATCH, in the musical sense of the word, a fugue in unison, wherein, to humour some conceit in the words, the melody is broken, and the sense interrupted in one part, and caught again or supported by another; as in the catch in Shakespeare's play of the Twelfth Night, where there is a catch sung by three persons, in which the humour is, that each who sings, calls and is called knave in turn: Or, as defined by Mr Jackson, a cæcillation is a phrase for three or more voices, one of which leads, and the others follow in the same notes. It must be so contrived, that rests (which are made for the purpose) in the music of one line be filled up with a word or two from another line; these form a cross purpose, or catch, from whence the name.

CATCH-Fly. See Lychnis, Botany Index.

CATCH-Pole, (quasi one that catches by the pole), a term used, by way of reproach, for the bailiff's follower or assistant.

CATCH-Word, among printers, that placed at the bottom of each page, being always the first word of the following page.

CATECHESIS, in a general sense, denotes an instruction given any person in the first rudiments of an art or science; but more particularly of the Christian religion. In the ancient church, catechesis was an instruction given vivum voce, either to children or adult heathens, preparatory to their receiving of baptism. In this sense, catechesis stands contradistinguished from mystagogia, which were a higher part of instruction given to those already initiated, and containing the mysteries of faith. Those who give such instructions are called catechists; and those who receive them, catechumen.

CATECHETIC, or Catechetical, something that relates to oral instruction in the rudiments of Christianity. — Catechetical schools were buildings appointed for the office of the catechist, adjoining to the church, and called catechumen: such was that in which Origen and many other famous men read catechetical lectures at Alexandria. See Catechumen.

CATECHISM, in its primary sense, an instruction, or institution, in the principles of the Christian religion, delivered vivum voce, and so as to require frequent repetitions, from the disciple or hearer, of what has been said. The word is formed from λγος, a compound of ὁλος and τροπος, q. d. circumvolutus; alluding to the noise or din made in this sort of exercise, or to the zeal and earnestness wherewith things are to be inculcated over and over on the learners. — Anciently the candidates for baptism were only to be instructed in the secrets of their religion by tradition, without writing; as had also been the case among the Egyptian priests; and the British and Gaulish druids, who only communicated the mysteries of their theology by word of mouth.

Catechism is more frequently used in modern times for an elementary book, wherein the principal articles of religion are summarily delivered in the way of question and answer.

CATECHIST, (νέος, catecheta), he that catechises, i.e. he that instructs novices in the principles of religion.

Catechist more particularly denotes a person appointed by the church to instruct those intended for baptism, by word of mouth, in the fundamental articles of the Christian faith. The catechists of churches were ministers usually distinct from the bishops and presbyters, and had their auditors or catechumen apart. Their business was to instruct the catechumens, and prepare them for the reception of baptism. But the catechists did not constitute any distinct order of the clergy, but were chosen out of any other order. The bishop himself sometimes performed the office; at other times presbyters, or even readers or deacons, were the catechists. Origen seems to have had no higher degree in the church than reader, when he was made catechist at Alexandria, being only 18 years of age, and consequently incapable of the deaconship.

CATECHU, in the Materica Medica, a name given to the extract otherwise known by the name of Terra-Japonica, or Japan earth. See Aresa and Mixora.
CATECHUMEN, a candidate for baptism, or one who prepares himself for the receiving thereof.

The catechumen, in church history, were the lowest order of Christians in the primitive church. They had some title to the common name of Christian, being a degree above pagans and heretics, though not consummated by baptism. They were admitted to the state of catechumen by the imposition of hands, and the sign of the cross. The children of believing parents were admitted catechumens, as soon as ever they were capable of instruction: but at what age those of heathen parents might be admitted, is not so clear. As to the time of their continuance in this state, there were no general rules fixed about it; but the practice varied according to the difference of times and places, and the readiness and proficiency of the catechumens themselves.

There were four orders or degrees of catechumens; the first were those instructed privately without the church, and kept at a distance for some time, from the privilege of entering the church, to make them the more eager and desirous of it. The next degree were the *audivitentes*, so called from being admitted to hear sermons and the Scriptures read in the church, but were not allowed to partake of the prayers. The third sort of catechumens were the *gemini-sacrament*, so called because they received imposition of hands kneeling. The fourth order was the *competentes et electi*, denoting the immediate candidates for baptism, or such as were appointed to be baptized the next approaching festival; before which, strict examination was made into their proficiency under the several stages of catechetical exercises.

After examination they were exercised for twenty days together, and were obliged to fasting and confession: some days before baptism they went veiled; and it was customary to touch their ears, saying, *Epistola, i.e. be opened*; as also to anoint their eyes with clay; both ceremonies being in imitation of our Saviour's practice, and intended to shadow out to the catechumens their condition both before and after their admission into the Christian church.

CATEGORICAL, in a general sense, is applied to those things ranked under a CATEGORY.

Categorical also imports a thing to be absolute, and not relative; in which sense it stands opposed to hypothetical. We say, a categorical proposition, a categorical syllogism, &c.

A categorical answer denotes an express and pertinent answer made to any question or objection proposed.

CATEGORY, in Logic, a series or order of all the predicates or attributes contained under any genus.

The school philosophers distribute all the objects of our thoughts and ideas into certain genera or classes, not so much, say they, to learn what they do not know, as to communicate a distinct notion of what they do know; and these classes the Greeks called categories, and the Latins *predicaments*.

Aristotle made ten categories, viz. substance, quantity, quality, relation, action, passion, time, place, situation, and habit, which are usually expressed by the following technical distich:

* Arbor, sex, servos, arduos, refrigerat, ustos.*
*Kurru crus stabo, nec tunicatus ero.*

CATEGORIAL, in the higher geometry, the name of a curve line formed by a rope hanging freely from two points of suspension, whether the points be horizontal or not. See *Fluxions*.

CATERPILLAR, in Zoology, the name of all winged insects when in their reptile or worm state. See *Entomology* Index.

Method of destroying CATERPILLARS on Trees.—Take a small dish with lighted charcoal, and placing it under the branches that are loaded with caterpillars, throw some pinches of brimstone upon the coals. The vapour of the sulphur, which is mortal to these insects, will not only destroy all that are on the tree, but prevent it from being infested with them afterwards. A pound of sulphur will clear as many trees as grow on several acres. This method has been successfully tried in France. In the *Journal Oeconomique*, the following is said to be infallible against the caterpillars feeding on cabbage, and perhaps may be equally serviceable against those that infest other vegetables. Sow with hemp all the borders of the ground where you mean to plant your cabbage; and, although the neighbourhood is infested with caterpillars, the space enclosed with the hemp will be perfectly free, not one of the vermine will approach it.

CATERPILLAR- Eaters, a name given by some authors to a species of worms bred in the body of the caterpillar, and which eat its flesh; these are owing to a certain kind of fly that lodges her eggs in the body of this animal, and they, after their proper changes, become flies like their parents.

M. Reaumur has given us, in his history of insects, some very curious particulars in regard to these little worms. Every one of them, he observes, spins itself a very beautiful case of a cylindric figure, made of a very strong sort of silk; these are the cases in which this animal spends its state of chrysalis; and they have a mark by which they may be known from all other animal productions of this kind, which is, that they have always a broad stripe or band surrounding their middle, which is black when the rest of the case is white, and white when that is black. M. Reaumur has had the pains and patience to find out the reason of this singularity, which is this: the whole shell is spun of a silk produced out of the creature's body; this at first runs all white, and towards the end of the spinning turns black. The outside of the case must necessarily be formed first, as the creature works from within: consequently this is truly white all over, but is transparent, and shows the last spun or black silk through it. It might be supposed that the whole inside of the shell should be black; but this is not the case: the whole is fashioned before this black silk comes; and this is employed by the creature, not to line the whole, but to fortify certain parts only; and therefore is all applied either to the middle, or to the two ends omitting the middle; and so gives either a black band in the middle, or a blackness at both ends, leaving the white in the middle to appear. It is not unrequent
CATERPILLAR, unfrequent to find a sort of small cases, lying about

garden walks, which move of themselves; when these

are opened, they are found to contain a small living

worm. This is one of the species of those caterpillar-

Eaters; which, as soon as it comes out of the body of

that animal, spin its case for its transformation

long before that happens, and lives in it without food

till that change comes on; and it becomes a fly like

that to which it owed its birth.

CATERVÆA, in ancient military writers, a term used

in speaking of the Gaulish or Cæsarian armies, de-

noting a body of 6000 armed men. The word cæterusa,

ceteriorus, is also frequently used by ancient writ-

ers to denote a party or corps of soldiers in disorder

di or disarray; by which it stands distinguished from
cohorts or turma, which were in good order.

CATESBÆA, the LILYTHORN. See BOTANY Index.

CATHÆRETICS, in Pharmacy, medicines of a

casting nature, serving to cut off fester flesh.

CATHARINE. Knights of St CATHARINE of Mount

Sinai, an ancient military order, erected for the assist-

ance and protection of pilgrims going to pay their de-

votion to the body of St Catharine, a virgin of Alex-

andria, distinguished for her learning, and said to have

suffered martyrdom under Maximin. The body of

the martyr having been discovered on Mount Sinai,

caused a great concourse of pilgrims; and travelling

being very dangerous, by-necessity of the Arabs, an or-

der of knighthood was erected in 1653, on the model

of that of the holy sepulchre, and under the patronage

of St Catharine; the knights of which obligated them-

selves by oath to guard the body of the saint, keep the

roads secure, observe the rule of St Basil, and obey

their grand master. Their habit was white, and on it

were represented the instruments of martyrdom where-

by the saint had suffered; viz. a half wheel armed

with spikes, and traversed with a sword stained with

blood.

CATHARINE. Fraternity of St Catharine at Siena,

a sort of religious society, instituted in that city in ho-

nour of St Catharine, a saint famous for her revelations,

and for her marriage with Jesus Christ, whose wedding

ring is still preserved as a valuable relique. This fra-

ternity yearly endows a certain number of destitute vir-

gins, and has the privilege of redeeming annually two

criminals condemned for murder, and the same number

doctors, by paying their debts.

CATHARTICS, in Medicine, remedies which pro-

mote evacuation by stool. See MATERIAL MEDICA.

CATHEDRA, in a general sense, a chair. The

word is more particularly used for a professor's chair,

and a preacher’s pulpit.

CATHEDRAL. A church wherein is a bishop's

se or seat: See Church and Bishop. The word

comes from the Greek καθήδρα, “chair,” of καθίσιν,

sede, “I sit.” The denomination CATHEDRAL seems to

have taken its rise from the manner of sitting in the

ancient churches, or assemblies of primitive Chris-

tians: in these, the council, i.e. the elders and priests,

was called Presbyterium; at their head was the bishop,

who held the place of chairman, CATHEDRALS, or Ca-

thedra; and the presbyters, who sat on either side,

were also called by the ancient fathers, Ασθηρεσες Επι-

coporum. The episcopal authority did not reside in

the bishop alone; but in all the presbyters, whereof

the bishop was president. A CATHEDRAL, therefore, originally,

was different from what it is now; the Christians,

till the time of Constantine, having no liberty to build

any temple: by their churches they only meant their

assemblies; and by CATHEDRAL, nothing more than consis-

tories.

CATHARINE PARR. See Parr.

CATHARINE I. Empress of Russia, a most extraor-

dinary personage, whose history deserves to be given

detail. She was the natural daughter of a country

girl; and was born at Ringen, a small village upon

the lake Virtherve, near Dorps, in Livonia. The year

of her birth is uncertain; but according to her own

account, she came into the world on the 4th of April

1637. Her original name was Martha, which she

changed for Catherine when she embraced the Greek

religion. Count Rosas, a lieutenant-colonel in the

Swedish service, who owned the village of Ringen,

supported, according to the custom of the country,

both the mother and the child; and was, for that rea-

son, supposed by many persons to have been her fa-

ther. She lost her mother when she was but three

years old; and, as Count Rosas died about the same

time, she was left in so destitute a situation, that the

parish-clerk of the village received her into his house.

Soon afterwards Gluck, Lutheran minister of Marien-

burgh, happening, in a journey through those parts,

to see the foundling, took her under his protection,

brought her up in his family, and employed her in at-

tending his children. In 1701, and about the 15th

year of her age, she espoused a dragon of the Swedish

garrison of Marienburgh. Many different accounts

are given of this transaction: one author of great cre-

dence affirms that the bride and bridegroom remained to-

gether eight days after their marriage; another, of le-

s authority, asserts, on the contrary, that on the

morning of the nuptials her husband being sent with a

detachment for Riga, the marriage was never consum-

mated. This much is certain, that the dragon was

absent when Marienburgh surrendered to the Russians,

and Catherine, who was reserved for a higher fortune,

never saw him more.

General Bauer, upon the taking of Marienburgh,

saw Catherine among the prisoners; and, being smit-

ten with her youth and beauty, took her to his house,

where she superintended his domestic affairs, and was

supposed to be his mistress. Soon afterwards she was

received into the family of Prince Menzikof, who was

no less struck with the attractions of the fair captive.

With him she lived until 1704; when, in the 17th

year of her age, she became the mistress of Peter the

Great, and won so much upon his affections, that he

espoused her on the 20th of May 1717. The cere-

mony was secretly performed at Jawerof in Poland, in

the presence of General Bruce; and on the 20th of Fe-

bruary 1712, it was publicly solemnized with great

pomp at Petersburgh.

Catherine, by the most unswerving amity and un-

remitting attention, by the softness and complacency

of her disposition, but above all by an extraordinary

liveliness.
Peter, whose violent temper was inflamed by this Catherine, discovery, struck Catherine with his cane, as well as the page, who endeavoured to prevent him from entering the armoury, and then retired without uttering a single word either to Mons or his sister. A few days after this transaction these persons were taken into custody, and Mons was carried to the winter palace, where no one had admission to him but Peter, who himself brought him his provisions. A malicious report at the same time circulated, that they were imprisoned for having received bribes, and making their influence over the empress subservient to their own mercenary views. Mons being examined by Peter, in the presence of Major-general Ushakov, and threatened with the torture, confessed the corruption which was laid to his charge. He was beheaded; his sister received five strokes of the knout, and was banished into Siberia; two of her sons, who were chamberlains, were also degraded, and sent as common soldiers among the Russian troops in Persia. On the day subsequent to the execution of the sentence, Peter conveyed Catherine in an open carriage under the gallows to which was nailed the head of Mons. The empress, without changing colour at this dreadful sight, exclaimed, "What a pity it is that there is so much corruption among courtiers!"

This event happened in the latter end of the year 1724; and as it was soon followed by Peter's death, and Catherine upon her accession recalled Madame Balke, it has been suspected that she shortened the days of her husband by poison. But notwithstanding the critical situation for Catherine in which he died, and her subsequent elevation, this charge is totally destitute of the least shadow of proof; for the circumstances of Peter's disorder were too well known, and the peculiar symptoms of his last illness sufficiently account for his death, without the necessity of recurring to poison.

While Peter was yet lying in the agonies of death, several opposite parties were caballing to dispose of the crown. At a considerable meeting of many among the principal nobility, it was secretly determined, on the moment of his dissolution, to arrest Catherine, and to place Peter Alexievitch upon the throne. Bassевич, apprised of this resolution, repaired in person to the empress, although it was already night. "My grief and consternation," replied Catherine, "render me incapable of acting myself: do you and Prince Menzikof consult together, and I will embrace the measures which you shall approve in my name." Bassевич, finding Menzikof asleep, awakened and informed him of the pressing danger which threatened the empress and her party. As no time remained for long deliberation, the prince instantly seized the treasure, secured the fortress, gained the officers of the guards by bribes and promises, also a few of the nobility, and the principal clergy. These partisans being convened in the palace, Catherine made her appearance; she claimed the throne in right of her coronation at Moscow; she exposed the ill effects of a minority; and promised, that, "so far from depriving the great duke of the crown, she would receive it only as a sacred deposit; to be restored to him when she should be united, in another world, to an adored husband, whom she was now upon the point of losing."
The pathetic manner with which she uttered this address, and the tears which accompanied it, added to the previous distribution of large sums of money and jewels, produced the desired effect: at the close of this meeting the remainder of the night was employed in making the necessary preparations to insure her accession in case of the emperor's death.

Peter at length expired on the morning of the 28th of January 1725. This event being made known, the senate, the generals, the principal nobility and clergy, hastened to the palace to proclaim the new sovereign. The adherents of the great duke seemed secure of success, and the friends of Catherine were avoided as persons doomed to destruction. At this juncture Bassevitz whispered one of the opposite party, "The empress is mistress of the treasure and the fortress; she has gained over the guards and the syndod, and many of the chief nobility; even here she has more followers than you imagine; and therefore your friends to make no opposition as they value their heads." This information being rapidly circulated, Bassevitz gave the appointed signal, and the two regiments of guards, who had been gained by a largess to declare for Catherine, and had already surrounded the palace, beat to arms. "Who has dared (exclaimed Prince Repnin, the commander in chief), to order out the troops without my knowledge?" "I, (retumed General Butterlin), without pretending to dispute your authority, in obedience to the commands of my most gracious mistress." This short reply was followed by a dead silence. In this moment of suspense and anxiety Menzikof entered, preceding Catherine, supported by the duke of Holstein. She attempted to speak, but was prevented by sighs and tears from giving utterance to her words: at length, recovering herself, "I come (she said,) notwithstanding the grief which now overwhelms me, to assure you, that, submissive to the will of my departed husband, whose memory will be ever dear to me, I am ready to devote my all to the peaceful occupations of government; until Providence shall summon me to follow him." Then, after a short pause, she artfully added, "If the great duke will profit by my instructions, perhaps I shall have the consolation, during my wretched widowhood, of forming for you an emperor worthy of the blood and the name of him whom you have now irretrievably lost." "As this crisis (replied Menzikof) is a moment of such importance to the good of the empire, and requires the most mature deliberation, your majesty will permit us to confer, without restraint, that this whole affair may be transacted without reproach, as well in the opinion of the present age as in that of posterity." "Acting as I do (answered Catherine) more for the public good than for my own advantage, I am not afraid to submit all my concerns to the judgment of such an enlightened assembly: you have not only my permission to confer with freedom; but I lay my commands upon you to deliberate maturely on this important subject, and I promise to adopt whatever may be the result of your decisions." At the conclusion of these words the assembly retired into another apartment, and the doors were locked.

It was previously settled by Menzikof and his party that Catherine should be empress; and the guards, who surrounded the palace with drums beating and colours flying, effectually vanquished all opposition. The only circumstance, therefore, which remained, was to give a just colour to her title, by persuading the assembly that Peter intended to have named her his successor. For this purpose Menzikof demanded of that emperor's secretary, whether his late master had left any written declaration of his intentions? The secretary replied, "That a little before his last journey to Moscow he had destroyed a will; and that he had frequently expressed his design of making another, but had always been prevented by the reflection, that if he thought his people, whom he had raised from a state of barbarism to a high degree of power and glory, could be ungrateful, he would not expose his final inclinations to the insult of a refusal; and that if they recollected what they owed to his labours, they would regulate their conduct by his intentions, which he had disclosed with more solemnity than could be manifest by any writing." An altercation now began in the assembly, and some of the nobles having the courage to oppose the accession of Catherine, Theophanes archbishop of Plesco called to their recollection the oath which they had all taken in 1722 to acknowledge the successor appointed by Peter, and added, that the sentiments of that emperor delivered by the secretary were in effect an appointment of Catherine. The opposite party, however, denied these sentiments to be so clear as the secretary chose to insinuate; and insisted, that as their late monarch had failed to nominate his heir, the election of the new sovereign should revert to the state. Upon this the archbishop farther testified, that the evening before the coronation of the empress at Moscow, Peter had declared, in the house of an English merchant, that he should place the crown upon her head with no other view than to leave her mistress of the empire after his decease. This attestation being confirmed by many persons present, Menzikof cried out, "What need have we of any testimony? A refusal to conform to the election of a great sovereign, thus authenticated, would be both unjust and criminal. Long live the Empress Catherine!" These words being instantaneously repeated by the greatest part of those who were present, Menzikof, saluting Catherine by the title of empress, paid his first obeisance by kissing her hand; and his example was followed by the whole assembly. She next presented herself at the window to the guards and to the people, who shouted acclamations of, "Long live Catherine!" while Menzikof scattered among them handfuls of money. Thus (says a contemporary) the empress was raised to the throne by the guards, in the same manner as the Roman emperors by the praetorian cohorts, without either the appointment of the people or of the legions.

The reign of Catherine may be considered as the reign of Menzikof, that empress having neither inclination or abilities to direct the helm of government; and she placed the most implicit confidence in a man who had been the original author of her good fortune, and the sole instrument of her elevation to the throne.

During her short reign her life was very irregular; she was extremely averse to business; would frequently, when the weather was fine, pass whole nights in the open air; and was particularly intemperate in the use
But the most noble part of her character was her peculiar humanity and compassion for the unfortunate. Motraye has paid a handsome tribute to this excellence. "She had, in some sort, the government of all his (Peter's) passions; and even saved the lives of a great many more persons than Le Fort was able to do: she inspired him with that humanity which, in the opinion of his subjects, nature seemed to have denied him. A word from her mouth in favour of a wretch just going to be sacrificed to his anger, would disarm him; but if he was fully resolved to satisfy that passion, he would give orders for the execution when she was absent, for fear she should plead for the victim." In a word, to use the expression of the celebrated Munich, *Elle eût proprement la médaille envers le monde entier et ses sujets.*

**Catherine II. Empress of Russia.** whose original name was Sophia Augusta Frederica, was the daughter of Christian Augustus of Anhalt Zerbst, a small district in Upper Saxony, and was born in the castle of Zerbst, on the 23rd of May 1729. She was educated under the eye of her parents, along with her brother Prince Frederic Augustus, and at an early period displayed a masculine spirit. Elegant, majestic, and handsome in her person, her complexion exhibited the union of the lily and the rose, while a native dignity was tempered by a smile of benevolence. But it was early observed, that she concealed under this a certain austerity of disposition, and an ambition, which was even then considered as excessive, and proved afterwards to be insatiable.

She soon learned all the fashionable accomplishments of that day. In addition to her native language, she wrote and conversed in French; of music she acquired a competent knowledge, and excelled particularly in needlework, which she did not disdain to practice after her elevation to the throne.

The empress Elizabeth, who had pitched upon her nephew the duke of Holstein Gottorp Oldenbourg for her successor, was also desirous to choose a consort for him, and the princess of Anhalt Zerbst was selected upon this occasion, when only fourteen years of age. She was chiefly indebted for so unexpected an honour to the tender regard which her imperial majesty always entertained for the memory of her uncle, who had been her lover; and in an evil hour she united the fate of the prince, better known afterwards by the name of Peter III. to that of the princess of Ahalt Zerbst. In consequence of a special invitation, the future empress repaired to St Petersburgh, accompanied by her mother, and being admitted into the bosom of the Greek church, the ceremonial of marriage, after some delay, took place; on which these august personages were formally acknowledged, by her imperial majesty and the senate, as grand duke and duchess of Russia. Elizabeth, at the same time, presented them with the palace of Oranienbaum, delightfully situated on the gulf of Cronstadt, as a summer residence; this had formerly belonged to Menzikof, the favourite of Peter the Great, who, in this capricious court, had been by turns a page, a prince, and an exile.

The grand duke was far from being handsome; on the contrary, his person was disagreeable, and almost disgusting. His education had been greatly neglected, and he was passionately fond of military parade.

Frederick
derick of Prussia was at once his friend and his model; he kept up a secret correspondence with that monarch at the time when Russia was at open war with him; he was accustomed in cups to kneel before a picture of this hero; and after quaffing a bumper, he would exclaim, “My brother! we shall conquer the world together.”

The first moments of this union seemed to be peculiarly auspicious. The illustrious pair were accustomed to withdraw themselves daily, as if desirous to enjoy the pleasure of each other’s company, in preference to the giddy dissipation of a court. It was perceived at last, that grandeur was not incompatible with happiness, and that hymeal felicity was not confined to plebeian life.

The empress hoped that the name and pretensions of Prince Iwan would be obliterated by the issue of the grand duke, and the whole empire impatiently wished and now expected an heir to the throne of Peter the Great. It has since been discovered, that this young couple occupied their time in a far different manner than was then suspected! His highness, it seems, retired from society on purpose to perfect himself in the Prussian exercise, and his consort on these occasions participated in his diversions, for he was accustomed to make her stand for hours together, as a centinel, with a musquet at her shoulder. This species of entertainment did not altogether suit the disposition of a young princess of an ardent temperament, and her highness accordingly began, in her own language, to think “that she was made for something else.” Although she did not love, she at this period governed her husband, and even concealed his foibles; imagining at first that she could not reign but by means of him, she wisely determined to make him appear worthy of a throne.

A marriage of eight years was not productive of any issue, and strange suspicions began to be entertained. This alarmed the court, for a formidable rival, who possessed a superior claim to the throne, still existed; it is true, he was in bondage, but in a country like Russia, the interval might not be long between a dungeon and a throne. The birth of a son and daughter, soon after this, put an end to all apprehensions of this kind, and tended not a little to give stability to the empire.

The grand duke, who at times discovered noble, and even magnificent sentiments, had about this period formed a most unfortunate connection with Elizabeth Veronska, a lady of high rank, but neither celebrated for her beauty nor her talents. He seldom saw his consort in private, and all the hours that were not occupied either by military exhibitions, or the pleasures of the table, were entirely devoted to his mistress.

The grand duchess, on the other hand, is said to have spent much of her time in company with a young Pole, whose history, like that of Catherine’s, has since been interwoven with the annals of Europe. This was Count Poniatsowski, afterwards known as Stanislaus Augustus king of Poland. He was the third son of a grandee of the same name, the favourite of Charles XII. of Sweden, by the princess Ezatowska, who boasted the possession of the noblest blood in Poland, as she traced her descent from the Jagellon, the ancient soveraigns of Lithuania. His person was of exquisite symmetry, his air noble, his manners agreeable; in short, he possessed a charming exterior, and his mind, a circumstance extremely rare, was no less graceful than his person. At this period he was in no higher station, than a gentleman in the suite of the minister plenipotentiary from England, who had formed an intimacy with his family during a former mission at Warsaw. Being now taught to look higher, he returned to his native country, and appeared soon after at Petersburg, as ambassador from the king of Poland. In this new capacity he did not forget to pay his respects at the little court of Oranienbaum, and the young plenipotentiary, with a view of ingratiating himself with the grand duke, smoked, drank, and praised the king of Prussia. At length Paul Petrovitch received the Polish minister with coolness, and he was actually forbidden to visit at the palace. This, however, it is said, did not deter him from concealing the order of the white eagle, and disguising himself as a mechanic, under which assumed quality he repaired one summer’s evening to the gardens, in the neighbourhood of the gulf of Cronstadt; but he was discovered by his highness, who ordered him to be brought before him, and, after affecting to reprimand the captain of his guard for his disrespect to the representative of a crowned head, told him he was at liberty to depart.

From this moment the grand duchess is said to have changed both her system and her conduct. She had formerly aspired only to direct the counsels of the future emperor; she now resolved, if possible, to obtain the crown for her son, and the regency for herself. Such a task would have discouraged a common mind, for it was impossible to achieve this without prevailing on the empress to consent to dethrone her own nephew. Bestuchew, the grand chancellor, who hated the heir apparent, joined cordially in their scheme; and Elizabeth, who herself had obtained the crown by means of a revolution, was taught to tremble for her life, in consequence of the designs of her successor, who was represented as having resolved to shorten her days by poison. But a sudden and unexpected revolution in the ministry put an end to these intrigues; for Betschew was driven into exile, and Poniatowski recalled.

A long and melancholy interval now ensued, during which the ambition of the grand duchess was rather suspended than annihilated. She, however, had recourse to, and soothed her anguish by means of books; it was in her study that she laid the foundation of her future greatness, and rendered herself in some measure deserving of a throne. During her leisure moments she found means to gain partisans, and she acquired the favour of the soldiery, who did duty around her person, by means of her liberality and condescension. Peter, on the other hand, to the personal exertions of a common soldier, added the orgies of a debauchee. Surrounded by his male and female favourites, he consumed whole days and nights in intoxication, and forgot that he was a prince. There were some few moments, however, when he appeared great, and even magnificent, but unfortunately they were of short duration; and it was his misfortune to have a weak woman for his mistress, and an able and ambitious one for his wife.

Such was the situation of the court when Elizabeth died, on the 5th of January 1762. This event, so productive of interesting effects, had been long foreseen by
Catherine, who now began to act a more conspicuous part on the theatre of public affairs. Her sorrow, which appeared unbounded, was only equalled by her devotion. She was constantly employed either at her prayers in the cathedral, or occupied in public proceedings, during which she scrupulously adhered to all the ceremonious practices of the Greek church. The courtiers were astonished at the sudden change, and affected to survey it with contempt; but it imposed on the people, and they now fully realized the renown of the empress, more especially as her consort had always treated their mysteries with indignity.

Another design, meditated with no less art, proved unsuccessful. She is said to have made use of all her eloquence to persuade Peter, that he ought to leave off the barbarous custom of being proclaimed emperor by the army, in the same manner as his predecessors: instead of this, she proposed that his title should be recognized by the senate alone, and produced a speech which herself had composed for the occasion; but Godowitz, one of the favourites, and the only friend of the new sovereign, perceived the snare, and, partly owing to his entreaties, and partly from an attachment to every thing military, the soldiery were as usual gratified with the ceremony of saluting the czar.

The grand duke now ascended the throne, by the name of Peter III, and the commencement of the new reign appeared to be peculiarly auspicious. The catastrophe, which terminated a short reign of six months, may be attributed to three apparently trifling, but, in reality, irretrievable errors; for it is allowed on all hands, that if they did not constitute the original cause, they at least afforded the pretext for his detraction and murder. The first of these was, the sudden peace with, and marked predilection for, the king of Prussia, certainly the greatest monarch of his age; the second, an attempt to reform a barbarous and fanatical clergy, whose power Peter I. had curbed, but whose persons he still affected to consider as sacred; the third was, the war against Denmark.

Let it be recollected, however, in honour to his memory, that the young monarch, immediately after his elevation, threw open the state prisons, recalled Moschin, Birss, Lestock, and several others, who had offended him during the late reign, from Siberia; that he limited the despotic of his officers, abridging his own power, by abolishing a state inquisition, exercised under the name of the Secret Council of Chancery; and that he framed the memorable decree which enfranchised the soldier from compulsory service in the army, and permitted them to travel without the royal permission.

The following answer to a letter from the king of Prussia, who had requested him to be on his guard against the plot then meditating, conveys no unfavourable opinion of his heart.

"Touching the interest you express for my safety, I request you will rest contented. I am called the father of my soldiers—they prefer a male to a female government. I walk alone constantly in St. Petersburg—if any mischief is meditated, it would have been affected long since; but I am a general benefactor. I repose myself on the protection of heaven; trusting to that, I have nothing to fear."

This false security proved his ruin. While his mind was occupied with plans of reform, and he aspired to Catherine's rival, and even to exceed, his illustrious predecessor, whose name he had assumed, a person who had sworn fidelity to him at the altar, and who owed allegiance by the double ties of a wife and a subject, was actually employed in planning a conspiracy, and organizing a revolt, against him. It has been said that he intended to have shut up his consort and son in a convent. But this is a meditated imprisonment, justified treachery, for the son, and murder. On the other hand, it is known that, so far from this being the intention of Peter, he was preparing for a journey to Holstein, and had actually empowered his consort to act as regent during his absence.

The mistakes of the emperor did not escape the eagle eyes of his enemies. He purposed to carry his guards into Holstein, with a view to recover the possessions wrested from his ancestors. The regiments that had hitherto done duty at the palace, and were inured to the indulgences of the capital, revolted at the idea of a foreign war: they had been accustomed to be governed by women, and they were taught to fix their eyes on the consort of the czar.

It is not the least wonderful part of her conduct, that previously to the great catastrophe now meditating, Catherine contrived to appear abandoned by all the world. She knew how interesting a female, and more especially an empress, appeared while in distress: and she took care to heighten the sensibility of the public, by bursting at times into a flood of tears. This artful woman had found means to attach many persons to her destiny: it must be owned, however, that her adherents were neither so powerful, nor so numerous as to afford her any well-founded hopes of success. She had gained several subalterns, and some privates, of the guards: but her principal partisans consisted of the Princess D'Aschekof, niece to the new chancellor: Prince Rozamonski, who had risen from obscurity, having been originally a peasant; Odart, an intriguing Italian; and Panin, governor to the grand duke. The arrest of Passick, one of the conspirators, seemed to lead to a discovery, which would have proved fatal to the malcontents; but this very circumstance induced them to declare instantly, and in the end crowned an apparently rash attempt with success.

The empress, who was asleep at the castle of Petersboff, received intimation of their design by a common soldier, who soon after returned with a carriage and eight horses. On the faith of this man, and accompanied only by a few peasants, a German female domestic, and a French valet de chambre, she arrived at eight o'clock in the morning in the capital, and stopped opposite the barracks of the regiment of Lamaliff. There she addressed the soldiers in an eloquent speech, intermingled with sighs and tears, and actually found means to persuade them that she and her son had but that moment escaped from the hands of assassins, sent by the emperor to murder them. This story, by agitating the passions of the troops, had a wonderful effect on them, and they all swore, with the exception of only one regiment, to die in defence of her and the young archduke. On this the empress ordered a capitulation to be brought, and commanded the priests to administer a new oath of allegiance. She afterwards repaired to one of the principal churches, where she was met
CAT [269] CAT

Catherine met by the bishop of Novgorod and the clergy, and, having returned thanks to Almighty God, ascended a balcony, and presented her son to the people. In a few hours she was again seen, dressed in the uniform of the guards, riding at the head of a numerous and well-appointed army against her husband.

That unfortunate prince first made a show of resistance, and manned his Lithuanian batteries, at Oreshek, with his Holstein guards, in order to oppose what appeared to him to be a contemptible sedition. When it was too late, he attempted to get possession of Cronstadt. He might still have escaped to Revel, but the women in his galley were apprehensive of danger, and the courtiers shuddered at the proposition of old Muschow, who wished them to assist the sailors in rowing.

On the first intelligence of the plot, this intrepid warrior had repaired to his benefactor, and advised him to march directly to the capital, at the head of his German troops. "I shall proceed you," said he, "in your generosity. I am your servant, and may my body be a rampart to your sacred person." But, on the other hand, the emissaries of the empress, bathing his hands in their crocodile tears, deprecated resistance, magnified the danger, and invited him to repose in the inviolable fidelity of his consort. In short, on the 14th of July 1762, he was taken prisoner by the orders of his own wife, to whom he had been married 14 years, prevailed on by the threats and intimations of Count Paul to renounce his crown, conveyed to the castle of Robscha, and three days afterwards put to death. Of the titled minions, who perpetrated this dastardly murder, one carried the guilty marks of the czar's scimitar on his forehead to the grave, and another, tortured for years by the remembrance of the last bloody scene in the tragedy of his expiring sovereign, exhibited a shocking spectacle of insanity and remorse.

The empress, on her assumption of the new vacant crown, notified the event to all the courts of Europe, under her own name of Catherine Alexiowna II. But there was still a competitor for the empire, and suspicion never slumbered near a throne. This was Prince Iwan, son to the princess of Macklenburgh, and uncle to Peter the Great, and the empress Anna Iwanowsna, who had destined him for her successor; but in consequence of a former revolution, he was seized while yet an infant, and doomed to lead a life of captivity. During 18 years of precarious existence, he had been shut up in the castle of Schlusselborg, and in all that time did he breathe the open air, or behold the sky, but once. This prince was visited by Peter III. in an arched room, 20 feet square, determined to set him at liberty; but, alas! the youth, in consequence of his long and solitary confinement had been deprived of his senses. In this situation, the emperor determined to build a house for him, with a convenient terrace, where he might take the air daily within the fortress. Such, however, are the changes of fortune, that, in three weeks, he himself was also precipitated from a throne, and exposed to a violent death.

This event was but the prelude to that of Iwan; for, as orders had been given, in case of an attempt to rescue him, that an end should be put to his life; and a real or pretended plot having been hatched for this purpose, the motives and details of which have hitherto been involved in the most profound obscurity, the unhappy prince experienced the same fate as his generous protector.

Catherine being now firmly seated on the throne, wisely determined to divert the thoughts of the nation from the late horrid scenes, and fix them on more agreeable objects. Having cooched Prussia, acquired a preponderance in the cabinet of Denmark, long become an absolute monarchy, and entered into a league with the popular party in Sweden, not yet bereft of its liberties, she cast her eyes on Courland, then governed by Prince Charles of Saxony, the second son of Augustus III., king of Poland; and, finding that country admirably situated for the increase of her present, and the extension of her future power, in 1762, expelled the lawful sovereign, and invested Biron, a creature of her own, with the ducal cap. Not content with this, the new duke, soon reduced to the most abject dependence, was presented with the crown, resigning his pretensions, and the states assembled at Miltau were actually interdicted from nominating a successor. This, however, was only a prelude to far greater scenes, for she had hardly dethroned one sovereign before she undertook to create another. Augustus II. or, as he is called by some, Augustus III. of Poland, having died at Dresden, in 1763, her imperial majesty did not let slip so fair an opportunity for interfering in the appointment to the vacant throne, and even placing one of her dependents on it. Count Poniatowski, on the elevation of Catherine, had sent a friend to Petersburgh, to sound the disposition of the empress about his return to that capital, where he naturally hoped to participate in her power, and bask in the sunshine of the royal smiles. But the more prudent German, who was at this very moment meditating a splendid provision for him elsewhere, prohibited the journey from political motives. Accordingly, notwithstanding the opposition of the grand chancellor, Bentzusoff, and, indeed of all her ministers, she determined to invest him with the ensigns of royalty. The head of the house of Brandenburg, swayed by his hatred to Saxony and Austria, or, what is still more likely, the Prussian court having perceived, even now, the scent of his future prey, Catherine was enabled to send 10,000 men into Poland, who, encamping on the banks of the Vistula, overawed the deliberations of the diet, assembled on the 9th of May 1764, and placed Stanislaus Augustus on the throne. Thus, by the appearance of a camp filled with Russian mercenaries, was violated one of the fundamental laws of the commonwealth, established ever since the time of Sigismund Augustus, two centuries before, in consequence of which the election of a king is deemed void, while there are any foreign troops within the territories of the republic; and so justly jealous were the ancient Poles of their national independence, that the marshal of the diet, on those occasions, was accustomed to request all ambassadors to absolve themselves, as he could not be answerable for the safety of their persons.

Having conferred the crown of Poland, September 7, 1764, on an amiable and accomplished prince, who, on account of his youth, his poverty, and even his dependence on Russia, would have been extolled from that painful pre-eminence had the free admission of the nation been collected; and who was, in consequence of,
Catherine of the hatred of his countrymen, still more subjected to the dominion of the empress, she began to prepare for a war against the Turks, which was accordingly declared in 1768. During this contest the Greek cross was triumphant both by sea and land. On the first of these elements her fleet, under Count Orloff, entered the straits of Gibraltar, and carried terror and desolation among the islands in the Archipelago, and throughout the defenceless shores of Asia Minor; on the second, her armies, under Galitzin and Romanzoff, achieved many important victories, seized on the fortress of Chocozim, and prevailed on the Greek inhabitants of Wallachia and Moldavia to acknowledge her as their sovereign.

In the mean time, however, a dangerous insurrection broke out in the heart of her dominions, instigated by a Cossack of the name of Pugatschew, who pretended to be Peter III. After displaying great valor and considerable talents, which had enabled him, at the head of raw and undisciplined levies, to contend against veteran troops and experienced generals, this unfortunate man was at length seized, inclosed in an iron cage, and beheaded at Moscow on the 21st of January 1775.

A peace had been concluded on the 21st of July, in the preceding year, with the Porte, which proved highly honourable to Russia; but it was productive of little benefit, for the liberty of navigating the Black sea, and a free trade with all the ports of the Turkish empire, which would have afforded inestimable advantages to a civilized people, was scarcely of any consequence to a nation unacquainted alike with commerce and manufactures.

Accordingly, we find her imperial majesty still unsatisfied. Ambition, which in a female bosom is ever insatiable, stimulated her to attempt new acquisitions, and we learn with astonishment that her diplomatic artifices proved infinitely more hostile to the Turkish crescent, than even her victorious arms. Scarcely had four years elapsed, when, after an armed negotiation, a new treaty of pacification was agreed to by the reluctant sultan, on the 21st of March 1789, in consequence of which the Crimea was declared independent; an event not calculated to close ancient enmities, but on the contrary to produce fresh dissensions, as it afforded an opening into the very heart of the Turkish empire, and a ready pretext for future interference.

New claims and new concessions immediately followed. Russia insisted on establishing consuls in the three provinces of Moldavia, Wallachia, and Bessarabia, which she was accordingly permitted to do by the treaty of 1781. Mortifying as this compliance was, it produced but a short respite. The emperor Joseph was now brought upon the political stage, and the Roman and Russian eagles, after hovering over the carcase of the Turkish empire, and meditating to devour the whole, were at last content with a part of the prey. The empress, as it may be readily believed, was not inattentive to her own interests; and by the treaty of Constantinople, signed January 9, 1784, to Russia was ceded the entire sovereignty of the Crimea, which then received its ancient name of Taurica, the isle of Taman, and part of Cuban.

It was now in the 58th year of her age, and the 25th of her reign, that Catherine may be said to have attained the very summit of her wishes. There was no one who pretended to the throne, unless her son Paul Petrovitz, an amiable prince, who had attained his 33d year, without displaying the least symptom of ambition, and who besides was so indulged with the most watchful jealousy. She had triumphed over a nation supposed to be the natural enemy of Russia, both by arms and negotiations, and she dazzled her barbarous subjects with the blaze of her glory, for they were eager to forget her errors, in order to contemplate a grandeur which soothed their national vanity. Knowing the effect of splendour upon ignorance, she ushered in the year 1787 with a brilliant journey to Chernow. Accompanied thither at once by a court and an army, with foreign ambassadors, an emperor and a king in her train, she intended to have assumed the high-sounding titles of Empress of the East, and Liberator of Greece. At Kiow, where she remained during three months, she was received under triumphal arches, and, having heard the petitions of the deputies from distant nations, and extended the walls of that city, she inscribed, with an arrogant anticipation, the following motto, in Greek characters, on the quarter next to Constantinople: "Through this gate lies the road to Byzantium."

Scarcely, however, had the empress, after visiting Moscow, returned to her capital, than the Turk thought proper to declare war. Her majesty, long since prepared for an event which was far from being displeasing, called forth the stipulated succours of her ally the emperor; and the combined army under the prince de Cobourg made itself master of Chocozim, at the end of a siege of three months. Oezakow, after a still more obstinate resistance, was taken by storm, by the Russians alone. A diversion, however, was made by the king of Sweden, who, subsidized with Turkish gold, and directed by Russian counsels, fought his own battles at the expense of his ally. But the exertions of this monarch were principally confined to the indecisive naval actions of Stoogland, in which both parties claimed the victory, and this was soon after followed by a convention for peace.

Disenmbarassed from an active, if not a powerful enemy, the empress no longer confined her conquests to the course of the Danube, but crowned the campaign with the capture of Ismael, which was taken by storm on the 22d of December. On this occasion Suarrow, one of her favourite generals, displayed a horrid mixture of courage and cruelty, and thus proved, to a demonstration, that personal bravery is far from being incompatible with the deadliest revenge. Incensed at the gallant resistance of the Turks, like Caesar, he snatched a standard from a subaltern, and planted it with his own hand on the walls of the city; like Sulla, he doomed the vanquished to experience a bloody proscription, and upwards of 30,000 men, women, and children, if we are to credit the boastful account of the barbarians themselves, perished by the sword and bayonet of the unmerciful Russians.

Instead of regaining the Crimea, as had been expected by the sultan, the fortress of Oezakow, and all the territories between the rivers Bogn and Donister, were assigned to the empress, who now found herself nearer to her empire.
Having concluded a final treaty of peace with the Turk, on the 9th of January 1792, by which the river Dnieper became the boundary of the two empires, and was to be navigated by both, the empress had more time to apply her attention to European politics. Part of Poland had been dismembered and partitioned during the year 1772, not only in contravention to the general rights of nations, but in direct opposition to the most solemn treaties on the part of Russia, Prussia, and Austria. The revolution which took place in that ill-fated country on May 3, 1791, and which afforded the prospect of a happy and stable government to the remains of the republic, was the signal of its annihilation. The imperial and royal spoilers seized this opportunity to fall once more in concert on their prey, which they forced to expire under their talons; and they have since cut it into shares, and attempted to disfigure it by new names, lest it should one day be reclaimed by the lawful owners. After this instinct to humanity, Stanislav, whom posterity may acknowledge as an unfortunate, but surely not as a great king, was forced soon after to abdicate, and allowed to retire into obscurity with his mistress, his children, and a pension.

Another great object had for some time engaged the attention of Catherine and her cabinet. This was the French revolution; an event pregnant with consequences that involved the claims, or, more properly speaking, the existence of all the sovereigns of Europe. With a treasury nearly exhausted by the war with the Ottoman Porte, which was not then terminated, and at a distance from the scene of action, the empress could not well engage in the contest; but she readily entered into the coalition, and soon after subsidized her late enemy the king of Sweden; but that enterprising prince met his fate, on the night of the 16th of March 1792, by the hand of an assassin.

Notwithstanding this sinister event, the head of the Greek church, compassionating the fate of the pretended father of the Christian world, promised to exert herself for the restoration of Avignon to the holy see. She also launched forth a menacing manifesto against France, and prepared for a new war.

