AND HURST, ROBINSON, AND COMPANY, 90, CHEAPSIDE,
LONDON.

1823.
CRYSTALS, in Chemistry, salts or other matters which assume a regular form. See Chemistry Index and Crystallization.

CTESIAS, a native of Caides, who accompanied Cyrus the son of Darius in his expedition against his brother Artaxerxes; by whom he was taken prisoner. But curing Artaxerxes of a wound he received in the battle, he became a great favourite at the court of Persia, where he continued practising physic for 17 years, and was employed in several negotiations. He wrote the History of Persia in 23 books, and a History of the Indies, but these works are now lost, and all we have remaining of them is an abridgment compiled by Photius. The most judicious among the ancients looked upon Ctesias as a fabulous writer; yet several of the ancient historians and modern Christian writers have adopted in part his chronology of the Assyrian kings.

CTESIBIUS, a mathematician of Alexandria, about 120 years before Christ. He was the first who invented the pump. He also invented a clepsydra, or water-clock. This invention of measuring time by water was wonderful and ingenious. Water was let drop upon wheels which it turned: the wheels communicated their regular motion to a small wooden image, which by a gradual rise pointed with a stick to the proper hours and minutes, which were engraved on a column near the machine. This ingenious invention gave rise to many improvements; and the modern method of measuring time with an hour-glass is in imitation of the clepsydra of Ctesibius.

CTESIPHON, a celebrated Greek architect, who gave the designs of the famous temple of Ephesus, and invented a machine for bringing thither the columns to be used in that noble structure. He flourished 544 B.C.

CTESIPHON, in Ancient Geography, a large village, or rather a fine city, of Chalcedon, the most southern province of Assyria. It was situated on the left or east side of the Tigris, opposite to Seleucia on this side; and built by the Parthians, to rival Seleucia. Here the kings of Parthia passed the winter (Strabo); as they did the summer at Ecbatana.

CTESIPHON was also the name of several noted persons of antiquity. 1. An Athenian, who advised his fellow citizens to crown publicly Demosthenes with a golden crown for his probity and virtue. This was opposed by the orator Aeschines, the rival of Demosthenes, who accused Ctesiphon of seditious views. 2. A Greek architect, who made the plan of Diana's temple at Ephesus. 3. An eulogist, to whom King Attalus set over his possessions in Asia. 4. A Greek historian, who wrote a history of Bosotia.

CUBA, a bear's whelp. Among hunters, a fox and marten of the first year are also called cubs. See Ursus.

CUBA, a large and very important island in the West Indies, belonging to Spain. On the south-east it begins at 20° 10' N. Lat., touches the tropic of Cancer on the north, and extends from 74° to 85° 16' W. Long. It is 764 miles long, lies 60 miles to the west of Hispaniola, 25 leagues north of Jamaica, 100 miles to the south of Cape Florida; and commands the entrance of the gulf both of Mexico and Florida, as also the windward passages. By this situation it may be called the key of the West Indies. It was discovered by Columbus in 1492, who gave it the name of Ferdinando, in honour of King Ferdinand of Spain; but it quickly after recovered its ancient name of Cuba. The natives did not regard Columbus with a very favourable eye at his landing; and the weather proving very tempestuous, he soon left this island, and sailed to Hayti, now called Hispaniola, where he was better received. The Spaniards, however, soon became masters of it. By the year 1515 it was totally conquered; and in that time they had destroyed, according to their own accounts, several millions of people. But the possession of Cuba was far from answering the expectations of the Spanish adventurers, whose avarice could be satiated with nothing but gold. These monsters, finding that there was gold upon the island, concluded that it must come from mines; and therefore tortured the few inhabitants they had left, in order to extort from them a discovery of the places where these mines lay. The miseries endured by these poor creatures were such that they almost unanimously resolved to put an end to their own lives; but were prevented by one of the Spanish tyrants called Vasco Porcellos. This wretch threatened to hang himself along with them, that he might have the pleasure, as he said, of tormenting them in the next world worse than he had done in this; and so much were they afraid of the Spaniards, that this A threat
Cuba.

Cuba.

threat diverted these poor savages from their desperate
resolution. In 1511, the town of Havana was built,
now the principal place on the island. The houses
were at first built only of wood; and the town itself
was for a long time so inconsiderable, that in 1536 it
was taken by a French pirate, who obliged the inha-
bitants to pay 700 ducats to save it from being burnt.
The very day after the pirate’s departure, three Spa-
nish ships arrived from Mexico, and having unloaded
their cargoes, sailed in pursuit of the pirate ship. But
such was the cowardice of the officers, that the pirate
took all the three ships, and returning to the Havan-
na, obliged the inhabitants to pay 700 ducats more.

To prevent misfortunes of this kind, the inhabitants
built their houses of stone; and the place has since
been strongly fortified. See Havana.

According to the Abbé Raynal, the Spanish settle-
ment at Cuba is very important, on three accounts;
1. As the produce of the country, which is consider-
able.
2. As being the staple of a great trade; and, 3. As
being the key to the West Indies. The cultivation
of sugar is carried on to a great extent, no fewer than 480
sugar engines having been erected, and the quantity
exported having amounted on an average from 1801
to 1810 to 644,000 cwt. per annum. Coffee began to
be planted in Cuba after the destruction of the coffee
plantations in St Domingo; and in 1803 it produced
about 12,000 quintals, or 18 millions of pounds.

In 1763 some emigrants introduced bees, which multi-
plied with such rapidity in the hollows of old trees,
that the inhabitants had ample supplies of honey for
their own consumption, besides a surplus for exporta-
tion. Although the surface of the island is in general
uneven and mountainous, yet it has plains sufficiently
extensive, and well enough watered, to supply the con-
sumption of the greatest part of Europe with sugar.

The incredible fertility of its new lands, if properly
managed, would enable it to surpass every other nation,
however they may have now got the start of it; yet
such is the indolence of the Spaniards, that to this day
they have comparatively but few plantations, where,
with the finest canes, they make but a small quantity
of coarse sugar at a great expense. This serves partly
for the Mexican market, and partly for the mother-
country. It has been expected with probability, that
the tobacco imported from Cuba would compensate this
loss; for after furnishing Mexico and Peru, there was
sufficient, with the little brought from Caracca and
Buenos Ayres, to supply all Spain. But this trade
too has declined through the mismanagement of the
court of Madrid. The article is monopolized for the
benefit of the crown; and the planters have been ex-
posed to such vexations, that its cultivation in 1803
had declined to 3,750,000 pounds, from 7,873,000 its
amount in 1794. Cuba furnished considerable quan-
tities of gold when the Spaniards first seized it, and it
still yields some small supplies of this metal. The
Spanish colonies have an universal trade in skins; and
Cuba supplies annually about 10 or 12 thousand.
The number might easily be increased in a country abound-
ing with wild cattle, where some gentlemen possess
large tracts of ground, that for want of population can
scarce be applied to any other purpose than that of
breeding cattle. The hundredth part of this island is
not yet cleared. The true plantations are all confined
to the beautiful plains of the Havana, and even
those are not what they might be. The number of in-
habitants has increased rapidly. In 1774 they amount-
ed to 220,000; but in 1804 the number was 432,000,
including 108,000 slaves. The food of these different
species consists of excellent pork, very bad beef, and
cassava bread. The colony would be still more flourish-
ing, if its productions had not been made the property
of a company, whose exclusive privilege operates as a
constant and invariable principle of discouragement. If
any thing could supply the want of an open trade, and
stone for the grievances occasioned by this monopoly
at Cuba, it would be the advantage which this island
has for such a long time enjoyed, in being the rendez-
vous of almost all the Spanish vessels that sail to the
new world. This practice commenced almost with the
colony itself. Ponce de Leon, having made an at-
tempt upon Florida in 1512, became acquainted with
the new canal of Bahama. It was immediately dis-
covered that this was the best route the ships bound
from Mexico to Europe could possibly take; and to
this the wealth of the island is principally, if not alto-
gether, owing.

CUB, in Geometry, a solid body consisting of six
equal sides. See Geometry.

CUBE.-Root of any Number or Quantity, is such a num-
ber or quantity, which, if multiplied into itself, and
then again the product then so arising by that number
or quantity, being the cube-root; this last product shall
be equal to the number or quantity whereof it is the
cube-root; as 2 is the cube-root of 8; because two
times two is 4, and two times 4 is 8; and 4 + 4 = the
cube-root of a^3 + a b + 3 a b b + b^3. See Algebra.

CUBES, in the Materia Medica, a small dried fruit
resembling a grain of pepper, but often somewhat
longer, brought into Europe from the island of Java.
In aromatic warmth and pungency, they are far infe-
terior to pepper.

CUBIC EQUATION. See Algebra.

CUBIDIA, a genus of spars. The word is derived from
cubius, "a cube," and is given them from their be-
ing of the shape of a common die, or of a cubic figure.
These bodies owe this shape to an admixture of lead,
and there are only two known species of the genus.
1. A colourless crystalline one, with thin flakes, found
in the lead mines of Derbyshire and Yorkshire, and some other parts
of the kingdom; and, 2. A milky white one with
thicker crusts. This is found in the lead-mines of
Derbyshire and Yorkshire, but is usually small, and
is not found plentifully.

CUBIT, in the mensuration of the ancients, a long
measure, equal to the length of a man’s arm, from the
elbow to the tip of the fingers.

Dr Arbuthnot makes the English cubit equal to 18
inches; the Roman cubit equal to 1 foot 5.406 inches;
and the cubit of the Scripture equal to 1 foot 9.888
inches.

CUBITÆUS MUSCLES, the name of two muscles of
the hand. See Anatomy, Table of the Muscles.

CUBITUS, in Anatomy, a bone of the arm, reaching
from the elbow to the wrist; otherwise called ulna, or
the greater bone. Some use the word for all that part
of the arm between the elbow and the wrist; including
the ulna or cubitus, properly so called, and the radius.

CUBOIDES, or Os Cubiforme, in Anatomy, the
seventh
CUCUMIS, a genus of plants belonging to the monoecea class; and in the natural method ranking under the 34th order, Cucurbitaceae. See Botany Index.

CUCUMBER, the CUCUMBER: a genus of plants belonging to the monoecea class; and in the natural method ranking under the 34th order, Cucurbitaceae. See Botany Index.

Four varieties of the cucumis sativus are chiefly cultivated in this country. They are raised at three different seasons of the year: 1. on hot-beds, for early fruit; 2. under bell or glass-houses, for the middle crop; 3. on the common ground, which is for a late crop, or to pickle. The cucumbers which are ripe before April are unwholesome; being raised wholly by the heat of the dung without the assistance of the sun. Those raised in April are good, and are raised in the following manner.

Towards the latter end of January, a quantity of fresh horse-dung must be procured with the litter among it; and a small proportion of sea-coal ashes should be added to it. In four or five days the dung will begin to heat; at which time a little of it may be drawn flat on the outside, and covered with two inches thickness of good earth: this must be covered with a bell glass; and after two days, when the earth is warm, the seeds must be sown on it, covered with a quarter of an inch of fresh earth, and the glass then set on again. The glass must be covered with a mat at night, and in four days the young plants will appear. When these are seen, the rest of the dung must be made up into a bed for one or more lights. This must be three feet thick, heat close together, and covered three inches deep with fine fresh earth; the frame must then be put on, and covered at night, or in bad weather, with mats. When the earth is hot enough, the young plants from under the bell must be removed into it, and set two inches distant. The glasses must be now and then a little raised, to give air to the plants, and turned often, to prevent the wet from the steam of the dung from dropping down upon them. The plants must be watered at proper times; and the water used for this purpose must be set on the dung till it becomes as warm as the air in the frame: and as the young plants increase in bulk, they must be earthed up, which will give them great additional strength. If the bed is not hot enough, some fresh litter should be laid round its sides: and if too hot, some holes should be bored into several parts of it with a stake, which will let out the heat; and when the bed is thus brought to a proper coolness, the holes are to be stopped up again with fresh dung. When these plants begin to shoot their third or rough leaf, another bed must be prepared for them like the first; and when it is properly warm through the earth, the plants of the other bed must be taken up, and planted in this, in which there must be a hole in the middle of each light, about a foot deep, and nine inches over, filled with light and fine fresh earth laid hollow in form of a bason: in each of these holes there must be set four plants: these must be, for two or three days, shaded from the sun, that they may take firm root; after which they must have all the sun they can, and now and then a little fresh air, as the weather will permit. When the plants are four or five inches high, they must be gently pegged down towards the earth, in directions as different from one another as may be; and the branches afterwards produced should be treated in the same manner. In a month after this the flowers will appear, and soon after the rudiments of the fruit. The glasses should now be carefully covered at night; and in the daytime the whole plants should be gently sprinkled with water. These will produce fruit till about midsummer; at which time the second crop will come in to supply their place; these are to be raised in the same manner as the early crop, only they do not require so much care and trouble. This second crop should be sown in the end of March or beginning of April. The season for sowing the cucumbers of the last crop, and for pickling, is towards the latter end of May, when the weather is settled: these are sown in holes dug to a little depth, and filled up with fine earth, so as to be left in the form of a bason; eight or nine seeds being put into one hole. These will come up in five or six days; and till they are a week old, are in great danger from the sparrows. After this they require only to be kept clear of weeds, and watered now and then. There should be only five plants left at first in each hole; and when they are grown a little farther up, the worst of these is to be pulled up, that there may finally remain only four. The plants of this crop will begin to produce fruit in July.

CUCURBIT, the name of a chemical vessel employed in distillation, when covered with its head. Its name comes from its elongated form in shape of a gourd: some cucurbits, however, are shallow and wide-mouthed. They are made of copper, tin, glass, and stone ware, according to the nature of the substances to be distilled. A cucurbit, provided with its capital, constitutes the vessel for distillation called an alembic.

CUCURBITA, the Gourd, and Pomfion; a genus of plants belonging to the monoecea class; and in the natural method ranking under the 34th order, Cucurbitaceae. See Botany Index.

All the species of gourds and pommions, with their respective varieties, are raised from seed sown annually in
in April or the beginning of May, either with or without the help of artificial heats. But the plants forwarded in a hot bed till about a month old, produce fruit a month or six weeks earlier on that account, and ripen proportionally sooner. The first species particularly will scarce ever produce tolerably sized fruit in this country, without the treatment above mentioned.

In this country these plants are cultivated only for curiosity; but in the places where they are natives, they answer many important purposes. In both the Indies, bottle-gourds are very commonly cultivated and sold in the markets. They make the principal food of the common people, particularly in the warm months of June, July, and August. The Arabinas call this kind of gourd *charrah*. It grows commonly on the mountains in their deserts. The natives boil and season it with vinegar; and sometimes, filling the shell with rice and meat, make a kind of pudding of it. The hard shell is used for holding water, and some of them are capacious enough to contain 22 gallons; these, however, are very uncommon. The fruit of the pommion likewise constitutes a great part of the food of the common people during the hot months, in those places where they grow. If gathered when not much bigger than a hen or goose egg, and properly seasoned with pepper, vinegar, &c. they make a tolerable good sauce for butcher’s meat, and are also used in soups. In England they are seldom used till grown to maturity. A hole is then made in one side, through which the pulp is scooped out; after being divided of the seeds, it is mixed with sliced apples, milk, sugar, and grated nutmeg, and thus a kind of pudding is made. The whole is then baked in the oven, and goes by the name of a *pumpkin pie*. For this purpose the plants are cultivated in many places in England by the country people, who raise them upon old dung-hills. The third species is also used in North America for culinary purposes. The fruit is gathered when about half grown, boiled and eaten as sauce to butcher’s meat. The squashes are also treated in the same manner, and by some people esteemed delicate eating.

*CUCURBITACEÆ*, the name of the 34th order in Linnaeus’s fragments of a natural method, consisting of plants which resemble the gourd in external figure, habit, virtues, and sensible qualities. This order contains the following genera, viz. *gronovia*, *melothria*, *passiflora*, *anguria*, *bryonia*, *cucumis*, *cucurbita*, *sevilles*, *monordica*, *sicys*, *trichothecae*.

*CUCURUCU*, in *Zoology*, the name of a serpent found in America, growing 10 or 12 feet long. It is also very thick in proportion to its length, and is of a yellowish colour, strongly variegated with black spots, which are irregularly mixed among the yellow, and often have spots of yellow within them. It is a very poisonous species, and greatly dreaded by the natives; but its flesh is a very rich food, and much esteemed among them, when properly prepared.

*CUD*, sometimes means the inside of the throat in brasts; but generally the food that they keep there, and chew over again. See *Anatomy Index*.

*CUDDALORE*, a town on the coast of Coromandal in India, belonging to the English, very near the place where Fort St. David once stood. *N. Lat. 11.

30. E. Long. 70. 53-30. This place was reduced by Cuddalore the French in the year 1781; and in 1783 underwent a severe siege by the British forces commanded by General Stuart. At this time it was become the principal place of arms held by the enemy on that coast; they had exerted themselves to the utmost in fortifying it; and it was garrisoned by a numerous body of the best forces of France, well provided with artillery, and every thing necessary for making a vigorous defence.

Previous to the commencement of the siege, they had constructed strong lines of defence all along the fort, excepting one place where the town was covered by a wood, supposed to be inaccessible. Through this wood, however, General Stuart began to cut his way; on which the besieged began to draw a line of fortification within that also. The British commander then determined to attack these fortifications before they were quite completed; and for this purpose a vigorous attack was made by the troops under General Bruce. The grenadiers assailed a redoubt which greatly annoyed them, but were obliged to retire; on which the whole army advanced to the attack of the lines. The French defended themselves with resolution; and as both parties charged each other with fixed bayonets, a dreadful slaughter ensued. At last the British were obliged to retreat; but the French having imprudently come out of their lines to pursue them, were in their turn defeated, and obliged to give up the lines they had constructed with so much pains, and so gallantly defended. The loss on the part of the British amounted to near 1000 killed and wounded, one half of whom were Europeans; and that of the French was not less than 600.

Though the British proved victorious in this contest, yet the victory cost so dear that there was not now a sufficient number to carry on the siege with any effect. The troops also became sickly; and their strength diminished so much, that the besieged formed a design of not only obliging them to raise the siege, but of totally destroying them. For this purpose 4000 men were landed from the squadron commanded by M. Suffren; and the conduct of the enterprise committed to the Chevalier de Damas, an experienced and valiant officer. On the 25th of June 1783, he sailed out at the head of the regiment of Aquinas, supposed to be one of the best in the French service, and of which he was colonel; with other troops selected from the bravest of the garrison. The attack was made by day-break; but though the British were at first put into some disorder, they quickly recovered themselves, and not only repulsed the enemy, but pursued them so warmly, that the Chevalier de Damas himself was killed, with about 200 of his countrymen, and as many taken prisoners.

This engagement was attended with one of the most remarkable circumstances that happened during the whole war, viz. a corps of sepoys grenadiers encountering the French troops opposed to them with fixed bayonets, and overcoming them. This extraordinary bravery was not only rewarded with due applause, but procured for that corps a provision for themselves and families from the presidencies to which they belonged. No other operation of any consequence took place.
Cuddalore place during the siege, which was now soon ended by the news of peace having taken place between the beligerent powers of Europe.

Cuddy, in a first-rate man of war, is a place lying between the captain-lieutenant's cabin and the quarter-deck; and divided into partitions for the master and other officers. It denotes also a kind of cabin near the stern of a lighter or harge of burden.

CudweEd. See Gaphum, Botany Index.

Cudworth, Ralph, a very learned divine of the church of England in the 17th century. In January 1657, he was one of the persons nominated by a committee of the parliament to be consulted about the English translation of the Bible. In 1678 he published his True Intellectual System of the Universe; a work which met with great opposition. He likewise published a treatise, entitled, Deae justicifatus: "or," The divine goodness of God vindicated, against the assertions of absolute and unconditional reprobatation. He embraced the mechanical or corpuscular philosophy: but with regard to the Deity, spirits, genii, and ideas, he followed the Platonists. He died at Cambridge in 1683. The editor of the new edition of the Biographia Britannica observes, that it is not easy to meet with a greater storehouse of ancient literature than the "Intellectual System;" and various writers, we believe, have been indebted to it for an appearance of learning which they might not otherwise have been able to maintain. That Dr Cudworth was fanciful in some of his opinions, and that he was too devoted a follower of Plato and the Platonists, will scarcely be denied even by those who are most sensible of his general merit. The reflections that have been cast upon such a man as the author, by bigotted writers, are altogether contemptible. It is the lot of distinguished merit to be thus treated. Lord Shaftesbury, speaking on this subject, has given an honourable testimony to the memory of Dr Cudworth, "You know (says his lordship) the common fate of those who dare to appear fair authors. What was that pious and learned man's case, who wrote the Intellectual System of the Universe! I confess it was pleasant enough to consider, that though the whole world were not less satisfied with his capacity and learning, than with his sincerity in the cause of Deity; yet he was accused of giving the upper hand to the atheists, for having only stated their reasons, and those of their adversaries, fairly together."

It is observed by Dr Birch, that Dr Cudworth's Intellectual System of the Universe has raised him a reputation, to which nothing can add but the publication of his other writings still extant in manuscript. That these writings are very valuable cannot be doubted. We may be assured that they display a great compass of sentiment and a great extent of learning. Nevertheless, from their voluminous quantity, from the obscurity of the subjects they treat upon, and from the revolutions of literary taste and opinion, it is morally certain that the publication of them would not be successful in the present age. Dr Cudworth's daughter Damaris, who married Sir Francis Masham of Oates in Essex, was a lady of genius and learning; she had a great friendship for Mr Locke, who resided several years at her house at Oates, where he died in Cudworth 1704.

Cue, an item or inuendo, given to the actors on the stage what or when to speak. See Paresty.

Cuenza, a town of Spain, in New Castile, and in the territory of the Sierra, with a bishop's see. It was taken by Lord Peterborough in 1706, but retaken by the duke of Berwick. It is seated on the river Xucar, in W. Long. 1. 45. N. Lat. 40. 10.

Cuerenherdt, Theodore van, a very extraordinary person, was a native of Amsterdam, where he was born in 1522. It appears, that early in life he travelled into Spain and Portugal; but the motives of his journey are not ascertained. He was a man of science, and according to report, a good poet. The sister arts at first he considered as an amusement only; but in the end he was, it seems, obliged to have recourse to engravings alone for his support. And though the different studies in which he employed his time prevented his attachment to his profession being so close as it ought to have been, yet at least the marks of genius are discoverable in his works. They are slight, and hastily executed with the graver alone; but in an open careless style, so as greatly to resemble designs made with a pen. He was established at Haarlem; and there pursuing his favourite studies in literature, he learned Latin, and was made secretary to that town, from whence he was sent several times as ambassador to the prince of Orange, to whom he addressed a famous manifesto, which that prince published in 1566. Had he stopped here, it had been well; but directing his thoughts into a different channel, he undertook an argument as dangerous as it was absurd. He maintained, that all religious communions were corrupted; and that, without a supernatural mission, accompanied with miracles, no person had a right to administer in any religious office: he therefore pronounced that man to be unworthy the name of a Christian who would enter any place of public worship. This he not only advanced in words, but strove to show the sincerity of his belief by practice; and for that reason would not communicate with either Protestant or Papist. His works were published in three volumes folio in 1590; and though he was several times imprisoned, and at last sentenced to banishment, yet he does not appear to have altered his sentiments. He died at Dergoude in 1590, aged 63 years. It is no small addition to the honour of this singular man, that he was the instructor of that justly celebrated artist Henry Goltzius. Cuerenherdt worked jointly with the Galles and other artists, from the designs of Martin Hemskerck. The subjects are from the Old and New Testament, and consist chiefly of middling-sized plates lengthwise. He also engraved several subjects from Franc. Floris.

Cuero. To walk en cuervo, is a Spanish phrase, for going without a cloak, or without all the formalities of a full dress.

Cuff, Henry, the unfortunate secretary of the unfortunate earl of Essex, was born at Hinton St George in Somersetshire, about the year 1560, of a genteel family, who were possessed of considerable estates in that county. In 1575, he was entered of Trinity college Oxford, where he soon acquired considera...
CUI

CUL

cul

cui

considerable reputation as a Grecian and disputant. He obtained a fellowship in the above-mentioned college; but was afterwards expelled for speaking disrespectfully of the founder (A). He was, however, soon after admitted of Merton college; of which, in 1586, he was elected probationer, and in 1588 fellow. In this year he took the degree of master of arts. Some time after he was elected Greek professor, and in 1594 proctor of the university. When he left Oxford it is uncertain; nor are we better informed as to the means of his introduction to the earl of Essex. When that nobleman was made lord lieutenant of Ireland, Mr Cuff was appointed his secretary, and continued intimately connected with his lordship until his confinement in the Tower; and he is generally supposed to have advised those violent measures which ended in their mutual destruction. The earl indeed confessed as much before his execution, and charged him to his face with being the author of all his misfortunes. Mr Cuff was tried for high treason, convicted, and executed at Tyburn on the 30th of March 1601. Lord Bacon, Sir Henry Wotton, and Camden, speak of him in very harsh terms. He was certainly a man of learning and abilities. He wrote two books: the one entitled, The Differences of the Ages of Man’s Life; the other, De Rebus Gestis in Sancto Concilio Nicae. The first was published after his death; the second is still in manuscript.

CUIAS, JAMES, in Latin Cujaecius, the best civilian of his time, was born at Toulouse, of obscure parents, in 1520. He learned polite literature and history; and acquired great knowledge in the ancient laws, which he taught with extraordinary reputation at Toulouse, Cahors, Bourges, and Valence in Dauphiné. Emmanuel Philibert, duke of Savoy, invited him to Turin, and gave him singular marks of his esteem. Cujas afterwards refused very advantageous offers from Pope Gregory XIII. who was desirous of having him teach at Bologna; but he chose rather to fix at Bourges, where he had a prodigious number of scholars; whom he not only took great pleasure in instructing, but assisted with his substance, which occasioned his being called the Father of his Scholars. He died at Bourges in 1590, aged 70. His works are in high esteem among civilians.

CUJAVIA, a territory of Great Poland, having on the north the duchy of Prussia, on the west the palatinate of Kalisk, and on the south those of Liciici and Raza, and on the west that of Plocko. It contains two palatinates, the chief towns of which are Inowluez and Brest, and now belongs partly to Russia, and partly to Prussia.

CUIRASS, a piece of defensive armour made of iron plate, well hammered, serving to cover the body, from the neck to the girdle, both before and behind. Some derive the word, by corruption, from the Italian evoe, “heart,” because it covers that part; others from the French cuir, or the Latin corium, “leather;” whence cortiaceus; because defensive arms were originally made of leather. The cuirass was not brought into use till about the year 1500, though they were known both to the ancient Greeks and Romans in different forms.

CUIRASSIERS, cavalry armed with cuirasses, as many of the Germans are: The French have regiments of cuirassiers; but we have had none in the British army since the Revolution.

CULDEE, in church-history, a sort of monkish priests formerly inhabiting Scotland and Ireland. Being remarkable for the religious exercises of preaching and praying, they were called, by way of eminence, cultores Dei; from whence is derived the word culdees. They made choice of one of their own fraternity to be their spiritual head, who was afterwards called the Scots bishop.

CULEMBAICH, a district or marquisate of the circle of Franconia, in Germany. It is bounded on the west by the bishopric of Bamberg; on the south by the territory of Nuremberg; on the east by the palatinate of Bavaria and Bohemia; and on the north by Voegtland and part of the circle of Upper Saxony. It is about 50 miles in length from north to south, and 30 in breadth from east to west. It is full of forests and high mountains; the most considerable of the latter are those of Frichtelberg, all of them covered with pine-trees. Here are the sources of four large rivers, the Main, the Sals, the Eger, and the Nab. Since 1814 this marquisate has formed part of the territories of Bavaria.

CULEMBACH, a town of Germany, in Franconia, the capital of the marquisate of the same name. It has good fortifications, and is seated at the confluence of two branches of the river Main. It was pillaged and burnt by the Huzzes in 1430, and by the inhabitants of Nuremberg in 1573. E. Long. 11. 28. N. Lat. 50. 12.

CULEUS, in Roman antiquity, the largest measure of capacity for things liquid, containing 20 amphore, or 40 urne. It contained 143 gallons 3 pints, English wine-measure, and was 11,095 solid inches.

CULEX, the Gnat; a genus of insects belonging to the order of diptera. See Entomology Index.

CULIACAN, a province of North America, in the audience of Guadalajara. It is bounded on the north by New Mexico, on the east by New Biscay and the Zacatecas, on the south by Chiametlan, and on the west by the sea. It is a fruitful country, and has rich mines.

CULLIAGE, a barbarous and immoral practice, whereby the lords of manorsanciently assumed a right to the first night of their vassals' brides.

CULLEN,
CULLEN, a borough town in the county of Banff in Scotland. It is situated on the sea-coast. W. Long. 2. 12. N. Lat. 57. 38. The manufacture of linen and damask has been established in this town for more than 50 years. Population 1770 in 1811.

Cullen, Dr. William, physician and distinguished medical teacher, was born in Lanarkshire, in the west of Scotland, 11th December, 1712. His father was for some time chief magistrate of the town of Hamilton; but though a very respectable man, his circumstances were not such as to permit him to lay out much money on the education of his son. William therefore, after serving an apprenticeship to a surgeon-apothecary in Glasgow, went on several voyages to the West Indies as a surgeon in a trading vessel from London; but of this employment he was tired, and settled himself, at an early period of life, as a country surgeon in the parish of Shotts, where he staid a short time practising among the farmers and country people, and then went to Hamilton with a view to practise as a physician, having never been fond of operating as a surgeon.

While he resided near Shotts, it chanced that Archibald Duke of Argyle, who at that time bore the chief political sway in Scotland, made a visit to a gentleman of rank in that neighbourhood. The duke was fond of literary pursuits, and was then particularly engaged in some chemical researches, which required to be elucidated by experiment. Eager in these pursuits, his grace, while on his visit, found himself much at a loss for the want of some small chemical apparatus, which his landlord could not furnish; but happily recollecting young Cullen in the neighbourhood, he mentioned him to the duke as a person who could probably furnish it.

He was accordingly invited to dine; was introduced to his grace—who was so much pleased with his knowledge, his politeness and address, that he formed an acquaintance which laid the foundation of all Dr Cullen's future advancement.

The name of Cullen by this time became familiar at every table in that neighbourhood; and thus he came to be known, by character, to the Duke of Hamilton, who then resided, for a short time, in that part of the country: and that nobleman having been suddenly taken ill, the assistance of young Cullen was called in; which proved a fortunate circumstance in serving to promote his advancement to a station in life more suited to his talents than that in which he had hitherto moved.

The duke was highly delighted with the sprightly character and ingenious conversation of his new acquaintance. Receiving instruction from him in a much more pleasing, and an infinitely easier way than he had ever before obtained, the conversation of Cullen proved highly interesting to his grace.

No wonder then that he soon found means to get his favourite doctor, who was already the esteemed acquaintance of the man through whose hands all preceptors in Scotland were obliged to pass, appointed to a place in the university of Glasgow, where his singular talents for discharging the duties of the station he now occupied soon became very conspicuous.

During his residence in the country, however, several important incidents occurred, that ought not to be passed over in silence. It was during this time that was formed a connection in business in a very humble line between two men, who became afterwards eminently conspicuous in much more exalted stations. William, afterwards Doctor Hunter, the famous lecturer on anatomy in London, was a native of the same part of the country; and not being in affluent circumstances more than Cullen, these two young men, stimulated by the impulse of genius to prosecute their medical studies with ardour, but thwarted by the narrowness of their fortune, entered into a copartnership as surgeons and apothecaries in the country. The chief end of their contract being to furnish the parties with the means of prosecuting their medical studies, which they could not separately so well enjoy, it was stipulated, that one of them alternately should be allowed to study in what college he inclined, during the winter, while the other should carry on the business in the country, for the common advantage. In consequence of this agreement, Cullen was first allowed to study in the university of Edinburgh for one winter; but when it came to Hunter's term next winter, he, preferring London to Edinburgh, went thither. There his singular neatness in dissecting, and uncommon dexterity in making anatomical preparations, his assiduity in study, his mildness of manner, and pliability of temper, soon recommended him to the notice of Dr. Douglas, who then read lectures upon anatomy and midwifery there; who engaged Hunter as an assistant, and whose chair he afterwards filled with so much honour to himself and satisfaction to the public.

Thus was dissolved, in a premature manner, a copartnership perhaps of no singular a kind as is to be found in the annals of literature: nor was Cullen a mass of that disposition to let any engagement with him prove a bar to his partner's advancement in life. The articles were freely departed from by him; and Cullen and Hunter ever after kept up a very cordial and friendly correspondence; though, it is believed, they never from that time had a personal interview.

During the time that Cullen practised as a country surgeon and apothecary, he formed another connection of a more permanent kind, which happily for him, was not dissolved till a very late period of his life. With the ardour of disposition he possessed, it cannot be supposed he beheld the fair sex with indifference. Very early in life he took a strong attachment to an amiable woman, a Miss Johnston, daughter to a clergyman in that neighbourhood, nearly of his own age, who was prevailed on to join with him in the sacred bonds of wedlock, at a time when he had nothing else to recommend him to her except his person and dispositions. After giving to him a numerous family, and participating with him the changes of fortune which he experienced, she died in summer 1756.

In the year 1746, Cullen, who had now taken the degree of doctor in physic, was appointed a lecturer in chemistry in the university of Glasgow: and in the month of October began his lectures in that science. His singular talents for arrangement, his distinctness of enunciation, his vivacity of manner, and his knowledge of the science he taught, rendered his lectures interesting to the students to a degree that had been till then unknown at the university. He became, therefore, in some measure, adored by the students. The former professors were eclipsed by the brilliancy of his reputation; and he had to experience all those little rubs that envy
and disappointed ambition naturally threw in his way.
Regardless, however, of these secret chagrin, he pressed forward with ardour in his literary career; and, supported by the favour of the public, he consol'd himself for the contumely he met with from a few individuals. His practice as a physician increased from day to day; and a vacancy having occurred in the year 1751, he was then appointed by the king professor of medicine in that university. This new appointment served only to call forth his powers, and to bring to light talents that it was not formerly known he possessed; so that his fame continued to increase.

As, at that period, the patrons of the university of Edinburgh were constantly on the watch for the most eminent medical men to support the rising fame of the college, their attention was soon directed towards Cullen; who, on the death of Dr Plummer, professor of chemistry, was, in 1756, unanimously invited to accept the vacant chair. This invitation he accepted; and having resigned all his employments in Glasgow, he began his academical career in Edinburgh in the month of October of that year; and there he resided till his death.

If the admission of Cullen into the university of Glasgow gave great spirit to the exertions of the students, this was still, if possible, more strongly felt in Edinburgh. Chemistry, which had been till that time of small account in that university, and was attended to by very few of the students, instantly became a favourite study; and the lectures upon that science were more frequented than any others in the university, anatomy alone excepted. The students, in general, spoke of Cullen with the rapturous ardour that is natural to youth when they are highly pleased. These eulogiums appeared extravagant to moderate men, and could not fail to prove disgusting to his colleagues. A party was formed among the students for opposing this new favourite of the public; and these students, by misrepresenting the doctrines of Cullen to others who could not have an opportunity of hearing these doctrines themselves, made even some of the most intelligent men in the university think it their duty publicly to oppose these imaginary tenets. The ferment was thus augmented; and it was some time before the professors discovered the arts by which they had been imposed upon, and universal harmony restored.

During this time of public ferment, Cullen went steadily forward, without taking any part himself in these disputes. He never gave ear to any tales respecting his colleagues, nor took any notice of the doctrines they taught: That some of their unguarded strictures might at times come to his knowledge is not impossible; but if they did, they seemed to make no impression on his mind.

These attempts of a party of students to lower the character of Cullen on his first outset in the university of Edinburgh having proved fruitless, his fame as a professor, and his reputation as a physician, became more and more respected every day. Nor could it well be otherwise: Cullen's professional knowledge was always great, and his manner of lecturing singularly clear and intelligible, lively and entertaining; and to his patients, his conduct in general as a physician was so pleasing, his address so affable and engaging, and his manner so open, so kind, and so little regulated by pecuniary considerations, that it was impossible for those who had occasion to call once for his medical assistance, ever to be satisfied on any future occasion without it. He became the friend and companion of every family he visited; and his future acquaintance could not be dispensed with.

But if Dr Cullen in his public capacity deserved to be admired, in his private capacity by his students he deserved to be adored. His conduct to them was so attentive, and the interest he took in the private concerns of all those students who applied to him for advice, was so cordial and so warm, that it was impossible for any one who had a heart susceptible of generous emotions, not to be enraptured with a conduct so uncommon and so kind. Among ingenious youth, gratitude easily degenerates into rapture—into respect nearly allied to adoration. Those who advert to this natural construction of the human mind, will be at no loss to account for that popularity which Cullen enjoyed—a popularity, that those who attempt to weigh every occurrence by the cool standard of reason alone, will be inclined to think excessive. It is fortunate, however, that the bulk of mankind will ever be influenced in their judgment not less by feelings and affections than by the cold and phlegmatic dictates of reason. The adoration which generous conduct excites, is the reward which nature hath appropriated exclusively to disinterested beneficence. This was the secret charm that Cullen ever carried about with him, which fascinated such numbers of those who had intimate access to him. This was the power which his envious opponents never could have an opportunity of feeling.

The general conduct of Cullen to his students was this. With all such as he observed to be attentive and diligent, he formed an early acquaintance, by inviting them by twos, by threes, or by fours at a time, to sup with him, conversing with them on these occasions with the most engaging ease, and freely entering with them on the subject of their studies, their amusements, their difficulties, their hopes, and future prospects. In this way he usually invited the youth of his own class, till he made himself acquainted with their abilities, their private character, and their objects of pursuit. Those among them whom he found most assiduous, best disposed, or the most friendless, he invited the most frequently, till an intimacy was gradually formed, which proved highly beneficial to them. Their doubts, with regard to their objects of study he listened to with attention, and solved with the most obliging condescension. His library, which consisted of an excellent assortment of the best books, especially on medical subjects, was at all times open for their accommodation; and his advice, in every case of difficulty to them, they always had it in their power most readily to obtain. They seemed to be his family; and few persons of distinguished merit have left the university of Edinburgh in his time, with whom he did not keep up a correspondence till they were fairly established in business. By these means, he came to have a most accurate knowledge of the state of every country, with respect to practitioners in the medical line; the only use he made of which knowledge, was to direct students in their choice of places, where they might have an opportunity of engaging in business with a reasonable prospect of success.
success. Many, very many, able men has he thus put into a good line of business, where they never could have thought of it themselves; and they are now reaping the fruits of this beneficent foresight on his part.

Nor was it in this way only that he befriended the students at the university of Edinburgh. Possessing a benevolence of mind that made him ever think first of the wants of others, and recollecting the difficulties that he himself had to struggle with in his younger days, he was at all times singularly attentive to their pecuniary concerns. From his general acquaintance among the students, and the friendly habits he was on with many of them, he found no difficulty in discovering those among them who were rather in embarrassed circumstances, without being obliged to hurt their delicacy in any degree. To such persons, when their habits of study admitted of it, he was peculiarly attentive. They were more frequently invited to his house than others; they were treated with more than usual kindness and familiarity; they were conducted to his library, and encouraged by the most delicate address to borrow from it freely whatever books he thought they had occasion for: and as persons in these circumstances were usually more shy in this respect than others, books were sometimes pressed upon them as a sort of constraint, by the doctor insisting to have their opinion of such or such passages they had not read, and desiring them to carry the book home for that purpose. He, in short, behaved to them rather as if he courted their company, and stood in need of their acquaintance than they of his. He thus raised them in the opinion of their acquaintance to a much higher degree of estimation than they could otherwise have obtained; which, to people whose minds were depressed by penury, and whose sense of honour was sharpened by the consciousness of an inferiority of a certain kind, was singularly engaging. Thus they were inspired with a secret sense of dignity, which elevated their minds, and excited an uncommon ardour of pursuit, instead of that melancholy inactivity which is so natural in such circumstances, and which too often leads to despair. Nor was he less attentive in the manner of supplying their wants, than attentive to discover them. He often found out some polite excuse for refusing to take payment for a first course, and never was at a loss for an after course. Before they could have an opportunity of applying for a ticket, he would sometimes lead the conversation to some subject that occurred in the course of his lectures; and as his lectures were never put in writing by himself, he would sometimes beg the favour to see their notes, if he knew they had been taken with attention, under a pretext of assisting his memory. Sometimes he would express a wish to have their opinion of a particular part of his course, and presented them with a ticket for that purpose; and sometimes he refused to take payment, under the pretext that they had not received his full course the preceding year, some part of it having been necessarily omitted for want of time, which he meant to include in this course. By such delicate address, in which he greatly excelled, he took care to foreron their wants. Thus he not only gave them the benefit of his own lectures, but by refusing to take their money, he also enabled them to attend those of others that were necessary to complete their course of studies. These were particular devices he adopted to individuals to whom economy was necessary; but it was a general rule with him, never to take money from any student for more than two courses of the same set of lectures, permitting him to attend these lectures as many years longer as he pleased gratis.

He introduced another general rule into the university, that was dictated by the same principle of disinterested beneficence, that ought not to be here passed over in silence. Before he came to Edinburgh, it was the custom of medical professors to accept of fees for their medical assistance, when wanted, even from medical students themselves, who were perhaps attending the professor's own lectures at the time. But Cullen never would take fees as a physician from any student at the university, though he attended them, when called in as a physician, with the same assiduity and care as if they had been persons of the first rank, who paid him most liberally. This gradually induced others to adopt a similar practice; so that it is now become a general rule for medical professors to decline taking any fees when their assistance is necessary to a student. For this useful reform, with many others, the students of the university of Edinburgh are solely indebted to the liberality of Dr Cullen.

The first lectures which Cullen delivered in Edinburgh were on chemistry; and for many years he also gave clinical lectures on the cases which occurred in the royal infirmary. In the month of February 1763, Dr Alston died, after having begun his usual course of lectures on the materia medica; and the magistrates of Edinburgh, as patrons of that professorship in the university, appointed Dr Cullen to that chair, requesting that he would finish the course of lectures that had been begun for that season. This he agreed to do; and though he was under a necessity of going on with the course in a few days after he was nominated, he did not once think of reading the lectures of his predecessor, but resolved to deliver a new course entirely his own. The popularity of Cullen at this time may be guessed at by the increase of new students who came to attend his course in addition to the eight or ten who had already attended to Dr Alston. The new students exceeded 100. An imperfect copy of these lectures thus fabricated in haste, having been published, the doctor thought it necessary to give a more correct edition of them in the latter part of his life. But his faculties being then much impaired, his friends looked in vain for those striking beauties that characterized his literary exertions in the prime of life.

Some years afterwards, on the death of Dr White, the magistrates once more appointed Dr Cullen to give lectures on the theory of physic in his stead. And it was on that occasion Dr Cullen thought it expedient to resign the chemical chair in favour of Dr Black; his former pupil, whose talents in that department of science were then well known, and who filled the chair till his death with great satisfaction to the public. Soon after, on the death of Dr Rutherford, who for many years had given lectures with applause on the practice of physic, Dr John Gregory (whose name can never be mentioned by any one who had the pleasure of his acquaintance without the warmest tribute of a grateful respect) having become a candidate for this place along with Dr Cullen, a sort of compromise took place between them,
by which they agreed each to give lectures alternately on the theory and on the practice of physic during their joint lives, the longest survivor being allowed to hold either of the classes he should incline. In consequence of this agreement, Dr. Cullen delivered the first course of lectures on the practice of physic in winter 1765, and Dr. Gregory succeeded him in that branch the following year. Never perhaps did a literary arrangement take place that could have proved more beneficial to the students than this. Both these men possessed great talents, though of a kind extremely dissimilar. Both of them had certain failings or defects, which the other was aware of, and counteracted. Each of them knew and respected the talents of the other. They co-operated, therefore, in the happiest manner, to enlarge the understanding, and to forward the pursuits of their pupils. Unfortunately this arrangement was soon destroyed by the unexpected death of Dr. Gregory, who was cut off in the flower of life by a sudden and unforeseen event. After this time, Cullen continued to give lectures on the practice of physic till a few months before his death, which happened on the 5th of February 1792, in the 77th year of his age.

In drawing the character of Dr. Cullen, his biographer, Dr. Anderson observes, that in scientific pursuits men may be arranged into two grand classes, which, though greatly different from each other in their extremes, yet approximate at times so near as to be blended indiscriminately together; those who possess a talent for detail, and those who are endowed with the faculty of arrangement. The first may be said to view objects individually as through a microscope. The field of vision is confined; but the objects included within that field, which must usually be considered singly and apart from all others, are seen with a wonderful degree of accuracy and distinctness. The other takes a sweeping view of the universe at large, considers every object he perceives, not individually, but as a part of one harmonious whole: His mind is therefore not so much employed in examining the separate parts of this individual object, as in tracing its relations, connections, and dependencies on those around it. Such was the turn of Cullen's mind. The talent for arrangement was that which peculiarly distinguished him from the ordinary class of mortals; and this talent he possessed perhaps in a more distinguished degree than any other person of the age in which he lived. Many persons exceeded him in the minute knowledge of particular departments, who, knowing this, naturally looked upon him as their inferior; but possessing not at the same time that glorious faculty, which "with an eye wide roaming, glances from the earth to heaven," or the charms which this talent can infuse into congenial minds, felt disgust at the pre-eminence he obtained, and astonishment at the means by which he obtained it. An Aristotle and a Bacon have had their talents in like manner appreciated; and many are the persons who can neither be exalted to sublime ideas with Homer, nor ravished with the natural touches of a Shakespeare. Such things are wisely ordered, that every department in the universe may be properly filled by those who have talents exactly suited to the task assigned them by heaven.

Had Cullen, however, possessed the talents for arrangement alone, small would have been his title to that high degree of applause he has attained. Without a knowledge of facts, a talent for arrangement produces nothing but chimeras; without materials to work upon, the structures which an overheated imagination may rear up are merely "the baseless fabric of a vision." No man was more sensitive of the justness of this remark than Dr. Cullen, and few were at greater pains to avoid it. His whole life, indeed, was employed, almost without interruption, in collecting facts. Whether he was reading, or walking, or conversing, these were continually falling into his way. With the keen perception of an eagle, he marked them at the first glance; and without stopping at the time to examine them, they were stored up in his memory, to be drawn forth as occasion required, to be confronted with other facts that had been obtained after the same manner, and to have their truth ascertained, or their falsity proved by the evidence which should appear when carefully examined at the impartial bar of justice. Without a memory retentive in a singular degree, this could not have been done; but so very extraordinary was Dr. Cullen's memory, that till towards the very decline of life, there was scarcely a fact that had ever occurred to him which he could not readily recollect, with all its concomitant circumstances, whenever he had occasion to refer to it. It was this faculty which so much abridged his labour in study, and enabled him so happily to avail himself of the labour of others in all his literary speculations. He often reaped more by the conversation of an hour than another man would have done in whole weeks of laborious study.

In his prelections, Dr. Cullen never attempted to read. His lectures were delivered *viva voce*, without having been previously put into writing, or thrown into any particular arrangement. The vigour of his mind was such, that nothing more was necessary than a few short notes before him, merely to prevent him from varying from the general order he had been accustomed to observe. This gave to his discourses an ease, a vivacity, a variety, and a force, that are rarely to be met with in academical discourses. His lectures, by consequence, upon the same subject, were never exactly the same. Their general tenor indeed was not much varied; but the particular illustrations were always new, well suited to the circumstances that attracted the general attention of the day, and were delivered in the particular way that accorded with the cast of mind the preacher found himself in at the time. To these circumstances must be ascribed that energetic artless eloquence, which rendered his lectures so generally captivating to his hearers. Even those who could not follow him in those extensive views his penetrating mind glanced at, or who were not able to understand those apt allusions to collateral objects which he could only rapidly point at as he went along, could not help being warmed in some measure by the vivacity of his manner. But to those who could follow him in his rapid career, the ideas he suggested were so numerous, the views he laid open were so extensive, and the objects to be attained were so important—that every active faculty of the mind was roused; and such an ardour of enthusiasm was excited in the prosecution of study, as appeared to be perfectly inapplicable to those who were merely unconcerned spectators. In consequence of this unshackled freedom in the composition and delivery of his lectures,
tires, every circumstance was in the nicest unison with the tone of voice and expression of countenance, which the particular cast of mind he was in at the time inspired. Was he joyous, all the figures introduced for illustration were fitted to excite hilarity, and good humour: was he grave, the objects brought under view were of a nature more solemn and grand: and was he peevish, there was a peculiarity of manner in thought, in word, and in action, which produced a most striking and interesting effect. The lanquor of a nerveless uniformity was never experienced, nor did an abortive attempt to excite emotions that the speaker himself could not at the time feel, ever produce those discordant ideas which prove disgusting and unplesing.

It would seem as if Dr Cullen had considered the proper business of a preceptor to be that of putting his pupils into a proper train of study, so as to enable them to prosecute those studies at a future period, and to carry them on much farther than the short time allowed for academical prelections would admit. He did not, therefore, so much strive to make those who attended his lectures deeply versed in the particular details of objects, as to give them a general view of the whole subject; to shew what had been already attained respecting it; to point out what remained yet to be discovered; and to put them into a train of study that should enable them at a future period, to remove those difficulties that had hitherto obstructed our progress, and thus to advance themselves to further and further degrees of perfection. If these were his views, nothing could be more happily adapted to them than the mode he invariably pursued. He first drew, with the striking touches of a master, a rapid and general outline of the subject, by which the whole figure was seen at once to start boldly from the canvas, distinct in all its parts, and unmixed with any other object. He then began anew to retrace the picture, to touch up the lesser parts, and to finish the whole in so perfect a manner as the state of our knowledge at the time would permit. Where materials were wanting, the picture the more continued to remain imperfect. The wants were thus rendered obvious; and the means of supplying these were pointed out with the most careful discrimination. The student whenever he looked back to the subject, perceived the defects; and his hopes being awakened, he felt an irresistible impulse to explore that hitherto untrodden path which had been pointed out to him, and fill up the chasm which still remained. Thus were the active faculties of the mind most powerfully excited; and instead of labouring himself to supply deficiencies that far exceeded the power of any one man to accomplish, he set thousands at work to fulfil the task, and put them into a train of going on with it.

It was to these talents, and to this mode of applying them, that Dr Cullen owed his celebrity as a professor; and it was in this manner that he has perhaps done more towards the advancement of science than any other man of his time, though many individuals might perhaps be found who were more deeply versed in the particular departments he taught than he himself was.

Dr Cullen's external appearance, though striking and not displeasing, was not elegant. He had an expressive countenance and a lively eye. In his person he was tall and thin, stooping much about the shoulders; and when he walked he had a contemplative look, seemingly regarding little the objects around him. According to the observation of one who was well acquainted with the character of Cullen, he was eminently distinguished as a professor for three things. "The energy of his mind, by which he viewed every subject with ardour, and combined it immediately with the whole of his knowledge. "The scientific arrangement which he gave to his subject, by which there was a lucidus ordo to the dullest scholar. He was the first person in this country who made chemistry cease to be a chaos. "A wonderful art of interesting the students in every thing which he taught, and of raising an emotative enthusiasm among them." Life of Dr Cullen, by Dr Anderson, in the Bee.

CULLODEN, a place in Scotland within two miles of Inverness, chiefly remarkable for a complete victory gained over the rebels on the 16th of April 1746. That day the royal army, commanded by the duke of Cumberland, began their march from Nairn, formed into five lines of three battalions each; headed by Major-general Huske on the left, Lord Sempill on the right, and Brigadier Mordaunt in the centre; flanked by the horse under the generals Hawley and Bland, who at the same time covered the cannon on the right and left. In this order they marched about eight miles, when a detachment of Kingston's horse, and of the Highlanders, having advanced before the rest of the army, discovered the van of the rebels commanded by the young Pretender. Both armies immediately formed in the order and numbers shown in the annexed scheme.

About two in the afternoon the rebels began to cannonade the king's army; but their artillery being ill served, did little execution; while the fire from their enemies was severely felt, and occasioned great disorder. The rebels then made a push at the right of the royal army, in order to draw the troops forward; but finding themselves disappointed, they turned their whole force on the left; falling chiefly on Barroll's and Munro's regiments, where they attempted to flank the king's front line. But this design also was defeated by the advancing of Wolfe's regiment, while in the mean time the cannon kept playing upon them with cartridge-shot. General Hawley, with some Highlanders, had opened a passage through some stone walls to the right for the horse which advanced on that side; while the horse on the king's right wheeled off upon their left, dispersed their body of reserve, and met in the centre of their front line in their rear; when being repulsed in the front, and great numbers of them cut off, the rebels fell into very great confusion. A dreadful carnage was made by the cavalry on their backs; however, some part of the foot still preserved their order; but Kingston's horse, from the reserve, galloped up briskly, and falling upon the fugitives, did terrible execution. A total defeat instantly took place, with the loss of 2500 killed, wounded, and prisoners, on the part of the rebels, while the royalists lost not above 200. The young Pretender had his horse shot under him during the engagement; and after the battle retired to the house
CULM, or CULMUS, among botanists, a straw or haulm; defined by Linnaeus to be the proper trunk of the grasses, which elevates the leaves, flower, and fruit.

This sort of trunk is tubular or hollow, and has frequently knots or joints distributed at proper distances through its whole length. The leaves are long, sleek, and placed either near the roots in great numbers, or proceed singly from the different joints of the stalk, which they embrace at the base, like a sheath or glove.

The haulm is commonly garnished with leaves; sometimes, however, it is naked; that is, devoid of leaves, as in a few species of cypress-grass. Most grasses have a round cylindrical stalk; in some species of Schenius, scirpus, cypress-grass, and others, it is triangular.

The stalk is sometimes entire, that is, has no branches; sometimes branching, as in Schenius aculeatus et copensis; and not seldom consists of a number of scales which lie over each other like tiles.

Lastly, in a few grasses the stalk is not interrupted with joints, as in the greater part. The space contained between every two knots or joints, is termed by botanists internodium and articulus culmi.

This species of trunk often affords certain marks of distinction in discriminating the species. Thus, in the genus eriocaule, the species are scarce to be distinguished.

THE REBEL ARMY.
CULM, [13] CUN

CUM, CUMBERLAND.

CULM, guished but by the angles of the culms or stalks. These in some species are in number 5, in others 6, and in others 10. CULMIFEROUS PLANTS, (from culmos, a straw or haunum): plants so called, which have a smooth jointed stalk, usually hollow, and wrapped about at each joint with single, narrow, sharp-pointed leaves, and the seeds contained in shaly husks; such as oats, wheat, barley, rye, and the other plants of the natural family of the GRASSES.

CULMINATION, in Astronomy, the passage of any heavenly body over the meridian, or its greatest altitude for that day.

CULPRIT, a term used by the clerk of the arrangements, when a person is indicted for a criminal matter. See PLEA TO INDICTMENT, par. 11.

CULROSS, a royal borough town in Scotland, situated on the river Forth, about 23 miles north-west of Edinburgh. Here is a magnificent house, which was built about the year 1590 by Edward Lord Kinloss, better known in England by the name of Lord Bruce, slain in the noted duel between him and Sir Edward Sackville. Some poor remains of the Cistercian abbey are still to be seen here, founded by Malcolm earl of Fife in 1217. The church was jointly dedicated to the Virgin and St Serf confessor. The revenue at the dissolution was 768 pounds Scots, besides the rents paid in kind. The number of monks, exclusive of the abbot, was nine. Population 1611 in 1811. W. Long. 5° 34'. N. Lat. 56° 8'.

CULVERIN, a long slender piece of ordnance or artillery, serving to carry a ball to a great distance. Manage derives the word from the Latin colubrina; others from coluber, "snake;" either on account of the length and slenderness of the piece, or of the ravages it makes.

There are three kinds of culverins, viz. the extraordinary, the ordinary, and the least sized. 1. The culverin extraordinary has 5½ inches bore; its length 32 calibers, or 13 feet; weighs 4800 pounds; its load above 12 pounds; carries a shot 5¾ inches diameter, weighing 20 pounds weight. 2. The ordinary culverin is 12 feet long; carries a ball of 17 pounds 5 ounces; caliber 5½ inches; its weight 4000 pounds.

3. The culverin of the least size, has its diameter 5½ inches; is 12 feet long; weighing about 4000 pounds; carries a shot 3¾ inches diameter, weighing 14 pounds 9 ounces.

CULVERTAILED, among shipwrights, signifies the fastening or letting of one timber into another, so that they cannot slip out, as the corlings into the beams of a ship.

CUMA, or CUMḨ, in Ancient Geography, a town of ÑEOLIA in Asia Minor. The inhabitants have been accused of stupidity for not laying a tax upon all the goods which entered their harbour during 300 years. They were called Cumiani.

CUM/E, or CUMA, in Ancient Geography, a city of Campania near Puteoli, founded by a colony from Chalcis and Cume of Ñeolia before the Trojan war. The inhabitants were called Cumiani. One of the Sibyls fixed her residence in a cave in the neighbourhood, and was called the Cumean Sibyl.

CUMBERLAND, CUMRIA, so denominated from the Cumbri, or Britons, who inhabited it; one of the most northerly counties in England. It was formerly a kingdom, extending from the vallum of Adrian to the city of Dumbrinton, now Dumfrieston on the fringe of Clyde in Scotland. At present it is a county of England, which gives the title of duke to one of the royal family, and sends two members to parliament. It is bounded on the north and north-west by Scotland; on the south and south-east by part of Lancashire and Westmoreland: it borders on the east with Northumberland and Durham; and on the west is washed by the Irish sea. Its extreme length is 72 miles, its greatest breadth 38, and it incloses an area of 1516 square miles, or 970,240 acres. It is well watered with rivers, lakes, and fountains; but none of its streams are navigable. In some places there are very high mountains, and the climate is moist, as in all hilly countries. The soil varies with the face of the country; being barren on the moors and mountains, but fertile in the valleys and level ground bordering on the sea. In general, the eastern parts of the shire are barren and desolate: yet even the least fertile parts are rich in metals and minerals. The mountains of Copland contain copper, though now little worked. Veins of the same metal, with a mixture of gold and silver, were found in the reign of Queen Elizabeth among the fells of Derwent; and royal mines were formerly wrought at Keswick. The county produces great quantities of coal; it abounds with lead mines, has a mine of black lead, and several mines of lapis calaminaris. The population in 1811 was 133,744. See CUMBERLAND, SUPPLEMENT.

CUMBERLAND, Richard, a learned English divine in the end of the 17th century, was son of a citizen of London, and educated at Cambridge. In 1672 he published a Treatise of the Laws of Nature; and in 1686, An Essay toward the Jewish Weights and Measures. After the Revolution he was nominated by King William to the bishopric of Peterborough. He wrote on history, chronology, and philosophy; and was as remarkable for humility of mind, benevolence of temper, and innocence of life, as for his extensive learning. He died in 1718.

CUMBRAY, GREAT and LITTLE, two islands in the frith of Clyde, in Scotland. The first is about six miles in circumference, and lies between the island of Bute and the coast of Ayrshire. The other is of smaller extent, and has a light-house.

CUMINUM, CUMIN; a genus of plants belonging to the pentandria class; and in the natural method ranking under the 4th order, umbellatae. See BOTANY INDEX.

CUNJEUS, Peter, born in Zeland in 1586, was distinguished by his knowledge in the learned languages, and his skill in the Jewish antiquities. He also studied law, which he taught at Leyden in 1615; and read politics there till his death in 1638. His principal work is a treatise, in Latin, on the republic of the Hebrews.

CUNEIFORM, in general, an appellation given to any body having the shape of a wedge.

CUNEIFORM BONE, in Anatomy, the seventh bone of the cranium, called also os basilare, and os sphenoides. See ANATOMY INDEX.

CUNEUS, in antiquity, a company of infantry drawn...
CUN [ 14 ]

Lord Lorne, at the time he was under the tuition of Mr Cunningham, though not seventeen years of age, was colonel of a regiment, which his father, the earl of Argyle, had raised for his majesty's service in Flanders. Mr Cunningham's connection with the duke of Argyle, with whom he had the honour of maintaining an intimacy as long as he lived, together with the opportunities he enjoyed of learning, in his travels, what may be called military geography, naturally tended to qualify him for writing on military affairs.

Mr Cunningham, both when he travelled with the nobleman above mentioned, and on other occasions, was employed by the English ministry in transmitting secret intelligence to them on the most important subjects. He was also, on sundry occasions, employed by the generals of the confederate armies, to carry intelligence, and to make representations to the court of Britain. In Carstaires's State Papers, published by Dr Macornick, principal of the United College of St Andrew's, in 1774, there are two letters from our author, dated Paris the 22d and 26th of August 1701, giving an account of his conferences with the marquis de Torcy, the French minister, relative to the Scots trade with France. This commercial negotiation, from the tenor of Cunningham's letters compared with his history, appears to have been only the ostensible object of his attention: for he sent an exact account to King William, with whom he was personally acquainted, of the military preparations throughout all France.

Mr Cunningham's political friends, Argyle, Sunderland, Sir Robert Walpole, &c. on the accession of George I. sent him as British envoy to the republic of Venice. He arrived in that city in 1715; and continued there, in the character of resident, till the year 1720, when he returned again to London. He lived many years after, which he seems chiefly to have passed in a studious retirement. In 1735, he was visited in London by Lord Hyndford, by the direction of his lordship's father, to whom he had been tutor, when he appeared to be very old. He seems to have lived about two years after: for the body of an Alexander Cunningham lies interred in the vicar chancel of St Martin's church, who died in the 83d year of his age, on the 15th day of May 1737; and who was probably the same person.

His "History of Great Britain, from the revolution in 1688 to the accession of George I." was published in two volumes 4to, in 1787. It was written by Mr Cunningham in Latin, but was translated into English by the reverend William Thomson, L.L.D. The original manuscript came into the possession of the reverend Dr Hollingbery, archdeacon of Chichester, some of whose relations had been connected with the author. He communicated it to the earl of Hardwicke, and to the reverend Dr Douglas, now bishop of Carlinie, both of whom recommended the publication. In a short preface to the work, the archdeacon says, "My first design was to have produced it in the original; but knowing how few are sufficiently learned to understand, and how many are indisposed to read two quarto volumes in Latin, however interesting and entertaining the subject may be, I altered my purpose, and intended to have sent it into the world in a translation.
A nervous fever depriving me of the power, defeated the scheme. But he afterwards transferred the undertaking to Dr Thomson; and Dr Hollingberry observes, that Dr Thomson "has expressed the sense of the author with fidelity." The work was undoubtedly well deserving of publication. It contains the history of a very interesting period, written by a man who had a considerable degree of authentic information, and his book contains many curious particulars not to be found in other histories. His characters are often drawn with judgment and impartiality; at other times they are somewhat tinted with prejudice. This is particularly the case with respect to Bishop Burnet, against whom he appears to have conceived a strong personal dislike. But he was manifestly a very attentive observer of the transactions of his own time; his work contains many just political remarks; and the facts which he relates are exhibited with great perspicuity, and often with much animation. Throughout his book he frequently intersperses some account of the literature, and of the most eminent persons of the age concerning which he writes; and he has also adorned his work with many allusions to the classics and to ancient history.

Alexander Cunningham, the author of the History of Great Britain, has been supposed to be the same person with Alexander Cunningham who published an edition of Horace at the Hague, in two volumes 8vo, in 1721, which is highly esteemed. But from the best information we have been able to collect, they were certainly different persons; though they were both of the same name, lived at the same time, had both been travelling tutors, were both said to have been eminent for their skill at the game of chess, and both lived to a very advanced age. The editor of Horace is generally said to have died in Holland, where he taught both the civil and canon laws, and where he had collected a very large library, which was sold in that country.

CUNNUS, in Anatomy, the pudendum muscibre, or the anterior parts of the genitals of a woman, including the labia pudendae and mons veneris. See Anatomy, No. 198.

CUNOCEPHALI, in Mythology, (from κούς, "dog," and κεφαλή, "head") a kind of baboons, or animals with heads like those of dogs, which were wonderfully endowed, and were preserved with great veneration by the Egyptians in many of their temples. It is related, that by their assistance the Egyptians found out the particular periods of the sun and moon; and that one half of the animal was often buried, while the other half survived: and that they could read and write. This strange history, Dr Bryant imagines, relates to the priests of Egypt, styled cahen, to the novices in their temples, and to the examinations they were obliged to undergo, before they could be admitted to the priesthood. The Egyptian colleges were situated upon rocks or hills, called caph, and from their consecration to the sun, caph-el: whence the Greeks deduced κεφαλή, and from cahen-caph-el they formed κουςκεφαλή. So that cahen-caph-el was some royal seminary in Upper Egypt, whence they draughted novices to supply their colleges and temples, by this ephoracy he explains the above history. The CUNUS is part of a plant, while the other survived, denoted the regular succession of the Egyptian priesthood. The cunocephalai are also found in India and other parts of the world. These and the cenocephali were thus denominated from their place of residence and from their worship.

CUNOONTES, a people mentioned by Solinus and Isidorus, and by them supposed to have the teeth of dogs. They were probably denominated, says Dr Bryant, from the object of their worship, the deity Chan-Adon, which the Greeks expressed Κανον, and thence called his votaries Cunoontes.

CUNONIA, a genus of plants belonging to the decandria class; and in the natural method ranking with those of which the order is doubtful. See Botany Index.

CUOGOLO, in Natural History, the name of a stone much used by the Venetians in glass-making, and found in the river Tesino. It is a small stone of an impure white, of a shatter texture, and is of the shape of a pebble.

CUP, a vessel of capacity of various forms and materials, chiefly to drink out of. In the Ephem. German, we have a description of a cup made of a common pepper-corn by Oswald Nerlinger, which holds 1200 other ivory cups, having each its several handle, all gilt on the edges; with room for 400 more.

CUP, in Botany. See Calyx, Botany Index.

Cup-Galle, in Natural History, a name given by authors to a very singular kind of galle, found on the leaves of the oak and some other trees. They are of the figure of a cup, or drinking-glass without its foot, being regular cones adhering by their point or apex to the leaf; and the top or broad part is hollowed a little way, so that it appears like a drinking-glass with a cover, which was made so small as not to close it at the mouth, but fall a little way into it. This cover is flat, and has in the centre a very small protuberance, resembling the nipple of a woman's breast. This is of a pale green, as is also the whole of the gall, excepting only its rim that runs round the top: this is of a scarlet colour, and that very beautiful. Besides this species of gall, the oak leaves furnish us with several others, some of which are oblong, some round and others flattened; these are of various sizes, and appear on the leaves at various seasons of the year. They all contain the worm of some small fly; and this creature passes all its changes in this its habitation, being sometimes found in the worm, sometimes in the nymph, and sometimes in the fly state, in the cavity of it.

CUPANIA, in Botany, a genus of plants belonging to the monoeica class; and in the natural method ranking under the 39th order, Tricoca. See Botany Index.

CUPEL, in Metallurgy, a small vessel which absorbs metallic bodies when changed by fire into a fluid scoria; but retains them as long as they continue in their metallic state. One of the most proper materials for making a vessel of this kind is the ashes of animal bones; there is scarcely any other substance which so strongly resists vehement fire, which so readily imbibles metallic scoria, and which is so little disposed to be vitriified by them. In want of these, some make a vessel.
C U P

use of vegetable ashes, freed by boiling in water from their saline matter, which would cause them to melt in the fire.

The bones, burnt to perfect whiteness, so that no particle of coaly or inflammable matter may remain in them, and well washed from filth, are ground into moderately fine powder; which in order to its being formed into cupels, is moistened with just as much water as is sufficient to make it hold together when strongly pressed between the fingers; some direct glutinous liquids, as whites of eggs or gum-water, in order to give the powder a greater tenacity: but the inflammable matter, however small in quantity, which accompanies these fluids, and cannot be easily burnt out from the internal part of the mass, is apt to revive a part of the metallic scoria that has been absorbed, and to occasion the vessel to burst or crack. The cupel is formed in a brass ring, from three quarters of an inch to two inches diameter, and not quite so deep, placed upon some smooth support: the ring being filled with moistened powder, which is pressed close with the fingers; a round-faced pestle, called a monk, is struck down into it with a few blows of a mallet, by which the mass is made to cohere, and rendered sufficiently compact, and a shallow cavity formed in the middle: the figure of the cavity is nearly that of a sphere, that a small quantity of metal melted in it may run together into one bead. To make the cavity the smoother, a little of the same kind of ashes levigated into an impalpable powder, and not moistened, is commonly sprinkled on the surface, through a small fine sieve made for this purpose, and the monk again struck down upon it. The ring or mould is a little narrower at bottom than at top; so that by pressing it down on some of the dry powder, spread upon a table, the cupel is loosened, and forced upwards a little; after which it is easily pushed out with the finger; and is then set to dry in a warm place free from dust.

CUPELLATION, the act of refining gold or silver by means of a cupel. For this purpose another vessel, called a muffle, is made use of, within which one or more cupels are placed. The muffle is placed upon a grate in a proper furnace, with its mouth facing the door, and as close to it as may be. The furnace being filled up with fuel, some lighted charcoal is thrown on the top, and what fuel is afterwards necessary is supplied through a door above. The cupels are set in the muffle; and being gradually heated by the successive kindling of the fuel, they are kept red hot for some time, that the moisture which they strongly retain may be completely dissipated: for if any vapours should issue from them after the metal is put in, they would occasion it to sputter, and a part of it to be blown off in little drops. In the sides of the muffle are some perpendicular slits, with a knob over the top of each, to prevent any small pieces of coals or ashes from falling in. The door, or some apertures made in it, being kept open, for the inspection of the cupels, fresh air enters into the muffle, and passes off through these slits: by laying some burning charcoal on an iron plate before the door, the air is heated before its admission; and by removing the charcoal or supplying more, the heat in the cavity of the muffle may be somewhat diminished or increased more speedily than can be effected by suppressing or exciting the fire in the furnace on the outside of the muffle. The renewal of the air is also necessary for promoting the scorification of the lead.

The cupel being of a full red heat, the lead cast into a smooth bullet, that it may not scratch or injure the surface, is laid lightly in the cavity; it immediately melts; and then the gold or silver to be cupelled is cautiously introduced either by means of a small iron ladle, or by wrapping them in paper, and dropping them on the lead with a pair of tongs. The quantity of lead should be at least three or four times that of the fine metal; but when gold is very impure, it requires 10 or 12 times its quantity of lead for cupellation. It is reckoned that copper requires for its scorification about 10 times its weight of lead: that when copper and gold are mixed in equal quantities, the copper is so much defended by the gold, as not to be separable with less than 20 times its weight of lead; and that when copper is in very small proportion, as a 20th or 30th part of the gold or silver, upwards of 60 parts of lead are necessary for one of the copper.

The cupel must always weigh at least half as much as the lead and copper; for otherwise it would not be sufficient for receiving half the scoria; there is little danger, however, of cupels being made too small for the quantity of a gold assay.

The mixture being brought into thin fusion, the heat is to be regulated according to the appearances; and in this consists the principal nicety in the operation. If a various coloured skin rises to the top, which liquefying, runs off to the sides, and is there absorbed by the cupel, visibly staining the parts it enters; if a fresh scoria continually succeeds, and is absorbed nearly as fast as it is formed, only a fine circle of it remaining round the edge of the metal; if the lead appears in gentle motion, and throws up a fume a little way from the surface; the fire is of the proper degree, and the process goes on successfully.

Such a fiery brightness of the cupel as prevents its colour from being distinguished, and the fumes of the lead rising up almost to the arch of the muffle, are marks of too strong a heat; though it must be observed, that the elevation of the fumes is not always in proportion to the degree of heat; for if the heat greatly exceeds the due limits, both the fumes and ebullition will entirely cease. In these circumstances the fire must necessarily be diminished: for while the lead boils and smokes vehemently, its fumes are apt to carry off some part of the gold; the cupel is liable to crack from the hasty absorption of the scoria, and part of the gold and silver is divided into globules, which lying discontinued on the cupel after the process is finished, cannot easily be collected; if there is no ebullition or fumes, the scorification does not appear to go on. Too weak a heat is known by the dull redness of the cupel; by the fume not rising from the surface of the lead; and the scoria like bright drops in languid motion, or accumulated, or growing consistent all over the metal. The form of the surface affords also an useful mark of the degree of heat; the stronger the fire, the more convex is the surface; and the weaker, the more flat: in this point, however, regard must be had to the quantity of metal; a large quantity being always flatter than a small one in an equal fire.
Towards the end of the process, the fire must be increased; for the greatest part of the fusible metal lead being now worked off, the gold and silver will not continue melted in the heat that was sufficient before. As the last remains of the lead are separating, the rainbow colours on the surface become more vivid, and variously intersect one another with quick motions. Soon after, disappearing all at once, a sudden luminous brightness of the button of gold and silver shows the process to be finished. The cupel is then drawn forwards towards the mouth of the muffle; and the button, as soon as grown fully solid, taken out.

**CUPELLING FURNACE.** See Cupelling Furnace.

Cupid, in Pagan mythology, the god of love. There seems to have been two Cupids; one the son of Jupiter and Venus, whose delight it was to raise sentiments of love and virtue; and the other the son of Mars and the same goddess, who inspired base and impure desires. The first of these, called Eros, or true love, bore golden arrows, which caused real joy, and a virtuous affection; the other, called Anteros, had leaden arrows, that raised a passion founded only on desire, which ended in satiety and disgust. Cupid was always drawn with wings, to represent his inconstancy; and naked, to shew that he has nothing of his own. He was painted blind, to denote that love sees no fault in the object beloved; and with a bow and quiver of arrows, to show his power over the mind. Sometimes he is placed between Hercules and Mercury, to show the prevalence of eloquence and valour in love; and at others is placed near Fortune, to signify that the success of lovers depends on that inconstant goddess. Sometimes he is represented with a helmet on his head and a spear on his shoulder, to signify that love disarms the fiercest men; he rides upon the backs of panthers and lions, and uses their manes for a bridle, to denote that love tames the most savage beasts. He is likewise pictured riding upon a dolphin, to signify that his empire extends over the sea no less than the land.

**CUPOLA,** in Architecture, a spherical vault, or the round top of the dome of a church, in the form of a cup inverted.

Cupping, in Surgery, the operation of applying cupping-glasses for the discharge of blood and other humours by the skin. See Surgery.

Cupressus, the Cypress Tree, a genus of plants belonging to the monoeica class; and in the natural method ranking under the 51st order, Coniferae. See Botany Index.

The wood of the *Cupressus*, or evergreen cypress, is said to resist worms, moths, and putrefaction, and to last many centuries. The coffins in which the Athenians were wont to bury their heroes, were made, says Thucydides, of this wood; as were likewise the chests containing the Egyptian mummies. The doors of St Peter’s church at Rome were originally of the same materials. These, after lasting upwards of 600 years, at the end of which they did not discover the smallest tendency to corruption, were removed by order of Pope Eugenius IV, and gates of brass substituted in their place. The same tree is by many eminent authors recommended as improving and meliorating the air by its balsamic and aromatic exhalations; upon

CUPRUM AMMONIAE. See Chemistry Index. This preparation is recommended in some kinds of spasmodic diseases, given in the dose of one or two grinds.

Cuprum, or Copper. See Copper, Chemistry Index.

Curacao, or Curassow, one of the larger Antilles islands, formerly subject to the Dutch; situated in W. Long. 68° 30’ N. Lat. 12° 30’. This island is little else than a bare rock, about ten leagues long and five broad; lying three leagues off the coast of Venezuela. It has an excellent harbour, but the entrance is difficult. The bason is extremely large, and convenient in every respect; and is defended by a fort skillfully constructed, and always kept in repair. The reason of forming a settlement upon this barren spot, was to carry on a contraband trade with the Spanish colonies on the continent; but after some time the method of managing this trade was changed. Curassow itself became an immense magazine, to which the Spaniards resorted in their boats to exchange gold, silver, vallita, cocoa, cochineal, bark, skins, and mules, for negroes, linen, silks, India stuffs, spices, laces, ribbands, quicksilver, steel, and iron-ware. These voyages, though continual, did not prevent a number of Dutch sloops from passing from Curassow to the continent. But the modern substitution of register-ships, instead of galleons, has made this communication less frequent; but it will be revived whenever, by the intervention of war, the communication with the Spanish Main shall be cut off. The disputes between the courts of London and Versailles also prove favourable to the trade of Curassow. At these times it furnishes provisions to the southern parts of St Domingo, and takes off all its produce. Even the French privateers, from the windward islands, repair in great numbers to Curassow, notwithstanding the distance. The reason is, that they find there all kinds of necessary stores for their vessels; and frequently Spanish, but always European goods, which are universally used. Every commodity without exception, that is landed at Curassow, pays one per cent. port-duty. Dutch goods are never taxed higher; but those that are shipped from other European ports pay nine per cent. more. Foreign coffee is subject to the same tax, in order to promote the sale of that of Surinam. Every other production of America is subject only to a payment of three per cent. but with an express stipulation, that they are to be conveyed directly to some port belonging to the republic. This island is now in possession of Great Britain.

Curate, the lowest degree in the church of England;
CURCASES, a name given in Egypt to an esculent root, approaching to the taste and virtues of the colocasia. It is also a name used in Malabar for a small fruit of the shape and size of a hazel nut. Both these things have the credit of being strong provocatives: and it is very probable that the curcas of the East Indies may be the fruit called bell by Avicenna, and said to possess the same virtues. Gracius has been led into a very great error by this similarity of names and virtues; and supposes the curcas of Egypt the same with that of the East Indies.

CURCULIO, a genus of insects belonging to the order of coleoptera. See Entomology Index.

CURCUMA, TURMERIC, a genus of plants belonging to the monandria class; and in the natural method ranking under the 8th order, Scitaminae. See Botany Index.

CURDISTAN, a country of Asia, situated between the Turkish empire and Persia, lying along the eastern bank of the river Tigri, and comprehending great part of the ancient Assyria. Some of the inhabitants live in towns and villages, and others rove from place to place, having tents like the wild Arabs, and are also robbers like them. Their religion is partly Christian, and partly Mahometanism.

CURDLING, the coagulating or fixing any fluid body; particularly milk. See Cheese, Agriculture Index.

Pausania says, that Aristaeus son of Apollo, and Cyrene, daughter of the river Peneus, were the first who found out the secret of curdling milk.

At Florence they curdle their milk for the making of cheese with arctichoke flowers, in lieu of the rennet used for the same purpose among us.

The Bisaltes, a people of Macedonia, Rochfort observes, live wholly upon curdled milk, i.e. on curds. He adds, that curds are the whole food of the people of Upper Auvergne in France, and whey their only drink.

CURETES, in antiquity, a sort of priests or people of the isle of Crete, called also Corybantes. See Corybantes and Crete. The Curetes are said to have been originally of Mount Ida in Phrygia; for which reason they were also called Idae Dactylis. See Dactylus.

Lucian and Diodorus Siculus represent them as very expert in casting of darts; though other authors give them no weapons but bucklers and pikes; but all agree in furnishing them with tabors and castanettes: and relate, that they used to dance much to the noise and clashing thereof. By this noise, it is said, they prevented Saturn from hearing the cries of young Jupiter, whereby he was saved from being destroyed.

Some authors, however, give a different account of the Curetes. According to Poetron and others, the Curetes were, in the times of Saturn, &c. and in the countries of Crete and Phrygia, what the druids were afterwards among the Gauls, &c. i.e. they were priests who had the care of what related to religion and the worship of the gods. Hence, as in those days it was supposed there was no communication with the gods but by divinations, auguries, and the operations of magic, the Curetes passed for magicians and enchanters: to these they added the study of the stars, of nature,
Cursete, and poesy; and so were philosophers, astronomers, &c.

Vossius, de Idolat. distinguishes three kinds of Cursetes, those of Eetolia, those of Phrygia, and those of Crete, who were originally derived from the Phrygians. The first, he says, took their name from wigns, tonsure, in regard, from the time of a combat wherein the enemy seized their long hair, they always kept it cut. Those of Phrygia and Crete, he supposes, were so called from wigns, young man, in regard they were young, or because they nursed Jupiter when he was young.

CURFEU, CURFEW, or CURFEW, a signal given in cities taken in war, &c. to the inhabitants to go to bed. Pasquin says, it was so called, as being intended to advertise the people to secure themselves from the robberies and debaucheries of the night.

Curfew-Bell in French courfèfeu, and in law Latin of the middle ages, ignitgium, or pyritgium, was a signal for all persons to extinguish their fires. The most eminent curfew in England was that established by William the Conqueror, who appointed, under severe penalties, that, at the ringing of the bell at 8 o'clock in the evening, every one should put out their lights and fires and go to bed; whence to this day a bell rung about this time is called a curfew-bell. This law was abolished by Henry I. in 1100.

This practice was highly necessary to prevent accidents in those ages when the fires were placed in a hole in the middle of the floor, under an opening in the roof to allow the escape of the smoke. This hole was covered up when the family went to bed. The same practice still exists in some countries, particularly in some parts of Scotland. But besides securing houses against accidents by fire, the law which was very generally established in England for extinguishing or covering fires, was probably meant also to check the turbulence which frequently prevailed in the middle ages, by forcing the people to retire to rest, or to keep within doors. From this ancient practice, in the opinion of Beckmann, has arisen a custom in Lower Saxony of saying, when people wish to go home sooner than the company choose, that they hear the Bürgerglocke, the burgher's bell.

The ringing of the prayer bell, as it is called, which is still practised in some Protestant countries, according to Beckmann, originated in that of the curfew-bell. Pope John XXIII. dreading that some misfortunes were to befall him, ordered every person on hearing the ignitgium to repeat the Ave Maria three times, with a view to avert them. When the appearance of a comet, and a dread of the Turks, alarmed all Christendom, Pope Calixtus VIII. increased these periodical times of prayer, by ordering the prayer-bell to be rung also at noon. Hist. of Invent. ii. 101.

CURIA, in Roman antiquity, was used for the senate house. There were several curiae in Rome; as the curia calabra, said to be built by Romulus; the curia hostilia, by Tullus Hostilius; and the curia pompeia, by Pompey the Great.

Curia also denoted the places where the curia used to assemble. Each of the 30 curiae of old Rome had a temple or chapel assigned to them for the common performance of their sacrifices, and other offices of their religion; so that they were not unlike our parishes. Some remains of these little temples seem to have subsisted many ages after on the Palatine hill, where Romulus first built the city, and afterwards resided.

CURIA, among the Romans, also denoted a portion or division of a tribe. In the time of Romulus, a tribe consisted of ten curiae, or a thousand men; each curia being one hundred. That legislator made the first division of his people into thirty curiae. Afterwards curia, or domus curialis, became used for the place where each curia held its assemblies. Hence also curia passed to the senate-house; and it is from hence the moderns came to use the word curia, "court," for a place of justice, and for the judges, &c. there assembled.

Varro derives the word from cura, "care," q. d. an assembly of people charged with the care of public affairs. Others deduce it from the Greeks; maintaining, that at Athens they called wigns the place where the magistrate held his assaults, and the people used to assemble: wigns, again, may come from wigns, authority, power; because it was here the laws were made.

CURIA, in our ancient customs.—It was usual for the kings of England to summon the bishops, peers, and great men of the kingdom to some particular place, at the chief festivals in the year; and this assembly is called by our historians curia; because there they consulted about the weighty affairs of the nation; whence it was sometimes also called sollemnis curia, generalis curia, augustalis, and curia publica, &c. See WITENA-Mot.

CURIA Baronum. See COURT-BARON.

CURIA Claudenda, is a writ that lies against him who should fence and inclose the ground, but refuses or defers to do it.

CURIATII, three brothers of Alba, maintained the interest of their country against the Romans, who had declared war against those of Alba. The two armies being equal, three brothers on each side were chosen to decide the contest; the Curiiatii by those of Alba, and the Horatii by the Romans. The three first were wounded, and two of the latter killed; but the third joining policy to valour, ran away; and having thus tired the Curiiatii, he took them one after another, and killed them all three.

CURING, a term used for the preserving fish, flesh, and other animal substances, by means of certain additions of things, to prevent putrefaction. One great method of doing this is by exposing the bodies to the smoke of wood, or rubbing them with salt, nitre, &c.

CURIO, the chief and priest of a curia.—Romulus, upon dividing the people into curiae, gave each division a chief, who was to be priest of that curia, under the title of curio and stamen curialis. His business was to provide and officiate at the sacrifices of the curia, which were called curionia; the curia furnishing him with a sum of money on that consideration, which pension or appointment was called curionium. Each division had the election of its curia; but all these particular curiae were under the direction of a superior or general, called curio maximus, who was the head of the body, and elected by all the curiae assembled in the comitia curiales.

All these institutions were introduced by Romulus.
CURIOUSUS, an officer of the Roman empire during the middle age, appointed to take care that no frauds and irregularities were committed; particularly no abuses in what related to the posts, the roads, &c. and to give intelligence to the court of what passed in the provinces. This made the curious people of importuneness, and put them in a condition of doing more harm than they prevented; on which account, Honorius cautioned them, at least in some parts of the empire, anno 413.

The curious came pretty near to what we call controllers. They had their name from cura, "care;" quod curis agendi et exvectionibus cursum publici inspiciendi operam darent.

CURLEW. See SCOLOPAX,ORNITHOLOGY Index.

CURMI, a name given by the ancients to a sort of malt liquor or ale. It was made of barley, and was drunk by the people of many nations instead of wine, according to Dioscorides's account. He accuses it of causing pains in the head, generating bad juices, and disordersing the nervous system. He also says, that in the western part of Iberia, and in Britain, such a sort of liquor was in his time prepared from wheat instead of barley. See ALE.

CURNOCK, a measure of corn containing four bushels, or half a quarter.

CURRANTS, or currants, the fruit of a species of grossularia. See GROSSULARIA, BOTANY Index.

The white and red sort are mostly used; for the black, and chiefly the leaves, upon first coming out, are in use to flavour English spirits, and counterfeit French brandy. Currants greatly assuage drought, cool and fortify the stomach, and help digestion; and the jelly of black currants is said to be very efficacious in curing inflammations of the throat.

Currants also signify a smaller kind of grapes, brought principally from Zante and Cephalonia. They are gathered off the bushes, and laid to dry in the sun, and so put up in large butts. They are opening and pectoral; but are more used in the kitchen than in medicine.

CURRENT, or CURRENT, a term used to express the present time. Thus the year 1804 is the current year, the 20th current is the 20th day of the month now running. With regard to commerce, the price current of any merchandise is the known and ordinary price accustomed to be given for it. The term is also used for any thing that has course or is received in commerce; in which sense we say, current coin, &c.

Current, in Navigation, a certain progressive movement of the water of the sea, by which all bodies floating therein are compelled to alter their course or velocity, or both, and submit to the laws imposed on them by the current.

In the sea, currents are either natural and general, as arising from the diurnal rotation of the earth about its axis; or accidental and particular, caused by the waters being driven against promontories, or into gulfs and straits, where wanting room to spread, they are driven back, and thus disturb the ordinary flux of the sea. Currents are various, and directed towards different parts of the ocean, of which some are constant, others periodical. The most extraordinary current of the sea is that by which part of the Atlantic or African ocean moves about Guinea from Cape Verd towards the curvature or bay of Africa, which they call Fernando Po; viz. from west to east, contrary to the general motion: and such is the force of the current, that when ships approach too near the shore, it carries them violently towards that bay, and deceives the mariners in their reckoning. There is a variety of shifting currents, which do not last, but return at certain periods: and these do most of them, depend upon and follow the anniversary winds or monsoons, which by blowing in one place may cause a current in another. Varenius informs us, that at Java, in the straits of Sunda, when the monsoons blow from the west, viz. in the month of May, the currents set to the eastward, contrary to the general motion. Between the island of Celebes and Madura, when the western monsoons set in, viz. in December, January, and February, or when the winds blow from the north-west, or between the north and west, the currents set to the south-east, or between the south and east. At Ceylon, from the middle of March to October, the currents set to the southward, and in the other parts of the year to the northward: because at this time the southern monsoons blow, and at the other the northern. Between Cochín-China and Malacca, when the western monsoons blow, viz. from April to August, the currents set eastward against the general motion; but the rest of the year they set westward, the monsoon conspiring with the general motion. They run so strongly in these seas, that unexperienced sailors mistake them for waves that beat upon the rocks, known usually by the name of breakers. So for some months after the 1st of February, the currents set from the Maldive towards India on the east, against the general motion of the sea. On the shore of China and Cambodiæ, in the months of October, November, and December, the currents set to the north-west, and from January to the south-west, when they run with such rapidity about the shoals of Parcel, that they seem swifter than an arrow. At Pulo Condore, upon the coast of Cambodiæ, though the monsoons are shifting, yet the currents set strongly towards the east, even when they blow to a contrary point. Along the coasts of the bay of Bengal, as far as the Cape Homania, at the extreme point of Malacca, the current runs southward in November and December. When the monsoons blow from China to Malacca, the sea runs swiftly from Pulo Cambi to Pulo Condore on the coast of Cambodiæ. In the bay of Sans Bras, not far from the Cape of Good Hope, there is a current particularly remarkable, where the sea runs from east to west to the landward; and this more vehemently, as it is opposed by winds from a contrary direction. The cause is undoubtedly owing to some adjacent shore which is higher than this. In the straits of Gibraltar the currents almost constantly drive to the eastward, and carry ships into the Mediterranean; they are also found to drive the same way into St George's channel.

The setting or progressive motion of the current may be either quite down to the bottom, or to a certain determinate depth. As the knowledge of the direction and velocity of currents is a very material article
Currents in navigation, it is highly necessary to discover both, in order to ascertain the ship's situation and course with as much accuracy as possible. The most successful method which has been hitherto practised by mariners for this purpose, is as follows: A common iron-pot, which may contain four or five gallons, is suspended by a small rope, fastened to its ear or handles, so as to hang directly upright, as when placed upon the fire. This rope, which may be from 70 to 100 fathoms in length, being prepared for the experiment, is coiled in the boat, which is hoisted out of the ship at a proper opportunity, when there is little or no wind to ruffle the surface of the sea. The pot being then thrown overboard into the water, and immediately sinking, the line is slackened till about 70 or 80 fathoms of the line are run out; after which the line is fastened to the boat's stern, by which she is accordingly restrained and rides at an anchor. The velocity of the current is then easily tried by the log and half-minute glass, the usual method of discovering the rate of a ship's sailing at sea. The course of the stream is next obtained by the compass provided for this operation. Having thus found the setting and drift of the current, it next remains to apply this experiment to the purposes of navigation; for which see that article.

Under-currents, are distinct from the upper or apparent, and in different places set or drive a contrary way. Dr. Smith makes it highly probable, that in the Downs, in the straits of Gibraltar, &c. there is an under-current, whereby as much water is carried out as is brought in by the upper currents. This he argues from the offing between the North and South Foreland, where it runs tide and half-tide, i.e. it is ebb or flood in that part of the Downs three hours before it is so off the sea: a certain sign, that though the tide of flood runs aloft, yet the tide of ebb runs under-foot, i.e. close by the ground; and so at the tide of ebb it will flow underfoot. This he confirms by an experiment in the Baltic sound, communicated to him by an able seaman present at the making of it. Being there then with one of the king's frigates, they went with their pinnace into the mid-stream, and were carried violently by the current. Soon after that, they sunk a basket with a large cannon bullet to a certain depth of water, which gave a check to the boat's motion; and sinking it still lower and lower, the boat was driven a-head to the windward against the upper current, the current aloft not being above four or five fathom deep. He added, that the lower the basket was let down, the stronger the under-current was found.

From this principle, it is easy to account for that continual indrain of water out of the Atlantic into the Mediterranean through the straits of Gibraltar, a passage about 20 miles broad; yet without sensible rising of the water along the coasts of Barbary, &c. or any overflowing of the land, which there lies very low.—Dr. Halley, however, solves the currents setting in at the straits without overflowing the banks, by the great evaporation, without supposing any under current.

Curriculus, in our ancient writers, denotes the year or course of a year. Actum est hoc anno undecim Dominice incarnationis quater quinuagesem et quinquagia nona; et quinquagesimae sexta. In the year Curriculus 1028; for four times fifty make two hundred; and five times two hundred make one thousand; five lustres are twenty-five years; and three curriculi are three years.

Currie, James, an eminent Scotch physician. See Supplement.

Curriers, those who dress and colour leather after it comes from the tan-yard. See Tanning.

Currodrepanus, (formed of currus, "chariot," and dreepan, "scythe" or "sickle"), in antiquity, a kind of chariot armed with scythes. The driver of these chariots was obliged to ride on one of the horses, as there was no other seat for him; the usual place for him being all armed with knives, as was likewise the hinder part of the chariot. There were no scythes pointing down to the earth, either from the beam or axle-tree; but these were fixed at the head of the axle-tree in such a manner as to be moveable by means of a rope, and thereby could be raised or let down, and drawn forward or let fall backward.

Currying, the method of preparing leather with oil, tallow, &c. The chief business is to soften cow and calf-skins, which make the upper leather and quarters of shoes, covering of saddles, coaches, and other things which must keep out water. 1. These skins, after coming from the tanner's yard, having many fleshy fibres on them, the currier soaks them some time in common water. 2. He then takes them out, and stretches them on a very even wooden horse; then with a paring knife he scrapes off all the superfluous flesh, and puts them in to soak again. 3. He puts them wet on a hurdle, and tramples them with his heels till they begin to grow soft and pliant. 4. He soaks thereon train-oil, which by its unctional quality is the best liquor for this purpose. 5. He spreads them on large tables, and fastens them at the ends. There, with the help of an instrument called a mangle, which is a thick piece of wood, the under side of which is full of furrows crossing each other, he folds, squares, and moves them forwards and backwards several times, under the teeth of this instrument, which breaks their too great stiffness. This is what is properly called currying. The order and number of these operations is varied by different curriers, but the material part is always the same. 6. After the skins are curried, there may be occasion to colour them. The colours are black, white, red, yellow, green, &c.; the other colours are given by the skinners, who differ from curriers in this, that they apply their colours on the flesh side; the curriers on the hair side. In order to whiten skins, they are rubbed with lumps of chalk or white lead, and afterwards with pumice-stone. 7. When a skin is to be made black, after having oiled and dried it, he passes over it a puff dip in water impregnated with iron; and after his first wetting, he gives it another in water prepared with soot, vinegar, and gum. These different dyes last longer the skin is black, and the operations are repeated till it be of a shining black. The grain and wrinkles, which contribute to the suppleness of calves and cows leather, are made by the reiterated folds given to the skin in every direction, and by the care taken to scrape off all hard parts on the colour side.

Cursing and Swearing, an offence against God and religion, and a sin of all others the most extravagant.
travagant and unaccountable, as having no benefit or advantage attending it. By the last statute against this crime, 19 George II. which repels all former ones, every labourer, sailor, or soldier, profanely cursing or swearing, shall forfeit 2s.; every other person under the rank of a gentleman, 2s.; and every gentleman or person of superior rank, 5s. to the poor of the parish; and, on a second conviction, double; and, for every subsequent offence, treble the sum first forfeited, with all charges of conviction: and, in default of payment, shall be sent to the house of correction for ten days. Any justice of the peace may convict upon his own hearing, or the testimony of one witness; and any constable or peace officer, upon his own hearing, may secure any offender, and carry him before a justice, and there convict him. If the justice omits his duty, he forfeits 5l. and the constable 40s. And the act is to be read in all parish churches, and public chapels, the Sunday after every quarter day, on pain of 5l. to be levied by warrant from any justice. Besides this punishment for taking God’s name in vain in common discourse, it is enacted, by stat. 3 Jac. I. c. 21. that if in any stage-play, interlude, or show, the name of the Holy Trinity, or any of the persons therein, be jestingly or profanely used, the offender shall forfeit one moiety to the king, and the other to the informer.

CURTISOR, a clerk belonging to the court of chancery, whose business it is to make out original writs. In the stat. 18 Edw. III. they are called clerks of course, and are 24 in number, making a corporation of themselves. To each of them is allowed a division of certain counties, into which they issue out the original writs required by the subject.

CURTATE DISTANCE, in Astronomy, the distance of a planet from the sun to that point, where a perpendicular let fall from the planet meets with the ecliptic.

CURATION, in Astronomy, is the interval between a planet’s distance from the sun and the currate distance.

Cureyn, (Curtana), was the name of Edward the Confessor’s sword, which is the first sword carried before the kings of England at their coronation; and it is said the point of it is broken as an emblem of mercy.

Curtin, Curtain, or Courtin, in fortification, is that part of the rampart of a place which is betwixt the flanks of two bastions, bordered with a parapet five feet high, behind which the soldiers stand to fire upon the covered way and into the moat.

Curtius, Marcus, a Roman youth, who devoted himself to the gods manes for the safety of his country, about 360 years before the Augustan age. A wide gap had suddenly opened in the forum, and the oracle had said that it never would close before Rome threw into it whatever it had most precious. Curtius immediately perceived that no less than a human sacrifice was required. He armed himself, mounted his horse, and solemnly threw himself into the gulf, which instantly closed over his head.

Curtius, Quintus, a Latin historian, who wrote the life of Alexander the Great in 10 books, of which the two first are not indeed extant, but were so well supplied by Freimsmius, that the loss is scarcely regretted. Where this writer was born, or even when he lived, are points no one pretends to know. By his style he is supposed to have lived in or near the Augustan age; while some are not willing, who imagine the work to have been composed in Italy about 300 years ago, and the name of Quintus Curtius to be fictitiously added to it. Cardinal du Perron was so great an admirer of this work, as to declare one page of it to be worth 30 of Tacitus; yet, M. le Clerc, at the end of his Art of Criticism, has charged the writer with great ignorance and many contradictions. He has nevertheless many qualities as a writer, which will always make him admired and applauded.

CURVATURE, or CURVATURE of a Line, is the peculiar manner of its bending or flexure, by which it becomes a curve of any form and properties. Thus the nature of the curvature of a circle is such, that at every point in the periphery is evenly distant from a point within, called the centre; and so the curvature of the same circle is everywhere the same. But the curvature in all other curves is continually varying.

CURVE, in Geometry, a line which running on continually in all directions, may be cut by one right line in more points than one. See CONIC SECTIONS and FLUXIONS.

Curve of Equable Approach. Leibnitz first proposed to find a curve, down which a body descending by the force of gravity, shall make equal approaches to the horizon in equal portions of time. This curve, as it has been found by Bernoulli and others, is the second cubical parabola placed with its vertex uppermost, and which the descending body must enter with a certain determinate velocity. The question was rendered general by Varignon for any law of gravity, by which a body may approach towards a given point by equal spaces in equal times. Maupertuis also resolved the problem in the case of a body descending in a medium whose resistance is as the square of the velocity.

CURVES, Algebraical or Geometrical, are those in which the relation of the abscissae to the ordinates can be expressed by a common algebraic equation.

CURVES, Transcendental, or Mechanical, are those which cannot be defined or expressed by an algebraic equation.

CURVET, or Corvet, in the manege, an air in which the horse’s legs are raised higher than in the demi-volt; being a kind of leap up, and a little forwards, wherein the horse raises both his fore-legs at once, equally advanced, (when he is going straight forward, and not in a circle); and as his fore-legs are falling, he immediately raises his hind legs, equally advanced, and not one before the other: so that all his four legs are in the air at once; and as he sets them down, he marks but twice with them.

CURVILINEAR, or CURVILINEAL, is said of figures bounded by curves or crooked lines.

CURVIROSTRA. See Loxia, Ornithology Index.

CURULE CHAIR, in Roman antiquity, a chair adorned with ivory, wherein the great magistrates of Rome had a right to sit and be carried.

The curule magistrates were the ædiles, the pretors, censors, and consuls. The chair was fitted in a kind of chariot, whence it had its name. The senators who had borne the offices of ædiles, pretors, &c. were carried to the senate-house in this chair, as were all
CUSCO, a large and handsome town of South America in Peru, formerly the residence of the Incas. It is seated at the foot of a mountain, and is built in a square form, in the middle of which there is the best market in all America. Four large streets terminate in this square, which are all as straight as a line, and regard the four quarters of the world. The Spaniards tell us wonderful things of the richness of the Incas' palace, and of the temple of the sun; but more sober travellers, judging from what remains, think most of them to be fabulous. At present it contains eight large parishes, and five religious houses, the best of which belongs to the Jesuits; and the number of the inhabitants may be about 20,000, of which three-fourths are the original natives, Americans. From this town there is a very long road, which runs along the Cordilleras; and, at certain distances, there are small houses for resting places, some parts of which are so artificially wrought, that it is surprising how a people who had no iron tools could perform such workmanship. There are streams of water run through the town, which are a great convenience in so hot a country where it never rains. It is 375 miles east of Lima. W. Long. 71° 47'. S. Lat. 13° 40'.

CUSCUTA, DODDER; a genus of plants belonging to the tetraandra class; and in the natural method ranking under those of which the order is doubtful. See BOTANY INDEX.

CUSI, the eldest son of Ham, and father of Nimrod; the other sons of Cush were Seba, Havilah, Sabtab, Raamah, and Sabtechah. Gen. x. 6—8. Though we know of no other person in Scripture that is called by this name, yet there are several countries that are called by it; whether the same man may have dwelt in them all at different times, or that there were some other men of this name, we are ignorant.

The Vulgate, Septuagint, and other interpreters, both ancient and modern, generally translate Cush, 

ethiopia: but there are many passages wherein this translation cannot take place.

CUSH is the name of the country watered by the Nile. In this place (Gen. ii. 13.) the LXX translation renders the word Cush by the name of Ethiopia; and, in this mistake, is not only here followed by our English version, but in the same particular in several other places.

Cush is the same as Cush. The Chaldees generally put the tau where the Hebrews use the shin: they say cuth instead of cush. See CUTH.

But Ethiopia is frequently in the Hebrew called Cush; and Josephus says, that they called themselves by this name, and that the same name was given them by all Asia. St. Jerome tells us that the Hebrews call the Ethiopians by the same name, and the Septuagint give them no other. Jeremiah (xiii. 25.) says, "Can the Cushite, or Ethiopian, change his colour?" In Ezekiel (xxxix. 10.) the Lord threatens to reduce "Egypt to a desert, from the tower of Syene even unto the border of Cush, or Ethiopia;" and in Isaiah, (xi. 11.) he says, "he will recover the remnant of his people, which shall be left, from Assyria, and from Egypt, and Pathros, and from Cush." All these marks agree with Ethiopia properly so called, which lies to the south of Egypt.

Bochart has shown very clearly that there was a country called the "land of Cush," in Arabia Petrea, bordering upon Egypt; that this country extended itself principally upon the eastern shore of the Red sea, and at its extremity to the point of the sea, inclining towards Egypt and Palestine.

Thus there are three countries of the name of Cush, described in Scripture, and all confounded by interpreters under the general name of Ethiopia.

CUSHION, in engraving, is a bag of leather filled with sand, commonly about nine inches square, and three or four thick, used for supporting the plate to be engraved.

CUSHION, in gilding, is made of leather, fastened to a square board, from 14 inches square to 10, with a handle. The vacuity between the leather and board is stuffed with fine tow or wool, so that the outer surface may be flat and even. It is used for receiving the leaves of gold from the paper, in order to its being cut into proper sizes and figures.

CUSH, in Natural History, a name given by the people of the Philippine islands to a very small and very beautiful species of parrot.

CUSP (cuspis), properly denotes the point of a spear or sword; but is used in astronomy to express the points or horns of the moon, or any other luminary.

CUSP, in Astrology, is used for the first point of each of the 12 houses, in a figure or scheme of the heavens. See HOUSE.

CUSPIDATED, in Botany, are such plants whose leaves are pointed like a spear.

CUSPINIAN, John, a German, was born at Swin- furt in 1473, and died at Vienna in 1529. He was first physician to the emperor Maximilian I. and employed by that prince in several delicate negotiations. We have of his in Latin, 1. A history of the Roman emperors from Julius Caesar to the death of Maximilian I. 2. A history of Austria; being a kind of continuation of the preceding. 2. A history of...
of the origin of the Turks, and of their cruelties towards Christians. Gerard Vossius calls Cuspinian magnum suo avo historia lumen.

CUSSO, the name given by the natives to a tree which is indigenous to the high country of Abyssinia. It is particularly described by Mr. Bruce; but as this celebrated traveller was totally unacquainted with the language of botany, it is impossible to discover to what class, order, or genus, it belongs. It grows nearly to the height of 20 feet, and the seed is employed by the Abyssinians as a vermifuge. From the figure which Mr. Bruce has given of this plant, it would appear to be most nearly allied to the palms.

CUSTOM, a very comprehensive term, denoting the manners, ceremonies, and fashions of a people, which having turned into a habit, and passed into use, obtain the force of laws; in which sense it implies such usages as, though voluntary at first, are yet by practice become necessary.

Custom is, hence, both by lawyers and civilians, defined lex non scripta, "a law or right not written," established by long usage, and the consent of our ancestors: in which sense it stands opposed to the lex scripta, or "the written law." See Law Index.

Custom and Habit, in the human economy. The former is often confounded with the latter. By custom we mean a frequent reiteration of the same act; and by habit, the effect that custom has on the mind or body. This curious subject fails to be considered first in a moral, and secondly in a physical, light.

1. Influence of Custom and Habit on the Mind, &c. Custom hath such influence upon many of our feelings, by warping and varying them, that its operations demand the attention of all those who would be acquainted with human nature. The subject, however, is intricate. Some pleasures are fortified by custom: and yet custom begets familiarity, and consequently indifference:

If all the year were playing holidays,
To sport would be as tedious as to work;
But when they seldom come, they wish’d for come,
And nothing pleaseth but rare accidents.

SHAKESPEARE.

In many instances, satiety and disgust are the consequences of reiteration: again, though custom blunts the edge of distress and of pain; yet the want of any thing to which we have been long accustomed is a sort of torture. A clue to guide us through all the intricacies of this labyrinth, would be an acceptable present.

Whatever be the cause, it is certain that we are much influenced by custom: it hath an effect upon our pleasures, upon our actions, and even upon our thoughts and sentiments. Habit makes no figure during the industry of youth; in middle age it gains ground; and in old age governs without control. In that period of life, generally speaking, we eat at a certain hour, take exercise at a certain hour, go to rest at a certain hour, all by the direction of Habit; nay, a particular seat, table, bed, comes to be essential; and a habit in any of these cannot be controuled without uneasiness.

Any slight or moderate pleasure, frequently reiterated for a long time, forms a peculiar connexion between us and the thing that causes the pleasure. This connexion, termed habit, has the effect to awaken our desire or appetite for that thing when it returns not as usual. During the course of enjoyment, the pleasure rises insensibly higher and higher till a habit be established; at which time the pleasure is at its height.

It continues not, however, stationary: the same customary reiteration which carried it to its height, brings it down again by insensible degrees, even lower than it was at first; but of that circumstance afterwards. What at present we have in view, is to prove by experiments, that those things which at first are but moderately agreeable, are the arietis to become habitual. Spirituous liquors, at first scarce agreeable, readily produce a habit in appetite; and custom prevails so far, as even to make us fond of things originally disagreeable, such as coffee, assafoditea, and tobacco.

A walk upon the quarter-deck, though intolerably confined, becomes however so agreeable by custom, that a sailor in his walk on shore confines himself commonly within the same bounds. The author knew a man who had relinquished the sea for a country life: in the corner of his garden, he reared an artificial mount with a level summit, resembling most accurately a quarter-deck, not only in shape but in size; and here he generally walked. In Minorca Governor Kane made an excellent road the whole length of the island: and yet the inhabitants adhere to the old road, though not only longer, but extremely bad. Play or gaming, at first barely amusing, by the occupation it affords, become in time extremely agreeable; and is frequently prosecuted with avidity, as if it were the chief business of life. The same observation is applicable to the pleasures of the internal senses, those of knowledge and virtue: in particular, children have scarce any sense of these pleasures; and men very little who are in the state of nature without culture: our taste for virtue and knowledge improves slowly; but is capable of growing stronger than any other appetite in human nature.

To introduce an active habit, frequency of acts is not sufficient without length of time: the quickest succession of acts in a short time is not sufficient; nor a slow succession in the longest time. The effect must be produced by a moderate soft action, and a long series of easy touches, removed from each other by short intervals. Nor are these sufficient without regularity in the time, place, and other circumstances of the action; the more uniform any operation is, the sooner it becomes habitual. And this holds equally in a passive habit; variety, in any remarkable degree, prevents the effect; thus any particular food will scarce ever become habitual where the manner of dressing is varied. The circumstances then requisite to augment a moderate pleasure, and at the long-run to form a habit, are: a weak uniform act, reiterated during a long course of time, without any considerable interruptions; every agreeable cause that operates in this manner will grow habitual.

Affection and aversion, as distinguished from passion on the one hand, and on the other from original disposition, are in reality habits respecting particular objects, acquired in the manner above set forth. The pleasure of social intercourse with any person must originally be faint, and frequently reiterated, in order to establish the habit of affection. Affection thus generated,
have recovered its tone and relish, disgust ensues instead of pleasure.

A habit never fails to admonish us of the wonted time of gratification, by raising a pain for want of the object, and a desire to have it. The pain of want is always first felt; the desire naturally follows; and upon presenting the object, both vanish instantaneously. Thus a man accustomed to tobacco, feels, at the end of the usual interval, a confused pain of want; which at first points at nothing in particular, though it soon settles upon its accustomed object: and the same may be observed in persons addicted to drinking, who are often in an uneasy restless state before they think of the bottle. In pleasures indulged regularly, and at equal intervals, the appetite, remarkably obsequious to custom, returns regularly with the usual time of gratification; not sooner, even though the object be presented. This pain of want arising from habit, seems directly opposite to that of satiety; and it must appear singular, that frequency of gratification should produce effects so opposite, as are the pains of excess and of want.

The appetites that respect the preservation and propagation of our species, are attended with a pain of want similar to that occasioned by habit: hunger and thirst are uneasy sensations of want, which always precede the desire of eating and drinking; and a pain for want of carnal enjoyment precedes the desire of an object. The pain being thus felt independent of an object, cannot be cured but by gratification. Very different is an ordinary passion, in which desire precedes the pain of want: such a passion cannot exist but while the object is in view: and therefore, by removing the object out of thought, it vanishes with its desire and pain of want.

The natural appetites above mentioned, differ from habit in the following particular: they have an undetermined direction toward all objects of gratification in general; whereas an habitual appetite is directed to a particular object: the attachment we have by habit to a particular woman, differs widely from the natural passion which comprehends the whole sex; and the

(A) Violent love, without affection, is finely exemplified in the following story. When Constantinople was taken by the Turks, Irene, a young Greek of an illustrious family, fell into the bands of Mahomet II. who was at that time in the prime of youth and glory. His savage heart being subdued by her charms, he shut himself up with her, denying access even to his ministers. Love obtained such ascendant as to make him frequently abandon the army, and fly to his Irene. War relaxed, for victory was no longer the monarch’s favourite passion. The soldiers, accustomed to booty, began to murmur, and the infection spread among the commanders. The Bashas Mustapha, consulting the fidelity he owed his master, was the first who durst acquaint him of the discourses held publicly to the prejudice of his glory. The sultan, after a gloomy silence, formed his resolution. He ordered Mustapha to assemble the troops next morning; and then with precipitation retired to Irene’s apartment. Never before did that princess appear so charming; never before did the prince bestow so many warm caresses. To give a new lustre to her beauty, he exhorted her women next morning to bestow their utmost art and care on her dress. He took her by the hand, led her into the middle of the army, and pulling off her veil, demanded of the bashas with a fierce look, whether they had ever beheld such a beauty? After an awful pause, Mahomet with one hand laying hold of the young Greek by her beautiful locks, and with the other pulling out his scimitar, severed the head from the body at one stroke. Then turning to his grandees, with eyes wild and furious, “This sword (says he), when it is my will, knows to cut the bands of love.” However strange it may appear, we learn from experience, that desire of enjoyment may conspire with the most brutal aversion, directed both to the same woman. Of this we have a noted example in the first book of Sulvy’s Memoirs; to which we refer the reader.
the habitual relish for a particular dish, is far from being the same with a vague appetite for food. That difference notwithstanding, it is still remarkable, that nature hath enforced the gratification of certain natural appetites essential to the species, by a pain of the same sort with that which habit produceth.

The pain of habit is less under our power than any other pain that arises from want of gratification: hunger and thirst are more easily endured, especially at first, than an unusual intermission of any habitual pleasure: persons are often heard declaring, they would forego sleep or food, rather than tobacco. We must not, however, conclude, that the gratification of a habitual appetite affords the same delight with the gratification of one that is natural: far from it; the pain of want only is greater.

The slow and reiterated acts that produce a habit, strengthen the mind to enjoy the habitual pleasure in greater quantity and more frequency than originally; and by that means a habit of intertemperate gratification is often formed: after unbounded acts of intemperance, the habitual relish is soon restored, and the pain for want of enjoyment returns with fresh vigour.

The causes of the present emotions hitherto in view, are either an individual, such as a companion, a certain dwelling-place, a certain amusement; or a particular species, such as coffee, mutton, or any other food. But habit is not confined to such. A constant train of trifling diversions may form such a habit in the mind, that it cannot be easy a moment without amusement: a variety in the objects prevents a habit as to any one in particular: but as the train is uniform with respect to amusement, the habit is formed accordingly; and that sort of habit may be denominated a generic habit, in opposition to the former, which is a specific habit. A habit of a town-life, of country-sports, of solitude, of reading, or of business, where sufficiently varied, are instances of generic habits. Every specific habit hath a mixture of the generic; for the habit of any one sort of food makes the taste agreeable, and we are fond of that taste wherever found. Thus a man deprived of an habitual object, takes up with what most resembles it; deprived of tobacco, any bitter herb will do rather than want; a habit of punch makes wine a good resource: accustomed to the sweet society and comforts of matrimony, the man unhappily deprived of his beloved object, inclines the sooner to a second. In general, when we are deprived of an habitual object, we are fond of its qualities in any other object.

The reasons are assigned above, why the causes of intense pleasure become not readily habitual: but now we discover, that these reasons conclude only against specific habits. In the case of a weak pleasure, a habit is formed by frequency and uniformity of reiteration, which, in the case of an intense pleasure, produceth satiety and disgust. But it is remarkable, that satiety and disgust have no effect, except as to that thing singly which occasions them; a surfeit of honey produceth not a loathing of sugar; and intemperance with one woman produceth no disrelish of the same pleasure with others. Hence it is easy to account for a generic habit in any intense pleasure; the delight we had in the gratification of the appetite, infames the imagination, and makes us search, with avidity,
CUS

Custom, by the pain of satiety; and thus a generic habit is formed, of which inconstancy in love is the necessary consequence; for a generic habit, comprehending every beautiful object, is an invincible obstruction to a specific habit, which is confined to one.

But a matter which is of great importance to the youth of both sexes, deserves more than a cursory view. Though the pleasant emotion of beauty differs widely from the corporeal appetite, yet when both are directed to the same object, they produce a very strong complex passion; enjoyment in that case must be exquisite; and therefore more apt to produce satiety than in any other case whatever. This is a never-failing effect, where consummated beauty in the one party, meets with a warm imagination and great sensibility in the other. What we are here explaining, is true without exaggeration; and they must be insensible upon whom it makes no impression: it deserves well to be pondered by the young and the amorous, who, in forming the matrimonial society, are too often blindly impelled by the animal pleasure merely, inflamed by beauty. It may indeed happen, after the pleasure is gone, and go it must with a swift pace, that a new connexion is formed upon more dignified and more lasting principles: but this is a dangerous experiment; for even supposing good sense, good temper, and internal merit of every sort, yet a new connexion upon such qualifications is rarely formed: it commonly, or rather always happens, that such qualifications, the only solid foundation of an indissoluble connexion, are rendered altogether invisible by satiety of enjoyment creating disgust.

One effect of custom, different from any that have been explained, is, when consumed, because it makes a great figure in human nature: though custom augments moderate pleasures, and lessens those that are intense, it has a different effect with respect to pain: for it blunts the edge of every sort of pain and distress, faint or acute. Uninterrupted misery, therefore, is attended with one good effect: if its torments be incessant, custom hardens us to bear them.

The changes made in forming habits are curious. Moderate pleasures are augmented gradually by reiteration, till they become habitual: and then are at their height: but they are not long stationary: for from that point they gradually decay, till they vanish altogether. The pain occasioned by want of gratification runs a different course: it increases uniformly; and at last becomes extreme, when the pleasure of gratification is reduced to nothing.

---

It so falls out,
That what we have we prize not to the worth,
While we enjoy it; but being lack'd and lost,
Why then we rack the value; then we find
The virtue that possession would not show us
Whilst it was ours.

**Much ado about Nothing**, Act iv. sc. 2.

The effect of custom with relation to a specific habit is displayed through all its varieties in the use of tobacco. The taste of that plant is at first extremely unpleasant: our disgust lessens gradually till it vanish altogether; at which period the taste is neither agreeable nor disagreeable: continuing the use of the plant, we begin to relish it; and our relish improves by use,
measure been overlooked; which is, that custom hath a greater influence than any other known cause, to put the rich and the poor upon a level; weak pleasures, the share of the latter, become fortunately stronger by custom; while voluptuous pleasures, the share of the former, are continually losing ground by satiety. Men of fortune, who possess palaces, sumptuous gardens, rich fields, enjoy them less than passengers do. The goods of Fortune are not unequally distributed; the object possess what others enjoy.

And indeed, if it be the effect of habit, to produce the pain of want in a high degree while there is little pleasure in enjoyment, a voluptuous life is of all the least to be envied. Those who are habituated to high feeding, easy vehicles, rich furniture, a crowd of valets, much deference and flattery, enjoy but a small share of happiness, while they are exposed to manifold distresses. To such a man, enslaved by ease and luxury, even the petty inconveniences in travelling, of a rough road, bad weather, or homely fare, are serious evils: he loses his tone of mind, turns peevish, and would wreak his resentment even upon the common accidents of life. Better far to use the goods of Fortune with moderation; a man who by temperance and activity hath acquired a hardy constitution, is on the one hand, guarded against external accidents; and, on the other, is provided with great variety of enjoyment ever at command.

We shall close this branch of the subject with an article more delicate than abstruse, viz. what authority custom ought to have over our taste in the fine arts. One particular is certain, that we cheerfully abandon to the authority of custom things that nature hath left indifferent. It is custom, not nature, that hath established a difference between the right hand and the left, so as to make it awkward and disagreeable to use the left where the right is commonly used. The various colours, though they affect us differently, are all of them agreeable in their purity: but custom has regulated that matter in another manner; a black skin upon a human being, is to us disagreeable; and a white skin probably not less so to a negro. Thus things, originally indifferent, become agreeable or disagreeable by the force of custom. Nor will this be surprising after the discovery made above, that the original agreeableness or disagreeableness of an object is, by the influence of custom, often converted into the opposite quality.

Proceeding to matters of taste, where there is naturally a preference of one thing before another; it is certain, in the first place, that our faint and more delicate feelings are readily susceptible of a bias from custom; and therefore that it is no proof of a defective taste, to find these in some measure influenced by custom; dress and the modes of external behaviour are regulated by custom in every country; the deep red or vermilion with which the ladies in France cover their cheeks, appears to them beautiful in spite of nature; and strangers cannot altogether be justified in condemning that practice, considering the lawful authority of custom, or of the fashion, as it is called: it is told of the people who inhabit the skirts of the Alps facing the north, that the swelling they universally have in the neck, is to them agreeable. So far has custom power to change the nature of things, and to make an object originally disagreeable take on an otherwise appearance.

But as to every particular that can be denominated proper or improper, right or wrong, custom has little authority, and ought to have none. The principle of duty takes naturally place of every other; and it argues a shameful weakness or degeneracy of mind, to find it in any case so far subdued as to submit to custom.

II. Effects of Custom and Habit in the Animal Economy. These may be reduced to five heads: 1. On the simple solids. 2. On the organs of sense. 3. On the moving power. 4. On the whole nervous power. 5. On the system of blood-vessels.

1. Effects on the Simple Solids. Custom determines the degree of flexibility of which they are capable. By frequently repeated flexion, the several particles of which these solids consist are rendered more supple and moveable on each other. A piece of catgut, e.g. when on the stretch, and having a weight appended to its middle, will be bended thereby perhaps half an inch; afterwards, by frequent repetitions of the same weight, or by increasing the weight, the flexibility will be rendered double. The degree of flexibility has a great effect in determining the degree of oscillation, provided that elasticity is not affected; if it go beyond this, it produces flaccidity. Again, custom determines the degree of tension; for the same elastic chord that now oscillates in a certain degree of tension, will, by frequent repetition of these oscillations, be so far relaxed, that the extension must be renewed in order to produce the same tension, and consequently the same vibrations, as at first. This appears in many instances in the animal economy, as when different muscles concur to give a fixed point or tension to each other; and thus a weakly child totters as it walks; but by giving it a weight to carry, and by thus increasing the tension of the system, it walks more steadily. In like manner, the fullness of the system gives strength, by distending the vessels everywhere, and so giving tension: hence a man, by good nourishment, from being weak, acquires a great increase of strength in a few days: and, on the other hand, evacuations weakened by taking off the tension.

2. Effects on the Organs of Sense. Repetition gives a greater degree of sensibility, in so far only as it renders perception more accurate. Repetition alone gives lasting impression, and thus lays the foundation of memory; for single impressions are but retained for a short time, and are soon forgot. Thus a person, who at present has little knowledge of cloths, will by frequently handling them, acquire a skill of discerning them, which to others seems almost impossible. Many are apt to mistake this for a nicer sensibility, but they are much mistaken; for it is an universal law, that the repetition of impression renders us less acute. This is well illustrated by the operation of medicines; for all medicines which act on the organs of sense must, after some time, be increased in their dose to produce the same effects as at first. This affords a rule in practice with regard to these medicines; it becoming necessary, after a certain time, to change one medicine even for a weaker of the same nature. Thus medicines which even have no great apparent force, are found, by long use, to destroy the sensibility of the system to other.
other impressions. But to this general rule, that, by
repetition, the force of impressions is more and more
diminished, there are some exceptions. Thus persons,
by a strong emetic, have had their stomachs rendered
so irritable, that one-twentieth of the first dose was sufficient
to produce the same effect. This, however, takes
place when the vomit is repeated every day;
for if the same vomit be given at pretty considerable
intervals, the general rule is observed to hold good.
Thus two contrary effects of habit are to be noted;
and it is proper to observe, that the greater irritability
is more readily produced when the first impression is
great, as in the case first given of the strong emetic.
This may be further illustrated by the effect of fear,
which is commonly observed to be diminished on repeti-
tion; which can only be attributed to custom; while,
on the other hand, there are instances of persons, who,
having once got a great fright, have for ever after
continued to feel more excited by impressions of the
like kind, however slight; which must be imputed en-
tirely to excess of the first impression, as has been al-
ready observed. To this head also belongs the asso-
ciation of ideas, which is the foundation of memory
and all our intellectual faculties, and is entirely the
effect of custom: with regard to the body also, these
associations often take place. And sometimes, in pro-
ducing effects on the body, associations seemingly op-
posite are formed, which, through custom, become abso-
lutely necessary; e. g. a person long accustomed to
sleep in the neighbourhood of a great noise, is so far
from being incommoded on that account, that after-
wards such noise becomes necessary to produce sleep.
It will be of use to attend to this in medical practice;
for we ought to allow for, however opposite it may
seem at the time, whenever usually attended the pur-
pose we design to effect. Thus, in the instance of
sleep, we must not exclude noise when we want to pro-
cure rest, or any cause which may seem opposite to
such an effect, provided custom has rendered them ne-
necessary.

3. Effects on the Moving Fibres. A certain degree
of tension is necessary to motion, which is to be deter-
bined by custom; e. g. a fencer, accustomed to one
foil, cannot have the same steadiness or activity with
one heavier or lighter. It is necessary also that every
motion should be performed in the same situation, or
posture of the body, as the person has been accustomed
to employ in that motion. Thus, in any chirurgical
operation, a certain posture is recommended; but if the
operator has been accustomed to another, such a one,
however awkward, becomes necessary afterwards to his
right performance of that operation.

Custom also determines the degree of oscillation of
which the moving fibres are capable. A person accu-
stomed to strong muscular exertions is quite incapable
of the more delicate. Thus writing is performed by
small muscular contractions; but if a person has been
accustomed to stronger motions with these muscles, he
will write with much less steadiness.

This subject of tension, formerly attributed to the
simple fibres, is probably more strictly applicable to the
moving; for besides a tension from flexion, there is
also a tension from irritation and sympathy; e. g. the
tension of the stomach from food, gives tension to the
whole body. Wine and spirits give tension;
e. g. a person that is so affected with tremor as scarcely
to hold a glass of any of these liquors to his head, and Habit.
has no sooner swallowed it, than his whole body be-
comes steady; and after the system has been accu-
stoned to such stimuli, if they are not applied at the
usual time, the whole body becomes flaccid, and of con-
sequence unstable in its motions.

Again, custom gives facility of motion. This seems
to proceed from the distension which the nervous
power gives to the moving fibres themselves. But in
whatever manner it is occasioned, the effect is obvious;
for any new or unusual motion is performed with great
difficulty.

It is supposed that sensation depends on a com-
munication with the sensorium commune, by means of or-
gans sufficiently distended with nervous influence. We
have found, that sensibility is diminished by repetition.
And we have now to observe, that in some cases it
may be increased by repetition, owing to the nervous
power itself flowing more easily into the part on ac-
count of custom. Attention to a particular object may
also determine a greater influx into any particular part,
and thus the sensibility and irritability of that particu-
lar part may be increased.

With regard to facility of motion, the nervous
power, no doubt, flows most easily into those parts to
which it has been accustomed; yet facility of motion
does not entirely depend on this, but in part also on
the concurrence of the action of a great many muscles;
e. g. Winslow has observed, that in performing any
motion, a number of muscles concur to give a fixed
point to those intended chiefly to act, as well as to oth-
ers that are to vary and modify their action. This,
however, is assisted by repetition and the freer in-
flux; as by experience we know the proper attitude for
giving a fixed point in order to perform any action with
facility and steadiness.

Custom gives a spontaneous motion also, which seems
to recur at stated periods, even when the exciting causes
are removed. Thus, if the stomach has been accu-
stoned to vomit from a particular medicine, it will re-
quire a much smaller dose than at first, nay, even the
very sight or remembrance of it will be sufficient to
produce the effect; and there are not wanting instances
of habitual vomiting, from the injudicious administra-
tion of emetics. It is on this account that all spas-
moid affections so easily become habitual, and are so
difficult of cure; as we must not only avoid all the ex-
citing causes, even in the smallest degree, but also
their associations.

Custom also gives strength of motion; strength de-
PENDS on strong oscillations, a free and copious influx
of the nervous power, and on dense solids. But in
what manner all these circumstances have been brought
about by repetition, has been already explained. The
effect of custom in producing strength, may be thus il-
Ilustrated: a man that begins with lifting a calf, by
continuing the same practice every day, will be able to
lift it when grown to the full size of a bull.

All this is of considerable importance in the practice
of physic, though but too little regarded; for the re-
covered of weak people, in a great measure, depends
on the use of exercise suited to their strength, or rather
within it, frequently repeated and gradually increased.
Farther, it is necessary to observe, that custom regu-
lates.
lating the particular celerity with which each motion is to be performed: for a person accustomed, for a considerable time to one degree of celerity, becomes incapable of a greater; e.g. a man accustomed to slow walking will be out of breath before he can run 20 paces. The train or order in which our motions are to be performed is also established by custom; for if a man is accustomed to certain motions, and in a particular order, he cannot afterwards perform them in any other. Custom also very frequently associates motions and sensations: thus, if a person has been in use of associating certain ideas with the ordinary stimulus which in health excites urine, without these ideas the usual inclination will scarce excite that excretion; and, when these occur, will require it even in the absence of the primary exciting cause: e.g. it is very ordinary for a person to make urine when going to bed; and if he has been for any length of time accustomed to do so, he will ever afterwards make urine at that time, though otherwise he would often have no such inclination: by this means some secretions become in a manner subject to the will. The same may be said of going to stool; and this affords us a good rule in the case of costiveness; for by endeavouring to fix a stated time for this evacuation, it will afterwards, at such a time, more readily return. It is farther remarkable, that motions are inseparably associated with other motions: this perhaps, very often proceeds from the necessary degree of tension; but it also often depends merely on custom, an instance of which we have in the uniform motions of our eyes.

4. Effects on the whole Nervous Power. We have found, that, by custom, the nervous influence may be determined more easily into one part than another; and therefore, as all the parts of the system are strongly connected, the sensibility, irritability, and strength of any particular part may be thus increased. Custom also has the power of altering the natural temperament, and of inducing a new one. It is also in the power of custom to render motions periodic, and periodically spontaneous. An instance of this we have in sleep, which is commonly said to be owing to the nervous power being exhausted, the necessary consequence of which is sleep, e.g. a rest of the voluntary motions to favour the recruit of that power; but if this were the case, the return of sleep should be at different times, according as the causes which diminish the nervous influence operate more or less powerfully; whereas the case is quite otherwise, these returns of sleep being quite regular. This is no less remarkable in the appetites, that return at particular periods independent of every cause but custom. Hunger, e.g. is an extremely uneasy sensation; but goes off of itself, if the person did not take food at the usual time. The excretions are farther proofs of this, e.g. going to stool, which, if it depended on any particular irritation, should be at longer or shorter intervals, according to the nature of the aliment. There are many other instances of this disposition of the nervous influence to periodic motions, as the story of the idiot of Stafford, recorded by Dr Plot (Spectator, N° 447.), who, being accustomed to tell the hours of the church clock as it struck, told them as exactly when it did not strike by its being out of order. Montaigne tells us of some oxen that were employed in a machine for drawing water, who, after making 300 turns, which was the usual number, could be stimulated by no whip or goad to proceed farther. Infants also cry for and expect the breast at those times in which the nurse has been accustomed to give it.

Hence it would appear, that the human economy is subject to periodical revolutions, and that these happen oftener may be imputed to variety; and this seems to be the reason why they happen oftener in the body than mind, because that is subject to greater variety. We see frequent instances of this in diseases, and in their crises; intermitting fevers, epilepsies, asthmatics, &c. are examples of periodical affections; and that critical days are not so strongly marked in this country as in Greece, and some others, may be imputed to the variety and instability of our climate; but perhaps still more to the less sensibility and irritability of our system; for the exhibition of medicine has little effect in disturbing the crises, though it be commonly assigned as a cause.

We are likewise subject to many habits independent of ourselves, as from the revolutions of the celestial bodies, particularly the sun, which determines the body, perhaps, to other daily revolutions besides sleeping and waking. There are also certain habits depending on the seasons. Our connections, likewise, with respect to mankind, are means of inducing habits. Thus regularity from associating in business induces regular habits both of mind and body.

There are many diseases which, though they arose at first from particular causes, at last continue merely through custom or habit. These are chiefly of the nervous system. We should therefore study to counteract such habits; and accordingly Hippocrates, among other things for the cure of epilepsy, orders an entire change of the manner of life. We likewise imitate this in the chinchouk; which often resists all remedies, till the air, diet, and ordinary train of life, are changed.

5. Effects on the Blood-vessels. From what has been so well on the nervous power, the distribution of the fluids must necessarily be variously affected by custom, and with that the distribution of the different excretions; for though we make an estimate of the proportion of the excretions to one another, according to the climate and seasons, they must certainly be very much varied by custom.

On this head we may observe, that blood-letting has a manifest tendency to increase the quantity of the blood; and if this evacuation be repeated at stated times, such symptoms of repletion, and such motions, are excited at the returning periods, as render the operation necessary. The same has been observed in some spontaneous hemorrhages. These, indeed, at first, may have some exciting causes, but afterwards they seem to depend chiefly on custom. The best proof of this is with regard to the menstrual evacuation. There is certainly something originally in females, that determines that evacuation to the monthly periods. Constant repetition of this comes to fix it, independent of strong causes, either favouring or preventing repletion; e.g. blood-letting will not impede it, nor filling the body induce it; and, indeed, so much is this evacuation connected with periodic motions, that it is little in our power to produce any effect by medicines but at
at those particular times. Thus if we would relax the uterine system, and bring back this evacuation when suppressed, our attempts would be vain and fruitless, unless given at that time when the menses should have naturally returned.

CUSTOMS, in political economy, or the duties, toll, tribute, or tariff, payable to the king upon merchandise exported and imported, form a branch of the perpetual taxes. See TAX.

The considerations upon which this revenue (or the more ancient part of it, which arose only from exports) was invested in the king, were said to be two: 1. Because he gave the subject leave to depart the kingdom, and to carry his goods away with him. 2. Because the king was bound of common right to maintain and keep up the port and havens, and to protect the merchant from pirates. Some have imagined they are called with us customs, because they were the inheritance of the king by immemorial usage and the common law, and not granted him by any statute: but Sir Edward Coke hath clearly shown, that the king's first claim to them was by grant of parliament 3 Edw. I. though the record thereof is not now extant. And indeed this is in express words confessed by statute 25 Edw. I. c. 7, wherein the king promises to take no customs from merchants, without the common assent of the realm, "saving to us and our heirs the customs on wool, skins, and leather, formerly granted to us by the commonalty aforesaid." These were formerly called hereditary customs of the crown; and were due on the exportation only of the said three commodities, and of none other: which were styled the staple commodities of the kingdom, because they were obliged to be brought to the king's staples, was established, in order to be there first rated, and then exported. They were denominated in the barbarous Latin of our ancient records, custuma (an appellation which seems to be derived from the French word coutum, which signifies toll or tribute, and owes its own etymology to the word coast, which signifies price, charge, or as we have adopted it in English, cost); not consuetudinis, which is the language of our law whenever it means merely usages. The duties on wool, sheep-skins or woollfells, and leather exported, were called custuma antiqua sive magna, and were payable by every merchant, as well native as stranger: with this difference, that merchant-strangers paid an additional toll, viz. half as much again as was paid by natives. The custuma parva et nova were an impost of 3d. in the pound, due from merchant-strangers only, for all commodities as well imported as exported; which was usually called the aliens duty, and was first granted in 31 Edw. I. But these and other hereditary customs, especially those on wool and woolfell, came to be of little account, when the nation became sensible of the advantages of a home manufacture, and prohibited the exportation of wool by statute 12 Edw. III. c. 1.

Other customs payable upon imports and exports were distinguished into subsidies, tonnage, poundage, and other imports. Subsidies were such as were imposed by parliament upon any of the staple commodities before mentioned, over and above the custuma antiqua et magna: tonnage was a duty upon all wines imported, over and above the prissage and butlerage aforesaid: poundage was a duty imposed ad valorem, at the rate of 2d. in the pound, on all other merchandise whatever: and the other imposts were such as were occasionally laid on by parliament, as circumstances and times required. These distinctions are now in a manner forgotten, except by the officers immediately concerned in this department; their produce being in effect all blended together, under the one denomination of the customs.

By these we understand, at present, a duty or sub-sidie paid by the merchants at the quay upon all imported as well as exported commodities, by authority of parliament; unless where, for particular national reasons, certain rewards, bounties or rebates are allowed for particular exports or imports. The customs thus imposed by parliament are chiefly contained in two books of rates, set forth by parliamentary authority; one signed by Sir Harbottle Grimeston, speaker of the house of commons in Charles II.'s time; and the other an additional one, signed by Sir Spencer Compton, speaker in the reign of George I. to which also subsequent additions have been made. Aliens pay a larger proportion than natural subjects, which is what is now generally understood by the aliens duty; to be exempted from which is one principal cause of the frequent applications to parliament for acts of naturalization.

These customs are then, we see, a tax immediately paid by the merchant, although ultimately by the consumer. And yet these are the duties felt least by the people: and if prudently managed, the people hardly consider that they pay them at all. For the merchant is easy, being sensible he does not pay them himself; and the consumer, who really pays them, confounds them with the price of the commodity; and in the same manner as Tacitus observes, that the emperor Nero gained the reputation of abolishing the tax of the sale of slaves, though he only transferred it from the buyer to the seller: so that it was, as he expresses it, remissum magis specie, quam vi: quia cum venditor pendere jubetur, in partem preti emportitum accrescebat. But this inconvenience attends it on the other hand, that these imposts, if too heavy, are a check and cramp upon trade; and especially when the value of the commodity bears little or no proportion to the quantity of the duty imposed. This in consequence gives rise also to smuggling, which then becomes a very lucrative employment; and its natural and most reasonable punishment, viz. confiscation of the commodity, is in such cases quite ineffectual; the intrinsic value of the goods, which is all that the smuggler has paid, and therefore all that he can lose, being very inconsiderable when compared with his prospect of advantage in evading the duty. Therefore must therefore he be had to extraordinary punishments to prevent it; perhaps even to capital ones: which destroys all proportion of punishment, and puts murderers upon an equal footing with such as are really guilty of no natural, but merely a positive offence.

There is also another ill consequence attending high imposts on merchandise, not frequently considered, but indisputably certain; that the earlier any tax is laid on a commodity, the heavier it falls upon the consumer in the end; for every trader, through
whose hands it passes, must have a profit, not only upon the raw materials and his own labour and time in preparing it, but also upon the very tax itself, which he advances to the government; otherwise he loses the use and interest of the money which he so advances. To instance in the article for foreign paper. The merchant pays a duty upon importation, which he does not receive again till he sells the commodity, perhaps at the end of three months. He is therefore equally entitled to a profit upon that duty which he pays at the custom-house, as to a profit upon the original price which he pays to the manufacturer abroad; and considers it accordingly in the price he demands of the stationer. When the stationer sells it again, he requires a profit of the printer or bookseller upon the whole sum advanced by him to the merchants: and the bookseller does not fail to charge the full proportion to the student or ultimate consumer; who therefore does not only pay the original duty, but the profits of these three intermediate traders who have successively advanced it for him. This might be carried much farther in any mechanical, or more complicated, branch of trade.

Custom-House, an office established by the king's authority in the maritime cities, or ports towns, for the receipt and management of the customs and duties of importation and exportation, imposed on merchandises, and regulated by decks of rates.

Custos Brevium, the principal clerk belonging to the custom-house, whose business it is to receive and keep all the writs made returnable in that court, filing every return by itself; and, at the end of each term, to receive of the prothonotaries all the records of the nisi prius, called the postes.

Custos Rotularum, an officer who has the custody of the rolls and records of the session of peace, and also of the commission of the peace itself.

He usually is some person of quality, and always a justice of the peace, of the quorum, in the county where he is appointed.

Custos Spiritualium, he that exercises the spiritual jurisdiction of a diocese, during the vacancy of any see, which by the canon law, belongs to the dean and chapter; but at present, in England, to the archbishop of the province by prescription.

Custos Temporalium, was the person to whom a vacant see or abbey was given by the king, as supreme lord. His office was, as steward of the goods and profits, to give an account to the escheator, who did the like to the exchequer.

CUT-FEATHER, in the sea-language. If a ship has too broad a bow, it is common to say, she will not cut a feather; that is, she will not pass through the water so swift as to make it foam or froth.

CUT-Purse, in Law; if any person clam et secreto, and without the knowledge of another, cut his purse or pick his pocket, and steal from thence above the value of twelve pence, it is felony excluded clergy.

Cut-purses, or succurriri, were more severely punished than common thieves by the Roman and Athenian laws.

CUT-Water, the sharp part of the head of a ship below the bow. It is so called, because it cuts or divides the water before it comes to the bow, that it may not come too suddenly to the breadth of the ship, which would retard it.

CUTANEOUS, in general, an appellation given to whatever belongs to the cutis or skin. Thus, we say, cutaneous eruptions: the itch is a cutaneous disease.

CUTH, or CUTHAH, in Ancient Geography, a province of Assyria, which, as some say, lies upon the Araxes, and is the same with Cush; but others take it to be the same with the country which the Greeks call Susiana, and which to this very day, says Dr. Wells, is by the inhabitants called Cusiotum. F. Calmet is of opinion that Cuthah and Scythia are the same place, and that the Cuthites who were removed into Samaria by Salamanasar (2 Kings xvi. 24.) came from Cush or Cuth, mentioned in Gen. ii. 23. See the article CUSH. The Cuthites worshipped the idol Nerpal, I. i. iv. 30. These people were transplanted into Samaria in the room of the Israelites, who before inhabited it. Calmet is of opinion, they came from the land of Cush, or Cuthah upon the Araxes; and that their first settlement was in the cities of the Medes, subdued by Salamanasar and the kings of Assyria his predecessors. The Scripture observes, that the Cuthites, upon their arrival in this new country, continued to worship the gods formerly adored by them beyond the Euphrates. Esarhadon king of Assyria, who succeeded Sennacherib, appointed an Israelitish priest to go thither, and instruct them in the religion of the Hebrews. But these people thought they might reconcile their old superstition with the worship of the true God. They therefore framed particular gods for themselves, which they placed in the several cities where they dwelt. The Cuthites then worshipped both the Lord and their false gods together, and chose the lowest of the people to make priests of them in the high places; and they continued this practice for a long time. But afterwards they forsook the worship of idols, and adhered only to the law of Moses, as the Samaritans, who are descended from the Cuthites, do at this day.

CUTICLE, the SCAFF SKIN. See Anatomy Index. CUTICULAR, the same with CUTANEOUS.

CUTIS, the SKIN. See Anatomy Index.

CUTLERY, a general term which includes all cutting tools. See SUPPLEMENT.

CUTTER, a small vessel, commonly navigated in the channel of England. It is furnished with one mast, and rigged as a sloop. Many of these vessels are used in an illicit trade, and others are employed by government to take them; the latter of which are either under the direction of the admiralty or custom-house.

CUTTER, is also a small boat used by ships of war.

Cutter of the Tolls, an officer of the escheator, whose business is to provide wood for the tallies, to cut or notch the sum paid upon them; and then to cast them into court, to be written upon. See TALLY.

Cutting, a term used in various senses and various arts; in the general it implies a division or separation. Cutting is particularly used in heraldry, where the shield is divided into two equal parts, from right to left, parallel to the horizon, or in the fesse-way.

The word also is applied to the honourable ordinations, and even to animals and moveables, when they are divided equally the same way; so, however, as that
one moiety is colour, the other metal. The ordinaries are said to be cut, couped, when they do not come full to the extremities of the shield.

Cutting, in Surgery, denotes the operation of extracting the stone out of the bladder by section. See Lithotomy, Surgery Index.

Cutting, in coinage. When the laminæ or plates of the metal, be it gold, silver, or copper, are brought to the thickness of the species to be coined, pieces are cut out, of the thickness, and nearly of the weight, of the intended coin; which are now called planchea, till the king's image hath been stamped on them. The instrument wherewith they cut, consists of two pieces of steel, very sharp, and placed one over another; the lower a little hollow, representing a mortar, the other a pestle. The metal put between the two, is cut out in the manner described under Coinage.

Note. Medallions, where the relieve is to be great, are not cut, but blank moulded.

Cutting, in the manager, is when the horse's feet interfere; or when with the shoe of one foot he beats off the skin from the outer joint of another foot. This is more frequent in the hind feet than the fore: the causes are either weariness, weakness in the reins, not knowing how to go, or ill shoeing.

Cutting, in painting, the laying on strong lively colour over another, without any shade or softening. The cutting of colours has always a disagreeable effect.

Cutting in wood, a particular kind of sculpture or engraving; denominated from the matter wherein it is employed.

It is used for various purposes; as for figured letters; head and tail pieces of books; and even for schemes and other figures, to save the expenses of engraving on copper; and the prints and stamps for paper, calicocoe, linens, &c.

The invention of cutting in wood, as well as that in copper, is ascribed to a goldsmith of Florence; but it is to Albert Durer and Lucas they are both indebted for their perfection. See Engraving and Painting.

One Hugo de Carpi invented a manner of cutting in wood, by means whereof the prints appeared as if painted in clair-obscure. In order to this, he made three kinds of stamps for the same design; which were drawn one after another through the press for the same print: they were so conducted, as that one served for the grand lights, a second for the demi-teints, and a third for the outlines and the deep shadows.

The art of cutting in wood was certainly carried to a very great pitch above two hundred years ago; and might even vie, for beauty and justness, with that of engraving in copper. At present it is in a low condition, as having been long neglected, and the application of artists wholly employed on copper, as the more easy and promising province; not but that wooden cuts have the advantage of those in copper on many accounts; chiefly for figures and devices in books; as being printed at the same time and in the same press as the letters; whereas for the other there is required a particular impression. In the representation of plants and flowers, and in designs for paper hangings, where the outline only is wanted to be printed in a bold full manner, this method will be found cheaper and more effectual than the use of copperplates.

The cutters in wood begin with preparing a plank or block of the size and thickness required, and very even and smooth on the side to be cut: for this, they usually take beech, pear-tree, or box; though the latter is the best, as being the closest, and least liable to be worm-eaten. The wood being cut into a proper form and size, should be planed as even and truly as possible: it is then fit to receive the drawing or chalking of the design to be engraved. But the effect may be made more apparent, and the ink, if any be used in drawing, be prevented from running, by spreading thinly on the surface of the wood white lead tempered with water, by grinding with a brush pencil, and afterwards rubbing it well with a fine linen rag whilst it is wet: and when it is dry, brushing off any loose or powdery part with a soft pencil.

On this block they draw their design with a pen or pencil, just as they would have it printed. Those who cannot draw their own design, as there are many who cannot, make use of a design furnished them by another; fastening it upon the block with paste made of flour and water, with a little vinegar or gum tragacanth; the strokes or lines turned towards the wood.