The empress has hitherto been contemplated in her public character. It may not be amiss now to fix our eyes on the individual; to pay some attention to the sex of the sovereign, and, viewing majesty as it were in an undress, behold the woman lurking behind the prince.

It might have been supposed, that in the neighbourhood of the Hyperborean regions, the passions, if not dormant, would be at least moderate, and that the men would consequently be temperate, and the women chaste. The contrary, however, is the case; and it is left to the philosopher to determine, whether the double windows and heated rooms of St Petersburg, added to an affection of oriental manners, be not to the full as critical, in respect to female virtue, as the climate of Naples and Turin. Certain it is, however, that, during the reign of Catherine II. no remarkable increase of indecorum took place, and that any occasion-

Indiscretions appear to have made but little impression on the public mind.

Count Gregory Orloff, distinguished in Russia by the appellation of Gregorevitsch, was one of the handsomest men in the north. Gratitude and affection both conspired to procure him a favourable reception at court: and from an obscure condition he soon rose to the highest offices of the state, which he, in fact, governed. His opinion in the cabinet was listened to with deference, and he was invested with the supreme military command. Still higher honours awaited him. The empress-queen was solicitous to grant him a diploma of prince of the empire; it was next in contemplation to decorate him with the titles of Duke of Ingria and Carelia, and the chancellor Bestucheff actually proposed to the empress that he should be admitted as the partner of her bed and throne. But this scheme was blasted by the interference of Count Panin; who, not content with his own remonstrances, invoked the interposition of Razumoffsky and Vorontzoff, and found means to divert Catherine from her purpose.

Soon after this the conduct of Orloff began to give dissatisfaction; for he absented himself from court; went but seldom to the palace; resided principally in the country; and, being extremely addicted to hunting, dedicated whole weeks to the chase of the bear. Panin, who had frequently experienced his arrogance, deemed this a happy opportunity to procure his disgrace. He accordingly introduced a young officer named Vissensky, who, being directed by the artful minister, behaved in such a manner as to give reason to believe that he would soon reign uncontrolled. Pride, however, on this occasion supplied the place of affection, and Orloff suddenly altering his conduct, his rival was dismissed with superb presents, and invested with an employment that required his residence in a remote province.

A new favourite soon after made his appearance in the person of Vassiltschikoff, a subaltern in the guards, and advantage was taken of the absence of Orloff to introduce him at the hermitage. This officer was young and handsome; but nature, which had been lavish to his person, seems to have been at no pains with his mind. He was immediately appointed chamberlain to the empress, enriched with splendid presents, and treated with the most flattering attention. In the mean time Gregorevitsch, who had been appointed to treat with the Turkish plenipotentiaries relative to a peace, on hearing of this unexpected event, instantly returned to the capital from Fukushima, but was arrested at the gates of Petersburg; and stripped of all his employments. He, however, experienced the imperial bounty, and received, as a recompense for his submission, the sum of 100,000 rubles in hand, a pension of 150,000 more, a magnificent service of plate; and, to crown the whole, an estate, with 6000 peasants upon it, was made over to him.

Vassiltschikoff, during 22 months, enjoyed all the distinction belonging to the reigning favourite; but at the end of that period he also found occasion to lament the inconstancy of fortune. This young man had conducted himself with great prudence, for he had never abused his influence. He possessed none of that haughtiness so common to upstarts; and he did not appear...
Catherine, eager to increase his own fortune, or to diminish that of his rivals. Such was his moderation, that, as his elevation excited no envy, so his disgrace was unaccompanied by exultation. His faults are still unknown; and most probably he had ceased to please. His retreat, however, was accompanied by every mark of respect; and, as he repaired to Moscow, the place of his destined exile, he received presents, on his journey, which might be styled imperial on account of their magnificence.

No sooner was this change made public than Orloff appeared once more on the scene, and was readmitted to all his former influence. Supposing Panin to be the cause of his late exile, he extorted a promise from his royal mistress to dismiss him from his employments. Her assent was given with reluctance; and the prayers of the grand duke, who was too generous to suffer his preceptor to fall a prey to the suspicions of a man he did not love, induced her to revoke her intentions.

In the mean time the mainly air and elegant appearance of Potemkin made a great impression on an illustrious personage. This officer had been bred in the guards; and, perceiving on that memorable day when the empress, mounted on a fine charger and dressed in regiments, exhibited herself at the head of the troops, that she had forgotten to place a plume in her hat, he snatched this decoration from his own, and presented it to the new sovereign. Neither this action, nor the grace with which it was performed, had escaped unnoticed; and the time was now arrived when his attachment was to receive an ample remuneration.

The post of favourite is almost peculiar to Russia, and was during many years considered an official employment. Ever since 1730 the nation had been governed by women, except during the short and unfortunate reign of Peter III. In fine, it seemed to be sanctioned, if not by a fundamental law of the empire, at least by prescription; as four empresses had successively consecrated it by their practice, and the age of the last Elizabeth made it be considered in some measure as a mere appendage to imperial grandeur.

Potemkin soon grew giddy with success, and his pride and presumption keeping pace with his elevation, he accordingly exposed himself to a number of disagreeable events. Boasting one day of the extent of his power in presence of Count Alexi Orloff, the brother of his predecessor, he received a blow which deprived him of an eye; and Prince Gregory Orloff having requested his dismission, he was forced to repair to Smolensk, at once the place of his nativity and exile. Such was his vexation, partly from the loss of his eye, and partly from his disgrace, that he actually entertained some idea of turning monk; but a submissive letter produced his recall; and from that moment he seemed to have dropped all thoughts of the cow.

Ambition now appears to have taken complete possession of the bosom of Potemkin; and this was amply gratified, for his influence soon-extended to every department of the state, and he himself, after procuring the dismissal of Count Zachar Chernicheff, became vice-president at war, with a seat in the council. But his aspiring hopes were not yet gratified, for he entertained still higher expectations.

With a view to the accomplishment of these, he affected to be once more seized with a fit of religion, and kept Lent with great strictness, living upon meat and water during that holy season. He also warned all the aunts in the Greek calendar with his prayers; went daily to confession, and having selected on this occasion the same priest that afforded absolution to a great personage, he besought him to inform her, that his alarmed conscience could no longer permit him to indulge in an intercourse, which, by marriage alone, would cease to be criminal.

This project, however, failed of success; and, soon after the empress’s return to Petersburgh (for it was at Moscow that it had been first conceived), a young man from the Ukraine, of the name of Zavadofsky, was honoured with the imperial countenance, while the haughty Potemkin received the customary intimation, “that he must prepare to travel.” Potemkin did not dare to disobey, but he evaded the order; for, setting out in great form, he proceeded a few miles towards the place indicated for his exile, but returned in the course of next day, and placed himself in the evening exactly opposite to the empress as she was about to sit down to whist. Every one expected to behold some signal mark of the imperial displeasure; but, on the contrary, Catherine, handing him a pack of cards, desired the ex-favourite to cut in, observing that he had always been a fortunate player. His posture, his honour’s, his influence, were all restored to him, and he now occupied a new situation about the person of her imperial majesty, for he became her friend.

In the mean time the bosom of the humble Zavadofsky began to catch the flame of ambition; and, as he was jealous of the grandeur of Potemkin, he aimed a deadly blow at his consequence. But the minister at war, become wily in his turn, warded it off, and made it recoil on the head of his rival. Perceiving a handsome young Servian officer of bussars, of the name of Zoritch, who had repaired to Petersburgh in search of promotion, he presented him with a captain’s commission, and, in a few days he was perceived behind the chair of the empress. A large estate, the rank of major-general, and an immense sum of money, soon became the appanage of this fortunate youth; but the empress perceiving that he was ignorant, and being disgusted at his want of accomplishments, recommended, as he could speak no language but that of the Russian boors, that he should be sent abroad for improvement.

Fortune seems to have been in a playful mood when she elevated Bimsky Korzakoff to the post of chamberlain, and successor to the Servian. This man had actually been a serjeant in the guards; he was now proclaimed aide-de-camp general to the empress, and presented with the palace of Vasiliwtschikoff.

He proved to be a vain upstart, whose dress exhibited a profusion of diamonds, and whose conduct was such as could not fail to involve him in ruin. This speedily occurred; for, being detected in a secret correspondence with a lady, she was banished from court, and he was obliged to repair to Moscow.

The same day that beheld his disgrace witnessed the good fortune of Laskoj, a Pole by descent, and an officer of the body guards by profession. The education of this young man had been neglected; but this defect was in some measure remedied by the zeal and attachment of an illustrious personage, who superintended
her usual hour, and breakfasted on coffee, according to Catherin

Catherine's improvement; and in a short time he became as remarkable for the superior elegance of his manner, as the grace of his person: but, while in the flower of youth, and the very height of his favour, he was attacked by a mortal disease, which cut him off after a short illness. He died in the arms of his mistress, who was inseparable on the occasion, and refused to take any sustenance during three whole days. A mausoleum, the plan of which was sketched out by an English artist, attended the respect of the empress, who had not seen it two years after. His fortune—be he bequeathed to her imperial majesty, but she presented it, with her accustomed generosity, to the sister of this handsome youth.

The next person who aspire to the post of favourite was a young man educated in Scotland, and who had become a fellow of the Royal Society of London. This was Prince Dashkoff, son to the celebrated princess of the same name, who had participated in the memorable revolution that levelled Peter III. with the dust. A lieutenant of the name of Yermoloff anticipated him, however, in this post, to which he was raised by the interest of Potemkin; but, proving ungrateful to his benefactor, he was suddenly disgraced, being replaced by Mamonoff, who attended her imperial majesty during her journey to the Crimea. He fell in love, however, with a lady of the court; and no sooner was the empress informed of this circumstance, than she insisted on his marrying her immediately; after which they were sent into exile at Moscow.

Piotro Zuboff, an officer of the horse guards, supplied his place. This aspiring young man, not content with wealth and honours, affected public employments; and it is asserted that the idea of the second division of Poland originated with him. In a short time he became omnipotent at Petersburg. He was decorated with the title of prince; received the post of grand master of the artillery; all the admirals, generals, and ministers of the empire, were to be seen at his levees, biding lowly before him, and, if we are to believe the author of a work of some reputation, paying their compliments, at the same time, in great form, to his favourite monkey.

Catherine hitherto had only afforded empty promises to the enemies of France: but, at the instigation of Zuboff, she now formed the design of giving actual assistance to the confederated kings; and, as a proof of her intentions, issued orders for a squadron of men of war to join the English fleet, and commanded a levy of 50,000 troops. She at the same time prosecuted a war on the frontiers of Persia, where her army, under the command of a near relation of the former master of the artillery, had experienced a most humiliating defeat; and she was now preparing to send fresh succours to his assistance.

Such were the projects that occupied the mind of Catherine, the overthrow of the French republic, and the subjugation of the distant Persians, when she was smitten by the hand of death. This fortunate princess had hitherto enjoyed an almost uninterrupted state of good health during the whole of her long reign. She was sometimes, indeed, subject to a colic, and her legs were now and then observed to swell; but neither of these symptoms were alarming.

On the morning of the 9th of November she rose at
CAT [ 274 ] CAT

Catherine, the proud dream of her ambition, and beheld her grandson Constantine sitting on the throne of the Ottomans. Her merit as a legislator, too, is great; but she would have been far more worthy of our admiration, had she effectually the generous idea of emancipating all the peasantry of her immense dominions. She was the only sovereign of Russia who ever exhibited a taste for letters. This was not all; she was an author herself, and did not disdain to compose little treatises for her grandchildren, whose education she superintended.

For music she also possessed an exquisite relish, and brought Gabrielle, and a number of singers of great note, from Italy, allowing them liberal salaries, and treating them with great attention. Throughout the whole of her long reign Catherine also evinced a marked predilection for painting. In the midst of a war with the Turks she purchased pictures in Holland, to the amount of 60,000 rubles, all of which were lost in consequence of a ship's being wrecked on the coast of Finland. This, however, rather served to stimulate her to fresh exertions, and her agents accordingly procured whatever was to be found in Italy worthy of notice. The Houghton collection from England was also transferred, by an act of her munificence, to the shores of the Baltic; and, while it added to her glory, disgraced this nation in the eyes of foreigners.

Her conduct to learned men was truly worthy of a woman of genius. She was proud of the correspondence and friendship of Voltaire; she invited Diderot to her court, and lived with him, while there, in habits of the utmost familiarity; to D'Alembert she looked up as to a superior being, and endeavoured, although in vain, to seduce him to reside at St Petersburgh; but he possessed a haughty soul, was devoted to liberty, and would not consent to degrade the mind of a freeman, by residing among a nation of slaves.

To the honour of Catherine, she was extremely attentive to the education of her people, and instituted a prodigious number of schools for their instruction. To remove their prejudices against inoculation, she herself submitted to the operation, and thus hazarded her life for her nation. Amidst the schemes of grandeur, the allurements of power, and the gratification of the passions, she found leisure to civilize and instruct her subjects: this added not a little to her glory, as it contributed to the benefit of so large a portion of the human race; but it will incessantly operate against a despotic government, by rendering the boors unfit for their claims, which they will some day break, perhaps, on the heads of the boyars, who at once enslave and oppress them.

No woman could so easily forgive; and in this point of view her conduct must be allowed to have possessed a great share of megalomancy. She generously pardoned old Munich and Godowitsz, the one the counsellor, the other the favourite of Peter III. She even admitted the former of these into her confidence, and would have conferred honours and preferments on the latter; but he loved his late sovereign, and with a noble scorn spurned at the proffered friendship of his successor. To the mistress of Peter III. although her own rival, she granted her life, restored her fortune, and at length admitted her daughters to honorable situations at court.

No personage in our own times has attracted a greater share of censure and eulogism than Catherine; and no woman in any age ever exhibited more of the masculine greatness of one sex, and the feminine weakness of another. As a female, she appears at times the slave of passion, and the puppet of her courtiers; but while we behold her diminishing, in this point of view, into insignificance, we look again, and contemplate the sovereign, towering like an immense colossus, and with one foot placed on Cherson, and another at Kutschatka, waving her iron sceptre over the subject nations, and regulating the destiny of a large portion of mankind.

The frailties, however, of the woman will soon be forgotten, while the glory that encircles the brows of the legislator and conqueror will long continue to dazzle the eyes of an admiring world. The present age, however, will not easily pardon the degradation of Stanislaus, the partition of Poland, and the massacre of Ismailow and of Praga.

Catherine, St. Order of, in modern history, belongs to ladies of the first quality in the Russian court. It was instituted in 1714 by Catherine wife of Peter the Great, in memory of his signal escape from the Turks in 1711. The emblems of this order are a red cross, supported by a figure of St Catherine, and fastened to a scarlet string edged with silver, on which are inscribed the name of St Catherine, and the motto Fide et patria.

CATHERLOUGH, or CARLOW, a town of Ireland in the county of Catherloough, and province of Leinster; seated on the river Barrow, 16 miles north-east of Killkenny. W. Long. 7° 3'. N. Lat. 52° 45'.

CATHERLOUGH, or CARLOW, a county of Ireland, about 28 miles in length, and eight in breadth; bounded on the east by Wicklow and Wexford, on the west by Queen's county, on the north by Kildare, and on the south and south-west by Wexford. It contains five baronies, 50 parishes, 13,000 houses, and 78,000 inhabitants. The county sends one member, and the town another to the imperial parliament. See CARLOW; SUPPLEMENT.

CATHETER, in Surgery, a fistulous instrument, usually made of silver, to be introduced into the bladder, in order to search for the stone, or discharge the urine when suppressed. See SURGERY Index.

CATHETUS, in Geometry, a line or radius falling perpendicularly on another line or surface; thus the catheti of a right-angled triangle are the two sides that include the right angle.

CATHETUS of Incidence, in Catoptrics, a right line drawn from a point of the object, perpendicular to the reflecting line.

CATHETUS of Reflection, or of the Eye, a right line drawn from the eye perpendicular to the reflecting plane.

CATHETUS of Obliquation, a right line drawn perpendicular to the speculum, in the point of incidence or reflection.

CATHETUS in Architecture, a perpendicular line supposed to pass through the middle of a cylindrical body, as a ballast, column, &c.

CATHNESS. See CAITHNESS.

CATHOLIC,
Catholic, in a general sense, denotes any thing that is universal or general.

**Catholic Church.** The rise of heresies induced the primitive Christian church to assume to itself the appellation of Catholic, being a characteristic to distinguish itself from all sects, who, though they had party names, sometimes sheltered themselves under the name of Christians.

The Roman church distinguishes itself now by the name of Catholic, in opposition to all those who have separated from her communion, and whom she considers as heretics and schismatics, and herself only as the true and Christian church. In the strict sense of the word, there is no Catholic church in being, that is, no universal Christian communion.

**Catholic King,** is a title which has been long hereditary to the king of Spain. Mariana pretends, that Erocorrede first received this title after he had destroyed Ariarathus in his kingdom, and that it is found in the council of Toledo for the year 588. Vasco ascribes the original of it to Alphonso in 738. Some allege that it has been used only since the time of Ferdinand and Isabella. Calombaro says, it was given them on occasion of the expulsion of the Moors. The Bollandists pretend it had been borne by their predecessors the Visigoth kings of Spain; and that Alexander VI only renewed it to Ferdinand and Isabella. Others say that Philip de Valois first bore the title; which was given him after his death by the ecclesiastics, on account of his favouring their interests.

In some epistles of the ancient popes, the title Catholic is given to the kings of France and of Jerusalem, as well as to several patriarchs and primates.

**Catholicicon,** in Pharmacy, a kind of soft purgative electuary, as called as being supposed an universal purger of all humours.

**Catiline,** Lucius, a Roman of a noble family, who, having spent his whole fortune in debauchery, formed the design of oppressing his country, destroying the senate, seizing the public treasury, setting Rome on fire, and usurping a sovereign power over his fellow-citizens. In order to succeed in this design, he drew some young noblemen into his plot; whom he prevailed upon, it is said, to drink human blood as a pledge of their union. His conspiracy, however, was discovered by the vigilance of Cicero, who was then consul. Upon which, retiring from Rome, he put himself at the head of an army, with several of the conspirators, and fought with incredible valour against Petreius, lieutenant to Antony, who was colleague with Cicero in the consulsip; but was defeated and killed in battle. See (History of) Rome—Sallust has given an excellent history of this conspiracy.

**Cato, Marcus Porcius,** the censor, one of the greatest men among the ancients, was born at Tusculum in the year of Rome 519, about the 23rd before Christ. He began to bear arms at 17; and, on all occasions showed extraordinary courage. He was a man of great sobriety, and reckoned no bodily exercise unworthy of him. He had but one horse for himself and his baggage, and he looked after and dressed it himself. At his return from his campaigns, he bestowed himself to plough his ground; not that he was without slaves to do it, but it was his inclination. He dressed also like his slaves, sat down at the same table with them, and partook of the same fare. He died in the meanwhile neglect to cultivate his mind, especially in regard to the art of speaking; and he employed his talents, which were very great, in generously pleasing causes in the neighbouring cities without fee or reward. Valerius Flaccus, who had a country seat near Cato, conceiving an esteem for him, persuaded him to come to Rome; where Cato, by his own merits, and the influence of so powerful a patron, was soon taken notice of, and promoted. He was first of all elect of the tribune of the soldiers for the province of Sicily; he was next made questor in Africa under Scipio. Having in this last office reproved him for his profuseness to his soldiers, the general answered, that "he did not want so exact a questor, but would make war at what expense he pleased; nor was he to give an account to the Roman people of the money he spent, but of his enterprises, and the execution of them." Cato, provoked at this answer, left Sicily, and returned to Rome.

Afterwards Cato was made praetor, when he fulfilled the duties of his office with the strictest justice. He conquered Sardinia, governed with admirable moderation, and was created consul. Being tribune in the war of Syria, he gave distinguished proofs of his valour against Antiochus the Great; and at his return stood candidate for the office of censor. But the nobles, who not only envied him as a new man, but dreaded his severity, set up against him seven powerful competitors. Valerius Flaccus, who had introduced him into public life, and had been his colleague in the consulsip, was a ninth candidate, and these two united their interests. On this occasion Cato, far from employing soft words to the people, or giving hopes of gentleness or complaisance in the execution of his office, loudly declared from the rostra, with a threatening look and voice, "That the times required firm and vigorous magistrates to put a stop to that growing luxury which menaced the republic with ruin; censors who would cut up the evil by the roots, and restore the rigour of ancient discipline." It is to the honour of the people of Rome, that, notwithstanding these terrible intimations, they preferred him to all his competitors, who courted them by promises of a mild and easy administration; the comitia also appointed his friend Valerius to be his colleague, without whom he had declared that he could not hope to compass the reformation he had in view. Cato's merit, upon the whole, was superior to that of any of the great men who stood against him. He was temperate, brave, and indefatigable; frugal of the public money, and not to be corrupted. There is scarce any talent requisite for public or private life which he had not received from nature, or acquired by industry. He was a great soldier, an able statesman, an eloquent orator, a learned historian, and very knowing in rural affairs. Yet, with all these accomplishments, he had very great faults. His ambition being poisoned with envy, disturbed both his own peace and that of the whole city as long as he lived. Though he would not take bribes, he was unmerciful and unconscionable in amassing wealth by all such means as the law did not punish.

The first act of Cato in his new office, was naming his colleague to be prince of the senate; after which the censors struck out of the list of the senators the
Cato, the 276th year of the Roman Commonwealth, in which was Lucius the brother of T. Flaminius. Lucius, when consul, and commanding in Gaul, had with his own hand murdered a Boeotian, a demeter to the Romans; and he had committed this murder purely to gratify the curiosity of his pathic, a yeung Carthaginian, who longing to see somebody die a violent death, had reproached the general for bringing him away from Rome just when there was going to be a fight of gladiators. Titus Flaminius, full of indignation at the dishonour done to his brother, brought the affair before the people; and insisted upon Cato's giving the reason of his proceeding. The censor related the story; and when Lucius denied the fact, put him to his oath. The accused, refusing to swear, was deemed guilty; and Cato's censure was approved. But no part of the censor's conduct seemed so cruel to the nobles and their wives as the taxes he laid upon luxury in all its branches, dress, household furniture, women's toilets, chariots, slaves, and equipage. These articles were all taxed at three per cent. of the real value. The people, however, in general, were pleased with his regulations, insomuch that they ordered a statue to be raised in his honour in the Temple of Health, with an inscription that mentioned nothing of his victories or triumphs, but imported only, that by his wise ordinances in his censorship he had reformed the manners of the republic. Plutarch relates, that before this, upon some of Cato's friends expressing their surprise, that when many persons without merit or reputation had statues, he had none; he answered, "I had much rather it should be asked why the people have not erected a statue to Cato, than why they have." Cato was the occasion of the third Punic war. Being dispatched to Africa to terminate a difference between the Carthaginians and the king of Numidia, on his return to Rome he reported that Carthage was grown excessively rich and populous, and he warmly exhorted the senate to destroy a city and republic, during the existence of which Rome could never be safe. Having brought from Africa some very large ships, he showed them to the conscript fathers in one of the lappets of his gown. "The country (says he) where this is taking ground is but three days voyage from Rome." We are told, that from this time he never spoke in the senate upon any subject, without concluding with these words, "I am also of opinion, that Carthage ought to be destroyed." He judged, that for a people debauched by prosperity, nothing was to be feared more than a rival state, always powerful, and now from its misfortunes grown wise and circumspect. He held it necessary to remove all dangers that could be apprehended from without, when the republic had within so many distempers threatening her destruction.

From the censor, dignified and severe, the reader will not perhaps be displeased to turn his view upon Cato sociable and relaxed. For we should have a false notion of him, if we imagined that nothing but a sad austerity prevailed in his speech and behaviour. On the contrary, he was extremely free; and often with his friends at table internalized the conversation with lively discourses and witty sayings. Of these Plutarch has collected a pretty large number; we shall relate but one, and make use of Balzac's paraphrase, and the

preface with which he introduces it. "The very censors, though sadness seems to be one of the functions of their office, did not altogether lay aside raillery. They were not always bent upon severity; and the first Cato, that troublesome and intolerable busiest man, ceased sometimes to be troublesome and intolerable. He had some glimpses of mirth, and some intervals of good humour. He dropped now and then some words that were not unpleasant, and you may judge of the rest by this. He had married a very handsome wife; and history tells us that she was extremely afraid of the thunder, and loved her husband well. These two passions prompted her to the same thing; she always pitched upon her husband as a sanctuary against thunder, and threw herself into his arms at the first noise she fancied she heard in the sky. Cato, who was well pleased with the storm, and very willing to be caressed, could not conceal his joy. He revealed that domestic secret to his friends; and told them one day, speaking of his wife, 'that she had found out a way to make him love bad weather; and that he never was so happy as when Jupiter was angry.' It is worth observing, that this was the only occasion in which he degraded the senator Manlius, who would probably have been consul the year after, only for giving a kiss to his wife in the day-time, and in the presence of his daughter.

Cato died in the year of Rome 604, aged 85. He wrote several works. 1. A Roman History. 2. Concerning the art of war. 3. Of Rhetoric. 4. A treatise of Husbandry. Of these, the last only is extant. Cato, Marcus Porcius, commonly called Cato Minor, or Cato of Utica, was great-grandson of Cato the Censor. It is said, that from his infancy he discovered by his speech, by his countenance, and even his childish sports and recreations, an inflexibility of mind; for he would force himself to go through with whatever he had undertaken, though the task was ill-suited to his strength. He was rough towards those that flattered him, and quite untractable when threatened; was rarely seen to laugh, or even to smile; was not easily provoked to anger; but if once incensed, hard to be pacified. Sylia having had a friendship for the father of Cato, sent often for him to his brother, and asked him familiarly with the Cato, who was then about 14 years of age, seeing the heads of great men brought there, and observing the signs of those that were present, asked his preceptor, 'Why does nobody kill this man?' Because, said the other, he is more feared than he is hated. The boy replied, 'Why then did you not give me a sword when you brought me bither, that I might have stabbed him, and freed my country from this slavery?'

He learned the principles of the Stoic philosophy, which so well suited his character, under Antipater of Tyre, and applied himself diligently to the study of it. Eloquence he likewise studied, as a necessary means to defend the cause of justice, and he made a very considerable proficiency in that science. To increase his bodily strength, he inured himself to suffer the extremes of heat and cold; and used to make journeys on foot and bare-headed in all seasons. When he was sick, patience and abstinence were his only remedies: he shut himself up, and would see nobody till he was well. Though remarkably sober in the beginning of
his life, making it a rule to drink but once after supper, and then retire, he insensibly contracted a habit of drinking more freely, and of sitting at table till morning. His friends endeavoured to excuse this, by saying that the affairs of the public engaged his attention all the day; and that, being ambitious of knowledge, he passed the night in the conversation of philosophers. Caesar wrote, that Cato was once found dead drunk at the corner of a street, early in the morning, by a great number of people who were going to the love of some great man; and that when, by uncovering his face, they perceived who it was, they blushed for shame: "You would have thought (added Caesar), that Cato had found them drunk, not they him." Pliny observes, that by this reflection Caesar praises his enemy at the same time that he blames him. And Seneca, his extravagant panegyrist, ventures to assert, that it is easier to prove drunkennes to be a virtue, than Cato to be vicious. He affected singularity; and in things indifferent, to act directly contrary to the taste and fashions of the age. Magnanimity and constancy are generally ascribed to him; and Seneca would fain make that haughtiness and contempt for others, which, in Cato, accompanied those virtues, a matter of praise. Cato, says Seneca, having received a blow in the face, neither took revenge nor was angry: he did not even pardon the affront, but denied that he had received it. His virtue raised him so high, that injury could not reach him. He is reputed to have been chaste in his youth. His first love was Lepida; but when the marriage was upon the point of being concluded, Metellus Scipio, to whom she had been promised, interfered, and the preference was given to him. This affront extremely exasperated our Stoic. He was for going to law with Scipio; and when his friends had diverted him from that design, by showing him the ridicule of it, he revenged himself by making verses upon his rival. When this first flame subsided, he married Attilia the daughter of Serranus, had two children by her, and afterwards divorced her for her very indiscreet conduct.

He served as a volunteer under Galles in the war of Spartacus; and when military rewards were offered him by the commander, he refused them, because he thought he had no right to them. Some years after, he went a legionary tribune into Macedonia under the pretor Rubrius: in which station he appeared, in his dress and during a march, more like a private soldier than an officer: but the dignity of his manners, the elevation of his sentiments, and the superiority of his views, set him far above those who bore the titles of generals and praetors. It is said, that Cato's design in all his behavior was to engross the world by the love of virtue, whose affections he engaged towards himself, without his having that in his intention. "For the sincere love of virtue (adds Plutarch) implies an affection for the virtuous. Those who praise the worthy without loving them, pay homage to their glory; but are neither admirers nor imitators of their virtues." When the time of his service expired, and he was leaving the army, the soldiers were all in tears; so effectually had he gained their hearts by his descending manners and sharing in their labours. After his return home, he was chosen to the questorship; and had scarce entered on his charge, when he made a great reformation in the questor's office, and particularly with regard to the registers. These registers, whose places were for life, and through whose hands passed incessantly all the public accounts, being to act under young magistrates inexperienced in business, assumed an air of importance; and, instead of asking orders from the questors, pretended to direct and govern as if they themselves were the questors. Cato reduced them to their proper sphere.

One thing by which Cato extremely pleased the people, was his making the assassins to whom Sylla had given considerable rewards out of the treasury for murdering the proscribed, disgorge their gains. Plutarch tells us, that Cato was so exact in discharging the duties of a senator, as to be always the first who came to the house, and the last who left it; and that he never quitted Rome during those days when the senate was to sit. Nor did he fail to be present at every assembly of the people, that he might awe those who, by an ill-judged facility, bestowed the public money in largesses, and frequently, through mere favour, granted remission of debts due to the state. At first his austerity and stiffness displeased his colleagues; but afterwards they were glad to have his name to oppose to all the unjust solicitations, against which they would have found it difficult to defend themselves. Cato very readily took upon him the task of refusing.

Cato, to keep out a very bad man, put in for the tribunate. He sided with Cicero against Catiline, and opposed Caesar on that occasion. His enemies sent him to recover Cyprus, which Ptolemy had forfeited, thinking to hurt his reputation by so difficult an undertaking; yet none could find fault with his conduct.

Cato laboured to bring about an agreement between Caesar and Pompey; but seeing it in vain, he sided with the latter. When Pompey was slain he fled to Utica; and being pursued by Caesar, advised his friends to be gone, and threw themselves on Caesar's clemency. His son, however, remained with him; and Statilius, a young man, remarkable for his hatred to Caesar.

The evening before the execution of the purpose he had formed with regard to himself, after bathing, he supped with his friends and the magistrates of the city. They sat late at table, and the conversation was lively. The discourse falling upon this maxim of the Stoics, that "the wise man alone is free, and that the vicious are slaves;" Demetrius, who was a Peripatetic, undertook to confute it from the maxims of his school. Cato, in answer, treated the matter very simply; and with so much earnestness and vehemence of voice, that he betrayed himself, and confirmed the suspicion of his friends that he designed to kill himself. When he had done speaking, a melancholy silence ensued; and Cato perceiving it, turned the discourse to the present situation of affairs, expressing his concern for those who had been obliged to put to sea, and who had determined to make their escape by land, and had a dry and sandy desert to pass. After supper, the company being dismissed, he walked for some time with a few friends, and gave his orders to the officers of the guard; and going into his chamber, he embraced his son and his friends with more than usual.
usual tenderness, which farther confirmed the suspicions of the resolution he had taken. Then laying himself down on his bed, he took up Plato’s Dialogue on the Immortality of the Soul. Having read for some time, he looked up, and missing his sword, which his son had removed while he was at supper, he called a slave, and asked who had taken it away; and receiving no pertinent answer, he resumed his reading. Some time after, he asked again for his sword; and, without showing any impatience, ordered it to be brought to him: but having read out the book, and finding nobody had brought him his sword, he called for all his servants, fell into a rage, and struck one of them on the mouth with so much violence that he very much hurt his own hand, crying out in a passionate manner, “What! do my own son and family conspire to betray me, and deliver me up naked and unarmed to the enemy?” Immediately his son and friends rushed into the room; and began to lament, and to beseech him to change his resolution. Cato raising himself, and looking heroically at them, “How long is it,” said he, “since I have lost my senses, and my son is become my keeper? Brave and generous son, why do you not bind your father’s hands, that when Caesar comes, he may find me unable to defend myself? Do you imagine that without a sword I cannot end my life? Cannot I destroy myself, by holding my breath for some moments, or by striking my head against the wall?” His son answered with his tears, and retired. Apollonides and Demetrius remained with him; and to them he addressed himself in the following words: “Is it to watch over me ye sit silent here? Do you pretend to force a man of my years to live? or can you bring any reason to prove, that it is not base and unworthy of Cato to beg his safety of an enemy? or why do you not persuade me to unlearn what I have been taught, that, rejecting all the opinions I have hitherto defended, I may now, by Caesar’s means, grow wiser, and be yet more obliged to him than for life alone? Not that I have determined any thing concerning myself; but I would have it in my power to perform what I shall think fit to resolve upon: and I shall not fail to ask your counsel, when I have occasion to act up to the principles which your philosophy teaches. Go tell my son, that he should not compel his father to what he cannot persuade him.” They withdrew, and the sword was brought by a young slave. Cato drew it, and finding the point to be sharp; “Now,” (said he) “I am my own master.” And, laying it down, he took up his book again, which it is reported he read twice over. After this he slept so soundly that he was heard to snore by those who were near him. About midnight he called two of his freedmen, Cleanthe his physician, and Butas, whom he chiefly employed in the management of his affairs. The last he sent to the port, to see whether all the Romans were gone; to the physician he gave his hand to be dressed, which was swelled by the blow he had given his slave. This being an intimation that he intended to live, gave great joy to his family. Butas soon returned, and brought word that they were all except Crassus, who had staid upon some business, but was just ready to depart. He added, that the wind was high and the sea rough. These words drew a sigh from Cato. He sent Butas again to the port, to know whether there might not be some one, who, in the hurry of embarkation, had forgot some necessary provisions, and had been obliged to put back to Utica. It was now break of day, and Cato slept yet a little more, till Butas returned to tell him, that all was perfectly quiet. He then ordered him to shut his door; and he flung himself upon his bed, as if he meant to finish his night’s rest; but immediately he took his sword, and stabbed himself a little below his chest; yet not being able to use his hand so well by reason of the swelling, the blow did not kill him. It threw him into a convulsion, in which he fell from his bed, and overthrew a table near it. The noise gave the alarm; and his son and the rest of the family, entering the room, found him weltering in his blood, and his bowels half out of his body. The surgeon, upon examination, found that his bowels were not cut; and was preparing to replace them and bind up the wound, when Cato, recovering his senses, thrust the surgeon from him, and tearing out his bowels, immediately expired, in the 48th year of his age.

By this rash act, independent of all moral or religious considerations, he carried his patriotism to the highest degree of political phrenzy; for Cato, dead, could be of no use to his country; but had he preserved his life, his counsel might have moderated Caesar’s ambition, and (as Montesquieu observes) have given a different turn to public affairs.

CATOCHE, or CATOCHEUS, a disease by which the patient is rendered in an instant as immovable as a statue, without either sense or motion, and continues in the same posture he was in at the moment of his being seized. See Medicine Index.

CATOPTRICS.

CATOPTRICS is that part of optics which explains the properties of reflected light, and particularly that which is reflected from mirrors.

As this and the other branches of Optics will be fully treated under the collective word, we shall, in the present article, 1st. Just give a summary of the principles of the branch, in a few plain aphorisms, with some preliminary definitions; and, 2dly. Insert a set of entertaining experiments founded upon them.

SECT. I. Definitions.

1. Every polished body that reflects the rays of light is called a mirror, whether its surface be plane, spherical, conical, cylindrical, or of any other form whatever.

2. Of mirrors there are three principally used in optical experiments: The plane mirror, CHI, (Fig. CXXXVI.)
CATOPTRICS.

1. The spherical convex mirror, GHI, (fig. 2.) and
the spherical concave mirror, GHI, (fig. 3.)
2. The point K, (fig. 2, 3.) round which the re-

dflecting surface of a spherical mirror is described, is
called its centre. The line KH, drawn from its cen-
tre perpendicular to its two surfaces, is the axis of the
mirror; and the point H, to which that line is drawn,
is its vortex.

4. The distance between the lines AG and BC, (fig. 1.)
is called the angle of incidence, and the dis-
tance between BG and CG is the angle of reflection.

SECT. II. Aphorisms.

1. In a plane mirror.

1. The image DE, (fig. 1.) will appear as far behind
the mirror as the object AC is before it.

2. The image will appear of the same size, and in
the same position as the object.

3. Every such mirror will reflect the image of an
object of twice its own length and breadth.

4. If the object be an opaque body, and its rays fall
on the mirror nearly in direct lines, there will be only
one image visible, which will be reflected by the inner
surface of the glass. But,

5. If the object be a luminous body, and its rays
fall very obliquely on the mirror, there will appear to
an eye, placed in a proper position, several images; the
first of which, reflected from the outer surface of the
glass, will not be as bright as the second, reflected from
the inner surface. The following images, that are pro-
duced by the repeated reflections of the rays between
the two surfaces of the glass, will be in proportion less
vivid, to the eighth or tenth, which will be seen vis-
able.

1. The image DF, (fig. 2.), will always appear be-
hind it.

2. The image will be in the same position as the ob-
ject.

3. It will be less than the object.

4. It will be curved, but not, as the mirror, spheri-
cal.

5. Parallel rays falling on this mirror will have the
focus or image at half the distance of the centre K
from the mirror.

6. In converging rays, the distance of the object
must be equal to half the distance of the centre, to make
the image appear behind the mirror.

7. Diverging rays will have their image at less than
half the distance of the centre. If the object be placed
in the centre of the mirror, its image will appear at one
eighth of that distance behind it.

1. That point where the image appears of the same
dimensions as the object, is the centre of that mirror.

2. Parallel rays will have their focus at one half the
distance of the centre.

3. Converging rays will form an image before the
mirror.

4. In diverging rays, if the object be at least one-
half the distance of the centre, the image will be
behind the mirror, erect, curved, and magnified, as
DEF, (fig. 3.); but if the distance of the object be
greater, the image will be before the mirror, inverted
and diminished, as DEF, (fig. 4.)

5. The sun's rays falling on a concave mirror, and
being parallel, will be collected in a focus at half the
distance of its centre, where their heat will be augment-
ed in proportion of the surface of the mirror to that of
the focal spot.

6. If a luminous body be placed in the focus of a
concave mirror, its rays being reflected in parallel lines,
will strongly enlighten a space of the same dimension
with the mirror, at a great distance. If the luminous
object be placed nearer than the focus, its rays will
diverge, and consequently enlighten a larger space.

It is on this principle that searchlights are con-
structed.

IV. In all plane and spherical mirrors the angle of
incidence is equal to the angle of reflection.

SECT. III. Entertaining Experiments.

I. Of all one senses the sight is certainly subject to L. Catop-
the greatest illusion. The various writers on optical illu-
sions.

have described a great number of instances in which
they deceive us, and have constantly endeavoured to in-
vestigate the causes, to explain their effects, and to re-
concile appearance with reality. We every day dis-
cover new phenomena, and doubtless many more are
reserved for posterity. It frequently happens, more-
over, that a discovery which at first seemed of little
consequence has led to matters of the highest import-
ance.

Take a glass bottle A (fig. 14.) and fill it with water
to the point B; leave the upper part BC empty, and
cork it in the common manner. Place this bottle op-
posite a concave mirror, and beyond its focus, that
it may appear reversed, and before the mirror, (see
Sect. II. sph. 3, 4.) of a sphere; concave mirror,)
place yourself still further distant from the bottle, and it will
appear to you in the situation a, b, c, (fig. 15.)

Now it is remarkable in this apparent bottle, that the
water, which, according to all the laws of catoptrics,
and all the experiments made on other objects, should
appear at a b, appears on the contrary at a c, and con-
sequently the part a b appears empty.

If the bottle be inverted and placed before the mir-
ror (as in fig. 16.), its image will appear in its natural
erect position; and the water, which is in reality at
BC, will appear at a b.

If while the bottle is inverted it be uncorked, and
the water run gently out, it will appear, that while the
part BC is emptying, that of a b in the image is filling;
and what is likewise very remarkable, as soon as the
bottle is empty the illusion ceases, the image also ap-
pearing entirely empty. If the bottle likewise be quite
full there is no illusion.

If while the bottle is held inverted, and partly empty,
some drops of water fall from the bottom A towards
BC, it seems in the image as if there were formed at
the bottom of that part a b, bubbles of air that rose
from a to b; which is the part that seems full of water.
All these phenomena constantly appear.

The remarkable circumstances in this experiment
are, first, not only to see an object where it is not, but
also where the image is not; and secondly, that of two
objects which are really in its same place, as the sur-
faced at one place, and the other at another; and to see
the bottle in the place of its image, and the water where
neither it nor its image are.

II. Construct a box AB, of about a foot long, eight
inches
CATOPTRICS.

The same will happen if the four mirrors placed on the sides of the box be more elevated. The objects, by either of these dispositions, will appear to be repeated nine, twenty-five, forty-nine times, &c. by taking always the square of the odd numbers of the arithmetical progression 3, 5, 7, 9, &c. as is very easy to conceive, if we remember that the subject enclosed in the box is always in the centre of a square, composed of several others, equal to that which forms the bottom of the box.

Other pieces of the same kind (that is, viewed from above) may be contrived, in which mirrors may be placed perpendicular on a triangular, pentagonal, or hexagonal (that is, a three, five, or six-sided) plane. All these different dispositions, properly directed, as well with regard to the choice as position of the objects, will constantly produce very remarkable and pleasing illusions.

If instead of placing the mirrors perpendicular, they were to incline equally, so as to form part of a reversed pyramid, the subject placed in the box would then have the appearance of a very extensive globular or many-sided figure.

IV. On the hexagonal or six-sided plane ABCDEF, surdraw six semidiameters GA, GB, GC, GD, GE, GF, sing multipli- cation of objects, and on each of these place perpendicularly two plane mirrors, which must join exactly at the centre C, and which placed back to back must be as thin as possible. Decorate the exterior boundary of this piece (which is at the extremity of the angles of the hexagon) with six columns, that at the same time serve to support the mirrors, by groves formed on their inner sides. (See the profile F). Add to these columns their entablatures, and cover the edifice in such a manner as you shall think proper.

In each one of these six triangular spaces, contained between two mirrors, place little figures of pasteboard, in relief, representing such objects as when seen in a hexagonal form will produce an agreeable effect. To these add small figures of enamel; and take particular care to conceal, by some object that has relation to the subject, the place where the mirrors join, which, as we have said before, all meet in the common centre G.

When you look into any one of the six openings of this palace, the objects there contained being repeated six times, will seem entirely to fill up the whole of the building. This illusion will appear very remarkable, especially if the objects made choice of are properly adapted to the effect that is to be produced by the mirrors.

Note, If you place between two of these mirrors part of a fortification, as a curtain and two demi-bastions, you will see an entire citadel, with six bastions. Or if you place part of a ball-room, ornamented with chandeliers and figures in enamel, all those objects being here multiplied, will afford a very pleasing prospect.

V. Within the case ABCD, place your mirrors v. Opaque O, P, Q, R, so disposed that they may each of them bodies make an angle of forty-five degrees, that is, that they seemingly may be half way inclined from the perpendicular, as rendered transparent in the figure. In each of the two extremities AB, make a circular overture, in one of which fix the tube GL.
CATOPTRICS.

GL, in the other the tube MF, and observe that in each of these is to be inserted another tube, as H and I (a).

Furnish the first of these tubes with an object-glass at G, and a concave eye-glass at F. You are to observe, that in regulating the focus of these glasses, with regard to the length of the tube, you are to suppose it equal to the line C, or visual pointed ray, which, entering at the aperture G, is reflected by the four mirrors, and goes out at the other aperture F, where the ocular glass is placed. Put any glass you will into the two ends of the moveable tubes H and I; and, lastly, place the machine on a stand E, moveable at the point S, that it may be elevated or depressed at pleasure.

When the eye is placed at F, and you look through the tube, the rays of light that proceed from the object T, passing through the glass C, are successively reflected by the mirrors O, P, Q, and R, to the eye at F, and there paint the object T in its proper situation; and these rays appear to proceed directly from that object.

The two moveable tubes H and I, at the extremities of each of which a glass is placed, serve only the more to disguise the illusion, for they have no communication with the interior part of the machine. This instrument being moveable on the stand E, may be directed to any object; and if furnished with proper glasses will answer the purpose of a common perspective.

The two moveable tubes H and I being brought together, the machine is directed toward any object, and desiring a person to look at the end F, you ask him if he sees distinctly that object. You then separate the two moveable tubes, and leaving a space between them sufficient to place your hand, or any other solid body; you tell him that the machine has the power of making objects visible through the most opaque body; and as a proof you desire him then to look at the same object, when, to his great surprise, he will see it as distinct as when there was no solid body placed between the tubes.

Note. This experiment is the more extraordinary, as it is very difficult to conceive how the effect is produced. The two arms of the case appearing to be made to support the perspective glass; and to whatever object it is directed, the effect is still the same.

VI. In the partition AB, make two apertures, CD, and EF, of a foot high, and ten inches wide, and about a foot distant from each other.Let them be at the common height of a man's head; and in each of them place a transparent glass, surrounded with a frame, like a common mirror.