When the paper is dry, they wash it gently over with a sponge dipped in water; which done, they take off the paper by little and little, still rubbing it a little first with the tip of the finger; till at length there be nothing left on the block but the strokes of ink that form the design, which mark out so much of the block as is to be spared or left standing. Figures are sometimes cut out of prints, by taking away all the white part or blank paper, and cemented with gum-water to the surface of the wood. The rest they cut off, and take away very curiously with the points of very sharp knives, or little chisels or gravers, according to the bigness or delicacy of the work: for they need no other instruments.

It differs from engraving in copper, because in the former the impression comes from the prominent parts or strokes left uncet; whereas in the latter, it comes from the channels cut in the metal.

The manner of printing with wooden prints is much more expeditious and easy than that of copper-plate: because they require only to be dip in the printing-ink, and impressed on the object in the same manner and with the same apparatus as the letter-printing is managed: and for purposes that do not require great correctness, the impression is made by the hand only, a proper handle being fixed to the middle of the print, by which it is first dipped in the ink, spread by means of a brush on a block of proportionable size covered with leather; and then lifted up instantly, and dropped with some little force on the paper which is to receive the impression.

Most of our readers are probably not ignorant that the art of engraving on wood has been revived of late years, and has been carried to great perfection by Messrs Bewick of Newcastle, and other ingenious artists. Of this number we may mention Messrs Nesbit and Anderson of London. The Natural History of Quadrupeds, in one volume 8vo, and the Natural History
History of British Birds, in two volumes, published with engravings cut in wood by Messrs Bewick, are excellent specimens of the degree of perfection at which this art has arrived.

Cuttings, or slips, in Gardening, the branches or sprigs of trees or plants, cut or slipped off to set again; which is done in any moist fine earth.

The best season is from August to April; but care is to be taken, when it is done, the sap be not too much in the top, lest the cut die before that part in the earth have root enough to support it: nor yet must it be too dry or scanty; the sap in the branches assisting it to take root.

In providing the cuttings, such branches as have joints, knots, or burrs, are to be cut off two or three inches beneath them, and the leaves to be stripped off as far as they are set in the earth. Small top branches, of two or three years growth, are fittest for this operation.

Cuttlefish. See Sepia. The bone of the cuttlefish is hard on one side, but soft and yielding on the other; so as readily to receive pretty neat impressions from medals, &c. and afterwards to serve as a mould for casting metals, which thus take the figure of the original; the bone is likewise frequently employed for cleaning or polishing silver. This fish contains in a certain distinct vessel a fluid as black as ink; which is said to emit when purrised, and thus to conceal itself by discolouring the water. The particular qualities of this liquor are not yet determined.

Dr Leigh says, he saw a letter which had been written with it ten years before, and which still continued.

Some report that the ancients made their ink from it; and others, that it is the basis of China or Indian ink; but both these accounts appear to have little foundation. Pliny, speaking of the inks made use of in his time, after observing that the cuttlefish is in this respect of a wonderful nature, adds expressly, that ink was not made from it.

Cutts, John Lord, a soldier of most hardy bravery in King William's wars, was son of Richard Cutts, Esq. of Matching in Essex; where the family were settled about the time of Henry VI. and had a great estate. He entered early into the service of the Duke of Monmouth, was aid-de-camp to the Duke of Lorraine in Hungary, and signalized himself in a very extraordinary manner at the taking of Buda by the Imperialists in 1686; which important place had been for near a century and a half in the hands of the Turks. Mr Addison, in a Latin poem worthy of the Augustan age, plainly hints at Mr Cutts's distinguished bravery at that siege. Returning to England at the revolution, he had a regiment of foot; was created baron of Gowran in Ireland, Dec. 6. 1692; appointed governor of the Isle of Wight, April 14. 1693; was made a major-general; and, when the assassination project was discovered, in 1695-6, was captain of the king's guard. In 1698 he was complimented by Mr John Hopkins, as one to whom "a double crown was due," as a hero and a poet. He was colonel of the Coldstream, or second regiment of guards, in 1701; when Mr Steele, who was indebted to his interest for a military commission, inscribed to him his first work, "The Christian Hero." On the accession of Queen Anne, he was made a lieutenant-general of the forces in Holland; commander in chief of the forces in Ireland, under the duke of Ormond, March 23. 1704-5; and afterwards one of the lords justices of that kingdom, to keep him out of the way of action; a circumstance which broke his heart. He died at Dublin, Jan. 26. 1706-7, and is buried there in the cathedral of Christ Church. He wrote a poem on the death of Queen Mary; and published, in 1687, "Poetical Exercises, written upon several occasions, and dedicated to her Royal Highness Mary princess of Orange." It contains, besides the dedication signed J. Cutts, verses to that princess; a poem on Wisdom; another to Mr Waller on his commending it; seven more copies of verses (one of them called La Muse Cavalier, which had been ascribed to Lord Peterborough, and as such mentioned by Mr Walpole in the list of that nobleman's writings), and 11 songs; the whole composing but a very thin volume. A specimen of his poetry is here added:

Only tell her that I love,
Leave the rest to her and fate;
Some kind planet from above
May perhaps her pity move;
Lovers on their stars must wait;
Only tell her that I love.
Why, oh, why should I despair?
Mercy's picture'd in her eye;
If she once vouchsafe to hear,
Welcome hope, and welcome fear.
She's too good to let me die;
Why, oh, why should I despair?

Cuvette, or Cunette, in Fortification, is a ditch within a ditch, being a pretty deep trench, about four fathoms broad, sunk, and running along the middle of the great dry ditch, to hold water; serving both to keep off the enemy, and prevent him from mining.

Cyanite, a species of mineral. See Mineralogy Index.

Cyanometer, an instrument for measuring the intensity of the blue colour of the sky. See Supplement.

Cyathus, κύαθος (from the verb καύω, to pour out), was a common measure among the Greeks and Romans, both of the liquid and dry kind. It was equal to an ounce, or the twelfth part of a pint. The cyathus was made with a handle like our punch ladle. The Roman toper used to drink as many cyathi as there were muses, i.e. nine; also as many as there were letters in the patron's name. Thus, they had modes of drinking similar to the modern health-drinking or toasting. The cyathus of the Greeks weighed 10 drachms; but Galen says that a cyathus contains 12 drachms of oil, 13 drachms and one scruple of wine, water, or vinegar, and 18 drachms of honey; and he adds that among the Veterinarians the cyathus contained two ounces.

Cyaxares, son of Phraortes, was king of Media and Persia. He bravely defended his kingdom, which the Scythians had invaded. He made war against Alyattes king of Lydia; and subjected to his power all Asia beyond the river Halys. He died after a reign of 40 years, in the year of Rome 165.

Cyaxares II. is supposed by some to be the same as Darius the Mede. He was son of Astyages king of Media. He added seven provinces to his father's dominions,
This is a valuable tree to the inhabitants of India, as it not only furnishes a considerable part of their constant bread, but also supplies them with a large article of trade. The pith consists of a farinaceous substance, which is extracted from it and made into bread in this manner: they saw the body into small pieces, and after beating them in a mortar, pour water upon the mass; this is left for some hours to settle. When fit, it is strained through a cloth, and the finer particles of the mealy substance running through with the water, the gross ones are left behind and thrown away. After the farinaceous part is sufficiently subsided, the water is poured off, and the meal being properly dried, is occasionally made into cakes and baked. These cakes are said to eat nearly as well as wheat bread, and are the support of the inhabitants for three or four months in the year.

The same meal more finely pulverized, and reduced into granules, is what is called sago, which is sent into all parts of Europe, and sold in the shops as a great strengthener and restorative.

There is a sort of sago made in the West Indies, and sent to Europe in the same manner as that from the East; but the West India sago is far inferior in quality to the other. It is supposed to be made from the pith of the areca orleracea. See Areca.

The brood boom (or bread-tree) of the Hottentots, a plant discovered by Professor Thunberg, is described as a new species of this genus, by the name of cycas Coffra, in the Nova Acta Reg. Soc. Scient. Ups. vol. ii. p. 283. Table V. The pith, or medulla, which abounds in the trunk of this little palm, Mr Sparrman informs us, is collected and tied up in dressed calf or sheep-skins, and then buried in the earth for the space of several weeks, till it becomes sufficiently mealy and tender to be kneaded up with water into a paste, of which they afterwards make small loaves or cakes, and bake them under the ashes. Other Hottentots, not quite so enterprising with patience enough to wait this tedious method of preparing it, are said to dry and roast the pith or marrow, and afterwards make a kind of frumenty of it.

CYCEON, from κατεσκευαζων, "to mix," a name given by the ancient poets and physicians to a mixture of meal and water, and sometimes of other ingredients. These constituted the two kinds of cyceon; the coarser being of water and meal alone; the richer and more delicate composed of wine, honey, flour, water, and cheese. Homer, in the 11th Iliad, talks of cyceon made with cheese and the meal of barley mixed with wine, but without any mention either of honey or water; and Ovid, describing the draught of cyceon given by the old woman of Athens to Ceres, mentions only flower and water. Dioscorides understood the word in both these senses; but extolled it most in the coarse and simple kind: he says, when prepared with water alone, it refrigerates and nourishes greatly.

CYCINNIS, a Grecian dance, so called from the name of its inventor, one of the satyrs belonging to Bacchus. It consisted of a combination of grave and gay movements.

CYCLADES INSULAE: islands anciently so called, by Pliny informs us, from the cyclos or orb in which they lie; beginning from the promontory Gerazum of Euboea, and lying round the island Delos, (Pliny). Where
CYCLES

Where they are, and what their number, is not so generally agreed. Strabo says, they were at first reckoned 12, but that many others were added: yet most of them lie to the south of Delos, and but few to the north; so that the middle or centre, ascribed to Delos, is to be taken in a loose, not a geometrical sense. Strabo recites them after Artemidorus, as follows: Helena, Ceos, Cynthia, Seriphus, Melos, Siphnos, Cimolus, Peraeis, Oenarus, Paros, Syrus, Myconus, Tenos, Andrus, Gyarus; but he excludes from the number Peraeis, Oenarus, and Gyarus.

CYCLAMEN, SOWBREAD; a genus of plants, belonging to the pentandria class; and in the natural method ranking under the 21st order, Precicis. See BOTANY Index.

CYCLE, in Chronology, a certain period or series of numbers, which regularly proceed from the first to the last, and then return again to the first, and so circulate perpetually. See CHRONOLOGY, N° 26.

CYCLE of Indiction, is a series of 15 years, returning constantly around, like the other cycles, and commenced from the third year before Christ; whence it happens, that if 3 be added to any given year of Christ, and the sum be divided by 15, what remains is the year of the indiction.

CYCLE of Induction, a period of 15 years, in use among the Romans. It has no connection with the celestial motion, but was instituted, according to Banionius, by Constantine; who having reduced the time which the Romans were obliged to serve to 15 years, he was consequently obliged every 15 years to impose, or munci according to the Latin expression, an extraordinary tax for the payment of those who were discharged; and hence arose this cycle, which, from the Latin word indicere, was styled indicion.

CYCLE of the Moon, called also the golden number, and the Metonic cycle, from its inventor Meton the Athenian, is a period of 19 years, which when they are completed, the new moons and full moons return on the same days of the month, so that on whatever days the new and full moons fall this year, 19 years hence they will happen on the very same days of the month, though not at the same hour, as Meton and the fathers of the primitive church thought; and therefore, at the time of the council of Nice, when the method of finding the time for observing the feast of Easter was established, the numbers of the lunar cycle were inserted in the kalendar, which, upon the account of their excellent use, were set in golden letters, and the year of the cycle called the golden number of that year.

CYCLE of the Sun, a revolution of 28 years, which being elapsed, the dominical or Sunday letters return to their former place, and proceed in the same order as before, according to the Julian kalendar.

CYCLISUS, in Surgery, an instrument in the form of a half moon, used in scraping the skull, in case of fractures on that part.

CYCLOID, a curve on which the doctrine of pendulums, and time-measuring instruments, in a great measure depends. Mr Huygens demonstrated, that from whatever point or height, a heavy body, oscillating on a fixed centre, begins to descend, while it continues to move in a cycloid, the time of its falls or oscillations will be equal to each other. It is likewise demonstrable, that it is the curve of quickest descent, i.e. a body falling in it, from any given point above, to another not exactly under it, will come to this point in a less time than in any other curve passing through those two points. This curve is thus generated, suppose a wheel or circle to roll along a straight line till it has completed just one revolution; a nail or point in that part of the circumference of the circle, which at the beginning of the motion touches the straight line, will, at the end of the revolution, have described a cycloid on a vertical plane.

CYCLOPÆIA, or ENCYCLOPÆIA, denotes the circle or compass of arts and sciences. A cyclopædia, say the authors of the French Encyclopædie, ought to explain as much as possible the order and connexion of human knowledge. See ENCYCLOPÆDIA.

CYCLOPS, in fabulous history, the sons of Neptune and Amphitrite; the principal of whom were Brontes, Steropes, and Peramont; but their whole number amounted to above a hundred. Jupiter threw them into Tartarus as soon as they were born; but they were delivered at the intercession of Telus, and became the assistants of Vulcan. They were of prodigious stature, and had each only one eye, which was placed in the middle of their foreheads.

Some mythologists say, that the Cyclops signify the vapours raised in the air, which occasion thunder and lightning; on which account they are represented as forging the thunderbolts of Jupiter. Others represent them as the first inhabitants of Sicily, who were cruel, of a gigantic form, and dwelt round Mount Etna.

CYCLOPTERUS, the Sucker, a genus of fishes belonging to the order of amphibia nates. See Ichthyology Index.

CYDER, or CIDER, an excellent drink made of the juice of apples, especially of the more curious table kinds; the juice of these being esteemed more cordial and pleasant than that of the wild or barb kinds. In making this drink, it hath long been thought necessary, in every part of England, to lay the harder cider-fruits in heaps for some time before breaking their pulps; but the Devonshire people have much improved this practice. In other countries, the method is to make these heaps of apples in a house, or under some covering inclosed on every side. This method hath been found defective, because, by excluding the free air, the heat soon became too violent, and a great perspiration ensued, by which in a short time the loss of juice was so great, as to reduce the fruit to half their former weight, attended with a general rottenness, rancid smell, and disagreeable taste. In the South-hams, a middle way has been pursued, to avoid the inconveniences and loss attending the above. They make their heaps of apples in an open part of an orchard, where, by the means of a free air and less perspiration, the desired maturity is brought about, with an insconsiderable waste of the juices and decay of the fruit entirely free of rankeness; and though some apples rot even in this manner, they are very few, and are still fit for use; all continue plump and full of juices, and very much heighten the colour of cyders, without ill taste or smell.
In pursuing the Devonshire method it is to be observed. 1. That all the promiscuous kinds of apples that have dropped from the trees, from time to time, are to be gathered up and laid in a heap by themselves, and to be made into cyder after having so lain about ten days. 2. Such apples as are gathered from the trees, having already acquired some degree of maturity, are likewise to be laid in a heap by themselves for about a fortnight. 3. The later hard fruit, which are to be left on the trees till the approach of frost is apprehended, are to be laid in a separate heap, where they are to remain a month or six weeks, by which, notwithstanding frost, rain, &c. their juices will receive such a maturation, as will prepare them for a kindly fermentation, and which they could not have attained on the trees by means of the coldness of the season.

It is observable, that the riper and mellower the fruits are at the time of collecting them into heaps, the shorter should be their continuance there; and on the contrary, the harsher, immaturer, and harder they are, the longer they should rest. These heaps should be made in an even and open part of an orchard, without any regard to covering from rain, dew, or what else may happen during the apples staying there; and whether they be carried in and broke in wet or dry weather, the thing is all the same. If it may be objected, that during their having lain together in the heap, they may have imbied great humidity, as well from the air as from the ground, rain, dew, &c. which are mixed with their juices; the answer is, this will have no other effect than a kindly diluting, natural to the fruit, by which means a speedier fermentation ensues, and all heterogeneous humid particles are thrown off.

The apples are then ground, and the pumice is received in a large open-mouthed vessel, capable of containing as much thereof as is sufficient for one making, or one cheese. Though it has been a custom to let the pumice remain some hours in the vessel appropriated to contain it, yet this practice is by no means commendable; for if the fruits did not come ripe from the tree, or otherwise matured, the pumice remaining in the vat too long will acquire such sharpness and coarseness from the skins as is never to be got rid of; and if the pumice is of well ripened fruit, the continuing too long there will occasion it to contract a sharpness that very often is followed with want of spirit and prickling: nay, sometimes it even becomes vinegar, or always continues of a wheyish colour; all which proceeds from the heat of fermentation that it almost instantly falls into on lying together; the pumice therefore should remain no longer in the vat than until there may be enough broke from one pressing, or that all be made into cheese, and pressed the same day it is broken. See farther on this subject AGRICULTURE Index.

In Plate CLXVIII. is a perspective view of the cider press and apple-mill. A, B, the bottom or lower beam; C, D, the upper beam; 5, 6, 7, 8, 9, the rights; 4, 4, 5, 6, 7, 8, spars; Z, 2, 2, braces, or cross-pieces; 4, 5, capitals; X, blocks; g, the screw; E, the back or receiver; F, the chees or cake of pumicke, placed on the stage or bason; G, the stage or bason; 10, 10a, beams that support the pieces of which the bason is composed; 11, perpendicular pieces for supporting these beams; H, the buckler; R, S, Q, a circular trough of the apple-mill; T, L, V, compartments or divisions, for different sorts of apples; M, the mill-stone; L, M, axis of the mill-stone; N, the spring-tree bar.

CYDER-Spirit, a spirituous liquor drawn from cyder by distillation, in the same manner as brandy from wine. The particular flavour of this spirit is not the most agreeable, but it may with care be divested wholly of it, and rendered a perfectly pure and insipid spirit upon rectification. The traders in spirituous liquors are well enough acquainted with the value of such a spirit as this: they can give it the flavour of some other kinds, and sell it under their names, or mix it in large proportion with the foreign brandy, rum and arrack, in the sale, without any danger of a discovery of the cheat.

CYDER-Wine. See AGRICULTURE Index.

CYDERKIN. See AGRICULTURE Index.

CYDIA, a painter who made a painting of the Argonauts in the 11th Olympiad. This celebrated piece was bought by the orator Hortensius for 164 talents.

CYDNUS, in Ancient Geography, a river of Cilicia; rising in Mount Taurus, to the north of Tarsus, through whose middle it ran, in a very clear and cold stream, which had almost proved fatal to Alexander on bathing in it; falling into the sea at a place called Rhegma, a breach, the sea breaking in there, and affording the people of Tarsus a station or port for their ships. The water of the Cydnus is commended by Strabo, as of service in nervous disorders and the gout.

CYDONIA, in Ancient Geography, one of the three most illustrious cities of Crete, situated in the north-west of the island, with a locked port, or walled round. The circumstances of the founding of Cydon are uncertain. Stephen of Byzantium says, that it was at first named Apollonia from Cydon the son of Apollo. Pausanias ascribes the founding of it to Cydon the son of Tegetus, who travelled into Crete. Herodotus affirms, that it was founded by the Samians, and that its temples were erected by them. Alexander, in the first book of the Cretans, informs us, that it received its name from Cydon the son of Mercury. Cydon was the largest city in the island; and was enabled to hold the balance between her contending neighbours. She sustained some famous sieges. Phaleucus, general of the Phocians, making an expedition into Crete with a fleet and a numerous army, invested Canea both by sea and land, but lost his army and his life before its walls. In succeeding times when Metellus subdued the island, he assailed Cydon with all his forces; and after combating an obstinate resistance, subjected it to the power of Rome. Cydon occupied the present situation of Canea; only extending half a league farther towards St Odoro; where on the sea-shore the remains are still to be seen of some ancient walls which appear to have been of a very solid construction. See Canea.

CYDONIUM, the Quince; so called from Cydon, a town of Crete, famous for its abounding with this fruit. Linnaeus has joined this genus to the apple and pear; but as there is such a remarkable difference between
between the fruits, Mr Miller treats the quince as a
genius by itself. The species are, 1. The oblonga, with
an oblong fruit, lengthened at the base. 2. The mali-
forma, with oval leaves, wholly on the upper side,
with some other varieties. The Portugal quince is
the most valuable; its pulp turns to a fine purple when
stewed or baked, and becomes much softer and less
austere than the others; so is much fitter for making
marmalade. The trees are also easily propagated, ei-
ther by layers, suckers, or cuttings; which must be
planted in a moist soil. Those raised from suckers are
seldom so well rooted as those which are obtained from
cuttings or layers and are subject to produce suckers
again in greater plenty; which is not so proper for
fruit-bearing trees. These trees require little prun-
ing: the chief thing to observe is, to keep the
stems clear from suckers, and cut off such branches
as cross each other; likewise all upright luxuriant
shoots from the middle of the tree should be taken off,
that the head may not be too much crowded with wood,
which is of ill consequence to all fruit trees. These
sorts may also be propagated by building or grafting
upon stocks raised by cuttings; so that the best sorts
may be cultivated this way in greater plenty than by
any other method. These are also in great esteem in
bud or graft pears upon; which for summer or autumn
fruits are a great improvement to them, especially
those designed for walls and espaliers; for the trees,
upon these stocks do not shoot so vigorously as those
upon free-stocks, and therefore may be kept in less
compass, and sooner produce fruit: but hard winter
fruits do not succeed so well upon these stocks; their
fruit being subject to crack, and are commonly stony,
especially all the breaking pears; therefore these stocks
are only fit for melting pears and a moist soil.

**CYGNUS, the Swan.** See *ANAS, ORNITHOLOGY*

**Index.**

**CYGNUS, the Swan, in Astronomy, a constellation of**
the northern hemisphere, between Lyra and Cepheus.
The stars in the constellation Cygnus, in Ptolemy’s ca-
tologue, are 19; in Tycho’s 18; in Hevelius’s 47; in
the Britannic catalogue 81.

**CYLINDER, in Geometry, a solid body supposed to**
be generated by the rotation of a parallelogram.

**Rolling or Loaded Cylinder,** a cylinder which rolls
up an inclined plane; the phenomena of which are ex-
plained under MECHANICS.

**CYLINDROID, in Geometry, a solid body ap-
proaching to the figure of a cylinder, but differing from
it in some respects, as having the bases elliptical, but
parallel and equal.

**CYLINDRUS, in Natural History, the name of a**
genus of shellfish, of which there are many elegant and
precious species.

**CYMA, in Botany, the tender stalks which herbs**
send forth in the beginning of spring, particularly those
of the cabbage kind.

**CYMA, or CYMATIUM, in Architecture, a member or**
moulding of the cornice, the profile of which is
width at the top, and convex at bottom.

**CYMBAL (κυμβαλος), a musical instrument in use**
among the ancients. The cymbal was made of brass,
like our kettle-drums, and, as some think, in their form,
but smaller, and of different use. Ovid gives cymbals
the epithet of *genialis,* because they were used at wed-
dings and other diversions.

Cassiodorus and Isidore call this instrument *actabu-
lum,* the name of a cup or cavity of a bone wherein an-
other is articulated; and Xenophon compares it to a
horse’s hoof; whence it must have been hollow; which
appears, too, from the figure of several other things de-
nominated from it; as a basin, caldron, goblet, cask,
and even a shoe, such as those of Empedocles, which
were of brass.

In reality, the ancient cymbals appear to have been
very different from our kettle-drums, and their use of
another kind: to their exterior cavity was fastened a
handle; whence Pliny compares them to the upper part
of the thigh, and Rhabanus to phials.

They were struck against one another in cadence,
and made a very acute sound. Their invention was
attributed to Cybele; whence their use in feasts and
sacrifices: setting aside this occasion, they were seldom
used but by dissolute and effeminate people. M. Lampe,
who has written expressly on the subject, attributes the
invention to the Curetes, or inhabitants of Mount Ida
in Crete; it is certain these, as well as the Corybantes
or guards of the kings of Crete, and those of Rhodes
and Samothrace, were reputed to excel in the music of
the cymbal.

The Jews had their cymbals, or at least instruments
which translators render cymbals; but as to their ma-
ter and form, critics are still in the dark. The mo-
dern cymbal is a mean instrument, chiefly in use among
vagrants, gypsies, &c. It consists of steel wire in a
triangular form, wherein are pass’d five rings, which
are touched and shifted along the triangle with an iron
rod held in the left hand, while it is supported in the
right by a ring, to give it the freer motion. Durandus
says, that the monks used the word cymbal for the clois-
ter-bell, used to call them to the refectory.

**CYME, in Ancient Geography, a city built by Pe-
lops on his return to Greece. Cyme the Amazon
gave it name, on expelling the inhabitants, according
to Mela. Latin authors, as Nepos, Livy, Mela, Pliny,
Tacitus, retain the appellation *Cyme,* after the Greek
manner. It stood in Aiolis, between Myrina and
Phocaea (Ptolemy); and long after, in Ptolemy’s
map, is set down nine miles distant from Myrina.—
From this place was the Sibylla Cumæa, called *Ery-
thea,* from Erythra, “a neighbouring place.” It was
the country of Ephorus. Lesbos was a Cuman origin-
ally (Stephanus); his father coming to settle at As-
cra in Bocotia.

**CYMENE, in Botany, a name given by the ancient**
Greeks to a plant with which they used to dye woollen
stuffs yellow, and with which the women of those times
used also to tinge the hair yellow, which was then the
favourite colour. The *cymene* of the Greeks is evi-
dently the same plant with the *lutea herba* of the La-
tins; or what is now called *dyes weed.* See Reseda,
*Botany Index.*

**CYMÉRUS, ECHRUS,** an Athenian, celebrated for
his extraordinary courage. He was brother to the poet
*Echylus.* After the battle of Marathon he pursued
the flying Persians to their ships, and seized one of
their vessels with his right hand, which was imme-
diately severed by the enemy. Upon this he seized

---

the vessel with his left hand, and when he had lost that also, he still kept his hold with his teeth.

CYNACHI, in Medicine, a disease, in which the throat is inflamed and swelled to such a degree as sometimes to threaten suffocation. See Medicine Index.

CYNANCHUM, BASTARD DOGSBANE; a genus of plants, belonging to the pentandria class; and in the natural method ranking under the 30th order, Con- 
tortae. See Botany Index.

CYNARA, the Artichoke; a genus of plants belonging to the syngenesis class. See Botany Index.

The varieties of the artichoke are propagated by slips or suckers, arising annually from the stool or root of the old plants in spring, which are to be taken from good plants of any present plantation in March or the beginning of April, and planted in the open quarter of the kitchen garden, in rows five feet asunder: and they will produce artichokes the same year in autumn. It should, however, be remarked, that though artichokes are of many years duration, the annual produce of their fruit will gradually lessen in the size of the eatable parts after the third or fourth year, so that a fresh plantation should be made every three or four years. The cardoon is a very hardy plant, and prospers in the open quarters of the kitchen-garden. It is propagated by seed sown annually in the full ground in March; either in a bed for transplantation, or in the place where they are designed to remain. The plants are very large, so must stand at considerable distances from one another. By this means you may have some small temporary crops between the rows, as of lettuce, spinach, endive, cabbage, savoy, or broccoli plants. In the latter end of September, or in October, the cardoons will be grown very large, and their footstalks have acquired a thick substance; you must then tie up the leaves of each plant, to admit of earthing them closely all round for blanching, which will take up six or eight weeks; and thus the plants will come in for use in November and December, and continue all winter.

CYNEUS, of Thessaly, the scholar of Demosthenes, flourished 275 years before Christ. Pyrrhus had such an esteem for him, that he sent him to Rome to solicit a peace; and so vast was his memory, that the day after his arrival he saluted all the senators and knights by name. Pyrrhus and he wrote a Treatise of War, quoted by Tully.

CYNICS, a sect of ancient philosophers, who valued themselves upon their contempt of riches and state, arts and sciences, and every thing, in short, except virtue or morality.

The Cynic philosophers owe their origin and institution to Antisthenes of Athens, a disciple of Socrates; who being asked of what use his philosophy had been to him, replied, “It enables me to live with myself.” Diogenes was the most famous of his disciples, in whose life the system of this philosophy appears in its greatest perfection. He led a most wretched life, a tub having served him for a lodging, which he rolled before him wherever he went. Yet he was nevertheless not the more humble on account of his ragged cloak, bag, and tub; for one day entering Plato’s house, at a time when there was a splendid entertainment there for several persons of distinction, he jumped upon a very rich couch in all his dirt, saying, “I trample on the pride of Plato.” “Yes (replied Plato), but with great pride, Diogenes.” He had the utmost contempt for all the human race; for he walked the streets of Athens at noon-day with a lighted lan- 
thorn in his hand, telling the people, “He was in search of a man.” Among many excellent maxims of morality, he held some very pernicious opinions: for he used to say that the uninterrupted good fortune of Harpalus, who generally passed for a thief and a robber, was a testimony against the gods. He regarded chastity and modesty as weaknesses. Hence Laertius observes of him, that he did every thing openly, whether it belonged to Ceres or Venus; though he adds, that Diogenes only ran to an excess of impu- dence to put others out of conceit of it. But impudence was the characteristic of these philosophers; who argued, that what was right to be done, might be done at all times, and in all places. The chief principle of this sect in common with the Stoics, was, that we should follow nature. But they differed from the Stoics in their explanation of that maxim; the Cynics being of opinion, that a man followed nature that gratified his natural motions and appetites; while the Stoics understood right reason by the word nature.

CYNIC-Spasm, a kind of convulsion, wherein the patient imitates the howlings of dogs.

CYNIPS, a genus of insects belonging to the hy- menoptera order. See Entomology Index.

CYNOCEPHALUS, in Zoology, the trivial name of a species of Simia. See Mammalia Index.

CYNOGLOSSUM, Hound’s Tongue; a genus of plants belonging to the pentandria class, and in the natural method ranking under the 41st order, Asperifol- ia. See Botany Index.

CYNOMETRY, in Botany, a genus of plants belonging to the decandria class, and in the natural method ranking with those of which the order is doubtful. See Botany Index.

CYNOMORIUM, in Botany, a genus of plants belonging to the monocoea class, and in the natural method ranking under the 50th order, Ameniaeae. See Botany Index.

CYNOPHONTIS, in antiquity, a festival observed in the dog days at Argos, and so called κυνοφόντις, i.e. from killing dogs: because it was usual on this day to kill all the dogs they met with.

CYNOREXY, an immoderate appetite, to the degree of a disease, called also fames comina and bulimy.

CYNOSARGES, a place in the suburbs of Athens, named from a white or swift dog, who snatched away part of the sacrifice offering to Hercules. It had a gymnasium, in which strangers or those of the half-blood performed their exercises; the case of Hercules, to whom the place was consecrated. It had also a court of judicature to try illegitimacy, and to examine whether persons were Athenians of the whole or half blood. Here Antisthenes set up a new sect of philosophers called Cynics, either from the place, or from the snarling or the impudent disposition of that sect.

CYNOSCEPHALÆ, in Ancient Geography, a place in Thessaly near Scotussa; where the Romans, under Q. Flaminius, gained a great victory over Philip, son of Demetrius king of Macedon. These Cynosce- phalæ
CYPREA, or COWRIE, a genus of shells belonging to the order of vermes testaceae. See CONCHOLOGY INDEX.

This genus is called cypraea and venera from its being peculiarly dedicated to Venus, who is said to have endowed a shell of this genus with the powers of a remora, so as to impede the course of the ship which was sent by Periander tyrant of Corinth, with orders toemasculate the young nobility of Cercyri.

CYPRESS. See CUPRESSUS, BOTANY INDEX.

CYPRIANUS, THASCUS-CECILIIUS, a principal father of the Christian church, was born at Carthage in Africa, at the latter end of the second or beginning of the third century. We know nothing more of his parents than that they were Heathens; and he himself continued such till the last 12 years of his life. He applied himself early to the study of oratory; and some of the ancients, particularly Lactantius, inform us, that he taught rhetoric in Carthage with the highest applause. Cyprian's conversion is fixed by Pearson to the year 246; and was at Carthage, where, as St Jerome observes, he had often employed his rhetoric in the defence of paganism. It was brought about by one Cecilius, a priest of the church of Carthage, whose name Cyprian afterwards took; and between whom there ever after subsisted so close a friendship, that Cecilius at his death committed to Cyprian the care of his family. Cyprian was also a married man himself; but as soon as he was converted to the faith, he resolved upon a state of continence, which was thought a high degree of piety, as not being yet become general. Being now a Christian, he was to give the usual proof of the sincerity of his conversion; and that was by writing against Paganism and in defence of Christianity. With this view he composed his piece De Gratia Dei, or concerning the grace of God, which he addressed to Donatus. It is a work of the same nature with the Apologetic of Tertullian, and the Octavius of Minutius Felix. He next composed a piece De Idoliorum Fantasie, or upon the vanity of idols. Cyprian's behaviour, both before and after his baptism, was so highly pleasing to the bishop of Carthage, that he ordained him a priest a few months after. It was rather irregular to ordain a man thus in his very noviciate; but Cyprian was so extraordinary a person, and thought capable of doing such singular service to the church, that it seemed allowable in this case to dispense a little with the form and discipline of it. For besides his known talents as a secular man, he had acquired a high reputation of sanctity since his conversion; having not only separated himself from his wife, as we have observed before, which in those days was thought an extraordinary act of piety, but also consigned over all his goods to the poor, and given himself up entirely to the things of God. It was on this account no doubt, too, that when the bishop of Carthage died the year after, that is, in the year 248, none was judged so proper to succeed him as Cyprian. The quiet and repose which the Christians had enjoyed during the last 40 years, had, it seems, greatly corrupted their manners; and therefore Cyprian's first care, after his advancement to the bishopric, was to correct disorders and reform abuses. Luxury was prevalent among them; and many of their women were not so strict
CYPRIANUS, as they should be, especially in the article of dress.

This occasioned him to draw up his piece De habitu virginum, "concerning the dress of young women?" in which, besides what he says on that particular head, he inculcates many lessons of modesty and sobriety. In the year 249, the emperor Decius began to issue out very severe edicts against the Christians, which particularly affected those upon the coast of Africa: and in the beginning of 250, the Heathens in the circus and amphitheatre of Carthage, insisted loudly upon Cyprian's being thrown to the lions: a common method of destroying the primitive Christians. Cyprian upon this withdrew from the church at Carthage, and fled into retirement, to avoid the fury of the persecutions. He wrote, in the place of his retreat, pious and instructive letters to those who had been his hearers; and also to the libellati, a name by which those pusillanimous Christians were called, who procured certificates of the Heathen magistrates, to show that they had complied with the emperor's orders in sacrificing to idols. At his return to Carthage, he held several councils on the repentance of those who had fallen during this persecution, and other points of discipline; he opposed the schemes of Novatus and Novatianus; and contended for the rebaptizing of those who had been baptized by heretics. At last he died a martyr in the persecution of Valerian and Gallienus, in 258. Cyprian wrote 81 letters, and several treatises. The best edition of his works are those of Pamphilus in 1568; of Rigaltius in 1648; and of Oxford in 1682. His works have all been translated into English by Dr. Marshal.

CYPRINUS, a genus of fishes, belonging to the order of abdinales. See Ichthyology Index.

CYPRIPEDEUM, the lady's slipper; a genus of plants belonging to the gynandra class, and in the natural method ranking under the 7th order, Orchideae. See Botany Index.

CYPRUS, an island situated in the Levant, or most easterly part of the Mediterranean sea, between 33 and 36 degrees of east longitude, and 35 and 36 of north latitude. In ancient times this island was known by the names of Acamis, Cerasitis, Aspalia, Amathus, Macaris, Cryptos, Colheris, Sphexia, Paphia, Salaminia, Azross, and Cypris. The etymologies of these names are neither very easily found, nor are they of much importance. The name by which it was most generally known is that of cypris, said to be derived from cprios, the name of a shrub or tree with which the island abounds; supposed to be the cypress.

Cyprus, according to Eratosthenes, was first discovered by the Phenicians, two or three generations before the days of Asterius and Minos, kings of Crete; that is, according to Sir Isaac Newton's computation, 2066 years before the Christian era. It was at that time so full of wood that it could not be tilled, and the Phenicians first cut down that wood for melting copper, with which the island abounded; and afterwards, when they began to sail without fear on the Mediterranean, that is, after the Trojan war, they built great navies of the wood produced on this island. Josephus, however, informs us, that the descendants of Cittim, the son of Javan, and grandson of Japhet, were the original inhabitants of Cyprus. According to his account, Cittim, seeing his brother Tarshish settled in Cillicia, where he built the city of Tarsus, settled with his followers in this opposite island; and either he or his descendants laid the foundation of the city of Cittim, which, according to Ptolemy, was the most ancient in the island. As Cyprus was too narrow to contain the great numbers who attended him, he left here as many as might serve to people the country, and with the rest passed over to Macedon.

The island of Cyprus was divided among several petty kings till the time of Cyprus the Great. He subdued them all; but left each in possession of his kingdom, obliging them only to pay him an annual tribute, and to send supplies of men, money, and ships when required. The Cyprian princes lived thus subject to the Persians till the reign of Darius Hytaetas, when they attempted to shake off the yoke, but with bad success; their forces being entirely defeated, and themselves again obliged to submit. They made another more successful attempt about the year before Christ 337; but, however, could never totally free themselves from their subjection. It is very probable that they submitted to Alexander the Great, though historians are silent as to that event. On the death of the Macedonian conqueror, the dominion of Cyprus was disputed by Antigonus and Ptolemy the son of Lagus. At last Antigonus prevailed, and the whole island submitted to him about 304 years before Christ. He and his son Demetrius kept possession of it for 11 years, when it was recovered by Ptolemy, and quietly possessed by him and his descendants till 58 years before Christ, when it was most unjustly seized by the Romans. In the time of Augustus, it began to be ranked among the proconsular provinces, and to be governed by magistrates sent thither by the senate. In the year 648 it was conquered by the Saracens; but recovered by the Romans in 957. They held it, however, but for a very short time, and the barbarians kept possession of it till the time of the croisades. It was then reduced by the croisaders; and Richard I. of England gave it to the princes of the Lusignan family, who held it till the year 1370. They divided it into 12 provinces, in each of which was a capital city, from which the province was denominated. So considerable was the island at this time, that besides the cities above mentioned, and others of less note it contained 800 villages. In 1370 it was taken by the Turks, and though it hath ever since continued under their tyrannical yoke, is still so considerable as to be governed by a beglerbeg, and seven sanjaks under him.

The air in this island is for the most part very unwholesome, on account of the many fens and marshes with which the country abounds. The soil is an excellent fertile city; and would produce all the necessaries of life in abundance, if properly cultivated. There are but few springs or rivers in this island; so that when the rains do not fall plentifully at the usual seasons, the inhabitants are much distressed by the scarcity of water. By reason of the uncultivated state of the country, they are also greatly infested with poisonous reptiles of various kinds. The people are extremely ignorant and lascivious, as indeed they are remarked to have been from the remotest antiquity. Anciently the worship of Venus was established in this island, whence her title among the poets of the Cyprian queen; and such an inclination had the inhabitants to
become the votaries of this goddess, both in theory and practice, that the young women used to prostitute themselves in her temple in order to raise themselves portions. The exports of the island are silks, oil, cotton, wine, salt, and turpentine: the imports are French and Venetian broad cloths; and sometimes a few bales of English manufacture, cutlery wares, sugar, tin, lead, &c. The number of inhabitants at present is believed not to exceed 60,000.

Knights of Cyprus, an order instituted by Guy de Lusignan, titular king of Jerusalem, to whom Richard I. of England, after conquering this island, made over his right.

Cyrano, Bergerac, a French author, born in Gascony, about the year 1620. He first entered into the army, where his natural courage engaged him frequently in duels in the quality of a second; which, with other rash actions, procured him the title of the Intrepide. But the little prospect he saw of preferment made him renounce the trade of war for the exercise of wit. His comic histories of the states and empires in the sun and moon, show him well acquainted with the Cartesian philosophy, and to have a lively imagination. Our Lord Byron classes him with Swift for his turn of humour, which he says the latter adopted and pursued.

Cyrenaica, an ancient kingdom of Africa, corresponding to the present kingdom and desert of Barca and Tripoli. It was originally inhabited by a number of barbarous nations, differing little from great gangs of robbers. Afterwards some colonies from Greece settled here, and Cyrenaica became so powerful a state, that it waged war with Egypt and Carthage, often with success. In the time of Darius Hystaspes, Arsedus, the reigning prince in Cyrenaica, was driven from the throne: on which his mother Pherecita applied for assistance to the king of Cyprus. Her son afterwards returning to Barca, the chief city of Cyrenaica, there assassinated, together with his father-in-law. Pherecita finding herself disappointed by the king of Cyprus, applied to Darius Hystaspes, and by the assistance of the Persians reduced Barca. Here she behaved with the utmost cruelty, causing all those who had been concerned in her son's death to be impaled, and the breasts of their wives to be cut off and affixed near them. She is said to have been afterwards devoured by worms; which was looked upon as a divine judgment for her excessive cruelty. The prisoners in the mean time were sent to Darius, who settled them in a district of Bactria, from them called Barca. Cyrenaica, however, seems to have remained free till the time of Alexander the Great, who conquered it along with Egypt. Soon after his death the inhabitants recovered their liberty; but were in a short time reduced by Ptolemy king of Egypt. Under these kings it remained till Ptolemy Philesion made it over to his bastard son Apian, who in the 658th year of Rome left it by will to the Romans. The senate permitted all the cities to be governed by their own laws; and this immediately filled the country with tyrants, those who were most potent in every city or district endeavouring to assume the sovereignty of it. Thus the kingdom was thrown into great confusion; but Lucullus in a good measure restored the public tranquillity on his coming thither during the first Mithridatic war. It was found impossible, however, totally to suppress these disturbances till the country was reduced to the form of a Roman province, which happened about 22 years after the death of Apian, and 76 before Christ. Upon a revolt, the city of Cyrene was ruined by the Romans; but they afterwards rebuilt it. In process of time it fell to the Arabs; and then to the Turks, who are still the nominal masters of it.

Cyrenaics, a sect of ancient philosophers, so called from their founder Aristippus of Cyrene, a disciple of Socrates.

The great principle of their doctrine was, that the supreme good of man in this life is pleasure; whereby they not only meant a privation of pain, and a tranquillity of mind, but an assemblage of all mental and sensual pleasures, particularly the last.

Cicero makes frequent mention of Aristippus's school, and speaks of it as yielding debauchees. Three disciples of Aristippus, after his death, divided the sect into three branches; under which division it languished and sunk: the first called the Hippiæae school; the second the Annicerion; and the third the Theodorian; from the names of their authors.

Cyrene, in Ancient Geography, the capital of Cyrenaica, and one of the cities called Pentapolis, distant from Apollonia, its sea-port, 10 miles, situated on a plain, of the form of a table, according to Strabo: A colony of the Theraeans. Though they were descendants of the Lacedaemonians, yet they differed from them in their turn of mind or disposition, applying themselves to philosophy; and hence arose the Cyrenaic sect, at the head of which was Aristippus, who placed all happiness in pleasure. The Cyrenaeans were a people much given to urination, or the use of the chariot, from their excellent breed of horses, (Pindar, Ephorus, Strabo).

CYRIL, St., bishop of Jerusalem, succeeded Maximus in 350. He was afterwards deposed for the crime of exposing to sale the treasures of the church, and applying the money to the support of the poor during a great famine. Under Julian he was restored to his see, and was firmly established in all his old honours and dignities under Theodosius; in which he continued unmolested to his death in 386. The remains of this father consist only of 23 catechisms, and one letter to the emperor Constantius.

Cyril, St., patriarch of Alexandria, succeeded Theophilus, his uncle, in 412. Scarce was be instaled, when he began to exert his authority with great vigour; he drove the Novatians and Jews from Alexandria, permitting their wealth and synagogues to be taken from them. This proceeding highly displeased Orestes, the governor of the city, who saw that if the bishop's authority was not soon suppressed, it might grow too strong for that of the magistrate. Upon which a kind of civil war broke out between Orestes and the bishop; many tumults were raised, and some battles fought in the very streets of Alexandria. St Cyril also distinguished himself by his zeal against Nestorius bishop of Constantinople, who in some of his homilies, had asserted that the Virgin Mary ought not to be called the mother of God. The dispute at first proved unfavourable to Cyril, whose opinion was not only condemned, but himself deprived of his bishopric and thrown into prison. But he was soon after released, and
and gained a complete victory over Nestorius, who in 431 was deposed from his see of Constantinople. Cyril returned to his see at Constantinople, where he died in 444. St Cyril also wrote against Theodorus of Mopsuestia, Diodorus of Tarsus, and Julian the apostate. He composed commentaries on St John's gospel, and wrote several other books. His works were published in Greek and Latin in 1638, in six volumes folio.

CYRUS, the son of Cambyses the Persian, by Mandane, daughter of Astyages king of the Medes. The two chief historians, who have written the life of Cyrus, are Herodotus and Xenophon; but their accounts of him are different, in as much as the latter makes his father a king of Persia, and the former a meaner man. The account of Herodotus, as Dr Prideaux observes, indeed contains narratives that are much more strange and surprising, and consequently more diverting and agreeable to the reader: and for this reason more have chosen to follow him than Xenophon.

Herodotus informs us, that Astyages king of the Medes dreamed that a vine sprung from the womb of his daughter Mandane, the branches whereof overshadowed all Asia; whereupon having consulted the soothsayers, he was told that his dream portended the future power and greatness of a child who should be born of his daughter: and further that the same child should deprive him of his kingdom. Astyages, to prevent the accomplishment of this prediction, instead of marrying his daughter to some powerful prince, gave her to Cambyses, a Persian of mean condition, and one who had no great capacity for forming any important design, nor for supporting the ambition of his son by his own riches and authority. Nor did Astyages stop here: the apprehensions he was under lest Mandane's son might perhaps find that assistance in his own courage, or some lucky circumstance which his family was not able to supply him with, induced him to take a resolution of despatching the child, if there should be any. As soon, therefore, as he understood his daughter was with child, he commanded one of his officers whose name was Harpagus, to destroy the infant as soon as it came into the world. Harpagus, fearing the resentment of Mandane, put the child into the hands of one who was the king's shepherd, in order to expose him. The shepherd's wife was so extremely touched with the beauty of Cyrus, that she desired her husband rather to expose her own son, who was born some time before, and preserve the young prince. After this manner Cyrus was preserved, and brought up among the king's shepherds.

One day, as the neighbouring children were at play together, Cyrus was chosen king; and having punished one of his little playfellows with some severity, for disobeying his commands, the child's parent complain'd of Cyrus to Astyages. This prince sent for young Cyrus, and observing something great in his air, his manner and behaviour, together with a great resemblance of his daughter Mandane, he made particular inquiry into the matter, and discovered that, in reality, Cyrus was no other than his grandson. Harpagus, who was the instrument of preserving him, was punished with the death of his own son: however, Astyages believing that the royalty which the soothsayers had promised to the young prince, was only that which he had lately exercised among the shepherd's children, troubled himself no more about it. Cyrus being grown up, Harpagus disclosed the whole secret of his birth to him, together with the manner wherein he had delivered him from the cruel resolution of his grandfather. He encouraged him to come into Media, and promised to furnish him with forces, in order to make him master of the country, and depose Astyages. Cyrus hearkened to these propositions, engaged the Persians to take up arms against the Medes, marched at the head of them to meet Astyages, defeated him, and possessed himself of Media. He carried on many other wars; and at length sat down before Babylon, which after a long siege he took.

The relation of Cyrus's life from Xenophon is as follows: Astyages king of Media married his daughter Mandane to Cambyses king of Persia, son to Achemenes king of the same nation. Cyrus was born at his father's court, and was educated with all the care his birth required. When he was about the age of 12 years, his grandfather Astyages sent for him to Media, together with his mother Mandane. Some time after, the king of Assyria's son having invaded Media, Astyages, with his son Cyaxares and his grandson Cyrus, marched against him. Cyrus distinguished himself in this war, and defeated the Assyrians. Cambyses afterwards recalled him, that he might have him near his own person; and Astyages dying, his son Cyaxares, uncle by the mother's side to Cyrus, succeeded him in the kingdom of Media.

Cyrus, at the age of 30 years, was, by his father Cambyses, made general of the Persian troops; and sent at the head of 33,000 men to the assistance of his uncle Cyaxares, whom the king of Babylon, with his allies the Cappadocians, Carians, Phrygians, Cilicians, and Paphlagonians were preparing to attack. Cyaxares and Cyrus prevented them, by falling upon them and dispersing them. Cyrus advanced as far as Babylon, and spread terror throughout the country. From this expedition he returned to his uncle, towards the frontiers of Armenia and Assyria, and was received by Cyaxares in the tent of the Assyrian king whom he had defeated.

After this Cyrus carried the war into the countries beyond the river Haly, entered Cappadocia, and subdued it entirely. From thence he marched against Croesus king of Lydia, beat him in the first battle; then besieged him in Sardis his capital; and after a siege of fourteen days obliged him to surrender. See CROESUS. After this, Cyrus having reduced almost all Asia, repassed the Euphrates, and made war upon the Assyrians. He marched directly to Babylon, took it, and there prepared a palace for his uncle Cyaxares, whither he might retire, if at any time he had an inclination to come to Babylon; for he was not then in the army. After all these expeditions, Cyrus returned to his father and mother into Persia, where they were still living: and going some time after to his uncle Cyaxares into Media, he married his cousin the only daughter and heiress of all Cyaxares's dominions, and went with her to Babylon, from whence he sent men of the first rank and quality to govern all the several nations which he had conquered. He engaged again in several wars, and subdued all the nations which
which lie between Syria and the Red sea. He died at the age of 70 years, after a reign of 30: but authors differ very much concerning the manner of his death. Herodotus, Justin, and Valerius Maximus relate, that he died in the war against the Scythians; and that falling into an ambush which Queen Tamys had laid for him, she ordered his head to be cut off, and cast into a vessel full of blood, saying, “Thou hast always thirsted after human blood, now glut thyself with it.” Diodorus the Sicilian says, that he was taken in an engagement and hanged. Ctesias assures us, that he died of a wound which he received in his thigh: but by Xenophon’s account he died peaceably in his bed, amidst his friends and his servants; and certain it is, that in Alexander’s time his monument was shown at Passargada in Persia.

From all this it is easy to conclude, that we are but imperfectly acquainted with the history of this great prince, the founder of the Persian, and destroyer of the Chaldean empire. We learn fewer particulars of it from Scripture, but then they are more certain than any that we have produced. Daniel (viii. 3—20.) in the famous vision wherein God showed him the ruin of several great emperors, which were to precede the birth of the Messiah, represents Cyrus to us under the idea of “a ram, which had two horns; and the two horns were high, but the one was higher than the other, and the higher came up last. This ram pushed westward, and northward, and southward, so that no beasts might stand before him; neither was there any that could deliver out of his hand, but he did according to his will, and became great.” The ram’s two horns signify the two empires which Cyrus reunited in his person; that of the Medes, and that of the Persians. The last was greater and more powerful than the empire of the Medes; or otherwise, these two horns signify the two branches of Cyrus’s successors. His son Cambyses dying, the empire was transferred to Darius the son of Hystaspes, and was continued down to Darius Codomannus, who, as Calmet thinks, is the great horn which the he-goat, that denotes Alexander, runs against. In chap. vii. 5. Daniel converses Cyrus to a bear, with three ribs in the mouth of it, to which it was said, “Arise, devour much flesh.” Cyrus succeeded his father Cambyses in the kingdom of Persia, and Darius the Mede, by Xenophon called Cyaixares, and Astyages in the apocryphal chapter (xii. 1.) of Daniel, in the kingdom of the Medes and empire of Babylon. He was monarch of all the east; or as he speaks (2 Chr. xxxvi. 22, 23, and Ezr. i. 1, 2.) “of all the earth,” when he permitted the Jews to return to their own country, in the year of the world 3466, before Jesus Christ 538. The enemies of the Hebrews, making use of this prince’s affection to his own religion, prevailed with him to put a stop by his orders to the building of the temple at Jerusalem; (Ezra iv. 5.) The prophets frequently foretold the coming of Cyrus; and Isaiah (xlv. 28.) has been so particular as to declare his name 200 years before he was born. Josephus (Antiq. lib. ii. c. 2.) says, that the Jews of Babylon showed this passage of the prophet to Cyrus; and that this prince, in the edict which he granted them for their return, acknowledged that he received the empire of the world from the God of Israel; and that the same God had described him by name in the writings of the prophets, and foretold that he should build a temple to him at Jerusalem. Cyrus is pointed out in Scripture under the name of the righteous man and the shepherd of Israel, (Isaiah xli. 2, 10, xlv. 28.) and xli. 11. Notwithstanding this, God says of him (Isaiah xlv. 5.) “I girded thee, though thou hast not known me.” And Jeremiah calls Cyrus and his people who overthrew the Babylonish empire, thieves and robbers. The taking of Babylon by Cyrus is clearly set down by the prophets, and may be seen under the articles BABYLON and BELSHAZZAR. Archbishop Usher fixes the birth of Cyrus to the year of the world 3405; his first year at Babylon to 3466, and his death to 3475. The eastern people will have it, that Cyrus by his mother’s side was descended from some of the Hebrew prophets; as also that his wife was a Jew, which is the reason (say they) that this prince so attached himself to the Jews, to whom he was so nearly allied.

CYRUS II. was the younger son of Darius Nothus, and the brother of Artaxerxes. He was sent by his father at the age of 16 to assist the Lacedemonians against Athens. Artaxerxes succeeded to the throne at the death of Nothus; and Cyrus, who was of an aspiring soul, attempted to assassinate him. He was discovered, and had been punished with death, had not his mother Parysatis saved him from the hands of the executioner by her tears and entreaties. This circumstance did not in the least check the ambition of Cyrus; he was appointed over Lydia and the sea-coasts, where he secretly fomented rebellion and levied troops under various pretences. At last he took the field with an army of 100,000 barbarians, and 13,000 Greeks under the command of Clearchus. Artaxerxes met him with 900,000 men near Cunaxa. The battle was long and bloody; and Cyrus might have perhaps obtained the victory, had not his uncommon rashness proved his ruin. It is said that the two royal brothers met in person, and their engagement ended in the death of Cyrus, 401 years before the Augustan age. Artaxerxes was so anxious to be universally heralded that his brother had fallen by his hand, that he put to death two of his subjects for boasting that they had killed Cyrus. The Greeks, who were engaged in the expedition, obtained much glory in the battle; and after the death of Cyrus they remained victorious in the field without a commander. They were not discouraged though at the distance of above 600 leagues from their country, and surrounded on every side by a powerful enemy. They unanimously united in the election of commanders, and traversed all Asia, in spite of the continual attacks of the Persians; and nothing is more truly celebrated in ancient history than the bold retreat of the ten thousand. The journey that they made from the time of their first embarkation till their return, has been calculated at 1155 leagues, performed in the space of 15 months, including all the time which was devoted to take rest and refreshment. This retreat has been celebrated by Xenophon, who was one of their leaders, and among the friends and supporters of Cyrus.

CYS, the bag or tunic including all encysted tumours, as the scirrhus, atheroma, staxoma, meliceres, &c.
CYSTIC, in Anatomy, a name given to two arteries and two veins.

CYSTIC Duct. See Anatomy Index.

CYTHERA, -orum, in Ancient Geography, an island opposite to Malles, a promontory, and to Boize a town of Laconia. The island was sacred to Venus, with a very ancient temple of that goddess exhibited in armour at Cythera, as in Cyprus. It is now called Cerigo, and forms one of the seven Ionian isles. See IONIAN ISLANDS, SUPPLEMENT.

CYTHEREA, in Mythology, the surname of Venus, so called from Cythera an island, where she had a temple esteemed the most ancient in Greece, and on the shores of which she was believed to be born by the Zephyrs, surrounded by the Loves, the Tritons, and Nereides, reclining in a languishing posture in a seashell. They give the name of Cytheriades to the Graces which attended her on the shore without quitting her, except on those occasions when she rather chose to be waited upon by the Pleasures.

CYTINUS, a genus of plants belonging to the gynandra class; and in the natural method ranking under the 11th order, Sarmentaceae. See Botany Index.

CYTISUS, TREE TREFOL, a genus of plants belonging to the diadephia class, and in the natural method ranking under the 32d order, Papilionaceae. See Botany Index.

CYZICENS, CYZICENA, among the ancient Greeks, were a sort of magnificent banqueting houses, always looking toward the north, and usually opening upon gardens. They had their name from Cyzicus, a city very considerable for the grandeur of its buildings; situated in an island of Myosia, bearing the same name.

CYZICUM, CYZICUS, in Ancient Geography, one of the noblest cities of the hither Asia; situated in a cognominal island of the Propontis, on the coast of Myosia; joined to the continent by two bridges (Strabo); the first by Alexander; the city, a colony of the Milesians (Pliny). Rendered famous by the siege of Mithridates, which was raised by Lucullus. The inhabitants were made a free people by the Romans, but forfeited their freedom under Tiberius. It was adorned with a citadel and walls round it; had a port and marble towers; and three magazines, one for arms, another for warlike engines, and a third for corn. Cyziceni, the people; noted by the ancients for their timidity and effeminacy: hence the proverb in Zenderotus and others, Tinctura Cyzicena, applied to persons guilty of an indecency through fear; but Stateres Cyziceni, nummi Cyziceni, denote things executed to perfection.

CZACKTHURN, a strong town of Germany, in Austria, and near the frontiers of Hungary. It is seated between the rivers Drave and Muhr, in, E. Long. 17. 19. N. Lat. 45. 24.

CZAR, a title of honour, assumed by the grand duke, on as they are now styled, emperors of Russia.

The natives pronounce it tsar, or tszor; and this, by corruption (it has been fancied), from Cesar, "emperor," from some imagined relation to the Roman emperors. But this etymology does not seem correct.

When the czar Peter formerly required of the European courts an acknowledgment of his imperial titles, and that the appellation of Emperor should never be omitted, there was great difficulty made about it, especially at the court of Vienna; which occasioned him to produce the famous letter, written in the German tongue, from Maximilian I. emperor of Germany, to Vassili Ivanovitch, confirming a treaty of alliance offensive and defensive against Sigismund king of Poland. In this dispatch, which is dated August the 4th, 1574, and is ratified with the seal of the golden bull, Maximilian addresses Vassili by calling him Kayser and Herrscher aller Russen, "emperor and ruler of all the Russians." But independently of this document, there could be no doubt that the foreign courts, in their intercourse with that of Moscow, styled the sovereign indiscriminately Great Duke, Czaz, and Emperor. With respect to England in particular, it is certain that in Chancellor's Account of Russia, so early as the middle of the 16th century, Ivan Vassiliowitch II. is called Lord and Emperor of all Russia; and in the English dispatches, from the reign of Elizabeth to that of Anne, he is generally addressed under the same appellation. When the European powers, however, styled the czaz Emperor of Muscovy, they by no means intended to give him a title similar to that which was peculiar to the emperor of Germany; but they bestowed upon him that appellation as upon an Asiatic sovereign, in the same manner as we now say the emperors of China and Japan. When Peter, therefore, determined to assume the title of emperor, he found no difficulty in proving that it had been conferred upon his predecessors by most of the European powers; yet when he was desirous of affixing to the term the European sense, it was considered as an innovation, and was productive of more negociations than would have been requisite for the terminus of the most important state affair. At the same time it occasioned a curious controversy among the learned, concerning the rite and progress of the titles by which the monarchs of this country have been distinguished. From their researches it appeared, that the early sovereigns of Russia were called great dukes, and that Vassili Ivanovitch was probably the first who styled himself czar, an expression which in the Slavonian language signifies king; and that his successors continued to bear within their own dominions that title as the most honourable appellation, until Peter the Great first took that of Povetil, or emperor. After many delays and objections, the principal courts of Europe consented, about the year 1722, to address the sovereign of Russia with the title of Emperor; without prejudice, nevertheless, to the other crowned heads of Europe.

CZASLAU, a town of Bohemia, and capital of a circle of the same name. The principal church has the highest tower in Bohemia; and near this place the king of Prussia gained a victory over the Austrians in 1742. It is seated on the river Crudenka, in E. Long. 15. 32. N. Lat. 49. 50.

CZENSTOKOW, a town of Russian Poland in the palace of Cracovia, with a fort, in which they keep a rich treasure called the treasure of the Virgin Mary. The pilgrims flock hither so much for the sake of a convent near it, that it is called the Loreto of Poland. The town is situated on the river Warte. E. Long. 19. 15. N. Lat. 50. 48.
DAC

CZERNIC, a town of Carniola, in Austria, situated in E. Long. 15° 00'. N. Lat. 46° 12'. It is remarkable for its lake; for a particular description of which see the article CIRCHNITZER.

CZERNIKOU, a considerable town of Muscovy, and capital of a duchy of the same name, with a castle.

DAC

THE fourth letter of the alphabet, and the third consonant.

Grammarians generally reckon D among the lingual letters, as supposing the tongue to have the principal share in the pronunciation thereof; though the Abbate de Dangeau seems to have reason in making it a palatal letter. The letter D is the fourth in the Hebrew, Chaldee, Samaritan, Syriac, Greek, and Latin alphabets; in the five first of which languages it has the same name, though somewhat differently spoken, e.g. in Hebrew, Samaritan, and Chaldee, Dileth, in Syriac Doleth, and in Greek Delta.

The form of our D is the same with that of the Latin, as appears from all the ancient medals and inscriptions, and the Latin D is no other than the Greek Δ, rounded a little, by making it quicker and at two strokes. The Δ of the Greeks, again, is borrowed from the ancient character of the Hebrew Dileth: which form it still retains, as is shown by the Jesuit Souciet, in his dissertation on the Samaritan Medals.

D is also a numerical letter, signifying five hundred, which arises hence, that in the Gothic characters, the D is half the M, which signifies a thousand, hence the verse,

Litara D velut A quingentes significabit

A dash added a-top D, denotes it to stand for five thousand.

Used as an abbreviation, it has various significations: thus D stands for Doctor; as, M. D. for Doctor of Medicine; D. T. Doctor of Theology; D. D. implies Doctor of Divinity, or "dono dedit." D. D. is used for "dat, dicat, dedicat; and D. D. D. for "dignum Deo donum dedit."

DAB, the English name of a species of Pleuronectes. See Ichthyology Index.

DABUL, a town of Asia, in the East Indies, on the coast of Malabar, and to the south of the gulf of Cambay, on a navigable river. It was formerly very flourishing, but is now much decayed. It belongs to the Maharrates, and its trade consists principally in pepper and salt. E. Long. 72° 50'. N. Lat. 17° 30'.

DACCA, a town of Asia, in the kingdom of Bengal in the East Indies, situated in E. Long. 92° 10'. N. Lat. 23° 45'.—The advantages of the situation of this place, and the fertility of the soil round it, long since made it the centre of an extensive commerce. The courts of Delhi and Mysore were furnished from thence with the cottons wanted for their own consumption; and it was formerly the custom of each to maintain an agent on the spot to superintend the manufacture, who had an authority, independent of the magistrate, over the brokers, weavers, embroiderers, and all the workmen whose business had any relation to the object of his commission. These unhappy people are forbidden, under pecuniary and corporal penalties, to sell, to any person whatever, a piece exceeding the value of three guineas. Dacca was for eighty years the capital of Bengal.

In this, as in all the other markets, the Europeans treat with the Moorish brokers settled upon the spot, and appointed by the government. They likewise lend their name to the individuals of their own nation, as well as to Indians and Armenians living in their settlements, who, without this precaution, would infallibly be plundered. The Moors themselves, in their private transactions, sometimes avail themselves of the same pretence, that they may pay only two, instead of five per cent. A distinction is observed, in their contracts, between the cottons that are bespoke and those which the weaver ventures, in some places, to manufacture on his own account. The length, the number of threads, and the price, of the former are fixed; nothing further than the commission for the latter is stipulated, because it is impossible to enter into the same detail. These nations that make a point of having fine goods, take proper measures that they may be enabled to advance money to their workmen at the beginning of the year. The weavers, who in general have but little employment at that time, perform their work with less hurry than in the months of October, November, and December, when the demand is pressing.

Some of the cottons are delivered unbleached, and others half bleached. It were to be wished that this custom might be altered. It is very common to see cottons that look very beautiful go off in the bleaching. Perhaps the manufacturers and brokers foresee how they will turn out, but the Europeans have not so exquisite a taste, nor such an experienced eye, to discern this. It is a circumstance peculiar to India, that cottons, of what kind soever they are, can never be well bleached and prepared but in the place where they are manufactured. If they have the misfortune to get damage before they are shipped for Europe, they must be sent back to the places from whence they came.

DACE, a species of Cyprinus. See Ichthyology Index.
This fish is extremely common in our rivers, and gives the expert angler great diversion. The dace will bite at any fly; but he is more than ordinarily fond of the stone caddis, or May fly, which is plentiful in the latter end of April and the whole month of May. Great quantities of these may be gathered among the reeds or sedges by the water-side, and on the hawthorn bushes near the waters. These are a large and handsome bait; but as they only last a small part of the year in season, recourse is to be had to the ant-fly. Of these the black ones found in large mole-hills or ant-hills are the best. These may be kept alive a long time in a bottle, with a little of the earth of the hill, and some roots of grass; and they are in season throughout the months of June, July, August, and September. The best season of all is when they swarm, which is in the end of July or beginning of August; and they may be kept many months in a vessel washed out with a solution of honey and water, even longer than with the earth and grass-roots in the vial; though that is the most convenient method with a small parcel taken for one day’s fishing. In warm weather this fish very seldom refuses a fly at the top of the water; but at other times he must have the bait sunk to within three inches of the bottom. The winter fishing for dace requires a very different bait: this is a white maggot with a red head, which is the product of the eggs of the beetle, and is turned up with the plough in great abundance. A parcel of these put in any vessel, with the earth they were taken in, will keep many months, and are an excellent bait. Small dace may be put into a glass jar with fresh water; and there preserved alive for a long time, if the water is properly changed. They have been observed to eat nothing but the animalcula of the water. They will grow very tame by degrees.

DACIA, a town of Bavaria in Germany. It is pretty large, well built, and seated on a mountain, near the river Amber, 10 miles N. W. of Munich. Here the electors have a palace and fine gardens. E. Long. 11° 30'. N. Lat. 48° 20'.

DACIA, in Ancient Geography, a country which Trajan, who reduced it to a province, joined to Moesia by an admirable bridge. This country lies extended between the Danube and Carpathian mountains, from the river Tisicicus, quite to the north bend of the Danube; so as to extend thence in a direct line to the mouth of the Danube and to the Euxine; on the north side, next the Carpathes, terminated by the river Iasius, now the Pruth; and on the west by the Tisicicus or Teisa; comprising a part of Upper Hungary, all Transylvania and Wallachia, and a part of Moldavia. Daci, the people; a name which Strabo takes to be the same with the Daci of comedies; neighbours, on the west, to the Getæ, an insular name also in comedies. Josephus mentions a set of religious men among the Daci, whom he calls Pléistis, and compares with the Esseni: of these Plistis no other author makes any mention. Dacicus, the epithet assumed by some emperors (Juvenal). There was a Dacia Aureliana, a part of Illyricum, which was divided into the eastern and western Sirmium being the capital of the latter, and Sardica of the former, but this belongs to the lower age.

DACIER, ANDREW, born at Castres in Upper Languedoc, 1651, had a great genius and inclination for learning, and studied at Saumur under Tannegue le Fevre, then engaged in the instruction of his daughter, who proved afterwards an honour to her sex. This gave rise to that mutual tenderness which a marriage of 40 years could never weaken in them. The duke of Montausier hearing of his merit, put him in the list of commentators for the use of the Dauphin, and engaged him in an edition of Pompeius Festus, which he published in 1681. His edition of Horace, printed at Paris in 10 vols. 12mo, and his other works, raised him a great reputation. He was made a member of the academy of inscriptions in 1695. When the history of Louis XIV. by medals was finished, he was chosen to present it to his majesty; who being informed of the pains which he had taken in it, settled upon him a pension of 2000 livres, and appointed him keeper of the books of the king’s closet in the Louvre. When that post was united to that of library-keeper to the king, he was not only continued in the privilege of his place during life, but the survivance was granted to his wife; a favour of which there had been no instance before. But the death of Madame Dacier in 1720, rendered this grant, which was so honourable to her, ineffectual. He died September 18th, 1722, of an ulcer in the throat. In his manners, sentiments, and the whole of his conduct, he was a complete model of that ancient philosophy of which he was so great an admirer, and which he improved by the rules and principles of Christianity.

DACIER, Anne, daughter of Tannegue le Fevre, professor of Greek at Saumur in France. She early showed a fine genius, which her father cultivated with great care and satisfaction. After her father’s death she went to Paris, whither her fame had already reached; she was then preparing an edition of Callimachus, which she published in 1674. Having shown some sheets of it to Mr. Huet, preceptor to the dauphin, and to several other men of learning at the court, the work was so highly admired, that the duke of Montausier made a proposal to her of publishing several Latin authors for the use of the dauphin. She rejected this proposal at first, as a task to which she was not equal. But the duke insisted upon it; so that at last he gained her consent; upon which she undertook an edition of Florus, published in 1674. Her reputation being now spread over all Europe, Christina, queen of Sweden, ordered Count Konigsmark to make her a compliment in her name: upon which Madame Agesse sent the queen a Latin letter with her edition of Florus; to which her majesty wrote an obliging answer, and not long after sent her another letter, to persuade her to abandon the Protestant religion, and made her considerable offers to settle at her court. In 1683 she married Mr. Dacier; and soon after declared her design to the duke of Montausier and the bishop of Meaux of reconciling herself to the church of Rome, which she had entertained for some time; but as Mr. Dacier was not yet convinced of the reasonableness of such a change, they retired to Castres in 1684, where they had a small estate, in order to examine the points of controversy between the Protestants and the Roman Catholics. They at last determined in favour of the latter, and made the public abjuration in 1685. After this, the king gave both husband and wife marks of
of his favour. In 1603, she applied herself to the education of her son and daughter, who made a prodigious progress: the son died in 1604, and the daughter became a nun in the abbey of Longchamp. She had another daughter, who had united in her all the virtues and accomplishments that could adorn the sex; but she died at 18. Her mother has immortalized her memory in the preface to her translation of the Iliad. Madame Dacier was in a very infirm state of health the two last years of her life; and died, after a very painful sickness, August 17, 1720, aged 69. She was remarkable for her firmness, generosity, equality of temper, and piety.

DACTYL, (dactylus), a foot in the Latin and Greek poetry, consisting of a long syllable, followed by two short ones; as carmine. Some say it is derived from δακτύλος, "a finger," because it is divided into three joints, the first of which is longer than the other two.

The dactyl is said to have been the invention of Dionysius or Bacchus, who delivered oracles in this measure at Delphi, before Apollo. The Greeks call it ποιητικός. The dactyl and spondee are the most considerable of the poetical feet; as being the measures used in heroic verse by Homer, Virgil, &c. These two are of equal time, but not equal motion. The spondee has an even, strong, and steady pace, like a trot: the dactyl resembles the nimbler strokes of a gallop.

DACTYLI IDEI: the Fingers of Mount Ida. Concerning these, Pagan theology and fable give very different accounts. The Cretans paid divine worship to them, as those who had nursed and brought up the god Jupiter; whence it appears that they were the same as the Corybantes and Curetes. Nevertheless Strabo makes them different; and says, that the tradition in Phrygia was, that the Curetes and Corybantes were descended from the Dactyli Idei: that there were originally an hundred men in the island, who were called Dactyli Idei; from whom sprang nine Curetes, and each of these nine produced ten men, as many as the fingers of a man's two hands; and that this gave the name to the ancestors of the Dactyli Idei. He relates another opinion, which is, that there were but five Dactyli Idei; who, according to Sophocles, were the inventors of iron: that these five brothers had five sisters, and that from this number they took the name of Fingers of Mount Ida, because they were in number ten: and that they worked at the foot of this mountain. Dionysus Siculus reports the matter a little differently. He says, "the first inhabitants of the island of Crete were the Dactyli Idei, who had their residence on Mount Ida; that some said they were an hundred; others only five in number, equal to the fingers of a man's hand, whence they had the name of Dactyli: that they were magicians, and addicted to mystical ceremonies: that Orpheus was their disciple, and carried their mysteries into Greece: that the Dactyl invented the use of iron and fire, and that they had been recompensed with divine honours."

Diomedes the grammarian says, the Dactyli Idei were priests of the goddess Cybele: called Idei, because that goddess was chiefly worshipped on Mount Ida in Phrygia; and Dactyl, because that, to prevent Saturn from hearing the cries of infant Jupiter, whom Cybele had committed to their custody, they used to sing certain verses of their own invention, in the Dactylic measure. See Curetes and Corybantes.

DACTYLLIC, something that has a relation to dactyls.

Anciently there were dactylic as well as spondaic flutes, tibic dactylica. The dactylic flutes consisted of unequal intervals; as the dactylic foot does of unequal measures.

DACTYLLIC Verses are hexameter verses, ending in a dactyl instead of a spondee; as spondaic verses are those which have a sponde in the fifth foot instead of a dactyl.

An instance of a dactylic verse we have in Virgil:

Bis patria occidere manus; quin protinus omnia
Perlegerem oculis.—Æn. vii. 35.

DACTYLLIOAMENCY, (Dactylliotantia), a sort of divination performed by means of a ring. The word is composed of the Greek δακτυλος, "ring," of δακτυλος, "a finger," and ματτας, "divination."

Dactyllomancy consisted principally in holding a ring, suspended by a fine thread, over a round table, on the edge whereof were made divers marks with the twenty-four letters of the alphabet. The ring in shak- ing, or vibrating over the table, stopped over certain of the letters, which, being joined together, composed the answer required. But the operation was preceded and accompanied by several superstitious ceremonies: for first the ring was to be consecrated with a great deal of mystery; the person who held it was to be clad in linen garments to the very shoes; his head was to be shaved all round; and in his hand he was to hold vervain. And before he proceeded, the gods were first to be appeased by a formulary of prayers, &c. Ammius Marcellinus gives the process at large in his 29th book.

DACTYLLIS, Cock's-foott GRASS, a genus of plants belonging to the triandria class; and in the natural method ranking under the 4th order, Gramina. See Botany Index.

DACTYLLUS, the fruit of the palm-trees, more usually called dates.

DACTYLLUS, a sort of dance among the ancient Greeks, chiefly performed, Hesychius observes, by the athlete.

DACTYLLUS, a name given by Pliny to a species of Pholas. See Pholas, Conchology Index.

DADUCHI, in antiquity, priests of Ceres. That goddess having lost her daughter Proserpine, say mythologists, began to make search for her at the beginning of the night. In order to do this in the dark, she lighted a torch and thus set forth on her travels throughout the world: for which reason it is that she is always seen represented with a lighted torch in her hand. On this account, and in commemoration of this pretended exploit, it became a custom for the priests, at the feasts and sacrifices of this goddess, to run about in the temple, with torches after this manner; one of them took a lighted torch from off the altar, and holding it with his hand, ran with it to a certain part of the temple where he gave it to another, saying to him, Tibi trudo: this second ran after the like manner to another part of the temple, and gave it to the third, and so of the rest. From this ceremony the priests became denominatad daduchi, dadusci, q. d.
country gave him a cordial reception. Dædalus made a famous labyrinth for Minos, and assisted Pasiphae the queen to gratify her unnatural passion for a bull. For this action Dædalus incurred the displeasure of Minos, who ordered him to be confined in the labyrinth which he had constructed. Here he made himself wings with feathers and wax, and carefully fitted them to his body and that of his son, who was the companion of his confinement. They took their flight in the air from Crete: but the heat of the sun melted the wax on the wings of Icarus, whose flight was too high, and he fell into that part of the ocean which from him has been called the Icarian sea. The father, by a proper management of his wings, alighted at Cumæ, where he built a temple to Apollo, and thence directed his course to Sicily, where he was kindly received by Cocalus, who reigned over part of the country. He left many monuments of his ingenuity in Sicily, which still existed in the age of Diodorus Siculus. He was despatched by Cocalus, who was afraid of the power of Minos, who had declared war against him because he had given an asylum to Dædalus. The flight of Dædalus from Crete with wings is explained by observing that he was the inventor of sails, which in his age might pass at a distance for wings. He lived 1400 years before the Christian era. There were two statues of the same name; one of Sicyon, son of Procris, and the other a native of Bithynia.

Dæmon (Daemon), a name given by the ancients to certain spirits or genii, which they say appeared to men, either to do them service or to hurt them. The Greek word daemon is derived (according to Plato, in his Cratylus, p. 390, ed. Servius, vol. 1) from daimein, "knowing or intelligent," but according to others from daimein, "to distribute" (see the Scholiast on Homer, II. i. ver. 222). Either of these derivations agrees with the office ascribed to demons by the ancient heathens, as the spirit intrusted with the inspection and government of mankind. For, according to the philosophers, demons held a middle rank between the celestial gods, and men on earth, and carried on all intercourse between them; conveying the addresses of men to the gods, and the divine benefits to men. It was the opinion of many, that the celestial divinities did not themselves interpose in human affairs, but committed the entire administration of the government of this lower world to these sublunary deities: Neque ensim pro majestate deum celestium fuerit, hac curare; (Apuleius de deo Socratis, p. 677.). Cuncta celestium voluntate, nomine, et authoritate, sed demonum obseque, et operis et ministerio fieri arbitrorum est; (Id. p. 675.). Hence they became the objects of divine worship. "If idols are nothing," Celsus (apud Origem, cont. Cel. lib. viii. p. 393), "what harm can there be to join in the public festivals? If they are demons, then it is certain that they are gods, in whom we are to confide, and to whom we should offer sacrifices and prayers to render them propitious."

Several of the heathen philosophers held that there were different kinds of demons; that some of them were spiritual substances of a more noble origin than the human race, and that others had once been men. But those demons who were the more immediate objects of the established worship among the ancient
DAEMON [ 50 ]

The word daemon is used indifferently in a good and a bad sense. In the former sense, it was very commonly used among the ancient heathens. "We must not (says Manander) think any daemon to be evil, hurtful to a good life, but every god to be good." Nevertheless, these are certainly mistaken who affirm, that daemon never signifies an evil being till after the times of Christ. Pythagoras held daemons, or spiritual beings, to be the attendants (Dioge. Laert. Vit. Pithagor. p. 314. ed. Amsterdam) Zaloeus, in his preface to his Laws (sopul Stob. Serm. 42.) supposes that an evil daemon might be present with a man, to influence him to injustice. The daemons of Empedocles were evil spirits, and exiles from heaven; (Plutarch dæmonem quosque daemonibus.) And in this life of Dion (p. 938.), he says, "It was the opinion of the ancients that evil and mischievous daemons, out of envy and hatred to good men, oppose whatever they do." Searce did any opinion more generally prevail in ancient times than this, viz. that as the departed souls of good men became good daemons, so the departed souls of bad men became evil daemons.

It has been generally thought, that by daemons we are to understand devils, in the Septuagint version of the Old Testament. Others think the word is in that version certainly applied to the ghosts of such dead men as the heathens defiled, in Deut. xxxii. 17. Ps. cxi. 37. That daemon often bears the same meaning in the New Testament and pass. Acts xvii. 34. 1 and Cor. x. 21. 1 Tim. iv. 1. Rev. ix. 21. is shown at large by Mr Joseph Mede (Works, p. 623, et seq. That the word is applied always to human spirits in the New Testament, Mr Farner has attempted to show in his Essay on demonesics, p. 208, et seq. As to the meaning of the word daemon in the fathers of the Christian church, it is used by them in the same sense as it was by the heathen philosophers, especially the latter Platonists; that is, sometimes for departed human spirits, and at other times for such spirits as had never inhabited human bodies. In the fathers, indeed, the word is more commonly taken in an evil sense, than in the ancient philosophers. Besides the two aforementioned kinds of daemons, the fathers, as well as the ancient philosophers, held a third, viz. such as sprang from the congress of superior beings with the daughters of men. In the theology of the fathers, these were the worst kind of daemons.

Different orders of daemons had different stations and employments assigned them by the ancients. Good daemons were considered as the authors of good to mankind; evil daemons brought innumerable evils both upon men and beasts. Amongst evil daemons there was a great distinction in respect to the offices assigned them; some compelled men to engage in evil enterprises, others stimulated them to madness. See DEMONIAC.

Much has been said concerning the daemon of Socrates. He pretended to his friends and disciples, and even declared to the world, that a friendly spirit, whom he called his daemon, directed him how to act on every important occasion in his life, and restrained him from imprudence of conduct.

In contemplating the character of this great philosopher, while we admire him as the noblest pattern of virtue and moral wisdom that appeared in the heathen world, we are naturally led to inquire, whether what he gave out concerning his daemon were a trick of imposture, or the reverie of a heated imagination, or a sober and true account of a favour which heaven designed to confer on so extraordinary a man.

To ascertain in this case the object of our inquiries, is by no means so easy as the superficial thinker may be apt to imagine. When we consider the dignity of sentiment that inspired the man, which appeared displayed throughout the character of Socrates; the respect which in his conversation and conduct he uniformly testified for the ordinary duties of social life, sufficiently prove that he was free from the influence of blind enthusiasm: we cannot infer, therefore, that, like the astronomer in Rasselas, he was deceived with respect to his daemon by an overheated imagination. It is so less difficult to believe, that God would distinguish a heathen in so eminent a manner, and yet leave him uninstructed in the principles of true religion. Surely, if ever scepticism is reasonable, it must be in such matters as the present.

Yet, if it be still insisted, that some one of these three notions concerning the daemon of Socrates must be more probable than the others; we would rather deem Socrates an enthusiast in this instance, than degrade him to the base character of an impostor, or suppose that a spiritual being actually revealed himself to the philosopher, and descended to become his constant attendant and counsellor. People are often under the influence of an overheated imagination with regard to some one thing, and cool and sober as to every thing else.

DAEMONIAC (from daemon), a human being whose Deity revelation and other mental faculties are overpowered and restrained, and his body possessed and actuated by some created spiritual being of superior power.

Such seems to be the determinate sense of the word, but
It is generally agreed, that neither good nor evil spirits are known to exert such authority at present over the human race: but in the ancient heathen world, and among the Jews, particularly in the days of our Saviour, evil spirits at least are thought by many to have been more troublesome.

The Greeks and Romans imagined that their deities, to reveal future events, frequently entered into the prophet or prophetess who was consulted, overpowered their faculties, and uttered responses with their organs of speech. Apollo was believed to enter into the Pythoess, and to dictate the prophetic answers received by those who consulted her. Other oracles besides that of Delphi were supposed to unfold futurity by the same machinery. And in various other cases either malignant demons or benevolent deities were thought to enter into and to actuate human affairs. The Lympathec, the Cerum, the Laront, of the Romans, were all of this description; and the Greeks, by the use of the word Δαιμονία, show that they referred to this cause the origin of madness. Among the ancient heathens, therefore, it appears to have been a generally received opinion, that superior beings entered occasionally into men, overpowered the faculties of their minds, and actuated their bodily organs. They might imagine that this happened in instances in which the effects were owing to the operation of different causes; but an opinion so generally prevalent had surely some plausible foundation.

The Jews, too, if we may trust the sacred writings and Josephus, appear to have believed in demoniacal possession. The case of Saul may be recollected as one among many in which superior created beings were believed by the Jews to exert in this manner their influence over human life. The general tenor of their history and language, and their doctrines concerning good and evil spirits, prove the opinion of demoniacal possession to have been well known and generally received among them.

In the days of our Saviour, it would appear that demoniacal possession was very frequent among the Jews and the neighbouring nations. Many were the evil spirits whom Jesus is related in the gospels to have ejected from patients that were brought unto him as possessed and tormented by those malevolent demons. His apostles too, and the first Christians, who were most active and successful in the propagation of Christianity, appear to have often exerted the miraculous powers with which they were endowed on similar occasions. The demons displayed a degree of knowledge and malevolence which sufficiently distinguished them from human beings: and the language in which the demoniacs are mentioned, and the actions and sentiments attributed to them in the New Testament, show that our Saviour and his apostles did not consider the idea of demoniacal possession as being merely a vulgar error concerning the origin of a disease or diseases produced by natural causes.

The more enlightened cannot always avoid the use of metaphorical modes of expression; which, though founded upon error, have yet been so established in language by the influence of custom, that they cannot be suddenly dismissed. When we read in the book of Joshua, that the sun on a certain occasion stood still, to allow that hero time to complete a victory; we easily find an excuse for the conduct of the sacred historian, in accommodating his narrative to the popular ideas of the Jews concerning the relative motions of the heavenly bodies. In all similar instances, we do not complain much of the use of a single phrase, originally introduced by the prevalence of some groundless opinion, the falsity of which is well known to the writer.

But in descriptions of characters, in the narration of facts, and in the laying down of systems of doctrine, we require different rules to be observed. Should any person, in compliance with popular opinions, talk in serious language of the existence, dispositions, declarations, and actions of a race of beings whom he knew to be absolutely fabulous, we surely could not praise him for candid integrity; we must suppose him to be either exulting in irony over the weak credulity of those around him, or taking advantage of their weakness, with the dishonest and the selfish views of an impostor. And if he himself should pretend to any connexion with this imaginary system of beings, and should claim, in consequence of his connexion with them, particular honours from his contemporaries; whatever might be the dignity of his character in all other respects, nobody could hesitate even for a moment to brand him as an impostor of the basest character.

Precisely in this light must we regard the conduct of our Saviour and his apostles, if the ideas of demoniacal possession were to be considered merely as a vulgar error. They talked and acted as if they believed that evil spirits had actually entered into those who were brought to them as possessed with devils, and as if those spirits were actually expelled by their authority out of the unhappy persons whom they had possessed. They expected, must suppose them, to have their profession and declarations believed, in consequence of their performing such mighty works, and to be honoured as having thus triumphed over the powers of hell. The reality of demoniacal possession stands upon the same evidence with the gospel system in general.

Neither is there anything absurd or unreasonable in this doctrine. It does not appear to contradict those abode of ideas which the general appearance of nature and the series of events suggest concerning the benevolence and wisdom of the Deity, and the councils by which he regulates the affairs of the universe. We often fancy ourselves able to comprehend things to which our understanding is wholly inadequate: we persuade ourselves, at times, that the whole extent of the works of the Deity must be well known to us, and that his designs must always be such as we can fathom. We are then ready, whenever any difficulty arises to us in understanding the conduct of Providence, to model things according to our own ideas; to deny that the Deity can possibly be the author of things which we cannot reconcile; and to assert, that he must act on every occasion in a manner consistent with our narrow views. This is the pride of reason; and it seems to have suggested the strongest objections that have been at any time urged against the reality of demoniacal possession. But the Deity may surely connect one order of
Demoniacal, his creatures with another. We perceive mutual relations and a beautiful connexion to prevail through all that part of nature which falls within the sphere of our observation. The inferior animals are connected with mankind, and subjected to their authority, not only in instances in which it is exerted for their advantage, but even where it is tyrannically abused to their destruction. Among the evil to which mankind have been subjected, why might not their being liable to demoniacal possession be one? While they have the sovereignty of the universe, he may employ whatever agents he thinks proper in the execution of his purposes; he may either commission an angel or let loose a devil; as well as bend the human will, or communicate any particular impulse to matter.

All that revelation makes known, all that human reason can conjecture, concerning the existence of various orders of spiritual beings, good and bad, is perfectly consistent with, and even favourable to, the doctrine of demoniacal possession. It was generally believed through the ancient heathen world; it was equally well known to the Jews, and equally respected by them; it is mentioned in the New Testament in such language, and such narratives are related concerning it, that the gospels cannot well be regarded in any other light than as pieces of imposture, and Jesus Christ must be considered as a man who dishonestly took advantage of the weakness and ignorance of his contemporaries, if this doctrine be nothing but a vulgar error: it reaches nothing inconsistent with the general conduct of Providence; it is not the caution of philosophy, but the pride of reason, that suggests objections against this doctrine.

Those, again, who are unwilling to allow that angels or devils have ever intermingled so much with the concerns of human life, urge a number of specious arguments in opposition to these.

The Greeks and Romans of old, say they, did believe in the reality of demoniacal possession. They supposed that spiritual beings did at times enter into the sons or daughters of men, and distinguish them demoniacally in that situation by capricious freaks, deeds of possession, without wanton mischief, or prophetic enunciations. But in the instances in which they supposed this to happen, it is evident that no such thing took place. Their accounts of the state and conduct of those persons whom they believed to be possessed in this supernatural manner, show plainly that what they ascribed to the influence of demons were merely the effects of natural disease. Whatever they relate concerning the Larvae, the Cereri, and the Lympathici, shews that these were merely people disordered in mind, in the same unfortunate situation with those madmen and idiots and melancholy persons whom we have among ourselves.

Pestus describes the Larvata as being furiosi et mente moti. Horace says,

Hellede percussa, Marus cum precipitat se,
Cerirus fuit.

The same is true of the demoniacs of the New Testament.

It appears still more evidently, that all the persons spoken of as possessed with devils in the New Testament, were either mad or epileptic, and precisely in the same condition with the madmen and epileptics of modern times. The Jews, among other reproaches which they threw out against our Saviour, said, He hath a devil, and is mad: why hearken ye him? The expressions, he hath a devil, and is mad, were certainly used on this occasion as synonymous. With all their virulence, they would not surely ascribe to him at once things that were inconsistent and contradictory. Those who thought of the character of Jesus, asserted concerning his discourses, in reply to his adversaries, These are not the words of him that hath a demon; meaning, no doubt, that he spoke in a more rational manner than a madman could be expected to speak. The Jews appear to have ascribed to the influence of demons, not only that species of madness in which the patient is raving and furious, but also melancholy madness. Of John, who secluded himself from intercourse with the world, and was distinguished for abstinence and acts of mortification, they said, He hath a demon. The youth, whose father applied to Jesus to free him from an evil spirit, describing his unhappy condition in these words, Have mercy on my son, for he is lunatic and sore vexed with a demon; for oft times he felteth into the fire, and oft into the water, was plainly epileptic. Every thing indeed that is related in the New Testament concerning demoniacs, proves that they were people affected with such natural diseases as are far from being uncommon among mankind in the present age.

When the symptoms of the disorders cured by our Saviour and his apostles as cases of demoniacal possession, correspond so exactly with those of diseases well known as natural in the present age, it would be absurd to impute them to a supernatural cause. It is much more consistent with common sense and sound philosophy to suppose, that our Saviour and his apostles wisely, and with that condescension to the weakness and prejudices of those with whom they conversed, which so eminently distinguished the character of the Author of our holy religion, and must always be a prominent feature in the character of the true Christian, adopted the vulgar language in speaking of those unfortunate persons who were groundlessly imagined to be possessed with demons, though they well knew the notions which had given rise to such modes of expression to be ill-founded; than to imagine that diseases, which arise at present from natural causes, were produced in days of old by the intervention of demons, or that evil spirits still continue to enter into mankind in all cases of madness, melancholy, or epilepsy.

Besides, it is by no means a sufficient reason for receiving any doctrine as true, that it has been generally received through the world. Error, like an epidemic disease, is communicated from one to another. In certain circumstances, too, the influence of imagination predominates, and restrains the exertions of reason. Many false opinions have extended their influence through a very wide circle, and maintained it long. On every such occasion as the present, therefore, it becomes us to inquire, not so much how generally any opinion has been received, or how long it has prevailed, as from what causes it has originated, and on what evidence it rests.
When we contemplate the frame of nature, we behold a grand and beautiful simplicity prevailing through the whole: notwithstanding its immense extent, and though it contains such numberless diversities of being; yet the simplest machine constructed by human art does not display easier simplicity, or an happier connection of parts. We may therefore venture to draw an inference, by analogy, from what is observable of the order of nature in general to the present case. To permit evil spirits to intermeddle with the concerns of human life, would be to break through that order which the Deity appears to have established through his works; it would be to introduce a degree of confusion unworthy of the wisdom of Divine Providence.

Such are the most rational arguments that have been urged on both sides in this controversy. Perhaps the demonologists have the stronger probabilities on their side; but we will not presume to take upon ourselves the office of arbitrators in the dispute.

Dæmoniacs, in church history, a branch of the Anabaptists; whose distinguishing tenet is, that the devils shall be saved at the end of the world.

Daffodil. See Narcissus, Botany Index.

Dagelet, an island on the coast of Corea, discovered by La Perouse in the year 1787. It is about three leagues in circumference, and is encircled with steep rocks, excepting a few sandy creeks, which form convenient landing-places. The island is covered with fine trees; and at the time the French navigator visited it, some boats were found on the stocks of a Chinese construction. The workmen, who were supposed to be Corean carpenters, were employed upon them, but fled to the woods on the approach of the ships. La Perouse supposes that the island is uninhabited, and that those people go from Corea, and live there only during the summer, for the purpose of building boats. The north-east point of this island is in 15° 37' 15" E. Long. 130° 2' from Paris.

Dagestan, a country of Asia, bounded by Circassia on the north, by the Caspian sea on the east, by Chirvein a province of Persia on the south, and by Georgia on the west. Its chief towns are Tarkus and Derbet, both situated on the Caspian sea.

Dagno, a town of Turkey in Europe, in Albania, with a bishop's see. It is the capital of the district of Ducagni, and is seated on the rivers Drino and Nero, near their confluence. It is 15 miles south-east of Scutari, and 15 north-east of Alessio. E. Long. 49° 48'. N. Lat. 42° 0'.

Dago, or Dacho, an island in the Baltic sea, on the coast of Livonia, between the gulf of Finland and Riga. It is of a triangular figure, and is about 20 miles in circumference. It has nothing considerable but two castles, called Dagoo-wurt and Paden. E. Long. 22° 30'. N. Lat. 56° 48'.

Dakan, as the false god Ashbod, or as the Greeks call it Aso. He is commonly represented as a monster, half man and half fish; whence most learned men derive his name from the Hebrew Dagon, which signifies "fish." Those who make him to have been the inventor of bread corn, derive his name from the Hebrew Dagon, which signifies frumentum; whence Philo Biblius calls him Ζυς Ἐσβοδος, Jupiter Aratrius.

This deity continued to have a temple at Ashbod during all the ages of idolatry to the time of the Maccabees; for the author of the first book of Maccabees tells us, that "Jonathan, one of the Maccabees, having beaten the army of Apollonius, Demetrius's general, they fled to Azotus, and entered into Bethdogon (the temple of their idol): but that Jonathan set fire to Azotus, and burnt the temple of Dagon and all those who had fled into it."

Dagon, according to some, was the same with Jupiter, according to others Saturn, according to others, Venus, and according to most, Neptune.

Dahalac is the largest island in the Red sea, and is placed by Mr Bruce, who has given a minute description of it, between 15° 27' and 15° 54' N. Lat. It is a low, flat island, with a sandy soil, mixed with shells, and in summer destitute of every kind of herbage, excepting a small quantity of bent grass, which is barely sufficient to feed a few antelopes and goats. In many places the island is covered with extensive plantations of acacia trees, which rarely exceed eight feet in height, spreading wide, and turning flat at top, probably from the influence of the wind, which blows from the sea. No rain falls in Dahalac from the end of March to the beginning of October; but in the intermediate months there are heavy showers, during which the water is collected in a great number of artificial cisterns, to serve the inhabitants during the ensuing summer. Of these cisterns, which are said to be the work of the Persians, or, as some suppose, of the first Ptolemies, 370 yet remain, cut out of the solid rock.

The inhabitants of Dahalac are a simple, fearful, and inoffensive people. It is the only part of Arabia where no one is furnished with arms of any kind. After the rains fail, the grass springs up with great luxuriance, and then the goats give the inhabitants a copious supply of milk, which in winter is the principal part of their subsistence. The poorer sort live entirely on shell and other fish. The sole employment of the inhabitants is to work the vessels which trade to the different parts of the coast. Dahalac contains 12 villages or towns, each of which is surrounded with a plantation of doom trees. Of the leaves of this tree, which are of a glossy white when dried, the inhabitants make baskets of great beauty and neatness. This seems to be the only thing like manufacture in the island. Dahalac, as well as the other islands of the Red sea is dependent upon Masuah. Each of the 12 villages furnishes a goat monthly to the governor, and every vessel putting in there for Masuah, pays him a pound of coffee, and every one from Arabia a dollar. These are his principal revenues. In the time of the Ptolemies, the pearl fishery in the vicinity of Dahalac flourished greatly, as well as another valuable fishery, namely that of tortoises.

Daonomy, or Dauma, a powerful kingdom of Africa, on the coast of Guinea. Abony, the modern name, lies in N. Lat. 7° 59'. This kingdom occurs in its true position, in the maps of Samoio, Thomas, and Mercator, where Dawbee, the ancient capital, is denominated Daumina. In 1700, it was erased from the maps of Africa, and the existence of the ancient nation of Dauma denied, till 1727, when it emerged from obscurity, and became known by the conquests of the maritime states of Whidah and Ardra. Between
The palace of the king of Dahomy is an extensive building of bamboo and mud-walled huts, surrounded by a mud-wall about 20 feet high, enclosing a quadrangular space of about a mile square. The entrance to the king's apartment is paved with human skulls, the lateral walls adorned with human jaw-bones, with a few bloody heads intermixed at intervals. The whole building resembles a number of farm-yards, with long thatched barns and sheds for cattle, intersected with low mud-walls. On the thatched roofs, numerous human skulls are ranged at intervals, on small wooden stakes. In allusion to these, when the king issues orders for war, he only announces to his general, that his house wants thatch. In this palace, or large house, as it is termed by the Dahomans, above 3000 females are commonly immured, and about 500 are appropriated by each of the principal officers. From this injurious and detestable practice, originate many flagrant abuses; the population is diminished, the sources of private happiness destroyed, and the best feelings of human nature being outraged, the energies of passion are converted into bitterness and ferocity.

The religion of Dahomy is vague and uncertain in its principles, and rather consists in the performance of some traditional ceremonies, than in any fixed system of belief, or of moral conduct. They believe more firmly in their amulets and fetiches, than in the deity; their national fetich is the Tiger; and their habitations are decorated with ugly images, tipt with blood, stuck with feathers, besmeared with palm-oil, and bedaubed with eggs. As their idea of deity do not coincide with those of Europeans, they imagine that their tutelary gods are different. "Perhaps," said a Dahoman chief to Snelgrave, "that god may be yours, who has communicated so many extraordinary things to white men; but as that god has not been pleased to make himself known to us, we must be satisfied with this we worship." The Dahomans manufacture and dye cotton-cloth, and form a species of cloth of palm-leaves. They are tolerably skilful in working in metals. The barDS, who celebrate the exploits of the king and his generals, are likewise the historians of the country.

DAILLE, JOHN, a Protestant minister near Paris, was one of the most learned divines of the 17th century, and was the most esteemed by the Catholics of all the controversial writers among the Protestants. He was tutor to two of the grandsons of the illustrious M. Du Plessis Mornai. M. Daille having lived 14 years with so excellent a master, travelled into Italy with his two pupils; one of them died abroad; with the other he saw Italy, Switzerland, Germany, Flanders, Holland, and England, and returned in 1621. He was received minister in 1623, and first exercised his office in the family of M. Du Plessis Mornai; but this did not last long, for that lord died soon after. The memoirs of this great man employed M. Daille at the following year. In 1624 he was appointed minister of the church of Saumur, and in 1626 removed to Paris. He spent all the rest of his life in the service of this last church, and composed several works. His first piece was his masterpiece, and an excellent work, Of the Use of the Fathers, printed 1631. It is a strong chain of reasoning, which forms a moral demonstration against those who would have religious disputes decided
DAIRED, or DAIRO, in the history of Japan, is the sovereign pontiff of the Japanese; or, according to Kämpfer, the hereditary ecclesiastical monarch of Japan. In effect, the empire of Japan is at present under two sovereigns, viz. an ecclesiastical one called the dairo, and a secular one who bears the title of kubo. The last is the emperor, and the former the oracle of the religion of the country.

DAIRY, in rural affairs, a place appropriated for the management of milk, and the making of butter, cheese, &c. See Agriculture Index.

The dairy-house should always be kept in the nearest order, and so situated as that the windows or lattices never front the south, south-east, or south-west. Lattices are also to be preferred to windows, as they admit a more free circulation of the air than glazed lights possibly can do. It has been objected, that they admit cold air in winter and the sun in summer; but the remedy is easily obtained, by making a frame the size of or somewhat larger than the lattice, and constructing it so as to slide backward and forward at pleasure. Packthread screwed across this frame, and oiled cap-paper pasted thereon, will admit the light, and keep out the sun and wind.

It is hardly possible in the summer to keep a dairy-house too cool; on which account none should be situated far from a good spring or current of water. They should be neatly paved either with red brick or smooth hard stone; and laid with a proper descent, so that no water may lodge. This pavement should be well washed in the summer every day, and all the utensils belonging to the dairy should be kept perfectly clean. Nor should we ever suffer the churns to be scalded in the dairy, as the steam that arises from hot water will injure the milk. Nor should cheese be kept therein, nor rennet for making cheese, nor a cheese-press be fixed in a dairy, as the whey and curd will diffuse their acidity throughout the room.

The proper receptacles for milk are earthen pans, or wooden vats or trundles; but none of these should be lined with lead, as that mineral certainly contains a poisonous quality, and may in some degree affect the milk; but if people are so obstinate as to persist in using them, they should never forget to scald them, scrub them well with salt and water, and to dry them thoroughly, before they deposit the milk therein. Indeed all the utensils should be cleaned in like manner before they are used; and if after this, they in the least degree smell sour, they must undergo a second scrubbing.

See Dairy, Supplement.

DAIS, a genus of plants belonging to the decandria class; and in the natural method ranking under the 31st order. See Bellis. See Botany Index.

DAISY. See Bellis, Botany Index.

DAIKIR, in our statutes, is used for the twentieth part of a last of hides. According to the statute of 51 Hen.III. De compositione ponderum et mensurorum, a last of hides consists of twenty daikir, and every daikir of ten hides. But by 1 Jac. cap. 32, one last of hides or skins is twelve dozen. See Dicker.

DALACA, an island of the Red sea, which is said to be very fertile, populous, and remarkable for a pearl fishery. It is probably the same with Dalacalac, which see.

DALBERGIA, a genus of plants belonging to the diadelphiea class. See Botany Index.

DALEA, a province of Sweden, bounded on the west by Dalecarlia, on the east by the Wermeland and the lake Wener, on the south by Gottenburg, and on the north by Norway and the sea.

DALEBURG, a town of Sweden, and capital of the province of Dale, seated on the western bank of the lake Wener, 50 miles north of Gottenburg. E. Long. 13° 0'. N. Lat. 59° 0'.

DALECARLIA, a province of Sweden, so called from a river of the same name, on which it lies, near Norway. It is divided into six districts, and is about 175 miles in length and 100 in breadth. It contained 124,806 inhabitants in 1811. It is full of mountains, which abound in mines of copper and iron, some of which are of a prodigious depth. Idra is the capital. The inhabitants are rough, robust, and warlike: and all the great revolutions in Sweden had their rise in this province.

DALECHAMP, James, a physician, was born at Caen in Normandy, in 1513. He was distinguished for his industry in botany, as well as in other branches of literature. He wrote notes on Pliny's Natural History, and translated Atheneus into Latin. He added 30 plates of rare plants to the Dioscorides of Ruellius, printed in 1552. After his death appeared his "Histeriora generalis Plantarum in xviii. libros digestis," Lugd. 1587, two vols folio. In this work, which is said to have been the labour of 30 years, the author proposed to include all the botanical discoveries previous to his own time, as well as those which he had made himself in the vicinity of Lyons and the Alps. He also published editions of Paulus Aegina, and Callius Aurelianus, with notes; a work on surgery, and another De Peste, lib. iii.

He practised physic at Lyons from 1552 to 1558, when he died, aged 75.

DALECHAMPIA, a genus of plants belonging to the monoezia class; and in the natural method ranking under the 38th order, Tricoecar. See Botany Index.

DALEM, a town in the kingdom of the Netherlands, and capital of a district of the same name. It was taken by the French in 1672, who demolished the fortifications. It is seated on the river Berme, five miles north-east of Liege. E. Long. 5° 43'. N. Lat. 50° 40'.

D'ALEMBERT. See ALEMBERT.

DALGARNO, George, an old and unjustly neglected Scottish writer. See Supplement.

DALKEITH, a town of Scotland, in Mid-Lothian, six miles south-east of Edinburgh; W. Long. 2° 20'. N. Lat. 55° 30'. It is the principal residence of the Duke of Buccleugh, who has here a noble house and extensive parks. In this house, which at the time was the head quarters of General Monk, the restoration of Charles II. was planned. This duke's eldest son has the title of Earl of Dalkeith. Here is a considerable corn market weekly on Thursdays. Population 4709 in 1811.

DALMATIA, a province in Europe, bounded on the
DAL [ 56 ]

DALRUMPTON, the north by Bosnia, on the south by the gulf of Venice, on the east by Servia, and on the west by Morlachia. Spalatro is the capital of that part belonging to the Venetians; and Raguza, of a republic of that name; the Turks have a third, whose capital is Herzegovina. The air is wholesome, and the soil fruitful; and it abounds in wine, corn, and oil.

DALRYMPLE, Sir David, a Scottish lawyer and judge, was born in Edinburgh, on the 28th October new style, 1726. His father was Sir James Dalrymple, of Hailes, Bart. and his mother Lady Christian Hamilton, a daughter of the Earl of Haddington. His grandfather Sir David Dalrymple was the youngest son of the first Lord Stair, and is said to have been the ablest of that family, so much distinguished for ability. He was lord advocate for Scotland, in the reign of George I. and his son, Sir James, had the ridership of the exchequer for life. Sir David Dalrymple was bred at Eton school, where he was distinguished as a scholar, and remarkable as a virtuous and orderly youth: from thence he went to the university of Utrecht, where he remained till after the rebellion in 1746. He was called to the bar at Edinburgh, 23rd February 1749; where he was much admired for the elegant propriety of the cases he drew. He did not attain indeed to the highest rank as a practising lawyer, but his character for sound knowledge and probity in the profession was great. He was appointed one of the judges of the Court of Session in the room of Lord Nesbit, March 6th 1776, with the warmest approbation of the public; and in May 1776, one of the lords commissioners of Justiciary, in the room of Lord Coalton, who resigned. He took his seat on the bench, according to the usage of the Court of Session, by the title of Lord Hailes, the name by which he is generally known among the learned of Europe. As a judge of the supreme civil and criminal courts, he acted in the view of his country; from which he merited and obtained high confidence and approbation.

But he was not only conspicuous as an able and upright judge, and a sound lawyer; he was also eminent as a profound and accurate scholar; being a thorough master of classical learning, the belles lettres, and historical antiquities, particularly of his own country, to the study of which he was led by his profession. Indefatigable in the prosecution of the studies he cultivated, his time was sedulously devoted to the promotion of useful learning, piety, and virtue. Numerous are the works that have issued from his pen, all of them distinguished by uncommon accuracy, taste, and learning. Besides some occasional papers, both serious and humorous, of his composing, that appeared in the world; and a variety of communications, critical, and biographical, in the Gentleman's Magazine, and other publications of like nature; he allotted some part of his time to the illustration and defence of primitive Christianity. In the year 1771 he composed a very learned and ingenious paper, or law-case, in the disputed peerage of Sutherland. He was one of the trustees of the Lady Elizabeth, the daughter of the last earl; and being then a judge, the names of two eminent lawyers were annexed to it. In that case, he displayed the greatest accuracy of research, and the most profound knowledge of the antiquities and rules of descent, in this country; which he managed with such dexterity of argument, as clearly to establish the right of his pupil, and to form a precedent, at the same time, for the decision of all such questions in future. In the year 1773, he published a small volume, entitled, "Remarks on the History of Scotland." These appeared to be the gleanings of the historical research which he was making at that time, and discovered his lordship's turn for minute and accurate inquiry into doubtful points of history, and at the same time displayed the candour and liberality of his judgment. This publication prepared the public for the favourable reception of the Annals of Scotland, in 2 vols 4to, the first of which appeared in 1776, and the second in 1779, and fully answered the expectations which he had raised. The difficulties attending the subject, the want of candour, and the spirit of party, had hitherto prevented our having a genuine history of Scotland, in times previous to those of Queen Mary; which had been lately written, in a masterly manner, by the elegant and judicious Dr Robertson. Lord Hailes carried his attention to the Scottish history, as far back as to the accession of Malcolm Canmore, in 1057, and his work contains the annals of successes, from Malcolm III. to the death of David II. And happy it was that the affairs of Scotland attracted the talents of so able a writer, who, to the learning and skill of a lawyer, joined the industry and curiosity of an antiquarian; to whom no object appears frivolous or unimportant, that serves to elucidate his subject. Lord Hailes has so well authenticated his work by references to historians of good credit, or deeds and writings of undoubted authority; and has so happily cleared it from false, uncertainty, and conjecture, that every Scotsman, since its appearance, has been able to trace back, with confidence in genuine memoirs, the history of his country, for 736 years, and may revere the memory of the respectable judge, who with indefatigable industry, and painful labour, has removed the rubbish under which the precious remains were concealed.

Lord Hailes at first intended, as appears by an advertisement prefixed to his work, to carry down his Annals to the accession of James I. but to the great dissatisfaction of the public, he stopped short at the death of David II. and a very important period of our history still remains to be filled up by an able writer. Lord Hailes's Annals of Scotland, it is believed, stand unrivalled in the English language, for a purity and simplicity of style, an elegance, perspicuity, and conciseness of narration, that particularly suited the form of his work; and is entirely void of that false ornament and stately gait, which makes the works of some other writers appear in gigantic, but fictitious majesty. In 1786, Lord Hailes came forward with the excellent Dr Watson, and other writers in England, to repel Mr Gibbon's attack on Christianity, and published a 4to volume, entitled, "An Enquiry into the Secondary causes which Mr Gibbon has assigned for the rapid Progress of Christianity," in which there is a great display of literary acumen, and of zeal for the cause he espouses, without the rancour of theological controversy. This was the last work he sent from the press, except a few biographical sketches of eminent Scotchmen, designed as specimens of a Biographia Scotiae, which he justly considered as a desideratum in our literature;
in proof of his faith, but he demonstrated the sincerity of his zeal, by the uncommon pains he took to illustrate primitive Christianity, and by his elaborate and able defences of it against its enemies. His profound researches into history, and his thorough knowledge of the laws, made him perfectly acquainted with the progress of the constitution of Britain, from the first dawn of liberty in the common law of the land, and the trial by jury, which preceded all written records, and afterwards in the origin and establishment of parliaments, through all its vicissitudes and dangers, till at last, by the blessing of divine Providence, which brought many wonderful events to concour to the same end, it was renewed, strengthened, and finally confirmed by the Revolution. It was this goodly and venerable fabric of the British constitution, which the deceased most respectable character contemplated with admiration and delight, (of late indeed with a mixture of anxiety and fear) as the temple of piety, as the genuine source of greater happiness and freedom, to a larger portion of mankind, than ever flowed from any government upon earth. Ill indeed can the times bear the loss of such an affectionate patriot, and able guardian of the laws of his country. But we must not murmur at the will of Providence, which in its mercy may have withdrawn the good man from the evil to come. In mercy, I say, to him, whose righteous spirit was so deeply grieved, when he saw the wicked rage, and the people imagine a vain thing." Such is the memorial which, in the hour of recent sorrow, followed this excellent man to the grave! Besides the works already mentioned, Lord Hailies published a great number of others, which consisted chiefly of re-editions and translations of old works, and editions of MS. papers.

DALTON, a town of Lancashire, in England. It is seated on the spring-head of a river, in a champaign country, near from the sea; and the ancient castle is made use of to keep the records, and prisoners for debt in the liberty of Furnes. Population 643 in 1811. W. Long. 3. 0. N. Lat. 54. 18.

DALTON, John, D. D. an eminent divine and poet, was the son of the Rev. Mr. John Dalton, rector of Dean near Whitehaven in Cumberland, where he was born in 1709. He was educated at Queen's College, Oxford; and became tutor or governor to the Lord Beauchamp, only son of the earl of Hertford, late Duke of Somerset; during which time he adapted Milton's admirable mask of Comus to the stage, by a judicious insertion of several songs and different passages selected from other of Milton's works, as well as of several songs and other elegant additions of his own, suited to the characters and to the manner of the original author. During the run of this piece he industriously sought out a grand-daughter of Milton's, who was then oppressed with age and poverty; and procured her a benefit from it, the profits of which amounted to a very considerable sum. He was promoted by the King to a prebend of Worcester; where he died on the 22d of July 1753. Besides the above, he wrote a descriptive poem, addressed to two ladies at their return from viewing the coal-mines near Whitehaven; and Remarks on 12 historical designs of Raphael, and the Museum Graecum et Egyptianum.

DAM, a boundary or confinement, as to dam up or
DAM, [58] DAM

Infra damnum sum, within the bounds or limits of his own property or jurisdiction.

DAMAGE, in Law, is generally understood of a hurt or hindrance attending a person's estate: but, in common law, it is a part of what the jurors are to inquire of in giving verdict for the plaintiff or defendant in a civil action, whether real or personal; for after giving verdict on the principal cause, they are likewise asked their conciencies touching costs and damages, which contain the hindrances that one party hath suffered from the wrong done him by the other. See Costs.

DAMAN, a maritime town of the East Indies, at the entrance into the gulf of Cambay. It is divided by the river Daman into two parts; one of which is called New Daman, and is a handsome town, well fortified, and defended by a good Portuguese garrison. The other is called Old Daman, and is very ill built. There is a harbour between the two towns, defended by a fort. It was taken by the Portuguese in 1535. Ship-building is carried on here to a considerable extent, the teak forests being at no great distance. E. Long. 73° 20' 22.

DAMASCENUS, John, an illustrious father of the church in the 8th century, born at Damascus, where his father, though a Christian, enjoyed the office of counsellor of state to the Saracen caliph; to which the son succeeded. He retired afterwards to the monastery of St. Sabas, and spent the remainder of his life in writing books of divinity. His works have been often printed: but the Paris edition in 1712, two vols folio, is esteemed the best.

DAMASCIUS, a celebrated heathen philosopher, born at Damascus in the year 430, when the Goths reigned in Italy. He wrote the life of his master Isidorus; and dedicated it to Theodora, a very learned and philosophical lady, who had also been a pupil to Isidorus. In this life, which was copiously written, he frequently made oblique attacks on the Christian religion. We have nothing remaining of it but some extracts preserved by Photius. Damascius succeeded Theon in the rhetorical school, and Isidorus in that of philosophy, at Athens.

DAMASCUS, a very ancient city of Syria, in Asia, seated in E. Long. 36° 40'. N. Lat. 33° 20'. Some of the ancients suppose this city to have been built by one Damascus, from whom it took its name; but the most generally received opinion is, that it was founded by Uz, the eldest son of Aram. It is certain, from Gen. xiv. 5, that it was in being in Abraham's time, and consequently may be looked upon as one of the most ancient cities in the world. In the time of King David it seems to have been a very considerable place; as the sacred historian tells us, that the Syrians of Damascus sent 20,000 men to the relief of Hadadezer king of Zobah. We are not informed whether at that time it was governed by kings, or was a republic. Afterwards, however, it became a monarchy which proved very troublesome to the kingdom of Israel, and would even have destroyed it entirely, had not the Deity miraculously interposed in its behalf. At last this monarchy was destroyed by Tiglath Pileser king of Assyria, and Damascus was never afterwards governed by its own kings. From the Assyrians and Babylonians it passed to the Persians, and from them to the Greeks under Alexander the Great. After his death it belonged, with the rest of Syria, to the Seleucidae; till their empire was subdued by the Romans, about 70 years before Christ. From them it was taken by the Saracens in 635; and it is now in the hands of the Turks. Notwithstanding the tyranny of the Turks, Damascus is still a considerable place, and is supposed to contain 200,000 inhabitants. It is situated in a plain of so great extent, that one can but just discern the bounding mountains. It stands on the west side of the plain, about two miles from the head of the river Barady, which waters it. It is of a long, straight figure, extending about two miles in length, adorned with mosques and steeples, and encompassed with gardens computed to be full 30 miles round. The river Barady, as soon as it issues from the canals of Antilibus into the plain, is divided into three streams, whereof the middlemost and biggest runs directly to Damascus, and is distributed to all the cisterns and fountains of the city. The other two seem to be artificial; and are drawn round, one to the right and the other to the left, on the borders of the gardens, into which they are let by little currents, and dispersed everywhere. The houses of the city, whose streets are very narrow, are all built on the outside either with sun-burnt brick or Flemish wall: and yet it is no uncommon thing to see the gates and doors adorned with marble portals, carved and inlaid with great beauty and variety; and within these portals to find large square courts beautified with fragrant trees and marble fountains, and compassed round with splendid apartments. In these apartments the ceilings are usually richly painted and gilded; and their doors, which are a sort of low stages seated in the pleasantest part of the room, and elevated about 16 or 18 inches above the floor, whereon the Turks eat, sleep, say their prayers, &c. are floored, and adorned on the sides with variety of marble mixed in mosaic knots and mazes, spread with carpets, and furnished all round with bolsters and cushions, to the very height of luxury. In this city are shown the church of John the Baptist, now converted into a famous mosque; the house of Ananias, which is only a small grotto or cellar, wherein is nothing remarkable; and the house of Judas with whom Paul lodged. In this last is an old tomb, supposed to be that of Ananias; which the Turks hold in such veneration, that they keep a lamp continually burning over it. There is a castle belonging to Damascus, which is like a little town, having its own streets and houses; and in this castle a magazine of the famous Damascus steel was formerly kept. The fruit-tree called the damascene, and the flower called the damask rose, were transplanted from the gardens belonging to this city; and the silks and linens known by the name of damaske, were probably invented by the inhabitants.

DAMASCUS Steel. See Damask.

DAMASIA, in Ancient Geography, a town of Vindelicia, on the Licus. Afterwards called Augusta, Now Augsburg in Swabia, on the Lech. E. Long. 10° 50'. N. Lat. 48° 20'.

DAMASK, a sort of silken stuff, having some parts rising above the ground, representing flowers or other figures. Damask should be of dressed silks, both in warp and woof. It has its name from its being originally brought from Damascus in Syria.
There is also a stuff in France called the caffet-da-mask, made in imitation of the true damask, having the warp of silk and the woof of thread; others are all thread or all wool.

Damask is also a kind of wrought linen, made in Flanders, so called, because its large flowers resemble those of damasks. It is chiefly used for tables; a table-cloth and a dozen of napkins are called a damask-service.

Damask is also applied to a very fine steel, in some parts of the Levant, chiefly at Damascus in Syria: whence its name. It is used for sword and cutlass blades, and is finely tempered.

Damaskkeening, or Damasking, the art or operation of beautifying iron, steel, &c., by making incisions therein, and filling them up with gold or silver wire; chiefly used for adorning sword-blades, guards, and grips, locks of pistols, &c.

Damaskkeening partakes of the mosaic, of engraving, and of carving: like the mosaic, it has inlaid work; like engraving, it cuts the metal, representing divers figures; and, as in chasing, gold and silver are wrought in relief. There are two ways of damasking: the one, which is the finest, is when the metal is cut deep with proper instruments, and inlaid with gold and silver wire: the other is superficial only.

Dameolpre, a kind of bilander, used in Holland for conveying merchandise from one canal to another; being very commodious for passing under the bridges.

Damianists, in church-history, a branch of the ancient scepulier-severities. They agreed with the catholicks in admitting the sixth council, but disowned any distinction of persons in the Godhead; and professed one single nature, incapable of any difference: yet they called God "the Father, Son, and Holy Ghost."

Damiens, Robert Francois, an assassin by whom Louis XV. of France was wounded in the year 1757. He was born in the suburbs of Arras, in the year 1714; and seems rather to have been actuated by frenzy or insanity in the perpetration of the horrid deeds of which he was guilty, than by any of the motives to which they have been ascribed. This spirit appeared in the early period of his life; and such were the extravagance and violence of his conduct, that he was distinguished, while a boy, by the appellation of Robert the Devil.

When he grew up he entered into the army, served as a soldier at the siege of Philipburg, and was present at several engagements. He returned afterwards to France, and became a domestic servant in the college of Jesuits at Paris. He married in 1738, which rendered it necessary for him to resign this situation. He was then employed in the same capacity by different masters, one of whom, it is said, he poisoned; and having robbed another, he was obliged to abscond to escape the punishment due to his crimes. During a period of five months after the discovery of the robbery, he lurked in the neighbourhood of St Omer, Dunkirk, and Brussels; and was observed to express himself in an absurd and incoherent manner concerning some disputes which at this time prevailed in France. The following soliloquy is said to have been uttered by him in a small town near Ypres: "If I return to France—Yes, I will return, I will die there, and the greatest man on earth shall die likewise, and you shall hear news of me." These expressions were uttered in the month of August 1756; and it is probable that they were regarded at the time only as the ravings of a madman. He spoke indeed in a similar strain in the December following, at the house of a relation, at Falasek near Arras, saying, "That the kingdom, his wife, and daughter, were all ruined!" It was about this time that he set out for Paris, and arrived there on the 31st of December. He was seen at Versailles, on the first day of January 1757. To blunt his feelings, and to prepare himself for the perpetration of the horrid act, it is said that he swallowed opium for several days. But the state of mind in which Damiens is described has been for some time before, seemed to render such auxiliaries unnecessary.

It was on the 4th of January, between five and six in the evening, that Louis XV. was wounded by the hand of this frantic assassin. He struck with a knife the right side of the king, while he was surrounded with his courtiers, and just as he was entering his carriage to go to Trianon. Damiens was instantly seized, examined at Versailles, and afterwards sent to Paris and confined in the tower of Montgomeri, in an apartment prepared for him, near to that which was formerly occupied by Ravaillac the murderer of Henry IV. The great court of parliament was charged by the king to institute his process; and although he was subjected to the most cruel tortures, which he bore with unmoved fortitude, no confession or acknowledgment could be extorted which afforded the smallest ground for suspicion that he had a single accomplice. When it was found that the torture failed of the purpose for which it was inflicted, he was condemned to die by the same punishment which Ravaillac suffered.

The 28th of March following was fixed as the day of his execution. On that day he was brought to the Place de Greve, where the apparatus and instruments of his destruction were prepared. All these he beheld with an undismayed countenance and a fearless eye, although he must have known well that new and more dreadful tortures yet awaited him. His punishment commenced with burning his right hand; his flesh was then torn with red-hot pincers; and the wounds were filled with melted wax, pitch, and lead. In attempting to quarter his body, the four horses which were employed pulled in vain for 50 minutes. All their efforts seemed to be ineffectual, till the executioners cut with knives the ligaments with which the limbs are attached to the body. Even after the legs were cut he was still alive, and it was only after the arms were treated in the same way that he ceased to breathe, and his body was dismembered. The period of his punishment, from the time he was put upon the scaffold till his death, was not less than an hour and a half; during the greater part of it he seemed to retain his recollection; for he raised his head many times, and cast his eyes on his mangled and burned limbs, and on the horses which were then exerting their whole force to tear his body asunder. And even during the severest of his tortures, the firmness of his mind was so little shaken, that he affected some degree of jocularity.

Thus
Thus perished this unfortunate assassin, the history of whose life, considered in itself, is scarcely worthy of a place even for the shortest sketch; and indeed we should probably not have introduced it here, were it not for the purpose of rectifying the mistaken views of some of his biographers. While we are told that he was an insane assassin, he is charged with the same degree of guilt, as if he had been all his life in full possession of every rational faculty. But the events of his life leave no doubt of his insanity; and the last horrid deed which he perpetrated strongly confirms it. He was not actuated by either public or private revenge; he had no accomplices; and it does not appear that he had any purpose whatever to serve by taking away the life of the monarch, even if he had succeeded and escaped. In the midst of his most cruel tortures, he obstinately persisted that it was not his intention to kill the king. According to his own fanatical language, he wished that God would touch his heart to induce him to give peace to his kingdom. Our readers will probably anticipate us in remarking the needless excess of lingering punishment which was inflicted on the insane Damien; and some of them will perhaps be surprised to be told that the execution was attended by some of the ladies of the court. Many of them too will naturally compare this event with what has happened more lately in our own country; and recollect, that a Nicholson and a Hadfield, influenced by a similar frenzy which urged them to a similar attempt, have been only doomed to perpetual confinement, not as punishment, but merely to preclude the possibility of perpetrating such deeds; because in such a state of mind they are not recognized by our milder and more equitable laws as rational beings; and therefore they are improper objects of punishment.

DAMIETTA, a port-town of Egypt, situated on the eastern mouth of the river Nile, four miles from the sea, and 100 miles north of Grand Cairo. E. Long. 31. 49. and N. Lat. 31. 25. The present town stands upon a different site from the ancient Damietta, so repeatedly attacked by the European princes. The latter, according to Abulfeda, was “a town surrounded by walls, and situated at the mouth of the eastern branch of the Nile.” Stephen of Byzantium informs us, that it was called Thamouditis under the government of the Greeks of the lower empire, but that it was then very inconsiderable. It increased in importance every day, in proportion as Pelusium, which was frequently plundered, lost its power. The total ruin of that ancient town occasioned the commerce of the eastern parts of the Delta to be transferred to Damietta. It was, however, no longer a place of strength, when, towards the year 238 of the Hegira, the emperors of Constantinople took possession of it a second time. The importance of a harbour so favourably situated opened the gates of the caliphs. In the year 244 of the Hegira, Elmetouankel surrounded it with strong walls. This obstacle did not prevent Roger king of Sicily from taking it from the Mahometans in the year 550 of the Hegira. He did not, however, long enjoy his conquest. Salah Eddin, who about that period mounted the throne of Egypt, expelled the Europeans from Damietta. Fifteen years after they returned to besiege it; but this able sultan baffled all their efforts. Notwithstanding their land army was supported by a fleet of 1200 sail, they were obliged to make a disgraceful retreat.

It was the fate of this place to be constantly besieged. In the year 615 of the Hegira, under the reign of Eladel, the crusaders attacked it with a very considerable force. They landed on the western shore of the Nile; and their first care was to surround their camp with a ditch and palisado. The mouth of the river was defended by two towers, furnished with numerous garrisons. An enormous iron chain, stretching from one side to the other, hindered the approach of vessels. The crusaders carried by storm the tower on the same side with their camp, broke the chain, and opened the entrance of the river for their fleet. Nejm Eddin, the sultan’s son, who was encamped near Damietta, covered it with an army. To stop the enemies vessels he threw a bridge over the Nile. The Franks overturned it, and the prince adopted the measure of choking up the mouth of the river, which he almost rendered impassable by several large boats he sunk there. After alternate and various successes, many bloody battles, and a siege of 17 months, the Christian princes took Damietta by storm. They did not, however, long enjoy the fruit of so much blood spilt, and of an armament which had cost immense sums. Completely invested near the canal of Achmoun, by the waters of the Nile and by the Egyptian army, they purchased their lives and their liberty by the sacrifice of their conquest.

One-and-thirty years after this defeat St Louis carried Damietta without striking a stroke. The Arabs, however, soon recovered it; but tired of keeping a place which continually drew upon them the most warlike nations of Europe, they totally destroyed it, and rebuilt it further up in the country. This modern Damietta, first called Menchid, as Abulfeda tells us, has preserved the memory of its origin in a square still called by that name. Writers in general have confounded these two towns, ascribing to the one the attributes of the other. The modern Damietta is round in a semicircle on the eastern bank of the Nile, two leagues and a half from the mouth of it. The eye, placed at one of the extremities of the crescent, takes in its whole extent. Savary reckoned it to contain 50,000 souls, others reduce it to 40,000. It has several squares, the most considerable of which has retained the name of Menchid. Spacious okals or khams, collecting under their porticoes the stuffs of India, the silks of Mount Lebanon, sal ammoniac, and pyramids of rice, proclaim that it is a commercial town. The houses, those in particular which are on the banks of the river, are very lofty. They have in general handsome saloons built on the top of their terraces, which are cheerful belvederes, open to every wind, where the Turk, effeminately reclining on a sofa, passes his life in smoking, in looking on the sea, which bounds the horizon on one side, on the great lake that extends itself in the other, and the Nile that, running between them, traverses a rich country. Several large mosques, adorned with lofty minarets, are dispersed over the town. The public baths, lined with marble, are distributed in the same manner as those of Grand Cairo. The linen you are served with is clean, and the water very pure. The heat and the treatment in them, so far from injuring the health, serve to strengthen, nay even to improve it, if used with moderation.
This custom, founded on experience, is general in Egypt.

The port of Damietta is continually filled with a multitude of boats and small vessels. Those called scherm serve to convey the merchandise on board the ships in the road, and to unload them; the others carry on the coasting-trade. This town carries on a great trade with Syria, with Cyprus, and Marseilles. The rice called meselaoun, of the finest quality there it is in Egypt, is cultivated in the neighbouring plains. The exports of it amount annually to about six millions of livres. The other articles of the produce of the country are linens, sal ammoniac, corn, &c. A ruinous policy for the country prohibits the exportation of this last article; but the law is evaded, and it passes under the name of rice.

The Christians of Aleppo and Damascus, settled in this town, have for several ages carried on its principal commerce. Turkish indolence, content with extorting from them from time to time, suffers them to become rich. The exportation of rice to foreign countries is prohibited; but by means of some douceurs to the custom-house-officers, the people of Providence lead annually several ships with it. The Bogas preventing them from entering the Nile, their cargoes are conveyed on board by the boats of the country. This inconvenience is the source of endless vexation and abuses. The boat, which is loaded in the evening with rice of the first quality, is frequently not that which arrives at the ship; an inferior quality is substituted for it during the night. The Marseille captains, aware of these mysteries, without being able to prevent them, endeavor to play off trick against trick, so that this commerce has become a general scene of knavery. But the badness of the port is still more detrimental to Damietta.

The road where the vessels lie being exposed to every wind, the slightest gale obliges the captains to cut their cables and take shelter at Cyprus, or to stand off to sea. It would be easy, by cutting a canal only of half a league, to open a passage for ships into the Nile, where there is deep water. This work, which might be executed at very little expense, would render Damietta a noble harbour; but despotism, insensible to the interest of the people, is always surrounded by destruction in its progress, and wants both the will and the power to create.

The tongue of land on which Damietta is situated, streasted on one side by the river, and on the other by the western extremity of Lake Menoufa, is only from two to six miles wide from east to west. It is intersected by innumerable rivulets in every direction, which render it the most fertile spot in Egypt. The soil produces, communis annui, 80 bushels of rice for one. The other produce is in the same proportion. It is there that nature, lavishing profusely her pomp and riches, presents flowers, fruits, and harvests, at every season of the year. Winter never deprives it of these advantages; its beauties are never impaired by summer. Descriptive heats, as well as chilling colds, are equally unknown in that happy spot. The thermometer varies only from 9 to 24 degrees above the freezing point. Damietta is indebted for this charming temperature to the immense quantity of water with which it is surrounded. The verdure is nowhere so fresh; the trees are nowhere covered with such quantities of fruit. The rivulets around the fields of rice are lined with several kinds of reeds, some of which rise to a great height. The reed calamus is here found in abundance, which is made use of for writing by the orientals. Its slender stalks bear long narrow leaves, which hang gracefully, and spreading branches covered with white flowers. Here also are to be seen forests of papyrus, of which the ancient Egyptians made their paper. Strabo, who calls it bitius, gives an accurate description of it. It is here also that the lotus, of which the Arabs have preserved the primitive name of nuphar, exults its lofty stalk above the waters. Its large calyx blows either of an azure blue or of a brilliant white, and it appears with the majesty of the king of the aquatic plants. The marshes and the canals in the interior parts of the country are filled with this superb flower, which diffuses a most agreeable odour.

There are a great many villages around Damietta, in most of which are manufactures where the most beautiful linens of the country are fabricated. The finest napkins in particular are made there, fringed with silk. You are served at table with them, especially on ceremonial visits, when the slave presents you with one to wipe your mouth with, after you have drunk your sherbet, or eaten the sweetmeats, which are carried round on a silver plate to all the company. These small towns, generally surrounded with little woods, or trees promiscuously planted, form a whimsical and picturesque assemblage. By the side of the scamorze and the melancholy tamarisk, one sees the elegant cassia-tree, with its clusters of yellow flowers like those of the cytisus. The top of the date-tree, loaded with enormous bunches, rises above the grove. The cassia, with its sweet-scented flower, grows under its shade. The orange and lemon trees cover the labourer's cabin with their golden fruit. The banana tree with its long leaves, the pomegranate with its scarlet flower, and the fig-tree with its sugary fruit, throw a vast variety into these landscapes.

DAMNII, anciently a people of Britain; situated between the Salgova to the south and the Caledonii to the north. Now Clydesdale.

DAMNONII. See DAMNION.

DAMOCLES, one of the flatterers of Dionysius the Elder of Sicily. He admired the tyrant's wealth, and pronounced him the happiest man on earth. Dionysius prevailed upon him to undertake for a while the charge of royalty, and be convinced of the happiness which a sovereign enjoyed. Damocles ascended the throne, and while he gazed upon the wealth and splendour that surrounded him, he perceived a sword hanging over his head by a horse hair. This so terrified him that all his imaginary felicity vanished at once, and he begged Dionysius to remove him from a situation which exposed his life to such fears and dangers.

DAMON, the name of several illustrious ancients; particularly of a Pythagorean philosopher very intimate with Pythias. When he had been condemned to death by Dionysius, he obtained from the tyrant leave to go and settle his domestic affairs, on promise of returning at a stated hour to the place of execution. Pythias pledged himself to undergo the punishment which was to be inflicted on Damon, should he not return in time, and he coalescently delivered himself in...
DAMPIER, William, an English navigator, was born at East Coker in Somersetshire, about the year 1652. His parents died while he was young, and having thus become an orphan, he was removed from the Latin school, and placed with the master of a ship at Weymouth. In this ship he made a voyage to Newfoundland; but, on his return, he left his master, with the resolution, as he himself observes, of never again exposing himself to the pinching cold of that northern climate. As the acquisition of experience in the art of navigation was ever his great object, he engaged himself as a common sailor in a voyage to the East Indies. He served in the Dutch war under Sir Edward Sprague, and was present at two engagements. The declining state of his health would not permit him to remain on board the fleet; he therefore came on shore, and removed to the country, where he remained some time. The year following he accepted an offer of employment in Jamaica as an under manager of an estate; but he only continued a short time in that situation; after which he engaged in a coasting trader, and thus acquired an accurate knowledge of all the ports and bays of that island. Soon after he entered on board a vessel bound to the bay of Campeachy, and returning a second time to the same coast, he remained with the log-wood-cutters, and engaged himself as a common workman. During his stay in this country he collected the materials for the minute and interesting account which he has given of the laborious life of these people, as well as of the geographical description and the natural history of the tract which they occupy.

Satisfied with the knowledge which he had obtained of the nature of the trade and country, he returned to Jamaica, and from thence to England, where he arrived in 1678. About the beginning of the year following he went out to Jamaica as a passenger, with the intention of revisiting the bay of Campeachy; but he was persuaded to associate himself with a body of privoteers, as they were called, who were then lying in several vessels in a bay of that island. These people who were called privoteers, were pirates, who, having no commission whatever from any government, undertook a predatory warfare on the commerce and settlements of the Spaniards. This body of plunderers was composed of English, Dutch, and French. In this expedition Dampier crossed the isthmus of Darien with his associates, and spent the year 1680 on the Peruvian coast, and was occasionally successful in plundering the towns. The following year, in consequence of a dissension which arose among them, Dampier, and the minority with whom he had joined, recrossed the isthmus, and entered with another fleet of privoteers, which was then stationed on the Spanish main; and, having spent another year among the West India islands, he, with some others, proceeded to Virginia in a single ship to dispose of their prize goods. Here he remained for a year; and afterwards engaged with a Captain Cook, who, with about 70 men, undertook an expedition against the Spaniards in the South seas. They sailed in 1683 in the month of August, touched at the coast of Guinea, and then proceeded round Cape Horn into the Pacific ocean. Having fallen in with a ship from London, which had sailed on a similar expedition, they joined company; and, having touched at the island of Juan Fernandez, they made the coast of South America, crossing along Chili and Peru. They took some prizes, and with them they proceeded to the Mexican coast, which they fell in with near Cape Blanco. While they lay here Captain Cook died, and the command devolved on Captain Davis. Having separated from the London ship, they were joined by another commanded by Captain Swan. An attempt to plunder the town of Guiaquil was unsuccessful, but at the mouth of the river they took some vessels which had about 1000 slaves on board. With these negroes Dampier proposed to work the gold mines in the neighbourhood of Santa Maria on the isthmus of Darien, from which the Spaniards had been driven away by some privateers. But this plan was not attempted. The next object of plunder was the Spanish fleet having on board the treasure of the Peruvian mines; but the English being ill supported by some French ships which had joined them, the fleet, after a running fight, got safe into Panama.

The English ships afterwards cruizing along the coast of Mexico, landed, took the town of Puebla Nova, and burnt two others. Dampier leaving Davis, went on board of Swan's ship, and proceeded with him along the northern parts of Mexico, as far as the southern part of California. During this expedition they frequently landed for the purpose of plunder, but particularly when they were in want of provisions. Returning from the plunder of one place, 50 of the party were killed by the Spaniards. This disaster so discouraged them that they relinquished all farther attempts on these coasts. Swan then proposed to run across the Pacific ocean, and return by the East Indies; and in hopes of a successful cruise off the Mainillas the crew were persuaded, with a very slender provision, to risk this long passage. On the last day of March 1686, they took their departure from Cape Corrientes, and on the 52d day reached Guam, one of the Ladrones islands. About this time the crew talked of killing and eating Swan and the officers, in case their stock of provision should be exhausted before it could be supplied. From Guam they proceeded to Mindanao. While the ship lay here a mutiny arose among the crew, and the majority carried her off, Swan and some of his people being left on the island. Among the former was Dampier, although it is said that he had no concern in the mutiny. After cruising some time off Manilla, and having careened their vessel at Pulo Condore, in 1687 they were driven to the Chinese coast, made the circuit of Luzonia and Mindanao, passed through the group of Spice islands, and reached the coast of New Holland in the beginning of 1688. They left this in March, and having passed along the west coast of Sumatra, they arrived at the Nicobar islands, where Dampier, at his own request, and two other Englishmen, a Portuguese, and some Malays, were set on shore. Dampier's object was to establish a trade in ambergris. Attempting to navigate a canoe to Acheen in Sumatra, they were overtaken by a severe storm, in which they experienced great hardships. The
Dampier. They at last reached Sumatra; but the fatigues and distress of the voyage proved fatal to several of them, who were carried off by a fever. Dampier himself was scarcely recovered at the end of a twelvemonth. After making several voyages to different places of the East Indies, he acted for some time as gunner at the English fort of Bencoolen. In 1691, wishing to revisit his native country, he embarked on board a ship for England, where he arrived in September. At this time he brought with him a native of Meangks, one of the Spice islands, who was supposed to be the son of a chief, and after being exhibited as a sight, died of the smallpox at Oxford.

It is not known in what manner Dampier was employed for some years after this period. It appears, however, that he was at last engaged in the king's service. He had the command of the Roebuck, a slop of 12 guns and 50 men. This vessel, it is supposed, was fitted out for some voyage of discovery, for she had 20 months provisions on board. He sailed from Britain in 1699, touched at the coast of Brasil, and then ran across to the coast of New Holland, and arrived there on the 1st of August, about latitude 26°. He proceeded northwards along the coast, searching the country in different places where he landed. To procure refreshments he found it necessary to direct his course towards Timor; and from this he sailed to the coast of New Guinea, where he arrived on the 26th of December. By sailing along to its easternmost extremity, he discovered that it was terminated by an island, which he circumnavigated, and named New Britain.

Here it would appear from his own journal that he encountered considerable difficulties from the small number of his men, and their eager desire to hasten home. On account of these difficulties he was prevented from prosecuting his discoveries. In May he returned to Timor, and from thence proceeded homeward by Batavia and the Cape of Good Hope. In February 1701 he arrived off the island of Ascension, when the vessel sprang a leak and founded; and it was with much difficulty that the crew reached the island. They remained at Ascension till they were taken away by an East India ship, and conveyed to England. This closes the account of Dampier's life and adventures, as it is detailed by himself. It appears, however, from the preface to the third volume, that he was preparing in 1703 for another voyage. It is mentioned also in Woods's Rogers' Voyage round the World, that Dampier had the command of a ship in the South seas about the year 1705, along with Captain Stradling, whose vessel foundedered at sea. Dampier accompanied Woods Rogers in his voyage round the world, in the years 1708, 1709, 1710, and 1711; but only in the capacity of pilot, which is supposed to be owing to something faulty in his conduct. During this expedition Guiaquil was taken, and Dampier had the command of the artillery. Nothing farther is known of the life of Dampier; and we are equally ignorant of the place and time of his death.

The works of Dampier are well known, and have been often reprinted. They consist of, 1. A Voyage round the world, 3 vols octavo. 2. A Supplement to it, describing the countries of Tonquin, Malacca, &c. 3. Two Voyages to Campasachy. 4. A Dis.

course of Trade-winds, Seasons, Tides, &c. in the Torrid Zone. 5. A Voyage to New Holland. His observations are curious and important, and conveyed in a plainstly style. His nautical remarks discover a great deal of professional knowledge. His knowledge in natural history is not scientific; but it appears to be accurate, and has been frequently quoted.

Damps, in Natural History, (from the Saxon word damp, signifying vapour or exhalation), are certain noxious exhalations issuing from some parts of the earth, and which prove almost instantly fatal to those who breathe them.

These damp s are chiefly observed in mines and coal-pits; though vapours of the same kind often issue from old lavas of burning mountains, and, in those countries where volcanoes are common, it is said that they fill the houses, and destroy people suddenly without the least warning of their approach. In mines and coal-pits they are chiefly of two kinds, called by the miners and colliers the choke and fire damp s; and both go under one general name of foul air. The choke-damp, known in modern chemistry by the name of fixed air, or carbonic acid gas, usually infests those places which have been formerly worked, but long neglected, and are called by the miners vicas. No place, however, can be reckoned safe from this kind of damp, except where there is a due circulation of air; and the procuring of this is the only proper means of preventing accidents from dams of all kinds. The choke-damp suffocates the miners suddenly, with all the appearances found in those that are suffocated by fixed air. Being heavy, it descends towards the lowest parts of the workings, and thus is dangerous to the miners, who can scarcely avoid breathing it. The fire-damp, which is inflammable air, hydrogen gas, rises to the roof of the workings, as being specifically lighter than the common atmosphere; and hence, though it will suffocate as well as the other, it seldom proves so dangerous in this way as by its inflammable property, by which it often takes fire at the candles, and explodes with extreme violence.

In the Phil. Trans. N° 119, there is an account of some explosions by damp s of this kind, on which we have the following observations. 1. Those who are in the place where the vapour is fired suddenly find themselves surrounded with flames, but hear little or no noise; though those who are in places adjacent, or above ground, hear a very great one. 2. Those who are surrounded by the inflamed vapour feel themselves scorched or burnt, but are not moved out of their places, though such as unhappily stand in the way of it are commonly killed by the violence of the shock, and often thrown with great force out at the mouth of the pit; nor are the heaviest machines found able to resist the impetuosity of the blast. 3. No smell is perceived before the fire, but a very strong one of brimstone is afterwards perceptible. 4. The vapour lies towards the roof, and is not perceived if the candles are held low; but when these are held higher, the damp descends like a black mist, and catches hold of the flame, lengthening it to two or three handfuls; and this appearance ceases when the candles are held nearer the ground. 5. The flame continues in the vault for several minutes after the crack. 6. Its colour is blue, something inclining to green, and very bright. 7. On the explosion of the vapour,
Damp

vapour, a dark smoke like that proceeding from fired gunpowder is perceived. 8. Damps are generally observed to come about the latter end of May, and to continue during the heat of summer. They return several times during the summer season, but observe no certain rule.

Besides these kinds of damps, which are very common, we find others described in the Philosophical Transactions, concerning the nature of which we can say nothing. Indeed the account seems somewhat suspicious. They are given by Mr Jessop, from whom we have the foregoing observations concerning the fire-damp, and who had these from the miners in Derbyshire. After describing the common damp, which consists of fixed air, "They call the second sort (says he) the pease-bloom damp, because, as they say, it smells like pease-bloom. They tell me it always comes in the summer time; and those grooves are not free which are never troubled with any other sort of damps. I never heard that it was mortal; the scent, perhaps, freeing them from the danger of a surprise: but by reason of it many good grooves lie idle at the best and most profitable time of the year, when the subterraneous waters are the lowest. They fancy it proceeds from the multitude of red-trafo flowers, by them called honeysuckles, with which the limestone meadows in the Peake do much abound. The third is the strangest and most pestilential of any; if all be true which is said concerning it. Those who pretend to have seen it (for it is visible) describe it thus: In the highest part of the roof of those passages which branch out from the main groove, they often see a round thing hanging, about the bigness of a foot-ball, covered with a skin of the thickness and colour of a cobweb. This, they say, if it is broken by any accident, as the splinter of a stone, or the like, disperseth itself immediately, and suffocates all the company. Therefore, to prevent casualties, as soon as they have espied it, they have a way, by the help of a stick and long rope, of breaking it at a distance; which done, they purify the place well with fire, before they dare enter it again. I dare not avouch the truth of this story in all its circumstances, because the proof of it seems impossible, since they say it kills all that are like to bear witness to the particulars: neither do I deny but such a thing may have been seen hanging on the roof, since I have heard many affirm it."—Some damps, seemingly of the same nature with those last mentioned, are noticed by the author of the Chemical Dictionary, under the word Damps. "Amongst the noxious mineral exhalations (says he), we may place those which are found in the mines of sal gem in Poland. These frequently appear in form of light flocks, threads, and spiders webs. They are remarkable for their property of suddenly catching fire at the lamps of the miners with a terrible noise and explosion. They instantly kill those whom they touch. Similar vapours are found in some mines of fossil coal."

With regard to the formation of damps we have as yet no certain theory; nor, though the experiments of aerologists are abundantly able to show the composition and manner of forming these noxious airs artificially, have they yet thrown much light on the method by which nature prepares them on a large scale. There are two general ways in which we may suppose this to be done: one by the stagnation of atmospheric air in old waste places of mines in coal-pits, and its conversion into these mephitic exhalations; the other by their original formation from the phlogistic or other materials found in the earth, without any interference of the atmosphere. In favour of the former opinion it may be urged, that old wastes are never free from damps, especially those of the kind resembling fixed air; nor are they always deficient in the inflammable kind. The same is also true of old wells, or even cellars, and in short every place where the air stagnates for any considerable time. But, on the other hand, we have many instances of fixed air coming out of the earth, and that in vast quantities, where no considerable stagnation of the atmosphere could be suspected; as for instance, in the grotto del Cani in Italy, where a continual stream of it has issued from time immemorial. The same seems to be the case with the tops of some high mountains, particularly Mont Blanc, the highest in Europe; on the top of which M. Saussere found the atmosphere so much impregnated with fixed air, that time water exposed to it very quickly gathered a crust on its surface. Sir William Hamilton, in his account of the eruptions of Vesuvius, informs us, that the inhabitants in the neighbourhood of that mountain are infected with a kind of pestilential vapours named by them mofetes, which issue from the old lava thrown out by the volcano. These are of the nature of the damps in our mines or coal-pits, and issue forth in such quantity as either to infect the atmosphere for a very considerable way round, or to do mischief by being carried from place to place by the atmospheric currents, which are not strong enough to dissipate them for some time. From some late accounts the samiel (or scorching winds, as they have been represented) in the eastern countries, seem to be no other than streams of fixed air of considerable extent, which exert their usual and fatal effects on those who breathe them. A strong argument in favour of this opinion is, that these winds cannot cross a river, it being the nature of water to absorb fixed air, and thus destroy them.

Hence it is rendered probable that these mephitic vapours are often to be met with in the open atmosphere, and consequently cannot always be the effect of stagnation; nor indeed does it at all appear that mere stagnation can affect the quality of the atmosphere either one way or other. This fluid cannot have its properties altered by being immersed in it upon which it can act, and by means of which action its component parts may be changed or separated. While this process is going on, there is generally, if not always, an absorption of air, accompanied indeed frequently with an emission of some aerial fluid equal in quantity to that which is absorbed. Mr Scheele, in his Essay on Fire, has shown by a number of experiments the effect of exposing certain substances to the action of air, both on the substances themselves and on the aerial fluid. The result of all these is no other than what we might expect from a very slow combustion, and which perhaps may on inquiry be found to be the only way by which air can be decomposed. If the substance exposed to the air was capable of absorbing that part of the fluid which had undergone a change, there was always an evident diminu-
Damp. nation, but not otherwise. Thus, on inclosing some caustic fixed alkali in a phial of atmospheric air, a considerable diminution took place; and the alkali, by becoming saturated with fixed air, showed that a decomposition had taken place, and that the depolymericated part of the air had separated from the other, as well as to the fixed alkali, and become fixed air by uniting with a certain proportion of phlogistic matter. Hence we may conceive, that in any place where the air was confined over a vast quantity of caustic alkaline salt, it would soon become unfit for the purposes of animal life, and we might say that a damp would be formed. But this would be a damp of a very different kind from that usually met with in mines; for here the depolymericated part of the atmosphere being converted into fixed air, and absorbed by the salt, only the azotic gas, or, as it has been called, phlogisticated air, would remain, so that no fixed air could ever be separated from it.

Let us now suppose, that instead of the alkaline salt a quantity of burning charcoal is confined in a place where there is not a proper circulation of air, and we shall soon see that a damp of the very same kind with that called by miners the 
chake-damp will be formed. But this takes place by reason of the dissipation of the charcoal by heat, and its union with the pore part of the atmosphere, or oxygen gas, which always constitutes fixed air. In this case, however, the damp must be of short continuance, and will soon be dissipated after the charcoal is extinguished; but if, instead of the charcoal, we substitute a large quantity of fermenting liquor, from whence the fixed air is naturally emitted, a damp will be formed much more difficult to be dissipated than the former, because it continues itself in a very short time; and, unless there is a very constant circulation of air, it will be dangerous to enter the place where it is.

From the last example we may form an idea of the manner in which these damps, consisting chiefly of fixed air, are formed. We know not indeed thoroughly the nature of fermentation; but we are assured, that it is always accompanied by an internal heat; which, in some cases, is raised to the utmost height, inasmuch that large quantities of most vegetable substances, packed together, will sometimes burst out into flame. It is not, however, at all times necessary for the extrication of fixed air, that the heat should come to this extremity. The example of fermenting liquors shows, that in some cases a very moderate heat is sufficient for the purpose. Now, though the comparison may seem somewhat inadequate between the solid substance of the earth and a fermenting liquid, yet we know that a gentle heat constantly takes place in the bowels of the earth; and that almost all terrestrial substances will emit fixed air on being exposed to heat. It is not at all improbable, therefore, that, on the large scale of nature, the quantity of matter will compensate for the weakness of the heat, and thus occasion a constant emission of fixed air; which, though slow in comparison of what is effected in our experiments by a violent artificial heat, may yet accumulate in the narrow spaces of mines in such a manner as to be very troublesome. In volcanic countries, where the heat of the earth is much greater, the emission of fixed air is in proportion: and thus we may account for that continued stream of it, which issues from the grove del Cani, and perhaps other places. The mofetes, which are said to proceed from old lavas, can only be accounted for by supposing the heat, which originally took place in them, to be in some measure renewed; or that they have been again, by some means or other, disposed to take fire as formerly: but this we offer merely as a conjecture; there not being as yet sufficient data to determine anything positively upon the subject.

It may be objected to the hypothesis just now laid down, that, if there is a continual disposition in the earth to produce fixed air, the whole surface of it must pour out such a quantity as would destroy every living creature upon it. This indeed might be granted, were the surface of the earth quite bare, and destitute of vegetation; but there is no absurdity, in supposing that the fixed air may be continually decomposed by the vegetables which grow all over the surface of the earth; and the atmosphere not only thus preserved from any taint from it, but supplied with a quantity of pure air, which it is certain vegetables give out. It is also certain, that whenever the atmosphere is suffered to be in contact with the bare surface of the ground for some time, a considerable quantity of fixed air will be produced, unless there is a constant circulation of atmospheric air to carry off the former before it has time to produce any sensible effect. Hence we may account for the damp in wells, cellars, and even in the confined places of old castles and ruinous buildings, where the air is not in contact with the surface of the ground itself, but with mere heaps of rubbish and old walls.

With regard to what is called the fire-damp, the case seems to be more plain. In the Phil. Trans. No 136. we have the following account of one of this kind, which seemed evidently to issue from the earth: "This work is upon a coal of five yards in thickness, and hath been begun upon about six or eight and thirty years ago. When it was first found, it was extremely full of water, so that it could not be brought down to the bottom of the coal; but a witchet, or cave, was driven to the middle of it, upon a level, for gaining room to work, and drawing down the spring of water that lies in the coal to the eye of the pit. In driving of which witchet, after they had gone a considerable way under ground, and were scant of wind, the fire-damps began by little and little to breed, and to appear in crevices and slits of the coal, where water had lain before the opening of the coal, with a small blush flame, working and moving continually; but not out of its first seat, unless the workmen held their candles to it; and then being weak, the blaze of the candle would drive it out with a sudden fizz away to another crevice, where it would soon after appear blazing and moving as formerly. This was the first knowledge of it in this work, which the workmen made but a sport of, and so partly neglected, till it had gotten some strength; and then upon a morning the first collier that went down, going forwards in the witchet with his candle in his hand, the damp presently darted out so violently at his candle, that it struck the man clear down, singed all his hair and clothes, and disabled him from working for a while after. Some other small warnings it gave them, inso
much that they resolved to employ a man on purpose that was more resolute than the rest, to go down a while before them every morning, to chase it from place to place, and so to weaken it. His usual manner was to put on the worst rags he had, and to wet them all in water, and when he came within the danger of it, then he fell down groveling upon his belly, and so went forward, holding in one hand a long wand or pole, at the head whereof he tied candles burning, and reached them by degrees towards it; then the damp would fly at them, and, if it missed of putting them out, would quench itself with a blast, and leave an ill-scented smoke behind. Thus they dealt with it till they had wrought the coal down to the bottom, and the water following, and not remaining as before in the body of it, among sulphurous and brassy metal that is in some veins of the coal, the fire-damp was not seen nor heard of till the latter end of the year 1675, which happened as followeth:

"After long working of this coal, it was found upon the rising grounds that there lay another reach of coal at the depth of 14 yards under it, which proved to be 3 1/2 yards thick, and something more sulphurous. This encouraged us to sink in one of the pits we had formerly used on the five-yards coal. As we sunk the lower part of it, we had many appearances of the fire-damp in the watery crevices of the rocks we sunk through, flashing and darting from side to side of the pit, and showing rainbow-like colours upon the surface of the water in the bottom; but upon drawing up of the water with buckets, which stirred the air in the pit, it would leave burning, till the colliers at work, with their breath and sweat, and the smoke of their candles, thickened the air in the pit, and then it would appear again; they lighted their candles at it sometimes when they went out; and so in this pit it did no farther harm."

In another pit, however, it soon appeared, and at last produced a most terrible explosion. This was occasioned by one of the workmen going imprudently down with a lighted candle, after a cessation of work for some days, and the force exerted by it seemed equal to that of gunpowder.

The formation of inflammable air in mines is to be ascribed, according to the doctrines of modern chemistry, to the decomposition of water, a process which is constantly going on in places where metallic substances are exposed to its action. As the metals are oxidized by their combination with the oxygen, one of the component parts of water, the hydrogen, its other component parts, is set at liberty, and accumulates in those places where it is generated.

A much more important consideration than the formation of damps, however, is the proper method of avoiding their pernicious effects. The inflammability of one kind affords an easy method of preventing it from accumulating, viz. by setting fire to it. This may be done with safety, unless it has been suffered to go too far before the experiment is made: for the inflammable air being much lighter than any other kind will naturally rise to the top; so that a man, lying flat on the ground, to avoid the force of the explosion, and holding up a lighted candle fixed upon a pole, may at once free the mine from such a troublesome guest. But where it has been allowed to accumulate in too great quantity, so that this method cannot be used, or in the other kind, which is not inflammable, the method commonly practised is to produce a constant circulation of air as much as possible through all parts of the mine. To procure this, they make a perpendicular opening, which they call a shaft, or shaft, so that the mine may have two or three openings: and thus by reason of the difference of temperature between the open atmosphere and that in the mine, there is a continual draught of air through them both. This current will always be stronger in proportion to the difference between the external atmosphere and that of the mine; and likewise in proportion to the difference between the depth of the two shafts. But as the temperature of the atmosphere is variable, it happens at certain seasons of the year, that there is not a sufficient difference between that of the atmosphere and in the mine to produce the necessary circulation. This happens principally in the spring and autumn; at which seasons it is necessary to light fires in the shafts, which are always efficacious for the purpose desired.

Among the other uses to which depheglogisticated air might be applied, Mr Cavallo reckons that of securing people from the dangerous effects of damps in mines, and other subterranean places. "If a large bladder," says he, "into which a solution of lime in water is introduced, be filled with depheglogisticated air, and a small wooden or glass pipe be adapted to its neck, a man may hold that pipe in his mouth, and may breathe the depheglogisticated air; and thus equipped, he may enter into these subterranean places, amidst the various elastic fluids contained in them. A large bladder of depheglogisticated air will serve for above a quarter of an hour, which is a length of time sufficient for various purposes; besides, if longer time is required to be spent in these places, a person may have two or more bladders of depheglogisticated air along with him, and may shift as soon as the air of one is contaminated. Without the necessity of any more complicated apparatus, the bladders full of depheglogisticated air may be kept stopped by putting corks into the glass or wooden pipes that are tied to their necks. This air might also be used for diving-bells."

DAMSEL, from the French domaïel or damaïson, an appellation anciently given to all young people of either sex, that were of noble or gentle extraction, as the sons and daughters of princes, knights, and barons: thus we read of Damsel Pepin, Damsel Louis le Gros, Damsel Richard Prince of Wales.

From the sons of kings this appellation first passed to those of great lords and barons, and at length to those of gentlemen who were not yet knights.

At present damsel is applied to all maids or girls not married, provided they be not of the vulgar.

DAN, or JOR-DAN, which last literally denotes "the river Dan"; so named from the people where it has its source, which is a lake called Phæle, from its round figure, to the north of its apparent rising from the mountain Panium or Pæneum, as was discovered by Philip, tetrarch of Trachonites; for on throwing light in the Phæle, he found them to emerge again at Panium (Josephus). From Panium it runs in a direct course to a lake called Samachonites, as far as which it is called Jordan the less; and thence to the lake..."
murder by Mercury and Minerva by order of Jupiter; but according to the more received opinion, they were condemned to severe punishment in hell, and were compelled to fill with water a vessel full of holes, so that the water ran out as soon as poured into it; and therefore their labour was infinite, and their punishment eternal. The heads of the sons of Ægyptus were buried at Argos; but their bodies were left at Lerna, where the murder had been committed.

DANAUS, in fabulous history, a son of Belus and Anchione, who, after his father's death, reigned conjointly with his brother Ægyptus on the throne of Egypt. Some time after, a difference arose between the brothers, and Danaus set sail with his fifty daughters in quest of a settlement. He visited Rhodes, where he consecrated a statue to Minerva, and arrived safe on the coast of Peloponnesus, where he was hospitably received by Gelanor, king of Argos. Gelanor had lately ascended the throne, and the first years of his reign were marked with dissensions with his subjects. Danaus took advantage of Gelanor's unpopularity, and obliged him to leave the crown. In Gelanor, the race of the Inachidae was extinguished, and the Belides began to reign at Argos in Danaus. Some authors say, that Gelanor voluntarily resigned the crown to Danaus, on account of the wrath of Neptune, who had dried up all the waters of Argolis, to punish the impiety of Inachus. The success of Danaus invited the fifty sons of Ægyptus to embark for Greece. They were kindly received by their uncle; who, either apprehensive of their number, or terrified by an oracle which threatened his ruin by one of his sons-in-law, caused his daughters, to whom they were promised in marriage, to murder them the first night of their nuptials. His order was executed. Hypermenestra alone spared the life of Lynceus: (See DANAIDES.) Danaus at first persecuted Lynceus with unremitting fury; but he was afterwards reconciled to him, and he acknowledged him for his son-in-law and successor after a reign of 50 years. He began his reign about 1386 years before the Christian era; and after death he was honoured with a splendid monument in the town of Argos, which still existed in the age of Pausanias. According to Æschylus, Danaus left Egypt, not to be present at the marriage of his daughters with the sons of his brothers; a connexion which he deemed unlawful and impious.

DANCE, or Dancing, as at present practised, may be defined "an agreeable motion of the body, adjusted by art to the measures or tune of instruments, or of the voice."—But, according to what some reckon more agreeable to the true genius of the art, dancing is "the art of expressing the sentiments of the mind, or the passions, by measured steps or bounds that are made in cadence, by regulated motions of the body, and by graceful gestures: all performed to the sound of musical instruments or of the voice."

There is no account of the origin of the practice of dancing among mankind. It is found to exist among all nations whatever, even the most rude and barbarous; and, indeed, however much the assistance of art may be necessary to make any one perfect in the practice, the foundation must certainly lie in the mechanism of the human body itself.

The connexion that there is between certain sounds
DAN

and those motions of the human body called dancing, hath seldom or never been inquired into by philosophers, though it is certainly a very curious speculation. The power of certain sounds not only over the human species, but even over the inanimate creation, is indeed very surprising. It is well known, that the most solid walls, nay the ground itself, will be found to shake at some particular notes in music. This strongly indicates the presence of some universally diffused and exceedingly elastic fluid, which is thrown into vibrations by the concussions of the atmosphere upon it, produced by the motion of the sounding body. If these concussions are so strong as to make the large quantity of elastic fluid vibrate that is dispersed through a stone wall or a considerable portion of earth, it is no wonder they should have the same effect upon that invisible and exceedingly subtle matter that pervades and seems to reside in our nerves.

Some there are that have their nerves constructed in such a manner, that they cannot be affected by the sounds which affect others, and some scarce with any; while others have such an irritability of the nerves in this case, that they cannot, without the greatest difficulty, sit or stand still when they hear a favourite piece of music played.

It is conjectured by very eminent philosophers, that all the sensations and passions to which we are subject, do immediately depend upon the vibrations excited in the nervous fluid above mentioned. Hence, musical sounds have the greatest power over those people who are of a delicate sensible frame, and who have strong passions. If it be true, therefore, that every passion in the human nature immediately depends upon a certain affection of the nervous system, or a certain motion or vibration in the nervous fluid, we shall immediately see the origin of the different dances among different nations. One kind of vibration, for instance, raises the passions of anger, pride, &c. which are indispensably necessary in warlike nations. The sounds, for such there are, capable of exciting a similar vibration, would naturally constitute the martial music among such nations, and dances conformable to it would be instituted. This appears to be the case particularly among barbarous nations, as we shall presently have occasion to remark. Other vibrations of the nervous fluid produce the passions of joy, love, &c.; and sounds capable of exciting these particular vibrations will immediately be formed into music for dancers of another kind.

As barbarous people are observed to have the strongest passions, so they are also observed to be the most easily affected by sounds, and the most addicted to dancing. Sounds to us the most disagreeable, the drumming of sticks upon an empty cask, or the noise made by blowing into reeds incapable of yielding one musical sound capable of being agreeable to them. Much more are they affected by the sound of instruments which have any thing agreeable in them. Mr Gallini informs us, that "The spirit of dancing prevails almost beyond imagination among both men and women in most parts of Africa. It is even more than instinct, it is a rage, in some countries of that part of the globe. Upon the Gold coast especially, the inhabitants are so passionately fond of it, that in the midst of their hardest labour, if they hear a person sing, or any musical instrument played, they cannot refrain from dancing. There are even well attested stories of some negroes flinging themselves at the feet of an European playing on a fiddle, entreatings him to desist, unless he had a mind to tire them to death; it being impossible for them to cease dancing while he continued playing."

The same thing is found to take place in America, though, as the inhabitants of that continent are found to be of a more fierce and barbarous nature than the African nations, their dances are still more uncouth and barbarous than those of the negroes. "In Mexico, says Gallini, they have also their dances and music, but in the most uncouth and barbarous style. For their symphony they have wooden drums, something in form of a kettle-drum, with a kind of pipe or flagellet, made of a hollow cane or reed, but very grating to an European ear. It is observed they love everything that makes a noise, how disagreeable soever the sound is. They will also hum over something like a tune when they dance 30 or 40 in a circle, stretching out their hands, and laying them on each others shoulders. They stamp and jump, and use the most frantic gestures for several hours, till they are heartily weary. And one or two of the company sometimes step out of the rings to make sport for the rest, by showing feats of activity, throwing their lances up into the air, catching them again, bending backwards, and springing forwards with great agility." The origin of dancing among the Greeks was most certainly the same as among all other nations; but as they proceeded a certain length in civilization, their dances were of consequence more regular and agreeable than those of the more barbarous nations. They reduced dancing into a kind of regular system; and had dances proper for exciting, by means of the sympathy above mentioned, any passion whatever in the minds of the beholders. In this way they are said to have proceeded very great lengths, to us absolutely incredible. At Athens it is said, that the dance of the Eumenides or Furies on the theatre had so expressive a character as to strike the spectators with irresistible terror: men grown old in the profession of arms trembled; the multitude ran out; women with child miscarried; people imagined they saw in earnest those terrible deities commissioned with the vengeance of heaven to pursue and punish crimes upon earth.

The Greeks had martial dances, which they reckoned to be very useful for keeping up the warlike spirit of their youth; but the Romans, though equally warlike with the Greeks, never had any thing of the kind. This probably may be owing to the want of that romantic turn for which the Greeks were so remarkable. The Romans had no heroes among them, such as Hercules, Achilles, or Ajax; nor does the whole Roman history furnish an example of a general that made war after the manners of the Greeks. Though their soldiers were as valiant as ever the Greeks could pretend to be, the object with them was the honour of the republic, and not their own personal praise. Hence there was less fury, and much more cool deliberate valour, exercised by the Romans than any other nation whatever. The passions of pride, resentment, obstinacy, &c. were excited in them, not by the mechanical means of music and dancing, but by being taught that it was their chief honour to fight for the republic. It does not
not however appear, that the Romans were at all less capable of being affected in this mechanical manner than the Greeks. When dancing was once introduced, it had the very same effects at Rome as at Athens.

Among the Jews, dancing seems to have made a part of the religious worship on some occasions, as we learn from some passages in the Psalms, though we do not find either that or singing positively enjoined as a divine precept. In the Christian churches mentioned in the New Testament, there is no account of dancing being introduced as an act of worship, though it is certain that it was used as such in after ages. Mr. Gallini tells us, that "at Limoges, not long ago, the people used to dance the round in the choir of the church which is under the invocation of their patron saint; and at the end of each psalm, instead of the Gloria Patri, they sung as follows: St Marcel, pray for us, and we will dance in honour of you."—Though dancing would now be looked upon as the highest degree of profanation in a religious assembly, yet it is certain, that dancing, considered as an expression of joy, is no more a profanation than singing, or than simple speaking; nor can it be thought in the least more absurd, that a Christian should dance for joy that Jesus Christ is risen from the dead, than that David danced before the ark when it was returned to him after a long absence.

Plato reduces the dances of the ancients to three classes. 1. The military dances, which tended to make the body robust, active, and well disposed for all the exercises of war. 2. The domestic dances, which had for their object an agreeable and innocent relaxation and amusement. 3. The meditatorial dances, which were in use in expiations and sacrifices.—Of military dances there were two sorts: the gymnopedique dance, or the dance of children; and the enoplión, or armed dance. The Spartans had invented the first for an early excitation of the courage of their children, and to lead them on insensibly to the exercise of the armed dance. This children’s dance was to be executed in the public place. It was composed of two choirs; the one of grown men, the other of children: whence, being chiefly designed for the latter, it took its name. They were both of them in a state of nudity. The choir of the children regulated their motions by those of the men, and all danced at the same time, singing the poems of Thales, Alcman, and Dionysodorus.—The enoplión or pyrrhic was danced by young men armed cap-a-pie, who executed, to the sound of the flute, all the proper movements either for attack or for defence. It was composed of four parts.—The first the podism or footing; which consisted in a quick shifting motion of the feet, such as was commonly resorted to in overtaking a flying enemy, or for getting away from him when an overmatch.—The second part was the xiphism: this was a kind of mock fight, in which the dancers imitated all the motions of combatants; aiming a stroke, darting a javelin, or dexterously dodging, pairing, or avoiding a blow or thrust. The third part, called the komos, consisted in very high leaps or vaultings, which the dancers repeated for the better using themselves occasionally to leap over a ditch, or spring over a wall. The tetraculos was the fourth and last part: this was a square figure, executed by slow and majestic movements; but it is uncertain whether this was everywhere executed in the same manner.

Of all the Greeks, the Spartans were those who most cultivated the Pyrrhic dance. Athenaeus relates, that they had a law by which they were obliged to exercise their children at it from the age of five years. This warlike people constantly retained the custom of accompanying their dances with hymns and songs. The following was sung for the dance called trichorœ, said to be instituted by Lycurgus, and which had its name from its being composed of three choirs, one of children, another of young men, and the third of old. The old men opened the dance, saying, "In time past we were valiant." The young men answered, "We are so at present." "We shall be still more so when our time comes," replied the chorus of children. The Spartans never danced but with real arms. In process of time, however, other nations came to use only weapons of wood on such occasions. Nay, it was only so late as the days of Athenaeus, who lived in the second century, that the dancers of the Pyrrhic, instead of arms, carried only flasks, ivy-bound wands (thyrus) or reeds. But, even in Aristotle’s days, they had begun to use thyruses instead of pikes, and lighted torches in lieu of javelins and swords. With these torches they executed a dance called the confagration of the world.

Of the dances for amusement and recreation, some were but simply gambols, or sportive exercises, which had no character of imitation, and of which the greater part exist to this day. The others were more complex, more agreeable, figured, and were always accompanied with singing. Among the first or simple ones was the ascotismus: which consisted in jumping, with one foot only, on bladders filled with air or wine, and rubbed on the outside with oil. The dippodium was jumped with both feet close. The kybastes was what is called in this country the somerset.—Of the second kind was that called the wine-press, of which there is a description in Longinus, and the Ionian dances: these last, in the original of their institution, had nothing but what was decent and modest; but, in time, their movements came to be so depraved, as to be employed in expressing nothing but voluptuousness, and even the grossest obscenity.

Among the ancients there were no festivals nor religious assemblies but what were accompanied with songs and dances. It was not held possible to celebrate any mystery, or to be initiated, without the intervention of these two arts. In short, they were looked upon to be so essential in these kinds of ceremonies, that to express the crime of such as were guilty of revealing the sacred mysteries, they employed the phrase, "to be out of the dance." The most ancient of these religious dances is the Bacchic; which was not only consecrated to Bacchus, but to all the deities whose festival was celebrated with a kind of enthusiasm. The most grave and majestic was the hyperchamatis; it was executed to the lyre, and accompanied with the voice. At his return from Crete, Theseus instituted a dance at which he himself assisted at the head of a numerous and splendid band of youth, round the altar of Apollo. The dance was composed of three parts: the strope, the antistrope, and the stationary. In the strope, the movements were from the right to the left; in the antistrope...
DANCE.

Dance, from the left to the right. In the stationary, they danced before the altar; so that the stationary did not mean an absolute pause or rest, but only a more slow or grave movement. Plutarch is persuaded, that in this dance there is a profound mystery. He thinks, that by the strophe is indicated the motion of the world from east to west; by the antistrope, the motion of the planets from the west to the east; and by the stationary, the stability of the earth. To this dance Theseus gave the name of geranos, or “the crane!” because the figures which characterised it bore a resemblance to those described by cranes in their flight.

With regard to the modern practice of dancing as an art, there are few directions that can be of much service. The following is extracted from Mr Gallini’s description of the several steps or movements.

“The dancing (says he) is generally on a theatre, or in a saloon or room. At the theatre there are four parts to be considered. 1. The nearest front to the spectators. 2. and 3. The two sides or wings. 4. The farther front from the spectators.

In a saloon or room, the place in which are the spectators decides the application respectively to them of right and left. The dancer should place himself in as advantageous a point of view to them as possible.

In the dance itself, there are to be distinguished, the attitude of the body, the figure, the position, the bends, the risings or leaps, the steps, the cabriole, the falling, the sliding, the turns of the body, the cadences.

“The attitude of the body requires the presenting one’s self in the most graceful manner to the company. “The figure is to follow the track prescribed to the steps in the dance. “The position is that of the varied attitudes, which must be at once striking and easy, as also of the different exertions of the legs and feet in dancing. “The bends are inflections of the knees, of the body, of the head, of the arms. “The risings are the contrast to the bends, the extension of the knee. One of these two motions necessarily precedes the other. “The step is the motion by the foot or feet from one place to another. “The leap is executed by springing up into the air; it begins with a bend, and proceeds with a quick extension of the legs, so that both feet quit the ground. “The cabriole is the crossing, or cutting of capers, during the leap, before the return of the feet to the ground. “The falling is the return of the feet to the ground, by the natural gravitation of the body. “The slide is the action of moving the foot along the ground without quitting it. “The turn is the motion of the body towards either side, or quite round. “The cadence is the knowledge of the different measures, and of the times of movement the most marked in the music. “The track is the line marked by the dance: it may be either straight or curve, and is susceptible of all the inflections corresponding to the various designs of the composer. There are the right, the diametral line, the circular line, and the oblique line.

The right line is that which goes lengthwise, reckoning from one end of the room towards the other. The diametral line is across the room, from one side to the other. The circular line is waxing, or undulatory, from one place to another. The oblique line proceeds obliquely from one quarter of the room towards another. Each of these lines may directly or separately form the dancer’s track, diversified with steps and positions.

“The regular figure is when two or more dancers move in contrary directions; that is to say, that when one moves towards the right, the other moves to the left. The irregular line is when the couples figuring together are both on the same side.

“Commonly the man gives the right hand to the lady in the beginning or ending of the dance, as we see in the minuet, bourree, &c.

“When a great number of dancers figure together, they are to execute the figure agreeably to the composition of the dance, with special attention to keep an eye constantly on the partner. When, in any given dance, the dancers have danced for some time in the same place, the track is only to be considered as the conductor of the steps, but not of the figure; but when the dance continues, without being confined to the same place, then the track must be considered as the conductor both of the steps and of the figure.

“Now, to observe the figure, the dancer must have placed himself at the beginning of the track upon which he is to dance, and comprehend the figure before he himself begins it. He is to remark and conceive whether the figure is right, diametrical, circular, or oblique; if it is progressive or retrogressive, or towards the right or left. He should have the air played or sung to him, to understand the movement. Where the tracks cross one another, the steps of each of the couples must leave a sufficient distance between them not to confuse the figure.

“There are commonly reckoned ten kinds of positions, which are divided into true and false, five each. There are three principal parts of the foot to be observed; the toes, the heel, and the ankle.

“The true positions are when the two feet are in a certain uniform regularity, the toes turned equally outwards. The false are divided into regular and irregular. They differ from the true, in that the toes are either both turned inwards; or if the toes of one foot are turned outwards, the others are turned inwards.

“In the first of the true positions, the heels of the two feet are close together, so that they touch; the toes being turned out. In the second, the two feet are open in the same line, so that the distance between the two heels is precisely the length of one foot. In the third, the heel of one foot is brought to the ankle of the other, or seems to touch in with it. In the fourth the two feet are one before the other a foot’s length distance between the two heels, which are on the same line. In the fifth, the two feet are across, the one before the other; so that the heel of one foot is directly opposite to the toes of the other.

“In the first of the false positions, the toes of both feet are turned inwards so that they touch, the heels being open. The second is, when the feet are asunder at a foot’s distance between the toes of each, which are turned inward, the heels being on a line. The third is when the toes of one foot are turned outwards, the other
DAN

Dance. other inwards, so that the two feet form a parallel.
The fourth is, when the toes of the two feet are turned inwards; but the toes of one foot are brought nearer the angle of the other. The fifth is, when the toes of the two feet are turned inwards, but the heel of one foot is opposite to the toes of the other.

"There are mixed positions, composed of the true and false in combination; which admit of such infinite variety, and are in their nature so unsusceptible of description by words, that it is only the sight of the performance that can give any tolerable idea of them.

"Of the bends of the knee there are two kinds; the one simple, the other forced. The simple bend is an inflection of the knees without moving the heel, and is executed with the foot flat on the ground. The forced bend is made on the toes with more force and lower.

"Much is to be observed on the head of steps. First, not to make any movement before having put the body in an upright posture, firm on the balance.

"Begin with the inflection of the knee and thigh; advance one foot foremost, with the whole foot on the ground, laying the stress of the body on the advanced leg.

"There are some who begin the step by the point of the toes; but that has an air of theatrical affectation. Nothing can be more noble than a graceful ease and dignity of step. The quantity of steps used in dancing is almost innumerable; they are nevertheless reducible under five denominations, which may serve well enough to give a general idea of the different movements that may be made by the leg, viz. the direct step, the open step, the circular step, the twisted step, and the cut step.

"The direct step is when the foot goes upon a right line, either forwards or backwards.

"The open step is when the legs open. Of this step there are three kinds; one when they open outwards; another, when, describing a kind of circle, they form an in-kneed figure; a third, when they open sidewise; this is a sort of right step, because the figure is in a right line.

"The round is when the foot, in its motion, makes a circular figure, either inwards or outwards.

"The twisted step, or pas tortille, is when the foot in its motions turns in and out. There are three kinds of this step; one forwards, another backwards, and the third sidelong.

"The cut step is when one leg or foot comes to strike against the other. There are also three sorts of this step; backwards, and sidelong.

"The steps may be accompanied with bendings, risings, leaps, cabrioles, fallings, slidings, the foot in the air, the tip-toe, the rest on the heel, quarter-turns, half-turns, three-quarter turns, and whole turns. There may be practised three kinds of bends, or sinkings, in the steps; viz. bending before the step proceeds, or at the act of stepping, and at the last of the steps. The beginning or initial sink pace is at the first setting off, on advancing the leg.

"The bend in the act of stepping continues the march or walk.

"The final sink pace closes the march.

"The rising is just the reverse of the bend, or sink pace, which shall have preceded it.

"Some great masters in the art of dancing, having observed that music, which is inseparable from it, was capable of being preserved and conveyed by the musical characters, imagined by analogy, that the like advantage could be procured to the composition of dancers. Upon this plan they attempt what is called the choreography, an art which they suppose was either utterly unknown to the ancients, or not transmitted to us from them.

"It may indeed be easily allowed, that the track or figure of a dance may be determined by written or engraved lines; but those lines will necessarily appear so perplexing, so intricate, so difficult, if not impossible to seize in their various relations, that they are only fit to disgust and discourage, without the possibility of their conveying a satisfactory or retentive instruction.—Whence it is, that the article Choreography in the French Encyclopedic is universally exploded as unintelligible and useless: though nothing more than an elementary indication of the art; and an explanation, such as it is, of some of the technical terms of it."

Stage-Dances. The Greeks were the first who united the dance to their tragedies and comedies; not indeed as making part of those spectacles, but merely as an accessory.

The Romans, as usual, copied after the Greeks; but in the reign of Augustus they left their instructors far behind them. Two very extraordinary men made their appearance at that time: they invented a new species of entertainment, and carried it to an astonishing degree of perfection. Nothing was then talked of but the wonderful talents and amazing performances of Pylades and Bathylus, who were the first to introduce among the Romans what the French call the ballet d'action, wherein the performer is both actor and dancer.

Pylades undertook the hard task of representing, with the assistance of the dance alone, strong and pathetic situations. He succeeded perhaps beyond his own expectation, and may be called the father of that style of dancing which is known to us by the name of grave or serious pantomime.

Bathyllus an Alexandrian and a freedman of Meccenas, took upon himself to represent such subjects as required a certain liveliness and agility. He was handsome in his person; and the two great scourges of Roman follies, Persius, and especially Juvenal, speak of him as the gallant of every woman in Rome. The latter, in his cynical style, even goes so far as to say, that when Bathylus performed the dance called, after the name of a celebrated female dancer, Chersonens-Leda, the gravest matron was turned off her guard, and the young virgin longed for the dancer's address.

Nature had been excessively partial to those two men. They were endowed with genius, and all the exterior charms that could captivate the eye. By their study, application, and the desire to establish a lasting reputation, they displayed to the greatest advantage all the resources which the art of dancing could supply. These, like two phenomena, disappeared, and never did the world see their like again. Government withdrew.
DAN [ 72 ]

DANCE. withdrew its protection; the art gradually sunk into obscurity, and became even entirely forgotten on the accession of Trajan to the empire.

Thus buried with the other arts in entire oblivion, dancing remained uncultivated till about the 17th century, when ballets were received in Italy at a magnificent entertainment given by a nobleman of Lombardy at Tortona, on account of the marriage between Galeas duke of Milan and Isabella of Arragon. Every resource that poetry, music, dancing, and machinery could supply, was employed and exhausted on the occasion. The description given of so superb an entertainment excited the admiration of all Europe, and excited the emulation of several men of genius, who improved the hint to introduce among their countrymen a kind of spectacle equally pleasing and novel.

It would seem, however, that at first the women had no share in the public or theatrical dance; at least we do not see them mentioned in the various entertainments given at the opera in Paris till the 21st of January 1651, when the then dauphiness, the princess of Gouti, and some other ladies of the first distinction in the court of Louis XIV. performed a ballet with the opera called Le Triomphe de l'Amour. This union of the two sexes served to enliven and render the spectacle more pleasing and more brilliant than it ever was at any other period. It was received with so much applause, that on the 15th of May following, when the same opera was acted in Paris at the theatre of the Palais Royal, it was thought indispensable for the success of that kind of entertainment to introduce female dancers. They have continued ever since to be the principal support of the opera.

The dance is now in such commendation, that, particularly in France, the opera-house seems rather an academy for dancing, than calculated for the representation of lyric poems. The disgusting and inordinate length of their recitatives is one of the chief causes of that general taste for dancing which prevails amongst them. A wit being asked one day what could be done to keep up an opera threatened with a most complete damnation? "Do! (says he); why, lengthen the dances and shorten the petticoats." So evident it is, that singing, though apparently the chief purpose of an opera, is by no means the most pleasing part of the entertainment for the spectators.

Thus what was at first introduced as a mere accessory to the musical performance, became in process of time its only support; and this circumstance excited the emulation of several eminent ballet-masters. The art, however, of composing those grand dances, which are now so much admired, was for many years in a state of infancy, till Monsieur Noverre stept forth and gave it that degree of perfection which it seems impossible to exceed. This celebrated ballet-master and performer, in a work lately published, has with great elegance and ingenuity delineated the nature, objects, and powers of dancing, enumerated the proper requisites to give it effect, and shown how much it may be ennobled by an acquaintance with the kindred arts.

Ballets, he observes, have hitherto been the faint sketches only of what they may be one day. An art entirely subervient, as this is, to taste and genius, may receive daily variation and improvements. History, painting, mythology, poetry, all join to raise it from that obscurity in which it lies buried; and it is truly surprising, that composers have hitherto disdained so many valuable resources.

According to our author, the reason why this art has remained so long in its infancy, is because its effects have been restrained to the transitory ones of fire-works calculated only to please the eye: and it never was supposed to have powers sufficient to speak to the heart; whereas it may vie, he says, with the best dramatic pieces, prove equally interesting, and captivate the spectator by the charms of the most complete illusion.

If ballets, therefore, says he, "are for the most part unintersing and uniformly dull; if they fail in the characteristic expression which constitutes their essence, the effect does not originate from the art itself, but should be ascribed to the artists. Are then the latter to be told that dancing is an imitative art? I am indeed inclined to think that they know it not, since we daily see the generality of composers sacrifice the beauties of the dance, and give up the graceful naïveté of sentiment, to become the servile copyists of a certain number of figures, known and hackneyed for above a century; so that the ballets of Phaeton, or of any ancient opera, revived by a modern composer, would prove so very similar to former ones, that one would think they have undergone no alteration, and are the same in every step."

"Ballet-masters should consult the productions of the most eminent painters. This would bring them nearer to nature, and induce them to avoid, as often as possible, that symmetry of figures, which, by repeating the object, present two different pictures on one and the same canvas."

"Those symmetrical figures from right to left, according to my judgment, are supportable only in the entrées, which are not meant to express any thing in particular, but are only calculated to afford some relief to the principal dancers. They may be introduced in a general dance at the conclusion of an entertainment; they may also be admitted in the pas de quatre, six, &c. though in my opinion it is ridiculous even in this case to prefer the display of bodily strength and agility to expression and sentiment. But such figures must give way to nature in what we call ballets d'action. An instant, though perhaps not very forcible, may serve to elucidate and support my argument."

"At the sudden and unexpected appearance of some young fauns, a troop of nymphs take themselves to flight with equal alacrity and precipitation. The former are in pursuit of the latter with that eagerness which the very hope of pleasure can inspire. Now they stop to observe what impression they have made on the nymphs; these at the same time, and for a similar reason, check their career; with fear they survey their pursuers, endeavour to guess at their intentions, and provide for a retreat to some spot, where they may rest secure from the dangers that threaten them. Both troops now join, the nymphs resist, defend themselves, and at last effect their escape with no less swiftness than dexterity."

"This I call a busy active scene, in which the dance, as it were, should speak with energy. Here studied and symmetrical figures cannot be introduced, without a manifest violation of the truth, without destroying..."
Dance. 

A ballet-master, devoid of taste and discernment, will make of this a mechanical piece of dancing, and thus deprive it of the effect it was calculated to produce, for want of entering into the spirit of it. His nymphs and fauns will be arranged upon a parallel line: he will place the former in attitudes awkwardly uniform, and insist on the latter holding up their arms to an even altitude; rather than deviate from the beaten path, and the antique rules of opera-dancing, he will cautiously avoid to have, on the right and left, his nymphs placed in unequal numbers, but will reduce a scene of action, which ought to be supported with spirit, to an exercise equally affected and uninteresting.

Perhaps some ill-disposed critics, so far strangers to the art as not to judge of it from its various effects, will maintain, that the above scene should present only two different objects, the one portrayed in the loversick fauns, the other expressed by the aspIrations of the nymphs. But how many shades may serve to embellish those pictures? How varied may the strokes of the pencil? How opposite the lights and what a number of tints ought to be employed in order to draw from this twofold situation a multiplicity of images, each more lively and spirited than the other?

As all men share the same passions, and these differ in proportion to their sensations and feelings, they may therefore be worked upon more or less powerfully in proportion as they manifest themselves outwardly with more or less force and impetuousness. This principle once acknowledged, and nature indeed enforces it daily, it would certainly be more to the purpose to diversify the attitudes and vary the expression; for then the pantomime action of each personage would be divested of a disgusting uniformity. The truth of imitation and the skill of the painter would conspicuously appear in giving a different aspect to the features, some of them expressing a kind of ferocity, others betraying less eagerness, these casting a more tender look; and to the rest, the languishing air of voluptuosity. The sketch of this first picture naturally leads to the composition of the second: here some nymphs appear divided between fear and desire; there some others express by the contrast of their attitudes the various emotions of their soul. Some are more scornful than their companions, whilst others betray a curiosity equal to their fears. This ensemble gives life to the whole picture, and is the more pleasing that it is perfectly consistent with nature. From this exposition, you will not hesitate to agree with me, that symmetry, the offspring of art itself, should never find place in the ballets d'action.

I shall beg leave to inquire of all those who reason from habitual prejudice, whether they will look for their favourite symmetry in a herd of sheep flying from the wolf, or among wretched peasants leaving their huts and fields, in order to shelter themselves from the fury of a party of enemies? By no means. But the art lies in concealing art itself: my aim is by no means to introduce disorder and confusion; on the contrary, I will have regularity even in irregularity. What I most insist on is, the introducing of well-concerted groups, situations forcibly expressed, but never beyond nature, and above all, a certain ease in the composition, which betrays not the labour of the composer. As for the figures, they are likely to please only in proportion as they quickly succeed each other, and are devised with equal taste and elegance.

A ballet perfect in all its parts, our author proceeds to observe, is a picture drawn from life, of the manners, dresses, ceremonies, and customs of all nations. It must therefore be a complete pantomime, and through the eyes speak, as it were, to the very soul of the spectator. If it wants expression, if it be deficient in point of situation and scenery, it degenerates into a spectacle equally flat and monotonous.

According to Plutarch, a ballet is, if the expression may be allowed, a mute conversation, or a speaking and animated picture, whose language consists of motions, figures, and gestures. These figures, says our author, are unlimited in their number, because there are a thousand things that the ballet may express. Phrynius, one of the oldest tragedy writers, says, that he could find in our ballet as many figures as the sea rolls waves in a high winter tide.

A well-composed ballet, therefore, may do without the assistance of words: M. Noverre even remarks that these only serve to weaken the action, and partly destroy its effects. He has no opinion of a pantomime which, in order to be understood, must borrow the help of a verbal explanation. "Any ballet whatever (says he) destitute of intrigue, action, and interest, displaying nothing more than the mechanical beauties of the art, and though decorated with a pompous title, unintelligible throughout, is not unlike those portraits and pictures to which the painters of old subscribed the names of the personages and actions they meant to represent: because they were imperfect in point of imitation, the situations weakly expressed, the outlines incorrect, and the colours unseemly."

When dancers shall feel, and Proteus-like, transform themselves into various shapes to express to the life the conflict of passions; when their features, their very looks, shall speak their inward feelings; when extending their arms beyond the narrow circle prescribed by the rigid rules of pedantry, and with equal grace and judgment giving them a fuller scope, they shall by proper situations describe the gradual and successive progress of the passions; when, in fine, they call good sense and genius to the assistance of their art; then they may expect to distinguish themselves: explanatory speeches will become useless; a mute but powerful eloquence will be substituted to much better effect; each motion will be a sentence; every attitude will portray a situation; each gesture convey a thought, and each glance a new sentiment: every part will please, because the whole will be a true and faithful imitation of nature.

A ballet, in whatever style it may be, should, according to Aristotle, be composed, as well as poetry, of two different parts, which he calls parts of quality and parts of quantity. Nothing exists in nature without matter, form, and figure: the ballet therefore becomes a mere nonentity, if it be deficient in any of these.
DAN

those essential parts which mark and constitute the being of any one thing animate or inanimate. The matter here is the subject intended for representation; its form consists in the ingenious distribution of the plan; and the various compounding parts constitute its figure. Form therefore contains the parts of quality, and the extent the parts of quantity.

Thus it appears, that ballets are in some degree subject to the rules of poetical composition. They, nevertheless, differ from tragedies and comedies, in that the former are not subject to the three unities of time, place, and action: Yet they require an unity of plot, in order that the various scenes may meet and end on the same point. The ballet, therefore, may be termed the brother of the drama, though not restrained to its stricter rules, which only serve to cramp the imagination, check its flight, and confine genius; and if adhered to, must set aside all thought of composition of ballets, by depriving them of their chief ornament, pleasing variety.

M. Noverre considers tragedy as the subject most suitable for the art of dancing. The former abounds in noble incidents, situations, &c. and these produce the best stage effects. Besides, the passions are more forcibly expressed by great characters than by common men: the imitation is of course less difficult, the action in the pantomime more significant, natural, and intelligible.

"The business of a skilful master (he observes), is to foresee, as it were at one glance, the general effect that may result from the ensemble, and never give the preference to one single part over the whole. The only way for him to bestow his thoughts on the greatest number, is to forget for a while the principal characters of the drama; if his whole attention should entirely be taken up with the parts of his first dancers of both sexes, the action is suspended, the scenes are slow in their progress, and the whole performance must fall short of its desired effect.

"In the tragedy of Merope by Voltaire, the principal characters are Merope, Polisonte, Egiste, and Narbas: But although the parts of the inferior actors are not of equal importance, yet they all concur to the general action, and to the progression of the drama, which would appear deficient in some parts, should either of those characters be wanting in the representation. No useless personage should be obtruded on the stage. Everything therefore that may tend to weaken the effect of the drama ought to be carefully avoided, and only that number of actors introduced which is barely requisite for the execution of the performance.

"A ballet is a production of the same kind. It must be divided into acts and scenes, each of which, as well as the act itself, must have its beginning, its middle, and its end; that is, in other words, exposition, plot, and denouement."

"I have observed above that the principal performers in a ballet should be forgotten for a while: My reason is, that, in my opinion, it is easier to give striking parts to Hercules and Omphale, Ariadne and Bacchus, Ajax and Ulysses, &c. than to 24 persons in their retinue. If these have nothing to say, they are superfluous, and of course ought to be rejected; but if they are to speak, let their conversa-

tion be consonant with that of the principal characters.

"The difficulty, therefore, does not lie in assigning a primary and distinctive part to Ajax or Ulysses; since it springs naturally from the importance of their situation in the play; but in introducing the figures in a becoming style, giving them parts of more or less importance, connected with the action of the two heroes; in introducing women, some of whom will appear concerned for Ajax, and the greater number showing their partiality for Ulysses. The triumph of the latter, the former's death, present to the mind of genius a series of images that vie with each other in point of interesting and picturesque situations. These, by means of a colouring skilfully contrasted, cannot but produce the most lively sensations. In fine, a ballet pantomime should be dramatic in all its parts; and the figure-dancers, who succeed to the principal performers, ought to continue the scene, not by a number of symmetrical figures and studied steps, but by that kind of animated expression which keeps up the attention of the spectators to the main subject for which the preceding actors have prepared the audience.

"Yet, either through ignorance, or in consequence of a vitiated habit, there are but few well supported ballets. Dance is introduced for the mere purpose of dancing; the end is supposed to be answered by the mechanical motions of the feet, or by high jumping, and that the idea which people of real taste may have of a ballet is fully answered, when inactive performers are introduced in it, who mix and jostle each other, presenting a confused heap of pictures, sketched without taste, awkwardly grouped, and totally devoid of that harmony and expression, the offspring of the soul, which alone can embellish art by giving it life."

M. Noverre, in considering the knowledge necessary for attaining perfection in the present art, observes, that mythology, ancient poetry, and chronology, ought to be the primary study of a ballet-master, who ought also to possess a genius for poetry and painting, since the art borrows all its charms from a perfect imitation of nature.

A slight knowledge of geometry cannot but prove very advantageous, as it will help the master to introduce his figures in due proportion, to calculate exactly, and execute with precision. By means of that unerring guide, he will retrench every superfluous accessory, and thus enliven the performance. Taste will introduce elegance, genius create variety, and judgment direct the whole.

What is a ballet but a piece of more or less complicated machinery, which strikes or surprises the beholder by its various effects, only in proportion as those are diversified and sudden: That chain and connection of figures, those motions succeeding each other with rapidity, those various forms turning contrary ways, that mixture of different incidents, the ensemble and harmony which mark the steps and accompany the exertions of the dancers; do not all these give you the idea of a mechanism most ingeniously contrived?

Ballets are often built on preternatural subjects; several of them require the assistance of machinery. For instance, few of the subjects taken from Ovid will be
A ballet-master who is no proficient in music, will make a bad choice of his airs. He will not enter into the spirit or character of them. The motions of his dancers will not be at the same time with that precision and delicacy which are absolutely necessary, unless he is endowed with that sensibility of organ which is more commonly the gift of nature than the result of art, and which is far above what may be acquired by long practice and steady application.

A good choice of music is as essential to dancing, as the choice of words and the phrasing of a speech is to eloquence. It is the tune and time of the music that fix and determine the motion of the dancers. If the former be uniform and devoid of taste, the ballet will, like its model, be dull and unmeaning.

By this immediate connection between music and dancing, it clearly appears that the reception which is knowledge of the former, the ballet-master will derive the greatest advantages. He will then be able to impart his thoughts to the composer; and if taste and knowledge combine together, he will either set the music himself, or at least furnish the composer with the principal outlines, to characterise the action of the dancer; as this will be varied and expressive, the ballet cannot fail of being equally so. Music well composed should paint and speak; and the dance set to those sounds, will be, as it were, the echo to repeat the words. If, on the contrary, it be mute, if it speak not to the ear of the dancer, then all sentiment and expression are banished from the performance.

As nothing can appear trifling to the man of genius, nothing should seem so to the ballet-master. It is impossible for him to distinguish himself in his profession, unless he applies to study those arts which have been just mentioned. Yet to insist that he should be master of all in that which is attainable only by those who give themselves entirely up to the study of each of them in particular, would be requiring a mere impossibility.

All that can be deemed strictly requisite, therefore, is a general knowledge, a slight tincture of those sciences which, by the connection they have with each other, are likely to contribute to the improvement of the art and to its reputation. From the natural union, however, that subsists between the arts, and from the harmony which reigns amongst them, that ballet-master will ennoble his composition with the most fire, spirit, liveliness, and interest, who has most genius and imagination, and whose knowledge is most extensive.

As to performers and their personal qualifications: The first point to which it is directed to pay attention, is the manner in which one takes up the profession of a dancer, at least so soon as he becomes capable of reflection; is his bodily formation? If one is conscious of any natural defect which seems irremediable by art, it will be best immediately to renounce every idea that may have been formed of the advantage arising from popular approbation. But where personal defects can be reformed by application, study, or the advice and assistance of judicious masters, then it becomes an essential concern quickly
DAN [ 76 ]

quickly to exert every effort, before the parts to be corrected have acquired strength and consistence, before nature has unalterably taken her bent, and the error becomes too habitual and inerterrate.

Among other personal defects, there are two which deserve particular notice: The first is that of being jarreté, "knock-kneed;" the other of being arqué, or "bow-legged."

A man is said to be jarreté or inknee'd when the haunches are strait, and inclining inwardly, the thighs lie near, and the knees are protuberant, and so close that they touch and knock together at every step, even when the feet are at a distance; so that such a person, from the knees to the feet, makes the figure of a triangle. In people of this formation, likewise, there is a clumsiness in the inside of the ankle, a great elevation in the instep, while the tendo Achilles is not only very slender, but much extended in the articulation.

The other defect of being arqué or bow-legged, is the opposite of the former, and exists in the same parts, namely, from the haunches to the feet, which describe a sort of bow or arch; for the haunches being in this case hollow, the thighs and knees stand open, and at a distance, so that they can never be brought in proper contact like those of a well-shaped person; their feet also are long and flat, the ankle juts out, and the tendo Achilles is large and closely inserted. A single view of these diametrically opposite effects, proves more forcibly than any arguments that the instructions which might correct the errors of one of this sort of dancers, would tend only to increase the defects of the other; and that consequently their aim and study ought to be correspondently opposite.

The dancer whose defect is of the first kind, that of being jarreté, must use the means which art furnishes him with, to separate and widen the too closely connected parts. The first step to this end is to turn the thighs outwardly, endeavouring to move them in that position, by taking the advantage of the free rotation which the thigh bone has in the cotyloid cavity of the haunches: assisted by this exercise, the knees will follow the same direction, and return, as it were, to their proper position. The knee-pan (which seems intended to prevent the knee from being thrown too far backward from its insertion) will stand perpendicular over the point of the foot, while the thigh and leg thus placed describe a line that will ensure firmness and stability to the whole body.

The second remedy to be used is, to keep the knees in a constant bend, and to make them appear very much stretched, without their being really so. This must be the result of long and constant practice; but when the habit is firmly contracted, it is impossible to return to the former position without causing unsupportable pain and numbness. Some dancers have been able to conceal this defect so artfully, that it was entirely undiscoverable, unless in dancing straight-capers or in very quick movements. The reason of its becoming visible at such times is, that the contraction of the muscles in the effort of leaping makes them stiff about the articulation, and forces every part into its former and natural situation; the knees thus strained, turn inwardly, and (for the time) regain their usual protuberance, which becomes an obstacle to the display of the entre-chat. The more these parts connect, to the greater distance will the lower extremities be thrown; hence the legs, neither being able to beat nor cross, remain motionless at the time of the knees rolling over each other, while the entre-chat, being neither cut, beat, nor crossed by the feet, is deprived of that life and brilliancy which are its chief merit.

A person thus formed, should entirely renounce the entre-chat, cabrioles, and every kind of dance that requires very quick and complicated movements, as it will infallibly render him weak and powerless; for the haunches being so strait, the muscles that are attached to them (wherein the motions of the trunk depend), have not a proper and easy play, which will be always in proportion to the dimension of these bones, because then the muscles shoot out or divide from a point more distant from the centre of gravity: therefore the grander sort of dancing, and terre à terre, is the best adapted to such dancers; and we may add, that whatever they lose on the score of strength, they regain in elegance and address. They are luxuriant and shining in the simplest parts; easy even in difficult ones, where no great efforts are required; just in their execution; elegant in their display; and their spring is always exerted with an infinity of grace, as they dexterously employ every resource which the motion of the instep can give them. These are advantages which atone for want of personal strength; and in dancing, agility and address are always preferable to the mere efforts of force.

The art of concealing or overcoming the defects of such performers as we have characterized by being arqué or bow-legged, is in a great measure the opposite of the former; namely, by endeavouring to bring together the parts that are too much separated, and forming that vacuity which is peculiar between the knees. These require no less exercise than the former in turning the thighs outwardly, and generally are less able to disguise their faults: for being more robust and vigorous, there is less pliability in their muscles, and their joints move less easily. And it must be added, if the deformity results from a natural distortion of the bone, labour will be as useless as all the aids of art will be impotent.

It was remarked, that dancers of the first class, or jarretés, should preserve a slight genuflexion or bend in their performance; while these, for the opposite reason, ought to keep their limbs rather extended or stretched, and to cross more closely, by that means diminishing the vacancy occasioned by the natural separation. Such dancers are nervous, lively, and brilliant in all cases which require more strength than elegance; vigour and agility may be inferred from their muscular force, and the firmness and resistance of their particular ligaments. Such is the pouncing, because they cross low rather than high; and putting on that account less space in beating time, they perform it with more liveliness: they display more brilliancy, because the light becomes visible between the limbs at the moment of crossing and recrossing; and this is precisely the clair-obscure of dancing; for if the time in the entre-chat or cross-caper is neither cut nor beat, but rolled or huddled over, there is no light to give distinction to the shadows, and the limbs, so closely joined, present an indistinct and effectless mass.
These dancers have less address than the others, as they generally depend on their strength; and indeed that strength is a constant obstacle to ease and pliancy; if it forsakes them a single moment, they appear awkward and ridiculous: nor can they conceal their situation by any trifling display; that, requiring mere address, would give them time to recover, which their want of natural elasticity otherwise prevents.

Dancers who are farreéts, are weak, slender, and delicate; the others, strong and vigorous, large made, and nervous. It is a common opinion, that stout, square-bellied men are heavy and sluggish; which they doubtless are in respect of bodily weight; but the notion is erroneous so far as regards dancing; for activity owes its very existence to muscular strength, and every man who has not a requisite share of that will always fall heavy. The reason is evident; the weak parts, in the instant of falling, not being able to resist the stronger (that is, the weight of the body, which acquires a momentum in proportion to the height it falls or descends from), yield and bend; and it is at the moment of relaxation or flexion that the noise of the fall is heard; a circumstance greatly lessened, or rather entirely avoided, when the body is able to maintain itself in a perpendicular direction; and while the muscular spring is sufficient to oppose that Descending force, and vigorously resist a shock which would otherwise destroy it.

Nature has not exempted the fair sex from those imperfections we have been taking notice of; but art, and the use of petticoats, come fortunately to the help of the female dancer. The hoop conceals a multitude of defects, which the critic's curious eye cannot ascend to discover. Most of them dance with their knees open, as if they were naturally arquées; but, thanks to this bad habit, and to the petticoats, they appear more brilliant than the men; because, as they least from the lower part of the leg, they perform the time quicker than we, who, concealing nothing from the spectator, are obliged to beat at a greater extent, and to do it originally from the haunch.

The vivacity of the sex contributes much to the brilliancy of their execution; though certainly not less is owing to the petticoats, which, by concealing the length of the limbs, catch the attention, and fix it more advantageously: thus all the fire of the beats being united in one point, appears more lively and brilliant; while the eye embraces one object only, without being hurried and confused in proportion to the space it has to overlook.

To perfection in dancing, M. Noverre observes, nothing is more necessary than the outward turn of the thigh; yet nothing is more natural to mankind than the contrary position; it is born with us. It will be superfluous, in establishing this truth, to take for example the Asiatics, the Africans, or any people who dance, or rather leap and move, without art or principle. If we attend only to children, or the rustic inhabitants of the villages, we shall see that they all turn their feet inwardly. The other position is purely invention; and a proof, far from equivocal, of this fault being an imaginary one, is, that a painter would transgress as much against nature as the rules of his art, were he to place the feet of his portrait in the situation of a dancer's. It is plain, then, that to dance elegantly, walk gracefully, or address ourselves with ease and manliness, we must absolutely reverse the nature of things; and force our limbs, by artificial applications equally tedious and painful, to assume a very different situation from what they originally received.

Such a change, however necessary in this art, can only be accomplished by laying its foundation in the earliest stages of infancy, when every bone and muscle are in a state of pliability, and capable of receiving any direction which we choose to give them.

The difficulty of attaining the outward position of the limbs, is owing to our ignorance of the proper arts to be employed. Most beginners persuade themselves that it is to be acquired by forcing the feet to turn outward: and though this part may readily take such a direction, from their suppleness, and being so easily moved at their articulation with the leg; yet this method is so far false, as it tends to displace the ancubes, and besides has not any effect upon either the knees or thighs.

Neither is it possible to throw the knees outwardly without the assistance of the thigh. The knees have only two motions, bending and extension; the one drawing the leg backward, the other throwing it forward: they have no power, therefore, of themselves to determine or assume an outward position; but must eventually depend on the thigh, which entirely commands all the lower part of the body, and turns them in consequence of its own rotatory motion; so that, in fact, whatever motion or position that takes, the knee, foot, and leg, are obliged to follow.

M. Noverre condemns the tourne-haunch as a clumsy and useless invention, which, instead of producing any good effect, serves only to lame those who use it, by giving a distortion to the waist, much more disagreeable than what it was intended to remove.

The simplest and most natural means are those which reason and good sense ought to adopt; and of these a moderate but continual exercise is indispensable: the practice of a circular motion or turning of the legs, both inwardly and outwardly, and of boldly beating at full extent from the haunch, is the only certain exercise to be preferred. It insensibly gives freedom, spring and pliancy; while the motions acquired by using the machine have more an air of constraint, than of that liberty and ease which should shine conspicuous in them.

It has been maintained, that a strong and vigorous person ought to spring higher and better than a slender or weaker man. But experience (says M. Noverre) daily proves the contrary. We see many dancers, who cut the time very strong, who beat with much vigour and firmness, and yet cannot spring to any considerable perpendicular elevation: for in order to this elevation, or on one side, ought here to be distinguished from the former; the latter is faint, and depends entirely upon address in the dancer. There are others, again, whose slender form renders their execution less bold, and rather elegant than forcible, rather lively than nervous, but who can rise to an extraordinary height: it is to the shape and formation of the foot, and to the length and elasticity of the tendon, that this power of elevation is originally owing; the knees, the loins, and the arms, all co-operate in this action; the stronger the pressure upon the muscles, the greater is the reaction, and the
DANCE [ 78 ]

Dance. spring or leap is proportionally high. The alternate motion of the knees participates with those of the instep and ‘tendo Achillis,’ though the latter are still the most essential auxiliaries; the muscles of the trunk lend their assistance, and preserve the body in a perpendicular direction; while the arms, running imperceptibly to the mutual assistance of all the parts, serve as wings to counterbalance the machine.

Observe all those animals that have long and slender ankles, as stags, roebocks, sheep, cats, monkeys, &c., and you will perceive that they have a quickness and facility of springing and leaping, which animals differently formed in that part can never obtain.

But were a man endowed with all the other qualities essential to the perfection of the art, yet still without strength and firmness in his loins he can never be a good dancer. This strength is certainly the gift of nature; but it may be much improved by the assiduity of an able teacher. We daily see dancers who have neither perpendicularity nor firmness, and whose performance is altogether unstable and irregular; and we likewise see others, who, though they possess not so great a degree of native force, have all the appearance of sinewy firmness and muscular strength in their haunches, back, and loins. Art has furnished a substitute for nature, in the lessons of some excellent teacher, who has convinced them, that when once they forego an attention to the loins, it is impossible to keep themselves in a right perpendicular line; and therefore all their exertions will be devoid of taste: that all wavering and instability in this part is inconsistent with perpendicularity and firmness, and will certainly cause distortion of the shape and waist: that the depression and sinking of the body deprives the lower parts of that liberty which is necessary to their easy motion: that hence the body is undetermined in its positions; frequently drags the limbs, and constantly loses the centre of gravity; and therefore cannot recover an equilibrium, but after various efforts and contortions totally repugnant to the graceful and harmonious motions of good dancing.

Such is the performance of those dancers who have no strength in their loins, or at least do not exert what they possess. In order to dance well, the body should be firm and steady: it should particularly be motionless and free from wavering while the legs are in exertion; for when the body follows the action of the feet, it displays as many grimaces and distortions as the legs execute different steps; the performance is then robbed of its ease, uniformity, harmony, exactness, firmness, perpendicularity, and equilibrium; in a word, of all those beauties and graces which are so essential to make dancing give pleasure and delight.

Many dancers are of opinion, that to be soft and luxuriant, the knees must be bent very low. But in this they are most certainly mistaken; for a more than ordinary flexion of the knees gives rather a dryness and insipidity to dancing; and a dancer may be very inelegant, and jerk, as it were, all his movements, as well in bending very low as in not bending at all. The reason will appear natural and evident, when we reflect, that the time and motions of the dancer are strictly subordinate to the time and movements of the music: pursuing this principle, it is not to be doubted, that when the flexion of the knees is greater than what the air or time of the dance requires, the measure then draws along, languishes, and is lost. To recover and catch again the time which this unnecessary flexion had destroyed, the extension of the knee must be equally quick; and it is this sudden transition which gives such a harshness and sterility to the execution, and renders it as disgusting as the opposite fault of stiffness and inflexibility.

That luxuriant softness requires more to its perfection than merely an exact flexion and extension of the knees; the spring of the instep must add its assistance, while the loins must balance the body to preserve these springs in proper bounds. It is this rare harmony of motion (says M. Noverre) which has procured the celebrated Dupré the glorious title of the God of Dance.

There are many dancers, and of an inferior class only, who can display a great variety of steps, badly enough chosen to be sure, and often displayed without either judgment or taste; but it is very uncommon to find among them that exactness of ear (that rare but innate talent of a dancer), which gives life to and stamps a value upon steps, and which diffuses over all their motions a spirit that animates and enlivens them.

There are some ears stupid and insensible even to the most simple, plain, and striking movements; there are others, more cultivated or refined, that can feel and comprehend the measure, but cannot seize its intricacies: and there are others again to whom the most difficult airs and movements are easy and intelligible, and at once comprehended. It is nevertheless certain, that a dancer may have a very perfect and nice feeling, and yet not make his feelings intelligible to the audience, if he has not the art of commanding those resources which depend upon a proper exertion of the coup de pied: awkwardness becomes visible where the exactest proportion was necessary; and every step which would have been becoming, and produced the happiest effect, had it been smartly introduced at the conclusion of the measure, will now be cold and lifeless, if all the limbs are in motion at once. It requires more time to move the whole body than to exert any single member; the flexion and extension of the instep is more readily and quickly made than the reciprocal motion of all the joints. This principle allowed, that the dancer is destitute of precision, who (supposing he possesses a musical ear) knows not how to time his steps; the elasticity of the instep, and the more or less active play of the muscles, add to the natural sensibility of the ear, and stamp value and brilliancy on the dance. The joint charms of the harmony springing from the movements of the music, and the motions of the dancer, captivate even those whose ears are the most insensible and least susceptible of musical impression.

There are some countries where the inhabitants in general are endowed with this innate musical taste. The Palatinate, Wurttemberg, Saxony, Brandenburg, Austria, and Bohemia, supply the orchestras of the German princes with many excellent musicians and eminent composers. The Germans, indeed, are born with a very lively and just taste for music, and have in them the seeds of true harmony; nothing is more common than to hear concerts, both in the streets and in the shops of their mechanics, performed with the greatest skill and exactness.

Such a natural and native taste for music as we have been
DANCE. [ 79 ] DANCE

Dancing. Being mentioned, is usually accompanied by, or includes in it, a similar one for dancing; they are kindred arts; the tender and harmonious accents of the one excite and produce the agreeable and expressive motions of the other, and their union entertains the eye and ear with animated pictures of sentiments; these two senses again convey to the heart the interesting images which affect them, while the heart, in its turn, communicates them to the mental faculty: thus the pleasure resulting from the harmony and intelligence of these two arts, enchants the spectator, and fills him with the most seducing pleasures of voluptuousness.

Dancing is probably nowhere varied to such a degree as in the provinces of Germany; where the well known dances of one village are strangers in the adjacent hamlet; their songs of mirth and merriment have no less different airs and movements, though they are all marked with that of gaiety. Their dances are pleasing and engaging, because the offspring of simple nature; their motions express joy and pleasure; and the exactness with which the whole is performed, gives a peculiar agreeableness to their steps, gestures, and attitudes. Do they spring?—a hundred persons, assembled round an oak, or some ancient pillar, seize the time at one instant, bound up and descend with the same exactness. Do they wish to mark the measure by a coup-de-pied?—all strike with one consent; or when they catch up their women, you see them all in the air at an equal height, nor do they descend but at the precise note that marks the time.

The counter-point, which is doubtless the touchstone of a delicate ear, is to them an object of no difficulty; hence their dance is so particularly animated, and the nicety of that organ has the effect of giving their different motions an air of gaiety and variety altogether exquisite.

A dancer whose ear is untuned to harmony, displays his steps without order or regularity, wanders from his part, and pursues the measure without being able to teach it: devoid of judgment, his dancing has neither sentiment nor expression; and the music which should direct his motions, regulate his steps, and guide his time, serves only to expose his imperfections and insufficiency. The study of music should therefore be applied to for the purpose of obviating this defect, and giving more sensibility and exactness to the organs of hearing.

It will not be expected that we should proceed to give a description of all the intricacies and combinations of steps that are or can be exerted in dancing; or enlarge on the mechanical particulars of the art. A dissertation on the latter would be insipid and disgusting; for the language of the feet and limbs is addressed to the eyes, and not to the ears; and a detail of the former would be endless, since every dancer has his peculiar manner of joining or varying the time. It may be sufficient just to mention on this point, that it is in dancing as in music, and with dancers as with musicians: dancing does not abound with more fundamental steps than music with notes; but there are octaves, breves, semibreves, minimis, crotchettes, double and treble crotchets; times to count and measures to follow. This mixture, however, of a small number of steps, and a few notes, furnishes dancers with a multitude of connexions and a variety of figures; taste and genius will always find a source of novelty in arranging them in different manners, and to express various ideas. Slow and lengthened, or quick and precipitate steps, and the time correspondently varied, give birth to this endless diversity.

Country-Dance, commonly so written, and hence seeming to imply a rustic way of dancing borrowed from country people or peasants, is by others supposed to be a corruption of the French Contre-danse, where a number of persons placing themselves opposite one to another begin a figure.

Rope-Dancer, (schamobates), a person who walks, leaps, dances, and performs several other feats upon a small rope or wire.

The ancients had their rope-dancers as well as we. These had four several ways of exercising their art: The first vaulted, or turned round the rope like a wheel round its axis, and there hung by the heels or neck. The second flew or slid from above, resting on their stomachs, with the arms and legs extended. The third ran along a rope stretched in a right line or up and down. Lastly, the fourth not only walked on the rope, but made surprising leaps and turns thereon. They had likewise the cremnobates or orbobates; that is, people who walked on the brink of precipices. Nay more, Suetonius in Galba, e. 6. Seneca in his 8th Epistle, and Pliny, lib. viii. c. 2. make mention of elephants, that were taught to walk on the rope.

St Vitus's Dance. See Medicine Index.

DANCETTE, in Heraldry, is when the outline of any bordure, or ordinary, is indented very largely, the largeness of the indentures being the only thing that distinguishes it from indented.

DANCING. See Dance.

Dancing-Girls of Egypt. See Alm.

Dancing-girls are employed all over the east, as affording great diversion at all public entertainments. They are all prostitutes; and, by the laws of their society, are bound to refuse no one for their price, which is rated according to their beauty and other accomplishments. There are even particular sets of them appropriated to the service of the Gentoo temples, and the use of the Brahmin priests who attend them. These poor creatures say that they were first debauched by their god, and afterwards by him consigned over to the use of the priests who belong to his temple.

These dancing-girls, whether in a settled or unsettled condition, live in a band or community under the direction of some superannuated female of the same profession, under whom they receive a regular education, and are trained up in all the arts of love and pleasing, like scholars in an academy. Thus they acquire the art of captivating the affections of the other sex to such a degree, that nothing is more common than for one of the princes or chief people of the country to take a likin to one of these girls, and waste immense sums on her, though at the same time their own harem is stocked with beauties far superior, and who are besides possessed of the natural modesty of the sex, to which the others have not the smallst pretensions. Thus some of these girls acquire immense wealth. In the neighbourhood of
Dancing girls of Goa, for instance on a part of the continent bordering on the district of that island, the dancing-girls founded a village, after being driven from Goa by the zeal of the archbishop. Here they reside in a body corporate, and attend the parties of pleasure of the noblemen and principal inhabitants, for it is not every one's purse that can afford them. Here many of them acquire considerable fortunes by this scandalous traffic, and throw it into a common stock for the sake of carrying on merchandise; being concerned in shipping and the most profitable voyages, for which they have regular factors and brokers.

The dress of these women varies according to the country they live in; but in all it is the most gorgeous imaginable. They are loaded with jewels, literally from top to toe, since even on their ears they wear rings. Their necks are adorned with carucetans, their arms with bracelets, and their ankles with chains of gold and silver, often enriched with precious stones. They also wear nose-jewels, which at first have an odd appearance, but to which the eye is soon reconciled. In Indostan, these dancing-girls, as well as the other women of the country, have a peculiar method of preserving and managing their breasts, which at the same time makes no inconsiderable part of their finery. They incline them in a pair of hollow cases, exactly fitted to them; made of very light wood, linked together and buckled at the back. These at once confine their breasts so that they cannot grow to any disgustfully exuberant size; though, from their smoothness and pliancy, they play so freely with every motion of the body, that they do not crush the tender texture of the flesh in that part, like the stiff whalebone stays in use among the Europeans. The outside of them is spread over with a thin plate of gold or silver, or set with gems, if they can afford it. Another occasional ornament the dancing-girls put on, particularly when they resort to their gallants, viz. a necklace of many loose turns, composed of flowers strung together, which they call mugrees, somewhat resembling Spanish double jessamy, but of much stronger and more agreeable fragrant odour, and far preferable to any perfumes. "They have nothing," says Mr. Grose, "of that nauseous boldness which characterizes European prostitutes, their style of seduction being all softness and gentleness."

With regard to the performances of these women as dancers, we have various accounts. The author of Memoirs of the late war in Asia, acquaints us, "that their attitudes as well as movements are not ungraceful. Their persons are delicately formed, gaudily attired, and highly perfumed. By the continuation of wanton attitudes, they acquire, as they grow warm in the dance, a frantic lasciviousness themselves, and communicate, by a natural contagion, the most voluptuous desires to the beholders." Mr. Lives seems to have been very cool on this subject. "I could not (says he) see anything in their performance worthy of notice. Their movements are more like tumbling or showing postures than dancing. Their dress is thin and light; and their hair, necks, ears, arms, wrists, fingers, legs, feet, and even their toes, are covered with rings of gold and silver, made after a clumsy manner. They wear two rings in their noses; and by their staring looks and odd gesticulations, you would rather suspect them to be mad women than morris dancers. The band of music that attends them is not less singular in its way: it is chiefly composed of three or four men, who hold two pieces of bell-metal in their hand, with which they make an incessant noise; another man beats what he is pleased to call a drum; and that they may not want vocal music to complete the band, there are always two others appointed to sing. These last generally lay in their mouths a good loading of betel-nut before they begin, which, after having been well chewed, tingles the saliva with such a redness, that a stranger would judge them to bleed at the mouth by too violent an exertion of their voice. These gentry are called ticky-tau boys, from the two words ticky tau, which they continually repeat, and chant with great vehemence. The dancing-girls are sometimes made use of in their religious ceremonies, as when the priests bring forth the images of their gods into the open fields on a car ornamented with lascivious figures, these girls dance before the images amidst a great crowd of people; and having been selected for their superior beauty, are very profitable to their masters the priests, who are said to prostitute them to all comers."

Mr. Grose informs us, that "these dances would hardly at first relish with Europeans, especially as they are accompanied with a music far from delightful, consisting of little drums called gun gums, cymbals, and a sort of flute, which makes a hideous din, and are played on by men, whose effeminacy, grimmaces, and uncouth shrivelled features, all together shock the eye and torture the ear. However by use we become reconciled to the noise, and may observe some not unpleasant airs, with which the dancers keep time; the words often express the matter of a pantomime dance, such as a lover courting his mistress; a procuress bringing a letter, and endeavouring to seduce a woman from one gallant in favour of another; a girl, timorous and afraid of being caught in an intrigue. All these scenes the girls execute in characteréd dances, and with no despicable expression, if they are proficient in their art; for then their gestures, air, and steps, are marking and well adapted. In some of their dances, even in public, modesty is not much respected by the lascivious attitudes into which they throw themselves, without exposing any nudity; being richly clad and be-decked with jewels after their manner. But in private parties to which they are called, as in gardens, they give themselves a great loose, and have dances in reserve, in which, though still without any grossness in discovering their bodies, they are mistresses of such motions and lewdness of looks and gestures as are perhaps more provoking.

DANDELION. See Leontodon, Botany Index.
DANDINI, Pietro, an eminent painter, was born at Florence in 1646, and received his first instructions in the art of painting from Valerio Spada, who excelled in small drawings with a pen. Whilst he was under the care of that artist, he gave such evident proofs of a holy genius, that he was then placed as a disciple with his uncle Vincenzo Dandini, a master of great reputation throughout all Italy, who had been bred up under Pietro da Cortona. He afterwards travelled through most of the cities of Italy, studying the works of those who were most distinguished; and resided for a long time at Venice, where he copied the paintings.
DANIEL, the fourth of the greater prophets, was born in Judæa, of the tribe of Judah, about the 25th year of the reign of Josiah. He was led captive to Babylon, with other young Hebrew lords, after the taking of Jerusalem by Nebuchadnezzar, who took them into his service. That prince gave them masters to instruct them in the language and sciences of the Chaldeans, and ordered them to be fed with the most delicate viands: but they, fearing that they should eat meat forbidden by the law of Moses, desired the king's officers to allow them only pulse. The wisdom and conduct of Daniel pleasing Nebuchadnezzar, that prince gave him several posts of honour. It is commonly believed, that this prophet, when but 12 years of age, made known the innocence of the chaste Susannah: but the learned seem not to agree, that the young Daniel, who confounded the old men, was the same with this prophet. However, he explained Nebuchadnezzar's dream of the mysterious statue, which foretold the four great monarchies; on which account he was made prefect of the province of Babylon. In the reign of Darius, the king of the Medes, he refused to adore the golden statue of the king, and was cast into the lions den, when those beasts, though pinched with hunger, did him no manner of hurt. And he explained the characters written on the wall of the room where Belshazzar was feasting.

It is believed that Daniel died in Chaldea, and that he did not take advantage of the permission granted by Cyrus to the Jews of returning to their own country. St Epiphanius says he died at Babylon; and herein he is followed by the generality of historians.

The prophecies of Daniel concerning the coming of the Messiah, and the other great events of after-times, are so clear and explicit, that, as St Jerome tells us, the church prefixed to them, that those which related to the kings of Syria and Egypt, chap. xi. must have been written after the times of Antiochus Epiphanes; whereas his prophecy was translated into Greek 100 years before his time, and the translation was in the hands of the Egyptians, who had no great kindness for the Jews and their religion. And those prophecies foretelling the success of Alexander, chap. viii. 5. xi. 3. were shown to Alexander by the Jews, in consequence of which they obtained several privileges from him; (Ant. lib. xi. c. 8.) The style of Daniel is so lofty and figurative as that of the other prophets; it is clear and concise, and his narrations and descriptions simple and natural: in short, he writes more like a historian than a prophet.

The Jews do not reckon Daniel among the prophets; part of his book, that is, from the fourth verse of his second chapter to the end of the seventh chapter, was originally written in the Chaldee language; the reason of which was, that in that part he treats of the Chaldean or Babylonish affairs; all the rest of the book is in Hebrew. The first six chapters of the book of Daniel are a history of the kings of Babylon, and what befell the Jews under their government. In the last six he is altogether prophetic, foretelling not
only what should happen to his own church and nation, among the Damnonii in the person of Vortigern, who was perhaps descended from the race of their ancient princes, as his name signifies in the British language a chieftain or the head of a family.

DANTE, ALIGHIERI, one of the first poets of Italy, was born at Florence in 1265, of an ancient and honourable family. Boccacio, who lived in the same period, has left a very curious and entertaining treatise, on the life, the studies, and manners of this extraordinary poet, whom he regarded as his master, and for whose memory he professed the highest veneration. This biographer relates, that Dante, before he was nine years old, conceived a passion for the lady whom he has immortalized in his singular poem. Her age was near his own; and her name was Beatrix, the daughter of Folco Portinari, a noble citizen of Florence. The passion of Dante, however, like that of his successor Petrarch, seems to have been of the chaste and platonic kind, according to the account he has himself given of it, in one of his early productions, entitled Vita Nuova; a mixture of mysterious poetry and prose; in which he mentions both the origin of his affection and the death of his mistress, who, according to Boccacio, died at the age of 24. The same author asserts, that Dante fell into a deep melancholy in consequence of this event, from which his friends endeavoured to raise him, by persuading him to marriage. After some time he followed their advice, and repented it; for he unfortunately made choice of a lady who bore some resemblance to the celebrated Xantippa. The poet, not possessing the patience of Socrates, separated himself from her with such vehement expressions of dislike, that he never afterwards admitted her to his presence, though she had born him several children. In his own part of his life he gained some credit in a military character; distinguishing himself by his bravery in an action where the Florentines obtained a signal victory over the citizens of Arezzo. He became still more eminent by the acquisitions of civil honours; and at the age of 25 he rose to be one of the chief magistrates of Florence, when that dignity was conferred by the suffrages of the people. From this exaltation the poet himself dated his principal misfortunes, as appears from the fragment of a letter quoted by Leonardo Bruni, one of his early biographers, where Dante speaks of his political failure with that liberal frankness which integrity inspires. Italy was at that time distracted by the contending factions of the Ghibellins and the Guelfs: the latter, among whom Dante took an active part, were again divided into the Blacks and the Whites. Dante, says Gravina, exerted all his influence to unite these inferior parties; but his efforts were ineffectual, and he had the misfortune to be unjustly persecuted by those of his own faction. A powerful citizen of Florence, named Corso Donati, had taken measures to terminate these intestine broils, by introducing Charles of Valois, brother to Philip the Fair king of France. Dante, with great vehemence, opposed this disgraceful project, and obtained the banishment of Donati and his partizans. The exiles applied to the pope (Boniface VIII.), and by his assistance succeeded in their design. Charles of Valois entered Florence in triumph, and those who had opposed his admission were banished in their turn. Dante had been dispatched to Rome as the ambassador,
Dante, or his party; and was returning, when he received intelligence of the revolution in his native city. His enemies, availing themselves of his absence, had procured an iniquitous sentence against him, by which he was condemned to banishment, and his possessions were confiscated. His two enthusiastic biographers Boccaccio and Manetti, express the warmest indignation against the injustice of his country. Dante, on receiving this intelligence, took refuge in Sienna, and afterwards in Arezzo, where many of his party were assembled. An attempt was made to surprise the city of Florence, by a small army which Dante is supposed to have attended: the design miscarried, and our poet is conjectured to have wandered to various parts of Italy, till he found a patron in the great Candella Scala, prince of Verona, whom he has celebrated in his poem. The high spirit of Dante was ill suited to courtly dependence; and he is said to have lost the favour of his Veronese patron by the rough frankness of his behaviour. From Verona he retired to France, according to Manetti; and Boccaccio affirms that he disputed in the theological schools of Paris with great reputation. Bayle questions his visiting Paris at this period of his life; and thinks it improbable, that a man, who had been one of the chief magistrates of Florence, should emigrate to engage in the public squabbles of the Parisian theologians; but the spirit both of Dante and the times in which he lived sufficiently account for this exercise of his talents; and his residence in France at this season is confirmed by Boccaccio, in his life of our poet, which Bayle seems to have had no opportunity of consulting.

The election of Henry count of Luxemburg to the empire, in November 1308, afforded Dante a prospect of being restored to his native city, as he attached himself to the interest of the new emperor, in whose service he is supposed to have written his Latin treatise De Monarchia, in which he asserted the rights of the empire against the encroachments of the Papacy. In the year 1311, he instigated Henry to lay siege to Florence; in which enterprise, says one of his biographers, he did not appear in person, from motives of respect towards his native city. The emperor was repulsed by the Florentines; and his death, which happened in the succeeding year, deprived Dante of all hopes concerning re-estalishment in Florence. After this disappointment, he is supposed to have passed some years in raving about Italy in a state of poverty and distress, till he found an honourable establishment at Ravenna, under the protection of Guido Novello da Polenta, the lord of that city, who received this illustrious exile with the most endearing liberality, continued to protect him through the few remaining years of his life, and extended his munificence to the ashes of the poet.

 Eloquence was one of the many talents which Dante possessed in an eminent degree. On this account he is said to have been employed on fourteen different embassies in the course of his life, and to have succeeded in most of them. His patron Guido had occasion to try his abilities in a service of this nature, and dispatched him as his ambassador to negotiate a peace with the Venetians, who were preparing for hostilities against Ravenna. Manetti asserts that he was unable to procure a public audience at Venice, and returned to Ravenna by land, from his apprehensions of the Venetian fleet; when the fatigue of his journey, and the mortification of failing in his attempt to preserve his generous patron from the impending danger, threw him into a fever, which terminated in death on the 14th of September 1321. He died, however, in the palace of his friend; and the affectionate Guido paid the most tender regard to his memory. This munificent patron (says Boccaccio) commanded the body to be adorned with poetical ornaments, and, after being carried on a bier through the streets of Ravenna, and being one of the most illustrious citizens, to be deposited in a marble coffin. He pronounced himself the funeral oration, and expressed his design of erecting a splendid monument in honour of the deceased: a design which his subsequent misfortunes rendered him unable to accomplish. At his request, many epitaphs were written on the poet: the best of them (says Boccaccio) by Giovanni del Virgilio of Bologna, a famous author of that time, and the intimate friend of Dante. Boccaccio then cites a few Latin verses, not worth transcribing, six of which are quoted by Bayle as the composition of Dante himself, on the authority of Paul Jovius. In 1483 Bernardo Bembo, the father of the celebrated cardinal, raised a handsome monument over the neglected ashes of the poet, with the following inscription:

*Exigua tumuli Danthes hic sorte jacebas
Squalentii nulli cognita pene situ;
At nunc maroneo subsinxs conderis arcus,
Omnibus et cultu splendidiore nites;
Nimimur Bembusus, Musis incensus Etruscis,
Hoc tibi, quem in primis ha coheres, dedat.*

Before this period the Florentines had mainly endeavoured to obtain the bones of their great poet from the city of Ravenna. In the age of Leo X. they made a second attempt, by a solemn application to the pope for that purpose; and the great Michael Angelo, an enthusiastic admirer of Dante, very liberally offered to execute a magnificent monument to the poet. The hopes of the Florentines were again unsuccessful. The particulars of their singular petition may be found in the notes of Codivì's Life of Michael Angelo. At what time, and in what place, he executed the great and singular work which has rendered him immortal, his numerous commentators seem unable to determine. Boccaccio asserts, that he began it in his 53d year, and had finished seven cantos of his Inferno before his exile; that in the plunder of his house, on that event, the beginning of his poem was fortunately preserved, but remained for some time neglected, till its merit being accidentally discovered by an intelligent poet named Dino, it was sent to the marquis Marcello Malespina, an Italian nobleman, by whom Dante was then protected. The marquis restored these lost papers to the poet, and intreated him to proceed in a work which opened in so promising a manner. To this incident we are probably indebted for the poem of Dante, which he must have continued under all the disadvantages of an unfortunate and agitated life. It does not appear at what time he completed it; perhaps before he quitted Verona, when he dedicated the Paradise to his Venetian patron. The critics have variously accounted for his having called his poem Comedy. He gave it the title (said one of his sons), becau

L 2 2
The very high estimation in which this production was held in his country, appears from a singular institution. The republic of Florence, in the year 1373, assigned a public stipend to a person appointed to read lectures on the poem of Dante: Boccaccio was the first person engaged in this office; but his death happening in two years after his appointment, his comments extended only to the seventeenth first canto of the Inferno. The critical dissertations that have been written on Dante are almost as numerous as those to which Homer has given birth; the Italian, like the Grecian bard, has been the subject of the highest panegyric, and of the grossest invective. Voltaire has spoken of him with that precipitate vivacity, which so frequently led that lively Frenchman to insult the reputation of the noblest writers. In one of his entertaining letters, he says to an Italian abbé, Je fais grand cas du courage, avec lequel vous avez osé dire que Dante était un fou, et son ouvrage un monstre.—Le Dante pourra entrer dans les bibliothèques des curieux, mais il ne sera jamais lu. But more temperate and candid critics have not been wanting to display the merits of this original poet. Mr Warton has introduced into his last volume on English poetry, a judicious and spirited summary of Dante's performance.

DANTE, John Baptist, a native of Perugia, an excellent mathematician, called the new Deudalos, from the wings he made himself, and with which he flew several times over the lake Tarsusyenus. He fell in one of his enterprises, the iron work with which he managed one of his wings having failed; by which accident he broke his thigh: but it was set by the surgeons, and he was afterwards called to Venice to profess mathematics.

DANTZIG, the capital of Polish Prussia, situated on a branch of the Vistula, about four miles above where it falls into the Baltic; in E. Long. 18° 36'. N. Lat. 54° 20'. This city is famous in history on many accounts, particularly that of its being formerly at the head of the Hanseatic association, commonly called the Hanse-towns. It is large, beautiful, populous, and rich; its houses generally are five stories high; and many of its streets are planted with chestnut-trees. One of the suburbs is called Scotland; and the Scots had great privileges, in consequence of their gallant defence of the town, under one of the family of Douglas, when it was besieged by the Poles. It is said there were upwards of 30,000 pedlars of that nation in Poland who travelled on foot, and some with three, four, or five horses. In King Charles II.'s time they were about 53,000: in that reign Sir John Denham and Mr Killigrew were sent to take the number of them, and to tax them by the poll, with the king of Poland's license; which having obtained, they brought home 10,000l. sterling, besides their charges in the journey. Dantzig has a fine harbour; and is still a most eminent commercial city, although it seems to be somewhat past its meridian glory, which was probably about the time that the president de Thou wrote his much esteemed Historia sui temporis, wherein, under the year 1607, he so highly celebrates its commerce and grandeur. It was a republic, claiming a small adjacent territory about 40 miles round it, which was under the protection of the king of Poland; but its privileges have been abridged, if not entirely annihila-
DANUBE, the largest and most considerable river in Europe, rising in the Black Forest, near Zunberg; and running north-east through Swabia, by Ulm, the capital of that country; then running east through Bavaria and Austria, passes by Ratisbon, Passau, Ens, and Vienna. It then enters Hungary, and runs south-east from Pressburg to Buda, and so on to Belgrade; after which it divides Bulgaria from Wallachia and Moldavia, discharging itself by several channels into the Black sea, in the province of Bessarabia. Towards the mouth, it was called the Jster by the ancients; and it is now said, that four of the mouths are choked up with sand, and that there are only two remaining. It begins to be navigable for boats at Ulm, and receives several large rivers as it passes along. It is so deep between Buda and Belgrade, that the Turks and Christians have had men of war upon it; and yet it is not navigable to the Black sea, on account of the cataracts. The Danube was generally supposed to be the northern boundary of the Roman empire in Europe. It was worshipped as a deity by the Scythians.

DAPHNE, a daughter of the river Peneus by the goddess Terra, of whom Apollo became enamoured. This passion had been raised by Cupid; with whom Apollo, proud of his late conquest of the serpent Python, had disputed the power of his darts. Daphne heard with horror the addresses of the god, and endeavoured to remove herself from his importunities by flight. Apollo pursued her, and Daphne, fearful of being caught, intreated the assistance of the gods, who changed her into a laurel. Apollo crowned her head with the leaves of the laurel, and so ordered that the tree should be sacred to his divinity. Some say that Daphne was admired by Leucippos, son of Oenomaus king of Pisa, who was in her company disguised his sex, and attended her in the woods in the habit of a huntsman. Leucippos gained Daphne's esteem and love; but Apollo, who was his powerful rival, discovered his sex, and Leucippos was killed by the companions of Diana. Daphne was also the name of a daughter of Tiresias, priestess in the temple of Delphi. She was consecrated to the service of Apollo by the Epignoi, or according to others by the goddess Tellus. She was called Sibyl, on account of the wildness of her looks and expressions when she delivered oracles. Her oracles were generally in verse; and Homer, according to some accounts, has introduced much of her poetry in his compositions.

DAPHNE, in Ancient Geography, a small village near to, or in the suburbs of, Antiochia of Seleucia in Syria; with a large grove, well watered with springs: In the middle of the grove stood the temple of Apollo and Diana. Its extent was 80 stadia or 10 miles; the distance from the city five miles: A place pleasant and agreeable from the pleasant weather and temperature of the air, and its soft-breathing breezes. The grove was of bay-trees, intermixed with cypresses: which last multiplied so fast, as to occupy the whole of it. Pompey gave some land for enlarging the grove. Antiochus Epiphanes built a very large temple of Daphnæus Apollo. The place at length became so infamous, that people of modesty and character avoided resorting thither; so that Daphnici mores became proverbial.

DAPHNE, in Ancient Geography, a small district on the lake Samachonites, in the Higher Galilee, very pleasant, and plentifully watered with springs, which feed the Lesser Jordan; whence its name seems to arise, probably in imitation of that near Antioch of Syria on the river Orontes.

DAPHNE, Spurge-laurel; a genus of plants, belonging to the octandria class; and in the natural method ranking under the 31st order, Pericarpio. See Botany Index.

DAPHNEPHORIA, a festival in honour of Apollo, celebrated every ninth year by the Bocotians. It was then usual to adorn an olive bough with garlands of laurels and other flowers, and place on the top a brazen globe, on which were suspended smaller ones. In the middle was placed a number of crowns, and a globe of inferior size, and the bottom was adorned with a saffron-coloured garment. The globe on the top represented the sun or Apollo. That in the middle was an emblem of the moon, and the others of the stars. The crowns, which were 65 in number, represented the sun's annual revolution. This bough was carried in solemn procession by a beautiful youth of an illustrious family, and whose parents were both living. The youth was dressed in rich garments which reached to the ground, his hair hung loose and dishevelled, his head was covered with a golden crown, and he wore on his feet shoes called Iphicratides, from Iphicrates an Athenian, who first invented them. He was called Daphnephorus, laurel-bearer; and at that time he executed the office of a priest of Apollo. He was preceded by one of his nearest relations, bearing a rod adorned with garlands, and behind him followed a train of virgins with branches in their hands. In this order the procession advanced as far as the temple of Apollo, surnamed Ismenius, where supplicatory hymns were sung to the god. This festival owes its origin to the following circumstance.—When an oracle advised the Eotians who inhabited Arne and the adjacent country, to abandon their ancient possessions, and go in quest of a settlement, they invaded the Theban territories, which at that time were pillaged by an army of Pelasgians. As the celebration of Apollo's festival was near, both nations, who religiously observed it, laid aside all hostilities, and according to custom cut down laurel boughs from Mount Helicon, and in the neighbourhood of the river Melas, and walked in procession in honour of the divinity. The day that this solemnity was observed, Polematast the general of the Bocotian army saw a youth in a dream, that presented him with a complete suit of armour, and commanded the Bocotians to offer solemn prayers to Apollo, and walk in procession with laurel boughs in their hands every ninth year. Three days after this dream, the Bocotian general made a sally, and cut off the greatest part of the besiegers, who were compelled by this blow to relinquish their enterprise. Polematast immediately instituted a novennial festival to the god, who seemed to be the patron of the Bocotians.

DAPIFER, the dignity or office of a grand master of a prince's household. This title was given by the emperor of Constantinople to the tsar of Russia as a testimony of favour. In France the like officer was instituted by Charles the Great, under the title of dapiferat; and the dignity of dapifer is still subsisting in Germany.
DAR [ 86 ]

Dapifer the elector of Bavaria assuming the title of arch-dapifer of the empire, whose office is, at the coronation of the emperor, to carry the first dish of meat to table on horseback.

DAPPLE-BAY, in the manege: When bay horses have marks of a dark bay, they are called dapple-boys.

DAPPLE-BLACK: When a black horse has got spots or marks more black or shining than the rest of his skin, he is called a dapple-black.

DARANTASIA, in Ancient Geography, called Forum Claudii by the Romans; a town of the Centurines in Gallia Narbonensis, situated between Lemnicum and Augusta Praetoria. Now Moustiers, and Moustiers en Tarantaise, in Savoy.

DARAPTI, among logicians, one of the modes of syllogisms of the third figure, whose premises are universal affirmative, and the conclusion is a particular affirmative: thus,

DAR - Every body is divisible;
A' - Every body is a substance;
TI - Therefore, some substance is divisible.

DARDA, a town and fort of Lower Hungary, built by the Turks in 1686, and taken by the Imperialists the next year, in whose hands it remains. It is seated on the river Drave, 10 miles from its confluence with the Danube, and at the end of the bridge of Esecek. E. Long. 19. 10. N. Lat. 43. 45.

DARDANELLES, two ancient and strong castles of Turkey, one of which is in Romania, and the other in Nautonia, on each side of the channel formerly called the Hellespont. This keeps up a communication with the Archipelago, and the Propontis or sea of Marmora. The mouth of the channel is four miles and a half over; and the castles were built in 1669, to secure the Turkish fleet from the insults of the Venetians. The ships that come from Constantinople are searched at the castle on the side of Nautonia, to see what they have on board.

DARDANIA, in Ancient Geography, a district of Messia Superior to the south. Now the south part of Servia, towards the confines of Macedonia and Illyricum.—Dardani was the name of the people, who seem to have been descendants of the Dardani of Troas. Also a small district of Troas, along the Hellespont, (Mela, Virgil); and the ancient name of Samothracia, (Pliny), from Dardanus, who removed thither.

DARDANUM PROMONTORIUM, (Pliny); Dardanis, (Strabo); a promontory of Troas, near Abydos, running into the Hellespont; with a cognominal town at it, called Dardanus, and Dardanum; all which gave name to the Dardines.

DARDANUS, a son of Jupiter and Electra, who, after the death of his brother Jason, left Samothrace his country, and passed into Asia Minor, where he married Batis, the daughter of Teucer king of Teuceria. After the death of his father-in-law he ascended the throne, and reigned 62 years. He built the city of Dardania, and was reckoned the founder of the kingdom of Troy. He was succeeded by Eriochneus. According to some, Corybas, his nephew, accompanied him to Teuceria, where he introduced the worship of Cybele. Dardanus taught his subjects to worship Minerva, and he gave them two statues of the goddess, one of which is well known by the name of Pallasium. According to Virgil, Dardanus was an Italian by origin.

DARE, the same with dace. See DACE, ICHTHYLOGY INDEX.

DARES, a Phrygian, who lived during the Trojan war, in which he was engaged, and of which he wrote the history in Greek. The history was extant in the age of Titian; the Latin translation, which is all that is known of it, is generally allowed to be spurious, though it is attributed by some to Cornelius Nepos. This translation first made its appearance A. D. 477, at Milan. Homer speaks of him, Iliad, v. 110, and 7.

DARFOOR, or DARFUR, a country or kingdom of Africa, which has been visited by no other European traveller excepting Mr Browne. This country is of considerable extent, and in many places covered with wood. During the dry season, the appearance of the open country is sterile and barren, but when the rains commence, the dry sandy soil is soon changed into green fields covered with luxuriant vegetation. Considerable quantities of maize, sesamum, beans, and lentils, are raised by the inhabitants for food. There are several species of trees in Darfur; but the tamarind alone is valuable for its fruit, or rises to a considerable size. The date, which is diminutive, does not appear to be indigenous. Domestic animals are, the camel, the sheep, the goat, and horned cattle, which are numerous. Of the milk of the cow, some of the inhabitants make a kind of cheese, but the process is not generally known. The camel is of an inferior quality; and the beef and the ass are imported from Egypt and Nubia. Their wild animals are, the lion, the leopard, the hyena, the wolf, and the wild buffalo. The termes, or white ant, abounds; and the cockchafer insect is frequently met with, though it has never been applied to any useful purpose in Darfur. The rocks are chiefly composed of grey granite, but in a few places alabaster and marble are found. Nitre is produced in considerable quantities, fossil salt is found in one district, and sulphur is collected by the pastoral Arabs on the south and west.

The principal towns in Darfur are Cocbe, the chief residence of the merchants, situated in N. Lat. 14. 12. Long. E. G. 28. 8. It is above two miles in length, but extremely narrow, containing numerous trees and vacant spaces within its boundaries. Sweini, which commands the northern road to Darfur, is situated above two journeys to the north of Cocbe. Kourma, a small town, lies 12 or 13 miles to the south-west of Cocbe, and Cubucubia, two and a half journeys to the west. Cubucubia commands the western roads, and has a market twice in the week. Kourma lies 14 or 15 miles to the north-west of Cocbe; Ril, about 60 miles to the south-east of Cocbe, is situated in a fertile plain, commands the southern and eastern roads, and was formerly the residence of the kings of Darfur. Gidid, Gelle, and Shoba, are the only other remarkable towns. The villages are numerous, but their population seldom exceeds a few hundred inhabitants. The population of Darfur is estimated by Browne at 200,000 persons. It consists of the native tribes of Fur, of a deep black complexion, crisped woolly hair, and features different from those of the negroes; Arabs of the tribes of Mahmid, Mahreea, Beni Eesara, Beni Gerar, &c. some of whom had settled
number; neither are these troops remarkable for skill, courage, or perseverance, though they endure hunger, thirst, and fatigue, with great resolution, and use no other camp equipment, but a light mat adapted to the size of the body. The troops of Darfooor, not actually engaged in war, are reviewed at an annual military festival, termed, The leathering of the kettle-drums, when presents are offered to the sovereign by all the principal people of the country, and various superstitious ceremonies are performed, among which are the sacrifice of a young boy and a girl.

Various superstitious opinions are blended with the Mahometanism of the Furian tribes. The mountaineers sacrifice to the deity of the mountains in order to procure rain. Mahometanism began to prevail in Darfooor, in the reign of Solyman, of the Dageou race, who is supposed by Browne to have lived at some period between 120 and 140 years ago. The Dageou race are reported to have been originally expelled from the vicinity of Tunis, and to have resigned the sceptre to the race of Fur, after being exhausted by intestine dissensions. At the inauguration of every king, they are said to have kindled a fire, which was preserved burning till his death. At the accession of a sultan, the present Furians spread before him various carpets, on which their deceased monarchs used to sit, and from that which obtains the preference, deduce an omen of his future character, which they suppose will resemble its former possessor.

DARIC, in antiquity, a famous piece of gold, first coined by Darius the Mede about 538 years before Christ, probably during his stay at Babylon, out of the vast quantity of gold which had been accumulated in the treasury. From thence it was dispersed over the east, and also in Greece; so that the Persian daric, which was also called stater, was the gold coin best known in Athens in ancient times. According to Dr Bernard, it weighed two grains more than one of our guineas; but as it was very fine, and contained little alloy, it may be reckoned worth about 25c. of our money. Plutarch informs us, that the darics were stamped on one side with an archer clothed in a long robe, and crowned with a spiked crown, holding a bow in his left hand and an arrow in his right; and on the other side with the effigies of Darius. All the other pieces of gold of the same weight and value that were coined of the succeeding kings, both of the Persian and Macedonian race, were called darics, from Darius in whose reign this coin commenced. Of these there were whole darics and half darics; and they are called in those parts of Scripture written after the Babylonish captivity adarkoina; and by the Talmudists darkonoth. Greaves says that the daric is still found in Persia; but it is certainly very scarce, and perhaps of doubtful antiquity.

DARIEN, or the Isthmus of Panama, is a province between South and North America, being a narrow isthmus or neck of land, which joins them together. It is bounded on the north by the Noris sea, on the south by the South sea, on the east by the gulf or river of Darien, and on the west by another part of the South sea and the province of Veragua. It lies in the form of a bow, or crescent, about the great bay of Panama in the South sea; and is 300 miles in length, and 60 in breadth. This province is not
the richest, but is of the greatest importance to Spain, and has been the scene of more actions than any other in America. The wealth of Peru is brought hither, and from hence exported to Europe. This has induced many enterprising people to make attempts on Panama, Porto-Bello, and other towns of this province, in hopes of obtaining a rich booty.

The Scotch got possession of part of this province in 1699, and attempted to form an establishment, which would have proved one of the most useful and important that ever was projected. Of the rise, progress, and catastrophe, of this well-imagined, but ill-fated, undertaking, Sir John Dalrymple, in the 2d volume of his Memoirs of Great Britain and Ireland, has given a very interesting account, authenticated in every particular by unquestionable documents. The projector and leader of the Darien expedition was a clergyman of the name of Paterson; who having a violent propensity to see foreign countries, he made his profession the instrument of indulging it, by going to the more western world, under pretence of converting the Indians to the religion of the old. In his course, he became acquainted with Captain Dampier and Mr Wafer, who afterwards published, the one his Voyages, and the other his Travels, in the region where the separation is narrowest between the Atlantic and the South seas; and both of whom, particularly the first, appear by their books to have been men of considerable observation. But he got much more knowledge from men who could neither read nor write, by cultivating the acquaintance of some of the old bucaniers, who, after surviving their glories and their crimes, still, in the extremity of age and misfortune, recounted with transport the ease with which they had passed and repassed from the one sea to the other, sometimes in hundreds together, and driving strings of mules before them loaded with the plunder of friends and of foes; Paterson having examined the places, satisfied himself, that on the isthmus of Darien there was a tract of country running across from the Atlantic to the South sea, which the Spaniards had never possessed, inhabited by a people continually at war with them; that along the coast, on the Atlantic side, there lay a string of islands called the Sambooses, uninhabited, and full of natural strength and forests, from which last circumstance one of them was called the island of the Pines; that the seas there were filled with turtle and the manatee or sea cow; that mid-way between Porto-Bello and Carthagena, but near 50 leagues distant from either, at a place called Acta, in the mouth of the Darien, there was a natural harbour, capable of receiving the greatest fleets, and defended from storms by other islands which covered the mouth of it, and from enemies by a promontory which commanded the passage, and by hidden rocks in the passage itself; that on the other side of the isthmus, and in the same tract of country, there were natural harbours, equally capacious and well defended; that the two seas were connected by a ridge of hills, which, by their height, created a temperate climate in the midst of the most sultry latitudes, and were sheltered by forests, yet not rendered damp by them, because the trees grew at a distance from each other, having very little underwood; that, contrary to the barren nature of hilly countries, the soil was of a black mould two or three
DAR]

African, and East Indian trade. But Paterson having few acquaintance, and no protection in London, thought of drawing the public eye upon him, and ingratiating himself with moneyed men, and with great men, by assisting them to model a project, which was at that time in embryo, for erecting the Bank of England. But that happened to him which has happened to many in his situation: the persons to whom he applied made use of his ideas, took the honour of them to themselves, were civil to him for a while, and neglected him afterwards. He therefore communicated his project of a colony only to a few persons in London, and these few discouraged him.

He next made offer of his project to the Dutch, the Hambourgers, and the elector of Brandenburgh; because, by means of the passage of the Rhine and Elbe through their states, he thought, that the great additional quantities of East Indian and American goods, which his colony would bring into Europe, would be distributed through Germany. The Dutch and Hambourgers, who had most interest in the subject of his visit, heard him with indifference: The elector, who had very little interest in it, received him with honour and kindness. But court arts and false reports lost him even that prince's favour.

Paternon, on his return to London, formed a friendship with Mr. Fletcher of Salton, whose mind was inflamed with the love of public good, and all of whose ideas to procure it had a sublimity in them. Fletcher brought Paterson down to Scotland with him, presented him to the marquis of Tweeddale, then minister for Scotland; and then, with that power, which a vehement spirit always possesses over a diffeident one, persuaded the marquis, by arguments of public good and the honour which would redound to his administration, to adopt the project. Lord Stair and Mr. Johnston, the two secretaries of state, patronized those abilities in Paterson which they possessed in themselves: and the lord advocate, Sir James Stuart, the same man who had adjusted the prince of Orange's declaration at the Revolution, whose son was married to a niece of Lord Stair, went naturally along with his connexions. These persons, in June 1693, procured a statute from parliament, and afterwards a charter from the crown in terms of it, for creating a trading company to Africa and the new world, with power to plant colonies and build forts, with consent of the inhabitants, in places not possessed by other European nations.

Paternon, now finding the ground firm under him, and that he was supported by almost all the power and talents of his country, the character of Fletcher, and the sanction of an act of parliament and royal charter, threw his project boldly upon the public, and opened a subscription for a company. The frenzy of the Scots nation to sign the solemn league and covenant, never exceeded the rapidity with which they ran to subscribe to the Darion Company. The nobility, the gentry, the merchants, the people, the royal burghs without the exception of one, most of the other public bodies, subscribed. Young women threw their little fortunes into the stock; widows sold their jointures, to get the command of money for the same purpose. Almost in an instant 400,000l. were subscribed in Scotland, although it be now known, that there was not at that time above £800,000l. of cash in the kingdom. The famous Mr. Law, then a youth, afterwards confessed, that the facility with which he saw the passion of speculation communicate itself from all to all, satisfied him of the possibility of producing the same effect from the same cause, but upon a larger scale, when the duke of Orleans, in the year of the Mississippi, engaged him against his will to turn his bank into a bubble. Paterson's project, which had been received by strangers with fears when opened to them in private, filled them with hopes when it came to them upon the wings of public fame: For Colonel Erskine, son to Lord Cardross, and Mr. Hal- dane of Greenhouses, the one a generous branch of a generous stem, and the other a country gentleman of fortune and character, having been deputed to receive subscriptions in England and on the continent, the English subscribed 300,000l. and the Dutch and Hambourgers 200,000l. more.

In the mean time the jealousy of trade (continues our author), has done more mischief to the trade of England than all other causes put together, created an alarm in England; and the houses of lords and commons, without previous inquiry or reflection, on the 13th of December 1695, concurred in a joint address to the king, against the establishment of the Darion company as detrimental to the interest of the East India Company. Soon after, the commons impeached some of their own countrymen for being instrumental in erecting the company; and also some of the Scots nation, one of whom was a peer, Lord Belhaven; that is to say, they arraigned the subjects of another country, for making use of the laws of their own. Among 600 legislators, not one had the happy ray of genius to propose a committee of both parliaments, to inquire into the principles and consequences of the establishment; and if these should, upon inquiry, be found, that the benefit of it should be communicated, by a participation of rights, to both nations. The king's answer was, "That he had been ill-used in Scotland." He soon after changed his Scottish ministers, and sent orders to his resident at Hamburgh to present a memorial to the senate, in which he disowned the company, and warned them against all connexions with it. The senate sent the memorial to the assembly of merchants, who returned it with the following spirited answer. "We look upon it as a very strange thing, that the king of Britain should offer to hinder us, who are a free people, to trade with whom we please; but are amazed to think that he would hinder us from joining with his own subjects in Scotland, to whom he had lately given such large privileges, by so solemn an act of parliament." But the merchants, seeing the scheme discouraged by their governments, were soon intimidated: The Dutch, Hamburgh, and London merchants withdrew their subscriptions.

The Scots, not discouraged, were rather animated by this oppression; for they converted it into a proof of the envy of the English, and of their consciousness of the great advantages which were to flow to Scotland from the colony. The company proceeded to build six ships in Holland, from 36 to 60 guns, and they engaged 1200 men for the colony; among whom were younger sons of many of the noble and most ancient families of Scotland, and 60 officers who had been disbanded at the peace, who carried with them such of their
their private men, generally raised on their own, or the estates of their relations, as they knew to be faithful and brave; and most of those were Highlanders. The Scots parliament, on the 5th August 1698, unanimously addressed the king to support the company. The lord president Sir Hugh Dalrymple, brother to Lord Stair, and head of the bench, and the lord advocate Sir James Stuart, head of the bar, jointly drew memorials to the king, able in point of argument, information, and arrangement; in which they defended the rights of the company upon the principles of constitutional and of public law. And neighbouring nations, with a mixture of surprise and respect, saw the poorest kingdom of Europe sending forth the most gallant and the most numerous colony that had ever gone from the old to the new world.

On the 26th day of July of the year 1698, the whole city of Edinburgh poured down upon Leith, to see the colony depart, amidst the tears and prayers and praises of relations and friends, and of their countrymen. Many seamen and soldiers, whose services had been refused, because more had offered themselves than were needed, were found hid in the ships, and, when ordered ashore, clung to the ropes and timbers, imploring to go without reward with their companions. Twelve hundred men sailed in five stout ships, and arrived at Darien in two months, with the loss of only 15 of their people. At that time it was in their power, most of whom were well born, and all of them hardly bred and inured to the fatigues and dangers of the late war, to have gone from the northmost part of Mexico to the southmost of Chili, and to have overturned the whole empire of Spain in the South seas: But modest, respecting their own and their country’s character, and afraid of being accused that they had plundered, and not a settlement in view, they began with purchasing lands from the natives, and sending messages of amity to the Spanish governors within their reach; and then fixed their station at Acta, calling it New St Andrew, from the name of the tutelar saint of Scotland, and the country itself New Caledonia. One of the sides of the harbour being formed by a long narrow neck of land which ran into the sea, they cut it across so as to join the ocean and the harbour. Within this defence they erected their fort plant on it 50 pieces of cannon. On the other side of the harbour there was a mountain a mile high, on which they placed a watch-house, which, in the rarefied air within the tropics, so favourable for vision, gave them an immense range of prospect to prevent all surprise. To this place, it was observed that the Highlanders often repaired, to enjoy a cool air, and to talk of their friends they had left behind in their hills; friends whose minds were as high as their mountains. The first public act of the colony was to publish a declaration of freedom of trade and religion to all nations. This luminous idea originated with Paterson.

But the Dutch East India Company having pressed the king, in concurrence with his English subjects, to prevent the settlement at Darien, orders had been sent from England to the governors of the West Indian and American colonies, to issue proclamations against giving assistance, or even to hold correspondence with the colony; and these were more or less harshly expressed, according to the tempers of the different governors. The Scots trusting to far different treatment, and to the supplies which they expected from those colonies, had not brought provisions enough with them; they fell into diseases from bad food and from want of food. But the more generous savages, by hunting and fishing for them, gave them that relief which fellow Britons refused. They lingered eight months, awaiting, but in vain, for assistance from Scotland; and almost all of them either died out or quitted the settlement. Paterson, who had been the first that entered the ship at Leith, was the last who went on board at Darien.

During the space of two years, while the establishment of his colony had been in agitation, Spain had made no complaint to England or Scotland against it. The Darien council even averred in their papers (which are in the advocate’s library), that the right of the company was debated before the king, in presence of the Spanish ambassador, before the colony left Scotland. But now, on the 30 of May 1698, the Spanish ambassador at London presented a memorial to the king, which complained of the settlement at Darien as an encroachment on the rights of his master.

The Scots, ignorant of the misfortunes of their colony, but provoked at this memorial, sent out another colony soon after of 1300 men, to support an establishment which was now no more. But this last expedition having been more hastily prepared than the first, was unlucky in its passage. One of the ships was lost at sea, many men died on ship board, and the rest arrived at different times, broken in their health and dispirited, when they heard the fate of those who had gone before them.—Added to the misfortunes of the first colony, the second had a misfortune peculiar to itself: The general assembly of the church of Scotland sent out four ministers, with orders “to take charge of the souls of the colony, and to erect a presbytery, with a moderator, clerk, and record of proceedings; to appoint ruling elders, deacons, overseers of the manners of the people, and assistants in the exercise of church discipline and government, and to hold regular kirk-sessions.” When they arrived, the officers and gentlemen were occupied in building houses for themselves with their own hands, because there was no help to be got from others; yet the four ministers complained grievously that the council did not order houses to be immediately built for their accommodation. They had not had the precaution to bring with them letters of recommendation from the directors at home to the council abroad. On these accounts, not meeting with all the attention they expected from the higher, they paid court to the inferior ranks of the colonists, and by that means threw divisions into the colony. They exhausted the spirits of the people, by requiring their attendance at sermon four or five hours at a stretch, relieving each other by preaching alternately, but allowing no relief to their hearers. The employment of one of the days set aside for religious exercise, which was a Wednesday, they divided into three parts, thanksgiving, humiliation, and supplication, in which three ministers followed each other. And as the service of the church of Scotland consists of a lecture with a comment, a sermon, two prayers, three psalms, and a blessing, the work of that day, upon an average of the length of the service of that
close together in the guard-room, which was used as a church, in a tropical climate, and in a sickly season. They presented a paper to the council, and made it public, requiring them to set aside a day for a solemn fasting and humiliation, and containing their reasons for their requisition; in which, under pretence of enumerating the sins of the people, they poured abuse on their rulers. They damped the courage of the people, by continually presenting hell to them as the termination of life to most men, because most men are sinners. Carrying the presbyterian doctrine of predestination to extremes, they stopped all exertions, by showing that the consequence of them depended not on those by whom they were made. They converted the numberless accidents to which soldiers and seamen are exposed into immediate judgments of God against their sins. And having resolved to quit the settlement, they, in excuse for their doing so, wrote bitter letters to the general assembly against the characters of the colonists, and the advantages of the colony itself.

One of them, in a kind of history of the colony which he published, with a savage triumph exulted over the misfortunes of his countrymen in the following words:—“They were such a rude company, that I believe Sodom never declared such impudence in sinning as they. An observant eye might see, that they were running the way they went; hell and judgment was to be seen upon them, and in them, before the time: Their cup was full; it could hold no more: They were ripe; they must be cut down with the sickle of the wrath of God.”

Of the first party that joined the second colony at Darien, after it had been three months settled, was Captain Campbell of Finabh, a company of the people of his own estate, whom he had commanded in Flanders, and whom he carried to Darien in his own ship. On their arrival at New St. Andrew, they found intelligence had been lately received, that a Spanish force of 1600 men, which had been brought from the coast of the South sea, lay encamped at Tubucante, waiting there till a Spanish squadron of eleven ships which was expected should arrive, when they were jointly to attack the fort. The military command was offered to Captain Campbell, in compliment to his reputation and to his birth, who was descended from the families of Breadalbane and Athole. In order to prevent a joint attack, he resolved to attack first; and therefore on the second day after his arrival, he marched with 200 men to Tubucante, before his arrival was known to the enemy, stormed the camp in the night-time, dissipated the Spanish force with much slaughter, and returned to the fort the fifth day: But he found the Spanish ships before the harbour, their troops landed, and almost all hope of help or provision cut off; yet he stood a siege near six weeks, till almost all the officers were dead; the enemy by their approaches had cut off his wells, and his balls were so far expended, that he was obliged to melt the pewter dishes of the garrison into balls. The garrison then capitulated, and obtained not only the common honours of war and security for the property of the company, but, as if they had been conquerors, exacted hostages for performance of the conditions. Captain Campbell alone desired to be excepted from the capitulation, saying he was sure the Spaniards could not forgive him the mischief which he so lately had done them. The brave, by their courage, often escape that death which they seem to provoke: Captain Campbell made his escape in his vessel, and, stopping nowhere, arrived safely at New York, and thence to Scotland, where the company presented him with a gold medal, in which his virtue was commemorated, to inflame his family with the love of heroic actions. And the Lord Lyon King at Arms, whose office it is in Scotland (and such offices should be everywhere) to confer badges of distinction according to the rules of heraldry upon honourable actions, gave him a Highlander and an Indian for supporters to his coat of arms.

A harder fate attended those whom Captain Campbell left at Darien. They were so weak in their health as not to be able to weigh up the anchors of the Rising Sun, one of their ships, which carried 60 guns: But the generous Spaniards assisted them. In going out of the harbour she ran aground: The prey was tempting, and to obtain it, the Spaniards had only to stand by and look on: but showed that mercy to the Scots in distress, which one of the countrymen of those Scots, General Elliot, returned to the posterity of the Spaniards at the end of the late conflagration at the siege of Gibraltar. The Darien ships being leaky and weakly manned, were obliged in their voyage to take shelter in different ports belonging to Spain and England. The Spaniards in the new world showed them kindness; the English governments showed them none; and in one place one of their ships was seized and detained. Of these only Captain Campbell’s ship and another small one were saved: The Royal Sun was lost on the bar of Charlestown; and of the colony, not more than 30, saved from war, shipwreck, or disease, ever saw their country again.

Paterson, who had stood the blow, could not stand the reflection of misfortune. He was seized with a lunacy in his passage home after the ruin of the first colony: But he recovered in his own country, where his spirit, still ardent and unbroken, presented a new plan to the company, founded on the idea of King William, that England should have the joint dominion of the settlement with Scotland.

He survived many years in Scotland, pitied, respected, but neglected. After the union of the two kingdoms, he claimed reparation of his losses from the equivalent-money given by England to the Darien Company, but got nothing: because a grant to him from a public fund would have been only an act of humanity, not a political job.

Thus ended the colony of Darien. Men look into the works of poets for subjects of satire; but they are more often to be found in the records of history. The application of the Dutch to King William against the Darien Company, affords the surest of all proofs, that it was the interest of the British islands to support it. England, by the imprudence of ruining that settlement, lost the opportunity of gaining and continuing to herself the greatest commercial empire that probably ever will be upon earth. Had she treated with Scotland, in the hour of the distress of the company, for a joint possession of the settlement, or adopted the union of the kingdoms, which the sovereign of both...
DAR

proposed to them, that possession could certainly have been obtained. Had she treated with Spain to relinquish an imaginary right, or at least to give a passage across the isthmus, upon receiving duties so high as to overbalance all the chance of loss by a contraband trade, she had probably obtained either the one or the other. Had she broke with Spain for the sake of gaining by force one of those favours, she would have lost far less than she afterwards did by carrying a war into that country for many years, to force a king upon the Spaniards against their will. Even a rupture with Spain for Darien, if it had proved successful, would have knit the two nations together by the most solid of ties, their mutual interest: for the English must then have depended upon Spain for the safety of their caravans by land, and the Spaniards upon England for the safety of their fleets by sea. Spain and England would have been bound together as Portugal and England have long been; and the Spanish treasures have sailed, under the wings of English navies, from the Spanish main to Cadiz, in the same manner as the treasures of Portugal have sailed under the same protection, sacred and untouched, from the Brazils to Lisbon.

It has been made a question, whether King William behaved with his ordinary sincerity and steadiness, in the assurances of favour which he gave more than once to the company during their distresses. The following anecdote makes it probable, that there was a struggle in his breast between the part which he was obliged to act to please his English and Dutch, at the expense of his Scots subjects, and his own feelings. A provision ship of the first colony, in which were 30 gentlemen passengers, and some of them of noble birth, having been shipwrecked at Carthagena, the Spaniards, believing or pretending to believe that they were smugglers, cast them into a dungeon, and threatened them with death. The company deputed Lord Basil Hamilton from Scotland to implore King William’s protection for the prisoners. The king at first refused to see him, because he had not appeared at court when he was last in London. But when this difficulty was removed by explanation, an expression fell from the king, which showed his sense of the generous conduct of another, although, influenced by the English and Dutch East India Companies, he could not resolve to imitate it in his own. For Lord Basil’s audience having been put off from time to time, but at last fixed to be in the council chamber after a council was over, the king, who had forgotten the appointment, was passing into another room, when Lord Basil placed himself in the passage, and said, “That he came commissioned by a great body of his majesty’s subjects to lay their misfortunes at his feet; that he had a right to be heard, and would be heard!” The king returned, listened with patience, gave instant orders to apply to Spain for redress; and then turning to those near him, said, “This young man is too bold, if any man can be too bold in his country’s cause.” I had this anecdote from the present earl of Selkirk, grandson to Lord Basil.

King William’s desertion of a company erected upon the faith of his own charter, and the English oppressions of it, were the reasons why so many of the Scots, during four successive reigns, disliked the cause of the Revolution and of the Union. And that dislike, joined to English discontents, brought upon both countries two rebellions, the expenditure of many millions of money, and (which is a far greater loss) the downfall of many of their noblest and most ancient families.

DARIUM, in Logic, one of the modes of syllogism of the first figure, wherein the major proposition is an universal affirmative, and the minor and conclusion particular affirmatives: thus,

DAR—Every thing that is moved, is moved by another.

RI—Some body is moved;

I—Therefore, some body is moved by another.

DARIORIGUM, in Ancient Geography, a town of the Veneti in Gallia Celtica; called in the Notitia Lugudensis, Civitas Venetum, after the manner of the lower age. Now Vannes, or Venes, in Brittany. W. Long. 2. 37. Lat. 47. 40.

DARIUS, the name of several kings of Persia. See (History of) PERSIA.

DARKNESS, the absence, privation, or want of natural light. “Darkness was upon the face of the deep.” (Gen. i. 2.) that is to say, the chaos was plunged in thick darkness, because hitherto the light was not created. One of the most terrible sorts of darkness was that which Moses brought upon Egypt as a plague to the inhabitants of it. The Septuagint, our translation of the Bible, and indeed most others, in explaining Moses’s account of this darkness, render it, “a darkness which may be felt;” and the Vulgate has it “palpable darkness;” that is, a darkness consisting of black vapours and exhalations, so condensed that they might be perceived by the organs of feeling or seeing; but some commentators think that this is carrying the sense too far, since in such a medium as this mankind could not live an hour, much less for the space of three days, as the Egyptians are said to have done, during the time this darkness lasted; and therefore they imagine, that instead of a darkness that may be felt, the Hebrew phrase may signify a darkness wherein men went groping and feeling about for every thing they wanted. Le Clerc is of this opinion, and thinks that Philo, in his life of Moses, understood the passage in its right sense. “For in this darkness (says he), whoever were in bed, dust not get up; and such as their natural occasions compelled to get up, went feeling about by the walls, or any thing they could lay hold on, as if they had been blind.” What it was that occasioned this darkness, whether it was in the air or in the eyes; whether it was a suspension of light from the sun in that country, or a black thick vapour which totally intercepted it, there is reason to think that the description which the author of the book of Wisdom (xvi. 1, 2, 3, &c.) gives us of their inward terrors and consternation, is not altogether conjectural, viz. that they were not only prisoners of darkness, and fettered with the bonds of a long night, but were horribly astonished likewise, and troubled with strange apparitions;
During the last three hours that our Saviour hung upon the cross, a darkness covered the face of the earth, to the great terror and amazement of the people present at the execution. This extraordinary alteration in the face of nature (says Dr. Macknight, in his Harmony of the Gospels), was peculiarly proper, whilst the Sun of righteousness was withdrawing his beams from the land of Israel and from the world; not only because it was a miraculous testimony borne by God himself to his innocence; but also because it was a fit emblem of his departure and its effects, at least till his light shone out anew with additional splendour in the ministry of his apostles. The darkness which now covered Judea and the neighbouring countries, beginning about noon, and continuing till Jesus expired, was not the effect of an ordinary eclipse of the sun: for that can never happen but at the new moon; whereas now it was full moon; not to mention, that the total darkness occasioned by eclipses of the sun never continues above twelve or fifteen minutes; whereas it must have been produced by the divine power, in a manner we are not able to explain. Accordingly, Luke (xxiii. 44, 45.), after relating that there was darkness over all the earth, adds, “and the sun was darkened;” which perhaps may imply, that the darkness of the sun did not occasion, but proceeded from, the darkness that was over all the land. Further, the Christian writers, in their most ancient apologies to the Heathens, affirm, that as it was full moon at the passover when Christ was crucified, no such eclipse could happen by the course of nature. They observed also, that it was taken notice of as a prodigy by the Heathens themselves.

DARLINGTON, a town of the county of Durham, situated on a flat on the river Skerne, which falls into the Tees. It is a pretty large place, has several streets, and a spacious market-place. It gives title of earl to the Vane family. W. Long. 1. 15. N. Lat. 54. 30.

DARMSTADT, a town of Germany, in the circle of the Upper Rhine, and capital of the grand duchy of Hesse, with a handsome castle, where its own prince generally resides. It is seated on a river of the same name, in E. Long. 8. 40. N. Lat. 49. 50.

DARNEL. See LOLLUM, BOTANY INDEX.

DARNLEY, LORD. See (History of) Scotland.

DARTMOUTH, a sea-port town in Devonshire, seated on the river Dart, near its fall into the sea. It is a well frequented and populous place, having a commodious harbour, and a considerable trade by sea. The town is large and well built; but the streets are narrow and bad, though all paved. It sends two members to parliament. Population 3595 in 1811. W. Long. 4. 0. N. Lat. 50. 25.

DARTOS, in Anatomy, one of the coats which form the scrotum. It is called the dartos muscle; but Dr. Hunter says, that no such muscle can be found, and Albinus takes no notice of it in his tables.

DARWIN, ERASMUS, a physician, a poet, and medical writer, was born at Elston, near Newark, in Nottinghamshire, on the 12th December 1731. He was the fourth son of Robert Darwin, Esq. He received the early part of his education at Chesterfield school, under the reverend Mr Burrows, of whom he always spoke with great respect. He was entered, with two of his elder brothers, at St John's college, Cambridge; and, being intended for the practice of medicine, took the degree of M. B. in 1755, defending in his thesis an opinion, that the motion of the heart and arteries is produced by the immediate stimulus of the blood. During his residence in Cambridge, Mr. Darwin was elected to one of Lord Exeter's scholarships, worth about 161, per annum, which, from the meagreness of his father's income at that time, was esteemed a desirable acquisition. After having prepared himself for his future profession, by an attendance on the lectures of Dr. Hunter, in London, and by a severe course of study at Edinburgh, he contemplated the metropolis as the proper theatre for his exertions. Deterted, however, by the want of an immediate introduction, and the improbability of obtaining immediate patronage, Dr. Darwin thought it altogether more advisable to settle in the country. The first place to which he went, in the capacity of a physician, was Nottingham, where he was entirely disappointed in his hopes of practice; he removed, therefore, to Litchfield, with letters of introduction to Lady Cresley and the reverend Mr. Seward. Here his great capacity and various acquirements were most justly appreciated: he resided at Litchfield during a great number of years, in the enjoyment of a very extensive reputation, and a very profitable practice, the foundation of which is supposed to have been laid by his success in restoring to health a gentleman of fortune in the neighbourhood, whose recovery was despaired of by a numerous circle of friends and acquaintances.

In the year 1757 Dr. Darwin married Miss Mary Howard, daughter of Charles Howard, Esq. by his wife, Elizabeth Foley: she died in 1770. By this lady he had five children, two of whom died in their infancy: the eldest son, Charles, he educated to his own profession, but he died in the 30th year of his age, very soon after he had finished his course of studies at Edinburgh, where he gained considerable reputation, by endeavouring to furnish a criterion for distinguishing pus from mucus.

Soon after the decease of his wife, Dr. Darwin commenced his laborious work, the Zoologia, which, however, he did not think proper to publish till about eight years since.

In 1778 he obtained a lease of a picturesque spot of ground, about a mile from Litchfield, where a cold bath was erected by Sir John Flayer, an eminent physician in the beginning of the last century: there is a grotto, surrounded by projecting rocks, from the edges of which trickles a perpetual shower of water. This place became his favourite retreat and amusement: here he formed a botanical garden, and began his poem on the “Loves of the Plants,” the scenery of which,
In 1780, Dr Darwin was called to attend Colonel Sacheverel Pole, of Radbourne-hall, four miles from Derby; and a few months after the decease of the colonel, he married his relict, Mrs Pole, with a jointure of 600l. per annum. The marriage of Dr Darwin occasioned his immediate removal from Litchfield to Radbourne, where he resided two years, till he got accommodated with a house in Derby. In this last situation he remained till about two months before his death, when he removed to Breadwall Priory about three miles from Derby, which was a commodious and peaceful retirement for his old age.

During the last few years, Dr Darwin was much subject to inflammation in his breast and lungs; and had a very serious attack of this disease in the course of the spring of 1801, from which, after repeated bleedings, he with difficulty recovered. On the 10th of April 1802, he was attacked with a severe shivering fit, followed by a correspondent hot one, and accompanied with symptoms of inflammation in his lungs: his surgeon, Mr Hadley, took from him, in the course of the day, 25 ounces of blood. The fever was removed, and in two or three days he became, in all appearance, quite well. On the 17th as he was walking in his garden with Mrs Darwin, and a lady of about his own age, the latter remarked, that he would have sufficient employment for ten years in bringing all his plans about the place to perfection. "You madam (he replied) have as good a prospect as any body I know, of your age, of living ten years; I have not." Mrs Darwin remarked his good looks, spirits, and strength. He said, "I always appear particularly well immediately before I become ill." He sat with his family in the evening, conversing with his usual cheerfulness; went to bed, and rose at six on the following morning; wrote some letters till after seven, when he was seized with a chilly fit, which increased, and was attended with thirst. He then sat down by the kitchen fire and drank a considerable quantity of butter-milk; but feeling himself much indisposed, he lay down on a sofa, when becoming more cold and torpid, he was raised up, and placed in an arm-chair, where, without pain or any emotion, he expired a little before nine, in the 71st year of his age.

Dr Darwin left a widow and six children, three boys and three girls, by his last marriage. There was also another child, who died an infant. Besides these, he left two natural daughters, whom he had established in a school at Asbourne, and for whose instruction and assistance he composed and published his "Treatise on Female Education."

During the whole of his life, Dr Darwin was remarkable for great benevolence of disposition, and it was particularly conspicuous in the care he took even of the lowest animals. The keenness of his feelings on this subject has been attributed to the strong impression made upon his mind by a representation of the tortures of the inquisition, which was shown to him at an early age. He had frequently expressed a strong desire, that the termination of his existence might be without pain, having always looked upon death as the least evil of the two. He was of a middle stature, in person gross and corpulent; his features were coarse, and his countenance heavy; if not wholly void of animation, it certainly was by no means expressive. In his gait and dress he was rather clumsy and slowly, and frequently walked with his tongue hanging out of his mouth.

His conversation abound with very unequal sallies of wit: when he found himself engaged with a powerful antagonist in argument, he had sometimes recourse to ridicule, a weapon which he did not always handle with dexterity, for he was affected with an impediment in his speech which rendered his enunciation scarcely intelligible.

About the age of twenty-one, Dr Darwin was seized with a fit of the gout; in consequence of which he totally abstained from all fermented liquors, not even tasting small beer, or a drop of any kind of wine; but he ate plentifully of flesh-meat, and all kinds of vegetables and fruit, using for his drink, at meals, chiefly water alone, or cream and water, with tea and coffee between them, as usual. By this abstinence from fermented liquors, he kept quite free from gout for 15 years, and from some other complaints to which he had been subject. He then indulged himself occasionally with a little wine and water; cider and water, &c. but was speedily admonished into his former temperance, by a paroxysm of the gout. He was in the habit of eating a large quantity of food, and his stomach possessed a strong power of digestion. His advice frequently was, "Eat, or be eaten!" but he took every opportunity to impress a dread of all fermented liquors on the minds of his patients, whose diseases he was too ready to represent as originating in the frequent use of them. In the "Botanic Garden," he has also taken an opportunity to express his strong antipathy against fermented and spirituous liquors, by comparing their effects to that of the Prometheus fire: "The ancient story of Prometheus, who concealed in his bosom the fire he had stolen, and afterwards had a vulture perpetually gnawing his liver, afford so apt an allegory for the effects of drinking spirituous liquors, that one should be induced to think the art of distillation, as well as some other chemical processes (such as calcining gold) had been known in times of great antiquity, and lost again. The swallowing draughts cannot be better represented in hieroglyphic language, than by taking fire into one's bosom; and certain it is, that the general effect of drinking fermented or spirituous liquors is an inflamed, shirrous, or paralytic liver, with its various critical or consequential diseases, as leprous eruptions on the face, gout, dropsy, epilepsy, and insanity."
The various productions of Dr Darwin's fanciful and philosophical pen, have long since been exposed to public criticism, and received an ample share, as well of obloquy as applause. Still, however, he has claims to celebrity from the literary lustre which adorns his character, as a medical philosopher, a philosophical agriculturist, and a poet.

The pretension of Dr Darwin to high rank as a medical philosopher will, of course, substantiate themselves in the merits, numerous and solid as they are, of the "Zoornetia." In whichever point of view this work shall be considered, whether as a mere repository of curious natural and medical facts, or as a scheme and system of pathological and physiological disquisition, is probably matter of trifling importance, so far as the reputation of its author is concerned. By either mode of appreciation, it is, unquestionably, a noble effort of human labour or of human wit; and though its illustrious author may have sometimes erred from excess of ingenuity, and been occasionally blinded by too great a love of system, the Zoornetia will ever be considered as a production of transcendent merit.

As a philosophical agriculturist Dr Darwin must ever be entitled to the highest consideration. In order to profit by the multitudinous experiments of Hales, Grew, Malpighi, Bonnet, Du Hamel, Buffon, Spallanzani, Priestley, &c. collected in the "Phytologia," it is not necessary to take possession of the air-built theory of vegetation which is there constructed, and securely inhabit it as an edifice whose solidity is equal to its beauty. Whether the analogy is in fact so close between the parts and functions of animal and vegetable beings;—whether the anatomy of the one so strictly corresponds with that of the other, as to induce a belief that the latter are in reality an inferior order of the former, possessed of a brain, uterus, muscles, and complete nervous system, is an inquiry, which, however curious, must surely be subordinate in comparison with those grand and indisputable discoveries which the application of chemistry to agriculture has brought to light. A small portion only of the Phytologia is devoted to this fanciful system of vegetable physiology: the second part, divided into three sections, treats on the economy of vegetation; and the third, on agriculture and horticulture, is divided into six sections.

Dr Darwin, in his character as a poet, does not stand very high in the estimation of some. The ear is fascinated and seduced by the mellifluousness of his numbers, but there is a harshness in his embellishments which is unchaste. His cadences are not sufficiently varied for a poem of such length as the "Botanic Garden;" indeed there is an evident mechanism in the construction of his lines which it is by no means pleasant to detect. But an imagination of unrivalled richness; a felicity of allusion to whatever can throw lustre on his subject, to ancient mythology and modern discoveries, to the works of nature and of art; if these are some of the essentials of poetry, Dr Darwin may certainly claim them as his own. No man, perhaps, was ever happier in the selection and composition of his epithets, had a more imperial command of words, or could elucidate with such accuracy and elegance the most complex and intricate machinery. Who but Dr Darwin would have thought of describing a porcelain manufactury in verse; the powers and construction of a steam engine; the mechanism of a watch; and the complexity of a cotton-mill? These, and many similar descriptions, to be found in the Botanic Garden, are inimitable in their way. In some of his minor effusions he is particularly happy: the beautiful little song "To May," is exquisitely finished; and it would be difficult to find thirty lines in the Botanic Garden rival in dignity and pathos the "Address to Switzer's Oak," introduced in the Phytologia.

As a prose writer, Dr Darwin was incorrect; his grammatical errors are numerous, and he was even deficient in orthography. In the year 1758, he published, in the Philosophical Transactions, "An attempt to confute the opinion of Henley Earl, concerning the ascent of vapour;" and "An account of the cure of a periodical hemoptoe, by keeping the patient awake." This was followed by "Experiments on animal fluids in the exhausted receiver." He inserted in the Derby Mercury, an elegy written at Matlock, and addressed to Mrs Darwin; another piece occasioned by the appearance of a most fatal distemper among horned cattle, at Calke, near Derby; and a third article on occasion of the earthquake, which several years ago was felt at Derby, and in the surrounding country. In 1782, the Botanical Society of Litchfield published a translation of Linnaeus's "Systema Vegetabilium," the execution of which was principally confided to Dr Darwin. His other works have already been mentioned in the course of this biographical sketch. He left a poem entitled "The Temple of Nature," which was published after his death.

Next to medicine, mechanics, and almost every branch of natural history, engaged his attention. He not only pursued these studies with great ardour and diligence himself, but also embraced every opportunity of cultivating and encouraging them among his numerous connexions and acquaintance. Very soon after he settled in Derby, he instituted and established a philosophical society and library, both of which were in a flourishing state at the time of his decease. He also took pleasure in encouraging works in natural history.

But though the learning, taste, and genius of Dr Darwin, were eminently displayed in these pursuits, yet there was one great end, to the attainment of which all his talents and views were directed. He did not hesitate openly and repeatedly to declare, that the acquisition of wealth was the leading object of all his literary undertakings. However, he was by no means insensible to the value of reputation. During the last years of his life, the love of fame was a passion which had a great power over his mind; and the incense of praise was so pleasant to him, that flattery was found to be the most successful means of gaining his notice and favour.

There are reasons for suspecting that Dr Darwin was not a believer in Divine Revelation. A few days before his death, a gentleman endeavoured to discover whether he entertained a belief and expectation of a future state of existence; the doctor was observed to speak with a considerable degree of sedateness on the subject, and remarked, that it was natural to extend our wishes and views beyond the present scene, and
that it was right to pursue such measures as are likely
to secure our happiness in another world; "but," he
added, "let us not hear any thing about hell."

DASYPUS, the ARMADILLO or Taton, a genus of
quadrapeds belonging to the order of Bruta. See MAMMALIA Index.

DATA, among mathematicians, a term for such
things or quantities as are given or known, in order to
find other things thereby that are unknown. The data
of Euclid is the first in order of the books that have
been written by the ancient geometers, to facilita-
tate and promote the method of resolution or analysis.
In general, a thing is said to be given which is either
actually exhibited, or can be found out, that is, which
is either known by hypothesis, or that can be demon-
strated to be known: and the propositions in the books
of Euclid's data show what things can be found out or
known, from those that by hypothesis are already
known: so that in the analysis or investigation of a
problem, from the things that are laid down as given
or known, by the help of these propositions, it is de-
monstrated that other things are given, and from these
last that others again are given, and so on, till it is de-
monstrated that that which was proposed to be found
out in the problem is given; and when this is done,
the problem is solved, and its composition is made and
derived from the compositions of the data which were
employed in the analysis. And thus the data of Eu-
clid are of the most general and necessary use in the
solution of problems of every kind.

Marinus, at the end of his preface to the data, is
mistaken in asserting that Euclid has not used the syn-
thetical, but the analytical method in delivering them:
for though in the analysis of a theorem, the thing to
be demonstrated is assumed in the analysis; yet in the
demonstrations of the data, the thing to be demonstra-
ted, which is, that something is given, is never once
assumed in the demonstration; from which it is mani-
fest, that every one of them is demonstrated syntheti-
cally; though indeed if a proposition of the data be
turned into a problem, the demonstration of the propo-
sition becomes the analysis of the problem. Simpson's
Preface to his edition of the Data.

From the primary use of the word data in mathe-
matics, it has been transplanted into other arts; as
philosophy, medicine, &c. where it expresses any quan-
tity, which, for the sake of a present calculation, is
taken for granted to be such, without requiring an
immediate proof for its certainty; called also the given
quantity, number, or power. And hence also such
things as are known, from whence, either in natural
philosophy, the animal mechanism, or the operation
of medicine, we come to the knowledge of others un-
known, are now frequently in physical writers called
data.

DATE, an addition or appendage in writings, acts,
instrumenta, letters, &c. expressing the day and month
of the year when the act or letter was passed or signed;
neither with the place where the same was done. The
word is formed from the Latin datum, "given," the
participle of do, "I give."

Our ancient deeds had no dates, but only the month
and year, to signify that they were not made in haste,
or in the space of a day, but upon longer and more
mature deliberation. The king's grants began with
these words, Presentibus et futuris, &c. but the grants
of private persons with Omnibus, presents litterae in-
specturis, &c.

A deed is good, though it mentions no date or hath
a false date; or even if it hath an impossible date, as
the 30th of February: provided the real day of its be-
ing dated or given, that is, delivered, can be proved.

DATE, the fruit of the great palm-tree. See PHOEN-
IX, BOTANY Index.

DATI, CARLO, professor of polite learning at Flo-
rence. His native country became very famous, as
well on account of his works, as of the eulogies which
have been bestowed on him by learned men. The chief
work to which Dati applied himself, was Della Pittu-
ra Antica, on which he published an essay in the year
1667. He died in 1675, much lamented, as well for
his humanity and amiable manners as for his parts and
learning.

DATISCA, a genus of plants belonging to the di-
cicia class; and in the natural method ranking under
the 54th order, Miscellanea.

DATISI, in Logic, a mode of syllogisms in the
third figure, wherein the major is an universal affirma-
tive, and the minor and conclusion particular affirming
propositions. For example,

DA- All who serve God are kings;
TI- Some who serve God are poor;
SI- Therefore some who are poor are kings.

DATIVE, in Grammar, the third case in the de-
cision of nouns: expressing the state or relation of a
thing to whose profit or loss some other thing is refer-
red. See Grammar.

It is called dative, because usually governed by a
verb, implying something to be given to some person.
As, commodare Socrati, "to lend to Socrates;" utile
reipublicae, "useful to the commonwealth;" pernicie-
s ecclesiæ, "pernicious to the church."

In English, where we have properly no cases, this
relation is expressed by the sign to or for.

DATUM, or DATUS, in Ancient Geography, a town
of Thrace, situated between Neapolis and the river Nea-
tus: A colony of Thracians, according to Eustathius;
who places it on the sea-coast, near the Strymon, in a
rich and fruitful soil, famous for ship-building and
mines of gold; hence the proverb Dales Ayuden, denot-
ing property and plenty (Strabo.) Apian describes it
as seated on a steep eminence, the whole of which it
covered. It was taken by Philip of Macedon, who
changed its name to Philippi, being originally called
Crenides on account of its springs. It was afterwards
famous for the defeat of Brutus and Cassius, by Augustus
and Antony.

DATURA, the THORN-APPLE: a genus of plants
belonging to the pentandria class; and in the natural
method ranking under the 28th order, Luride. See
BOTANY Index.

DAUBENTON, LOUIS JEAN MARIE, a distin-
guished naturalist, was born at Montbar, in the depart-
ment of the Côte d'Or, in France, on the 29th of May
1716. His father, Jean Daubenton, was a notary in
that place, and his mother's name was Marie Piche-
not. In his youth he distinguished himself by the
sweetness of his temper, and by his diligent applica-
tion
Dau- benton. The Jesuits of Dijon, under whose tuition he was first placed, noticed him in a peculiar manner. Having gone through a course of what was called philosophy, under the Dominicans of Dijon, his father, who destined him for the church, and who had made him assume the ecclesiastical dress at the age of twelve, sent him to Paris to study theology. But his predilection for natural history induced him privately to study medicine. Accordingly he attended the lectures of Baron, Martinengo, and Col de Villar, and likewise those of Winslow, Honsault, and Antoine de Jussieu in the botanic garden. The death of his father in 1736 enabled him to follow his inclination without constraint. Accordingly he took a degree at Rheims in 1741, and returned to his own country with the intention of following the practice of medicine. But fortune destined him for a more brilliant career.