Behind this partition place two mirrors H and I, inclined to it in an angle of forty-five degrees; that is, half way between a line-drawn perpendicular to the ground and its surface; let them be both 18 inches square: let all the space between them be enclosed by boards or pasteboard painted black, and well closed, that no light may enter; let there be also two curtains to cover them, which may be drawn aside at pleasure.

When a person looks into one of these supposed mirrors, instead of seeing his own face, he will perceive the object that is in front of the other; so that if two persons present themselves at the same time before these mirrors, instead of each one seeing himself, they will reciprocally see each other.

Note, There should be a sconce with a candle placed on each side of the two glasses in the wainscot, to enlighten the faces of the persons who look in them, otherwise this experiment will have no remarkable effect.

This experiment may be considerably improved by placing the two glasses in the partition in adjoining rooms, and a number of persons being previously placed in one room, when a stranger enters the other, you may tell him his face is dirty; and desire him to look in the glass, which he will naturally do; and on seeing a strange face he will draw back; but returning to it, and seeing another, another, and another, like the phantom kings in Macbeth, what his surprise will be is more easy to conceive than express. After this a real mirror may be privately let down on the back of the glass; and if he can be prevailed to look in it once more, he will then, to his further astonishment, see his own face; and may be told, perhaps persuaded, that all he thought he saw before was the mere effect of imagination.

How many tricks, less artful than this, have passed in former times for sorcery; and pass at this time in some countries for apparitions!

Note. When a man looks in a mirror that is placed perpendicular to another, his face will appear entirely deformed. If the mirror be a little inclined, so as to make an angle of 80 degrees (that is, one-ninth part from the perpendicular), he will then see all the parts of his face, except the nose and forehead. If it be inclined to 60 degrees (that is, one-third part), he will appear with three noses and six eyes: in short, the apparent deformity will vary at each degree of inclination; and when the glass comes to 45 degrees (that is, half way down), the face will vanish. If, instead of placing the two mirrors in this situation, they are so disposed that their junction may be vertical, their different inclinations will produce other effects; as the situation of the object relative to these mirrors is quite different. The effects of these mirrors, though remarkable enough, occasions but little surprise, as there is no method of concealing the cause by which they are produced.

VII. Make a box of wood, of a cubical figure, Fig. 13, ABCD, of about 1 1/2 inches every way. Let it be fixed to the pedestal P, at the usual height of a man's head. In each side of this box, let there be an opening.

(a) These four tubes must terminate in the substance of the case, and not enter the inside, that they may not hinder the effect of the mirrors. The fourfold reflection of the rays of light from the mirrors, darkens in some degree the brightness of the object; some light is also lost by the magnifying power of the perspective. If, therefore, instead of the object-glass at G, and concave eye-glass at F, plane glasses were substituted, the magnifying power of the perspective will be taken away, and the object appear brighter.

Vol. V. Part I. N a
CATOPTRICS.

In this box place two mirrors A, B, with their backs against each other; let them cross the box in a diagonal line, and in a vertical position. Decorate the openings in the sides of this box with four oval frames and transparent glasses, and cover each of them with a curtain, so contrived that they may all draw up together.

Place four persons in front of the four sides, at equal distances from the box, and then draw up the curtains that they may see themselves in the mirrors; when each of them, instead of his own figure, will see that of the person who is next to him, and who, at the same time, will seem to him to be placed on the opposite side. Their confusion will be the greater, as it will be very difficult for them to discover the mirrors concealed in the box. The reason of this phenomenon is evident; for though the rays of light may be turned aside by a mirror, yet as we have before said, they always appear to proceed in right lines.

VIII. Provide a box ABCD of about two feet long, 15 inches wide, and 12 inches high. At the end A place a concave mirror, the focus of whose parallel rays is at 18 inches from the reflecting surface. At L place a pasteboard blacked, in which a hole is cut sufficiently large to see on the mirror H the object placed at B E F D.

Cover the top of the box, from A to I, close, that the mirror H may be entirely darkened. The other part IB must be covered with a glass, under which is placed a gauze.

Make an aperture at G, near the top of the side ER; beneath which, on the inside, place, in succession, paintings of different subjects, as vistas, landscapes, &c. so, that they may be in front of the mirror H. Let the box be so placed that the object may be strongly illuminated by the sun, or by wax lights placed under the enclosed part of the box AI.

By this simple construction the objects placed at GD will be thrown into their natural perspective, and if the subjects be properly chosen, the appearance will be altogether as pleasing as in optical machines of a much more complicated form.

Note. A glass mirror should be always here used, as those of metal do not represent the objects with equal vivacity, and are besides subject to tarnish. It is also necessary that the box be sufficiently large, that you may not be obliged to use a mirror whose focus is too short; for in that case, the right lines near the border of the picture will appear bent in the mirror, which will have a disagreeable effect, and cannot be avoided.

IX. To set fire to a combustible body by the reflection of two concave mirrors, fig. 18.

The rays of a luminous body placed in the focus of a concave mirror being reflected in parallel lines, if a second mirror be placed diametrically opposite the first, it will, by collecting those rays in its focus, set fire to a combustible body.

Place two concave mirrors, A and B, at about 12 or 15 feet distance from each other, and let the axis of each of them be in the same line. In the focus C of one of them place a live coal, and in the focus D of the other some gunpowder. With a pair of double bellows, which make a continual blast, keep constantly blowing the coal, and notwithstanding the distance between them, the powder will presently take fire.

It is not necessary that these mirrors be of metal or brass, those made of wood or pasteboard gilt will produce the explosion, which has sometimes taken effect at the distance of 50 feet, when mirrors of 18 inches, or two feet diameter, have been used.

This experiment succeeds with more difficulty at great distances; which may proceed from the moisture in a large quantity of air. It would doubtless take effect more readily, if a tin tube, of an equal diameter with the mirrors, were to be placed between them.

X. Behind the partition AB, place, in a position something oblique, the concave mirror EF, which must be at least ten inches in diameter, and its distance from the partition equal to three fourths of the distance of its centre.

In the partition make an opening of seven or eight inches, either square or circular; it must face the mirror, and be of the same height with it. Behind this partition place a strong light, so disposed that it may not be seen at the opening, and may illuminate an object placed at C, without throwing any light on the mirror.

Beneath the aperture in the partition place the object C, that you intend shall appear on the outside of the partition, in an inverted position; and which we will suppose to be a flower. Before the partition, and beneath the aperture, place a little flowerpot D, the top of which should be even with the bottom of the aperture, that the eye, placed at G, may see the flower in the same position as if its stalk came out of the pot.

Take care to paint the space between the back part of the partition and the mirror black, to prevent any reflections of light from being thrown on the mirror; in a word, so dispose the whole that it may be as little enlightened as possible.

When a person is placed at the point G, he will perceive the flower that is behind the partition, at the top of the pot at D: But on putting his hand to pluck it, he will find that he attempts to grasp a shadow.

If in the opening of the partition a large double convex lens of a short focus be placed, or, which is not quite so well, a bottle of clear water, the image of the flower reflected thereon will appear much more vivid and distinct.

The phenomena that may be produced by means of concave mirrors are highly curious and astonishing. By their aid, spectres of various kinds may be exhibited. Suppose, for example, a person with a drawn sword places himself before a large concave mirror, but farther from it than its focus; he will then see an inverted image of himself in the air, between him and the mirror, of a less size than himself. If he steadily present the sword towards the centre of the mirror, an image of the sword will come out therefrom towards the sword in his hand, point to point, as it were to fence with him: and by his pushing the sword nearer, the image will appear to come nearer him, and almost to touch his breast, having a striking effect upon him. If the mirror be turned 45 degrees, or one-eights, round,
CATOPTRICS.

round, the reflected image will go out perpendicular to the direction of the sword presented, and apparently come to another person placed in the direction of the motion of the image. If that person is unacquainted with the experiment, and does not see the original sword, he will be much surprised and alarmed. This experiment may be another way diversified, by telling any person, that at such an hour, and in such a place, he should see the apparition of an absent or deceased friend (of whose portrait you are in possession). In order to produce this phantom, instead of the hole in the partition AB in the last figure, there must be a door which opens into an apartment to which there is a considerable descent. Under that door you are to place the portrait, which must be inverted and strongly illuminated, that it may be lively reflected by the mirror, which must be large and well polished. Then having introduced the incredulous spectator at another door, and placed him in the proper point of view, you suddenly throw open the door at AB, when, to his great astonishment, he will immediately see the apparition of his friend.

It will be objected, perhaps, that this is not a perfect apparition, because it is only visible at one point of view, and by one person. But it should be remembered, that it was an established maxim in the last centuries, that a spectre might be visible to one person and not to others. So Shakespeare makes both Hamlet and Macbeth see apparitions that were not visible to others present at the same time. It is not unlikely, moreover, that this maxim took its rise from certain apparitions of this kind that were raised by the monks, to serve some purposes they called religious; as they alone were in possession of what little learning there then was in the world.

Opticians sometimes grind a glass mirror concave in one direction only, as it is said longitudinally; it is in fact a concave portion of a cylinder, the breadth of which may be considered that of the mirror. A person looking at his face in this mirror, in the direction of its concavity, will see it curiously distorted in a very lengthened appearance; and by turning the cylindrical mirror a quarter round, his visage will appear distorted another way, by an apparent increase in width only. Another curious and singular property attends this sort of mirror: If in a very near situation before it, you put your finger on the right hand side of your nose, it will appear the same in the mirror; but if in a distant situation, somewhat beyond the centre of concavity, you again look at your face in the mirror, your finger will appear to be removed to the other or left hand side of your nose. This, though something extraordinary, will in its cause appear very evident from a small consideration of the properties of spherical concave mirrors.

CATOPTROMANCY, 

---

CATOBRACIA, KATROBRIA, a kind of divination among the ancients; so called, because consisting in the application of a mirror. The word is formed from katrobi, speculum, "mirror," and mar- thrion, divination, "divination." Pausanias says, it was in use among the Achaian; where those who were sick, and in danger of death, let down a mirror, or looking glass fastened by a thread, into a fountain before the temple of Ceres; then looking in the glass, if they saw a ghastly disfigured face, they took it as a sure sign of death: on the contrary, if the flesh appeared fresh and healthy, it was a token of recovery. Sometimes glasses were used without water, and the images of things future represented in them. See GASTROMANCY.

CATROU, FRANCIS, a famous Jesuit, born at Paris in 1559. He was engaged for 12 years in the Journal de Trevoux, and applied himself at the same time to other works, which distinguished him among the learned. He wrote a general History of the Mogul empire, and a Roman history, in which he was assisted by Father Rouille, a brother Jesuit. Catrou died in 1737; and this last history was continued by Rouille, who died in 1740.

CATTERHUN, a remarkable Caledonian post about two miles north of the town of Brechin in the county of Angus in Scotland. Mr Pennant describes it as of uncommon strength. "It is (says he) of an oval form, made of a stupendous dike of loose white stones, whose convexity, from the base within to that without, is 122 feet. On the outside a hollow, made by Caterrathun, the disposition of the stones, surrounds the whole. Round the base is a deep ditch, and below that about 100 yards, are vestiges of another, that went round the hill. The area within the stony mound is flat: its axis, or length of the oval, is 456 feet, the transverse diameter 200. Near the east side is the foundation of a rectangular building; and on most parts are the foundations of others small and circular: all which had once their superstructures, the shelter of the possessors of the post: there is also a hollow, now almost filled with stones, the well of the place." There is another fortification, but of inferior strength, in the neighbourhood. It is called the Brown Catterthun, from the colour of the ramparts, which are composed only of earth. It is of a circular form, and consists of various concentric dikes. On one side of this rises a small rill, which, running down the hill, has formed a deep gully. From the side of the fortress is another rampart, which extends parallel to the rill, and then reverts, forming another additional post or retreat. The meaning of the word Catter-thun, is Camp-town; and Mr Pennant thinks these might probably be the posts occupied by the Caledonians before their engagement at the foot of the Grampian mountains with the celebrated Agricola. See (History of) Scotland.

CATTI, a people of Germany, very widely spread, on the east reaching to the river Sals, on the north to Westphalia; occupying, besides Hesse, the Wetterau, and part of the tract on the Rhine, and on the banks of
of the river Lohne. The Hercynian forest began and ended in their country.

CATIVELLAUNI, an ancient people of Britain, seated in the country which is now divided into the counties of Hertford, Bedford, and Bucks. The name of this ancient British people is written in several different ways by Greek and Roman authors, being sometimes called Catti, Cassi, Catticulanei, Cattildani, Cattildani, &c. That they were of Belgic origin cannot be doubted; and it is not improbable that they derived their name of Catt from the Belgic word Katten, which signifies illustrious or noble, and that the addition of Velani, which means on the banks of rivers, might be given them after their arrival in Britain, as descriptive of the situation of their country. However this may be, the Cattivellana formed one of the most brave and warlike of the ancient British nations when Caesar invaded Britain, and long after. Cassibelanus, their prince, was made commander in chief of the confederated Britons, not only on account of his own personal qualities, but also because he was at the head of one of their bravest and most powerful tribes. In the interval between the departure of Caesar and the next invasion under Claudius, the Cattivel- launi had reduced several of the neighbouring states under their obedience; and they again took the lead in opposition to the Romans at their second invasion, under their brave but unfortunate prince, Caracalla. The country of the Cattivelana was much frequented and improved by the Romans, after it came under their obedience. Verulamium, its capital, which stood near where St Alban's now stands, became a place of great consideration, was honoured with the name and privileges of a municipio or free city, and had magistrates after the model of the city of Rome. This place was taken and almost destroyed by the insurgents under Boadicea; but it was afterwards rebuilt, restored to its former splendour, and surrounded with a strong wall, some vestiges of which are still remaining. Durumbris and Magiavintum, in the second tier of Antoninus, were probably Dunstable and Fenny Stratford, at which places there appear to have been Roman stations. The Salene of Ptolemy, a town in the country of the Cattivelana, was perhaps situated at Salisbury in Bedfordshire, where several Roman antiquities have been found. There were, besides these, several other Roman forts, stations, and towns in this country, which it would be tedious to enumerate. The territories of the Cattivelana made a part of the Roman province called Britannia Prima.

CATTLE, a collective word, which signifies the hoof-footed animals, which serve either for tilling the ground, or for food to man. They are distinguished into large or black cattle, and into small cattle: of the former are horses, bulls, oxen, cows, and even calves and heifers: amongst the latter are rams, ewes, sheep, lambs, goats, kids, &c. Cattle are the chief stock of a farm; they who deal in cattle are styled graziers.

CATULLUS, CADIUS VALERIUS, a Latin poet, born at Verona, in the year of Rome 666. The harmony of his numbers acquired him the esteem and friendship of Cicero, and other great men of his time. Many of his poems, however, abound with gross obscenities. He wrote satirical verses against Ceasar, under the name of Marmoro. He spent his whole life in a state of poverty; and died in the flower of his age and the height of his reputation. Joseph Scaliger, Passerat, Muret, and Isaac Vossius, have written learned notes on this poet.

CAVIT, JAMES, a great civilian, politician, and Dutch poet, was born at Broershaven, in Zeeland, in the year 1577. After having made several voyages, he fixed at Middleburg; and acquired by his pleadings such reputation, that the city of Dort chose him for its pensionary; as also, some time after, that of Middleburg. In 1634, he was nominated pensionary of Holland and West Friesland; and in 1648, he was elected keeper of the seal of the same state, and stadtholder of the sees: but some time after, he resigned these employments, to enjoy the repose which his advanced age demanded. As the post of grand pensionary had been fatal to almost all those who had enjoyed it, from the beginning of the republic till that time, Catz delivered up his charge on his knees, before the whole assembly of the states, weeping for joy, and thanking God for having preserved him from the inconveniences that seemed attached to the duties of that office. But though he was resolved to spend the rest of his days in repose, the love of his country engaged him to comply with the desires of the states, who importuned him to go on an embassy to England, in the delicate conjuncture in which the republic found itself during the protectorate of Cromwell. At his return, he retired to his fine country seat at Sorgviet, where he lived in tranquility till the year 1665, in which he died. He wrote a great number of poems in Dutch; most of which are on moral subjects, and esteemed, that they have been often printed in all the different sizes; and, next to the Bible, there is no work so highly valued by the Dutch.

CATZENELLIBOGEN, a town of Germany, in the duchy of Nassau, with a strong castle. It is capital of a county of the same name. E. Long. 7. 38. N. Lat. 50. 20.

CAVA, in Anatomy, the name of a vein, the largest in the body, terminating in the right ventricle of the heart. See Anatomy Index.

CAVA, a considerable and populous town of Italy, in the kingdom of Naples, and in the Hither Prisipato, with a bishop's see. It is situated at the foot of Mount Vetulian, in E. Long. 15. 15. N. Lat. 40. 40.

CAVAILLAN; a town of France, in the department of Vaucluse, and formerly a bishop's see. It is situated on the river Durance, in a fertile and pleasant country, and 20 miles south-east of Avignon. Population 7000. E. Long. 4. 17. N. Lat. 43. 52.

CAVALCADE, a formal pompous march or procession of horsemen, equipages, &c. by way of parade or ceremony, to grace a triumph, public entry, or the like.

CAVALCADE, or CAVALCADE, anciently denoted a riding master; but at present is disposed in that sense, and only employed to denote a sort of equerries or officers who have the direction of princes stables. The French say, escuyer cavalcadeur of the king, the duke of Orleans, &c. Menage writes it cavalcadour, and derives it from the Spanish cavalgador, a horseman.

CAVALCANTE, GUIDO, a nobleman of Florence in
CAVAN

CAVALENTIUS in the 13th century, who having followed the party of the Goths, experienced the changeableness of fortune.

He showed great strength of mind in his misfortunes, and never neglected to improve his talents. He wrote a treatise in Italian concerning style, and some verses which are esteemed. His poem on the love of this world has been commented on by several learned men.

CAVALIER. CAVALIER, a horseman, or person mounted on horseback: especially if he be armed withal, and have a military appearance.

Anciently the word was restrained to a knight, or miles. The French still use Cherceller in the same sense.

CAVALIER, considered as a faction. See BRITAIN, No. 109.

CAVALIER, in fortification, an elevation of earth of different shapes, situated ordinarily in the gorge of a bastion, bordered with a parapet, and cut into more or less embrasures, according to the capacity of the cavalier.

Cavaliers are a double defence for the faces of the opposite bastion: they defend the ditch, break the besieger's galleries, command the traverses in dry moats, scour the salient angle of the counterscarp, where the besiegers have their counter batteries, and enflame the enemy's trenches, or oblige them to multiply their parallels: they are likewise very serviceable in defending the breach and the retrenchments of the besieged.

CAVALIER, in the manage, one that understands horses, and is practised in the art of riding them.

CAVALIERI, Bonaventure, an eminent mathematician in the 17th century, a native of Milan, and a friar of the order of the Jesuits of St. Jerome, was a professor of the mathematics at Bologna, where he published several mathematical books, particularly the "Method of Indivisibles." He was a scholar of Galileo. His "Directorium generale Uranometriae" contains great variety of most useful practices in trigonometry and astronomy. His trigonometrical tables in that work are excellent.

CAVALLO, Tiberius, an eminent natural philosopher. See Supplement.

CAVALRY, a body of soldiers that charge on horseback. The word comes from the French, cavalerie, and that from the corrupt Latin, caballus, a horse.

The Roman cavalry consisted wholly of those called equites, or knights, who were a distinct order in the distribution of citizens. The Grecian cavalry were divided into cataphracts and non cataphractes, i.e. into heavy and light armed. Of all the Greeks, the Thessalians excelled most in cavalry. The Lacedemonians, inhabiting a mountainous country, were but meanly furnished with cavalry, till, carrying their arms into other countries, they found great occasion for horse to support and cover their foot. The Athenian cavalry, for a considerable time, consisted only of 96 horsemen: after expelling the Persians out of Greece, they increased the number to 300; and afterwards to 1,000, which was the biggest pitch of the Athenian cavalry.

The chief use of the cavalry is to make frequent excursions to disturb the enemy, intercept his convoys, and destroy the country: in battle to support and cover the foot, and to break through and disorder the enemy; also to secure the retreat of the foot. Formerly, the manner of fighting of the cavalry was, after firing their pistols or carbines, to wheel off, to give opportunity for loading again. Gustave Adolphus is said to have first taught the cavalry to charge through, to march straight up to the enemy, with the sword drawn in the bridle hand, and each man having fired his piece, at the proper distance, to betake himself to his sword, and charge the enemy as was found most advantageous.

CAVAN, a town of Ireland, and capital of a county of the same name, in the province of Ulster, situated in W. Long. 6° 32'. N. Lat. 54° 0'.

Cavan, a county of Ireland, 47 miles in length and 23 in breadth; is bounded on the east by Monaghan, and on the south by Longford, West-Meath, and East-Meath. It has but two towns of any note, viz. Cavan and Kilmore. It contains 33 parishes, and in 1821 was computed to have 18,000 houses and 90,000 inhabitants. The county sends two members to the imperial parliament. It has nine market towns. See Cavan, Supplement.

CAVANILLES, Antonio JosepH, an eminent Spanish botanist. See Supplement.

CAUBUL, an extensive country in Asia. See Supplement.

CAUCASUS, the name of a very high mountain of Asia, being one of that great ridge which runs between the Black and Caspian seas. Sir John Chardin describes this as the highest mountain, and the most difficult to pass, of any he had seen. It has frightful precipices, and in many places the roads are cut out of the solid rock. At the time he passed it, the mountain was entirely covered with snow; so that, in many places, his guides behaved to clear the way with shovels. The mountain is 36 leagues over, and the summit of it eight leagues in breadth. The top is perpetually covered with snow; and our traveller relates, that the two last days he seemed to be in the clouds, and was not able to see 20 paces before him. Excepting the very top, however, all the parts of Mount Caucasus are extremely fruitful; abounding in honey, corn, fruits, bags, and large cattle. The vines twine about the trees, and rise so high, that the inhabitants cannot gather the fruit from the uppermost branches. There are many streams of excellent water, and a vast number of villages. The inhabitants are for the most part Christians of the Georgian church. They have fine complexions, and the women are very beautiful. In the winter they wear snow shoes in the form of rackets, which prevent their sinking in the snow, and enable them to run upon it with great swiftness.

CAUDEBEC, a rich, populous, and trading town, in Normandy, and capital of the territory of Caux. It is seated at the foot of a mountain near the river Seine, in E. Long. 46° 46'. N. Lat. 40° 30'.

CAUDEX, by Malpighi and other botanists, is used to signify the stem or trunk of a tree; by Linnaeus, the stock or body of the root, part of which ascends, part descends. The ascending part raises itself gradually above ground, serving frequently for a trunk, and corresponds in some measure to the caudex of former writers; the descending part strikes gradually downward into the ground, and puts forth radicles or small fibres, which are the principal and essential part of every root. The descending caude-
dex therefore corresponds to the radix of other botanists. Agreeably to this idea, Linnaeus considers trees and shrubs as roots above ground: an opinion which is confirmed by a well-known fact, that trees, when inverted, put forth leaves from the descending caudex, and radicles or roots from the ascending. For the varieties in the descending caudex, see the article RADIX.

CAUDIUM, in Ancient Geography, a town of Samnium, on the Via Appia, between Calatia and Beneventum: Caudinus, the epithet. The Caudinae Furcae, Furcatae, were memorable by the disgrace of the Romans; being spears disposed in the form of a gallows, under which prisoners of war were made to pass, and gave name to a defile or narrow pass near Caudium (Livy); where the Samnites obliged the Roman army and the two consuls to lay down their arms, and pass under the gallows, or yoke, as a token of submission.

CAVE, any large subterraneous hollow. These were undoubtedly the primitive habitations, before men began to build edifices above ground. The primitive method of burial was also to reposite the bodies in caves, which seems to have been the origin of catacombs. They long continued the proper habitations of shepherds. Among the Romans, caves (centra) used to be consecrated to nymphs, who were worshiped in caves, as other gods were in temples. The Persians also worshipped their god Mithras in a natural cave consecrated for the purpose by Zoroaster. The cave of the nymph Egeria is still shown at Rome. Kircher, after Gaffarellus, enumerates divers species of caves; as divine, natural, &c.—Of natural caves some are possessed of a medicinal virtue, as the Grotto de Serpente; others are poisonous or mephitical: some are replete with metallic exhalations, and others with waters. Divine caves were those said to affect the human mind and passions in various ways, and even to inspire with a knowledge of future events. Such were the sacred caverns at Delphi which inspired the Pythia; the Sibyl's cave at Cumae, still shown near the lake Avernus; the cave of Trophonius, &c.

CAVE, Dr William, a learned English divine, born in 1637, educated in St John's College, Cambridge; and successively minister of Hasely in Oxfordshire, Allhallows the Great in London, and of Islington. He became chaplain to Charles II. and in 1684 was installed a canon of Windsor. He compiled the Lives of the Primitive Fathers in the three first Centuries of the Church, which is esteemed a very useful work, and Historia Literaria, &c. in which he gives an exact account of all who had written for or against Christianity from the time of Christ to the 14th century: which works produced a very warm dispute between Dr Cave and M. de Clerc, who was then writing his Bibliothèque Universelle in Holland, and who charged the doctor with partiality. Dr Cave died in 1713.

CAVE, Edward, printer, celebrated as the projector of the Gentleman's Magazine, the first publication of the species, and since

The fruitful mother of a thousand more,
was born in 1691. His father being disappointed of some small family expectations, was reduced to fol-

low the trade of a shoemaker at Rugby in Warwickshire. The free school of this place, in which his son had, by the rules of its foundation, a right to be instructed, was then in high reputation, under the Rev. Mr Holyock, to whose care most of the neighbouring families, even of the highest rank, intrusted their sons. He had judgment to discover, and for some time genrously to encourage, the genius of young Cave; and was so well pleased with his quick progress in the school, that he declared his resolution to breed him for the university, and recommend him as a servitor to some of his scholars of high rank. But prosperity which depends upon the caprice of others is of short duration. Cave's superiority in literature exalted him to an invidious familiarity with boys who were far above him in rank and expectations; and, as in unequal associations it always happens, whatever unlucky prank was played was imputed to Cave. When any mischief, great or small, was done, though perhaps others boasted of the stratagem when it was successful, yet upon detection or miscarriage, the fault was sure to fall to poor Cave. The harsh treatment he experienced from this source, and which he bore for a while, made him at last leave the school, and the hope of a literary education, to seek some other means of gaining a livelihood. He was first placed with a collector of the excise; but the insouciance of his mistresses, who employed him in servile drudgery, quickly disgusted him, and he went up to London in quest of more suitable employment. He was recommended to a timber merchant at the Bankside; and while he was there on liking, is said to have given hopes of great mercantile abilities; but this place he soon left, and was bound apprentice to Mr Collins, a printer of some reputation, and deputy alderman. This was a trade for which men were formerly qualified by a literary education, and which was pleasing to Cave, because it furnished some employment for his scholastic attainments. Here, therefore, he resolved to settle, though his master and mistresses lived in perpetual discord, and their house was therefore no comfortable habitation. From the inconveniences of these domestic tumults he was soon released, having in only two years attained so much skill in his art, and gained so much the confidence of his master, that he was sent without any superintendent to conduct a printing house at Norwich, and publish a weekly paper. In this undertaking he met with some opposition, which produced a public controversy, and procured young Cave the reputation of a writer.

His master died before his apprenticeship was expired, and he was not able to bear the perverseness of his mistress; he therefore quitted her house upon a stipulated allowance, and married a young widow, with whom he lived at Bow. When his apprenticeship was over, he worked as a journeyman at the printing-house of Mr Barbar, a man much distinguished and employed by the Tories, whose principles had at that time so much prevalence with Cave, that he was for some years a writer in Mist's Journal. He afterwards obtained by his wife's interest a small place in the post-office; but still continued, at his intervals of attendance, to exercise his trade, or to employ himself with some typographical business. He corrected the Gradus ad Parnassum; and was liberally rewarded by the Company
Company of Stationers. He wrote an Account of the Criminals, which had for some time a considerable sale; and published many little pamphlets that accident brought into his hands, of which it would be very difficult to recover the memory. By the correspondence which his place in the post-office facilitated, he procured a country newspaper, and sold their intelligence to a journalist in London for a guinea a week. He was afterwards raised to the office of the clerk of the franks, in which he acted with great spirit and firmness; and often stopped franks which were given by members of parliament to their friends, because he thought such extension of a peculiar right illegal. This raised many complaints; and the influence that was exerted against him procured his ejectment from office. He had now, however, collected a sum sufficient for the purchase of a small printing office, and began the Gentleman's Magazine; an undertaking to which he owed the affluence in which he passed the last 20 years of his life, and the large fortune which he left behind him. When he formed the project, he was far from expecting the success which he found; and others had but little prospect of its consequence, that though he had for several years talked of his plan among printers and booksellers, none of them thought it worth the trial. That they were not (says Dr Johnson) restrained by their virtue from the execution of another man's design, was sufficiently apparent as soon as that design began to be gainful; for, in a few years, a multitude of magazines arose, and perished; only the London Magazine, supported by a powerful association of booksellers, and circulated with all the art and all the cunning of trade, exempted itself from the general fate of Cave's invaders, and obtained, though not an equal, yet a considerable sale.

Cave now began to aspire to popularity; and being a greater lover of poetry than any other art, he sometimes offered subjects for poems, and proposed prizes for the best performers. The first prize was £50, for being but newly acquainted with wealth, and thinking the influence of col. extremely great, he expected the first authors of the kingdom to appear as competitors, and offered the allotment of the prize to the universities. But, when the time came, no name was seen among the writers that had been ever seen before; and the universities and several private men rejected the province of assigning the prize. The determination was then left to Dr Cromwell Martimer and Dr Birch; and by the latter the award was made, which may be seen in Gent. Mag. vol. vi. p. 59.

Mr Cave continued to improve his Magazine, and had the satisfaction of seeing its success proportionate to his diligence, till in 1751 his wife died of an asthma. He seemed not at first much affected by her death, but in a few days lost his sleep and his appetite, which he never recovered. After lingering about two years, with many vicissitudes of amendment and relapse, he fell by drinking acid liquors into a diarrhoea, and afterwards into a kind of lethargic insensibility; and died Jan. 10. 1754, having just concluded the 23d annual collection.

CAVEARE. See CAVIAR.

CAVEAT, in Law, a kind of process in the spiritual courts, to stop the proving of a will, the granting of tithes of administration, &c. to the prejudice of another. It is also used to stop the institution of a clerk to a benefice.

CAVEATING, in fencing, is the shifting the sword from one side of that of your adversary to the other.

CAVEDO, in commerce, a Portuguese long measure, equal to 27.555 English inches.

CAVENDISH, Thomas, of Suffolk, the second Englishman that sailed round the globe, was descended from a noble family in Devonshire. Having dissipated his fortune, he resolved to repair it at the expense of the Spaniards. He sailed from Plymouth with two small ships in July 1586; passed through the straits of Magellan; took many rich prizes along the coasts of Chili and Peru; and near California, possessed himself of the St Ann, an Acapulco ship, with a cargo of immense value. He completed the circumnavigation of the globe, returning home round the Cape of Good Hope, and reached Plymouth again in September 1588. On his arrival, it is said that his seamen and sailors were clothed in silk, his sails were damask, and his topmast was covered with cloth of gold. His acquired riches did not last long: he reduced himself, in 1591, to the expedition of another voyage; which was far from being so successful as the former; he went no farther than the straits of Magellan, where the weather obliging him to return, he died of grief on the coast of Brazil.

CAVENDISH, Sir William, descended of an ancient and honourable family, was born about the year 1505, the second son of Thomas Cavendish of Cavendish in Suffolk, clerk of the pipe in the reign of Henry VIII. Having had a liberal education, he was taken into the family of the great Cardinal Wolsey, whom he served in the capacity of gentleman-usher of the chamber; when that superb prelate maintained the dignity of a prince. In 1527, he attended his master on his splendid embassy to France, returned with him to England, and was one of the few who continued faithful to him in his disgrace. Mr Cavendish was with him when be died, and desiring going to court till he had performed the last duty of a faithful servant by seeing his body decently interred. The king was so far from disapproving of his conduct, that he immediately took him into his household, made him treasurer of his chamber, a privy counsellor, and afterwards conferred on him the order of knighthood. He was also appointed one of the commissioners for taking the surrender of religious houses. In 1540, he was nominated one of the auditors of the court of augmentations, and soon after obtained a grant of several considerable lordships in Hertfordshire. In the reign of Edward VI, his estates were much increased by royal grants in seven different counties; and he appears to have continued in high favour at court during the reign of Queen Mary. He died in the year 1557. He was the founder of Chatsworth, and ancestor of the dukes of Devonshire. He wrote "The life and death of Cardinal Wolsey," printed at London in 1607; reprinted in 1706, under the title of "Memoirs of the great favourite Cardinal Wolsey."

CAVENDISH, William, Duke of Newcastle, grandson of Sir William Cavendish, was born in 1592. In 1610, he was made knight of the Bath; in 1620, raised to the dignity of a peer, by the title of Baron Ogle,
privy counsellor; but he soon withdrew from the board, with his friend Lord Russell, when he found that Popish interest prevailed. He carried up the articles of impeachment to the house of lords, against Lord-Chief-justice Scruggs, for his arbitrary and illegal proceedings in the court of king's bench; and when the king declared his resolution not to sign the bill for excluding the duke of York (afterwards James II.) he moved the house of commons, that a bill might be brought in for the association of all his majesty's Protestant subjects. He also openly named the king's evil counsellors, and voted for an address to remove them from his presence and councils for ever. He nobly appeared at Lord Russell's trial, in defence of that great man, at a time when it was scarce more criminal to be an accomplice than a witness for him. The same fortitude, activity, and love of his country, animated this illustrious patriot to oppose the arbitrary proceedings of James II. and when he saw that was no other method of saving the nation from impending slavery, he was the foremost in the association for invading over the prince of Orange, and the first nobleman who appeared in arms to receive him at his landing. He was created duke of Devonshire in 1694, by William and Mary. His last public service was in the union with Scotland, for concluding of which he was appointed a commissioner by Queen Anne. He died in 1707, and ordered the following inscription to be put on his monument.

Williamus ducis Devonis,
Bono ris Principium Fidelibus subitius,
Imminuit et Invisus Tyrannis.
William duke of Devonshire,
Of good Princes the faithful Subject,
The Enemy and Aversion of Tyrants.

Besides being thus estimable for public virtues, his grace was distinguished by his literary accomplishments. He had a poetical genius, which showed itself particularly in two pieces written with equal spirit, dignity, and delicacy: these are, an Ode on the Death of Queen Mary; and an allusion to the archbishop of Cambrey's Suplement to Homer. He had great knowledge in the languages, was a true judge in history, and a critic in poetry; he had a fine hand in music, an elegant taste in painting, and in architecture had a skill equal to any person of the age in which he lived. His predecessor, Sir John Cavendish, was the person who killed the famous Wat Tyler in 1381.

Cavendish, Henry, an eminent chemist and natural philosopher. See Supplement.

Cavetto, in Architecture, a hollow member, or round concave moulding, containing a quadrant of a circle, used as an ornament.

Cavezon, in the manage, a sort of nose band, either of iron, leather, or wood, sometimes flat, and at other times hollow or twisted, clapt upon the nose of a horse to wring it, and so forward the suppling and breaking of the horse.

Caviare, a kind of food lately introduced into Britain. It is made of the hard roes of sturgeon, &c. See Acme. Formed into small cakes, about an inch thick, and three or four inches broad. The method of making it is, by taking out of the spawn all the nerves or strings, then washing it in white wine or vinegar, and spread-
Cauviere. See Cabiords.

Cauil (cavillatio), is defined by some a fallacious kind of reason, carrying some resemblance of truth, which a person, knowing its falsehood, advances in dispute for the sake of victory. The art of framing sophisms or fallacies is called by Boethius cautulatorum.

CAUK, or Cauie. See Barties, Chemistry and Mineralogy Index.

CAUKING, or Cauiling of a Ship, is driving a quantity of oaken, or old rope untwisted and drawn asunder, into the seams of the planks, or into the intervals where the planks are joined together in the ship’s decks or sides, in order to prevent the entrance of water. After the oaken is driven very hard into these seams, it is covered with hot melted pitch or resin, to keep the water from rotting it.

Among the ancients, the first who made use of pitch in caulkling, were the inhabitants of Phœacia, afterwards called Corsica. Wax and resin appear to have been commonly used previous to that period; and the Poles at this time use a sort of unctuous clay for the same purpose on their navigable rivers.

CAULKING IRONS, are iron chisels for that purpose. Some of these irons are broad, some round, and others grooved. After the seams are stopped with oakum, it is done over with a mixture of tallow, pitch, and tar, as low as the ship draws water.

CAUL, in Anatomy, a membrane in the abdomen, covering the greatest part of the guts; called, from its structure, Reticulum, but most frequently Omentum. See Anatomy Index.

CAUL is likewise a little membrane, found on some children, encompassing the head when born.

Drelincourt takes the caul to be only a fragment of the membranes of the fetus; which ordinarily break at the birth of the child. Lampridius tells us, that the midwives sold this caul at a good price to the advocates and pleaders of his time; it being an opinion, that while they had this about them, they should carry with them a force of persuasion which no judge could withstand; the canons forbid the use of it, because some witches and sorcerers, it seems, had abused it.

VOL. V. Part I.

CAULIFLOWERS, in Gardening, a much esteemed species of cabbage. See Brassica.

CAURIS, in Natural History, a name given by some to the genera of shells called, by the generality of writers, pereidae, and comela venerei. It is from a false pronunciation of this word manners; these shells are called courières. See Porcellan Shell, Conchology Index.

CAURISNES (Courres), were Italians that came into England about the year 1235, terming themselves the pope’s merchants, but driving no other trade than letting out money; and having great banks in England, they differed little from Jews, save (as history says) they were rather more merciless to their debtors. Some will have them called Courssines, quasi Causus Ursius, bearish, or cruel in their causes; others Courssini or Corssin, as coming from the isle of Corsica; but Cowel says, they have their name from Cuirusium, Caurei, a town in Lombardy, where they first practised their arts of usury and extortion; from whence spreading themselves, they carried their infamous trade through most parts of Europe, and were a common plague to every nation where they came. The then bishop of London excommunicated them; and King Henry III. banished them from the kingdom in the year 1240. But, being the pope’s solicitors and money changers, they were permitted to return in the year 1250; though in a very short time they were again driven out of the kingdom on account of their intolerable exactions.

CAUSAN, Matrimonii Prelocution, in common law, a writ that lies where a woman gives lands to a man in fee to the intent he shall marry her, and he refuses to do it in a reasonable time, being therewith required by the woman; and in such case, for not performing the condition, the entry of the woman into the lands again has been adjudged lawful.

The husband and wife may sue this writ against another who ought to have married her.

CAUSALITY, among metaphysicians, the action or power of a cause in producing its effect.

CAUSALITY, among miners, denotes the lighter, sulphureous, earthy parts of ores, carried off in the operation of washing. This, in the mines, they throw in heaps upon banks, which in six or seven years they find it worth their while to work over again.

CAUSE, that from whence any thing proceeds, or by virtue of which any thing is done; it stands opposed to effect. We get the ideas of cause and effect from our observation of the vicissitude of things, while we perceive some qualities or substances begin to exist, and that they receive their existence from the use application and operation of other beings. That which produces, is the cause; and that which is produced, the effect; thus, fluidity in wax is the effect of a certain degree of heat, which we observe to be constantly produced by the application of such heat.

Aristotle, and the schoolmen after him, distinguished the four kinds of causes; the efficient, the material, the formal, and the final. This, like many of Aristotle’s distinctions, is only a distinction of the various meanings of an ambiguous word; for the efficient, the matter, the form, and the end, have nothing common in their nature, by which they may be accounted species of the same genus; but the Greek word, which we translate
translate cause, had these four different meanings in Aristotle’s days, and we have added other meanings. We do not indeed call the matter or the form of a thing its cause; but we have final causes, instrumental causes, occasional causes, and many others. Thus the word cause has been so hackneyed, and made to have so many different meanings in the writings of philosophers, and in the discourse of the vulgar, that its original and proper meaning is lost in the crowd.

With regard to the phenomena of nature, the important end of knowing their causes, besides gratifying our curiosity, is, that we may know when to expect them, or how to bring them about. This is very often of real importance in life; and this purpose is served, by knowing what, by the course of nature, goes before them and is connected with them; and this, therefore, we call the cause of such a phenomenon.

If a magnet be brought near to a mariner’s compass, the needle, which was before at rest, immediately begins to move, and bends its course towards the magnet, or perhaps the contrary way. If an unlearned sailor is asked the cause of this motion of the needle, he is at no loss for an answer. He tells you it is the magnet; and the proof is clear; for, remove the magnet, and the effect ceases; bring it near, and the effect is again produced. It is, therefore, evident to sense, that the magnet is the cause of this effect.

A Cartesian philosopher enters deeper into the cause of this phenomenon. He observes, that the magnet does not touch the needle, and therefore can give it no impulse. He pictures the ignorance of the sailor. The effect is produced, says he, by magnetic effluvia, or subtle matter, which passes from the magnet to the needle, and forces it from its place. He can even shew you, in a figure, where these magnetic effluvia issue from the magnet, what round they take, and what way they return home again. And thus he thinks he comprehends perfectly how, and by what cause, the motion of the needle is produced.

A Newtonian philosopher inquires what proof can be offered for the existence of magnetic effluvia, and can find none. He therefore holds it as a fiction, a hypothesis; and he has learned that hypothesis ought to have no place in the philosophy of nature. He confesses his ignorance of the real cause of this motion, and thinks that his business as a philosopher is only to find from experiment the laws by which it is regulated in all cases.

These three persons differ much in their sentiments with regard to the real cause of this phenomenon; and the man who knows most is he who is sensible that he knows nothing of the matter. Yet all the three speak the same language, and acknowledge that the cause of this motion is the attractive or repulsive power of the magnet.

What has been said of this, may be applied to every phenomenon that falls within the compass of natural philosophy. We deceive ourselves, if we conceive that we can point out the real efficient cause of any one of them.

The grandest discovery ever made in natural philosophy, was that of the law of gravitation, which opens such a view of our planetary system, that it looks like something divine. But the author of this discovery was perfectly aware that he discovered no real cause, but only the law or rule according to which the unknown cause operates.

Natural philosophers, who think accurately, have a precise meaning to the terms they use in the science; and when they pretend to shew the cause of any phenomenon of nature, they mean by the cause, a law of nature of which that phenomenon is a necessary consequence.

The whole object of natural philosophy, as Newton expressly teaches, is reducible to these two heads: first, by just induction from experiment and observation, to discover the laws of nature; and then to apply those laws to the solution of the phenomena of nature. This was all that this great philosopher attempted, and all that was thought attainable. And this indeed he attained in a great measure, with regard to the motions of our planetary system, and with regard to the rays of light.

But supposing that all the phenomena which fall within the reach of our senses were accounted for from general laws of nature justly deduced from experience; that is, supposing natural philosophy brought to its utmost perfection: it does not discover the efficient cause of any one phenomenon in nature.

The laws of nature are the rules according to which the effects are produced; but there must be a cause which operates according to these rules. The rules of navigation never navigated a ship. The rules of architecture never built a house.

Natural philosophers, by great attention to the course of nature, have discovered many of her laws, and have very happily applied them to account for many phenomena; but they have never discovered the efficient cause of any one phenomenon; nor do those who have distinct notions of the principles of the science make any such pretence.

Upon the theatre of nature we see innumerable effects which require an agent endowed with active power: but the agent is behind the scene. Whether it be the Supreme cause alone, or a subordinate cause or causes; and if subordinate causes be employed by the Almighty, what their nature, their number, and their different offices may be, are things hid, for wise reasons, without doubt, from the human eye.

CAUSE, among civilians, the same with action. See ACTION.

CAUSE, among physicians. The cause of a disease is defined by Galen to be that during the presence of which we are ill, and which being removed, the disorder immediately ceases. The doctrine of the causes of diseases is called ETIOLOGY.

Physicians divide causes into procastratic, antecedent, and continent.

Procastratic Cause (αἷμα πρωτωμερίας), called also primitive and incipient cause, is either an occasion which of its own nature does not beget a disease, but happening on a body inclined to diseases, breeds a fever, gout, &c. (such as are watching, fasting, and the like); or an evident and manifest cause, which immediately produces the disease, as being sufficient thereto, such as is a sword in respect of a wound.

Antecedent Cause, (αἷμα προγεγομένην), a latent disposition of the body, from whence some disease may arise; such as a plethora in respect of a fever, a cachexy in respect of a scurvy.
CAUSALITY

Continent, Conjunct, or Proximate Cause, that principle in the body which immediately adheres to the disease, and which being present, the disease is also present: or, which being removed, the disease is taken away: such is the stone in a naphritic patient.

Causeway, or Causey, a massive construction of stones, staves, and fascines; or an elevation of fat viscidous earth, well beaten: serving either as a road in wet marshy places, or as a mole to retain the waters of a pond, or prevent a river from overflowing the lower grounds. See Road.—The word comes from the French chaussée, anciently wrote chausée; and that from the Latin calcata, or calculata; according to Sommer and Spelman, a cæculata. Berger takes the word to have had its rise in pedum cælata, quibus terruntur. Some derive it from the Latin calcus, or French chaus, as supposing it primarily to denote a way paved with chalk stones.

Causeway (calcetum or cæcula), more usually denotes a common hard raised way, maintained and repaired with stones and rubbish.