Monthar had given birth, about the same time, to another man of a very different character, who, though possessed of an independent fortune, a robust constitution, and a passion for pleasure, had determined notwithstanding to devote himself to the cultivation of the sciences. This man was Buffon. Hesitating for some time what branch of physics he should make his peculiar study, he tried by turns geometry, mechanical philosophy, and agriculture. At last his friend Dufay, who during his short superintendence had raised the botanic garden from that state of neglect in which former naturalists had left it, and who had procured for Buffon the reversion of his office, dying, and leaving him his place, Buffon's choice was fixed on natural history, and he saw before him that wide field which he afterwards traversed with so much reputation.

Natural history was at that time little else than a dry catalogue of names, destitute of that methodical arrangement, of that precision, of those interesting details which have since distinguished it. It occupied a very low station among the sciences, and instead of being a fashionable study, was degraded into the drudge of memory and surgery. Buffon formed the bold plan of giving life to this dry and apparently sterile mass, of painting nature as she is, always young, always active; of pointing out the harmony of all her parts, and the laws by which they are combined into one system, and of giving his picture all the glow, all the freshness, all the charms of nature herself. But to secure success it was necessary to make truth the basis of his system. Every thing must be collected, revised, and examined. The forms and dimensions of animals must be compared, and their internal structure ascertained. The ardent and impatient spirit of Buffon could ill brook a task so tedious and painful, and the imperfection of his sight rendered him unqualified for it. He looked about, therefore, for a man possessed of sufficient judgment, patience, and neatness of hand for his purpose, and at the same time modest enough to submit willingly to act a secondary part. He found such a man in Daubenton, the companion of his infancy.

The character of these two philosophers was almost opposite in every respect. Buffon was violent, impatient, rash; Daubenton was all gentleness, patience, and caution: Buffon wished to divine the truth rather than to discover it: Daubenton believed nothing which Buffon had not himself seen and ascertained. Buffon suffered his imagination to lead him from nature; Daubenton, on the contrary, discarded from his writings every expression which was calculated to mislead. They were thus happily fitted to correct each other's faults. Accordingly the history of quadrupeds, which appeared while they laboured together, is the most exempt from error of any of the divisions which constitute Buffon's natural history.

Buffon drew Daubenton to Paris about 1742: procured for him the place of demonstrator of the cabinet of natural history, at first with a salary of only 500 francs, but which was gradually increased to 2000. He furnished him likewise with a lodging, and neglected nothing to secure his comfort and convenience. Daubenton on his side devoted himself to second the views of his benefactor. The cabinet of natural history, which was arranged, and in a great measure collected by his means, was of immense service. In the history of quadrupeds, he gave the description and dissection of 183 species of quadrupeds. These details contained a vast number of new facts, and arranged in such a manner that the most curious results are often obtained merely by comparing them together. This work procured for Daubenton a very high reputation, and drew upon him the envy of Reaumur, who at that time considered himself at the head of natural history. But the credit and reputation of Buffon was sufficient to prevent his friend from falling a victim to the attack of this formidable antagonist.

In the subsequent parts of his natural history, Buffon was persuaded to separate himself from Daubenton. This injured the precision and value of these parts excessively; while it deprived Daubenton of 12,000 francs a year. Afterwards the intimacy between them revived, and continued till the death of Buffon.

The number of dissertations on natural history which Daubenton published in the Memoirs of the French Academy, is so great, that even a list of them would be too long for this place. Descriptions of different animals, dissections, comparisons between the forms of different animals, anatomical examinations of fossil bones, to determine the animals to which they had belonged, the physiology of vegetables, and different parts of mineralogy, successively occupied him; not to mention his experiments on agriculture and rural economy, which, however, were of more service to him afterwards than all the rest of his labours, on account of the reputation among the populace which they had procured him.

In the year 1794, when the dregs of the people were masters of France, Daubenton was under the necessity of applying to the section of Sans-culottes for a certificate of civism, to enable him to retain his place in the garden of plants, which he had filled with honour for 52 years. A professor and academician would scarcely have obtained it; but it was readily granted to Shepherd Daubenton, under which title it had been fortunately presented. The following is a translation of this certificate:

SECTION OF THE SANS-CULOTTES.

Copy of the extract of the deliberations of the General Assembly of the sitting of the fifth of the first decade.
It appears, that after the report made to the fraternal society of the section of the sans-culottes concerning the good civism and acts of humanity which the Shepherd Daubenton has always testified, the General Assembly unanimously decree to give him a certificate of civism, and the president followed by several members of the said assembly give him the fraternal hug, with all the acclamations due to a true model of humanity, which has been testified by several renewals of the hug.

(Signed) R. G. DARDEL, President.

Besides his publications, Daubenton was of great service to science as a lecturer. From 1775 he gave lectures on natural history in the college of medicine. In 1783 he lectured on rural economy. He was appointed professor of mineralogy by the convention at the garden of plants, and he gave lectures during the ephemeral existence of the Normal school. He was likewise one of the editors of the Journal des Scavans, and contributed to both the Encyclopedias. As a lecturer he was extremely popular, and what is uncommon, he retained his popularity to the last.

Notwithstanding the feebleness of his constitution, he arrived at a very advanced age without much disease or loss of his faculties. This may be, in some measure, ascribed to the gentleness of his temper, and his remarkable resignation. He was temperate and moderate even in his studies. Part of his time was spent in reading romances with his wife.

In the year 1799 he was appointed one of the members of the conservative senate, and he resolved to attend the meeting of it. This obliged him to alter his regime. The season was severe. At the first meeting that he attended he fell from his seat in an apoplectic fit. The most speedy assistance was procured, and by its means he was restored to his senses. With the utmost calmness he pointed out with his fingers the progress of the paralysis in different parts of his body, and died, on the first of January 1800, without a struggle.

DAUCUS, the CARROT, a genus of plants belonging to the pentandra class; and in the natural method ranking under the 45th order, umbelliferae. See BOTANY AND AGRICULTURE INDEX.

DAVENANT, Sir William, an eminent poet of the 17th century, was born at Oxford in 1606. After some stay at the university, he entered into the service of Frances first duchess of Richmond, and afterwards of Fulke Grevil, Lord Brooke; who having an excellent taste for poetry, was much charmed with him. He got great esteem by writing poems and plays; and upon the death of Ben Johnson was created poet-laureat. He wrote his poem Concordant at Paris. He formed a design for carrying over a considerable number of artificers, especially weavers, to Virginia, by the encouragement of Henrietta Maria, the queen mother of England, who obtained leave for him of the king of France.

But he and his company were seized by some parliament ships, and he carried prisoner first to the isle of Wight, and then to the tower of London; but, by the mediation of Milton and others, he got his liberty as a prisoner at large. At this time tragedies and comedies being prohibited, he contrived to set up an opera, to be performed by declamations and music. This Italian opera began in Rutland-house in Charter-house yard, 1656; but was afterwards removed to the Cockpit in Drury-Lane, and was much frequented for many years. In 1648, his Madagascar, with other poems, was printed. He died in 1668.

DAVENANT, Dr Charles, an eminent civilian and writer, eldest son of the preceding, and educated at Cambridge: he wrote several political tracts, and likewise plays. He was (1685) empowered, with the master of the revels, to inspect the plays designed for the stage, that no immoralities might be presented. His Essays on Trade are in high esteem, and were reprinted in 5 vols 8vo, in 1771. Dr Davenant was inspector-general of exports and imports; and died in 1712.

DAVENTERY, or DAINTRY, a handsome town of Northamptonshire in England, situated on the side of a hill, on the great road to Chester and Carlisle. W. Long. 1. 15. N. Lat. 52. 12.

DAUGHTER, (filius), a female child. See the article CHILDREN.

Daughters, among the ancients, were more frequently exposed than sons, as requiring greater charge to educate and settle them in the world. See EXPOSING OF CHILDREN.

Those who had no legitimate sons were obliged, by the Athenian laws, to leave their estates to their daughters, who were confined to marry their nearest relations, otherwise to forfeit their inheritance; as we find to have been practiced, likewise among the Jews, many of whose laws seem to have been transcribed by Solon.

If an heirless happened to be married before her father's death, this did not hinder the nearest relation to claim the inheritance, and even to take the woman from her husband; which is said to have been a common case.

DAVID, king of Israel, and Hebrew poet, was born at Bethlehem 1085, and died 1014 years B. C. His history is particularly recorded in the sacred writings.

St DAVID'S, an episcopal town in Pembroke, in S. Wales; but has neither market nor fair. It is seated in a barren soil on the river Ilen, not a mile from the sea-shore. It was once a considerable place, and had walls, which are now demolished; but it is small at present, and thinly inhabited: the cathedral is a pretty good structure. From the cape, near this place, there is a prospect of Ireland. Population 1816, in 1811. W. Long. 5. 20. N. Lat. 52. 0.

St DAVID'S, a town and port of Asia, in the peninsula on this side the Ganges, and on the coast of Coromandel, 80 miles south of Fort St George. E. Long. 79. 55. N. Lat. 11. 30. On the taking of Madras by the French in 1746, the presidency of all the English settlements on the Coromandel coast was removed to Fort St David, and continued there till about the year 1752, when it was removed back to Madras. In June 1758, the fort was taken and demolished by the French, and has never been rebuilt since.

DAVIDISTS, DAVIDICI, or DAVIDIC GEORGIANES, a sect of heretics, the adherents of David George, a native of Delft, who, in 1525, began to preach a new doctrine; publishing himself to be the true Messiah; and
and that he was sent thither to fill heaven, which was quite empty for want of people to deserve it. He is likewise said to have denied the existence of angels, good and evil, of heaven and hell, and to have rejected the doctrine of a future judgment. He rejected marriage, with the Adamic; held, with Manes, that the soul was not defiled by sin; and laughed at the self-denial so much recommended by Jesus Christ. Such were his principal errors. He made his escape from Delft, and retired first to Friesland, and then to Bas- il, where he changed his name, assuming that of John Brock, and died in 1536.

He left some disciples behind him, to whom he promised, that he would rise again at the end of three years. Nor was he altogether a false prophet herein; for the magistrates of that city, being informed, at the three years end, of what he had taught, ordered him to be dug up and burnt, together with his writings, by the common hangman.

There are still some remains of this ridiculous sect in Holstein, Friesland, and other countries, whose temper and conduct seem to discredit the exaggerated accounts which some writers have given of their founder. He was probably a deluded fanatic and mystic.

DAVILA, HENRY CATHARINE, a celebrated historian, was the youngest son of Antonio Davila, grand constable of Cyprus, who on the taking of that island by the Turks in 1570, had been obliged to retire into Spain, whence this family supposed they had derived their name and origin. From Spain Antonio re- gained to the court of France, and settled his son Louis and two daughters under the patronage of Catharine of Medici, whose son he afterwards gave to the young historian, born 1576, at an ancient castle in the territories of Padua, though generally called a native of Cyprus. The little Davila was brought early into France; and at the age of 18 he signalized himself in the military scenes of that country. His last exploit there was at the siege of Amiens, where he fought under Henry IV. and received a wound in the knee, as he relates himself in his history. After peace was established in France, he withdrew into Italy, and entered into the service of the Venetians. Davila, while he was at Venice, wrote his admirable history of the civil wars in France, which contains every thing worth notice that passed from the death of Henry II. in 1559, to the peace of Vervins in 1598. He con- tinued to serve the republic of Venice with great reputation, till a most unfortunate adventure put an end to his life in 1631. Passing through Verona with his wife and family on his way to Crema, which he was ap- pointed to defend, and demanding, according to the usual ceremony, his equipage, his horses and carriages for his retinue, a brutal Veronese, called Il Turco, entered the room where he and his fa- mily were at supper, and being mildly reprimanded for his intrusion by Davila, discharged a pistol at the his- torian, and shot him dead on the instant. His accom- plices also killed the chaplain of Davila, and wounded most of his attendants. But his eldest son Antonio, a youth of 18, revenged the death of his father, by killing the murderer on the spot. All the confed- erates were secured next morning, and publicly executed at Verona. It is very remarkable, that Davila passed no censure on the massacre of St Bartholomew. His character of the queen-mother has that partiality, which it was natural for him to show to the patroness of his family; but his general veracity is confirmed by the great authority of the first duke of Epernon, who (to use the words of Lord Bolingbroke) "had been an actor, and a principal actor too, in many of the scenes that Davila recites." Girard, secretary to the duke, and no contemptible biographer, relates that his his- tory came down to the place where the old man re- sided in Gascony, a little before his death; that he read it to him; that the duke confirmed the truth of the narration of it; and seemed the more surprised by what means the author could be so well informed of the most secret councils and measures of those times.

DAVIS, SIR JOHN, an eminent lawyer and poet, born about the year 1570. He first distinguished him- self by his poem Nasa Teipum, on the Immortality of the Soul. He became attorney-general, and speaker of the house of commons in Ireland; and afterwards was appointed lord chief justice of the court of King's Bench in England, but died before his installation, in 1626. He published many law tracts; but was esteemed more as a scholar and a wit than as a lawyer.

DAVIS, John, a famous navigator in the 16th century, was born at Sandridge, near Dartmouth in Devonshire; and distinguished himself by making three voyages to the most northern parts of America, in order to discover a north-west passage to the East Indies; in which he discovered the straits which bear his name. He afterwards performed five voyages to the East Indies; in the last of which he was slain in a desperate fight with some Javanese, near the coast of Malacca, on the 27th of December 1605. He wrote an ac- count of his second voyage for the discovery of the north-west passage; a voyage to the East Indies; and other tracts.

DAVIS'S STRAITS. See New Britain.

DAVIT, in a ship, a long beam of timber, repre- sented by a, a, Plate CLXIX. and used as a crane whereby to hoist the flukes of the anchor to the top of the bow, without injuring the sides of the ship as it ascends; an operation which, by mariners, is called fishing the anchor. The anchors being situated on both the bows, the davit may be occasionally shifted so as to project over either side of the ship, according to the position of that anchor on which it is employed. The inner end of the davit is secured by being thrust into a square ring of iron b, which is bolted to the deck, and forelocked under the beams. This ring, which is called the span-shackle, exhibited at large by fig. 9, is fixed exactly in the middle of the deck, and close behind the forecastle. Upon the outer end of the davit is hung a large block through which a strong rope traverses, called the fish-pendant, o; whose foremost end is fitted a large iron hook e, and to its after-end a tackle or complication of pulleys, f; the former of which is called the fish-hook, and the latter the fish-tackle.

The davit, therefore, according to the sea phrase, is employed to fish the anchor; which being previously cutted, the fish-hook is fastened upon its flukes; and the efforts of the tackle being transmitted to the hook, by means of the fish-pendant, draws up that part of the anchor sufficiently high upon the bow to fasten it,
DAU [ 100 ] DAY

DAUPHIN, a title which was given to the eldest son of the royal family of France, and presumptive heir of the crown; on account of the province of Dauphiné, which in 1343 was given to Philip de Valois; on this condition, by Humbert dauphin of the Viennois. The dauphin, in his letters patent, styled himself, By the grace of God, eldest son of France, and dauphin of Viennois.

DAUPHIN was anciently the title or appellation of the prince of Viennois in France.

Most authors who have sought the origin of the name Dauphin and Dauphine, seem to have given too much loose to conjecture. Du Chesne is of opinion, that it was the grandson of Guy the Fat who first bore the name of dauphin. Chorier observes, that William, canon of Notre Dame at Grenoble, who has written the life of Margaret, daughter of Stephen, earl of Burgundy, married with Guy, son of Guy the Fat, calls the latter simply Guy the Old, and the former always Count Dauphin; and adds, that no record or monument ever attributes the title of dauphin to Guy the Fat, or any of his predecessors: so that it must necessarily have taken its rise in his son, all whose successors so constantly assumed it, that it became the proper name of the family. He died in 1142, in the flower of his youth; so that it must be about the year 1120 that the title commenced; and without doubt, adds he, on some illustrious occasion. He observes farther, that this prince was of a military disposition, and delighted in nothing but war: and again, that it was the custom of the cavaliers to deck their casques, coats of arms, and the housing of their horses, with some figure or device peculiar to themselves, whereby they were distinguished from all others engaged in the same combat or tournament. From all these circumstances he conjectures that this Guy chose the dolphin for his signature; that this was the crest of his helmet; and that he bore it on his coat in some notable tournament or battle, wherein he distinguished himself. And this, Chorier makes no doubt, is the real origin of the appellation. Nothing was more common in those times than to make proper names become the names of families or dignities. Witness the Ademars, Arthanda, Aynards, Alemans, Berenger, and many others; who all owe their names to some one of their ancestors, from whom it has been transmitted throughout the family.

The seigneurs or lords of Auvergne have likewise been appellation of dauphin; but the dauphins of Auvergne had it not till a good while after those of the Viennois, and even received it from them. The manner was this: Guy VIII. dauphin of Viennois, had by his wife Margaret, daughter of Stephen, earl of Burgundy, a son and two daughters. The son was Guy IX., his successor. Beatrix, one of the daughters, was married to the count d’Auvergne, who, according to Blondel, was William V. or rather, as Chorier and others hold, Robert VI. father of William V. This prince lost the greatest part of the county of Auvergne, which was taken from him by his uncle William, assisted by Louis the Young; and was only left master of the little canton whereof Voldes is the capital. He had a son whom he called Dauphin, on account of Guy, or Guiguès, his uncle by the mother’s side. From his time his successors, holding the same petty canton of Auvergne, styled themselves dauphins of Auvergne, and bore a dolphin for their arms.

DAUPHINS, or Delphins, in literary history, a name given to the commentators on the ancient Latin authors, who were employed by Louis XIV. of France for the benefit of the prince, under the care and direction of M. de Montausier his governor, and Bouvet and Hueb his preceptors. They were 39 in number.

DAUPHINÉ, a late province of France, bounded on the west by the Rhone, on the north by the Rhone and Savoy, on the south by Provence, and on the coast by the Alps; and now forming the departments of Drome, Isere, and Upper Alps. In some places it is very fertile; and produces corn, wine, olives, wool, cottons, silk, iron, crystal, and copper. But the greatest part of the province is barren, and the inhabitants are obliged to go into other countries for subsistence. The mountains abound in game of all sorts: and here are fir-trees proper for masts. The principal rivers are the Rhone, the Durance, the Isere, and the Drome. There is a great number of mineral springs; and Grenoble is the capital town.

DAURAT, John, an eminent French poet, born in 1507. In the reign of Henry II. he was preceptor to the king’s pages, and Charles IX. who took great delight in his conversation, honored him with the title of his poet; but his generosity and want of management placed him in that class of learned men who have been very near starving. Conformable to the taste of the age, he had so much skill in making anagrams, that several illustrious persons gave him their names to anagrumatize: he also undertook to explain the Centuries of Nostradamus. Making verses was a disease in him: for no book was printed, nor did any person of consequence die, but Daurat made some verses on the occasion; as if he had been poet ordinary, or his muse had been a hired mourner to the whole kingdom. Scaliger tells us, that he spent the latter part of his life in endeavouring to find all the bible in Homer. He died in 1588.

DAY, according to the most natural and obvious sense of the word, signifies that space of time during which it continues to be light; in contradistinction to night, which is that portion of time wherein it is dark: but the space of time in which it is light, being somewhat vague and indefinite, the time between the rising and the setting of the sun is usually looked on as the day; and the time which lapses from its setting to its rising again, the night.

The word "day" is often taken in a large sense, so as to include the night also; or to denote the time of a whole apparent revolution of the sun round the earth; in which sense it is called by some a natural day, and by others an artificial one; but, to avoid confusion, it is usual to call it in the former sense simply the "day," and in the latter a "nocturnea"; by which term that acceptance of it is aptly denoted, as it implies both day and night.
D A Y

The nycthemeron is divided into twenty-four parts, called hours; which are of two sorts, equal, and unequal or temporary. See the article Hour.

Different nations begin their day at a different hour. Thus the Egyptians begin their day at midnight; from whom Hippocrates introduced that way of reckoning into astronomy, and Copernicus and others have followed him; but the greatest part of astronomers reckon the day to begin at noon, and so count twenty-four hours, till the noon of the next day; and not twice twelve, according to the vulgar computation. The method of beginning the day at midnight prevails in Britain, France, Spain, and most parts of Europe.

The Babylonians began their day at sunrise: reckoning the hour immediately before its rising again, the twenty-fourth hour of the day; from whence the hours reckoned in this way are called the Babylonian. In several parts of Germany, they begin their day at sunset, and reckon on till set next day, calling that the twenty-fourth hour: these are generally termed Italian hours. The Jews also began their nycthemeron at sunset: but then they divided it into twelve hours as we do; reckoning twelve hours for the day, be it long or short, and twelve for the night; so that their hours continually varying with the day and night, the hours of the day were longer than those of the night for one half year, and the contrary the other; from whence their hours are called temporary: those at the time of the equinoxes became equal, because then those of the day and night are so. The Romans also reckoned their hours after this manner, as do the Turks at this day.

This kind of hours is called planetary, because the seven planets were anciently looked upon as presiding over the affairs of the world, and to take it by turns each of these hours, according to the following order: Saturn first, then Jupiter, Mars, the Sun, Venus, Mercury, and last of all the Moon: hence they denominated each day of the week from that planet whose turn it was to preside the first hour of the nycthemeron. Thus, assigning the first hour of Saturday to Saturn, the second will fall to Jupiter, the third to Mars, and so the twenty-second of the same nycthemeron will fall to Saturn again, and therefore the twenty-third to Jupiter, and the last to Mars: so that on the first hour of the next day, it will fall to the sun to preside: and by the like manner of reckoning, the first hour of the next will fall to the Moon; of the next to Mars; of the next to Mercury; of the next to Jupiter; and of the next to Venus: hence the days of the week came to be distinguished by the Latin names of Dies Saturni, Solis, Lunae, Martis, Mercurii, Iovis, and Venetis; and among us, by the names of Saturday, Sunday, Monday, etc.

Day-Coal; in Natural History, a name given by the miners of England, and the common people who live in coal countries, to that seam or stratum of the coal which lies uppermost in the earth. The same vein or stratum of coal usually runs a great way through the country, and dips and rises in the earth at different places; so that this upper stratum, or day-coal, is in the various parts of the same stratum, sometimes near the surface, and sometimes many fathoms deep. The subterranean fires found in some of our coal countries feed principally on this coal; and are nearer to or farther from the surface as it rises or sinks.

Day-Flies. See Ephemeris, Entomology Index.

Day-Net, among fowlers. See Net.

Days of Grace, are those granted by the court at the prayer of the defendant or plaintiff, in whose delay it is.

Days of Grace, in commerce, are a customary number of days allowed for the payment of a bill of exchange, &c. after the same becomes due.

Three days of grace are allowed in Britain; ten in France and Dantzig; eight at Naples; six at Venice, Amsterdam, Rotterdam, and Antwerp; four at Francefort; five at Leipsic; twelve at Hamburg; six in Portugal; 14 in Spain; 30 in Genoa, &c.

In Britain the days of grace are given and taken as a matter of course, the bill being only paid on the last day: but in other countries, where the time is much longer, it would be reckoned dishonourable for a merchant to take advantage of it; bills are therefore paid on the very day they fall due.

Day's-Man, in the north of England, an arbitrator or person chosen to determine an affair in dispute.

Intercolary Days. See Intercolary Days.

Day's-Work, among seamen, the reckoning or account of the ship's course during 24 hours, or between noon and noon, according to the rules of trigonometry. See Dead-Reckoning.

DAZE, in Natural History, a name given by our miners to a glittering sort of stone, which often occurs in their works; and, as it is an unprofitable substance, is one of those things they call weeds. The word dose takes in; with them, every stone that is hard and glittering: and therefore it comprehends the whole genus of the telangia or stony nodules, which have the flakes of tale in their substance: these according to the colour of the stony matter they are bedded in, and their own colour, give the names of black dose, white, red, and yellow dose, to these stones.

DEACON, (Diaconus), a person in the lowest degree of holy orders, whose business is to baptize, read in the church, and assist at the celebration of the eucharist. The word is formed from the Latin Diaconus, of the Greek Diakonos, minister, servant. Deacons were instituted seven in number, by the apostles, Acts chap. vi. which number was retained a long time in several churches. Their office was to serve in the Agape, and to distribute the bread and wine to the communicants. Another part of the office of deacons was to be a sort of monitors and directors to the people in the exercise of their public devotions in the church; for which purpose they made use of certain known forms of words, to give notice when each part of the service began. Whence they are sometimes called eirikerukes, "the holy cryers of the church."

Deacons had, by license and authority from the bishop, a power to preach, to reconcile penitents and grant them absolution, and to represent their bishop in general councils. Their office out of the church was to take care of the necessitous, such as orphans, widows, prisoners, and all the poor and sick who had any title to be maintained out of the revenues of the church; to inquire into the morals and conversation of the people, and to make their report thereof to the bishop. Whence, on account of the variety of business, it was usual to have several deacons in the same church.
In the Roman church it is the deacon's office to incense the officiating priest or prelate; to lay the corporal on the altar; to receive the paten or chalice; to receive the subdeacon, and present them to the person officiating; to incense the choir; to receive the pix from the officiating prelate, and carry it to the subdeacon; and at the pontifical mass, when the bishop gives the blessing, to put the mitre on his head, and to take off the archbishop's pall and lay it on the altar. In England, the form of ordaining deacons, declares that it is their office to assist the priest in the distribution of the holy communion: in which, agreeably to the practice of the ancient church, they are confined to the administration of the wine to the communicants. A deacon in England is not capable of any ecclesiastical promotion; yet he may be a chaplain to a family; curate to a beneficed clergyman, or lecturer to a parish-church. He may be ordained at 23 years of age, anno currente; but it is expressly provided, that the bishop shall not ordain the same person a priest and deacon in the same day. Deacons, according to St. Paul, should be chaste, sincere, and blameless; neither great drinkers, nor given to filthy lucre: they should hold the mystery of the faith in a pure conscience; and should be well approved before they are admitted to the ministry. In the church of Scotland, the deacon's office is only to take care of the poor.

DEACONESS, a female deacon; an order of women who had their distinct offices and services in the primitive church. This office appears as ancient as the apostolical age: for St. Paul calls Phoebe a servant of the church of Cenchreae. The original word is διακονία, answerable to the Latin word ministra. Tertullian calls them virgines, widows, because they were commonly chosen out of the widows of the church; and, for the same reason, Epiphanius, and the council of Laodicea, call them "widows," because they were not only women but such as were ordinarily taken into this office. For, indeed, by some ancient laws, these four qualifications are required in every one that was to be admitted into this order. 1. That she should be a widow. 2. That she should be a widow that had born children. 3. A widow that was but once married. 4. One of a considerable age, 40, 50, or 60 years old. Though all these rules admitted of exceptions. Concerning their ordination, whether it was always performed by imposition of hands, the learned are much divided in their sentiments. Baronius and Valerius think they were not, and made no other account of them than as mere lay persons. But the author of the constitutions, speaking of their ordination, requires the bishop to use imposition of hands, with the form of prayer which is there recited. We are not, however, to suppose that this is a thing necessary to execute any part of the sacerdotal office. They were only to perform some inferior services of the church, and those chiefly relating to the women for whose souls they were ordained. One part of their office was to assist the minister at the baptism of women, to undress them for immersion, and to dress them again, that the whole ceremony might be performed with all the decency becoming so sacred an action. Another part of their office was to be private catechists to the women catechumens, who were preparing for baptism. They were likewise to attend the women that were sick and in distress; to minister to martyrs and confessors in prison; to attend the women's gate in the church: and lastly, to assign all women their places in the church, regulate their behaviour, and preside over the rest of the widows: whence in some canons they are styled "governors." This order, which since the 10th or 12th century has been wholly laid aside, was not abolished everywhere at once, but continued in the Greek church longer than in the Latin, and in some of the Latin churches longer than in others.

DEACONRY, Diaconate, the order or ministry of a deacon or deaconess. See DEACON and DEACONESS.

DEACONRY, (Diaconia,) is also a name still reserved to the chapels and oratories in Rome, under the direction of the several deacons, in their respective regions or quarters.

To the deaconries were annexed a sort of hospitals or boards for the distribution of alms, governed by the regio-denary deacons, called cardinal deacons, of whom there were seven, answering to the seven regions; their chief being called the arch-deacon.

The hospital adjoining to the church of the deaconry had an administrator for the temporal concerns, called the father of the deaconry, who was sometimes a priest and sometimes a layman.

At present there are fourteen of these deaconries or hospitals at Rome, which are reserved to the cardinals. Du Cange gives us their names; as, the deaconry of St. Maria in the Broadway, the deaconry of St. Eustachio near the Pantheon, &c.

DEAD LANGUAGES. See PHILOLOGY, chap. ii.

DEAD BODIES. See EMBALMING.

DEAD BODIES. See EMBALMING.

DEAD LIGHTS, certain wooden ports which are made to fasten into the cabin windows, to prevent the waves from rushing into the ship in a heavy sea. As they are made exactly to fit the windows, and are strong enough to resist the waves, they are always fixed in on the approach of a storm, and the glass lights taken out, which must otherwise be shattered to pieces by the surges, and suffer great quantities of water to enter the vessel.

DEAD-MEN'S EYES, in the sea-language, a kind of blocks, with many holes in them, but no sheeves, whereby the shrouds are fastened to the chains: the crow-reeve also uses these holes; and, in some ships, the main-stays are set tight in them: but then they have only one hole, through which the lanyards are passed several times. See Plate CLXIX.

DEAD PORT. See LAW INDEX.

DEAD RECKONING, in Navigation, the judgment or estimation which is made of the place where a ship is situated, without any observation of the heavenly bodies. It is discovered by keeping an account of the distance she has run by the log, and of her course steered by the compass; and by rectifying these data by the usual allowance for drift, lee-way, &c. according to the ship's known trim. This reckoning, however, is always to be corrected, as often as any good observation of the sun can be obtained.

DEAD-SEA, in Geography, a lake of Judea, into which the river Jordan discharges itself; being about 70 miles long and 20 broad. See ASHALITITES.
Dead-Tongue is a disease incident to young trees, and cured by cutting off the dead parts close to the next good twig or shoot, and slaying them over as in grafting.

Dead-Water, at sea, the eddy-water just astern of a ship; so called because it does not pass away so swiftly as the water running by her sides does. They say that a ship makes much dead-water when she has a great eddy following her stern.

DEADLY-CARROT. See THAPSI.

DEADLY-FEUD, in English law-books, a profession of irreconcilable enmity, till a person is revenged by the death of his enemy. The word feud is derived from the German Feud; which, as Hottoman observes, signifies modo bellum, modo capitales, intimations. Such enmity and revenge were allowed by law in the time of the Saxons, viz. If any man was killed, and a pecuniary satisfaction was not made to the kindred, it was lawful for them to take up arms and revenge themselves on the murderer; which was called deadly feud. And this probably was the original of the appeal.

DEAFNESS, the state of a person who wants the sense of hearing; or the disease of the ear, which prevents its due reception of sounds. See Medicine Index.

Deafness generally arises either from an obstruction or a compression of the auditory nerve; or from some collection of matter in the cavities of the inner ear; or from the auditory passage being stopped up by some hardened excrement; or, lastly, from some excescence, a swelling of the glands, or some foreign body introduced within it.

Those born deaf are also dumb, as not being able to learn any language, at least in the common way. However, as the eyes, in some measure at least, they may understand what is said by the motion of the lips, tongue, &c., of the speaker; and even accustom themselves to move their own, as they see other people do, and by this means learn to speak. Thus it was that Dr Wallis taught two young gentlemen born deaf to know what was said to them, and to return pertinent answers. Digby gives us another instance of the same within his own knowledge; and there was a Swiss physician in Amsterdam, one John Conrad Amman, who reduced the thing to a fixed art or method, which he published in his Surdis Logicens, Amsterdam, 1692, and de Loguela, ibid. 1700. See an account of methods employed in the education of this class of persons, in the article Deaf and Dumb, in the supplement.

In the Phil. Trans. No. 312. we have an account by Mr Waller, R. S. Secr. of a man and his sister, each about 30 years old, born in the same town with Mr Waller, who had neither of them the least sense of hearing; yet both of them knew, by the motion of the lips only, whatever was said to them, and would answer pertinently to the question proposed. It seems they could both hear and speak when children, but lost their hearing afterwards: whence they retained their speech, which, though uncoch, was yet intelligible.

Such another instance is that of Mr Godby’s daughter, minister of St Gervais in Geneva, related by Bishop Burnet. “At two years old they perceived she had lost her hearing; and ever since, though she hears great noises, yet hears nothing of what is said to her. But by observing the motions of the mouth and lips of others, she acquired so many words, that out of these she has formed a sort of jargon, in which she can hold conversation whole days with those that can speak her language. She knows nothing that is said to her, unless she see the motion of their mouths that speak to her, so that in the night they are obliged to light candles to speak to her. One thing will appear the strangest part of the whole narration: she has a sister, with whom she has practised her language more than with any body else; and in the night, by laying her hand on her sister’s mouth, she can perceive by that what she says, and so can discourse with her in the dark.” Burnet, Let. IV. p. 245.†

† See farther the article Dumbness.

It is observable, that deaf persons, and several others thick of hearing, hear better and more easily if a loud noise be raised at the time when you speak to them; which is owing, no doubt, to the greater tension of the ear-drum on that occasion. Dr Wallis mentions a deaf woman, who if a drum were beat in the room could hear any thing very clearly; so that her husband hired a drummer for a servant, that by this means he might hold conversation with his wife. The same author mentions another, who, living near a steeple, could always hear very well if there was a ringing of three or four bells, but never else.

DEALS, a thin kind of fir-planks of great use in carpentry. They are formed by sawing the trunk of a tree into as great many longitudinal divisions, of more or less thickness according to the purposes they are intended to serve.

A very good method of seasoning planks of deal and fir is to throw them into salt water as soon as they are sawed, and keep them there three or four days, frequently turning them: in this case they will be rendered much harder, by drying afterwards in the air and sun: but neither this, nor any other method yet known, will prevent them from shrinking.

Rods of deal expand gradually, or cross the grain, in moist weather, and contract again in dry; and thence have been found to make an useful hygrometer.

DEAL, a town of Kent in England, lying between Dover and Sandwich, in E. Long. 1° 20'. N. Lat. 51° 16. is supposed to be the Dola of Nennius, and is situated on a flat and level coast. This town, according to Dr Campbell, justifies an observation he had made in favour of situations of this kind, viz. that they are less liable than others to be injured by the sea. The town of Deal, as far as we are able to judge, except it may be the sea’s asking a little from it, is in much the same condition in which it ever was, even from the earliest accounts. The learned Dr Halley has proved, Miscellaneous Curios, vol. iii. p. 426. that Julius Caesar landed here, August 26th, the year before the coming of 55—the great campaign of last year—of large beam of infinite service to the place: so that it is large and populous, divided into the upper and lower towns, and is in effect the principal place in the Downs. Population 3420 in 1811.

DEAN, an ecclesiastical dignitary in cathedral and collegiate churches, and head of the chapter.

Rural-Dean, called also Arch-Presbyter, originally exercised jurisdiction over ten churches in the country, and afterwards became only the bishop’s substitute, to
grant letters of administration, probate of wills, &c.;
to convocate the clergy; and to signify to them some-
times by letter the bishop's will, and to give induction
to the archdeacon. Their office is not lost in that of
the archdeacon and chancellors.

**Dean of a Monastery.** was a superior established un-
der the abbot, to ease him in taking care of ten monks
whence he was called decanus.

**Dean and Chapter.** are the council of the bishop, to
assist him with their advice in affairs of religion, and
also in the temporal concerns of his see. When the rest
of the clergy were settled in the several parishes of
each diocese, these were reserved for the celebration of
divine service in the bishop's own cathedral; and the
chief of them, who presided over the rest, obtained the
name of decanus or dean, being probably at first ap-
pointed to superintend ten canons or prebendaries.

All ancient deans are elected by the chapter by
conge d'eíivre from the king, and letters missive of re-
commendation, in the same manner as bishops: but in
those chapters that were founded by Henry VIII. out
of the spoils of the dissolved monasteries, the deanery
is donative, and the installation merely by the king's
letters patent. The chapter, consisting of canons or
prebendaries, are sometimes appointed by the king,
sometimes by the bishop, and sometimes elected by
each other.

The dean and chapter are the nominal electors of a
bishop. The bishop is their ordinary and immediate
superior; and has, generally speaking, the power of
visiting them, and correcting their excesses and enor-
mities. They had also a check on the bishop at com-
mon law; for till the statute 32 Hen. VIII. c. 28. his
grant would not have bound his successors, un-
less confirmed by the dean and chapter.

**Dean of Guild.** See Law Index.

**DEANERY,** the office of a **DEAN.**—Deaneries and
prebendaries may become void like a bishopric, by death,
by deprivation, or by resignation either to the king or
bishop. If a dean, prebendary, or other spiritual per-
son, be made a bishop, all the preferments of which he
was before possessed are void: and the king may pre-
tend to them in right of his prerogative royal. But
they are not void by the election, but only by the con-
secration.

**DEATH,** is generally considered as the separation
of the soul from the body; in which sense it stands op-
posed to life, which consists in the union thereof.

Physicians usually define death by a total stoppage
of the circulation of the blood, and a cessation of the
animal and vital functions consequent thereon; as,
respiration, sensation, &c.

An animal body, by the actions inseparable from
life, undergoes continual change. Its smallest fibres
become rigid; its minute vessels grow into solid fibre,
no longer pervious to the fluids; its greater vessels
grow hard and narrow; and every thing becomes con-
tracted, closed, and bound up; whence the dryness,
immobility, and extenuation, observed in old age. By
such means the offices of the minister vessels are de-
stroyed; the humours stagnate, harden, and at length
coadsele with the solids. Thus are the subtlest fluids
in the body intercepted and lost, the concoction weak-
ened, and the respiration prevented; only the coarser
juices continue to run slowly through the greater ves-
sels, to the preservation of life, after the animal func-
tions are destroyed. At length, in the process of these
changes, death itself becomes inevitable, as the neces-
sary consequence of life. But it is rare that life is thus
long protracted, or that death succeeds merely from the
decays and impairments of old age. Diseases, a long
and horrid train, cut the work short.

The signs of death are in many cases very uncertain.
If we consult what Winslow or Bruchier have said
on this subject, we shall be convinced, that between life
and death the shade is so very indistinguishable, that
even all the powers of art can scarcely determine where
the one ends and the other begins. The colour of the
visage, the warmth of the body, and the openness of the
joints, are but uncertain signs of life still subsisting;
while, on the contrary, the paleness of the complexion,
the coldness of the body, the stiffness of the extremi-
ties, the cessation of all motion, and the total insensi-
ibility of the parts, are but uncertain marks of death
begun. In the same manner also, with regard to the
pulse and breathing; these motions are so often kept
under, that it is impossible to perceive them. By
bringing a looking-glass near to the mouth of the per-
son supposed to be dead, people often expect to find
whether he breathes or not. But this is a very uncer-
tain experiment; the glass is frequently sullied by the
vapour of the dead man's body; and often the person
is still alive, though the glass is no way tarnished. In
the same manner, neither burning nor scarifying, ne-
ither noises in the ears nor pungent spirits applied to
the nostrils, give certain signs of the discontinuance
of life; and there are many instances of persons who
have endured them all, and afterwards recovered
without any external assistance, to the astonishment
of the spectators. This ought to be a caution against
hasty burials, especially in cases of sudden death,
drowning, &c.

**DEATH, in Law.** In law, there is a natural death
and civil death: natural, where nature itself expires;
civil, where a person is not actually dead, but adjudged
so by law. Thus, if any person, for whose life an estate
is granted, remains beyond sea, or is otherwise absent,
seven years, and no proof made of his being alive, he
shall be accounted naturally dead.

**Brothers of Death.** a denomination usually given to
the religions of the order of St Paul, the first hermit.
They are called **brothers of death, fratres à morte,** on
account of the figure of a death's head which they
were always to have with them, in order to keep
perpetually before them the thoughts of death. This
order, by its constitutions made in 1620, does not seem
to have been established long before Pope Paul V.
Louis XIII. in 1627, permitted them to settle in
France. The order was probably suppressed by Pope
Urban VIII.

**Law of Death—Bed.** See Law Index.

**Death-Watch, in Natural History,** a little insect
famous for a ticking noise, like the beat of a watch,
which the vulgar have long taken for a presage of death
in the family where it is heard: whence it is also cal-
ced *pediculus fatidicus, mortis aga, pulstatorius,* &c.

There are two kinds of death-watches. Of the first
we have a good account in the Phil. Trans. by Mr.
Allen. It is a small beetle, 3-16ths of an inch long
of a dark brown colour, spotted; having pellucid wing
unde
under the vagina, a large cap or helmet on the head, and two antennae proceeding from beneath the eyes, and doing the office of proboscides. The part it eats when the male observed, was the extreme edge of the face, which he chooses to call the upper-lip, the mouth being protracted by this bony part, and lying underneath out of view.

This account is confirmed by Dr Derham; with this difference, that instead of ticking with the upper lip, he observed the insect to draw back its mouth, and beat with its forehead. That author had two death-watches, male and female, which he kept alive in a box several months; and could bring one of them to beat whenever he pleased, by imitating its beating. By this ticking noise he could frequently invite the male to get up upon the other in the way of copulation. When the male found he got up in vain, he would get off again, beat very eagerly, and then up again: Whence the ingenious author concludes those mutations to be the way whereby these insects woo one another, and find out and invite each other to copulation.

The second kind of death-watch is an insect in appearance quite different from the first. The former only beats seven or eight strokes at a time, and quicker: the latter will beat some hours together without intermission; and his strokes are more leisurely, and like the beat of a watch. This latter is a small grayish insect, much like a louse when viewed with the naked eye.

It is very common in all parts of the house in the summer months: it is very nimble in running to shelter, and shy of beating when disturbed; but will beat very freely before you, and also answer the beating, if you can view it without giving it disturbance, or shaking the place where it lies, &c. The author cannot say whether they beat in any other thing, but he never heard them beat in ear paper. As to their noise, the same person is in doubt whether it be made by their heads, or rather snouts, against the paper; or whether it be not made after some such manner as grasshoppers and crickets make their noise. He inclines to the former opinion. The reason of his doubt is, that he observed the animal's body to shake and give a jerk at every beat, but could scarce perceive any part of its body to touch the paper. But its body is so small and near the paper, and its motion in ticking so quick, that he thinks it might be, yet he not perceive it. The ticking, as in the other, he judges to be a wooring act; as having observed another, after much beating, come and make offers to the beating insect, who, after some offers, left off beating, and got upon the back of the other. When they were joined, he left off again; and they continued some hours joined tail to tail, like dog and bitch in copulation. Whether this insect changes its shape and becomes another animal or not, he does not say; though he has some cause to suspect that it becomes a sort of fly. It is at first a minute white egg, much smaller than the nits of lice; though the insect is near as big as a louse. In March it is hatched, and creeps about with its shell on. When it first leaves its shell, it is even smaller than its egg; though that be scarcely discernible without a microscope. In this state it is perfectly like the mites in cheese. From the mite state they grow gradually to their mature perfect state. When they become like the old ones, they are at first very small, but run about much more swiftly than before.

DEBENTURE, a term of trade used at the customhouse for a kind of certificate signed by the officers of the customs, which entitles a merchant exporting goods to the receipt of a bounty or drawback. All merchandises that are designed to be taken on board for that voyage being entered and shipped, and the ship being regularly cleared out, and sailed out of port on her intended voyage, debentures may be made out from the exporter's entries, in order to obtain the drawbacks, allowances, bounties, or premiums; which debentures for foreign goods are to be paid within one month after demand. And in making out these debentures, it must be observed, that every piece of vellum, parchment, or paper, containing any debenture for drawing back customs or duties, must, before writing, be stamped, and pay a duty of 8d.

The forms of debentures vary according to the merchandise exported. In the execution of debentures for tobacco, it must be particularly observed, 1. That debentures for the same quantity may be made on one or more parchments. 2. That the exporter's oath must be printed, specifying whether he acts for himself or on commission. 3. If exported to any other foreign ports than Ireland, the word Ireland must be added to the oath after Great Britain. 4. That no tobacco may be consumed on board of ships of war in Europe but what has paid full duties, and been manufactured in Great Britain, no drawback is to be allowed for tobacco exported in any man of war. 5. That the eight pounds per hogshead of 350 pounds, or more, allowed for draught at importation, must not be deducted on exportation. 6. That debentures for tobacco exported to Ireland must not be paid till a certificate be produced, testifying the landing thereof. 7. That no person may swear to the exportation but such as are permitted to swear to debentures for other goods. In debentures for all other foreign goods, no person may be admitted to swear to the exportation but the true exporter, either as a proprietor, or who, being employer by commission, is concerned in the direction of the voyage. All kinds of debentures, before delivered or paid to the exporters, are entered into a separate book, kept for that purpose by the collector and comptroller of the customs.

DEBITA FUNDI. See Law Index.

DEBITA FRUCTIUM. See Law Index.

DEBILITY, among physicians, a relaxation of the solids, occasioning oftentimes weaknesses and faintings.

DEBIR, in Ancient Geography, a sacerdotal city of Palestine, near Hebron; but neither distance, nor point of the compass on which it lies, can be determined. It was ancienly called Kirjath-sepher or Kirjath-sepher, and Kirjath-senna (Joshua).—Another Debir in the tribe of Gad, beyond Jordan.

DEBRECHEN, a town of Upper Hungary, about 77 miles east of Buda. E. Long. 21. 10. N. Lat. 47. 45.

DEBRUIZED, in Heraldry, a term peculiar to the English, by which is intimated the grievous restraint of any animal, debarred of its natural freedom, by any of the ordinaries being laid over it.
DEBT, in Law, any thing due to another, whether it be money, goods, or services; or the action brought for recovering the same.

National Debt. See Funds and National Debt.

DEBTOR, a person who owes anything to another; in contradistinction to creditor, which is he to whom the debt is owing.

DEBTOR, in merchants accounts. See Book-keeping.

DECADE, a word used by some old writers for the number ten, and decades for an enumeration by tens. The word is derived from the Latin decas, which is derived from a Greek word of the same import. The word has been more peculiarly appropriated to the number of books, q. d. decades, into which the Roman History of Titus Livius is divided. Hence also came decadal arithmetic, the Decameron of Boccacio, &c.

DECAGON, in Geometry, a plain figure with ten sides and ten angles.

DECAGYNA (from δεκα, ten, and γυνα, a woman), the name of an order, or secondary division, in the class decandria, of the sexual method, consisting of plants whose flowers are furnished with ten stamens and the same number of styles; which last are considered by Linnaeus and the sexualists as the female organ of generation in plants. Neurada and American nightshade furnish examples.

DECALOGUE, the ten precepts or commandments delivered by God to Moses, after engraving them on two tables of stone.

The Jews, by way of excellence, call these commandments the ten words, from whence they had afterwards the name of decalogus: but it is to be observed, that they joined the first and second into one, and divided the last into two. They understand that against stealing to relate to the stealing of men, or kidnapping; alleging, that the stealing one another's goods or property is forbidden in the last commandment.

The emperor Julian objected to the decalogue, that the precepts it contained (those only excepted which concern the worship of false gods, and the observation of the sabbath) were already so familiar to all nations, and so universally received, that they were unworthy, for that very reason, to be delivered by so great a legislator, to so peculiar a people. The church of Rome has struck the second commandment quite out of the decalogue; and to make their number complete, hath split the tenth into two: the reason of which may be easily conceived.

DECAN, a kingdom of Asia, in the peninsula on this side the Ganges, bounded on the south by the kingdom of Bivagar, on the west by the ocean, on the north by Moguckistan, and on the east by the mountains which separate it from Colonda.

DECANDRIA, (from δεκα, ten, and andρα, a husband), Linneus's tenth class, comprehending those hermaphrodite plants which bear flowers with ten stamens. See Botany Index.

DECANTATION, among chemists, &c. the gently pouring off a liquor from its pieces, by inclining the lip or canthus of the vessel; whence the name.

DECANUS, in Roman antiquity, an officer who presided over the other ten officers, and was head of the contubernium, or sergeant of a file of soldiers.
DECennalia, ancient Roman festivals, celebrated by the emperors every tenth year of their reign, with sacrifices, games, and largesses for the people. The emperor Augustus first instituted these solemnities, in which he was imitated by his successors. At the same time the people offered up vows for the emperor, and for the perpetuity of the empire, which were therefore called vo
ta decennalia. Augustus's view in establishing the decennalia was to preserve the empire and the sovereign power without offence or restraint to the people. For during the celebration of this feast, the prince used to surrender up all his authority into the hands of the people; who filled with joy, and charmed with the goodness of Augustus, immediately delivered it him back again.

DECHALES, Claudius Frances Milliet, an excellent mathematician, mechanic, and astronomer, descended from a noble family, and born at Chamberry in 1611. His principal performances are an edition of Euclid's Elements of Geometry, in which the unserviceable propositions are rejected, and the uses of those retained annexed; a discourse on fortification; and another on navigation. These with others have been collected, first in 3 vols folio, and afterwards in 4, under the title of Mundus Mathematicus: being indeed a complete course of mathematics. He died in 1678, professor of mathematics in the university of Turin.

DECIMATES, or Deciaiti, in Ancient Geography, a people of Gallia Narbonensis, next the borders of Italy, on the Mediterranean. Now the diocese of Grace and Antibes. Deciatum oppidum, was a town situated between Antibes and Nice.

DECIDUOUS, an appellation chiefly used in respect of plants: thus, the calyx or cup of a flower is said to be deciduous, when it falls along with the flower-petals; and, on the contrary, it is called permanent, when it remains after they are fallen. Again, deciduous leaves are those which fall in autumn; in contradistinction to those of the evergreens, which remain all the winter. See Defoliation.

DECIL, in Astronomy, an aspect or position of two planets, when they are distant from each other a tenth part of the zodiac.

DECIMAL ARITHMETIC, the art of computing by decimal fractions. See Arithmetic.

CIRCULATING DECIMALS, called also recurring or repeating decimals, are those in which a figure or several figures are continually repeated. They are distinguished into single and multiple, and these again into pure and mixed.

A pure single circulate is that in which one figure only is repeated; as .222, &c. and is marked thus 2.

A pure multiple circulate is that in which several figures are continually repeated; as .232323, &c. marked 23; and .524524, &c. marked 524.

A mixed single circulate is that which consists of a terminate part, and a single repeating figure; as .4222, &c. or 4.2. And

A mixed multiple circulate is that which contains a terminate part with several repeating figures; as 45.24.

That part of the circulate which repeats is called the repetend, and the whole repetend, supposed infinitely continued, is equal to a vulgar fraction, whose numerator is the repeating number or figures, and its denominator the same number of nines: so .3 is = \(\frac{3}{9}\); and .23 is = \(\frac{23}{99}\); and .524 is = \(\frac{524}{999}\).

Dr Wallis, it appears, was the first who distinctly considered or treated of infinite circulating decimals, as he himself informs us in his Treatise of Infinites. Since his time many other authors have treated on this part of arithmetic; the principal of those, however, to whom the art is mostly indebted, are Messrs Brown,
DECK [ 108 ]

DECIMAN

Decimation, a punishment inflicted by the Romans, on such soldiers as quit their posts, or behaved themselves cowardly in the field. The names of the guilty were put into an urn or helmet, and as many were drawn out as made the tenth part of the whole number, and those were put to the sword, and the others saved. This was called decimatio; and from it the ancient Roman militia, who, to punish whole legions when they had failed in their duty, made every tenth soldier draw lots, and put him to death for an example to the others.

As the Romans had their decimatio, they had also the vicessimatio, and even centesimatio, when only the 20th or 100th man suffered by lot.

DECIPHERING, the art of finding the alphabet of a cipher. For the art both of Ciphering and Deciphering, see the article CIPHER.

DECIMUS MUS, a celebrated Roman consul, who, after many glorious exploits, devoted himself to the gods names for the safety of his country in a battle against the Latins, about 340 years before the Augustan age. His son Decius imitated his example, and devoted himself in like manner in his fourth consulship, when fighting against the Gauls and Samnites. His grandson also did the same in the war against Pyrrhus and the Tarantines. This action of devoting one's self was of infinite serving to the state. The old soldier was animated by the example, and induced to follow with intrepidity a commander who, arrayed in an unusual dress, and addressing himself to the gods with solemn invocation, rushed into the thickest part of the enemy to meet his fate.

DECIUS, Cn. Metius, Q. Trojanus, a native of Panonian, sent by the emperor Philip to appease a sedition in Moesia. Instead of obeying his master's command, he assumed the imperial purple, and soon after marched against him, and at his death became the only emperor. He signalized himself against the Persians; and, when he marched against the Goths, he pushed his horse into a deep marsh, from which he could not extricate himself, and he perished with all his army by the darts of the barbarians. A.D. 251, after a reign of two years.

DECK of a Ship (from decken, Dan. to cover); the planked floors of a ship, which connect the sides together, and serve as different platforms to support the artillery and lodge the men, as also to preserve the cargo from the sea in merchant vessels. As all ships are broader on the lower deck than on the next above it, and as the cannon thereof are always heaviest, it is necessary that the frame of it should be much stronger than that of the others; and for the same reason the second or middle deck ought to be stronger than the upper deck or forecastle.

Ships of the first and second rates are furnished with three whole decks, reaching from the stem to the stern, besides a forecastle and a quarter-deck, which extends from the stern to the mainmast; between which and the forecastle a vacancy is left in the middle, opening to the upper deck, and forming what is called the waist. There is yet another deck above the hinder or utmost part of the quarter-deck, called the poop, which also serves as a roof for the captain's cabin or couch.

The inferior ships of the line of battle are equipped with two decks and a half; and frigates, sloops, &c. with one gun-deck and a half, with a spar-deck below to lodge the crew.

The decks are formed and sustained by the beams, the clamps, the water-ways, the carlings, the ledges, the knees, and two rows of small pillars called stanchions, &c. See those articles.

That the figure of the deck, with its corresponding parts, may be more clearly understood, we have exhibited a plan of the lower-deck of a 74 gun ship in Plate CLXIX. And as both sides of the deck are exactly similar, the pieces by which it is supported appear on one side, and on the other side the planks of the floor of which it is composed, as laid upon those upper pieces.

A, the principal or main hatch-way.
B, the stern-post.
C, the stern.
D, the beams, composed of three pieces, as exhibited by D, in one of which the dotted lines show the arrangement of one of the beams under the other side of the deck.
E, part of the vertical or hanging knees.
F, the horizontal or lodging knees, which fasten the beams to the sides.
G, the carlings, ranging fore and ast from one beam to another.
H, the gun-ports.
I, the pump-ales, being large wooden tubes, which return the water from the pumps into the sea.
K, the spurs of the beams, being curved pieces of timber serving as half-beams to support the decks, where a whole beam cannot be placed on account of the hatchways.
L, the wing-transom, which is bolted by the middle to the stern-post, and whose ends rest upon the fashion-pieces.
M, the bulk-head or partition which incloses the manger, and prevents the water which enters at the hawse-holes from running aft between decks.
NN, the fore hatchway.
OO, the after hatchway.
P, the drum-head of the great captern.
PP, the drum-head of the main captern.
Q, the wing-transom knee.
R, one of the breast-hooks under the gun-deck.
S, the breast-hook of the gun-deck.
TT, the station of the chain-pumps.
V, the breadth and thickness of the timbers at the height of the gun-deck.
UU, scuttles leading to the gunner's store-room, and the bread-room.
W, the station of the fore-mast.
X, the station of the main-mast.
Y, the station of the mizen-mast.
Z, the ring-bolts of the decks, used to retain the cannon whilst charging.
saad;
Deck

Declamation.

c a a d. The water-ways, through which the scoop
holes are pierced, to carry the water off from the deck
into the sea.

b b. Plan of the foremost and aftmost cable bits, with
their cross-pieces g g, and their standards e e.

Thus we have represented on one side all the pieces
which sustain the deck with its cannon; and on the
other side the deck itself, with a tier of 32 pounders
planted in battery thereon. In order also to show the
use of the breeching and train-tackle, one of the guns
is drawn in as ready for charging.

The number of beams by which the decks of ships
are supported, is often very different, according to the
practice of different countries, the strength of the tim-
ber of which the beams are framed, and the services
for which the ship is calculated.

As the deck which contains the train of a fire-ship
is furnished with an equipage peculiar to itself, the
whole apparatus is particularly described in the article
Fire-Ship.

Half-Deck, implies a continued floor laid from
stem to stern, upon one line, without any stops or in-
tervals.

Half-Deck, a space under the quarter-deck of a
ship of war, contained between the foremost bulk-head
of the steerage and the fore-part of the quarter-deck.
In the colliers of Northumberland the steerage itself is
called the half deck, and is usually the habituation of
the crew.

DECLAMATION, a speech made in public, in
the tone and manner of an oration, uniting the ex-
pression of action to the propriety of pronunciation, in
order to give the sentiment its full impression upon
the mind. According to the manners and customs of
the present age, public harangues are made only, 1. In
the pulpit. 2. In the senate, in council, or other
public assembly. 3. By public professors. 4. On the
theatre.

I. With regard to the declamation of the pulpit, the
dignity and sanctity of the place, and the importance
of the subject, require the preacher to exert the utmost
powers of his voice to produce a pronunciation that is
perfectly distinct and harmonious, and that he observe
a deportment and expression which is expressive and grace-
ful. No man, therefore, who is destitute of a voice,
should ascend the pulpit, and there act the part of a
pantomime before his audience. The preacher should
not, however, roar like a common crier, and rend the
ear with a voice of thunder; for such kind of decla-
mation is not only without meaning and without per-
suasion, but highly incongruous with the meek and
gentle expressions of the gospel. He should likewise
take particular care to avoid a monotony; his voice
should rise from the beginning, as it were by degrees,
and its greatest strength should be exerted in the applica-
tion. Each inflection of the voice should be adapted
to the phrase, and to the meaning of the words; and
each remarkable expression should have its peculiar in-
flexion. The dogmatic requires a plain, uniform tone
of voice only; and the menaces of the gospel demand a
greater force than do its promises and rewards; but the
latter should not be pronounced in the soft tone of a
flute, nor the former with the loud sound of a trum-
pet. The voice should still retain its natural tone in
all its various inflexions. Happy is the preacher, to

whom nature has given a voice that is at once strong, and
flexible, and harmonious.

An air of complacency and benevolence, as well as
devotion, should be constantly visible in the coun-
tenance of the preacher. But every appearance of affect-
tion must be carefully avoided; for nothing is so dis-
gustful to an audience as even the semblance of dis-
similation. Eyes constantly rolling, turned towards
heaven, and streaming with tears, rather denote a hy-
pocrite, than a man possessed of the real spirit of reli-
gion, and that feels the true import of what he preaches.
An air of affected devotion infallibly destroys the efi-
cacy of all that the preacher can say, however just and
important it may be. On the other hand, he must
avoid every appearance of mirth or raillery, or of that
cold unfeeling manner which is so apt to freeze the
hearts of his hearers.

The body should be in general erect, and in a natu-
ral and easy attitude. The perpetual movement or
contortion of the body has a ridiculous effect in the
pulpit, and makes the figure of a preacher and a har-
angue much too similar. But, on the other hand, he
ought not to remain constantly upright and motionless
like a speaking statue.

The motions of the hands give a strong expression
to a discourse; but they should be constantly decent,
dignified; and expressive. The preacher who is
insensibly in action, who is perpetually clasping his
hands, or who menaces with a clenched fist, or counts
his arguments on his fingers, will only excite mirth
among his auditors. In a word, declamation is an art
that the sacred orator should study with the utmost as-
siduity. The design of a sermon is to convince, to af-
tect, and to persuade. The voice, the countenance,
and the action, which are to produce this triple effect,
are therefore the objects to which the preacher should
particularly apply himself.

II. The declamation of a minister or statesman in
the senate, in council, or other public assembly, is of
a more unconfined nature. To persuade, to move the
passions, and gain an ascendency in a public assembly,
the orator should himself feel the force of what he says,
and the declamation should only express that internal
sensation. But nothing should be carried to excess. A
suavity in the tone of voice, a dignity of deportment,
a graceful action, and a certain tranquillity of coun-
tenance, should constantly accompany the statesman when
he speaks in public, even when he is most earnestly en-
gaged in debate, or when he is addressing his sovereign
in person. A pleasing tone of voice and a distinct
pronunciation, prejudice the hearers greatly in the
speaker's favour. A young man may improve these
to a surprising degree. Demosthenes, who had a natu-
ral impediment in his speech, was accustomed to go
to the sea shore, and partly filling his mouth with pe-
bles, he declaimed with a loud voice. The stones by
degrees gave a volubility to his tongue, and the ro-
aring of the waves reconciled him insensibly to the noise
of the multitude.

III. The principal object of a public professor is the
instruction of the studious youth; for which purpose
he is to convince and persuade. Every tone of voice,
every expression of the countenance, or action of the
body, which can produce this effect by enforcing the
words, should therefore be employed by those who are

to
Declarative, to teach the science. There is, moreover, one very
essential reflection which every professor ought to
make, and which is, that the chair from which he ha-
rangues is surrounded by young students, naturally pos-
sessed with vivacity, not unfrequently ludicrous; and
for the most part previously instructed in the prepara-
tory sciences. They are therefore constantly inclined
to criticise, to jest, and to ridicule; for which reason,
the professor should endeavour to inspire them with re-
spect and attention, by a grave, commanding, and ve-
nerable countenance, and carefully avoid all appearance
of grimace in his action, and every kind of affectation
in his discourse, that he may not afford the least oppor-
tunity of pleasantry.

IV. We now come to theatrical declamation. 1. This
was very different among the ancients from what it is,
and ought to be, with us, from the nature of the thing
itself, and from the difference of circumstances. Num-
berless passages in Quintilian, and other ancient his-
torians, critics, grammarians, and commentators, evi-
dently prove, that the ancient dramatic declamation
was subservient to the rules of the musical rhyth-
mus; and by this, according to Aristides*, their ac-
tion, as well as recital, was regulated. But to ex-
plain this seeming paradox, it will be necessary to make
here some preliminary remarks. The ancients gave a
much more extensive signification than we do to the
word music (musica), which they derived from the
muses, or at least from some of them. It is for this
reason that the same Aristides and Quintilian defined it
to be "An art that teaches all that relates to the use
of the voice, and the manner of performing all the
motions of the body with grace:"

*De Musica, lib. i.

"Ars decoris in vocibus et motibus. Therefore poetry, declamation, dancing,
pantomimes, and many other gestures and exercises,
were subservient to this art.

2. That part of general music which taught the art
of declamation and gesture according to the rules of
an established method (and which we perform by in-
stant, or at most by the aid of common sense), was
distinguished by the name hypocrisiomusic; and this
musical art was called by the Greeks orcheis, and by
the Romans salutatio. It was, however, so far from be-
ing an advantage to the ancients to have had this art,
which we have not, that it was, on the contrary, a mark
of great imperfection. For, in the first place, it was an
instance of high absurdity to represent a tragedy, or
comedy, before an audience of twenty thousand people,
the far greatest part of whom could neither hear nor
see what passed to any good purpose, unless they were
possessed of organs which we have not. The theatres
of London and Paris may conveniently contain about
a thousand persons; and that is found sufficient in the
most populous cities, where there are several places of
entertainment on the same day, and where the people
are reasonable enough to excuse each other in their
diversions. As the features of the face could not be
distinguished at so great a distance, and still less the
alteration of countenance; in order to represent the
different passions, they were obliged to have recourse
to masks, a wretched childish invention, that destroy-
ed all the strength and variety of expression. Their
action became extravagant, and at the same time
subservient to a regular mechanism; which prevented
all the refinement, and all the pleasure of surprise, in
the performance, and must have had an effect horribly
disagreeable to those who were placed near the stage.

3. The egregious imperfection of their language
likewise, which consisted of syllables long and short,
whose duration was determined by a set measure of
time, and their manner of tuning these syllables, after
the method of the orcheis of the Greeks, was another
disadvantage. For by this means they determined by
notes or characters placed after the long and short
syllables, not only the nature, but the duration, of each
action. Now, nothing could be more affected, more
constrained and disgusting, than such a method of de-
claming. How far superior in this respect are the
moderns, who consult nature alone in their theatrical
declamation; who can make the sound of each word
who can accompany it with a proper attitude; who can
incessantly vary their action; who can seize the
lucky moment, and make the countenance fully ex-
press the sensations of the mind! Nature does all here;
and art, infinitely inferior to nature, did all among the
ancients. Modern declamation cannot be subservi-
ted to a musical rhythmus, seeing we speak rapidly, and
without affectation. Our actors learn their art without
art, from nature itself, assisted by reflection; and they
arrive at a degree of excellence infinitely greater than
that of the ancients, by a method far more simple, and
by efforts incomparably more easy.

4. We do not, moreover, precisely know what the
theatrical declamation of the ancients was; nor what
were the musical instruments which accompanied that
declamation. The title to the Esuch of Terence
says, for example, "that Fioscus, the freedman of
Claudius, made the music of that piece, in which he
employed the two flutes, the right and the left." These
flutes, it is likely, gave the tone to the actor, which
must have had a very odd effect on the audience. Most
of the ancient pieces have similar titles. They who
would be particularly informed of the art of declaim-
ing among the Greeks and Romans, may read to ad-
vantage the Critical Reflections on Poetry and Paint-
ing by the Abbé du Bos. The third part of that
work consists entirely of learned researches and inge-
nious reflections on this silly practice of the ancients.
But as this art has happily no place in modern de-
clamation, and can at best serve only to make a parade
of erudition, we shall say no more of it, but pass to
matters of real utility.

5. We think there is good reason to believe, more-
ever, that the most polished nations of modern Europe
do not accompany their discourses in general with so
many gesticulations, as did the Greeks, the Romans,
and other inhabitants of warm climates. They ap-
pear to have found the method of animating a discourse,
and giving it an expression, by the simple inflections of
the voice, and by the features of the countenance;
which is far more distinct, simple and natural, than all
these contortions which perpetually derange the na-
tural attitude of the body and its members, and give
the speaker the air of a harlequin.

6. Expression, therefore, forms at once the essence
and the end of declamation: and the means of produ-
cing it consists, in a pronunciation that is sonorous,
distinct, and pleasing, supported by an action that is de-
cent and proper to the subject. If the best dramatic
poet has need of a good declaimer or actor to make
his
his writings produce their proper effect, the actor has likewise need of a good poet to enable him to please and affect by the action; for it is to little purpose that he endeavours to charm his auditory by uniting, with nature, all the powers of art, if the poet has not furnished him with sentiments that are rational and affecting.

7. The actor, in studying his part before a large mirror, where he can see his whole figure, in order to determine the most proper expressions for every thought, should consult nature, and endeavour to imitate her. But in this imitation, he should take care not to make too servile a copy. He has this to observe, in common with his colleagues, the masters in all the polite arts: the theatre is intended to exhibit an imitation of nature, and not nature itself. Tragedy and comedy form pictures of human life; but these pictures are also pieces of perspective, which require strokes somewhat stronger than nature, that they may be discerned at a distance. The actor is elevated to a considerable height from the ground: he is separated by scenery, he is separated from the audience by the orchestra, and he speaks in verse; all this is not natural; but the spectator is to accede to this necessary illusion, in order to promote his own pleasure, which would not be so great as it is were all these matters otherwise disposed. Declamation, therefore, should somewhat exceed, but never lose sight of, nature.

8. The tone of the actor's voice should be natural, but regulated by the extent of the theatre; sufficiently loud to be heard by all the audience, but not so violent as to rend their ears. A pure and graceful pronunciation, without any provincial accent, is likewise a great merit in an actor; and he should also habituate himself to speak in a manner perfectly distinct. It is a capital point in the pronunciation of verse, not to separate the two hemistichs, by resting too long on the censure in the middle, or dwelling on the end of each hemistich: for, by so doing, the actor falls into a monotonous, an insufferable uniformity of cadence, in a piece that consists of some thousand verses. The gradations of the voice demand also a very judicious observance. The speaker, who begins in a high tone, will find it very difficult to sustain it through the whole piece; and he, who clamours incessantly, will find his lungs fail him in those parts where the vehemence of passion requires the strongest efforts. If we may be allowed the expression, the strongest touches, the boldest figures, will not there stand out from the picture in a striking manner.

9. The department of an actor should be constantly graceful, decent, and proper to the character he represents. An old man has a different position of body from a young petit-maitre; an aged queen from a young princess; a noble gallant from a valet de chambre. A rational observance of nature, and an imitation of the best authors, are here the best guides. The same may be said of the action of the hands, the theatrical step, &c. An inanimate figure, a body in the position of a statue, and bands immovable, are as displeasing in the scene, as aplayer whose incessant gesticulation resembles the action of a puppet.

10. Every actor who aspires to make his art something more than merely mechanical, will begin by enabling himself readily to repeat his part, that the defect of his memory may not embarrass his action. When he is so far a master of it, he will make it the subject of serious reflection in his closet; and to seize the true sense of the author; and to find out that expression of each sentiment and passion, which is the most natural, the most striking, and best adapted to the stage; and which he will cultivate by repeated essays, till he is able to render it in its full force.

DECLARATORY ACTION. See LAW INDEX.
DECLINATION, in Grammar, an inflection of nouns, according to their diverse cases; as nominative, genitive, dative, &c. See GRAMMAR.
DECLINATION, in Astronomy, the distance of any celestial object from the equinoctial, either northward or southward. It is either true or apparent, according as the real or apparent place of the object is considered. See ASTROLOGY INDEX.
DECLINATION of the Sea Compass or Needle, is its variation from the true meridian of any place.
DECLINATION of a Plane or Wall, in Dialing, is the horizontal arch contained between the plane and the prime vertical circle, if you reckon from east to west; or between the meridian and the plane, reckoning from north to south. Many ways are used for finding this declination: but the most easy and practicable is by a declinator. See DECLINATOR.
DECLINATOR, or DECLINATORY, an instrument chiefly used in practical dialing, for taking the declinations, inclinations, or reclinations of the planes on which the dials are to be delineated. See DIALING, N° 21, 25.
DECLINATURE of JUDGES. See LAW INDEX.
DECLIVITY denotes the reverse of ACCLIVITY.

DECOCTION, usually signifies either the action of boiling a substance in water, or the water itself in which the substance has been boiled. It is only applicable to matters containing some principles soluble in water; such particularly are animal and vegetable matters. Decoction ought not to be used with such substances as contain any volatile principles, as they would be dissipated in the air during the process. But it may be safely used, may even becomes necessary, when the matter is to be treated are solid, and of a close and compact texture; because then the water could not extract its principles without a boiling heat. Most soft animal matters, as flesh, skin, tendons, may be conveniently boiled in water; because they contain no principle volatile with a boiling heat. Water extracts from them nothing but a gelatinous substance, and some oily parts which float on the surface of the water. All vegetable matters which are inodorous, and particularly those which are hard, as roots, barks, &c. are generally boiled, when an extraction of their principles by water is required. To this rule, however, there are some exceptions. Peruvian bark, for instance, gives its strength to cold water better than such as is boiling hot. Many other vegetables also have the same property of yielding less to boiling than to cold water. And therefore a general rule may be established, that decoction ought not to be employed but when absolutely necessary; that is, when the same principles, or the same quantities of those principles, cannot be obtained by an infusion, and that without heat, if it can be so done, considering that the proximate principles
DEC

Decoration of vegetables are generally so delicate, and so susceptible of change and decomposition, that frequently the most gentle heat changes much their nature and properties.

DECOLLATION, beheading, a term seldom used but in the phrase decollation of St John Baptist: which denotes a painting wherein is represented the Baptist's head struck off from his trunk; or the feast held in honour of that martyr.

DECOMPOSITION, in Chemistry, usually signifies the dissolution or separation of the constituent parts of bodies. It differs from mere mechanical division; for when a body is mechanically decomposed, the parts into which it is resolved are essentially different from the body itself; and though a mechanical force be applied to it ever so long, or with ever so much violence, the minutest particles into which the body may be reduced still retain their original nature. Thus, for example, though we suppose nitre, or any other salt, to be reduced to ever so fine powder, each particle retains the nature of nitre, as much as the largest unpounded mass; but if sulphuric acid be applied, a decomposition takes place, and one of the component parts of the nitre, namely the nitric acid, rises in the form of fumes, which lay hid in the mild neutral salt. See Decomposition, Chemical Supplement.

DECORATION, in architecture, any thing that adorns and enriches a building, church, triumphal arch, or the like, either without or within.

The orders of architecture contribute greatly to the decoration; but then the several parts of those orders must have their just proportions, characters, and ornaments; otherwise the finest order will bring confusion rather than richness. See Architecture.

Decorations in churches are paintings, vases, festoons, &c. occasionally applied to the walls; and with so much conduct and discretion, as not to take off any thing from the form of the architecture: as is much practised in Italy at the solemn feasts.

Decoration is more particularly applied to the scenes of theatres.

In operas, and other theatrical performances, the decorations must be frequently changed conformably to the subject.

The ancients had two kinds of decorations for their theatres: the first, called versatiles, having three sides, or faces, which were turned successively to the spectators: the other called ductiles, showing a new decoration by drawing or sliding another before it. This latter sort is still used, and apparently with much greater success than among the ancients, who were obliged to draw a curtain whenever they made a change in the decorations; whereas on our stage the change is made in a moment, and almost without being perceived.

DECORUM, in Architecture, is the suitableness of a building, and the several parts and ornaments thereof, to the station and occasion.

DECOUPLE, in Heraldry, the same as uncoupled; thus a chevron decouple is a chevron wanting so much of it towards the point, that the two ends stand at a distance from one another, being parted and uncoupled.

DECOY, in naval affairs, a stratagem employed by a ship of war to betray a vessel of inferior force into an uncautious pursuit, till she has drawn her within the range of her cannon, or what is called within gun-shot. It is usually performed by painting the stern and sides in such a manner as to disguise the ship, and represent her either much smaller and of inferior force, or as a friend to the hostile vessel, which she endeavours to ensnare, by assuming the pomp and ornaments to the nation to which the stranger is supposed to belong. When she has thus provoked the adversary to chase, if hopes of acquiring a prize, she continues the decoy by spreading a great sail, as endeavouring to escape at the same time that her course is considerably retarded by an artful alteration of her trim till the enemy approaches. Decoying is also performed to elude the chase of a ship of a superior force in a dark night, by throwing out a lighted cask of pitch into the sea, which will burn for a considerable time and misguide the enemy. Immediately after the cask is thrown out, the ship changes her course, and may easily escape, if at any tolerable distance from the foe.

DECOY, among fowlers, a place made for catching wild-fowl. A decoy is generally made where there is a large pond surrounded by a wood, and beyond that a marshy and uncultivated country: if the piece of water is not thus surrounded, it will be attended with the noise and other accidents which may be expected to frighten the wild-fowl from the prey, where they mean to sleep, during the day-time, in security. If these noises or disturbances are wilful, it hath been held that an action will lie against the disturber. As soon as the evening sets in, the decoy rises (as they term it), and the wild fowl feed during the night. If the evening is still, the noise of their wings, during their flight, is heard at a very great distance, and is a pleasing though rather melancholy sound. This rising of the decoy in the evening, is in Somersetshire called raddling.

The decoy-ducks are fed with hempseed, which is thrown over the skreens in small quantities, to bring them forwards into the pipes or canals, and to allure the wild fowl to follow, as this seed is so light as to float.

There are several pipes, as they are called, which lead up a narrow ditch that closes at last with a funnel net. Over these pipes (which grow narrower from their first entrance) is a continued arch of netting suspended on hoops. It is not a pipe, but a decoy pipe for almost every wind that can blow, as upon this circumstance it depends which pipe the fowl will take to; and the decoy-man always keeps on the leeward side of the ducks, to prevent his effluvia reaching their sagacious nostrils. All along each pipe, at certain intervals, are placed skreens made of reeds, which are so situated, that it is impossible the wild-fowl should see the decoy-man, before they have passed on toward the end of the pipe, where the purse-net is placed. The inducement to the wild-fowl to go up one of these pipes is, because the decoy-ducks trained to this leave the way, either after hearing the whistle of the decoy man, or enticed by the hemp-seed; the latter will divide under water whilst the wild-fowl fly on, and are taken in the purse.

It often happens, however, that the wild-fowl are in such a state of sleepiness and dozing, that they will not follow the decoy-ducks. Use is then generally mad.
made of a dog, who is taught his lesson; he passes backwards and forwards between the reed screens (in which are little holes, both for the decoy-man to see, and the little dog to pass through); this attracts the eye of the wild-fowl, who, not choosing to be interrupted, advance towards the small and contemptible animal, that they may drive him away. The dog all the time, by the direction of the decoy-man, plays among the screens of reeds, nearer and nearer the purse-net: till at last, perhaps the decoy-man appears behind a screen, and the wild-fowl not daring to pass by him in return, nor being able to escape upwards on account of the net-covering, rush on into the purse-net. Sometimes the dog will not attract their attention, if a red handkerchief, or something singular, is not put about him.

The general season for catching fowls in decays, is from the latter end of October till February: the taking of them earlier is prohibited by an act 10 Geo. II. c. 32, which forbids it from June 1st to October 1st, under the penalty of five shillings for each bird destroyed within that space.

The Lincolnshire decoys are commonly set at a certain annual rent, from 5 to 20 pounds a-year: and one is in Somersethshire that pays 30l. The former contribute principally to supply the markets in London. Amazing number of ducks, widgeon, and teal, are taken: by an account sent us of the number caught a few winters past, in one season, and in only ten decoys, in the neighbourhood of Wainfleet, it appeared to amount to 37,000, in which are included several other species of ducks; it is also to be observed, that, in the above particular, widgeon and teal are reckoned but as one, and consequently sell but at half price of the ducks. This quantity makes them so cheap on the spot, that we have been assured, several decoy-men would be content to contract for years to deliver their ducks at Boston, for 10d. per couple. The account of the numbers here mentioned, relates only to those that were sent to the capital.

It was customary formerly to have in the fens an annual driving of the young ducks before they took wing. Numbers of people assembled, who beat a vast tract, and forced the birds into a net placed at the spot where the sport was to terminate. A hundred and fifty dozens have been taken at once: but this practice being supposed to be detrimental, has been abolished by act of parliament.

DECREPIT, an order made by a superior power for the regulation of an inferior.

Decree, in the civil law, is a determination which the emperor pronounces upon hearing a particular cause between the plaintiff and defendant.

Decrees of Councils, are the laws made by them, to regulate the doctrine and policy of the church.

Decrees in Chancery, are the determination of the lord-chancellor, upon a full hearing of the merits of a cause.

DECREET, in the Law of Scotland, a final decree of judgment of the lords of session, from which an appeal only lies to parliament.

Decret-Arbitral, in Scots Law, the sentence or judgment of one to whom parties voluntarily submit the determination of any question between them. See Law Index.

Vol. VII. Part I.
DEDICATION [114]

DEDICATION is a term used in various fields, such as botany, anatomy, and mathematics. It was also used in the context of dedicating a book or a work of art.

DEDICATION, in literature, is an address prefixed to a book, soliciting patronage, or testifying respect for the person to whom it is made. The dedication of the fourth part of Mr. Edwards's History of Birds, is curious: To God! the one eternal! the incomprehensible the omnipresent, omniscient, and almighty Creator of all things that exist! from orbs immeasurably great, to the minutest points of matter!—this Atom is dedicated and devoted, with all possible gratitude, humiliation, and worship, and the highest adoration both of body and mind, by his most resigned, low, and humble creature, C. E. D. E.

DEE, John, a famous mathematician and astrologer, was born (July 1527) in London, where his father was a wealthy vintner. In 1542, he was sent to St. John's College, Cambridge. After five years close application to mathematical studies, particularly astronomy, he went to Holland, in order to visit several eminent mathematicians on the continent. Having continued abroad near a year, he returned to Cambridge, and there he was elected one of the fellows of Trinity College, then first erected by King Henry VIII. In 1548, he took the degree of master of arts; and, in the same year, left England a second time; his stay at home being rendered uneasy to him, by the suspicions that were entertained of his being a conjuror; arising partly from his application to astronomy, but especially on account of a piece of machinery in the Equis of Aristophanes, which he exhibited to the university, and in which he represented the Scarebus flying upon Jupiter, with a man and a basket of victuals on its back. These suspicions he could never after shake off, nor did his subsequent conduct, as we shall see, tend to clear him of the imputation; for if he was not actually a conjuror, it was not for want of endeavours.

Upon leaving England, he went to the university Louvain, where he was much esteemed, and visited several persons of high rank. Here he resided about two years, and then set out for France; where, in the college of Rheims, he read lectures of Euclid's elements with vast applause. In 1551, he returned to England and was introduced by the secretary Cecil to King Edward, who assigned him a pension of 100 crowns, which he afterwards relinquished for the rectory of Upton upon Severn: but soon after the accession of Queen Mary, having some correspondence with the lady Elizabeth, servants, he was accused of practising against the queen's life by enchantment. On this account he suffered a tedious confinement, and was several times examined; till, in the year 1555, he obtained his liberty by an order of council.

When Queen Elizabeth ascended the throne, astrological Dee was consulted by Lord Dudley, concerning a propitious day for her majesty's coronation. He was on this occasion introduced to the queen, who made him great promises, which were never performed, though she conjured him to receive his instructions relative to the mystical interpretation of some of his intelligible writings, which he published about this time. In 1564, he made another voyage to the continent, in order to ascertain a book which he had dedicated to the emperor Maximilian. He returned to England the same year: but in 1571, we find him in Lorrai, where, being dangerously ill, the queen sent over the

physical
physicians to his relief. Having once more returned to his native country, he settled at Mortlake in Surrey, where he continued his studies with unremitting ardour, and collected a considerable library of curious books and manuscripts, and a variety of instruments; most of which were afterwards destroyed by the mob, as belonging to one who dealt with the devil. In 1578, the queen being much indisposed, Mr Dee was sent abroad to consult with German physicians and philosophers (astrologers no doubt) on the occasion. We now behold him again in England, where he was soon after employed in a more rational service. Her majesty, desirous to be informed concerning her title to those countries which had been discovered by her subjects, commanded Mr Dee to consult the ancient records, and furnish her with proper geographical descriptions. Accordingly, in a short time he presented to the queen, in the gardens at Richmond, two large rolls, in which the discovered countries were geographically described and historically illustrated. These rolls are preserved in the Cotton library, "Augusius I." His next employment was the reformation of the calendar, on which subject he wrote a rational and learned treatise, preserved in the Ashmolean library at Oxford.

Hitherto the extravagancies of our eccentrical philosopher seem to have been counterpoised by a tolerable proportion of reason and science; but henceforward we consider him as a mere necromancer and credulous alchemist. In the year 1581, he became acquainted with one Edward Kelly, by whose assistance he performed diverse incantations, and maintained a frequent imaginary intercourse with spirits. He was particularly intimate, it seems, with the angels Raphael and Gabriel. One of them made him a present of a black spectulum, in which his angels and demons appeared as often as he had occasion for them; they answered his questions, and Kelly's business was to record their dictates:

Kelly did all his feats upon
The devil's looking-glass, a stone.

Hudib. Part II. Canto III. 631.

In 1583, they were both introduced to a certain Polish nobleman, then in England, named Albert Laske, palatine of Siradice, a person equally addicted to the same ridiculous pursuits. He was so charmed with Dee and his companion, that he persuaded them to accompany him to his native country. They embarked for Holland in Sept. 1583; and travelling over land, arrived at the town of Laski in February following. Their patron, however, finding himself abused by their idle pretensions, persuaded them to pay a visit to Rudolph king of Bohemia; who, though a credulous man, was soon disgusted with their nonsense. They were afterwards introduced to the king of Poland, but with no better success. Soon after this, they were invited by a rich Bohemian nobleman to his castle of Trebons, where they continued for some time in great affluence: owing, as they asserted, to their art of transmutation by means of a certain powder in the possession of Kelly.

Dee, now quarrelling with his companion in iniquity, quitted Bohemia, and returned to England, where he was once more graciously received by the queen; who, in 1595, made him warden of Manchester college, in which town he resided several years. In 1604, he returned to his house at Mortlake, where he died in the year 1608, aged 81; leaving a large family, and many works behind him.—The black stone into which Dee used to call his spirits, was in the collection of the earls of Peterborough, whence it came to Lady Elizabeth Germaine. It was next the property of the late duke of Argyll, and is now Mr Walpole's. It appears upon examination to be nothing but a polished piece of cannon coal.—That Dee was a man of considerable acquirements, is beyond a doubt; his mathematical knowledge is generally allowed; but, unless we suppose him a wicked impostor, which is by no means improbable, we must transmit him to posterity as one of the most foolish superstitious necromancers of his time. Nevertheless, the celebrated Dr Hook, many years after Dee's death, took it into his head to prove that his journal, published by Casaubon, was entirely cryptographical, concealing his political transactions, and that he was employed by Queen Elizabeth as a spy.

DEE, the name of several rivers in Scotland and England; as those whereon the cities of Chester in England, and New Aberdeen in Scotland, are situated. The river Dee in Aberdeenshire rises in the mountains of Mar forest, and falls into the German ocean at Aberdeen. It abounds with salmon, so as to form a considerable salmon fishing. Over this river there is a fine bridge of seven arches, built by a bishop of Aberdeen, who left a revenue for its support.

DEED, an instrument written on paper or parchment, comprehending some contract, bargain, or agreement between the parties thereto, in relation to the matter therein contained.

DEEMSTERS, or DEMSTERS (from the Saxon dema, judge or umpire). All controversies in the isle of Man are decided without process, writings, or any charges, by certain judges, chosen yearly from among themselves, called deemsters; there being two of them for each division of the island: they sit judges in all courts, either for life or property; and with the advice of 24 keys, declare what is law in uncommon emergencies.

DEEPING, a town of Lincolnshire in England, seated in a sandy ground, on the river Weland, six miles east from Stamford. W. Long. 0. 20. N. Lat. 52° 35'.

DEER, in Zoology. See Cervus. The method of hunting deer in the island of Ceylon is very particular. The huntsmen go out in the night, and only two usually go together; the one of these carries upon his head an earthen vessel, in which there is some fire burning and flaming; the ingredients are generally small sticks cut into pieces, and common resin. Of this the other man carries a supply about him to replenish the pot when it grows low. The person who has the fire upon his head, carries in one hand a staff, on which there are fixed eight bells; and the larger those are, the better. This man goes first into the woods, and the other follows close behind with a spear in his hand. As soon as the deer hears the noise of the bells, he turns towards the place whence the sound comes; and seeing the fire, he eagerly runs up to it, and stands gazing at a small distance: the second man has
has then nothing to do but to kill him with the spear; for he sees neither of them. Not only deer, but even elk and hares, are thus taken; for they gaze at the fire, and never see the men. The profits of this sort of hunting are very large, and the danger nothing; for though there are numbers of tygers, elephants, and wild boars, in these woods, the huntsmen are in no danger from them while the fire burns, for they all run away from it.

De: Facto, something actually in fact, or existing; in contradistinction to de jure, where a thing is only so in justice, but not in fact: as a king de facto, is a person who is actually in possession of a crown, but has no legal right to the same; and a king de jure, is the person who has a just right to the crown, though he is out of possession thereof.

DEFAMATION, the speaking slanderous words of another; for which the slanderer is punishable, according to the nature of his offence, either by action upon the case at common law, or by statute in the ecclesiastical court.

DEFAULT, in Law, is generally taken for non-appearance in court, or a day assigned; but imports any omission of that which we ought to do, for which judgment may be given against the defaulter.

DEFEASANCE, or DEFEASANCE, in Law, a condition relating to some certain deed, which being performed, the deed is defeated and rendered void, as if it had never been made. The difference between a common condition and a defeasance is, that the condition is annexed to, or inserted in, the deed; and a defeasance is a deed by itself concluded and agreed on between the parties, and having relation to another deed.

DEFECATE, in Chemistry, a term applied to a body freed and purged from impurities and impurities.

DEFECTION, the act of abandoning or relinquishing a party or interest a person had been engaged in. The word is formed of the Latin deficio, to fall off.

DEFECTIVE, in general, an appellation given to things which want some of the properties that naturally they ought to have. Thus,

DEFECTIVE OR DEFICIENT Nouns, in Grammar, are such as want either a whole number, a particular case, or are totally inextendable. See NOUN.

The term defective is also applied to a verb that has not all its moods and tenses. See VERB, MOOD, &c.

DEFENCE, in Fortification, all sorts of works that cover and defend the opposite posts, as flanks, casemates, parapets, and faussebroys. See FORTIFICATION.

Line of DEFENCE, a supposed line drawn from the angle of the curtain, or from any other part in the curtain, to the flanked angle of the opposite bastion.

DEFEND, in general, signifies much the same with protecting or keeping off injuries offered to anyone either by enemies or otherwise.

DEFEND, in our ancient laws and statutes, signifies to prohibit or forbid: as Usuarius defendit quaque rem Edwardus ne romanarent in regna. L. L. Edw. Conf. c. 38. & 5 Rich. II. c. 7. In which sense Chaucer also uses it in the following passage:

"Where can you say in any manner age, That ever God defended marriage."

In 7 Edw. I. there is a statute entitled, "Statutum de defensione portandi arma," &c. And it is defended by law to distrain on the highway. Coke on Little, fol. 161.

DEFENDANT; in Law, the person sued in an action personal; as tenant is he who is sued in an action real. See ACTION.

DEFENDER of the Faith (Fidei Defensor), a peculiar title belonging to the king of England; as Catholicus to the king of Spain, and Christianissimus to the king of France, &c. These titles were given by the popes of Rome. That of Fidei Defensor was first conferred by Leo X. on King Henry VIII. for writing against Martin Luther; and the bull for it bears date quinto idus Octob. 1521. It was afterwards confirmed by Clement VII. But the pope, on Henry’s suppressing the houses of religion at the time of the Reformation, not only deprived him of his title, but depose him from his crown also: though in the 35th year of his reign, his title, &c. was confirmed by parliament; and hath continued to be used by all succeeding kings to this day. Chamberléyme says, the title belonged to the king of England before that time; and for proof hereof appeals to several charters granted to the university of Oxford. So that Pope Leo’s bull was only a renunciation of an ancient right.

DEFENDERS, were anciently notable dignities both in church and state, whose business was to look to the preservation of the public weal, to protect the poor and helpless, and maintain the interests and causes of churches and religious houses. See PROTECTOR. The council of Chalcedon, can. 2, calls the defender of a church Epidius. Codin, de officiis aulae Const. makes mention of defenders of the palace. There were also a defender of the kingdom, defender regni; defenders of cities, defensores civitatis; defenders of the people, defensores plebis; of the poor, fatherless, widows, &c.

About the year 420, each patriarchal church began to have its defender; which custom was afterwards introduced into other churches, and continued to later days under other names; as those of Advocate and Advouée.

In the year 407, we find the council of Carthage asked the emperor, for defenders, of the number of Scholastics, i. e. advocates who were in office; and that it might be allowed them to enter and search the cabinets and papers of the judges and other civil magistrates, whenever it should be found necessary for the interest of the church.

DEFERENS, or DEFERENT, in the ancient astronomy, an imaginary circle, which, as it were, carries about the body of a planet, and is the same with the eccentric; being invented to account for the eccentricity, perige, and apogee of the planets.

DEFILE, in Fortification, a straight narrow passage, through which a company of horse or foot can pass only in file, by making a small front.

DEFINITE, in Grammar, is applied to an article that has a precise determinate signification; such as the article the in English, le and la in French, &c. which fix and ascertain the noun they belong to, to some particular; as the king, le roy: whereas, in the quality of king, de roy, the articles of and de mark nothing precise, and are therefore indefinite.

DEFINITION,
DEFINITION, in general, a short description of a thing by its properties; or, in logic, the explication of the essence of a thing by its kind and difference.

DEFINITIVE, a term applied to whatever terminates a process, question, &c. in opposition to provisional and interlocutory.

DEFLAGRATION, in Chemistry, the kindling or setting fire to a salt or mineral, &c. either alone, or mixed for that purpose with a sulphureous one, in order to purify it.

This short process has been often recommended to the world as of great use in trying the strength of brandies and other vinous spirits, and has been greatly improved in this respect by Mr. Geoffroy.

The common way of trying spirits by deflagration, is to measure out any quantity of it, then to heat it, and set it on fire. If, after it will no longer burn, the remainder is half as much as the quantity measured out for the trial was, then the spirit tried is found to consist of half water, and half totally inflammable spirit; that is, it is somewhat below what we understand by the term perfect proof. This method is much more certain than that by the crown of bubbles which arises upon shaking the spirit in a phial. Mons. Geoffroy's method is this: Take a cylindrical vessel two inches high, and as much in diameter, consisting of thin plate silver, that metal being much less liable to rust than copper; this vessel must be fitted with a little rectangular gage exactly graduated into lines, half lines, &c. Then the vessel being set level upon a copper case made to contain it, a parcel of the brandy to be examined is poured in, to the height of 16 lines. This height is to be exactly hit by pouring in more than enough at first, and then sucking out the overplus with a very small tube. Then the vessel being heated a little, so as just to make the liquor fume, it is to be set on fire and left to go out of itself; at the instant when the flame expires, the gage is plunged perpendicularly into the vessel, and the lines and quarters exactly noted which the liquor wants of its former height: this difference gives the precise quantity of alcohol or pure spirit contained in the liquor. Thus, if eight lines of phlegm are found remaining, this being the half of the 16 lines of the original filling, it is plain that the liquor contained one half spirit, or was something below proof. If only four lines remained, it was nearly double proof, or of a middle nature between alcohol and common proof-spirits.

DEFLECTION, the turning any thing aside from its former course by some adventitious or external cause. This word is often applied to the tendency of a ship from her true course by reason of currents, &c. which turn her out of her right way. It is likewise applied by astronomers to the tendency of the planets from the line of their projection, or the tangent of their orbit.

DEFLECTION of the Rays of Light, a property which Dr. Hook observed in 1675, and read an account of before the Royal Society, March 18th the same year. He says he found it different both from reflection and refraction, and that it was made towards the surface of the opaque body, perpendicularly. This is the same property which Sir Isaac Newton calls inflexion.

DEFLORATION, or deflowering, the act of violating or taking away a woman's virginity. See Defloration.

VIRGINITY.—Death or marriage are decreed by the civil law in case of defloration.

The ancients had so much respect for virgins, that they would not put them to death till they had first procured them to be deflowered. It is said, the natives of the coast of Malabar pay strangers to come and deflower their brides.

In Scotland and the northern parts of England, it was a privilege of the lords of the manor, granted them by King Ewen, that they should have the first night's lodging with their tenants wives. King Malcolm III. allowed the tenants to redeem this service at a certain rate, called marcheta, consisting of a certain number of cows: Buchanan says it was redeemed with half a mark of silver. The same custom had place in Wales, Flanders, Friesland, and some parts of Germany.

DEFLUXION, in Medicine, the fall of the humours from a superior to an inferior part of the body.

DEFOE, DANIEL, a writer famous for politics and poetry, was bred a hosier; which profession however he soon forsook, and became one of the most enterprising authors that any age produced. When discontent ran high at the Revolution, and King William was obliged to dismiss his Dutch guards, Defoe, who had true notions of civil liberty, ridiculed the enemies of government in his well-known poem, called the True-Born Englishman, which had a prodigious sale. The next satire he wrote was entitled Reformation of Manners; aimed at some persons of high rank, who rendered themselves a disgrace to their country. When the ecclesiastics in power breathed too much of a spirit of persecution, Defoe wrote a tract called the Shortest Way with the Dissenters: for which he was called to account, and explained himself with great firmness. He was afterwards sentenced to the pillory for attacking some public measures; which so little intimidated him, that, in defiance of their usage, he wrote a Hymn to the Pillory. It would be endless to enumerate all his publications; but the following are the principal: the History of the Plague in 1665; a novel entitled the History of Colonel Jack; a new Voyage round the World by a Company of Merchants, printed for Bettesworth, 1725; the History of Roxana; Memoirs of a Cavalier; the History of Moll Flanders; a book entitled Religious Courtship, which has undergone upwards of 20 editions; and the Life and Adventures of Robinson Crusoe, an admirable performance of which there have been editions without number, but concerning which there is an anecdote that does the author of it no credit as to the better part of a writer's character, honesty. When Captain Woods Rogers touched at the island of Juan Fernandez, in the South sea, he brought away Alexander Selkirk, a Scotch sailor, who had been left ashore there, and had lived on that desolate place above four years. When Selkirk came back to England, he wrote a narrative of his adventures, and put the papers into the hands of Defoe, to digest for publication; who ungenerously converted the materials into the History of Robinson Crusoe, and returned Selkirk his papers again! A fraud for which, in a humane view, the distinguished merit of that romance can never stone. Daniel Defoe died at Islington, in 1731. All his productions of the romantic
Defoe, Defoliation

DEFOLIATION, (from de, and fulgium "a leaf"); the fall of the leaves. A term opposed to fronde- 
scentia, the annual renovation of the leaves, produced 
by the unfolding of the buds in spring. See FRONDE- 
scentia.

Most plants in cold and temperate climates shed their 
leaves every year: this happens in autumn, and is 
generally announced by the flowering of the common 
meadow saffron. The term is only applied to trees 
and shrubs; for herbs perish down to the roots every 
year, losing stem, leaves, and all.

All plants do not drop their leaves at the same time. 
Among large trees, the ash and walnut, although latest 
in unfolding, are soonest divested of them: the latter 
seldom carries its leaves above five months.

On the oak and hornbeam, the leaves die and wither 
as soon as the colds commence; but remain 
attached to the branches till they are pushed off by the 
new ones, which unfold themselves the following 
spring. These trees are doubtless a kind of ever-
greens: the leaves are probably destroyed only by 
cold; and perhaps would continue longer on the plant, 
but for the force of the spring sap, joined to the 
moisture.

In mild and dry seasons, the lilac, privet, yellow jas-
samine of the woods, and maple of Crete, preserve their 
leaves green until spring, and do not drop them till the 
new leaves are beginning to appear. The fig-tree, and 
many other trees that grow between the tropics, are of 
this particular class of evergreens. The trees in Egypt, 
says Doctor Hasselquist, cast their leaves in the latter 
end of December and beginning of January, having 
young leaves ready before all the old ones are fallen 
off; and, to forward this operation of nature, few of the 
trees have buds; the sycamore and willow, indeed, have 
some, but with few and quite loose stipula or scales. 
Nature did not imagine buds so necessary in the southern 
as in the northern countries: this occasions a great 
difference between them.

Lastly, some trees and shrubs preserve their leaves 
constantly through the whole year; and are not in the 
least influenced by the clemency or inclemency of sea-
sons. Such are the fir, juniper, yew, cedar, cypress, 
and many other trees, hence denominated evergreens. 
These preserve their old leaves a long time after the 
formation of the new, and do not drop them at any 
determinate time. In general, the leaves of evergreens are harder, and less succulent, than those 
which are renewed annually. The trees are gene-
really natives of warm climates; as the alaternuses 
of France and Italy, the evergreen oak of Portugal and 
Suabia.

Some herbaceous perennials, as the house-leeks and 
navel-worts, enjoy the same privilege with the ever-
green trees, and resist the severities of winter: some 
even can dispense with the earth for some time; being 
replete with juices, which the leaves imbibe from the 
humidity of the atmosphere, and which, in such plants,
Defoliation or cherry-bay, an evergreen, on the common cherry; and the ilex, or evergreen oak, on the oak.

DEFAULCT, in Law, the casting of any one out of his land, or withholding of lands and tenements by force from the right owner.

DEFAULCT, in Scots Law, the opposing or resisting of the officers of the law in the execution of their office. See LAW INDEX.

DEFAMITY, the want of that uniformity necessary to constitute the beauty of an object. See BEAUTY.

Defaminity is either natural or moral. These are both referred by Mr. Hutcheson to an internal sense; and our perceptions, of them as he supposes, arise from an original arbitrary structure of our own minds, by which certain objects, when observed, are rendered the occasions of certain sensations and affections.

That many objects give no pleasure to our sense is obvious. Many are certainly void of beauty; but then, says this author, there is no form which seemingly disagreeable of itself, when we dread no other evil from it, and compare it with nothing better of the kind. Many objects are naturally displeasing and distasteful to our external senses, as well as others pleasing and agreeable; as smells, tastes, and some separate sounds; but with regard to our sense of beauty, no composition of objects which give not unpleasant simple ideas, seems positively unpleasant or painful of itself, had we never observed any thing better of the same kind.

Had there been a species of the form which we now denominate ugly or deformed, and had we never seen or expected greater beauty, we should have received no disgust from it; though the pleasure would not have been so great in this form as in those we now admire. Our sense of beauty seems designed to give us positive pleasure; but not positive pain or disgust, any farther than what arises from disappointment.

There are indeed many faces which at first view are apt to raise dislike. But this is generally not from any positive deformity; but either from want of expected beauty, or from the carrying some natural indications of morally bad dispositions, which we all acquire a faculty of discerning in countenances, airs, and gestures. That this is not occasioned by any form positively disgusting, appears hence, that if, upon long acquaintance, we are sure of finding sweetness of temper, humanity, and cheerfulness, though the bodily form continues, it shall give us no disgust. There are horrors raised by some objects, which are only the effects of fear for ourselves, or compassion towards others, when either reason, or some foolish association of ideas, makes us apprehend danger; and not the effect of any thing in the form itself. For we find, that most of those objects which excite horror at first, when experience or reason has removed the fear, may become the occasion of pleasure.

The casual conjunction of ideas gives us disgust, when there is nothing disagreeable in the form itself. And this, in effect, is the cause of most of our fantastic aversions to the figures of divers animals, &c. Thus serpents of all kinds, and many insects, really beautiful enough, are beheld with aversion by many people, who have got some accidental ideas of mischief associated to them. A similar reasoning is applied to our perception of moral beauty and deformity. Deformity. Inquiry into the Original of our Ideas of Beauty and Virtue, passim.

But it is more just to distinguish between the sentiments of delight or disgust, excited in us by beautiful or deformed objects, which are effects of some causes, and the natural and real qualities of the perceived objects by which they are produced. There are objects, says an excellent writer, which have a natural aptitude to please or offend, or between which and the contemplating mind there is a necessary congruity or incongruity; and though the actual perception of the understanding, and consequent feeling of the heart, in contemplating the actions and affections of moral agents, may exist in very different degrees, on account of the accidental obstructions arising from bodily indigination, mental prejudices and biasse, and the association of ideas; yet, in every rational mind properly disposed, morally good actions must for ever be acceptable, and can never of themselves offend; and morally evil actions must for ever be disagreeable, and can never of themselves please. What is right in actions and characters is beautiful and amiable, and gives pleasure; what is wrong is deformed and odious, and excites disgust: right and pleasure, wrong and pain, are as distinct as cause and effect. It is no less absurd to maintain, that the perception of virtue is nothing distinct from the perception of the pleasure resulting from it, than to infer, with some metaphysicians, that solidity, exterior, and figure, are only particular modes of sensation, because attended, whenever we are pleased, with some sensations of sight or touch. Thus does the author show, that moral beauty and deformity are real qualities of certain actions; in which consists their aptitude to please or disgust. With respect to natural beauty, he observes, that uniformity amidst variety pleases, because of the natures of variety and uniformity, which are such, that whenever united, they are adapted to please every unbiased mind that discerns them. He accounts for the pleasure they afford, without referring them to an arbitrary internal sense, by the following circumstances that attend them. They are more easily comprehended by the mind: order and symmetry give things their stability and strength, and subervency to any valuable purpose; regularity and order evidence art and design. Disorder and confusion, whence deformity arises, denote only the negation of regularity and order; or any arrangement and disposition of things, which are not according to a law, rule, or plan, and prove not design. These are not positively displeasing; except when we are piously expect ed order, or where impotence or want of skill appears, and the contriver has either failed of his design or executed it ill.

In a work entitled Fugitive Pieces, is preserved an essay on Bodily Deformity, by William Hay, Esq. who was himself what he describes, and who, while he rivals his own figure with great pleasantry, discusses the general subject in a manner equally instructive and agreeable. He considers, 1. The natural consequences of bodily deformity; 2. How it affects the outward circumstances; and, 3. What turn it gives to the mind.

1. It is certain, that the human frame, being warped and disproportioined, is lessened in strength and ac-
But whether deformity, abstractedly considered, is really prejudicial to health, in its consequences it appears to be most commonly an advantage. Deform persons have a less share of strength than others, and therefore should naturally be more careful to preserve it; and as temperance is the great preservative of health, it may incline them to be more temperate. Another great preservative of health is moderate exercise, which few deformed persons can want strength to perform. As a deformed person is not formed for violent exercise, he is less liable to such disorders as are the natural consequences of it. He will also escape many accidents, to which men of athletic make, and who glory in their strength, are always exposing themselves to make trial and proof of it. If he cannot car an ox, like Milo, he will not like Milo be harnessed in the oak by attempting to rend it. He will not be the man that shall ride from London to York in a day, or to Windsor in an hour, for a wager; that shall be perpetually performing surprising journeys in a surprising short time, for no earthly business but the pleasure of relating them. Conscious of his own weakness, he will be cautious of running in places or occasions of danger. Nature, too, warns deformed persons to be careful not to offer such affronts as may call them forth into the field of false honor where they cannot acquitted themselves well for want of strength and agility; and they are secured from affronts themselves, since others will consider the little credit they will gain by compelling them to appear on that scene. On the whole, therefore, it may be concluded, that deformity is a protection to a man's health and person; which (strange as it may appear) are better defended by feebleness than strength.

2. The influence of bodily deformity on a man's fortune may next be considered. Among the lower class, he is cut off from many professions and employments. He cannot be a soldier, he is under standard; he cannot be a sailor, he wants activity to climb the rigging; he cannot be a chairman or porter, he wants strength to bear the burden. In higher life, he is qualified for a lawyer, he can scarce be seen over the bar: for a divine, he may drop from his bassock of sight in his pulpit. The improvement of his mind is his proper province, and his business only such as depends on ingenuity. If he cannot be a dancin master to adjust the heels, he may be a schoolmaster to instruct the head: he cannot be a graceful actor on the stage; but he may produce a good play: he would appear ill as a herald in a procession; but may pass for a merchant on the change: he cannot undergo the fatigue of the campaign; but he may advise the operations of it: he is designed by nature rather to sit on Parnassus, than to descend on the plains of Eoli. He cannot be crowned at the Olympic games; but in be the Pindar to celebrate them: he can acquire glory by the sword; but he may by the pen, and they may be the only modes they exploit which are beyond his power to imitate.

Lord Bacon (that extensive and penetrating genius who pointed out every part of nature for examination in his Essay on Deformity, says, "that in their superior it quencheth jealousy towards them, as person that they think they may at pleasure despise; and layeth their competitors and emulators asleep, as new
Definiteness, believing they should be in a possibility of advancement till they see them in possession." But it is much to be doubted whether this is not more than counterbalanced by the contumely of the world, which it requires no mean parts to conquer; for if (as has been said) a good person is a letter of recommendation, deformity must be an obstruction in the way to favour. In this respect, therefore, deformed persons set out in the world to a disadvantage; and they must first surmount the prejudices of mankind before they can be upon a par with others, and must obtain by a course of behaviour that regard which is paid to beauty at first sight. When this point is once gained, the tables are turned, and then the game goes in their favour: for others, sensible of their injustice to them, sooner find them better than they expected, than believe them better than they are; whereas in the beautiful person they sometimes find themselves imposed upon, and are angry that they have worshipped only a painted idol. For (again take Lord Bacon's words) "neither is it almost seen, that very beautiful persons are otherwise of great virtue: they prove accomplished, but not of great spirit; and study rather behaviour than virtue. Where-as deformed persons, if they be of spirit, will free themselves from scorn, which must be either by virtue or malice; and therefore let it not be marvelled if they sometimes prove excellent persons, as was Agesilaus, Zanger the son of Solomon, Æsop, Gasca president of Peru; and Socrates may likewise go amongst them, with others." Nay, he says, "in a great wit deformity is an advantage to rising;" and in another part of his works, "that they who by accident have some inevitable and indelible mark on their persons or fortunes, as deformed people, bastards, &c. if they want not virtue, generally prove fortunate;"

Osborn, in his Historical Memoirs of Queen Elizabeth, informs us, that "she chose the goodliest persons for her household servants; but in her counselors did not put by sufficiency, though accompanied with a crooked person; as it changed in a father and a son of the Cecils, both incomparable for prudence." It is well known the queen would make the father (Burleigh) sit in her presence; telling him that she did not use him for his legs but his head. But the son (afterwards lord treasurer and earl of Salisbury) was not so civilly treated by the populace; and is an instance, not only that envy pursues a great man, but that the highest post cannot redeem a deformed one from contempt: it attends him like his shadow, and like that too is ever reminding him of his ill figure, which is often objected for want of real criminals. For the same writer says of the same great man, "that the misfortunes accompanying him from his birth, did not a little add to that cloud of distraction that fell upon all that he said or did; a mulet in nature, like an optic spectacle, multiplying much in the sight of the people the apparitions of ill." Nor was this contempt buried with him: it trampled on his ashes, and insulted his grave; as appears by an epitaph, which Osborn cites, as void of wit as it is full of scurrility; in one line of which there is an epithet, not so elegant as descriptive of his person, viz. "Little Bosive Robin that was so great."

Such contempt in general, joined with the ridicule of the vulgar, is another certain consequence of bodily deformity; for men naturally despise what appears less beautiful or useful, and their pride is gratified when they see such foils to their own persons. It is this sense of superiority which is testified by laughter in the lower sort; while their betters, who know how little any man whatsoever hath to boast of, are restrained by good sense and good breeding from such an insult. But it is not easy to say why one species of deformity should be more ridiculous than another, or why the mob should be more merry with a crooked man, than with one that is deaf, lame, squinting, or purblind. It is a back in alto relieve that bears all the ridicule; though one would think a prominent belly a more reasonable object of it, since the last is generally the effect of intemperance, and of a man's own creation. Socrates was ugly, but not contemptued; and Philoæmen (A) of very mean appearance, and though contemned on that account not ridiculed: for Montaigne says, "Ill features are but a superficial ugliness, and of little certainty in the opinion of men; but a deformity of limbs is more substantial, and strikes deeper in." As it is more uncommon, it is more remarkable; and that perhaps is the true reason why it is more ridiculed by the vulgar.

5. The last consideration on this subject relates to those passions and affectations which most naturally result from deformity. Lord Bacon observes, that "deformed persons are commonly even with nature; for nature hath done ill by them, so do they by nature, being for the most part (as the scripture saith) void of natural affection." But (says Mr Hay) "I can neither find this passage in scripture, nor the reason of it; nor can I give my assent or negative to a proposition, till I am well acquainted with the terms of it. If by natural affection is here meant universal benevolence, and deformity necessarily implies a want of it, a deformed person must then be a complete monster. But however common the case may be, my own sensations inform me that it is not universally true. If by natural affection is meant a partial regard for individuals, I believe the remark is judicious, and founded in human nature. Deformed persons are despised, ridiculed, and ill-treated by others; are seldom favourites, and commonly most neglected by parents, guardians, and relations; and therefore, as they are not indebted for much fondness, it is no wonder if they repay but little. It is the command of scripture, Not to set our affections on things below; and it is the voice of reason not to overvalue what we must soon part with; therefore, to be so fond of others as not to be able to bear their absence, or to survive them, is neither a religious nor moral duty, but a childish and womanish weakness; and I must congratulate deformed persons, who, by example,

(A) Coming to an inn, where he was expected, before his attendants, the mistress of the house seeing a plain person of very mean aspect, ordered him to assist in getting things ready for Philoæmen. His attendants finding him so employed, he told them he was then paying the tribute of his ugliness. Plutarch.

Vol. VII. Part I.
I lament, that God is pleased to advance to royalty so few such instruments of good to mankind.

Again: "I am uneasy when I see a dog, a horse, or any other animal, ill treated: for I consider them as enured with quick sense, and no contemptible share of reason; and that God gave man domination over them, not to play the tyrant, but to be a good prince, and promote the happiness of his subjects. But I am much more uneasy at any cruelty to my own species; and heartily wish Procrustes disciplined in his own bed, and Phalaris in his bull. A man bruised all over in a boxing match, or cut to pieces in fighting a prize, is a shocking spectacle; and I think I could with less horror see a thousand fall in battle, than human nature thus depreciated and disgraced. Violence, when exerted in wantonness or passion, is brutality; and can be termed bravely only when it is sanctioned by justice and necessity.

"I have been in a situation to see not a little of the pomp and vanity, as well as of the necessity and misery, of mankind: but the last only affects me; and if, as a magistrate, I am ever guilty of partiality, it is in favour of the poor. When I am at church among my poor but honest neighbours in the country, and see them serious in performing the ceremonies prescribed, tears sometimes steal down my cheek, on reflecting, that they are doing and bearing things they do not understand, while those who understand them better neglect them; that they, who labour and live hard, are more thankful to heaven than those who fare luxurious on the fruits of their labour; and are keeping and repeating the fourth commandment at the very instant the others are breaking it.

"These are some of the sensations I feel; which I have freely and fairly disclosed, that the reader may judge how far I am an instance of a deformed person wanting natural defects. And I am a good subject of speculation; because all in me is nature: for to own the truth, I have taken but little pains (though I ought to have taken a great deal) to correct my natural defects.

"Lord Bacon's next position is, 'That deformed persons are extremely bold: first in their own defence, as being exposed to scorn; but in process of time by a general habit.' This probably is so among the inferior sort, who are in the way of continual insults; for a return of abuse is a natural weapon of self-defence, and in some measure justified by the law of retaliation: To upbraid a man with a personal defect, which he cannot help, is also an immoral act; and he who does it, has reason to expect no better quarter than to hear of faults, which it was in his own power not to commit. But I find this observation far from being verified in myself: an unbecoming bashfulness has been the consequence of my ill figure, and of the worse management of me in my childhood. I am always uneasy when any one says I am a paunch, I always feel that I am a picture, and cannot look with a proper confidence in the face of another. I have ever reproached myself with this weakness, but am not able to correct it. And it may be a disadvantage to a man in the opinion of those he converses with; for though true modesty is amiable, the false is liable to misconstruction; and when a man is out of countenance for no reason, it may be imagined that he has some bad reason for being so. In point
Definitively, I am indeed a perfect riddle to myself; for I, who feel a reluctance in crossing a drawing-room, or in opening my mouth in private company, before persons with whom I am not well acquainted, find little in delivering my sentiments in public, and exposing my discourse, often as trifling as my person, to the ears of a thousand. From what cause this proceeds, I know not: it may be partly from hopes of wiping off any ill impression from my person by my discourse, partly from a sense of doing my duty, and partly from a security in public assemblies from any gross personal reflection.

"Lord Bacon compares the case of deformed persons to that of eunuchs; in whom kings were wont to put great trust as good spies and whisperers; for they that are envious towards all, are more obsequious and officious towards one. But, with submission to so good a judge of human nature, I own I can discover no uncommon qualification in them for spies; and few motives to envy peculiar to themselves. Spies submit to that base and ungenerous office, either for the sake of interest or power; if for interest, it is to gratify their covetousness; if for power, their ambition or revenge; which passions are not confined to the eunuch or deformed, but indiscriminately seize all classes of men. Envy too may prompt a man to mean actions, in order to bring down the person envied to his own level; but if it is on account of superiority of fortune it will operate alike on men of all shapes. Eunuchs have but one peculiar motive to envy: but that (as Lord Bacon expresses it) makes them envious towards all; because it is for a pleasure which all but themselves may enjoy. Deformed persons are deprived only of beauty and strength, and therefore those alone are to be deemed the extraordinary motives to their envy; for they can no more be beautiful or strong than eunuchs be successful lovers. As to myself, whatever sparks of envy might be in my constitution, they are now entirely extinguished; for, by frequent and serious reflections, I have long been convinced of the small value of most things which men value the most.

"There is another passion to which deformed persons seem to be more exposed than to envy; which is jealousy: for being conscious that they are less amiable than others, they may naturally suspect that they are less beloved. I have the happiness to speak this from conjecture, and not from experience; for it was my lot, many years ago, to marry a young lady, very piously educated, and of a very distinguished family, and whose virtues are an honour to her family and her sex: so that I had never any trial of my temper, and can only guess at it by emotions I have felt in my younger days; when ladies have been more liberal of their smiles to those whom I thought, in every respect deformity, but person, my inferiors."

The most useful inference from all this to a deformed person is, to be upon his guard against those frailties to which he is more particularly exposed; and to be careful, that the outward frame do not distort the soul. Orandum est (says Juvenal), ut sit mens sana in corpore sano. "Let us pray for a sound mind in a healthy body," and every deformed person should add this petition, ut sit mens recta in corpore curvo, for "an upright mind in a crooked one." And let him frequently apply to himself this article of self-examination, Lenior et melior fis, accedente senecta? "As age approaches, do your temper and morals improve?" It is a duty peculiarly incumbent; for if beauty adds grace to virtue itself, vice must be doubly hideous in deformity.

Ridicule and contempt are a certain consequence of deformity; and therefore what a person cannot avoid, he should learn not to regard. He should bear it like a man; forgive it as a Christian; and consider it as a philosopher. And his triumph will be complete, if he can exceed others in pleasantry on himself. Wit will give over when it seems itself outdone: and so will malice when it finds it has no effect: and if a man's behaviour afford no cause of contempt, it will fall upon those who condemn him without cause.

Instead of repining, therefore, a deformed person ought to be thankful to Providence for giving him such a guard to his virtue and repose. Thousands are daily ruined by a handsome person; for beauty is a flower that every one wants to gather in its bloom, and spares no pains or stratagem to reach it. All the poetical stories concerning it have their moral. A Helen occasions war and confusion; the Hyacinths and Ganymedes are seized on for catapults; the Eudymiones and Adonises for gallants; Narcissus can admire nobody but himself, and grows old before he is cured of that passion. Who is a stranger to the story of Lucretia killing herself for her violated chastity? or of Virginia killed by her father to preserve it? In those circumstances says Juvenal, she might wish to change persons with Brutus, the only lady we know among the ancients celebrated for a blemish. The handsomest men are chosen for eunuchs and gallants; and when they are caught in exercising the last function, both (b) Horace and Juvenal inform you of the penalties and indignities they undergo. Silius (c) was converted by the insatiable Messalina into a husband; and Sporus, by the monster Nero, into a wife. The last-mentioned poet shows that praying for beauty is praying for a curse; and (d) Persius refuses to join in such a prayer: and has not the deformed person reason to thank his stars, which have placed him

DEF

Deformity, more out of danger than even virtue could be; for that could not guard a Joseph, an (E) Hippolytus, a Bellerophon, and others, against the revenge of slighted love.

Another great advantage of deformity is, that it tends to the improvement of the mind. A man that cannot shine in his person, will have recourse to his understanding; and attempt to adorn that part of him, which alone is capable of ornament. When his ambition prompts him to begin, with Cowley, to ask himself this question,

What shall I do to be for ever known?

And make the age to come my own?

on looking about him, he will find many avenues to the temple of fame barred against him; but some are still open through that of virtue; and those, if he has a right ambition, he will most probably attempt to pass. The more a man is inactive in his person, the more his mind will be at work; and the time which others spend in action, he will pass in study and contemplation: by these he may acquire wisdom; and by wisdom, fame. The name of Socrates is as much sounded as those of Alexander and Caesar; and is recorded in much fairer characters. He gained renown by wisdom and goodness; they by tyranny and oppression; he by instructing, they by destroying, mankind: and happy it is, that their evil deeds were confined to their lives; while he continues to instruct us to this day. A deformed person will naturally consider where his strength and his foible lie: and as he is well acquainted with the last, he will easily find out the first, and must know, that (if it is anywhere) it is not like Samson's, in the hair; but must be in the lining of the head. He will say to himself, "I am weak in person; unable to serve my country in the field. I can acquire no military glory; but I may, like Socrates, acquire reputation by wisdom and probity: let me therefore be wise and honest. My figure is very bad; and I should appear but ill as an orator either in the pulpit or at the bar: let me therefore pass my time in my study, either in reading what may improve myself, or in writing what may entertain or instruct others. I have not the strength of Hercules, nor can I rid the world of so many monsters: but perhaps I may get rid of some that infest myself. If I cannot draw out Cacus from his den, I may pluck the villain from my own breast. I cannot cleanse the stable of Augeas: but I may cleanse my own heart from filth and impurity: I may demolish the hydra of vices within me; and should be careful too, that while I lop off one, I do not suffer more to grow up in its stead. Let me be serviceable in any way that I can: and if I am so, it may, in some measure, be owing to my deformity; which at least should be a restraint on my conduct, lest my conduct make me more deformed."

Few persons have a house entirely to their mind; or the apartments in it disposed as they would.

And there is no deformed person, who does not wish that his soul had a better habitation; which is sometimes not lodged according to its quality. Lord Clarendon says of Sir Charles Cavendish (brother to the marquis of Newcastle), that he was a man of the noblest and largest mind, though of the least and most inconvenient body that lived. And every body knows, that the late prince of Orange had many amiable qualities. Therefore, in justice to such persons, we must suppose that they did not repine that their tenements were not in a more regular style of architecture. And let every deformed person comfort himself with reflecting, that though his soul hath not the most convenient and beautiful apartment, yet that it is habitable; that the accommodation will serve as an inn upon the road; that he is but tenant for life, or (more properly) at will; and that, while he remains in it, he is in a state to be envied by the deaf, the dumb, the lame, and the blind.

DESOSSION (Defossio), the punishment of burying alive, inflicted among the Romans on vestal virgins guilty of incontinency. It is also a custom among the Hungarians to inflict this punishment on women convicted of adultery. Heretics were also punished in this manner. See Burying Alive.

DEGENERATION, or DEGENERATING, in general, denotes the growing worse, or losing some valuable qualities whereof a thing was formerly possessed. Some naturalists have been of opinion, that things are capable of degenerating into quite a distinct species, but this is a mere chimera. All that happens in the degeneration of a plant, for instance, is the losing its usual beauty, colour, smell, &c. a circumstance entirely owing to its being planted in an improper soil, climate, &c.

DECLUTTUS, the action of swallowing. See Anatomy Index.

DEGRADATION, in our law-books called degradation and deposition, the act of depriving or stripping a person for ever of a dignity or degree of honour, and taking away the title, badge, and privileges thereof.

The degradation of a peer, a priest, a knight, a gentleman, an officer, &c. are performed with divers ceremonies. That which anciently obtained in degrading a person from his nobility is very curious. It was practised in the time of Francis I. upon Captain Fangel, who had in a cowardly manner given up Fontarabia, whereof he was governor. On this occasion, 20 or 30 cavaliers, without blemish or reproach, were assembled; before whom the gentleman was accused of treason and breach of faith by a king-at-arms. Two scaffolds were erected; the one for the judges, heralds, and pursuivants; and the other for the guilty cavalier, who was armed at all points, and his shield placed on a stake before him, reversed with the point upwards. On one side assisted 12 priests in surplices, who sung the vigils of the dead. At the close of each psalm they made a pause, during which the officers of

Degradation. arms stripped the condemned of some piece of his armour, beginning with the helmet, and proceeding thus till he was quite disarmed; which done, they broke his shins in three pieces with a hammer. Then the king-at-arms emptied a basin of hot water on the criminal's head; and the judges, putting on mourning habits, went to the church. This done, the degraded was drawn from off the scaffold with a rope tied under his arm-pits, laid on a bier, and covered with mortuary clothes; the priest singing some of the prayers for the dead; and then he was delivered to the civil judge and the executioner of justice.

For a more domestic instance: Sir Andrew Harcla, earl of Carlisle, being attendant and convicted of treason, 18 Edw. II. coram rege; after judgment was pronounced on him, his sword was broken over his head, and his spurs hewn off his heels; Sir Anthony Lucy the judge, saying to him, "Andrew, now thou art no knight but a knave." By stat. 13 Car. II. William Lord Monson, Sir Henry Mildmay, and others, were degraded from all titles of honour, dignities, and preemitions, and prohibited to bear or use the title of lord, knight, esquire, or gentlemen, arms, or armours, afterwards. It has been maintained that the king may degrade a peer; but it appears from late authorities, that he cannot be degraded but by act of parliament.

As to ecclesiastics, we have an instance of degradation before condemnation to death, in the eight century, at Constantinople. It is in the person of the patriarch Constantine, whose Constantine Copronymus caused to be executed. He was made to ascend the ambo; and the patriarch Nicetas sent some of his bishops to strip him of the pallium, and anathematized him; then they made him go out of the church backwards.

But we have a much later instance in our own history: When Cramer, archbishop of Canterbury, was degraded by order of Queen Mary, they dressed him in episcopal robes, made only of canvas, put the mitre on his head, and the pastoral staff in his hand; and in this attire showed him to the people. Which done, they made him stand up, and they did not stand so much on the ceremony of degradation in order to put the priest to death; by reason of the delays and difficulties that it would occasion. Pope Boniface pronounced that six bishops were required to degrade a priest; but the difficulty of assembling so many bishops rendered the punishment frequently impracticable. In England, a priest, after having been delivered to his ordinary, if he cannot purge himself of the crime with which he is charged, his gown and other robes are stripped over his ears by the common hangman; by which he is declared divested of his orders.

It is decided, however, that degradation does not efface the priestly character. Degradation only seems to differ from deposition in a few ignominious ceremonies which custom has added thereto. Accordingly, in the business of Armouil archbishop of Rheims, sentenced in the council of Orleans in 992, it was deliberated what form they should follow in the deposition; whether that of the canons, that is, simple deposition; or that of custom, viz. degradation. And it was declared, that he should surrender the ring, pastoral staff, and pallium, but that his robes should not be torn off. In effect, the canons prescribe no more than a mere reading of the sentence. It is the rest, therefore, added thereto by custom, viz. the stripping off the ornaments, and the tearing the pontifical vestments, that properly constitute degradation.

Degradation, in Painting, expresses the lessening the appearance of distant objects in a landscape, in the same manner as they would appear to an eye placed at that distance from them.

Degree, in Geometry, a division of a circle, including a three hundred and sixty part of its circumference.

Degree of Latitude. See Latitude.

Degree of Longitude. See Longitude.

A degree of the meridian on the surface of the globe is variously determined by various observers. Mr Picart measured a degree in the latitude of 49° 21', and found it equal to 57,060 French toises. But the French mathematicians, who have lately examined Mr Picart's operations, assure us, that the degree in that latitude is 57,183 toises. Our countryman, Mr Norwood, measured the distance between London and York, and found it 90,575.51 English feet; and finding the difference of latitudes 20° 28', determined the quantity of one degree to be 367,196 English feet, or 69 English miles and 288 yards. Mr Maupertuis measured a degree in Lapland, in the latitude of 66° 20', and found it 57,438 toises. A degree was likewise measured at the equator by other French mathematicians, and found to contain 56,767.8 toises. Whence it appears, that the earth is not a sphere, but an oblate spheroid.

Degree, in the civil and canon law, denotes an interval in kinship, by which proximity and remoteness of blood are computed. See Consanguinity and Descent.

Degrees, in Music, are the little intervals whereby the concords or harmonical intervals are composed.

Degree, in universities, denotes a quality conferred on the students or members thereof, as a testimony of their proficiency in the arts or sciences, and entitling them to certain privileges.

Dejanira. A fabulous history, daughter of Oeneus king of Ætolia, and wife to Hercules. The centaur Nessus endeavouring to ravish her, was slain by Hercules with a poisoned arrow. Nessus, when dying, gave his bloody shirt to Dejanira; assuring her, that it was a sovereign remedy to cure her husband if ever he proved unfaithful. Some time after Dejanira, thinking she had reason to suspect his fidelity, sent him the shirt; which he had no sooner put on, than he was seized with the most excruciating torments. Being unable to support his pains, he retired to Mount Oeta, and erecting a pile of wood, set fire to it, and threw himself into the flames; upon which Dejanira killed herself in despair.

Dejection, in Medicine, the act of voiding the excrements by the anus. See Anatomy, No 93.

Dejection, in Astrology, is applied to the planets when in their detriment, as astrologers speak, i. e. when they have lost their force or influence, as is prevented, by reason of their being in opposition to some others which check and counteract them. Or it is used when a planet is in a sign opposite to that in which it has its greatest effect or influence which is called.
DEI [ 126 ]

Deification, in antiquity. See Apotheosis.

Deiphon, in fabulous history, a brother of Triptolemus, son of Ceres and Metanira. When Ceres travelled over the world, she stopped at his father's court, and undertook to nurse him and bring him up. To reward the hospitality of Ceres, the goddess began to make his son immortal, and every evening she placed him on burning coals to purify him from whatever mortal particles he still possessed. The uncommon growth of Deiphon astonished Metanira, who wished to see what Ceres did to make him so vigorous. She was frightened to see her son on burning coals; and the shrieks that she uttered disturbed the mysterious operations of the goddess, and Deiphon perished in the flames.

Deiscal, in the ancient British customs, the name of a ceremony originally used in the Druidical worship, and retained in many places down to a very late period, as a civil ceremony towards persons of particular distinction. The temples of the ancient Britons were all circular; and the druids, in performing the public offices of their religion, never neglected to make three turns round the altar, accompanied by all the worshippers. This practice was so habitual to the ancient Britons, that it continued in some places many ages after the Druids and their religion were both destroyed. In the Scottish isles, the vulgar never went to the ancient sacrificing and fire-hallowing cairns, but they walk three times round them, from east to west, according to the course of the sun. This sanctified tour, or round by the south, is called deiscal, from dres or dres, "the right hand," and stil or stil, "the sun;" the right hand being never next the heaviest cairn. In the same isles it is the custom and fashion of the people to testify their respect for their chieftains, the proprietors of their several isles, and other persons of distinction, by performing the deiscal round them in the same manner. A gentleman giving an account of his reception in one of the Western islands, in which he was proprietor, describes the ceremony of the deiscal in this manner: "One of the natives would express his high esteem for my person, by making a turn round about me, sun-wise, and at the same time blessing me, and wishing me all happiness. But I bid him let alone that piece of homage, telling him I was sensible of his good meaning towards me. But this poor man was very much disappointed, as were also his neighbours; for they doubted not but this ancient ceremony would have been very acceptable to me; and one of them told me, that this was a thing due to my character from them, as to their chief and patron; and that they could not, and would not, fail to perform it."

Deism, the doctrine or belief of the deists. Deism, from Θεός, God, may properly be used to denote natural religion, as comprehending those truths which have a real foundation in reason and nature; and in this sense it is so far from being opposite to Christianity, that it is one great design of the gospel to illustrate and enforce it. Thus some of the deistical writers have affected to use it. But deism more precisely signifies that system of religion, relating both to doctrine and practice, which every man is to discover for himself by the mere force of natural reason, independent of all revelation, and exclusive of it; and this religion Dr Tindal and others pretend is so perfect, as to be incapable of receiving any addition or improvement even from divine revelation.

Deists, a class of people known also under the denomination of Free-thinkers, whose distinguishing character it is, not to profess any particular form or system of religion; but only to acknowledge the existence of a god, and to follow the light and law of nature, rejecting revelation, and opposing Christianity.

This name seems to have been first assumed as the denomination of a party about the middle of the 17th century, by some gentlemen in France and Italy, who were desirous of thus disguising their opposition to Christianity by a more honourable appellation than that of atheists. Virolet, an eminent reformer, mentions certain persons, in his epistle dedicatory prefixed to the second tome of his Instruction Chrétienne, published in 1653, who called themselves by a new name, that of Deists. These, he tells us, professed to believe in God, but showed no regard to Jesus Christ, and considered the doctrine of the apostles and evangelists as fables and dreams. He adds, that they laughed at all religion, though they outwardly conformed to the religion of those with whom they lived, or whom they wished to please, or feared to offend. Some, he observes, professed to believe the immortality of the soul; others denied both this doctrine and that of providence. Many of them were considered as persons of acute and subtle genius, and took pains in disseminating their notions.

The deists hold, that, considering the multiplicity of religions, the numerous pretences to revelation, and the preposterous arguments generally advanced in proof thereof, the best and surest way is to return to the simplicity of nature and the belief of one God; which is the only truth agreed to by all nations. They complain, that the freedom of thinking and reasoning is oppressed under the yoke of religion; and that the minds of men are ridden and tyrannized by the necessity imposed on them of believing inconceivable mysteries; and contend that nothing should be required to be assented to or believed but what their reason clearly conceives.

The distinguishing character of modern deists is, that they reject all revealed religion, and discard all pretences to it as the effects of imposture or enthusiasm. They profess a regard for natural religion, though they are far from being agreed in their notions concerning it. They are classed by some of their own writers into mortal and immortal deists: the latter acknowledging a future state; and the former denying it, or representing it as very uncertain.

Dr Clarke distinguishes two sorts of deists. 1. Those who pretend to believe the existence of an eternal, infinite, independent, intelligible Being, who made the world, without concerning himself in the government of it. 2. Those who believe the being and natural providence of God, but deny the difference of actions, as morally good or evil, resolving it into the arbitrary constitution of human laws; and therefore they suppose that God takes no notice of them. With respect to both these classes, he observes that their opinions can consistently terminate in nothing but downright atheism.
Henry Hudson, took possession of the lands on both Delaware sides the river Delaware; and as early as the year 1623 built a fort at the place, which has since been called Gloucester. In 1627, by the influence of William Useling, a respectable merchant in Sweden, a colony of Swedes and Finns came over, furnished with all the necessaries for beginning a new settlement, and landed at Cape Henlopen; at which time the Dutch had wholly quitted the country. The Dutch, however, returned in 1630, and built a fort at Lewistown, by them named Hoarkill. The following year the Swedes built a fort near Wilmington, which they called Christain or Christiana. Here also they laid out a small town, which was afterwards demolished by the Dutch. The same year they erected a fort higher up the river, upon Tenecum island, which they called Nea Guttenburgh; they also about the same time built forts at Chester, Elsinburgh, and other places. John Prinz then governed the Swedes, who, in 1634, deputed his son-in-law, John Pappoa, and returned to Sweden. Pappoa soon followed his father-in-law to his native country, and John Rysing succeeded to the government. In 1655, the Dutch, under the command of Peter Stuyvesant, arrived in Delaware river, from New Amsterdam (New York), in seven vessels, with 6 or 700 men. They dispossessed the Swedes of their forts on the river, and carried the officers and principal inhabitants prisoners to New Amsterdam, and from thence to Holland. The common people submitted to the conquerors, and remained in the country. On the first of October 1664, Sir Robert Carr obtained the submission of the Swedes on Delaware river. Four years after, Col. Nicolls, governor of New York, with his council, on the 21st of April, appointed a scout and five other persons to assist Capt. Carr in the government of the country. In 1672, the town of Newcastle was incorporated by the government of New York, to be governed by a bailiff and six assistants; after the first year, the four oldest were to leave their office, and four others to be chosen. The bailiff was president, with a double vote; the constable was chosen by the bench. They had power to try causes not exceeding 10l. without appeal. The office of scout was converted into that of sheriff, who had jurisdiction in the corporation and along the river, and was annually chosen. They were to have a free trade, without being obliged to make entry at New York, as had formerly been the practice. Wampum was at this time the principal currency of the country. Governor Lovelace of New York, by proclamation, ordered that four white grains and three black ones should pass for the value of a dollar or penny. This proclamation was published at Albany, Esopus, Delaware, Long-island, and the parts adjacent. In 1674 Charles II, by a second patent, dated June 29th, granted to his brother duke of York all that country called by the Dutch New Netherlands, of which the three counties of Newcastle, Kent, and Sussex, were a part. In 1683, the duke of York, by deed dated Aug. 24th, sold to William Penn the town of Newcastle, with the district of 12 miles round the same; and by another deed of the same date, granted to him the remainder of the territory, which till the revolution was called the Three Lower Counties. These three counties were considered as a part of Pennsylvania in matters of government.
Delaware, vermont. The same governor presided over both; but the assembly and courts of judicature were different; different as to their constituent members, but in form nearly the same. At the late revolution they became a distinct territory, called

The Delaware State. This state is bounded on the north by Pennsylvania; on the east by Delaware river and bay; on the south, by a due east and west line, from Cape Henlopen, in lat. 38. 30. to the middle of the peninsula; and on the west by Maryland. It is the smallest state; the thirteen except Rhode, its area being only 2200 square miles. The land is generally low and flat, which occasions the waters to stagnate, and subjects the inhabitants to intermittent fevers.

The Delaware state is divided into three counties, viz. Newcastle, Kent, Sussex: the chief towns of which are, Wilmington and New Castle, Dover, Milford, and Lewiston. The population of the whole state in 1810 was 72,674, including 4177 slaves. The number of free blacks was 13,136.

Three rivers, the Choptank, Nanticoke, and Pocomoke, having their sources in this state, and are navigable for vessels of 30 or 60 tons, 20 or 30 miles into the country. They all run a westerly course into Chesapeake bay. The fourth part of the state is a low flat country, and a considerable portion of it lies in forest. What is under cultivation is chiefly barren, except in Indian corn, of which it produces fine crops. In some places rye and flax may be raised, but wheat is a foreigner in these parts. Where nature is deficient in one resource, she is generally bountiful in another. This is verified in the tall thick forests of pines which are manufactured into boards, and exported in large quantities to every sea-port in the three adjoining states. As you proceed north, the soil is more fertile, and produces wheat in large quantities, which is the staple commodity of the state. They raise all the other kinds of grain common to Pennsylvania. The state has no mountain in it, except Thunder Hill, in the western part of Newcastle county, and is generally level, except some small parts, which are stony and uneven. The trade of this state is carried on almost entirely in the chief town, Wilmington, which had 9,591 tons of shipping in 1815, and contained about 5000 inhabitants. The articles exported are principally wheat, corn, and lumber.

No preference is given by law to any mode of worship. In 1814 the Presbyterians had 24 churches; the Episcopalians 14; the Quakers 8; the Baptists 7; the Methodists several. A considerable fund is appropriated by the state for the support of schools. The expense of instruction varies from 10 to 32 dollars per annum.

The value of lands and houses in this state in 1799, was 6,233,423 dollars, and in 1814 it was 13,449,370 dollars. The value of manufactures in this state in 1810 was 970,701 dollars; and the exports in 1817 amounted to 44,554 dollars. The state taxes in 1811 were stated to be 72,163 dollars.

Under the present constitution, the legislature is divided into two distinct branches, which together are styled the General Assembly of Delaware. One branch, called the House of Assembly, consists of seven representatives from each of the three counties, chosen annually by the freeholders. The other branch, called the Council, consists of nine members, three for each county, who must be more than 25 years of age, chosen illy wise by the freeholders. A rotation of members is established by displacing one member for a count the end of every year. All money bills must originate in the house of assembly, but they may be altered, amended, or rejected by the legislative council. A parent or chief magistrate is chosen by the joint lot of both houses, and continues in office three years at the expiration of which period, he is ineligible for exceeding years. If this office is vacant during the recess of the legislature, or he is unable to attend to business, the speaker of the legislative council is vice-president for the time; and in his absence the powers of the president devolve upon the speaker of the assembly. A privy council, consisting of members, two from each house, chosen by ballot constituted to assist the chief magistrate in the administration of the government. The three justices the supreme court, a judge of admiralty, and justices of the common pleas and orphans courts, appointed by the joint ballot of the president and general assembly, and commissioned by the president hold their offices during good behaviour. The president and privy council appoint the secretary, the attorney-general, register for the produce of wills, sisters in chancery, clerks of the common pleas and orphans courts, and the clerks of the peace, who hold their offices during five years, unless sooner removed for mal-conduct. The house of assembly name 24 sons in each county for justices of peace, from which number the president, with the advice of his council appoints and commissions twelve, who serve for 3 years, unless sooner dismissed for mal-administration.

The members of the legislative and privy councils, justices of the peace, and sheriffs hold their offices during good behaviour and the power of common pleas and orphans courts have power to hold chancery courts in certain cases. The clerk of the supreme court is appointed by the chief justice and the recorder of the register of deeds by the justices of the common pleas, for 5 years, unless sooner dismissed. The military and marine officers are appointed by general assembly. The court of appeals consists of seven persons: the president, who is a member, and six others, by virtue of his office, and six others, three by the legislative council, and three by the house of assembly. To this court appeals lie in the supreme court, in all matters of law and equity. The judges hold their office during good behaviour.

The justices of the several courts, the members of the privy council, secretaries, treasurers of the loan office, clerks of the common pleas, and all persons concerned in army or navy contracts, are ineligible to their house of assembly. Every member, before taking his seat, must take the oath of allegiance, and subscribe a religious test, declaring his belief in God, Father, in Jesus Christ, and the Holy Ghost; and the inspiration of the Scriptures.

The house of assembly have the privilege of impeaching delinquent officers of government; and impeachments are to be prosecuted by the attorney-general, or other persons appointed by the assembly, a trial before the legislative council. The punishment may extend to temporal or perpetual disability.
DELEGATE, in a general sense, a deputy or commissioner.

DELEGATES, commissioners appointed by the king under the great seal, to hear and determine appeals from the ecclesiastical court.

Court of DELEGATES, the great court of appeal in all ecclesiastical causes. These delegates are appointed by the king's commission under his great seal, and issuing out of chancery, to represent his royal person, and hear all appeals to him made by virtue of the statute 25 Henry VIII. c. 19. This commission is usually filled with lords spiritual and temporal, judges of the courts at Westminster, and doctors of the civil law. Appeals to Rome were always looked upon by the English nation, even in the times of Popery, with an evil eye, being contrary to the liberty of the subject, the honour of the crown, and the independence of the whole realm; and were first introduced, in very turbulent times, in the 16th year of King Stephen (A.D. 1131.), at the same period (Sir Henry Spelman observes) that the civil and canon laws were first imported into England. But in a few years after, to obviate this growing practice, the constitutions made at Clarendon, 11 Hen. II. on account of the disturbances raised by Archbishop Becket and other zealots of the holy see, expressly declare, that appeals in causes ecclesiastical ought to lie from the archdeacon to the diocesan; from the diocesan to the archbishop of the province; and from the archbishop to the king; and are not to proceed any farther without special license from the crown. But the unhappy advantage that was given in the reign of King John, and his son Hen. III. to the encroaching power of the Pope, who was ever vigilant to improve all opportunities of extending his jurisdiction to Britain, at length riveted the custom of appealing to Rome in causes ecclesiastical so strongly, that it never could be thoroughly broken off till the grand rupture happened in the reign of Hen. VIII. when all the jurisdiction usurped by the pope in matters ecclesiastical was restored to the crown, to which it originally belonged; so that the statute 25 Hen. VIII. c. 12. to all the bishops of the realm, assembled in the upper house of convocation.

DELEGATION, a commission extraordinary given by a judge to take cognisance of, and determine, some cause which ordinarily does not come before him.

DELEGATION, in Scots Law. See Law Index.

DELEN, DIRK VAN, an eminent painter of architecture and perspective, was born at Heusden, but in what year is not known. He was a disciple of Frans Hals, in whose school he practised to paint those particular subjects which were most esteemed by that master, such as portraits and conversations; and by that means he acquired the skill to design figures with a great deal of spirit and correctness. But his predominant inclination directed him to paint architecture and perspective; and these he studied with so much care, as to make his works admired and coveted through the Low Countries. His subjects were the insides of churches, filled with figures; grand temples; magnificent saloons and galleries, with people assembled at concerts of music, feasting, or dancing. Those subjects he finished highly; his architecture was in a noble taste; and the figures were well designed, as well as grouped with a great deal of judgment. Several authors mention the performances of this master with large commendation, for the goodness of his invention, and neatness of his handling.

DELETEROUS, an appellation given to things of a destructive or poisonous nature. See Poison.

DELT, a town of the United Provinces, and capital of Delfland in Holland. It is a pretty large place, very clean and well built, with canals in the streets, planted on each side with trees. The public buildings, especially the town-house, are very magnificent. Here are two churches; in one is the tomb of the prince of Orange, who was assassinated; and in the other, that of Admiral Tromp. It has a fine arsenal, well furnished; is about two miles in circumference, and is defended against inundations by three dams or dikes. Here is made a prodigious quantity of fine earthen-ware called delft-ware; but the trade is on the decline since extensive potteries were established in England and Germany. It is pleasantly situated among the meadows on the river Shie, in E. Long. 4. 13. N. Lat. 52. 6.

DELF-WARE, a kind of pottery of baked earth, covered with an enamel or white glazing, which gives it the appearance and neatness of porcelain. Some kinds of this enamelled pottery differ much from others, either in their sustaining sudden heat without breaking, or in the beauty and regularity of their forms, of their enamel, and of the painting with which they are ornamented. In general, the fine and beautiful enamelled potteries, which approach the nearest to porcelain in external appearance, are, at the same time, those which least resist a brisk fire. Again, those which sustain a sudden heat, are coarse, and resemble common porcelain.

The basis of this pottery is clay, which is to be mixed, when too fat, with such a quantity of sand, that the earth shall preserve enough of its ductility to be worked, moulded, and turned easily; and yet that its firmness shall be sufficiently taken from it, that it may not crack or shrink too much in drying or in baking. Vessels formed of this earth must be dried very gently to avoid cracking. They are then to be placed in a furnace to receive a slight baking, which is only meant to give them a certain consistence or hardness. And, lastly, they are to be covered with an enamel or glazing, which is done, by putting upon the vessels thus prepared the enamel, which has been ground very fine, and diluted with water.

As vessels on which the enamel is applied are but slightly baked, they readily imbibe the water in which the enamel is suspended, and a layer of the enamel adheres to their surface; these vessels may then be painted with colours composed of metallic calces, mixed and ground with a fusible glass. When they are become perfectly dry, they are to be placed in the furnace, included in cases of baked earth called seggas, and exposed...
Delia, in antiquity, a festival celebrated every fifth year in the island of Delos, in honour of Apollo. It was first instituted by Theseus, who at his return from Crete placed a statue there, which he had received from Ariadne. At the celebration they crowned the statue of the gods with garlands, appointed a choir of music, and exhibited horse-races. They afterwards led a dance, in which they imitated by their motions the various windings of the Cretan labyrinth, from which Theseus had extricated himself by Ariadne’s assistance. There was another festival of the same name yearly celebrated by the Athenians in Delos. It also was instituted by Theseus, who, when he was going to Crete, made a vow, that if he returned victorious, he would yearly visit in a solemn manner the temple of Delos. The persons employed in this annual procession were called Deliaste and Theori. The ship, the same which carried Theseus, and had been carefully preserved by the Athenians, was called Theoria and Delia. When the ship was ready for the voyage, the priest of Apollo solemnly adorned the stern with garlands, and an universal lustration was made all over the city. The Theori were crowned with laurels, and before them proceeded men armed with axes, in commemoration of Theseus, who had cleared the way from Troy to Athens, and delivered the country from robbers. When the ship arrived at Delos, they offered solemn sacrifices to the gods of the island, and celebrated a festival to his honour. After this they retired to their ship, and sailed back to Athens, where all the people of the city ran in crowds to meet them. Every appearance of festivity prevailed at their approach, and the citizens opened their doors, and prostrated themselves before the Deliaste as they walked in procession. During this festival it was unlawful to put to death any malefactor, and on that account the life of Socrates was prolonged for 30 days.

Delia, a surname of Diana, because she was born in Delos.

Deliac, (Deliacus), among the ancients, denoted a polter, or a person who sold fowls, fatted ca
pons, &c. The traders in this way were called Deliaci; the people of the isle of Delos first practised this occupation. They also sold eggs, as appears from Cicero, in his Academic Questions, lib. iv. Pliny, lib. x. cap. 30. and Columella, lib. viii. cap. 8. likewise mention the Deliaci.

Deliacal problem, a celebrated problem among the ancients, concerning the duplication of the cube.

Delibamenta, in antiquity, a libation to the infernal gods, always offered by pouring downwards. See Libation.

Jus Deliberandi. See Law Index.

Deliberative, an appellation given to a kind or branch of rhetoric, employed in proving a thing, or convincing an assembly thereof, in order to persuade them to put it in execution.

To have a deliberative voice in the assembly, is when a person has a right to give his advice and his vote therein. In councils, the bishops have deliberative
live voices; those beneath them have only consultative voices.

DELI,CT, in Scotia Law, signifies such small offences or breaches of the peace as are punishable only by fine or short imprisonment.

DELLLE, JACQUES, an eminent French poet. See Supplement.

DELINQUENT, a guilty person, or one who has committed some fault or offence for which he is punishable. See BRITAIN, No. 97.

DELICUENCE, in Chemistry, signifies the property which certain bodies have of attracting moisture from the air, and becoming liquid thereby. This property is never found but in saline substances, or matters containing them. It is caused by the great affinity which these substances have for water. The more simple they are, according to Mr Macquer, the more they incline to deliquescence. Hesec acids, and certain alkalis, which are the most simple, are also the most deliquescient salts. Mineral acids are so deliquescent, that the strongly imbibe moisture from the air, even though they are already mixed with a sufficient quantity of water to be fluid. For this purpose, it is sufficient that they be concentrated only to a certain degree.—Many neutral salts are deliquescent, chiefly those whose bases are not saline substances. Salts formed by the vitriolic acid, with fixed or volatile alkalies, earths, or most metallic substances, are not deliquescent; although this acid is the strongest of all, and, when disengaged, attracts the moisture of the air most powerfully.

Though the immediate cause of deliquescence is the attraction of the moisture of the air, as we have already observed; yet it remains to be shown why some salts attract this moisture powerfully, and others, though seemingly equally simple, do not attract it at all. The vegetable alkali, for instance, attracts moisture powerfully; the mineral alkali, though to appearance equally simple, does not attract it at all. The acid of tartar by itself does not attract the moisture of the air; but if mixed with borax, which has a little attraction for moisture, the mixture is exceedingly deliquescent. Some theories have been suggested, in order to account for these and other similar facts; but we are as yet too little acquainted with the nature of the atmosphere to form certain conclusions on the subject.

DELICUIUM, or DELICUUM ANIMI (from delinquo, "I swoon"), a swooning or fainting away: called also syncope, hypophymia, hypophysia, cyselias, and asphyxia.

DELICUIUM (from deliquesc, "to be dissolved"), in Chemistry, is the dissolution or melting of a salt by suspending it in a moist cellair.

Salt of tartar, or any fixed alkali, set in a cellair or other cool moist place, and in an open vessel, resolves or runs into a kind of liquor called by the older chemists oil of tartar per deliquium.

DELIRIUM (from deirio, "to rave or talk idly"). When the ideas excited in the mind do not correspond to the external objects, but are produced by the change induced on the common sensory, the patient is said to be delirious. See MEDICINE Index.

DELIVERY, or CHILD-BIRTH. See MIDWIFERY.

DELL, or DELHI, a city and province in Hindostan. The city was once the capital of the empire. The road between it and Agra, the other capital, is that famous alley or walk planted with trees by Jehin Ghir, and 150 leagues in length. Each half league is marked with a kind of turret; and at every stage there are little sarays or caravanseras for the benefit of travellers. The road, though pretty good, has many inconveniences. It is not only frequented by wild beasts, but by robbers. The latter are so dexterous at casting a noose about a man's neck, that they never fail, if within reach, to seize and strangle him. They gain their point likewise by means of handsome women; who, feigning great distress, and being taken up behind the unwary traveller, choke him with the same durance.—The capital consists of three cities, built near one another. The first, now quite destroyed, is said to have had 52 gates; and to have been the residence of King Porus, conquered by Alexander the Great. The second, which is also in ruins, was demolished by Shah Jehan, to build Jehan-abad with the materials. This makes the third city, and joins the ruins of the second. This city stands in an open plain country, on the river Jamna, which rises in this province. It is encompassed with walls, except towards the river. These are of brick, flanked with round towers; but without a ditch, and terraced behind, four or five feet thick. The circumference of the walls may be about nine miles. The fortress, which is a mile and a half circuit, has good walls and round towers, and ditches full of water, faced with stone. It is surrounded with fine gardens, and in it is the Mogul's palace. See INDOSTAN. E. Long. 77. 25. N. Lat. 28. 20.

DELMENHORST, a strong town of Germany, in Westphalia, and now united to the grand duchy of Osnabrug, seated on the river Delm, near the Weser. E. Long. 8. 37. N. Lat. 53. 10.

DELOS, an island of the Archipelago, very famous in ancient history. Originally it is said to have been a floating island, but afterwards it became fixed and immovable. It was held sacred on account of its being the birth-place of Apollo and Diana.—Anciently this island was governed by its own kings. Virgil mentions the Amus reigning here in the time of the Trojan war. He was, according to that poet, both king and high-priest of Apollo, and entertained Xenias with great kindness. The Persians allowed the Delians to enjoy their ancient liberties, after they had reduced the rest of the Grecian islands. In after ages, the Athenians made themselves masters of it; and held it till they were driven out by Mithridates the Great, who plundered the rich temple of Apollo, and obliged the Delians to side with him. Mithridates was in his turn driven out by the Romans, who granted the inhabitants many privileges, and exempted them from all sorts of taxes. At present it is quite abandoned; the lands being covered with ruins and rubbish in such a manner as to be quite incapable of cultivation. The inhabitants of Mycone hold it now, and pay but ten crowns land tax to the Grand Signor for an island which was once one of the richest in the world.—Strabo and Callimachus tells us that the island of Delos was watered by the river Inopus: but Plian calls it only a spring; and adds, that its waters swelled and abated at the same time with those of the Nile. At present there is no river in the island, but one of the noblest springs
springs in the world; being twelve paces in diameter, and inclosed partly by rocks, and partly by a wall. Mount Cynthius, whence Apollo had the surname of Cynthius, is by Strabo placed near the city, and said to be so high, that the whole island was covered by its shadow; but our modern travellers speak of it as a hill of a very moderate height. It is but one block of granite of the ordinary sort, cut on that side which faced the city into regular steps, and inclosed on both sides by a wall. On the top of the mountain are still to be seen the remains of a stately building, with a mosaic pavement, many broken pillars, and other valuable monuments of antiquity. From an inscription discovered there some time ago, and which mention a vow made to Serapis, Isis, and Anubis, some have conjectured, that on this hill stood a temple dedicated to these Egyptian deities, though nowhere mentioned in history. The city of Delos, as is manifest from the magnificent ruins still extant, took up that spacious plain reaching from one end to the other. It was well peopled, and the richest city in the Archipelago, especially after the destruction of Corinth; merchants flocking thither from all parts, both in regard of the immunity they enjoyed there, and of the convenient situation of the place between Europe and Asia. Strabo calls it one of the most frequented empories in the world; and Pliny tells us, that all the commodities of Europe and Asia were sold, purchased, or exchanged, there. It contained many noble and stately buildings; as the temples of Apollo, Diana, and Latona; the porticoes of Philip of Macedon, and Dionysius Eutyches; a gymnasion; an oval basin made at an immense expense, for the representation of sea-fights; and a most magnificent theatre. The temple of Apollo was, according to Plutarch, begun by Erysichthon the son of Cecrops; but afterwards enlarged and embellished at the common charge of all the states of Greece. Plutarch tells us, that it was one of the most stately buildings in the universe; and speaks of an altar in it, which, in his opinion, deserved a place among the wonders of the world. It was built with the horns of various animals, so artificially adapted to one another that they hanged together without any cement. This altar is said to have been a perfect cube; and the doubting it was a famous mathematical problem among the ancients. This went under the name of Problema Delitacum; and is said to have been proposed by the oracle, for the purpose of freeing the country from a plague. The diaster was to cease when the problem was solved. The trunk of the famous statue of Apollo, mentioned by Strabo and Pliny, is still an object of great admiration to travellers. It is without head, feet, arms, or legs; but from the parts that are yet remaining, it plainly appears, that the ancients did not exaggerate when they commended it as a wonder of art. It was of gigantic size, though cut out of a single block of marble; the shoulders being six feet broad, and the thighs nine feet round. At a small distance from this statue lies, amongst confused heaps of broken columns, architraves, bases, chaplets, &c. a square piece of marble 15 feet long, ten feet nine inches broad, and two feet three inches thick; which undoubtedly served as a pedestal for this colossal. It bears in very fair characters this inscription in Greek, "The Naxians to Apollo." Plutarch tells us, in the life of Nicias, that he caused to be set up, near the temple of Delos, an huge palm-tree of brass, which he consecrated to Apollo; and adds, that a violent storm of wind threw down this tree on a colossal statue raised by the inhabitants of Naxos. Round the temple were magnificent porticoes built at the charge of various princes, as appears from inscriptions which are still very plain. The names of Philip king of Macedon, Dionysius Eutyches, Mithrdates Eupator, kings of Pontus, and Nicomedes king of Bithynia, are found on several pedestals. To this temple the inhabitants of the neighbouring islands sent yearly a company of virgins to celebrate, with dancing, the festival of Apollo and his sister Diana, and to make offerings in the name of their respective cities.

So very sacred was the island of Delos held by the ancients, that no hostilities were practised here, even by the nations that were at war with one another, when they happened to meet in this place. Of this Lilybaeum gives an instance. He tells us, that some Roman deputies were obliged to put in at Delos, in their voyage to Syria and Egypt, found the galleys of Perruc king of Macedon, and those of Eucmenes king of Pergamus, anchored in the same harbour, though these two princes were then making war upon one another.

Hence this island was a general asylum, and the protection extended to all kinds of living creatures; for this reason it abounded with hares, no dogs being suffered to enter it. No dead body was suffered to be buried in it, nor was any woman suffered to lie in there; all dying persons, and women ready to be delivered, were carried over to the neighbouring island of Rhenea.

DELPHI, in Ancient Geography, a town of Phocis, situated on the south-west extremity of Mount Parnassus. It was famous for a temple and oracle of that god, of which the following was said to be the origin: A number of goats that were feeding on Mount Parnassus, came near a place which had a deep and long perforation. The steam which issued from the hole seemed to stir up the goats, and they played and frolicked about in such an uncommon manner, that the goat-herd was tempted to lean on the hole, and see what mysteries the place contained. He was immediately seized with a fit of enthusiasm, his expressions were wild and extravagant, and passed for prophecies. This circumstance was soon known about the country, and many experienced the same enthusiastic inspiration. The place was revered; a temple was soon after erected in honour of Apollo; and a city built, which became the chief and most illustrious in Phocis. The influence of its god has controlled the councils of states, directed the course of armies, and decided the fate of kingdoms. The ancient history of Greece is full of his energy, and an early register of his authority. The circumjacent cities were the stewards and guardians of the god. Their deputies composed the famous Amphictyonic assembly, which once guided Greece.

The temple of Apollo, it is related, was at first a kind of cottage covered with boughs of laurel; but he was early provided with a better habitation. An edifice of stone was erected by Tropoionus and Agamedes, which subsisted about 700 years, and was burned in the year 636 after the taking of Troy, and 548 before Christ. It is mentioned in the hymn to Apollo ascribed.
Delphi, ascribed to Homer. An opulent and illustrious family, called Aetomenidae, which fled from Athens and the tyrant Hippias, contracted with the deputies for the building of a new temple, and exceeded their agreement. The front was raised with Parian marble, instead of the stone called Poros; which resembled it in whiteness, but was not so heavy. A Corinthian was the architect. The pediments were adorned with Diana, and Latona, and Apollo, and the Muses; the setting of Phoebus or the sun; with Bacchus, and the women called Thydades. The architraves were decorated with golden armour; bucklers suspended by the Athenians after the battle of Marathon, and shields taken from the Gauls under Brennius. In the portico were inscribed the celebrated maxims of the seven sages of Greece. There was an image of Homer, and in the cell was an altar of Neptune, with statues of the Fates, and of Jupiter and Apollo, who were surnamed Leaders of the Fates. Near the hearth, before the altar at which Neoptolemus the son of Achilles was slain by a priest, stood the iron chair of Pindar. In the sanctuary was an image of Apollo gilded. The enclosure was of great extent, and filled with treasures, in which many cities had consecrated tenth of spoil taken in war, and with the public donations of renowned states in various ages. It was the grand repository of ancient Greece, in which the labours of the sculptor and statuary, gods, heroes, and illustrious personages, were seen collected and arranged: the inequalities of the area of acclivity contributing to a full display of the noble assemblage.

The oracles were delivered by a priestess called Pythia, who received the prophetic influence in the following manner. A lofty tripod, decked with laurel, was placed over the aperture, whence the sacred vapour issued. The priestess, after washing her body and especially her hair, in the cold water of Castalia, mounted on it, to receive the divine effluvia. She wore a crown of laurel, and shook a sacred tree, which grew by. Sometimes she chewed the leaves; and the frenzy which followed may with probability be attributed to this usage, and the gentler or more violent symptoms to the sanctity taken. In one instance the paroxysm was so terrible, that the priests and supplicants ran away, and left her alone to expire, it was believed, of the god. Her part was unpleasant; but, if she declined acting, they dragged her by force to the tripod. The habit of her order was that of virgins. The rules enjoined temperance and chastity, and prohibited luxury in apparel. The season of inquiry was in the spring, during the month called Bulsius; after which Apollo was supposed to visit the altars of the Hyperboreans.

The city of Delphi arose in the form of a theatre, upon the winding declivity of Parnassus, whose fantastic tops overshadowed it, like a canopy, on the north, while two immense rocks rendered it inaccessible on the east and west, and the rugged and shapeless Mount Cipris defended it on the south. The foot of the last named mountain was washed by the rapid Plistus, which discharged itself into the sea at the distance of only a few leagues from the sacred city. This inaccessible and romantic situation, from which the place derived the name of Delphi (signifying, as explained in the glossaries, solitary, alone), was rendered still more striking, by the innumerable echoes which multiplied every sound, and increased the ignorant veneration of visitants for the god of the oracle. The artful ministers of Apollo gradually collected such objects in the groves and temple as were fitted to astonish the senses of the admiring multitude. The splendour of marble, the magic of painting, the invaluable statues of gold and silver, represented (to use the language of antiquity) not the resemblance of an earthly habitation, but rather expressed the image of Olympus, adorned and enlightened by the actual presence of the gods.

The protection and superintendence of this precious depository of riches and superstition belonged to the Amphictyons, as already noticed. But the inhabitants of Delphi, who, if we may use the expression, were the original proprietors of the oracles, always continued to direct the religious ceremonies, and to conduct the important business of prophecy. It was their province alone to determine at what time, and on what occasion, the Pythia should sit on the sacred tripod, to receive the prophetic steams by which she communicated with Apollo. When overloading with the heavenly inspiration, she uttered the confused words, or rather frantic sounds, irregularly suggested by the impulse of the god; the Delphians collected these sounds, reduced them into order, animating them with sense, and adorned them with harmony. The Pythia, appointed and dismissed at pleasure, was a mere instrument in the hands of those artful ministers, whose character became so venerable and sacred, that they were finally regarded, not merely as attendants and worshippers, but as the peculiar family of the god. Their number was considerable, and never exactly ascertained, since all the principal inhabitants of Delphi, claiming an immediate relation to Apollo, were entitled to officiate in the rites of his sanctuary; and even the inferior ranks belonging to that sacred city were continually employed in dances, festivals, processions, and in displaying all the gay pageantry of an airy and elegant superstition.

Delphi was conveniently situated for the confluence of notaries, lying in the centre of Greece, and as was then imagined, of the universe. It was customary for those who consulted the oracle to make rich presents to the god: his servants and priests feasted on the numerous victims which were sacrificed to him; and the rich magnificence of his temple had become proverbial even in the age of Homer. In after times, Creesus, the wealthiest of monarchs, was particularly munificent in his donations. This sacred repository of opulence was therefore often the object of plunder. Neoptolemus was slain, while sacrificing, on suspicion of a design of that kind. Xerxes divided his army at Panopeus and proceeded with the main body through Boeotia into Attica, while a party keeping Parnassus on the right, advanced along Schiste to Delphi; but was taken with a panic when near Eium, and fled. This monarch, it is related, was as well apprised of the contents of the temple, and the sumptuous offerings of Halyattes and Creesus, as of the effects which he had left behind in his own palace. The divine hoard was seized by the Phocians under Philomelus, and dissipated in a long war with the Amphictyons. The Gauls experienced a reception like that of the Persians, and mani-
DELPHINUS, or DOLPHIN, a genus of fish belonging to the order of Cetacea. See CETACEA INDEX.

DELPHINUS, in Astronomy, a constellation of the northern hemisphere; whose stars in Ptolemy's catalogue are 10; in Tycho's the same number; in Halley's 14; and in Flamsteed's 18.

DELFPHOS, a town, or rather village, of Tarsus, in Asia, in the province of Libyad; occupies part of the site of the ancient Delphi. See DELPHI.

A late traveller informs us, that some vestiges of temples are visible; and above them in the mountaine side, are sepulchres, niches, and horizontal cavities in the body, some covered with slabs. Farther on is a niche cut in the rock with a seat, intended, it seems, for the accommodation of travellers weary with a rugged track and the long ascent. The monastery is on the site of the gymnasium. Strong terraces and other traces of a large edifice remain. The village is at a distance. Castalia is on the right hand as you ascend to it, the water coming from on high and closing the road; a steep precipice, above which the mountain still rises immensely, continuing on in the same direction. The village consists of a few poor cottages of Albanians covering the site of the temple and oracle. Beneath it to the south is a church of St. Elias, with areas, terrace-walls, arches, and vestiges of the buildings once within the court. The concavity of the rock in this part gave to the site the resemblance of a theatre. Turning to the left hand, as it was toward the extremity of one of the wings, you come again to sepulchres hewn in the rock, and to a semicircular recess or niche with a seat on the other side. Higher up than the village, is the hollow of the stadium, which were some seats and scattered fragments.

Higher up, within the village, is a piece of an ancient wall, concealed from view by a shed, which it supports. The stone is brown, rough, and ordinaries, probably that of Parnassus. On the south side are many inscriptions, with wide gaps between the letters which are negligently and faintly cut; all nearly of the same tenor, and very difficult to copy. They register the purchase of slaves who had entrusted the price of their freedom to the god; containing the contract between Apollo and their owners, witnessed by the priests and by some of the archons. This remnant seems to be part of the wall before Cassotis; as above it is still a fountain, which supplies the village with excellent water.

The water of Castalia in the neighbourhood, from which the Pythia, and the poets who versified here, were believed to derive a large share of the inspiration, descends through a cleft of Parnassus; the rock on each side high and steep, ending in two summits; of which one was called Hyampetus, and beneath it the sacred portion of Autonous, a local hero, as distinguished as Phylacus. From this precipice the Delphians threw down the famous Aesop. By the stream within the cleft, are seen small broken stones leading to a cavity in which is water, and once perhaps haps up to the top. Grooves have been cut, and the marks of tools are visible on the rock; but the current, instead of supplying a fountain, now passes over its native bed, and hastens down a course deep enough to join the Plitus. Close by, at the foot of the estate precipice...
DELPHOS, Deluge.

precipice, is a basin with steps on the margin, once, it is likely, the bath used by the Pythia. Above, in the side of the mountain, is a pretty church dedicated to St John, within which are excavations resembling niches, partly concealed from view by a tree.

DELTA, is a part of Lower Egypt, which takes up a considerable space of ground between the branches of the Nile and the Mediterranean sea: the ancients called it the isle of Delta, because it is in the shape of a triangle, like the Greek letter of that name. It is about 130 miles along the coast from Damietta to Alexandria, and 90 on the side from the place where the Nile begins to divide itself. It is the most plentiful country in all Egypt, and it rains more there than in other parts, but the fertility is chiefly owing to the inundation of the river Nile. The principal towns on the coast are Damietta, Rosetta, and Alexandria; but, within land, Menouzia, and Maala or Emala.

DELTIOIDES, in Anatomy. See Anatomy, Table of the Muscles.

DELUGE, an inundation or overflowing of the earth, either wholly or in part, by water.

We have several deluges recorded in history; as that of Ogyges, which overflowed almost all Attica; and that of Deucalion, who drowned all Thessaly in Greece; but the most memorable was that called the Universal Deluge, or Noah's Flood, which overflowed and destroyed the whole earth; and from which only Noah, and those with him in the ark, escaped.

This flood makes one of the most considerable epochs in chronology. Its history is given by Moses, Gen. ch. vi. and vii. Its time is fixed, by the best chronologers, to the year from the creation 1656, answering to the year before Christ 2293. From this flood, the state of the world is divided into diatessaron and antediluvian. See Antediluvians.

Among the many testimonies of the truth of this part of the Mosaic history, we may account the general voice of mankind at all times, and in all parts of the world. The objections of the free-thinkers have indeed principally turned upon three points, viz. 1. The want of any direct history of that event by the profane writers of antiquity; 2. The apparent impossibility of accounting for the quantity of water necessary to overflow the whole earth to such a depth as it is said to have been: and, 3. There appearing no necessity for an universal deluge, as the same might have been accomplished by a partial one.

I. The former of these objections has given rise to several very elaborate treatises, though all that has yet been done in this way has scarcely been able to silence the objectors. Mr Bryant, in his system of Mythology, has with great learning and considerable success endeavoured to show, that the deluge was one of the principal, if not the only foundation of the Gentile worship; that the first of their deities was Noah; that all nations of the world look up to him as their founder; and that he, his sons, and the first patriarchs, are alluded to in most if not all of the religious ceremonies, not only of the ancient but of the modern heathens.

In short, according to this author, the deluge, so far from being forgot, or obscurely mentioned by the heathen world, is in reality conspicuous throughout every one of their acts of religious worship.

The Egyptian Osiris, according to him, was the same with Ham the son of Noah, though the name was sometimes bestowed on Noah himself. That this is the case, is evident, he thinks, from its being said that he was exposed in the ark, and afterwards restored to day: that he planted the vine, taught mankind agriculture, and inculcated upon them the maxims of religion and justice. Something of the same kind is related of Perseus. He is represented by some ancient historians as a great astronomer, and well versed in other sciences. After being conceived in a shower of gold, he was exposed in an ark upon the waters, and is said to have had no renewal of life. —The history of Myrina the Amazon affords a kind of abridgement and mixture of the histories of Osiris and Perseus. Similar to these is the history of Hercules himself. But our author observes, that under the titles of Osiris, Perseus, Myrina, &c. the ancients spoke of the exploits of a whole nation, who were no other than the Cushites or Cushites, the descendants of Cush the son of Ham and father of Nimrod. These people spread themselves into the most remote corners of the globe; and hence the heroes whom they represented are always set forth as conquering the whole world.—According to Diodorus Siculus, the Egyptian Osiris was the same with the Dionysus of the Greeks. He is said to have been twice born, and to have had two fathers and two mothers; to have been wonderfully preserved in an ark; to have travelled all over the earth; taught the use of the vine, to build, plant, &c. The Indians claim him as a native of their country, though some allow that he came from the west. Of Cronus and Astarte, it is said that they went over the whole earth, disposing of the countries as they pleased, and doing good where they came. The same is related of Ouranos, Themis, Apollo, &c. though all their exploits are said to have been the effects of conquest, and their benevolence enforced by the sword. In a similar manner he explains the histories of other heroes of antiquity; and having thus, in the characters and history of the most celebrated personages, found traces of the history of Noah and his family, our author proceeds to inquire into the memories of the deluge itself, to be met with in the history or religious rites of the different nations of antiquity.

"We may reasonably suppose (says he), that the particulars of this extraordinary event would be commemorated by the patriarch himself, and deluge to transmitted to every branch of his family; that they were made the subject of domestic converse, where the history was often renewed, and ever attended with a reverential awe and horror, especially in those who had been witnesses to the calamity, and had experienced the hand of Providence in their favour. In process of time, when there was a falling off from the truth, we might further expect, that a person of so high a character as Noah, so particularly distinguished by the Deity, could not fail of being reverenced by his posterity, and when idolatry prevailed, that he would be one of the first among the sons of men whom divine honours would be paid. Lastly, we must conclude, that these memorials would be interwoven in the mythology of the Gentile world; and that there would be continual allusions to these ancient occurrences in the rites and mysteries as they were practiced by the nations of the earth. In conformity to these
Deluge.

these suppositions, I shall endeavor to shew that these things did happen; that the history of the deluge was religiously preserved in the first ages; that every circumstance of it is to be met with among the historians and mythologists of different countries: and traces of it are to be found, particularly in the sacred rites of Egypt and of Greece.

5

It will appear from many circumstances in the more ancient writers, that the great patriarch was highly reverenced by his posterity. They looked up to him as a person highly favoured by heaven; and honored him with many titles, each of which had a reference to some particular part of his history. They styled him Prometheus, Deucalion, Atlas, Theuth, Zuth, Xuthus, Inachus, Osiris. When there began to be a tendency towards idolatry, and the adoration of the sun was introduced by the posterity of Ham, the title of Helius, among others, was conferred upon him. They called him also Map and Map, which is the moon. When colonies went abroad, many took to themselves the title of Minyades and Minyae from him; just as others were denominated Achaeomedes, Aurita, Helius, from the sqm. People of the former name are to be found in Arabia and in other parts of the world. The natives at Orchomenos were styled Minyae, as were some of the inhabitants of Theassy. Noah was the original Zeus and Dion. He was the plenter of the vine, and inventor of fermented liquors: whence he was denominated Zeus, which signifies ferment, rendered Zeus by the Greeks. He was also called Dionysus, interpreted by the Latins Bacchus, but very improperly. Bacchus was Chus, the grandson of Noah; as Ammon may in general be esteemed Ham, so much reverenced by the Egyptians.

Among the people of the east, the true name of the patriarch was preserved; they called him Noas, Noas, and sometimescontracted Noas; and many pieces of sanctity, as well as rivers, were denominated from him. Anaxagoras of Clazomenae had obtained some knowledge of him in Egypt. By him the patriarch was denominated Noas or Nous; and both he and his disciples were sensible that this was a foreign appellation; notwithstanding which, he has acted as if it had been a term of the Greek language. Eusebius informs us, that the disciples of Anaxagoras say, that Nous is, by interpretation, the deity Dis or Dios; and they likewise esteem Nous the same as Prometheus, because he was the renewer of mankind, and was said to have fashioned them again, after they had been in a manner extinct. After this, however, he gives a solution of the story, upon the supposition that Nous is the same with the Greek word μω, the mind: that the mind was Prometheus; and Prometheus was said to renew mankind, from new forming their minds, and leading them, by cultivation, from ignorance.

Suidas has preserved, from some ancient author, a curious memorial of this wonderful personage, whom he affects to distinguish from Deucalion, and styles Nannacus. According to him, this Nannacus was a person of great antiquity, and prior to the time of Deucalion. He is said to have been a king, who foreseeing the approaching deluge, collected every body together, and led them to a temple, where he offered up his prayers for them, accompanied with many tears. There is likewise a proverbial expression about Nannacus applied to people of great antiquity.

"Stephanus gives great light to this history, and supplies many deficiencies. 'The tradition (says he), that there was one formerly named Ananus, the extent of whose life was above 300 years. The people who were of his neighbourhood and acquaintance had inquired of an oracle how long he was to live; and there was an answer given, that when Ananus died, all mankind would be destroyed. The Phrygians, upon this account, made great lamentations, from whence arose the proverb τό τις Ανάνακος, τό λατεντάτον τοίς Ανάνακος, made use of for people in circumstances highly calamitous. When the flood of Deucalion came, all mankind were destroyed, according as the oracle had foretold. Afterwards, when the surface of the earth began to be again dry, Zeus ordered Prometheus and Minerva to make images of clay in the form of men; and, when they were finished, he called the winds, and made them breathe into each, and render them vital."

From these histories Mr Bryant concludes as follows: "However the story may have been varied, the principal outlines plainly point out the person who is alluded to in these histories. It is, I think, manifest, that Ananus, and Nannacus, and even Inachus, relate to Noah or Noah. And not only these, but the histories of Deucalion and Prometheus have a like reference to the patriarch; in the 600th year, in the 600th year, the 600th year, and not the 300th, of whose life the waters prevailed upon the earth. He was the father of mankind, who were renewed in him. Hence he is represented by another author, under the character of Prometheus, as a great artist, by whom men were formed anew, and were instructed in all that was good.

"Noah was the original Cronus and Zeus; though the latter is a title conferred sometimes upon his son Ham. There is a very particular expression recorded by Clemens of Alexandria, and attributed to Pythagoras, who is said to have called the sea the teos of Cronus; and there was a farther tradition concerning this person, that he drank, or swallowed up all his children. The tears of Isis are represented as very mysterious. They are said to have flowed whenever the Nile began to rise, and to flood the country. —The overflowing of that river was the great source of affluence to the people, and they looked upon it as their chief blessing; yet it was ever attended with mystical tears and lamentations. This was particularly observed at Coptos, where the principal deity was Isis. An ancient writer imagines that the tears and lamentations of the people were to implore an inundation; and the tears of Isis were supposed to make the river swell. But all this was certainly said and done in memorial of a former flood, of which they made the overflowing of the Nile a type."

"As the patriarch was by some represented as a king called Noachus or Nenochus; so by others he was styled Inachus, and supposed to have reigned at Argos. Hence Inachus was made a king of Greece; and Phoroneus and Apis brought in succession after him. But Inachus was not a name of Grecian original; it is mentioned by Eusebius, in his account of the first ages,
Deluge. ages, that there reigned in Egypt Telegenus a prince of foreign extraction, who was the son of Ones the shepherd, and the seventh in descent from Inachus. And in the same author we read, that a colony went forth from that country into Syria, where they founded the ancient city of Antioch; and that they were conducted by Casus and Belus, who were sons of Inachus. By Inachus is certainly meant Noah; and the history relates to some of the more early descendants of the patriarch. His name has been rendered very unlike itself, by having been lengthened with terminations, and likewise fashioned according to the idiom of different languages. But the circumstances of the history are so precise and particular, that we cannot miss of the truth.

"He seems in the east to have been called Noa, Nosa, Nusa, and Nus; and by the Greeks his name was compounded Dionusus. The Ammonians, wherever they came, founded cities to his honour; hence places called Nusa, will often occur; and indeed a great many of them are mentioned by ancient authors. These, though widely distant, being situated in countries far removed, yet retained the same original histories; and were generally famous for the plantation of the vine. Misled by this similarity of traditions, people in after times imagined that Dionusus must necessarily have been where his history occurred; and as it was the turn of the Greeks to place every thing to the account of conquest, they made him a great conqueror, who went over the face of the whole earth, and taught mankind the plantation of the vine. We are informed, that Dionusus went with an army over the face of the whole earth, and taught mankind, as he passed along, the method of planting the vine, and how to press out the juice, and receive it in proper vessels. Though the patriarch is represented under various titles, and even these not always uniformly appropriated; yet there will continually occur such peculiar circumstances of his history as will plainly point out the person referred to. The person preserved is always mentioned as preserved in an ark. He is described as being in a state of darkness, which is represented allegorically as a state of death. He then obtained a new life, which is called a second birth; and is said to have his youth renewed. He is, on this account, looked upon as the first-born of mankind; and both his antediluvian and postdiluvian states are commemorated, and sometimes the intermediate state is also spoken of. Diodorus calls him Deucalion; but describes the deluge as in a manner universal. 'In the deluge which happened in the time of Deucalion, almost all flesh died.' Apollodorus having mentioned Deucalion as argus, consigned to the ark, takes notice upon his quitting it, of his offering up an immediate sacrifice to the God who delivered him. As he was the father of all mankind, the ancients have made him a person of very extensive rule; and supposed him to have been a king. Sometimes he is described as a monarch of the whole earth; at other times he is reduced to a petty king of Thessaly. He is mentioned by Helladius in this latter capacity; who speaks of the deluge in his time, and of his building altars to the gods. Apollonius Rhodius supposes him to have been a native of Greece, according to the common notions; but notwithstanding his prejudices he gives so parti-

Vol. VII. Part I. 

cular a character of him, that the true history cannot be mistaken. He makes him indeed the son of Prometheus, the son of Japetus; but in these ancient mythological accounts all genealogy must be entirely disregarded. Though this character be not precisely true, yet we may learn that the person represented was the first of men, through whom religious rites were renewed, cities built, and civil polity established in the world; none of which circumstances are applicable to any king of Greece. We are assured by Philo, that Deucalion was Noah; and the Chaldeans likewise mentioned him by the name of Xisthirus, as we are informed by Cedrenus.

"That Deucalion was unduly adjudged by the Deucalian people of Thessaly to their country solely, may be proved out of his name occurring in different parts of the world, and always accompanied with some history. The natives of Syria laid the same claim to him. He was supposed to have founded the temple at Hierapolis, where was a chasm through which the waters after the deluge were said to have retreated. He was likewise reported to have built the temple of Jupiter at Athens; where there was a cavity of the same nature, and a like tradition, that the waters of the flood passed off through this aperture. However groundless the notions may be of the waters having retreated through these passages, yet they show what impressions of this event were retained by the Ammonians, who introduced some history of it wherever they came. As different nations succeeded one another in these parts, and time produced a mixture of generations, they varied the history, and modelled it according to their notions and traditions; yet the ground-work was always true, and the event for a long time universally commemorated. Josephus, who seems to have been a person of extensive knowledge, and versed in the histories of nations, says, that this great occurrence was to be met with in the writings of all persons who treated of the first ages. He mentions Berosus of Chaldaea, Hieronymus of Egypt, who wrote concerning the antiquities of Phoenicia; also Alcaceas, Abydenus, Melon, and Nicholas Damascenus, as writers, by whom it was recorded, and adds, that it was taken notice of by many others.

"Among the eastern nations, the traces of this event are more vivid and determinate than those of the flood among the Greeks, and more conformable to the accounts of Moses. Eusebius has preserved a most valuable extract from this purpose from Abydenus; which was taken from the archives of the Medes and Babylonians. This writer speaks of Noah, whom he names Seithirus, as a king; and says, that the flood began upon the 15th day of the month Deius; that during the prevalence of the waters, Seithirus sent out birds, that he might judge if the flood had remained; but that the birds, not finding any resting place, returned to him again. This was repeated three times; when the birds were found to return with their feet stained with soil; by which he knew the flood was abated. Upon this he quitted the ark, and was never more seen of men, being taken away by the gods from the earth. Abydenus concludes with a particular, in which the eastern writers are unanimous; that the place of descent from the ark was in Armenia, and speaks of its remains being preserved for a long time. Plutarch mentions the
Of carrying a boat in procession at particular seasons in which was an oracular shrine held in great veneration. They were said to have been 80 in number and to have carried the sacred vessel about just as the were directed by the impulse of the Deity. This custom was likewise in use among the Egyptians; an Bishop Pocock has preserved three specimens of ancient sculpture, wherein this ceremony is displayed. There are of wonderful antiquity, and were found by him in Upper Egypt.

"Part of the ceremony in most of the ancient mysteries consisted in carrying about a ship or boat; which custom, upon due examination, will be found to relate to nothing else but Noah and the deluge. The ship of Isis is well known, and the festivity among the Egyptians whenever it was carried in public. The name of this, and of all the navicular shrines, was Baris; which is remarkable, for it was the very name of the mountain, according to Nicolaus Damascenus, on which the ark of Noah rested, the same as Ararat in Armenia. He mentions, that there is a large mountain in Armenia, which stands above the country of the Minyans called Baris; to this it was said that many people took themselves in the time of the deluge, and were saved; and there is a tradition of one person in particular floating in an ark, and arriving at the summit of the mountain. We may be assured then, that the ship of Isis was a sacred emblem; in honour of which there was among the Egyptians an annual festival.

It was in after times admitted among the Romans, and set down in their calendar for the month of March. The former, in their description of the primary deities, have continually some reference to a ship or floating machine. Hence we frequently read of θείκας πλωτίδες (sailing gods). They oftentimes, says Porphyry, describe the sun in the character of a man sailing upon a float. As Plutarch observes to the same purpose, that they do not represent the ship and its contents, but something about floating machines. In doing which they did not refer to the luminaries, but to a person represented under those titles. The sun, or Orus, is likewise described by Jamblichus as sitting upon the lotus and sailing in a vessel.

"It is said of Sesostiris, that he constructed a ship which was 280 cubits in length. It was of cedars plated without with gold, and inlaid with silver; as it was, when finished, dedicated to Osiris at Thebes. It is not credible that there should have been a ship of this size, especially in an inland district, the most remote of any in Egypt. It was certainly a temple as a shrine. The former was framed upon this large scale; and it was the latter on which the gold and silver were so lavishly expended. There is a remarkable circumstance relating to the Argonautic expedition that the dragon slain by Jason was of the size of a trireme; by which must be meant, that it was of the shape of a ship in general, for there were no triremes at the time alluded to. And I have more reason to believe that all those dragons, as they have been represented the poets, were in reality temples, Dracontia; for among other rites, the worship of the serpent was instituted. There is another reason to think, that the temple, as well as that of Sesostiris, was fashioned, respect to its superficial contents, after the model a ship; and as to the latter, it was probably inte
Deluge. in its outlines, to be the exact representation of the ark, in commemoration of which it was certainly built. It was a temple sacred to Osiris at Theba: or, to say the truth, it was itself called Theba; and both the city, said to be one of the most ancient in Egypt, as well as the province, were undoubtedly denominated from it. Now Theba was the name of the ark. It is the very word made use of by the sacred writer; so that we may, I think, be assured of the prototype after which this temple was fashioned. It is said indeed to have been only 280 cubits in length; whereas the ark of Noah was 300. But this is a variation of only one-fifteenth in the whole: and as the ancient cubit was not in all countries the same, we may suppose that this disparity arose rather from the manner of measuring, than from any real difference in the extent of the building. It was an idolatrous temple, said to have been built by Sesostris in honour of Osiris. I have been repeatedly obliged to take notice of the ignorance of the Greeks in respect to ancient titles, and have shown their misapprehension of terms in many instances; especially in their supposing temples to have been erected by persons to whom they were in reality sacred. Sesostris was Osiris; the same as Dionysus, Menes, and Noah. He is called Seisithrus by Abydenus; Xiosauthros by Berosus and Apollodorus; and is represented by them as a prince in whose time the deluge happened. He was called Zuth, Xuth, and Zew; and had certainly divine honours paid to him.

Pausanias gives a remarkable account of a temple of Hercules at Eruthra in Ionia, which he mentions as the highest antiquity, and very like those of Egypt. The deity was represented upon a float, and was supposed to have come thither in this manner from Pheneicia. Aristides mentions, that at Smyrna, upon the feast called Dionysus, a ship used to be carried in procession. There was a custom prescribed among the Athenians at the Panathenæa, when what was termed the sacred ship was borne with great reverence through the city to the temple of Dameter at Eleusis. At Phalerus, near Athens, there were honours paid to an unknown hero, who was represented in the stem of a ship. At Olympia, the most sacred place in Greece, was a representation of the like nature. It was a building like the fore-part of a ship, which stood facing the end of the hippodromus; and towards the middle of it was an altar, upon which, at the renewal of each olympiad, certain rites were performed.

I think it is pretty plain that all these emblematical representations, of which I have given so many instances, related to the history of the deluge, and the conservation of one family in the ark. This history was pretty recent when these works were executed in Egypt, and when the rites were first established: and there is reason to think, that in early times most shrines of the Mizraim were named under the resemblance of that memory by the name of Noah. Nay, farther, both ships and temples received their names from thence, being styled by the Greeks, who borrowed largely from Egypt, Noah, and Naxos, and mariners Naxos, Naxote, in reference to the patriarch, who was variously styled Noah, Naxos, and Noah.

However the Greeks may in their mysteries have sometimes introduced a ship as a symbol, yet in their reference to the deluge itself, and to the persons preserved, they always speak of an ark. And though they were apt to mention the same person under various titles, and by these means different people seem to be made principals in the same history; yet they were so far uniform in their account of this particular event, that they made each of them to be exposed in an ark. Thus it is said of Deucalion, Perseus, and Dionysus, that they were exposed upon the waters in a machine of this fabric. Adonis was hid in an ark by Venus, and was supposed to have been in a state of death for a year. Theocritus introduces a pastoral personage named Comates, who was exposed in an ark for the same term, and wonderfully preserved. Of Osiris being exposed in an ark we have a very remarkable account in Plutarch; who mentions, that it was on account of Typhon, and that it happened on the 17th of the month Athyr, when the sun was in Scorpio. This, in my judgment, was the precise time when Noah entered the ark, and when the flood came, which, in the Egyptian mythology, was called Typhon.

"Typhon is one of those whose character has been explained or confounded. This has arisen from the different of the ent personages being included under one name, word Typhon, undoubtably were distinguished in the language of Egypt. Typhon was a compound of Toph or Tophan; and signified a high altar of the Deity. There were several such in Egypt, upon which they offered human sacrifices; and the cities which had these altars were styled Typhon. But there was another Typhon, who was very different from the former, however by mistake blended with that character. By this was signified a mighty whirlwind and inundation; and it often times denoted the ocean; and particularly the ocean in a ferment. For, as Plutarch observes, by Typhon was understood any thing violent and unruly. It was a derivative from Toph, like the former name; which Toph seems here to have been the same as the Suph of the Hebrews. By this they denoted a whirlwind; but among the Egyptians it was taken in a greater latitude, and signified any thing boisterous, particularly the sea. Plutarch speaks of it as denoting the sea; and says likewise, that the salt of the sea was called the foam of Typhon. It signified also a whirlwind, as we learn from Euripides, who expresses it Tophos; and the like is to be found in Hesychius, who calls it a violent wind.

The history of Typhon was taken from hieroglyphical descriptions. In these the dove, oinos, was represented as hovering over the mundane egg, which was exposed to the fury of Typhon: For an egg, containing in it the elements of life, was thought no improper emblem of the ark, in which were preserved the rudiments of the future world. Hence, in the Dionysiacs, and in other mysteries, one part of the nocturnal ceremony consisted in the consecration of an egg. By this, we are informed, the earth was signified the world. This world was Noah and his family; even all mankind, inclosed and preserved in the ark.

In respect to Typhon, it must be confessed that the history given of him is attended with some obscurity. The Grecians have comprehended several characters under one term, which the Egyptians undoubtedly distinguished. The term was used for a title as well
DeL

as a name; and several of those personages which had a relation to the deluge were styled Typhon or Diluvian. All these the Greeks have included under one and the same name, Typhon. The real deity by whom the deluge was brought upon the earth had the appellation of Typhon, by which was meant Dileu Deus (A). It is well known that the ark was constructed by a divine commission in which, when it was completed, God inclosed the patriarch and his family. Hence it is said, that Typhon made an ark of curious workmanship, that he might dispose of the body of Osiris. Into this Osiris entered, and was shut up by Typhon. All this relates to the Typhonian deity who inclosed Noah, together with his family, within the limits of an ark. The patriarch also, who was thus interested in the event, had the title of Typhonian. I have shown that the ark by the mythologists was spoken of as the mother of mankind. The stay in the ark was looked upon as a state of death and of regeneration. The passage to life was through the door of the ark, which was formed in its side. Through this the patriarch made his descent; and at this point was the commencement of time. This story is obscurely alluded to in the account of Typhon; of whom it is said, that without any regard to time or place, he forced a passage and burst into light obliquely through the side of his mother. This return to light was described as a revival from the grave; and Plutarch accordingly mentions the return of Osiris from Hades, after he had been for a long season inclosed in an ark and in a state of death. This renewal of life was by the Egyptians esteemed a second state of childhood. They accordingly, in their hieroglyphics, described him as a boy, whom they placed upon the lotus or water-lily, and called him Orus. He was the supposed son of Isis; but it has been shown that Isis, Rhea, Atargatis, were all emblems of the ark, that receptacle which was styled the mother of mankind. Orus is represented as undergoing from the Titans all that Osiris suffered from Typhon; and the history at bottom is the same. Hence it is said of Isis, that she had the power of making people immortal; and that when she found her son Orus, in the midst of the waters, dead through the malice of the Titans, she not only gave him a renewal of life, but also conferred up him immortality."

In this manner does our author decipher almost all the ancient fables, of which no satisfactory solution was ever given before. He shows that the primitive gods of Egypt, who were in number eight, were no other than the eight persons saved in the ark; that almost all the heathen deities had one way or other a reference to Noah. He shows that he was characterized under the titles of Janus, Nereus, Proteus, Oannes, Dagon, &c. &c. and in short, that the deluge, so far from being unknown to the heathens, or forgot by them, was in a manner the basis of the whole of their worship. He traces the history of the raven and dove sent forth by Noah in the customs of various nations, not only in the east but the west also. Of the numberless testimonies of the truth of this part of sacred history to be met with among the western nations, however, we shall select one more, which is an ancient coin usually known by the name of the Apamean medal. The learned Ficalconeri (says Mr. Bryant) has a curious dissertation upon a coin of Philip the Elder, which was struck at Apamaea (B), and contained on its reverse an epitome of this history. The reverse of most Asiatic coins relates to the religion and mythology of the places where they were struck. On the reverse of this coin is delineated a kind of square machine floating upon the water. Through an opening in it are seen two persons, a man and a woman, as low as the breast; and upon the head of the woman is a veil. Over this ark is a triangular kind of pediment, on which there sits a dove; and below it another, which seems to flutter its wings, and hold in its mouth a small branch of a tree. Before the machine is a man following a woman, who by their attitude seem to have just quitted it, and to have got upon dry land. Upon the ark itself, underneath the persons there inclosed, is to be read in distinct characters, ΝΕΕ. The learned editor of this account says, that it had fallen to his lot to meet with three of these coins. They were of brass and of the medallion size. One of them he mentions to have seen in the collection of the duke of Tuscany; the second in that of the cardinal Ottoboni; and the third was the property of Augustino Chigi, nephew to Pope Alexander VII."

Not content with these testimonies, however, which Accounts of the East of the East are to be met with in the western regions, or at least to be met in those not very far to the eastward, our author shows that "the same mythology (of the Egyptians), and the same hieroglyphics, were carried as far as China and Japan; where they are to be found at this day." The Indians have a person whom they call Buto or Budo. This is the same as Boutus of Egypt, Battus of Cyrene, and Bœotus of Greece: the account given of him is similar to that of Typhon; for it is said that he did not come to life in the usual way, but made himself a passage through the side of his mother; which mother is represented as a virgin. This history, though now current among the Indians, is of great antiquity, as we may learn from the account given of this personage by Clemens Alexandrinus. "There is a cast of Indians (says he) who are disciples of Boutas. This person, on account of his extraordinary sanctity, they look up to as a god." The name of Boutas, Battus, and Bœotus, though apparently conferred upon the patriarch, yet originally related to the machine in which he was preserved. Of this some traces may be found among the Greeks. One of the Ammonian names for the ark was Aren or Ares; and Bœotus is said by Diodorus Siculus to have been the son of Neptune and Arne, which is a contraction of arane the ark. The chief city, Boutus in Egypt, where

(A) "Plutarch owns that the Egyptians in some instances esteemed Typhon to be no other than Helius the chief deity; and they were in the right, though he will not allow it."

(b) Our author had before shown that the ancient name of Apamea was Cibotus, one of the names of the ark.
Deluge. [141] Deluge.

where was the floating temple, signified properly the city of the float or ark. The Beotians, who in the Dionysiacs so particularly commemorated the ark, were supposed to be descended from an imaginary personage Boeotus; and from him likewise their country was thought to have received its name. But Beotus was merely a variation from Bontus, and Butus, the ark; which in ancient times was indifferently styled Theba, Argus, Aren, Butus, and Beotus. The term Cibotus is a compound of the same purport, and signifies both the temple of the ark and also a place for shipping.

"All the mysteries of the Gentile world seem to have been memorials of the deluge, and of the event which immediately succeeded. They consisted for the most part of a melancholy process; and were celebrated by night, in commemoration of the state of darkness in which the patriarch and his family had been involved. The first thing at those awful meetings was to offer an oath of secrecy to all who were to be initiated: after which they proceeded to the ceremonies: these began with a description of chaos; by which was signified some memorial of the deluge. Chaos was certain-ly the same as Job, the great abyss. Who, says Epi-

phanius, is so ignorant as not to know, that Chaos and Bathos, the abyss, are of the same purport?

"The names of the deities in Japan and China, and the form of them, as well as the mythology with which they are attended, point out the country from whence they originally came. In China the deity upon the lotus in the midst of waters, has been long a favourite emblem, and was imported from the west: the insignia of the dragon was from the same quarter. The Cuthites worshipped Cham, the son; whose name they variously compounded. In China, most things which have any reference to splendour and magnificence, seem to be demoted from the same object. Cham is said, in the language of that country, to signify any thing supreme. Cum is a fine building or palace, similar to Coma of the Ammonians. Cum is a lord or master; Cham a sceptre. Lastly, by Cham is signified a priest, analogous to the Chamanim and Chemenim of Cutha and Babylonia. The country itself is by the Tartars called Ham. The cities Cham-ju, Campion, Compion, Cuman, Chamul, and many others of the same form, are manifestly compounded of the sacred term Cham. Cambal, the name of the ancient metropolis, is the city of Cham-bal; and Milton styles it very properly Cambal, seat of Cathania Chan. By this is meant the chief city of the Cuthian monarch; for Chan is a derivative of Cachen, a prince. It seems sometimes in China and Japan to have been expressed Quan and Quano.

"Two temples are taken notice of by Hamilton, near Syrian in Pugu, which he represents as so like in structure, that they seemed to be built on the same model. One of these was called Kiakick, or the God of Gods temple. The other is called the temple of Dagon; and the doors and windows of it are perpetually shut, so that none can enter but the priests. They will not tell of what shape the idol is, but only say that it is not of human form. The former deity, Kiakick, is represented as asleep, of a human shape, and 60 feet long; and when he awakes, the world is to be destroyed. As soon as Kiakick has dissolved the frame and being of this world, Dagon will gather up the fragments, and make a new one. I make no doubt but the true name of the temple was Iach Iach, and dedicated to the same god as the Jachusi in Japan. Mr. Wise takes notice of the Grecian exclamation to Dionysus, when the terms Iacche, O Iacche, were repeated: and he supposes, with great probability, that the Peguan name had a reference to the same deity. It is certain, that the worship of Dionysus prevailed very early among the nations in the east. The Indians used to maintain, that his rites first began among them. Professor Bayer has shown, that traces of his worship are still to be observed among the Tamuli of Tranquebar. "They have a tradition (says he), that there was once a gigantic person named Maidushuren, who was born of Nisadabura near the mountain Meru. He had the horns of a bull, and drank wine, and made war upon the gods. He was attended by eight Pudam, who were gigantic and mischievous demons, of the family of those Indian shepherds called Kobalar." In this account we have a manifest reference to the history of Dionysus, as well as that of the Dioniscus, by whom his rites were introduced. And we may perceive that it bears a great resemblance to the accounts transmitted by the Grecians. What are these Kobalar, who were descended from the shepherds, but the same as the Cobali of Greece, the uniform attendants upon Dionysus? a set of priests whose cruelty and chicanery rendered them infamous. 'The Cobali (says an ancient author) were a set of cruel demons, who followed in the retinue of Dionysus. It is a term made use of for knaves and cheats.'

"As the deity, in the second temple of Syrian; to which strangers were not admitted, was not of a human form, and was called Dagon, we may easily conceive the hidden character under which he was described. We may conclude, that it was no other than that mixed figure of a man and a fish, under which he was of old worshipped both in Palestine and Syria. He is expressed under this symbolical representation in many parts of India; and by the Brahman is called Wisnou or Vishnou. Dagon and Vishnou have a like reference. They equally represent the man of the sea, called by Berosus Oannes; whose history has been reversed by the Indians. They suppose that he will restore the world, when it shall be destroyed by the chief God. But by Dagon is signified the very person through whom the earth has been already restored when it was in a state of ruin, and by whom mankind was renewed. Dagon and Noah, I have shown to be the same. Vishnou, is represented, like Dagon, under the mixed figure of a man and a fish, or rather of a man, a princely figure, proceeding from a fish. The name of this district, near which the temples above stand, we find to be called Syrias; justly it was named the region where stood the temples of Atargatis and Dagon. Syria, Syria, and Syrian, are all of the same purport, and signify Celestis and Solaris from Schor, the sun.'

Our author next proceeds to describe some of the Indian temples or pagodas; particularly those of Sal-sete, Elephants, and another called Efora, near Aurungabad in the province of Balagate, which was visited by Thevenot. The traveller relates, that "upon making diligent inquiry among the natives about
Deluge. about the origin of these wonderful buildings, the constant tradition was, that all these pagodas, great and small, with all their works and ornaments, were made by giants; but in what age they could not tell."

"Many of these ancient structures (continues Mr. Bryant) have been attributed to Ramtseander, or Alexander the Great; but there is nothing among these stately edifices that in the least savours of Grecian workmanship; nor had that monarch, nor any of the princes after him, opportunity to perform works of this nature. We have not the least reason to think that they ever possessed the country; for they were called off from their attention this way by feuds and engagements nearer home. There is no tradition of this country having been ever conquered except by the fabulous armies of Hercules and Dionysus. What has led people to think that those works were the operation of Alexander, is the similitude of the name Ramtseander. To this person they have sometimes been attributed; but Ramtseander was a deity, the supposed son of Bal; and he is introduced among the personages who were concerned in the incarnations of Vishnou.

"The temple of Eora, and all the pagodas of which I have made mention, must be of great antiquity, as the natives cannot reach their era. They were undoubtedly the work of the Indo-Cuthites, who came so early into these parts. And that these structures were formed by them, will appear from many circumstances; but especially from works of the same magnificence which were performed by them in other places. For scarce any people could have effected such great works, but a branch of that family which erected the tower in Babylonia, the walls of Balbec, and the pyramids of Egypt."

Having then described a number of East Indian idols of surprising magnitude, "the Babyloniens and Egyptians (says he), and all of the same great family, used to take a pleasure in forming gigantic figures, and exhibiting other representations equally stupendous. Such were the colossal statues at Thebes, and the sphinx in the plains of Coume. The statue erected by Nebuchadnezzar in the plains of Dura, was in height threescore Babylonish cubits. It was probably raised in honour of Cham, the sun; and perhaps it was also dedicated to the head of the Chaldaic family, who was deified, and reverenced under that title. Marcellinus takes notice of a statue of Apollo named Cometus; which, in the time of the emperor Verus, was brought from Seleucia to Rome. This related to the same deity as the preceding. We may also infer, that the temple at Kamju was erected to Cham the sun, whom the people worshipped under the name of Samo-niu."

"It is remarkable, that in Japan the priests and nobility have the title of Cami. The emperor Quabacondo, in a letter to the Portuguese viceroy, 1585, tells him that Japan is the kingdom of Chams; whom, says he, we hold to be the same as Scin, the origin of all things. By Scin is probably meant San, the sun, who was the same as Cham, rendered here Chams. The laws of the country are spoken of as the laws of Chams; and we are told by Kempter, that all the gods were styled either Sin or Cami. The founder of the empire is said to have been Tensio Dai Sin, or"
The most common representation in this country is that of *Godos Ten Oo*, or 'the ox-headed prince of heaven.'

"It has already been noticed, that the ark was represented under the symbol of an egg, called the *mundane egg*; which was exposed to the rage of Typhon. It was also described under the figure of a lunette, and called *Selene*, the moon. The person by whom it was framed, and who through its means was providentially preserved, occurs under the character of a steer, and the machine itself under the semblance of a cow or heifer. We have moreover been told that it was called *Cibotus*, which Clemens of Alexandria calls *Thebota*. Epiphanius mentions it by the name *Ieal Boath*; and says that, according to an eastern tradition, a person named *Nun* was preserved in it. The horse of Neptune was another emblem, as was also the hippopotamus or river-horse. The people of Elis made use of the tortoise for the same purpose, and represented Venus as resting upon its back. Some traces of these hieroglyphics are to be found in Japan, which were certainly carried thither by the Indian Ethipians.

"From an account of a temple of *Daiboth* (probably the same with *Daibod*) at Meaco in Japan, we may perceive that the people there speak of the renewal of the world at the deluge as the real creation, which I have shown to be a common mistake in the histories of the event. And though the story is told with some variation, yet in all the circumstances of consequence it accords very happily with the mythology of Egypt, Syria, and Greece. It matters not how the emblems have by length of time been misinterpreted. We have the mundane egg upon the waters, and the concomitant symbol of the moon; and the egg at last opened by the assistance of the sacred steer, upon which the world issues forth to this day." The author proceeds afterwards to mention the great veneration paid in these parts to the ox and cow; and says, that nobody dares injure them. One deity of the Japanese was *Canon*, the reputed lord of the ocean. He was represented in an erect posture, crowned with a flower, and coming out of the mouth of a fish. He is represented in the same manner by the natives of India, and named *Vishnou and Macauter*; and he is to be found in other parts of the east. Father Bouschet mentions a tradition among the Indians concerning a flood in the days of Vishnou which covered the whole earth. It is moreover reported of him, that seeing the prevalence of the waters, he made a float; and being turned into a fish, he steered it with his tail. This person, in the account of the Banians by Lord, is called *Menow*; which certainly should be expressed *Men-Now*. It is said, that in the Shaster of this people, a like history is given of the earth being overwhelmed by a deluge, in which mankind perished; but the world was afterwards renewed in two persons called *Menow and Cetroupe*.

Vishnou is described under many characters, which he is said at times to have assumed. One of these, according to the bramin of Tanjour, was that of *Rama Sani*. This undoubtedly is the same as Sama Bama of Babylonia, only reversed: and it relates to that great phenomenon the *Iris*; which was generally accompanied with the dove, and held in veneration by the Semarim.

"As the history of China is supposed to extend upwards to an amazing height, it may be worth while to consider the first eras in the Chinese annals, as they are represented in the writings of Japan (for the Japanese have preserved histories of China); and by such a collation, I believe no small light may be obtained towards the discovery of some important truths. Hitherto it has not been observed that such a collation could be made.

"In the histories of this country, the first monarch of Japan is named *Foji*; the same whom the Chinese history of China, call *Foji*, and place at the head of their list. This prince had, according to some, the body, according to others the head, of a serpent. If we may believe the Japanese historians, he began his reign above 21,000 years before Christ. The second Chinese emperor was *Sin-Noo*, by the people of China called *Sin-Num*; and many begin the chronology of the country with him. He is supposed to have lived about 3000 years before Christ; consequently there is an interval of near 18,000 years between the first emperor and the second; a circumstance not to be credited. The third, who immediately succeeded Sin-Noo, was Hoam-Ti. In this account we may, I think, perceive, that the Chinese have acted like the people of Greece and other regions. The histories which were imported they have prefixed to the annals of the nation; and adopted the first personages of antiquity, and made them monarchs in their own country. Whom can we suppose Foji, with the head of a serpent, to have been, but the great founder of all kingdoms, the father of mankind? They have placed him at an immense distance, not knowing his true era. And I think we may be assured, that under the character of Sin-Num and Sin-Noo we have the history of Noah; and Hoam-Ti was no other than Ham. According to Kämpfer, Sin-Noo was exactly the same character as Serapis of Egypt. 'He was a husbandman, and taught mankind agriculture, and those arts which relate to the immediate support of life. He also discovered the virtues of many plants; and he was represented with the head of an ox, and sometimes only with two horns. His picture is held in high estimation by the Chinese.' Well indeed might Kämpfer think, that in Sin-Noo he saw the character of Serapis; for this personage was no other than Sar-Apis, the great father of mankind, the same as Men-Neus of Egypt, the same also as Dionysus and Osiris. By Du Halde he is called *Chin-Nong*, and made the next monarch after Foji. The Chinese accounts afford the same history as has been given above.

"As the family of Noah consisted of eight persons inclusive, there have been writers who have placed some of them in succession, and supposed that there were three or four persons who reigned between Sin-Noo and Hoam. But Du Halde says, that in the true histories of the country, the three first monarchs were Foji, Chin-Nong, and Hoam, whom he styles Hoam-Ti. To these, he says, the arts and sciences owe their invention and progress. Thus we find, that those who were heads of families have been raised to be princes; and their names have been prefixed to the list of kings; and their history superadded to the annals of the country. It is further observable, in the accounts given of those supposed kings, that their term
The history of Japan is divided into three eras; which consist of gods, demi-gods, and mortals. The person whom the natives look upon to be the real founder of their monarchy is named Synmu; in whose reign the Sinto religion, the most ancient of the country, was introduced. It was called Sin-sup and Chami silito; from Sin and Chami, the deities which were the objects of worship. At this time it is said that 600 foreign idols were brought into Japan. To the Sinto religion was afterwards added the Budso, together with the worship of Amida. This deity they commonly represented with the head of a dog, and esteemed him the guardian of mankind. This religion was more complicated than the former, and abounded with hieroglyphical representations and mysterious rites. It is the same which I have termed the Arkite Idolatry, wherein the sacred steer and cow were venerated. The deity was represented upon the lotus and upon a tortoise, and oftentimes as proceeding from a fish. In this also, under the character of Buddha, we may trace innumerable memorials of the ark, and of the person preserved in it. The author above, having mentioned the eleventh emperor inclusive from Syn-Mu, tells us, that in his time these rites began. In his reign Budso, otherwise called Kobotos, came over from the Indies to Japan; and brought with him upon a white horse, his religion and doctrines. We find here, that the object of worship is made the person who introduced it (a mistake almost universally prevalent); otherwise in this short account what a curious history is unfolded!

The only people to whom we can have recourse for any written memorials concerning these things are the inhabitants of India Proper. They were, we find, the persons who introduced these hieroglyphics both in China and Japan. It will therefore be worth while to consider what they have transmitted concerning their religious opinions; as we may from hence obtain still greater light towards explaining this symbolical worship. Every manifestation of God's goodness to the world was in the first ages expressed by an hieroglyphic; and the Deity was accordingly described under various forms, and in different attitudes. These at length were mistaken for real transfigurations; and Vishnou was supposed to have appeared in different shapes, which were styled incarnations. In one of these he is represented under the figure before mentioned, of a princely person coming out of a fish. In another he appears with the head of a boar, treading upon an evil demon, which seems to be the same as the Typhon of the Egyptians. On his head he supports a lunette, in which are seen cities, towers, in short, all that the world contains. In Baidæus we have a delineation and history of this incarnation. Kircher varies a little in his representation, yet gives him a similar figure of the Deity, and styles him Vishnou Barachater. By this I should think was signified Vishnou, "the offspring of the fish." The bramins say, that there was a time when the serpent with a thousand heads withdrew itself, and would not support the world, it was so overburdened with sin. Upon this the earth sunk in the great abyss of waters, and mankind and all that breathed perished. But Vishnou took upon himself the form above described, and diving to the bottom of the sea, lifted the earth out of the waters, and placed it, together with the serpent of a thousand heads, upon the back of a tortoise.

In the third volume of M. Perron's Zendav, there is an account given of the cosmogony of Persia; also of the subsequent great events that followed. The supreme Deity, called by him Ormida, is said to have accomplished the creation at sixferent intervals. He first formed the heavens; at second the waters; at the third the earth. In order were produced the trees and vegetables; the fifth place were formed birds and fishes, and wild inhabitants of the woods; and in the sixth last place, he created man. The man thus produced is said to have been an ox-like person, and is described as consisting of a purely divine and a mortal part. For some time after his creation he lived in great piness; but at last the world was corrupted by a monster named Ahriman. This demon had the boldness to visit heaven: whence he came down to the earth in the form of a serpent, and introduced a set of wicked beings, called karsters. By him the first ox-like personage, called Abouadd, was so infected that he did after which Kaimorts, probably the divine part, which the ox was the representative, died also. On the left arm of the deceased proceeded a being called Goshormaun, who was said to have raised a cry louder than the shout of 1000 men. After some conversation between the supreme Deity and Goshormaun, it determined to put Ahriman to flight, and to desolate all those wicked persons he had introduced; for they now seemed to be an universal opposition to the supreme Deity Ormida. At this season a second like personage is introduced by the name of Taschir. He is spoken of both as a star and a sun. At the same time he is mentioned as a person upon the earth under three forms. By Taschir is certainly signified De Ashter; the same person whom the Greeks and Romans represented as a female, and called Astarte, was described horned, and sometimes with the head of a bull; supposed to proceed from an egg; and esteemed her the same as Juno and the moon. Last it was thought proper to bring an universal inundation over the face of the earth; that all impurity might be washed away; which being accomplished by Taschir, every living creature perished, and the earth was for some time entirely covered. At last, the waters retreating within their proper bounds, the mountain of Alborndard in Ferak-kand first appeared; and the author compares it to a tree, and supposes that other mountains proceeded from it. After this was a renewal of the world; and the earth was restored to its pristine state. The particular place where Ahriman planted the germinas from whence all the waters to spring, was Ferak-kand, which seems to be the land of Arach; the country upon the Araxes Armenia.

Thus we have given an ample specimen of this ingenious author's method of reasoning, and disclosing traces of the sacred history even in things that have been thought least to relate to it. That Greeks and western nations had some knowledge o
the flood, has never been denied; and from what has been already related, it appears that the same has per-
vasion the remotest regions of the east. The know-
 ledge which these people have of the fall of man, and the evil consequences which ensued, cannot, according to our author, be the consequences of their intercourse with Christians: for their traditions afford neither any traces of Christianity, nor its founder. Whatever truths may be found in their writings, therefore, must be derived from a more ancient source. "There are (says he) in every climate some shattered fragments of original history; some traces of a primitive and universal language: and these may be observed in the names of deities, terms of worship, and titles of honour, which prevail among nations widely separated, who for ages had no connexion. The like may be found in the names of pagodas and temples; and of sundry other objects which will present themselves to the traveller. Even America would contribute to this purpose. The more rude the monuments, the more ancient they may possibly prove, and afford a greater light upon in-
quiry."

The accounts hitherto met with in this continent, indeed, are far from being equally authentic and satis-
factory with those hitherto treated of. In Acosta's history of the Indies, however, we are informed, that the Mexicans make particular mention of a deluge in their country, by which all men were drowned. According to them, one Viracocha came out of the great lake Titicaca in their country. This person stood in Tiaguanao, where at this day are to be seen the ruins of some ancient and very strange buildings. From the ceremonies came the name of Cusco, where mankind began to multiply. They show also a small lake, where they say the sun hid himself: for which reason they sacrifice largely to him, both men and other animals.—Hennepin informs us, that some of the savages are of opinion, that a certain spirit, called Otken by the Iro-
quois, and Atahautia by those at the mouth of the ri-
ver St Lawrence, is the creator of the world; that Messow repaired it after the deluge. They say, that this Messow or Otken, being a-hunting one day, his dogs lost themselves in a great lake, which thereupon overflowing, covered the whole earth in a short time, and swallowed up the world. According to Herrera, the people of Cuba knew that the heavens and the earth had been created; and said they had much in-
formation concerning the flood; and that the world had been destroyed by water, by three persons, who came three several ways. Gabriel de Cabrera was told by a man of more than 70 years of age, that an old man, knowing the deluge was to come, built a great ship, and went into it with his family and abun-
dance of animals; that he sent out a crow, which did not at first return, staying to feed on the carcases of dead animals, but afterwards came back with a green branch. He is said to have added other par-
ticulars nearly consonant to the Mosaic account, as far as Noah's sons covering him when drunk, and the other scoffing at it. The Indians, he said, descended from the latter, and therefore had no clothes: but the Spaniards descending from the former, had both clothes and horses.—The same author likewise informs us, that it was reported by the inhabitants of Castilla del Oro in Terra Firma, that when the universal de-

Vol. VII. Part II. 

To these American testimonies we may add another from the remote and uncivilized island of Otaheite. Testimo-
nies from Dr Watson, in his discourse to the clergy, informs us, that one of the navigators to the southern hemi-
sphere have asked some of the inhabitants of that island concerning their origin, was answered, that their supreme God, a long time ago, being angry, dragged the earth through the sea, and their island being broken off, was preserved. In the East Indies, we are informed by Dr Watson, that Sir William Jones, by whom a society for the advancement of Asia-
tic literature was instituted at Calcutta, discovered in the oldest mythological books of that country, such an account of the deluge as corresponds sufficiently with that of Moses.
II. The fact being thus established by the universal consent of mankind, that there was a general deluge which overflowed the whole world; it remains next to inquire, by what means it may reasonably be supposed to have been accomplished. The hypotheses on this subject have been principally the following.

1. It has been asserted, that a quantity of water was created on purpose, and at a proper time annihilated, by divine power. This, however, besides its being absolutely without evidence, is directly contrary to the words of the sacred writer who is the author of this hypothesis, mean to defend. He expressly derives the waters of the flood from two sources; first, the fountains of the great deep, which he tells us were all broken up; and secondly, the windows of heaven, which he says were opened; and speaking of the decrease of the waters, he says, the fountains of the deep and the windows of heaven were stopped, and the waters returned continually from off the earth. Here it is obvious, that Moses was so far from having any difficulty about the quantity of water, that he thought the sources from whence it came were not exhausted; since both of them required to be stopped by the same almighty hand who opened them, lest the flood should increase more than it actually did.

2. Dr Burnet, in his Telluris Theoria Sacra, endeavours to show, that all the waters in the ocean were not sufficient to cover the earth to the depth assigned by Moses. Supposing the sea drained quite dry, and all the clouds of the atmosphere dissolved into rain, we should still, according to him, want much the greatest part of the water of the deluge. To get clear of this difficulty, Dr Burnet and others have adopted Descartes's theory. That philosopher supposes the antediluvian world to have been perfectly round and equal, without mountains or valleys. He accounts for its formation on mechanical principles, by supposing it at first in the condition of a thick turbid fluid replete with divers heterogeneous matters; which, subsiding by slow degrees, formed themselves into different concentric strata, or beds, by the laws of gravity. Dr Burnet improves on this theory, by supposing the primitive earth to have been no more than a shell or crust investing the surface of the water contained in the ocean, and in the central abyss which he and others suppose to exist in the bowels of the earth. At the time of the flood, this outward crust, according to him, broke in a thousand pieces; and consequently sunk down among the water, which thus spouted up in vast cataracts, and overflowed the whole surface. He supposes also, that before the flood there was a perfect coincidence of the equator with the ecliptic, and consequently that the antediluvian world enjoyed a perpetual spring; but that the violence of the shock by which the outer crust was broken, shifted also the position of the earth, and produced the present obliquity of the ecliptic. The theory, it will be observed, is equally arbitrary with the former. But it is, besides, directly contrary to the words of Moses, who assures us, that all the high hills were covered; while Dr Burnet affirms that there were then no hills in being.

3. Other authors, supposing a sufficient fund of water in the abyss or sea, are only concerned for an expeditious to bring it forth: accordingly some have recourse to a shifting of the earth's centre of gravity, which, drawing after it the water out of its channel, overwhelmed the several parts of the earth successively.

4. The inquisitive Mr Whiston, in his New Theory of the Earth, shows, from several remarkable coincidences, that a comet descending in the plane of the ecliptic, towards its perihelion, passed just before the earth on the first day of the deluge; the consequences whereof would be, first, that this comet, when it came below the moon, would raise a vast and strong tide, both in the small seas, which according to his hypothesis were in the antediluvian earth (for he allows no great ocean there as in ours), and also in the abyss which was under the upper crust of the earth. And this tide would rise and increase all the time of the approach of the comet towards the earth; and would be at its greatest height when the comet was at its least distance from it. By the force of which tide, as also by the attraction of the comet, he judges, that the abyss must put on an elliptical figure, whose surface being considerably larger than the former spheric one, the outward crust of the earth, incumbent on the abyss, must accommodate itself to that figure, which it could not do while it held solid, and conjoined together. He concludes, therefore, that it must of necessity be extended, and at last broken by the violence of the said tides and attraction; out of which the included water issuing, was a great means of the deluge; this answering to what Moses speaks of the "fountains of the great deep being broken open."—Again, the same comet, he says, descends towards the sun, passed so close by the body of the earth, that it involved it in its atmosphere and tail for a considerable time; and of consequence left a vast quantity of its vapours, both expanded and condensed on the surface; a great part of which being rarefied by the solar heat, would be drawn up into the atmosphere, and afterwards return in violent rains; and this he takes to be what Moses intimates by the "windows of heaven being opened," and particularly by the "forty days rain." For as to the following rain, which wishes this made the whole time of raining 150 days, Mr Whiston attributes it to the earth coming a second time within the atmosphere of the comet, so the comet was on its return from the sun. Lastly, to remove this vast jorb of waters again, he supposes a mighty wind to have arisen, which dried up some, and forced the rest into the abyss through the crests by which it came up: only a good quantity remained in the alveus of the great ocean, now first made, and in lesser seas, lakes, &c. This theory was at first only proposed as an hypothesis; but, on further consideration, Mr Whiston thought he could actually prove that a comet did at that time pass very near the earth, and that it was the same which afterwards appeared in 1688. After this he looked upon his theory no longer as an hypothesis, but published it in a particular treatise, entitled The Cause of the Deluge demonstrated. But the uncertainty of the comet's return in 1758, and the absolute failure of that which ought to have appeared in 1788 or 1799, must certainly render Mr Whiston's calculations for such a length of time extremely dubious: and the great similarity between the tale of comets, and streams of electric matter, renders his supposition
position of their being aqueous vapours exceedingly improbable.

5. According to Mr de la Pryme, the antediluvian world had an external sea as well as land, with mountains, rivers, &c. and the deluge was effected by breaking the subterraneous caverns and pillars thereof, with dreadful earthquakes, and causing the same to be for the most part, if not wholly, absorbed and swallowed up, and covered by the seas that we now have. Lastly, this earth of ours arose out of the bottom of the antediluvian sea: and in its room, just as many islands are swallowed down, and others thrust up in their stead. On this, as on all the other hypotheses, it may be remarked, that it is quite arbitrary, and without the least foundation from the words of Moses. The sacred historian speaks not one word of earthquakes, nor, from the nature of the thing, we know it is impossible that the flood could have been occasioned by an earthquake, and the ark preserved, without a miracle. It is certain, that if a ship sinks at sea, the commotion excited in the water by the descent of such a large body, will swallow up a small boat that happens to come too near. If the pillars of the earth which they then broke, what must the commotion have been, when the continents of Europe, Asia, and Africa, descended into the abyss at once; not to mention America, which lying at so great a distance from Noah, he might be supposed out of danger from that quarter. By what miracle was the little ark preserved amidst the tumult of those impetuous waves which must have rushed in from all quarters? Besides, as the ark was built not at sea, but on dry ground, when the earth on which it rested sunk down, the ark must have sunk along with it; and the waters falling in as it were overhead, must have dashed in pieces the strongest vessel that can be imagined. Earthquakes, also, operate suddenly and violently; whereas, according to the Mosaic account, the flood came on gradually, and did not arrive at its height till six weeks, or perhaps five months, after it began.

6. Mr Hutchinson and his followers present us with a theory of the deluge, which they pretend to derive from the words of God itself. This theory has been particularly enlarged upon and illustrated by Mr Catcott, who in 1768 published a volume on the subject. This gentleman asserts, that when the world was first created, at the time when it is said to have been "without form and void," the terrestrial matter was then entirely dissolved in the aqueous; so that the whole formed, as it were, a thick muddy water. The figure of this mass was spherical; and on the outside of this sphere lay the gross dark air. Within the sphere of earth and water was an immense cavity, called by Moses the deep; and this internal cavity was filled with air of a kind similar to that on the outside. On the creation of light, the internal air received elasticity sufficient to burst out through the external covering of earth and water. Upon this the water descended, filled up the void, and left the earth in a form similar to what it hath at present. Thus, according to him, the antediluvian world, as well as the present, consisted of a vast collection or nucleus of water, called the great deep, or the abyss; and over this the shell of earth perforated in many places; by which means the waters of the ocean communicated with the abyss.

The breaking up of these fountains was occasioned by a miraculous pressure of the atmosphere, from the immediate action of the Deity himself. So violent was this pressure, that the air descended to where it had been originally; occupied the space of the abyss; and drove out the waters over the whole face of the dry land. But this account, far from being infallibly certain, seems inconsistent with the most common observation. No pressure, however violent, will cause water rise above its level, unless the pressure is unequal. If, therefore, the atmosphere entered into the supposed abyss, by a vehement pressure on the surface of the ocean, that pressure must only have been on one place, or on a few places; and even though we suppose the atmosphere to have been the agent made use of, it is impossible that it could have remained for any time in the abyss without a continued miracle; as the pressure of the water would immediately have forced it up again through those holes which had afforded it a passage downwards.

The explication given from Hutchinson by Mr Catcott, of the "windows of heaven," is somewhat extraordinary. According to him, the waters were not in heaven, but in the bowels of the earth; and mean no more than the cracks and fissures by which the diärax, as he calls them, found a passage through the shell or covering of earth, which they utterly dissolved and reduced to its original state of fluidity. It is, however, difficult to conceive how the opening of such windows as these, could cause a violent rain for 40 days and nights.

It is not to be supposed, that we can pretend to ascertain any thing on the subject more than others have done. The following conjectures, however, may be offered on the manner in which the deluge might have happened, without any violence to the established laws of nature.

1. If we consider the quantity of water requisite for another purpose of the deluge, it will not appear so very extraordinary as it has been commonly represented. The height of the highest hills is thought not to be quite four miles. It will therefore be deemed a sufficient circumstance, when we suppose the waters to have been four miles deep on the surface of the ground. Now it is certain, that water, or any other matter, when spread out at large upon the ground, seems to occupy an immense space in comparison of what it does when contained in a cubical vessel, or when packed together in a cubical form. Suppose we wanted to overflow a room 16 feet every way, or containing 256 square feet, with water, to the height of one foot, it may be nearly done by a cubical vessel of six feet filled with water. A cube of eight feet will cover it two feet deep, and a cube of ten feet will very nearly cover it four feet deep. It makes not the least difference whether we suppose feet or miles to be covered. A cube of ten miles of water would very nearly overflow 256 square miles of plain ground to the height of four miles. But if we take into our account the vast number of eminences with which the surface of the earth abounds, the above-mentioned quantity of water would do a great deal more. If, therefore, we attempt to calculate the quantity of water sufficient to deluge the earth, we must make a very considerable allowance for the bulk of all the hills on its surface.
To consider this matter, however, in its utmost latitude: The surface of the earth is supposed, by the latest computations, to contain 199,512,595 square miles. To overflow this surface to the height of four miles, is required a parallelopiped of water 16 miles deep, and containing 49,878,148 square miles of surface. Now, considering the immense thickness of the globe of the earth, it can by no means be improbable, that this whole quantity of water may be contained in its bowels, without the necessity of any remarkable abyss or huge collection of water, such as most of our theorists suppose to exist in the centre. It is certain, that as far as the earth has been dug, it hath been found not dry, but moist; nor have we the least reason to imagine, that it is not at least equally moist all the way down to the centre. How moist it really is cannot be known, nor the quantity of water requisite to impart to it the degree of moisture it has; but we are sure it must be immense. The earth is computed to be near 8000 miles in diameter. The ocean is of an unfathomable depth; but there is no reason for supposing it more than a few miles. To make all reasonable allowance, however, we shall suppose the whole solid matter in the globe to be only equal to a cube of 5000 miles; and even on this supposition we shall find, that all the waters of the deluge would not be half sufficient to moisten it. The above-mentioned parallelopiped of water would indeed contain 798,030,368 cubic miles of the fluid; but the cube of earth containing no less than an hundred and twenty-five thousand millions of cubic miles, it is evident that the quantity assigned for the deluge would scarce be known to moisten it. It could have indeed no more effect this way, than a single pound of water could have upon 150 times its bulk of dry earth. We are persuaded, therefore, that any person who will try by experiment how much water a given quantity of earth contains, and from that experiment will make calculations with regard to the whole quantity of water contained in the bowels of the earth, must be abundantly satisfied, that though all the water of the deluge had been thence derived, the diminution of the general store would, comparatively speaking, have been next to nothing.

2. It was not from the bowels of the earth only that the waters were discharged, but also from the air; for we are assured by Moses, that it rained 40 days and 40 nights. This source of the diluvian waters hath been considered as of small consequence by almost every one who hath treated on the subject. The general opinion concerning this matter we shall transcribe from the Universal History, vol. i. where it is very fully expressed. “According to the observations made of the quantity of water that falls in rain, the rains could not afford one ocean, nor half an ocean, and would be a very insensible part of what was necessary for a deluge. If it rained 40 days and 40 nights throughout the whole earth at once, it might be sufficient to lay all the lower grounds under water, but it would signify very little as to the overflowing of the mountains; so that it has been said, that if the deluge had been made of rains only, there would have needed not 40 days, but 40 years, to have brought it to pass. And if we suppose the whole atmosphere condensed into water, it would not all have been sufficient for this effect; for it is certain that it could not have risen above 32 feet, the height to which water can be raised by the pressure of the atmosphere; for the weight of the whole air, when condensed into water, can be no more than equal to its weight in its natural state, and must become no less than 800 times denser; for that is the difference between the weight of the heaviest air and that of water.”

On this subject we must observe, that there is a very general mistake with regard to the air, similar to the above-mentioned one regarding the earth. Because the earth below our feet appears to our senses firm and compact, therefore the vast quantity of water, contained even in the most solid parts of it, and which will readily appear on proper experiment, is overlooked, and treated as a non-entity. In like manner, because the air does not always deluge with excessive rains, it is also imagined that it contains but very little water. Because the pressure of the air is able to raise only 32 feet of water on the surface of the earth, it is therefore supposed we may know to what depth the atmosphere could deluge the earth if it was to let fall the whole water contained in it. But daily observation shows, that the pressure of the atmosphere hath not the least connexion with the quantity of water it contains. Nay, if there is any connexion, the air seems to be lightest when it contains most water. In the course of a long summer’s drought, for instance, the mercury in the barometer will stand at 30 inches, or little more. If it does so at the beginning of the drought, it ought to ascend continually during the time the dry weather continues; because the air is all the while absorbing water in great quantity from the surface of the earth; and is known to be contrary to fact. At such times the mercury does not ascend, but remains stationary; and what is still more extraordinary, when the drought is about to have an end, the air, while it yet contains the whole quantity of water it absorbed, and hath not discharged one single drop, becomes suddenly lighter, and the mercury will perhaps sink an inch before any rain falls. The most surprising phenomenon, however, is yet to come. After the atmosphere has been discharging for a number of days successively, a quantity of matter 800 times heavier than itself, instead of being lightened by the discharge, it becomes heavier, nay, specifically heavier, than it was before. It is also certain, that very dry air, provided it is not at the same time very hot, is always heaviest; and the driest air which we are acquainted with, namely Dr Priestley’s dephlogisticated air (oxygen gas), is considerably heavier than the air we commonly breathe. For these reasons, we think the quantity of water contained in the whole atmosphere ought to be considered as indefinite, especially as we know that by whatever agent it is suspended, that agent must counteract the force of gravity, otherwise the water would immediately descend; and while the force of gravity in any substance is counteracted, that substance cannot appear to us to gravitate at all.

3. The above considerations render it probable at least that there is in nature a quantity of water sufficient to deluge the world, provided it was applied to the purpose. We must next consider whether there is any natural agent powerful enough to effectuate this purpose. We shall take the phrases used by Moses in their most obvious sense. "The breaking up of the fountains of the deep, ..."
Deluge.

Deep, we may reasonably suppose to have been the opening of all passages, whether small or great, through which the subterraneous waters possibly could discharge themselves on the surface of the earth. The opening of the windows of heaven we may also suppose to be the pouring out the water contained in the atmosphere, through those invisible passages by which it enters in such a manner as totally to elude every one of our senses, as when water is absorbed by the air in evaporation. As both these are said to have been opened at the same time, it seems from hence probable, that one natural agent was employed to do both. Now it is certain, that the industry of modern inquiry hath discovered an agent unknown to the former ages, and whose influence is so great, that with regard to this world, it may be said to have a kind of omnipotence. The agent we mean is electricity. It is certain, that, by means of it, immense quantities of water can be raised to a great height in the air. This is proved by the phenomena of water-spouts. Mr Forster relates, that he happened to see one break very near him, and observed a flash of lightning proceed from it at the moment of its breaking. The conclusion from this is obvious. When the electric matter was discharged from the water, it could no longer be supported by the atmosphere, but immediately fell down. Though water-spouts do not often appear in this country, yet every one must have made an observation somewhat similar to Mr Forster's. In a violent storm of thunder and rain, after every flash of lightning or discharge of electricity from the clouds, the rain pours down with increased violence; thus showing, that the cloud, having parted with so much of its electricity, cannot longer be supported in the form of vapour, but must descend in rain. It is not indeed yet discovered that electricity is the cause of the suspension of water in the atmosphere; but it is certain that evaporation is promoted by electrifying the fluid to be evaporated. It may therefore be admitted as a possibility, that the electric fluid contained in the air is the agent by which it is enabled to suspend the water which rises in vapour. If therefore the air is deprived of the due proportion of this fluid, it is evident that rain must fail in prodigious quantities.

Again, we are assured from the most undeniable observations that electricity is able to swell up water on the surface of the earth. This we can make it do even in our trifling experiments; and much more must the whole force of the fluid be supposed capable of doing it, if applied to the waters of the ocean, or any other. The agitation of the sea in earthquakes is a sufficient proof of this. It is certain, that at these times there is a discharge of a vast quantity of electric matter from the earth into the air: and as soon as this happens, all storms arise on the surface of the earth.

From a multitude of observations it also appears, that there is at all times a passage of electric matter from the atmosphere into the earth, and, vice versa, from the earth into the atmosphere. There is therefore no absurdity in supposing the Deity to have influenced the action of the natural powers in such a manner, that for 40 days and nights the electric matter contained in the atmosphere should descend into the bowels of the earth—il—indeed there is occasion for supposing any such immediate influence at all, since it is not impossible that there might have been, from some natural cause, a descent of this matter from the atmosphere for that time. But by whatever cause the descent was occasioned, the consequence would be, the breaking up of the fountains of the deep, and the opening the windows of heaven. The water contained in the atmosphere being left without support, would descend in impetuous rains; while the waters of the ocean, those from which fountains originate, and those contained in the solid earth itself, would rise from the very centre, and meet the waters which descended from above. Thus the breaking up of the fountains of the deep, and the opening the windows of heaven, would accompany each other, as Moses tells us they actually did; for, according to him, both happened on the same day.

In this manner the flood would come on quietly and gradually, without that violence to the globe which Burnet, Whiston, and other theorists, are obliged to suppose. The abatement of the waters would ensue on the ascent of the electric fluid to where it was before. The atmosphere would then absorb the water as formerly; that which had ascended through the earth would again subside; and thus every thing would return to its pristine state.

III. Having thus shown in what manner it is possible that an universal deluge might take place by means of the natural agents known to us at present, we shall next consider some more of the evidences that such an event actually did happen, and that the deluge was universal. The proof here is so strong from the traditions prevalent among almost every nation on the face of the earth, and which have been already so amply treated, that no farther objection could be made to the Mossio account, were it not that the necessity of an universal deluge is denied by some, who contend that all the deluges mentioned in history or recorded by tradition were only partial, and may be accounted for from the swelling of rivers or other accidental causes. Many indeed, even of those who profess to believe the Mosaic account, have thought that the deluge was not universal; or, though it might be universal with respect to mankind, that it was not so with regard to the earth itself. The learned Isaac Vossius was of this opinion, though his reasons seem principally to have been that he could not conceive how an universal deluge could happen. To effect this (says he) many miracles must have concurred; but God works no miracles in vain. What need was there to drown those lands where no men lived, or are yet to be found? 'Tis a foolish thing to think that mankind had multiplied so much before the flood as to have overspread all the earth. How slow and sluggish the first men were in propagating their kind, is evident from hence, that Noah was not the ninth in a linear descent from Adam. They are quite wide of the truth, therefore, who think mankind to have spread over all the earth in the days of Noah, who perhaps at that time had not extended themselves beyond the borders of Syria and Mesopotamia: but no reason obliges us to extend the inundation of the deluge beyond those bounds which are inhabited; you, it is altogether absurd to aver, that the effect of a punishment inflicted upon mankind only, should extend to those places where no men lived. Although we should therefore believe that part of the earth only to have been overflowed
Deluge.  overflowed by the waters which we have mentioned, and which is not the hundredth part of the terrestrial globe, the deluge will nevertheless be universal, accustomed, since the destruction was universal, and overwhelmed the whole habitable world.

Another scheme of a partial deluge is published by Mr Coelus in his Universal History of Arts and Sciences under the name Preterian. This appears to have been formed with a design to accommodate the belief of a deluge to the opinions of the freethinkers, who deny the truth of the Mosaic accounts, as he tells us that they are willing to allow it. According to this author, the first inhabitants of the earth being placed at the confluence of two great rivers, the Euphrates and Tigris; those rivers may have overflowed their banks all of a sudden, and surprised the neighbouring inhabitants not yet accustomed to such sorts of visits, and drowned part of them (and if really designed as a punishment), such as were more guilty. That some of the animals, particularly the more aloof, and consequently not so apprehensive of danger or so ready to take to flight to avoid it, might have been involved in the same calamity, as well as some of the volatiles, which being deprived of food by the earth's being covered with water, might have perished; particularly those who, by the too great weakness of their wings to support their bodies, were not proper for a long flight. As for others who had these advantages above the rest, they would have no need to take care of their own preservation, by flying to those parts of the earth which their natural instinct could shew them free from the inundation.

A third scheme of a partial deluge is given by the learned Bishop Stillingfleet in his Origines Sacrae. "I cannot (says he) see any urgent necessity from the Scripture to assert, that the flood did spread itself all over the surface of the earth. That all mankind (those in the ark excepted) were destroyed by it, is most certain, according to the Scripture. When the Lord said, that he would destroy man from the face of the earth, it could not be any particular deluge of so small a country as Palestine, as some have ridiculously imagined; for we find an universal corruption in the earth mentioned as the cause; an universal threatening upon all men for this cause; and afterwards an universal destruction expressed as the effect of this flood. So then it is evident, that the flood was universal with regard to mankind; but from thence follows no necessity at all of asserting the universality of it as to the globe of the earth, unless it be sufficiently proved that the whole earth was peopled before the flood, which I despair of ever seeing proved; and what reason can there be to extend the flood beyond the occasion of it, which was the corruption of mankind?—The only probability then of asserting the universality of the flood, as to the globe of the earth, is from the destruction of all living creatures, together with man. Now though men might not have spread themselves over the whole surface of the earth, yet beasts and creeping things might, which were all destroyed with the flood; for it is said, 'that all flesh died that moved upon the earth,' both of fowl and of cattle, and of every creeping thing that creepeth upon the earth, and every man.' To what end should there be not only a note of universality added, but such a particular enumeration of the several kinds of beasts, creeping things and fowls, if they were not all destroyed? To this I answer; I grant that, as far as the flood extended, all these were destroyed: but I see no reason to extend the destruction of those beyond that compass and space of the earth where men inhabited, because the punishment upon the beasts was occasioned by, and could not be concomitant with, the destruction of mankind; but the deluge being the sin of man, who was punished in the beasts that were destroyed for his sake, as well as in himself) where the occasion was not, as where there were animals and no men, there seems no necessity of extending the flood thither.—But to what end, will it therefore be replied, did God command Noah, with so much care, to take all kinds of birds, beasts, and creeping things into the ark with him, if all these living creatures were not destroyed by the flood? I answer, because all those things were destroyed wherever the flood was. Suppose then the whole continent of Asia was peopled before the flood, which is as much as in reason we may suppose; I say, all the living creatures in that continent were destroyed; or if we may suppose it to have extended over our whole continent of the ancient known world, what reason would there be, that in the opposite part of the globe, which we suppose to be unpeopled then, all the living creatures should there be destroyed, because men had sinned in this? and would there not have been on this supposition a sufficient reason to preserve living creatures in the ark for future propagation?" &c.

Thus we have the strength of all the arguments that have been offered in support of a partial deluge, deluge which may all be summed up in the three following articles: 1. The impossibility, in a natural way, of accounting for the quantity of water, necessary to overflow the whole world; 2. The small number of mankind supposed at that time to have existed on the earth; and, 3. The inutility of an universal deluge, when the divine purposes could have been equally well answered by a partial one. But to all this may make one general answer, that a partial deluge is in the nature of things impossible. We cannot imagine that the waters could accumulate upon any country without going off to the sea, while the latter retained its usual level; neither can we suppose any part of the sea to remain above the level of the rest. On the supposition of Bishop Stillingfleet, therefore, that the deluge extended over the whole continent of Asia, we know that it must have covered the high mountains of Ararat, on which the ark rested; Caucasus, Taurus, &c. The height of Ararat is indetermined, as no traveller of any credit pretends to have ascended to its top; but from the distance at which it is seen, we can scarce look upon it to be inferior to the most celebrated mountains of the old continent. Sir John Chardin thinks that some part of Caucasus is higher; and supposing each of these to be only a mile and a half in height, the sea all round the globe must have been raised to the same height; and therefore, all that could remain of dry ground as a shelter to animals of any kind, must have been the uninhabitable tops of some high mountains scattered at immense distances from one another. We may therefore with equal reason suppose that these were in like manner
manner covered, and that no living creature whatever could find shelter even for a moment: and it is certainly more agreeable to the character of the Deity to believe, that he would at once destroy animal life by suffocation in water, rather than allow numbers of them to collect themselves on the tops of mountains to perish with hunger and cold. It is besides very improbable, that any creature, whether bird or beast, could sustain a continued rain of 40 days and 40 nights, even without supposing them to have been absolutely immersed in water.

This consideration alone is sufficient to show, that if there was a deluge at all, it must have been universal with regard to the world as well as the human race; and the possibility of such a deluge by natural means has already been evinced. Under the article ANTEDELUVIANS it is shown, that, according to the most moderate computaion, the world must have been vastly more full of people than at present. The least calculation there made indeed seems incredible, since, according to it, the world must have contained upwards of 68,719 times as many inhabitants as are at present to be met with in the empire of China, the most populous country in the world: but China bears a much larger proportion to the habitable part of the world than this. The violence exercised by mankind upon one another have always been the means of thinning their numbers, and preventing the earth from being overstocked with inhabitants; and the strong expression in Scripture, that the "earth was filled with violence," shows that it must have gone to an extraordinary height. But though this violence must have undoubtedly thinned the old world of its inhabitants, it must likewise have dispersed some of them into distant regions. There is therefore no reason for supposing that before the flood the human race were not driven into the remotest regions of the habitable world, or that America was destitute of inhabitants then more than it is at present. As the country of Yost and Coeleseg, who would confine the whole race of mankind to a small part of Asia, must appear evidently futile and erroneous in the highest degree.

Some objections have been made to the doctrine of an universal deluge from the state of the continent of America, and the number of animals peculiar to that and other countries, which could not be supposed to travel to such a distance either to or from the ark of Noah. On this subject Bishop Stillingfleet observes, that the supposition of animals being propagated much farther in the world than mankind before the flood, seems very probable, "because the production of animals is parallel in Genesis with that of fishes, and both of them different from men." For God said, "Let the waters bring forth every moving creature that hath life, viz. fish and fowl." And accordingly it is said, that the waters brought forth abundantly every living creature after their kind, and every fowl after his kind. Accordingly, in the production of beasts, we read, "Let the earth bring forth the living creature after his kind, cattle, and every creeping thing, and beast of the earth, after his kind: and it was so." But in the production of man it is said, "Let us make man in our image, and after our likeness." From hence I observe this difference between the formation of animals and of man, that in one God gave a prolific power to the earth and waters for the production of the several living creatures which came from them, so that the seminal principles of them were contained in the matter out of which they were produced; which was otherwise in man, who was made by a peculiar hand of the great Creator himself, who thence is said to have formed man out of the dust of the ground.

"If now this supposition be embraced, by it we presently clear ourselves of many difficulties concerning the propagation of animals in the world, and their conservation in the ark; as how the unknown kind of serpent in Brazil, the slow-bellied creature in the Indies, and all those strange species of animals seen in the West Indies, should either come into the ark of Noah, or be conveyed out of it into those countries which are divided by so vast an ocean on one side, and at least so large a tract of land on the other. Besides, some kind of animals cannot live out of the climate where they are; and there are many sorts of animals discovered in America, and the adjoining islands, which have left no remainder of themselves in these parts of the world. And it seems strange, that these should propagate into those parts of the world from the place of the flood, and leave none at all of their number behind them in these parts whence they were propagated."

To this Mr. Cockburn, in his treatise on the deluge, replies Mr. Cockburn, that as it pleased God to create only one man and one woman at the beginning, and their posterity were sufficient to overspread the earth, it might well be supposed to be furnished with animals from an original pair of each. 2. On the supposition of many pairs of brute animals having been created originally, they must, when the human race were few in number, have multiplied to such a degree as to render the world uninhabitable. In confirmation of this, he informs us from the accounts of the Indian missionaries, that in the kingdom of Chanteloubes had for 40 years been desolate, though it was eight days journey in length; which, at 30 miles a-day, made it 240 miles long. After passing this country, another was met with more wild, and full of great rocks; where there were a vast number of animals yet worse than the fowls, as elephants, rhinoceroses, lions, bears, buffaloes, and other beasts, in such multitudes, that whatever men cultivated for the support of life was spoiled or destroyed by them, nor was it possible for the inhabitants to prevent it.

The isle of France may be said to be the kingdom of rats. They come down from the mountains like an army, creep up the steepest rocks, march into the flat country, assemble in the marshy grounds, and bring destruction everywhere, especially in the night. Men can scarce sleep for them, and are obliged to roll themselves in such things as may best secure them from their bitings. It was the same in the isle of Bourbon, which was so much infested with them at first, till it became...
became more fully peopled. "We have good reason therefore (says Mr. Cockburn) to conclude, that there was but one pair of animals created at first, that they might not increase too fast for mankind; and though they would multiply much more, and increase faster than men could do, they had room to spread themselves for a long time without much annoyance to man; and as men increased in number, and extended their habitations, they would be able to drive them further off, or defend themselves from their depredations." The same mode of reasoning is by our author made use of with regard to aquatic animals. The multitude of these indeed, however great, could be no disadvantage to man, who lived on land; but if we consider how large and numerous a spawn fishes cast at once, and in how short a time they multiply to immense numbers, he thinks it reasonable to conclude, that only one pair was created at once; and that the command to the waters to bring forth abundantly both fish and fowl, related only to the variety of species, not to a number of each.

3. Though at the restoration of the world it was to be repopulated by six persons instead of two, and though at the same time animal food was given to man, yet Noah was commanded only to take a single pair of each of the animals, clean beasts, which are but few in number, only excepted. It is further observable, that notwithstanding this scanty supply of animals, they had increased so much by the time of Nimrod, that it then became necessary to hunt and destroy them; Nimrod was celebrated for his courage and skill in that necessary employment. "So numerous (adds he) were the animals before the flood, though but two kinds were created, that Dr. Woodward, from the remains of that period, has calculated many of the greatest productions of it still preserved, concludes, that at the time the deluge came, the earth was so loaded with herbage, and so thronged with animals, that such an expedition was even wanting to ease it of the burden, and to make room for a new succession of its productions."

4. Mr. Cockburn is of opinion, that America must have been peopled before the flood, as the old continent could not be supposed able to hold the number of inhabitants.

5. With regard to the main difficulty, viz. how the animals peculiar to different countries could travel to such distances to and from the ark, Mr. Cockburn replies, that America, which Bishop Stillington chiefly insists upon, has nothing peculiar to it, but what may equally well be urged both with respect to Asia and Africa; each of them having animals peculiar to themselves. It is also possible, that there might formerly be a more easy communication between the Asiatic and American continents than there is now. See the article America, No. 101—113.

Our author likewise observes, that though the ark rested on Mount Ararat, yet we are not told where it was built, which might be far enough from the place where it is commonly supposed; so that these animals which are peculiar to America might not have so far to travel to the ark as is commonly imagined. This argument, however, seems to be very inconclusive; for though we should suppose the ark to have been constructed in America itself, the animals of Mesopotamia would have had as far to travel from thence to America, as the American animals from their own country to Mesopotamia, according to the common opinion. But in whatever part of the earth Noah lived and the ark was built, it was at God's command that the several kinds of animals came hither in order to their preservation; and his command could bring them from the farthest parts of the earth during the 120 years that all the world lay under condemnation. Though after all, none of the animals might have very far to travel to the ark; for if only one pair of each kind was created at first, and all of these in or near one place, since they were all brought before Adam, and received names from him, there is no absurdity in supposing that some of every kind might remain in the country where they were first produced, from whence Noah's habitation might not be very distant. Neither can any objection be brought from the extinction of some species of animals in certain countries of the world, since they might have been hunted and destroyed either by the human race or by other creatures. Thus it is said, that there are now few or no deer in Switzerland, though formerly there were a great many when it was full of woods. In Britain also there are no wolves now to be found, though the island was infested with them in former times.

In considering the subject of the deluge, among other questions which occur, one is, by what means were these ravenous animals, which feed only upon flesh, supported in the ark? For this some authors have supposed, that Noah, besides these animals whom he took into the ark for preservation, took likewise a great number for slaughter. For this purpose Bishop Wilkins has allowed no fewer than 1825 sheep, though he was of opinion that there were no carnivorous animals before the flood; and this latter opinion is adopted by Mr. Cockburn. The idea of slaughtering a number of harmless animals to satisfy a few vile rapacious ones, and that too in a place designed for the common asylum of the animal creation, seems inconsistent with that scheme of mercy displayed in the whole transaction. It is by much the more probable supposition then, that though some animals had been accustomed to live on flesh in their natural state, they could nevertheless subsist upon vegetable food. This seems the more probable, as some animals naturally carnivorous, particularly dogs and cats, may be supported in their domestic state by vegetable food alone. If we extend this to the whole canine and feline genera, we shall take in most of the beasts of prey; as lions, tigers, leopards, panthers, wolves, foxes, hyenas, &c. Bears are well known sometimes to feed on berries; swans will eat bread and milk; and there is no reason to suppose that the most carnivorous birds could not be kept alive by grain or other vegetable food. By thus excluding such a number of useless animals, a very considerable space will be allowed for the circulation of air in the ark, the want of which seems to be the most inexplicable difficulty, if we may judge from the present constitution of things. It seems indeed to be certain, that no equal number of animals could subsist for a twelvemonth in an equal space so closely shut up as they were. The ark, it is true, contained near two millions of cubic feet; but considering the number of its inhabitants,
habitants, the great space necessary for the food with which they were to be supplied, and the continual pollution of the air by their dung and filth, as well as the effluvia from their bodies, there seems little probability that even such a vast bulk of air could suffice for any length of time. This difficulty will appear the greater, when we consider that this ventilation was impossible, as this could not have been done without opening both the door and window; and the former, we are certain, was not opened until the time that the command was given to come forth out of the ark. Neither is there the smallest probability, that the opening of a single window could renew the air in such a manner as to make it fit for breathing throughout the whole extent of the ark.

In this particular, therefore, we must have recourse to the immediate interposition of Divine power, and suppose that the air was miraculously preserved of a sufficient degree of purity, as the garments of the inhabitants were preserved, by the turning old, and their feet from being affected by the journey through the desert in which they wandered so long. Many other questions concerning the economy of the ark might be proposed, as, how they supplied themselves with water; in what manner they could use fire for the dressing of their victuals, &c. But as every answer to these must be founded wholly upon conjecture, and none can pretend that there was a natural impossibility of effecting any of these things, we forbear to insist farther upon them. The case, however, is very different with respect to the air necessary for sustaining animal life; for here there is a plain impossibility in a natural way; nay, we may even doubt whether the general mass of atmosphere, after being deprived of its electric matter, or otherwise altered in such a manner as to let fall such a quantity of the water it contained, was fit for the support of human life; so that a miracle would have been necessary at any rate. To this indeed it may be replied, that on such a supposition, men and other animals would have been destroyed, not by the flood, but by the vitiated air they breathed. But, as it has been already hinted, it is improbable that any living creature could resist the violent rain which took place, and which would soon drive the birds from their shelter, as the waters beginning to overflow the ground would soon expel the human race from their houses; and it would not be till the end of the 40 days and 40 nights that the air could be at its worst state, long before which time all animal life would be extinct.

We shall conclude this article with considering some of the alterations which are supposed to have taken place in the world in consequence of the deluge. One of these is the much greater quantity of water on the present than on the old world. Dr. Keill has indeed endeavoured to prove, that the present extent of the surface of the waters is necessary to raise such a quantity of vapours as may supply the surface of the earth with rain and with springs. In answer to this, it is said, that it may be justly questioned whether all springs are derived from the vapours raised by the sun's heat and, 2. Whether the primitive earth stood in need of such a quantity of rain to render it as fertile as the present? Dr. Woodward gives the following reason for supposing the antediluvian seas to have been nearly of the same extent with those at present, viz. that the spoils of the sea, the shells and other marine bodies, are left in such prodigious numbers, and in heaps upon heaps in the earth, besides those which have long since perished, that they could not have been left in such quantities, had not the seas occupied much the same space as they do now. This argument, however, is thought by Mr. Cockburn to be also inconclusive: "For (says he), 1. Animal food, whether fish or flesh, was not used by mankind before the deluge; but, 2. Suppose it had, yet for the first 500 years the number of mankind was but small, and likely at a great distance from the sea; so that the increase of all kinds of fish during so long a time must have been prodigious. We need not be surprised, then, at the immense quantities of the exuviae of marine animals left on the earth by the deluge. But the reason he brings to prove that the several continents of the world were encompassed with seas as they are now, viz. that there are different sorts of fishes in the different seas of the world, so the exuviae of the same kind are generally found upon contiguous lands, does not always hold, since there are some shells found in the continent which are strangers to the parts of the sea conterminous to these continents. That the seas in the present earth are vastly more extended, and consequently the dry land so much less in proportion, may likewise be inferred from the great multitude of islands that lie near the shores of the greater continents, if it be true, what some allege, that they are parts broken off by the deluge from the main land, which before that reached to and beyond them. And though islands are thought to be rarely found in the great ocean, yet there have of late been found in the midst of the Indian ocean vast clusters of islands, &c.

To all this it may be replied, That the Mosaic account says nothing of the extent of the seas either before or after the flood; but simply tells us, that the waters were poured out upon the surface of the earth from the windows of heaven and the fountains of the deep, and that as the flood decreased, the waters returned from off the face of the earth. If part of them returned, we have not the least reason to suppose that the whole did not do so likewise. That the fish, as well as land animals, were more numerous in the antediluvian world than now when such quantities are destroyed by mankind, is very probable, as we see they abounded to this day in uninhabited places. This may account for the astonishing quantities of their exuviae to be met with in many different parts of the earth; but from the formation of islands nothing can be concluded concerning the antediluvian world. Late discoveries have shown that many islands have a volcanic origin; others are formed by the growth of coral; some by an accumulation of sea-weeds and other matters floating on the surface of the ocean, and detained upon sand banks or sunk rocks: while not a few of those near the great continents owe their origin to the quantities of mud brought down by the great rivers which empty themselves into the ocean. Authentic history scarcely affords an instance of an island formed by the breaking off a piece from the continent, though it does many of islands being joined to continents by some one or other of the causes just mentioned.

The inferior fertility of the earth after the deluge is much
much insisted upon by the same author, for the following reasons: 1. The grant of animal food to Noah and his posterity; which he thinks is an indication of greater barrenness in the ground than formerly. 2. Our Saviour compares the days of Noah with those of Lot; and as the country about Sodom is said to have been exceedingly fertile like the garden of the Lord, he is of opinion that the antediluvian world must have been very fertile also. 3. As (according to Dr Woodward) the first earth brought forth all manner of plants of itself, without any labour or culture of man, and even before there was a man to till the ground, we may reasonably suppose that the exterior stratum or surface of the earth consisted of such terrestrial matter as was fit for these productions; that is, of a rich light mould, affording plentifully matter for vegetation. Now, though God was pleased, upon man’s transgression, to withdraw in part his beneficence from the earth; yet the earth itself was untouched till the deluge, the same surface of rich mould was still upon it, and brought forth plentifully, especially when man’s culture for corn was added. But the inundation of waters at the deluge greatly altered the constitution of the earth itself; it mixed and confounded this upper stratum of vegetative earth with other terrestrial matter not fit for vegetation, with sand, gravel, stones, and all kinds of mineral matter, which must needs render the earth in general much less fertile than before, and which made the plough necessary to dig up the proper vegetative mould, and bring it to the surface, and also manure or compost to increase and enrich it; neither of which before the flood it needed.

There is a moral reason why the earth after the flood should be less fertile than before. The luxuriant productions of the first earth, after man’s nature became corrupted, and to deviate more and more from righteousness, served only to excite and foment his lusts, and to minister plentiful fuel to his vices and luxury. To cut off, therefore, such occasion sin and wickedness, God, in great mercy to men, entrenched the earth in its former fertility, thereby obliging them to labour and diligence, and employing most of their time to procure their necessary subsistence, which the earth by diligent culture will still afford, but not that luxuriant abundance it did before the flood. If we take a survey of the different regions and countries of the world, we shall find this to be the truth of the case. Some places, both in Asia and America, are as it were a paradise in respect of the rest, to show us perhaps what was and would have been the state of the earth had not man sinned; but far the greatest part is nothing to be compared to these, and evidently shows that effect which the sins of men had upon the earth itself. In a word, if we take a survey of the whole, it cannot be thought that the first blessing was restored to the earth after the flood, or that it came out of the hands of its Maker, in the state it is at present, since so great a part of it bears still the marks of the curse laid upon it.

Notwithstanding all that is here alleged, the extraordinary fertility of the ancient earth must still appear very problematical, if we consider all circumstances. For,

1. Even at the creation, when the earth was at its utmost perfection, we cannot suppose that every part of it produced spontaneously like the garden of Eden. On the contrary, we are told that this garden was planted by the Lord God, and that Adam was put into it to dress it and keep it. It appears, therefore, that even in the Paradisaical state the earth would not have produced food for man without culture; for as God planted the first garden, there can be no doubt that had man continued in his state of innocence and multiplied, he must have planted other gardens when it became necessary. After the fall, the fertility of the earth was expressly removed, and that not in a slight degree; but if we can judge from the present state of things, it must have become extremely wild and barren. Thus, when it is said, “Thorns also and thistles shall it bring forth to thee;” we may judge of the state of the soil from that which we see bringing forth thorns and thistles at this day. Every one knows that an abundant crop of these weeds indicates poor ground, which will require a great deal of cultivation to bring it into order. Nay, that we may be sure that the cultivation of the earth was at this time no easy matter, it is likewise said, “In sorrow shalt thou eat of it all the days of thy life.” Hence it would appear, that the antediluvian earth, instead of being more fertile, was much more barren than at present. That the labour of cultivating the ground at that time was also so great as to be almost intolerable, is evident from the speech of Lamech on the birth of Noah: “This same (says he) shall comfort us concerning our work and toil of our hands, concerning the ground which the Lord hath cursed.”

2. There is a very evident natural reason why the antediluvian world should have been more barren than the present, and why the deluge should have removed that barrenness. Under the article Antediluvian, No. 19. it is hinted, that the purity of the air at that time was a principal cause of the longevity of the human race. If this was really the case, which is very probable, we must suppose the atmosphere to have then contained a greater quantity of pure air than it does at present; for experiments have put it beyond doubt, that from this the support of animal life is immediately derived. But this kind of air, however favourable to animal life, is found to be very unfavourable to vegetation; and therefore in proportion to its abundance in the antediluvian atmosphere, the animals will be healthy, and the vegetables weak, puny, and sickly. But the deluge, by overflowing the earth for a whole year, destroyed every animal and vegetable, and consequently induced a vast putrefaction all over the globe; the consequence of which was the production of an immense quantity of what is called phlogisticated air (noxious gas). This, mixing with the pure atmosphere, vitiated it to such a degree as to make it less friendly to animal life, but more so to vegetation. Hence the present world must naturally be more fertile than the former; and not only on this account, but by reason of its being manured by the stagnation of the waters upon its surface for a twelvemonth, and the immense quantity of animal matter left by them, the ground, instead of being lessened in its fertility, as Dr Woodward supposes, must have been restored, as far as we can judge, to the very state it was in at its original formation.

3. That this was really the case appears probable from what
what the Deity said to Noah after offering up his sacrifice. "I will not (says he) curse the ground any more for man's sake." Now this was plainly intimating that the earth was restored to its primitive fertility, and that he would no more take it away; for when he did so to the primitive world, it was in these words, "Cursed is the ground for thy sake." That the curse here alluded to was really the depriving the earth of its fertility, and not the overflowing the earth with water, is evident; because, after declaring that he would no more curse the ground for man's sake, he adds, "Neither will I again smite every living thing as I have done."

4. The moral reasons assigned why the present world should be less fertile than the former, seem to be inconclusive. However barren we may reckon the earth just now, it is certain that it produces, or might produce, much more than would suffice for all its inhabitants. The difficulties which mankind undergo are not at all owing to the barrenness of the earth, but to their own conduct, or their oppression of one another. Neither does it clearly appear that animal food is in any degree cheaper than vegetable, but rather the contrary: so that whatever was the reason of this grant after the flood, we cannot fairly ascribe it to a foresight of the future barrenness of the earth.

Another question which naturally occurs on the subject of the deluge is, Whether there was any rain before it or not? The argument against the existence of rain before the flood, is obviously derived from the rainbow being made a symbol of the divine favour immediately after. It is certain, indeed, unless we suppose the nature of light or of water to have been different before this event from what it was afterwards, there is a natural impossibility of the refraction of the sun's light being prevented from showing the appearance of a rainbow, whenever the sun and clouds were in a certain position with regard to one another. It appears improbable to those who take this side of the question, that the Deity should institute any thing as an emblem of his displeasure being turned away, when the same emblem had been seen perhaps a very short time before the catastrophe happened. On the other hand, it is replied, that there is no absurdity in supposing it to have been the case; for though the rainbow existed before the deluge, yet it never was appointed to be the symbol of this particular event, viz. the reconciliation of the Deity; and the impossibility of vegetables being supplied with a sufficient quantity of moisture without rain, is likewise urged as a decisive argument. Still, however, it appears, that even vegetation may subsist, and that in its utmost perfection, without rain; for we are informed, that by means of a mist the ground was originally watered, and vegetables supplied with moisture, before there was any rain; and if this was the case at one time, it might have been at any other, or at any number of times we can suppose. Indeed, as matters stand at present, this would undoubtedly be a very scanty supply; and perhaps so it was in the antediluvian world; and thus the want of rain might have been one cause of that barrenness in the antediluvian world which we have already mentioned as probable, and which Mr. Bryant mentions as the opinion of all the ancient mythologists.

DEMADÉS, a famous Athenian, who from being a mariner, became a great orator, and appeased Philip by his eloquence, after the famous victory over the Athenians at Chersonese, in the 338th year B.C.

DEMAIN, or DEMÉSNE, in Law, is commonly understood to be the lord's chief manor place, with the lands thereto belonging, which he and his ancestors have, time out of mind, kept in their own manual occupation.

DEMAND, in its popular sense, denotes a calling for or requiring one's due.

DEMAND, in Law, has a more special signification, as contradistinguished from plaint; for all civil actions are pursued either by demands or plaints, according to which the pursuer is called either demandant or plaintiff; viz. in real actions, demandant; and in personal actions, plaintiff. See Plaintiff.

DEMERARY, formerly a Dutch settlement in Guiana, now in possession of the English. See BPMARARA, SUPPLEMENT.

DEMESNE. See DEMAIN.

DEMESNE Lands. See Revenue.

DEMÉTRIA, a festival in honour of Ceres, called by the Greeks Demeter. The votaries of the goddess lashed themselves with whips made with the bark of trees. The Athenians had a solemnity of the same name in honour of Demetrios Poliorcetes.

DEMÉTRIUS, a son of Antigonus and Stratonice, surnamed Poliorcetes, "Destroyer of towns." At the age of 22, he was sent by his father against Ptolemy, who invaded Syria. He was defeated near Gaza; but he soon repaired his loss by a victory over one of the generals of the enemy. He afterwards sailed with a fleet of 250 ships to Athens, and restored the Athenians to liberty, by freeing them from the power of Cassander and Ptolemy, and expelling the garrison which was stationed there under Demetrius Phalerus. After this successful expedition, he besieged and took Monychia, and defeated Cassander at Thermopylae. His reception at Athens after these victories was attended with the greatest servility, and the Athenians were not ashamed to raise altars to him as a god, and consult his oracles. This uncommon success raised the jealousy of the successors of Alexander; and Seleucus, Cassander, and Lysimachus, united to destroy Antigonus and his son. Their hostile armies met at Ipsus, 299 years before the Augustan age. Antigonus was killed in the battle: and Demetrius, after a severe loss, retired to Ephesus. His ill success raised him many enemies; and the Athenians, who had lately adored him as a god, refused to admit him into their city. He soon after ravaged the territory of Lysimachus, and reconquered himself to Seleucus, to whom he gave his daughter Stratonice in marriage. Athens now laboured under tyranny, and Demetrius relieved it and pardoned the inhabitants. The loss of his possessions in Asia recalled him from Greece, and he established himself on the throne of Macedonia by the murder of Alexander the son of Cassander. Here he was continually at war with the neighbouring states, and the superior power of his adversaries obliged him to leave Macedonia, after he had sat on the throne for seven years. He passed into Asia, and attacked some of the provinces of Lysimachus, with various success; but fa-
Demetrius mine and pestilence destroyed the greatest part of his army, and he retired to the court of Seleucus for support and assistance. He met with a kind reception; but hostilities were soon begun; and after he had gained some advantages over his son-in-law, Demetrius was totally forsaken by his troops in the field of battle, and became an easy prey to the enemy. Though he was kept in confinement by his son-in-law, yet he maintained himself like a prince, and passed his time in hunting, and in every laborious exercise. His son Antigonus offered Seleucus all his possessions, and even his person, to procure his father’s liberty; but all proved inavailing, and Demetrius died in the 54th year of his age, after a confinement of three years, 286 years before Christ. His remains were given to Antigonus, and honoured with a splendid funeral pomp at Corinth, and hence conveyed to Demetrius. His posterity remained in possession of the Macedonian throne till the age of Perseus who was conquered by the Romans. Demetrius has rendered himself famous for his fondness of dissipation when among the dissolute, and for his love of virtue and military glory in the field of battle. He has been commended as a great warrior; and his ingenious inventions, his warlike engines, and stupendous machines in the war with the Rhodians, justify his claims to that character. He has been blamed for his voluptuous indulgences; and his biographer observes that no Grecian prince had more wives and concubines than Poliorcetes. His obedience and reverence to his father has been justly admired; and it has been observed, that Antigonus ordered the ambassadors of a foreign prince particularly to remark the cordiality and friendship which subsisted between him and his son.

Demetrius, surnamed Donatus, succeeded his father Antigonus on the throne of Macedonia. He reigned 12 years, and was succeeded by his son Philip.

Demetrius, a son of Philip king of Macedonia, delivered as an hostage to the Romans. His modesty delivered his father from a heavy accusation laid before the Roman senate. When he returned to Macedonia, he was falsely accused by his brother Perseus, who was jealous of his popularity, and his father too credulously consented to his death.

Demetrius I. surnamed Soter or Saviour, was son of Seleucus Philopator, the son of Antiochus the Great, King of Syria. His father gave him as a hostage to the Romans. After the death of Seleucus, Antiochus Epiphanes, the deceased monarch’s brother, usurped the kingdom of Syria, and was succeeded by his son Antiochus Eupator. This usurpation displeased Demetrius, who was detained at Rome. He procured his liberty on pretence of going to hunt, and fled to Syria, where the troops received him as their lawful sovereign. He put to death Eupator and Lysias, and established himself on his throne by cruelty and oppression. Alexander Bala, the son of Antiochus Epiphanes, laid claims upon the crown of Syria, and defeated Demetrius in a battle, 230 years before Christ.

Demetrius II. surnamed Nicator, or Conqueror, was son of Soter, to whom he succeeded by the assistance of Ptolemy Philometor. He married Cleopatra, the daughter of Ptolemy, who was before the wife of the expelled monarch Alexander Bala. Demetrius gave himself up to luxury and voluptuousness, and suffered his kingdom to be governed by his favourites. At that time a pretender son of Bala, called Diodorus Tryphon, seized a part of Syria; and Demetrius, to oppose his antagonist, made an alliance with the Jews, and marched into the east, where he was taken by the Parthians. Phraates, king of Parthia, gave him his daughter Rodogyno in marriage; and Cleopatra was so incensed at his new connection, that she gave herself up to Antiochus Sidetes her brother-in-law, and married him. Sidetes was killed in a battle against the Parthians, and Demetrius regained the possession of his kingdom. His pride and oppression rendered him odious; and his subjects asked a king of the house of Seleucus from Ptolemy Phuscon king of Egypt; and Demetrius, unable to resist the power of his enemies, fled to Ptolemais, which was then in the hands of his wife Cleopatra. The gates were shut up against his approach by Cleopatra; and he was killed by order of the governor of Tyre, whither he had fled for protection, A. U. C. 627. He was succeeded by Alexander Zebina, whom Ptolemy had raised to the throne.

Demetrius Philopator, a celebrated orator and Peripatetic philosopher, was the father of Theophrastus. He acquired so much authority at Athens, that he governed the city for ten years; and ruled with so much wisdom and virtue, that they set up 36 statues in honour of him. By the slander of some malicious persons in his absence, he was, however, condemned to die; and his image was pulled down; which, when Demetrius heard, he said, they could not pull down that virtue for which those images were set up. He escaped into Egypt, and was protected by Ptolemy Lagos. This king, it is said, asked his advice concerning the succession of his children to the throne; viz. whether he ought to prefer those he had by Eurdice to Ptolemy Philadelphus, whom he had by Berenice? and Demetrius advised him to leave his crown to the former. This displeased Philadelphus so much, that his father being dead, he banished Demetrius; who was afterwards killed by the bite of an asp. Demetrius composed more works in prose and verse than any other Peripatetic of his time; and his writings consisted of poetry, history, politics, rhetoric, harangues, and embassies. None of them are extant except his rhetoric, which is usually printed among the Rhetores Selecti.

Demetrius, a Cynic philosopher, disciple of Apollonius Tyaneus, in the age of Caligula. The emperor wished to gain the philosopher to his interest by a large present; but Demetrius refused it with indignation, and said, If Caligula wishes to bribe me, let him send me his crown. Vespasian was displeased with his insolence, and banished him to an island. The Cynic derided the punishment, and bitterly inveighed against the emperor. He died in a great old age; and Seneca observes that “nature had brought him forth to show mankind that an exalted genius can live securely, without being corrupted by the vices of the world.”

Demi (formed from dimidium), a word used in composition with other words to signify half.

Demi-Attic, boroughs or larger villages of Attica. The Athenian tribes were distinguished into Demi. Homer, in his catalogues, distinguishes the Athenians by the appellation Demos. And when Theseus prevailed, on
on them to quit the country and settle at Athens, they
still continued to frequent the demi, and to perform
their several religious ceremonies there.

**Demi-Culverin**, a piece of ordnance, usually 4½
inches bore, 2700 pounds weight, 10 feet long, and
carrying point blank 175 paces. A demi-culverin of the
least size is 4½ inches bore, 10 feet long, and 2000
pounds weight. It carries a ball of 4 inches diameter
and of 9 pounds weight, and its level range is 174
paces. A demi-culverin of the largest sort is 4½ inches
bore, 13½ feet long, and weighs 3000 pounds weight.
It carries a ball 4½ inches diameter, weighing 12
pounds 11 ounces, point blank 178 paces.

**Demi-Gorge**, in Fortification, is that part of the
polygon which remains after the flank is raised, and
goes from the curtain to the angle of the polygon. It
is half of the vacant space or entrance into a bastion.

**Demi-Quaver**, a note in Music, two of which are
equal to a quaver.

**Demi-Semi-Quaver**, in Music, the shortest note, two
of them being equal to a semiquaver.

**DEMISE**, in Law, is applied to an estate either in
fee-simple, fee-tail, or for a term of life or years; and
it is commonly taken in many writs. The king's
death is in law termed the demise of the king.

**DEMIURGE** (from δημος, which denotes a "public
servant," and ως "work"), in the mythology of the
eastern philosophers, was one of the ΞΟΙΣ employed
by the supreme Deity in the creation of the world.
He is represented as claiming dominion over the
new world he had formed; and excluding totally the
supreme Deity from all concern in it.

**DEMOCRACY**, from δημοσ, "people," and κράτος,
"to command" or "govern;" the same with a popular
government, wherein the supreme power is lodged in
the hands of the people; such were Rome and Athens
of old; but the most perfect example of democracy is
afforded by the United States of North America at the
present day, the government of which, for the security
it gives, the good order it preserves, the small burdens
it imposes, and the admirable judgment with which its
foreign and domestic policy has been conducted, de-
serves to be considered as one of the best and wisest in
the world. See Government, Supplement.

**DEMOCRITUS**, one of the greatest philosophers of
antiquity, was born at Abdera, a town of Thrace,
about the 80th Olympiad; that is, about 462 years
before Christ. His father, says Valerius Maximus,
was able to entertain the army of Xerxes; and Dio-
genae Laertius adds, upon the testimony of Herodotus,
that the king, in requital, presented him with some
Magi and Chaldeans. From these Magi and Chaldeans
Democritus received the first part of his education;
and from them, whilst yet a boy, he learned theology
and astronomy. He next applied to Leucippus, and
learned from him the system of atoms and a vacuum.
His father dying, the three sons, for so many there were,
divided the estate. Democritus made choice of that
part which consisted in money, as being, though the
least share, the most convenient for travelling; and it
is said, that his portion amounted to above 100 talents,
which is near 20,000l. sterling. His extraordinary
inclination for the sciences and for knowledge, induced
him to travel into all parts of the world where he hoped
to find learned men. He went to visit the priests of
Egypt, from whom he learned geometry; he consulted
the Chaldeans and the Persian philosophers; and it is
said that he penetrated even into India and Ethiopia,
to confer with the Gymnosophists. In these travels
he wasted his substance; after which, at his return, he
was obliged to be maintained by his brother; and if
he had not given proofs of the greatest understanding,
and thereby procured to himself the highest honours,
and the strongest interest of his country, he would have
incurred the penalty of that law which denied in-
terment in the family-sepulchre to those who had spent
their patrimony. After his return from travelling, he
lived at Abdera, and governed there in a most absolute
manner, by virtue of his consummate wisdom. The
magistrates of that city made him a present of 300 ta-
lents, and erected statues to him even in his lifetime:
but being naturally more inclined to contemplation
than delighted with public honours and employments,
he withdrew into solitude and retirement. Democri-
tus incessantly laughed at human life as a continued
farce, which made the inhabitants of Abdera think he
was mad; on which they sent Hippocrates to cure
him; but that celebrated physician having discoursed
with the philosopher, told the Abderians, that he had
a great veneration for Democritus; and that in his
opinion, those who esteemed themselves the most healthy
were the most distempered. Democritus died, ac-
cording to Diogenes Laertius, in the 361st year before
the Christian era, aged 109. It is said that he put out
his eyes, in order that he might meditate more pro-
foundly on philosophical subjects; but this has little
probability. He was the author of many books, which
are lost; and from these Epicurus borrowed his philosophy.

**DEMOLIURE, ABRAHAM**, an eminent mathematician,
born at Vitri in Champagne, May 1667. The revocation of
the edict of Nantz, in 1685, determined him to fly into
England, rather than abandon the religion of his fathers. He laid the foundation of
his mathematical studies in France, and perfected him-
self at London; where a mediocrity of fortune obliged
him to employ his talents in this way, and to read pub-
lic lectures for his better support. The *Principia
Mathematica* of Newton, which chance is said to have
thrown in his way, made him comprehend at once,
how little he had advanced in the science he professed.
He fell hard to work; he succeeded as he went along;
and he soon became connected with, and celebrated
among the first-rate mathematicians. His eminence
and abilities soon opened to him an entrance into the
Royal Society of London, and afterwards into the Acad-
emy of Sciences at Paris. His merit was so known
and acknowledged by the former, that they judged him
a fit person to decide the famous contest between New-
ton and Leibnitz. The collection of the academy of
Paris contains no memoir of this author, who died at
London Nov. 1754, soon after his admission into it;
but the Philosophical Transactions of London have se-
veral, and all of them interesting. He published also
some capital works, such as, *Miscellanea Analytica, de
seriebus et quadraturis*, &c. 1730, 4to. But perhaps
he has been more generally known by his "Doctrine
DEM [ 158 ]

of Chances; or, Method of calculating the Probabilities of Events at Play." This work was first printed 1618, in 4to, and dedicated to Sir Isaac Newton: it was reprinted 1758, with great alterations and improvements; and a third edition was afterwards published with additions, and "A Treatise on Annuities," dedicated to Lord Carpenter.

DEMONSTRABLE, a term used in the schools to signify that a thing may be clearly proved. Thus, it is demonstrable, that the three angles of a triangle are equal to two right ones.

DEMONSTRATION, in Logic, a series of syllogisms, all whose premises are either definitions, self-evident truths, or propositions already established. See Logic.

DEMONSTRATIVE, in Grammar, a term given to such pronouns as serve to indicate or point out a thing. Of this number are hic, hie, hoc, among the Latin; and this, that, these, those, in English.

DEMOSTHENES, the famous Athenian orator, was born at Athens 381 B.C. He lost his father at seven years of age; and was placed under the conduct of guardians, who robbed him of his substance, and neglected his education. Demosthenes repaired this loss by his love of eloquence and his extraordinary abilities. He became the disciple of Isaeus and Plato, and applied himself to study the orations of Isocrates. At the age of 17 he gave an early proof of his eloquence and abilities against his guardians, from whom he obtained the retribution of the greatest part of his estate. His rising talents were, however, impeded by various natural defects. But these were at last conquered by dint of resolution and unwearied attention. He declined by the sea-shore, that he might be used to the noise of a tumultuous assembly; and with pebbles in his mouth, that he might correct a defect in his speech. He practised at home with a naked sword hanging over his shoulder, that he might check an ungraceful motion to which he was subject. He also confined himself in a subterranean cave, to devote himself more closely to studious pursuits; and to eradicate all curiosity of appearing in public, he shaved one half of his head. In this solitary retirement, by the help of a glimmering lamp, he composed the greatest part of his orations, which have ever been the admiration of every age; though his contemporaries and rivals inveighed against them, and observed that they smelt of oil. His abilities as an orator raised him to consequence at Athens, and he was soon placed at the head of government. In this public capacity he roused his countrymen from their indolence, and animated them against the encroachment of Philip of Macedonia. In the battle of Cheronea, Demosthenes betrayed his pusillanimity, and saved his life by flight. After the death of Philip, he declared himself warmly against his son and successor Alexander; and when the Macedonians demanded of the Athenians their orators, Demosthenes reminded his countrymen of the fable of the sheep, which delivered their dogs to the wolves. By the prevalence of party, however, he was forced to retire from Athens; and in his banishment, which he passed at Trozen and Ægina, he lived with more effeminacy than true heroism. When Antipater made war against Greece after the death of Alexander, Demosthenes was publicly recalled from his exile, and a galley was sent to fetch him from Ægina. His return was attended with much splendour, and all the citizens crowded at the Piraeus to see him land. His triumph and popularity were short. Antipater and Craterus were near Athens, and demanded all the orators to be delivered up into their hands. Demosthenes fled to the temple of Neptune in Calauria; and when he saw that all hopes of safety were vanished, he took a dose of poison, which he always carried in a quill, and expired on the day that the Thesmophoria were celebrated, 332 years before Christ. The Athenians raised a brazen statue to his honour, with an inscription translated into this distich:

Si tibi par menti robur, Vir magne, fuisset,
Grecia non Macedo succuluisse hero.

Demosthenes has been deservedly called the prince of orators. Indeed no orator had ever a finer field than Demosthenes in his Olynthiacs and Philippics, which are his capital orations; and undoubtedly to the greatness of the subject, and to that integrity and public spirit which breathe in them, they owe a large portion of their merit. The subject is, to excite the indignation of his countrymen against Philip of Macedon, the public enemy of the liberties of Greece; and to guard them against the treacherous measures by which that crafty tyrant endeavoured to lull them into a neglect of their danger. To attain this end, we see him use every proper means to animate a people distinguished by justice, humanity, and valour, but in many instances become corrupt and degenerate. He boldly accuses them of venality, indolence, and indifference to the public good; while, at the same time, he reminds them of their former glory and of their present resources. His contemporary orators, who were bribed by Philip, and who persuaded the people to peace, he openly reproaches as traitors to their country. He not only prompts to vigorous measures, but teaches how they are to be carried into execution. His orations are strongly animsted, and full of the impetuosity and ardour of public spirit. His composition is not distinguished by ornament and splendour. It is an energy of thought, peculiarly his own, which forms his character, and raises him above his species. He seems not to attend to words, but to things. We forget the orator, and think of the subject. He has no parade and ostentation, no studied introductions: but is like a man full of his subject; who after preparing his audience by a sentence or two for the reception of plain truths, enters directly on business.

The style of Demosthenes is strong and concise; though sometimes, it must be confessed, harsh and abrupt. His words are highly expressive, and his arrangement firm and manly. Negligent of lesser graces, he seems to have aimed at that sublimity which lies in sentiment. His action and pronunciation are said to have been uncommonly vehement and ardent; which, from the manner of his writings, we should readily believe. His character appears to have been of the austere rather than of a gentle kind. He is always grave, serious, passionate; never degrading himself, nor attempting any thing like pleasantry. If his admirable eloquence be in any respect faulty, it is that he sometimes borders on the hard and dry. He may
may be thought to want smoothness and grace; which
is attributed to his imitating too closely the manner
of Thucydides, who was his great model for style,
and whose history he is said to have transcribed eight
times with his own hand. But these defects are
more than atoned for by that masterly force of mas-
culine eloquence, which, as it overpowered all who
heard it, cannot in the present day be read without
emotion.
Cicero calls him a perfect model, and such as he him-
sclf wished to be. These two great princes of eloquence
have been often compared together; but the judgment
hesitates to which to give the preference. The arch-
bishop of Cambrai, however, seems to have stated their
merits with great justice and perspicuity in his Reflec-
tions on Rhetoric and Poetry. The passage, transla-
ted, is as follows: "I do not hesitate to declare that
I think Demosthenes superior to Cicero. I am per-
suaded no one can admire Cicero more than I do. He
adorns whatever he attempts. He does honour to lan-
guage. He disposes of words in a manner peculiar
to himself. His style has great variety of character.
Whenever he pleases, he is even concise and vehement,
for instance, against Catiline, against Verres, against
Antony. But ornament is too visible in his writings.
His art is wonderful, but it is perceived. When the
orator is providing for the safety of the republic, he
forgets not himself, nor permits others to forget him.
Demosthenes seems to escape from himself, and to see
nothing but his country. He seeks not elegance of
expression; unsought for, he possesses it. He is su-
perior to admiration. He makes use of language, as
a modest man does of dress, only to cover him. He
thunder, he lightens. He is a torrent which carries
everything before it. We cannot criticise, because
we are not ourselves. His subject enchains our atten-
tion, and makes us forget his language. We lose him
from our sight; Philip alone occupies our minds. I
am delighted with both these orators; but I confess
that I am less affected by the infinite art and magnif-
cent eloquence of Cicero, than by the rapid simplicity
of Demosthenes."

DEMPSTER, Thomas, a very learned man, but
of a singular character. He was born in Scotland, but
we do not find in what year. He went over to France
for the sake of embracing the Catholic religion, and
taught classical learning at Paris about the beginning
of the 17th century. Though his business was to teach
school, yet he was as ready to draw his sword, and as
quarrelsome, as if he had been a duellist by profession;
and it is said, that there scarce passed a day but he had
something or other of this kind upon his bands. This
spirit and turn of temper drew him into many scandals;
and one in particular, which obliged him to quit the
country. Grangier, principal of the college of Beau-
vais at Paris, being obliged to take a journey, appoint-
ed Dempster his substitute. Dempster caused whip
a scholar, in full school, for challenging one of his fel-
lovas to fight a duel. The scholar, to revenge this
affront, brought three gentlemen of his relations, who
were of the king's life Guards, into the college. Dempo-
ster made the whole college take arms; hamstrung the
three life-guard-men's horses before the college-gate;
and put himself in such a posture of defence, that
the three sparks were forced to ask for quarter. He
gave them their lives; but imprisoned them, and did
not release them for some days. They sought another
way to revenge themselves: they caused an informa-
tion to be made of the life and moral behaviour of
Dempster, and got some witnesses to be heard against
him. Upon this he went over to England, where he
found refuge; but did not make any long stay. He
went abroad again, and read lectures upon polite learn-
ing in several universities; in that of Nismes particu-
larly, where he disputed for a professor's chair, and ob-
tained it. He went to Bologna, and was professor
there for the remainder of his life; and was there also
admitted a member of the Academy Della Rotte. He
died there in September 1625, leaving behind him se-
veral learned works; as Commentaries on Rosmaude
Antiquitatis Romanorum, and upon Claudian, &c.; four
books of epistles; several dramatic pieces, and other
poems; some books of law; an Apparatus to the His-
tory of Scotland; a Martyrology of Scotland; and a
List of the Scottish Writers.

DEMPSTER of Court, the name formerly given in
Scotland to the common executioner or hangman.

DEMPSTER, or DEEMSTER. See DEMISTER.

DEMULCENTS, among physicians, medicines
good against scrofulous humours. Such are the roots
of marsh-mallows, of white lilies, of liquorice, and of
viper-grass, the five emollient herbs, &c.

DEMURRAGE, in Commerce, an allowance made
to the master of a ship by the merchants, for staying in
a port longer than the time first appointed for his de-
parture.

DEMURRER, in Law, a stop put to any action
upon some point of difficulty which must be determined
by the court, before any further proceedings can be
had in the suit.

DEN, a syllable which, added to the names of
places, shows them to be situated in valleys or near
woods; as Tenterden.

DENERIUS, in Roman antiquity, the chief silver
coin among the Romans, worth in our money about
sevenpence three farthings. As a weight, it was the
seventh part of a Roman ounce.

DENARIUS, is also used in our law-books for an
English penny.

DENBIGHSHIRE, a county of Wales, bounded on
the south by Merioneth and Montgomery shires, on
the north by Flintshire and the Irish sea, on the west
by Caernarvon. It contains 410,000 acres, a considerable part of
which is rugged and mountainous. It contained 66,400 in-
habitants in 1811. The soil in general is barren; but
the vale of Clwyd, so called from its being watered by
that river, is a very fertile pleasant spot of great ex-
tent. The chief commodities are black-cattle, sheep,
and goats, rye, called here amelcorn, and lead-ore. The
county sends two members to parliament, viz. a knight
for the shire, and a burgess for Denbigh the capital.
See DENBIGHSHIRE, SUPPLEMENT.

DENBIGH, the capital town in Denbighshire in North
Wales. It is seated on the side of a rocky hill, on a
branch of the river Clwyd, and was formerly a place
of great strength, with an impregnable castle, now de-
monstrous. It is pretty large, well-built, and inhabited
by.
DENDRACHATES, in Natural History, the name used by the ancients for an extremely elegant and beautiful species of agate, the ground of which is whitish, variegated with veins of a brighter white. These veins are beautifully disposed in a number of various figures; but generally in many concentric irregular circles, drawn round one or more points. It is common also, in various parts of this stone, to find very beautiful delineations of trees, mosses, sea-plants, and the like, so elegantly expressed, that many have erroneously taken them for real plants included in the substance of the stone: whence the name dendrachates.

DENDROMETER, (from δένδρων a tree, and μετρῷ I measure, an instrument invented by Messrs Duncombe and Whittle, for which they obtained a patent; and so called from its use in measuring trees. This instrument consists of a semicircle A (fig. 1.), divided into two quadrants, and graduated from the middle: upon the diameter B there hangs a plummet L for fixing the instrument in a vertical position: there is also a chord D parallel to the diameter, and a radius E, passing at right angles through the diameter and chord. From a point on the radius hangs an altimeter G, between the chord and diameter, to which is fixed a small semicircle C, and a screw, to confine it in any position. The altimeter, which is contrived to form the same angle with the radius of the instrument as the tree forms with the horizon, is divided from its centre both ways into forty equal parts: and these parts are again subdivided into halves and quarters. Upon the small semicircle G, on which is accounted the quantity of the angle made by the altimeter and radius, are expressed degrees from 60 to 120, being 30 on each quadrant. The radius is numbered with the same scale of divisions as the altimeter. There is also a nonius to the small semicircle, which shows the quantity of an angle to every five minutes. On the back of the instrument the stock M of the sliding piece is confined to the axis N, which moves concentrically parallel to the elevation index F on the opposite side, to which it is fixed. This index is numbered by a scale of equal divisions with the altimeter and radius; at the end of the index is a nonius, by which the angles of elevation above, or of depression below, the horizon, measured upon the semicircle of the instrument, are determined to every five minutes. There is also a groove in the radius, that slides across the axis by means of a screw I, working between the chord and semicircle of the instrument; and this screw is turned by the key O.

Upon the stock M (fig. 2.) is a sliding piece P, that always acts at right angles with the altimeter, by means of a groove in the latter. To the shank of the sliding piece is affixed a moveable limb Q, which forms the same angle with the altimeter as the boughs forms with the body or trunk of the tree. This limb may be of any convenient length, divided into equal parts of the same scale with all the foregoing divisions. At the extremity of the fixed axis, on a centre, an index R, with telescope sights, works horizontally upon the moveable limb of the sliding piece. Upon this horizontal index R may be fixed a small quadrant T, described with any convenient radius from the centre on which the index moves, and divided into 90 degrees, beginning at a right line drawn from the centre at right angles with the fiducial edge of the said index; and upon the extremity of the axis is a nonius, whereby to determine the quantity of an angle upon the quadrant every five minutes. There are also two small circular arcs S, serving to keep the sights in a parallel position, each containing an equal number of degrees. Upon these arcs is measured the angle, subtending a side equal to the difference of the altitudes of the observed objects above the plane of the horizon, and whose base is the nearest distance between the perpendiculars in which those objects are situated. The dendrometer is fitted to a theodolite, and may be used either with or without it as occasion requires.

The principal use of this instrument is for measuring the length and diameter of any tree, perpendicular or oblique to a horizontal plane, or in any situation of the plane on which it rests, or of any figure, whether regular or irregular, and also the length and diameter of the boughs, by mere inspection; and the inventors of it have calculated tables, annexed to their account of the instrument itself, by the help of which the quantity of timber in a tree is obtained without calculation, or the use of the sliding rule. The instrument is rectified by setting it in a perpendicular position, by means of the plummet, and screwing it to the staff; then the altimeter is placed in the exact position of the tree, whether perpendicular, reclining, or inclining, and screwed fast. If the tree stands on level ground, the horizontal distance from the tree to the axis of the instrument is measured with a tape-line, and the radius is moved with the key till that distance be cut upon it by the inside of the diameter; but if the ground be slanting, the distance from the tree to the instrument is measured, and the elevation index is moved till the point of the tree from which the distance was measured is seen through the sights, and there screwed fast; and the radius is moved backwards or forwards with the key, till this distance is cut upon the elevation index by the perpendicular line of the altimeter; and the horizontal line will be marked upon the radius by the inside of the diameter. In order to obtain the length of the tree, the elevation index is first moved downwards, till the bottom of the tree cut by the horizontal wires is observed through the sights, and the feet and inches marked by the index upon the altimeter below the point of sight or horizontal line are noted down: then the index is moved upwards till the part to which you would measure, cut by the horizontal wires, is seen, and the feet and inches marked on the altimeter above the point of sight are noted:
Dendrometer, an instrument for measuring distances by a single observation, which has been proposed by Mr Pitt of Pendeford, near Wolverhampton, and of which the following is the description in the words of the author.