Devil's Causeway, a famous work of this kind, which ranges through the county of Northumberland, commonly supposed to be Roman, though Mr. Horace suspects it to be of latter times.

Giants' Causeway, is a denomination given to a huge pile of stony columns in the district of Coleraine in Ireland. See Giant's Causeway.

CAUSSIN, Nicholas, surnamed the Just, a French Jesuit, was born at Troyes in Champagne, in the year 1580; and entered into the Jesuits order when he was 26 years of age. He taught rhetoric in several of their colleges, and afterwards began to preach, by which he gained very great reputation. He increased this reputation by publishing books, and in time was preferred to be confessor to the king. But he did not discharge this office to the satisfaction of Cardinal Richelieu, though he discharged it to the satisfaction of every honest man; and therefore it is not to be wondered at that he came at length to be removed. He died in the Jesuits convent at Paris in 1651. None of his works did him more honour than that which he entitled La Cour Sainte. It has been printed a great many times; and translated into Latin, Italian, Spanish, Portuguese, German, and English. He published several other books both in Latin and French.

CAUSTICITY, a quality belonging to several substances, by the acrimony of which the parts of living animals may be corroded and destroyed. Bodies which have this quality, when taken internally, are true poisons. The causticity of some of these, as of arsenic, is so deadly, that even their external use is proscribed by prudent physicians. Several others, as nitric acid, lapis infernalis or lunar caustic, common caustic, butter of antimony, are daily and successfully used to consume fleshy, to open issues, &c. They succeed very well when properly employed and skilfully managed. The causticity of bodies depends entirely on the state of the saline, and chiefly of the acid matters they contain. When these acids happen to be at the same time much concentrated, and slightly attached to the matters with which they are combined, they are then capable of acting, and are corrosive or caustic. Thus fixed and volatile alkalies, although they are themselves caustic, become much more so by being treated with quicklime; because this substance deprives them of causticity, all their fixed air, or carbonic acid, to which they owe their mildness. By this treatment, then, the saline principle is more disengaged, and rendered more capable of action. Also all combinations of metallic matters with acids form salts more or less corrosive, because these acids are deprived of all their superabundant water, and are besides but imperfectly saturated with the metallic matters. Nevertheless, some other circumstance is necessary to constitute the causticity of these saline metallic matters. For the same quantity of marine acid, which, when pure and diluted with a certain quantity of water, would be productive of no harm, shall, however, produce all the effects of a corrosive poison, when it is united with mercury in corrosive sublimate, although the sublimate shall be dissolved in so much water that its causticity cannot be attributed to the concentration of its acid. This effect is, by some chemists, attributed to the great weight of the metallic matters, with which the acid is united; and this opinion is very probable, seeing its causticity is nothing but its dissolving power, or its disposition to combine with other bodies; and this disposition is nothing else than attraction.

On this subject Dr. Black observes, that the compounds produced by the union of the metals with acids are in general corrosive. Many of them applied to the skin destroy it almost as fast as the mineral acids; and some of the most powerful potential cantraries are made in this way. Some are reckoned more acid than the pure acids themselves; and they have more powerful effects when taken internally, or at least seem to have. Thus we can take 10 or 12 drops of a fossil acid, diluted with water, without being disturbed by it; but the same quantity of acid previously combined with silver, quicksilver, copper, or regulus of antimony, will throw the body into violent disorders, or even prove a poison, if taken all at once.

This increased activity was, by the mechanical philosophers, supposed to arise from the weight of the metallic particles. They imagined that the acid was composed of minute particles of the shape of needles or wedges; by which means they were capable of entering the pores of other bodies, separating their atoms from each other, and thus dissolving them. To these acid spiculae the metallic particles gave more force; and the momentum of each particular needle or wedge was increased in proportion to its increase of gravity by the additional weight of the metallic particle. But this theory is entirely fanciful, and does not correspond with facts. The activity of the compound is not in proportion to the weight of the metal; nor are the compounds always possessed of any great degree of acrimony: neither is it true that any of them have a greater power of destroying animal substances than the pure acids have.

There is a material difference between the powers called stimuli and corrosives. Let a person apply to any part of the skin a small quantity of lunar caustic, and likewise a drop of strong nitrous acid, and he will find that the acid acts with more violence than the caustic; and the disorders that are occasioned by the compounds of metals and acids do not proceed from a causticity in them, but from the metal affecting and proving a stimulus to the nerves: and that this is the
Causitvty of the body. Thus the compounds of antimony and mercurry with the vegetable acids, do not show the smallest degree of acrimony; but, taken internally, they produce violent convulsive motions over the whole body, which are occasioned by the metallic matter having a power of producing this effect; and the acid is only the means of bringing it into a dissolved state, and making it capable of acting on the nervous system. In general, however, the compounds of metallic substances with acids may be considered as milder than the acids in a separate state; but the acid is not so much neutralized as in other compounds, for it is less powerfully affected by the metal; so that alkaline salts, absorbent earths, or even heat alone, will decompose them; and some of the inflammable substances, as spirit of wine, aromatic oils, &c. will attract the acid, and precipitate the metal in its metallic form: and the metals can be employed to precipitate one another in their metallic form; so that the cohesion of these compounds is much weaker than those formed of the same acids with alkaline salts or earths.

Caustics, is an appellation given to substances of so hot and fiery a nature, that, being applied, they consume, and as it were burn, the texture of the parts, like hot iron.

Caustics are generally divided into four sorts; the common stronger caustic, the common milder caustic, the antimonial caustic, and the lunar caustic. See Pharmacy and Chemistry Index.

Caustic Curve, in the higher geometry, a curve formed by the concourse or coincidence of the rays of light reflected from some other curve.

Causus, or Burning Fever, a species of continual fever, accompanied with a remarkable inflammation of the blood.

Cauterization, the act of burning or searing some morbid part, by the application of fire either actual or potential. In some places they cauterize with burning tow, in others with cotton or moxa, in others with live coals; some use Spanish wax, others pyramidal pieces of linen, others gold or silver; Severinus recommends flame blown through a pipe; but what is usually preferred among us is a hot iron.

Cauterizing irons are of various figures; some flat, others round, some curved, &c. of all which we find draughts in Albucasis, Scultetus, Ferrara, and others. Sometimes a cautery is applied through a capsula, to prevent any terror from the sight of it. This method was invented by Plencranius, and is described by Scultetus. In the use of all cauteries, care is to be taken to defend the neighbouring parts, either by a lamina, defensive plaster, or lint moistened in oxycerate. Sometimes the hot iron is transmitted through a copper capsula, for the greater safety of the adjoining parts. The degrees and manners of cauterizing are varied according to the nature of the disease and the part affected.

Cautery, in Surgery, a medicine for burning, eating, or corroding any solid part of the body.

Cauteries are distinguished into two classes: actual and potential: by actual cauteries are understood red hot instruments, usually of iron; and by potential cauteries are understood certain kinds of corroding medicines. See Pharmacy.

Caution, in the Civil and Scots Law, denotes much the same with what, in the law of England, is called Bail.

Cautioner, in Scots Law, that person who becomes bound for another to the performance of any deed or obligation. As to the different kinds and effects of cautionry, see Law, Part III. No. clxxv. 19.

CAWK. See CAUS.

Caxa, a little coin made of lead mixed with some scoria of copper, struck in China, but current chiefly at Bantam in the island of Java, and some of the neighboring islands. See (the Table subjoined to) Money.

Caxamalca, the name of a town and district of Peru in South America, where there was a most sumptuous palace belonging to the Incas, and a magnificent temple dedicated to the sun.

Caxton, William, a mercer of London, eminent by the works he published, and for being reputed the first who introduced and practised the art of printing in England; as to which, see (the History of) Printing.

Cayenne, a rich town and island of South America, and capital of the French settlements there, is bounded on the north by the Dutch colonies of Surinam, and situated in W. Long. 53° 10' N. Lat. 3° 50'.

This settlement was begun in 1646. A report had prevailed for some time before this, that in the interior parts of Guiana, there was a country known by the name of El Dorado, which contained immense riches in gold and precious stones; more than ever Cortez and Pizarro had found in Mexico and Peru; and this fable had fired the imagination of every nation in Europe. It is supposed that this was the country in quest of which Sir Walter Raleigh went on his last voyage; and as the French were not behind their neighbours in their endeavours to find out so desirable a country, some attempts for this purpose were likewise made by that nation much about the same time; which at last coming to nothing, the adventurers took up their residence on the island of Cayenne. In 1643, some merchants of Rouen united their stock, with a design to support the new colony; but, committing their affairs to one Poncelet de Brevigny, a man of a ferocious disposition, he declared war both against the colonists and savages, in consequence of which he was soon massacred. This catastrophe entirely extinguished the adoration of these associates; and in 1651, a new company was established. This promised to be much more considerable than the former; and they set out with such a capital as enabled them to collect 700 or 800 colonists in the city of Paris itself. They embarked on the Seine, in order to sail down to Havre de Grace; but unfortunately the abbe de Marivault, a man of great virtue, and the principal promoter of the undertaking, was drowned as he was stepping into his boat. Another gentleman, who was to have acted as general, was assassinated on his passage, and 12 of the principal adventurers who had promised to put the colony into a flourishing situation, not only were the principal perpetrators of this fact, but uniformly behaved in the same atrocious manner. At last they hanged one of their own number; two died; three were banished to

Cayenne.

a desert island; and the rest abandoned themselves to
every kind of excess. The commandant of the citadel
deserted to the Dutch with part of his garrison. The
savages, roused by numberless provocations, fell upon
the remainder: so that the few who were left thought
themselves happy in escaping to the Leeward islands
in a boat and two canoes, abandoning the fort, ammu-
nition, arms, and merchandise, fifteen months after they
had landed on the island.

In 1663, a new company was formed, whose capital
amounted only to 8750l. By the assistance of the ministry they expelled the Dutch who had taken pos-
session of the island, and settled themselves much more
comfortably than their predecessors. In 1667 the island
was taken by the English, and in 1676 by the Dutch,
but afterwards restored to the French; and since that
time it has never been attacked. Soon after some pi-
rates, laden with the spoils they had gathered in the
South seas, came and fixed their residence at Cayenne;
resolving to employ the treasures they had acquired
in the cultivation of the lands. In 1688, Ducasse, an able
seaman, arrived with some ships from France, and pro-
tected them to the plundering of Surinam. This was
agreed to. The expedition, however, proved unfortu-
nate. Many of the assailants were killed, and all the
rest taken prisoners and sent to the Caribbees islands.
Cayenne surrendered to the British in 1689, but was
restored to France at the peace of Paris in 1714.

The island of Cayenne is about 16 leagues in cir-
cumference, and is only parted from the continent by
two rivers. By a particular formation, uncommon in
islands, the land is higher near the water side, and low
in the middle. Hence the island is so full of morasses,
that all communication between the different parts of
it is impossible, without taking a great circuit. There
are some small tracts of an excellent soil to be found
here and there; but the generality is dry, sandy, and
soon exhausted. The only town in the colony is de-
defended by a circuit, a large ditch, a very good mud
rammed, and five bastions. In the middle of the town
is a pretty considerable extremity, of which a redoubt
has been made that is called the fort. The entrance
into the harbour is through a narrow channel; and ships
can only get in at high water, through the rocks and
reefs that are scattered about this pass.

The first produce of Cayenne was the arnatto from
the culture of which the colonists proceeded to that of
cotton, indigo, and lastly sugar. It was the first of
all the French colonies that attempted to cultivate
coffee. The coffee tree was brought from Surinam in
1721 by some deserters from Cayenne, who purchased
their pardon by so doing. Ten or twelve years after
they planted cacao. In the year 1752 there were
exported from Cayenne 260,541 pounds of arnatto,
80,353 pounds of sugar, 17,910 pounds of cotton,
26,881 pounds of coffee, 91,016 pounds of cacao, 618
trees for timber, and 104 planks.

CAYLUS, COUNT DE, Marquis de Sternay, Baron
de Brezec, was born at Paris in 1592. He was the
eldest of the two sons of John Count de Caylus, lie-
tenant general of the armies of the king of France,
and of the marquess de Valletta. The count and
countess, his father and mother, were very careful
of the education of their son. The former instructed
him in the profession of arms, and in bodily exercises;
the latter watched over and fostered the virtues of
his mind, and this delicate task she discharged with
singular success. The countess was the niece of
Madame de Maintenon, and was remarkable both
for the solidity of her understanding and the charms
of her wit. She was the author of that agreeable
book entitled "The Recollections of Madame de
Caylus," of which Voltaire lately published an elegant
edition. The amiable qualities of the mother appeared
in the son; but they appeared with a bold and mi-
nitary air. In his natural temper he was gay and
sprightly, had a taste for pleasure, a strong passion for
independence, and an invincible aversion to the ser-
vitude of a court. Such were the instructors of the
count de Caylus. He was only twelve years of age
when his father died at Brussels in 1704. After fi-
nishing his exercises, he entered into the corps of the
Musqueatores; and in his first campaign in the year
1709, he distinguished himself by his valour in such a
manner, that Louis XIV. commended him before all
the court, and rewarded him with an ensigncy in the
Gendarmerie. In 1711 he commanded a regiment of
dragoons, which was called by his own name; and
he signalized himself at the head of it in Catalonia. In
1713, he was at the siege of Fribourg, where he was
exposed to imminent danger in the bloody attack of
the covered way. The peace of Rastadt having left him
in a state of inactivity ill suited to his natural temper,
his vivacity soon carried him to travel into Italy; and
his curiosity was greatly excited by the wonders of that
country, where antiquity is still fruitful, and produces
so many objects to improve taste and to excite admira-
tion. The eyes of the count were not yet learned; but
he was struck with the sight of so many beauties, and
soon became acquainted with them. After a year's
absence, he returned to Paris with so strong a passion
for travelling and for antiquities, as induced him to
quit the army.

He had no sooner quitted the service of Louis, than
he sought for an opportunity to set out for the Levant.
When he arrived at Smyrna, he visited the ruins of
Ephesus. From the Levant he was recalled in Febru-
ary 1717 by the tenderness of his mother. From
that time he left not France, but to make two excursions
to London. The Academy of Painting and Sculpture
adopted him an honorary member in the year
1731; and the count, who loved to realize titles, spar-
ed neither his labour, nor his credit, nor his fortune,
to instruct, assist, and animate the artists. He wrote
the lives of the most celebrated painters and engraver-
that have done honour to this illustrious academy;
and, in order to extend the limits of the art, which
seemed to him to move in too narrow a circle, he col-
clected, in three different works, new subjects for the
painter, which he had met with in the works of the
ancients.

Such was his passion for antiquity, that he wished
to have had it in his power to bring the whole of it
to life again. He saw with regret, that the works of
the ancient painters, which have been discovered
by our most skilful artists, are effaced and deplored almost as soon
as they are drawn from the subterraneous mansions
where they were buried. A fortunate accident fur-
ished:
nished him with the means of showing us the composition and the colouring of the pictures of ancient Rome. The coloured drawings which the famous Pietro Sante Bartoli had taken there from antique pictures, fell into his hands. He had them engraved; and, before he enriched the king of France’s cabinet with them, he gave an edition of them at his own expense. It is perhaps the most extraordinary book of antiquities that ever will appear. The whole is painted with a purity and precision that is inimitable; we see the liveliness and the freshness of the colouring which charmed the Caesars. There were only 30 copies published; and there is no reason to expect that there will hereafter be any more.

Count de Caylus was engaged at the same time in an enterprise still more favourable to Roman grandeur, and more interesting to the French nation. Colbert had framed the design of engraving the Roman antiquities that are still to be seen in the southern provinces of France. By his orders Mignard the architect had made drawings of them, which Count de Caylus had the good fortune to recover. He resolved to finish the work begun by Colbert, and to dedicate it to that great minister; and so much had he this enterprise at heart, that he was employed in it during his last illness, and warmly recommended it to M. Mariette.

In 1742, Count Caylus was admitted honorary member of the Academy of Belles Lettres; and then it was that he seemed to have found the place for which nature designed him. The study of literature now became his ruling passion; he consecrated to it his time and his fortune; he even renounced his pleasures to give himself wholly up to that of making some discovery in the field of antiquity. But amidst the fruits of his research and invention, nothing seemed more flattering to him than his discovery of encaustic painting. A description of Pliny’s, but too concise a one to give him a clear view of the matter, suggested the idea of it. He availed himself of the friendship and skill of M. Maguelot, a physician in Paris, and an excellent chemist; and by repeated experiments found out the secret of incorporating wax with diverse tints and colours, and of making it obedient to the pencil. Pliny has made mention of two kinds of encaustic painting practised by the ancients; one of which was performed with wax, and the other upon ivory, with hot punches of iron. It was the former that Count Caylus had the merit of reviving: and M. Muntz afterwards made many experiments to carry it to perfection.

In the hands of Count Caylus, literature and the arts lent each other a mutual aid. But it would be endless to give an account of all his works. He published above 40 dissertations in the Memoirs of the Academy of Belles Lettres. The artists he was particularly attentive to; and to prevent their falling into mistakes from an ignorance of costume, which the abest of them have sometimes done, he founded a prize of 100 livres, the object of which is to explain, by means of authors and monuments, the usages of ancient nations. In order that he might enjoy with the whole world the treasures he had collected, he caused them to be engraved, and gave a learned description of them in a work which he embellished with 800 copperplates.

The strength of his constitution seemed to give him hopes of a long life; but a humour settling in one of his legs, which entirely destroyed his health, he expired on the 5th of September 1765, and by his death his family is extinct. The tomb erected to the honour of Count Caylus is to be seen in the chapel of St Germain l’Auxerrois, and deserves to be remarked. It is perfectly the tomb of an antiquary. This monument was an ancient sepulchral antique, of the most beautiful porphyry, with ornaments in the Egyptian taste. From the moment he procured it, he had destined it to grace the place of his interment. While he awaited the fatal hour, he placed it in his garden, where he used to look upon it with a tranquil but thoughtful eye, and pointed it out to the inspection of his friends.

The character of Count Caylus is to be traced in the different occupations which divided his cares and his life. In society, he had all the frankness of a soldier, and a politeness which had nothing in it of deceit or circumvention. Born independent, he applied to studies which suited his taste. His heart was yet better than his abilities. In his walks he used frequently to try the honesty of the poor, by sending them with a piece of money to get change for him. In those cases he enjoyed their confusion at not finding him; and then presenting himself, used to commend their honesty, and give them double the sum. He said frequently to his friends, “I have this day lost a crown; but I was sorry that I had not an opportunity of giving a second. The beggar ought not to want integrity.”

CAYSTER, or CAYSTRUS, in Ancient Geography, a river of Ionia, whose mouth Ptolemy places between Colophon and Ephesus; commended by the poets for its swans, which it had in great numbers. Its source was in the Montes Ciliani; (Pliny). CAYSTRIUM was a part of the territory of Ephesus. CAPPADOCIA of Lydia were plains lying in the middle between the inland parts and Mount Tmolus.

CAZEROM, or CAZERON, a city of Asia, in Persia, situated in E. Long. 70. N. Lat. 29. 15.

CAZIC, or CAZIQUE, a title given by the Spaniards to the petty kings, princes, and chiefs, of the several countries of America, excepting those of Peru, which are called curatas. The French call them casiques, a denomination which they always give to the Tartarian hordes.—The cazics, in some places, do the office of physicians, and in others of priests, as well as of captains. The dignity of cazic among the Chipics, a people of South America, does not descend to children, but must be acquired by valour and merit. One of the prerogatives attached to it is, that the cazic may have three wives, while the other people are allowed only one. Mexico comprehended a great number of provinces and islands, which were governed by lords called capitanes, dependent on and tributary to the emperor. Thirty of these vassals are said to have been so powerful, that they were able, each of them, to bring an arm of 100,000 men into the field.

CAZIMIR, a handsome town of Poland, in the palatinate of Lublin, situated on a hill covered with trees, in E. Long. 10. N. Lat. 51. 5.

CEA. See CROES.

Index.

CEBES,
CEBES, of Thebes, a Socratic philosopher, author of the admired Table of Cebes; or, "Dialogues on the Birth, Life, and Death of Mankind." He flourished about 405 years before Christ. The above piece is mentioned by some of the ancient writers, by Lucian, D. Laertius, Tertullian, and Suidas: but of Cebes himself we have no account, save that he is once mentioned by Plato, and once by Xenophon. The former says of him, in his "Tuodo," that he was a sagacious investigator of truth, and never assented without the most convincing reasons: the latter, in his "Memoria," ranks him among the few intimates of Socrates, who excelled the rest in the innocency of their lives. Cebes's Tabula is usually printed with Epictetus's Manual.

CECIL, William, Lord Burleigh, treasurer of England in the reign of Queen Elizabeth, was the son of Richard Cecil, Esq., master of the robes to King Henry VIII. He was born in the house of his grandfather, David Cecil, Esq., at Bourn in Lincolnshire, in the year 1520; and received the rudiments of his education in the grammar-school at Grantham. From thence he was removed to Stamford; and about the year 1535, was entered at St John's College, Cambridge. Here he began his studies with a degree of enthusiastic application very uncommon in young gentlemen of family. At the age of 16 he read a sophistry lecture, and at 19 a voluntary Greek lecture, which was more extraordinary as being at a time when the Greek language was by no means universally understood. In 1541 he went to London, and became a member of the society of Gray's Inn, with an intention to study the law; but he had not been long in that situation before an accident introduced him to King Henry, and gave a new bias to his pursuits. O'Neil, a famous Irish chief, coming to court, had brought with him two Irish chaplains, violent bigots to the Roman faith; with these Mr Cecil, visiting his father, happened to have a warm dispute in Latin, in which he displayed uncommon abilities. The king, being informed of it, ordered the young man into his presence, and was so pleased with his conversation, that he commanded his father to find a place for him. He accordingly requested the reversions of the custum brevium, which Mr Cecil afterwards possessed. About this time he married the sister of Sir John Cheke, by whom he was recommended to the earl of Hertford, afterwards duke of Somerset, and protector.

Soon after King Edward's accession, Mr Cecil came into the possession of the office of custos brevium, worth about 240l. a-year. His first lady dying in 1543, he married the daughter of Sir Anthony Cook, director of the king's studies. In 1547, he was appointed by the protector master of requests; and soon after attended his noble patron on his expedition against the Scots, and was present at the battle of Musselburgh. In this battle, which was fought on the 10th of September, 1547, Mr Cecil's life was miraculously preserved by a friend, who, on pushing him out of the level of a cannon, had his arm shattered to pieces. The sight and judgment of his friend must have been as extraordinary as his friendship, to perceive the precise direction of a cannon shot; unless we suppose, that the ball was almost quite spent; in which case the thing is not impossible. The story is told in his life by a domestic. In the year 1548, Mr Cecil was made secretary of state; but in the following year, the duke of Northumberland's faction prevailing, he suffered in the disgrace of the protector Somerset, and was sent prisoner to the Tower. After three months confinement he was released; in 1551 restored to his office; and soon after knighted, and sworn of the privy council. In 1553, he was made chancellor of the order of the Garter, with an annual fee of 100 marks.

On the death of Edward VI, Mr Cecil prudently refused to have any concern in Northumberland's attempt in favour of the unfortunate Lady Jane Grey; and when Queen Mary succeeded to the throne, he was graciously received at court; but not choosing to change his religion, was dismissed from his employments. During this reign, he was twice elected knight of the shire for the county of Lincoln; and often spoke in the house of commons with great freedom and firmness, in opposition to the ministry. Nevertheless, though a Protestant and a patriot (that is, a courtier out of place), he had the address to steer through a very dangerous sea without a shipwreck.

Queen Elizabeth's accession in the year 1558 immediately dispelled the cloud which had obscured his fortunes and ministerial capacity. During the brief reign of her sister, he had constantly corresponded with the princess Elizabeth. On the very day of her accession, he presented her with a paper containing twelve articles necessary for her immediate dispatch; and, in a few days after, was sworn of the privy council, and made secretary of state. His first advice to the queen was, to call a parliament; and the first business he proposed after it was assembled was the establishment of a national church. A plan of reformation was accordingly drawn up under his immediate inspection, and the legal establishment of the church of England was the consequence. Sir William Cecil's next important concern, was to restore the value of the coin, which had in the preceding reigns been considerably debased. In 1561, he was appointed master of the wards; and, in 1571, created baron of Burleigh, as a reward for his services, particularly in having lately stifled a formidable rebellion in the north. The following year he was honoured with the Garter, and raised to the office of lord high treasurer of England. From this period we find him the praemium mobile of every material transaction during the glorious reign of Queen Elizabeth. Notwithstanding the temporary influence of other favourites, Lord Burleigh was, in fact, her prime minister, and the person on whom she chiefly confided in matters of real importance. Having filled the highest and most important offices of the state for 40 years, and guided the helm of government during the most glorious period of English history, he departed this life on the 4th of August 1558, in the 78th year of his age. His body was removed to Stamford, and there deposited in the family vault, where a magnificent tomb was erected to his memory. Notwithstanding his long enjoyment of such lucrative employments, he left only an estate of 4000l. per annum, 14,000l. in money, and effects worth about 11,000l. He lived, indeed, in a manner suitable to his high rank and importance.
Cecilia, Sr, the patroness of music, has been honoured as a martyr ever since the fifth century. Her story, as delivered by the notaries of the Roman church, and from thence transcribed into the Golden Legend and other books of the like kind, says, that she was a Roman lady, born of noble parents about the year 205. That, notwithstanding she had been converted to Christianity, her parents married her to a young Pagan nobleman named Valerianus; who going to bed to her on the wedding night, as the custom is, says the book, was given to understand by his spouse, that she was mighty visited by an angel, and that he must forbear to approach her, otherwise the angel would destroy him. Valerianus, somewhat troubled at these words, desired that he might see his rival the angel; but his spouse told him that was impossible, unless he would consent to be baptized and become a Christian. This he consented to; after which, returning to his wife, he found her in her closet at prayer, and by her side, in the shape of a beautiful young man, an angel clothed with brightness. After some conversation with the angel, Valerianus told him that he had a brother named Tiburtius, whom he greatly wished to see a partaker of the grace which he himself had received. The angel told him, that his desire was granted, and that they should be both crowned with martyrdom in a short time. Upon this the angel vanished, and was not long in showing himself as good as his word; Tiburtius was converted, and both he and his brother Valerianus were beheaded. Cecilia was offered her life upon condition that she would sacrifice to the deities of the Romans; but she refused; upon which she was thrown into a cauldron of boiling water, and scalded to death. Others say, that she was stifled in a dry bath, i.e. an enclosure, from whence the air was excluded, having a slow fire underneath it; which kind of death was sometimes inflicted by the Romans upon women of quality who were criminals. Upon the spot where her house stood, is a church, said to have been built by Pope Urban I, who administered baptism to her husband and his brother; it is the church of St Cecilia at Trastevere; within is a most curious painting of the saint, as also a stately monument with a cumbent statue of her with her face downwards. There is a tradition of St Cecilia, that she excelled in music; and that the angel who was thus enamoured of her, was drawn from the celestial regions by the charms of her melody; this has been deemed authority sufficient to making her the patroness of music and musicians. The legend of St Cecilia has given frequent occasion to painters and sculptors to exercise their genius in representations of her, playing on the organ, and sometimes on the harp. Raphael has painted her singing with a regal in her hands; and Domenichino and Mignard, singing and playing on the harp.

CECROPS, the founder and first king of Athens, about the time of Moses the lawgiver of the Hebrews. He was the first who established civil government, religious rites, and marriage among the Greeks; and died after a reign of 50 years. See ATTICA, No 4.

CEDAR. See JUNIPERUS and PINUS, BOTANY INDEX.

The species of cedar famous for its duration, is that popularly called the cedar of Lebanon (Pinus cedrus), by the ancients cedrus magnus, or the great cedar; also cedrelae, cedrus. See PINUS, BOTANY INDEX.

CEDRENUS, GEORGE, a Greek monk, lived in the 11th age, and wrote, "Annals, or an abridged History, from the beginning of the World to the Reign of Isaac Comnenus, emperor of Constantinople, who succeeded Michael IV. in 1057." This work is no more than an extract from several historians. There is an edition of it, printed at Paris in 1647, with the Latin version of Xylander, and the notes of Father Goar, a Dominican.

CEDRUS, THE CEDAR TREE, MAHOGANY, &c. See JUNIPERUS, PINUS, and SWITZENIA, BOTANY INDEX.

CEILING, in Architecture, the top or roof of a lower room; or a covering of plaster over laths nailed on the bottom of the joints that bear the floor of the upper room; or where there is no upper room, on joints for the purpose; hence called ceiling joints. The word ceiling answers pretty accurately to the Latin jacuinar, "every thing over head."

Plastered ceilings are much used in Britain, more than in any other country: nor are they without their advantages, as they make the room light and airy; are good in case of fire; stop the passage of the dust, lessen the noise overhead; and, in summer, make the air cooler.

CEILING, in sea language, denotes the inside planks of a ship.

CEIMELIA, from cemen, "to be laid up," is antiquity, denotes choice or precious pieces of furniture or ornaments, reserved or laid up for extraordinary...
CELEMELIARCHIUM, the repository or place where ceimelia are preserved.

CEIMELIOPHYAX, (from ceimelios and phuyx, I bear), the keeper or curator of a collection of ceimelia; sometimes also denominated ceimeliarchia. The ceimeliarchia, or ceimeliophyax, was an officer in the ancient churches or monasteries, answering to what was otherwise denominated chartophylox and custos archivorum.

CELENE, in Ancient Geography, the capital of Phrygia Magna, situated on a crenellated mountain, at the common sources of the Meander and Marystas. The king of Persia had a strong palace beneath the citadel, by the springs of the Marystas, which rose in the market-place, not less in size than the Meander, and flowed through the city. Cyrus the Younger had also a palace there, but by the springs of the Meander, which river passed likewise through the city. He had, moreover, an extensive paradise or park, full of wild boars, which he hunted on horseback for exercise or amusement; and watered by the Meander, which ran through the middle. Xerxes was said to have built these palaces and the citadel after his return from his expedition into Greece.

Antiochus Soter removed the inhabitants of Celenene into a city which he named, from his mother, Apamea; and which became afterwards a mart inferior only to Ephesus. See Apamea.

CELANDINE. See CHELIDIONUM, BOTANY INDEX.

CELANO, a town of Italy, in the kingdom of Naples, in Faminus Abruzzi. It is seated a mile from the lake Celano, anciently called Pucinus. E. Long 13° 39'. N. Lat. 41° 56'.

CELARENT, among logicians, a mode of syllogism, wherein the major and conclusion are universal negative propositions, and the minor an universal affirmative.

E. gr. CE None whose understanding is limited can be omniscient.

LA Every man's understanding is limited.

rEnt Therefore no man is omniscient.

CELASTRUS. See BOTANY INDEX.

In Senegal the negroes use the powder of the root of this plant as a specific against gonorrhœa, which it is said to cure in eight or sometimes in three days. An infusion of the bark of a species of staff tree, which grows in the isle of France, is said to possess the same virtues.

CELEBES, an island in the Indian sea, situated under the equator, and called by some Macassar. It extends 2° north, and 6° south latitude, and between 115° and 135° east longitude. It is of a very irregular figure, consisting of three long peninsulas. The air is hot and moist, and subject to great rains during the north-west winds, which blow from November to March, at which time the country is overflowed, and for this reason they build their houses on piles of wood ten feet high. The most healthful time is during the monsoons, which seldom fail blowing regularly in one part of the year. The chief vegetables are rice and cocoons; but they have ebony, sanders, &c. Their fruits and flowers are much the same as in the neighbouring parts of the Indies. They have pepper, sugar, tobacco, arse, the finest cotton, and opium. The natives have bright olive complexions, and the women have shining black hair. They are thought to be very handsome by the Dutch and Chinese, who often purchase them for bed-fellows. The men are industrious, robust, and make excellent soldiers. Their arms are sabres, and trunks, from whence they blow poisoned darts, which are pointed with the tooth of a sea-fish. Some likewise use poisoned daggers. They were the last of the Indian nations that were enslaved by the Dutch, which could not be effected till after a long war. They teach their children to read and write, and their characters have some resemblance of the Arabic. Their religion being Mahometan, the men indulge themselves in many wives and concubines. The employment of the women is spinning, cooking, and making their own and their husbands clothes. The men wear jewels in their ears, and the women gold chains about their necks. The inhabitants in general go half-naked, without any thing on their head, legs, or feet, and some have nothing but a cloth about their middle. The streets of the town Macassar are spacious, and planted with trees on every side. It stands by the side of the only large river they have in the island. The Dutch have a fort here, mounted with 40 guns, and garrisoned with 700 men; having gradually possessed themselves of a great part of the country. They were, however, dispossessed by the British during the late wars, but received back the colony at the peace in 1814. It is said that the population has diminished since the Dutch conquest.

The religion of these islands was formerly idolatry. They worshipped the sun and moon. They sacrificed to them in the public squares, having no materials which they thought valuable enough to be employed in raising temples. About two centuries ago, some Christians and Mahometans having brought their opinions to Celebes, the principal king of the country took a dislike to the national worship. Having convened a general assembly, he ascended an eminence, when, spreading out his hands towards heaven, he told the Deity, that he would acknowledge for truth that doctrine whose ministers should first arrive in his dominions, and, as the winds and waves were at his command, the Almighty would have himself to blame if he embraced a falsehood. The assembly broke up, determined to wait the orders of heaven, and to obey the first missionaries that should arrive. The Mahometans were the most active, and their religion accordingly prevailed. See CELEBES, SUPPLEMENT.

CELEBRES, in Roman antiquity, a regiment of body-guards belonging to the Roman kings, established by Romulus, and composed of 300 young men, chosen out of the most illustrious Roman families, and approved by the suffrages of the whole of the people, each of which furnished ten. The same comes from color, "quick, ready at" and was given them because of their promptness to obey the king.

The celebres always attended near the king's person, to guard him, to be ready to carry his orders, and to execute
execute them. In war they made the van-guard in the engagement, which they always began first; in re-treats they made the rear-guard.

Though the celeres were a body of horse, yet they usually dismounted, and fought on foot; their commander was called tribune, or prefect of the celeres. They were divided into three troops of 100 each, commanded by a captain called centurio; their tribune was the second person in the kingdom.

Plutarch says, Numa broke the celeres. If this be true, there were some re-established; for we find them under most of the succeeding kings: witness the great Brutus, who expelled the Tarquins, and who was the tribune of the celeres.

CELERI, in Botany, the English name of a variety of the Apium graveolens.

The seed of celeri should be sown at two or three different times, the better to continue it for use throughout the whole season without running up to seed. The first sowing should be in the beginning of March, upon a gentle hot-bed; the second may be at the end of the same month, which ought to be in an open spot of light earth, where it may have the benefit of the sun; the third time of sowing should be in the latter end of April, or beginning of May, on a moist soil; and if exposed to the morning sun only, it will be so much the better, but it should not be under the drip of trees. The middle of May, some of the plants of the first sowing will be fit to transplant for blanching.

The manner of transplantaing it is as follows: after having cleared the ground of weeds, you must dig a trench by a line about 10 inches wide, and 8 or 9 inches deep, loosening the earth in the bottom, and laying it level; and the earth that comes out of the trench should be equally laid on each side the trench, to be ready to draw in again to earth the celeri as it advances in height. These trenches should be made at three feet distance from each other; then plant your plants in the middle of the trench, at about four or five inches distance, in one straight row, having before trimmed the plants, and cut off the tops of the long leaves; and as they are planted, you must observe to close the earth well to their roots with your feet, and to water them plentifully until they have taken new root. As these plants advance in height, you must observe to draw the earth on each side close to them, being careful not to bury their hearts, nor ever to do it but in dry weather; otherwise the plants will rot. When your plants have advanced a considerable height above the trenches, and all the earth, which was laid on the sides thereof, hath been employed in earthing them up, you must then make use of a spade to dig up the earth between the trenches, which must also be made use of for the same purpose, continuing from time to time to earth it up until it is fit for use. The last crop should be planted in a drier soil, to prevent its being rotted with too much wet in the winter. You will do well to cover your ridges of celeri with some peat-dung, or some such light covering, when the frost is very hard, which will admit the air to the plants; for if they are covered too close they will be very subject to rot; by this means you will preserve your celeri till spring; but you must remember to take off the covering whenever the weather will per-mit, otherwise it will be apt to cause the celeri to pipe and run to seed. The celeri, when full blanched, will not continue good above three weeks or a month before it will rot or pipe; therefore, in order to continue it good, you should have at least six or seven different seasons of planting, proportioned to the consumption.

The other sort of celeri, which is commonly called celeriac, is to be managed in the same manner; excepting that this should be planted on the level ground, or in very shallow drills: for this plant seldom grows above eight or ten inches high, so requires but little earthing up; the great excellence of this being in the size of the root, which is often as large as ordinary turnips.

The best method to save the seed of celeri, is to make choice of some long good roots of the upright celeri, which have not been too much blanched, and plant them out, at about a foot asunder, in a moist soil, early in the spring; and when they run up to seed, keep them supported with stakes, to prevent their being broken down with the wind: and in July, when the seed begins to be formed, if the season should prove very dry, it will be proper to give some water to the plant, which will greatly help its producing good seeds. In August these seeds will be ripe, at which time it should be cut up, in a dry time, and spread upon cloths in the sun to dry; then beat out the seeds, and preserve it in bags for use.

CELERI, Wild, (Apium antarcticum), was found in considerable quantities by Sir Joseph Banks and Dr Solander on the coast of Terra del Fuego. It is like the garden celeri in the colour and disposition of the flowers, but the leaves are of a deeper green. The taste is between that of celeri and parsley. It is a very useful ingredient in the soup for sea-men, because of its antiscorbutic quality.

CELERITY, in Mechanics, the swiftness of any body in motion. It is also defined to be an affection of motion, by which any movable body runs through a given space in a given time.

CELERINS, a religious order, so called from their founder Peter de Meuron, afterwards raised to the pontificate under the name of Celestin V. This Peter, who was born at Isernia, a little town in the kingdom of Naples, in the year 1215, of but mean parents, retired, while very young, to a solitary mountain, in order to dedicate himself wholly to prayer and mortification. The fame of his piety brought several, out of curiosity, to see him; some of whom charmed with his virtues, renounced the world to accompany him in his solitude. With these he formed a kind of community in the year 1254: which was approved by Pope Urban IV. in 1264, and erected into a distinct order, called the Hermits of St Damien. Peter de Meuron governed this order till 1286, when his love of solitude and retirement induced him to quit the charge. In July 1294, the great reputation of his sanctity raised him, though much against his will, to the pontificate. He then took the name of Celestin V. and his order that of Celestins from him. By his bull he approved their constitutions, and confirmed all their monasteries to the number of 20. But he sat too short time in the chair of St Peter to do many great things for his order; for having governed the church five months
months and a few days, and considering the great burden he had taken upon him, to which he thought himself unequal, he solemnly renounced the pontificate in a ceremony held at Naples.

After his death, which happened in 1296, his order made great progress, not only in Italy but in France likewise; whether the then general Peter of Tivoli sent 12 religious to the request of King Philip the Fair, who gave them two monasteries, one in the forest of Orleans, and the other in the forest of Compiegne at Mount Chartreux. This order likewise passed into several provinces of Germany. They have about 96 convents in Italy, and 21 in France, under the title of priories.

The Celestines rise two hours after midnight to say matins. They eat no flesh at any time, except when they are sick. They fast every Wednesday and Friday, from Easter to the feast of the exaltation of the holy cross; and, from that feast to Easter, every day. As to their habit, it consists of a white gown, a capuche, and a black scapulary. In the choir, and when they go out of the monastery, they wear a black cowl with the capuche: their shirts are of serge.

CELETES, or CELEST, (from σαλάς, a race-horse) in antiquity, denote single or saddle-horses, by way of contradistinction from those yoked or harnessed together, called bigarii, quadriganarii, &c. The same denomination is also given to the cavaliers or riders on horseback: and hence some deduce celeres, the name of Romulus's guard.

CELEUSMA, or CELEUM, in antiquity, the shout or cry of the seamen, whereby they animated each other in their work of rowing. The word is formed from σαλασιμος, to call, to give the signal.

CELEUSMA, was also a kind of song or formula, rehearsed or played by the master, or others, to direct the strokes and movements of the mariners, as well as to encourage them to labour. See CELEUSTES.

CELEUSTES, in Ancient Navigation, the boatswain or officer appointed to give the rowers the signal, when they were to pull, and when to stop. He is also denominated coppeus, and by the Romans, porticus, sometimes simply Hortatorr.

CELIBACY, the state of unmarried persons. Scaliger derives the word from the Greek σαρακ, "bed," and σαρακευτος, "I leave!" others say it is formed from καλος θεωρικος, q. d. the blessedness of heaven.

The ancient Romans used all means imaginable to discourage celibacy. Nothing was more usual than for the censors to impose a fine on bachelors. Dionysius Halicarnassensis mentions an ancient constitution whereby all persons of full age were obliged to marry. But the first law of that kind, of which we have any certainty, is that under Augustus, called lex Julia de maritandis ordinibus. It was afterwards denominated Papia Poppaea, and more usually Julia Papia, in regard to some new sanctions and amendments made to it under the consul Papia and Poppaeus. By this law, divers prerogatives were given to persons who had many children; penalties imposed on those who lived a single life, as that they should be incapable of receiving legacies, and not exceeding a certain proportion.

CELIBATE, the same with celibacy; but it is chiefly used in speaking of the single life of the Papish clergy, or the obligation they are under to abstain from marriage. In this sense we say the law of celibate. Monks and religious take a vow of celibate; and what is more, of chastity.

The church of Rome imposes an universal celibacy on all its clergy, from the pope to the lowest deacon and subdeacon. The advocates for this usage pretend that a vow of perpetual celibacy was required in the ancient church as a condition of ordination, even from the earliest apostolic ages. But the contrary is evident, from numerous examples of bishops and archbishops, who lived in a state of matrimony, without any prejudice to their ordination or their function. It is generally agreed that most of the apostles were married. Some say all of them, except St. Paul and St. John. Others say St. Paul himself was married, because he writes to his yoke-fellow, whom they interpret his wife. Be this as it will, in the next ages after the apostles, we have examples of divers married bishops, presbyters, and deacons, without an antecedent proof or mark of dishonour set on them; e. g. Valens, presbyter of Philippi, mentioned by Polycarp; and Onuphrem, bishop of Nilo. Novatus was a married presbyter of Carthage, as we learn from Cyriacus, who himself was also a married man, as Pagi confesses; and so was Cecilius the presbyter who converted him; and Numidius, another presbyter of Carthage. The reply which the Romanists give to this, is, that all married persons, when they came to be ordained, promised to live separate from their wives by consent, which answered the vow of celibacy in other persons. But this is not only said without proof, but against it. For Novatus presbyter of Carthage was certainly allowed to cohabit with his wife after ordination; as appears from the charge that Cyriacus brings against him, that he had struck and abused his wife, and thereby caused her to miscarry. There seems indeed to have been, in some cases, a tendency towards the introduction of such a law by one or two zealots; but the motion was no sooner made than it was quashed by the authority of wiser men. Thus Episcopus observes, that Paphnutius, bishop of Gymnosophists, for laying the law of celibacy upon his brethren; but Dionysius bishop of Corinth wrote to him, that he should consider the weakness of men, and not impose that heavy burden on them. In the council of Nice, anno 325, the motion was renewed for a law to oblige the clergy to abstain from all conjugal society with their wives, whom they had married before their ordination; but Paphnutius, a famous Egyptian bishop, and one who himself never was married, vigorously declaimed against it, upon which it was unanimously rejected. So Socrates and Sozomen tell the story; to which all that Valesius, after Bellarmine, has to say, is, that he suspects the truth of it. The council in Trulla, held in 692, made a difference in this respect between bishops and presbyters; allowing presbyters, deacons, and all the inferior orders, to cohabit with their wives after ordination; and giving the Roman church a smart rebuke for the contrary prohibition, but at the same time laying an injunction upon bishops to live separate from their wives, and appointing the wives to betake themselves to a monastic life, or become deaconesses in the church. And thus was a total celibate established in the Greek church as to bishops, but not any
any others. In the Latin church, the like establishment was also made, but by slow steps in many places. For, in Africa, even bishops themselves cohabited with their wives at the time of the council of Trullo. The celibacy of the clergy, however, appears of an ancient standing, if not of command and necessity, yet of counsel and choice. But as it is clearly neither of divine nor apostolical institution, it is at first hard to conceive from what motives the court of Rome persisted so very obstinately to impose this institution on the clergy. But we are to observe that this was a leading step to the execution of the project formed of making the clergy independent of princes, and rendering them a separate body to be governed by their own laws. In effect, while priests had children, it was very difficult to prevent their dependence on princes, whose favours have such an influence on private men; but having no family, they were more at liberty to adhere to the pope.

CELIDOGRAPHIA, the description of the spots which appear on the surfaces of the sun and planets. See Astronomy.

CELLA, (Cella) in ancient writers, denotes a place or apartment usually under ground, and vaulted, in which were stored some sort of necessaries, as wine, honey, and the like; and according to which it was called Cella Fimaria, Ocellaria, Melaria, &c. The word is formed from the Latin cellere, to conceal.

Cella was also used for the lodging or habitation of a common prostitute, as being anciently under ground, hence also denominated formis.

Intravit cellium veteris centone lupanar,

On which place an ancient scholiast remarks, that the names of the whores were written on the doors of their several cells; by which we learn the meaning of inscription cela in Martial, lib. xi. ep. 46.

Cella was also applied to the bedchambers of domestics and servants; probably as being low and narrow. Cicero, inveighing against the luxury of Antony, says the beds in the very cells of his servants were spread with pompous purple coverlets.

Cella is also applied to the members or apartments of baths. Of these there were three principal, called frigidae, tepidae, and caldae: to which may be added a fourth, called cella astra, and sometimes sudatoria.

Cella likewise signified the adyta, or inmost and most retired parts of temples, wherein the images of the gods to whom the edifices were consecrated were preserved. In this sense we meet with cella Domus, cel. de Concordia.

Cella is also used for a lesser or subordinate sort of monastery dependent on a great one, by which it was created, and continues still to be governed. The great abbeys in England had most of these cells in places distant from the mother abbey, to which they were accountable, and from which they received their supplies. The alien priories in England were cells to abbeys; in Normandy, France, Italy, &c. The name cella was also given to rich and considerable monasteries not dependent on any other.

Cella, signifies also a little apartment or chamber, such as those wherein the ancient monks, cellaries, and hermits, lived in retirement. Some derive the word from the Hebrew נuitive, i.e. a place or room which any thing is shut up.

The same name is still retained in divers monasteries. The dormitory is frequently divided into so many cells or lodges. The Carthusians have a separate house, which serves them as a cell. The hall wherein the Roman consulare is held, is divided by partitions into divers cells, for the several cardinals to lodge in.

CELL is also a name given to the little divisions in honeycombs, which are always regular hexagons. See Bee.

CELLA, in Botany, is applied to the hollow place between the partitions in the pods, husks, and other seed-vessels of plants; according as there is one, two, three, &c. of these cells, the vessel is said to be unilocular, bilocular, trilocular, &c.

Celia, in Anatomy, little bags, or bladders, where fluids or other matters are lodged; called loculi, cellulae, &c. Thus the cellulae adiposae are the little cells where the fat is contained; cellulae in the colon, are spaces wherein the excrement are detained till voided, &c.

CELLAR, (Cellarium), in ancient writers, denotes the same with cells, viz. a conservatory of cataracts or drinkables.

Cellar differs from vault, as the latter is supposed to be deeper, the former being frequented little below the surface of the ground. In which sense, cellarium also differed from pessum, as the former was only a storehouse for several days, the latter for a long time. Thus it is the bestower, a sort of ancient Cynics, are said by St. Jerome to carry their cellar about with them.

Cellarium also denoted an allowance of bread, wine, oil, or other provision, furnished out of the cells, to the use of the governor of the province and his officers, &c. In which sense, the word amounts to much the same with annona.

Cellars, in modern building, are the lowest rooms in a house, the ceilings of which usually lie level with the surface of the ground on which the house is built; or they are situated under the pavement before the house, especially in streets and squares.

Cellars, and other places vaulted under ground, were called by the Greeks hypogaea: the Italians still call them fusi delle case.

CELLARIER, or CELLERER, (Cellarium or Cellarius), an officer in monasteries, to whom belong the care and procuration of provisions for the convent. The denomination is said to be borrowed from the Roman law, where cellarius denotes an examiner of accounts and expenses. Ulpian defines it thus: "Cellarius, id est, idea propositus ut rationes salvas sit." The cellarius was one of the four abstractiones, or great officers of monasteries; under his ordaining was the spitarium or bakehouse, and the accipitaria or brewery. In the richer houses there were particular lands set apart for the maintenance of his office, called in ancient writings ad celi-monomachorum. The cellarius was a great man in the convent. His whole office in ancient times had a respect to that origin: he was to see his lord's corn got in, and laid up in granaries; and his appointment consisted in a certain proportion thereof, usually fixed at a thirteenth part
of the whole, together with a forced gown. The office of cellarier then only differed in name from those of bailiff and minstrel; excepting that the cellarier had the receipt of his lord's rents throughout the whole extent of his jurisdiction.

CELLARER was also an officer in chapters, to whom belonged the care of the temporals, and particularly the distributing of bread, wine, and money, to canons, on account of their attendance in the choir. In some places he was called cellarier, in others barner, and in others surwiner.

CELLARIUS, CHRISTOPHER, was born in 1658, at Smealcade in Franconia, of which town his father was minister. He was successively rector of the colleges at Wymar, Zeis, and Merseburg; and the king of Prussia having founded an university at Halle in 1653, he was prevailed on to be professor of eloquence and history there, where he composed the greatest part of his works. His great application to study hastened the infirmities of old age; for it is said, he would spend whole days and nights together at his books, without any attention to his health, or even the calls of nature. His works relate to grammar, geography, history, and the oriental languages; and the number of them is amazing. He died in 1707.

CELLINI, BENVENUTO, an eminent statuary, who was bred a jeweller and goldsmith, but seems to have had an extraordinary genius for the fine arts in general. He was contemporary with Michael Angelo and Julio Romano, and was employed by popes, kings, and other princely patrons of sciences and arts, so highly cultivated in the days of Leo X. and Charles V. some of his productions being esteemed most exquisite. He lived to a very considerable old age; and his life, almost to the last, was a continued scene of adventure, persecution, and misfortunes, truly wonderful. He wrote his own history, which was not, however, published till the year 1730, probably, on account of the excessive freedom with which he therein treated many distinguished personages of Italy and other countries. It was translated into English by Dr. Nugent in 1771, to which the reader is referred, as it will not admit of an abridgment suitable to the design of this work.

CELLULAR, in a general sense, is applied to any thing consisting of single cells.

CELLULAR Membrane. See Anatomy Index.

CELOSIA, COCK'S-COMB. See Botany Index.

CELSIA. See Botany Index.

CELSUS, AURELIUS CORNELIUS, a celebrated philosopher of the first century, who wrote eight books on medicine, in elegant Latin. He was the Hippocrates of the Latins; and Quintilinus gives him a high eulogium. The great Boerhaave tells us, that Celsus is one of the best authors of antiquity for letting us into the true meaning and opinions of Hippocrates; and that, without him, the writings of this father in physic would be often unintelligible, often misunderstood by us. He shows us also how the ancient physicians distemper by friction, bathing, &c. His eight books de Medicina have been several times printed. The Elzevir edition, in the year 1650, by Vander Linden, is the best, as being entirely corrected from his manuscripts.

CELSUS, an Epicurean philosopher, in the second century. He wrote a work against the Christians, entitled, The True Discoverie: to which Origines, at the desire of Ambrose his friend, wrote a learned answer. To this philosopher Lucian dedicated his Pseudomonas.

CELTS, or CELTS, an ancient nation, by which most of the countries of Europe are thought to have been peopled. The compilers of the Universal History are of opinion that they were descended from Gomer the eldest son of Japheth, the son of Noah. They think that Gomer settled in the province of Phrygia in Asia; Askenos his eldest son, or Toparnax his youngest, or both, in Armenia; and Rhesus, of the second son, in Sephardenia. When they spread themselves wider, they seem to have moved regularly in columns without interfering with or disturbing their neighbours. The descendants of Gomer, or the Celts, took the left hand, insensibly spreading themselves westward towards Poland, Hungary, Germany, France, and Spain; while the descendants of Magog, Gomer's brother, moving eastward, peopled Tartary.

In this large European tract, the Celts began to appear a powerful nation under a regular monarchy, or rather under several considerable kingdoms. Mention is made of them indeed in so many parts of Europe, by ancient geographers and historians, that Oroseus took Celtes to be a general name for the continent of Europe, and made a map of it bearing this title. In those parts of Asia which they possessed, as well as in the different parts of Europe, the Celts went by various names. In Lesser Asia they were known by the names of Titans and Sacks; in the northern parts of Europe, by those of Cymmerians, Cymbrians, &c.; and in the southern part they were called Celts, Gauls, or Galatians.

With respect to the government of the Celts we are entirely in the dark. All we know is, that the curates, and afterwards druids and barbs, were the interpreters of their laws; judged all causes whether criminal or civil; and their sentences was reckoned so sacred, that whoever refused to abide by it was by them excluded from assisting at their sacred rites; after which no man dared to converse with him: so that this punishment was reckoned the most severe of all, even severer than death itself.

They neither reared temples nor statues to the Deity, but destroyed them wherever they could find them, planting in their stead large spacious groves; which, being open on the top and sides, were, in their opinion, more acceptable to the Divine Being, who is absolutely unconfined. In this their religion seems to have resembled that of the Persians and disciples of Zoroaster. The Celts only differed from them in making the oak instead of fire the emblem of the Deity; in choosing that tree above all others to plant their groves with, and attributing several supernatural virtues both to its wood, leaves, fruit, and mistletoe, all of which were made use of in their sacrifices and other parts of their worship. But after they had adopted the idolatrous superstition of the Romans and other nations, and the apostasy of their heroes and princes, they came to worship them each in the same manner; as Jupiter under the name of Zveran, which in the Celtic signifies thunder; Mercury, whom some authors call Hesu or Hesu, probably from the Celtic handh, which signifies a dog, and might be the Anaks lauras.
Celts, certain ancient instruments, of a wedge-like form, of which several have been discovered in different parts of Great Britain. Antiquarians have generally attributed them to the Celtic; but not agreeing as to their use, distinguished them by the above meaningless appellation. But Mr Whitaker makes it probable that they were British battle-axes. See Battle-Axes.

Celtiberia, in Ancient Geography, a country of the Hither Spain, along the right or south-west side of the river Iberus; though sometimes the greatest part of Spain was called by the name Celtiberia. The people were denominated Celtiberi, or the Celt seated on the Iberus. They were brave and very warlike; their cavalry in particular was excellent. They wore a black and rough cloak, the shag of which was like goats hair. Some of them had light bucklers like the Gauls: others hollow and round ones like those of other nations. They all wore boots made of hair, and iron helmets adorned with crests of a purple colour. They used swords which cut on both sides, and poniards of a foot long. Their arms were of an admirable temper, and are said to have been prepared in the following manner: they buried plates of iron under ground, where they let them remain till the rust had eaten the weakest part of the metal, and the rest was consequently hard and firm. Of this excellent iron they made their swords, which were so strong and well tempered, that there was neither buckler nor helmet that could resist their edge. The Celtiberians were very cruel towards their enemies and malefactors, but showed the greatest humanity to their guests. They not only cheerfully granted their hospitality to strangers who travelled in their country, but were desirous that they should seek protection under their roof.

Celtis. See Botany Index.

Cement, in a general sense, any glutinous substance capable of uniting and keeping things together in close cohesion. In this sense the word cement comprehends mortar, solder, glue, &c. but has been generally restrained to the compositions used for holding together broken glasses, china, and earthen ware. For this purpose the juice of garlic is recommended as exceedingly proper, being both very strong, and if the operation is performed with care leaving little or no mark. Quicklime and the white of an egg mixed together and expeditiously used, are also very proper for this purpose. Dr Lewis recommends a mixture of quicklime and cheese in the following manner: Sweet cheese shaved thin, and stirred with boiling hot water, changes into a tenacious slime which does not mingle with the water. Worked with fresh particles of hot water, and then mixed upon a hot stone with a proper quantity of unalackcd lime, to the consistence of a paste, it proves a strong and durable cement for wood, stone, earthen ware, and glass. When thoroughly dry, which will be in two or three days, it is not in the least acted upon by water. Cheese barely beat with quicklime, as directed by some of the chemists for luting cracked glasses, is not near so efficacious. A composition of the drying oil of linseed and white lead is also used for the same purposes, but is greatly inferior.

Cement, in building, is used to denote any kind of mortar of a stronger kind than ordinary. The cement commonly used is of two kinds; hot and cold. The hot cement is made of resin, bees-wax, brick-dust, and chalk boiled together. The bricks to be cemented are heated, and rubbed one upon another, with cement between them. The cold cement is that above described for cementing china, &c. which is sometimes, though rarely, employed in building.

The ruins of the ancient Roman buildings are found to cohere so strongly, that most people have imagined the
Cement

the ancients were acquainted with some kind of mortar, which, in comparison of ours, might justly be called cement; and that to our want of knowledge of the materials they used, is owing the great inferiority of modern buildings in their durability. In 1770, one Mr. Loriot, a Frenchman, pretended to have discovered the secret of the ancient cement, which, according to him, was no more than a mixture of powdered quicklime with lime which had been long stacked and kept under water. The stacked lime was first to be made up with sand, earth, brickdust, &c. into mortar, after the common method, and then about a third part of quicklime in powder was added to the mixture. This produced an almost instantaneous petrifaction, something like what is called the setting of alabaster, but in a much stronger degree; and was possessed of many wonderful qualities needless here to relate, seeing it has never been known to succeed with any other person who tried it. Mr. Anderson, in his essays on agriculture, has discussed this subject at considerable length, and seemingly with great judgment. He is the only person we know who has given any rational theory of the uses of lime in building, and why it comes to be the proper basis of all cements. His account is in substance as follows:

Lime which has been stacked and mixed with sand becomes hard and consistent when dry, by a process similar to that which produces the natural stalactites in caverns. These are always formed by water dropping from the roof. By some unknown and inexplicable process of nature, this water has dissolved in it a small portion of calcareous matter in a caustic state. As long as the water continues covered from the air, it keeps the earth dissolved in it: it being the natural property of calcareous earths, when deprived of their fixed air, to dissolve in water. But when the small drop of water comes to be exposed to the air, the calcareous matter contained in it begins to attract the fixable part of the atmosphere. In proportion as it does so, it also begins to separate from the water, and to reassume its native form of limestone or marble. This process is Mr. Anderson's hypothesis of the lime being made, when the calcareous matter is perfectly crystallised in this manner, be affirmed, that it is to all intents and purposes limestone or marble of the same consistence as before: and in this manner (says he), within the memory of man, have huge rocks of marble been formed near Matlock in Derbyshire. If lime in a caustic state is mixed with water, part of the lime will be dissolved, and will also begin to crystallize. The water which parted with the crystallized lime will then begin to act upon the remainder, which it could not dissolve before; and thus the process will continue, either till the lime be all reduced to an effete, or (as he calls it) crystalline state, or something hinders the action of the water upon it. It is this crystallization which is observed by the workmen when a heap of lime is mixed with water, and left for some time to maceurate. A hard crust is formed upon the surface, which is ignorantly called frosting, though it takes place in summer as well as in winter. If therefore the hardness of the lime, or its becoming a cement, depends entirely on the formation of its crystals, it is evident that the perfection of the cement must depend on the perfection of the crystals, and the hardness of the matters which are entangled among them. The additional substances used in making of mortar, such as sand, brickdust, or the like, according to Mr. Anderson, serve only for a purpose similar to what is answered by sticks put into a vessel full of any saline solution, namely, to afford the crystals an opportunity of fastening themselves upon it. If therefore the matter interposed between the crystals of the lime is of a friable, brittle nature, such as brickdust or chalk, the mortar will be of a weak and imperfect kind; but, when the particles are hard, angular, and very difficult to be broken, such as those of river or pit sand, the mortar turns out exceedingly good and strong. Sea sand is found to be an improper material for mortar, which Mr. Anderson ascribes to its being less angular than the other kinds. That the crystallization may be the more perfect, he also recommends a large quantity of water; that the ingredients be perfectly mixed together, and that the drying be as slow as possible. An attention to these circumstances, he thinks, would make the buildings of the moderns equally durable with those of the ancients; and from what remains of the ancient Roman works, he thinks a very strong proof of his hypothesis might be adduced. The great thickness of their walls necessarily required a vast length of time to dry. The middle of them was composed of pebbles thrown in at random, and which have evidently had mortar so thin as to be poured in among them. By this means a great quantity of the lime would be dissolved, and the crystallization performed in the most perfect manner; and the indefatigable pains and perseverance for which the Romans were so remarkable in all their undertakings, leave no room to doubt that they would take care to have the ingredients mixed together as well as possible. The consequence of all this is, that the buildings formed in this manner are all as firm as if cut out of a solid rock; the mortar being equally hard, if not more so, than the stones themselves.

Notwithstanding the bad success of those who have attempted to repeat M. Loriot's experiments, however, Dr. Black informs us, that a cement of this kind is certain to be practicable. It is the cementation of lime by pouring the lime while hot from the kiln, and then forcing it into a thin paste of sand and water, which, not slacking immediately, absorbs the water from the mortar by degrees, and forms a very hard mass. "It is plain, he adds, that the strength of this mortar depends on using the lime hot or fresh from the kiln."

By mixing together gypsum and quicklime, and then adding water, we may form a cement of tolerable hardness, and which apparently might be used to advantage in making troughs for holding water, or lining small canals for it to run in. Mr. Wiegley says, that a good mortar or cement, which will not crack, may be obtained, by mixing three parts of a thin magma of stacked lime with one of powdered gypsum; but adds, that it is used only in a dry situation. A mixture of tars with slackening acquire in time a stony hardness, and may be used for preventing water from entering. See Mortar and Stucco.

Cement, among engravers, jewellers, &c. is the same with the hot cement used in building*; and is used for keeping the metals to be engraved firm to the block, foregoing and also for filling up what is to be chiseled.

Cement, in Chemistry, is used to signify all those powders
powders and pastes with which any body is surrounded in pots or crucibles, and which are capable by the help of fire of producing changes upon that body. They are made of various materials; and are used for different purposes, as for pasting gold from silver, converting iron into steel, copper into brass; and by cementation more considerable effects can be effected upon bodies, than by applying to them liquids of any kind; because the active matters are then in a state of vapour, and assisted by a very considerable degree of heat.

Cement which quickly hardens in water. This is described in the posthumous works of Mr. Hooke, and is recommended for gilding live crows, carps, &c. without injuriong the fish. The cement for this purpose is prepared, by putting some Burgundy pitch into a new earthen pot, and warming the vessel till it receives so much of the pitch as will stick round it, then stirring and adding finely-powdered amber over the pitch when growing cold, adding a mixture of three pounds of linseed oil, and one of the oil of turpentine, covering the vessel and boiling them for an hour over a gentle fire, and grinding the mixture as it is wanted with as much pomice-stone in fine powder as will reduce it to the consistence of paint. The fish being wiped dry, the mixture is spread upon it; and the gold leaf being then laid on, the fish may be immediately put into water again, without any danger of the gold coming off, for the matter quickly hardens in the water.

Cement Pot, are those earthen pots used in the cementation of metals.

Cementation, the act of corroding or otherwise changing a metal by means of a Cement.

Cemetery (Kerameutria, from Keram, to "sleep"), a place set apart or consecrated for the burial of the dead.

Anciently none were buried in churches or churchyards; it was even unlawful to inter in cities, and the cemeteries were without the walls. Among the primitive Christians these were held in great veneration. It even appears from Eusebius and Tertullian, that, in the early ages, they assembled for divine worship in the cemeteries. Valerian seems to have consecrated the cemeteries and other places of divine worship, but they were restored again by Gallienus. As the martyrs were buried in these places, the Christians chose them for building churches on, when Constantine established their religion; and hence some derive the rule which still obtains in the church of Rome, never to consecrate an altar without putting under it the relics of some saint. The practice of consecrating cemeteries is of some antiquity. The bishop walked round it in procession, with the crozier or pastoral staff in his hand, the holy water pot being carried before, out of which the aspersions were made.

Cenchrus. See Botany Index.

Cenehill, in the Saxon antiquities, an expiatory mealt, paid by one who had killed a man to the kindred of the deceased. The word is compounded of the Saxon cinne, i.e. cognatio, "relation," and geld, solutio, "payment."

Cenobite. See Coenobite.

Cenotaph, in antiquity, an empty tomb, erected by way of honour to the deceased. It is distinguished from a sepulchre, in which a coffin was deposited. Of these there were two sorts; one for those who had, and another for those who had not, been honoured with funeral rites in another place.

The sign whereby honorary sepulchres were distinguished from others, was commonly the wreck of a ship, to denote the decease of the person in some foreign country.

Censer, in antiquity, a vase containing incense to be used in sacrifices. Censer is chiefly used in speaking of the Jewish worship. Among the Greeks and Romans it is more frequently called thuribulum, xemnphos, and acernos.

The Jewish censer was a small sort of chafing dish, covered with a dome, and suspended by a chain. Josephus tells us, that Solomon made 20,000 gold censers for the temple of Jerusalem, to offer perfumes in, and 50,000 others to carry fire in.

Censusio, in antiquity, the act or office of the censor. See Census.

Censor included both the rating or valuing of a man's estate, and the imposing of duties and penalties.

Censorio hastaria, a punishment inflicted on a Roman soldier for some offence, as laziness or luxury, whereby his hasta or spear was taken from him, and consequently his wages and hopes of preferment stopped.

Censitius, a person ceased, or entered in the censual tables. See Census.

In an ancient monument found at Ancyra, containing the actions of the emperor Octavius, we read,

Quo busto circum Romaniorem
Censitum sunt capita quadragiae
Centum millia et sexaginta tria.

Censitus is also used in the civil law for a servile sort of tenant, who pays capitation to his lord for the lands he holds of him, and is entered as such in the lord's rent roll. In which sense, the word amounts to the same with capite cenosis, or capite censitis. See Capita Cenosi.

Censor (from censere to "think" or "judge"), one of the prime magistrates in ancient Rome. Their business was to register the effects of the Roman citizens, to impose taxes in proportion to what each man possessed, and to take cognizance or inspection of the manners of the citizens. In consequence of this last part of their office, they had a power to censure vice or immorality, by inflicting some public mark of ignominy on the offender. They had even a power to create the princeps senatus, and to expel from the senate such as they deemed unworthy of that office. This power they sometimes exercised without sufficient grounds; and therefore a law was at length passed, that no senator should be degraded or disgraced in any manner until he had been formally accused and found guilty by both the censors. It was also a part of the censorian jurisdiction, to fill up the vacancies in the senate, upon any remarkable deficiency in their number; to let out to farm all the lands, revenues, and customs, of the republic; and to contract with artificers for the charge of building and repairing all the public works and edifices both in Rome and the colonies of Italy. In all parts of their office, however, they
they were subject to the jurisdiction of the people; and
an appeal always lay from the sentence of the censors
to that of an assembly of the people.

The first two censors were created in the year of
Rome 317, upon the senate's observing that the cons-
sules were so much taken up with war as not to have
time to look into other matters. The office continued
to the time of the emperors, who assumed the censorial
power, calling themselves morum prefecti; though
Vespasian and his son took the title of censors. Deci-
us attempted to restore the dignity to a particular
magistrate. After this we hear no more of it, till Con-
stantine's time, who made his brother censor, and he
seems to have been the last that enjoyed the office.

The office of censor was so considerable, that for a
long time none aspired to it till they had passed all the
rest; so that it was thought aspiring that Cneus
should be admitted censor, without having been either
consul or praetor. At first, the censors enjoyed their
dignity for two years, but in 302 the dictator Manen-
sus made a law restraining it to a year and a half,
which was afterwards observed very strictly. At first
one of the censors was elected out of a patrician, and
the other out of a plebeian family; and upon the death
of either, the other was discharged from his office, and
two new ones elected, but not till the next lustrum.
In the year of Rome 622, both censors were chosen from
among the plebeians; and after that time the office
was shared between the senate and people. After their
election in the Comitia Centuriata, the censors pro-
ceeded to the capitol, where they took an oath not to
manage either by favour or dissimulation, but to act
equitably and impartially throughout the whole course
of their administration.

The republic of Venice still has a censor of the man-
ners of their people, whose office lasts six months.

Censoria of Books, are a body of doctors or others
established in divers countries to examine all books be-
fore they go to the press, and to see they contain no-
ting contrary to faith and good manners.

At Paris, before the late revolution, the faculty of
theology claimed this privilege as granted to them by
the state; but, in 1634, new commissions of four do-
tors were created, by letters patent, the sole censors of
all books, and answerable for every thing contained
therein.

In England, we had formerly an officer of this kind,
under the title of licensor of the press: but, since the
Revolution, our press has been laid under no such re-
straint.

Censorinus, a celebrated writer in the third
century, well known by his treatise De die Notabil.
This treatise, which was written about the year 338, Gerard
Vossius calls a little book of gold; and declares it to be
a most learned work of the highest use and importance
to chronologers, since it connects and determines,
with great exactness, some of the principal eras in pax-
gen history. It was printed at Cambridge, with the
notes of Lindemebrius, in 1695.

Censure, a judgment which condemns some book,
person, or action; or more particularly, a reprimand
from a superior. Ecclesiastical censures are penaltys,
by which, for some remarkable misbehaviour, Christians
are deprived of the communion of the church; or pro-
limited to exercise the sacerdotal office.

Vol. V. Part I.
CENT signifies properly a hundred, being an abridgment of the word centum; but is often used in commerce to express the profit or loss arising from the sale of any commodity: so that when they say there is 10 per cent. profit, or 10 per cent. loss, upon any merchandise that has been sold, it is to be understood that the seller has either gained or lost 10l. on every 100l. of the price at which he bought that merchandise; which is \( \frac{1}{10} \) of profit, or \( \frac{1}{10} \) of loss, upon the total of the sale.

CENTAUR, in Astronomy, a part or moiety of a southern constellation, in form half man half horse; usually joined with the wolf. The word comes from κενταύρος, formed of κέντας, man; and αὐρος, bull; q. d. bull-pricker. The stars of this constellation, in Ptolemy's Catalogue, are 36; in Tycho's, 43; and in the Britannic Catalogue, with Sharp's Appendix, 35.

CENTAURS, in Mythology, a kind of fabulous monsters, half men and half horses. The poets pretended that the Centaurs were the sons of Ixion and a cloud; the reason of which fancy is, that they retired to a castle called οὐρανός, which signifies a cloud.—This fable is differently interpreted: some will have the Centaurs to have been a body of shepherds and herdsmen, rich in cattle, who inhabited the mountains of Arcadia, and to whom is attributed the invention of bucolic poetry. Palephus, in his book of incredibles, relates, that under the reign of Ixion, king of Thessaly, a herd of bulls on Mount Thessaly ran mad, and ravaged the whole country, rendering the mountains inaccessible; that some young men who had found the art of taming and mounting horses, undertook to clear the mountains of these animals, which they pursued on horseback, and thence obtained the appellation of Centaurs. This success rendering them insolent, they insulted the Lapithæ, a people of Thessaly; and because when attacked they fled with great rapidity, it was supposed they were half horses and half men.—The Centaurs in reality were a tribe of Lapithæ, who inhabited the city Pteleon, adjoining to Mount Pelion, and first invented the art of breaking horses, as is intimated by Virgil.

CENTAUBEA, GREATER CENTAURY. See Botany Index. There are 61 species belonging to this genus. The root of one of them, called glastisfolia, is an article in the materia medica. It has a rough, somewhat acid taste, and abounds with a red viscid juice. Its rough taste has gained it some esteem as an astrigent, its astringency as an aperient, and its glutinous quality as a vulnerary; but the present practice takes very little notice of it in any intention. Another of the species is the cyanus or blue bottle, which grows commonly among corn. The expressed juice of this flower stains linen of a beautiful blue colour, but is not permanent. Mr Boyle says, that the juice of the inner petals, with a little alum, makes a beautiful permanent colour, equal to ultramarine.

LESSER CENTAURY. See Centiana, Botany Index. CENTEILLA. See Botany Index. CENTENARIUS, or CENTENARIO, in the middle age, an officer who had the government or command, with the administration of justice, in a village. The centenarii as well as vicarii were under the jurisdiction and command of the court. We find them among the Franks, Germans, Lombards, Goths, &c.

CENTENARIUS was also used for an officer who had the command of 100 men, most frequently called a CENTURION.

CENTENARIUS, in monasteries, was an officer who had the command of 100 monks.

CENTENIUM OVAE, among naturalists, denotes a sort of hen's egg much smaller than ordinary, vulgarly called a cock's egg; from which it has been fabulously held that the cockatrice or basilisk is produced. The name is taken from an opinion, that these are the last eggs which hens lay, having laid 100 before; whence centenium, q. d. the hundredth egg—These eggs have no yolks, but in other respects differ not from common ones, having the albumen, chalza, membranes, &c. in common with others. In the place of the yolk is found a little body like a segment coiled up, which doubtless gave rise to the fable of the basilisk's origin from thence. Their origin is with probability ascribed by Harvey to this, that the yolks in the vitellary of the hen are exhausted before the albumina.

CENTER, or CENTRE, in a general sense, signifies a point equally distant from the extremities of a line, figure, or body. The word is formed from the Greek τρέφω, a point.

CENTER of an Arch. Under the article Bridge, the different forms of arches have been particularly considered.

Under this article, it comes very properly to be ascertained in what manner the arch-stones are supported till the arch is completed, and the most commodious and least expensive manner in which this can be accomplished. When the span is small, and upon a limited scale, as cellars, and vaults below ground, the foundation of the side walls is dug out, the earth rounded off between the arch thrown over upon it, and the earth is afterwards dug out and carried away. This must have been done on any account. By this method the wood and workmanship are saved; but it is only in particular instances that this can be done. When the arch to be cast is on land, and at no great height above the surface of the earth, a frame for supporting the arch-stones can be raised from the earth, and bound together, frequently, with a great profusion of wood, which on account of the smallness of the arch is not taken into account; but, when the span is great, or at a great height above the surface of the earth, the expense of a frame formed in the same manner would be enormous, and in many cases impracticable; but whether the arch be great or small, high or low, a proper economy ought to be observed; and the less the expense in wood and workmanship incurred, so much the more advantage to those concerned, and the purpose being obtained, so much more credit is due to the engineer.

It is again to be considered, on the other hand, that in order to save some expense, either in wood or workmanship, the frame or center, as we shall call it, is made too slight, and so connected in its parts, that the pressure of the arched stones is greater than it can support. The whole work is brought down, and the saving on the one part produces a more serious loss on the other; so that both the workmen and proprietors agree, that it is better that the center be too strong than too weak; better have too much wood in it than too
too little. To assist the mechanic in this important affair, is the design of treating this article with particular attention; for which purpose we shall be at pains to acquire every assistance that can be collected, from the most experienced engineers, and from the researches and experiments of the most distinguished philosophers who have treated of such arts as may enable us to elucidate the subject, and make it worth the attention of engineers and mechanics who may have occasion to exert their genius in that line.

In the first place, it will be necessary to consider the weight to be supported: 3.dly. The quantity of the materials to be used, that shall be of sufficient strength to support such a weight: 3.dly. The most effective method to apply these materials, as supported by the most approved authorities, or practised by the ablest engineers. The weight to be supported is the arch-stones. Suppose an arch 20 feet span, (see figures for the arches, a new figure being unnecessary). It has been shown under the article BRIDGE, that the arch can be raised to 90 degrees and upwards, without the support of the center; after which it begins to rest upon the frame of which the center is composed, if the arch is a semicircle, or semiellips; if a segment of a circle, it will press sooner upon the center, and the more so the flatter the arch is. 1st. Suppose a semicircle; then there is 120 degrees of the arch to be supported by the center, the diameter supposed is 20 feet. One hundred and twenty degrees will measure 20.4393 feet; but as it is advisable to give the advantage to the center, we call it 21 feet in an arch of 20 feet span. If the stone is of a durable and hard quality, perhaps an arch-stone of 12 or 14 inches might be of sufficient strength; yet it is not probable that any one would think of less than 18 inches for the thickness of the arch; for it will not have too heavy an appearance if it should be two feet thick. We shall calculate the weight at 18 inches square; the thickness of the stone is not here to be considered, as the weight of the whole is to be supported till the key-stone is driven: the specific gravity of good free stone is 2.532, the solid feet in an arch of 120 degrees, the span 20 feet is 21 feet, nearly as above. The stone 18 inches square by 21 feet gives 47.25 solid feet; the weight by the above specific gravity is 7477.3075 lb. avoirdupois, about 66.753 cwt. being the weight that one rib of the center frame must sustain, without warping, or by the pressure on its haunches make it rise in the crown; neither must it sink under the pressure: in either case the consequences would be fatal, either in causing the arch to give way, upon striking out the center, or in weakening it in such a manner as to shorten its durability; being twisted in its shape, the equilibrium would be destroyed, and the consequence would be either to spring the key-stone, or, if that was prevented by the weight above it, the same weight would cause it to yield at about, or a little above, 30 degrees from the spring of the arch. From all which the necessity of the strength and firmness of the center frame is evident.

If the arch exceeds 20 feet, suppose 50, the weight will evidently become greater, and an additional strength necessary on that account; and likewise on account of its greater extent, the frame that would be sufficiently firm at 20 feet would be supple at 50. To prevent any error on this account, another calculation for 50 feet will become necessary. In the span of 50 the arch of 120 degrees measures 52.36 feet; suppose the arch-stone, 21/2 feet deep by 2, is five superficial feet, multiplied by 52.36 is 261.8 solid feet, and at the above specific gravity gives 41429.715473 lb. avoirdupois, equal to 369.908 cwt. Here the weight is increased upon the center frame, in the proportion of 66.5 to 369.9, that is, more than five times, besides what allowance it will be necessary to make for the difference of the stiffness of the center frame; both which will be considered in their proper places.

Let us now consider what will be the increase of weight, upon a span of 100 feet. The rise of the arch, before it presses on the center frame in a semicircle, being in the same proportion, the arch of 120 degrees in 100 feet span measures 104.719 feet; the arch-stone may be supposed abundantly strong of 4 feet length, for the depth of the arch, and 3 feet broad, which makes a superficially of 12 feet, and multiplied by 104.719 gives 1356.628 solid feet, the specific gravity, that is, the stone is supposed of the same durability gives 198.861.381 lb. avoirdupois, equal to 1775.548 cwt. about five times more weight than upon the arch of 50 feet span. If the arch is 130 feet span, 120 degrees measures 136.13556 feet. Suppose the arch-stone 5 feet, as in the arch-stones of the bridge over the Dee at Aberdeen, at least they are between 41/2 and 5 feet. The Aberdeen granite is a very hard stone, and perhaps exceeds the specific gravity above. The arch-stone here supposed to be 5 feet by 3, equal to 15 square feet, multiplied by 136.13556, gives 2042.0334 solid feet. According to the above specific gravity, the weight to be supported till the key-stone is driven, is 2885.2838 cwt. The weight of the key-stone in the whole of the above may be deducted.

As center-frames must likewise be used for iron bridges, we shall consider them, and take the span 236 feet, still supporting a semicircle.

It may be proper to take the weight that it would be if the arch were the segment of a circle, the span of the arch 236, the height above the spring of the arch or the versed sine of the arch, 34 feet, in which case the diameter of the circle would be 444 feet nearly; the arch-stones in this segment would press upon the center-frame, at about 18 feet from the spring of the arch. Suppose the arch-stone 5 feet by 4, equal to 20 superficial feet, the whole measure of the arch is 444.154 lineal feet, the solid content is 4131.84 feet, and weight 318.689 tons; but the weight of the iron was only 260 tons. It may not be improper here to observe, that in a stone bridge of that span, 5 feet of arch-stone would be too small to sustain the arch. It may perhaps be admitted, that it would be sufficient to support its own weight; and if so, the arch being smoothed above, a second arch of a five feet stone may be thrown over above it. These two together may form a stronger arch than a stone of ten feet depth would do. And thus a stone arch may be extended to any span, and made of abundant strength; and experience has shown its durability to withstand the weather. Thus the old London bridge has performed its faithful services to the public for 600 years: that it was an incumbrance in passing up and down
the river, and clumsy in its construction, were owing to the taste of the times. Perhaps few will be found that would be willing to insure an iron bridge against the ruin occasioned by the weather for the same time, or perhaps much above one-half that time. But this is not a fit place to enter into the full discussion of this subject. To return to the weight pressing upon a center-frame. Having now taken a view of the weight to be supported, it comes next to be considered what strength of wood is necessary to resist this force, and the most proper and commodious manner of combining the parts. To determine this, we must have recourse to such experiments as have been made for trying the strength of different species of stone and wood.

Experiments have been made to ascertain the strength of timber, and many of them appear to have been conducted with great care and attention. Some of these the reader will find collected and detailed under the article Strength of Materials. We shall here state the result of some of the curious experiments which were instituted by the Count de Buffon to ascertain this point. According to these experiments, the batten of five inches square, whose length was 14 feet, and which supported a weight of 3500, which may be called its breaking force, should have double the strength of a batten of 28 feet long. But it has a great deal more. The latter by the experiment is equal to 1775 only; whereas the half of 3500 is 2650. But it is to be considered, that the power of the lever is in proportion to its distance from the fulcrum; this power arising from the weight of the log, is the weight of one foot of wood acting as a weight at a distance from the fulcrum. The log increases in its power to break by its length; 12 inches of this log, five inches square, weighs about 10.4 lb. somewhat more or less; and 10.4 lb. at 13 feet distance, acts with a force of 156.2 lb.: this we consider the last term; and 0, the point of fracture, is the first term; the first and last term, multiplied by half the number of terms, are equal to the sum of all the terms; that is, 156.2 x 67, amount 8788.8 lb. added to 1775, equal 2653.8; so near to the half, that the difference may easily be accounted for, from the real weight of the wood on which the experiment was made; and one taking the weight from tables of specific gravity, of the supposed 60 lb. To take another example, a batten of nine feet is double the strength of one of the same size of 18 feet long. The weight that breaks a batten of nine feet, five inches square, is 8308 lb.; the half is 4154; but by the experiment, 3700 lb. break the batten at 18 feet. N. B. The weight being laid upon the middle, 9 1/2 is the number of terms, one-half is 4.625. Seventeen feet one-half is 8 1/2; 10.4 lb. multiplied by 8 1/2, is 102 x 4.625, half the number of terms, is 471.25 + 3700, is 4171.25, somewhat greater, but which is so near, that the smallest accident for failure, not discernible in the wood, will occasion the difference. Now, to reduce the experiment of this given size to any other of greater dimensions; suppose one foot; similar solids of the same altitude are to one another as their bases; that is, 25, the base of the five inch square, is to 14 1/2, the base of the 12 inch square, as the weight that would break the batten of nine feet, to the weight that will break another of the same nine feet length, and of one foot square (c. 6. El. 18.), that is, as the base 25 is to the weight 8308, so is 144 to 4785.4 lb. equal 213,8125 ton, and the proportion as above, for greater or less length of logs or spars. As we have no experiments made of logs of 12 inches square, unless there is something in the texture of the fibres, in pieces of different diameters, we have every reason to conclude, the above proportion will give the proper strength of the material used. It must, however, not be forgot, that the pieces upon which the experiments were made, were nicely chosen for the purpose. It will scarcely be practicable to find a piece of 12 inches square, and even of nine feet length, equally well adapted to bear a proportionable strain; and much more difficult to find a piece of still greater length. These experiments and proportions afford a safe criterion for proper limits to be attended to in practice. In this, we do not mean to apply such a load upon the beam as will break it; we intend the beam to support the load, without giving way or yielding to it.

In the same experiments, we are told by the author, that two-thirds of the weight broke the beam in the space of two months; that one-half the weight gave a set or bend which it did not recover, but shewed no further tendency to break; that one-third of the weight, after long continuance, did not give it a set; but the weight being removed, the beam returned to the same position as before it was loaded. Betwixt one-third and the half of load or weight that would break the beam, is the strength we allot to it for permanent use. Before we proceed to put the above observations into full practice, let us examine whether the log is necessary to be square to give it the greatest strength; practice, in a great measure, determines that it is not. It is, however, necessary to inquire what breadth to a given depth is sufficient as a maximum that we ought not to exceed; or what is the minimum that we may use, so as not to lose the principal intended effect. Besider has made a series of experiments on the transverse strength of bodies, which are detailed in his Science des Ingenieurs, but the spars are only of one inch, not exceeding two inches in breadth or thickness. Among these, we select one spar two inches breadth, one inch depth, and 18 inches length; which at the medium of three trials was broken, lying loose at both ends, by 805 lb. Another one inch board, two inches deep, and 18 inches long, broke with the force of 136 lb.; nearly in the proportion of the square of the depth, being only a diminution of 20 lb. weight. In the present case, the quantity of matter is the same in both.

It may therefore be concluded from this experiment, that a batten of any depth, and one-half breadth, is equally strong in that position as if it had been square timber; and that the strength is according to the depth, if the breadth is only such as that it does not yield in that direction. And hence the advantage in point of economy; for if the piece is set upon its edge, suppose nine inches deep and one broad, provided that by straining the piece in depth, it shall not yield in the lateral direction, it will bear as much strain as if nine inches square. The experiment may be performed upon a small scale. Suppose five inches, and one inch broad, the thin sections may be issued at different distances with pieces five inches square. Suppose at the distances of 1, 2, 3, 6c. fig. 1. Plate CXXXVIII. and the weight applied that broke the five inch square of the length of 14 feet, viz. 5300 lb.
All the experiments which have been alluded to above were made upon scantling of sound oak. But it has already been observed, that in practice, such pieces cannot always, if at all, be selected. But the practical mechanic, confining himself to between one-third and one-half of the absolute strength, according as his judgment dictates him, respecting the soundness of the piece he uses; there can be no doubt, that, upon occasions, he will be convinced, that he cannot, with safety, allow even one-third of the absolute strength, but must take it considerably below that proportion.

As to other species of wood, trials have also been made; and the result from different experiments has occasioned some deviation. We are told that Buffon makes it about \( \frac{5}{12} \) of the strength of oak, Parent \( \frac{5}{4} \) lb., and Emerson \( \frac{7}{4} \); all of them different. The difference between Buffon and Parent is \( \frac{1}{12} \); between Parent and Emerson is \( \frac{1}{4} \); and between Buffon and Emerson is \( \frac{1}{6} \). It is easy to conceive that the different states of the wood, and different circumstances in the same species of sir and oak, will make a considerable difference; although the same persons were employed on the same materials, the experiments would probably vary; much more, may it be allowed that at different times different states of the wood must make the results different.

The experiments made by different persons vary in their amount. Belidor's experiments agree one part with another, and so do Buffon's, but differ in their results from Belidor's. Belidor's slips of oak are only of one inch square, and Buffon's are from four to eight inches square, and from 7 to 28 feet in length. When the one is reduced to the standard of the other, they do not agree: the difference may arise from various causes. We know that there is a difference in the strength of oak of different growths, and from different soils, as well as in other species of wood; there is likewise a difference in the degree of seasoning of the wood. Buffon gives the weight of his wood, Belidor does not. If Buffon's log or batten, four inches square, weighs about 60 lb. that is, about 77 lb. the solid foot; whereas a solid foot of dry oak will not weigh above 60 lb.; but Buffon acknowledges that his wood was in the sap, as vapours issued at both ends in the binding. These differences may make all the odds in the breaking, unless the proportion was established to be, as the squares of the diameter of the battens; but this is not the case, for in Buffon's experiments, the square of four, to the square of five of the seven feet batten, the breaking force is 8300 lb.; but the experiment gives it 11525; that of six inches square 16 : 36 :: 5312 : 11053; exp. 18950. In the seven inch square 16 : 29.5321 : 18628; exp. 32200. In the eighth inch square 16.64 : 5312 : 21248; exp. 4709, the difference between the four and five inch square is one-third part of the experiment weight; the difference between the four and six is somewhat more than one-third the experiment weight; and in the seventh, the difference is a little less than half the experiment weight; between the seventh and the eighth the difference is 812, or one-fourth part of the experiment weight.

There is likewise a difference at the different lengths; for it does not appear that the different lengths bear a proportion to their parts; a batten of four inches square of seven feet length, is expected to be double the strength of one of the same dimensions of 14 feet length; that is, the one of 14 feet length is expected to break with one half of the weight that breaks the seven feet batten; but we find it much less; but when it is considered that the weight of the materials acting at a greater distance from the center of motion, this must be taken into the account, and added to the weight of the breaking force. For example, the batten of five inches square and 12 inches length, weighs 13.368 lb. at the rate of 77 lb. per solid foot. This weight, acting upon the batten of 14 feet, taking the amount of the whole in an arithmetical ratio, is 13.368 \( \times \frac{14}{5} \times \frac{1}{77} \times 12 \), acting upon the whole, added to 5300, the breaking force of 12. The breaking force, at seven feet, is 11525; one half is 5762.5; one twenty-fourth part greater than the half. The batten of six inches square, the breaking force at 14 feet is 7475, the weight of 12 inches of this batten is 19.25 lb. at 77 lb. per solid foot; the acting force of this weight at 14 feet length is 19.25 \( \times \frac{14}{5} \times \frac{1}{77} \), is 1010.625, added to 7475, equal to 8486.625. Now the breaking force of seven feet length is 18950; one half is 9475, difference is 980, that is, nine and a half times less than the half. In the seven inch batten of seven feet length, the breaking force is 32,200 lb. and of 14 feet length, the breaking force is 13,225. The weight of 12 inches of the seven inch square is 2602 lb. acting upon the 14 feet length, is 1370.5 + 1322.5 = 2600 lb. which is one-ninth less than the half. Again, 12 inches of the eight inch batten weighs 34.2 lb. at 77 lb. per solid foot, acting upon the 14 feet length, is 1795 lb., added to 19775, the force that broke it at 14 feet length is 21770 lb. about one-tenth part less than the half of 47,649 lb. which broke it at seven feet length. From the above comparison, it may be allowed, that the difference of the force that broke the spar at seven feet, and that which broke it at 14, so far as it differs from the half, is accounted for upon philosophical principles; and when we consider that the spars or battens cannot be supposed to be mathematically exact in their measure, and that a difference in point of breaking, may be accounted for from that cause; but further, it may be observed that the weight of the materials is not equal in the solid foot. For example, the spar four inches square, and several feet in length, weighs 60 lb.; that is, at the rate of 77 lb. per solid or cubic foot, the eight feet spar at the rate of 76.5 lb. do.; the nine feet spar at the rate of 77 1/2 lb.; the 10 feet spar at the rate of 75.6; the 12 feet spar at the rate of 75.1 lb. per cubic foot; which difference of weight, with the difference of exact mathematical measure, may fully account for all the difference that takes place in the manner of accounting for the above-mentioned difference of the weight of breaking at 7 and 14 feet; as also the difference that takes place between 8 and 16; 9 and 18, &c. The experiments being made upon green wood, cannot be approved of; they ought to have been made of such seasoned wood as is fitted for mechanical purposes, of which none of this kind can be used; or if experiments are made with unseasoned wood, notwithstanding the greatest strength, they ought likewise to have been made with dry wood seasoned for use. A cubic foot of dry oak
In general, the force is greater as the surfaces increase, but a regular proportion to fix upon a theory is not found; but the last line in the table, the weight that crushes the 432.3 surface must be greater than 131, the stone being of the same quality; if in the proportion of 84 to 127, the crushing weight will be 272.7 instead of 131.