"The idea of an instrument to measure distances by a single observation, has sometimes been discussed, both in conversation and upon paper; and, though the subject has generally been treated with neglect, and even with a kind of contempt, by sound mathematicians, upon an idea of its extravagance and eccentricity, or upon a supposition of its being founded upon false principles, yet I cannot but strongly recommend it to the attention of the ingenious mathematical instrument maker, as an article perhaps capable of being brought to a higher degree of perfection than has generally been supposed.

"The method of determining distances by two observations, from either end of a base line, is well known to every one in the least degree conversant with plane trigonometry: that of determining such distances by one observation has been less explained and understood; and to this I wish to call the attention of the ingenious, whose local circumstances of situation may enable them to investigate and improve the subject.

"To determine distances by one observation, two methods may be proposed, founded on different principles; the one, on the supposition of the observer being in the centre, and the object in the circumference, of a circle; the other, on the contrary supposition, of the observer being in the circumference, and the object in the centre.

"To determine the distance of any object on the first supposition, of the observer being in the centre, the bulk or dimensions of such object must be known, either by measure or estimation; and the angle formed by lines drawn to its extremities being taken, by an accurate instrument, the distance is easily calculated; and such calculations may be facilitated by tables, or thermometers adapted to that purpose. For this method, our present instruments, with a nomen, and the whole very accurately divided, are sufficient; the only improvement wanting seems to be, the application of a micrometer to such instrument, to enable the observer to read his angle with more minute accuracy, by ascertaining not only the degrees and parts of a degree, but also the minutes and parts of a minute.

"As, in this method, the bulk of inaccessible objects can only be estimated, the error in distance will be exactly in the proportion of the error in such estimation; little dependence can therefore be placed on distances thus ascertained. For the purposes of surveying, indeed, a staff of known length may be held by an assistant; and the angle from the eye of the observer to its two ends being measured by an accurate instrument, with a micrometer fitted to ascertain minutes and parts of a minute, distances may be thus determined with great accuracy; the application of a micrometer to the theodolite, if it could be depended upon, for thus determining the minute parts of a degree, in small angles, is very much a desideratum with the practical surveyor.

"This method of measuring distances, though plain and simple enough, I shall just beg leave to illustrate by an example; suppose A, (fig. 3) the place of the instrument;
Suppose the length of the staff BC be 100 inches, or other parts; divide the number 343,500 by the minutes contained in the angle $A$, the quotient will be the distance $AB$, or $AC$, in the same parts.

The number 343,500 becomes the dividend in this case, because the arc of a circle subtending an angle of 343.5 minutes, or $57^\circ 45'$, is equal in length to the radius, and the object staff BC is supposed divided into 100 equal parts.

Thus, suppose the angle $A$ be $1^\circ$, or $60'$, then, $60 \times 343,500 = 5715$ inches $= AB$.

Or, if the angle $A$ be $60' 15'$, then $60 \times 343,500 = 5715.5$ inches.

Hence it appears, that an error of $\frac{r}{6}$ of a minute in the angle $A$, would cause an error of 9 inches and a half in the distance $AB$, or about $\frac{2}{3}$ part of the whole; the accuracy, therefore, of thus taking distances, depends upon the accuracy whereby angles can be ascertained; and the error in distance will bear the same proportion to the actual distance, as the error in taking the angle does to the actual angle.

But this method of ascertaining distances cannot be applied to inaccessible objects, and it is moreover subject to the inconvenience of an assistant being obliged to go to the object whose distance is required, (an inconvenience almost equal to the trouble of actual admeasurement), therefore the perfection of the second method proposed (if attainable) is principally to be desired; namely, that of conceiving the observation made on the circumference of a circle, whose centre is in the object whose distance is to be ascertained; and none of our instruments now in use being adapted to this mode of observation, a new construction of a mathematical instrument is therefore proposed, the name intended for which is the *Dendrometer*.

This name is not now used for the first time, it was applied in the same way by a gentleman who had, as I have been informed, turned his thoughts to this particular subject; but I do not find that he ever brought his instrument into use, or explained its principles; nor do I understand that this principle has ever been applied in practice, for the familiar purpose of ascertaining terrestrial distances in surveying, or otherwise; though the same principle has been so generally, and successfully, applied, in determining the distance of the heavenly bodies by means of their parallax.

The following principles of construction are proposed, which may perhaps be otherwise varied and improved. O, fig. 4, the object whose distance is required; ABCDE the instrument in plano; BC, a telescope, placed exactly parallel to the side AE; CE, an arch of a circle, whose centre is at A, accurately divided from E, in degrees, &c.; AD, an index, moveable on the centre A, with a nonius scale at the end D, graduated to apply to the divisions of the arch; also with a telescope, to enable the observer to discriminate the object, or any particular part or side thereof, more accurately. The whole should be mounted on three legs, in the manner of a plain table, or therodolite, and furnished with spirit-tubes to adjust it to an horizontal position. The instrument being placed in such position, the telescope BC must be brought upon the object O, or rather upon some particular point or side thereof; when, being there fastened, the index AD must be moved, till its telescope exactly strikes the same point of the object; then the divisions, on the arch ED, mark out the angle DAE; which will be exactly equal to the angle BOA, as is demonstrated in the 15th and 29th propositions of Euclid, Book I.; and the side BA being already known, the distance BO, or AO, may be easily determined in two different ways; viz. first, by supposing the triangle BOA, an isosceles triangle, then multiply the side BA by 3435, as before, and divide the product by the minutes contained in the angle DAE = the angle BOA; the quotient will be the distance BO = AO, very nearly; or, secondly, by supposing the triangle ABO right-angled at B, then, as the sine of the angle found DAE = BOA is to the side known BA, so is the radius to the side AO, or so is the sine of the angle BAO to the side BO. To illustrate this by an example, suppose the side BA = 1 yard, the angle found DAE = BOA = $5^\circ 15'$, then, per first method, $1 \times 3435(= 229$ yards $= the$ distance BO, or AO. Or, by the second method,

As the sine of the angle found $5^\circ 15' = 7.6398160$
Is to the side $BA = 1$ yard $= 0.0000000$
So is radius $90^\circ 0'$ $= 10.0000000$

To the log. of the side $AO = 229$ yards $= 2.3601840$

Or,

As to the sine of the angle found $5^\circ 15' = 7.6398160$
Is to the side $BA = 1$ yard $= 0.0000000$
So is the sine of the angle BAO $= 89^\circ 45' = 9.9999999$

To the log. of the side $BO = 229$ yards $= 2.3601799$

"As the perfection of this instrument depends totally upon its accuracy in taking small angles, which accuracy must depend, for its minute divisions, upon its being fitted with a micrometer; and as the writer of this cannot doubt that the particular mode of doing this must be familiar to the intelligent instrument maker, he cannot but strongly recommend it to the attention of the ingenious of that profession, as an object which, when perfected, would be a real and considerable improvement in their art, and an useful instrument in the practical surveyor. Its accuracy would also, in some measure, depend upon the length of the line BA in the figure; that line might therefore be extended, by the instrument being constructed to fold or slide out to a greater length, when in use; upon which principle, connected with the application of a micrometer, an accurate and useful instrument might certainly be constructed. To adjust such instrument for use, let a staff be held up at a distance, in the manner of fig. 1, exactly equal in length to the distance of the two telescopes, and the index AD being brought exactly upon the side AE, if the two telescopes accurately strike either end of the staff, the instrument improperly adjusted.

The
DENHAM, Sir John, an eminent English poet, the only son of Sir John Denham, chief baron of the exchequer in Ireland, and one of the lords commissioners there, was born in Dublin in 1615; but his father, in 1617, being made a baron of the exchequer in England, he received his education in that country. In his youth he followed gaming more than any thing else; but in 1641, published a tragedy called the Sophy, which was much admired by the best judges; and, in 1643, wrote his famous poem called Cooper's Hill, which Mr Dryden pronounces will ever be the standard of good writing for majesty of style. Denham was sent ambassador from Charles II. to the king of Poland; and at the Restoration was made surveyor-general of his majesty's buildings, and created knight of the Bath. On obtaining this post, he is said to have renounced his poetry for more important studies. He died at his office in Whitehall in 1668; and his works have been often since printed.

DENIER, a small French copper coin, of which 12 make a sol. There are two kinds, the one tournois, the other parisis, whereof the latter was worth a fourth part more than the former.

DENIZEN, in Law, an alien made a subject by the king's letters patent; otherwise called donation, because his legitimation proceeds ex donatione regis, "from the king's gift."

A denizen is in a kind of middle state between an alien and a natural-born subject, and partakes of both of them. He may take lands by purchase or devise, which an alien may not; but cannot take by inheritance; for his parent, through whom he must claim, being an alien, had no inheritable blood, and therefore could convey none to the son; and, upon a like defect of blood, the issue of a denizen born before denization, cannot inherit to him; but his issue born after may. A denizen is not excused from paying the alien's duty, and some other mercantile burdens. And no denizen can be of the privy-council, or either house of parliament, or have any office of trust civil or military, or be capable of any grant of lands, &c. from the crown.

DENMARK, one of the most ancient monarchies in Europe, comprehending the peninsula of Jutland, and the islands of Zealand, Funen, &c. But Denmark, properly so called, is only that part of Scandinavia which formerly went by the name of Cimbrica Cerseneus, and now is called Jutland. Including Holstein, it is bounded by the sea called the Categate on the north; by the Baltic on the east; by the kingdom of Hanover on the south, and the duchy of Mecklenburg on the south-east; extending from 53. 30. to 57. 30. N. Lat.

The origin of the name Denmark is very uncertain. Name

The most probable conjecture concerning it is that of whence de-Saxoniae-Grammaticus, the most ancient and best Danish historian. He derives it from Dan the son of Hambie, the first king, and Mark or Marc, signifying a country in several dialects of the Teutonic; according to which etymology, the word Denmark signifies the land or country of Dan. This Dan is thought to have lived about 1038 years before the Christian era, first king.
Denmark. Almost all historians agree that he was the son of Humble, a native of Zealand. His possessions and influence were very considerable not only in Zealand, but in the islands of Langland and Mona. It was his courage, however, and skill in the art of war, that induced the inhabitants of Denmark to choose him for their king. He was called to the assistance of the Jutlanders upon an irruption of the Saxons into their territories, and promised the sovereignty of the country if he drove out the enemy. On this he immediately raised an army, gained a complete victory over the Saxons, and obliged them to leave the country; and he was accordingly elected king.

In such early ages as these, we are not to look for any authentic history either of this or any other kingdom. The history of Denmark, for a great number of ages after the reign of Dan, is filled with fabulous exploits of heroes, encounters with giants, dragons, &c. One of their kings named Frotho, who reigned about 761 years before Christ, is said to have conquered all Britain, Slavexick, Russia, Pomerauria, Holstein, &c. an assertion which cannot easily be credited, considering the difficulty which succeeding warriors, even the greatest in the world, found to subdue the inhabitants of those countries. It is certain, however, that anciently the kingdom of Denmark made a much more conspicuous figure than it does at present. The Danes appear to have had a very considerable naval force almost from the foundation of their empire; and the conquests they undoubtedly made in our island are certain proofs of their valour.

The natural enemies of the Danes, were the Swedes, Norwegians, and Saxons; especially the first. With one or other of these nations almost perpetual war was carried on. The kingdom was also often rent by civil dissensions; which the neighbouring monarchs did not fail to take advantage of, in order to reduce the kingdom of Denmark under their subjection. As neither party, however, generally came off with advantage, the history of the wars affords nothing interesting or entertaining. One of the greatest of the Danish monarchs was Valdemar I, who obtained the throne in 1157; having defeated and killed his competitor Swen, after a ten years civil war. He maintained a long war with the Vandals, whose power he at last entirely broke, and reduced under his subjection the island of Rügen. He also proved victorious over the Norwegians, so that their king and queen came in person to submit to him. In 1165, he also laid the foundations of the city of Danzig, which, though it hath since become a place of much consequence, consisted at first only of a few poor fisher-men’s huts; but the privileges and immunities conferred upon it by this monarch, soon proved the means of its becoming a flourishing city. In 1169, he entirely subdued the Courlanders; and, soon after, was invested with the duchy of Holstein, by the emperor Frederic Barbarossa. He is said to have been poisoned by a quack medicine, given with a design to recover him from a distemper with which he was seized in 1182.

In the year 1195, Canuto, Valdemar’s successor, caused a muster to be made of all the men fit to bear arms in his dominions; and ordered each province to fit out its proportion of shipping, every way equipped, and ready for action. The whole force of Denmark, at that time, consisted of 670 ships of war, besides the squadrons supplied by vassals, tributary states, and allies. The number of the land forces is not mentioned. In the reign of this prince, the Danish dominions were enlarged by the entire conquest of Stromar, the districts of Lubec and Hamburgh, formerly known by the name of Nordalbingia, but now included under the general name of Holstein. He died in 1203, and was succeeded by Valdemar II, who proved a very great and warlike prince. In 1211, he founded the city of Stralsund, opposite to the isle of Rügen. The same year his queen died in childbirth; and in memory of her he built the castle of Drongholm, that name importing the Queen’s Island. In 1218, he undertook an expedition against the Livonians, having received advice that they, assisted by the Lithuanians, Muscovites, and other barbarous nations, had driven from their habitations all those in the neighbourhood who had embraced Christianity, and taken an oath of allegiance to the crown of Denmark. Fitting out a powerful fleet, therefore, he immediately set sail for that country; but his troops were no sooner landed, than they were seized with a panic at the sight of such a powerful army of savages as were assembled to oppose them. The king himself was dismayed at the unusual spectacle of a whole army clothed in skins, and resembling beasts more than human creatures. Encouraged, however, by the bishops who attended him, he ventured an engagement, and overthrew the barbarians with incredible slaughter. This victory was gained near the fortress of Valdemar, which received its name on that account.

How potent and flourishing the kingdom of Denmark was at this time, appears from an estimate of its state and the revenues of the tributary provinces, those countries conquested by Valdemar, and the standing forces of the whole kingdom. This account was copied by Pontanus from Witfield, a writer of those days, who had it from a register kept by Valdemar’s steward. From the provinces were daily sent in 24 lasts of oats, 24 lasts of rye, and half that quantity of wheat, 13 talents of cheese and butter, and nine of honey; 24 oxen, 300 sheep, 200 hogs; and 600 marks of coined money. This was the certain revenue: but to this was added near an equal sum from adventitious circumstances; such as fines, forfeitures, taxes on law-suits and pleadings, with a variety of other contingencies; the whole amounting to upwards of 100,000 marks a-year, or 23,730,000l. per annum; a sum in those days almost incredible. With this revenue were kept for constant service 1400 great and small ships for the king’s use, each of which at a medium carried 121 soldiers; making the whole of the standing forces, besides garrisons, consist of 169,430 fighting men.

In 1223, a very great misfortune befell Valdemar, notwithstanding all his power. Henry earl of Swein, otherwise called Henry Palatinus, a German prince, having been deprived of part of his dominions by Valdemar, surprised and carried off the king himself, and took proud possession of the property. The condition on which he at last obtained his liberty were very hard. He was obliged to pay a prodigious sum of money; to relinquish Holstein, Swerin, Hamburgh, and all his possessions on the other side of the Elbe; and lastly, solemnly to swear that he would maintain this.
DEN [ 165 ] DEN

Denmark. This compulsive contract, and never take any measures to punish Henry or his associates. This treaty was signed on the 15th of March 1226.

Besides these territories which the Danish monarch had been obliged to cede by treaty, many tributary princes took the opportunity of his captivity to recover their liberty; and among the rest, the inhabitants of Lubeck revolted, and entered into alliance with Albert duke of Saxony against Valdemar. The latter, however, was not of a disposition to submit tamely to such treatment. He obtained a dispensation from the pope to break his engagements with Henry, and immediately entered Holstein at the head of a numerous army. Here he met by several German princes, at the head of a very numerous army; and a desperate engagement ensued. Valdemar at first had the advantage; but being wounded in the eye, his troops were at last defeated with great slaughter. It doth not appear that ever the kingdom of Denmark was able to revenge himself of his enemies, or to recover the dominions he had lost. So far from this, he was obliged; in 1228, to cede Lauenburg to the duke of Saxony, who had already seized on Ratzeburg and Molna. Soon after this, his eldest son Valdemar was accidentally killed as he was hunting, and his two other sons married the daughters of his two greatest enemies. Abel, the third son, married the daughter of Adolphus duke of Holstein; and Eric, the second, married the duke of Saxony's daughter. These misfortunes are supposed to have hastened his death, which happened in the month of April 1242.

On the death of Valdemar, the kingdom was divided between the two young princes; and between them a war commenced the very next year. A peace was concluded the year following, and war renewed the year after: but how long it continued, we are not informed. In 1250, Eric paid a visit to his brother Abel, intreating his mediation between him and the princes of Holstein, with whom he was then at war. Abel received him, in appearance, with great kindness, and promised that his utmost endeavours to procure a reconciliation should not be wanting; but in the meantime, laid a plan for having him murdered at sea: this was effected, and Abel became master of the whole kingdom.

The new king did not long enjoy the sovereignty he had so wickedly obtained. He was tormented by his own conscience; especially when he found among his brother's papers, one by which he was left heir to the whole kingdom on the death of Eric, and many kind expressions with regard to himself. He was at last killed in a battle with his own subjects in 1252, on account of some taxes he intended to impose.

From this time to the year 1333, the kingdom of Denmark gradually declined. Usurpers established themselves in different provinces; while the kings of Sweden did not fail to avail themselves of the distracted state of the Danish affairs. In 1333, died Christopher II. who possessed only the cities of Scanderborg in Jutland and Neuburg in Fonia, with some few other inconsiderable places, of all the hereditary dominions of Denmark, Halland, Holbe, Cailemburg, and Samson; were held by Canute Porsius; Schouen, Lystre, and Bleking, by the king of Sweden, to whom they had been lately sold; John earl of Wagria had the jurisdiction of Zealand, Falstre, Laaland, and Fémars; Gerhard, of Jutland and Fonia; and Lawrence Jonea of Longland and Arras.

After the death of Christopher, an interregnum of seven years ensued. The first attempt for the sovereignty was made by Oto, second son to the late king, who laid a scheme for driving Gerhard out of Jutland; but not being able to accomplish it, he was taken prisoner, and closely confined by Gerhard. The king of Sweden next wrote to Pope Benedict XIII, beseeching His Holiness to confirm to him the provinces of Schonen and others which he possessed; and to allow him to subdue the rest of the kingdom, which was now usurped and rendered miserable by a set of petty princes, who knew not how to govern. To influence him the more powerfully, he also promised to hold this kingdom of the pope; and to pay him the usual tax collected by the church. This request, however, was refused. Valdemar of Sleswick, nephew to Gerhard, then aspired to the sovereignty. He had formerly been elected king; but had given over all thoughts of enjoying the sovereignty, on account of the superior influence of Christopher; but now resumed his ambitious views at the instigation of his uncle. Several of his nobility also cast their eyes on young Valdemar, Christopher's son, now at the emperor's court. But while each of these princes were laying schemes to aggrandize themselves, the unhappy Danes were distressed by exorbitant taxes, famine, and pestilence; the two last in consequence of the former. The state of the peasants neglected to cultivate the lands, which they held on a very precarious tenure; the consequence of this was poverty and an unwholesome diet; and this, co-operating with the peculiar disposition of the air, produced a plague, which destroyed more than half the inhabitants of the country. The poor dropped down dead on the streets with disease and hunger, and the gentry themselves were reduced to a state of wretchedness; yet, though the whole of the kingdom was evidently on the verge of ruin, ambitious projects employed the great, as if everything had been in the most profound tranquillity.

In the midst of these grievous calamities, Gerhard sovereign of Jutland, proposed to his nephew Valdemar an exchange of territories, which he believed would prove favourable to the designs of the latter on the crown. A treaty for this purpose was actually drawn up and signed; but the inhabitants, notwithstanding their distressed situation, so highly resented their being disposed of like cattle from one master to another, that they refused to pay the usual taxes. Gerhard resolved to compel them; and therefore led 10,000 men, whom he had levied in Germany, into the heart of the province. Providence, however, now raised up an enemy to this tyrant. One Nicholas Norevi, a man greatly esteemed for his courage, public spirit, and prudence, beheld with sorrow the condition to which Denmark was reduced. He had long meditated a variety of projects for his relief, and at last imagined things were in such a situation that the whole depended on his single arm. Young Valdemar, Christopher's son, had a number of adherents in the kingdom; his most dangerous enemy was Gerhard, and could be removed. The Jutlanders would at least be free from an oppressor, and might choose Valdemar, or any other they thought proper.
proper, for their sovereign. Collecting a body of chosen horse, therefore, he marched in the night to Randershusen, where Gerhard had fixed his head quarters; and having forced open the tyrant’s quarters, immediately put him to death. He then fled with the utmost expedition; but was pursued and overtaken by a party of the enemy’s horse, through which he forced his way and escaped. Gerhard’s son, hearing of his death, retired into Holstein, from whence they had come; leaving the army, composed chiefly of Holsteiners, to be cut in pieces by the enraged peasants, who fell upon them from every quarter.

Still, however, the Holsteiners kept possession of the citadels and fortified places, from whence Nicholas resolved to dislodge them. He accordingly raised a body of forces; attacked and took Landen, a castle situated on the river Scherne: After which he laid siege to Alberg; but the garrison making an obstinate defence, he turned the siege into a blockade, by which they were soon reduced to great extremity. The governor sent an express to the sons of Gerhard, acquainting them with the impossibility of his holding out more than a few days, without being relieved. This determined them to march to the relief of so installed a place. They came up with Nicholas just as the governor was ready to surrender, but were defeated; though Nicholas was unfortunately killed in the engagement.

Jutland having thus regained its liberty, the rest of the kingdom followed its example. Zealand first openly declared itself. Here Henry, Gerhard’s son, maintained several garrisons; and resolved to defend his possessions in spite of all the power of the inhabitants. For this purpose he drew together an army: but, in the mean time, a tumult arose among the peasants on account of a Danish nobleman slain by the Holsteiners. By this the people were at last so irritated, that falling upon the Holsteiners sword in hand, they killed 300 of them, drove the rest out of the island, and chose Valdemar, Christopher’s son, for their sovereign.

The Danes now resumed their courage; the lands were cultivated, the famine and pestilence ceased, and the kingdom began to flourish as formerly. Matters continued in a prosperous way till 1387, when Margaret mounted the throne. She raised the kingdom to its highest pitch of glory, as partly by her address, and partly by hereditary right, she formed the union of Calmar, by which she was acknowledged sovereign of Sweden, Denmark, and Norway. She held her dignity with such firmness and courage, that she was justly styled the Semiramis of the North. Her successors being destitute of her great qualifications, the union of Calmar fell to nothing: but Norway still continued annexed to Denmark. About the year 1448, the crown of Denmark fell to Christian count of Oldenburg, from whom the present royal family of Denmark is descended; and, in 1536, the Protestant religion was established in Denmark by that wise and politic prince Christian III.

Christian IV. of Denmark, in 1629, was chosen for the head of the Protestant league formed against the house of Austria: but, though brave in his own person, he was in danger of losing his dominions; when he was succeeded in that command by the famous Gustavus Adolphus, king of Sweden. The Dutch, after the duties of the Sound, his son Frederick II. consented to accept of an annuity of 150,000 florins for the whole. The Dutch, after this, persuaded him to declare war against Charles Gustavus king of Sweden, which had almost cost him his crown in 1657. Charles stormed the fortress of Fredericstad; and in the succeeding winter, he marched his army over the ice to the island of Funen, where he surprised the Danish troops, took Odense and Nyborg, and marched over the Great Belt to besiege Copenhagen itself. In the mean time, the English usurper, interposed: and Frederick defended his capital with great magnanimity to the peace of Roschild; by which Frederick ceded the provinces of Halland, Bleking, and Scania, the island of Bornholm, Babus, and Drontheim, in Norway, to Sweden. Frederick sought to elude those severe terms; but Charles took Cronenburg, and once more besieged Copenhagen by sea and land. The steady intrepidity of Frederick under those misfortunes enabled him to his subjects; and the citizens of Copenhagen made an admirable defence, till a Dutch fleet arrived in the Baltic, and beat the Swedish fleet. The fortune of war was now entirely changed in favour of Frederick, who showed on every occasion great abilities, both civil and military; and having forced Charles to raise the siege of Copenhagen, might have carried the war into Sweden, had not the English fleet, under Montague, appeared in the Baltic. This enabled Charles to besiege Copenhagen a third time; but France and England offering their mediation, a peace was concluded in that capital; by which the island of Bornholm returned to the Danes; but the island of Rugen, Bleking, Halland, and Schonen, remained with the Swedes.

The year 1660 affords us an example of a revolution almost unequalled in the annals of history, viz., when a victorious army of a prince, that of a free people resigning their liberty into the hands of their sovereign; and of their own accord, and without the least compulsion, rendering him despotick, observed the state.

This was occasioned by the great character which Frederick had acquired by his prudent and valiant conduct when Copenhagen was besieged by the king of Sweden; and at that time he had also taken care to ingratiate himself with the commonalty, by obliging the nobility to allow them some immunities which they did not enjoy before; allowing them also, by a special edict, to possess lands, and enjoy all the privileges of nobility. After the conclusion of the treaty with Sweden, a diet was summoned at Copenhagen, to take into consideration the state of the kingdom, which was now very much exhausted, both by reason of the debts in which it was involved, and by the calamities of war. This distressed state of affairs was, by the commons, attributed to the nobility; who on the other hand, took no care to conciliate the affections of the inferior classes, but rather increased the discontent by their arrogance. They had even the imprudence to remonstrate against the immunities above mentioned, which had been granted by the king during the siege. In consequence of this the deputies of the commons and clergy united against them; and being joined by the citizens of Copenhagen, formed a very considerable party. On bringing forward in the assembly the sums necessary for the
DENMARK

the national exigencies, a general excise was proposed by the nobles on every article of consumpt; and to which they themselves were willing to submit, though, by an express law, their order was to be exempted from all taxes. This offer was accompanied with a re-
monstration to the king; in which they endeavoured, not only to reclaim many obsolete privileges, but to add fresh immunities, and introduce many other regulations, all of them tending to diminish the royal preroga-
vative, and check the rising influence of the commons and clergy. This proposal occasioned great disputes in the diet; and the two inferior orders insisted that they would not admit of any tax which should not be levied equally upon all ranks, without reserve or restriction. The nobles not only refused to comply with this proposal, but even to be subject to the tax for more than three years; pretending that all taxes whatever were infringements on their privileges. By way of compensation, however, they proposed new duties upon leather and stamped paper, and at last offered to pay a poll-tax for their peasants. This exchange seemed at first to be agreeable to the two inferior estates; but they suddenly altered their mind, and demanded that the seills and domains, which the nobles had hitherto possessed exclusively, and at a very moderate rent, should be let to the highest bidder.

Such a proposal appeared to the nobles to be to the last degree unreasonable. They said it was an infraction of their dearest privileges; as, by the 45th article of the coronation oath taken by Frederic, the possession of the royal seills was guaranteed to their order; but, in the heat of dispute, one of the chief senators having imprudently thrown out some reproachful expressions against the commons, a general ferment ensued, and the assembly was broken up in confusion. This gave occasion to the intercession of the king's friends; and an idea of rendering the crown hereditary, and enlarging the royal prerogative, began to be suggested as the proper method of humbling the nobility. This was first broached by the bishop of Zealand, at whose house a numerous meeting was held on the 6th of Octo-
ber 1665, where the scheme was fully laid open and approved; an act for rendering the crown hereditary drawn up; and the best method of publicly producing it taken into consideration. All this time the king seemed quite inactive, nor could he be prevailed upon to take any part in an affair which so nearly concerned him. But his indolence was abundantly compensated by the alertness and diligence of the queen; between whom and the heads of the party matters were soon concerted. On the morning of the 8th of October, therefore, the bishop of Zealand having obtained the consent and signature of the ecclesiastical deputies, de-
1

Nansen; and as they were returning from the palace, they met the senator who had already given offence to the commons. With him they had a violent al-
tercation, and were threatened with imprisonment for presuming to approach the king without acquainting the order of nobles. This threat was now altogether nugatory. The nobles having got some intelligence of what was going forward, had just assembled in order to consider of what was to be done, when the deputies of the two other estates entered, and informed them of their proceedings, and delivered to them the proposal for rendering the crown hereditary. By this decla-
rative the nobles were thrown into the utmost consterna-
tion; but judging it improper to put a negative on the proposal at present, they endeavoured to gain time, and replied, that though they willingly gave their as-
sent to the declaration, yet that, as it was a matter of great consequence, it deserved the most serious dis-
cussion. Nansen, however, refused, that the other estates had already taken their resolution; that they would lose no time in debate; and that if the nobles would not concur with them, they would immediately repair to the palace by themselves, where they had not the least doubt that the king would graciously accept their proposal.

In the mean time the nobles had privately dispatch-
ed a message to the king, intimating, that they were willing to render the crown hereditary to the male line of his issue, provided it was done with all the usual formalities. But this proposal did not prove agreeable to his majesty, unless they would confirm the right of succes-
sion in the female line also. He added, however, with great appearance of moderation, that be by no means wished to prescribe rules for their conduct; they were to follow the dictates of their own judgment; but as for his part, be would save every thing to their free consent. While the nobles were waiting for this an-
swer, the other deputies, perceiving that they wished to keep the matter in suspense, lost all patience, and repaired in solemn procession to the court; where, be-
ing admitted into the royal presence, the matter was opened by the bishop of Zealand. He addressed his majesty on the resolution taken by the clergy and commons, offering in their name to render the crown he-
reditary, and to invest him with absolute authority; adding, that they were ready to sacrifice their lives in the defence of an establishment so salutary to their country. His majesty thanked them for their favourable intentions; but mentioned the concurrence of the no-les as a necessary condition; though he had no doubt of this when they should have time to accompany the declaration with all the necessary formalities; he as-
sured them of his protection, promised a redress of all grievances, and dismissed them with an exhortation to continue their sittings, until they should have brought their design to perfection, and he could receive their voluntary submission with all due solemnity.

On departure of the commons from the place where they had been conferring with the nobles, the latter had been so distracted and confused, that they broke up without coming to any resolution, designing, how-
ever, to decide the matter finally at their meeting on the afternoon of the following day. But while they were thus wavering and irresolute, the court and the popular party took the necessary measures to force them
on the return of Charles of Sweden from his exile, he renewed the war against Denmark with a most embittered spirit; but on the death of that prince, who was killed at the siege of Fredericksbuhl, Frederic durst not refuse the offer of his Britannic majesty's mediation between him and the crown of Sweden; in consequence of which, a peace was concluded at Stockholm, which left him in possession of the duchy of Sleswick. Frederic died in the year 1730, after having, two years before, seen his capital reduced to ashes by an accidental fire. His son and successor, Christian Frederic, made no other use of his power, and the advantages which he mounted the throne, than to cultivate peace with all his neighbours, and to promote the happiness of all his subjects, whom he eased of many oppressive taxes.

In 1734, after guaranteeing the Pragmatic Sanction, Christian sent 6000 men to the assistance of the emperor, during the dispute of the succession to the crown of Poland. Though he was pacific, yet he was jealous of his rights, especially over Hamburg. He obliged the Hamburgers to call in the mediation of Prussia, to abolish their bank, to admit the coin of Denmark as current, and to pay him a million of silver marks. He had, two years after, viz. in 1738, a dispute with his Britannic majesty about the little lordship of Steinhorst, which had been mortgaged to the latter by the duke of Holstein Lauenburg, and which Christian said belonged to him. Some blood was split during the contest; in which Christian, it is thought, never was in earnest. It brought on, however, a treaty, in which he availed himself of his Britannic majesty's predilection for his German dominions; for he agreed to pay Christian a subsidy of 70,000l. sterling a-year, on condition of keeping in readiness 7000 troops for the protection of Hanover: this was a gainful bargain for Denmark. And two years after, he seized some Dutch ships for trading without his leave to Iceland: but the difference was made up by the mediation of Sweden. Christian had so great a party in that kingdom, that it was generally thought he would revive the union of Calmar, by procuring his son to be declared successor to his then Swedish majesty. Some steps for that purpose were certainly taken: but whatever Christian's views might have been, the design was frustrated by the jealousy of other powers, who could not bear the thoughts of seeing all Scandinavia subject to one family. Christian died in 1746, with the character of being the father of his people.

His son and successor, Frederic V., had, in 1743, married the princess Louisa, daughter to his Britannic majesty. He improved upon his father's plan for the happiness of his people, but took no concern, except that of a mediator, in the German war. For it was by his intervention that the treaty of Closterseven was concluded between his royal highness the duke of Cumberland and the French general Richelieu. Upon the death of his first queen, the mother of his successor, he married a daughter of the duke of Brunswick Wolfenbuttel; and died in 1766. He was succeeded on the throne by his son Christian VII. who married the princess Caroline, Matilda of England. But this alliance proved extremely
the same morning Prince Frederic got up, and went with the queen-dowager to the king’s bed-chamber, accompanied by General Eichstedt and Count Rantzau. Having ordered the king’s valet de chambre to awake him, they informed his majesty, that the queen, with Count Struensee, his brother, and Brandt one of the new ministers, were at that moment busy in drawing up an act of renunciation of the crown, which they would immediately after compel him to sign; and therefore there was a necessity for him to give an order for their arrestment. The king after some hesitation consented. Count Rantzau was dispatched at that untimely hour into the queen’s apartments, and immediately executed the orders of the king. The unfortunate princess was conveyed in one of the king’s carriages to the castle of Cronenburgh, together with the infant princess, attended by Lady Mostyn, and escorted by a party of dragoons. Struensee and Brandt were seized in their beds and imprisoned, as well as several other members of the new administration, to the number of 18. The queen-dowager and her adherents seemed to assume the government entirely into their own hands, and a total change took place in the departments of administration. Struensee and Brandt were put in irons, and very severely treated: they underwent long and frequent examinations; and Struensee at last confessed that he had a criminal intercourse with the queen. Both their heads were struck off on the 28th of April; execution but many of their partisans were set at liberty. The Struensee confession of Struensee is by many, and indeed with no small degree of probability, supposed to have been extorted by fear of torture, and to have no foundation in truth; but as no means were used by the court of Britain to clear up the queen’s character, the affair must undoubtedly wear a suspicious aspect. At last, however, his Britannic majesty interfered so far as to send a small squadron of ships to convey the unhappy princess to Germany. Here the city of Zell was appointed for her residence; and in this place she died of a malignant fever on the 10th of May 1775, aged 23 years and 10 months.

The inhuman treatment of this princess did not long prove advantageous to the queen-dowager and her party: A new revolution took place in April 1784, change in the administration when the queen-dowager’s friends were removed, a new council was formed under the auspices of the prince royal, and no instrument deemed authentic unless signed by the king and countersigned by the prince. Since that time, the king, who from the beginning of his administration showed a great degree of incapacity, was entirely laid aside from public business. He died in 1808, and was succeeded by the crown-prince, now Frederick IV.

Denmark wisely took no part in the wars which arose out of the French revolution. But about 1800, she concurred with Sweden and Russia in making loud complaints against the conduct of British cruisers, and at length the three powers entered into an association for the common protection of their commercial rights. This was speedily followed by hostilities. Admiral Parker, with Lord Nelson under him, sailed to the Baltic with a strong fleet, and attacked the Danish squadron in the road of Copenhagen, supported by formidable batteries, on the 30th March 1801. After a very obstinate battle, seventeen Danish ships of the
Denmark, line were taken or destroyed, and about 4000 Danes fell in the action. An armistice followed, which terminated in a peace, the emperor Paul, the chief supporter of the confederacy, having been assassinated a few days before this battle.

After the overthrow of the Prussians at the battle of Jena, France possessed herself of part of the southern shores of the Baltic; and as it was feared she would thus be in a condition to get the naval means of Denmark into her power, a secret expedition was fitted out in August 1807, consisting of 27 sail of the line under Lord Gambier, and 20,000 land troops under Lord Cathcart. This force appeared suddenly before Copenhagen; and the British agent, Mr Jackson, demanded that the Danes should deliver up their fleet to be held as a deposit by the British government, and to be restored at the general peace in the same condition. This demand was met with a peremptory refusal. The fleet then advanced, the town was surrounded, and a furious bombardment began, on the 2d of September, which continued till the 5th, and destroyed 400 houses. The town was surrendered on the 7th, when the British carried away 16 sail of the line and several frigates, besides a quantity of naval stores. A great outcry was raised against this assault on a neutral nation then at peace with us; the British nation generally condemned the measure; and as it was eventually the cause of involving Britain in a war with Russia, it was undoubtedly upon the whole rather productive of loss than advantage.

Denmark continued to adhere firmly to Bonaparte till 1813. Lubeck being taken, and the greater part of Holstein overrun by the Swedes, she was reduced to the necessity of making peace on terms dictated by her enemies. She gave up Norway to Sweden; as a compensation for which she received Pomernia, and this was exchanged for a part of the duchy of Lauenburg.

The kingdom of Denmark at present is divided into six grand districts or provinces; viz. 1. Denmark properly so called, comprehending the islands of Zealand, Funen, Langland, Lolland, Falster, Møn, Samsoe, Arro, Bornholm, Anholst, Læsø, and that part of the duchy of Schleswick, or South Jutland. 2. The duchy of Sleswick, or South Jutland. 3. The duchy of Holstein. 4. The duchy of Lauenburg; and, 5. Iceland, with the islands lying in the northern seas; for a particular description of which see these articles.

The language of Denmark is a dialect of the Teutonic, and bears a strong affinity to the Norwegian tongue; but is disagreeable to strangers, on account of the drawing tone with which it is pronounced. They have borrowed many words from the German; and indeed the High Dutch is used in common discourse by the court, the gentry, and the burgesses. The better sort likewise understand French, and speak it fluently. The Lutheran doctrine is universally embraced through all Denmark, Sweden, and Norway; so that there is not another sect in those kingdoms. Denmark is divided into six dioceses, one in Zealand, one in Funen, and four in Jutland; but the bishops are, properly speaking, no other than superintendent, or præmi inter pares. They have no cathedrals, ecclesiastical courts, or temporalities. Their business is to inspect the doctrine and morals of the inferior clergy. The revenue of the bishop of Copenhagen amounts to about 2000 rix-dollars; and this is the richest benefice in the kingdom. The clergy are wholly dependent on the government. They never intermeddle, and are never employed or consulted in civil affairs. They nevertheless have acquired great influence, and erected a sort of spiritual tyranny over the minds of the common people, by whom they are much revered. They are, generally speaking, men of exemplary lives, and some erudition. Their churches are kept more clear, and better adorned, than those of England; the people are great lovers of music, and their organists commonly entertain the congregation for half an hour before and after service. The state of literature is very low in Denmark. There is, indeed, an university at Copenhagen; but meanly endowed, and very ill supplied with masters. Taste and the belles lettres are utterly unknown in this country, which yet has produced some men of great eminence in mathematics and medicine, such as Tycho Brabe, Berlichich, and the Barbolines.

The constitution of Denmark was heretofore of the free Gothic original. The convention of the estates, even including the representatives of the boors or peasants, elected a king for his personal virtues, having still a regard to the son of their late monarch, whom, however, they made no scruple of setting aside, if they deemed him unworthy of the royal dignity. They enacted laws; conferred the great offices of state; debated all affairs relating to commerce, peace, war, and alliances; and occasionally gave their consent to the imposition of necessary taxes. The king was no other than chief magistrate, generalissimo, and as it were, prime minister to his people. His business was to see justice administered impartially; to command the army in time of war; to encourage industry, religion, arts, and sciences; and to watch over the interests of his subjects.

In 1660, however, the constitution was new modeled, as has been already related, and which was to the following purport. "The hereditary kings of Denmark and Norway should be in effect, and ought to be esteemed by their subjects, the only supreme head upon earth; they shall be above all human laws, and shall acknowledge, in all ecclesiastical and civil affairs, no higher power than God alone. The king shall enjoy the right of making and interpreting the laws, of abrogating, adding to, and dispensing with them. He may also annul all the laws which either he or his predecessors shall have made, excepting this royal law, which must remain irrevocable, and be considered as the fundamental law of the state. He has the power of declaring war, making peace, imposing taxes, and levying contributions of all sorts, &c. &c. &c.

Then follow the regulations for the order of succession, the regency in case of minority, the majority of the king, the maintenance of the family, and, after having enumerated all the possible prerogatives of royal uncircumscribed authority, as if sufficient had not yet been laid down, it is added in the 26th article: "All that we have hitherto said of power and eminence, and sovereignty, and if there is any thing further which has not been expressly specified, shall all be comprised in the following words: The king of Denmark and Norway shall be the hereditary monarch, and endued with the highest authority; insomuch that all that can be said and written to the advantage..."
Denmark is a Christian, hereditary, and absolute king, shall be extended under the most favourable interpretation to the hereditary king and queen of Denmark and Norway, &c. &c.

The laws of Denmark are so concise, that the whole body is contained in one quarto volume, written in the language of the country. Every man may plead his own cause, without employing either counsel or attorney; but there are a few advocates for the benefit of those who cannot or will not speak in their own defence. The proceedings are so summary, that a suit may be carried through all the courts, and finally decided in 13 months. There are three courts in Denmark, and an appeal lies from the inferior to the superior tribunal. The lowest of these is, in cities and towns, denominated the Byfoglyde Court; and in the country, the Ridderskole. Causes may be appealed from this to the Lantreg, or general head court for the province; but the final appeal lies to the court of High-right in Copenhagen, where the king presides in person, assisted by the prime nobility. The judges of the two other courts are appointed by his majesty's letters patent, to sit and determine causes during bene placito. These are punishable for any misdemeanours of which they may be guilty; and when convicted of having passed an unjust sentence, they are condemned to make reparation to the injured party. Their salaries are very inconsiderable, and paid out of the king's treasury, from the fines of delinquents, besides a small gratuity from the plaintiff and defendant when sentence is passed. Such is the peculiar privilege enjoyed by the city of Copenhagen, that causes appealed from the Byfoglyde court, instead of passing through the provincial court, are tried by the burgomaster and common council; from whence they proceed immediately to the highest court as the last resource. Affairs relating to the revenue are determined in the rent-chamber of Denmark, which is analogous to our court of exchequer. To another tribunal, composed of some members from this rent-chamber, from the admiralty, and college of commerce, merchants appeal for redress when their commodities are seized for non-payment of duties. All disputes relating to the sea are determined by the court of admiralty, constituted of commissioners appointed for these purposes. The chancellor may be more properly termed a secretary's office. It consists of clerks, who write and issue all the king's decrees and citations, transcribe papers, and according to the directions they receive, make draughts of treaties, and alliances with other nations. The government of Denmark is very commendable for the excellent police it maintains. Justice is executed upon criminals with great severity, and such regulations are established as effectually prevent those outrages that are daily committed in other countries. No man presumes to use his tongue against the government, far less to hatch schemes of treason. All the subjects are, or seem to be, attached to their sovereign by the ties of affection. Robbery on the highway, burglary, coining or clipping, are crimes seldom or never heard of in Denmark. The capital crimes usually committed are theft and manslaughter. Such offenders are beheaded very dexterously with one stroke of a sword. The executioner, though infamous, is commonly rich; because, beside the proper functions of his office, he is employed in other mean occupations, which few other Denmárk persons will undertake. He, by means of his understrapper, called the præacher, empties all the jakes, and removes from houses, stables, or streets, dead dogs, horses, &c. which no other Dane would vouchsafe to touch on any consideration whatever.

The Danish nobility and gentry are all included in the term noblesse; and formerly there were no distinctions of title; but within these 60 or 70 years some few favourites have been dignified with the titles of count and baron. These, and these only, enjoy the privilege of disposing of their estates by will; though others may make particular dispositions, provided they have sufficient interest to procure the king's approbation and signature. The noblesse of Denmark formerly lived at their own seats with great magnificence; and at the conventions of estates met the king with numerous and superb retinues; but since he became absolute, they are so impoverished by exorbitant taxes, that they can hardly procure subsistence; but, for the most part live obscurely in some corner of their ruined country palaces, unless they have interest enough to procure some employment at court. They no longer inherit the spirit and virtues of their ancestors; but are become servile, indolent, ostentatious, extravagant, and oppressive.

Their general character is a strange composition of pride and meanness, insolence and poverty. If any gentleman can find a purchaser for his estate, the king, by the Danish laws, has a right to one third of the purchase-money; but the lands are so burdened with impositions, that there would be no danger of an alienation, even though this restriction was not in force. Nay, some gentlemen in the island of Zealand have actually offered to make a surrender to the king of large tracts of very fertile land in the island of Zealand, if his majesty would be pleased to accept of them in place of the impost laid on them. The reason of this is, because, by the law of Denmark, if any estate is burdened beyond what it can bear, the owner must make up the deficiency out of his other estates, if he has any. Hence the king generally refuses such offers; and some gentlemen have been transported with joy when they heard that his majesty had been "graciously pleased to accept their whole estates."

This oppression of the nobles by the king produces in them a like disposition to oppress the commons; and the consequence of all this is, that there is no part of the world where extravagance and dissipation reign to such a degree. The courtiers maintain splendid equipages, wear fine clothes, drink a vast quantity of French wine, and indulge themselves with eating to excess. Such as derive money from their employment, instead of purchasing land in Denmark, remit their cash to the banks of Hamburgh and Amsterdam. The merchants and burghers tred in the steps of the nobility, and spend all their gains in luxury and pleasure, afraid of incurring the suspicion of influence, and being stripped by taxation. The peasant, or poor, follows the same example. No sooner has he earned a rix-dollar than he makes haste to expend it in brandy, lest it should fall into the hands of his oppressive landlord. This lower class of people are as absolute slaves as the negroes in the West Indies, and subject upon much harder fate. The value of estates is not computed by the number of

Y 2 acres,
DENMARK

 acres, but by the stock of boors, who, like the timber, are reckoned a parcel of the freehold; and nothing can be more wretched than the state of these boors; they feed upon stock-fish, salted meats, and other coarse diet; there is not the least piece of furniture of any value in their houses, except feather-beds, of which there is great plenty in Denmark, and which are used not only as beds to lie on, but as blankets for covering. After the boor has toiled like a slave to raise the king’s taxes, he must pay the overplus of his toil to his needy landlord. Should he improve his ground and repair his farm house, his cruel master will immediately transplant him to a barren farm and a naked habitation, that he may let the improved ground to another tenant at a higher price. The peasants likewise sustain a great deal of damage and violence from the licentious soldiers that are quartered in their houses. They are moreover obliged to furnish horses and waggons for the royal family and all their attendants, when the king makes a progress through the country, or removes his residence from one place to another. On such occasions the neighbouring boors are summoned to assemble with their cattle and carriages, and not only to live at their own expense, but to bear every species of outrage from the meanestJacques of those who attend his majesty. The warlike spirit of the Danes no longer subsists; the common people are mean-spirited, suspicious, and deceitful, nor have they that talent for mechanics, so remarkable in some northern nations. While the peasants are employed in their labour without doors, the women are occupied at home in spinning yarn for linen, which is what they principally manufacture. In Denmark all persons of any rank above the vulgar dress in the French taste, and affect finery; the winter-dress of the ladies is peculiar to the country, very neat, warm, and becoming. The common people are likewise remarkably neat, and pride themselves in different changes of linen. They are very little addicted to jollity and diversion; their whole amusements consist in running at the goose on Shrove Tuesday, and in winter in being drawn in sledges up on the ice. With respect to marriage, the man and woman frequently cohabit together in contract long before the ceremony is performed; the nobility and gentry pique themselves on sumptuous burials and monuments for the dead: the corpse is very often kept in a vault, or in the chancel of a church, for several years, before an opportunity offers of celebrating the funeral.

The taverns in this country are poorly supplied; and he who dines in them must be contented to eat in a public house, unless he will condescend to pay an extravagant price for a private apartment; the metropolis is but indifferently furnished with game; the wild ducks and plover are hardly eatable: but the hares are good, and the markets sometimes produce tolerable roebuck; their sea-fish are not to be commended; but the rivers produce plenty of delicious carp, perch, and craw-fish; the gardens of the gentry are well provided with melons, grapes, peaches, and all sorts of greens and salads in perfection.

The army of Denmark is composed of the troops of Denmark and Holstein.

The forces of Denmark and Holstein are divided into regular and national or militia. These forces (the foot and horse guards excepted, who are all regulars) are not separated, as in our army, into distinct regiments, but are formed in the following manner: Before the late augmentation, every regiment of infantry, when complete, consisted of 26 officers and 1632 privates, divided into ten companies of fusiliers and two of grenadiers. Of these 1632 privates, 480, who are chiefly foreign-born in Germany, are regulars. The remaining 1152 are the national militia, or peasants who reside upon the estates of their landlords and other estates of a proportion to its value. These national troops are occasionally exercised in small corps upon Sundays and holidays; and are embodied once every year for about 17 days in their respective districts. By a late addition of ten men to each company, a regiment of infantry is increased to 1778, including officers. The expense of each regiment which before amounted to 6000l. has been raised by the late augmentation to 8000l. The cavalry is upon the same footing; each regiment consisting of 17 officers, including sergeants and corporals, and 365 privates, divided into five squadrons. Of these about 260 are regulars, and the remainder national troops. The regiments of foot and horse guards are regulars; the former is composed of 21 officers and 465 men, in five companies; and the latter of 7 officers and 134 men, in two squadrons.

From their insular situation, the Danes have always excelled as a maritime people. In the earlier ages, when piracy was an honourable profession, they were a race of pirates, and issued from the Baltic to the coasts of England and Norway. And though, since the improvement of navigation by the invention of the compass, other nations have risen to a greater degree of naval eminence, still, however, the Danes, as they inhabit a cluster of islands, and possess a large tract of sea-coast, are well versed in maritime affairs, and are certainly the most numerous, as well as the most experienced, sailors of the north.

The greatest part of the Danish navy is stationed in the harbour of Copenhagen, which lies within the fortifications; the depth of water being only 20 feet, the ships have not their lower tier of guns on board, but take them in when they get out of port. Besides large magazines, each vessel has a separate storehouse on the water's edge, opposite to which she is moored when in harbour, and may by this means be instantly equipped; the number of registered seamen is near 40,000, and are divided into two classes; the first comprises those inhabiting the coasts, who are allowed to engage in the service of merchant-ships trading to any part of the world. Each receives 8s. annually from the crown, as long as he sends a certificate of his being alive; but is subject to a recall in case of war. The second comprehends the fixed sailors, who are constantly in the employ of the crown, and amount to about 4000, ranged under four divisions, or 40 companies: they are stationed at Copenhagen for the ordinary service of the navy, and work in the dockyard. Each of them, when not at sea, receives 8s. per month, beside a sufficient quantity of flour and other provisions; every two years a complete suit of clothes; and every year breeches, stockings, shoes, and a cap. Some of them are lodged in barracks. When they sail, their pay is augmented to 20s. per month.
Denmark, month. The marine artillery consists of 850 men, in
four divisions.

The Danish navy was formerly estimated at 38 ships
of the line, besides frigates. It may be doubted, how-
ever, whether the whole of these were at any one time
fit for service. Seventeen ships of war were destroy-
ed in Admiral Parker's attack in 1801; and Lord
Gambier brought away, in 1807, 16 ships of the line and
15 frigates. No authentic account of the strength of the
Danish navy has been published since the late peace.

The population of Denmark in 1811 was stated to
be 1,800,000; and that of Iceland is estimated at
53,000. The revenue of the country is estimated at
1,700,000,000 sterl. Norway, when Denmark lost it,
contained 950,000 inhabitants.

The revenue of his Danish majesty arises from taxes
lain on his own subjects, from the duties paid by for-
ereigns, from his own estate, crown lands, and con-
cessions. The taxes are altogether arbitrary, and
therefore fluctuating; but they are always grievous to
the subject. They commonly consist of customs or toll,
for export and import; of excise upon the consump-
tion of wine, salt, tobacco, and all kinds of provi-
sions; of taxes upon marriages, paper, brewing, or grinding,
and the exercise of different professions; of impositions
on land, poll-money, ground-rent for all houses in Co-
penhagen and elsewhere; of money raised for main-
taining fortifications, and for a portion to the king's
daughter when she happens to be married; but this
wield exceeds 100,000 rix dollars. One considerable
article in the revenue is the toll paid by foreign ships
that pass through the Sound, or Orse Sound (the strait
between Schonen and Zealand), into the Baltic. This
was originally no other than a small contribution,
which trading nations agreed to make for maintaining
lights at certain places, to direct their course through
the passage in dark and stormy weather. In process of
time the Danes converted this voluntary contribution,
to an exorbitant toll, and even exacted arbitrary
sums in proportion to the weakness of the nation whose
ships they visited. These exactions sometimes involved
them in quarrels, and the toll was regulated in repeated
treaties. See Denmark, Supplement.

Dennis, John, the celebrated critic, was the son of
a reputable tradesman in London, and born in the
year 1677. He received the first branches of education
at the great school in Harrow on the Hill, where he
commenced acquaintance and intimacy with many
young noblemen and gentleman, who afterwards made
considerable figures in public affairs, whereby he laid
the foundation of a very strong and extensive interest,
which might, but for his own fault, have been of in-
finite use to him in future life. From Harrow he went
to Caius-college Cambridge; where, after his proper
standing, he took the degree of batchelor of arts. When
he quitted the university, he made the tour of Eu-
rope; in the course of which he conceived such a de-
testation for despotism, as confirmed him still more in
those Whig principles which he had from his infancy
imbibed.

On his return to England he became early ac-
quainted with Dryden, Wycherly, Congreve, and
Southern; whose conversation inspiring him with a
passion for poetry, and a contempt for every attainment
that had not something of the belles lettres, diverted
him from the acquisition of any profitable art, or the
exercise of any profession. This, to a man who had
not an independent income, was undoubtedly a misfor-
tune: however his zeal for the Protestant succession
having recommended him to the patronage of the duke
of Marlborough, that nobleman procured him a place
in the customs worth 120l. per annum; which he en-
joyed for some years, till from profuseness and want of
economy, he was reduced to the necessity of disposing
of it to satisfy some very pressing demands. By the
advice of Lord Halifax, however, he reserved to him-
self, in the sale of it, an annuity for a term of years;
which term he outlived, and was, in the decline of his
life, reduced to extreme necessity.

Mr. Theo. Gibber relates an anecdote of him, which
we cannot avoid repeating, as it is not only highly char-
aracteristic of the man whose affairs we are now con-
dering, but also a striking and melancholy instance,
among thousands, of the distressful predicaments into
which men of genius and literary abilities are perhaps
apter than any others to plunge themselves, by paying
too slight an attention to the common concerns of life,
and their own most important interests. "After that
he was worn out (says that author) with age and po-
verty, he resided within the verge of the court, to
prevent danger from his creditors. One Saturday night
he happened to saunter to a public house, which in a
short time he discovered to be without the verge. He
was sitting in an open drinking-room, when a man of
a suspicious appearance happened to come in. There
was something about the man which denoted to Mr
Dennis that he was a bailiff. This struck him with a
panic; he was afraid his liberty was at an end; he
sat in the utmost solicitude, but did not offer to
stir lest he should be seized upon. After an hour or
two had passed in this painful anxiety, at last the clock
struck twelve; when Mr. Dennis, in an ecstasy, cried
out, addressing himself to the suspected person, "Now,
Sir, bailiff or no bailiff, I don't care a farthing for
you, you have no power now." The man was asto-
nished at his behaviour; and when it was explained to
him, was so much affronted with the suspicion, that
had not Mr. Dennis found his protection in age, he
would probably have smarted for his mistaken opin-
on. A strong picture of the effects of fear and apprehen-
sion, in a temper naturally so timorous and jealous as
Mr. Dennis's; of which the following is a still more
whimsical instance. In 1704 came out his favourite
tragedy, "Liberty Asserted," in which were so many
strokes on the French nation, that he thought they
were never to be forgiven. He had worked himself
into a persuasion that the king of France would insist
on his being delivered up, before he would consent to
peace; and full of this idea of his own importance,
when the congress was held at Utrecht, he is said to
have waited on his patron the duke of Marlborough,
to desire that no such article might be stipulated. The
duke told him he had really no interest then with the
ministry; but had made no such provision for his own
security, though he could not help thinking he had
done the French as much injury as Mr. Dennis himself.
Another story relating to this affair is, that being at a
gentleman's house on the coast of Sussex, and walking
one day on the sea-shore, he saw a ship sailing, as he
fancied, towards him; he instantly set out for London,
DEN

in the fancy that he was betrayed; and congratulating himself on his escape, gave out that his friend had decoyed him down to his house, to surrender him up to

the French.

Mr Dennis, partly through a natural peevishness and petulance of temper, and partly perhaps for the sake of procuring the means of subsistence, was continually engaged in a paper-war with his contemporaries, whom he ever treated with the utmost severity: and, though many of his observations were judicious, yet, he usually conveyed them in language so sullen and abusive, as destroyed their intended effect; and as his attacks were almost always on persons of superior abilities to himself, viz. Addison, Steele, and Pope, their replies usually turned the popular opinion so greatly against him, that, by irritating his testy temper the more, it rendered him a perpetual torment to himself; till at length, after a long life of vicissitudes, disappointments, and turmoils, rendered wretched by indiscipline, and hateful by malevolence, having outlived the reversion of his estate, and reduced to distress, from which his having been daily creating enemies had left him scarcely any hopes of relief, he was compelled to what must be the most irksome situation that can be conceived in human life, the receiving obligations from those whom he had been continually treating ill. In the very close of his days, a play was acted for his benefit at the little theatre in the Hay-market, procured through the united interests of Messrs. Thomson, Mallet, and Pope; the last of whom, notwithstanding the gross manner in which Mr Dennis had on many occasions used him, and the long warfare that had subsisted between them, interceded for him, and even wrote an occasional preface to the play, which was spoken by Mr Cibber. Not long after this, viz. on the 6th of January 1733, he died, being then in the 77th year of his age.

Mr Dennis certainly was possessed of much erudition, and a considerable share of genius. In prose, he is far from a bad writer, where abuse or personal scurrility does not mingle itself with his language. In verse, he is extremely unequal; his numbers being at some times spirited and harmonious, and his subjects elevated and judicious; and at others flat, harsh, and pernicious. As a dramatic author, he certainly deserves not to be held in any consideration. It was justly said of him by a wit, that he was the most complete instructor for a dramatic poet, since he could teach him to distinguish good plays by his precepts, and bad ones by his examples.

DENOMINATION (from denominare, of de and nominare, "a name"); a name imposed upon anything, usually expressing some quality predominant therein.

DENOMINATOR, in Arithmetic, a term used in speaking of fractions. See ARITHMETIC, p. 21.

Denominator of a Ratio, is the quotient arising from the division of the antecedent by the consequent. Thus 6 is the denominator of the ratio 30 to 5; because 30 divided by 5 gives 6. This is otherwise called the exponent of the ratio.

Denominator of Bodies, is that property directly opposite to rarity, whereby they contain such a quantity of matter under such a bulk. Accordingly, a body is said to have double or triple the density of another body, when their bulk being equal, the quantity of matter is in the one double or triple the quantity of matter in the other.

DENITY OF the Air, is a property that has employed the later philosophers, since the discovery of the Torricellian experiment.

It is demonstrated, that in the same vessel, or even in vessels communicating with each other, at the same distance from the centre, the air has everywhere the same density. The density of air, ceteris paribus, increases in proportion to the compressing power. Hence the inferior air is denser than the superior; the density, however, of the lower air is not proportional to the weight of the atmosphere, on account of heat and cold, and other causes perhaps, which make great alterations in density and rarity. However, from the elasticity of the air, its density must be always different at different heights from the earth's surface; for the lower parts being pressed by the weight of those above, will be made to accede nearer to each other, and the more so as the weight of the incumbent air is greater. Hence the density of the air is greatest at the earth's surface, and decreases upwards in geometrical proportion to the altitudes taken in arithmetical progression.

If the air be rendered denser, the weight of bodies in it is diminished; if rarer, increased, because bodies lose a greater part of their weight in denser than in rarer mediums. Hence, if the density of the air be sensibly altered, bodies equally heavy in a rarer air, if their specific gravities be considerably different, will lose their equilibrium in the denser, and the specifically heavier body will preponderate. See PNEUMATICS.

DENTALIA, a shell-fish, belonging to the order of vermest testaces. See CONCHOLYGI.

DENTARIA, Toothwort, or Tooth-w Violet; a genus of plants belonging to the tetradyosmiaceae class; and in the natural method ranking under the 39th order, Silicous. See BOTANY INDEX.

DENTATUS, CURIUS, a renowned disinterested Roman general, whose virtues render him more memorable than even his great military reputation, flourished 272 years B.C. He was thrice consul; he conquered the Samnites, Sabines, and Lucaniuns; and gave each citizen 40 acres of land, allowing himself none more. The ambassadors of the Samnites making him a visit, found him boiling turnips in a pippin; upon which they offered him gold to come over to their interest; but he told them, his design was not to grow rich, but to command those who were so. He defeated Pyrrhus near Tarentum, and received the honour of a triumph.

DENTELLIA, in Botany, a genus of plants belonging to the pentadria class. See BOTANY INDEX.

DENTILES, or DENTIA, in Architecture, an ornament in cornices bearing some resemblance to teeth, particularly used in the Ionic and Corinthian orders. See ARCHITECTURE.

DENTIFRICE, in Medicine, a remedy for the teeth. There are various kinds; generally made of earthy substances finely pounded, and mixed with alum, or some other saline substances; but these are pernicious on account of their wearing away the enamel of the teeth, but more especially by the septic quality with which these earthy substances are endowed. On this account, a portion of Peruvian bark finely pounded is now commonly added, which answers the double purpose
purspose of cleaning the teeth, and preserving them afterwards from corruption.

DENTISCALPRA, in Surgery, an instrument for scouring yellow, livid, or black teeth; to which being applied near the gums, it scrapes off the foul morbld crust.

DENTITION, the breeding or cutting the teeth in children. See Medicine Index.

DENUNCIATION, a solemn publication or pro-\n\n
All vessels of enemies are lawful prizes, after denunciation or proclamation of war. The design of the denunciation of excommunicated persons is, that the sentence may be the more fully executed by the person's being more known.

DENUNCIATION at the Horn, in Scots Law. See Law Index.

DENYS THE LITTLE. See Dionysius.

DENTS, St, a famous town of France, in the department of Paris. Here is an ancient and magnificent church, in which were the tombs of many of the French kings; and in the treasury, among other curiosities, the swords of St Lewis and the Maid of Orleans, and the sceptre of Charles Magne. The abbey of the late Benedictines, a magnificent piece of modern architecture, has more the appearance of a palace than a convent. In 1793, after the abolition of royalty, the royal tombs in the church were all destroyed; and the name of the town was changed to that of Franciade. It is seated on the river Coudre, near the Seine, five miles north of Paris. E. Long. 2. 26. N. Lat. 48. 56.

DEOBBRENT, in Pharmacy, such medicines as open obstructions.

DEODAND, in our customs, a thing given or forfeited as it were to God, for the pacification of his wrath in case of misadventure, whereby a Christian soul comes to a violent end without the fault of any reasonable creature.

As, if a horse strike his keeper and kill him; if a man, in driving a cart, falls so as the cart-wheel runs over him, and presses him to death; if one be felling a tree, and gives warning to the bystanders to look to themselves, yet a man is killed by the fall thereof; in the first case, the horse; in the second, the cart-wheel, cart, and horses; and in the third, the tree, is Deodandus, "to be given to God," that is, to the king, to be distributed to the poor by his almoner, for expiation of this dreadful event; though effected by irrational, nay, senseless and deadly creatures.

Omnia quoque mortem sunt Deodanda: What moves to death, or kills him dead, Is Deodand, and forfeited.

This law seems to be an imitation of that in Exodus, chap. xxii. "If an ox gore a man or a woman with his horns, so as they die; the ox shall be stoned to death, and his flesh not be eaten; so shall his owner be innocent."

Fleta says the Deodand is to be sold, and the price distributed to the poor, for the soul of the king, his ancestors, and all faithful people departed this life.

DEPHELGAMATION, an operation by which the superabundant water of a body is taken from it; and it is principally effected by evaporation or distillation. Dephlegamation is also called Concentration, particularly when acids are the subject. See Concentration.

DEPHELOGISTICATED, in Chemistry, any thing deprived of the phlogiston supposed to be contained in it.

DEPHELOGISTICATED Air, is the same with oxygen gas of modern chemistry, and is an invisible elastic fluid, of somewhat greater specific gravity than that of common atmospheric air, and capable of supporting animal life and flame for a much longer time than the air we commonly breathe. See Oxygen, Chemistry Index.

DEPILATORY MEDICINES, are those applied in order to take off the hair: such are known to be the effects of lime and ordiment, but they ought to be used with great caution.

DEPONENT, in Latin grammar, a term applied to verbs which have active significations, but passive terminations or conjugations, and want one of their participles passive.

DEPONENT, in the Law of Scotland, a person who makes a deposition. See Deposition.

DEPOPULATION, the act of diminishing the number of people in any country, whether by war, disease, or political causes.

DEPORTATION, a sort of banishment used by the Romans, whereby some island or other place was allotted to a criminal for the place of his abode, with a prohibition not to stir out of the same on pain of death.

DEPOSIT, among civilians, something that is committed to the custody of a person, to be kept without any reward, and to be returned again on demand.

DEPOSITORY, in Law, a person intrusted as keeper or guardian of a deposit.

DEPOSITION, in Law, the testimony given in court by a witness upon oath.

DEPOSITION is also used for the sequesterating or depriving a person of his dignity and office.

This deposition only differs from abdication, in that the latter is supposed voluntary, and the act of the dignitary or officer himself; and the former of compulsion, being the act of a superior power, whose authority extends thereto. Some say the deposition, and some the abdication, of King James II.

Deposition does not differ from deprivation: we say, idiously, a deposed or deprived bishop, official, &c.

Deposition differs from suspension, in that it absolutely and for ever strips or divests a priest, &c. of all dignity, office, &c. whereas suspension only prohibits, or restrains, the exercise thereof.

Deposition only differs from degradation, in that the latter is more formal, and attended with more circumstances, than the former: but in effect and substance they are the same; those additional circumstances being only matter of show, first set on foot out of zeal and indignation, and kept up by custom, but not warranted by the laws or canons. See Degradation.

DEPRECAITION, in Rhetoric, a figure whereby the orator invokes the aid and assistance of some one;
DEP [176] DER

or prays for some great evil or punishment to befall him who speaks falsely, either himself or his adversary.

DEPRECATORY, or DEPREATIVE, in Theology, a term applied to the manner of performing some ceremonies in the form of prayer.

The form of absolution is deprecatory in the Greek church, being conceived in these terms, May God absolve you: whereas it is in the declarative form in the Latin church, and in some of the reformed churches, I absolve you.

DEPRESSION of the Pole. When a person sails or travels towards the equator, he is said to depress the pole; because as many degrees as he approaches nearer the equator, so many degrees will the pole be nearer the horizon. This phenomenon arises from the spherical figure of the earth.

DEPRESSION of a Star, or of the Sun, is its distance below the horizon; and is measured by an arc of a vertical circle, intercepted between the horizon and the place of the star.

DEPRESSION of the Visible Horizon, or Dip of the Horizon, denotes its sinking or dipping below the true horizontal plane, by the observer’s eye being raised above the surface of the sea; in consequence of which, the observed altitude of an object is by so much too great.

DEPRESSOR, or DEPRIMENS, in Anatomy, a name applied to several muscles, because they depress the parts they are fastened to.

DEPRIVATION, in the common law, the act of bereaving, divesting, or taking away a spiritual promotion or dignity: as when a bishop, vicar, prebend, or the like, is deposed or deprived of his preferment, for some matter or fault, in fact or in law. See DEPOSITION.

Deprivation is of two kinds; a beneficio, et ab officio.

Deprivation a beneficio is, when for some great crime a minister is wholly and for ever deprived of his living or preferment; which differs from suspension, in that the latter is only temporary.

Deprivation ab officio is, when a minister is for ever deprived of his order; which is the same, in reality, with what we otherwise call deposition and degradation; and is usually for some heinous crime deserving death, and is performed by the bishop in a solemn manner. See DEGRADATION.

DEPTFORD, a town of Kent in England, considerable for its fine docks and for the king’s yard and storehouses. It was anciently called West Greenwich. It is divided into Upper and Lower Deptford, and has two parish churches. Here is an hospital incorporated by Henry VIII. called Trinity House of Deptford Strond. The brethren of the Trinity House hold their corporation by this hospital, and are obliged, at certain times, to meet here for business. Both these are for decayed pilots, or masters of ships, or for their widows, who have a handsome monthly allowance. The town is handsomely built, and contained 15,833 inhabitants in 1811. It is four miles east of London. E. Long. 0. 4. o. N. Lat. 51. 30.

DEPTH, the measure of any thing from the surface downwards.

Measuring of Depths by the Barometer, depends on the same principles on which heights are measured by the same instrument. The measurement of depths being chiefly applied to mines, is still more precarious than the measurement of heights, on account of the various kinds of vapsours with which the subterraneous regions are filled. But for a particular account of these difficulties, with the best methods of obviating them, see BAROMETER and MINES.

DEPTH of a Squadron or Battalion, is the number of men in a file; which in a squadron is three, and in a battalion generally six. See SQUADRON, FILE, &c.

We say, the battalion was drawn up six deep; the enemy’s horse was drawn up five deep.

DEPURATION, is the freeing of any fluid from its heterogeneous matter or incumbrance. It is of three kinds; 1. Decantation; which is performed by letting the liquor to be depurated stand for some time in a pretty deep vessel, till the gross sediment has fallen to the bottom; after which the clear fluid is poured off. 2. Despumation; which is performed by means of the whites of eggs, or other viscid matter, and is also called clarification. 3. Filtration; which is effected by passing the fluid through cloth or porous paper.

DEPURATORY FEVER, a name given by Sydenham to a fever which prevailed much in the years 1661, 1662, 1663, and 1664. He called it depuratory, because he supposed that nature regulated all the symptoms in such a manner, as to fit the febrile matter, prepared by proper concoction, for expulsion in a certain time, either by a copious sweat or a freer perspiration.

DEPUTATION, a mission of select persons, out of a company or body, to a prince or assembly, to treat of matters in their name.

DEPUTY, a person sent upon some business by some community.

Deputy is also one that exercises an office in another’s right; and the forfeiture or misdemeanor of such deputy shall cause the person whom he represents to lose his office.

DEPUTATUS, among the ancients, a name applied to persons employed in making armour; and likewise to brisk active people, whose business was to take care of the wounded in engagements, and carry them off the field.

DER, a syllable frequently prefixed to the names of places in England. It is said to signify that such were formerly places where wild beasts herded together, so called from the Saxon, deep, fera, unless the situation was near some river.

DERBEND, a strong town of Asia, in Persia, said to have been founded by Alexander the Great. The walls are built with stones as hard as marble, and near it are the remains of a wall which reached from the Caspian to the Black sea. It is situated near the Caspian sea, at the foot of Mount Caucasus. E. Long. 50. o. N. Lat. 42. 8.

DERBY, the capital of a county of the same name in England. It is thought to have received its name from being formerly a park or shelter for deer; and what makes this supposition more probable is, that the arms of the town consist of a buck couchant in a park. It is very ancient, having been a royal borough in the time of Edward the Confessor. At present it is a handsome town, and sends two members to parliament.
large quantity of new land appears, such derelict lands belong to the king.

DERHAM, DR WILLIAM, a very celebrated English philosopher and divine, born in 1657. In 1682, he was presented to the vicarage of Wargrave in Berkshire; and in 1689, to the valuable rectory of Uppminster in Essex; which latter lying at a convenient distance from London, afforded him an opportunity of conversing and corresponding with the greatest virtuosos of the nation. Applying himself there with great eagerness to natural and experimental philosophy, he soon became a distinguished member of the Royal Society, whose Philosophical Transactions contain a great variety of curious and valuable pieces, the fruits of his laudable industry. In his younger years he published his Artificial Clockmaker, which has been often printed: and in 1711, 1712, and 1714, he preached those sermons at Boyle’s lecture, which he afterwards digested under the well-known titles of Physico-Theology and Astro-Theology, and enriched with valuable notes and copper-plates. The last thing he published of his own composition was Christo-Theology, a demonstration of the divine authority of the Christian religion, being the substance of a sermon preached at Bath in 1720. This great good man, after spending his life in the most agreeable as well as improving study of nature, died at Uppminster in 1735; and besides many other works, left a valuable collection of curiosities, particularly specimens of birds and insects of this island.—It may be necessary just to observe, that Dr Derham was very well skilled in medical as well as in physical knowledge; and was constantly a physician to the bodies as well as the souls of his parishioners.

DERIVATION, in Medicine, is when a humour which cannot conveniently be evacuated at the part affected, is attracted from thence, and discharged elsewhere; thus a blister is applied to the neck to draw away the humour from the eyes.

DERIVATION, in Grammar, the affinity one word has with another, by having been originally formed from it. See DERIVATIVE.

DERIVATIVE, in Grammar, a word which takes its origin from another word, called its primitive.—Such is the word derivative itself, which takes its origin from the primitive ricu, a rivulet or channel, out of which lesser streams are drawn; and thus manhood, deity, lawyer, &c. are derived from man, deus, law, &c.

DERMESTES, a genus of insects belonging to the order of coleopters. See ENTOMOLOGY Index.

DERNIER RESORT. See RESORT.

DEROGATION, an act contrary to a preceding one, and which annuls, destroys, and revokes it, either in whole or in part.

DEROGATORY, a clause importing derogation. A derogatory clause in a testament, is a certain sentence, cipher, or secret character, which the testator inserts in his will, and of which he reserves the knowledge to himself alone, adding a condition, that no will he may make hereafter is to be reckoned valid, if this derogatory clause is not inserted expressly and word for word. It is a precaution invented by lawyers against latter-wills extorted by violence, or obtained by suggestion.

Z

DERP,
DERP, a town of Livonia, and capital of a palatinate of the same name, with a bishop's see, and an university. It is subject to the Russians, and lies near the river Ambeck. E. Long. 31° 55'. N. Lat. 30° 40'.

DERTONA, DERTON, or DERTHEN, in Ancient Geography, a colony of the Cispadas; called Julia Augusta on inscriptions and coins; midway between Genoa and Piacentia, and situated to the east of the Tanarus in Liguria. Now Tortona, a city of Milan. E. Long. 9° 12'. N. Lat. 44° 4.

DERTOSA, in Ancient Geography, the capital of the Hercaunos, in Tarraceneus, or the Hither Spain: a municipium and colony; surmounted Julia Egergania (Coins). Dertossini, the people. Now Tortosa, in Catalonia, on the Ebro. E. Long. 1° 15'. N. Lat. 40° 45'.

DERVENTIO, in Ancient Geography, a river of the Brigantes in Britain. Now the Darwent in the east of Yorkshire, falling into the Ouse. Also a town of the Brigantes on the same river. Now called Audley, seven miles from York, to the north-east (Camden).

DERVIS, or Dervich, a name given to a sort of monks among the Turks, who lead a very austere life, and profess extreme poverty, though they are allowed to marry. The word is originally Persian, दरविष, signifying a "beggar," or "person who has nothing:" and because the religious, and particularly the followers of Mevelva, profess not to possess any thing, they call both the religious in general, and the Mevelvites in particular, Dervises or Derviches.

The dervises, called also Mevelvites, are a Mahometan order of religious; the chief or founder whereof was see Mevelva. They are now very numerous. Their chief monastery is that near Cogna in Natolia, where the general makes his residence, and where all the assemblies of the order are held; the other houses being all dependent on this, by a privilege granted to this monastery under Ottoman L.

The dervises affect a great deal of modesty, patience, humility, and charity. They always go bare-legged and open-breasted, and frequently born themselves with hot irons, to mortise themselves to patience. They always fast on Wednesdays, eating nothing on those days till after sunset. Tuesdays and Fridays they hold meetings, at which the superior of the house presides. One of them plays all the while on a flute, and the rest dance, turning their bodies round and round with the greatest swiftness imaginable. Long custom to this exercise from their youth has brought them to such a habititude, that it does not discompose them at all. This practice they observe with great strictness, in memory of Mevelva their patriarch's turning miraculously round, as they pretend, for the space of four days, without any food or refreshment; his companion Hamsa playing all the while on the flute; after which he fell into an ecstacy, and therein received wonderful revelations for the establishment of their order. They believe the flute an instrument consecrated by Jacob and the shepherds of the Old Testament, because they sang the praises of God upon it. They profess poverty, chastity, and obedience; and really observe them while they remain dervises: but if they choose to go out and marry, they are always allowed.

The generality of dervises are mountebanks; some apply themselves to legendaries, postures, &c. to amuse the people; others give in to sorcery and magic: but all of them, contrary to Mahomet's precept, are said to drink wine, brandy, and other strong liquors, to give them the degree of gaiety their order requires.

Beside their great saint Mevelva, there are particular saints honoured in some particular monasteries: as Kiderle, greatly revered in the monasteries of Egypt, and held by some to be St. George; and by others, with more probability, the prophet Elias.

The dervises are great travellers; and, under pretence of preaching, and propagating their faith, are continually passing from one place to another: on which account they have been frequently used as spies.

There are also dervises in Persia, called in that country Abdala, q. d. servants of God. They lead a very penurious, austere life, and preach the Alcoran in the streets, coffee-houses, and wherever they can meet with auditors. The Persian dervises retail little but fables to the people, and are in the utmost contempt among the men of sense and letters.

There are in Egypt two or three kinds; those that are in convents, are in a manner of the religions order, and live retired; though there are of these some who travel and return again to their convents. Some take this character, and yet live with their families, and exercise their trades; of this kind are the dancing dervises at Damascus, who go once or twice a-week to a little uninhabited convent, and perform their extraordinary exercises; these also seem to be a good people: but there is a third sort of them who travel about the country, and beg, or rather oblige people to give, for whenever they sound their horn something must be given them. The people of these orders, in Egypt, wear an octagonal badge, of a greenish white alabaster, at their girdles, and a high stiff cap without any thing round it.

DESAGUILLERS, JOHN THEOPHILUS, who introduced the practice of reading public lectures in experimental philosophy, in the metropolis, and who made several improvements in mechanics; was the son of the reverend John Desaguilliers, a French Protestant refugee, and was born at Rochelle in 1683. His father brought him to England an infant; and at a proper age placed him at Christ-Church College, Oxford; where he succeeded Dr. Keil in reading lectures on experimental philosophy at Hart-Hall. The magnificent duke of Chandos made Dr Desaguilliers his chaplain, and presented him to the living of Edgeware, near his seat at Cannons: and he was afterwards chaplain to Frederic prince of Wales. He read lectures with great success to the time of his death in 1749. He communicated many curious papers printed in the Philosophical Transactions; published a valuable Course of Experimental Philosophy, in 2 vols 4to; and gave an edition of Gregory's Elements of Catoptrics and Dioptrics, with an Appendix on reflecting telescopes, 8vo.

He was a member of the Royal Society, and of several foreign academies.

DESART, a large extent of country entirely barren, and producing nothing. In this sense some are sandy deserts; as those of Lop, Xamo, Arabia, and several others in Asia; in Africa, those of Libya and Zara: others are stony, as the desert of Tharan in Arabia Petraea.
The Descant, properly so called, is that part of Arabia, south of the Holy Land, where the children of Israel wandered forty years.

Descant, in Music, the art of composing in several parts. See Composition.

Descant is threefold, viz. plain, figurative, and double.

Plain Descant is the ground-work and foundation of all musical compositions, consisting altogether in the orderly placing of many concords, answering to simple counterpoint. See Counterpoint.

Figurative or Florid Descant, is that part of an air of music wherein some discords are concerned, as well, though not so much, as concords. This may be termed the ornamental and rhetorical part of music, in regard that there are introduced all the varieties of points, syncopes, diversities of measures, and whatever is capable of adorning the composition.

Descant Double, is, when the parts are so contrived, that the treble, or any high part, may be made the bass; and, on the contrary, the bass the treble. See Cartes.

Descendant. The issue of a common parent, in infinitum, are called his descendants. See the article Descend.

Descension, in Astronomy, is either right or oblique.

Right Descension, is an arch of the equinoctial, intercepted between the next equinoctial point and the intersection of the meridian, passing through the centre of the object, at its setting, in a right sphere.

Oblique Descension, an arch of the equinoctial, intercepted between the next equinoctial point and the horizon, passing through the centre of the object, at its setting, in an oblique sphere.

Descend, in general, is the tendency of a body from a higher to a lower place; thus all bodies, unless otherwise determined by a force superior to their gravity, descend towards the centre of the earth. See Gravity and Mechanics.

Descend, or Hereditary Succession, in Law, is the title whereby a man, on the death of his ancestor, acquires his estate by right of representation, as his heir at law. An heir, therefore, is he upon whom the law casts the estate immediately on the death of the ancestor; and an estate so descending to the heir is in law called the inheritance.

Descent is either lineal or collateral. The former is that conveyed down in a right line from the grandfather to the father, and from the father to the son, and from the son to the grandson. The latter is that springing out of the side of the line or blood; as from a man to his brother, nephew or the like.

The doctrine of descents, or law of inheritances in fee-simple, is a point of the highest importance: (See the article Fee). All the rules relating to purchases, whereby the legal course of descents is broken and altered, perpetually refer to this settled law of inheritance, as a datum or first principle universally known, and upon which their subsequent limitations are to work. Thus a gift in tail, or to a man and the heirs of his body, is a limitation that cannot be perfectly understood without a previous knowledge of the law of descents in fee-simple. One may well perceive, that this is an estate confined in its descents to such heirs only of the donee as have sprung or shall spring from his body: but who those heirs are, whether all his children both male and female, or the male only, and (among the males) whether the eldest, youngest, or other son alone, or all the sons together, shall be his heir; this is a point that we must result back to the standing law of descents in fee-simple to be inferred of.

And as this depends not a little on the nature of kindred, and the several degrees of consanguinity, it will be necessary to refer the reader to the article Consanguinity, where the true notion of this kindred or alliance in blood is particularly stated.

We shall here exhibit a series of rules or canons of inheritance, with illustrations, according to which, by the law of England, estates are transmitted from the ancestor to the heir.

1. "Inheritances shall lineally descend to the issue of the person last actually seized in infinitum, but shall never lineally ascend."

To understand both this and the subsequent rules, it must be observed, that by law no inheritance can vest nor can any person be the actual complete heir of another, till the ancestor is previously dead. Nemo est hae-rès viventís. Before that time, the person who is next in the line of succession is called heir apparent, or heir presumptive. Heirs apparent are such whose right of inheritance is indefeasible, provided they outlive the ancestor; as the eldest son or his issue, who must, by the course of the common law, be heirs to the father whenever he happens to die. Heirs presumptive are such, who, if the ancestor should die immediately, would in the present circumstances of things be his heirs; but whose right of inheritance may be defeated by the contingency of some nearer heir being born: as a brother or nephew, whose presumptive succession may be destroyed by the birth of a child; or a daughter, whose present hopes may be hereafter cut off by the birth of a son. Nay, even if the estate hath descended, by the death of the owner, to such a brother, or nephew, or daughter; in the former case, the estate shall be divested and taken away by the birth of a posthumous child; and, in the latter, it shall also be totally divested by the birth of a posthumous son.

We must also remember, that no person can be properly such an ancestor as that an inheritance in lands or tenements can be derived from him, unless he hath had actual seizin of such lands, either by his own entry, or by the possession of his own or his ancestor's lease for years, or by receiving rent from a leasee of the freehold: or unless he hath what is equivalent to corporal seizin in hereditaments that are incorporal; such as the receipt of rent, a presentation to the church in case of an advowson, and the like. But he shall not be accounted an ancestor who hath had only a bare right or title to enter or be otherwise seizin. And therefore all the cases which will be mentioned in the present article, are upon the supposition that the deceased (whose inheritance is now claimed) was the last person actually seizin thereof. For the law requires this notoriety of possession, as evidence that the ancestor had that property in himself, which is now to be transmitted to his heir. Which notoriety hath succeeded in the place of the ancient feudal investiture, whereby, while feuds were precarious, the vassal on the descent of lands was formerly admitted to the lord's court
Descent. [ 180 ]

Descent.

(As is still the practice in Scotland;) and therefore received his seisin, in the nature of a renewal of his ancestor’s grant, in the presence of the feudal peers: till at length, when the right of succession became indefeasible, an entry on any part of the lands within the county (which if disputed was afterwards to be tried by those peers), or other notorious possession, was admitted as equivalent to the formal grant of seisin, and made the tenant capable of transmitting his estate by descent. The seisin therefore of any person, thus understood, makes him the root or stock from which all future inheritance by right of blood must be derived, which is very briefly expressed in this maxim, seism facili stipitem.

When therefore a person dies so seised, the inheritance first goes to his issue: as if there be Geoffrey, John, and Matthew, grandfather, father, and son; and John purchases lands and dies; his son Matthew shall succeed him as heir, and not the grandfather Geoffrey; to whom the land shall never ascend, but shall rather escheat to the lord.

2. “The male issue shall be admitted before the female.”—Thus sons shall be admitted before daughters; or, as our male lawgivers have somewhat uncomplaisantly expressed it, the worthiest of blood shall be preferred. As if John Stiles had two sons, Matthew and Gilbert, and two daughters, Margaret and Charlotte, and dies; first Matthew, and (in case of his death without issue) then Gilbert shall be admitted to the succession in preference to both the daughters.

3. “Where there are two or more males in equal degree, the eldest only shall inherit; but the females all together.” As if a man hath two sons, Matthew and Gilbert, and two daughters, Margaret and Charlotte, and dies; Matthew his eldest son shall alone succeed to his estate, in exclusion of Gilbert the second son and both the daughters; but if both the sons die without issue before the father, the daughters Margaret and Charlotte shall both inherit the estate as coparceners.

4. “The lineal descendants in infinitum, of any person deceased, shall represent their ancestor; that is, shall stand in the same place as the person himself would have done had he been living.” Thus the child, grand-child, or great-grand-child (either male or female), of the eldest son, succeeds before the younger son, and so in infinitum. And these representatives shall take neither more nor less, but just so much as their principals would have done. As if there be two sisters, Margaret and Charlotte; and Margaret dies, leaving six daughters; and then John Stiles the father of the two sisters dies without other issue; these six daughters shall take among them exactly the same as their mother Margaret would have done, had she been living; that is, a moiety of the lands of John Stiles in coparcenership: so that, upon partition made, if the land be divided into twelve parts, thereof Charlotte the surviving sister shall have six, and her six nieces, the daughters of Margaret, one a-piece.

5. “On failure of lineal descendants, or issue of the person last seised, the inheritance shall descend to the blood of the first purchaser; subject to the three preceding rules.” Thus, if Geoffrey Stiles purchases land, and it descends to John Stiles his son, and John dies seized thereof without issue; whoever succeeds to this inheritance must be of the blood of Geoffrey, the first purchaser of this family. The first purchaser, perquisitor, is he who first acquired the estate to his family, whether the same was transferred to him by sale, or by gift, or by any other method, except only that of descent.

6. “The collateral heir of the person last seised must be his next collateral kinsman of the whole blood.”

First, he must be his next collateral kinsman either personally or jure representationis; which proximity is reckoned according to the canonical degrees of consanguinity: See Consanguinity. Therefore the brother being in the first degree, he and his descendants shall exclude the uncle and his issue, who is only in the second.—Thus, if John Stiles dies without issue, his estate shall descend to Francis his brother, who is lineally descended from Geoffrey Stiles, his next immediate ancestor or father. On failure of brethren or sisters and their issue, it shall descend to the uncle of John Stiles, the lineal descendant of his grandfather George; and so on in infinitum.

But, secondly, the heir need not be the nearest kinsman absolutely, but only sub modo; that is, he must be the nearest kinsman of the whole blood; for if there be a much nearer kinsman of the half blood, a distant kinsman of the whole blood shall be admitted, and the other entirely excluded. A kinsman of the whole blood is he that is derived, not only from the same ancestor, but from the same couple of ancestors. For as every man’s own blood is compounded of the bloods of his respective ancestors, he only is properly of the whole or entire blood with another who hath (so far as the distance of degrees will permit) all the same ingredients in the composition of his blood that the other hath. Thus, the blood of John Stiles being composed of those of Geoffrey Stiles his father, and Lucy Baker his mother, therefore his brother Francis, being descended from both the same parents, hath entirely the same blood with John Stiles; or he is his brother of the whole blood. But if, after the death of Geoffrey, Lucy Baker the mother marries a second husband, Lewis Gay, and hath issue by him: the blood of this issue, being compounded of the blood of Lucy Baker (it is true) on the one part, but that of Lewis Gay (instead of Geoffrey Stiles) on the other part, it hath therefore only half the same ingredients with that of John Stiles; so that he is only his brother of the half blood, and for that reason they shall never inherit to each other. So also, if the father has two sons, A and B, by different venters or wives; now these two brethren are not brethren of the whole blood, and therefore shall never inherit to each other, but the estate shall rather escheat to the lord. Nay, even if the father dies, and his lands descend to his eldest son A, who enters thereon, and dies seized without issue; still B shall not be heir to this estate, because he is only of the half blood to A, the person last seised; but had A died without entry, then B might have inherited; not as heir to A his half-brother, but as heir to their common father, who was the person last actually seised.

The rule then, together with its illustration, amounts to this; That in order to keep the estate of John Stiles as nearly as possible in the line of his purchasing ancestor, it must descend to the issue of the nearest couple of ancestors that have left descendants behind them; because
because the descendants of one ancestor only are not so likely to be in the line of that purchasing ancestor as those who are descended from two.

But here a difficulty arises. In the second, third, fourth, and every superior degree, every man has many couples of ancestors, increasing according to the distances in a geometrical progression upwards, the descendants of all which respective couples are (representatively) related to him in the same degree. Thus, in the second degree, the issue of George and Cecilia Stiles and of Andrew and Esther Baker, the two granddaughters and grandmothers of John Stiles, are each in the same degree of propinquity; in the third degree, the respective issues of Walter and Christian Stiles, of Luke and Frances Kempe, of Herbert and Hannah Baker, and of James and Emma Thorpe, are (upon the extinction of the two inferior degrees) all equally entitled to call themselves the next kindred of the whole blood to John Stiles. To which therefore of these ancestors must we first resort, in order to find out descendants to be preferably called to the inheritance? In answer to this, and to avoid the confusion and uncertainty that might arise between the several stocks wherein the purchasing ancestor may be sought for.—

7. The seventh and last rule or canon is, "That in collateral inheritances the male stocks shall be preferred to the female (that is, kindred derived from the blood of the male ancestors shall be admitted before those from the blood of the female); unless where the lands have in fact descended from a female."

Thus the relations on the father's side are admitted in infinitum, before those on the mother's side are admitted at all; and the relations of the father's father, before those of the father's mother; and so on.

For the origin and progress of the above canons, the reasons upon which they are founded, and their agreement with the laws of other nations, the curious reader may consult Blackstone's Commentaries, vol. ii. p. 208—237.

We shall conclude with exemplifying the rules themselves by a short sketch of the manner in which we must search for the heir of a person, as John Stiles, who dies seized of land which he acquired, and which therefore he held as a feud of indefinite antiquity. See the Table of Descents on Plate CLXIX.

In the first place succeeds the eldest son, Matthew Stiles, or his issue, (N 1.) — If his line be extinct, then Gilbert Stiles and the other sons respectively, in order of birth, or their issue, (N 2.) — In default of these, all the daughters together, Margaret and Charlotte Stiles or their issue, (N 3.) — On the failure of the descendants of John Stiles himself, the issue of Geoffrey and Lucy Stiles, his parents, is called in; viz. first, Francis Stiles, the eldest brother of the whole blood, or his issue, (N 4.) — then Oliver Stiles, and the other whole brothers respectively, in order of birth, or their issue, (N 5.) — then the sisters of the whole blood altogether, Bridget and Alice Stiles, or their issue, (N 6.) — In defect of these, the issue of George and Cecilia Stiles, his father's parents; respecting being still had to their age and sex, (N 7.) — then the issue of Walter and Christian Stiles, the parents of his paternal grandfather, (N 8.) — then the issue of Richard and Anne Stiles, the parents of his paternal grandfather's father, (N 9.) — and so on in the paternal grandfather's paternal line, or blood of Walter Stiles, in infinitum. In defect of these the issue of William and Jane Smith, the parents of his paternal grandfather's mother, (N 10.) — and so on in the paternal grandfather's maternal line, or blood of Christian Smith, in infinitum; till both the immediate bloods of George Stiles, the paternal grandfather, are spent.

Then we must resort to the issue of Luke and Frances Kempe, the parents of John Stiles's paternal grandmother, (N 11.) — then to the issue of Thomas and Sarah Kempe, the parents of his paternal grandmother's father, (N 12.) — and so on in the paternal grandmother's paternal line, or blood of Luke Kempe, in infinitum. In default of which, we must call in the issue of Charles and Mary Holland, the parents of his paternal grandmother's mother, (N 13.) — and so on in the paternal grandmother's maternal line, or blood of Frances Holland, in infinitum; till both the immediate bloods of Cecilia Kempe, the paternal grandmother, are also spent. Whereby the paternal blood of John Stiles entirely failing, recourse must then, and not before, be had to his maternal relations; or the blood of the Bakers, (N 14, 15, 16.) willis's (N 17, 18, 19,) and White's (N 20) in the same regular successive order as in the paternal line.

The student should bear in mind, that during this whole process, John Stiles is the person supposed to have been last actually seized in the estate. For if ever it comes to vest in any other person, as heir to John Stiles, a new order of succession must be observed upon the death of such heir; since he, by his own seisin, now becomes himself an ancestor, or stirpes, and must be put in the place of John Stiles. The figures therefore denote the order in which the several classes would succeed to John Stiles, and not to each other; and before we search for an heir in any of the higher figures, (as N 8) we must first be assured that all the lower classes from (N 1 to 7) were extinct at John Stiles's death.

Descent, or Succession, in the Law of Scotland. See Law Index.

Descent of Dignities. A dignity differs from common inheritances, and goes not according to the rules of the common law: for it descends to the half-blood; and there is no coparensiveness in it, but the eldest takes the whole. The dignity of peerage is personal, annexed to the blood; and so inseparable that it cannot be transferred to any person, or surrendered even to the crown; it can move neither forward nor backward, but only downward to posterity; and nothing but corruption of blood, as if the ancestor be attainted of treason or felony, can hinder the descent to the right heir.

Descend, in genealogy, the order or succession of descendants in a line or family; or their distance from a common progenitor: Thus we say, one descent, two descents, &c.

Descend, in Heraldry, is used to express the coming down of any thing from above; as, a lion en descend is a lion with his head towards the base points, and his heels towards one of the corners of the chief, as if he were leaping down from some high place.

Deschamps,
DESCHAMPS, Francis, a French poet, born in
Champagne, was the author of a tragedy entitled Cato
of Utica, and a history of the French theatre. He
died at Paris in 1747.

DESCRIPTION, in literary composition, is such
a strong and beautiful representation of a thing, as
gives the reader a distinct view and satisfactory notion
of it. See NARRATION and Description.

DESEADA, or DESIDERADA, one of the Carib-
bee islands, about ten miles long and five broad, lying
eastward of Guadaloupe.

DESERET, or DESART. See DESART.

DESERTER, in a military sense, a soldier who,
by running away from his regiment or company, aban-
don the service.

A deserter is, by the articles of war, punishable by
death; which, after conviction, is executed upon him
at the load of the regiment he formerly belonged to,
with his crime written on his breast.

DESERTION, in Law. See LAW INDEX.

DESHABILLE, a French term, naturalized of
late. It properly signifies a night-gown, and other
necessaries, made use of in dressing or undressing. Mr
— is not to be spoken with, he is yet in his desha-
bille, i.e. undressed, or in his night-gown. The
word is compounded of the privative de, and s'habiller, "to
dress one's self."

DESHACHE, in Heraldry, is where a beast has
its limbs separated from its body, so that they still re-
main on the escutcheon, with only a small separation
from their natural places.

DESIDERATUM, is used to signify the desirable
perfections in any art or science; thus, it is a deside-
ratum with the blacksmith, to render iron fusible by
a gentle heat, and yet preserve it hard enough for ordi-
nary uses; with the glazier and looking-glass-maker,
to render glass malleable; with the clock-maker,
to bring pendulums to be useful where there are irregu-
lar motions, &c.

DESIGN, in a general sense, the plan, order, rep-
resentation, or construction of a building, book, paint-
ing, &c. See Architecture, Painting, Poetry,
Oratory, History.

Design, in the manufactories, expresses the figures
where with the workman enriches his stuff or silk, and
which he copies after some painter or eminent draughts-
man, as in diaper, damask, and other flowered silk
and tapestry, and the like.

In undertaking of such kinds of figured stuffs, it is
necessary, says Mons. Savary, that before the first stroke
of the shuttle, the whole design be represented on the
threads of the warp, we do not mean in colours, but
with an infinite number of little pickthreads, which,
being disposed so as to raise the threads of the warp,
let the workman see, from time to time, what kind of
silk is to be put in the eye of the shuttle for wool.
This method of preparing the work is called reading
the design, and reading the figure, which is performed
in the following manner? A paper is provided, con-
siderably broader than the stuff, and of a length propor-
tionate to what is intended to be represented thereon.
This they divide lengthwise by as many black lines as
there are intended threads in the warp; and across these
lines by others drawn breadthwise, which, with the
former, make little equal squares; on the paper thus
squared, the draughtsman designs his figures, and height-
ens them with colours as he sees fit. When the design
is finished, a workman reads it, while another lays it
on the simblist.

To read the design, is to tell the person who man-
ger the loom the number of squares or threads com-
prised in the space he is reading, intimating at the
same time, whether it is ground or figure. To put what
is read on the simblist, is to fasten little strings to the
several pickthreads, which are to raise the threads needed: and this they continue to do till the whole de-
sign is read.

Every piece being composed of several repetitions of
the same design, when the whole design is drawn, the
drawer, to re-begin the design afresh, has nothing to do
but to raise the little strings, with slip-knots, to the top
of the simblist, which he had let down to the bottom;
this he is to repeat as often as is necessary, till the whole
be manufactured.

The ribbon-weavers have likewise a design, but far
more simple than that now described. It is drawn on
paper with lines and squares, representing the threads
of the warp and woof. But instead of lines, whereof
the figures of the former consist, these are constituted of
points only, or dots, placed in certain of the little
squares formed by the intersection of the lines. These
points mark the threads of the warp that are to be ra-
ised, and the spaces left blank denote the threads that
are to keep their situation; the rest is managed as in
the former.

Design is also used, in Painting, for the first idea of
a large work, drawn roughly, and in little, with an in-
tention to be executed and finished in large.

In this sense, it is the simple contour or outlines of
the figures intended to be represented, or the lines
that terminate and circumscribe them: such design is
sometimes drawn in crayons or ink, without any shad-
ows at all; sometimes it is hatched, that is, the shad-
owns are expressed by sensible outlines, usually drawn
across each other with the pen, crayon, or graver.
Sometimes, again, the shadows are done with the cray-
on rubbed so as that there do not appear any lines;
at other times, the grains or stroke of the crayon ap-
ppear, as not being rubbed: sometimes the design is
washed, that is, the shadows are done with a pencil
in Indian ink, or some other liquor; and sometimes the
design is coloured, that is, colours are laid on much
like those intended for the grand work.

Design, in Music, is mostly defined by Rousseau to
be the invention and the conduct of the subject, the
disposition of every part, and the general order of the
whole.

It is not sufficient to form beautiful airs, and a le-
gitimate harmony; all these must be connected by a
principal subject, to which all the parts of the work
relate, and by which they become one. Thus unity
ought to prevail in the air, in the movement, in the
character, in the harmony, and in the modulation. All
these must indispensably relate to one common idea
which unites them. The greatest difficulty is, to recon-
cile the observation of those precepts with an elegant
variety, which, if not introduced, renders the whole
piece irksome and monotonous. Without question, the
musician, as well as the poet and the painter, may risk
every thing in favour of this delightful variety; if, un
under
under the pretext of contrasting, they do not endeavor to cheat us with false appearances, and instead of pieces justly and happily planned, present us with a musical minc’d meat, composed of little abortive fragments, and of characters so incompatible, that the whole assembled forms a heterogeneous monster.

Non ut placida coaeunt immittis, non ut Serpentis avibus geminuntur, tigribus agni.

Translated thus:

But not that nature should reverse appear; Mix mild with fierce, and gentle with severe; Profane her laws to contradiction’s height: Tygers with lambs, with serpents birds unite.

It is therefore in a distribution formed with intelligence and taste, in a just proportion between all the parts, that the perfection of design consists; and it is above all, in this point, that the immortal Pergolesi has shown his judgment and his taste, and has left far behind he all his competitors. His Statut Major, his Orfeo, his Sera Padrona, are, in three different species of composition, three masterpieces of designing equally perfect.

This idea of the general design of a work is likewise particularly applicable to every piece of which it consists: thus the composer plans an air, a duet, a chorus, &c. For this purpose, after having invented his subject, he distributes it, according to the rules of a legitimate modulation, into all the parts where it ought to be perceived, in such a proportion, that its impression may not be lost on the minds of the audience; yet that it may never be reiterated in their ears, without the graces of novelty. The composer errs in designing, who suffers his subject to be forgot; he is still more culpable who pursues it till it becomes trite and tiresome.

DESIGNATION, the act of marking or indicating, and making a thing known. The designation of such an estate is made by the tenants, butments, and holdings. Among the Romans, there were designations of the consuls and other magistrates, some time before their election.

DESIGNATOR, a Roman officer, who assigned and marked each person his place and rank in public ceremonies, shows, processions, &c. The word is formed from the verb designare, “to design.”

The designator was a kind of a marshal, or master of the ceremonies, who regulated the seats, march, order, &c. There were designators at funeral solemnities, and at the games, theatre, and shows, who not only assigned every one his place, but also led him to it; as appears from the prologue to the Penuilus of Plautus. Much of the same nature were the agonathecæ of the Greeks.

DESIGNING, the art of delineating or drawing the appearance of natural objects, by lines on a plane. To design, according to the rules of mathematics, makes the object of perspective. See PERSPECTIVE.

DESPOP., a term sometimes used for an absolute prince: (see next article). The word, in its first origin, signified the same with the Latin servus, and the English master: but in time it underwent the same fate on medals, as, among the Latins, Cæsar did with regard to Augustus: BACIAETC answering to Augustus, and AECIOITHC, despotes, to Caesar. See Cæsar.

Thus, Nicephorus having ordered his son Stauracius to be crowned, the son, out of respect, would only take the name AECIOITHC, leaving to his father that of BACIAETC. For it is to be noted, that it was just about the time that the emperors began to cease to use Latin inscriptions. This delicacy, however, did not last long; for the following emperors preferred the quality of AECIOITHC to that of BACIAETC, particularly Constantine, Michael Ducas, Nicephorus Botaniates, Romanus Diogenes, the Comneni, and some others. In imitation of the princes, the princesses likewise assumed the title of AECIOINA.

It was the emperor Alexius, surnamed the angel, that created the dignity of despot, and made it the first after that of emperor, above that of Augustus or Sebastocrator and Cæsar. See August.

The despots were usually the emperor’s sons or sons-in-law, and their colleagues or co-partners in the empire, as well as their presumptive heirs. The despots that were sons of the emperors had more privileges and authority than those that were only sons-in-law. Codin, p. 58, describes the habits and ornaments of the despot. See the notes of Father Goar on that author. Under the successors of Constantine the Great, the title despot of Sparta was given to the emperor’s son or brother, who had the city of Sparta or Lacedemon by way of appanage.

DESPOT is at present a title of quality given to Wallachia, Serbia, and some of the neighboring countries.

DESPOTICAL, in general, denotes any thing that is uncontrolled and absolute; but is particularly used for an arbitrary government, where the power of the prince is unlimited, and his will a law to his subjects; such as those of Turkey, Persia, and most of the eastern governments; and even those of Europe, if we except the republics, our own, and of late the French government.

DESPOLLUE, in Heraldry, the whole case, skin, or plough of a beast, with the head, feet, tail, and all appurtenances, so that being filled and stuffed it looks like the entire creature.

DESPREAX. See BOILEAU.

DESSAULT, Peter Joseph, a distinguished French surgeon, was born at Magny Vernois, a village of Franche Comté, in the year 1744. He was descended of parents of a humble rank in life. He received the early part of his education in a school of the Jesuits, and was destined for the church; but his own inclination tended to the study of medicine, and in this he was at length indulged and settled as an apprentice in the military hospital of Belfort. Here he acquired some knowledge of anatomy and surgery; and having previously made considerable progress in mathematical studies, he applied this knowledge, after the example of Barelli and others, to the investigation of physiological subjects. He translated the work of Barelli, De Mutis Animalium, and added notes and illustrations, in which, although he proceeded upon wrong principles, he discovered at a very early period strong proofs of his zeal and industry.

About his 20th year he went to Paris, where he enjoyed the best opportunities of storing his mind with the knowledge of surgery and anatomy, which he prosecuted.
Dessault, executed with the utmost ardour and success. He spent almost the whole of his time at the anatomical theatres and hospitals; but by this close attendance his health suffered greatly. He was seized with a cachectical disease, which confined him to bed for a twelvemonth; and he was indebted for his recovery to the vigour of his constitution, and the kind offices of a young friend who constantly watched the progress of his disorder. His health being re-established, neither his circumstances nor the activity of his mind would permit him to indulge in repose. He commenced teacher of anatomy in the winter of 1766, and was soon attended by 300 pupils, a great proportion of whom was older than himself. But this success excited the jealousy of the established teachers and professors, who exerted all the influence of authority to silence him; and although he was patronised and protected by some surgeons of great eminence, the opposition which he met with would have obliged him to renounce public teaching, had he not been permitted to go on by the express permission of the directors to call another as a sanction. His reputation was now greatly extended; but still be declined private practice, till he was established in some distinguished public station. In the year 1776, he was admitted a member of the corporation of surgeons, and it would appear that his finances were at this time extremely limited, from the circumstance of his being indulged by that body in paying his fees when it should be convenient for himself. He successively filled the honourable stations in the corporation and academy of surgery, and in the year 1782, he was appointed surgeon-major to the hospital De la Charité.

Dessault was now regarded as one of the first surgeons of Paris. He succeeded to the next vacancy at the Hotel Dieu; and after the death of Moreau, almost the whole surgical department of that hospital was intrusted to him. Here he instituted a clinical school of surgery, on a liberal and extensive plan, which attracted a great concourse of students, not only from every part of France, but from foreign countries. The audience composed of 600 students frequently met to hear his instructions, and most of the surgeons of the French army derived their knowledge from his lectures.

The surgical practice of Dessault was always distinguished for its efficacy and simplicity. Among the improvements which he introduced into surgery may be mentioned bandages for the retention of fractured limbs, the use of compresses in promoting the cure of ulcers, the use of ligature in umbilical hernia of children, the extraction of loose cartilages in joints, the use of bougies in stenosis of the rectum, and that of elastic probes in contractions of the urethra. He also introduced essential improvements in the construction of various surgical instruments.

In the year 1791, he published a work entitled Journal de Chirurgie, the object of which was to record the most interesting cases which occurred in his clinical school, with the remarks which he made upon them in the course of his lectures. The editing of this work was intrusted to his pupils. But in the midst of his valuable labours he became obnoxious to some of the prevailing parties of that turbulent period, and in 1792 he was denounced to the popular sections in the cant language of the times, as an egotist or indif-

ferent. After being twice examined, he was seized while he was delivering a lecture, carried away from his theatre, and committed to the prison of the Luxembourg. But in three days he was liberated and permitted to resume all his functions. When the school of health was established, he was appointed clinical professor for external maladies; and it was through his means that the Évechète was converted into an hospital for surgical operations.

The horrid scenes which were exhibited in May 1795, made so deep an impression on his mind, from the apprehension of a renewal of the horrors which he had formerly experienced, that he was seized with a fever, accompanied with delirium; and this put an end to his life on the 1st of June, the same year, at the age of 51. He had attended the dauphin in the temple; and from the circumstance of his death having happened but a short time before that prince, an opinion was prevalent among the populace that he was poisoned, because he refused to do any thing against the dauphin's life. This story seems to have no foundation, but it affords a proof of the opinion held by the public of Dessault's integrity. A pension was settled on his widow by the republic. Fame, and not emolument, had been always the object of his ambition; for he neglected many opportunities of acquiring wealth. Indifferent to all other pleasures and pursuits, Dessault was solely and passionately attached to his profession. His temper was ardent, and sometimes rather violent; but his sentiments were always elevated and noble. The only work of which he is to be considered as the sole author, is entitled Traité des Maladies chirurgicale, et des Opérations qui leur conviennent, in 2 vols 8vo.

DESSAW, a city of Upper Saxony, in Germany, situated on the river Elbe, 60 miles north-west of Dresden, and subject to the prince of Anhalt Dessau. E. Long. 12. 40. N. Lat. 51. 50.

DESSERT, or DESERT, a service of fruits and sweetmeats, usually served in at table.

DESSICATIVE, or DESCENCING, in Pharmacy, an epithet applied to such topical medicines as dry up the humours flowing to a wound or ulcer.

DESTINIES, in Mythology. See PARCE.

DESTINY, among philosophers and divines. See FATE.

DESTRUCTION, in general, an alteration of any thing from its natural state to one contrary to nature, whereby it is deemed the same with CORRUPTION.

A chemical destruction, or corruption, is nothing but a resolution of the whole naturally mixt body into its parts.

DESUDATION, in Medicine, a profuse and inordinate sweat, succeeded by an eruption of pustules, called sudamina, or heat pimples.

DESLUTOR, in antiquity, a vaulter or leaper, who, leading one horse by the bridle, and riding another, jumped from the back of one to the other, as the custom was after they had run several courses or heats. — This practice required great dexterity, being performed before the use of either saddles or stirrups. The custom was practised in the army when necessity required it; but chiefly amongst the Numidians, who always carried with them two horses at least for that purpose, changing them as they tired. The Greeks and
DET [ 185 ]

and Romans borrowed the practice from them; but only used it at races, games, &c. The Sarmatian were great masters of this exercise, and the husars have still some remains of it.

DETACHMENT, in military affairs, a certain number of soldiers drawn out from several regiments or companies equally, to be employed as the general thinks proper, whether on an attack, at a siege, or in parties to scour the country.

DETENTION (from detinere, “I detain,”) the possession or holding of lands, or the like, from some other claimant. The word is chiefly used in an ill sense, for an unjust withholding, &c.

DETECTS, in a clock, are those stops which, by being lifted up or let fall down, lock and unlock the clock in striking.

DETECT-Wheel, or Hoop-Wheel, in a clock, that wheel which has a hoop almost round it, wherein there is a vacancy, at which the clock locks.

DETERGENTS, in Pharmacy, such medicines as are not only softening and adhesive, but also, by a peculiar activity, conjoined with suitable configuration of parts, are apt to abrade and carry along with them such particles as they lay hold on in their passage.

DETERIORATION, the impairing or rendering any thing worse; it is just the reverse of melioration.

DETERMINATE PROBLEM, is that which has but one solution, or a certain limited number of solutions; in contradistinction to an indeterminate problem, which admits of infinite solutions.

DETERMINATE SECTION, the name of a tract or general problem, written by the ancient geometrician Apollonius. None of this work has come down to us, excepting some extracts, and an account of it, by Pappus, in the Preface to the seventh book of his Mathematical Collections. He there says that the general problem was “To cut an infinite right line in one point so that, of the segments contained between the point of section sought, and given points in the said line, either the square on one of them, or the rectangle contained by two of them, may have a given ratio, either to the rectangle contained by one of them and a given line, or to the rectangle contained by two of them.”

DETERMINATION, in Mechanics, signifies much the same with the tendency or direction of a body in motion. See MECHANICS.

DETERMINATION, among school-divines, is an act of divine power, limiting the agency of second causes, in every instance, to what the Deity predestinated concerning them. See PREDESTINATION.

DETERIORS, the same with DETERGENTS.

DETINUE, in Law, a writ or action that lies against one who has got goods or other things delivered to him to keep, and afterwards refuses to deliver them.—In this action, the thing detained is generally to be recovered, and not damages; but if one cannot recover the thing itself, he shall recover damages for the thing, and also for the detainer. Detinence lies for any thing certain and valuable, wherein one may have a property or right; as for a horse, cow, sheep, hens, dogs, jewels, plate, cloth, bags of money, sacks of corn, &c. It must be laid so certain, that the thing detained may be known and recovered: and therefore, for money out of a bag, or corn out of a sack, &c. it lies not; for the money or corn cannot

in this case be known from other money or corn; so that the party must have an action on the case, &c.

Yet detinence may be brought for a piece of gold of the price of 22s. though not for 22s. in money.

DETONATION, in Chemistry, signifies an explosion with noise made by the sudden inflammation of some combustible body: such are the explosions of gunpowder, fulminating gold, and fulminating powder. See CHEMISTRY Index.

DETRANCHE, in Heraldry, a line bend-wise, proceeding always from the dexter side, but not from the very angle, diagonally athwart the shield.

DETTINGEN, a village of Germany, in the circle of the Upper Rhine, and in the territory of Hanau. Here the Austrians and the British, in June 1743, were attacked by the French, who met with a repulse; but as the allies were inferior in number, they could not make the advantage of it they might otherwise have done. F. Long. 8. 45. N. Lat. 50. 8.

DEVA, or DEUWA, in Ancient Geography, a town of the Cornavii in Britain. Now Chester, on the Dee. W. Long. 3. 0. N. Lat. 53. 15.

DEUCALEDONIUS OCEANUS, supposed to be derived from the Gaelic words Duach Gael, the northern Highlanders: the sea on the north-west of Scotland.

DEUCALION, king of Thessaly. The flood said to have happened in his time (1500 B.C.), is supposed to have been only an inundation of that country, occasioned by heavy rains, and an earthquake that stopped the course of the river Peneus where it usually discharged itself into the sea. On these circumstances the fable of Deucalion’s flood is founded.

—According to the fable, he was the son of Prometheus. He governed his people with equity; but the rest of mankind being extremely wicked, were destroyed by a flood, while Deucalion and Pyrrha his queen saved themselves by ascending Mount Parnassus. When the waters were decreased, they went and consulted the oracle of Thamus, on the means by which the earth was to be repopulated: when they were ordered to veil their heads and faces, to unloose their girdles, and throw behind their backs the bones of their great mother. At this advice Pyrrha was seized with horror; but Deucalion explained the mystery, by observing, that their great mother must mean the earth, and her bones the stones; when taking them up, those Deucalion threw over his head became men, and those thrown by Pyrrha, women.

Some have supposed that Deucalion, whom the Greeks have represented under a variety of characters, and concerning whom their poets have given many fabulous accounts, was the same with the patriarch Noah; and that Deucalion’s flood in Thessaly, as well as that of Ogyges in Attica, and of Prometheus in Egypt, were the same with that of Noah recorded in scripture. Diodorus Siculus tells us in the design which happened in the time of Deucalion almost all flesh died. Apollodorus having mentioned Deucalion or Daucalion, “consigned to the ark,” takes notice upon his quitting it, of his offering up an immediate sacrifice, Δαυδωμος, “to the God who delivered him.” As he was the father of mankind, the ancients have given him great dignity and universal monarchy; though sometimes he is reduced to a petty

†

king
DEV [ 186 ]

DEVENSHRING. See DEVONSHIRING.

DEVENTER, a large, strong, trading, and populous town of the United Provinces, in Overysel, with an university. It is surrounded with strong walls, flanked with several towers, and with ditches full of water. It is seated on the river Issel, 55 miles east of Amsterdam, and 42 west of Bentheim. E. Long. 5. 3 N. Lat. 52. 18.

DEVEREUX, ROBERT, earl of Essex, the son of Walter Devereux, Viscount Hereford, was born at Netherwood in Herefordshire, in the year 1567. He succeeded to the title of earl of Essex at ten years of age; and about two years after was sent by his guardian, Lord Burleigh, to Trinity-college in Cambridge. He took the degree of master of arts in 1582, and soon after retired to his seat at Lampsie in South Wales. He did not however continue long in this retreat; for we find him, in his seventeenth year, at the court of Queen Elizabeth, who immediately honoured him with singular marks of her favour. Authors seem very unnecessarily perplexed to account for this young earl’s gracious reception at the court of Elizabeth. The reasons are obvious; he was her relation, the son of one of her most faithful servants, the son-in-law of her favourite Leicester, and a very handsome and accomplished youth. Towards the end of the following year, 1585, he attended the earl of Leicester to Holland; and gave signal proofs of his personal courage during the campaign of 1586, particularly at the battle of Zutphen, where the gallant Sidney was mortally wounded. On this occasion the earl of Leicester conferred on him the honour of knight banneret.

In the year 1587, Leicester being appointed lord steward of the household, Essex succeeded him in the honourable post of master of the horse; and the year following, when the queen assembled an army at Tilbury to oppose the Spanish invasion, Essex was made general of the horse. From this time he was considered as the happy favourite of the queen. And if there was any mark yet wanting to fix the people’s opinion in that respect, it was shown by the queen’s conferring on him the honour of the garter.

We need not wonder that so quick an elevation, and to so great a height, should affect so young a man as the earl of Essex; who showed from henceforth a very high spirit, and often behaved petulantly enough to the queen herself, who yet did not love to be controlled by her subjects. His eagerness about this time to dispute her favour with Sir Charles Blunt, afterwards Lord Mountjoy and earl of Devonshire, cost him some blood; for Sir Charles, thinking himself affronted by the earl, challenged him, and after a short dispute wounded him in the knee. The queen, so far from being displeased with it, is said to have sworn a good round oath, that it was fit somebody should take him down, otherwise there would be no ruling him. However, she reconciled the rivals; who, to their honour, continued good friends as long as they lived.

The gallant Essex, however, was not so entirely captivated with his situation as to become insensible to the allurements of military glory. In 1589, Sir John Norris and Sir Francis Drake having sailed on an expedition against Spain, our young favourite, without the permission or knowledge of his royal mistress, followed the fleet; which he joined as they were sailing towards Lisbon, and acted with great resolution in the repulse of the Spanish garrison of that city. The queen wrote him a very severe letter on the occasion; but she was, after his return, soon appeased. Yet it was not long before he again incurred her displeasure, by marrying the widow of Sir Philip Sidney. In 1591, he was sent to France with the command of 400 men to the assistance of Henry IV. In 1596, he was joined with the lord high admiral Howard in the command of the famous expedition against Cadiz, the success of which is universally known. In 1597 he was appointed
pointed master of the ordnance; and the same year com-
manded another expedition against Spain, called the
Island voyage, the particulars of which are also well
known.

Soon after his return, he was created earl marshal of
England; and on the day of the great Lord Burleigh,
in 1588, elected chancellor of the university of Cam-
bridge. This is reckoned one of the last instances of
this great man's felicity, who was now advanced too
high to sit at ease; and those who lounged for his ho-
nours and employments, very closely applied them-
selves to bring about his fall. The first great shock he
received in regard to the queen's favour, arose from a
warm dispute between her majesty and himself, about
the choice of some fit and able persons to superintend
the affairs of Ireland. The affair is related by Cam-
den; who tells us, that nobody was present but the
lord admiral, Sir Robert Cecil secretary, and Windes-
bank clerk of the seal. The queen looked upon Sir
William Knolls, uncle to Essex, as the most proper
person for that charge: Essex contended, that Sir
George Carew was a much fitter man for it. When
the queen could not be persuaded to approve his choice,
he so far forgot himself and his duty, as to turn his
back upon her in a contemptuous manner; which in-
solence her majesty not being able to bear, gave him a
box on the ear, and bid him go and be hanged. Essex,
like a blockhead, put his hand to his sword, and swore
revenge. Where was his gallantry on this occasion?
Could a stroke from an angry woman tinge the honour
of a gallant soldier? This violent storm, however, soon
subsided; and they were again reconciled, at least ap-
parently.

The total reduction of Ireland being brought upon
the tapis soon after, the earl was pitched upon as the
only man from whom it could be expected. This was
an artful contrivance of his enemies, who hoped by this
means to ruin him. Nor were their expectations
disappointed. He declined this fatal preferment as long
as he could: but perceiving that he should have no
quiet at home, he accepted; and his commission for
lord lieutenant passed the great seal on the 12th of
March 1598. His enemies now began to insinuate
that he had sought this command, for the sake of
greater things which he then was meditating; but
there is a letter of his to the queen, preserved in the
Harleian collections, which shows, that he was so far
from entering upon it with alacrity, that he looked
upon it rather as a banishment, and a place assigned
him for a retreat from his sovereign's displeasure, than
a potent government bestowed upon him by her favour.

To the Queen.

"From a mind delighting in sorrow; from spirits
wasted with passion; from a heart torn in pieces
with care, grief, and travail; from a man that hateth
himself and all things else that keep him alive;
what service can your majesty expect, since any ser-
vie past deserves no more than banishment and pro-
scription to the cursedest of all islands? It is your
rebels pride and succession must give me leave to
ransom myself out of this hateful prison, out of my
loathed body; which if it happen so, your majesty
shall have no cause to mistake the fashion of my death,
since the course of my life could never please you.

The earl met with nothing in Ireland but ill suc-
cess and crosses: in the midst of which, an army was
suddenly raised in England, under the command of the
earl of Nottingham; nobody well knowing why, but
in reality from the suggestions of the earl's enemies to
the queen, that he rather meditated an invasion on his
native country, than the reduction of the Irish rebels.
This and other considerations made him resolve to quit
his post, and come over to England; which he accord-
ingly did without leave. He burst into her majesty's
bed-chamber as she was rising, and she received him
with a mixture of tenderness and severity: but she
soon after thought fit to deprive him of all his employ-
ments, except that of master of the horse. He was
committed to the custody of the lord-keeper, with
whom he continued six months. No sooner had he re-
gained his liberty, than he was guilty of many extra-
vagancies; to which he was instigated by knaves and
fools, but perhaps more powerfully by his own passions.
He first determined to obtain an audience of the queen
by force. He refused to attend the council when sum-
moned. When the queen sent the lord-keeper, the
lord chief-justice, and two others, to know his griev-
ances, he confined them; and then marched with his
friends into the city, in expectation that the people
would rise in his favour; but in that he was disappoint-
ed. He was at last besieged and taken in his house
in Essex-street; committed to the Tower; tried by his
peers, condemned, and executed. Thus did this brave
man, this favourite of the queen, this idol of the people,
fall a sacrifice to his want of that dissimulation, that
cunning, that court-policy, by which his enemies were
enabled to effect his ruin. He was a polite scholar,
and a generous friend to literature.

To those who have not taken the trouble to consult
and compare the several authors who have related the
story of this unfortunate earl, it must appear wonder-
ful, if, as hath been suggested, he was really beloved
by Queen Elizabeth, that she should consent to his ex-
cution. Now that she had conceived a tender passion
for him, is proved beyond a doubt by Mr Walpole in his
very entertaining and instructive Catalogue of Noble
Authors: — "I am aware (says that author) that it is
become a mode to treat the queen's passion for him as
a romance. Voltaire laughs at it; and observes, that
when her struggle about him must have been the great-
est (the time of his death), she was sixty-eight. —Had
he been sixty-eight, it is probable she would not have
been in love with him." — "Whenever Essex acted a
fit of sickness, not a day passed without the queen's
sending often to see him; and once went so far as to sit
long
De Vereux. long by him, and order his broth's and things. It is re-
corded by a diligent observer of that court, that in one
of his sick moods, he took the liberty of going up to
the queen in his night-gown. In the height of these
fretful fooleries, there was a mask at Black Fryars
on the marriage of Lord Herbert and Mrs Russell.
Eight lady maskers chose eight more to dance the
measures. Mrs Ffiton, who led them, went to the
queen, and wooed her to dance. Her majesty asked
what she was? Affection, she said. Affection! said the
queen; Affection is false. Were not these the murmurs
of a heart ill at ease? Yet her majesty rose, and
danced. She was then sixty-eight. Sure it was as
natural for her to be in love.

Mr Walpole farther observes, that her court and
contemporaries had an uniform opinion of her passion
for Essex, and quotes several instances from a letter
written by Sir Francis Bacon to the earl; in which,
among other things, he advises him to consult her taste
in his very apparel and gestures, and to give way to
any other inclination she may have. Sir Francis advi-
sed the queen herself, knowing her inclination, to
keep the earl about her for society. What Henry IV. of
France thought of the queen's affection for Essex, is
evident from what he said to her ambassador—"Que sa
majesté ne laissez jamais son cousin d'Essex elogier
de son cotillon."—After his confinement, on hearing
he was ill, she sent him word, with tears in her eyes,
that if she might with her honour, she would visit him.

If (says Mr Walpole) these instances are problematic,
are the following so? In one of the curious
letters of Rowland White, he says, the queen hath of
late used the fair Mrs Bridges with words and blows
of anger. In a subsequent letter, he says, the earl is
again fallen in love with his fairest B. It cannot choose
but come to the queen's ear, and then he is undone."—
Essex himself says, that her fond parting with him when
he set out for Ireland, pierced his very soul.

Probably the reader has now very little doubt as to
Queen Elizabeth's affection for the unfortunate Essex;
but, in proportion to our belief of the existence of
the affection, her motives for consenting to his execution
became more inexplicable. Queen Elizabeth had a
very high opinion of her, beauty and personal attrac-
tions, and probably expected more entire adoration
than the earl's passion for variety would suffer him to
pay. Towards the latter end of her life, she was cer-
tainly an object of disgust. He had too much honest
simplicity in his nature to feign a passion which he did
not feel. She foolishly gave credit to the stories of his
ambitious projects incompatible with her safety; and
was informed that he had once inadvertently said, that
she grew old and cankered, and that her mind was be-
come as crooked as her carcass. If this be true, where
is the woman that would not sacrifice such a lover to
her resentment?

It is said, however, that, concerning his execution,
his majesty was irresolute to the last, and sent orders to
countermand it: but, considering his obstinacy in re-
fusing to ask her pardon, afterwards directed that he
should die. It is reported that the queen, in the height
of her passion for the earl of Essex, had given him a
ring, ordering him to keep it; and that whatever crime
he should commit, she would pardon him when he
should return that pledge. The earl, upon his con-
demnation, applied to Admiral Howard's lady, his re-
lation, desiring her, by a person whom she could trust,
to return it into the queen's own hands; but her hus-
band, who was one of the earl's greatest enemies, and
to whom she had imprudently told the circumstance,
would not suffer her to acquit herself of the commission;
so that the queen consented to the earl's death, being
full of indignation against so proud and saucy a spir-
it, who chose rather to die than implore her mercy.
Some time after, the admiral's lady fell sick, and being
near her death, she sent word to the queen that she had
something of great consequence to communicate before
she died. The queen came to her bedside, and having
ordered all her attendants to withdraw, the lady re-
turned, but too late, the ring, desiring to be excused
that she did not return it sooner: on which, it is
said, the queen immediately retired, overwhelmed with
grief.

The earl of Essex died in the thirty-fourth year of
his age; leaving by his lady one son and two daugh-
ters.

DEVICE, among painters. See DEVISE.

DEVIL (Diabolus), an evil angel, one of those ce-
estial spirits cast down from heaven for pretending to
equal himself with God. The Ethiopians paint the
devil white, to be even with the Europeans who paint
him black.

There is no mention of the word devil in the Old
Testament, but only of the word Satan and Belial: nor
do we meet with it in any heathen authors, in the sense
it is taken among Christians, that is, as a creature re-
volted from God. Their theology went no farther
than to evil genii or demons.

Some of the American idolaters have a notion of
two collateral independent beings, one of whom is
good and the other evil: which last they imagine has
the direction and superintendence of this earth, for
which reason they chiefly worship him: whence those
that give us an account of the religion of these savages
give out with some impropriety, that they worship
the devil. The Chaldeans, in like manner, believed
both a good principle and an evil one; which last they
imagined was an enemy to mankind.

Isaiah, speaking, according to some commentators,
of the fall of the devil, calls him Lucifer, from his
former elevation and state of glory: but others explain
this passage of Isaiah in reference to the king of Ba-
bylon, who had been precipitated from his throne and
glory. The Arabians call Lucifer, Ebbis; which some
think is only a diminutive or corruption of the word
Diabolus.

Devil on the Neck, a tormenting engine made of
iron, straitening and wincing the neck of a man, with
his legs together, in a horrible manner; so that the
more he stirreth in it, the straiter it presseth him; for-
merly in use among the persecuting papists.

DEVINCION (Devincentio), in antiquity, was used
to signify a love charm or incantation to gain the affec-
tion of a person beloved.

It was done by tying knots; and is thus described
by Virgil in his eighth Eclogue:

Necte tribus modis ternos, Amaryllis, coloris :
Necte, Amaryllis, modo ; et Feneris, dic, vincula necto.

DEVISE, or DEVICE, in Heraldry, Painting, and
Sculpture,
Sculpture, any emblem used to represent a certain family, person, action, or quality; with a suitable motto, applied in a figurative sense. See Motto.

The essence of a device consists in a metaphorical similitude between the things representing and represented: thus, a young nobleman, of great courage and ambition, is said to have borne for his devise, in a late caravel at the court of France, a rocket mounted in the air, with this motto in Italian, "poco duri purche minaasii," expressing, that he preferred a short life, provided he might thereby attain to glory and eminence.

The Italians have reduced the making of devises into an art, some of the principal laws of which are these; 1. That there be nothing extravagant or monstrous in the figures. 2. That figures be never joined which have no relation or affinity with one another; excepting some whimsical unions established in ancient fables, which custom has authorised. 3. That the human body be never used. 4. The fewer figures the better. 5. The motto should be every way suitable.

DEVISE, in Law, the act whereby a person bequeathes his lands or tenements to another by his last will or testament.

DEUNX, in Roman antiquity, 11 ounces, or 7/4 of the Libra.

DEVOLVED, something acquired by right of devolution. Such a right is devolved to the crown; such an estate devolved on M—— by the death of N——.

The word is also used for a right, acquired by a superior, of conferring a benefice, when the inferior and ordinary collator has neglected to confer, or has conferred it on an unqualified person.

If a person neglects to present to a benefice in six months, the presentation lapses or devolves upon the bishop, from thence to the priuate, and from thence to the king.

DEVOLUTION, in Law, a right acquired by succession from one to another.

DEVONSHERING, a term used by the farmers to express the burning of land by way of manure: the method is to cut off the turf about four inches thick, and burn it in heaps, and then spread the ashes upon the land. The name is probably derived from its having been earliest practised in Devonshire.

DEVONSHIRE, a county of England, bounded on the south by the English channel, on the north by the Bristol channel, on the east by Somersetshire, and on the west by Cornwall. It is about 72 miles long and 71 broad. The soil is various; in the western parts of the county it is coarse and moorish, bad for sheep, but proper for black cattle. In the northern parts, the dry soil and downs are well adapted to sheep, with numerous flocks of which they are well covered. Cattle are also much increased upon account of the rich, and fertile, well-drained soil. After corn, tobacco, hops, and tobacco, are also produced there; and the land is well manured. The soil of the rest of the country is rich and fertile both in corn and pasture, yielding also in some places plenty of marle for manuring it. In other places they have peat and burn the surface, making use of the ashes as a manure. It has mines of lead, iron, and silver, in which it formerly exceeded Cornwall, though now it is greatly inferior.

On the coast also they have herring and pilchard fisheries. Devonshire sends two members to parliament, and gives title of duke to the noble family of Cavendish. It contains 464 parishes; and in 1811 the population amounted to 383,308. See Devonshire, Supple.

DEVOTION, (Devotion), a sincere ardent worship of the Deity.

Devotion, as defined by Jurieu, is a softening and yielding of the heart, with an internal consolation, which the souls of believers feel in the practice or exercise of piety. By devotion is also understood certain religious practices, which a person makes it a rule to discharge regularly; and with reason, if the exactitude be founded on solid piety, otherwise it is vanity and superstition. That devotion is vain and trifling, which would accommodate itself both to God and to the world. Treux.

The character of devotion has frequently suffered from the forbidding air which has been thrown over it, by the narrowness of bigotry on the one hand, or the gloom of superstition on the other. When freer and more cheerful minds have not had occasion to see it accompanied with those feelings of delight and benevolence which naturally attend it, they are apt to be prejudiced against piety at large, by mistake of this ungracious appearance for its genuine form. Nor has the rank of vulgar enthusiasts contributed a little to begot or strengthen the same aversion, in persons of a cool and speculative temper; who have happened to meet with such images and phrases among religionists of a certain strain, as ill suit the rational, pure, and spiritual nature of true devotion. It may likewise be remarked, on the other side, that people of taste and sensibility have not seldom been disgusted with the insipid style too often employed on such subjects, by those who possess neither, or who purposely avoid every thing of that kind, from an aim at simplicity misunderstood, or perhaps from a fear of being thought too warm, in an age of fashionable indifference and false refinement.

Wherever the vital and unadulterated spirit of Christian devotion prevails, its immediate object will be to please him whom we were made to please, by adoring his perfections; by admiring his works and ways; by entertaining with reverence and complacency the various intimations of his pleasure, especially those contained in holy writ; by acknowledging our absolute dependence, and infinite obligations; by confessing and lamenting the disorders of our nature and the transgressions of our lives; by imploying his grace and mercy through Jesus Christ; by interceding for our brethren of mankind; by praying for the propagation and embellishment of truth, righteousness, and peace on earth; in fine, by longing for a more entire conformity to the will of God, and breathing after the everlasting enjoyment of his friendship. The effects of such a spirit habitually cherished, and feelingly expressed before him, with conceptions more or less enlarged and elevated, in language more or less emphatical and accurate, sententious or diffusive, must surely be important and happy. Among these effects may be reckoned, a profound humility in the sight of God, a high veneration for his presence and attributes, an ardent zeal for his worship and honour, an affectionate faith in the Saviour of the world, a constant imitation of his divine example, a diffusive charity for men of all denominations,
DEUTERONOMY, one of the sacred books of the Old Testament; being the last of those written by Moses; (see Pentateuch). The word is Greek, compounded of διεύθυνα, second, and νόμος, law.

Deuterononomy was written in the 40th year after the delivery from Egypt, in the country of the Moabites, beyond Jordan; Moses being then in the 120th year of his age. It contains, in Hebrew, 11 parishes; though only 10 in the edition of the rabbins at Venice; 20 chapters, and 935 verses. In the Greek, Latin, and other versions, it contains 34 chapters. The last is not of Moses. Some say, it was added by Joshua immediately after Moses' death; which is the more probable opinion. Others will have it added by Ezra.

DEUTEROPOTOMI, in Grecian antiquity, a designation given to such of the Athenians as had been thought dead, and, after the celebration of the funeral rites, unexpectedly recovered. It was unlawful for the deuteropotomi to enter into the temple of the Eumenides, or to be admitted to the holy rites, till after they were purified, by being let through the lap of a woman's gown, that they might seem to be new born.

DEUTEROSIS, the Greek name by which the Jews called their Mischnah or second law. See Mischnah.

DEUTZIA, a genus of plants belonging to the deciduaria class. See Botany Index.

DEW, a dense, moist vapour, found on the earth in spring and summer mornings, in form of a misting rain, being collected there chiefly while the sun is below the horizon.

It hath been disputed whether the dew is formed from the vapours ascending from the earth during the night time, or from the descent of such as have been already raised through the day. The most remarkable experiments adduced in favour of the first hypothesis are those of Dr Dufay of the Royal Academy of Sciences, at Paris. He supposed, that if the dew ascended it must wet a body placed low down sooner than one placed in a higher situation; and if a number of bodies were placed in this manner, the lowermost would be wetted first; and the rest in like manner, gradually up to the top.

To determine this, he placed two ladders against one another, meeting at their tops, spreading wide asunder at the bottom, and so tall as to reach 32 feet high. To the several steps of these he fastened large squares of glass like the panes of windows, placing them in such a manner that they should not overshadow one another. On the trial it appeared exactly as Dr Dufay had apprehended. The lower surface of the lowest piece of glass was first wetted, then the upper, then the lower surface of the pane next above it; and so on, till all the pieces were wetted to the top. Hence it appeared plain to him, that the dew consisted of the vapours ascending from the earth during the night-time; which, being condensed by the coldness of the atmosphere,
Dew atmosphere, are prevented from being dissipated as in
the day-time by the sun's heat. He afterwards tried a
similar experiment with pieces of cloth instead of panes
of glass, and the result was quite conformable to his
expectations. He weighed all the pieces of cloth next
morning, in order to know what quantity of water each
had imbibed, and found those that had been placed
lowermost considerably heavier than such as had been
placed at the top; though he owns that this experiment
did not succeed so perfectly as the former.

M. Muschenbrock, who embraced the contrary opinion,
thought he had invalidated all Dr Dufay's proofs,
by repeating his experiments, with the same success,
on a plane covered with sheet-lead. But to this Dr
Dufay replied, that there was no occasion for suppos-
ing the vapour to rise through the lead, nor from that
very spot; but that as it arose from the adjoining open
ground, the continual fluctuation of the air could not
but spread it abroad, and carry it thither in its
ascent.

But though this experiment of M. Muschenbrock's
is not sufficient to overthrow those of Dr Dufay, it
must still remain dubious whether the dew rises or falls.
One thing which seems to favour the hypothesis of its
descent is, that in cloudy weather there is little or no
dew to be observed. From this M. de Luc brings an
argument in favour of the hypothesis just now men-
tioned. He accounts for it in the following manner:

\begin{quote}
When there are no clouds in the air, the heat of the
inferior air and that which rises from the earth dissi-
pates itself into the superior regions; and then the va-
pours which are dispersed throughout the air condense,
and fall down in dew: But, when the clouds continue,
they separate the inferior from the superior part of the
atmosphere, and thus prevent the dissipation of the
heat, by which means the vapours remain suspended.
When the sky grows cloudy, some hours after sunset,
although the heat has been sensibly diminished, it is
again increased; because continuing to rise out of the
earth, it is accumulated in the inferior air. But ne-
ither can this be reckoned a positive proof of the de-
ascend of the dew; since we may as well suppose the
heat of the atmosphere to be great enough to dissi-
pate it in its ascent, as to keep it suspended after its
ascend through the day.
\end{quote}

On the other hand, its being found in greater quan-
tities on bodies placed low down than on such as are
high up, is no proof of the ascent of the dew; because
the same thing is observed of rain. A body placed low
down receives more rain than one placed in an elevated
situation; and yet the rain certainly descends from the
atmosphere. The reason why the dew appears first on
the lower parts of bodies may be, that, in the evening,
the lower part of the atmosphere is first cooled, and
consequently most disposed to part with its vapours.
It is also certain, that part of the water contained in the
air may be condensed at any time on the sides of a
glass, by means of cold, so as to run down its sides in
small drops like dew. It seems therefore, that this
subject is not sufficiently determined by such experi-
ments as have yet been made; nor indeed does it ap-
ppear easy to make such experiments as shall be perfect-
ly decisive on the matter.

Several substances exposed to the same dew receive
and charge themselves with it in a very different man-
ner; some more, others less, and some even not at all.
The drops seem to make a sort of choice of what bo-
dies they shall affix themselves to; glass and crystals
are those to which they adhere in the most ready man-
ner, and in the largest quantity; but metals of all kinds
never receive them at all, nor do the drops ever adhere
to them. The reason of this is, probably, because me-
" alloys promote evaporation more than glass does. Thus,
if a piece of metal and a piece of glass are both made
equally moist, the former will be found to dry in much
less time than the latter. Hence it would seem, that
there is between metals and water some kind of re-
pulsion; and this may be sufficient to keep off the very
small quantity that falls in dew; for whatever tends
to make water evaporate after it is actually in contact
with any substance, also tends to keep the water from
ever coming into contact with it. On this subject
several curious particulars are mentioned by Dr Per-
cival relative to the attraction and repulsion between
dew and glass or metallic vessels. The experiments
were made by M. Dufay, who, in order to determine
with certainty whether the difference between vitri-
bated substances and metals was the same in all cases, set
a china saucer in the middle of a silver plate, and on one
side, adjoining to it, was placed a china plate, with
a silver dish very much resembling the saucer in the
middle. In this experiment the china saucer was cov-
ered with dew, but the plate, though extending four
inches round it, was not moistened in the least. The
china plate also had become quite moist, while the silver
vessel in the middle had not received the smallest drop.
M. Dufay next endeavoured to ascertain whether a
china saucer set upon a plate of metal, as already desc.
ded, did not receive more-dew than it would have done
if exposed alone. To accomplish this design, he took
two watch crystals of equal dimensions, and placed the
one upon a plate of silver, the other upon a plate of
china, each with its concavity uppermost. That which
was upon the silver plate he surrounded with a ferrel
of the same metal, well polished, that no watery par-
ticles might attach themselves to the convex surface of
the glass. In this situation he exposed the crystals for
several days successively, and always found five or
six times more dew in that which was on the china plate
than on the other placed on the silver. The repulsion
between the dew and silver is further confirmed by the
following experiment of M. Dufay, with regard to the
crystal on the silver plate. He informs us, that the small
quantity of dew on the side near the centre, was in
minute drops; and that round the border there was a
space of five or six lines perfectly dry; towards which
the drops regularly decreased in magnitude, as if the
silver ferrel had driven away the dew from that part of
the glass which was contiguous to it. These experi-
ments were repeated thirty times with invariable suc-
cess. M. Dufay's experiments have received a re-
markable confirmation, from some lately made by Dr
Watson, now bishop of Llandaff, with a view to de-
termine the quantity of vapour that ascends from a
given surface of earth. By means of a little bees-
wax (says he), I fastened a half-crown very near, but
not quite contiguous, to the side of the glass; and
setting the glass with its mouth down in the grass, it presently became covered with vapour, except
that part of it which was next the half-crown. Not only
the.
the half-crown itself was free from vapour, but it had hindered any from settling on the glass which was near it; for there was a little ring of glass surrounding the half-crown, to the distance of a quarter of an inch, which was quite dry, as well as that part of the glass which was immediately under the half-crown; it seemed as if the silver had repelled the water to that distance. A large red wafer had the same effect as the half-crown; it was neither wetted itself, nor was the ring of glass contiguous to it wetted. A circle of white paper produced the same effect, so did several other substances, which it would be too tedious to enumerate."

Substances of a very different kind from the usual dew are said to have sometimes fallen from the atmosphere. In the Phil. Trans., we are told, that in the year 1695 there fell in Ireland, in the provinces of Leinster and Munster, for a considerable part of the winter and spring, a fatty substance resembling butter, instead of the common dew. It was of a clammy texture, and dark-yellow colour; and was, from its great resemblance, generally called dew-butter by the country people. It always fell in the night, and chiefly in the moorish low grounds; and was found hanging on the tops of the grass, and on the thatch of the houses of the poor people. It was seldom observed to fall twice in the same place; and usually, wherever it fell, it lay a fortnight upon the ground before it changed colour; but after that it gradually dried up, and became black. The cattle fed in the fields where it lay as well as in others, and received no harm by it. It fell in pieces of the bigness of one's finger-end; but they were dispersed scatteringly about, and it had an offensive smell like a churchyard. There were in the same places very stinking fogs during the winter, and some people supposed this no other than a sediment from the fog. It would not keep very long, but never bred worms. See Dew, Supplement.

May-Dew whites linen and wax; the dew of autumn is converted into a white frost. Out of dew putrified by the sun, arise divers insects, which change space from one species into another; what remais is converted into a fine white salt, with angles like those of saltpetre, after a number of evaporations, calculations, and fixations.

There is a spirit drawn from May-dew, which has wonderful virtues attributed to it. The method of collecting and preparing it, is described by Hanneman, physician at Kiel. It is to be gathered in clean linen cloths; exposed to the sun in close vials; then distilled, and the spirit thrown upon the caput mortuum; this is to be repeated till the earth unite with the spirit, and become liquid; which happens about the seventh or eighth cohabitation or distillation. By such means you gain a very red, odoriferous spirit. Stolterfeld, a physician of Lubeck, thinks May-dew may be gathered in glass-plates, especially in still weather, and before sunrise; and Etmoller is of the same sentiment. It might likewise be collected with a glass funnel, exposed to the sun, having a crooked neck to bring the dew into a vial in a chamber. See Phil. Trans. No. 3. Hoffman, and others. It is apparently from the preparation of this dew, that the brothers of the Rosy-Cross took their denomination. See Rosicrucians.

Dew-Born, in country affairs, a distemper in cattle, being swelled in the body, as much as the skin can hold, so that some beasts are in danger of bursting. This distemper proceeds from the greediness of a beast to feed, when put into a rank pasture, but commonly when the grass is full of water. In this case the beast should be stirred up and down, and made to purge well; but the proper cure is bleeding in the tail; then take a grated nutmeg, with an egg, and breaking the top of the shell, put out so much of the white as you may have room to slip the nutmeg into the shell; mix them together, and then let shell and all be put down the beast's throat; then do, walk him up and down, and he will soon mend.

Dew-Worm. See LUMBRICUS, HELMINTHOLOGIA

Index.

DEWAN, in the Mogul government, is the receiver-general and civil governor of the province. In private affairs the same word signifies a steward.

DEWANNY, the revenue department of a province.