The measures here taken are cubic, and the pressing force is upon cubic lines, the thickness one line; where the pressure is upon a square foot, it is likewise to be understood one foot deep, or upon a cubic foot; the stone used, he terms Glory stone, of which he gives its absolute force to be 870011, that it will bear 663,572lb. In the cubic foot of soft stone the strength is 248832lb. The proportional force of the hard and soft is 2.2 to 1.

A cubic foot of a stone fixed in a wall, and projecting one foot, was broken by a force of 55728lb. And a cubic foot of soft, by 10080lb. the proportion 5.2 to 1.

A cubic foot of hard stone, supported upon two fulcrums at 1 foot distance, was broken by 20562lb. suspended from its middle; and the soft by 38592, the proportion about 5.2 to 1.

In fine, a cubic foot of the hard stone was torn asunder by 45,500lb. and the soft by 15,850lb. the proportion 2.9 to 1. Thus far Gauthy's account.

It is to be observed, that the above table does not strictly correspond with itself; for the proportion upon the square line, or \( \frac{1}{4} \) of an inch, in place of 10.5 is upwards of 11. Now, the increase of force which crushes 96 square lines, and 128 one line thick, is 7.8 oz. nearly upon the square line, that is a little more than \( \frac{1}{2} \) of 35 oz. upon the square line; then, as 128 square lines is to 4496oz, so is 1.4 square lines to 508, to which add one-fifth, viz. 101.1, this makes 6064 upon the square inch, and this multiplied by 144, the square inches in a foot, is 874,022.4oz. but Mr Gauthy says, that the square foot of surface of one foot deep, is of the strength of 870,911lb.

Again there are 20,736 square lines in a square inch, the force upon a surface of 64 square inches being about 11.5 upon each square line, is 238,464oz. upon the square foot. Upon the surface of 96 lines, 27oz. to the square line, gives 559,872 to the square foot. Upon the surface of 128 lines, 35\( \frac{1}{2} \) to the square line, is 878,806 to the square foot, the proportion of 238,464oz. to 870,911 is about 5.3 nearly, and of 559,872 to 870,911 is \( \frac{1}{2} \) nearly; but by the experiment the number 870,911 is lbs. upon the square foot; the other numbers are only ozs. The variation between the first difference and between the pressing force of 6069oz. upon the square inch, makes in that proportion 874,022oz. the increase of force from one square inch to one square foot, must be \( \frac{1}{2} \) part of what the above experiment upon the square foot produces. Further experiments upon this therefore become necessary. In the mean time, we have no reason to doubt the experiment upon the square foot, or upon the smaller parts; intermediate experiments only can make them accord. One example adduced is of consequence. A pillar in the church of All Saints, in Angers, of 24 feet height, and 11 inches square, supports a weight of 50,000lb. that is \( \frac{1}{2} \) being added 856,539 upon the square foot, which is said not to be \( \frac{1}{2} \) part of the load that would crush it. From this it is evident, that the load it supports exceeds the weight of an arch of 50 feet span, of a semicircular form; the arch-stones being 25 feet long, or depth of the arch, and 2 feet in breadth. It is asserted under the article Bridge, that instead of an arch \( \frac{1}{2} \) of the opening or 10 feet thick, that a pier of 2 feet thick would be sufficient, but that it is given twice the length of the arch-stone, that is 5 feet thick in place of

of 10; but from this example, it is five times thicker than necessary, and has therefore superabundant strength, allowing even for the force of a current. How superfluous then will these clumsy piers be reckoned, whose sole effect is a useless obstruction to the water! But as our principal design at present is upon the strength of wood, in prosecution of this inquiry, we have paid particular attention to the strength of this material, in the transverse direction, as far as it can be supported by experiment. Before we proceed to make particular application to its use, it will be necessary to consider its strength or power of resistance in its breadth and thickness. In this it may be with safety averred that such force as will bruise or crush its fibres, although only of 1/5 or 1/6 of an inch; the same weight continued will produce the same effect upon the next stratum, till the whole piece is bruised, and its cohesive power overcome. This is supported by the experiments of celebrated mechanicians, as those of Buffon, Muschenbroek, Bouger. Muschenbroek, in his Essai de Physique, says, that a piece of sound oak 1/2 of an inch is torn asunder by 11,500 lb.; and that a plank 12 inches broad, and 1 inch thick, will just bear 189,196 lbs. These give for the cohesion of an inch 15,755, and 15,763 lbs. Bouger in his Traité de Navire says, that it is very well known that a rod of sound oak, of 1/2 inch square can be torn asunder by 1000 lb.; this gives 16,000 for the square inch. Bouger speaks with certainty, that 1/2 inch square of sound oak can be torn asunder by 1000 lb. If we reduce the above proportion of the experiment, it will appear, that the force will be much greater than 16,000, to tear asunder a piece of sound oak of one inch square. It must in the mean time be allowed, that Buffon’s experiments being upon a larger scale, can be followed with more security than those upon a smaller scale.

But, after all, we have not yet got sufficient data to form a criterion for an arch; nor can this be expected till we have more precisely ascertained the strength of an arch above a right line, parallel to the horizon.

In the next place, as an arbor in form is composed of it towards the perpendicular, and the other towards a horizontal line; the force that it will sustain, is between that force that a body will carry in the perpendicular, and that which produces a fracture upon any material in the horizontal direction. If the perpendicular is greater than the horizontal line, it will have more of the strength of the bruising force, than of the transverse fracture; and the force may be expressed by the ratio compounded of the bruising or crushing force, and that of the transverse fracture; or not improperly expressed, as it has been denominated by others, the absolute and relative force.

Unfortunately we have not yet a sufficient variety of experiments to ascertain the absolute force, as those made are only upon a small scale; and the number is not adequate to form a proportion of the increase for the force that will crush a piece of wood of 1/2, or as the French philosophers have done most this way, we take their measure 1/4 of an inch, or one line, and from that to an inch; but the force required is found to be greater than that of the square of the diameter, as also the force to produce a transverse fracture, or to give the relative strength. This increases in a greater ratio than that of the square of the diameters; for in the above experiments, the weight that broke a batten 4 inches square, was to that weight which broke an 8-inch square batten, each of the length of 7 feet, more than double of the square of 4 to the square of 8 as above; we are, therefore, much limited as to an exact procedure.

At the same time, by keeping the experiments in view, and the observations made upon them, we shall be able to give such a ratio, as to the necessary strength, and will furnish the ingenious artist with a pretty sure principle to act upon, and prevent his using superfluous materials, either in their application to horizontal right lines, or inclined in the right-lined direction, or in curves.

If we attend to the weight that crushes one inch of sound oak, by Muschenbroek’s experiments, we find that it is 17,300 lb. but, if computed from the increase, being as the squares of the diameters, it is only 16,000 lb. but it has been found as above, that the power to break; or make a transverse fracture in the same wood, of the same length, of different diameters, if a considerable difference in diameters is taken, the difference of weight is twice that produced by the square of the diameter. This comparison makes the proportion between the strength of stone, and that of wood, to be as 17,300 is to 6048, or 1 to 2 1/2 nearly. Thus we may with a sufficient degree of accuracy substitute the one for the other in point of strength, and form a proportion between the arch and the strength of a horizontal line. As several experimentalists agree, that a square inch of wood can be crushed or pulled asunder with a weight of between 16,000 and 17,300 lb. and that a piece of wood one inch square, 18 inches in length, can be broken by 406 lb. or at 12 inches by 609, or at 6 inches by 1218; attending to the addition as mentioned above, which has been proved by comparison of experiments, to be upon the principle of the lever. If, then, the geometrical mean is taken between the elevation of the arch, as pressure or absolute strength, and the length of the horizontal line, this mean will be the strength of the arch above the horizontal line; for it is evident, that so much as the piece of wood is elevated towards the perpendicular, so much the nearer it approaches to its absolute strength, and by so much as the arch is flatter or the piece of wood less inclined, the nearer it is to a straight line, and so much the more reduced to its relative strength; the position of the arch, therefore, must be in the ratio compounded of these two.

Having now established the principles, let us endeavour to apply them to practice, in forming a center or supporting an arch, to produce the intended curvature or mould for an arch of any intended span, and at the same time have strength to support the same. Several ingenious artists have not only formed, but have written and laid down principles for forming these moulds, both with regard to strength and economy; at the same time we have not found any that have treated the subject upon principles that are fully established. We have, therefore, been the more particular, according to the principles laid down. 1st, We have assigned the weight to be supported, as established by uncontested principles: And, 2dly, established the strength of
of wood as to its thickness or diameter, that is sufficient to sustain such weight; which we have supported by the most approved experiments, comparing one with the other; and in the third place, we have considered the effects when the materials are applied in the horizontal direction, or elevated in any degree toward the perpendicular.

In a work of this kind, it is not only necessary to lay before our readers well grounded principles, and a well supported theory, but along with these, the different opinions, and various modes used by the most distinguished artists, who have exhibited their plans to the public, together with the principles on which they were founded, and the success they have met with, in answering the purposes proposed.

Among the most distinguished who have treated this subject, we may consider Pitoet, a member of the Academy of Sciences, who wrote about the beginning of the last century. His method undoubtedly shows considerable ingenuity; but, at the same time, we must observe that he has been rather too profuse in the quantity of materials which he has employed.

To lay his plan of operation before our readers, we shall give a figure showing the constructions. The arch of the circle or ellipse being formed, as little or no weight lies upon the center, till between 30 and 35 degrees of the arch, a stretcher is extended at this height, to the same height on the opposite side; two struts support this stretcher from the spring of the arch; upon the upper part of the stretcher, immediately above, or a little within the upper end of the truss on each side, two spars joining upon the king-post, spring from about the middle of the arch, the stretcher being divided into four parts. Another strut springs from the rise of the arch, meeting the stretcher at this fourth part, from each side of the arch; these last struts are joined by a tie-beam, which gives additional strength to the first stretcher; upon these, on the upper side of the stretcher, two spars join the king-post, a little below the other; those spars are joined by bridles or cross spars, from the circular arch, to the lower strut; rib of the same formation being placed at proper distances, according to the width of the bridge, and joined by bridging joints, which may be of greater or lesser strength, according to the span of the arch, and of consequence the weight it has to support. Pitoet is the first writer who has given us any account of the method of forming frames, according to the above general description. If no rests are left at the spring of the arch, as a base for the center to rest upon; let AB, fig. 1. Plate CXXXVIII. be the ends of two planks raised from the foundation, upon which the center may rest; let CD be the stretcher, extended about 35 or 40 degrees from the spring of the arch; or, as little weight rests upon the center till that height, the stretcher may be as high as 45 degrees; let AE, AG, BD, BG be the two struts on each side; from each extremity of the center, let BE, AE, be fixed to the stretcher near C and D, and AG, BE, at 3 of CD, their stretcher or tiebeam FG, equal to one-half of CD, the bridles, 2, 3, &c. from A to C, and from B to D, are intended to prevent the arch from yielding from A to C, and from B to D. The struts EF, EF, meeting the king-post K in F, and the interior struts GH, GH, meeting the king-post in H, support the bridles 4, 5, Center.

The arch for which Pitoet allotted this center, is of 60 feet span; and the arch stones seven feet in length, the weight of a solid cubic foot he makes 160 lb. The Portland stone is admitted to weigh 260 lb.; but we do not find any other freestone of such weight. It is however to be considered, that the Paris foot is 12.786 of our inches; that is, a little more than 12.448 of our measure, which will make a difference of the weight upon the foot; as also their lb. is lighter than ours about 1.2 oz. by which the stone here mentioned is not better than ours. In a matter of this kind, such exactness is not necessary. As was proposed, we first consider the weight to be supported by the frame; and here it is evident from the figure that no strain lies upon the frame below C; the arch is raised, or can be raised to this height, before the frame is set; therefore the perpendicular Cc determines the limits of the absolute pressure upon the frame. The triangle CcD presses on the frame, and the triangle Cfg adds to the lateral pressure; the weight of the arch, that actually presses upon the frame, is contained between the perpendicular lines Cc, Dd; no more can press upon the center frame. The part of the arch below C will rest upon the abutment raised upon the pier; but if it is insisted that there is a pressure upon the lower part of the center frame, what can only possibly rest, or press upon it, must be contained between the parallels Cc and fg; although it will be admitted, that the arch can be raised to the height C, without the center frame; but to indulge such as may it is not advisable to do it, we will admit what lies between these parallels to press upon the frame. Now to determine the weight of these parts of the arch, the distance between the perpendiculars Cc, Dd is 53 feet; the archstone is 7 feet, and admit it to be three feet broad, 53 x 7 x 3 x 160 lb. = 178,980 lb.

To determine the area between the two parallels Cc, fg, the line fg perpendicular to the diameter AB, is 134; the base is 93, and Cc perpendicular to it is 7 feet, the area is 334 feet; Cc the base of the triangle Cfc is 7.2, and fc is 1.7; the area is 25, the difference is 82. If this difference had been the excess of the triangle Cfc above the triangle Cfg, it would have been a pressure upon the frame; but as it is the reverse, the pressure is upon the abutment. This distinction is requisite to be taken notice of, that an unnecessary expenditure of wood and workmanship be not expended where it is unnecessary; as well as its being unworkman-like, or having an appearance of ignorance in the engineer.

Let us now inquire, what strength of materials is sufficient to support this weight. It has been laid down as a principle, that the parts of wood in an arch act upon one another by their absolute strength; but are liable to the transverse fracture, in proportion to the length of the piece, in a span of 60 feet, the length of the piece may be 7 feet without sensibly impairing its strength, in reducing it to the round; and experiment gives the relative strength of 7 feet to be 47649 lb. by 8 inches square. It has been formerly illustrated from
from experiments, that the strength is according to the depth, with this precaution, that the breadth or thickness be such, that it is prevented from warping, the absolute strength being nearly, by last experiment mentioned, as the squares of the depth. The absolute strength to the relative force has been found nearly 60 to 1, although by some it is said to be only 43 to 1; the absolute strength of the plank 12 inches broad by one thick, is 18963 lb.; if two inches, it would be no more than 18963 lb. If it had been 8 inches square, the every 7 feet of the arch might be broken with the weight 18963 lb.; but the whole weight of the arch is only 178080 lb. that is, 11080 less weight than what that part of the frame would bear; but 7 feet is only about one-seventh part of 33; the frame is therefore of sufficient strength to support the whole weight of the arch when equally divided along its whole length. This is not the case with the center frame of an arch, as it is loaded at one place, and not at another; it is therefore apt to yield between the parts where the load is laid; that is, it may rise in the middle, and thus change the form of the arch; for the center frame is not only intended to support the arch, but likewise to preserve its true form; for this cause some struts may be necessary to prevent its putting the arch out of shape. To remedy this, where the arch begins to press upon the frame at C, draw the chord line C c, fig. 2, which acts as a tie-beam to the arch, from C at 33 degrees to c at 31 degrees, as, beyond this, if the arch frame had been permitted to alter its shape, it would begin to be restored to it, at least the force would tend that way. At that part of the arch, where its weight begins to flatten the arch, as at 2, draw the stretcher 2, 2, which likewise acts as a tie-beam, and gives support to the bridge 1, on one side, and 3 the bridge upon the other side, from D d 1 and thus the arch c d is prevented from sinking by the tie-beams e d. This will effectively prevent any warping or yielding of the frame, notwithstanding the enormous load from the size of the arch-stones.

But it is necessary to attend to the relative strength of different kinds of timber of which frames may be constructed. The relative proportion of the strength of oak and fir has been ascertained by different experiments; and although the results do not exactly agree, yet the mean or least proportion may be taken. Let us take \( \frac{3}{4} \), that of Buffon. Now to reduce a frame of oak to one of fir of equal strength, divide 8 inches, the diameter of the oak, by \( \frac{3}{4} \), the relative strength of fir; this gives 12 inches. Allow 12 inches. The depth of the frame will then be 93/4 inches by 4 or 4 inches in breadth; that is, 32 1/2 inches. In this way the strength of the fir arch is rendered equal, and by the additional allowance superior to the oak in strength, and of less expense in wood and workmanship.

We have here taken the most simple method of investigation and computation, that every mechanic, whether scientific or not, can easily follow it in every step, and judge of the propriety or impropriety of what is advanced.

It will now be necessary to follow Mr. Pitot in estimating the quantity of materials which he allows. The ring of his arches consists of pieces of oak 2 inches broad and six thick. The stretcher CD is 12 inches square, the straining piece GG is likewise 12 inches square, the lower struts 10 inches by 3; the king-post 12 inches square, the upper struts 10 by 6, the ridges 20 by 8, French measure. Pitot allows the square inch to carry 8530 lb. that is, one half of the absolute strength, which is ascertained by experiment to be 17500 lb. nearly, and not by the square of the diameter, which would be only 16000 lb. But on account of knots, he reduces it to 17500 lb. per inch. He then computes the whole load upon the frame to be 707520 lb., which is the weight of the whole arch-stones, supposing each to be three feet broad, and the whole to press upon the frame. This seems so very near, that it would be needless to dispute about the difference. We have shown that no more than 178080 lb. presses upon the frame, but we are not so fully satisfied as to the weight that rests upon the center. Pitot supposes it to be 1/4ths of the whole weight; but he has assigned no reason for this conjecture. Mr. Couplet assumes that it presses by 3/8ths. Another writer, who makes some comment upon the whole, says that 1/4ths is nearer the truth than 3/8ths, but gives no reason for his opinion, which seems to be equally vague as the other. The pressure here allowed, and the reason of assigning such a pressure, have been already explained. Our readers, therefore have it in their power to examine the principles, and decide for themselves.

It has been asserted by some, that the arch does not press upon the center frame below C. At the same time, were we inclined to dispute this opinion, we might state our objection in the following manner. Suppose the area of the triangle C e f was equal to the area of the triangle C f g, so that the friction above would make the triangle C e f rest upon the side e f; and as the triangle C f g is greater than C e f in the proportion of 33 1/2ths to 25 1/2d, the cohesion of the parts will determine the intermediate space between C c and g f to rest upon the abutment as has been said, and not on the perpendicular, unless a scissure is made in the direction g f, in which case it would be detached from the lateral pressure, and so rest upon the center. As this is not the case, any plea for a pressure below C is entirely removed; and a method to determine with precision the actual pressure upon the center frame is shown. If the arch is the center of a circle or an ellipse, a frame so much stronger is necessary, as more of the arch presses upon the frame; but the method of determining the strength is the same as here laid down. A second figure of the ellipse and another calculation are required. It is here to be understood, that the frame calculated for is only one rib; and the weight it supports is that of the arch-stones, between the parallels C c, D d, to three feet in breadth. If, therefore, the bridge is 42 feet broad, it requires 14 ribs of the above strength. These are joined over with planks, suppose of two inches thick, and upon these the arch-stones are laid, equally carried on from C and D, and rising equally on each side, till the key-stone is set, in which state they remain, till the engineer judges it proper to slacken the frame, by striking out the wedges at the rests, A and B (or, as the French use logs between the frame and arch), so far as to allow the arch-stones to press upon one another, by the equilibrium curvature.
curvature of the arch; after which, it being found, that the arch is perfectly just and secure, the frame is entirely removed. In the frame, fig. 2, the tie-beams are not taken into the account for strength, the arch being abundantly strong without them. Their use is merely to stiffen the frame, on account of the manner in which the weight is laid on. In an elliptic arch, it has been mentioned that it is somewhat different, requiring more strength and the binding likewise different. In what are termed elliptical arches, few or none are strictly so, the true elliptic curve being difficult to form on so large a scale. It may therefore be acceptable to our readers, and also to the ingenious mechanic, if we give the form of an ellipse that will answer nearly to the elliptic equation, and upon a universal plan, easy of construction. The greater and lesser axes of the ellipse being given, divide the excess of the greater axis above the lesser into three equal parts; set off two of these from the center of the greater axis each way; upon this distance describe an equilateral triangle on each side of the greater axis, and produce the sides of the triangle both ways from the vertex of these triangles, to the extremity of the lesser axis; describe two arches till terminated by the sides of the triangle produced gives the flat part of the ellipse. At the intersection of the produced sides of the triangle as a center, with the distance of the extremity of the greater axis, describe an arch which will meet the other arch, and complete the ellipse. Let AB, fig. 3, be the greater axis 60, and DE the lesser axis 40, be drawn at right angles, bisecting one another in C. Set off AF 40, upon AB, then the excess FB is 20, which divide into three parts; set off two of these from C to G and H; upon GH describe the equilateral triangles GHK, GHL; produce KG, KH, to any indefinite length; which may be cut by the arch drawn through D and E; from the centers KL, at the intersections of GH, and distance AB, let the other part of the ellipse be described; thus an universal method of describing a beautiful ellipse, and so just that it answers the elliptic equation exceedingly near, at least till it becomes very flat.

A second form of a center frame described by Pitot, is adapted to an elliptical arch. The construction differs nothing from the former, only the two upper struts are parallel; the strength as in the former is superabundant, which is easily accounted for, from not knowing the real weight that lies upon the frame, or by considering the whole weight of the arch to rest upon the frame. Both this and the former Pitot has considered as divisible into three pieces, which renders it more manageable in erecting, particularly in large spans. See fig. 4.

Fontana has given a description of a very neat frame consisting of two pieces, the upper and the lower. The struts 2, 2, 2 taken from fig. 4, leave a representation of Fontana’s frame. Different constructions being laid before our readers, the ingenious artist may improve the hints that have been thrown out; and thus form a more simple or better construction.

We shall now select draughts of the most approved center frames that we are able to collect; and make such remarks upon them as may occur. Fig. 5 exhibits a form, which the experienced engineer will readily allow to be neat and ingenious; but there is much more wood and work expended than is necessary. It is divided into two parts, the base or stretcher LL, of the upper part, resting upon the lower part of the frame, the greatest part of which at least must appear quite superfluous. The lower rests, EF, appear only necessary to prevent the stretcher LL from yielding, and thereby allowing the arch to lose its true curvature.

The general maxim of construction adopted by Perronet, a celebrated French architect, is to make the truss consist of several courses of separate trusses, independent, as he supposes, of each other, and thus to employ the united support of them all. Each truss spans over the whole distance of the piers. It consists of a number of struts, set end to end, so as to form a polygon. By this construction, the angles of the ultimate truss lie in lines pointing towards the centre of the curve. It is the invention of Perraut, a physician and architect, and was practiced by Mansart de Sagonne at the great bridge of Moulins.

In the centering of the bridge of Cravant, fig. 6, the arches are elliptic. The longer axis or span is 60 feet, the semi-transverse axis or rise 20 feet. The arch-stones weigh 176 lb. per foot, and are four feet in length, which is the thickness of the arch. The truss beams were from 15 to 18 feet long, and 9 inches deep by 8 broad. The whole frame was constructed of oak. The distance between the trusses, which were five in number, 5/5 feet. The whole weight of the arch amounted to 135,000 lb. which is nearly equal to 600 tons, making 112 tons for the weight on each truss. Ninety tons of this must be allowed really to press the truss; but a great part of the pressure is sustained by the four beams which make the feet of the truss, joined in pairs on each side. The diagonal of the parallelogram of forces drawn for these beams is to one of the sides as 360 to 285. Then 360: 285:: 90: 17½ tons the weight on each foot. The section of each is 144 inches. Three tons may be laid with perfect safety on every inch; and the amount of this is 432 tons, which is six times more than the real pressure on the foot-beams in their longitudinal direction. The absolute strength of each foot-beam is equal to 216 tons. But being more advantageously placed, the diagonal of the parallelogram of forces which corresponds to its position is to the side as 438 to 285. This is equal to 58½ tons for the strain on each foot; which is not much above one-fourth of the pressure it is able to bear. This kind of centering, therefore, undoubtedly possesses the advantage of superabundant strength. The upper row of struts is quite sufficient; nothing is wanted but to procure stiffness for it.

In his executing the bridge at Neuilly, fig. 7, of 120 feet span, and only 30 feet rise; the arch 5 feet thick; his strut-beams are 17 by 14 inches of size, and king-post 25 by nine, the strut-beams placed in three parallel polygons, each abutting upon the king-post, he uses the binders or bridges of 9 inches square. This arch is remarkable for its flatness. The account Perronet gives of his success with this frame, and the effects it produced in his work, are as follows. Notwithstanding the different improvements he had made upon his center frame, he here found that it sunk 13 inches, before
the key-stones were set, and that the crown rose and 
sunk as the different courses were laid. At 20 courses 
on each side, with a load of 16 tons upon the crown, it 
sunk an inch; when 20 more courses were laid, it sunk 
half an inch more, and continued sinking as the work 
advanced. When the key-stone was set, it had sunk 13 inches; and, as it sunk at the crown, and in the 
advance, to the crown, it rose at the haunches, so as to 
open the upper parts of the joints almost an inch; 
which gradually lessened towards the crown, and, of 
consequence the joints in the lower part opened as the 
upper part was compressed. This no doubt showed a 
suspense in the frame, and at the same time inattention 
in the architect, to load the crown, when he perceived 
it sinking with having already too much weight upon 
it. If he had observed the crown to rise, it would then 
have been proper to give it additional weight.

Let us now attend to the description of the centre 
frame of the bridge of Orleans, fig. 8. The architect 
to this bridge was Hupeau; and it is universally allow-
ed to be an elegant structure. The arch stones are 
six feet in length, the form is elliptical, the span 100 
feet, and rise 30. Hupeau died before any of the 
arches were complete. The center-frame had been 
placed, and some rows of the arch laid. Upon his de-
mise, Perronnet succeeded as architect, and finished 
the bridge. As the work advanced, he found that 
the crown of the center rose; he then found it sink as re-
markably, which showed that there was some defect; 
he inserted the long beam AB, on each side; he then 
found the frame sufficiently stiff; for this made a 
change in the nature of the strut.

Having taken a view of the practice of the French 
architects, as to their form and effects, let us direct 
our attention to those of our own country, which are 
well worthy of notice. We shall only name some that 
have used trussings, and among these we find the cen-
ter-frame of Blackfriars bridge, fig. 9. The span here 
is 100 feet; the form is elliptical, the arch-stones from 
the haunches seven feet, near the key-stone not quite 
so much, as they decrease in length from the haunch 
to the key-stone.

A particular description of this arch is not neces-
sary: a view of the figure will show the use of the dif-
ferent parts; it may be sufficient to observe, that when 
the arch stone was placed, it had changed its shape only 
one inch, and when the frame was taken out, the arch 
remained firm without any sinking of consequence. The 
great arch did not sink above one inch, and none of 
them above an inch and a half; whereas those already 
mentioned sunk by the supposition of the frame 13 
inches, and some of them 9 inches more when the frame 
was removed.

Different methods are employed for easing the frame 
or disengaging it from its weight. We shall give a 
short description of Mr Mylne’s method of placing 
and disengaging his center-frame from the mason-work. 
Each end of the truss was mortised into a plank of oak 
cut in the lower part as in the figure; a similar piece 
of oak was placed to receive the upper part of the posts. 
The blocks rested upon these posts, but were not mor-
tised into them, pieces of wood being interposed. The 
upper part of this block was cut similar to the lower 
part of the other; the wedge E, being intended to 
be driven between them, was notched as in the figure, 
and filled up with small pieces of wood, to prevent the 
 wedge from sliding back by the weight of the arch; 
which, it will appear from the figure, would have been 
the case: the event proved the fact. When the centre 
was to be struck, the inserted pieces of wood were 
taken out, and the wedge, which was prepared for driv-
ing back by being girl with a ferrule round the top, 
was removed by a piece of iron driven in with the 
head so broad as to cover the whole of the wood. A 
plank of wood was prepared armed with iron in the 
same manner at the one end, and suspended so that it 
could freely set in driving back the wedge to any dis-
tance, however small, with certainty. Thus, by an 
equal gradation, the centre was eased from the arch, 
which appeared to have been so equally supported 
throughout the whole of the operation, and the arch-
stones so properly laid, that it did not sink above one 
in; and thus it was evident that the centre might be 
entirely removed, having completely answered the 
purpose.

The above may be considered as sufficient to show 
the effects of the trussed arches, which have 
been employed by the French architects. We 
shall now take the liberty of suggesting some hints 
which may tend to improve the construction, and re-
medy the faults and failures that have occurred in 
practice.

Trussed arches for center frames being found expen-
dient in navigable rivers, and almost in every river 
which is apt to be raised by rains, or other rise in the 
river, the frame is apt to be endangered or carried off 
to the great risk of bringing down the arch, and ruin-
ing the work before it is finished. In arches were 
there is no such danger, the frame may be properly se-
cured by posts from below, which are made to abut 
upon these parts of the arch where the greatest strain 
must fall.

In the centre used by Pitot we have only to com-
plain of an unnecessary expenditure of wood and work-
manship. We have already shown what strength of 
oak is necessary, and have reduced the strength of 
oak to an equal strength of fir-wood for the ring of 
his frame, which, alone ought to have the strength 
required to be fully adequate to the load; but as this 
weight must be gradually applied, the frame must like-
wise have such a degree of firmness as to form the ex-
act mould of the arch that is intended. And, for this 
purpose, it must be prevented from yielding in any 
part of its arch. Now, as it has been made to appear, 
that the frame supports no part of the arch till it rise 
from the spring to about 35 degrees, it is a semicircle, 
and so in proportion for a segment of a circle; in an 
ellipse, to a part similar according to the nature of that 
curve; the supporting struts and ties can be more 
particularly directed to support that part of the arch 
which produces the greater strain upon the centre. In 
fig. 2, where the necessary strength for Pitot’s arch is 
pointed out, the frame of fir requisite to stiffen the 
frame is 9½ by 2½. The tie-beam C C is joined to 
those parts of the arch where the strain being greatest, 
would tend most to raise it in the crown. The strength 
of this tie-beam being 9½ by 2½ and its length 2½ feet, 
would require a weight of 3049½ lb. to make the trans-
verse fracture; one-third of this at the bridle \( x, 3 \) is sufficient to resist the strain at the part of the arch; and the abutment, being according to the principles laid down under the article Bridge, prevents the possibility of its rising at the haunches; but if not formed according to these principles, the two tie-beams \( C d \) \( D d \) are joined by a third tie-beam \( 2, 2 \) with its bridle \( 3, 4 \). Fig. 4. is Pitot's centering for his elliptic arch: the strength of fig. 2. may suffice to this by giving the ring and tie-beams \( \frac{3}{4} \) an inch more depth.

Fig. 6. represents two centerings used by Perronet; A is that used by him in erecting the bridge at Nogent, and B that at Maxence; they differ little from one another. That at Nogent is 90 feet by 28 of height. The span of the latter being greater, we shall here consider the weight to be supported. This is the arch from A to C, which is an arch of 47° 45'. The measurement is 42 feet; the arch stones 45', and supposing them 3 feet broad, they would amount to 679 solid feet, which at 160 lb. per foot, is equal to 90646.88 lb. This is little more than one-half of the semicircular arch: and although it is flatter, the weight is so much less, that no additional strength is necessary to be given to the frame, fig. 2. for the 60 feet span. There is likewise abundance of strength of materials for the 90 feet arch; but on the greater extent, that it may be rendered more stiff, a tie-beam \( x, 4, 3, 4 \) may be added on each side of the arch, as represented by the dotted line.

It is scarcely necessary to make any farther calculations on the centering used by Perronet. It appears, that notwithstanding the superabundance of wood employed, they were so ample as when used upon an extended arch, they rose and sunk so much, that the arch was changed from its intended form by a radius of several feet. These changes took place in erecting the bridges at Nogent and Maxence, which are represented in fig. 6. Perronet, it would appear, was not satisfied with these; and, convinced of their insufficiency, changed the form of the frame of the bridge at Neully. But this form is far from answering the purpose; for, when the arch-stones began to press upon the centering, it yielded to the weight. He then loaded the crown to prevent its rising there, but it still sunk; he added more weight to the crown, it continued sinking as the work advanced. When the key-stone was set, it had sunk more than 13 inches, and it was found to have raised the haunches; for when the centering was slackened, the arch still sunk for about 9 inches more. The arch-stones being raised at the haunches, the joints were of necessity opened; for the pressure from the crown, when the centering was removed, forced them again into contact, by which the arch flattened to such a degree, that from an arch intended to have a radius of 150 feet, it flattened till part of it was as if formed from a radius of 244 feet. It here appeared to be settled, from which a considerable deformity must appear in the structure; which deformity took its rise from two evident causes: the want of firmness in the centering, and the bridge not properly loaded at the haunches. It is evident, that if the load at the haunches is only equal to the weight of the arch-stones from the place where they begin to rest on the centering to the crown of the arch, the pressure of the arch could never overcome itself or its equal weight upon the haunches; much more, if the weight upon the haunches, before it comes to press upon the centering, was made to exceed that part of the arch that did press upon it, the load upon the crown of the arch would have restored the figure of the centering. It seems to be a strange oversight, that Perronet, when he saw that his centering was rising at the haunches, did not apply his loading to this part of the arch, by which he might have restored it to its equilibrium before his centre was struck, and before his lime had lost the band; if this is once done, it is allowed that it does not again recover it.

From the whole of this it appears evident, that filling up the haunches to a proper height, so as to make a firm abutment to the pressing part of the arch, serves two good purposes. It acts as an abutment to the centre frame, in preventing its sinking by the load as the work advances; and likewise prevents the arch-stones at the haunches being raised from their beds; for it is only acted upon by a force considerably less than what they have a power to resist. Having now seen the defects of this centering, and animadverted on the manner of executing the work, let us now examine the weight of this arch, and what resistance would have prevented its change in shape, and preserved its intended form.

The part of the arch that presses upon the center, is from C to C, fig. 10. an arch of 36 degrees, and measures 94' 2 feet nearly; the stones 5 feet in length, and breadth 3, make 17979.035 solid feet, 160 lb. the weight of a solid foot, make the whole weight 218645.88 lb. Allow each beam of the press to be 7 feet, and its absolute strength to bear it at 12 inches deep, by one inch thick, 180263; the absolute power of transverse fracture, 95416 lb. The strength of the arch is the mean of these, or ratio compounded; taking one-third of each, the geometrical mean is 44285 lb. that each 7 feet can sustain when formed into an arch; there are 13 times 7 in 94 feet, equal to a power of 582764, to sustain the weight of 316645.68 lb equally distributed. But this not being the case, a tie-beam of about 50 feet marked \( c, c \), \( d, d \), will prevent the arch yielding to the pressure. It is supported at \( e \) by the struts \( E, h, h \); and these by the joint support of \( e, f, h \), tied at \( k \). The whole centre frame is supported by the upright posts \( C, C \), \( D, D \). Two wedges \( A, A \) and \( B, B \) are placed across between two blocks which are fitted for a rest to the frame. When it is required to be slackened, and the frame withdrawn from the arch, they allow it to rest by its own pressure. This, it must appear obvious, ought to be done when the key-stone is set before the lime has begun to be dry and solid.

The centre frame of the bridge of Orléans is represented fig. 8. It has been already noticed in this undertaking, that Perronet succeeded Hupseau. As the work advanced, he found the arch and frame to sink, and trying his ordinary mode of loading the crown of the arch, he was now taught by experience to strengthen his centre frame, and happily succeeded by continuing his strut. By forming the base of the triangle \( 1, 2, 2 \), on each side, his frame was rendered sufficiently stiff, and the inner part below \( A, B \), \( A, B \) became superfluous. The weight that presses upon this frame is great both
on account of the flatness of the arch, and the length of the arch-stone. The pressing arch is an arch of 77 degrees; it measures 88.57 feet, × 5 the length of the arch-stone, and by 3 in width, makes 1595.66 solid feet × 160 lb. the weight of a solid foot, gives 25,594.56 lb. The length of each plank of the truss being 7 feet, depth 12 inches by 2 inches thick, the strength is 1891.63 lb. The weight for every 7 feet in length of the arch, one third of this 6304.51 lb. in 88 feet, there is 12 times 7, that is 6304.513 = 756.63 lb. to support 25,594.56 lb. more than 3 times stronger, without taking into account the strength of the arch, being the mean of the splitting force and transverse section: the tie-beams, as in fig. 7, will be of abundant strength to stiffen the frame.

The next we take notice of is, the truss-frame, fig. 9, used by Mr Mylne, at Blackfriars bridge, London. This is supported by ties and struts in such a manner, that no sinking took place during the mason work going on, although the arch-stones at the haunches were 7 feet, gradually lessening to the crown of the arch; and, when the frame was struck, which was done by a very ingenious method, by the wedges of the constructions as in the figure, in place of sinking 9 inches, it did not sink above 1 inch, which may well be accounted for by the compression of the mortar; whether a smaller quantity of materials might not have answered the same purpose, such as fig. 7. We shall refer to the judicious reader, or to the ingenious artist who may have occasion to depend upon such frames for support of this work, or a tie-beam between 1 and 3 on each side, represented by the dotted line. As there is a strain upon the frame at 3, 3, let these tie-beams be supported by the struts a, b, c, d, e, on each side, and tied at 4, 4 as represented by the dotted line 4, 4. It does not appear that what lies between the dotted line a, 4, b, c, d, e, bares any part in the support or stiffness of the frame, and therefore becomes unnecessary; nor does it appear, that the different beams used as kingposts are of so much advantage for strengthening the frame, as tie-beams would be. At the same time, those used by Mr Mylne are employed with so much judgment, that none of their effects are misapplied. This cannot be said of any of the frames used by the French architects, even of that used at the bridge of Orleans. They are not often employed by the British architects; they rather prefer a tie-beam at the spring of the arch from one side to the other. This, however, might be as judiciously applied at the height where the arch begins to rest upon the frame, especially if the shoulders are properly loaded or filled up, so as to be in counterpoise to the arch-stones, that rest upon the frame. In this case they effectually prevent the necessity of a tie-beam, as a diameter at the spring of the arch; and from the spring proper supports may be given at the upper tie-beam, and from it to any part of the arch, where the greatest strain lies.

Having, from the examples adduced, and the observations made upon them, found center-frames of sufficient strength to support arches of very extensive spans, and even greater extent than they have yet been applied; it may be said, why not continue these frames for the bridge, without the very great additional expense of throwing a stone arch over them? The reason would answer, that the stone was more durable, and had other advantages, particularly as to neatness, when once thrown, and fired from the unchartered truss and tie-beams necessary in the wooden frame. The carpenter would reply, that if wood was not so durable as stone, it could be raised at much less expense; and, when it failed in any part, it could be replaced at a small expence, and made to last longer than a stone arch; which latter, when it fails, requires as much expense as at first, and even more, in clearing off the rubbish of its decayed and now useless materials. As to neatness, the frame of wood vies with the arch of stone in elegance, and is erected at half the expence, and even less. But now since iron materials are introduced in place of stone, there is room for experiments with regard to neatness and extent of span.

We shall here suppose the carpenter exhibits this plan. Let AB be a span of 60 feet, (fig. 11.) the arch a semicircle, the absolute strength of oak a plank 12 inches by one is 1891.63 lb. Let the arch be composed of pieces 5 feet long, 12 inches deep, and 2 inches broad; a second arch joining to this, of the same depth and breadth in close contact, but the joints of the one to the middle of the other, like brick-building, or as the carpenters express it, breaking-joint. The absolute strength of this arch is, before the two trusses are joined, more than 84 ton, as may be collected from the calculations above, which is more than 3 times what can ever come upon it. The beauty of this arch would be hurt by placing struts below to stiffen it, for which there is not the smallest occasion: for it can be stiffened to better advantage above the arch. But this is not practicable in center-frames. Let the road-way be CDEF, resting upon the perpendicular support 1, 2, 3 &c. As the carriage acts upon these in the oblique direction, transepts from the arch in a radial direction, give them the advantage of equal pressure upon the arch. Each of these perpendiculars is mortised into short pieces, that will form into an arch, the pieces all abutting one upon another, and forming a fillet over the arch, and projecting so far, that the faces of an architrave of any order may be formed along the face of the arch, which adds both to its strength and beauty. Thus there is formed a rib, 12 inches deep and 4 thick, with its fillet over it 4 inches deep and 6 inches broad, to cover the faces of the architrave. Suppose the arch 44 feet wide, 7 of these ribs may give a strength not inferior to the strength of stone or any metal; but it will be said; it will not be so durable. It is well known how long wood lasts in the roofs, and joists of flooring, and even when it forms a part of the wall of a house built of brick. The interstices between these perpendicular bearings of the wood may be built up with brick; even brick on edge; or brick thick. will render its preservation equal to what it is in a house, and will preserve it from the bad effects of wet and dry; and the lower part of the ribs covered with a thin lining. A door being left in the side to observe at different times any failure in the wood, it may be repaired without interrupting the passage by the bridge. It ought to be so covered above, that water may be prevented from going through to the injury of the bridge. It has been formerly mentioned, in speaking.
Hermes Trismegistus defines God an intellectual sphere, whose center is everywhere, and circumference nowhere.

CENTESIMA USURA, that wherein the interest in a hundred months became equal to the principal, i.e. where the money is laid out at one per cent. per month; answering to what in our style would be called 12 per cent., for the Romans reckoned their interest not by the year, but by the month.

CENTESIMATION, a milder kind of military punishment in cases of desertion, mutiny, and the like, when only every hundredth man is executed.

CENTILQUIUM, denotes a collection of 100 sentences, opinions, or sayings.

The centiloquium of Hermes contains 100 aphorisms, or astrological sentences, supposed to have been written by some Arab, falsely fathered on Hermes Trismegistus. It is only extant in Latin, in which it has several times been printed.—The centiloquium of Ptolomy is a famous astrological piece, frequently confounded with the former, consisting likewise of 100 sentences or doctrines, divided into short aphorisms, entitled also in Greek 

CENTIPES, in Zoology. See SCOLOPENDRA.

CENTIPED WORM, a term used for such worms as have a great many feet, though the number does not amount to 100, as the term seems to import.—M. Malouet relates the history of a man, who, for three years, had a violent pain in the lower part of the forehead near the root of the nose; at length he felt an itching, and afterwards something moving within his nostril, which he brought away with his finger; it was a worm of the centipede kind, an inch and a half long, which ran swiftly. It lived five or six days among tobacco. The patient was free of his pain ever after. Mr Littre mentioned a like case in 1708, of a larger centipede voided at the nose, after it had thrown the woman, in whose frontal sinus it was, into convulsions, and had almost deprived her of her reason.

CENTILIVRE, Susanka, a celebrated comic writer, was the daughter of Mr Freeman of Holbeach, in Lincolnshire; and had such early turn for poetry, that it is said she wrote a song before she was seven years old. Before she was twelve years of age, she could not only read Molière in French, but enter into the spirit of all the characters. Her father dying, left her to the care of a step-mother, whose treatment not being agreeable to her, she determined, although most destitute of money and every other necessary, to go up to London to seek a better fortune than what she had hitherto experienced. As she was proceeding on her journey on foot, she was met by a young gentleman from the university of Cambridge, the afterwards well known Anthony Hammond, Esq. who was so extremely struck with her youth and beauty, that he fell instantly in love with her; and inquiring into the particulars of her story, soon prevailed upon her unexperienced innocence to seize on the protection he offered her, and go with him to Cambridge. After some
some months cohabitation, he persuaded her to come to London, where, in a short time, she was married to a nephew of Sir Stephen Fox. But that gentleman not living with her above a twelvemonth, her wit and beauty soon procured her a second husband, whose name was Carrol, and who was an officer in the army; but being the misfortune to be killed in a duel about a year and a half after their marriage, she became a second time a widow. For the sake of support she now applied to her pen, and became a votary of the muses: and it is under this name of Carrol that some of her earlier pieces were published. Her first attempt was in tragedy, in a play called the *Perjured Husband*; yet natural vivacity leading her afterwards to comedy, we find but one more attempt in the buskin, among 18 dramatic pieces which she afterwards wrote.

In 1706, she wounded the heart of one Mr Joseph Centlivre, yeoman of the mouth, or, in other words, principal cook to her majesty, who married her; and, after passing several years happily together, she died at his house in Spring Garden, Charing-cross, in December 1723.

This lady for many years enjoyed the intimacy and esteem of the most eminent wits of the time, viz. Sir Richard Steele, Mr Rowe, Budgell, Farquhar, Dr Sewell, &c.; and very few authors received more tokens of esteem and patronage from the great. With regard to her merit as a writer, it must be allowed that her plays do not abound with wit, and that the language of them is sometimes even poor, enervate, incorrect, puerile; but then her plots are buoyant and well conducted, and her characters in general natural and well marked.

**CENTNER, or Docimastic Hundred, in Metallurgy and Assaying,** is a weight divisible, first into a hundred, and thence into a greater number of other smaller parts; but though the word is the same both with the assayers and metallurgists, yet it is to be understood as expressing a very different quantity in their different acceptation of it. The weights of the metallurgists are easily understood, as being of the common proportion; but those of the assayers are a thousand times smaller than these, as the portions of metals or ores examined by the assayers are usually very small.

The metallurgists, who extract metals out of their ores, use a weight divided into a hundred equal parts, each part a pound; the whole they call a centner or hundred weight; the pound is divided into thirty-two parts, or half ounces; and the half ounce into two quarters of ounces, and these each into drachms.

These divisions and denominations of the metallurgists are easily understood; but the same words, though they are equally used by assayers, with them express very different quantities; for as the centner of the metallurgists contains a hundred pounds, the centner of the assayers is really no more than one drachm, to which the other parts are proportioned.

As the assayers weights are divided into such an extreme degree of minuteness, and are so very different from all the common weights, the assayers usually make them themselves in the following manner, out of small silver, or fine solder plates, of such a size, that the mark of their weight, according to the division of the drachm, which is the docimastic or essaying centner, may be put upon them. They first take for a basis one weight, being about two-thirds of a common drachm; this they mark (64 lb.) Then having at hand some granulated lead, washed clean, well dried, and sifted very fine, they put as much of it into one of the small dishes of a fine balance as will equipoise the (64 lb.) as it is called, just mentioned: then dividing the granulated lead into very nice halves, in the two scales, after taking out the first silver weight, they obtain a perfect equilibrium between the two scales; they then pour the granulated lead out of one dish of the scales, and instead of it put in another silver weight, which make exactly equiponderant with the lead in the other scale, and mark it (32 lb.). If this second weight, when first put into the scale, exceed by much the weight of the lead, they take a little from it by a very fine file; but when it comes very near, they use only a whetstone to wear off an extremely small portion at a time. When it is brought to be perfectly even and equal to the lead, they change the scales to see that no error has been committed, and then go on in the same manner till they have made all the divisions, and all the small weights. Then to have an entire centner or hundred weight, they add to the (64 lb.) as they call it, a 32 lb. and a 4 lb. and weighing against them one small weight, they make it equal to them, and mark it (100). This is the docimastical or essaying centner, and is really one drachm.

**CENTO,** in poetry, a work wholly composed of verses or passages promiscuously taken from other authors, only disposed in a new form and order.—Probuba Falconia has written the life of Jesus Christ in centos taken from Virgil. Alexander Ross has done the like in his Christiadæos, and Stephen de Pleure the same.

**CENTONARII,** in antiquity, certain of the Roman army, who provided different sorts of staff called centesores, made use of to quench the fire which the enemy's engines threw into the camp.

These centonarii kept with the carpenters and other officers of artillery.

**CENTRAL FORCES,** the powers which cause a moving body to tend towards, or recede from, the centre of motion. See Mechanics.

**Central Rule,** a rule discovered by Mr Thomas Baker, whereby to find the centre of a circle designed to cut the parabola in as many points as an equation to be constructed hath real roots. Its principal use is in the construction of equations, and he hath applied it with good success as far as biquadratics.

The central rule is chiefly founded on this property of the parabola, that, if a line be inscribed in that curve perpendicular to any diameter, a rectangle formed of the segments of the inscript is equal to the rectangle of the intercepted diameter and parameter of the axis.

The central rule has the advantage over Carter and De Latere's methods of constructing equations, in that both these are subject to the trouble of preparing the equation by taking away the second term.

**CENTRIFUGAL FORCE,** that force by which all bodies that move round any other body in a curve endeavour to fly off from the axis of their motion in a tangent
CENTRIFUGAL Machine, a very curious machine, invented by Mr Erskine, for raising water by means of a centrifugal force combined with the pressure of the atmosphere.

It consists of a large tube of copper, &c, in the form of a cross, which is placed perpendicular in the water, and rests at the bottom on a pivot. At the upper part of the tube is a horizontal cog-wheel, which touches the cogs of another in a vertical position; so that by the help of a double winch, the whole machine is moved round with very great velocity.

Near the bottom of the perpendicular part of the tube is a valve opening upwards; and near the two extremities, but on the contrary sides of the arms, or cross part of the tube, are two other valves opening outwards. These two valves are, by the assistance of springs, kept shut till the machine is put in motion, when the centrifugal velocity of the water forces them open, and discharges itself into a cistern or reservoir placed there for that purpose.

On the upper part of the arms are two holes, which are closed by pieces screwed into the metal of the tube. Before the machine can work, these holes must be opened, and water poured in through them, till the whole tube be full: by this means all the air will be forced out of the machine, and the water supported in the tube by means of the valve at the bottom.

The tube being thus filled with water, and the holes closed by the screw caps, it is turned round by means of the winch, when the water in the arms of the tube acquires a centrifugal force, opens the valves near the extremities of the arms, and flies out with a velocity nearly equal to that of the extremities of the said arms.

The above description will be very easily understood by the figure, we have added on Plate CXXVII. which is a perspective view of the centrifugal machine, erected on board a ship. ABC is the copper tube.

D, a horizontal cog-wheel, furnished with twelve cogs.
E, a vertical cog-wheel, furnished with thirty-six cogs.
F, F, the double winch.
A, the valve near the bottom of the tube.
B, B, the two pivots on which the machine turns.
C, one of the valves in the cross-piece; the other at D, cannot be seen in this figure, being on the other side of the tube.
E, E, the two holes through which the water is poured into the machine.
GH, the cistern or reservoir.
I, L, part of the ship's deck.
The distance between the two valves C, D, is six feet.
The diameter of these valves is about three inches; and that of the perpendicular tube about seven inches.

If we suppose the men who work the machine to turn the winch round in three seconds, the machine will move round its axis in one second; and consequently each extremity of the arms will move with a velocity of 18.8 feet in a second. Therefore a column of water of three inches diameter will issue through each of the valves with a velocity of 18.8 feet in a second: but the area of the aperture of each of the valves is 7.14 inches; which being multiplied by the velocity in inches = 225.6, gives 1650.784 cubic inches, the quantity of water discharged through one of the apertures in one second; so that the whole quantity discharged in that space of time through both the apertures is = 3221.568 inches; or 19329.48 cubic inches in one minute. But 60812 cubic inches make a tun; consequently, if we suppose the centrifugal machine revolves round its axis in one second, it will raise nearly 3 tons 44 gallons in one minute: but this velocity is certainly too great, at least to be held for any considerable time; so that, when this and other deficiencies in the machine are allowed for, two tons is nearly the quantity that can be raised by it in one minute.

It will perhaps be unnecessary to observe, that as the water is forced up the perpendicular tube by the pressure of the atmosphere, this machine cannot raise water above 32 feet high.

An attempt was made to substitute this machine in place of the pumps commonly used on shipboard; but the labour of working was found to be so great as to render the machine inferior to the chain-pump. A considerable improvement, we apprehend, would be, to load with a weight of lead the ends of the tubes through which the water issues, which would make the machine turn with a great deal more ease, as the centrifugal force of the lead would in some measure act the part of a fly.

CENTRIFETAL FORCE, that force by which a body is everywhere impelled, or any how tends, towards some point as a centre. See MECHANICS.

CENTRISCUS, in Ichthyology, a genus of fishes belonging to the order of amphibia nantes. See Ichthyology Index.

CENTRONIA, in Natural History, a name by which the echini marini have been distinguished. Dr Hill makes them a distinct class of animals, living under the defence of shelly coverings formed of one piece, and furnished with a vast number of spines moveable at the creature's pleasure.

CENTUMCELLAE, in Ancient Geography, Trajan's villa in Tuscany, on the coast, three miles from Alge; with an excellent port, called Trojanus Portus, (Ptolemy); and a factitious island at the mouth of the port, made with a huge block of stone, on which two turrets rose, with two entrances into the bason or harbour, (Rutilius). Now Civita Vecchia. E. Long. 12. 30. N. Lat. 42°.

CENTUMVIRI, in Roman antiquity, judges appointed to decide common causes among the people: They were chosen three out of each tribe; and though five more than a hundred, were nevertheless called centumviri, from the round number centum a hundred.

CENTUNCULUS. See Botany Index.

CENTURION, among the Romans, an officer in the infantry, who commanded a century, or a hundred men.

In order to have a proper notion of the centurions, it must be remembered, that every one of the thirty manipuli, in a legion was divided into two ordinates, or

... See MECHANICS, or

manuals; and consequently the three bodies of the hastati, principes, and triarii, into 20 orders a piece, as into 10 manipuli. Now, every manipulus was allowed two centurions, or captains, one to each order or century; and, to determine the point of priority between them, they were created at two different elections. The 30 who were made first always took the precedence of their fellows; and therefore commanded the right-hand orders, as the others did the left. The triarii,
Centurion or pilum, so called from their weapon the pilum, being esteemed the most honourable, had their cen-
turions elected first, next to them the principes, and afterwards the hastati; whence they were called primus et seccundus pilus, primus et secundus princeps, primus et secundus hastatus; and so on. Here it may be observed, that primi ordines is sometimes used in historians for the centurions of these orders; and the centurions are sometimes styled principes ordinum, and principes centuriorum. We may take notice too what a large field there lay for promotion: first through all the orders of the hastati; then quite through the principes; and afterwards from the last order of the triarii to the primipilus, the most honourable of the centurions, and who deserves to be particularly described. This officer, besides his title of primipilus, went under the several titles of duae legionis, prefectus legionis, primus centuriorum, and primus centurio; and was the first centurion of the triarii in every legion. He presided over all the other centurions, and generally gave the word of command by order of the tribunes. Besides this, he had the chief of the eagle or chief standard of the legion; hence, aequa processus is to bear the dignity of primipilus; and hence aequa is taken by Pliny for the said office. Nor was this station only honourable, but very profitable too: for he had a special stipend allowed him, probably as much as a knight's estate; and, when he left that charge, was reputed equal to the members of the equestrian order, bearing the title of primipilus, in the same manner as those who had discharged the greatest civil offices were styled ever after, consulares, censorii, &c.

CENTURIPAE, CENTURIPAE, OF CENTURIPAE, IN ANCIENT GEOGRAPHY, A TOWN IN THE SOUTHWEST OF THE TERRITORY OF ETNA, ON THE RIVER CYBAMORUS: NOW CENTURIBI OR CENTURIPI. It was a democratic city, which, like Syracuse, received its liberty from Timoleon. Its inhabitants cultivated the fine arts, particularly sculpture and engraving. In digging for the remains of antiquities, cameos are nowhere found in such abundance as at Centuriippi and its environs. The situation of the place is romantic: it is built on the summit of a vast group of rocks, which was probably chosen as the most difficult of access, and consequently the properest in times of civil commotion. The remains still existing of its ancient bridges are a proof of its having been a considerable city. Cicero speaks of it as such. It was taken by the Romans, plundered and oppressed by Verres, destroyed by Pompey, and restored by Octavius, who made it a residence of a Roman colony.

CENTURY, IN A GENERAL SENSE, ANY THING DIVIDED INTO, OR CONSISTING OF, A HUNDRED PARTS. The marquis of Worcester published a Century of Inventions, (for a specimen of which, see Acoustics,) and Dr Hooke has given a Decimate of Inventions, as Part of a Century, of which he affirmed himself master. It is remarkable, that both in the century of the former, and the decimate of the latter, we find the principle on which Savary's fire or steam engine is founded. See Steam-Engine.

CENTURY, IN ANTIQUITY. THE ROMAN PEOPLE, WHEN THEY WERE ASSEMBLED FOR THE ELECTING OF MAGISTRATES, ENACTING OF LAWS, OR DELIBERATING UPON ANY PUBLIC AFFAIR, WERE ALWAYS DIVIDED INTO CENTURIES, AND VOTED BY CENTURIES, IN ORDER THAT THEIR VOTES MIGHT BE THE MORE EASILY COLLECTED, WHENCE THESE ASSEMBLIES WERE CALLED COMITIA CENTURIONATA. THE ROMAN COHORTS WERE ALSO DIVIDED INTO CENTURIES. SEE CENTURIION AND COHORT.

CENTURY, IN CHRONOLOGY, THE SPACE OF 100 YEARS. This method of computing by centuries is generally observed in church history, commencing from the time of our Saviour's incarnation: in which sense we say the first century, the second century, &c.

CENTURIES OF MAGDEBURG, A FAMOUS ECCLESIASTICAL HISTORY, RANGED INTO 13 CENTURIES, CARRIED DOWN TO THE YEAR 1298, COMPILED BY SEVERAL HUNDRED PROTESTANTS OF MAGDEBURG, THE CHIEF OF WHOM WAS FLAVIUS ILLYRICO.

CENTUSSIS, IN ROMAN ANTIQUITY, A COIN CONTAINING 100 ASSAES.

CENTZONTLI, IN ORNITHOLOGY, THE MEXICAN NAME OF THE TURDUS POLYGLOTTON. SEE TURDUS, ORNITHOLOGY INDEX.

CEODES, IN BOTANY, A GENUS OF THE DIOCCEIA ORDER, BELONGING TO THE POLYGAMIA CLASS OF PLANTS. THERE IS NO CALYZ; THE COROLLA IS MONOPETALOUS, WITH A SHORT TUBINATED TUBE; THE STAMEN IS TEN, SUBULATED, FILAMENTOUS; THE ANTEHRE ROUNDISH.

If a coerl applied to learning, and attained to priest's orders, he was also considered as a thane; his wide grid, or price of his life, was the same, and his testimony had the same weight in a court of justice. When he applied to trade, and made three voyages beyond sea, in a ship of his own, and with a cargo belonging to himself, he was also advanced to the dignity of a thane. But if a coerl had a greater propensity to arms than to learning, trade, or agriculture, he then became the esquire, or military retainer, to some potent and warlike earl, and was called the buscarle of such an earl. If one of these buscarles acquired himself so well as to obtain from his patron either five hyes of land, or a gilt sword, helmet, and breastplate, as a reward of his valour, he was likewise considered as a thane. Thus the title of honour stood open to these coers, whether they applied themselves to agriculture, commerce, letters, or arms, which were then the only professions esteemed worthy of a freeman.

CEOS, CEA, CIA, OR COI, IN ANCIENT GEOGRAPHY, ONE OF THE CYCLADES, LIES OPPOSITE TO THE PROMONTORY OF ACHAIA CALLED PHOCIS, AND IS 80 MILES IN CIRCUMFERENCE. THIS ISLAND IS COMMANDED BY THE ANCIENTS FOR ITS FERTILITY AND THE RICHNESS OF ITS PASTURES. THE FIRST SILK STUFF, IF
Pliny and Solinus are to be credited, were wrought here. Ceos was particularly famous for the excellent figs it produced. It was first peopled by Aristaeus, the son of Apollo and Cyrene, who being grieved for the death of his son Actaeon, retired from Thebes, at the persuasion of his mother, and went over with some Thebans to Ceos, at that time uninhabited. Diodorus Siculus tells us, that he retired to the island of Cos; but the ancients, as Servius observes, called both these islands by the name of Cos. Be that as it will, the island of Ceos became so populous, that a law prevailed there, commanding all persons upwards of sixty to be poisoned, that others might be able to subsist; so that none above sixty were to be seen in the island, being obliged, after they arrived at that age, either to submit to the law, or abandon the country, together with their effects. Ceos had, in former times, four famous cities, viz. Julia, Carthessa, Coressus, and Pessora. The two latter were, according to Pliny, swallowed up by an earthquake. The other two flourished in Strabo's time. Carthessa stood on a rising ground at the end of a valley, about three miles from the sea. The situation of it agrees with that of the present town of Zea, which gives name to the whole island. The ruins both of Carthessa and Julia are still remaining; those of the latter take up the whole mountain, and are called by the modern inhabitants Polis, that is, the city. Near this place are the ruins of a stately temple, with many pieces of broken pillars, and statues of most exquisite workmanship. The walls of the city were of marble, and some pieces are still remaining above 12 feet in length. Julia was, according to Strabo, the birthplace of Simonides, Bacchylides, Erasistratus, and Aristo. The Oxford marbles tell us that Simonides, the son of Leoprepis invented a sort of artificial memory, the principles of which he explained at Athens; and add, that he was descended of another Simonides, who was a poet no less renowned than himself. One of these two poets invented those melancholy verses which were sung at funerals, and are called by the Latinis narratio. Strabo says, that the Athenians, having besieged the city of Julia, raised the siege, upon advice that the inhabitants had resolved to murder all the children under a certain age, that useful persons might not be employed in looking after them. Ceos was, with the other Greek islands, subdued by the Romans, and bestowed upon the Athenians by Mark Antony the triumvir, together with Aegina, Tinos, and some other adjoining islands, which were all reduced to the Roman province by Vespasian. The island is now called Zea.

CEPA, the Onion. See Allium, Botany Index. CEPHALANTHUS, Button-Wood. See Botany Index.

CEPHALIC, in a general meaning, signifies any thing belonging to the head. Cephalic Medicines, are remedies for disorders of the head. Cordials are comprehended herein, as are also whatever promotes a free circulation of the blood through the brain.

Except when the disorder arises from excess of heat, or an inflammatory disposition in the head, moist topicals should never be used, but always dry ones.

To rub the head after it is shaved proves an instantaneous cure for a cephalalgia, a stuffing of the head, and weakness of the eyes, arising from a weak and relaxed state of the fibres. And as by every fresh evacuation of the humours their quantity is not only lessened, but also their tormentious parts derived thither, the more frequently the head be shaved, the larger quantity of humour is discharged; so that the frequent shaving of the head and beard is likewise a perpetual blister; and in as much as it is useful, it is a cephalic.

CEPHALIC Vein, in Anatomy, creeps along the arm between the skin and the muscles, and divides it into two branches; the external goes down to the wrist, where it joins the basilica, and turns up to the back of the hand; the internal branch, together with a small one of the basilica, makes the median.

The ancients used to open this vein for disorders of the head, for which reason it bears this name; but a better acquaintance with the circulation of the blood informs us that there is no foundation for such a notion.

CEPHALENA, or CEPHALONIA, the largest of the islands constituting the Ionian republic. It was known in Homer's time by the names of Samos and Epirus Melaina, is about forty miles in length, twenty in breadth, and a hundred and thirty in compass. It had anciently four cities, one of which bore the name of the island. Strabo tells us, that in his time there were only two cities remaining; but Pliny speaks of three; adding, that the ruins of Same, which had been destroyed by the Romans, were still in being. Same was the metropolis of the island, and is supposed to have stood in the place which the Italians call Porto Guiscardo. It contains now three small towns, 150 villages, and 60,000 inhabitants. This island was subdued by the Thbeans, under the conduct of Amphitryon, who is said to have killed Pierides, who then reigned here. After it had been long in subjection to the Thbeans, it fell under the power of the Macedonians, and was taken from them by the AEtolians, who held it till it was reduced by M. Fulvius Nobilius, who having gained the metropolis after a four months siege, sold all the citizens for slaves, adding the whole island to the dominions of the republic. It was subject to the Venetians from the year 1449 till the peace of Campo Formio in 1797. It was taken from the French in 1799, and formed into an independent commonwealth. It was again brought under the dominion of the French in 1807, but was taken by the British in 1809, and continues under their protection. See IONIAN ISLES, Supplement.

CEPHALONIA, the capital of the island of the same name, situated in the Mediterranean, near the coast of Epirus, and subject to the Venetians. E. Long. 21. N. Lat. 38. 30.

CEPHUS, in fabulous history, a king of Arcadia, on whose head Minerva fastening one of Medusa's hairs, he was rendered invincible.

CEPHUS, in Astronomy, a constellation of the northern hemisphere. See Astronomy Index.

CERAM, an island in the Indian ocean, between the Molucca islands on the north, and those of Ambayna and Banda on the south, lying between E. Long. 128. and 129. in S. Lat. 3. It is about 150 miles long, and 60 broad; and here the Dutch have
CER

CERAMBYX, in Zoology, a genus of insects, of the beetle kind, belonging to the order of insecta coleoptera. See Entomology Index.

CERASTES, in Zoology, the trivial name of a species of ANGUUS and COLUBER. See Ophology Index.

CERASTIUM, MOUSE-ear. See Botany Index.

CERASUS. See Prunus, Botany Index.

CERATE, in Pharmacy, a thickish kind of ointment applied to ulcerations, excoriations, &c. See Pharmacy Index.

CERATION, the name given by the ancients to the small seeds of ceratonia, used by the Arabian physicians as a weight to adjust the doses of medicines; as the grain weight with us took its rise from a grain of barley.

CERATION, or Ceratium, was also a silver coin, equal to one-third of an obolus.

CERATOCARPUS. See Botany Index.

CERATONIA, the CAROB TREE, or St John's bread. See Botany Index. The pods of this plant are called St John's bread, from an ill-founded assertion of some writers on Scripture, that these were the locusts which St John ate with his honey in the wilderness.

CERATOPHYLLUM. See Botany Index.

CEREAUNIA, CEREAUNIS, or CEREAUNIS LAPIS, in Natural History, a sort of flinty stone, of no certain colour, but of a pyramidal or wedge-like figure: popularly supposed to fall from the clouds in the time of thunder-storms, and to be possessed of divers notable virtues, as promoting sleep, preserving from lightning, &c. The word is from the Greek κεραυν, thunderbolt. The ceraunia is the same with what is otherwise called the thunder-stone, or thunder-bolt; and also sometimes sagitta or arrow's head, on account of its shape. The ceraunia are frequently confounded with the ombric and bronteum, as being all supposed to have the same origin. The generality of naturalists take the ceraunia for a native stone, formed among the pyrites, of a saline, concrete, mineral juice. Mercatus and Dr Woodward assert it to be artificial, and to have been fashioned thus by tools. The ceraunia, according to these authors, are the heads of the ancient weapons of war, in use before the invention of iron; which, upon the introduction of that metal, growing into disuse, were dispersed in the fields through this and the neighbouring country. Some of them had possibly served in the early ages for axes, others for wedges, others for chisels; but the greater part for arrow-heads, darts, and lances. The ceraunia is also held by Pliny for a white or crystal-coloured gem, that attracted lightning in itself. What this was, is hard to say. Prudentius also speaks of a yellow ceraunia, by which he is supposed to mean the carbuncle or topaz.

CEREBRA. See Botany Index.

CEREBERUS, in fabulous history, a dreadful three-headed mastiff, born of Typhon and Echidna, and placed to guard the gates of hell. He fastened upon those who entered, but devoured all who attempted to get back. He was, however, mastered by Hercules, who dragged him up to the earth, when, in struggling, a

foam dropped from his mouth, which produced the poisonous herb called aconite or wolf'sbane.

Some have supposed that Cerberus is the symbol of the earth, or of all-devouring time; and that its three mouths represent the present, past, and future. The victory obtained by Hercules over this monster denotes the conquest which this hero acquired over his passions. Dr Bryant supposes that Cerberus was the name of a place, and that it signified the temple of the Sun; deriving it from Kir Abor, the place of light. This temple was called also Tor-Cuph-El, which was changed to θεραπευσας; and hence Cerberus was supposed to have had three heads. It was likewise called Tor-Keren, Torris Regina; whence τρισ, three, and ἱερος, head.

CERCELE, in Heraldry. A cross cercele is a cross which, opening at the ends, turns round both ways like a ram's horn. See Cross.

CERCIS, the JUDAS TREE. See Botany Index.

CERCOPITHECI, in Natural History, the name given by Mr Ray to monkeys, or the class of apes with long tails. See Simia, Mammalia Index.

CERDA, JOHN LEWIS DE LA, a learned Jesuit of Toledo, wrote large commentaries on Virgil, which have been much esteemed; also several other works. He died in 1643, aged 80.

CERDONIANS, ancient heretics who maintained most of the errors of Simon Magnus, Saturinus, and the Manichees. They took their name from their leader Cerdon, a Syrian, who came to Rome in the time of Pope Hyginus, and there abjured his errors; but in appearance only; for he was afterwards convicted of persisting in them, and accordingly cast out of the church again. Cerdon asserted two principles, the one good and the other evil; this last, according to him, was the creator of the world, and the god that appeared under the old law. The first, whom he called unknown, was the father of Jesus Christ; who, he taught, was incarnate only in appearance, and was not born of a virgin; nor did he suffer death but in appearance. He denied the resurrection, and rejected all the books of the Old Testament, as coming from an evil principle. Marcion, his disciple, succeeded him in his errors.

CEREALIA, in antiquity, feasts of Ceres, instituted by Triptolemus, son of Celsus king of Eleusine in Attica, in gratitude for his having been instructed by Ceres, who was supposed to have been his nurse, in the art of cultivating corn and making bread.

There were two feasts of this kind at Athens; the one called Eleusinia, the other, Thesmophoria. See the article ELEUSINTIA. What both agreed in, and was common to all the cerealia, was, that they were celebrated with a world of religion and purity; so that it was esteemed a great pollution to meddle, on those days, in conjugal matters. It was not Ceres alone that was honoured here, but also Bacchus. The victims offered were hogs, by reason of the waste they make in the products of the earth; whether there were any wine offered or not, is matter of much debate among the critics. Pliny in and Macrobius seem to countenance the negative side; Cato and Virgil the positive. Macrobius says, indeed, they did not offer wine to Ceres, but muleum, which was a composition of wine and honey boiled up together; that the sa-
ceres was a pregnant sow, together with cakes and mulsum; and that is what Virgil means by Mul Baccus. The cerealia passed from the Greeks to the Romans, who held them for eight days successively; commencing, as generally held, on the fifth of the ides of April. It was the women alone who were concerned in the celebration, all dressed in white: the men, likewise in white, were only spectators. They ate nothing till after sunset; in memory of Ceres, who in her search after her daughter took no repast but in the evening.

After the battle of Cannae, the desolation was so great at Rome, that there were no women to celebrate the feast, by reason they were all in mourning; so that it was omitted that year.

CEREA, in Botany, from Ceres, the goddess of corn; Linnaeus's name for the larger esculent seeds of the grasses: these are rice, wheat, rye, barley, oats, millet, panic grass, Indian millet, holcus, zizania, and maize. To this head may be likewise referred delphion (lotus); which, by preparation, is rendered esculent.

CEREBELLUM, the hinder part of the head. See ANATOMY INDEX.

CEREBRUM, the Brain. Its structure and use are not so fully known as some other parts of the body; and different authors consider it in various manners. However, according to the observations of those most famed for their accuracy and dexterity in anatomical inquiries, its general structure is as given in ANATOMY. See INDEX.

Dr Hunter observes, that the principal parts of the medullary substance of the brain in idiots and madmen, such as the thalamus nervorum opticorum, and medulla oblongata, are found entirely changed from a medullary to a hard, tough, dark-coloured substance, sometimes resembling white leather.

CEREMONIAL (ceremoniale) a book in which is prescribed the order of the ceremonies to be observed in certain actions and occasions of solemnity and pomp. The ceremonial of the Roman church is called ordo Romanus. It was published in 1516 by the bishop of Corcyra; at which the college of cardinals were so scandalized, that some of them voted to have the author as well as book burnt, for his temerity in exposing the sacred ceremonies to the eyes of profane people.

CEREMONIAL is also used for the set or system of rules and ceremonies which custom has introduced for regulating our behaviour, and which persons practise towards each other, either out of duty, decency, or civility.

CEREMONIAL, in a more particular sense, denotes the manner in which princes and ambassadors used to receive and to treat one another. There are endless disputes among sovereigns about the ceremonial: some endeavouring to be on a level, and others to be superior; insomuch that numerous schemes have been proposed for settling them. The chief are, 1. To accommodate the difference by compromise or alteration; so that one shall precede now, the other the next time; or one in one place, and the other in another: 2. By seniority; so that an elder prince in years shall precede a younger, without any other, distinction, These expediens, however, have not yet been accepted by any, except some alternate princes, as they are called, in Germany.

CEREMONIAL is more particularly used in speaking of the laws and regulations given by Moses relating to the worship of God among the ancient Jews. In this sense it amounts to much the same with what is called the Levitical law; and stands contradistinguished from the moral as well as judicial law.

CEREMONY, an assemblage of several actions, forms, and circumstances, serving to render a thing more magnificent and solemn. In 1646, M. Ponce published a history of ancient ceremonies, tracing the rise, growth, and introduction of each rite into the church, and its gradual advancement to superstition therein. Many of them were borrowed from Judaism; but more seemingly from Paganism. Dr Middleton has given a fine discourse on the conformity between the Pagan and Popish ceremonies, which he exemplifies in the use of incense, holy water, lamps, and candles, before the shrines of saints, votive gifts or offerings round the shrines of the deceased, &c. In effect, the altars, images, crosses, processions, miracles, and legends; may, even the very hierarchy, pontificate, religious orders, &c. of the present Romans, be shown, are all copied from their heathen ancestors. — We have an ample and magnificent account of the religious ceremonies and customs of all nations in the world, represented in figures designed by Picart, with historical explanations, and many curious dissertations.

Master of the CEREMONIES, an officer instituted by King James I. for the more honourable reception of ambassadors and strangers of quality. He wears about his neck a chain of gold, with a medal under the crown of Great Britain, having on one side an emblem of peace, with this motto, Beati pacifici; and on the other, an emblem of war, with Dieu et mon droit: his salary is 500l. per annum.

Assistant Master of the CEREMONIES, is to execute the employment in all points, whencesover the master of the ceremonies is absent. His salary is 141l. 13s. 4d. per annum.

Marshal of the CEREMONIES, is their officer, being subordinate to them both. His salary is 100l. per annum.

CERENZA, a town of Italy, in the kingdom of Naples, and in the Hither Calabria, with a bishop's see. It is seated on a rock, in E. Long. 17. 5. N. Lat. 39. 23.

CERES, a pagan deity, the inventor or goddess of corn; in like manner as Bacchus was of wine.

According to the poets, she was the daughter of Saturn and Ops, and the mother of Proserpine, whom she had by Jupiter. Pluto having stolen away Proserpine, Ceres travelled all over the world in quest of her daughter, by the help of a torch, which she had lighted in Mount Ætna.

As Ceres was thus travelling in search of her daughter, she came to Celcus king of Eceus, and undertook to bring up his infant son Triptolemus. Being desirous to render her charge immortal, she fed him in the day time with divine milk, and in the night covered him with fire. Celcus observing an unusual improvement in his son, resolved to watch him;
to which end he hid himself in that part of the house where she used to cover the child with fire: but when he saw her put the infant under the embers, he cried out and discovered himself. Ceres punished the curiosity and indiscretion of the father with death. Afterwards she taught the youth the art of sowing corn and other fruits, and mounted him in a chariot drawn by winged dragons, that he might traverse the world, and teach mankind the use of corn and fruits. After this, having discovered, by means of the nymph A rhetusa, that Proserpine was in the infernal regions, she applied to Jupiter, and obtained of him that Proserpine should be restored, on condition that she had tasted nothing during her stay in that place: but it being discovered, by the information of Ascalaphus, that, as she was walking in Pluto's orchard, she had gathered an apple, and had tasted of some of the seeds, she was for ever forbidden to return. Ceres, out of revenge, turned Ascalaphus into an owl. At length, Jupiter, to mitigate her grief, permitted that Proserpine should pass one half of the year in the infernal regions with Pluto, and the other half with her mother on earth.

Cicero speaks of a temple of Ceres at Catanea in Sicily, where was a very ancient statue of that goddess, but entirely concealed from the sight of men, every thing being performed by maids and virgins.

CERET, a town of France in Roussillon, with a magnificent bridge of a single arch. It is seated near the river Tec, in E. Long. 2° 46'. N. Lat. 42° 23'.

CERES, in Botany. See CACTUS.

CERIGO, an island in the Archipelago, anciently called Cytherea; noted for being the birthplace of Helen and of Venus. It is now one of the seven isles constituting the Ionian republic. At present there is nothing very delightful in the place; for the country is mountainous, and the soil dry. It abounds in hares, quails, turtle, and excellent falcons. It is about 30 miles in circumference, and produces corn, wine, flax, oil, and cotton. The town of the same name is strong both by art and nature, being seated on a craggy rock. The inhabitants, who are Greek Christians, were about 10,000 in number in 1806.

CERINES, a town in the island of Cyprus, with a good castle, a harbour, and a bishop's see. E. Long. 33° 35'. N. Lat. 35° 22'.

CERINTH, Honewort. See Botany Index.

CERINTHIANs, ancient heretics, who denied the deity of Jesus Christ. They took their name from Cerinthus, one of the first heresarchs in the church, being contemporary with St John. See Cerinthus.

They believed that Jesus Christ was a mere man, born of Joseph and Mary; but that, in his baptism, a celestial virtue descended on him in form of a dove; by means whereof he was consecrated by the Holy Spirit, and made Christ. It was by means of this celestial virtue, therefore, that he wrought so many miracles; which, as he received it from heaven, quitted him after his passion, and returned to the place whence it came; so that Jesus, whom they called a pure man, really died and rose again; but that Christ, who was distinguished from Jesus, did not suffer at all. It was partly to refute this sect that St John wrote his gospel. They received the gospel of St Matthew, to countenance their doctrine of circumcision, from Christ's being circumcised; but they omitted the genealogy. They discarded the epistle of St Paul, because that apostle held circumcision abolished.

CERINTHUS, a heresiarch, contemporary with the apostles, ascribed the creation not to God, but to angels. He taught that Jesus Christ was the son of Joseph, and that circumcision ought to be retained under the gospel. He is looked upon as the head of the converted Jews, who raised in the church of Antioch the tumult of which St Luke has given the history in the 17th chapter of the Acts. Some authors ascribe the book of the Apocalypse to Cerinthus; adding, that he put it off under the name of St John, the better to authorize his reveries touching Christ's reign upon earth: and it is even certain that he published some works of this kind under the title of Apocalypse. See Apocalypse.

CEROPEGIA. See Botany Index.

CERTHIA, in Ornithology, the Creeper or Ox-eye, a genus belonging to the order of pice. See Ornithology.

CERTIFICATE, Trial by, in the law of England, a species of trial allowed in such cases where the evidence of the person certifying is the only proper criterion of the point in dispute: for when the fact in question lies out of the cognizance of the court, the judges must rely on the solemn averment or information of persons in such a situation as affords them the most clear and competent knowledge of the truth. As therefore such evidence, if given to a jury, must have been conclusive, the law, to save trouble and circuitry, permits the fact to be determined upon such certificate merely. Thus, 1. If the issue be whether A was absent with the king in his army out of the realm in time of war, this shall be tried by the certificate of the marshal of the king's host in writing under his seal, which shall be sent to the justices. 2. If, in order to avoid an outlawry, or the like, it was alleged that the defendant was in prison, ultra mare, at Bourdeaux, or in the service of the mayor of Bourdeaux, this should have been tried by the certificate of the mayor, and the like of the captain of Calais. But when this was law, those towns were under the dominion of the crown of England. And therefore, by a parity of reason, it should now hold, that in similar cases arising at Jamaica or Minorca, the trial should be by certificate from the governor of those islands. We also find that the certificate of the queen's messengers, sent to summon home a peeress of the realm, was formerly held a sufficient trial of the contempt in refusing to obey such summons. 3. For matters within the realm, the customs of the city of London shall be tried by the certificate of the mayor and aldermen, certified by the mouth of their recorder, upon a surmise from the party alleging it, that the custom ought to be thus tried; else it must be tried by the country: As, the custom of distributing the effects of freemen deceased; or of enrolling apprentices, or that he who is free of one trade may use another; if any of these, or other similar points come in issue. 4. The trial of all customs and practice of the courts shall be by certificate from the proper officers of those courts respectively;
CELER

CERTIFICATE and when returned was made on a writ by the sheriff or under sheriff, shall be only tried by his own certificate.

CERTIORARI, in Law, a writ which issues out of the chancery, directed to an inferior court, to call up the records of a cause there depending, in order that justice may be done. And this writ is obtained upon complaint, that the party who seeks it has received a course of hearing, and is not likely to have an impartial trial in the inferior court. A certiorari is made returnable either in the king's bench, common pleas, or in chancery.

It is not only used out of the court of chancery, but likewise out of the king's bench; in which last mentioned court it lies where the king would be certified of a record. Indictments from inferior courts, and proceedings of the quarter-sessions of the peace, may also be removed into the king's bench by a certiorari: and here the very record must be returned, and not a transcript of it; though usually in chancery, if a certiorari be returnable there, it removes only the tenor of the record.

CERTITUDE, considered in the things or ideas which are the objects of our understanding, is a necessary agreement or disagreement of one part of our knowledge with another: as applied to the mind, it is the perception of such agreement or disagreement: or such a firm well-grounded assent, as excludes not only all manner of doubt, but all conceivable possibility of a mistake.

There are three sorts of certitude, or assurance, according to the different natures and circumstances of things. 1. A physical or natural certitude, which depends upon the evidence of sense; as that I see such or such a colour, or hear such or such a sound; nobody questions the truth of this, where the organs, the medium, and the object, are rightly disposed. 2. Mathematical certitude is that arising from mathematical evidence: such as, that the three angles of a triangle are equal to two right ones. 3. Moral certitude is that founded on moral evidence, and is frequently equivalent to a mathematical one; as that there was formerly such an emperor as Julius Caesar, and that he wrote the commentaries which pass under his name; because the historians of these times have recorded it, and no man has ever disproved it since: this affords a moral certitude, in common sense so great, that one would be thought a fool or madman for denying it.

CERTOSA, a celebrated Carthusian monastery, in the territory of the Pavesi, in the duchy of Milan, four miles from Pavia: its park is surrounded with a wall 20 miles in circumference; but there are several small towns and villages therein.

CERVANTES. See SAAVEDRA.

CERVERA, a town of Spain in Catalonia, seated on a small river of the same name, in E. Long. 1°. 9'. N. Lat. 41°. 28'.

CERVIA, a sea-port town of Italy, in Romagna, with a bishop's see, seated on the gulf of Venice, in E. Long. 13°. 5'. N. Lat. 44°. 16'.

CERVICAL NERVES are seven pairs of nerves, so called, as having their origin in the cervix, or neck.

CERVICAL VESSELS, among anatomists, denote the arteries, veins, &c. which pass through the vertebrae and muscles of the neck up to the skull.

CERVIX, in Anatomy, properly denotes the hind part of the neck; as contradistinguished from the fore part, which is called jugulum, or the throat.

CERVIX of the Scapula, denotes the head of the shoulder blade, or that upper process whose sinus receives the head of the humerus.

CERVIX of the Uterus, the neck of the uterus, or that oblong canal or passage between the internal and external orifices, which receives and encloses the penis like a sheath, whereas it is also called VAGINA.

CERUMEN, a thick, viscous, bitter, excrementitious humour, separated from the blood by proper glands placed in the meatus auditorius, or outer passage of the ear.

CERUS, WHITE LEAD, a sort of calx of lead, made by exposing plates of that metal to the vapour of vinegar. See Chemistry Index.

Ceruss, as a medicine, is used externally, either mixed in ointments or by sprinkling in on old gleetings and watery ulcers, and in many diseases of the skin. If, when it is reduced into a fine powder, it is received in with the breath in inspiration, and carried down into the lungs, it causes incurable asthmatics. Instances of the very pernicious effects of this metal are too often seen among those persons who work lead in any form, but particularly among the workers in white lead.

The painters use it in great quantities; and that it may be afforded cheap to them, it is generally adulterated with common whiting.

CERVUS, or DEER, in Zoology, a genus of quadrupeds belonging to the order of Pecora. See Mammalia Index.

CERVUS Volans, in Natural History, a name given by authors to the stag-fly, or horned beetle, a very large species of beetle with horns sloped, and something like those of the stag.

CERYX, in antiquity. The ceryces were a sort of public criers, appointed to proclaim or publish things aloud in assemblies. The ceryx among the Greeks answered to the proco among the Romans. Our criers have only a small part of their office and authority.

There were two kinds of ceryces, civil and sacred. The former were those appointed to call assemblies, and make silence therein; also to go on messages, and do the office of our heralds, &c. The sacred ceryces were a sort of priests, whose office was to proclaim silence in the public games and sacrifices, publish the names of the conquerors, proclaim feasts, and the like. The priesthood of the ceryces was annexed to a particular family, the descendants of Ceryx, son of Eumolpus. To them it also belonged to lead solemn victims to slaughter. Before the ceremonies began, they called silence in the assembly, by the formula, Σφακαιοι ες ενυθει λαμα; answering to the favete linguis of the Romans. When the service was over, they dismissed the people with this formula, λαμα αφηνη, ιτι, μηνια εστ.

CESARE, among logicians, one of the modes of the second figure of syllogisms; the minor proposition of which is an universal affirmative, and the other two universal negatives: thus,

CE No immorals holes ought to be read;
SA But every obscene book is immoral;
RE Therefore no obscene books ought to be read.

CESENA,
C E S

CESAROTTI, Melchior, an Italian poet. See Supplement.

CESENA, a town of Romagna in Italy, with a bishop's see, subject to the pope, and seated on the river Savio, in F. Long. 12. 40. N. Lat. 44. 8.

CESPITOSÆ PLANTÆ (from ceesper, turf or sod), are those plants which produce many stems from one root, and thence form a close thick carpet on the surface of the earth.

CÉSPEDES FLUVIALES, turf bogs.

CESSATION, the act of intermitting, or discontinuing, the course of any thing, work, or action. Cessation of Arms, an armistice or occasional truce. See Truce.

When the commander of a company finds things reduced to an extremity, so that he must either surrender, or sacrifice the garrison and inhabitants to the mercy of the enemy, he plants a white flag on the breach, or beats the chamade; on which a cessation of arms commences, to give room for a capitulation.

CESSIO BONORUM, in Scots Law, the name of that action by which an insolvent debtor may apply for liberation from prison, upon making over his whole real and personal estate to his creditors.

CESSION, in Law, an act by which a person surrenders and transmits to another person a right which belonged to himself. Cession is more particularly used in the civil law for a voluntary surrender of a person's effects to his creditors to avoid punishment. See the article Bankrupt.

In several places the cession carried with it a mark of infamy, and obliged the person to wear a green cap or bonnet; at Luca, an orange one; to neglect this was to forfeit the privileges of the Cession. This was originally intended to signify that the cessionary was become poor through his own folly. The Italian lawyers describe the ceremony of cession to consist in striking the bare breech three times against a stone, called Lapis Vituperii, in presence of the judge. Formerly it consisted in giving up the girdles and keys in court; the ancients using to carry at their girdles the chief utensils wherewith they got their living; as the scrivener his escritoire, the merchant his bag, &c. The form of cession among the ancient Gauls and Romans was as follows: The cessionary gathered up dust in his left hand from the four corners of the house, and standing on the threshold, holding the door-post in his right hand, threw the dust back over his shoulders; then stripping to his shirt, and quitting his girdle and bags, he jumped with a pole over a hedge; hereby letting the world know that he had nothing left, and that when he jumped, all he was worth was in the air with him. This was the cession in criminal matters. In civil cases it was sufficient to lay a broom, a switch, or a broken straw, on the threshold: this was called chrenecrua per duripillum et festacum.

Cession, in the ecclesiastical law, is when an ecclesiastical person is created a bishop, or when a person of a parish takes another benefice, without dispensation, or being otherwise qualified. In both these cases their first benefices become void by cession, without any resignation; and to these livings that the person had, who was created bishop, the king may present for that time, whosoever is patron of them; and in the other case the patron may present: but by dispensation of retainer, a bishop may retain some or all the prebendings he was entitled to before he was made bishop.

CESTRUM, BASTARD JASMINE. See Botany Index.

CESTUI, a French word, signifying he or him, frequently used in the English law writings. Thus, Cestui qui trust, a person who has lands, &c. committed to him for the benefit of another; and if such person does not perform his trust, he is compellable to it in chancery. Cestui qui vie, one for whose life any lands, &c. are granted. Cestui qui use, a person to whose use any one is infested of lands or tenements. Formerly the feoffees to uses were deemed owners of the land, but now the possession is adjudged in cestui qui use.

CESTUS, among ancient poets, a fine embroidered girdle said to be worn by Venus, to which Homer ascribes the power of charming and conciliating love. The word is also written cestum and cestos; it comes from secuo, a girdle or other thing embroidered or wrought with a needle; derived, according to Servius, from seruo, pungere; whence also incustus, a term used at first for any indecency by undoing the girdle, &c. but now restrained to that between persons near a skin. See Incest.

CETACEOUS, an appellation given to the fishes of the whole kind. See Cetology.

CETE, the name of Linnaeus's seventh order of mammalia, comprehending the Monodon, Balæna, Physeter, and Delphinus. See Cetology.

CETERACH, the trivial name of a species of Asplenium. See Asplenium, Botany Index.

CETOLOGY.

Definition of the title. Under this general title is comprehended the history of that division of marine animals, which in the Linnaean arrangement constitutes the seventh order of the class mammalia. This is the order cetæ or whales. Ray and Willoughby have included this order of animals under the class of fishes. Ray, in his arrangement of fishes, divides them into two principal sections. The one comprehends those fishes which are furnished with lungs for respiration; and the other, those which breathe by means of gills, and may be considered as truly fishes. In the former section are included the cetaceous fishes; and the reasons which he assigns for arranging them in this manner are, that they agree in external form with fishes; that they are entirely naked, or covered only with a smooth skin; and that they live entirely in the water, and have all the actions of fishes. Although this tribe of animals resembles fishes, not only in manners and habits, but also in being inhabitants of the same element, Linnaeus thought proper to class them with the mammalia.
CETOLOGY.

On account of the similarity of their internal structure, having a double heart and warm blood, and respiring like them by means of lungs.