DE WIT, JOHN, the famous pensionary, was born in 1625, at Dort; where he prosecuted his studies so diligently, that, at the age of 23, he published Elementa Curvarum Linearum, one of the profoundest books in mathematics at that time. After taking his degrees, and travelling, he, in 1650, became pensionary of Dort; and distinguished himself very early in the management of public affairs. He opposed with all his power the war between the English and the Dutch; and when the event justified his predictions, he was unanimously chosen pensionary of Holland. In this capacity he laboured to procure a peace with Cromwell; in which peace a secret article was introduced by one side or other, for the exclusion of the house of Orange. In the war with England after the king's restoration, when it was thought expedient, on Opdam's defeat and death, that some of their own deputies should command the fleet, he was one of the three put in commission; and wrote an accurate relation of all that happened during the expedition he was engaged in, for which, at his return, he received the solemn thanks of the States General. In 1657, he established the perpetual edict for abolishing the office of Stadtholder, to fix the liberty of the republic, as it was hoped, on a firm basis; which produced seditions and tumults, that restored the office, on pretence that the De Wits were enemies to the house of Orange, and plundered the state. The pensionary begged dismission from his post; which was granted, with thanks for his faithful services. But the invasion of the French, and the internal divisions among the Hollanders themselves, spread everywhere terror and confusion; which the Orange party heightened to ruin the De Wits. Cornelius, the pensionary's brother, was imprisoned and condemned to exile; and a report being raised that he would be rescued, the mob armed, and surrounded the prison where the two brothers then were together, dragged them out, barbarously murdered them, hung the bodies on the gallows, and cut them to pieces, which many of them even broiled and ate with savage fury. Such was the end of one of the greatest geniuses of his age; of whom Sir William Temple, who was well acquainted with him, writes with the greatest esteem and admiration. He observes, that when he was at the head of the government, he differed nothing in his manner of living from
from an ordinary citizen. His office, for the first ten years, brought him in little more than 300l. and in the latter part of his life, not above 700l. per annum. He refused a gift of 10,000l. from the states-general, because he thought it a bad precedent in the government. With great reason, therefore, Sir William Temple, speaking of his death, observes, "He was a person that deserved another fate, and a better return from his country, after 18 years spent in their ministry, without any care of his entertainments or ease, and little of his fortune. A man of unwarried industry, inflexible constancy, sound, clear, and deep understanding, and untainted integrity; so that whenever he was blinded, it was by the passion he had for that which he esteemed the good and interest of the state. This testimony is justly due to him from all that were well acquainted with him, and is the more willingly paid, since there can be as little interest to flatter, as honour to reproach, the dead." 

Besides the works already mentioned, he wrote a book containing those maxims of government upon which he acted; which will be a never-fading monument to his immortal memory. A translation of it from the original Dutch, entitled, The true interest and political maxims of the republic of Holland, has been printed in London; to the last edition of which, in 1746, are prefixed historical memoirs of the illustrious brothers Cornelius and John de Wit, by John Campbell, Esq. 

DEXTANS, in Roman antiquity, ten ounces, or $\frac{1}{4}$ of their libra. See Libra. 

DEXTER, in Heraldry, an appellation given to whatever belongs to the right side of a shield or cost of arms: thus we say, bend-dexter, dexter-point, &c. 

DEXTROCHERE, or DESTROCHERE, in Heraldry, is applied to the right arm painted in a shield, sometimes naked, sometimes clothed, or adorned with a bracelet; and sometimes armed, or holding some moveable member used in the arms. 

DEY, the title of the sovereign of Algiers, under the protection of the grand signior. A prince under this title was appointed by the sultan, at the request of the Turkish soldiers, in the year 1710. The term dey in the Turkish language, signifies an uncle by the mother's side; and the reason of the denomination is this: that the Turkish military consider the grand signior as their father; the republic as their mother, by which they are nourished and maintained; and the dey as the brother of the republic, and consequently the uncle of all who are under his dominion. Besides the age, experience, and valour, which are necessary qualifications of a person to be elected, he must also be a native Turk, and have made the voyage to Mecca. He has no guards or considerable retinue. He presides at the divan, and is most distinguished by the respect and submission which are paid him.

DIABETES, in Physic, a preternatural discharge of urine, which has changed its properties, and exceeds the quantity of liquids drank. See Medicine Index. 

DIABOLUS. See Devil. 

DIABOLUS MARINUS. See Raja, Ichthyology Index. 

DIABOLUS METALLORUM, a title given by chemists to Jupiter or Tin: because, when incorporated with other metals, it renders them incapable of reduction, or at least very difficult to undergo that operation. 

DIACASTIC CURVE, a species of the caustic curves formed by refraction. 

DIACHTYON, in Pharamacy, an emollient digestive plaster, composed of mucilages or viscid juices drawn from certain plants. See Pharmacy. 

DIACODIUM, in Pharmacy, a syrup prepared from poppy heads. It is also called the syrupus de meconio. See Pharmacy. 

DIACOUSTICS, called also Diaphonics, the consideration of the properties of refracted sound, as it passes through different mediums. The word is formed from the Greek dia, per, "through," which intimates a passage, and ousa, "I hear;" g. d. the consideration of the passage of the sounds we hear. See Acoustics. 

DIACRI, in antiquity, was the name of a party or faction at Athens.—That city, we read, was divided into two parties; the one favourers of an oligarchy, who would only have a few persons employed in the government; the other consisted of such as were for a democratical or popular government, wherein the whole people should have a share. The first were called diacri, and the latter pediaci; the latter inhabiting the lower, and the former the aego, or upper quarter or part of the city.—The laws of Solon imported, that Pisistratus should be chief of the diacri; though the scholiast on Aristophanes's comedy The Wasps affirms, that Pandion distributed the quarter of the diacri among his sons, and put Lyceus at their head. 

DIADELPHIA (di'-del-fia), and adelphos, "a brother"), the 17th class in the sexual system, comprehending those plants which bear hermaphroditic flowers with two sets of united stamens; but this circumstance must not be absolutely depended on. They are the papilionaceae of Tournefort, the irregularates tetrapetalae of Rivinus, and the leguminosae of Ray. See Botany Index. 

DIADEM, in antiquity, a head-band or fillet, worn by kings as a badge of their royalty. It was made of silk, thread, or wool, and tied round the temples and forehead, the ends being tied behind, and let fall on the neck. It was usually white and quite plain; though sometimes embroidered with gold, and set with pearls and precious stones. In latter times, it came to be twisted round crowns, laurels, &c. and even appears to have been worn on divers parts of the body. See Crown. The word comes from the Latin diademum; of the Greek diadema, "a little band encompassing the head," of the verb, diadochoo, "I gird." 

DIADEM, in Heraldry, is applied to certain circles or rims serving to inclose the crowns of sovereign princes, and to bear the globe and cross, or the fleur de lis, for their crest. The crowns of sovereigns are bound, some with a greater and some with a less number of diadems.—The bandage about the heads of Moors on shields is also called diadem in blazoning. 

DIÆRESIS, in Surgery, an operation serving to divide and separate the part when the continuity is a hinderance of the cure. 

DIÆRESIS, in Medicine, is the consuming of the vessels of an animal body, when, from some corroding cause, certain passages are made which naturally ought not
to have been; or certain natural passages are dilated beyond their ordinary dimensions, so that the humours which ought to have been contained in the vessels extravasate or run out.

Diæresis, in Grammar, the division of one syllable into two, which is usually noted by two points over a letter, as aulat, instead of aule, dissolvenda for dissolvenda.

Diætæ, in Grecian antiquity, a kind of judges, of which there were two sorts, the cleroti and dialectærii. The former were public arbitrators, chosen by lot to determine all causes exceeding ten drachmas, within their own tribe, and from their sentence an appeal lay to the superior courts.

The dialectærii, on the contrary, were private arbitrators, from whose sentence there lay no appeal, and accordingly they always took an oath to administer justice without partiality.

Diagraphic, the art of cutting or engraving figures, such as seals, intaglios, matrices of letters, &c. or coins for medals. See Engraving.

Diagnosis, (from διάγνωσις, to discern or distinguish), the diagnostics or the signs of a disease. They are of two kinds, viz. the adjacent and the pathognomonic: the first are common to several diseases, and serve only to point out the difference between diseases of the same species; the latter are those which always attend the disease, and distinguish it from all others.

Diagnostic, in Medicine, a term given to those signs which indicate the present state of a disease, its nature and cause.

Diagonal, in Geometry, a right line drawn across a quadrilateral figure, from one angle to another; by some called the diameter, and by others the diametral, of the figure. See Geometry.

Diagoras, surnamed the Atheist, lived in the 91st Olympiad. He was not a native of Athens, but he philosophized as seals, intaglios, matrices of letters, and had composed a poem which a certain poet stole from him. He sued the thief, who swore it was his own, and got glory by it. This tempted Diagoras to deny a Providence. The Athenians summoned him to give an account of his doctrine. He fled, and they set a price upon his head, promising a reward to any who should kill him; but he took shipping, and was cast away.

Diagram, in Geometry, a scheme for explaining and demonstrating the properties of any figure, whether triangle, square, circle, &c. See Geometry.

Diagram, among ancient musicians, the same with the scale of the modern. See Scale.

Diah, Diat, a name given by the Arabs to the punishment of retaliation. By the Mahometan law, a brother, or the next relation of a murdered person, ought to take part against the murderer, and demand his blood in reparation for that which he has shed. Before the time of Mahomet, the Arabs had a custom of putting a Freeman of their prisoners to death in lieu of every slave they lost in battle, and a man for every woman that was killed. But Mahomet regulated the laws of reprisal; directing in the Alcoran, by the diat, that a freeman should be required for a freeman, and a slave for a slave. The Turks, probably in consequence of this law, formerly massacred almost all their prisoners of war, but they now content themselves with enslaving and selling them.

Dialect, an instrument, serving to measure time; which, if affected by the aid of the sun, is called a sundial. The word is from the Latin dies, "day," because indicating the hour of the day. The ancients also called it scathereum, from its effect by the shadow. See the article Dialling.

Dialect, an appellation given to the language of a province in so far as it differs from that of the whole kingdom. The term, however, is more particularly used in speaking of the ancient Greek, whereof there were four dialects, the Attic, Ionic, Æolic, and Doric; each of which was a perfect language in its kind, that took place in certain countries, and had peculiar beauties.

In Great Britain, besides, the grand diversity of English and Scotch, almost every county has a dialect of its own, all differing considerably in pronunciation, accent, and tone, although one and the same language.

Dialectics, in the literary history of the ancients, that branch of logic, which taught the rules and modes of reasoning. See Logic, Part III.

Zeno Eleates was the first who discovered the natural series of principles and conclusions observed in reasoning, and formed an art thereof in form of a dialogue; which, for this reasoning, was called dialectica.

The dialectics of the ancients is usually divided into several kinds: the first was the eleatica, that of Zeno Eleates, which was threefold; viz. consequentium, solutionum, and contentionum. The first consisting of rules for deducing or proving conclusions. The second the art of dialogue; which became of such universal use in philosophy, that all reasoning was called interrogation: then syllogism being laid aside, the philosophers did all by dialogue; it lying on the respondent to conclude and argue from the several concessions made. The last part of Zeno's dialectics, egorum, was contentious, or the art of disputing and contradicting; though some, particularly Laertius, ascribe this part to Protagoras, a disciple of Zeno.

The second is the dialectica megarica, whose author is Euclid, not the mathematician, but another of Megara. He gave much into the method of Zeno and Protagoras: though there are two things appropriated to him: the first, that he impugned the demonstrations of others, not by assumptions, but conclusions; continually making illations, and proceeding from consequence to consequence: the second, that he set aside all arguments drawn from comparisons of similitude as invalid.

He was succeeded by Eubulides, from whom the sophisitic way of reasoning is said to be derived. In his time the art is described as manifold: mentiens, fallens, electa, obviate, arcvalis, cornuta and calva. See Sophism.

The third is the dialectics of Plato, which he proposes as a kind of analysis to direct the human mind,
DIALECTICS

by dividing, defining, and bringing things to the first truth; where being arrived, and stopped there a little, it applies itself to explain sensible things, but with a view to return to the first truth, where alone it can rest. Such is the idea of Plato's analysis.

The fourth is Aristotle's dialectics; containing the doctrine of simple words, delivered in his book of Predicaments; the doctrine of propositions, in his book De Interpretatione; and that of the several kinds of syllogism, in his books of Analytics, Topics, and Elenchuses.

The fifth is the dialectics of the Stoics; which they call a part of philosophy, and divide into rhetoric and dialectic; to which some add the definitive, whereby things are justly defined; comprehending likewise the canons or criteria of truth.

The Stoics, before they come to treat of syllogisms, have two principal places; the one about the signification of words, the other about the things signified. On occasion of the first, they consider abundance of words belonging to the grammarians' province: what, and how many letters; what is a word, diction, speech, &c. On occasion of the latter, they consider things themselves, not as without the mind, but as in it, received in by means of the senses. Accordingly, they first teach, that nil sit in intellectu, quod non præce fuit in sensu; "whatever is in the mind came thither by the senses!" and that aut incursione sui, as Plato, who meets the sight; aut simulitutinis, as Caesar by his effigy; aut proportionem, either by enlarging as a giant, or by diminishing as a pigmy; aut translatione, as a Cyclope; aut compositione, as a Centaur; aut contrario, as death; aut privatio, as a blind man.

The sixth is Epicurus's dialectics; for though he seems to have despised dialectic, he cultivated it with vigour. He was only averse to that of the Stoics; who he thought attributed too much to it, as pronouncing him alone wise who was well versed in dialectics.

For this reason, Epicurus, seeming to set aside the common dialectics, had recourse to another way, viz. to certain canons which he substituted in their stead, the collection whereof he called canonica; and as all questions in philosophy are either de re or de voce, he gave separate rules for each. See Epicureans.

DIALIA, in antiquity, sacrifices performed by the flamen dialis. See Flamen.

DIALING, or Dialling. See DIALLING.

DIALIS, in antiquity, a Latin term signifying something that belongs to Jupiter. The word is formed from Δίας, the genitive of Δίος, Jupiter.

Flamen Dialis. See Flamen.

DIALITHA, in the writings of the ancients, a word used to express the elegant ornaments of the Greeks and Romans, composed of gold and gems. They also called these lithocolla, "cemented stones or gems." The gold being in this case as a cement to hold the stones together. They were bracelets and other ornamental things about their habits thus made; and their cups and table-furniture, for magnificent treats, were of this kind. The green stones were found to succeed best of all in these things; and the emerald and greenish topaz, or, as we call it, chrysolite, were most in esteem for this purpose. This use of the stones explains what Pliny very often says of them in his description: Nihil vicundius aurum decet, "Nothing becomes gold better!" this he says of the green tohex or chrysolite; and this and many other like passages have greatly perplexed the critics, who did not hit upon this explication.

DIA LLING.

The art of drawing dials on the surface of any given body or plane. The Greeks and the Latins call this art gnomonica and scieatherica, by reason it distinguishes the hours by the shadow of the gnomon. Some call it photo-scieatherica, because the hours are sometimes shown by the light of the sun. Lastly, others call it horolography.

Dialling is a most necessary art: for notwithstanding we are provided with moving machines, such as clocks and watches, to show time; yet these are apt to be out of order, go wrong, and stop; consequently they stand frequently in need of regulation by some invariable instrument, as a dial; which being rightly constructed and duly placed, will always, by means of the sun, inform us of the true solar time; which time being corrected by the equation table published annually in the ephemerides, almanacks, and other books, will be the mean time to which clocks and watches are to be set.

The antiquity of dials is beyond doubt. Some attribute their invention to Anaximenes Milesius; and others to Thales. Vitruvius mentions one made by the ancient Chaldee historian Berosus, on a reclining plane, almost parallel to the equinoctial. Aristarchus Samius invented the hemispherical dial. And there were some spherical ones, with a needle for a gnomon. The discus of Aristarchus was a horizontal dial, with its limb raised up all around, to prevent the shadow stretching too far.

It was late ere the Romans became acquainted with dials. The first sun-dial at Rome was set up by Papius Cursor, about the year of the city 460; before which time, says Pliny, there is no mention of any account of time but by the sun's rising and setting; it was set up at or near the temple of Quirinus, but went ill. About 30 years after, M. Valerius Messala being consul, brought out of Sicily another dial, which he set up on a pillar near the rostrum; but for want of its being made for that latitude, it could not go true. They made use of it 99 years; till Martius Philippus set up another more exact.

But there seem to have been dials among the Jews much earlier than any of these. Witness the dial of Abaz: who began to reign 400 years before Alexander, and within 12 years of the building of Rome: mentioned by Isaiah, chap. xxxviii. ver. 8.

The first professor on dialling is Clavius; who demonstrates all, both the theory and the operations, after the rigid manner of the ancient mathematicians;
but so intricately, that few, we dare say, ever read them all. Dechales and Ozanam gave much easier demonstrations in their Courses, and Wolfius in his Elements. M. Picard has given a new method of making large dials, by calculating the hour-lines; and M. de la Hire, in his Dialling, printed in 1683, a geometrical method of drawing hour-lines from certain points determined by observation. Eberhardus Welpurus, in 1625, published his Dialling, wherein he lays down a method of drawing the primary dials on a very easy foundation. The same foundation is described at length by Sebastian Munster, in his Rudi menta Mathematica, published in 1551. Sturmius, in 1672, published a new edition of Welpurus’s Dialling, with the addition of a whole second part, about inclining and declining dials, &c. In 1709, the same work, with Sturmius’s additions, was republished, with the addition of a fourth part, containing Picard’s and de la Hire’s methods of drawing large dials. Paterson, Michael, and Muller, have each wrote on Dialling in the German tongue; Coetsius in his Horologio graphia Planum, printed in 1683; Gaupenius, in his Gnomonica Mechanica; Bion, in his Use of Mathematicall instruments; the late ingenious Mr. Ferguson, in his Select Lectures; Mr. Emmerson, in his Dialling; and Mr. W. Jones, in his Instrumental Dialling.

Definitions. A Dial, accurately defined, is a plane, upon which lines are described in such a manner, that the shadow of a wire, or of the upper edge of another plane, erected perpendicularly on the former, may show the true time of the day.

The edge of the plane by which the time of the day is found, is called the stile of the dial, which must be parallel to the earth’s axis; and the line on which the said plane is erected, is called the subtile.

The angle included between the subtile and stile, is called the elevation or height of the stile.

Those dials whose planes are parallel to the plane of the horizon, are called horizontal dials; and those dials whose planes are perpendicular to the plane of the horizon, are called vertical or erect dials.

Those erect dials, whose planes directly front the north or south, are called direct north or south dials; and all other erect dials are called decliners; because their planes are turned away from the north or south.

Those dials whose planes are neither parallel nor perpendicular to the plane of the horizon, are called inclining or reclining dials, according as their planes make acute or obtuse angles with the horizon; and if their planes are also turned aside from facing the south or north, they are called declining-inclining or declining-reclining dials.

The intersection of the plane of the dial, with that of the meridian, passing through the stile, is called the meridian of the dial, or the hour-line of XII.

Those meridians, whose planes pass through the stile, and make angles of 15, 30, 45, 60, 75, and 90 degrees with the meridian of the plane (which marks the hour-line of XII) are called hour-circles; and their intersections with the plane of the dial are called hour-lines.

In all declining dials, the subtile makes an angle with the hour-line of XII, and this angle is called the distance of the subtile from the meridian.

The declining plane’s difference of longitude, is the angle formed at the intersection of the stile and plane of the dial, by two meridians; one of which passes through the hour-line of XII, and the other through the subtile.

Thus much being premised concerning dials in general, we shall now proceed to explain the different methods of their construction.

If the whole earth a P e p were transparent, and hollow, like a sphere of glass, and had its equator divided into 24 equal parts by so many meridian semicircles, a, b, c, d, e, f, g, &c. one of which is the universal geographical meridian of any given place, as London on which (which is supposed to be at the point a); and if the dialling done of XII were marked at the equator, both upon a plate.

That meridian and the opposite one, and all the rest of the hours in order on the rest of the meridians, those meridians would be the hour-circles of London: then, if the sphere had an opaque axis, as P e p, terminating in the poles P and p, the shadow of the axis would fall upon every particular point of a particular hour-circle; and, when the sun came to the plane of the opposite meridian, and would consequently show the time at London, and at all other places on the meridian of London.

If this sphere was cut through the middle by a solid plane ABCD, in the rational horizon of London, one half of the axis EP would be above the plane, and the other half below it; and if straight lines were drawn from the centre of the plane to those points where its circumference is cut by the hour-circles of the sphere, those lines would be the hour-lines of a horizontal dial for London: for the shadow of the axis would fall upon each particular hour-line of the dial, when it fell upon the like hour-circle of the sphere.

If the plane which cuts the sphere be upright, as Fig. 2, AFGC, touching the given place (London) at F, and directly facing the meridian of London, it will then become the plane of an erect direct south dial: and if right lines are drawn from its centre E to those points of its circumference where the hour-circles of the sphere dial, those will be the hour-lines of a vertical south-dial for London, to which the hours are to be set as in the figure (contrary to those on a horizontal dial), and the lower half E p of the axis will cast a shadow on the hour of the day in this dial, at the same time that it would fall upon the like hour-circle of the sphere, if the dial plane was not in the way.

If the plane (still facing the meridian) be made to incline or recline any given number of degrees, the hour-circles of the sphere will still cut the edge of the plane in those points to which the hour-lines must be drawn straight from the centre; and the axis of the sphere will cast a shadow on these lines at the respective hours. The like will still hold, if the plane be made to incline or recline by any given number of degrees from the meridian towards the east or west; provided the inclination be less than 90 degrees, or the declination be less than the co-latitude of the place: and the axis of the sphere will be a gnomon or stile for the dial. But it cannot be a gnomon, when the declination is quite 90 degrees, nor when the inclination is equal to the colatitude; because in these two cases, the axis has no elevation above the plane of the dial.

And thus it appears, that the plane of every dial represents the plane of some great circle upon the earth; and the gnomon of the earth’s axis, whether it be a small.
DIALLING.

small wire as in the above figures, or the edge of a thin plate, as in the common horizontal dials.

The whole earth, as to its bulk, is but a point, if compared to its distance from the sun; and therefore, if a small sphere of glass be placed upon any part of the earth's surface, so that its axis be parallel to the axis of the earth, and the sphere have such lines upon it, and such planes within it, as above described; it will show the hours of the day as truly as if it were placed at the earth's centre, and the shell of the earth were as transparent as glass.

But because it is impossible to have a hollow sphere of glass perfectly true, blown round a solid plane; or if it was, we could not get at the plane within the glass to set it in any given position; we make use of a wire-square to explain the principles of dialling, by joining 24 semicircles together at the poles, and putting a thin flat plate of brass within it.

A common globe of 12 inches diameter has generally 24 meridian semicircles drawn upon it. If such a globe be elevated to the latitude of any given place, and turned about until one of the meridians is opposite the north point, where the hour of XII is supposed to be marked, the rest of the meridians will cut the horizon at the respective distances of all the other hours from XII. Then if these points of distance be marked on the horizon, and the globe be taken out of the horizon, and a flat board or plate be put into its place, even with the surface of the horizon; and if straight lines be drawn from the centre of the board to those points of distance on the horizon which were cut by the 24 meridian semicircles; these lines will be the hour-lines of a horizontal dial for that latitude, the edge of whose gnomon must be in the very same situation that the axis of the globe was, before it was taken out of the horizon; that is, the gnomon must make an angle with the plane of the dial equal to the latitude of the place for which the dial is made.

If the pole of the globe be elevated to the co-latitude of the given place, and any meridian be brought to the north point of the horizon, the rest of the meridians will cut the horizon at the respective distances of all the hours from XII, for a direct south dial, whose gnomon must be an angle with the plane of the dial, equal to the co-latitude of the place; and the hours must be set the contrary way on this dial to what they are on the horizontal.

But if your globe have more than 24 meridian semicircles upon it, you must take the following method for making horizontal and south dials.

Elevate the pole to the latitude of your place, and turn the globe until any particular meridian (suppose the first) comes to the north point of the horizon, and the opposite meridian will cut the horizon in the south. Then set the hour-index to the uppermost XII on its circle; which done, turn the globe westward until 15 degrees of the equator pass under the brazen meridian, and then the hour index will be at I (for the sun moves 15 degrees every hour), and the first meridian will cut the horizon in the number of degrees from the north point that I is distant from XII. Turn on until other 15 degrees of the equator pass under the brazen meridian, and the hour index will then be at II, and the first meridian will cut the horizon in the number of degrees that II is distant from XII: and so by making 15 degrees of the equator pass under the brazen meridian for every hour, the first meridian of the globe will cut the horizon in the distances of all the hours from XII to VI, which is just 90 degrees; and then you need go no farther, for the distances of XI, X, IX, VIII, VII, and VI, in the forenoon, are the same from XII as the distances of I, II, III, IV, V, and VI, in the afternoon: and these hour-lines, continued through the centre, will give the opposite hour-lines on the other half of the dial.

Thus, to make a horizontal dial for the latitude of London, which is 51½ degrees north, elevate the north pole of the globe 51½ degrees above the north point of the horizon; and then turn the globe until the first meridian (which is that of London on the English terrestrial globe) cuts the north point of the horizon, and set the hour-index to XII at noon.

Then turning the globe westward until the index points successively to I, II, III, IV, V, and VI, in the afternoon, or until 75°, 30°, 45°, 60°, 75°, and 90° through the equator pass under the brass meridian, you will find that the first meridian of the globe cuts the horizon in the following number of degrees from the north towards the east, viz. 11½, 24½, 38½, 52½, 71½, and 90; which are the respective distances of the above hours from XII upon the plane of the horizon.

To transfer these, and the rest of the hours, to a horizontal plane, draw the parallel right lines ac and db, upon the plane, as far from each other as is equal to the intended thickness of the gnomon or stile of the dial, and the space included between them will be the meridian or twelve-o'clock line on the dial. Cross this meridian at right angles with the six-o'clock line gh, and setting one foot of your compasses in the intersection a, as a centre, describe the quadrant ge with any convenient radius or opening of the compasses; then, setting one foot in the intersection b, as a centre, with the same radius describe the quadrant fd, and divide each quadrant into 90 equal parts or degrees, as in the figure.

Because the hour-lines are less distant from each other about noon, than in any other part of the dial, it is best to have the centres of these quadrants at a little distance from the centre of the dial plane, on the side opposite to XII, in order to enlarge the hour-distances thereabouts, under the same angles on the plane. Thus the centre of the plane is at C, but the centres of the quadrants are at a and b.

Lay a ruler over the point b (and keeping it there for the centre of all the afternoon hours in the quadrant fA) draw the hour-line of I through 11½ degrees in the quadrant; the hour-line of II, through 24½ degrees; of III, through 38½ degrees; of IV, through 53½ degrees; and of V, through 71½: and because the sun rises about four in the morning, on the longest day, at London, continue the hour-lines of IIII and V in the afternoon through the centre b to the opposite side of the dial. This done, lay the ruler to the centre a of the quadrant eg; and through the like divisions or degrees of that quadrant, viz. 11½, 24½, 38½, 53½, and 71½, draw the forenoon hour-lines of XI, X, IX, VIII, and VII, and because the sun sets not before eight in the evening on the longest day, continue the hour-lines of VII and VIII in the forenoon, through the centre a to VII.
VII and VIII in the afternoon; and all the hour-lines will be finished on this dial; to which the hours may be set, as in the figure.

Lastly, through 51° degrees of either quadrant, and from its centre, draw the right line $a$ for the hypotenuse or axis of the gnomon $ag$; and from $g$, let fall the perpendicular $gi$, upon the meridian line $ai$, and there will be a triangle made, whose sides are $ag$, $gi$, and $ia$. If a plate similar to this triangle be made as thick as the distance between the lines $ac$ and $bd$, and set upright between them, touching at $a$ and $b$, its hypotenuse $ag$ will be parallel to the axis of the world, when the dial is truly set; and will cast a shadow on the hour of the day.

N. B. The trouble of dividing the two quadrants may be saved if you have a scale with a line of chords upon it (as represented in the plate); for if you extend the compasses from 0 to 60 degrees of the line of chords, and with that extent, as a radius, describe the two quadrants upon their respective centres, the above distances may be taken with the compasses upon the lines, and set off upon the quadrants.

To make an erect direct south dial. Elevate the pole to the co-latitude of your place, and proceed in all respects as above taught for the horizontal dial from VII in the morning to VI in the afternoon; only the hours must be reversed as in the figure; and the hypotenuse $ag$ of the gnomon $ag$, must make an angle with the dial-plane equal to the co-latitude of the place.

As the sun can shine no longer on this dial than from six in the morning until six in the evening, there is no occasion for having any more than 12 hours upon it.

To make an erect dial, declining from the south towards the east or west. Elevate the pole to the latitude of your place, and screw the quadrant of altitude to the zenith. Then, if your dial declines towards the east (which we shall suppose it to do at present), count in the horizon the degrees of declination, from the point towards the east, and bring the lower end of the quadrant to that degree of declination at which the reckoning ends. This done, bring any particular meridian of your globe (as suppose the first meridian) directly under the graduated edge of the upper part of the brazen meridian, and set the hour to XII at noon. Then, keeping the quadrant of altitude at the degree of declination in the horizon, turn the globe eastward on its axis, and observe the degrees cut by the first meridian in the quadrant of altitude (counted from the zenith) as the hour-index comes to XI, X, IX, &c. in the forenoon, or as 15, 30, 45, &c. degrees of the equator pass under the brazen meridian at these hours respectively; and the degrees then cut in the quadrant by the first meridian, are the respective distances of the forenoon hours from XII on the plane of the dial.

Then, for the afternoon hours, turn the quadrant of altitude round the zenith, until it comes to the degree in the horizon opposite to that where it was placed before; namely, as far from the west point of the horizon towards the south, as it was set at first from the east point towards the north; and turn the globe westward on its axis, until the first meridian comes to the brazen meridian again, and the hour index to XII; then, continue to turn the globe westward; and as the index points to the afternoon hours I, II, III, &c. or as 15, 30, 45, &c. degrees of the equator pass under the brazen meridian, the first meridian will cut the quadrant of altitude in the respective number of degrees from the zenith that each of these hours is from XII on the dial.—And note, that when the first meridian goes off the quadrant at the horizon in the forenoon, the hour-index shows the time when the sun will come upon this dial; and when it goes off the quadrant in the afternoon, the index will point to the time when the sun goes off the dial.

Having thus found all the hour-distances from XII, lay them down upon your dial-plane, either by dividing a semicircle into two quadrants of 60 degrees each (beginning at the hour-line of XII), or by the line of chords, as above directed.

In all declining dials, the line on which the stile or gnomon stands (commonly called the subtire-line) makes an angle with the twelve o'clock line, and falls among the forenoon-hour-lines, if the dial declines towards the east; and among the afternoon-hour-lines, when the dial declines towards the west; that is, to the left hand from the twelve o'clock line in the former case, and to the right hand from it in the latter.

To find the distance of the subtire from the twelve o'clock line; if your dial declines from the south towards the east, count the degrees of that declination in the horizon from the east point towards the north, and bring the lower end of the quadrant of altitude to that degree of declination where the reckoning ends: then turn the globe until the first meridian cuts the horizon in the like number of degrees, counted from the south points towards the east; and the quadrant and first meridian will then cross one another at right angles; and the number of degrees of the quadrant, which are intercepted between the first meridian and the zenith, is equal to the distance of the subtire line from the twelve o'clock line; and the number of degrees of the first meridian, which are intercepted between the quadrant and the north pole, is equal to the elevation of the stile above the plane of the dial.

If the dial declines westward from the south, count that declination from the east point of the horizon towards the south, and bring the quadrant of altitude to the degree in the horizon at which the reckoning ends; both for finding the forenoon hours and distance of the subtire from the meridian: and for the afternoon hours, bring the quadrant to the opposite degree in the horizon, namely, as far from the west towards the north, and then proceed in all respects as above.

Thus we have finished our declining dial; and in so doing we made four dials, viz.

1. A north dial, declining eastward by the same number of degrees. 2. A north dial, declining the same number west. 3. A south dial, declining east. And, 4. A south dial, declining west. Only, placing the proper number of hours, and the stile or gnomon respectively, upon each plane. For (as above-mentioned) in the south-west plane, the subtire line falls among the afternoon hours; and in the south-east, of the same declination, among the forenoon hours, at equal distances from XII. And so all the morning hours on the west decliner will be like the afternoon hours on the east decliner: the south-east decliner will produce the north-west decliner; and the south-west decliner the north-east decliner, by only extending the hour-lines
DIALLING.

hour-lines, stile and substile, quite through the centre: the axis of the stile (or edge that casts the shadow on the hour of the day) being in all dials whatever parallel to the axis of the world, and consequently pointed towards the north pole of the heaven in north latitudes, and towards the south pole in south latitudes.

But because every one who would like to make a dial, may perhaps not be provided with a globe to assist him, and may probably not understand the method of doing it by logarithmic calculation; we shall show how to perform it by the plain dialling lines, or scale of latitudes and hours (as represented on the Plate), and which may be had on scales commonly sold by the mathematical-instrument-makers.

This is the easiest of all mechanical methods, and by much the best, when the lines are truly divided: and not only the half-hours and quarters may be laid down by all of them, but every fifth minute by most, and every single minute by those whose line of hours is a foot in length.

Having drawn your double meridian line $a b$, $c d$, fig. 5, on the plane intended for a horizontal dial, and crossed it at right angles by the six o'clock line $f e$ (as in fig. 3.), take the latitude of the place with your compasses, in the scale of latitudes, and set that extent from $c$ to $e$, and from $a$ to $f$, on the six o'clock line: then, taking the whole six hours between the points of the compasses in the scale of hours, with that extent set one foot in the point $c$, and let the other foot fall where it will upon the meridian line $a b$, as at $g$.

Do the same from $f$ to $b$, and draw the right lines $e d$ and $f b$, each of which will be equal in length to the whole scale of hours. This done, setting one foot of the compasses in the beginning of the scale at $X I I$, and extending the other to each hour of the scale, lay off these extents from $d$ to $e$ for the afternoon hours, and from $b$ to $f$ for those of the forenoon; this will divide the line $e d$ and $b f$ in the same manner as the hour-scale is divided at 1, 2, 3, 4, and 5; on which the quarters may also be laid down, if required. Then, laying a ruler on the point $c$, draw the first five hours in the afternoon, from that point, through the dots at the numeral figures, 1, 2, 3, 4, 5, on the line $d e$; and continue the lines of $I I I$ and $I V$ through the centre $a$ to the other side of the dial, for the like hours of the morning: which done, lay the ruler on the point $a$, and draw the last five hours in the forenoon through the dots, 5, 4, 3, 2, 1, on the line $f b$; continuing the hour-lines of $V I I I$ and $V I I I I$ through the centre $a$ to the other side of the dial, for the like hours of the evening; and set the hours to their respective lines, as in the figure. Lastly, make the gnomon the same way as taught above for the horizontal dial, and the whole will be finished.

To make an erect south dial; take the co-latitude of your place from the scale of latitudes, and then proceed in all respects for the hour-line as in the horizontal dial; only reversing the hours, as in fig. 4, and making the angle of the stile's height equal to the co-latitude.

But, lest the young diallist should have neither globe nor wooden scale, we shall now show how he may make a dial without any of these helps. Only, if he has not a line of chords, he must divide a quadrant into 90 equal parts or degrees for taking the proper angle of the stile's elevation; which is easily done.

With any opening of the compasses, as $Z L$, fig. 6, divide the two semicircles $L F k$ and $L Q k$, upon the centres $Z$ and $z$, where the six o'clock line crosses the double meridian line, and divide each semicircle into 12 equal parts, beginning at $L$ (though, strictly speaking, only the quadrants from $L$ to the six o'clock line need be divided); then connect the divisions which dial are equidistant from $L$, by the parallel lines $K M$, $I N$, $H O$, $G P$, and $F Q$.

Draw $V Z$ for the hypotenuse of the stile, making the angle $V Z E$ equal to the latitude of your place; and continue the line $V Z$ to $H$.

Draw the line $R r$ parallel to the six o'clock line; and set off the distance $a K$ from $Z$ to $Y$, the distance $b I$ from $Z$ to $X$, $c H$ from $Z$ to $W$, $d G$ from $Z$ to $T$, and $e F$ from $Z$ to $S$. Then draw the lines $S s$, $T t$, $W w$, $X x$, and $Y y$, each parallel to $R r$. Set off the distance $y Y$ from $a o$ to $11$, and from $f t$ to $1$; the distance $S X$ from $b$ to $10$, and from $g$ to $2$; $s W$ from $c$ to $9$, and from $h$ to $3$; $T d$ from $d$ to $8$, and from $i$ to $4$; $s S$ from $e$ to $7$, and from $n$ to $5$.

Then laying a ruler to the centre $Z$, draw the forenoon hour lines through the points $11, 10, 9, 8, 7$; and laying it to the centre $z$, draw the afternoon lines through the points $1, 2, 3, 4, 5$; continuing the forenoon lines of $V I I I I$ and $V I I I I I I I$ through the centre $Z$, to the opposite side of the dial, for the like afternoon hours; and the afternoon lines $V I I I$ and $V$ through the centre $z$, to the opposite side, for the like morning hours. Set the hours to these lines as in the figure, and then erect the stile or gnomon, and the horizontal dial will be finished.

To construct a south dial draw the line $V Z$, making an angle with the meridian $Z L$ equal to the co-latitude of your place; and proceed in all respects as in the above horizontal dial for the same latitude, reversing the hours as in fig. 4, and making the elevation of the gnomon equal to the co-latitude.

Perhaps it may not be unacceptable to explain the method of constructing the dialling lines, and some others; which is as follows:

With any opening of the compasses, as $E A$, fig. 7, Dialling according to the intended length of the scale, describe the circle $A D C B$, and cross it at right angles by the diameters $C E A D$ and $D E B$. Divide the quadrant $A B$ first into 9 equal parts, and then each part into 10; so shall the quadrant be divided into 90 equal parts or degrees. Draw the right line $A F B$ for the chord of this quadrant; and setting one foot of the compasses in the point $A$, extend the other to the several divisions of the quadrant, and transfer these divisions to the line $A F B$ by the arcs $10, 10, 20, 20, 30, 30, &c.$ and this will be a line of chords, divided into 90 unequal parts; which, if transferred from the line back again to the quadrant, will divide it equally. It is plain by the figure that the distance from $A$ to $D$ in the line of chords, is just equal to $A E$, the radius of the circle from which that line is made; for if the arc $60$, $60$, be continued, of which $A$ is the centre, it goes exactly through the centre $D$ of the arc $A B$.

And therefore, in laying down any number of degrees on a circle, by the line of chords, you must first open the compasses so as to take in just 60 degrees upon...
up on that line as from A to 60: and then, with that extent, as a radius, describe a circle, which will be exactly of the same size with that from which the line was divided: which done, set one foot of the compasses in the beginning of the chord line, as at A, and extend the other to the number of degrees you want upon the line; which extent, applied to the circle, will include the like number of degrees upon it.

Divide the quadrant CD into 90 equal parts, and from each point of division draw right lines, as i k l, &c. to the line CE, all perpendicular to that line, and parallel to DE, which will divide EC into a line of sines: and although these are seldom put among the dialling lines on a scale, yet they assist in drawing the line of latitudes. For if a ruler be laid upon the point D, and over each division in the line of sines, it will divide the quadrant CB into 90 unequall parts, as B a, B b, &c. shown by the right lines 10 a, 20 b, 30 c, &c. drawn along the edge of the ruler. If the right line BC be drawn, subtending this quadrant, and the nearest distances B a, B b, B c, &c. be taken in the compasses from B, and set upon this line in the same manner as directed for the line of chords, it will make a line of latitudes BC, equal in length to the line of chords AB, and of an equal number of divisions, but very unequal as to their lengths.

Draw the right line DGA, subtending the quadrant DA; and parallel to it, draw the right line r s, touching the quadrant DA at the numeral figure 9. Divide this quadrant into six equal parts, as 1, 2, 3, &c. and through these points of division draw right lines from the centre E to the line r s, which will divide it at the points where the six hours are to be placed, as in the figure. If every sixth part of the quadrant be subdivided into four equal parts, right lines drawn from the centre through these points of division, and continued to the line r s, will divide each hour upon it into quarters.

In fig. 9, we have the representation of a portable dial, which may be easily drawn on a card, and carried in a pocket-book. The lines a d, a b, and b c of the gnomon, must be cut quite through the card; and as the end a b of the gnomon is raised occasionally above the plane of the dial, it turns upon the uncut line c d as on a hinge. The dotted line AB must be slit quite through the card, and the thread C must be put through the slit, and have a knot tied behind, to keep it from being easily drawn out. On the other end of this thread is a small plummet D, and on the middle of it a small bead for showing the hour of the day.

To rectify this dial, set the thread in the slit right against the day of the month, and stretch the thread from the day of the month over the angular point where the curve lines meet at XI; then shift the bead to that point on the thread, and the dial will be rectified.

To find the hour of the day, raise the gnomon (no matter how much or bow little) and hold the edge of the dial next the gnomon towards the sun, so as the uppermost edge of the shadow of the gnomon may just cover the shadow line; and the bead then playing freely on the face of the dial, by the weight of the plummet, will show the time of the day among the hour lines, as it is forenoon or afternoon.

To find the time of sun-rising and setting, move the thread among the hour-lines, until it either covers some one of them, or lies parallel betwixt any two; and then it will cut the time of sun-rising among the forenoon hours, and of sun-setting among the afternoon hours, for that day of the year to which the thread is set in the scale of months.

To find the sun's declination, stretch the thread from the day of the month over the angular point at XII, and it will cut the sun's declination, as it is north or south, for that day, in the proper scale.

To find on what days the sun enters the signs, when the beam, as above rectified, moves along any of the curve-lines which have the signs of the zodiac marked upon them, the sun enters those signs on the days pointed out by the thread in the scale of months.

The construction of this dial is very easy, especially if the reader compares it all along with fig. 9. Plate CLXXII. as he reads the following explanation of the figure.

Draw the occult line AB (fig. 9) parallel to the top of the card, and cross it at right angles with the six o'clock line ECD; then upon C, as a centre, with the radius CA, describe the semicircle AEL, and divide it into 12 equal parts (beginning at A), as A r, A s, &c. and from these points of division draw the hour-lines r, s, t, u, v, w, x, y, z, &c. all parallel to the six o'clock line E C. If each part of the semicircle be subdivided into four equal parts, they will give the half-hour lines and quarters, as in fig. 2. Draw the right line ASD, making the angle SAB equal to the latitude of your place. Upon the centre A describe the arch RST, and set off upon it the arcs SR and ST, each equal to 23½ degrees, for the sun's greatest declination; and divide them into 24 equal parts, as in fig. 2. Through the intersection B of the lines ECD and A D O, draw the right line FDG at right angles to A D O. Lay a ruler to the points A and B, and draw the line AB through 23¼ degrees of north declination in the arc SB; and then laying the ruler to the points A and T, draw the line ATG through 23½ degrees of north declination in the arc ST: so shall the lines ABF and ATG cut the line FDG in the proper lengths for the scale of months. Upon the centre D, with the radius DF, describe the semicircle F O G; which divide into six equal parts, F m, m n, n o, &c. and from these points of division draw the right lines m h, m i, p k, and q l, each parallel to o D. Then setting one foot of the compasses in the point F, extend the other to A, and describe the arc AZ H for the tropic of 23; with the same extent, setting one foot in G, describe the arc A E O for the tropic of 23. Next setting one foot in the point H, and extending the other to A, describe the arc A C I for the beginnings of the signs Σ and Τ; fig. 9 comp. and with the same extent, setting one foot in the point p pared with I, describe the arc A N for the beginnings of the signs Σ and Τ; fig. 9 comp. and with the same extent, setting one foot in A, and describe the arc AM for the beginnings of the signs Σ and Τ; fig. 9 comp. and with the same extent, setting one foot in A, and describe the arc AM for the beginnings of the signs Σ and Τ; fig. 9 comp. Then setting one foot in the point D, and extending the other to A, describe the curve AL K for the beginnings of the signs Σ and Τ; and the signs will be finished. This done, lay a ruler from the point A over the sun's declination in the arch RST; and where the ruler cuts the line EDG, make marks.
marks: and place the days of the months right against these marks, in the manner shown by fig. 2. Lastly, draw the shadow line PQ parallel to the occult line AB; make the gnomon, and set the hours to their respective lines, as in fig. 2, and the dial will be finished.

There are several kinds of dials called universal, because they serve for all latitudes. One, of Mr. Pardie's construction, was formerly considered as the best. It consists of three principal parts; the first whereof is called the horizontal plane, A, fig. 10; because in practice it must be parallel to the horizon. In this plane is fixed an upright pin, which enters into the edge of the second part B, called the meridional plane; which is made of two pieces, the lowest whereof B is called the quadrant, because it contains a quarter of a circle, divided into 90 degrees; and it is only into this part, near B, that the pin enters. The other piece is a semicircle D adjusted to the quadrant, and turning in it by a groove, for raising or depressing the diameter EF of the semicircle, which diameter is called the axis of the instrument. The third piece is a circle C, divided on both sides into 24 equal parts, which are the hours. This circle is put upon the meridional plane so that the axis EF may be perpendicular to the circle, and the point C the common centre of the circle, semicircle, and quadrant. The straight edge of the semicircle is chamfered on both sides to a sharp edge, which passes through the centre of the circle. On one side of the chamfered part, the first six months of the year are laid down, according to the sun's declination for their respective days; and on the other side the last six months. And against the days on which the sun enters the signs, there are straight lines drawn upon the semicircle, with the characters of the signs marked upon them. There is a black line drawn along the middle of the upright edge of the quadrant, over which hangs a thread H, with its plummet I, for levelling the instrument. N.B. From the 23rd of September to the 20th of March, the upper surface of the circle must touch both the centre C of the semicircle, and the line of Γ and ω; and from the 20th of March to the 23rd of September, the lower surface of the circle must touch that centre and line.

To find the time of the day by this dial. Having set it on a level place in sunshine, and adjusted it by the levelling screws k and l, until the plumb-line hangs over the back line upon the edge of the quadrant, and parallel to the said edge; move the semicircle in the quadrant, until the line of Γ and ω (where the circle touches) comes to the latitude of your place in the quadrant: then turn the whole meridional plane BD, with its circle G, upon the horizontal plane A, until the edge of the shadow of the circle fall precisely on the day of the month in the semicircle; and then the meridional plane will be due north and south, the axis EF will be parallel to the axis of the world, and will cast a shadow upon the true time of the day among the hours on the circle.

N.B. As, when the instrument is thus rectified, the quadrant and semicircle are in the plane of the meridian, so the circle is then in the plane of the equinoctial. Therefore, as the sun is above the equinoctial in summer (in northern latitudes), and below it in winter; the axis of the semicircle will cast a shadow on the VOL. VII. Part I.
pole M may be in a vertical position; which is done by making 90° on the arch at bottom coincide with the O of the nonius. The arch is then fixed by the tightening screw at the back of D. Hang a silken plumb-line on the hook at G; which line is to coincide with a mark at the bottom of the latitude arch at H, all the while you move the upper plate A round its centre. If it does not so, there are four screws to regulate this adjustment, two of which pass through the base I into the plate A; the other two screws fasten the nonius piece D together; when unscrewed a thread or two, the nonius piece may be easily moved to the right or left of 90° as may be found requisite.

Prob. 1. To find the latitude of the place. Fasten the latitude and hour circles together, by placing the pin K into the holes; slide the nonius piece E on the hour-circle to the sun’s declination for the given day: the sun’s declination you may know in the ephemeris by White, or other almanacks, for every day in the year. The nonius piece E must be set on that portion of the hour-circle marked ND or SD, according as the sun has north or south declination. About 20 minutes or a quarter of an hour before noon, observe the sun’s shadow or spot that passes through the hole at the axis O, and gently move the latitude arch C down in its groove at D, till you observe the spot exactly fall on the cross line on the centre of the nonius piece at L; and by the falling of this spot, so long as you observe the sun to increase in altitude, you depress the arch C; but at the instant of its stationary appearance the spot will appear to go no lower; then fix the arch by the screw at the back of D, and the degrees thereby cut by the nonius on the arch will be the latitude of the place required: if great exactness is wanted, allowance should be made for the refraction of the atmosphere, taken from some nautical or astronomical treatise.

Prob. 2. The latitude of the place being given, to find the time by the sun or stars. From an ephemeris, as before, you find the sun’s declination for the day north or south, and set the nonius piece E on the arch accordingly. Set the latitude arch C, by the nonius at D, to the latitude of the place; and place the magnifying glass at M, by which you will very correctly set the index carrying a nonius to the upper XII at S. Take out the pin K, slacken the horizontal screw N, and gently move, either to the right or left as you see necessary, the hour-circle C, at the same time with the other hand moving the horizontal plate A round its axis to the right and left, till the latitude arch C fall into the meridian; which you will know by the sun’s spot falling exactly in the centre of the nonius piece, or where the lines intersect each other. The time may be now read off exactly to a minute by the nonius on the dial-plate at top, and which will be the time required. The horizontal line drawn on the nonius piece L, not seen in the figure, being the parallel of declination, on which the sun’s dial marks, therefore can fall on the centre of that line at no other time but when the latitude arch C is in the meridian, or due north and south. Hence the hour-circle, on moving round with the pole, must give the true time on the dial-plate at top. There is a hole to the right, and cross hairs to the left, of the centre axis hole O, where the sun’s rays pass through; whence the sun’s shadow or spot will also appear on the right and left of the centre on the nonius piece L, the holes of which are occasionally used as sights to observe through. If the sun’s rays are too weak for a shadow, a dark glass to screen the eye is occasionally placed over the hole. The most proper time to find a true meridian is three or four hours before or after noon, and take the difference of the sun’s declination from noon at the time you observe. If it be the morning, the difference is that and the preceding day; if afternoon, that and the following day; and the meridian being once found exact, the hour-circle E is to be brought into this meridian, a fixed place made for the dial, and an object to observe by it also fixed for it at a great distance. The sights LO must at all times be directed against this fixed object, to place the dial truly in the meridian, proper for observing the planets, moon, or bright stars, by night.

Prob. 3. To find the sun’s azimuth and altitude. The latitude arch C being in the meridian, bring the pole M into the zenith, by setting the latitude arch to 90°. Fasten the hour-circle E in the meridian by putting in the pin K; fix the horizontal plates by the screw N; and set the index of the dial-plate to XII, which is the south point: Now take out the pin K, and gently move the hour-circle E; leaving the latitude arch fixed, till the sun’s rays or spot passing through the centre hole in the axis O fall on the centre line of the hour-circle E, made for that purpose. The azimuth in time may be then read off on the dial-plate at top by the magnifying glass. This time may be converted into degrees, by allowing at the rate of 15° for every hour. By sliding the nonius piece E, so that the spot shall fall on the cross line thereon, the altitude may be taken at the same time if it does not exceed 45°. Or the altitude may be taken more universally, by fixing the nonius piece E to the 0 on the divisions, and sliding down the latitude arch in such a manner in the groove at D, till the spot falls exactly on the centre of the nonius E. The degrees and minutes then shown by the nonius at D, taken from 90°, will be the altitude required. By looking through the sight holes LO, the altitude of the moon, planets, and stars, may be easily taken. Upon this principle it is somewhat adapted for levelling also; by lowering the nonius piece E, equal altitudes of the sun may be had; and by raising it higher, equal depressions.

More completely to answer the purposes of a good theodolite, of levelling, and the performance of problems in practical astronomy, trigonometry, c.

---

A telescope and spirit-level applies on the latitude arch at HG by two screws, making the latitude arch a vertical arch; and the whole is adapted to triangular staffs with parallel plates, similar to those used with the best theodolites. It consists of the common equatorial circles reduced to a portable size, and instead of a telescope carries a plain sight. Its principal parts consist of the sight-piece OP, fig. 20, movable over the declination’s semicircle D. It has a nonius Q to the semicircle.
semicircle. A dark glass to screen the eye applies occasionally over either of the holes at O; these holes on the inner side of the piece are intersected by cross lines, as seen in the figure below; and to the sight P two pieces are screwed, the lower having a small hole for the sun's rays or shadow, and the upper two cross hairs or wires.

The declination circle or arch D is divided into two, 90° each; and is fixed perpendicularly on a circle with a chamfered edge, containing a number division that subdivides into single minutes the under equatorial circle MN, which in all cases represents the equator, and is divided into twelve 12 hours, and each hour into five minutes. At right angles below this equatorial circle is fixed the semicircle of altitude AB, divided into two quadrants of 90° each. This arch serves principally to measure angles of altitude and depression; and it moves centrally on an upright pillar fixed in the horizontal circle EF. This circle EF is divided into four quadrants of 90° each, and against it there is fixed a small number plate at N. The horizontal circle may be turned round its centre or axis; and two spirit levels LL are fixed on it at right angles to one another.

We have not room to detail the great variety of astronomical and trigonometrical problems, that may be solved by this general instrument, which is described in Jones's "Instrumental Dialling." One example connected with our present purpose may here suffice, viz. To find the time when the latitude is given. Supposing the instrument to be well adjusted by the directions hereafter given: The meridian of the place should be first obtained to place the instrument in, which is settled by a distant mark, or particular cavities to receive the screws at IGH, made in the base it stands on. The meridian is best found by equal altitudes of the sun. In order to take these, you set the middle mark of the number on the declination arch D at O, and fix it by the screw behind; then set the hourary or hour-circle to XII. The circle EF being next made horizontal, you direct the sights to the sun, by moving the horizontal circle EF and altitude semicircle AB: the degrees and minutes marked by the number on the letter will be the altitude required. To take equal altitudes, you observe the sun's altitude in the morning two or three hours before noon by the semicircle AB: leave the instrument in the same situation perfectly unaltered till the afternoon, when, by moving the horizontal circle EF, only find the direction of the sight or the sun's spot to be just the same, which will be an equal altitude with the morning. The place of the horizontal circle EF against the number at each time of observation is to be carefully noted; and the middle degree or part between each will be the place where the semicircle AB, and sight OP, will stand or coincide with, when directed to the south or north, according to the sun's situation north or south at noon at the place of observation. Set the index, or sight-piece OP, very accurately to this middle point, by directing the sight to some distant object; or against it, let one be placed up; this object will be the meridian mark, and will always serve at any future time. To find the time, the meridian being thus previously known by equal altitudes of the sun (or star), and determined by the meridian mark made at a distance, or by the cavities in the base to set the screw in: Place the equatorial accordingly, and level the horizontal circle EF by the spirit-levels thereon. Set the semicircle AB to the latitude of the place, and the index of the sights OP to the declination of the sun, found by the ephemerides, as before directed. Turn the semicircle D till the sight holes are accurately directed to the sun, when the number on the hour-circle MN will show the time. It may easily be known when the sun's rays are direct through, by the spot falling on the lower interceptors of the marks across the hole at O. See the figure S adjoining.

The adjustments of this equatorial dial are to be made from the following trials. 1st, To adjust the levels LL on EF: Place the O of any of the divisions on EF to the middle mark or stroke on the number at N: bring the air-bubbles in the levels in the centres of each case, by turning the several screws at IGH: this being exactly done, turn the circle EF to 90° or half round: if the bubble of the air then remains in the centre, they are right, and properly adjusted for use; but if they are not, you make them so by turning the necessary screws placed for that purpose at the ends of the level-cases by means of a turn-screw, when you bring them to that fixed position, that they will remain when the plate EF is turned half round. 2dly, To adjust the line of sight OP: Set the number on the declination arch D, the number on the hour-circle to VI, and the number on the semicircle AB to 90°. Direct to some part of the horizon where there may be a variety of fixed objects. Level the horizontal circle EF by the levels LL, and observe any object that may appear on the centre of the cross wires. Reverse the semicircle AB, viz. so that the opposite 90° of it be applied to the number, observing particularly that the other number preserve their situation. If then the remote object formerly viewed still continues in the centre of the cross wires, the line of sight OP is truly adjusted; but if not, unscrew the two screws of the frame carrying the cross wires, and move the frame till the intersection appears against another or new object, which is half way between the first and that which the wires were against on the reverse. Return the semicircle AB to its former position; when, if the intersection of the wires be found to be against the half-way object, and that to which they were last divided, the line of sight is adjusted: if not, the operation of observing the interval of the two objects, and applying half way, must be repeated. It is necessary to observe, that one of the wires should be in the plane of the declination circle, and the other wire at right angles; the frame containing the wires is made to shift for that purpose.

The hole at P which forms the sun's spot is also to be adjusted by directing the sight to the sun, that the centre of the shadow of the cross hairs may fall exactly on the upper hole; the lower frame with the hole is then to be moved till the spot falls exactly on the lower sight-hole.

Lastly, it is generally necessary to find the correction always, to be applied to the observations by the semicircle of altitude AB. Set the number to O on the declination arch D, and the number on XII on the equator or hour-circle: Turn the sight to any fixed and distinct object, by moving the arch AB, the circle EF only: Note the degree and minute of the angle of altitude or depression: Reverse the declination semi-circle,
Dialling.

To take the altitude of the sun by this dial, and with the declination thereby to find the latitude of the place. Place a common pin $P$ in the hole $h$, projecting in the side of the meridian where the quadrant of altitude is; then bring the centre mark of the sliding piece $H$ to the $0$ or middle of the two divisions of latitude on the other side, and turn the pin towards the sun till it cuts a shadow over the degree of the quadrant of altitude; then what degree the shadow cuts is the altitude. Thus, in fig. 22, the shadow $Ag$ appears to cut 33°, the altitude of the sun.

The sun's declination is found by moving the cursor in the sliding piece till the mark across the hole stands just against the day of the month; then, by turning to the other side of the bridge, the mark will stand against the sun's declination.

In order to find the altitude of the place, observe that the latitude and the declination be the same, viz. both north or south; subtract the declination from the meridian or greatest daily altitude of the sun, and the remainder is the complement of the latitude; which subtracted from 90°, leaves the latitude.

Example.

| The meridian altitude may be | 57 48 |
| The sun's declination for the day | 19 18 |
| Complement of latitude | 38 30 |
| The latitude | 51 30 |

But if the latitude and declination be contrary, add them together, and the sum is the complement of the latitude. This dial is sometimes mounted on a stand, with a compass, two spirit levels, and adjusting screws, &c. &c. (see fig. 23.), by which it is rendered more useful and convenient for finding the sun's azimuth, altitudes, variation of the needle, declinations of planes, &c. &c.

An Universal Dial on a plain cross, is described by Mr. Ferguson. It is moveable on a joint $C$, for elevating it to any given latitude on the quadrant $C$ or $90°$, Fig. 24, 25, as it stands upon the horizontal board $A$. The arms $a$ of the cross stand at right angles to the middle part; and the top of it from $a$ to $n$, is of equal length with either of the arms $m$ or $m$. See fig. 24.

This dial is rectified by setting the middle line $t$ to the latitude of the place on the quadrant, the board $A$, and the point $N$ northward by the needle; thus, the plane of the cross will be parallel to the plane of the equator. Then, from III o'clock in the morning till $VI$, the upper edge $kl$ of the arm $io$ will cast a shadow on the time of the day on the side of the arm $cm$; from $VI$ till $IX$, the lower edge $i$ of the arm $io$ will cast a shadow on the hours on the side $oq$; from $IX$ in the morning to $XII$ at noon, the edge $ab$ of the top part $aw$ will cast a shadow on the hours on the arm $wef$; from $XII$ to $III$ in the afternoon, the edge $cd$ of the top part will cast a shadow on the hours on the arm $km$; from $III$ to $VI$ in the evening the edge $gh$ will cast a shadow on the hours on the part $pq$; and from $VI$ till $IX$, the shadow of the
the edge ef will show the time on the top part an. The breadth of each part, ab, ef, &c. must be so great, as never to let the shadow fall quite without the part or arm on which the hours are marked, when the sun is at his greatest declination from the equator.

To determine the breadth of the sides of the arms which contain the hours, so as to be in just proportion to their length; make an angle ABC (fig. 25.) of 23½ degrees, which is equal to the sun's greatest declination; and suppose the length of each arm, from the side of the long middle part, and also the length of the top part above the arms, to be equal to B d. Then, as the edges of the shadow, from each of the arms, will be parallel to B e, making an angle of 23½ degrees with the side B d of the arm, when the sun's declination is 23½; it is plain, that if the length of the arm be B d, the least breadth that it can have, to keep the edge B e of the shadow B e g d from going off the side of the arm d e, before it comes to the end of it e d, must be equal to e d or d B. But in order to keep the shadow within the quarter divisions of the hours, when it comes near the end of the arm, the breadth of it should be still greater, so as to be almost doubled, on account of the distance between the tips of the arms.

The hours may be placed on the arms, by laying down the cross a b e d (fig. 26.) on a sheet of paper; and with a black lead pencil held close to it, drawing its shape and size on the paper. Then take the length a e in the compasses, and with one foot in the corner a, describe with the other the quadrant e f. Divide this arc into six equal parts, and through the points of division draw right lines a g, e b, &c. continuing three of them to the arm a e, which are all that can fall upon it; and they will meet the arm in those points through which the lines that divide the hours from each other, as in fig. 24, are to be drawn right across it. Divide each arm, for the three hours contained in it, in the same manner; and set the hours to their proper places, on the sides of the arms, as they are marked in fig. 33. Each of the hour spaces should be divided into four equal parts, for the half hours and quarters, in the quadrant e f; and right lines should be drawn through these division-marks in the quadrant, to the arms of the cross, in order to determine the places thereon where the subdivisions of the hours must be marked.

This is a very simple kind of universal dial; it is easily made, and has a pretty uncommon appearance in a garden.

Fig. 27. is called an Universal Mechanical Dial, as by its equinoctial circle an easy method is had of describing a dial on any kind of plane. For example: suppose a dial is required on an horizontal plane. If the plane be immovable, as ABCD (fig. 27.), find a meridian line as GF; or if moveable, assume the meridian at pleasure: then by means of the triangle KEF, whose base is applied on the meridian line, raise the equinoctial dial H till the index GI becomes parallel to the axis of the earth, (which is so, if the angle KEF be equal to the elevation of the pole), and the 12 o'clock line on the dial hand over the meridian line of the plane or the base of the triangle. If then, in the night time or a darkened place, a lighted candle be successively applied to the axis GI, so as the shadow of the index or stile GI falls upon one hour-line after another, the same shadow will mark out the several hour-lines on the plane ABCD. Noting the points therefore on the shadow, draw lines through them to G; then an index being fixed on G, according to the angle IGF, its shadow will point out the several hours by the light of the sun. If a dial were required on a vertical plane, having raised the equinoctial circle as directed, push forward the index GI till the tip thereof I touch the plane. If the plane be inclined to the horizon, the elevation of the pole should be found on the same; and the angle of the triangle KEF should be made equal thereto.

Mr Ferguson describes a method of making three Dials on three different planes, so that they may show the time of the day by one gnomon. On the flat board ABC (fig. 28.), describe an horizontal dial, with its gnomon FGH; the angle of the shadow of which shows the time of the day. To this horizontal board join the upright board EDC, touching the edge GH of the gnomon; then making the top of the gnomon at G the centre of the vertical south dial, describe it on the board EDC. Besides, on a circular plate IK, describe an equinoctial dial, and by a slit c d in the XI o'clock line from the edge to the centre, put it on the gnomon EG as far as the slit will admit. The same gnomon will show the same hour on each of these dials.

An Universal Dial, showing the hours of the day by a terrestrial globe, and by the shadows of several gnomons, at the same time; together with all the places of the earth which are then enlightened by the sun; and those to which the sun is then rising, or on the meridian, or setting. This dial is made of a thick square piece of wood, or hollow metal. The sides are cut into semicircular hollows, in which the hours are placed; the stile of each hollow coming out from the bottom thereof, as far as the ends of the hollows project. The corners are cut out into angles; in the insides of which the hours are also marked; and the edge of the end of each side of the angle serves as a stile for casting a shadow on the hours marked on the other side.

In the middle of the uppermost side, or plane, there is an equinoctial dial; in the centre whereof an upright wire is fixed, for casting a shadow on the hours of that dial, and supporting a small terrestrial globe on its top.

The whole dial stands on a pillar in the middle of a round horizontal board, in which there is a compass and magnetic needle, for placing the meridian stile toward the south. The pillar has a joint with a quadrant upon it, divided into 90 degrees (supposed to be hid from sight under the dial in the figure) for setting it to the latitude of any given place.

The equator of the globe is divided into 24 equal parts, and the hours are laid down upon it at these parts. The time of the day may be known by these hours, when the sun shines upon the globe.

To rectify and use this dial, set it on a level table, or sole of a window, where the sun shines, placing the meridian stile due south, by means of the needle; which will be, when the needle points as far from the north fleur-de-lis towards the west, as it declines westward, at your place. Then bend the pillar in the joint, till the
black line on the pillar comes to the latitude of your place in the quadrant.

The machine being thus rectified, the plane of its dial part will be parallel to the equator, the wire or axis that supports the globe will be parallel to the earth's axis, and the north pole of the globe will point toward the north pole of the heavens.

The same hour will then be shown in several of the hollows, by the ends of the shadows of their respective stiles; the axis of the globe will cast a shadow on the same hour of the day, in the equinoctial dial, in the centre of which it is placed, from the 20th of March to the 23rd of September: and if the meridian of your place on the globe be set even with the meridian stile, all the parts of the globe that the sun shines upon will answer to those places of the real earth which are then enlightened by the sun. The places where the shade is just coming upon the globe answer to all those places of the earth to which the sun is then setting; as the places where it is going off, and the light coming on, answer to all the places of the earth where the sun is then rising. And lastly, if the hour of II be marked on the equator of the place (as it is marked on the meridian of London in the figure), the division of the light and shadow on the globe will show the time of the day.

The northern stile of the dial (opposite to the southern or meridian one) is hid from the sight in the figure, by the axis of the globe. The hours in the hollow to which that stile belongs are also supposed to be hid by the oblique view of the figure; but they are the same as the hours in the front hollow. Those also in the right and left hand semicircular hollows are mostly hid from sight; and so also are all those on the sides next the eye of the four acute angles.

The construction of this dial is as follows:

On a thick square piece of wood, or metal, draw the lines a c and b d, fig. 17, as far from each other as you intend for the thickness of the stile a b c d; and in the same manner draw the like thickness of the other three stiles e f g h, i k l m, and n o p q, all standing outright as from the centre.

With any convenient opening of the compasses, as n A, (so as to have proper strength of stuff when KL is equal to n A), set one foot on c as a centre, and with the other foot describe the quadrant arc A c. Then, without altering the compasses, set one foot on b as a centre, and with the other foot describe the quadrant d B. All the other quadrants in the figure must be described in the same manner, and with the same opening of the compasses, on their centres e f i k, and n o; and each quadrant divided into six equal parts, for as many hours, as in the figure; each of which parts must be subdivided into 4, for the half hours and quarters.

At equal distances from each corner, draw the right lines I p and K p, I q and M q, N r and O r, P s, and Q s; to form the four angular hollows I p K, L q M, N r O, and P s Q; making the distances between the tips of these hollows, as l K, L M, N O, and P Q, equal to the radius of the quadrants; and leaving sufficient room within the angular points p q r and s, for the equinoctial in the middle.

To divide the inside of these angles properly for the hour spaces thereon, take the following method.
DIALLING.

ports the globe at top, shows the time of the day, in the middle or equinoctial line, all the summer half-year, when the sun is on the north side of the equator.

Having shown how to make sun-dials by the assistance of a good globe, or of a dialling scale, we shall now proceed to the method of constructing dials arithmetically; which will be more agreeable to those who have learned the elements of trigonometry, because globes and scales can never be so accurate as the logarithms in finding the angular distance of the hours. Yet as a globe may be found exact enough for some other requisites in dialling, we shall take it occasionally.

The construction of sun-dials on all planes whatever may be included in one general rule; intelligible, if that of a horizontal dial for any given latitude be well understood. For there is no plane, however obliquely situated with respect to any given place, but what is parallel to the horizon of some other place; and therefore, if we can find that other place by a problem on the terrestrial globe, or by a trigonometrical calculation, and construct a horizontal dial for it, that dial applied to the plane where it is to serve will be a true dial for that place. Thus, an erect direct south dial in $51^2$ degrees north latitude, would be a horizontal dial on the same meridian, 90 degrees southward of $51^2$ degrees of north latitude. But if the upright plane declines from facing the south at the given place, it would still be a horizontal plane 90 degrees from that plane, but for a different longitude, which would alter the reckoning of the hours accordingly.

CASE I. 1. Let us suppose that an upright plane at London declines 36 degrees westward from facing the south, and that it is required to find a place on the globe to whose horizon the said plane is parallel; and also the difference of longitude between London and that place.

Rectify the globe to the latitude of London, and bring London to the zenith under the brass meridian; then that point of the globe which lies in the horizon at the given degree of declination (counted westward from the south point of the horizon) is the place at which the above-mentioned plane would be horizontal.

Now, to find the latitude and longitude of that place keep your eye upon the place, and turn the globe eastward until it comes under the graduated edge of the brass meridian; then the degree of the brass meridian that stands directly over the place in its latitude, and the number of degrees in the equator, which are intercepted between the meridian of London and the brass meridian, is the place’s difference of longitude.

Thus, as the latitude of London is $51^2$ degrees north, and the declination of the place is 36 degrees west; elevate the north pole $51^2$ degrees above the horizon, and turn the globe until London comes to the zenith, or under the graduated edge of the meridian; then count 36 degrees on the horizon westward from the south point, and make a mark on that place of the globe over which the reckoning ends, and bringing the mark under the graduated edge of the brass meridian, it will be found to be under $30^2$ degrees in south latitude; keeping it there, count in the equator the number of degrees between the meridian of London and the brass meridian (which now becomes the meridian of the required place), and you will find it to be $42^2$.

Therefore an upright plane at London, declining 36 degrees westward from the south, would be a horizontal plane at that place, whose latitude is $30^2$ degrees south of the equator, and longitude $42^2$ degrees west of the meridian of London.

Which difference of longitude being converted into time, is 2 hours 51 minutes.

The vertical dial declining westward 36 degrees at London, is therefore to be drawn in all respects as a horizontal dial for south latitude $30^2$ degrees; save only that the reckoning on the hours is to anticipate the reckoning on the horizontal dial by 2 hours 51 minutes; for so much sooner will the sun come to the meridian of London, than to the meridian of any place whose longitude is $42^2$ degrees west of London.

2. But to be more exact than the globe will show us, we shall use a little trigonometry.

Let NESW (fig. 12.) be the horizon of London, whose zenith is $Z$, and $P$ the north pole of the sphere; and let $ZA$ be the position of a vertical plane at $Z$, declining westward from $S$ (the south) by an angle of 36 degrees; on which plane an erect dial for London at $Z$ is to be described. Make the semidiameter $ZD$ perpendicular to $ZA$; and it will cut the horizon in $D$, 36 degrees west of the south $S$. Then a plane, on the tangent $HD$, touching the sphere in $D$, will be parallel to the plane $ZA$; and the axis of the sphere will be equally inclined to both these planes.

Let $WQ$ be the equinoctial, whose elevation above the horizon of $Z$ (London) is $38^2$ degrees; and $PR$ be the meridian of the place $D$, cutting the equinoctial in $R$. Then it is evident, that the arc $RD$ is the latitude of the place $D$ (where the plane $KA$ would be horizontal) and the arc $RQ$ is the difference of longitude of the plane $ZA$ and $DH$.

In the spherical triangle $WDR$, the arc $WD$ is given, for it is the complement of the plane’s declination from $S$ to south; which complement is $54^2$ (viz. $90^0-36^0$); the angle at $R$, in which the meridian of the place $D$ cuts the equator, is a right angle; and the angle $RWD$ measures the elevation of the equinoctial above the horizon of $Z$, namely $38^2$ degrees. Say therefore, as radius is to the co-sine of the plane’s declination from the south, so is the co-sine of the latitude of $Z$ to the sine of $RD$ the latitude of $D$; which is of a different denomination from the latitude of $Z$, because $Z$ and $D$ are on different sides of the equator.

As radius $\quad -\quad -\quad 1.00000$  
To co-sine $36^2, \sigma = RQ\quad 9.90796$  
So co-sine $51^2, 30^2 = QZ\quad 9.79415$  
To sine $30^2, 14^2 = DR\quad (9.70211) = \text{the latitude of } D,$  
whose horizon is parallel to the vertical plane $ZA$ at $Z$.

N. B. When radius is made the first term, it may be omitted; and then by subtracting it mentally from the sum of the other two, the operation will be shortened. Thus, in the present case,
DIA LLING.

To the logarithmic sine of \(WR = \circ \quad 54^\circ \quad 0' \quad 9.90796\)
Add the logarithmic sine of \(RD = \circ \quad 38^\circ \quad 30' \quad 9.79415\)

Their sum = radius \(= \quad 9.70211\)

gives the same solution as above. And we shall keep to this method in the following part of this article.

To find the difference of longitude of the places D and Z, say, As radius is to the co-sine of 38\(\frac{3}{4}\) degrees, the height of the equinoctial at Z, so is the co-tangent of 36 degrees, the plane's declination, to the co-tangent of the difference of longitudes. Thus,

To the logarithmic sine of \(\frac{\circ}{2} \quad 51^\circ \quad 30'\) \(= 9.89354\)
Add the logarithmic tang. of \(\frac{\circ}{9} \quad 54' \quad 0'\) \(= 10.13874\)

Their sum = radius \(= 10.03228\)

is the nearest tangent of 49\(\frac{9}{10}\) \(8' = WR\): which is the co-tangent of 42\(\frac{3}{4}\) \(52' = RQ\), the difference of longitude sought. Which difference, being reduced to time, is 2 hours 52\(\frac{3}{4}\) minutes.

3. And thus having found the exact latitude and longitude of the place D, to whose horizon the vertical plane at Z is parallel, we shall proceed to the construction of a horizontal plane for the place D, whose latitude is 38\(\frac{3}{4}\) \(4'\) south; but anticipating the time at D by 2 hours 52\(\frac{3}{4}\) minutes (neglecting the \(\frac{3}{4}\) minute in practice), because D is so far westward in longitude from the meridian of London; and this will be a true vertical dial at London, declining westward 36 degrees.

Fig. 13.

Assume any right line CSL (fig. 13.) for the subtile of the dial, and make the angle KCP equal to the latitude of the place (viz. \(30^\circ \quad 14'\)), to whose horizon the plane of the dial is parallel; then CRP will be the axis of the stil, or edge that casts the shadow on the hours of the day, in the dial. This done, draw the contingent line EQ, cutting the subtilar line at right angles in K; and from K make KR perpendicular to the axis CRP. Then KG \(= KR\) being made radius, that is, equal to the chord of 60\(\circ\) or tangent of 43\(\circ\) on a good sector, take 42\(\frac{3}{4}\) \(52'\) (the difference of longitude of the places Z and D) from the tangents, and having set it from K to M, draw CM for the hour-line of XIL. Take KN, equal to the tangent of an angle less by 15 degrees than KM; that is, the tangent of 27\(\frac{1}{2}\) \(52'\); and through the point N draw CN for the hour-line of I. The tangent of 12\(\circ\) \(52'\) \((\quad \frac{15}{30}\) \(42'\), set off the same way, will give a point between K and N, through which the hour-line of II is to be drawn. The tangent of 2\(\circ\) \(8'\) \((\quad \frac{15}{30}\) \(43'\)) placed on the other side of CL, will determine the point through which the hour-line of III is to be drawn: to which 2\(\circ\) \(8'\), if the tangent of 15\(\circ\) be added, it will make 15\(\circ\) \(8'\); and this set off from K towards Q on the line EQ, will give the point for the hour-line of IV; and so of the rest. The foregoing hour-lines are drawn in the same way, by the continual addition of the tangents of 13\(\circ\), 30\(\circ\), 45\(\circ\), \&c. to 4\(\circ\) \(52'\) \((=\quad \frac{36}{15}\) \(30'\)) for the hours of XI, XII, \&c. as far as necessary; that is, until there be five hours on each side of the subtile. The sixth hour, counted from that hour or part of the hour on which the subtile falls, will be always in a line perpendicular to the subtile, and drawn through the centre C.

4. In all erect dials, CM, the hour-line of XII, is perpendicular to the horizon of the place for which the dial is to serve; for that line is the intersection of a vertical plane with the plane of the meridian of the place, both which are perpendicular to the plane of the horizon: and any line HO or \(\angle \phi\), perpendicular to CM, will be a horizontal line on the plane of the dial, along which line the hours may be numbered; and CM being set perpendicular to the horizon, the dial will have its true position.

5. If the plane of the dial had declined by an equal angle towards the east, its description would have differed only in this, that the hour-line of XII would have fallen on the other side of the subtile CL, and the line HO would have a subcontrary position to what it has in this figure.

6. And these two dials, with the upper points of their stiles turned toward the north pole, will serve for other two planes parallel to them; the one declining from the north toward the east, and the other from the north toward the west, by the same quantity of angle. The like holds true of all dials in general, whatever be their declination and obliquity of their planes to the horizon.

Case II. 7. If the plane of the dial not only declines, but also reclines, or inclines. Suppose its declination from fronting the south to the arc SD on the horizon; and its inclination be equal to the arc d of the vertical circle DZ: then it is plain, that if the quadrant of altitude Z d D on the globe cuts the point D in the horizon, and the inclination is counted upon the quadrant from D to d: the intersection of the hour-circle PR d, with the equinoctial WQE, will determine R d, the latitude of the place d, whose horizon is parallel to the given plane Z A at Z; and RQ will be the difference in longitude of the places at d and Z.

Trigonometrically this: Let a great circle pass through the three points, W, d, E; and in the triangle Wd d, right-angled at D, the sides WD and D d are given; and thence the angle DW d is found, and so is the hypothenuse Wd. Again, the difference, or the sum, of DW d and DWR, the elevation of the equinoctial above the horizon of Z, gives the angle d WR; and the hypothenuse of the triangle WR d was just now found; whence the sides R d and WR are found, the former being the latitude of the place d, and the latter the complement of RQ, the difference of longitude sought.

Thus, if the latitude of the place Z be 52\(\frac{3}{4}\) \(10'\) north; the declination SD of the plane Z A (which would be horizontal at d) be 36\(\circ\), and the inclination be 15\(\circ\), or equal to the arc d D; the south latitude of the place d, that is, the arc RA d will be 15\(\circ\) \(9'\); and RQ the difference

* The co-sine of 36\(\circ\), or of RQ.  † The co-sine of 51\(\frac{3}{4}\), or of QZ.  ‡ The co-sine of 38\(\circ\), or of WDR.  § The co-tangent of 36\(\circ\), or of DW.
DIALLING.

Fig. 15.

The difference of the longitude, 36° 2′. From these data, therefore, let the dial (fig. 15.) be described, as in the former example.

8. There are several other things requisite in the practice of dialling; the chief of which shall be given in the form of arithmetical rules, simple and easy to those who have learned the elements of trigonometry. For in practical arts of this kind, arithmetical should be used as far as it can go; and scales never trusted to, except in the final construction, where they are absolutely necessary in laying down the calculated hour-differences on the plane of the dial.

Rule I. To find the angles which the hour-lines on any dial make with the subtise. To the logarithmic sine of the given latitude, or of the stile’s elevation above the plane of the dial, add the logarithmic tangent of the hour (*) distance from the meridian, or from the (+) subtise; and the sum minus radius will be the logarithmic tangent of the angle sought.

For KC (fig. 15.) is to KM in the ratio compounded of the ratio of KC to KG (= KR) and of KG to KN; if the making CK the radius 10,000,000, or 10,000, or 10, or 1, are the ratio of 10,000,000, or of 10,000, or of 10, or of 1, to KG×KM.

Thus, in a horizontal dial, for latitude 51° 30′, to find the angular distance of XI in the forenoon, or I in the afternoon, from XII.

To the logarithmic sine of 51° 30′ 9.89354 2
Add the logarithmic tang. of 51° 30′ 9.42885 5
The sum —— radius is 9.32419 = the logarithmic tangent of 11° 50′, or of the angle which the hour-line of XI or I makes with the hour of XII.

And by computing in this manner, with the sines of the latitude, and the tangents of 30°, 45°, 60°, and 75°, for the hours of II, III, IIII, and V in the afternoon; or of X, IX, VIII, and VII in the forenoon; you will find their angular distances from XII to be 24° 18′, 38° 3′, 53° 35′, and 71° 6′; which are all that there is occasion to compute for. And these distances may be set off from XII by lines of chords; or rather, by taking 1000 from a scale of equal parts, and setting that extent as a radius from C to XII, and then, taking 209 of the same parts (which are the natural tangent of 11° 50′), and setting them from XII to XI and I, on the line h c, which is perpendicular to C XII; and so for the rest of the hour-lines, which, in the table of natural tangents, against the above distances, are 431, 782, 1355, and 2922, of such equal parts from XII, as the radius C XII contains 1000. And lastly, set off 1257 (the natural tangent of 51° 30′) for the angle of the stile’s height, which is equal to the latitude of the place.

Rule II. The latitude of the place, the sun’s declination, and his hour distance from the meridian, being given, to find (1.) his altitude, (2.) his azimuth. (1.) Let d (fig. 14.) be the sun’s place, d R his declination; and in the triangle PZd, Pd, the sum, or the difference, of d R, and the quadrant PR, being given by the supposition, as also the complement of the latitude PZ, and the angle d PZ, which measures the hourary distance of d from the meridian; we shall (by Case 4. of Keill’s Oblique Spheric Trigonometry) find the base Z d, which is the sun’s distance from the zenith, or the complement of his altitude.

And (2.) as sine Z d sine P Z P : d Z P, or of its supplement D Z S, the azimuthal distance from the south.

Or the practical rule may be as follows:

Write A for the sine of the sun’s altitude, L and l for the sine and co-sine of the latitude, D and d for the sine and co-sine of the sun’s declination, and H for the sine of the horary distance from VI.

Then the relation of H to A will have three varieties.

1. When the declination is toward the elevated pole, and the hour of the day is between XII and VI; it is

\[ A = L + D + H \]

2. When the hour is after VI, it is

\[ A = L - D - H \]

3. When the declination is toward the depressed pole, we have

\[ A = H + L - D \]

Which theorems will be found useful, and expeditious enough for solving those problems in geography and dialling which depend on the relations of the sun’s altitude to the hour of the day.

Example I. Suppose the latitude of the place to be 31° 9′; then take 4 hours distant from XII, that is, an hour after VI in the morning, or before VI in the evening; and the sun’s declination 20° north. Required the sun’s altitude?

Then to log. L=log. sin. 51° 30′ 1.89354**
add log. D=log. sin. 20° 9′ 1.33495
Their sum 1.42779 gives

\[ L = \text{logarithm of } 0.267664, \text{in the natural sines}. \]

(*) That is, of 15, 30, 45, 60, 75°, for the hours of I, II, III, IIII, and V, in the afternoon; and XI, X, IX, VIII, VII, in the forenoon.

(‡) In all horizontal dials and erect north or south dials, the subtise and meridian are the same; but in all declining dials the subtise line makes an angle with the meridian.

(1) In which case the radius CK is supposed to be divided into 10,000 equal parts.

** Here we consider the radius as unity, and not 10,000; but which, instead of the index 9, we have —— as above; which is of no farther use than making the work a little easier.

Vol. VII. Part I. D d
DIALLING.

The declination, inclination, and rection of planes, are frequently taken with a sufficient degree of accuracy by an instrument called a declinometer.

The construction of this instrument is as follows: On a mahogany board ABK, (fig. 34.) is inserted a CLXXIV. semicircular arch AGEB of ivory or box-wood, divided into two quadrants of 90° each, beginning from the middle G. On the centre C turns a vertical quadrant DFE divided into 90°, beginning from the base E; on which is a moveable index CF, with a small hole at F for the sun's rays to pass through, and form a spot on a mark at C. The lower extremity of the quadrant at E is pointed, to mark the linear direction of the quadrant when applied to any other plane; as this quadrant takes off occasionally, and a plumb-line P hangs at the centre on C, for taking the inclinations and rections of planes. At H, on the plane of the board, is inserted a compass of points and degrees, with a magnetical needle turning on a pivot over it. The addition of the moveable quadrant and index considerably extends the utility of the declinometer, by rendering it convenient for taking equal altitudes of the sun, the sun's altitude and bearing, at the same time, &c.

To apply this instrument in taking the declination: To take by of a wall or plane: Place the side ACB in a horizontal direction to the plane proposed, and observe what degree or point of the compass the N part of the needle stands over from the north or the south, and it will be the meridian line of the plane from the north or south accordingly. In this case allowance must be made for the variation of the needle (if any) at the place; and which, if not previously known, will render this operation very inaccurate. At London it is now 20° 30' to the west.

Another way more exact may be used, when the sun shines out half an hour before noon. The side ACB being placed against the plane, the quadrant must be so moved on the semicircle AGB, and the index CF on DE, till the sun's rays passing through the hole at F fall exactly on the mark at G, and continued so till the sun requires the index to be raised no higher: you will then have the meridian or greatest altitude of the sun; and the angle contained between G and E will be the declination required. The position of CE is the meridian or 12 o'clock line. But the most exact way for taking the declination of a plane, or finding a meridian line, by this instrument, is, in the forenoon, about two or three hours before 12 o'clock, to observe two or three heights or altitudes EF of the sun; and at the same time the respective angular polar distance GE from G: write them down; and in the afternoon watch for the same, or one of the same altitudes, and mark the angular distances or distance on the quadrant AG. Now, the division or degree exactly between the two noted angular distances will be the true meridian, and the distance at which it may fall from the C of the divisions at G will be the declination of the plane. The reason for observing two

Their sum 1.18014 gives

H / d = logarithm of 0.111408, in the natural sines.

And these two numbers (0.267664 and 0.111408) make 0.419072 = A; which, in the table, is the nearest natural sine of 24° 47', the sun's altitude sought.

The same hour distance being assumed on the other side of VI, then LD - H / d = 0.116246, the sine of 6° 40', which is the sun's altitude at V in the morning, or VII in the evening, when his north declination is 20°.

But when the declination is 20° south (or towards the depressed pole) the difference H / d - LD becomes negative; and thereby shows, that an hour before VI in the morning, or past VII in the evening, the sun's centre is 6° 40' below the horizon.

Examp. 2. From the same data, to find the sun's azimuth. If H, L, and D, are given, then (by par. 2. of Rule II.) from H having found the altitude and its complement Z d; and the arc P d (the distance from the pole) being given; say, as the co-sine of the altitude is to the sine of the distance from the pole, so is the sine of the hour-distance from the meridian to the sine of the azimuth distance from the meridian.

Let the latitude be 51° 30' north, the declination 15° south, and the time 11 h. 24 m. in the afternoon, when the sun begins to illuminate a vertical wall, and it is required to find the position of the wall.

Then, by the foregoing theorems, the complement of the altitude will be 81° 32', and P d the distance from the pole being 105° 5', and the horary distance from the meridian, or the angle d PZ, 36°,

To log. sin. 74° 31' - - 1.98464
Add log. sin. 36° 0' - - 1.76932

And from the sum - - 3.75396
Take the log. sin. 81° 32' - - 1.99525

Remains 1.75861 = log. sin. 35°, the azimuth distance sought:

When the altitude is given, find from thence the hour, and proceed as above.

This praxis is of singular use on many occasions:—in finding the declination of vertical planes more exactly than in the common way, especially if the transits of the sun's centre are observed by applying a ruler with sights, either plain or telescopical, to the wall or plane whose declination is required:—in drawing a meridian line, and finding the magnetic variation:—in finding the bearings of places in terrestrial surveys; the transits of the sun over any place, or his horizontal distance from it, being observed, together with the altitude and hour; and thence determining small differences of longitude:—in observing the variations at sea, &c.

†† The distance of one hour from VI.

‡‡ The co-latitude of the place.

†† The co-declination of the sun.
two or three altitudes and angles in the morning is,
that in case there should be clouds in the afternoon,
you may have the chance of one corresponding alti-
tude.

The quadrant occasionally takes off at C, in order
to place it on the surface of a pedestal or plane intended
for an horizontal dial; and thereby from equal alti-
tudes of the sun, as above, draw a meridian or 12
o'clock line to set the dial by.

The base ABK serves to take the inclination and
reclination of planes. In this case, the quadrant is
taken off, and the plummet P is fitted on a pin at the
centre C: then the side IGK being applied to the
plane proposed, as QL (fig. 35.) if the plumb-line cuts
the semicircle in the point G, the plane is horizontal;
or if it cut the quadrant in any point at S, then will
GCS be the angle of inclination. Lastly, if applying
the side ACG to the plane, the plummet cuts G, the
plane is vertical; or if it cuts either of the quadrants,
it is accordingly the angle of reclination. Hence, if
the quantity of the angle of inclination be compared
with the elevation of the pole and equator, it is easily
known whether the plane be inclined or reclined.

Of the double Horizontal Dial, and the Babylonian
and Italian Dials.

To the gnomonic projection, there is sometimes added a
stereographic projection of the hour-circles, and the
parallels of the sun's declination, on the same hori-
Zonal plane; the upright side of the gnomon being
sloped into an edge, standing perpendicular over the
centre of the projection; so that the dial, being in its
due position, the shadow of that perpendicular edge is
a vertical circle passing through the sun, in the stere-
ographic projection.

The moon being duly marked on this dial, the
sun's declination, and the length of the day at any
time, are had by inspection (as also his latitude, by
means of a scale of tangents). But its chief property
is, that it may be placed true, whenever the sun shines,
without the help of any other instrument.

Let d (fig. 14.) be the sun's place in the stereogra-
phic projection, x dy being the parallel of the sun's de-
clination, Z d a vertical circle through the sun's centre,
P d the hour-circle; and it is evident, that the diamete-
er NS of this projection being placed duly north and
south, these three circles will pass through the point
d. And therefore, to give the dial its due position,
we have only to turn its gnomon toward the sun, on a
horizontal plane, until the hour on the common gno-
omonic projection coincides with that marked by the
hour-circle P d, which passes through the intersection
of the shadow Z d with the circle of the sun's present
declination.

The Babylonian and Italian dials reckon the hours,
not from the meridian as with us, but from the sun's
rising and setting. Thus, in Italy, an hour before sun-
set is reckoned the 23rd hour; two hours before sun-
set the 22d hour; and so of the rest. And the shadow
that marks them on the hour-lines, is that of the point
of a stile. This occasions a perpetual variation be-
tween their dials and clocks, which they must correct
from time to time, before it arises to any sensible quan-
tity, by setting their clocks so much faster or slower.
And in Italy, they begin their day, and regulate their
clocks, not from sunset, but from about mid-twilight,
when the Ave-Maria is said; which corrects the dif-
fERENCE that would otherwise be between the clock and
the dial.

The improvements which have been made in all
sorts of instruments and machines for measuring time,
have rendered such dials of little account. Yet, as
the theory of them is ingenious, and they are really,
in some respects, the best contrived of any for vulgar
use, a general idea of their description may not be un-
acceptable.

Let fig. 16. represent an erect direct south wall, on
which a Babylonian dial is to be drawn, showing the
hours from sun-rising; the latitude of the place, whose
horizon is parallel to the wall, being equal to the angle
KCR. Make, as for a common dial, K = KR (which
is perpendicular to CR) the radius of the equinoctial
AEQ, and draw BS perpendicular to CK for the stile
of the dial; the shadow of whose point R is to mark
the hours, when SR is set upright on the plane of the
dial.

Then it is evident, that in the contingent line AEQ,
the spaces K 1, K 2, K 3, &c. being taken equal to
the tangents of the hour-distances from the meridian,
to the radius KG, one, two, three, &c. hours after
sun-rising, on the equinoctial day; the shadow of the
point R will be found, at these times, respectively
in the points 1, 2, 3, &c.

Draw, for the like hours after sun-rising, when the
sun is in the tropic of Capricorn $\gamma$, the like com-
mon lines CD, CE, CF, &c. and at these hours the
shadow of the point R will be found in those lipes re-
fpectively. Find the sun's altitudes above the plane
of the dial at these hours; and with their co-tangents
S d, S e, S f, &c. to radius SH, describe arcs intersect-
ing the hour-lines in the points d, e, f, &c. so shall the
right lines I d, I e, I f, &c. be the lines of I, II, III,
&c. hours after sun-rising.

The construction is the same in every other case;
due regard being had to the difference of longitude
of the place at which the dial would be horizontal, and
the place for which it is to serve; and likewise, taking
care to draw no lines but what are necessary; which
may be done partly by the rules already given for de-
termining the time that the sun shines on any plane;
and partly from this, that on the tropical days, the hy-
perbola described by the shadow of the point R limits
the extent of all the hour-lines.

Of the right placing of Dials, and having a true Meri-
dian Line for the regulating of Clocks and Watches.

The plane on which the dial is to rest being duly
prepared, and every thing necessary for fixing it, you
may find the hour tolerably exact by a large equinoctial
ring-dial, and set your watch to it. And then the
dial may be fixed by the watch at your leisure.

If you would be more exact, take the sun's altitude
by a good quadrant, noting the precise time of obser-
vation by a clock or watch. Then compute the time
for the altitude observed; and set the watch to agree
with that time, according to the sun. A Hadley's
quadrate is very convenient for this purpose: for by
it you may take the angle between the sun and his
image reflected from a bason of water; the half of
which angle, subtracting the refraction, is the altitude
required.
required. This is best done in summer; and the nearer the sun is to the prime vertical (the east or west azimuth) when the observation is made, so much the better.

Or, in summer, take two equal altitudes of the sun in the same day; one any time between 7 and 10 in the morning, the other between 2 and 5 in the afternoon; noting the moments of these two observations by a clock or watch: and if the watch shows the observations to be at equal distances from noon, it agrees exactly with the sun; if not, the watch must be corrected by half the difference of the forenoon and afternoon intervals; and then the dial may be set true by the watch.

Thus, for example, suppose you had taken the sun's altitude when it was 20 minutes past \( VII \) in the morning by the watch; and found, by observing in the afternoon, that the sun had the same altitude 10 minutes before III; then it is plain that the watch was 5 minutes too fast for the sun: for 5 minutes after \( XII \) is the middle time between \( VII \). 20 m. in the morning, and \( III \). 30 m. in the afternoon; and therefore, to make the watch agree with the sun, it must be set back five minutes.

A good meridian line, for regulating clocks or watches, may be had by the following method.

Make a round hole, almost a quarter of an inch diameter, in a thin plate of metal; and fix the plate in the top of a south window, in such a manner that it may recline from the zenith at an angle equal to the colatitude of your place, as nearly as you can guess: for then the plate will face the sun directly at noon on the equinoctial days. Let the sun shine freely through the hole into the room; and hang a plumb-line to the ceiling of the room, at least five or six feet from the window, in such a place as that the sun's rays, transmitted through the hole, may fall upon the line when it is noon by the clock; and having marked the said place on the ceiling, take away the line.

Having adjusted a sliding bar to a dovetail groove, in a piece of wood about 18 inches long, and fixed a hook into the middle of the bar, nail the wood to the above-mentioned place on the ceiling parallel to the side of the room in which the window is; the groove and the bar being towards the floor: Then hang the plumb-line upon the hook in the bar, the weight or plummet reaching almost to the floor; and the whole will be prepared for further and proper adjustment.

This done, find the true solar time by either of the two last methods, and thereby regulate your clock. Then, at the moment of the next noon by the clock, when the sun shines, move the sliding bar in the groove, until the shadow of the plumb-line bisects the image of the sun (made by his rays transmitted through the hole) on the floor, wall, or on a white screen placed on the north side of the room; the plummet or weight at the end of the line hanging freely in a pool of water placed below it on the floor.—But because this may not be quite correct for the first time, on account that the plummet will not settle immediately, even in water; it may be farther corrected on the following days, by the above method, with the sun and clock; and so brought to a very great exactness.

N.B. The rays transmitted through the hole will cast but a faint image of the sun, even on a white screen, unless the room be so darkened that no sunshine may be allowed to enter but what comes through the small hole in the plate. And always, for some time before the observation is made, the plummet ought to be immersed in a jar of water, where it may hang freely; by which means the line will soon become steady, which otherwise would be apt to continue swinging.

**Description of two New Instruments for facilitating the practice of Dialling.**

1. The **Dialling Sector**, contrived by the late Mr Benjamin Martin, is an instrument by which dials are drawn in a more easy, expeditious, and accurate manner. The principal lines on it are the line of latitudes and the line of hours (fig. 32). They are found on fig. 37. most of the common plane scales and sectors; but in a manner that greatly confines and diminishes their use; for the first, they are of a fixed length; and secondly, too small for any degree of accuracy. But in this new sector, the line of latitudes is laid down, as it is called, sectorwise, viz. one line of latitudes upon each leg of the sector, beginning in the centre of the joint, and diverging to the end (as upon other sectors), where the extremes of the two lines at 90° and 90° are nearly one inch apart, and their length 11½ inches: which length admits of great exactness; for at the 70th degree of latitude, the divisions are to quarters of a degree or 15 minutes. This accuracy of the division admits of a peculiar advantage, namely, that it may be equally communicated to any length from 1 to 23 inches, by taking the parallel distances (see fig. 33), viz. from 10 to 10, 20 to 20, 30 to 30, and so on, as is done in like cases on the lines of sines, tangents, &c. Hence its universal use for drawing dials of any proposed size. The line of hours for this end is adapted and placed contiguous to it on the sector, and to a size large enough for the very minutes to be distinct on the part where they are smallest, which is on each side of the hour of III.

From the construction of the line of hours before shown, the divisions on each side of the hour III are the same to each end, so that the hour-line properly is only a double line of three hours. Hence a line of 3 hours answers all the purposes of a line of 6, by taking the double extent of 3, which is the reason why upon the sector the line of hours extends only to 48.

To make use of the line of latitude and line of hours on the sector: As single scales only, they will be found more accurate than those placed on the common scales and sectors, in which the hours are usually subdivided but into 3 minutes, and the line of latitudes into whole degrees. But it is shown above how much more accurately these lines are divided on the dialling sector. As an example of the great exactness with which horizontal and other dials may be drawn by it, on account of this new sectored disposition of these scales, and how all the advantages of their great length are preserved in any lesser length of the \( FT \) o'clock line \( e \) and \( a \), (fig. 30): Apply either of the distances of \( ce \) or \( af \) to fig. 30, the line of latitude at the given latitude of London, suppose 51° 32' on one line to 51° 32' on the other, in the manner shown in fig. 5, and then taking all the hours, quarters,
DIALLING.

quarters, &c. from the hour scale by similar parallel extents, you apply them upon the lines e d and f b as before described.

As the hour-lines on the sector extend to but 45', the double distance of the hour 3, when used either singly or sectorally, must be taken, to be first applied from 51° 32' on the latitudes, to its contact on the XII o'clock line, before the several hours are laid off. The method of drawing a vertical north or south dial is perfectly the same as for the above horizontal one; only reversing the hours as in fig. 1, and making the angle of the stile's height equal to the complement of the latitude 38° 28'.

The method of drawing a vertical declining dial by the sector, is almost evident from what has already said in dialling. But more fully to comprehend the matter, it must be considered there will be a variation of particulars as follows: 1. Of the subtile or line over which the stile is to be placed; 2. The height of the stile above the plane; 3. The difference between the meridian of the place and that of the plane, or their difference of longitude. From the given latitude of the place, and declination of the plane, you calculate the three requisites just mentioned, as in the following example. Let it be required to make an erect south dial, declining from the meridian westward 28° 43', in the latitude of London 51° 32'. The first thing to be found is the distance of the subtile line GB (fig. 31.) from the meridian of the plane G XII. The analogy from this is: As radius is to the sine of the declination, so is the co-tangent of the latitude to the tangent of the distance sought, viz. As radius: 28° 43': tan. 38° 28': tangent 20° 35'. This and the following analogy may be as accurately worked on the Gunter's line of sines, tangents, &c. properly placed on the sector, as by the common way from logarithms. Next, to find the plane's difference of longitude. As the sine of the latitude is to radius, so is the tangent of the declination to the tangent of the difference of longitude, viz. As s 51° 32': radius:: tan. 28° 43': tan. 35° 0'. Lastly, to find the height of the stile: As radius is to the co-sine of the latitude, so is the co-sine of the declination to the sine of the stile's height, viz. Radius: s 38° 28'::: cos 65° 17': s 35° 0'.

The three requisites thus obtained, the dial is drawn in the following manner: Upon the meridian line G XII, with any radius GC describe the arch of a circle, upon which set off 28° 43' from C to B, and draw GB, which will be the subtile line, over which the stile of the dial must be placed.

At right angles to this line GB, draw AQ indefinitely through the point G: then from the scale of latitude take the height of the stile 33° 5', and set it each way from G to A and Q. Lastly, take the double length of 3 on the hour-line in your compasses, and setting one foot at A or Q, with the other foot mark the line GB in D, and join ADQD, and then the triangle ADQ is completed on the subtile GB.

To lay off the hours, the plane's difference of longitude being 35°, equal to 2 h. 20 min. in time, allowing 15° to an hour, so that there will be 2 h. 20' between the point D, and the meridian G XII, in the line AD. Therefore, take the first 20' of the hour-scale in your compasses, and set off from D to 2; then take 1 h. 20', and set off from D to 1; 2 h. 20', and set off from D to 12; 3 h. 20', from D to 11; 4 h. 20' from D to 10; and 5 h. 20' from D to 9, which will be 40' from A.

Then, on the other side of the subtile line GB, you take 40' from the beginning of the scale, and set off from D to 3 then take 1 h. 40', and set off from D to 4; also 2 h. 40', and set off from D to 5; and so on to 8, which will be 20' from Q. Then from G the centre, through the several points 2, 1, 12, 11, 10, 9, on one side, and 3, 4, 5, 6, 7, 8, on the other, you draw the hour-lines, as in the figure they appear. The hour of VIII need only be drawn for the morning; for the sun goes off from this west decliner 20' before VIII in the evening. The quarters, &c. are all set off in the same manner from the hour-scale as the above hours were.

The next thing is fixing the stile or gnomon, which is always placed in the subtile line GB, and which is already drawn. The stile above the plane has been found to be 33° 5'; therefore with any radius GB describe an obscure arch, upon which set off 33° 5' from B to S, and draw GS, and the angle SGB will be the true height of the gnomon above the subtile GB.

II. The DIALLING TRIGON is another new instrument of great utility in the practice of dialling, and was also contrived by the late Mr. Martin. It is composed of two graduated scales and a plane one. On the scale AB (fig. 36.) is graduated the line of latitudes; and on Fig. 36. the scale AC, the line of hours: these properly conjoined with the plane scale BD, as shown in the figure, truly represent the gnomonical triangle, and properly called a dialling trigon. The hour-scale AC is here of its full length; so that the hours, halves, quarters, &c. and every single minute (if required) may be immediately set off by a steel point; and from what has before been observed in regard to the sector, it must appear that this method by the trigon is the most expeditious way of drawing dials that any mechanism of this sort can afford. As an example of the application of the trigon in the construction of an horizontal dial for the latitude of London 51° 32', you must proceed as follows: Apply the trigon to the 6 o'clock line a f (fig. 29.) on the morning side, so that the line of latitude may coincide with the 6 o'clock line, and the beginning of the divisions coincide with the centre a; and at 51° 32' of the line of latitudes place the 6 o'clock edge of the line of hours, and the other end or beginning of the scale close against the plane scale c d, as by the figure at d, and fastening these bars down by the several pins placed in them to the paper and board, then the hours, quarters, &c. are all marked off with a steel point instantly, and the hour lines drawn through them as before, and as shown in the figure. When this is done for the side a f or morning hours, you move the scale of latitudes and hours to the other side, and then the trigon for afternoon side, and place the hour-scale 10° 32' as before, and push down the hours, quarters, &c. and draw the lines through them for the afternoon hours, which is clearly represented in the figure.

In like manner is an erect north or south dial drawn (see fig. 30.), the operation being just the same, only reversing the hours as in the figure, and marking the angles.
angles of the stile’s height equal to the complement of the latitude.

The trigon may be likewise used for drawing vertical declining dials (fig. 31.) as it is with the same facility applied to the lines AQ, GB, and the hours and quarters marked off as before directed.

DIA LLING.

On the scale BD of the trigon is graduated a line of chords, which is found useful for laying off the necessary angles of the stile’s height. The scales of this trigon, when not in use, lie very close together, and pack up into a portable case for the pocket.

DIA A

Dialling Lines, or Scales, are graduated lines, placed on rules, or the edges of quadrants, and other instruments, to expedit the construction of dials. See Plate CLXXI.

Dialling-Sector. See Dialling, p. 212, and Plate CLXXXIV.

Dialling-Sphere, is an instrument made of brass, with several semicircles sliding over one another, on a moving horizon, to demonstrate the nature of the doctrine of spherical triangles, and to give a true idea of the drawing of dials on all manner of planes.

Dialling-Trigon. See Dialling, p. 213, and Plate CLXXXIV.

Dialling, in a mine, called also Plumming, is the use of a compass (which they call dial), and a long line, to know which way the load or vein of ore inclines, or where to shift an air-shaft, or bring an adit to a desired place.

Diallogism, in Rhetoric, is used for the soliloquy of persons deliberating with themselves. See Soliloquy.

DIALOGUE, in matters of literature, a conversation between two or more persons either by writing or by word of mouth.

Composition and Style of written Dialogue. As the end of speech is conversation, no kind of writing can be more natural than dialogue, which represents this. And accordingly we find it was introduced very early, for there are several instances of it in the Mosaic history. The ancient Greek writers also fell very much into it, especially the philosophers, as the most convenient and agreeable method of communicating their sentiments and instructions to mankind. And indeed it seems to be attended with very considerable advantages, if well and judiciously managed. For it is capable to make the drier subjects entertaining and pleasant, by its variety, and the different characters of the speakers. Besides, things may be canvassed more minutely, and many lesser matters, which serve to clear up a subject, may be introduced with a better grace, by questions and answers, objections and replies, than can be conveniently done in a continued discourse. There is likewise a further advantage in this way of writing, that the author is at liberty to choose his speakers: and therefore, as Cicero has well observed, when we imagine that we have persons of an established reputation for wisdom and knowledge talking together, it necessarily adds a weight and authority to the discourse, and more closely engages the attention. The subject matter of it is very extensive; for whatever is a proper argument of discourse, public or private, serious or jocose; whatever is fit for wise and ingenious men to talk upon, either for improvement or diversion, is suitable for a dialogue.

From this general account of the nature of dialogue, it is easy to perceive what kind of style best suits it. Its affinity with Epistles, shows there ought to be no great difference between them in this respect. Indeed, some have been of opinion, that it ought rather to sink below that of an epistle, because dialogues should in all respects represent the freedom of conversation; whereas epistles ought sometimes to be composed with care and accuracy, especially when written to superiors. But there seems to be but little weight in this argument, since the design of an epistle is to say the same things, and in the same manner, as the writer judges would be most fit and proper for him to speak, if present. And the very same thing is designed in a dialogue, with respect to the several persons concerned in it. Upon the whole, therefore, the like plain, easy, and simple style, suited to the nature of the subject, and the particular characters of the persons concerned, seems to agree to both.

But as greater skill is required in writing dialogues than letters, we shall give a more particular account of the principal things necessary to be regarded in their composition, and illustrate them chiefly from Cicero's excellent dialogues concerning an orator.—A dialogue, then consists of two parts; an introduction, and the body of the discourse.

1. The introduction acquaints us with the place, time, persons, and occasion of the conversation. Thus Cicero places the scene of his dialogues at Crassus' country seat; a very proper recess, both for such a debate and the parties engaged in it. And as they were persons of the first rank, and employed in the greatest affairs of state, and the discourse held them for two days, he represents it to have happened at the time of a festival, when there was no business done at Rome, which gave them an opportunity to be absent.

And because the greatest regard is to be had in the choice of the persons, who ought to be such as are well acquainted with the subject upon which they discourse; in these dialogues of Cicero, the two principal disputants are Crassus and Antony, the greatest orators of that age, and therefore the most proper persons to dispute upon the qualifications necessary for their art. One would think it scarce necessary to observe, that the conference should be held by persons who lived at the same time, and so were capable to converse together. But yet some good writers have run into the impropriety of feigning dialogues between persons who lived at distant times. Plato took this method, in which he has been followed by Macrobius. But others,
Dialogue, who have been willing to bring persons to discourse together, who lived in different ages, without such in-
consistency, have wrote dialogues of the dead. Lucian
has made himself most remarkable in this way. As to
the number of persons in a dialogue, they may be more
or less; so many as can conveniently carry on a con-
versation without disorder or confusion may be ad-
mitted. Some of Cicero’s dialogues have only two,
others three or more, and those concerning an orator
seven; and it is convenient they should all, in some
respects, be persons of different characters and abilities;
which contributes both to the variety and beauty of the
discourse, like the different attitudes of figures in a
picture. Thus, in Cicero’s dialogues last-mentioned,
Crassus excelled in art, Antony principally for the force
of his genius, Catullus for the purity of his stile, Sec-
vola for his skill in the law, Caesar for wit and humour;
and through Sulpicius and Cotta, who were young men,
were both excellent orators, yet they differed in their
manner. But there should be always one chief person,
who is to have the main part of the conversation; like
the hero in an epic poem or a tragedy, who excels the
rest in action; or the principal figure in a picture,
which is most conspicuous. In Plato’s dialogues, this
is Socrates; and Crassus in those of Cicero above-
mentioned.

It is usual likewise, in the introductions, to acquaint
us with the occasion of the discourse. Indeed this is
not always mentioned; as in Cicero’s dialogue of the
parts of oratory, where the son begins immediately
with desiring his father to instruct him in the art.
But it is generally taken notice of, and most commonly
represented as accidental. The reason of which may
be, that such discourses appear more natural; and
may likewise afford some kind of apology for the
writer in managing his different characters, since the
greatest men may be supposed not always to speak with
the utmost exactness in an accidental conversation.
Thus Cicero, in his dialogues concerning an orator,
makes Crassus occasionally fall upon the subject of
oratory, to divert the company from the melancholy
thoughts of what they had been discoursing of before,
with relation to the public disorders, and the dangers
which threatened their country. But the introduction
ought not to be too long and tedious. Mr Addison
complains of this fault in some authors of this kind.

“For though (as he says) some of the finest treatises
of the most polite Latin and Greek writers are in dia-
logue, as many very valuable pieces of French, Italian,
and English, appear in the same dress; yet in some of
them there is so much time taken up in ceremony, that,
before they enter on their subject, the dialogue is half
over.”

2. We come now to the body of the discourse, in
which some things relating to the persons, and others to
the subject, are proper to be remarked.

And as to the persons, the principal thing to be at-
tended to is to keep up a justness of character through
the whole. And the distinct characters ought to be
so perfectly observed, that from the very words them-
selves, it may be always known who is the speaker.
This makes dialogue more difficult than single descrip-
tion, by reason of the number and variety of characters
which are to be drawn at the same time, and each of
them managed with the greatest propriety. The prin-
cipal speaker should appear to be a person of great
sense and wisdom, and best acquainted with the sub-
ject. No question ought to be asked him, or objection
started to what he says, but what he should fairly an-
swer. And what is said by the rest should principally
tend to promote his discourse, and carry it through in
the most artful and agreeable manner. When the argu-
ment is attended with difficulties, one other person or
more may be introduced, of equal reputation or near
it, but of different sentiments, to oppose him, and main-
tain the contrary side of the question. This gives op-
portunity for a thorough examination of the point on
both sides and answering all objections. But if the
combatants are not pretty equally matched, and mas-
ters of the subject, they will treat it but superficially.
And through the whole debate there ought not to be
the least wrangling, peevishness, or obstinacy; nothing
but the appearance of good humour and good breeding,
the gentleman and the friend, with a readiness to sub-
tit to conviction and the force of truth, as the evidence
shall appear on one side or the other. In Cicero, these
two characters are Crassus and Antony. And from them
Mr Addison seems to have taken his Philander and
Cynthis in his Dialogues upon the usefulness of ancient
medals, which are formed pretty much on Cicero’s
plan. When younger persons are present, or such
who are not equally acquainted with the subject, they
should be rather upon the inquiry than dispute: And
the questions they ask should be neither too long nor
too frequent, that they may not too much interrupt
the debate, or appear over talkative before wiser and
more experienced persons. Sulpitius and Cotta sustain
this character in Cicero, and Eugenius in Mr Addison.
And it is very convenient there should be one person
of a witty and jocose humour, to enliven the discourse
at proper seasons, and make it the more entertaining,
especially when the dialogue is drawn out to any con-
siderable length. Caesar has this part in Cicero. And
in Mr Addison, Cynthis is a person of this turn, and
opposes Philander in a merry way. Mr Addison’s sub-
ject admitted of this: but the seriousness and gravity
of Cicero’s argument required a different speaker for
the jocose part. Many persons ought not to speak im-
mediately after one another. Horace’s rule for plays is:

To crowd the stage is odious and absurd.
Let no fourth actor strive to speak a word.

Though Scaliger and others think a fourth person
may sometimes be permitted to speak in the same scene
without confusion. However, if this is not commonly to
be allowed upon the stage, where the actors are present,
and may be distinguished by their voice and habit;
much less in a dialogue, where you have only their
names to distinguish them.

With regard to the subject, all the arguments should
appear probable at least, and nothing be advanced
which may seem weak or trivial. There ought also to
be an union in dialogue, that the discourse may not
ramble, but keep up to the main design. Indeed, short
and pleasant digressions are sometimes allowable for
the ease and entertainment of the reader. But every-
thing should be so managed, that he may still be able
to carry on the thread of the discourse in his mind, and
keep the main argument in view, till the whole is fi-
nished. The writers of dialogues have not confined
their discourses to any certain space of time; but either concluded them with the day, or broke off when their speakers have been tired, and resumed them again the next day. Thus Cicero allows two days for his three dialogues concerning an orator; but Mr Addison extends his to three days, allowing a day for each. Nor has the same method always been observed in composing dialogues. For sometimes the writer, by way of narrative, relates a discourse which passed between other persons. Such are the dialogues of Cicero and Mr Addison last mentioned, and many others both of the ancients and moderns. But, at other times, the speakers are introduced in person, as talking to each other. This, as Cicero observes, prevents the frequent repetition of those words, he said, and he replied; and by placing the hearer, as it were, in the conversation, gives him a more lively representation of the discourse, which makes it the more affecting. And therefore Cicero, who wrote his dialogue of old age in this manner, in which Cato, who was then in years, largely recounts the satisfaction of life which may be enjoyed in old age, tells his friend Atticus, he was himself so affected with that discourse, that when he reviewed it sometimes, he fancied they were not his own words, but Cato’s. There are some other dialogues of Cicero, written in the same way; as Of friendship and Of the parts of Oratory. And both Plato and Lucian generally chose this method.

DIALTHÉA, in *Pharmacy*, an unguent formerly much used as a resolvent; so called from Aithéa, or marshmallows, which is the principal ingredient in it.

DIALYSIS, in Grammar, a mark or character, consisting of two points, ††, placed over two vowels of a word, in order to separate them, because otherwise they would make them a diphthong, as Mosaic, &c.

DIAMASTIGOSIS, a festival at Sparta in honour of Diana Orthia, which received that name biblical ραγγείν, from whipping, because boys were whipped before the altar of the goddess. These boys, called Bomonices, were originally free-born of Spartans, but in the more delicate ages they were of mean birth, and generally of a slavish origin. This operation was performed by an officer in a severe and unfeeling manner; and that no compassion should be raised, the priest stood near the altar with a small light statue of the goddess, which suddenly became heavy and insupportable if the lash of the whip was more lenient or less rigorous. The parents of the children attended the solemnity, and exhorted them not to commit any thing either by fear or groans, that might be unworthy of Laconian education. These flagellations were so severe, that the blood gushed in profuse torrents, and many expired under the lash of the whip, without uttering a groan, or betraying any marks of fear. Such a death was reckoned very honourable; and the corpse was buried with much solemnity with a garland of flowers on its head. The origin of this festival is unknown. Some suppose that Lycurgus first instituted it to inure the youth of Lacedemon to bear labour and fatigue, and render them insensible to pain and wounds. Others maintain, that it is a mitigation of an oracle, which ordered that human blood should be shed on Diana’s altar; and according to their opinion, Orestes first introduced that barbarous custom, after he had brought the statue of Diana Taurica into Greece. There is another tradition which mentions, that Pausanias, as he was offering up prayers and sacrifices to the gods, before he engaged with Mardonius, was suddenly attacked by a number of Lydians, who disturbed the sacrifice, and were at last repelled with staves and stones, the only weapons with which the Lacedemonians were provided at that moment. In commemoration of this, therefore, that whipping of boys was instituted at Sparta, and after that the Lydian procession.

**DIAMETER**, in *Geometry*, a right line passing through the centre of a circle, and terminated at each side by the circumference thereof. See *Geometry*.

**DIAMOND**, the most highly valued of precious stones. The finest diamonds are perfectly transparent and colourless, of a regular form, and entirely free from flaws and veins. They have been distinguished by lapidaries into oriental and occidental. But these terms are not expressive of the country from which they are brought, but merely of their qualities and value, the oriental being reckoned the finest and hardest, and the occidental of inferior value. See *Chemistry* and *Mineralogy Index*.

Cornish diamond, a name given by many to the rock crystals found in the tin mines of Cornwall. These crystals are usually bright and clear, and are found most frequently in the form of an hexagonal column terminated at each end by an hexagonal pyramid.

Rose diamond is one that is quite flat underneath, with its upper part cut in divers little faces, usually triangles, the uppermost of which terminate in a point.—In rose diamonds, the depth of the stone from the base to the point must be half the breadth of the diameter of the base of the stone. The diameter of the crown must be $\frac{1}{2}$ of the diameter of the base. The perpendicular, from the base to the crown, must be $\frac{1}{4}$ of the diameter of the stone. The lozenges which appear in all circular rose diamonds, will be equally divided by the ribs that form the crown; and the upper angles or facets will terminate in the extreme point of the stone, and the lower in the base or girdle.

Rough diamond, is the stone as nature produces it in the mines.

A rough diamond must be chosen uniform, of a good shape, transparent, not quite white, and free of flaws and shivers. Black, rugged, dirty, flawy, veiney stones, and all such as are not fit for cutting, they use to pound in a steel mortar made for that purpose; and when pulverized, they serve to saw, cut, and polish the rest. Shivers are occasioned in diamonds by this, that the miners, to get them more easily out of the vein, which winds between two rocks, break the rocks with huge iron levers, which shakes, and fills the stone with cracks and shivers. The ancients had two mistaken notions with regard to the diamond: the first, That it became soft, by steeping it in hot goats blood; and the second, that it is malleable, and bears the hammer. Experience shows us the contrary; there being nothing capable of mollifying the hardness of this stone; though its hardness be not such, that it will endure being struck at pleasure with the hammer.

Facitious diamonds. Attempts have been made to produce
Diana

produce artificial diamonds, but with no great success.

—Those made in France called temple diamonds, on account of the Temple at Paris, where the best of them are made, fall vastly short of the genuine ones; accordingly they are but little valued, though the consumption be pretty considerable for the habits of the actors on the stage, &c. See PASTE.

DIAMOND, in the glass trade, an instrument used for squaring the large plates or pieces; and, among glaziers, for cutting their glass.

These sorts of diamonds are differently fitted up. That used for large pieces, as looking-glasses, &c. is set in an iron ferril, about two inches long, and a quarter of an inch in diameter; the cavity of the ferril being filled up with lead, to keep the diamond firm: there is also a handle of box or ebony fitted to the ferril, for holding it by.

DIAMOND, in Heraldry, a term used for expressing the black colour or the achievements of peerage.

Guilligam does not approve of blazoning the coats of peers by precious stones instead of metal and colours; but the English practice allows it. Morgan says the diamond is an emblem of fortitude.

Diana, the goddess of hunting. According to Cicero, there were three of this name; a daughter of Jupiter and Proserpine, who became mother of Cupid; a daughter of Jupiter and Latona; and a daughter of Upis and Glauce. The second is the most celebrated, and to her all the ancients allude. She was born at the same birth as Apollo: and the pains which she saw her mother suffer during her labour gave her such an aversion to marriage, that she obtained of her father to live in perpetual celibacy, and to preside over the travaile of women. To shun the society of men, she devoted herself to hunting; and was always accompanied by a number of chosen virgins, who, like herself, abjured the use of marriage. She is presented with a quiver and attended with dogs, and sometimes drawn in a chariot by two white horses. Sometimes she appears with wings, holding a lion in one hand, and a panther in the other, with a chariot drawn by two horses of different colours. She is represented as tall; her face has something manly; her legs are bare, well shaped, and strong; and her feet are covered with a buskin worn by huntresses among the ancients. She received many surnames, particularly from the places where her worship was established, and from the functions over which she presided. She was called Lucina, Ithidia, or Juno Promunda, when invoked by women in childbirth; and Trivia when worshipped in the cross-ways, where her statues were generally erected. She was supposed to be the same as the moon and Proserpine or Hecate, and from that circumstance she was called Triformis; and some of her statues represented her with three heads, that of a horse, and a boar. Her power and functions under these three characters have been beautifully expressed in these two verses:

Terret, lustrat, agit, Proserpina, Luna, Diana,
Ima, suprema, femina, sceptrum, fulgore, sagittae.

She was also called Agroterae, Ovithia, Taurica, Delia, Cynthia, Arcia, &c. She was supposed to be the same as the Isis of the Egyptians, whose worship was introduced into Greece with that of Osiris under the name Vol. VII. Part I.

of Apollo. When Typhon waged war against the gods, Diana metamorphosed herself into a cat to avoid his fury. She is generally known, in the figures that represent her, by the crescent on her head, by the dogs which attend her, and by her hunting habit. The most famous of her temples was that of Ephesus, which was one of the seven wonders of the world: (See Ephesus). She was there represented with a great number of breasts, and other symbols, which signified the earth or Cybele. Though she was the patroness of chastity, yet she forgot her dignity to enjoy the company of Endymion, and the very familiar favours which she granted to Pan and Orion are well known: (See Endymion, Pan, Orion). The inhabitants of Taurica were particularly attached to the worship of this goddess, and they cruelly offered on her altar all the strangers that were shipwrecked on their coasts. Her temple in Africa was served by a priest who had always murdered his predecessor; and the Laconians annually offered her human victims till the age of Lycurgus, who changed this barbarous custom for the sacrifice of flagellation. The Athenians generally offered her goats; and others a white kid, and sometimes a boar pig or an ox. Among plants, the poppy and the dittany were sacred to her. She, as well as her brother Apollo, had some oracles; among which those of Egypt, Cilicia, and Ephesus, are the most known.

DIANA, or ARBOR LUNAE, in Chemistry, the beautiful arborescent form of silver, dissolved in nitric acid, and precipitated by another metal; so called from its resembling the trunk, branches, leaves, &c. of a tree. See Silver, Chemistry Index.

Diana Portus, a port of Corsica, situated between Aleria and Mariana, on the east side.

Dianæ arbor, or Arbor Lune, in Ancient Geography, a promontory of Bithynia; now Scutari, a citadel opposite Constantinople, on the east side of the Bosphorus Thracius.

Dias and Aria, a port of Corsica, situated between Aleria and Mariana, on the east side.

DIANDRIA (from διας, twice, and άρας, a man), the name of the second class in Linnaeus's sexual system, consisting of hermaphrodite plants: which, as the name imports, have flowers with two stamens or male organs.

The orders in this class are three, derived from the number of styles or female parts. Most plants with two stamens have one style; as jessamine, lilac, privet, veronica, and bastard alaternus: vernal grass has two styles; pepper, three.

DIANUM, in Ancient Geography, a town of the Contestani, in the Iberian Spain; famous for a temple of Diana, whence the name: now Denia, a small town of Valencia, on the Mediterranean. Also a promontory near Dianium: now El Cabo Martin, four leagues from Denia, running out into the Mediterranean.

DIANTHERA, a genus of plants belonging to the diandria class, and in the natural method ranking under the 42d order, Personatae. See Botany Index.

DIANTHUS, CLOVE GILLFLOWER, CARNATION, PINK, SWEET-WILLIAM, &c. a genus of plants belonging to the decandria class, and in the natural method ranking under the 22d order, Caryophyllae. See Botany Index.

There is a great variety of species; but not more than four that have any considerable beauty as garden flowers,
Dianthus. Flowers, each of which furnishes some beautiful varieties. 1. The caryophyllus, or clove gilliflower, including all the varieties of carnation. It rises with many short trailing shoots from the root, garnished with long, very narrow, evergreen leaves; and amidst them upright slender flower-stalks, from one to three feet high, emitting many side shoots; all of which, as well as the main stalk, are terminated by large solitary flowers, having short oval scales to the calyx, and crenated petals. The varieties of this are very numerous, and unlimited in the diversity of flowers. 2. The del-tonites, or common pink, rises with numerous short leafy shoots, crowning the root, in a tufted head close to the ground, closely garnished with small narrow leaves; and from the ends of the shoots many erect flower-stalks, from about six to fifteen inches high, terminated by solitary flowers of different colours, single and double, and sometimes finely variegated. This species is perennial, as all the varieties of it commonly cultivated also are. 3. The Chinensis, Chinese or Indian pink, is an annual plant with upright firm flower-stalks, branching erect on every side, a foot or fifteen inches high, having all the branches terminated by solitary flowers of different colours and variegations, appearing from July to November. 4. The barbatus, or bearded dianthus, commonly called sweet william. This rises with many thick leafy shoots, crowning the root in a cluster close to the ground; garnished with spear-shaped evergreen leaves, from half an inch to two inches broad. The stems are upright and firm, branching erect two or three feet high, having all the branches and main stem crowned by numerous flowers in aggregate clusters of different colours and variegations.

Culture. Though the carnations grow freely in almost any garden earth, and in it produce beautiful flowers, yet they are generally superior in that of a light loamy nature; and of this kind of soil the florists generally prepare a kind of compost in the following manner, especially for those fine varieties which they keep in pots. A quantity of loamy earth must be provided, of a light sandy temperature, from an upland or dry pasture field or common, taking the top spit turf and all, which must be laid in a heap for a year, and turned over frequently. It must then be mixed with about one-third of rotten dung of old hotbeds, or rotten manure dung, and a little sea-sand, forming the whole into a heap again, to lie three, four, or six months, at which time it will be excellent for use; and if one parcel or heap was mixed with one of these kinds of dungs, and another parcel with the other, it will make a change, and may be found very beneficial in promoting the size of the flowers. This compost, or any other made use of for the purpose, should not be sifted, but only well broken with the spade and hands. — When great quantities of carnations are required, either to furnish large grounds, or for market, or when it is intended to raise new varieties, it is easily effected by sowing some seed annually in spring, in common earth, from which the plants will rise abundantly. Several good varieties may also be expected from the plants of each sowing; and possibly not one exactly like those from which the seed was saved. The single flowers are always more numerous than the double ones; but it is from the latter only that we are to select our varieties. The season for sowing the seed is Dianthus any time from the 20th of March to the 15th of April. — The plants generally come up in a month after sowing; they must be occasionally weeded and watered till July, when they will be fit for transplanting into the nursery beds. These beds must be made about three feet wide, in an open situation; and taking advantage of moist weather, prick the plants therein four inches asunder, and finish with a gentle watering, which repeat occasionally till the plants have taken good root. Here they must remain till September, when they will be so well advanced in growth as to require more room; and should then have their final transplantation into other three feet wide beds of good earth, in rows nine inches asunder, where they are to be placed in the order of quinacx. Here they are to remain all winter, until they flower, and have obtained an increase of the approved varieties of doubles by layers: and until this period, all the culture they require is, that if the winter should prove very severe, an occasional shelter of mats will be of advantage. In spring, the ground must be loosened with a hoe; they must be kept clear from weeds; and when the flower-stalks advance they are to be tied up to sticks, especially all those that promise by their large flower-pods to be doubles.

The only certain method of propagating the double varieties is by layers. The proper parts for layers are those leafy shoots arising near the crown of the root, which, when about five, six, or eight inches long, are of a proper degree of growth for layers. The general season for this work is June, July, and the beginning of August, as then the shoots will be arrived at a proper growth for that operation; and the sooner it is done after the shoots are ready the better, that they may have sufficient time to acquire strength before winter; these laid in June and July will be fit to take off in August and September, so will form fine plants in the month of October. The method of performing the work is as follows. First provide a quantity of small hooked sticks for pegs. They must be three or four inches long; and their use is to peg the layers down to the ground. Get ready also in a barrel a quantity of light rich mould, to raise the earth, if necessary, round each plant, and provide also a sharp penknife. The work is begun by stripping off all the leaves from the base of the shoots, and shortening those at top an inch or two evenly. Then choose a strong joint on the middle of the shoot or thereabouts, and on the back or under side thereof, cut with the penknife the joint half way through, directing your knife upwards so as to slit the joint up the middle, almost to the next joint above, by which you form a kind of tongue on the back of the shoot; observing that the swelling skinny part of the joint remaining at the bottom of the tongue must be trimmed off, that nothing may obstruct the issue of the fibres; for the layers always form their roots at that part. This done, loosen the earth about the plant; and, if necessary, add some fresh mould, to raise it for the more ready reception of the layers; then with your finger make a hollow or drill in the earth to receive the layer; which bend horizontally into the opening, raising the top upright, so as to keep the gash or slit part of the layer open; and, with one of the hooked sticks, peg down the-
Diatreme, the body of the layer, to secure it in its proper place and position, still preserving the top erect and the slit open, and draw the earth over it an inch or two, bringing it close about the erect part of the shoot; and when all the shoots of each plant are thus laid, give directly some water to settle the earth close, and the work is finished. In dry weather the waterings must be often repeated, and in five or six weeks the layers will have formed good roots. They must then be separated with a knife from the old plant, gently raised out of the earth with the point of a knife or trowel, in order to preserve the fibrous roots of the layer as entire as possible; and when thus taken up, cut off the naked sticky part at bottom close to the root, and trim the tops of the leaves a little. They are then ready for planting either into beds or pots. In November the fine varieties in pots should be removed to a sunny sheltered situation for the winter; and if placed in a frame, to have occasional protection from hard frost, it will be of much advantage. In the latter end of February, or some time in March, the layers in the small pots, or such as are in beds, should be transplanted with balls into the large pots, where they are to remain for flower. To have as large flowers as possible, curious floriasts clear off all side shoots from the flower stem, suffering only the main or top buds to remain for flowering. When the flowers begin to open, attendance should be given to assist the fine varieties, to promote their regular expansion, particularly the largest kinds called bursters, whose flowers are sometimes three or four inches diameter. Unless these are assisted by art, they are apt to burst open on one side, in which case the flower will become very irregular; therefore, attending over every plant at that period, observe, as soon as the calyx begins to break, to cut it a little open at two other places in the indenting at top with narrow-pointed scissors, and thereby the more regular expansion of the petals will be promoted: observing, if one side of any flower comes out faster than another, to turn the pot about, that the other side of the flower may be next the sun, which will also greatly promote its regular expansion. When any fine flower is to be blown as large and spreading as possible, floriasts place spreading paper collars round the bottom of the flowers, on which they may spread their petals to the utmost expansion. These collars are made of stiff white paper, cut circular about three or four inches over, having a hole in the middle to receive the bottom of the flower, and one side cut open to admit it. This is to be placed round the bottom of the petals in the inside of the calyx, the leaves of which are made to spread flat for its support. The petals must then be drawn out and spread upon the collar to their full width and extent; the longest ones underneath, and the next longest upon these, and so on; observing that the collar must nowhere appear wider than the flower; and thus a carnation may be rendered very large and handsome.

These directions will answer equally well for the propagation of the pinks and sweet-williams, though neither of these require such nicety in their culture as the carnations.

Diatason, in Music, a musical interval, by which most authors who have written on the theory of music to express the octave of the Greeks.

Diatason, among the musical-instrument-makers, a kind of rule or scale whereby they adjust the pipes of Diapason organs, and cut the holes of hautboys, flutes, &c. in due proportion for performing the tones, semitones, and concords, with precision.

Diatason Diack, in Music, a kind of compound concord, whereof there are two sorts; the greater, which is in the proportion of 10:3; and the lesser, in that of 16:5.

Diatason Diapente, in Music, a compound consonance in a triple ratio, as 3:9. This interval, says Marinus Capella, consists of 9 tones and a semitone; 19 semitones, and 38 dieses. It is a symphony made when the voice proceeds from the first to the twelfth sound.

Diatason Diatessaron, in Music, a compound concord founded on the proportion of 8 to 3. To this interval Marinus Capella allows 8 tones and a semitone; 17 semitones, and 34 dieses. This is when the voice proceeds from its first to its eleventh sound. The moderns would rather call it the eleventh.

Diatason Ditone, in Music, a compound concord, whose terms are as 10:4, or as 5:2.

Diatason Semiditone, in Music, a compound concord, whose terms are in the proportion of 12:5.

Diapedesis, in Medicine, a transudation of the fluids through the sides of the vessels that contain them, occasioned by the blood's becoming too much attenuated, or the pores becoming too patent.

Dipensia, a genus of plants belonging to the pentandria class. See Botany Index.

Diapente, in ancient music, an interval marking the second of the concords, and with the diatessaron an octave; and in modern music is called a fifth.

Dipper, a kind of cloth on which are formed various figures, and which is chiefly employed for table-linen.

Diaphanous, an appellation given to all transparent bodies, or such as transmit the rays of light.

Diaphoresis, in Medicine, an elimination of the humours in any part of the body through the pores of the skin. See Perspiration.

Diaphoretics, among physicians, all medicines which promote perspiration.

Diaphragm, (Diaphragma,) in Anatomy, a part vulgarly called the midriff, and by anatomists septum transversum. It is a strong muscular substance, separating the breast or thorax from the abdomen or lower ventre, and serving as a partition between the abdominal and the thoracic viscera. See Anatomy Index. Plato, as Galen informs us, first called it diaphragm, from the verb διαφρεσαι, to separate or be between two. Till his time it had been called ψυχωθει, from a notion that an inflammation of this part produced phrenzy; which is not more warranted by experience than another tradition, that a transverse section of the diaphragm with a sword causes the patient to die laughing.

Diaphoresis, (Διαφορεσαι), in Rhetoric, is used to express the hesitation or uncertainty of the speaker.

We have an example in Homer, where Ulysses, going to relate his sufferings to Alcinous, begins thus;

Τι ομιλεσω τι δισελευς, οτι δισελευς κατηλευς?
Quid primum, quid deinde, quid postrema allocutus?

This figure is most naturally placed in the exordium or introduction to a discourse. See Doubting.

E. 2

Diarbeck,
DIARBECK, or DIARBEKR, an extensive province of Eastern Asiatic Turkey; comprehending, in its latest extent, Diarbeke, properly so called, Ierock or Chaldea, and Curdistan, which were the ancient countries of Mesopotamia, Chaldea, and Assyria, with Babylon. It is called Diarbeck, Diarbecker, or Diarbeker, as signifying the "duke's country," from the word dhýyer "a duke," and beker "country." It extends along the banks of the Tigris and Euphrates from north-northwest to south-east, that is, from Mount Taurus, which divides it from Armenia on the north, to the utmost recess of the Persian gulf on the south, about 600 miles; and from east to west, that is, from Persia on the east to Syria and Arabia Deserta on the west, in some places 200, and in others about 300 miles, but in the southern or lower parts not above 150. As extending also from the 30th to the 38th degree of latitude, it lies under part of the fifth and sixth climates, whose longest day is about 14 hours and a half, and so in proportion, and consequently enjoys a good temperature of air, as well as, in the greater part of it, a rich and fertile soil. There are indeed, as in all hot countries, some large deserts in it, which produce no sustenance for men or cattle, nor have any inhabitants. Being a considerable frontier towards the kingdom of Persia, it is very well guarded and fortified; but as for those many cities once so renowned for their greatness and opulence, they are at present almost dwindled into heaps of ruins. Bagdad, Mossoul, Caramed, and a few more, indeed continue to be populous and wealthy; but the rest can scarce be called by any other name than that of sorry places. The rivers Euphrates and Tigris have almost their whole course through this country.

Diarbeck Proper is bounded on the north by Armenia on the west by Syria, on the south by part of Arabia Deserta and Irack Proper, and on the east by Kurdistane. It was named by Moses Padan-Aram; the latter being the general name of Syria; and the former signifying fruitful, a proper epithet for this country, which is really so to a very high degree, especially on the northern side, where it yields corn, wine, oil, fruits, and all necessaries of life in great abundance. Formerly it was the residence of many famed patriarchs, yet was overrun with the grossest idolatry, not only in the time of Abraham's coming out of it, and Jacob's sojourning in it, but likewise during the time it continued under the dominion of the Assyrians, Babylonians, Medes, Persians, and Romans. It received indeed the light of the gospel soon after our Saviour's ascension, from St Thaddæus, who is said to have been sent thither by St Thomas, at the request of Abgarus king of Edessa. This account, together with that monarch's letter to Jesus Christ, we have from Eusebius, who took it from the archives of that city; and the whole had passed current and uncontradicted for many ages, till more enlightened moderns found reasons to condemn it; but whether right or wrong, it plainly appears that Christianity flourished here in a most eminent manner, till its purity was sullied about the beginning of the sixth century by the heresy of the Jacobites, whose patriarch still resides here, with a jurisdiction over all that sect in the Turkish dominions.

Diarbeck Proper is a beglerbegate, under which are reckoned twelve sanjacés; and the principal towns Diarbeck in it are, Diarbeik or Caramed, Rika, Mossoul, Ora Diarbeik, or Edessa, Elbir, Niabish, Gezir Mardin, Zibin, Ur of the Chaldees, Amed, and Carasara; but all now of little note excepting Diarbeik and Mossoul.

DIARBEKIR, the capital of the above district, is situated on a delightful plain, on the banks and near the head of the Tigris, about 155 miles, or 15 caravan days journey north-east from Aleppo, in latitude 37° 35', east longitude 46° 50'. The bridge of 20 arches over the said river is said to have been built by the order of Alexander the Great. It is one of the richest and most mercantile cities in all Asiatic Turkey; and is well fortified, being encompassed with a double wall, the outermost of which is flanked with 72 towers, said to have been raised in memory of our Saviour's 72 disciples. It has several stately piazzas or market-places, well stored with all kinds of rich merchandise, and 12 magnificent mosques, said to have been formerly Christian churches. Its chief manufacture is the dressing, tanning, and dyeing of goatskins, commonly called Turkey leather, of which the vent is almost incredible in many parts of Europe and Asia; besides this, there is another of dyed fine linen and cotton cloths, which are nearly in the same request. The waters of the Tigris are reckoned extraordinary for those two branches of trade, and give red leather a finer grain and colour than any other. There is a good number of large and convenient inns on both sides of the river, for the caravans that go to and from Persia; and on the road near the town is a chapel with a cupola, where Job is said to lie buried. This place is much frequented by pilgrims of all nations and religions, and a Turkish hermit has a cell close to it. The fair sex, who, in most other parts of the Turkish empire, are kept quite immured, and considered as mere slaves, enjoy here an extraordinary liberty, and are commonly seen on the public walks of the city in company with the Christian women, and live in great friendship and familiarity with them. The same is said of the men, who are polite, affable, and courteous, and very different from what they affect to be, especially the Turks, in other cities of this empire. The city is under the government of a basha, who has great power and very large dominions. He has commonly a body of 20,000 horse under him, for repelling the frequent incursions of the Curdes and Tartars, who always go on horseback to rob the caravans. The adjacent territory is very rich and beautiful; the bread, wine, and flesh are excellent, the fruits exquisite, and the pigeons better and larger than any in Europe.

Mr Ives, who passed through this city in 1718, informs us, that "about two years ago it was very populous, its inhabitants amounting to 400,000 souls; but in the last year 300,000 died either by cold or famine. The Christians residing in the city before this calamity were reckoned to amount to 26,000, of whom 20,000 died. This account I had from one of the French missionaries, a Capuchin, who also said, that before the famine the city contained 60,000 fighting men, but that now they are not able to muster 10,000. He assures us, that the houses and streets, nay the most merchantile, were filled with dead; that every part of the city exhibited a dreadful image of death; and that the surviving inhabitants not only greedily
Yet, in the midst of this scene of horror, the grandees of the city had every thing in plenty; for they had taken care to monopolize vast quantities of corn, which they sold out to the other inhabitants at most extravagant prices, and thereby acquired for themselves immense fortunes. Corn rose from two piastres a measure to 50, 60, and even 70, in the space of six months. The father added, that the very severe winter of 1756, and the harvest in 1757, were the causes of this dreadful visitation; for by reason of the former, there were but few acres of land sown with corn; and by the latter, the small crop they had was in a great measure destroyed. He spoke of the severity of that winter in terms almost incredible: that it was common to see the people fall down dead in the streets; that he himself once quitting a warm room, and going into the open air, fell down motionless; and that his brother, in attempting to assist him, met with the same fate. This account of the effects of cold in the city of Diarbeikir, which lies only in about 35° north, seems at first very surprising; but considering that the place stands on a rising ground in the midst of an extensive plain, and that the high Curdistan mountains lie to the south and east of it, and the Armenian or Turcomanian to the north, whose heads are always covered with snow, and even now in July supply the city with ice; it will not appear at all improbable, that in a very severe winter, such as that was in 1756, the inhabitants of this city should so severely feel the effects of it. This account of the missionary is most probably exaggerated in many particulars. General Gardanne reckons the population at 80,000, and Mr. McDonald Kaneir at no more than 38,000. The truth probably lies between these statements.

Diarbeikir, or Diarbeik, in Medicine, is a frequent and copious evacuation of liquid excrement by stool. See Medicine Index.

Diarrhoea, or Loose ness, in Anatomy, is a frequent and copious evacuation of liquid excrement by stool. See Medicine Index.

Diarrhoés, in Anatomy, a kind of articulation or juncture of the bones; which being pretty lax affords room for a manifest motion. The word comes from διά, through, and σάρξ, juncture, assembly. It is opposed to συναρτούς, wherein the articulation is so close that there is no sensible motion at all. See Anatomy, No. 2.

Diary, a term sometimes used for a journal or daybook, containing an account of every day's proceedings. Thus we say, diaries of the weather, &c.

Diary Fever, is a fever of one day. See Epemera.

Diachism, among musicians, denotes the difference between the commas and enharmonic diesis, commonly called the lesser comma.

Diocleaus, in Pharmacy, a celebrated composition, so called from scordium, one of its ingredients. See Pharmacy.

Dias, among physicians, signifies the dilatation of the heart, auricles, and arteries; and stands opposed to the systole, or contraction of the same parts. See Anatomy Index.

Dias, in Grammar, a figure in prosody whereby a syllable naturally short is made long. Such is the first syllable of Priamides in the following verse of Virgil:

Atque hic Priamides! nihil tibi, amice, relictum.
DICHTOMOUS, in Botany. See BOTANY Index.

DICHTOMY, a term used by astronomers for that phasis or appearance of the moon, wherein she is bisected, or shows just half her disk. In this situation the moon is said to be in a quadrature aspect, or to be in her quadrature.

DICKER, in old writers, denotes the quantity of ten hides of skins whereof 20 made a last: also 10 pair of gloves, 10 bars of iron, and the like, are sometimes expressed by the term dicker.

DICKINSON, EDMUND, a celebrated English physician and chemist, was born in 1624. He studied and took his degrees at Merton college, Oxford; and in 1659 published his Deiphilus Phoenicisantes, &c. in which he attempted to prove, that the Greeks borrowed the story of the Pythian Apollo, and all that rendered the oracle at Delphi famous, from the Holy Scriptures, and the book of Joshua in particular: a work that procured him great reputation both at home and abroad. He practised physic first at Oxford; but removing to London in 1684, his good fortune in recovering the earl of Arlington from a dangerous sickness, procured his promotion to be physician in ordinary to Charles II. and to his household. As that prince understood and loved chemistry, Mr. Dickinson grew into great favour at court, and was continued in his appointments under James II. After the abdication, he retired from practice, and died in 1707. He published many other things, particularly Physica vetus et vera, &c. containing a system of philosophy, chiefly framed on principles collected from the Mosaic history.

DICRANUM, a genus of mosses, including various species, brought together from the Mniaceae, and Bryaceae. See Smith's Flora Britannica.

DICRANUM, WHITE DITCHAN, or Eriocnema; a genus of plants belonging to the decandria class; and in the natural method ranking under the 26th order, Multitiliqueae. See BOTANY Index.

DICTATOR, a magistrate at Rome invested with regal authority. This officer was first chosen during the Roman wars against the Latins. The consuls being unable to raise forces for the defence of the state, because the plebeians refused to enlist if they were not discharged of all the debts they had contracted with the patricians, the senate found it necessary to elect a new magistrate with absolute and uncontrollable power to take care of the state. The dictator remained in office for six months, after which he was again elected if the affairs of the state seemed to be desperate; but if tranquillity was re-established, he generally laid down his power before the time was expired. He knew no superior in the republic, and even the laws were subjected to him. He was called dictator, because dictus, named by the consul, or quantum dictis ejus parebat populus, because the people implicitly obeyed his command. He was named by the consul in the night vesta soce, and his election was confirmed by the augurs. As his power was absolute, he could proclaim war, levy forces, conduct them against an enemy, and disband them at his pleasure. He punished as he pleased, and from his decision there lay no appeal, at least till latter times. He was preceded by 24 lictors with the fasces; during his administration, all other officers, except the tribunes of the people, were suspended, and he was the master of the republic. But amidst all this independence, he was not permitted to go beyond the borders of Italy; he was always obliged to march on foot in his expeditions; he never could ride in difficult and laborious marches without previously obtaining a formal leave from the people. He was chosen only when the state was in imminent danger from foreign enemies or inward seditions. In the time of a pestilence, a dictator was sometimes elected, as also to hold the comitia or to celebrate the public festivals, or drive a nail into the capitol, by which superstitious ceremony the Romans believed that a plague could be averted or the progress of an enemy stopped. This office, so respectable and illustrious in the first ages of the republic, became odious by the perpetual usurpations of Sulla and Julius Caesar; and after the death of the latter, the Roman senate passed a decree which for ever after forbade a dictator to exist in Rome. The dictator, as soon as elected, chose a subordinate officer called his master of horse, magister equitum. This officer was respectable; but he was totally subordinate to the will of the dictator, and could do nothing without his express order. This subordination, however, was sometimes removed; and during the second Punic war the master of the horse was invested with a power equal to that of the dictator. A second dictator was also chosen for the election of magistrates at Rome after the battle of Cannae. The dictatorship was originally confined to the patricians; but the plebeians were afterwards admitted to share it. Titus Lartius Flavus was the first dictator in the year of Rome, 233.