Mr. Pennant, in his British Zoology, has objected to the classification of cetaceous animals with the mammals, as Linneus has done, because, "to have preserved the chain of beings entire, he says that Linneus should have made the genus phoce or seals, and that of the trichecus or manati, immediately precede the whale, those being the links that connect the mammalia or quadrupeds with the fish; for the seal is in respect to its legs the most imperfect of the former class; and in the manati the hind feet coalesce, assuming the form of a broad horizontal tail." On this account, Mr. Pennant has arranged the cetaceous order of animals under his class of fishes, including them under the first division of that class. For the same reasons we have separated them from the class of fishes; but although they resemble the quadrupeds, which compose chiefly the class mammalia, in being warm-blooded, and in the functions of circulation and respiration; yet, as they possess characters so totally distinct from any of the mammalia, we judged it more natural to separate them also from this class, and to treat of them in the present article.

This tribe of animals is also entitled to a separate treatise, both on account of the interest to be derived from their natural history, and on account of their importance in a commercial view.

The history of cetaceous animals, as well as that of the other inhabitants of the ocean, cannot be expected to be complete. They are beyond the reach of the naturalist, from the nature of the element in which they live; and even when he is favoured with a transient glimpse, the rapidity of their motions precludes the possibility of obtaining much accurate knowledge of their manners and habits. But the abode of the whale is the most inaccessible parts of the ocean. The frozen regions of the north and south are his chief retreat—regions so inhospitable, as to forbid the approach of the most hearty naturalist with all his zeal and ardour, and to be visited only by the adventurous fisherman, prompted by the hope of gain. To the latter, chiefly, we are indebted for what knowledge we possess of this tribe of animals. And from men who had a very different object in view, who, in this hazardous trade, had to struggle with the severest seasons, in a climate where the rigour of winter rarely relaxes, information on this subject could neither be accurate nor extensive.

This, however, was the principal source from which the earlier writers on this department of natural history derived their information. Such were Sibbald, Martens, Dudley, Klein, and Anderson, who composed their descriptions from the relations and memoirs which were communicated to them by fishermen and voyagers. Hence have originated these erroneous and inaccurate details which have been introduced into the works of naturalists.

The name of Cete, as the word which is derived from the Greek language originally signifies, was given indiscriminately to all marine animals of extraordinary size. It has been limited by later naturalists to that tribe of fishes which are distinguished from other fishes by the functions of respiration and circulation, and by being viviparous. These are now included under the general term cetaceous fishes. Beside the discriminative marks of respiration, circulation, and being viviparous, others may be mentioned. In the cetaceous fishes the skin is not covered with scales as in other fishes; there are one or two orifices in the upper part of the head for discharging water; the lateral fins from other are furnished with articulations as in the human hand, and the tail is horizontal. There is another remarkable difference between the cetaceous and other fishes, in the greater quantity of blood, and the thick covering of fat or blubber, for which the former are distinguished. And considering the temperature of the climate, and the element in which these animals live, this seems to be a wise and necessary provision of nature. The great quantity of blood produces a greater degree of heat, and the spongy porous mass of blubber, and being from its nature a slow conductor of heat, is an industry of excellent defence against the rigour of the seasons in the polar regions.

In the following treatise we propose to lay before our readers, 1st, The Classification and Natural History of Cetaceous Fishes; 2d, Their Anatomy and Physiology; and, lastly, The History of the Whale Fishery as an object of trade. These shall be the subjects of three chapters.

CHAPTER I. Of the Classification and Natural History of Cetaceous Fishes.

Cetaceous fishes have been divided into four classes, the characters of which are taken from the want of four teeth, from the structure of the teeth, and from their position in one or both jaws. The following table exhibits the characters of these classes, with a translation opposite for the sake of the English reader.

1st, Baleena, or Whale.

Dentium loco laminae corneae in maxilla superiore. In place of teeth there are horny plates in the upper jaw.

2d, Monodon, or Unicorn Fish.

Dens unicus aut duo in parte antica maxillae superiore. One or two teeth horizontally inserted in the anterior part of the upper jaw.

3d, Physeter, or Spermacceti Whale.

Dentes veri in maxilla inferiore; aliquot vero plani, vis conspicui in maxilla superiore. Teeth in the lower jaw, but scarcely conspicuous in the upper jaw.

4th, Delphinus, or Dolphin.

Dentes in utraque maxilla. Teeth in both jaws.

Each of the four classes which we have now enumerated and characterised, comprehends only a single genus, the characters of which are as follows:

GENERIC CHARACTERS.

1st Genus, Baleena, or Whale.

Maxilla superior dentium loco, laminis cornesis instructis; fistula duplex in vertice. The upper jaw is furnished with horny plates in place of teeth, and there are two blow-holes on the top of the head.

2d,
Chap. I.

Classification. &c.

Genus Monodon, or Unicorn-Fish.

Dens unicus aut duo, longi, aut breves, recti et recurvi, in parte antica maxillae superioris exserti; fistula in occipite.

3d Genus, Physeter, or Spermactcl Whale.

Dentes veri et visibles in maxilla inferiore, inquisbuscsum vero maxilla superior dentibus planis via conica instructa; fistula in angulo superiori rostri.

4th Genus, Delphinus, or Dolphin.

Maxilla utrque dentata; fistula in fronte.

CLASS I. BALÆNA.

Generic characters.

The body is naked, elliptical, or of an oblong conical shape, and of a black or brownish colour.

The head is very long, laterally compressed, and diminishing towards the back. The opening of the mouth is very large. The jaws are nearly equal, and without teeth; but in place of teeth, the upper jaw is furnished on both sides with horny plates, transversely disposed. The lower jaw is anteriorly of an oval or roundish form, broader than the upper jaw, and having a forrow on the margin for receiving the horny plates. The eyes are small; they are placed near the insertion of the lateral fins. The ears are also small, and are situated behind the eyes.

In some of the species the anterior part of the body is plicated or folded underneath.

The penis is enclosed in a sheath. The female is furnished with two mamme; and the organs of generation are placed between them. Behind them is the anus.

There are three or four fins; two lateral fins, one at the extremity of the tail, which is placed horizontally. The dorsal fin is often wanting.

* Species which have no Dorsal Fin.

Plate CXL. Fig. 1. 1. BALÆNA MYSTICETUS, the Greenland, or large Whalebone Whale.

French, Baleine Franche. Baleine de grande boise; Spaniards, Valiente; Whalefish, by the Germans; Whalefish, Dutch; Hvalfisk, by the Norwegians; Hvalfisk, by the Swedes; Stitchelback, Sandavall, by the Danes; Putskallr, by the Icelanders; and Arbek, Arbevisvooak, by the Greenlanders.

Character.

In this species the jaws are nearly of equal length; the lower is of an oval form, and broad in the middle; the back is spotted, black and white.

Description.

This is the largest of animals known. The body, from a side view, appears of an elliptical form. The head

Vol. V. Part II.

CETOLOGY.

Classification. &c.

LOGY.

is very nearly equal to one-third of the whole length of the body. It is as it were composed of two inclined planes joined together under a larger or smaller angle, and has something the appearance of the roof of a small house.

In the middle of the line formed by the junction of the two inclined planes, there rises a large tabercla, in which are situated the spouts or blow-holes opposite to each other, and curved in the shape of the letter S. The jaws are nearly equal in length; the lower is broader towards the middle of its length than the upper; and besides it spreads out and has membranous coverings, which terminate in a broad deep furrow, which is destined to receive the horny teeth of the upper jaw. When the jaws are close, the opening of the mouth folds upwards towards the orbit of the eyes, and exhibits by its inflexion the curved form of a sickle.

The want of teeth is supplied by about 500 horny Whale-lambs. This is the substance called whalebone. They bone.

are attached to the upper jaw on both sides, and supported at the base by a kind of bone which extends the whole length of the roof of the mouth. They are arranged transversely, and in an oblique direction. Each of them is from three to five feet long, is thickest at the base, tapers towards the point, is a little curved, and terminates in a fringe of long hair which hangs about the tongue. Towards the two extremities of each row, there are besides many other small lamains, which are of a square form, of the thickness of a writing quill, and about four inches long. These latter are arranged in the same direction as the former; but are of a softer substance, and do not come so close to each other.

The tongue is soft and spongy, strongly attached to the lower jaw, and rounded at the extremity. On the upper side it is white, but on the sides it is marked with black spots. It is often 10 feet broad and 18 feet long.

The eyes are placed very low, at the broadest part of the head; just above the angles of the mouth, and very near the origin of the lateral fins. They are furnished, as the means of defence, with eyelids and eyelashes; and resemble in form and magnitude those of an ox.

The crystalline lens, which is white and transparent, is not larger than a pea. The external organ of hearing, consists of a small hole of the diameter of a quill, which is placed immediately behind the eyes.

The back forms a gentle curvature from the tubercle on the top of the head; towards the middle of the trunk it is again elevated, and then tapers gradually to the tail. The lower part of the body diminishes in the same proportion. The lateral fins have their origin fins near the angle of the mouth. They are two large thick masses, of an oval irregular form, and are often 10 feet long. The tail fin is divided into two oval fleshy lobes, which terminate in a point.

The male is furnished with a penis which is eight feet long, and surrounded with a double skin, which gives it something of the appearance of a knife in its sheath. The female has two mammas, which are placed on each side of the organs of generation.

The skin of the whale is divided into the epidermis skin or scarf-skin, the true skin, the fat or blubber, and the muscle or flesh. The epidermis is as thin as parch-
of food for so large an animal. It seems not improbable, however, that the medusæ as well as the actines may form part of its food.

The excrement of the whale has some degree of solidity, and it is of a yellow colour, approaching something to the colour of saffron.

The whale fishery, or rather it might be termed the fishery by chase of the whale, constitutes one of the principal occupations of the inhabitants of Greenland. The capture of a single whale is sufficient for the subsistence of a whole family for a long time. The flesh is eaten raw, baked, or after being half rotten, or dried in the heat of the sun; and according to Horrebow, it has a very good taste. The skin, the tail, and the fins, undergo no kind of preparation; for it seems these parts furnish, in the raw state, a very delicate morsel to the Greenlanders. The fat is either eaten, or burnt for the purpose of giving light. The intestines are employed to shut up the doors and windows of their habitations; and the tendons furnish thread for sewing, or for the construction of nets. Of the bones the Greenlanders make stools or chairs, and instruments that are used in hunting and fishing. The best lines are made of the hair that terminates the horny plates of the upper jaw.

The following are the dimensions of a whale taken towards the north pole, and recorded by M. de Pages in the account of his voyage round the world.

2. BALKNA GLACIALIS, Iceland Whale.

French, Le Nord Coper, Balzine de Sardo; German, Nordkoper; Norwegian, Siddeal, Nordkoper.

In this species, the jaws are nearly of equal length. Speciﬁc The under jaw is rounded, and broader towards the character middle of its length. There is no dorsal ﬁn. The back is whitish.

The Iceland whale differs from the former only in body; the colour and dimensions of the body. The head and horny laminae of the upper jaw are much smaller. The trunk of the body is more slender, and is of a light

CETACELOGY.

There is one fin on the back.

According to the fishermen, the fin fish is as long, but not so thick as the common whale. When the jaws are shut, the head resembles a cone, which constitutes nearly one-third part of the whole length of the whale, and terminates in a sharp snout. On the top of the head are two respiratory orifices divided longitudinally. This whale, it is said, ejects the water with much greater force than the common whale. The horny laminae of the upper jaw are fringed and disposed in the same manner as those of the preceding. They differ in being shorter, and of a blue colour. The length is from 10 to 12 inches. The long hair which terminates the laminae is so twisted that the edges of the upper jaw seem covered with a thick cord interwoven together. The eyes are placed very low, nearly in the direction of the angles of the mouth. Towards the posterior extremity of the back, there arises a triangular fin, about 3 or 4 feet high, having the summit bent backwards. The lateral fins are of an oval figure, from 6 to 7 feet long. The tail fin is divided into two lobes which form nearly a right angle.

This species lives on the herring, the mackerel, a kind of salmon frequent in the northern seas, and other small fish.

The upper part of the body is of a shining brown colour. The belly and the under part of the lower jaw are of a splendid white.

This species of whale is found in the Greenland seas, in the European seas, in the Indian ocean, and in the new world. In March 1673, Martens mentions that he saw a whale of this species in the straits of Gibraltar. As the mass of the body constitutes the third or the fourth of that of the common whale, the fat is less thick. It yields, it is said, only ten tons of oil. This whale is therefore less an object of the fisherman’s pursuit, for the produce of oil is not equivalent to the expense, the risk, and the danger that attend it.

It has been remarked, that as soon as the fin fish makes its appearance in the seas round Spitzbergen, the common whale is no longer to be seen.

In Greenland the flesh, the fins, the skin, and the Whales tendons, are employed as food by the poorer inhabitants; and the bones are applied to a great many domestic uses. It is said that the flesh has the same taste as that of a sturgeon.

4. BALENA NOBODA, THE BUNCH OR HUMPBACK WHALE.

French, Baleine-tampon; German, Plock-fish; Dutch, Fend-fish.

The lateral fins are white. There is a bunch near characters. the tail larger than the head of a man.

Of this species less is known than of the others. Description. In place of the dorsal fin, there is a bunch near the tail which declines posteriorly. It is about a foot high, and a little thicker than the human head. The lateral fins are white, placed near the middle of the body, and are 18 feet long. The stub of the bunch resembles that of the fin fish. According to Klein, the head of this species is not held in much estimation, though it is more valued than that of the latter species. It is a native of the seas of New England.

T 4

5. BALENA.

Characters. The jaws are equal and pointed; the horny laminae of the upper jaw are short, and of a bluish colour. Classification, &c.
always of the greatest length; and it would appear that the whale has the power of dilating and contract- ing them at pleasure.

The colour of the upper part of the body is black; the lower part of the mouth and the lateral fins are white; the cavity of the furrows is of a blood red; the interior folds, the belly, and the tail fin, are marked with black and white spots. Under the epidermis is the skin which covers the fat, which in this species is but a thin layer, and consequently yields less oil than the preceding.

When the pike-headed whale takes in food, it opens its capacious mouth, and swallows a great quantity of water along with its prey. It is then that the folds of the skin on the belly are observed to dilate consider- ably; and then too the contrast between the fine red in the cavity of the furrows, the black colour of the lamina of the jaw, and the bright white on the under part of the mouth, produces a very striking effect.

At every attempt at progressive motion, this species ejects the water by the respiratory orifices, but with less violence than other whales. The moment after, it disappears under the water. And when it plunges and shews the tail fin, it is considered as a sign that it is going to descend to a great depth, and that it will remain a longer time under the surface. When the sea is calm, it is seen asleep on the surface of the water; and the moment it awakes, it performs a number of different motions with inconceivable rapidity. Sometimes it lies on its side; in an instant it strikes the water with the lateral fins with prodigious force, and then turns on its back. It springs up into the air, and returns to the water in a whirling motion, at a con- siderable distance from the place from which it arose.

The food of the pike-headed whale consists of a species of halic, a small species of salmon which frequents the northern ocean, and the sandeel. It has only a single young one at a time. The young whale follows its mother till another is brought forth; but this does not happen every year.

The slightest wound is observed to occasion the death of this species of whale; for the wound very soon runs into gangrene. The animal often goes to a great distance from the spot where it received the fatal blow. The surest method seems to be to strike with the spear immediately behind the lateral fins; and if it happen that the intestines are wounded, the whale instantly plunges into the ocean.

This species frequents chiefly the Greenland seas, between the 61st and 65th degree of latitude. In winter it appears only in the open seas, but in summer it approaches the shores, and enters the great bays.

The length varies from 50 to 54 feet. Birkald has given a description of a young one which was thrown ashore on the coast of Scotland. The following are the dimensions of the principal parts of the body.

7. BALENA MUSCULUS, the Round-lipped Whale.

French and Greenland, Rorqual; Iceland, Stieps, Reydus.

Characters. In this species the lower jaw is longest and broadest. The protuberance on the back is straight, triangular, and stretches to the tail. This species resembles the preceding in the form of the body. In both there is a prodigious enlargement of the side of the head, which gradually diminishes towards the tail. The structure of the lower jaw furnishes the principal characteristic distinction. In the pike-headed whale it is pointed; but in this species it is rounded, which gives the head an obtuse shape. The opening of the mouth is so wide, that it will admit fourteen men standing upright at the same time. The upper jaw is narrower than the lower; it is also more pointed at the extremity, and is received into the lower jaw. The tongue is composed of a soft spongy substance; and is covered with a fine membrane or skin. At the base of the tongue, on each side, there is a fleshy mass of a red colour, which shuts up the entrance of the gutter so closely that only small fish can be admitted. The whole palate is covered with black laminae, which terminate at their extremity in a silky hair which hangs over the tongue. The laminae and the hair are of unequal length and breadth. Those which are attached to the anterior part of the jaw are 3 feet long, and 1½ inches broad; while those near the entrance to the gutter are scarcely six inches long by one inch broad.

The eyes are placed above the angle of the mouth; they resemble those of the ox. Above the eyes, in the middle of the head, are situated the two respiratory orifices, which are of a pyramidal form.

The pectoral fins are large, a little oval, and tapering; and situated opposite to the angle of the mouth. The dorsal fin is placed directly opposite to the opening of the anus. It tapers a little, and is curved backward. The tail fin is divided into two lobes, which are curved like a scythe, and end in a point.

From the end of the lower jaw to the navel, the under part of the body is covered with rugets or folds, which are two inches broad, having the cavities by which they are separated of the same breadth. The sides are covered with a layer of fat or blubber, 4 inches thick; and on the head and neck, where the fat is more abundant, 6 inches in thickness. The upper part of the body is black; the belly is white.

The herring is the food of this species of whale.

In the month of September 1692, a whale of this species was thrown ashore on the coast of Scotland, as we find it recorded by Shibald. For twenty years before the fishermen had observed it occasionally in pursuit of the herring; and they recognised it in consequence of a wound which it had received from a mus-
It is found most frequently in the Greenland seas; and often also in the European. One which was taken on the Dogger bank, measured 17 feet in length. It had lost the dorsal fin, and by some other accident the jaws were so swelled, that the head formed a mass specifically lighter than water, and therefore did not sink in that element.

**Class II. Monodon.**

**Genus 1st, Monodon, Unicorn-fish, or Sea-Unicorn.**

The body is naked, oval, oblong, round and spotted. The head is small, and not easily distinguished from the rest of the body. There is only one respiratory orifice, which is placed on the top of the head, and shut up by a covering cut in form of a comb. The opening of the mouth is small. There are no teeth in the mouth; but from the upper jaw there proceeds, inclining sometimes to the right side, and sometimes to the left, one long tooth which is twisted in a spiral form. There are rarely two; but when that is the case, they are nearly of the same length; and there is only one species which has the teeth curved at the extremity. The eyes and ears are very small. The penis of the male is enclosed in a kind of sheath; and the female has two mammae on the belly, between which are the organs of generation.

There are three or four fleshly fins; two pectoral fins; one at the extremity of the tail; and that of the back is often replaced by a projection which runs its whole length.

**Species.**

</table>

**Characters.**

One tooth in shape of a horn, inserted in the upper jaw, and spirally twisted; there are rarely two.

**Description.**

The body of the narwhal is oblong and oval; the back broad, convex, and tapering towards the tail; the head is rounded, small, enlarged at the top, and terminates in an obtuse rounded snout. There are no teeth; but a long twisted tooth, which is attached to the upper jaw. It was long supposed that this bony instrument of defence was the horn of a very rare quadruped, and consequently it was sold at a very high price. Each tooth is from nine to ten feet in length, and possesses some of the properties of ivory. It is however easy to distinguish them. The fibres of the tooth of the unicorn-fish are finer than ivory; it is more compact, heavier, and less apt to become yellow. The narwhal is rarely furnished with more than one tooth, but under the common skin of the head on the other side, the rudiments of another may be observed. There have been, however, different examples of two teeth, and both nearly of the same length. In the year 1604, a female having two teeth was taken, and the bones of the head, with the teeth inserted, were brought to Hamburgh. The two teeth proceeded in a right line from the anterior part of the skull. At the place of insertion they were only two inches saunder, but gradually diverging, they were separated at the extremity 18 inches.

The left tooth was 9 inches in circumference, and 7 feet 5 inches long. The right was 7 feet long, and 8 inches in circumference at the base. Both teeth entered 13 inches into the bones of the head, which was 2 feet 9 inches long, and 13 inches broad.

The opening of the mouth is in general very small; not larger, according to some, than to admit the hand of a man. The tongue is nearly of the same size. The head ends in a rounded snout. The lower lip is thin, and shorter than the upper.

The eyes are placed opposite to the opening of the mouth; and they are surrounded by a kind of eye-lid. On the top of the head there is one respiratory orifice, which may be shut and opened at pleasure by means of a fringed covering.

The pectoral fins are about a foot long, and eight inches broad. The fin of the tail is divided into two oblong oval lobes. In place of the dorsal fin, there is a ridge or projection about nine inches high, which extends from the breathing hole on the head to the base of the fin, which terminates the trunk of the body, and diminishes gradually in height as it approaches to the tail.

The skin is about one inch in thickness. The colour is of a grayish white, marked with a great number of black spots which seem to penetrate the substance of the skin. The skin of the belly is of a shining white, and soft as velvet to the touch.

The oil which the unicorn-fish yields is in small quantity, but is considered to be of a superior quality to that of the Greenland or common whale. The food of this food fish is one of the species of the Flavonectes, and some species of Haliotis.

The length of the unicorn-fish is from 20 to 22 feet, the circumference about 12 feet. According to some authors, indeed, some fish have been found 60 feet long. It inhabits chiefly the northern seas of Europe and America, about Davis straits, and the coasts of Iceland.

It would be difficult to take this fish singly and in the open sea; for they are excellent swimmers, and move with astonishing velocity by means of the tail fin. But as they live in very cold climates, and cannot remain long under water without respiring, they frequent the bays that are free of ice. In these places they crowd together in such numbers, that they force their teeth into the body of each other; and in this situation they can neither plunge into the deep water, nor avoid the pursuit and blows of the fishermen.

There is no part of this fish which is not applied to uses of some useful purpose by the inhabitants of Greenland. They are extremely fond of the flesh, which they eat roasted or dried in the smoke. The intestines also are regarded as a very delicate food. They are also roasted. The fat affords an oil for burning. From the gullet they obtain bags or bladders which they employ in fishing. The tendons are made into excellent thread or small cords. Of the tooth they make several instruments which are used in the chase, or stakes for the construction of their huts.

The kings of Denmark have a most magnificent mahogany throne, which is entirely composed of the teeth of the cent-throne unicorn-fish. It is preserved in the castle of Rosenborg; and it is esteemed of greater value than if it teeth were made of gold.

It has been affirmed by some naturalists, that these have
have been found, individuals of the unicorn fish having protrusions on the back, and that in others the teeth were not spirally twisted, but smooth from the base to the extremity. Should these differences turn out to be uniform and constant, other species besides those already known must be admitted.

2. Monodon Spurius, the Spurious Narwhal or Unicorn-fish.

French, L'Anarnak.

In this species there are two small curved teeth in the upper jaw, and one fin on the back.

This species, which has been described by Fabricius in his Fauna Greenlandica, properly belongs to the genus Monodon, at least the characters correspond more nearly to this genus than any other. The body is oblong, rounded, and of a black colour. There are no teeth in the month; but to the upper jaw are attached two small teeth which are of a conical form, a little curved at the extremity, and about one inch long. Besides the two pectoral fins, there is a small one on the back.

This species is one of the smallest fishes belonging to this class. It resembles the other cetaceous fishes by a breathing hole on the top of the head.

It rarely happens that the tail fin is seen when it plunges into the water; but when it respirates the air, it rises above the surface of the sea as high as the insertion of the pectoral fins.

The flesh and fat are found to have a violently purgative effect. From this property the Greenlanders have given it the name of Anarnak, which is adopted by the French naturalists.

It inhabits chiefly the open sea, and very rarely approaches the shores. It is most commonly found in the Greenland seas.

CLASS III. PHYSETER.

Genus 1st, Physeter, Spermacti Whale.

The body is naked, sometimes oval, and sometimes in the form of a lengthened cone. The head is very thick, anteriorly truncated, and occupying nearly one half or one third of the whole length of the body. There is only one breathing hole, which is placed on the snout. The jaws are unequal. The lower is shorter and narrower, and it is furnished with teeth which are sometimes of a conical form, and sometimes blunt; sometimes straight, but often curved in form of a sickle. In the upper jaw there are corresponding cavities. It is also furnished with teeth, but they are flat, lie horizontally, and are scarcely visible.

The eyes are small, and are situated near the insertion of the pectoral fins. The external opening of the organ of hearing is very small, and not easily detected.

The penis, as in the other classes, is included in a sheath. The female has two mammary situated in the abdomen, and between them are placed the parts of generation, near which is the external opening of the anus.

There are three fleshy fins. Two of these are the pectoral; and the third is at the extremity of the tail. The place of the dorsal fin is occupied by a false fin, and often by a kind of callosity.
On each side of the same organ in the female are placed the mammas, which are four or five inches long.

The tail, which is small for the size of the fish, terminates in a fin, which is divided into two lobes, hollowed out in form of a sickle.

The back is black, or of a slate blue, spotted with white. The belly is also white. The fat or blubber, which lies immediately under the skin, is about five or six inches thick on the back, and rather less on the belly. The flesh is of a pale red, like that of pork. The head, though very large, is the least fleshy part of the body. But it yields the substance called spermaceti, in great abundance. This seems to vary in colour according to the climate in which the whale has lived.

The food of the spermaceti whale is the dog-fish and the lump-fish.

This whale swims with great velocity; and he often appears on the surface of the water. It is at this time that the fishermen take the opportunity of striking him with their spears; and it often happens that the parts of the body which have been wounded become gangrenous, and fall off before the death of the animal.

The flesh, the skin, the fat, and the intestines, are applied to the same purposes as those of the unicornfish. The tongue, roasted, is reckoned excellent food; and of the different bones of the body beside the teeth, instruments for the chase are made.

This whale inhabits chiefly the Greenland seas and Davis straits; but occasionally is found on the European shores to the southward. In the year 1784, in the month of March, 31 of these fishes came on shore on the western coast of Audierne in Lower Brittany in France. The following are the dimensions of one of these taken at the time.

This species is chiefly an inhabitant of the northern seas.

Towards the end of the 17th century, 102 of this species came on shore at Cairston in the Orkney islands. The longest was 24 feet.

3. Physeter Trunfo, the Spermaceti Whale.

French, Le Cachalot de la Nouvelle Angleterre; Le Trunfo.

This species is distinguished by a bunch on the back, having the head straight and pointed.

The head of this species is of an immense size. It divides the body nearly into two equal parts. The upper jaw is much longer and thicker than the lower, which is furnished with 18 teeth, straight and pointed, about three inches distant from each other; and when the mouth is shut, they are received into cavities of the upper jaw.

The eyes are small. The breathing hole is at least a foot in diameter, and it is placed at the superior extremity of the snout.

The thickest part of the body is near the insertion of the pectoral fins. These are very small, and that of the tail is divided into two lobes. In place of the dorsal fin, there is a bunch on the back which is more than a foot thick. It is placed nearly opposite to the parts of generation.

The skin is of a grayish colour, and very soft to the touch. The length of this whale varies from 48 to 60 feet.

It is chiefly an inhabitant of the seas which wash the shores of New England.

An individual of this species landed in the year 1741, near Bayonne in France. It yielded ten tons of spermaceti, which was reckoned of a superior quality to that of the large spermaceti whale. In the stomach of the same whale was found a round mass of seven pounds weight, which was taken for ambergris.

The substance called spermaceti is lodged in particular cells in the head near the seat of the brain. It is cut, extracted by making a hole in the skull.

It has been observed by some naturalists that this whale is more agile and more dangerous than any other of the species. When it is wounded, it is said that it throws itself on its back, and defends itself with its mouth.

Mr Pennant has described this under the name of the blunt-headed whale (Physeter Microps, Lin.). But if we attend to the form of the body, the structure of the
the head, the number and structure of the teeth, it seems to constitute a distinct species.

There is a bunch on the back; the teeth are curved and pointed at the top; the breathing hole is in the middle of the snout.

The description of the trunk and head, the position of the breathing-hole, the relative length of the jaws, the number and structure of the teeth, and especially the size of the dorsal fin, present differences which sufficiently distinguish this from the following species. The body is cylindrical, from the extremity of the snout to a line drawn perpendicular to the place where the penis is inserted, and from thence to the tail fin it gradually diminishes. The head is at least the third of the whole length of the body. The profile of the head presents a kind of parallelogram. The jaws are nearly of equal length. On each side of the lower jaw there is a row of 25 curved, sharp-pointed teeth. The breathing-hole is placed at the superior extremity of the snout. The dorsal fin is replaced by a bunch, 18 inches high, and four and a half inches long at the base. The tail fin is divided into two lobes, forming a kind of crescent.

One of this species is described by Anderson, which was 48 feet long, 12 of perpendicular height, and 36 in circumference, at its greatest thickness.

5. **PHYZETER MICROPS**, the Black-headed Spermacet Whale or Cachalot.

French, Cachalot Microps, Cachalot à dents en Fascicule; Norwegian, Staur-Hyming; Greenland, Tissaguir.

In this species there is a long straight fin on the back. The teeth are curved, the point is at first directed to the mouth, and then turns outwards.

The descriptions of naturalists who have treated of this species of whale are greatly confused; and this probably arises from not having attended sufficiently to the form of the teeth. According to Fabricius, there are only 22 teeth in the lower jaw, 11 on each side. All these teeth are curved, having the concave side towards the mouth, and are sunk in the jaw-bone, two-thirds of their whole length. The external part of the teeth is white as ivory, of a conical form; and the point, which is sharp, inclines a little outwardly. That part of the tooth which is sunk in the jaw is compressed on two sides, and flattened on the side next to the gullet. The Greenlanders say that this whale has teeth in the upper jaw: but this is not clearly ascertained. Perhaps they are only furred teeth, similar to what we have described in the great spermacet whale. Each tooth extends to a finger length, and is about one and a half inch broad. The longest occupy the middle part of the jaw. The smaller are at the extremities. The snout ends in a blunt surface; and, according to most naturalists, the upper jaw is the longest. The pectoral fins are about four feet long. What occupies the place of a fin on the back is of considerable height, and has been by some naturalists compared to a long needle.

This whale is the declared enemy of some of the other whales, as the pike-headed whale and the porpoise, which it pursues as its prey. In Greenland the flesh of this whale is greatly esteemed, even more than that of any of the other species. It is rarely taken with the harpoon.

It inhabits chiefly the northern ocean.

6. **PHYZETER MULAR**.

French, La Cachalot Mular.

This species is distinguished by a very elevated fin on the middle of the back. The teeth are slightly curved and obtuse.

This species resembles the former in the general structure of the body. It differs in the form of the teeth, which are less curved, and are obtuse. The longest, which are eight inches in length, and nine inches in circumference, occupy the front of the jaw. The others are only six inches long. Sometimes the teeth are found to be hollow, and sometimes they are solid. Is this owing to the difference of age in the individuals in which it has been observed? Beside the pectoral fins, which is placed on the back is very remarkable on account of its length. Sibbald compares it to the mizzen mast of a vessel.

According to Anderson, this species is farther distinguished by having three bunches or protuberances towards the extremity of the back: the first is 18 inches high; the second, six inches; and the last only three inches. The same historian has observed, that he was informed by the captain of a ship, that he saw on the coast of Greenland a great number of this species of whale, at the head of which was one of 100 feet long, which seemed to be the leader; and which, at the appearance of the ship, gave such a terrible shout, spouting water at the same time, as to shake the vessel. At this signal, the whole made a precipitate retreat.

This species is gregarious, and frequents the seas about the North Cape. They are but rarely taken; for they are very wild and difficult to wound. It appears, that the harpoon can only pierce them in one or two places near the pectoral fins.

The fat or blubber is very tenacious, and yields but a small proportion of oil.

**CLASS IV. DELPHINUS.**

**Genus 1st. DELPHINUS**, the Dolphin.

The body is naked, oval, or of an oblong conical shape, of a blue colour, inclining to black. The head is conical, diminishing gradually towards the snout.

**U u**
The breathing hole, which is on the top of the head, is in form of a crescent, the horns of which are directed towards the snout. The jaws are of equal length, sometimes beaked, and sometimes rounded. They are furnished with teeth, which are conical or compressed, pointed or obtuse, and in some species notched.

The eyes are placed near the angles of the mouth. The pupil of the eye is black, and the iris white. The external opening of the ears is situated behind the eyes. The nostrils terminate in the snout. The penis of the male is included in a sheath; and the mammary of the female are attached to the belly; and between them are the organs of generation.

There are four fins; two are pectoral; there is one on the back, and one at the extremity of the tail. In one species only the dorsal fin is wanting.

**Species.**

1. *Delphinus Phocena*, the Porpoise or Porpoise.

French, Le Marsouin; Spanish, Marsopa; Dutch, Bruinvisch; German, Meerschwein, Braunfisch; Danes, Marsvin, Tumler; Norweg. Nise; Greenland, Nis.

**Character.**

The form of the body is conical. The dorsal fin is triangular. The snout is pointed. The teeth are enlarged at the summit, rounded and cutting.

The body of this fish is round, thick, and diminishes towards the tail. The head resembles an obtuse cone. It is swollen out towards the top above the orbits of the eyes. It then gradually diminishes, and ends in a sharp snout.

The eyes are placed opposite the opening of the mouth; and the pupil of the eye, which is black, is surrounded with a white iris. Behind the eyes there is a small round hole, about one inch in diameter: This is the organ of hearing. The nostrils are placed between the breathing hole and the extremity of the snout. The breathing hole is situated on the top of the head, in a line perpendicular to the interval between the eyes and the angles of the mouth.

The pectoral fins are attached to the edges of the lower surface of the body. The dorsal fin is triangular, and is situated very nearly on the middle of the trunk. Directly under the dorsal fin on the belly are the parts of generation. The anus is situated at an equal distance between the parts of generation and the tail fin.

The length of the porpoise is from four feet to six and eight. This fish is an excellent swimmer. When it rises to the surface to respire, the back only appears; the head and tail are kept under water. But when it is dead, it becomes straight. It feeds on small fishes, and pursues them with inconceivable rapidity.

The porpoise is generally gregarious; this is particularly the case in the time of copulation in the month of August. It is not unusual to see at that time 75 males in pursuit of one female; and so eager are they in the chase, that they are often thrown ashore. The female goes with young 10 months, and brings forth one at a time. At birth the young one is of considerable size, and it constantly follows the mother till it is weaned. When a pregnant female is killed, it has been observed that the tail of the fœtus is seen thrust through the navel of the mother. This is supposed to be occasioned by the spasmodic contraction, produced by the efforts of the mother in the struggles of death.

The flesh of the porpoise has a disagreeable oily taste. It is however used as food by the inhabitants of Lapland and of Greenland. In Greenland they suffer it to undergo some degree of putrefaction to make it tender, and then they prepare it by boiling or boiling. They use the skin, the fat, and the entrails for this purpose. The Dutch and the Danes take the porpoise only for the extraction of the oil.

The porpoise inhabits those places which are sheltered by rocks and bays, and is often seen in summer than in winter.

2. *Delphinus Delphis*, the Dolphin, or Bottle-nosed Whale.

French, Dauphin; German, Meerschwein, Tummeler; Dutch, Dolphin Tummecker; Norwegian, Springer; Iceland, Leipter.

The body is nearly oval. The dorsal fin is curved at the top. The snout is flattened and sharp. The teeth are cylindrical and pointed.

The greatest thickness of the dolphin is at the insertion of the pectoral fins; from which the body gradually diminishes towards the head and tail, and thus has the oval form. The head enlarges at the top like that of the porpoise; but, in the dolphin, it diminishes in thickness, and ends in a flattened beak, like that of a goose. The jaws are of equal length, and furnished on each side with a row of cylindrical teeth, a little pointed at the end, and projecting near one and a half inches above the gum. It would appear that the number of teeth varies according to the age and sex. Klein has reckoned 96 in the upper jaw, and 90 in the under. Mr Pennant, on the contrary, mentions that he saw 19 teeth in the latter, and 21 in the former. Forty-seven teeth have been observed by others in each jaw.

The eyes are placed almost in the same line with the opening of the mouth. The breathing hole is on the top of the head, opposite to the orbit of the eyes. It appears in form of a crescent, the horns of which are directed towards the snout.

The pectoral fins are oval, and inserted at the under part of the breast. The dorsal fin occupies the middle of the body. It is curved backwards at the extremity. The tail fin is divided into two lobes, the one of which folds over the other.

The upper surface of the body is black; the breast is white. From under the eyes on each side passes a white ray, which stretches towards the pectoral fins.

The dolphin is almost always an inhabitant of the open sea, and very rare’s approach the shores. His motions are inconceivably swift; and hence he has been named by the mariners, the arrow of the sea.

The length of the dolphin varies from five to nine or ten feet.

The description which has now been given, has little to do with the fanciful accounts which have been given of this fish, or to the imaginary representations by the ancient painters and engravers. On the pieces of money which were in circulation in the time of Alexander the Great, and are preserved by Bocchini, as well as on other medals, the dolphin is represented with
CE TO

LOGY.

No animal has been more celebrated by the ancient poets and historians than the dolphin. From the earliest ages he was considered as consecrated to the gods, and honoured as the benefactor of man. Pliny, Aelian, and other ancient authors, speak highly of his attachment to mankind. The younger Pliny has written a charming story of the loves of a dolphin for Hippus; and Ovid relates, with all the beauties of poetry, the story of the musician Arion, who was pursuing by pirates and thrown into the sea, was rescued and saved by this kind animal.

Inde (fide majus) tergo delphinus recurvo,
Se memorant onere supposuisse novi,
Ille sedens eitlaramque tenet, pretiumque veclendi
Contat, et aequorae carmine nucet aquas,
Di pia facta vident, Abris delphinia receptus
Jupiter; et stellas jussit habere novem.

OVID. Fasti, lib. ii. 117.

But (past belief) a dolphin’s arched back
Preserved Arion from his destined wreck.
Secure he sits, and with harmonious strains
Requites his bearer for his friendly pains.
The gods approve: the dolphin heaven adorns,
And with nine stars a constellation forms.

But after all these fabulous accounts of the dolphin by the ancients, and the pressages drawn by the modern sailors from their movements, it does not appear that this species of fish is endowed with more sagacity than any other of the cetaceous fishes, or discovers greater attachment to man. What may have been the foundation of these fables, it is not our present object to inquire. It is true, that the dolphin and others of the cetaceous fishes accompany ships for several days together. But this seems to be in search of food, on account of the offals of animal matters that are thrown overboard.

3. DELPHINUS TURISO.

Grenland, Nesornak; French, Le Nesornak.

The form of the body is conical. The dorsal fin is curved. The snout is compressed above. The teeth are straight and blunt.

The greatest thickness of this species is between the dorsal and pectoral fins. From this to the extremity of the tail the body becomes gradually more slender.

The breathing hole, which is placed above the orbits of the eyes, is about 1½ inch in diameter. The anterior part of the head is inclined and rounded, and terminates in a flat beak. The lower jaw is the longest. Both jaws are furnished with 42 cylindrical teeth, which are disposed in a single row.

The pectoral fins are very low, and are of a fauces form. The dorsal fin rises like an inclined plane, and is incurvated behind. At the posterior base of the latter fin there arises a projection which stretches to the tail. The tail fin is divided into two lobes in form of a crescent.

The upper part of the body is black; the belly is white.

It has been observed by some naturalists, that when this species rises to the surface to respire, a great part of the body appears above water. It inhabits the open seas, and is consequently taken with difficulty. The flesh, the fat, and the entrails, are eaten in the same way as the porpoise.

DELPHINUS ORCA, the Grampus.

The body is nearly oval. The dorsal fin is very high. The teeth are conical and slightly curved.

The profile of the grampus is oval and oblong. The description greatest thickness is about the middle of the trunk, from which it gradually diminishes towards both extremities. The snout is short and round. The lower jaw is broader than the upper. Both jaws are furnished with conical teeth, which are unequal and curved at the top, and are from 20 to 30 in number in each jaw.

The eyes are situated in the same line with the opening of the mouth.

But the most distinguishing mark of the grampus is the dorsal fin, which rises from the middle of the back in the form of a cone, and is nearly four feet in height. The pectoral fins are very broad, and nearly oval. The tail fin is divided into two lobes in the form of a crescent. The penis is three feet in length.

The upper part of the body is black; the belly is white. Sometimes white spots are observed on the head and back.

The grampus is the largest fish belonging to the genus. Some have been seen of 25 feet in length by 12 or 13 in circumference. One of 24 feet long was taken in the mouth of the river Thames in the year 1739.

All naturalists agree in describing the grampus as the most cruel and voracious of the family of the dolphin. Its ordinary food is the seal and some species of flat fish. But it is said that it will attack the porpoise, and even the large whale. The latter, so far from defending himself, is struck with terror, utters dreadful shouts, and to escape from the enemy, quits the open seas, and retires towards the coasts, which is perhaps the reason that the whale is sometimes thrown ashore. The grampus, however, is often the victim of its voracity. It is at this time that the fishermen watch the opportunity of striking him with the harpoon.

When the emperor Claudius was engaged in the construction of the harbour of Ostia, a grampus, attracted by some skins which had been sunk in a shipwreck, came upon the coast. There he remained for several days; and forming a kind of canal to receive his huge body in the sand, was protected from the agitation of the sea. While in pursuit of his prey, one day, he was driven ashore by the violence of the waves. The back appeared above the surface of the sand, and the emperor caused strong nets to be stretched across the mouth of the harbour to prevent the escape of the fish, in case he should again get into the water. He then advanced in person, accompanied with his pretorian bands, and exhibited a very amusing spectacle to the Romans. The soldiers embarked in boats were ordered to attack him with spears and other missile weapons. One of the boats was filled with water, and
CETOLOGY.

The pectoral fins are broad and of an oval figure. The dorsal fin is wanting, but in its place there is an angular protuberance. The tail fin is divided into two rounded lobes.

The penis of the male is bony, of a white colour, and inclosed in a sheath. The mammae of the female are placed on each side of the organs of generation.

The whole body is white, and marked in young fishes with brown and blue spots. The skin is an inch thick, and covers a layer of fat of three inches. It is said that the flesh of this species has a reddish colour like that of pork.

It lives on different fishes, particularly the cod and the haddock. And as the throat is of small capacity, it is sometimes suffocated in attempting to swallow fish of too large size. The female has one young at a time, which at birth is of a greenish colour, but becomes afterwards bluish, and as it advances in age is white. The females are gregarious, and the young follow at their sides, imitating all their motions. This species is often observed following ships, and exhibiting a thousand different motions an amusing spectacle.

It quits the open sea during the rigour of winter, and enters the bays that are free from ice. It is seldom an object of trade, on account of the little advantage from the fat. Their arrival, however, is considered by the whale fishers as the fortunate presage of an abundant fishery. The length is from 12 to 18 feet.

7. DELPHINUS BIDENTATUS.

The body is conical. The dorsal fin is spear-shaped. The snout is slender and flat. There are two sharp teeth in the lower jaw.

This species in some of its characters resembles the Delphinus toro, but in others is so different that it is properly to be regarded as a distinct species. The forehead is convex and rounded. The upper jaw is flat, and ends in a beak like that of a duck; but there are only two sharp teeth at the anterior extremity of the lower jaw. The pectoral fins, which are of an oval form and small for the size of the body, are placed opposite to the angles of the mouth. The place of the dorsal fin corresponds to the origin of the tail, is spear-shaped, pointed, and inclines backward. The tail fin is divided into lobes, forming by their union a crescent. The lower part of the body is of a light brown colour, the upper part is brownish black. This species is supposed to be from 30 to 40 feet long.

8. DELPHINUS BUTSKOFF, Bottle-headed or Beaked Whale.

The form of the body is conical. The dorsal fin is incurved towards the tail. The snout is flat and slender. The upper jaw and the palate are furnished with small teeth.

The body represents a cone whose summit is towards the tail. The head is of a greater height than breadth. The front, which is full and round, becomes suddenly narrow, and ends in a flat beak rounded at the extremity. The breathing-hole is on the top of the head, opposite to the orbit of the eyes; it forms a crescent whose horns are turned towards the tail: This is the characteristic
Chapter I. Cetology.

The head is nearly of the same height as the length. Classified.

It is very thick at the top, and suddenly diminishing towards the anterior part ends in a short round snout.

The jaws are equal; they are covered with membro.

Descrip.

The upper jaw is also notched.

The entire body excepting the belly is of a leaden colour.

In the Journal de Physique for the year 1789, M. Bonnaire published an account of two cetaceous fishes which were taken near Honfleur in September of the preceding year. The largest was 23 1/2 feet long, and the smallest 12 1/2. The fishermen received them at a distance struggling on the strand. When they approached they found the smallest stuck on the sand in shallow water. The mother made several attempts to move her young one into deep water, and not only failed but stuck fast by the head, the largest part of the body. The fishermen first took possession of the young one, secured it with ropes; and by their own exertions, aided by a horse and the flowing of the sea, succeeded in bringing it on shore. They then went into the water up to the middle to secure the mother; and having made above 50 wounds with knives on the head and back, and a large wound in the belly, at which the fish seemed to be in great pain, by uttering groans like those of a hog, they were driven off by the violent motion of the tail. A small anchor was then brought, which was introduced into the breathing hole, and a rope was fastened round the tail. The fish finding itself thus entangled, made such violent efforts, that she broke a thick rope, disengaged herself from the anchor, and taking the advantage of the rising tide, escaped and launched into the deep, at the same instant throwing up an immense quantity of water mixed with blood to the height of 12 feet. She was found next day floating on the water quite dead, at the distance of three leagues from Honfleur.

The following are the principal dimensions of the young fish and the mother,