DICTION, the phrase, elocution or style, of a writer or speaker. See ORATORY, No. 99—122.

DICTIONARY, in its original acceptation, is the arranging all the words of a language according to the order of the alphabet, and annexing a definition or explanation to each word. When arts and sciences began to be improved and extended, the multiplicity of technical terms rendered it necessary to compile dictionaries, either of science in general, or of particular sciences, according to the views of the compiler.

DICTIONARY OF THE ENGLISH LANGUAGE. The design of every dictionary of language is to explain, in the most accurate manner, the meaning of every word; and to shew the various ways in which it can be combined with others, in as far as this tends to alter its meaning. The dictionary which does this in the most accurate manner is the most complete. Therefore the principal study of a lexicographer ought to be, to discover a method which will be best adapted for that purpose. Dr. Johnson, with great labour, has collected the various meanings of every word, and quoted the authorities: but, would it not have been an improvement if he had given an accurate definition of the precise meaning of every word, preserving the way in which it ought to be employed with the greatest propriety; shewing the various deviations from that original meaning, which custom had so far established as to render allowable; and fixed the precise limits beyond which it could not be employed without becoming a vicious expression? With this view, it would have been necessary to exhibit the nice distinctions that take place between words which are nearly synonymous. Without this, many words can
IMMEDIATELY. adv. of time.

1. Instantly, without delay. Always employed to denote future time, and never past. Thus, we may say, I will come immediately; but not I am immediately come from such a place. See PRESENTLY.

2. Without the intervention of any cause or event; as opposed to meditately.

PRESENTLY. adv. of time.

1. Instantly, without delay. Exactly synonymous with immediately; being never with propriety employed to denote any thing but future time.

2. Formerly it was employed to express present time.
Thus, The house presently possessed by such a one, was often used: but this is now become a vicious expression; and we ought to say, The house possessed at present.

It differs from immediately in this, that even in the most corrupt phrases it never can denote past time.

FORM. subst. The external appearance of any object, when considered only with respect to shape or figure. This term therefore, in the literal sense, can only be applied to the objects of the sight and touch; and is nearly synonymous with figure: but they differ in some respects. Form may be employed to denote more rude and unfinished shapes; figure, those which are more perfect and regular. Form can never be employed without denoting matter; whereas figure may be employed in the abstract; thus, we say a square or a triangular figure; but not a square or triangular form. And in the same manner we say, the figure of a house; but we must denote the substance which forms that figure, if we use the word form; as, a cloud of the form of a house, &c. See FIGURE.

2. In contrast to irregularity or confusion. As beauty cannot exist without order, it is by a figure of speech employed to denote beauty, order, &c.

3. As form respects only the external appearance of bodies, without regard to their internal qualities, it is, by a figure of speech, employed in contrast to these qualities, to denote empty show, without essential qualities. In this sense it is often taken when applied to religious ceremonies, &c.

4. As form is employed to denote the external appearance of bodies; so, in a figurative sense, it is applied to reasoning, denoting the particular mode or manner in which this is conducted; as, the form of a syllogism, &c.

5. In the same manner it is employed to denote the particular mode of procedure established in courts of law; as, the forms of law, religion, &c.

6. Form is sometimes, although improperly, used to denote the different circumstances of the same body; as, water in a fluid or a solid form. But as this phrase regards the internal qualities rather than the external figure, it is improper; and Dictionary ought to be, water in a fluid or a solid state.

7. But when bodies of different kinds are compared with one another, this term may be employed to denote other circumstances than shape or figure: for we may say, a juice exuding from a tree in the form of wax or resin; although, in this case, the consistence, colour, &c. and not the external arrangement of parts, constitutes the resemblance.

8. From the regular appearance of a number of persons arranged in one long seat, such persons so arranged are sometimes called a form; as, a form of students, &c. And,

9. By an easy transition, the seat itself has also acquired that name.

GREAT. adj. A relative word, denoting largeness of quantity, number, &c. serving to augment the value of those terms with which it is combined, and opposed to small or little. The principal circumstances in which this word can be employed are the following:

1. When merely inanimate objects are considered with regard to quantity, great is with propriety employed, to denote that the quantity is considerable; as, a great mountain, great house, &c. and it is here contrasted with small. When great is thus employed, we have no other word that is exactly synonymous.

2. When inanimate objects are considered with regard to their extent, this term is sometimes employed, although with less propriety, as, a great plain, a great field, &c. And in this sense it is nearly synonymous with large; and they were often used indiscriminately, but with some difference of meaning: for, as large is a term chiefly employed to denote extent of superficies, and as great more particularly regards the quantity of matter; therefore, when large is applied to any object which is not merely superficial, it denotes that it is the extent of surface that is there meant to be considered, without regard to the other dimensions: whereas when the term great is employed, it has reference to the whole contents. If, therefore, we say, a large house, or a large river, we express that the house, the river, have a surface of great extent, without having any necessary connexion with the size in other respects. But if we say, a great house, or a great river, it at once denotes that they have not only a large surface, but are also of great size in every respect.

3. Great, when applied to the human species, never denotes the size or largeness of body, but is applied solely to the qualities of the mind. Thus, when we say that Socrates was a great man, we do not mean that he was a man of great size, but that he was a man who excelled in the endowments of the mind. The terms which denote largeness of size in the human body, are big, bulky, huge, &c.

4. Great is sometimes applied to the human species, as denoting high rank. In this case it is often used in the plural number than otherwise. Thus, we say simply the great, meaning the whole body of
of men in high station, as opposed to mean. It should seldom be employed in this sense, as it tends to confound dignity of rank with elevation of mind.

5. As this is a general term of augmentation, it may be joined with all nouns which denote quantity, quality, number, excellence, or defects; or such as imply praise, blame, anger, contempt, or any other affection of the mind.

6. It is employed to denote every step of ascending or descending consanguinity; as great-grandfather, great-grandson, &c.

HIGH. adj. Exalted in a perpendicular direction at a distance from the surface of the earth. Opposed to low.

1. High is a term altogether indefinite, and is employed to express the degree of elevation of any inanimate body. Thus, we say a high mountain, a high house, steeple, tower, pillar, &c. Nor is there any other word that can here be considered as synonymous; lofty being employed only to denote a very eminent degree of elevation.

2. To express the perpendicular elevation of vegetables either high or tall may be employed, as being in this case nearly synonymous. We may therefore say, a high or tall tree, a high or tall mast, &c. but with this difference between these two expressions, that tall can be more properly applied to those that are much elevated and of small dimensions; and high, to such as are more bulky, and of greater size.

3. The perpendicular height of man can never be expressed by the word high; tall being here the proper expression. And although high is sometimes used to express the height of other animals, yet it seems to be an improper expression. See TALL.

4. High, when applied to the human species, always refers to the mind; and denotes hauhtiness, stateliness, pride, &c. and, when combined with the expressions of any energy of the mind, it denotes that in a higher degree. In this sense, it is opposed to meanness, abjectness, and humility.

5. As this is an indefinite term, tending to denote any thing that is elevated above us, it may be combined with almost every noun which admits of this elevation. And as objects high above us are always out of our reach, it is in a metaphorical sense used to denote any thing that seems to be above the ordinary condition of mankind; or those qualities or endowments of mind that are not easily acquired; as, dignity or elevation of sentiment; dignity of rank; acuteness in reasoning on difficult subjects; pride, hauhtiness, or any other quality which seems beyond the ordinary level of mankind; dearness of price, &c.

6. In the same manner we apply this term to time; which having a metaphorical resemblance to a river flowing on with an unceasing current through all successive ages, anything of remote antiquity is denoted by the term high.

7. Likewise those degrees of latitudes far removed from the line, where the pole becomes more elevated.

8. And to some particular crimes, as being attached with peculiar degrees of guilt; as, high treason.

TALL. adj. Something elevated to a considerable degree in a perpendicular direction. Opposed to low.

1. This term is chiefly employed to express the height of man and other animals; and is applied to denote the height of the body only, without having any reference to the mind. When applied to man, no other word can be substituted in its stead: when applied to other animals, high is sometimes considered as nearly synonymous. See HIGH.

2. It is likewise employed to denote the perpendicular height of vegetables; and in this case, it is nearly synonymous with high. See HIGH.

3. It can in no case be employed to express the height of merely inanimate objects; as we can never say a tall steeple, tower, or pillar, but a high steeple, &c. For the distinctions in these cases, see HIGH.

LONG. adj. A relative term, denoting the distance between the extremes of any body, which is extended more in one of its geometrical dimensions than another. Opposed to short.

1. This term may be applied to all inanimate objects, of whatever kind, whose dimensions in one way exceed the other, and when not in an erect posture, whatever be the other circumstances attending them; whether it relates to superficies alone, or to solid bodies; whether these be bounded or open, straight or crooked, flexible or rigid, or in any other circumstances whatever: thus we say, a long or short line, a long or short ridge, street, ditch, rope, chain, staff, &c. But it is to be observed, that although long is in the strict sense only opposed to short; yet as it expresses the extension of matter in one of its geometrical proportions, it is often contrasted by those words which express the other proportions when we mean only to describe the several proportions: as, a table long and broad. And as these several dimensions are expressed by different words, according to the various forms, modifications, and circumstances, in which bodies are found, therefore it is in this sense contrasted by a great diversity of terms: as, a long and broad or wide, narrow or strait, street or lane; a long and thick, or small rope, chain, staff. For the distinctions in these cases, see BROAD, WIDE, &c.

2. Objects necessarily fixed in an erect position can never have this term applied to them; and therefore we cannot say a long, but a high, tower or steeple. And for the same reason, while trees are growing and fixed in an erect position, we cannot apply this term to them; but when they are filled and laid upon the ground, it is quite proper and necessary. Thus, we do not say a long, but a tall or high tree, while it is growing; but we say a long, not a tall log of wood; and in the same manner we say a tall mast, when it is fixed in the ship; but a long mast, while it lies upon the beach. See TALL and HIGH.

3. Those vegetables which are of a tender plant nature,
2. As many bodies may be considered either with respect to the capaciousness or superficial extent; in all these cases, either the term broad or wide may be used; as a broad or wide street or ditch, &c. but with a greater or less degree of propriety, according to the circumstances of the object, or the idea we wish to convey. In a street where the houses are low and the boundaries open, or in a ditch of small depth and large superfluities, as this largeness of superfluities bears the principal proportion, broad would be more proper; but if the houses are of great height, or the ditch of great depth, and capaciousness is the principal property that affects the mind, we would naturally say a wide street or ditch; and the same may be said of all similar cases. But there are some cases in which both these terms are applied, with a greater difference of meaning; thus we say a broad or a wide gate: But as the gate is employed to denote either the aperture in the wall, or the matter which closes that aperture, these terms are each of them used to denote that particular quality to which they are generally applied: and as the opening itself can never be considered as a superfluities, the term wide, in this case, denotes the distance between the sides of the aperture; while on the contrary, broad denotes the extent of matter fitted to close that aperture; nor can these two terms in any case be substituted for one another.

3. As a figurative expression, it is used as a cant phrase for a mistake: as, you are wide of the mark; that is, not near the truth.

NARROW, adj. A relative term, denoting a proportional smallness of distance between the sides of the superfluities of plain bodies. Opposed to broad.

1. As this is only applied to superfluities, it is exactly contrasted by broad, and is applied in all cases where the term broad can be used, (see broad); and in no other case but as a contrast to it, except the following.

2. It sometimes is employed to describe the smallness of space circumscribed between certain boundaries, as opposed to wide, and nearly synonymous with straight; as we say a wide or a narrow house, church, &c. For the necessary distinctions here, see the article STRAIT.

3. In a figurative sense it denotes parsimony, poverty, confined sentiments, &c.

STRAIT, adj. A relative term, denoting the extent of space in certain circumstances. Opposed to wide; see wide.

1. This term is employed, in its proper sense, to denote only space, as contained between surrounding bodies in such circumstances as to denote some degree of confinement; and is exactly opposed to wide; as a wide or a strait gate, &c. See wide.

2. So necessary is it that the idea of confinement should be connected with this word, that in all those cases where the space contained is large, as in a church, or house, we cannot express a smaller proportional width by this term. And as we have no other word to express space in these circumstances,
cumstances, we have been obliged to force the word narrow from its natural signification, and make it express this. See Narrow.

3. In some particular cases, narrow or strait may be applied to the same object: as, a narrow or a strait line: but here strait is never employed but where an idea of confinement is suggested, and where it is exactly contrasted to wide: nor can narrow be employed but in such circumstances where broad would be a perfect contrast to it. Therefore these two terms may always be used in the same circumstances as those which contrast them may be. For an account of which see Wide.

4. The term strait is likewise in a peculiar manner used to denote the smallness of the internal diameter of those small bodies which are fitted to receive or contain others, as any kind of bag, tube, body clothes, mortises, and others of the same kind; and in all these cases this term may be employed to denote the smallness of their lesser diameter, and never the term narrow. But in certain circumstances the word tight may be substituted for it. See Tight.

5. Strait, in a figurative sense, denotes any sort of confinement of sentiment or disposition.

TIGHT. adj. A term employed in certain circumstances to denote the internal capacity of particular bodies. Nearly synonymous with strait.

This term is confined entirely to denote the smallness of the internal dimensions of such objects, as are formed to cover or to receive or contain other solid bodies, and can be employed in no other case. And although it agrees with strait, it always denotes confinement, and by being applicable to the same species of objects, yet it differs in the following respects: 1. If there be any difference of the diameter of the objects to which the term strait can be applied, it always has reference to the smaller; yet tight may be applied to any sort of confinement, whether it regards the length or breadth. 2. Strait can be applied to all bodies of capacity when of small diameter, without any sort of reference to the nature of the substance which it may be capable of containing. For we can say a strait bag, a strait sleeve, a strait mortise, a strait gate, &c. whereas tight can only be applied to any body when it is considered as having reference to another body which is intended to be contained in it, and is pinched from want of room. Thus we say, the sleeve of a coat is too tight for the arm, the mortise is too tight for the tenon, &c.: but we cannot say the bag or the gate is too tight, because they are not fitted to receive any sort of objects. And hence it happens that in many cases the dimensions of the same body may be expressed by tight or strait when considered in different circumstances. Thus we may say, this sleeve is too strait, when we look at a coat when lying on the table and consider its proportions; but it is not till we have tried it upon the arm that it is intended to cover, that we call it tight. And we may say, a gate is too strait or too tight: but in this first case we consider it as being too confined for admitting objects to pass through it; and in the last, as being too confined with respect to the leaves that are to shut the aperture, not allowing them space to move with freedom.

These examples may serve to give some idea of the plan of an English Dictionary composed upon philosophical principles: But, besides the circumstances above enumerated, there are many others which would require particular attention in the execution of a work of this kind. In the English language, a great variety of terms occur, which denote matter under certain general forms or circumstances, without regarding the minute diversities that may take place; as the word cloth, which denotes matter as manufactured into a particular form, including under it all the variety of stuffs manufactured in that particular way, of whatever materials, colour, texture or fineness, they may be. The same may be said of wood, iron, yarn, and a great variety of terms of the same nature, some of which cannot assume any plural; while others admit of it in all cases, and others admit or refuse it according to the different circumstances in which they are considered.

In a dictionary, therefore, all this variety of cases ought to be clearly and distinctly pointed out under each particular article: this is the more necessary, as some of these words have others formed from them which might be readily mistaken for their plurals, although they have a very different signification; as chaües, which does not denote any number of pieces of different kinds of cloth, but wearing apparel, &c. The following example will illustrate this head.

WOOD. sub. A solid mass of which the trunks and branches of trees consist.

1. This term is employed to denote the solid parts of vegetables of all kinds, in whatever form or circumstances they are found. Nor does this term admit of plural with propriety, unless in the circumstances after mentioned: for we say, many different kinds of wood, in preference to many kinds of woods; or we say, oak, ash, or elm wood, not woods.

2. But where we want to contrast wood of one quality or country with that of another, it admits of a plural: for we say, white woods are in general softer than red, or West Indian woods are in general of greater specific gravity than the European woods: But unless where the colour, or some quality which distinguishes it from growing wood, is mentioned, this plural ought as much as possible to be avoided, as it always suggests an idea of growing wood.

3. Wood likewise denotes a number of trees growing near one another; being nearly synonymous with forest: See Forest. In this sense it always admits of a plural; as, Yeo woods and wilds whose solitary gloom, &c.

A dictionary cannot be reckoned complete without explaining obsolete words; and if the terms of the several provincial dialects were likewise given, it would be of great utility: nor would this take much time; because a number of these words needs no other explanation than to mark along with them the words which had come in their place, when there happened to be one perfectly synonymous: and in those cases where
Dictionary, the same idea could not be expressed in modern language without a periphrasis, it would be of use to explain them distinctly; so that, when a writer found himself at a loss for a term, and obliged to search for one beyond the bounds of our own language, he might take one of these, when he found that it was expressive and energetic, in preference to another drawn from a foreign language. This would at least have one good effect: it would make our language more fixed and stable; not to say more accurate and precise, than by borrowing from foreign languages. The following examples may serve to give some idea of the manner of treating this part of the work.

**Moe**, or **mo.** adj. An obsolete term still employed in the Scotch dialect, and by them pronounced *mae*; denoting a greater number, and nearly synonymous with *more*: but it differs in this respect, that in the Scotch dialect, *mae* and *maur* (English *more*), are each employed in their distinct sphere, without encroaching upon one another; *mae* being employed to denote number, but never quantity or quality; and *maur*, to denote quantity and quality, but never number: thus they say *mae*, not *maur*, *apples, men, &c.* and they say *maur*, not *mae*, *cloth, earth, courage, &c.* See **Maur.** Both of these terms are supplied by the word *more*; which in the English language is applied indiscriminately to denote quantity, quality, and number. See **More.**

**Thir.** pron. Obsolete; still employed in the Scotch dialect: the plural of *this*; and contrasted to *these*, in the same manner as that is to *this*.

As there is no word in the English language equivalent to this, we thus show the manner in which it is employed. In the English language we say, *that stone or house*, pointing at one at a distance, *is larger or more commodious than this stone or this house*, which is supposed to be at hand. In the same manner, in the Scotch dialect, they say, *these* (or, as it is pronounced, *thee*) *stones are whiter than thir stones*; denoting, that the former are at a distance, and the latter at hand. And, in the same manner, it is invariably applied to denote any present object in the plural manner, as opposed to these: as *these* or *thir apples*, as at hand, or at a distance; *these*, or *thir trees*, &c.; but never in the singular number, as it is always *this* or *that tree, house, &c.*

As the English language is so exceedingly irregular in the pronunciation, the same letter in the same situation often assuming sounds totally different in different words, it is impossible to establish any general rules, on this subject, which do not admit of many exceptions: therefore, a dictionary is the best means of ascertaining and pointing out the proper pronunciations of words. For, if the writer first pointed out all the different sounds that the same letter could ever be made to express, and assigned to every particular sound which each letter could be made to assume, a particular mark, which was appropriated to denote that particular sound of the letter whenever it occurred; by placing these particular marks above the letters in the dictionary, the sound of each letter would be pointed out in all cases with the utmost certainty. It would be impossible for us to illustrate this by examples, without first Dictionary ascertaining all the sounds of each letter; which would lead us into a discussion too long for this place.

We shall only further observe, That, besides having the accented syllable of every word properly distinguished in a dictionary to assist in the pronunciation, the English language requires another essential improvement, viz. the use of accents to distinguish the meaning of words and phrases: which, although, it is not so properly confined to a lexicographer, yet it is not quite without his sphere. Thus the word *as* admits of two very different sounds, as well as different significations; as in this example, "Cicero was nearly as eloquent as Demosthenes." in which the first *as* is pronounced *az*, and the last is pronounced *am.* Now, it often happens, that, in reading, the particular way in which it ought to be understood is not pointed out by the context, till after the word itself is pronounced, which has an equal chance at least of being pronounced wrong; whereas, if it were always accentuated when employed in the one sense, and not in the other, it would free the reader from this perplexity. There are other cases in which the use of proper accents in writing would be of great consequence; as at the beginning of a sentence, when it was put as a question, or used ironically, &c. the want of which every one must have observed. But as this does not so properly belong to the lexicographer as the grammarian, we shall here take no further notice of it.

The above examples, we hope, will be sufficient to give the reader some idea of the plan that we would propose; and enable him to determine, whether or not a dictionary, executed upon this plan, would convey to his mind a more perfect knowledge of the English language, than those dictionaries that have been hitherto published. These examples were given rather with a view to show the manner in which a work of this kind might be conducted, than as perfect and unexceptionable explanations; of the several articles there enumerated; and therefore we did not think it necessary to produce any authorities, although we are sensible that they would be requisite in such a work.

**DICTYMNIA, or DICTYNIA, in Mythology,** were feasts celebrated at Lacedemon and in Crete, in honour of Diana Dictymnia or Dictynia, or of a nymph taken for her, who, having plunged herself into the sea, to escape the passion of Minos, was caught in a fisherman's net or *dorren*, whence the name.

**DICTYS CRETESIS,** a very ancient historian, who serving under Idomeneus king of Crete in the Trojan war, wrote the history of that expedition in nine books; and Tzetzes tells us, that Homer formed his Iliad upon the plan of that history. It is however maintained, that the Latin history of Dictys which we have at present is spurious.

**DIDACTIC,** in the schools, signifies the manner of speaking or writing, adapted to teach or explain the nature of things. The word is formed from the Greek *didasko*, *I teach.*

There are many words which are only used in the didactic and dogmatic way; and there are many works, ancient and modern, both in prose and verse, written after
after this method: such are the Georgics of Virgil, Lucretius's poem De Rerum Natura, and Pope's Essay on Criticism and on Man, &c. &c.

DIDAPPER. See CYLINDRUS, ORNITHOLOGY INDEX.

DIDELPHIS, or PPUS, a genus of quadrupeds belonging to the order of Soric. See MAMMALIA INDEX.

Diderot, Denis, an eminent French writer, was the son of a merchant, and born at Langres in the year 1713. He received his education among the Jesuits, and being destined for the church by one of his uncles, who had a canonry to bestow upon him, he had received the tonsure. But he discovered so little inclination for the ecclesiastical profession, that his father sent him to Paris to prosecute his studies, and afterwards placed him with an attorney. It soon appeared, however, that he was more attached to different departments of literature and science, than disposed to submit to the drudgeries of the profession to which his father had destined him; and having thus neglected his business, his allowance was withheld, which obliged him to make provision for himself. The studies to which Diderot devoted his attention were extremely various. Physics, geometry, metaphysics, moral philosophy, and belles lettres, were at different times the objects of his pursuit. He even indulged in poetry and works of invention; but attached himself chiefly to more serious studies. "He possessed a ready flow and great animation of language in conversation; and these qualities, with a decisive tone and manner, procured for him partisans and protectors.

One of the first of his publications was a translation of "Stanyan's History of Greece." In the year 1745 he published "Principles of Moral Philosophy," 12mo, a work by which he obtained some reputation. But the year following, when he published a piece entitled Pensees Philosophiques, he acquired considerable celebrity. This work was highly commended by the partisans of the new philosophy, among whom he had now enlisted himself, and became one of its most zealous disciples. The same work was afterwards reprinted under the title of Etranges aux Esprits Forts. It was greatly read, and it is supposed contributed much to the diffuseness of those free opinions which had now become so prevalent in France. Soon after this period, in conjunction with his friend D'Alembert, the plan of the vast undertaking, the Dictionnaire Encyclopedique, was laid. The professed object of this work was to become a magazine for every branch of human knowledge; but at the same time, it has been alleged that it was also intended by the authors and editors as the great engine by means of which the established opinions, whether of a religious or political nature, which they supposed had their origin in fraud and superstition, should be subverted. The province of this work which was entrusted to Diderot was the description of Arts and Trades, (Arts et Metiers). But, besides, he contributed many other articles in various departments of science. His writings in the Dictionary have been considered as extremely verbose and diffuse; and in all of them he is too fond of metaphysical subtleties and the pompous parade of scientific language. The first edition of the Dictionary was completed between the years 1751 and 1767; and although Diderot was occupied in this laborious undertaking for a period of nearly 20 years, the recompense which he obtained is said to have been extremely small.

During this time he composed various other works. Among these he published, "A letter on the Blind, for the use of those who see." This work made a good deal of noise, and in consequence of some of the sentiments which it contained, had given offence to the government, for which the author was kept in confinement for six months at Vincennes. This piece was soon followed by another, entitled "A letter on the Deaf and Dumb, for the use of those who hear and speak," 2 vols 12mo, 1751. "The sixth Sense," published in 1752; "Thoughts on the interpretation of Nature," 1754; "The Code of Nature," 1755, are similar works, and may be ranked in the same class. His moral character was considerably affected by the publication of Bijoux Indiscrets, 2 vols 12mo; which is a collection of licentious tales; for this indeed he made some kind of compensation, when he published two prose comedies, Le Fils Naturel, 1757; and Le Pere de Famille, 1758; which are not only interesting as dramatic pieces, but exhibit a pure and correct morality. The latter is considered as one of the best comedies of the sentimental kind which has appeared on the French stage. It has indeed received universal admiration. He published afterwards a pamphlet, "On Public Education," which contains undoubtedly some useful hints; but at the same time it proposes many things which are impracticable. To the list of his works now mentioned we may add, "An Eulogy on Richardson," which is full of warmth and enthusiasm; and "An Essay on the Life and Writings of Seneca the Philosopher." This was his last work, and was published in 1779. Among some observations on this work by the Monthly Reviewers, the author of it is thus characterized: "The works of M. Diderot, says the writer, have long since disgusted the modest votaries of true philosophy, by the tone of arrogance and self-sufficiency, and the truth and figures of a declamatory eloquence, that form their essential and distinctive character." It contains, it is further added, like the other writings of that author, a mingling of good and bad; of brilliant thoughts and obscure remarks; of sentences that dart from the imagination with the energy of lightning, and cloudy periods of metaphysical rhetoric, that convey either no ideas, or false ones."

The character of Diderot suffered considerably from some defamatory attacks which he made on his former friend Rousseau, who had quarrelled with the French philosophers and had separated himself from their school. From the "Confessions" of the Genevan philosopher, it would appear that they expected some anecdotes which would not have been much to their honour. In some of his letters Rousseau thus speaks of Diderot. His words are remarkable, as they are equally applicable to his own character. "Although born with a good heart and an open disposition, he had an unfortunate propensity to misinterpret the words and actions of his friends; and the most ingenuous explanations only supplied his subtle imagination with new interpretations against them." Diderot was married and had a family; and although he possessed some irritability of temper, he was a kind husband and a tender parent. At the conclusion of the Dictionary, the state of his affairs rendered
DEIDUS, or DODO, a genus of birds belonging to the order of gallin. See Ornithology Index.

DIDYMUS of Alexandria, an ecclesiastical writer of the fourth century; who, though he is said to have lost his eyes at five years of age, when he had scarcely learned to read, yet applied so earnestly to study, that he attained all the philosophic arts in a high degree, and was thought worthy to fill the chair in the famous divinity school at Alexandria. He was the author of a great number of works: but all we have now remaining are, a Latin translation of his book upon the Holy Spirit, in the works of St. Jerome, who was the translator; short strictures on the Canonical Epistles; and a book against the Manichees.

DIDYNAMIA, (from Ἰδιῦς, twice, and ἕνωμεν, power), the name of the 14th class in Linnaeus's sexual method, consisting of plants with hermaphrodite flowers, which have four stamens or male organs, two of which are long and two short. See Botany Index.

DIEMEN'S LAND, formerly supposed to be the southern coast or point of New Holland, but now found to be an island, as it is separated from New Holland by Bass's strait, which was discovered by Mr. Bass and Lieutenant Flinders in the end of the year 1798. The northern coast is in S. Lat. 40° 55', and between 146° 45' and 148° 15' E. Long. This coast was discovered in November 1642, by Tasman, who gave it the name of Van Diemen's Land. Captain Furneaux touched at it in March 1773, and the country has since been further explored by other navigators. Here is a very safe road, named by Captain Cook Adventure Bay. Two other harbours or bays were discovered or explored by Messrs. Bass and Flinders, viz. Port Dalrymple and Frederick Henry bay, and two considerable rivers, which have been called Port Dalrymple and Derwent rivers. The parts adjoining to Adventure bay are mostly hilly, and form an entire forest of tall trees, rendered almost impassable by brakes of fern, shrubs, &c. The soil on the flat land, and on the lower part of the hills, is sandy, or consists of a yellowish earth, and in some parts of a reddish clay; but further up the hills it is of a gray rough cast. The forest trees are all of one kind, generally quite straight, and bearing clusters of small white flowers. The principal plants observed were wood-sorrel, milk-wort, cudweed, bell-flowers, gladiolus, samphire, and several kinds of fern. The only quadruped seen distinctly was a species of opossum, about twice the size of a large rat. The kangaroo, found farther northward in New Holland, may also be supposed to inhabit here, as some of the inhabitants had
DIEPE, a handsome sea-port town of France, in Upper Normandy, in the department of the lower Seine, with a good harbour, an old castle, and two handsome moles. The parish church of St James is an elegant structure; and there is a tower from which, in fine weather, the coast of England may be seen. The population amounts to 20,000. The principal trade consists in the fisheries, ivory, toys, and furs. It was bombarded by the English in 1694, and it is not now so considerable as it was formerly. It is seated at the mouth of the river Bethune, in E. Long. 1° 4'. N. Lat. 54° 47'.

DIES MARCHII, was the day of congress or meeting of the English and Scots, annually appointed to be held on the marches or borders, in order to adjust all differences between them.

DIESIS in Music, is the division of a tone less than a semitone; or an interval consisting of a less or imperfect semitone.

DIES is the smallest and softest change or inflexion of the voice imaginable; it is called a fant, expressed thus X, by a St Andrew's cross or saltier.

DIESPITER, in antiquity, a name given to Jupiter; and signifying diei pater, “father of the day.” St Augustine derives the name from dies, “day,” and portus, “production, bringing forth;” it being Jupiter that brings forth the day. Of which sentiment were Servius and Macrobius; the former adding, that in the language of the Osii they called him Lucenius, as Diispiet in Latin.

DIET, in Medicine, according to some, comprehends the whole regimen or rule of life with regard to the six non-naturals; air, meats and drinks, sleep and watching, motion and rest, passions of the mind, retentions and excretions. Others restrain the term of diet to what regards eating and drinking, or solid aliments and drinks. See Food.

The natural constitution of the body of man is such, that it can easily bear some change and irregularities without much injury. Had it been otherwise, we should be almost constantly put out of order by every slight cause. This advantage arises from those wonderful communications of the inward parts, whereby, when one part is affected, another comes immediately to its relief.

Thus, when the body is too full, nature causes evacuations through some of the outlets; and for this reason it is, that diseases from intemperance are generally more dangerous than from repletion; because we can more expeditiously diminish than increase the juices of the body. Upon the same account, also, though temperance be beneficial to all men, the ancient physicians advised persons in good health, and their own masters, to indulge a little now and then, by eating and drinking more plentifully than usual. But, of the two, intemperance in drinking is safer than in eating; and if a person has committed excess in the latter, cold water drunk upon a full stomach will help digestion; to which it will be of service to add lemon juice, or elixir of vitriol. If he has eaten high-seasoned things, rich sauces, &c. then let him sit up for some little time, and afterwards sleep. But if a man happen to be obliged to fast, he ought to avoid all laborious work. From safety it is not proper to pass directly to sharp hunger, nor from hunger to satiety; neither will it be safe to indulge absolute rest immediately after excessive labour, nor...
not suddenly to fall to hard work after long idleness. In a word, therefore, all changes in the way of living should be made by degrees.

The softer and milder kinds of aliment are proper for children, and for youth the stronger. Old people ought to lessen the quantity of their food, and increase that of their drink; but yet some allowance is to be made for custom, especially in the colder climates like ours; for as in these the appetite is keener, so is the digestion better performed. Mead's Monita et Praecepta.

**Diet, Drinks, a form in Physic, including all the medicated wines, ales, and wheys, used in chronic cases. They require a course or continuation to answer any intention of moment.**

**Diet of Appearance, in Scots Law, the day to which a defender is cited to appear in court; and every other day to which the court shall afterwards adjourn the consideration of the question.**

**Diet, or Dyet, in matters of policy, is used for the general assembly of the states or circles of the empire of Germany and of Poland, to deliberate and concert measures proper to be taken for the good of the public.**

The general diet of the empire is usually held at Ratisbon. It consists of the emperor, the nine electors, and the ecclesiastical princes; viz. the archbishops, bishops, abbots, and abbesses; the secular princes, who are dukes, marquises, counts, viscounts, or barons; and the representatives of the imperial cities._—It meets on the emperor's summons, and any of the princes may send their deputies thither in their stead. The diet makes laws, raises taxes, determines differences between the several princes and states, and can relieve the subjects from the oppressions of their sovereigns._

The diet of Poland, or the assembly of the states, consisted of the senate and deputies, or representative of every palatinate or county and city; and usually met every two years, and oftener upon extraordinary occasions, if summoned by the king, or, in his absence, by the archbishop of Gnesen. The general diet of Poland sat but six weeks, and often broke up in a tumult much sooner; for one dissenting voice prevented their passing any laws, or coming to any resolutions, on what was proposed to them from the throne. Switzerland has also a general diet, which is usually held every year at Baden, and represents the whole Helvetic body; it seldom lasts longer than a month. Besides this general diet, there are diets of the Protestant cantons, and diets of the Catholic ones; the first assemble at Aarau, and are convoked by the canton of Zurich; the second at Lucern, convoked by the canton of that name.

**Dietetic, that part of physic which treats of diet. See Diet, Food, and Drink, in this work, and Dietetic in the Supplement.**

**Dietrich, or Dieticy, Christian William Ernest, a modern artist, who was born at Weimar in 1712. He resided chiefly at Dresden, where he was professor of the Academy of Arts. He was a painter of very extensive abilities, and succeeded both in history and landscape. We have by him a great number of small subjects, to the amount of 150 or more, which he engraved from his own compositions, in the style (says Basan) of Ostade, of Laireuse, and of Salvador Rosa. Sixty of these engravings are exceedingly rare.**

**Dietets, a town in the circle of the Upper Rhine in Germany, situated on the river Lohn, 20 miles north of Mentz, and subject to the house of Nassau-Orange. E. Long. 7° 40’. N. Lat. 50° 28’._

**Dieu et Mon Droit, i.e. God and my right, the motto of the royal arms of England, first assumed by King Richard I. to intimate that he did not hold his empire in vassalage of any mortal.**

It was afterwards taken up by Edward III., and was continued without interruption to the time of the late King William, who used the motto Je maintiens, though the former was still retained upon the great seal. After him Queen Anne used the motto Semper cedens, which had been before used by Queen Elizabeth; but ever since Queen Anne, Dieu et mon droit continues to be the royal motto.

**Diff, is the name of an instrument of music among the Arabs, serving chiefly to beat time to the voice; it is a hoop, sometimes with pieces of brass fixed to it to make a jingling, over which a piece of parchment is distended. It is beat with the fingers, and is the true tympanum of the ancients.**

**Diffarreation, among the Romans, a ceremony whereby the divorce of their priests was solemnized. The word comes from the preposition dis; which is used, in composition, for division or separation; and farrealtio, a ceremony with wheat, of fer, “wheat.”**

Diffarreation was properly the dissolving of marriages contracted by consecration; which were those of the pontifices or priests. Festus says, it was performed with a wheaten cake. Vigilantius will have consecration and diffarreation to be the same thing.

**Difference, in Mathematics, is the remainder, when one number or quantity is subtracted from another.**

**Difference, in Logic, an essential attribute, belonging to some species, and not found in the genus; being the idea that defines the species. Thus body and spirit are the two species of substance, which in their ideas include something more than is included in the idea of substance. In body, for instance, is found impenetrability and extension; in spirit, a power of thinking and reasoning; so that the difference of body is impenetrable extension, and the difference of spirit is cogitation.**

**Difference, in Heraldry, a term given to a certain figure added to coats of arms, serving to distinguish one family from another; and to show how distant younger branches are from the elder or principal branch.**

**Differential, (Differentielle,) in the higher geometry, an infinitely small quantity, or a particle of quantity so small as to be less than any assignable one. It is called a differential, or differential quantity, because frequently considered as the difference of two quantities; and, as such, is the foundation of the differential calculus: Sir Isaac Newton, and the English, call it a moment, as being considered as the momentary increase of quantity. See Fluxions.**

**Differential Equation, an equation involving or containing differential quantities; as the equation $3 \times dx$.**
D I F  [ 232 ] D I F

Differential \(3x^2 dx - 2 ax dx + ay dx + axdy = 0\). Some mathematicians, as Stirling, &c. have also applied the term differential equation in another sense, to certain equations defining the nature of series.

It is of very general use, especially in the construction of tables, and the summation of series. It was first used, and the rules of it laid down, by Briggs, in his construction of Logarithms and other Numbers, much the same as they were afterwards taught by Cotes, in his *Constructio Tabularum per Differentias*.

The method was next treated in another form by Newton in the 5th Lemma of the 3d book of his *Principia*, and in his *Methodus Differentialis*, published by Jones in 1711, with the other tracts of Newton. This author here treats it as a method of describing a curve of the parabolic kind, through any given number of points. He distinguishes two cases of this problem: the first when the ordinates drawn from the given points to any line given in position, are at equal distances from one another; and the second, when these ordinates are not at equal distances. He has given a solution of both cases, at first without demonstration, which was afterwards supplied by himself and others: see his *Methodus Differentialis* above mentioned; and *Stirling's Explanations of the Newtonian Differential Method*, in the Phil. Trans. No. 362.; Cotes, *De Methodo Differentiali Newtoniana*, published with his *Harmonia Mmnrurum*: *Herman's Phoronlm*: and Le Seur and Jacquier, in their Commentary on Newton's *Principia*. It may be observed, that the methods there demonstrated by some of these authors extend to the description of any algebraic curve through a given number of points, which Newton, writing to Leibnitz, mentions as a problem of the greatest use.

By this method, some terms of a series being given and conceived as placed at given intervals, any intermediate term may be found nearly; which therefore gives a method for interpolation: Briggs's *Arith. Log. ubi supra*: Newton, *Method. Differ. prop. 5*; Stirling, *Methodus Differentialis*.

Thus also may any curvilinear figure be squared nearly, having some few of its ordinates. Newton, *ibid. prop. 6*; Cotes *De Method. Differ.*; Simpson's *Mathematical Dissert. p. 115*. And thus may mathematical tables be constructed by interpolation: Briggs, *ibid. Cotes Canonotechnia*.

The successive differences of the ordinates of parabolic curves, becoming ultimately equal, and the intermediate ordinate required being determined by these differences of the ordinates, is the reason for the name *Differential Method*.

To be a little more particular.—The first case of Newton's problem amounts to this: A series of numbers, placed at equal intervals, being given, to find any intermediate number of that series, when its interval or distance from the first term of the series is given. Subtract each term of the series from the next following term, and call the remainders first differences, then subtract in like manner each of these differences from the next following one, calling these remainders 2d differences; again, subtract each 2d difference from the next following, for the 3d differences; and so on:

\[d = \text{the first of the 1st differences,}\]
\[d' = \text{the first of the 2d differences,}\]
\[d'' = \text{the first of the 3d differences,}\]

and if \(x\) be the interval or distance between the first term of the series and any term sought, \(T\), that is, let the number of terms from \(A\) to \(T\), both included, be \(n + 1\); then will the term sought, \(T\), be:

\[A + \frac{\beta}{1} d + \frac{\beta}{2} d' + \frac{\beta}{3} d'' + \ldots + \frac{\beta}{n} d^n + \ldots + \frac{\beta}{n} d^n + \frac{\beta}{n} d^n = 0, \text{ &c.}\]

Hence, if the differences of any order become equal, that is, if any of the diffs. \(d', d'', \text{ &c.}\) become \(0\), the above series will give a finite expression for \(T\) the term sought; it being evident, that the series must terminate when any of the differences \(d', d'', \text{ &c.}\) become \(0\).

It is also evident that the co-efficients \(\frac{\beta}{1} \frac{\beta}{2} \frac{\beta}{3} \ldots\)

\&c. of the differences, are the same as to the terms of the binomial theorem.

For ex. Suppose it were required to find the log. tangent of \(51^\circ 12' 24''\), or \(60^\circ 1' 56''\), or \(51^\circ 1' 2066\), &c.

Take out the log. tangents to several minutes and seconds, and take their first and second differences, as below:

<table>
<thead>
<tr>
<th>(5'50'')</th>
<th>(d')</th>
</tr>
</thead>
<tbody>
<tr>
<td>5</td>
<td>7162964</td>
</tr>
<tr>
<td>5</td>
<td>14453</td>
</tr>
<tr>
<td>5</td>
<td>14404</td>
</tr>
<tr>
<td>5</td>
<td>14357</td>
</tr>
</tbody>
</table>

Here \(A = 7164147\); \(x = \frac{\beta}{10}\); \(d'' = 14404\); and the mean 2d difference \(d'' = -48\). Hence:

\[A = 7164147\]
\[d'' = 14404\]

\[\frac{\beta}{1} d'' = -48\]

\[\frac{\beta}{1} d'' = -48\]

\[\beta = 2977\]

\[\frac{\beta}{1} d'' = -48\]

\[\frac{\beta}{1} d'' = -48\]

\[\frac{\beta}{1} d'' = -48\]

\[\text{Therefor. the tang. of } 51^\circ 12' 24'' \text{ is } 71644398\]

Hence may be deduced a method of finding the sums of the terms of such a series, calling its terms \(A, B, C, D, \text{ &c.}\). For, conceive a new series having its 1st term = \(0\), its 2d = \(A\), its 3d = \(A + B\), its 4th = \(A + B + C\), its 5th = \(A + B + C + D\), and so on; then it is plain that assigning one term of this series, is finding the sum of all the terms, \(A, B, C, D, \text{ &c.}\). Now since these terms are the differences of the sums, \(\beta, A + B, A + B + C, \text{ &c.} \); and as some of the differences of \(A, B, C, \text{ &c.} \) are \(0\) by supposition; it follows that some of the differences of the sums will be \(\text{&c.}\) by which a term was assigned, \(A\) represented the 1st term: \(d\) the 1st of the 1st differences, and \(d\) the interval between the first term and the last; \(\text{&c.}\) to write \(\beta\) instead of \(A\), \(A\) instead of \(d\), \(d\) instead of \(d'\), \(d''\).
DIGBY, Sir Kenelm, an English philosopher, was born at Gothurst in Buckinghamshire in 1603, and became very illustrious for his virtue and learning. He was descended of an ancient family. His great-grandfather, accompanied by six of his brothers, fought valiantly at Bosworth field on the side of Henry VII. against the usurper Richard III. His father Sir Everard Digby, was engaged in the gunpowder plot against King James I. and for that crime was beheaded; but his son was restored to his estate. King Charles I. made him gentleman of the bedchamber, commissioner of the navy, and governor of the Trinity-house. He granted him letters of reprisal against the Venetians, by virtue of which he took several prizes with a small fleet under his command. He fought the Venetians near the port of Scanderoon, and bravely made his way through them with his booty. He was a great lover of learning, and translated several authors into English; and his "Treatise of the Nature of Bodies and the Immortality of the Soul," discovers great penetration and extensive knowledge. He applied to chemistry; and found out several useful medicines, which he gave freely away to people of all sorts, especially to the poor. He distinguished himself particularly by his sympathetic powder for the cure of wounds at a distance; his discourse concerning which made a great noise for a while. He had conferences with Des Cartes about the nature of the soul.

In the beginning of the civil wars, he exerted himself very vigorously in the King's cause; but he was afterwards imprisoned by the parliament's order, in Winchester-house, and had leave to depart thence in 1643. He afterwards compounded for his estate, but was ordered to leave the nation; when he went to France, and was sent on two embassies to Pope Innocent X. from the queen, widow to Charles I. whose chancellor he then was. On the restoration of Charles II. he returned to London; where he died in 1663, aged 60.

This eminent person, on account of his early talents, and great proficiency in learning, was compared to the celebrated Picus de Mirandola, who was one of the wonders of human nature. His knowledge, though various and extensive, appeared to be greater than it really was; as he had all the powers of elocution and address to recommend it. He knew how to shine in a circle of ladies or philosophers; and was as much attended to when he spoke on the most trivial subjects, as when he conversed on the most important. It is said that one of the princes of Italy, who had no child, was desirous that his princess should bring him a son by Sir Kenelm, whom he esteemed a just model of perfection.

DIGEST, (Digestum), a collection of the Roman laws, ranged and digested under proper titles, by order of the emperor Justinian.

That prince gave his chancellor Tribonius a commission for this purpose; who, in consequence thereof, chose sixteen jurisconsulti, or lawyers, to work upon the same. These, accordingly, took out the best and finest decisions from the two thousand volumes of the ancient jurisconsulti, and reduced them all into one body; which was published in the year 533, under the name of the Digest. To this the emperor gave the force of a law, by a letter at the head of the work, which serves it as a preface.

The Digest makes the first part of the Roman law, and the first volume of the corpus or body of the civil law, contained in fifty books. It was translated into Greek under the same emperor, and called Pandecta. See Pandects.

Cujus says, that Digest is a common name for all books disposed in a good order and economy; and hence it is that Tertullian calls the gospel of St Luke a Digest.

Hence also abridgements of the common law are Gg
denominated
denominated digests of the numerous cases, arguments, readings, pleadings, &c. dispersed in the year books, and other reports and books of law, reduced under proper heads or common places. The first was that of Statham, which comes as low as Henry VI. That of Fitzherbert was published in 1516; Brooke's in 1573, of which Hughes's, published in 1663, is a sequel. Rolls, Danvers, and Nelson, have also published Digests or abridgements of this kind, including the chancery books, &c., so which may be, so called the New Abridgement, Viner's Abridgement, &c.

DIGESTION, in the animal economy, is the dissolusion of the aliment into such minute parts as are fit to enter the lacteal vessels, and circulate with the mass of blood. See Anatomy Index.

DIGESTION, in Chemistry, is an operation which consists in exposing bodies to a gentle heat, in proper vessels, and during a certain time. This operation is very useful to favour the action of certain substances upon each other; as, for example, of well calcined, dry, fixed alkali upon rectified spirit of wine. When these two substances are digested together in a mattress, with a gentle sand-bath heat, the spirit of wine acquires a reddish-yellow colour, and an alkaline quality. The spirit would not so well acquire these qualities by a stronger and shorter heat.

DIGESTIVE, in Medicine, such remedies as strengthen and increase the tone of the stomach, and assist in the digestion of food. To this class belong as medicines and strengtheners or corrombans.

DIGESTIVE, in Surgery, denotes a sort of unguent, plaster, or the like, that is supposed to ripen and prepare the matter of wounds, &c. for suppuration.

DIGGES, LEONARD, an eminent mathematician in the 16th century, was descanted from an ancient family, and born at Digges-court in the parish of Barham in Kent; but in what year is not known. He was educated for some time at Oxford, where he laid a good foundation of learning. Retiring from thence, he prosecuted his studies, and became an excellent mathematician, a skilful architect, and an expert surveyor of land, &c. He composed several books: as, 1. Tectonica: briefly shewing the exact measuring, and speedy reckoning of all manner of lands, squares, timber, stones, steeples, &c. 1556, 4to. Augmented and published again by his son Thomas Digges, in 1592; and also reprinted in 1647.—2. A Geometrical Practical Treatise, named Pantometria, in three books. This he left in manuscript; but after his death, his son supplied such parts of it as were obscure and imperfect, and published it in 1591, folio; subjoining, "A discourse geometrical of the five regular and platonic bodies, containing sundry theoretical and practical propositions, arising by mutual conference of these solids, inscription, circumscription, and transformation."—3. Prognostication Everlasting of right good effect: or Choice Rules to judge the weather by the sun, moon, and stars, &c. in 4to, 1555, 1556, and 1564; corrected and augmented by his son, with divers general tables, and many compendious rules, in 4to, 1592. He died about the year 1574.

DIGGES, THOMAS, only son of Leonard Digges, after a liberal education from his tenderest years, went and studied for some time at Oxford; and by the improvements he made there, and the subsequent instruc-

DIGGERS, some persons who were accustomed to go for gold, and in mining for it.
DIGIT, in Astronomy, the twelfth part of the diameter of the sun and moon, used to express the quantity of an eclipse. Thus an eclipse is said to be of six digits, when six of these parts are hid.

DIGITS, or Monades, in Arithmetic, signify any integer under 10; as, 1, 2, 3, 4, 5, 6, 7, 8, 9, and by means of which all numbers are expressed.

DIGIT is also a measure taken from the breadth of the finger. It is properly three-fourths of an inch, and contains the measure of four barley corns laid breadthwise.

DIGITALIS, fox-glove; a genus of plants, belonging to the didynamia class; and in the natural method ranking under the 26th order, Luridae. See BOTANY Index. Fox-glove has been employed in cases of hemoptysis, of phthisis, and of mania, with apparent good effects; but its use in these diseases is less common and less efficacious than in others. It should be administered with great caution. See Medicine and Materia Medica Index.

DIGITATUM, among botanists. See Botany Index.

DIGLYPH, in Architecture, a kind of imperfect triglyph, console, or the like; with two channels or engravings, either circular or angular.

DIGNÉ, an episcopal town in the department of the Lower Alps, formerly Provence, in France, famous for its hot springs. It is seated on a river called Bléone, 20 miles S. by W. of Embrun, in E. Long. 6. 12. N. Lat. 44. 10. The population is about 3300 souls.

DIGNITARY, in the canon law, a person who holds a dignity, that is, a benefice which gives him some pre-eminence over mere priests and canons. Such is a bishop, dean, archdeacon, presbytery, and so on.

DIGNITY, as applied to the titles of noblemen, signifies honour and authority. And dignity may be divided into two classes, the titles of duke, earl, baron, &c. are the highest names of dignity; and those of baronet, knight, serjeant at law, &c. the lowest. Nobility only can give so high a name of dignity as to supply the want of a surname in legal proceedings; and as the omission of a name of dignity may be pleaded in abatement of a writ, &c. so it may be where a peer who has more than one name of dignity, is not named by the most noble. No temporal dignity of any foreign nation can give a man a higher title here than that of ESQUIRE.

DIGNITY, in the human character, the opposite of MEANNESS.

Man is endowed with a sense of the worth and excellence of his nature: he deems it more perfect than that of the other beings around him; and he perceives that the perfection of his nature consists in virtue, particularly in virtues of the highest rank. To express that sense, the term dignity is appropriated. Further, to behave with dignity, and to refrain from all mean actions, is felt to be, not a virtue only, but a duty: it is a duty every man owes to himself. By acting in that manner, he attracts love and esteem: by acting meekly, or below himself, he is disapproved and condemned.

This sense of the dignity of human nature reaches even our pleasures and amusements. If they ensnare the mind by raising grand or elevated emotions, or if they humanize the mind by exercising our sympathy, they are approved as suited to the dignity of our nature: if they contract the mind by fixing it on trivial objects, they are condemned as not suited to the dignity of our nature. Hence in general, every occupation, whether of use or amusement, that corresponds to the dignity of man, is termed manly; and every occupation below his nature, is termed childish.

To those who study human nature, there is a point which has always appeared intricate: How comes it that generosity and courage are more esteemed, and bestow more dignity, than good nature, or even justice; though the latter contribute more than the former to private as well as to public happiness? This question, bluntly proposed, might puzzle even a philosopher; but, by means of the foregoing observations, will easily be solved. Human virtues, like other objects, obtain a rank in our estimation, not from their utility, which is a subject of reasoning, but from the direct impression they make on us. Justice and good nature are a sort of negative virtues, that scarce make any impression but when they are transgressed: courage and generosity, on the contrary, producing elevated emotions, enliven the great sense of a man's dignity, both in himself and in others; and for that reason, courage and generosity are in higher regard than the other virtues mentioned; we describe them as grand and elevated, as of greater dignity, and more praiseworthy.

This leads us to examine more directly emotions and passions with respect to the present subject: and it will not be difficult to form a scale of them, beginning with the meanest, and ascending gradually to those of the highest rank and dignity. Pleasure felt as at the organ of sense, named corporeal pleasure, is perceived to be low; and when indulged to excess, is perceived as to be mean; for that reason, persons of any delicacy dissemble the pleasure they feel at the very sight of drinking. The pleasures of the eye and ear, having no organic feeling, and being free from any sense of meanness, are indulged without any shame: they even rise to a certain degree of dignity when their objects are grand or elevated. The same is the case of the sympathetic passions: a virtuous person behaving with fortitude and dignity under cruel misfortunes, makes a capital figure; and the sympathizing spectator feels in himself the same dignity. Sympathetic distress at the same time is never mean: on the contrary, it is agreeable to the nature of a social being, and has general approbation. The rank that love possesses in the scale depends in a great measure on its objects; it possesses a low place when founded on external properties merely; and is mean when bestowed on a person of inferior rank without any extraordinary qualification: but when founded on the more elevated internal properties, it assumes a considerable degree of dignity. The same is the case of friendship. When gratitude is warm, it animates the mind; but it scarce rises to dignity.

Joy
DIGRESSION, in Oratory, is defined by Quintilian, agreeably to the etymology of the word, to be a going off from the subject we are upon to some different thing, which, however, may be of service to it. See Oratory, No. 37.

DIGYNIA, (from δί, twice, and γύνη, a woman), the name of an order or secondary division in each of the first 13 classes, except the 9th, in Linneus’s sexual method; consisting of plants, which to the classic character, whatever it is, add the circumstance of having two styles or female organs.

DIV, the divinities of the ancient inhabitants of the earth, were very numerous. Every object which caused terror, inspired gratitude, or bestowed applause, received the tribute of veneration. Man saw a superior agent in the stars, the elements, or the trees; and supposed that the waters which communicated fertility to his fields and possessions, were under the influence and direction of some invisible power inclined to favour and to benefit mankind. Thus arose a train of divinities which imagination arrayed in different forms, and armed with different powers. They were endowed with understanding, and were actuated by the same passions.
passions which daily afflict the human race; and those
children of superstition were appeased or provoked as
the imperfect beings which gave them birth. Their
wrath was mitigated by sacrifices and incense; and
sometimes human victims bled to expiate a crime
which superstition alone supposed to exist. The sun,
from his powerful influence and animating nature, first
attracted the notice and claimed the adoration of the
uncivilized inhabitants of the earth. The moon also
was honoured with sacrifices and addressed in prayers;
and after immortality had been liberally bestowed on
all the heavenly bodies, mankind classed among their
deities the brute creation, and the cat and the sow
shared equally with Jupiter himself, the father of gods
and men, the devoted veneration of their votaries. This
immense number of deities has been divided into dif-
cerent classes according to the will and pleasure of the
mythologists. The Romans, generally speaking, reck-
oned two classes of the gods, the divi majorum gen-
tium, or divi conscendentes; and the divi minorum gentium.
The former were 12 in number, six males and six fe-
males. [Vid. Consentes.] In the class of the latter
were ranked all the gods which were worshiped in differ-
ent parts of the empire. Besides these there were
some called divi selecti, sometimes classed with the 12
greater gods; these were Janus, Saturn, the Genius,
the Moon, Pluto, and Bacchus. There were also some
called demigods, that is, who deserved immortality
by the greatness of their exploits, and for their uncom-
mon services to mankind. Among these were Priapus,
Verbummus, Hercules, and those whose parents were
some of the immortal gods. Besides these, all the pas-
sions and the moral virtues were reckoned as powerful
deities, and temples were raised to a goddess of con-
cord, peace, &c. According to the authority of He-
iod, there were no less than 30,000 gods that inhab-
ited the earth, and were guardians of men, all subser-
vient to the power of Jupiter. To these, succeeding
ages have added an almost equal number: and indeed
they were so numerous, and their functions so various,
that we find temples erected, and sacrifices offered, to
unknown gods. It is observable that all the gods of the
ancients have lived upon earth as mere mortals;
and the immortality of gods was only represented by
the mythologists as a helpless child; and
we are acquainted with all the particulars that attend-
ed the birth and education of Juno. In process of
time, not only good and virtuous men, who had been
the patrons of learning and the supporters of liberty,
but also thieves and pirates, were admitted among the
gods, and the Roman senate courteously granted im-
ortality to the most cruel and abandoned of their
emperors.

DIJAMBUS, in Poetry, the foot of a Latin verse
of four syllables; it is compounded of two iambs, as
sferías.

DIJON, an ancient and very considerable town of
France; formerly capital of Burgundy, and of the Di-
jonais; now the episcopal town of the department of
Côte d'Or. Before the revolution it had a parliament,
a mint, an university, academy of sciences, an abbey,
and a citadel. Most parts of the churches and public
structures are very beautiful, and in one of the squares
there was an equestrian statue of Louis XIV. It is
seated in a very pleasant plain, between two small ri-
vers, which produces excellent wine. It contains 21,600
inhabitants. E. Long. 5. 7. N. Lat. 47. 19.

DIKE, a ditch or drain, made for the passage of
waters. The word seems formed from the verb to dig,
though others choose to derive it from the Dutch, djk,
a drain, sea-bank, or wall.

DIKE, or Dyke, also denotes a work of stone, tim-
ber or fascines, raised to oppose the entrance or pas-
sage of the waters of the sea, a river, lake, or the like.
The word comes from the Flemish dyk, or dijk, a heap
of earth to bound or stem the water. Junius and Menage
take the Flemish to have borrowed their word from the
Greeks θεῖα, wall. Guichard derives it from the He-
brew, daghah. These dikes are usually elevations of
earth, with hurdles of stakes, stones, and other matters.
The dikes of Rochelle are made with vessels fastened
to the bottom. The dikes of Holland are frequently
broke through, and drawn large tracts of land.

DILAPIDATION, in Law, a wasteful destroying,
or letting buildings, especially parsonage houses, &c.
run to decay, for want of necessary repairment. If the
clergy neglect to repair the houses belonging to their
benefices, the bishop may sequester the profits thereof
for that purpose. And in these cases, a prosecution
may be brought, either in the spiritual court or at com-
mon law, against the incumbent himself, or against his
executor or administrator.

DILATATION, in Physics, a motion of the parts
of any body, by which it is so expanded as to occupy
a greater space. This expansive motion depends upon
the elastic power of the body; whence it appears that
dilatation is different from rarefaction, this last being
produced by means of heat.

DILATATORES, in Anatomy, a name given to
several muscles of the human body. See Anatomy,
Tables of the Muscles.

DILATORY PLEAS, in Law, are such as are put
in merely for delay; and there may be a demurrer to a
dilatory plea, or the defendant shall be ordered to
plead better, &c. The truth of dilatory pleas is to be
made out by affidavit of the fact, &c. by stat. 4 and
5 Anne. See Plea.

DILATRIS, a genus of plants belonging to the tri-
andria class. See Botany Index.

DILEMMA, in Logic, an argument equally con-
clusive by contrary suppositions. See Logic.

DILIGENCE, in Scots Law, signifies either that
care and attention which parties are bound to give, in
implementing certain contracts or trusts, and which var-
ies according to the nature of the contract; or it
signifies certain forms of law, whereby the creditor
efforts to operate his payment, either by affecting
the person or estate of the debtor. See Law Index.

DILL. See Anthemum, Botany Index.

DILLEMBOURG, a town of Germany, in Wet-
tervia, and capital of a county of the same name.
It is subject to a prince of the house of Nassau, and is
situated in E. Long. 8. 24, N. Lat. 50. 45.

DILLEGENC, a town of Germany, in the circle
of Suabia, formerly with a university, which was con-
verted into a lyceum when the town was transferred
to Bavaria in 1802. It is seated near the Danube. E.
Long. 10. 30. N. Lat. 48. 34.

DILLENIUS, John James, a distinguished Ger-
man botanist, see Supplement.

DILUTE.
DILUTE. To dilute a body is to render it liquid; or if it were liquid before, to render it more so by the addition of a thinner thereto. These things thus added are called diluents, or dilutors.

DIMACHE, (from δί, double, and μάχη, I fight), in antiquity, a kind of horsemanship first instituted by Alexander. Their armour was lighter than that of the infantry, and at the same time heavier than that used by horsemen, so that they could act as horse or foot as occasion required.

DIMENSION, in Geometry, is either length, breadth, or thickness: hence, a line hath one dimensions, viz. length; a superficies two, viz. length and breadth; and a body, or solid, has three, viz. length, breadth, and thickness.

DIMINATION, in Architecture, a contraction of the upper part of a column, by which its diameter is made less than that of the lower part.

DIMINUTIVE, in Grammar, a word formed from some other, to soften or diminish the force of it, or to signify a thing is little in its kind. Thus, cellula is a diminutive of cell, globule of globule, hillock of hill.

DIMISSORY LETTERS, (Litteræ Dimissorìæ), in the canon law, a letter given by a bishop to a candidate for holy orders, having a title in his diocese, directed to some other bishop, and giving leave for the bearer to be ordained by him.

When a person produces letters of ordination or tenure conferred by any other than his own diocesan, he must at the same time produce the letters dimissory given by his own bishop, on pain of nullity.

Letters dimissory cannot be given by the chapter, sede vacante; this being deemed an act of voluntary jurisdiction which ought to be reserved to the successor.

DIMORITE, a name given to the Apollinarists, who at first held, that the Word only assumed a human body, without taking a reasonable soul like ours; but being at length convinced by formal texts of Scripture, they allowed, that the Word did assume a soul, but without understanding; the Word supplying the want of that faculty. From this way of separating the understanding from the soul, they became denominated dimorites, q. d. dividere, separare, of δια, and μορία I divide.

DIMSDALE, Thomas, Baron, greatly distinguished for his practice of inoculation for the small-pox, was the son of a surgeon and apothecary at Thed Köln Gernon in Essex, and was born in the year 1712. His family belonged to the society of Quakers; and his grandfather accompanied William Penn to America; but soon after returned and settled in his native village. Thomas was brought up to his profession first under his father, and afterwards he became a pupil in St Thomas Hospital, London. He commenced his practice at Hertford about 1734, and married the only daughter of Nathaniel Brassay, of Roxford, near that town, an eminent banker in London, and representative of Hertford in former parliaments. She died in 1744, and left no children. To relieve his mind under this loss, he voluntarily offered his assistance to the physicians and surgeons in the army under the duke of Cumberland, and continued with it till after the surrender of Carlisle to the king's forces, when he received the duke's thanks, and returned to Hertford. In 1746 he married Anne Isles, a relation of his first wife, and by her fortune, and that which he acquired by the death of the widow of Sir John Dimsdale of Hertford, he retired from practice; but his family becoming numerous, and seven of his ten children being living, he resumed it, and took the degree of doctor of medicine, in 1761. Having fully satisfied himself about the new method of treating persons under inoculation for the small-pox, he published his treatise on it in 1776, which was soon circulated all over the continent, and translated into all its languages, not omitting the Russian. He concludes with saying that, "although the whole process may have some share in the success, it, in my opinion, consists chiefly in the method of inoculating with recent fluid matter, and the management of the patients at the time of eruption." This proof of his professional knowledge occasioned his being invited to inoculate the empress Catherine and her son, in 1768, of which he gives a particular account in his Tracts on Inoculation, 1781. His reward for this was an appointment of actual counsellor of state and physician to her imperial majesty, with an annuity of 500l. the rank of a baron of the Russian empire, to be borne by his eldest lawful descendant in succession, and a black wing of the Russian eagle in a gold shield in the middle of his arms, with the customary helmet, adorned with the baron's coronet, over the shield; to receive immediately 10,000l. and 2000l. for travelling charges, miniature pictures of the empress and her son, and the same title to his son, to whom the grand duke gave a gold snuff-box, richly set with diamonds. The baron inoculated numbers of people at Moscow; and, resisting the empress's invitation to reside as her physician in Russia, he and his son were admitted to a private audience of Frederic II. king of Prussia, at Sans Souci, and thence returned to England. In 1779, he lost his second wife, who left him seven children. He afterwards married Elizabeth daughter of William Dinsdale, of Bishops-Stortford, who survived him. He was elected representative of the borough of Hertford in 1780; and declined all practice, except for the relief of the poor. He went to Russia once more, in 1781, to inoculate the late emperor and his brother Constantine, sons of the grand duke; and, as he passed through Brussels, the late emperor Joseph received him in private, and wrote in his presence a letter, which he was to convey to the empress of Russia. In 1790, his son, Baron Nathansel, was elected for the borough of Hertford, on his resignation and retirement to Bath, for several winters; but at last he fixed altogether at Hertford, and died, aged 89, Dec. 30. 1800, after an illness of about three weeks. About 17 years before his death he felt the sight of one eye declining, having before lost that of the other, but recovered both by the operation of the cataract, by Wenzel.

DINDYMA, -orum, (Virgil.) from Dindymus, vi; a mountain allotted by many to Phrygia. Strabo has two mountains of this name; one in Lyzia near Cyzicus; the other in Gallogracia near Pessinus; and none in Phrygia. Ptolemy extends this ridge from the borders of Troas, through Phrygia, to Gallogracia; though therefore there were two mountains called Dindymus in particular, both sacred to the mother of the gods, and none of them in Phrygia Major; yet there
here might be several hilly and eminences in it, on
which this goddess was worshipped, and therefore cal-
ed Dindyma in general. Hence Cybele is surnamed
Dindymone, (Horc.)

DINGWALL, a royal borough of Scotland in the
shire of Ross, seated on the frith of Cromarty, 15 miles
west of the town of Cromarty. Near it runs the river
Conel, famous for producing pearls. W. Long. 4. 15;
N. Lat. 57. 45. Dingwall was a Scotch barony in the
person of the duke of Ormond in right of his lady,
but forfeited in 1750. Population 850.

DINNER, the meal taken about the middle of the
day. The word is derived from the French diner,
which Du Cange derives from the barbarous Latin
dinner. Henry Stephens derives it from the Greek δινηρη;
and will have it were diner. Menage deduces
it from the Italian desinare, "to dine"; and that from
the Latin desinere, "to leave off work."

It is generally agreed to be the most salutary to
make a plentiful dinner, and to eat sparingly at supper.
This is the general practice among us. The French,
however, in imitation of the ancient Romans, defer
their good cheer to the evening; and Bernardinus Pa-
ternus, an eminent Italian physician, maintains it to
be the most wholesome method, in a treatise expressly
on the subject.

The grand Tartar emperor of Chins, after he has
dined, makes publication by his heralds, that he gives
leave for all the other kings and potentates of the
earth to go to dinner; as if they waited for his leave.

DINOCRATES, a celebrated architect of Macedo-
nia, who rebuilt the temple of Ephesus, when burnt
by Erostratus, with much more magnificence than be-
fore. Vitruvius informs us that Dinocrates proposed
to Alexander the Great to convert Mount Athos into
the figure of a man, whose left hand should contain a
walled city, and all the rivers of the mount flow into
his right, and from thence into the sea! He also con-
ceived a scheme for building the dome of the temple of
Arische at Alexandria, of loadstone; that should by its
attraction uphold her iron image in the centre, suspend-
éd in the air! Projects which at least showed a vast ex-
tent of imagination.

DIO CHRYSTOSTOM, that is, Golden Mouth, a cele-
brated orator and philosopher of Greece, in the first
year, was born at Frusa in Bithynia. He attempted to
persuade Vespasian to quit the empire: was hated
by Domitian; but acquired the esteem of Trajan.
This last prince took pleasure in conversing with him,
and made him ride with him in his triumphal chariot.
"There are still, extant 80 of Dio's orations, and some
other of his works; the best edition of which is that of
Hermand and Samuel Haimanus, in 1730, in folio.

DIOCESE, or DIOCESS, the circuit or extent of
the jurisdiction of a Bishop. The word is formed from
the Greek diocese, government, administration; form-
ed of ὁμος, which the ancient glossaries render admi-
istros, moderator, ordines; hence διοικεται τις πόλις, the
administration or government of a city.

DIOCESE is also used in ancient authors, &c. for
the province of a METROPOLIS.

Dioces (διοικεται), was originally a civil govern-
ment, or prefecture, composed of divers provinces.

The first division of the empire into dioceses is or-
dinarily ascribed to Constantine; who distributed the
whole Roman state into four, viz. the diocese of Italy,
the diocese of Illyria, that of the East, and that of
Africa. And yet long before Constantine, Strabo,
who wrote under Tiberius, takes notice, lib. xiii. p.
432. that the Romans had divided Asia into dioceses;
and complains of the confusion such a division occasion-
ed in geography, Asia being no longer divided by
people, but by dioceses, each whereof had a tribunal or
court, where justice was administered. Constantine
then was only the inventor of those large dioceses,
which comprehended several metropoles and govern-
ments; the former dioceses only comprehending one
jurisdiction or district, or the country that had resort
to one judge, as appears from this passage in Strabo,
and (before Strabo) from Cicero himself, lib. iii. epist.
(ad famil. 9. and lib. xiii. ep. 67.

Thus, at first a province included divers dioceses;
and afterwards a diocese came to comprise divers pro-
vinces. In after times the Roman empire became di-
vided into 13 dioceses or prefectures; though, in-
cluding Rome, and the surburbaric regions, there
were 14. These 14 dioceses comprehended 120 pro-
vinces; each province had a proconsul, who resided
in the capital or metropolis; and each diocese of the
empire had a consul, who presided in the principal city
of the district.

On this civil constitution the ecclesiastical one was
afterwards regulated: each diocese had an ecclesiasti-
cal vicar or primate, who judged finally of all the con-
cerns of the church within his territory.

At present there is some further alteration: for dio-
ceses do not now signify an assemblage of divers pro-
vinces; but is limited to a single province under a met-
ropolitan, or more commonly to the single jurisdiction
of a bishop.

Gul. Brito affirms diocese to be properly the terri-
ory and extent of a baptismal or parochial church;
where divers authors use the word to signify a simple
parish. See PARISH.

DIOCLEIA, (διοικεται), in antiquity, a solemnity
kept in the spring at Megara, in memory of the Athe-
nian hero, who died in the defence of the youth he
loved.

DIOCLESIUS, CAIUS VALERIUS JOVIVS, a cele-
bated Roman emperor, born of an obscure family in
Dalmatia in 245. He was first a common soldier,
and by merit and success he gradually rose to the office
of a general; and at the death of Numerian in 284 he
was invested with imperial power. In this high station
he rewarded the virtues and fidelity of Maximian, who
had shared with him all the subordinate offices in the
army, by making him his colleague on the throne. He
created two subordinate emperors, Constantius and Ga-
lerius, whom he called Caesars, whilst he claimed for
himself and his colleague the superior title of Augustus.
Diolesian has been celebrated for his military vir-
ility; and though he was naturally unpolished by education
and study, yet he was the friend and patron of learn-
ing and true genius. He was bold and resolute, active
and diligent, and well acquainted with the arts, which
will endear a sovereign to his people, and make him re-
spectable even in the eyes of his enemies. His crocity,
however, against the followers of Christianity, has been
deservedly branded with infamy. After he had reign-
ed 22 years in the greatest prosperity, he publicly ab-
dicated.
DIO [240]

DI O

Dioclesia.

Dioecia.

DIOGENES of Apollonia, in the island of Crete, held a considerable rank among the philosophers who taught in Ionia before Socrates appeared at Athens. He was the scholar and successor of Anaximenes, and in some degree rectified his master’s opinion concerning air being the cause of all things. On the contrary, that he was the first who observed that air was capable of condensation and rarefaction. He passed for an excellent philosopher, and died about the 450th year before the Christian era.

DIOGENES the Cynic, a famous philosopher, was the son of a banker of Sinope in Pontus. Being banished with his father for coinage false money, he retired to Athens, where he studied philosophy under Antisthenes. He added new degrees of austerity to the sect of the Cynics, and never did any philosopher carry so far a contempt for the conveniences of life. He was one of those extraordinary men who run every thing to extremity, without excepting even reason itself; and who confirm the saying, that “there is no great genius without a tincture of madness.” He lodged in a tub; and had no other moveables besides his staff, wallet and wooden bowl, which last he threw away on seeing a boy drink out of the hollow of his hand. He used to call himself a vagabond, who had neither house nor country, was obliged to beg, was all clothed, and lived from hand to mouth; and yet, says Zeller, he took as much pride in these things as Alexander could in the conquest of the world. He was not indeed a jot more humble than those who are clothed in rich apparel, and fare sumptuously every day. He looked down on all the world with scorn; he magisterially censured all mankind, and thought himself unquestionably superior to all other philosophers. Alexander one day paid him a visit, and made him an offer of riches or any thing else; but all that the philosopher requested of him was, to stand from betwixt the sun and him. As if he had said, “Do not deprive me of the benefits of nature, and I leave to you those of fortune.” The conqueror was so affected with the vigour and elevation of his soul, as to declare, that, “if he was not Alexander, he would choose to be Diogenes;” that is, if he was not in possession of all that was pompous and splendid in life, he would, like Diogenes, heroically despise it. Diogenes had great presence of mind, as appears from his smart sayings and quick repartees; and Plato seems to have hit off his true character when he called him a Socrates run mad. He spent a great part of his life at Corinth, and the reason of his living there was as follows: as he was going over to the island Ægina, he was taken by pirates, who carried him into Crete, and there exposed him to sale. He answered the crier who asked him what he could do, that “he knew how to command men;” and perceiving a Corinthian who was going by, he showed him to the crier, and said “Sell me to that gentleman, for he wants a master.” Xenocrates, for that was the Corinthian’s name, bought Diogenes, and carried him with him to Corinth. He appointed him tutor to his children, and intrusted him also with the management of his house. Diogenes’s friends being desirous to redeem him, “You are fools (said he); the lions are not the slaves of those who feed them, but they are the servants of the lions.” He therefore
therefore plainly told Xeniades, that he ought to obey him, as people obey their governors and physicians. Some say, that Diogenes spent the remainder of his life in Xeniades's family; but Dion Chrysostom asserts that he passed the winter at Athens, and the summer at Corinth. He died at Corinth when he was about 90 years old; but authors are not agreed either as to the time or manner of his death. The following accoun

...
and murdered by one of his familiar friends called 
Callistrates or Callipus, 354 years before the Christian 
era.

Dion Cassius, a native of Nicea in Bithynia. His 
father's name was Apronianus. He was raised to 
greatest offices of state in the Roman empire by 
Pertinax, and his three successors. He was naturally 
 fond of study, and he improved himself by unwearyed 
application. He was ten years in collecting materials 
for a history of Rome, which he made public in 80 
books, after a laborious employment of 12 years in 
composing it. This valuable history began with 
the arrival of Augustus in Italy, down to the reign of 
the emperor Alexander Severus. The first 34 books are 
totally lost, the 20 following, that is, from the 35th to 
the 54th, remain entire, the six following are mutilated, 
and fragments is all that we possess of the last 20. 
In the compilation of this extensive history, Dion 
proposed to himself Thucydides for a model, but he is not 
perfectly happy in his imitation. His style is pure and 
elegant, and his narrations are judiciously managed, 
and his reflections learned: but upon the whole, he is 
credulous, and the bigotted slave of partiality, satire, 
and flattery. He inveighs against the republican 
principles of Brutus and Cicero, and extols the cause of 
Cæsar. Seneca is the object of his satire, and he 
represents him as debauched and licentious in his mo 
rales.

Dionis, Peter, a distinguished French surgeon, 
was born in Paris. In the time of Louis XIV. he was 
appointed anatomical and chirurgical demonstrator in 
the royal garden, and he was the first who held that place. 
He was surgeon in ordinary to Maria Theresa of 
Austria, queen of France, and to two dauphinesses and 
the royal children. He was the author of several works, 
both on anatomical and surgical subjects. One of the 
first of his publications, is entitled Anatomie de l'Homme, 
suivant la Circulation du Sang, 8vo, which appeared 
in 1690, and has been frequently reprinted, and 
translated into different languages. It was translated into 
the Tartarian dialect by a Jesuit for the use of the 
emperor of China. This work has been considered as 
a useful compendium of anatomy. In another work 
which he published in 1698, entitled, Dissertation 
Historique et Physique sur la Generation de l'Homme, 
he supports the ovarian hypothesis. In 1707 he 
published a work on surgery, entitled Cours d'Operations 
de Chirurgie, 8vo, which was several times reprint 
ed; and latterly it was edited with notes by La Faye 
in 2 vols. This treatise was long received as a standard 
book on the subject. It contains many useful and 
pertinent observations detailed in plain, unaffected lan 
guage. Dionis is the author of two other works: first, 
Sur la Mort subite, et sur la Catalepsie, published 
in 1790, and the other Traité general des Accouche 
ments, in 1718. But the last is little else than an 
abridgment of Mauriceau's work on the same subject. 
Dionis died at Paris in 1718.

Dionæa, Venus's Fly-trap, a genus of plants 
belonging to the decandria class. See Botany Index.

Dionysia, in Grecian antiquity, solemnities in 
honour of Bacchus, sometimes called by the general 
name of Orgia; and by the Romans Bacchanalia, and 
Liberalia. See Bacchanalia and Bacchus.

Dionysiac, in antiquity, was a designation 
given to plays and all manner of sports acted on the 
dionysiac stage; because playhouses were dedicated to Dion-
ysius, i.e. Bacchus, and Venus, as being the deities of 
sports and pleasure.

Dionysius I. from a private secretary became 
general and tyrant of Syracuse and all Sicily. He was 
likewise a poet; and having, by bribes, gained the 
tragedy prize at Athens, he indulged himself so immod 
ately at table from excess of joy, that he died of the 
debauch, 386 B.C.; but some authors relate that he 
was poisoned by his physicians.

Dionysius II. (his successful successor) was a great 
nder tyrant than his father; his subjects were obliged 
to apply to the Corinthians for succour; and Timoleon 
their general having conquered the tyrant, he fled to 
Athens, where he was obliged to keep a school for sub 
sistence. He died 343 B.C.

Dionysius Halicarnassensis, a celebrated histori 
an, and one of the most judicious critics of antiquity, 
was born at Halicarnassus: and went to Rome after 
the battle of Actium, where he staid 22 years under 
the reign of Augustus. He there composed in Greek 
his History of the Roman Antiquities, in 20 books, 
of which the first 11 only are now remaining. There 
are also still extant several of his critical works. The 
best edition of the works of this author is that of 
Oxford, in 1704, in Greek and Latin, by Dr Hudson.

Dionysius, a learned geographer, to whom is 
attributed a Periegesis, or Survey of the Earth, in Greek 
verse. Some suppose that he lived in the time of Au 
gustus; but Scaliger and his successor place him under 
the reign of Severus, or Marcus Aurelius. He wrote 
many other works, but his Periegesis is the only one 
we have remaining; the best and most useful edition 
of which is that improved with notes and illustrations 
by Hill.

Dionysius Areopagita, was born at Athens, and 
educated there. He went afterwards to Heliopolis in 
Egypt; where, if we may believe some writers of his 
life, he saw that wonderful eclipse which happened at 
our Saviour's passion, and was urged by some extra 
ordinary impulse to cry out, Aut Deus patitur, out cum 
patienta dolet; "either God himself suffers, or con 
doles with him who does." At his return to Athens he 
was elected into the court of Areopagus, from whence 
he derived his name of Areopagite. About the year 
50 he embraced Christianity; and, as some say, was 
appointed first bishop of Athens by St Paul. Of his 
conversion we have an account in the 17th chapter of 
the Acts of the Apostles. He is supposed to have suf 
feter martyrdom; but whether under Domitian, Tra 
jan, or Adrian, is not certain. We have nothing re 
aining under his name, but what there is the greatest 
reason to believe spurious.

Dionysius the Lesser, a Scythian, became abbot 
of a monastery at Rome; he was the first who com 
puted time from the birth of Dionysius to Christ, and 
fixed that great event, according to the vulgar era. 
He was also a learned canon law writer, and died about 
the year 540.

Diophantine Problems, in Mathematics, cer 
tain questions relating to square and cube numbers, 
and right-angled triangles, &c. the nature of which 
was
was determined by Diophantus, a mathematician of
Alexandria, who is believed to have lived about the
third century. We have his works, which were
published with notes at Paris, in 1621, by Bachet de Me-
ziriac; and another edition in 1670, with observations
on every question by M. Fermat.

In these questions it is endeavoured to find commensu-
lar numbers to answer indeterminate problems;
which bring out an infinite number of incommensur-
able quantities. For example, it is proposed to find a
right-angled triangle, whose sides, \(a, b, c\), are ex-
pressed by commensurable numbers; it is known that
\(a^2 + b^2 = c^2\), \(c\) being the supposed hypotenuse. But
it is possible to assume \(a\) and \(b\) so, that \(c\) will be in-
commensurable; for if \(a = 1\), and \(b = 2\), \(c = \sqrt{5}\).

The art of resolving such problems consists in so
managing the unknown quantity or quantities in such
a manner, that the square or higher power may vanish
out of the equation, and then by means of the unknown
quantity in its first dimension, the equation may be re-
solved without having recourse to incommensurables;
e.g., let it be supposed to find \(a, b, c\), the sides of a
right-angled triangle, such as will give \(a^2 + b^2 = c^2\).
Suppose \(a = x + u\), then \(a^2 + b^2 = x^2 + 2xu + u^2\); out of
which equation \(x\) vanishes, and \(x = \frac{b - u}{2}\); then as-
suming \(y\) and \(u\) equal to any numbers at pleasure, the
sides of the triangle will be \(y\), \(\frac{y - u}{2}\), and the hypo-
thesis \(x + u = \frac{y - u}{2}\); if \(y = 3\), and \(u = 1\), then \(y - u = 4\),
and \(x + u = 5\). It is evident that this problem admits
of an infinite number of solutions.

For the resolution of such kind of problems, see

DIOPHANTUS, a celebrated mathematician of
Alexandria, has been reputed to be the inventor of
algebra; at least his is the earliest work extant on
that science. It is not certain when Diophantus lived.
Some have placed him before Christ, and some after,
in the reigns of Nero and the Antonines: but all with
equal uncertainty. It seems he is the same Diophan-
tus who wrote the Canon Astronomicus, which Suidas
says was commented on by the celebrated Hypatia,
daughter of Theon of Alexandria. His reputation
must have been very high among the ancients, since
they ranked him with Pythagoras and Euclid in ma-
thematical learning. Bachet, in his notes upon the 5th
book De Arithmetica, has collected, from Diophantus's
epitaph in the Anthologia, the following circumstances
of his life; namely, that he was married when he was
33 years old, and had a son born five years after;
that this son died when he was 42 years of age, and that
his father did not survive him above four years; from which
it appears, that Diophantus was 84 years old when he
died.

DIOPTER, or DIOPTRA, the same with the index
or alihide of an astrolabe, or other such instrument.

Dioptra was an instrument invented by Hipparchus,
which served for several uses; as, to level water-courses;
to take the height of towers, or places at a distance; to
determine the places, magnitudes, and distances of the
planets, &c.

DIOPTRICS,

THAT part of Optics which treats of the laws of
refraction, and the effects which the refraction
of light has in vision. The word is originally Greek,
formed of διό, per, "through," and φτωχας, i. see.

As this and the other branches of Optics are fully
covered under the collective name, we shall here, 1. Just
give a summary of the general principles of the branch,
in a few plain aphorisms, with some preliminary de-
definitions; and, 2. Present our readers with a set of en-
tertaining experiments, illustrative of, or dependent
upon, those principles.

DEFINITIONS.

1. When a ray of light passing out of one medium
into another of a different density, is turned from that
straight line in which it would otherwise proceed into
one of a different direction, it is said to be refracted.
Thus the rays AB, AC, &c. (fig. 1.) by passing out
of air into the glass BGC, are turned from their na-
tural course into that of BF, CE, &c. and are there-
fore said to be refracted by the lens BGC.

2. Any spherical transparent glass, that converges
or diverges the rays of light as they pass through it, is
called a lens.

3. Of lenses there are five sorts: 1. A plane or
single convex lens, which is plane on one side and con-
ven on the other; as AZ, fig. 2. 2. A double convex
Fig. 1.

lens, as B. 3. A plano-concave lens, that is, plane on
one side and concave on the other, as C. 4. A double
concave, as D. And, 5. A meniscus, which is convex
on one side and concave on the other, as E.

4. The point C, (fig. 2.) round which the spherical
surface of a lens, as AZ, is described, is called its cen-
tre; the line XY, drawn from that centre perpendicular
to its two surfaces, is the axis; and the point V, to
which the axis is drawn, is the vertex of that lens.

5. When the rays of light that pass through a single
or double convex lens are brought into their smallest
compass, that point is the focus of the lens.

6. In optical instruments, that lens which is next
the object is called the object glass; and that next the
eye, the eye glass.

7. The distance between the line AB, (fig. 3.) and
Fig. 2.

the perpendicular EF, is called the angle of incidence;
and the distance between the line BD and the perpen-
dicular EF, is called the angle of refraction.

APHORISMS.

1. A ray of light passing obliquely out of one me-
dium into another that is denser, will be refracted to-
ward the perpendicular; as the ray AB, by passing
out of air into glass, is refracted into BF, inclined

H a 2

Digitized by Google
to the perpendicular AF. On the contrary, a ray passing out of a denser into a rarer medium, will be refracted from the perpendicular; as the ray BC, passing out of the glass GH into air, is refracted into DI.

2. The sines of the angles of incidence and refraction, when the lines that contain them are all equal, will have a determinate proportion to each other, in the same mediums; which, between air and water, will be as 4 to 3; between air and glass, as 3 to 2, nearly; and in other mediums, in proportion to their densities.

3. Any object viewed through a glass, whose two surfaces are parallel, will appear of its natural shape and dimensions; provided it be only of the size of the pupil of the eye, and the light proceeding from it be received directly through the glass by one eye only. In all other situations an alteration will be perceived not only in its apparent situation, but its dimensions also. This alteration will be greater in proportion to the thickness of the glass, and the obliquity of the rays; in general, it is so small as to be overlooked.

4. All the rays of light which fall upon a convex lens, whether parallel, converging, or diverging to a certain degree, will be made to meet in a focus on the other side; but if they diverge excessively, they will not do so. Thus, if rays diverge from a point placed before the glass, at the focal distance from it, they will become parallel after passing through it; and if the point from which they proceed be nearer the glass than its focal distance, they will still continue to diverge, though in a less degree than before.

5. When parallel rays fall upon a concave lens, they will be made to diverge after passing through it. If they are diverging already before they fall upon the glass, they will diverge more after passing through it; or even if they are converging to a certain degree, they will diverge upon passing through a concave lens; but if the convergence is very great, they will converge after passing through the glass, though to a more distant point than that at which they would otherwise have met.

6. When an object is viewed through two convex lenses, its apparent diameter ought to be to its real one as the distance of the focus of the object glass is to that of the eye glass; but by reason of the aberration of the rays of light, the magnifying power will be somewhat greater or less in proportion to the diameter of the object.

By these aphorisms we are enabled to account for the various effects of dioptric machines, as refracting telescopes, microscopes, the camera obscura, &c. See Optics.

ENTERTAINING EXPERIMENTS.

I. Optical Illusions.

On the bottom of the vessel ABCD, (fig. 4.) place three pieces of money, as a shilling, a half-crown, and crown; the first at E, the second at F, and the last at G. Then place a person at H, where he can see no further into the vessel than I: and tell him, that by pouring water into the vessel you will make him see three different pieces of money; bidding him observe carefully whether any money goes in with the water.

Here you must observe to pour in the water very gently, or contrive to fix the pieces, that they may not move out of their places by its agitation.

When the water comes up to K, the piece at E will become visible; when it comes up to L, the pieces at E and F will appear; and when it rises to M, all the three pieces will be visible.

From what has been said of the refraction of light, the cause of this phenomenon will be evident: for while the vessel is empty, the ray HI will naturally proceed in a straight line: but in proportion as it becomes immersed in water, it will be necessarily refracted into the several directions, NE, OF, PG, and consequently, the several pieces must become visible.

II. Optical Augmentation.

Take a large drinking glass of a conical figure, that is small at bottom and wide at top; in which put a shilling, and fill the glass about half full with water: then place a plate on the top of it, and when it quickly over, that the water may not get out. You will then see on the plate, a piece of the size of a half-crown; and somewhat higher up, another piece of the size of a shilling.

This phenomenon arises from seeing the piece through the conical surface of the water at the side of the glass, and through the flat surface at the top of the water, at the same time: for the conical surface dilates the rays, and makes the piece appear larger; but by the flat surface the rays are only refracted, by which the piece is seen higher up in the glass, but still of its natural size. That this is the cause will be further evident by filling the glass with water; for as the shilling cannot be then seen from the top, the large piece only will be visible.

III. Optical Subtraction.

Against the wainscot of a room fix three small pieces of paper, as A, B, C, (fig. 5.) at the height of your eye; and placing yourself directly before them, shut your right eye and look at them with the left; when you will see only two of those papers, suppose A and B; but altering the position of your eye, you will then see the third and one of the first, suppose A; and by altering your position a second time, you will see B and C; but never all three of them together.

The cause of this phenomenon is, that one of the three pencils of rays that come from those objects, falls constantly on the optic nerve at D; whereas to produce distinct vision, it is necessary that the rays of light fall on some part of the retina E, F, G, H. We see by this experiment, one of the uses of having two eyes; for he that has one only, can never see three objects placed in this position, nor all the parts of one object of the same extent, without altering the situation of his eye.

IV. Alternate Illusion.

With a convex lens of about an inch focus, look attentively at a silver seal, on which a cipher is engraved.
DIOPTRICS.

The glass in the tube F, which brings about this surprising change, is somewhat on the principle of the common multiplying glass, as represented at G, which by the number of its inclined surfaces, and from the refractive power of the rays proceeding from the objects placed before it, shows it in a multiplied state or quantity. Its only difference is, that the sides of this glass are flat, and diverge upwards from the base to a point in the axis of the glass like a cone: the number of the sides is six; and each side, from its angular position to the eye, has the property of refracting from the border of the print F such a portion of it (designedly placed), as will make a part in the composition of the figure to be represented: for the hexagonal and conical figure of this glass prevents any sight of the ace of diamonds in the centre being seen; consequently the ace of clubs being previously and mechanically drawn in the circle of refraction in six different parts of the border, at 1, 2, 3, 4, 5, 6, and artfully disguised in the ornamental border by blending them with it, the glass in the tube E will change the appearance of the ace of diamonds F into the ace of clubs G. In the same manner may other prints undergo similar changes, according to the will of an ingenious draughtsman who may design them. The figure of the glass is clearly shown at H.

VI. Camera Obscura, or Dark Chamber.

Make a circular hole in the shutter of a window, from whence there is a prospect of the fields, or any other object not too near; and in this hole place a convex glass, either double or single, whose focus is at the distance of five or six feet (A). Take care that no light enter the room but by this glass: at a distance from it equal to that of its focus, place a sheet of paper, covered with the whitest paper; which should have a black border, to prevent any of the side rays from disturbing the picture. Let it be two feet and a half long, and 18 or 22 inches high: bend the length of it inwards, to the form of part of a circle, whose diameter is equal to double the focal distance of the glass. Then fix it on a frame of the same figure, and put it on a moveable foot, that it may be easily fixed at that exact distance from the glass where the objects paint themselves to the greatest perfection. When it is thus placed, all the objects that are in the front of the window will be painted on the paper, in an inverted position (B), with the greatest regularity and in the most natural colours.

If you place a moveable mirror without the window; by turning it more or less, you will have on the paper—

(A) The distance should not be less than three feet; for if it be, the images will be too small, and there will not be sufficient room for the spectators to stand conveniently. On the other hand, the focus should never be more than 15 or 20 feet, for then the images will be obscure, and the colouring faint. The best distance is from 6 to 12 feet.

(B) This inverted position of the images may be deemed an imperfection, but is easily remedied: for if you stand above the board on which they are received, and look down on it, they will appear in their natural position: or if you stand before, and placing a common mirror against your breast in an oblique direction, look down in it, you will there see the images erect, and they will receive an additional lustre from the reflection of the glass; or place two lenses, in a tube that draws out; or, lastly, if you place a large concave mirror at a proper distance before the picture, it will appear before the mirror, and in an erect position.
DIOPTRICS.

VIII. To magnify small Objects by means of the Sun’s Rays let into a Dark Chamber.

Let the rays of light that pass through the lens in the shutter be thrown on a large concave mirror, properly fixed in a frame. Then take a slip or thin plate of glass; and sticking any small object on it, hold it in the incident rays, at a little more than the focal distance from the mirror; and you will see on the opposite wall, amidst the reflected rays, the image of that object, very large, and extremely clear and bright. This experiment never fails to give the spectator the highest satisfaction.

IX. The Portable Camera Obscura.

The great pleasure produced by the camera obscura in the common form, has excited several to render it more universally useful by making it portable, easily fixed on any spot, and adapted to every prospect. We shall not here examine the merits of the various sorts that have been invented; but content ourselves with describing of two late improved constructions, as made and sold by the opticians of the present time, and that appear in their construction the most convenient and advantageous of any yet contrived.

The pocket or portable camera obscura, with a drawer to draw out in the front, is represented in fig. 7. The images of the objects before the instrument are reflected upon a glass ground rough on its upper side, and that is placed at top of the, under part of the box, under the moveable cover represented in the figure. The images represented thereon will afford a most beautiful and perfect piece of perspective or landscape of whatever is before the camera, and more particularly so if the sun shines upon the objects. The outlines of them may easily be traced on the glass by a black lead pencil. There is sometimes a scale of proportions placed in the upper surface of the drawer, by which any particular building or other object may be drawn in a given proportion or magnitude, and according to the figures inserted on the scale, which are adapted to the focus or foci of the lenses made use of in the camera. The glasses that are made use of in this camera are only three, and are represented in fig. 8. The convex glass A is placed in the front of the drawer of the camera, and is of a focus agreeable to the length of the box. The mirror CE reclines in the box in an angle of 45 degrees from a perpendicular situation. The rays flowing from the object F through the convex glass A to the plane mirror CE will be reflected from it, and meet in points on the glass placed horizontally in the direction CD, and will form thereon the aforementioned images. If on this glass and oiled paper or any other transparent substance be placed the images.

(c) There is another method of making the dark chamber; which is by a scioptic ball, that is, a ball of wood, through which a hole is made, in which hole a lens is fixed: this ball is placed in a wooden frame, in which it turns freely round. The frame is fixed to the hole in the shutter; and the ball, by turning, answers, in great part, the use of the mirror, on the outside of the window. If the hole in the window be so bigger than a pea, the object will be represented without any lens, though by no means so distinctly, or with such vivid colours.

(d) When the sun is directly opposite to the hole, the lens will itself be sufficient: or by means of the mirror on the outside window, as in Experiment VI, the lens will answer the purpose at any time.
The construction is as follows: Let ABCD (fig. 10.) be the side of a tin box, eight inches high, eight inches long, and ten broad (or any other similar dimensions), the top of which must have a funnel, with a cover, as represented in fig. 11.; which at the same time it gives Fig. 11. a passage to the smoke, prevents the light from coming out of the box. In the middle of the bottom of the box must be placed a low tin lamp E, which is to be moveable. It should have three or four lights, that must be at the height of the centre of the glasses in the tubes N and O. In the largest of these tubes must be placed a glass semiglobular lens N, about four inches diameter; and in the smaller one a double convex lens O, about 2\frac{1}{2} inches diameter, and six inches focus, the length of the tubes holding them about 4\frac{1}{2} inches each; the inner tube containing the small lens O must be a sliding one, in order to adjust it at a proper distance from the painted sliders, so that the objects thereon may be distinctly represented on the cloth or white wall. A slit or opening between the glass N and the front side BGDH of the box must be made large enough to admit the sliders to be passed through, (as in fig. 11.) The clearness of the light, and the objects upon the cloth, will depend much upon the light of the lamp; it will therefore be proved best, to place, instead of the common lamp E, a kind of the new or Argand's patent lamp, which will be found considerably to improve the effect of the lantern by its superior strength of light.

From the construction of this lantern it is evident that when the glass sliders, with the painted figures, are placed in the groove or slit in the lantern for that purpose, and the room darkened, a quantity of light from the lamp at E will be collected by the lens N, and refracted upon the cloth placed opposite, and thereby moving the sliding tube containing the small lens O gradually in or out as occasion may require, this lens will form images of the figures on the sliders in their distinct colours and proportions, with the appearance of life itself, and of any size from six inches to seven feet, according to the distance of the lantern from the cloth. The lantern, with one of the sliders ready for use, is clearly represented in fig. 11. By the aid of the new patent lamp aforementioned, considerable useful improvements are made to the lantern. Mr Jones, optician, of Holborn, has contrived an apparatus to be applied to it, that converts it into a microscope by night, and it shows all the variety of transparent and many of the opaque objects magnified upon a cloth or screen opposite, similar to the figures above mentioned, but not in so large a degree; about one or two feet diameter is the utmost that can at present be obtained.

Method of painting the Glasses for the lantern. Draw on a paper the subject you desire to paint, and fix it at each end to the glass. Provide a varnish with which you have mixed some black paint, and with a fine pencil draw on the other side of the glass, with very light touches, the design drawn on the paper. If you are desirous of making the painting as perfect as possible, you should draw some of the outlines in their proper colours, provided they are the strongest tints of these colours that are used. When the outlines are dry, you colour the figures with their proper tints or degradations.
DIOPTRICS.

Degradations. Transparent colours are most proper for this purpose, such as carmine, lake, Prussian blue, verdigris, &c. and these may be tempered with a strong white varnish, to prevent their peeling off. You are then to shade them with black mixed with the same varnish, or with bistre, as you find convenient. You may also leave strong lights in some parts, without any colours, in order to produce a more striking effect. Observe, in particular, not to use more than four or five colours, such as blue, red, green, and yellow. You should employ, however, a great variety of tints, to give your painting a more natural air; without which they will represent vulgar objects, which are by no means the more pleasing because they are gawdy.

When the lamp in the lantern is lighted, and, by drawing out the tube to a proper length, the figures painted on the glass appear bright and well defined, the spectator cannot fail of being highly entertained by the succession of natural or grotesque figures that are painted on the glasses. This piece of optics may be rendered much more amusing, and at the same time more marvellous, by preparing figures to which different natural motions may be given (e), which every one may perform according to his own taste; either by movements in the figures themselves, or by painting the subject on two glasses, and passing them at the same time through the grooves, as will be seen in the next experiment.

XI. To represent a Tempest by a Magic Lantern.

Provide two plates of glass, whose frames are so thin that they may both pass freely through the slit or groove of the common magic lantern at the same time.

On one of these glasses you are to paint the appearance of the sea from the slightest agitation to the most violent commotion. Representing from A to B (fig. 12) a calm; from B to C a small agitation, with some clouds; and so on to F and G, which should exhibit a furious storm. Observe, that these representations are not to be distinct, but run into each other, that they may form a natural gradation; remember also, that great part of the effect depends on the perfection of the painting, and the picturesque appearance of the design.

On the other glass (fig. 13) you are to paint vessels of different forms and dimensions, and in different directions, together with the appearance of clouds in the tempestuous parts.

You are then to pass the glass slowly through the groove; and when you come to that part where the storm begins, you are to move the glass gently up and down, which will give it the appearance of a sea that begins to be agitated; and so increase the motion till you come to the height of the storm. At the same time you are to introduce the other glass with the ships, and moving that in like manner, you will have a natural representation of the sea, and of ships in a calm and in a storm. As you draw the glasses slowly back, the tempest will seem to subside, the sky grow clear, and the ships glide gently over the waves.—By means of two glasses disposed in this manner you may likewise represent a battle or sea-fight, and numberless other subjects, that every one will contrive according to his own taste. They may also be made to represent some remarkable or ludicrous action between different persons, and many other amusements that a lively imagination will easily suggest.

XII. The Nebulous Magic Lantern.

The light of the magic lantern, and the colour of images, may not only be painted on a cloth, but also reflected by a cloud of smoke.

Provide a box of wood or pasteboard (fig. 14.) of about four feet high, and of seven or eight inches square at bottom, but diminishing as it ascends, so that its aperture at top is but six inches long, and half an inch wide. At the bottom of this box there must be a door that shuts quite close, by which you are to place in the box a chafing-dish with hot coals, on which is to be thrown incense, whose smoke goes out in a cloud at the top of the box. It is on this cloud that you are to throw the light that comes out of the lantern, and which you bring into a smaller compass by drawing out the movable tube. The common figures will here serve. It is remarkable in this representation, that the motion of the smoke does not at all change the figures; which appear so conspicuous, that the spectator thinks he can grasp them with his hand.

Note. In this experiment some of the rays passing through the smoke, the representation will be much less vivid than on the cloth; and if care be not taken to reduce the light to its smallest focus, it will be still more imperfect.

XIII. To produce the Appearance of a Phantom upon a Pedestal placed on the middle of a Table.

Enclose a common small magic lantern in a box ABCD (fig. 15.) that is large enough to contain also an inclined mirror M, which must be moveable, that it may reflect the cone of light thrown on it by the lantern, in such a manner that it may pass out at the aperture made in the top of the box. There should be a flap with hinges to cover the opening, that the inside of the box may not be seen when the experiment is making. This aperture should likewise be oval, and of a size adapted to the cone of light that is to pass through it. There must be holes made in that part of the box which is over the lantern, to let out the smoke: and over that part must be placed a chafing-dish of an oblong figure, and large enough to hold several lighted coals. This chafing-dish may be enclosed in a painted tin box of about a foot high, and with an aperture at top something like fig. 14. It should stand on four short feet, to give room for the smoke of the lamp to pass out. There must also be a glass that will ascend and descend at pleasure in a vertical groove a b. To this glass let there be fixed a cord, that, going over a pulley c, passes out of the box at the side CD, by which the

(e) There are in the Philosophical Essays of M. Muschenbroek, different methods of performing all these various movements, by some mechanical contrivances that are not difficult to execute.
the glass may be drawn up, and will descend by its own weight. On this glass may be painted a spectre, or any other more pleasing figure. Observe, that the figures must be contracted in drawing, as the cloud of smoke does not cut the cone of light at right angles, and therefore the figures will appear longer than they do on the glass.

After you have lighted the lamp in the lantern, and put the mirror in a proper direction, you place the box or pedestal ABCD on a table; and putting the chasing dish in it, throw some incense in powder on the coals. You then open a trap door, and let down the glass slowly; and, when you perceive the smoke diminish, you draw up the glass, that the figure may disappear, and shut the trap-door. This appearance will occasion no small surprise, as the spectre will seem to rise gradually out of the pedestal, and on drawing up the glass will disappear in an instant. Observe, that when you exhibit this experiment, you must put out all the lights in the room; and the box should be placed on a high table, that the spectators may not perceive the aperture by which the light comes out. Though we have mentioned a small magic lantern, yet the whole apparatus may be so enlarged, that the phantom may appear of a formidable size.

XIV. The Magic Theatre.

By making some few additions to the magic lantern with the square tube, used in Experiment X. various scenes, characters, and decorations of a theatre, may be represented in a lively manner. In this experiment it is quite necessary to make the lantern much larger than common, that the objects painted on the glasses, being of a larger size, may be represented with greater precision, and consequently their several characters more strongly marked.

Let there be made a wooden box ABCD, fig. 16. a foot and a half long, 15 inches high, and 12 wide. Let it be placed on a stand EF, that must go round it, and by which it may be fixed with two screws to a table. Place over it a tin cover, as in the common lantern. Make an opening in its two narrowest sides; in one of which place the tube H, and in the other the tube I.; let each of them be six inches wide, and five inches high: in each of these tubes place another that is moveable, in order to bring the glasses, or concave mirror, that are contained in them, to a proper distance. In the middle of the bottom of this box place a tin lamp M; which must be moveable in a groove, that it may be placed at a proper distance with regard to the glasses and mirror; this lamp should have five or six lights, each of them about an inch long. At the beginning of the tube H, toward the part N, make an opening of an inch wide, which must cross it laterally: another of three quarters of an inch, that must cross it vertically, and be nearer the box than the first; and a third of half an inch, that must be before the first. The opening made laterally must have three or four grooves, the second two, and the third one: that different subjects of figures and decorations may be passed, either sidewise, ascending or descending, so that the scenes of a theatre may be the more exactly imitated (F). Enclose these grooves between two convex rectangular glasses, of six inches long, and five inches high, and of about 20 inches focus; one of which must be placed at O, and the other toward P. Have another tube Q, of about a foot long, which must enter the marked H; and at its outward extremity place a lens of about 15 inches focus. There must also be a third tube R, four inches long, into which that marked I is to enter to the exterior end of this adjust a concave mirror, whose focus must be at seven or eight inches from its reflecting surface.

The magic lantern being thus adjusted, nothing more is necessary than to provide glasses, painted with such subjects as you would represent, according to the grooves they are to enter. The lamp is then to be lighted; and placing a glass in one of the grooves, you draw out the moveable tubes till the object paints itself on a cloth to the most advantage: by which you determine the distance of the lantern and the size of the image. You then make a hole in the partition of that size, and fix it in a plate of clear glass, over which you paste a very thin paper, which must be varnished, that it may be as transparent as possible.

On this paper are to be exhibited the images of all those objects, that by passing successively through the grooves, are to represent a theatrical entertainment. The exhibition will be very agreeable; because the magic lantern being concealed behind the partition, the cause of the illusion cannot by any means be discovered.

In order to show more clearly in what manner a subject of this sort should be painted, and the glasses disposed, we will here make choice of the siege of Troy for a theatrical subject; in which will be found all the incidents necessary to the exhibition of any other subject whatever.—In the first act the theatre may represent, on one side, the ramparts of Troy; toward the back part, the Grecian camp; and at a farther distance, the sea, and the isle of Tenedos. We will suppose the time to be that when the Greeks feigned to raise the siege; and embarked, leaving behind them the wooden horse, in which were contained the Grecian soldiers.—On a glass, therefore, of the same width with the aperture made in the side AC of the box, you are to paint a deep blue curtain, lightly charged with ornaments, quite transparent. This glass is to be placed in the first vertical groove; so that by letting it gently down, its image may appear to rise in the same manner as the curtain of a theatre. All the glasses that are to ascend or descend must be bordered with thin pieces of wood, and so exactly fill the grooves, that they may not slide down of themselves.—You must have several glasses of a proper size to pass through the horizontal grooves, and of different lengths according to the extent of the subject. You may paint on

(F) In the decorations, the clouds and the palaces of the gods should descend; earthy palaces, gardens, &c. enter at the side.

Vol. VII. Part I.
on the first, the walls of Troy. On the second, the Grecian camp. On the third, the sea, the isle of Tenedos, and a serene sky. On the fourth, the Grecian troops by detached figures. On the fifth, other troops, disposed in battalions, and placed at a distance. On the sixth, divers vessels, which as the glass advances in the grooves diminish in size. On the seventh, the wooden horse and Sinon. On the eighth, Trojan men and women.

These glasses being properly painted, you place in the horizontal grooves the first, second, third, and fourth. Then draw up the curtain, by letting down the glass on which it is painted, and draw away gently the fourth glass, and after that the second; then advance very gently the fifth that represents the embarkation, and pass it quite through. Next pass, the opposite way, the sixth, which represents the Grecian fleet. The objects painted on the fourth, fifth, and sixth, quite disappearing, you are to advance the seventh, on which is painted the wooden horse; and at the same time the eighth, where the Trojans will appear to draw the horse into the city. The curtain is then to be let down, that you may withdraw the scenes of the first act, and place in the grooves those that are to compose the second.—In the second act may be represented the interior part of the city of Troy; on one side may be seen the wooden horse, and in the back part the temple of Pallas. The glasses for this act may be painted in the following manner. On the first may be palaces and houses, representing the inside of a city. On the second, the temple of Pallas in the centre, with a clear night and the moon. In the front may be seen the wooden horse, that the Trojans have placed near the temple of Pallas. On the third, a troop of Greeks, with Sinon at their head, who are going to open the gates of the city to the Grecians. On the fourth, different troops of armed Greeks, painted on a long glass, to afford variety. On the fifth, several troops of Trojans. On the sixth, various appearances of fire and smoke, so disposed, that this glass being drawn up above the others, the objects painted on the first glass may appear in a conflagration.

Before you draw up the curtain, you should place the first and second glasses. You then pass the whole third glass slowly; a little after, the fourth, on which are painted the different bodies of armed Greeks; and at the same time, from the opposite side, the sixth glass, that represents the Trojan troops; observing to move them slowly both in advancing and retreating, to imitate a combat (c). Then draw up, by degrees, the sixth, on which are painted the fire, flame, and smoke, so that the palaces and houses painted on the first glass may appear to take fire gradually, and at last present a general conflagration. After having represented these incidents with the greatest attention, you let fall the curtain to prepare for the third act. In this may be represented the inside of Priam’s palace; where is seen an altar, round which several Trojan princesses appear, who have fled thither for safety. On the first glass may be painted the palace. On the second, a view of the back part of the palace, with the altar. On the third, Priam with several Trojan men and women. On the fourth, Pyrrhus and a troop of Greeks. On the fifth, the same actors, with the palace in flames. On the sixth, a conflagration. The two first glasses which are to be drawn up, should be placed before you raise the curtain. Then pass the third; next advance the fourth; which being drawn up, discovers on the fifth the palace in flames; then drawing up the sixth, let down the first, that the palace may appear entirely destroyed by the conflagration.

The fourth act may represent the environs of Troy, with a distant prospect of the sea. The first and third glasses of the first act may be here used; to which may be added a third, representing Æneas bearing his father Anchises, followed by his son Iulus and some Trojans. With this glass may be represented the flight of the Trojans; and the embarkment of Æneas with another glass, on which are painted certain vessels. To this act the following scenes may be added: The cave of Æolus; the back part of the cave; Æolus; the winds; Juno in her chariot.

The fifth act should represent the open sea, with the fleet of Æneas sailing for Italy. On the first glass must be painted the sea, as in the eleventh experiment, or else the waves should be imitated by another glass under the first. On the second, the Trojan fleet. On the third, Neptune in his car. On the fourth, the palace of Jupiter. On the fifth, the inside of the palace; the gods assembled in council, with Venus obtaining leave of Jupiter for Æneas to land in Italy,—After having placed the first glass, that represents a calm sea, the curtain is raised, and the second scene is advanced, which contains the Trojan fleet. The first is then brought forward, to represent a violent tempest: then raising the third glass, Neptune appears, who commands the waves to be still, which is done by making the tempest subside by degrees. The fleet then advances, and passes over the whole theatre; presently after the fourth and fifth scenes descend, that represent Olympus, and finish the exhibition.

Note, We must here repeat, that if you would represent a subject of this sort to advantage, it is quite necessary that the glasses be well painted; and those that are to be in front should be in stronger and more opaque colours, that the images of those behind may not appear mixed with them, which will be the case if they are all equally transparent. The glasses should also be of different lengths; that some being placed before the others are drawn away, their extremities may not be perceived.

The larger these subjects are represented, the better effect they will have: the front of the theatre should appear to be about three feet wide; and if some parts of the figures were moveable, it would still add to the variety of the entertainment.

DIOSCOREA,

(c) He that moves the glasses, seeing the effect they produce, is the better able to render the representation as natural as possible.
DIO SCOREA, a genus of plants belonging to the dioecia class; and in the natural method ranking under the 11th order, Sarmentozae. See Botany Index.

The only remarkable and useful species is the bulbifer or yam. The roots of it are eaten by the inhabitants of both the Indies; and are particularly serviceable in the West India islands, where they make the greatest part of the negroes food. The plant is supposed to have been brought from the East to the West Indies; for it has never been observed to grow wild in any part of America; but in the island of Ceylon, and on the coast of Malabar, it grows in the woods, and there are in those places a great variety of sorts. It is propagated by cutting the root in pieces, observing to preserve an eye in each, as is practised in planting potatoes. One plant will produce three or four large roots. The skin of these roots is pretty thick, rough, unequal, covered with many stringy fibres or filaments, and of a violet colour approaching to black. The inside is white, and of the consistence of red beet. It resembles the potato in its meazliness, but is of a closer texture. When raw, the yams are viscous and clammy; when roasted or boiled, they afford very nourishing food; and are often preferred to bread by the inhabitants of the West Indies, on account of their lightness and facility of digestion. When first dug out of the ground, the roots are placed in the sun to dry; after which they are either put into sand, dry garretts, or casks; where, if kept from moisture, they may be preserved whole years, without being spoiled or diminished in their goodness. The root commonly weighs two or three pounds; though some yams have been found upwards of twenty pounds weight.

DIO SCORIDES, a physician of Cilicia, who lived, as some suppose, in the age of Nero. He was originally a soldier; but afterwards he applied himself to study, and wrote a book upon medicinal herbs.

DIOSCURI (Dioscorides), from Δις, Jupiter, and ἵπποι, infants), in antiquity, a festival in honour of the Δίσιος, or Castor and Pollux, who were reputed to be the sons of Jupiter. It was observed by the Cyrenaeans, but more especially by the Spartans, whose country was honoured by the birth of these heroes. The solemnity was full of mirth, being a time wherein they shared plentifully of the gifts of Bacchus, and diverted themselves with sports, of which wrestling matches always made a part.

DIO SMAS, AFRICAN SPIREA, a genus of plants belonging to the pentandria class; and in the natural method ranking with those of which the order is doubtful. See Botany Index.

DIO SPOLIS, in Ancient Geography, a city of the Delta, or Lower Egypt; to the south of the Buisitic branch, before it divides into two. Another of Bithynia, in the territory of Hieraclea. —A third, called Magnes, denoting Thebae of the Higher Egypt. —A fourth, Diospolis Parva, the metropolis of the Nomos Diospolites of the Higher Egypt. —A fifth Diospolis, of Samaria, the same with Lydda. —A sixth Diospolis, the ancient name of Laodices of Phrygia, on the Lycus.

DIO SPOLITES NOMOS, (Ptolemy,) a division of Thessaly or the Higher Egypt, to distinguish it from another of the Lower Egypt or the Delta; to the south of the Nomos Thinities, on the west side of the Diospolites Nile.

DIO SPYROS, an Indian Date Plum; a genus of plants belonging to the polygamy class; and in the natural method ranking under the 18th order, Bicorneas. See Botany Index.

DIPHTHONG, in Grammar, a double vowel, or the mixture of two vowels pronounced together, so as to make one syllable.

The Latins pronounced the two vowels in their diphthongs as or o, or as ce, much as we do; only that the one was heard much weaker than the other, though the division was made with all the delicacy imaginable. Diphthongs, with regard to the eyes, are distinguished from those with regard to the ears: in the former either the particular sound of each vowel is heard in the pronunciation; or the sound of one of them is drowned; or lastly, a new sound, different from either, results from both; the first of these only are real diphthongs, as being such both to the eye and ear. Diphthongs with regard to the ear are either formed of two vowels meeting in the same syllable, or whose sounds are severally heard; or of three vowels in the same syllable, which only afford two sounds in the pronunciation.

English diphthongs, with regard to the eye and ear, are ai, au, ea, ee, ei, oo, ou. Improper English diphthongs, with regard to the eye only, are aee, aee, eee, ee, te, ei, or, ve, uu.

DIPLOE, in Anatomy, the soft medullary, or medullary substance which lies between the two lamina of the bones of the cranium. See Anatomy Index.

DIPLOMA. See Diplomatics.

In a peculiar sense, it is used for an instrument or license given by colleges, societies, &c. to a clergyman to exercise the ministrial function, or to a physician to practise the profession, &c. after passing examination, or admitting him to a degree.

DIPLOMATICS, the science of diplomas, or of Bickley's ancient literary monuments, public documents, &c. It Elements does not, however, nor can it, absolutely extend its researches to antiquity; but is chiefly confined to the middle age, and the first centuries of modern times. For though the ancients were accustomed to reduce their contracts and treaties into writing; yet they grav'd them on tables, or covered them over with wax, or brass, copper, stone, or wood, &c. And all that in the first ages were not traced on brass or marble, has perished by the length of time, and the number of destructive events.

1. The word diploma signifies properly a letter or epistle, that is folded in the middle, and that is not open. But, in more modern times, the title has been given to all ancient epistles, letters, literary monuments, and public documents, and to all those pieces of writing which the ancients called Synopsis, Chirographa, Coaldia, &c. In the middle age, and in the diplomas themselves, these writings were called Lettere, Tractato, Placidia, Charter indiculae, Sagilla, and Builer; as also Panchartar, Pantocharter, Tractoria, Descriptiones, &c. The originals of these pieces are named Exemplaria, or Autographa, Chartera authentica, Originalia, &c. and the copies, Apographa, Copia, Particular, and • forth.
forth. The collections that have been made of them are called Chartaria and Chartula. The place where these papers and documents were kept, the ancients named Scrinia, Tabularium, or Registrum, words that were derived from the tables of brass, and, according to the Greek idiom, Archivum or Archivum.

2. In order to understand the nature of these ancient papers, diplomas, and manuscripts, and to distinguish the authentic from the counterfeit, it is necessary to know that the paper of the ancients came from Egypt, and was formed of thin leaves or membranes, taken from the branches of a tree named Papyrus, or Bibium Egyptianum, and which were pasted one over the other with the slime of the Nile, and were pressed and polished with a pumice stone. This paper was very scarce; and it was of various qualities, forms, and prices, which they distinguished by the name of charta hieratica, lucida, augusta, amphitheatrica, soveta, tanivica, emperetica, &c. They cut this paper into square leaves, which they pasted one to the other, in order to make rolls of them: from whence an entire book was called volumen, from volvere; and the leaves of which it consisted, paginae. Sometimes, also, they pasted the leaves all together by one of their extremities, as is now practised in binding; by this method they formed the back of a book, and these the learned called codices. They rolled the volume round a stick, which they named umbilicus; and the two ends that came out beyond the paper, cornua. The title, wrote on parchment, in purple characters, was joined to the last sheet, and served as a cover. They made use of all sorts of strings or ribbons, and even sometimes of locks, to close the book; and sometimes also it was put into a case. But there is not now to be found, in any library or cabinet, whatever, any one of these volumes. We have been assured, however, by a traveller, that he had seen several of them in the ruins of Herculaneum; but so damaged, the paper so stiff and brittle, by the length of time, that it was impossible to unroll them, and consequently to make use of any of them; for on the first touch they fell into shatters.

3. We are ignorant of the precise time when our modern paper was invented; and when they began to make use of pens in writing instead of the stalks of reeds. The ink that the ancients used, was not made of vitriol and gall, like the modern, but of soot. Sometimes also they wrote with red ink made of vermillion; or in letters of gold, on purple or violet parchment. It is not difficult for those who apply themselves to this study, to distinguish the parchment of the ancients from that of the moderns, as well as their ink and various exterior characters: but that which best distinguishes the original from the counterfeit is, the writing or character itself; which is so distinctly different from one century to another, that we may tell with certainty, within about 40 or 50 years, when any diploma was written. There are two works which furnish the clearest lights on this matter, and which may serve as sure guides in the judgments we may have occasion to make on what are called ancient diplomas. The one is the celebrated treatise on the Diplomatic, by F. Mabillon; and the other, the first volume of the Chronicon Gotvicense. We there find specimens of all the characters, the flourishes, and different methods of writing, of every age. For these matters, therefore, we must refer our readers to those authors; and shall here only add, that,

4. All the diplomas are written in Latin, and consequently the letters and characters have a resemblance to each other: but there are certain strokes of the pen which distinguish not only the ages, but also the different nations; as the writings of the Lombards, French, Saxons, &c. The letters in the diplomas are also usually longer, and not so strong as those of manuscripts. There has been also introduced a kind of court hand, of a very disproportionate length, and the letters of which are called Estiles litterae crisis, ac protractiones. The first line of the diploma, the signature of the sovereign, that of the chancellor, notary, &c. are usually wrote in this character.

5. The signature of a diploma consists either of the sign of the cross, or of a monogram or cipher, composed of the letters of the names of those who subscribed it. The initial letters of the name, and sometimes also the titles, were placed about this cross. By degrees the custom changed, and they invented other marks, as, for example, the sign of Charlemagne was thus:

They sometimes also added the dates and epoch of the signature, the feasts of the church, the days of the calendar, and other like matters. The successive corruption of the Latin language, the style and orthography of each age, as well as their different titles and forms; the abbreviations, accentuation, and punctuation, and the various methods of writing the diphthongs; all these matters united, form so many characters and marks by which the authenticity of a diploma is to be known.

6. The seal annexed to a diploma was anciently of white wax, and artfully imprinted on the parchment itself. It was afterwards pendant from the paper, and inclosed in a box or case, which they called bulla. There are some also that are stamped on metal, and even on pure gold. When a diploma bears all the characters that are requisite to the time and place where it is supposed to be written, its authenticity is not to be doubted: but at the same time we cannot examine them too scrupulously, seeing that the monks and priests of former ages have been very adroit in making of counterfeits, and the more as they enjoyed the confidence of princes and statesmen, and were even sometimes in possession of their rings or seals.

7. With regard to manuscripts that were wrote before the invention of printing, it is necessary (1.) to know their nature, their essential qualities, and matter; (2.) to be able to read them freely, and without error; (3.) to judge of their antiquity by those characters which we have just mentioned with regard to the diplomas; and (4.) to render them use of in the sciences. As there are scarce any of the ancient codes now remaining (see par. 2.), wrote on the Egyptian paper, or on wood, ivory, &c. we have only to consider those that are written on parchment or vellum (membranae), and such as are wrote on our paper (chartareae). The former
DIPPER, Diplomates, Dipping.

former of these are in most esteem. With regard to the character, these codes are written either in square and capital letters, or in half square, or round and small letters. Those of the first kind are the most ancient. There are no intervals between the words, no letters different from the others at the beginning of any word, no points, nor any other distinction. The codes which are written in letters that are half square, resemble those we have in Gothic characters, as well for the age as the form of the letters. Such as are written in round letters are not so ancient as the former, and do not go higher than the ninth or tenth century. These half spaces between the words, and some punctuation. They are likewise not so well written as the preceding, and are frequently disfigured with comments. The codes are divided, according to the country, into Lombard, Italian, Gaulic, Franco-Gaulic, Saxon, Anglo-Saxon, &c.

8. In the ancient Greek books, they frequently terminated the periods of a discourse, instead of all other division, by lines; and these divisions were called, in Latin, versus, from versendo: for which reason these lines are still more properly named versus than lineae. At the end of a work, they put down the number of verses which it consisted, that the copies might be more easily collated: and it is in this sense we are to understand Trebonius, when he says, that the Pandects contain 150,000 pene versus. These codes were likewise vel proba vel deterioris notae, more or less perfect, not only with regard to the calligraphy or beauty of the character, but to the correction of the text also.

9. It is likewise necessary to observe, in ancient codes, the abbreviations, as they have been used in different centuries. Thus, for example, A. C. D. signifies Aulus Caesar Decimus; Ap. Cn. Appius Caecus; Aug. Imp. Augustus Imperator. The characters that are called notae, are such as are not to be found in the alphabet; but which, notwithstanding, signify certain words. All these matters are explained in a copious manner by Vossius, and in the Chronicon Gotvicense. Lastly, The learned divide all the ancient codes into codices minus raros, rariores, editae, et anecdotos. The critical art is here indispensably necessary: its researches, moreover, have no bounds; and the more, as the use of it augments every day, by the discoveries that are made in languages, and by the increase of erudition.

DIPONDIUS, in the scripture language, is used by St Luke to signify a certain coin which was of very little value. Our translation of the passage is, "Are not two sparrows sold for two farthings?" In St Matthew, who relates the same thing, we read "Are not two sparrows sold for a farthing?" The Greek reads assarion instead of as. Now assarion, as some say, was worth half an as, that is to say, four French deniers and ¾th; and, according to others, two deniers and ⅙th. Dipondius seems rather to signify half an as. Calmet, Dict. Bibl. Luke xii. 6. Matt. x. 29.

Dr Arbuthnot differs in opinion from the author last quoted. He says, that this coin was at first libralis, or of a pound weight; and even when diminished, it retained the name of libella. So that dipondius denotes two asses.

DIPPING, among miners, signifies the interruption or breaking off the veins of ore; an accident that gives them a great deal of trouble before they can discover the ore again. A great deal of the skill of the miners consists in the understanding this dipping of the veins, and knowing how to manage in it. In Cornwall they have this general rule to guide them in this respect: most of their tin-loads, which run from east to west, constantly dip northwards. Sometimes they underlie; that is, they slope down towards the north three feet in height perpendicular. This must carefully be observed by the miners, that they may exactly know where to make their air-shafts when occasion requires; yet, in the higher mountains of Dartmoor, there are some considerable loads, which run north and south; these always underlie towards the east. Four or five loads may run nearly parallel to each other in the same hill; and yet, which is rare, they may meet altogether in one hatch, as it were a knot, which well tins the place, and so separate again, and keep their former distances.

Dipping Needle, an instrument used for observing the quantity of inclination towards the earth, assumed by any needle or other body after it has acquired the magnetic virtue. This was first observed by one Robert Norman, an Englishman, and maker of compasses for mariners, in the end of the 16th century; who finding that he was always obliged to counterbalance that end which turns to the north by a bit of wax or such other substance, though the balance had been ever so exact before, published an account of his discovery as a matter of importance. The subject was instantly attended to; and instruments were not only contrived for ascertaining the quantity of the dip, but various speculations formed concerning the cause of such a surprising phenomenon.

The general phenomena of the dipping needle are: that about the equatorial parts of the earth it remains in a horizontal position, but depresses one end as we recede from these; the north end, if we go towards the north, and the south end if we proceed towards the south pole. The farther north or south that we go, the inclination becomes the greater; but there is no place of the globe hitherto discovered where it points directly downwards, though it is supposed that it would do so in some part very near the pole. Its inclination is likewise found to vary very considerably at different times in different places of the earth, and by some changes of situation, in such a manner as must appear at first sight very unaccountable. Of all those who have attempted the investigation of this obscure subject, none have been more successful than M. Cavallo, who in his Treatise on Magnetism has given particular attention to all the phenomena, and accounted for them upon plain and rational principles, in the following manner:

The dip of the magnetical needle in general may be understood from the following easy experiment:—Lay an oblong magnet horizontally upon a table and over it suspend another smaller magnet (a sewing needle to which the magnetic virtue has been communicated will answer the purpose), in such a manner as to remain in a horizontal position when not disturbed by another magnet. Now, if this last small magnet or sewing needle, suspended by the middle, be brought just over the middle of the large one, it will turn itself in such a manner that the south pole of the small mag-
DIP [ 254 ]

Dipping Needle.

DIP re will point towards the north pole of the large one: and if at an equal distance from both, will remain in a horizontal position. But if we move it nearer to one of the poles than the other, it will readily be understood that the corresponding end of the needle will be attracted by the pole to which it approaches, and of consequence inclined downwards; the contrary end being proportionally elevated. It is likewise evident, that this inclination will be greater or less according to the distance at which the small magnet is placed from the pole of the large one; the attraction of the nearest pole having always the greatest effect upon it. And it is equally plain, that when brought directly over one of the poles of the large magnet, it will turn its own contrary one directly towards it, and thus lie exactly in the axis of the large one.

The application of this experiment to the phenomena of the dipping needle is obvious, as nothing more is requisite for solving the whole mystery than to suppose the earth itself to be the large magnet, and the magnetic needle or any other magnetic body the small magnet in the experiment: for admitting that the north pole of the earth possesses a south magnetism, and that the opposite pole is possessed of a north magnetic polarity; it appears, and the theory is confirmed by experiment, that when a magnet is suspended properly in the equatorial parts of the world, it must remain in a horizontal position: but when removed nearer to one of the poles, it must decline one of its extremities, viz. that which is possessed of the contrary magnetic polarity, and that this inclination must increase in proportion as the magnet or magnetic needle recedes from the equator of the earth; and, lastly, when brought exactly upon either of the poles of the earth it must stand perpendicular to the ground, or in the same direction with the axis of the earth.

The only difficulty in this explanation arises from the attributing a south magnetism to the north pole of the earth: but by this our author means only that its magnetism is contrary to that end of the magnetic needle which turns towards it; and in the same manner it must be understood, that the south pole of the earth has a north magnetic polarity.

If the extremities of the axis of the earth, or the poles about which it performs its diurnal revolution, coincided with its magnetic poles, or even if the magnetic poles were always at a certain distance from them, the inclination of the needle would be always the same at equal distances from the equator, and might be very useful for determining the latitudes. But it would seem, that these poles are perpetually shifting their place, since both the inclination and horizontal direction of the needle are continually varying even in the same place, so that its quantity of inclination cannot be exactly calculated. Two general remarks may be made upon this subject. 1. That the inclination of the needle does not alter regularly in going from north to south, or from south to north, in any meridian. 2. That its alteration in the same place, and at different times, is but small. Thus, in London, about the year 1770, the dip was 71° 50' below the horizon, and in 1775 it stood at 72° 3'; the alteration in near 200 years scarce amounting to three quarters of a degree; which may be attributed to the errors of the instruments; as these were at first exceedingly erroneous and even yet are far from being arrived at perfection.

The general method of constructing dipping needles is, to pass an axis quite through the needle itself, and to let the extremities of the axis rest upon two supports, like the beam of a pair of scales, that the needle may move vertically round; and hence, when placed in the magnetic meridian, it will naturally assume that position which is called the magnetic line, viz. the two ends nearly north and south, and one of them inclined considerably to the horizon. The degrees of the inclination are shown upon a graduated circle; and when the instrument is made use of at land it has a stand, but at sea a ring is necessary to suspend it. When furnished with a stand, it has also a spirit-level; and the stand has three screws, by which the whole is adjusted in such a manner as to let the centre of motion in the needle, and the mark of 90° on the lower part of the divided circle, be exactly in the same line perpendicular to the horizon.

The greatest imperfections attending this instrument are the balancing of the needle itself, and the difficulty of knowing whether, after being made magnetic, it be properly balanced or not. The necessity here indeed can be but very small, as arising only from dust or moisture. The method recommended by Mr. Cavallo to obviate these inconveniences, is first to observe the dip of the needle; then to reverse its magnetism by the application of magnets, so that the end of it which before was elevated above the horizon may now be below it; and, lastly, to observe its dip again; for a mean of the two observations will be pretty near the truth, though the needle may not be perfectly balanced. See Magnetism and Magnetic Needle.

DIPSACUS, Teazel; a genus of plants belonging to the tetrardia class; and in the natural method ranking under the 48th order, Aggregata. See Botany Index.

DIPSAS, a sort of serpent, the bite of which produces such a thirst as proves mortal; whence its name dipsas, which signifies thirsty. In Latin it is called situla, "a pail." Moses speaks of it in Deut. viii. 15.

DIPTERA (from δυπτερα, wing), in Zoology, an order of insects, which have only two wings, and under each wing a style, or oblong body, terminated by a protuberance or head, and called a balance. See Entomology Index.

DIPTOTES, in Grammar, are such nouns as have only two cases, as suppositio, suppositio, &c.

DIPTYCHA, in antiquity, a public register, wherein were written the names of the consuls, and other magistrates, among the heathens; and of bishops, and defunct as well as surviving brethren, among the Christians.

The word is formed from the Greek διπτηχεος, or διπτηχειος, and that from διπτειος, a masculine noun derived from διπτεω, a fold or plait. From its future διπτυχοις is formed διπτυχος, a fold or plait, to which adding δυς, twice, we have δυτυχειος, in the genitive δυτυχεος, whence the nominative neuter δυτυχεος, q. d. a book folded in two leaves; though there were some in three, and others in four or five leaves. An ingenious author imagines this name to have been first given them, to distinguish them from the books that were rolled, called volumina.
It is certain there were profane dipltycha in the Greek empire, as well as sacred ones in the Greek church. The former were the matricula, or registers, wherein the names of the magistrates were entered: in which sense dipltycha is a term in the Greek chancery.

Sacred Dipltycha. The word is plural; dipltycha being a double catalogue, in one whereof were written the names of the living, and in the other those of the dead, which were to be rehearsed during the office. We meet with something not unlike the sacred dipltycha of the Greeks, in the canon of the mass according to the Latin usage; where the people are enjoined to pray once for the living, and once for the dead; several saints are invoked in different times, &c. In these dipltycha were entered the names of bishops, who had governed their flock aright; and these were never expunged out of the same, unless they were convicted of heresy, or some other gross crime. In the dipltycha were likewise entered the names of such as had done any signal service to the church, whether they were living or dead, and mention was made of them in the celebration of the liturgy.

Casaubon in his observations on Athenæus, lib. vi. cap. 14, supposes the Christians to have borrowed the custom of writing names in a book, and rehearsing them at mass, from the heathens, who entered the names of persons they would do any signal honour to, in the verses of the Salii; as was done to Germanicus and Verus, sons of the emperor Marcus Aurelius, and a long time before, during the age of the republic, to Mæmæurus Veturius, and Lucius Volumnia, as we are told by Tacitus, lib. ii. Spartan, Ovid, Festus, Plutarch, &c. But Fa. Rosweyd does not approve this notion of Casaubon. The pretended St Dionysius, a very ancient author, says the contrary, and asserts the first establishment of this usage to have been founded on Scripture, 2 Tim. ii. 15. Psal. cxvi. 15. Rosweyd adds Ecclesiastic. xlv. 1. and takes these to have been the passages the ancient church had a view to, rather than the Salian verses.

The profane dipltycha were frequently sent as presents to princes, &c. on which occasions they were finely gilt, and embellished; as appears from Symmachus, lib. ii. ep. 81. Those presented were usually of ivory. The first law, De Expens. Ludor. C. Theod. forbids all magistrates below consuls to make presents of dipltycha of ivory in the public ceremonies.

DIRÆ, the general name of the three furies in the Pagan system of theology. They were so called, as being quasi Deorum irae, the ministers of divine vengeance in punishing guilty souls after death. They were the daughters of Night and Acheron. See Furies.

DIRCA, a genus of plants belonging to the octandria class; and in the natural method ranking under the 31st order, Vesperculæ. See Botany Index.

DIRECT, in Arithmetic, is when the proportion of any terms, or quantities, is in the natural or direct order in which they stand, being the opposite to inverse, which considers the proportion in the inverted order of the terms. So, 3: 4 :: 6: 8 directly; or 3: 4 :: 8: 6 inversely.

DIRECTION, in Mechanics, signifies the line or path of a body's motion, along which it endeavours to proceed according to the force impressed upon it. See Direction.

DIRECTION, in Astronomy, the motion and other phenomena of a planet when direct.

DIRECTION, in Astrology, is a kind of calculus, by which it is pretended to find the time in which any notable accident shall befall the person whose horoscope is drawn.

DIRECTOR, in commercial policy, a person who has the management of the affairs of a trading company: thus we say, the directors of the India Company, South Sea Company, &c. See Company.

The directors are considerable proprietors in the stock of their respective companies, being chosen by plurality of votes from among the body of proprietors. The Dutch East India Company had formerly 65 such directors; that of France, 21: the British East India Company has 24, including the chairman, who may be re-elected for four years successively. The last have salaries of £350 a year each, and the chairman £500. They meet at least once a week, and commonly oftener, being summoned as occasion requires. The directors of the Bank of England are 24 in number, including the governor and deputy-governor.

DIRECTOR, in Surgery, a grooved probe, to direct the edge of the knife or scissors in opening sinuses or fistula, that by this means the adjacent vessels, nerves, and tendons, may remain unburst. See Surgery.

DIRIBITORES, among the Romans, officers appointed to distribute tablets to the people at the comitia. See Comitia.

DIRIGENT, or Directrix, a term in geometry, signifying the line of motion, along which the describent line or surface is carried in the genesis of any plane or solid figure.

DIS, an inseparable article prefixed to divers words; the effect whereof is either to give them a signification contrary to what the simple words have, as disobedig, disobey, &c. or to signify a separation, detachment, &c. as disposing, distributing.

DIS, a town of Norfolk, seated on the river Waveney, on the side of a hill. It is a neat flourishing town, with one large church, a Presbyterian and a Quaker meeting. It has about 600 good houses; the streets are well paved, pretty wide, and always clean. At the west end of the town is a large mear or lake; but so muddy, that the inhabitants can make no other use of it but in catching of eels. In the town are carried on manufactories of sail-cloth, hose, and the making of stays. E. Long. 1. 16. N. Lat. 52. 25.

DIS, a god of the Gauls, the same as Pluto the god of hell. The inhabitants of Gaul supposed themselves descended from that deity.

DISA, a genus of plants belonging to the gynandria class. See Botany Index.

DISABILITY, in Law, is when a man is disabled, or made incapable to inherit any lands, or take that benefit which otherwise he might have done: and this may happen four ways; by the act of an ancestor, or of the party himself, by the act of God, or of the law. 1. Disability by the act of the ancestor, is where the ancestor is attainted of high treason, &c. which corrupts the blood of his children, so that they may not inherit his estate. 2. Disability by the act of the party,
Disability is where a man binds himself by obligation, that, upon surrender of a lease, he will grant a new estate to a lessee; and afterwards he grants over the reversion to another, which puts it out of his power to perform it. 3. Disability by the act of God, is where a man is non sane memoria, whereby he is incapable to make any grant, &c. So that, if he passeth an estate out of him, it may after his death be made void; but it is a maxim in law, "That a man of full age shall never be received to disable his own person." 4. Disability by the act of the law, is where a man by the law, without any thing by him done, is rendered incapable of the benefit of the law; as an alien born, &c.

Disandra, a genus of plants, belonging to the heptandra class. See Botany Index.

Islands of Disappointment, a cluster of small islands, lying in S. Lat. 14° 10'. W. Long. 141° 16'. They were discovered by Commodore Byron in 1765, who gave them their name from the shores affording no anchorage for his ships; for which reason he was obliged to quit them without landing, or procuring any refreshments for his crew, who were then languishing with sickness. They are inhabited by Indians, who appeared on the beach with spears in their hands, that were at least 16 feet long. They everywhere discovered hostile intentions, and seemed by signs to threaten the people in the boat with death if they came ashore. There are cocoa trees in great abundance, and the shore abounds with turtle.

Disc, in antiquity, a quoit made of stone, iron, or copper, five or six fingers broad, and more than a foot long, inclining to an oval figure, which they hurled in form of a bowl, to a vast distance, by the help of a leathern thong tied round the person's hand who threw it, and put through a hole in the middle. Homer has made Ajax and Ulysses great artists at this sport.

Disc, in Astronomy, the body and face of the sun and moon, such as they appear to us on the earth; or the body and face of the earth, such as it appears to a spectator in the moon.

Disc, in Optics, is the width of the aperture of telescope glasses, whatever their form be, whether plane, convex, concave, &c.

Discerning, or Discernment, a faculty of the mind whereby it distinguishes between ideas. See Metaphysics.

Disciple, one who learns any thing from another: thus, the followers of any teacher, philosopher, &c. are called disciples. In the Christian sense, they were followers of Jesus Christ, in general: but in a more restrained sense, the disciples denote those alone who were the immediate followers and attendants on his person, of which there were 70 or 72. The names disciples and apostles are often synonymously used in the gospel history; but sometimes the apostles are distinguished from disciples, or persons selected out of the number of disciples, to be the principal ministers of his religion: of these there were only 12. The Latins kept the festival of the 70 or 72 disciples on July 15th, and the Greeks on January 4th.

Discipline, in a general sense, denotes instruction and government, as military discipline, ecclesiastical discipline, &c.
DiSCord or vibration; though the reason why this coincidence should give pleasure, more than any other modification or combination of sounds, appears to us inscrutable. The agreeable effects of dissonance in harmony, are no objection to this theory; since it is allowed, that the sensations excited by discord are not in themselves immediately and necessarily pleasing, but only possible by curricular deception. The ear is surprised with the shock it receives, without being able to imagine how it should have happened; and in proportion as it is harsh and grating, we feel the pleasure of returning harmony enhanced, and the disappointment of being artfully and insensibly extricated more agreeable.

The name of dissonance is given sometimes to the interval, and sometimes to each of the two sounds which form it. But though two sounds equally form a dissonance between themselves, the name is most frequently given to that sound in particular which is most extraneous to the chord.

The number of possible dissonances is indefinite; but as in music we exclude all intervals which are not found in the system received, the number of dissonances is reduced to a very few: besides, in practice, we can only select from those few as are agreeable to the species, and the mode in which we compose; and from this last number we must exclude such as cannot be used consistently with the rules prescribed. But what are those rules? Have they any foundation in nature, or are they merely arbitrary? This is what Rousseau, whom in this article we have followed or abandoned as his observations appeared useful or frivolous, purposes to investigate as its principal object.

But where does his scrutiny terminate? Not in the abolition of the rules prescribed. These have still subsisted, and will still subsist, while the frame of man, and the nature of music, remain what they are. If then the rules be permanent and universal, the principle upon which they are founded may be latent or ambiguous; but the rules themselves can never be purely arbitrary. How else could it happen, that Rameau, D'Alembert, and Rousseau, should admit the force and effect of these rules, whilst each of those masters exerts his whole genius to give a different account of their cause and origin? Rousseau himself, as we have seen in a former article, inculcates the necessity of dissonances for the completion of harmony; (see CHORD). Now, if this be true, the easiest methods of introducing and dismissing these discord must be the most eligible, and of consequence the rules for using them must be established. It is not then upon the subsistence or demolition of any particular theory that they depend. Should we attend to the particular objections which may be urged against any system whatever; where is the theory which will be found proof against the efforts of scepticism? After all, the objections of Rousseau against Rameau's theory, as applied by D'Alembert to the origin of consonances, (see Musc. art. 94, 95, 96, 97, 98, 99), appear to be much more frivolous than the analogies from which he pretends this origin to be deduced. It appears from D'Alembert's exposition to this theory, that, if not for all, it affords a solution for the most material and essential phenomena in harmony; which is sufficient for its establishment, till another can be found, which gives a rational and consistent account of the whole: a discovery which has not yet been made. But whilst we acknowledge the futility of Rousseau's objections against D'Alembert's explication of dissonances, we must at the same time admire the ingenuity with which he has deduced them from principles purely mechanical, without departing from the system of M. Rameau. This mechanical explication will be found in his Musical Dictionary, under the article Dissonance.

DISCORD (the goddess of), in Pagan theology. She is represented by Astartes with fiery eyes, a pale countenance, livid lips, and wearing a dagger in her bosom. It was she who at the marriage of Pelus and Theias thrown in the golden apple, whereon was written "To the fairest:" which occasioned a contention between the goddesses Juno, Minerva, and Venus; each pretending a title to the apple. She was likewise called Ate and Eris.

DISCOVERY, in dramatic poetry, a manner of unravelling a plot or fable in tragedies, comedies, and romances; wherein, by some unforeseen accident, a discovery is made of the name, fortune, quality, &c. of a principal person, which were before unknown. See CATASTROPHE.

DISCOUNT, in commerce, a term among traders, merchants, and bankers. It is used by the two former on occasion of their buying commodities on the usual time of credit, with a condition that the seller shall allow the buyer a certain discount at the rate of so much per cent. per annum, for the time for which the credit is generally given, upon condition that the buyer pays ready money for such commodities, instead of taking the time of credit. Traders and merchants also frequently taking promissory notes for moneys due payable to them or order at a certain time, and sometimes having occasion for money before the time is elapsed, procure these notes to be discounted by bankers before the time of payment. Bills of exchange are also discounted by bankers; and in this consists one article of the profits of banking. See BANK.

DISCRETE, or DISJUNCT, PROPORTION, is when the ratio of two or more pairs of numbers or quantities is the same, but there is not the same proportion between all the four numbers. Thus, if the numbers 3 : 6 : 8 : 16 be considered, the ratio between 3 : 6 is the same, as that between 8 : 16, and therefore the numbers are proportional: but it is only discretely or disjunctly, for 3 is not to 6 as 6 to 8; that is, the proportion is broken off between 8 and 3, and is not continued as in the following continual proportions, 3 : 6 :: 12 : 24.

DISCRETE QUANTITY, is such as is not continued and joined together. Such, for instance, is any number.

DISCRETION; prudence, or knowledge to govern one's self.

There are many more shining qualities in the mind of man, but there is none so useful as discretion; it is this indeed that gives a value to all the rest, which sets them at work in their proper times and places; and turns them to the advantage of the person who is possessed of them. Without it learning is pedantry, and wit impertinence; virtue itself looks like weakness; the best parts only qualify a man to be more sprightly in errors, and active to his own prejudice.

Nor does discretion only make a man master of his own
Discretion own parts, but of other men's. The discreet man finds out the talents of those he converses with, and knows how to apply them to proper uses. Accordingly, if we look into particular communities and divisions of men, we may observe that it is the discreet man, not the witty, nor the learned, nor the brave, who guides the conversation, and gives measures to the society. A man with great talents, but void of discretion, is like Polyphemus in the fable, strong and blind, ended with an irresistible force, which for want of sight is of no use to him. Though a man has all other perfections, and wants discretion, he will be of no great consequence in the world; but if he has this single talent in perfection, and but a common share of others, he may do what he pleases in his particular station of life.

It is proper, however, to distinguish between discretion and cunning, the latter being the accomplishment only of little mean, ungenerous minds. Discretion points out the noblest ends to us, and pursues the most proper and laudable methods of attaining them; cunning has only private selfish aims, and sticks at nothing which may make them succeed. Discretion has large and extensive views, and, like a well-formed eye, commands a whole horizon: cunning is a kind of short-sightedness, that discovers the minutest objects which are near at hand, but is not able to discern things at a distance. Discretion, the more it is discovered, gives the greater authority to the person who possesses it; cunning, when it is once detected, loses its force, and makes a man incapable of bringing about even those events which he might have done, had he passed only for a plain man. Discretion is the perfection of reason, and a guide to us in all the duties of life; cunning is a kind of instinct, that only looks out after our immediate interest and welfare. Discretion is only found in men of strong sense and good understanding: cunning is often to be met with in brutes themselves, and in persons who are but the fewest removes from them. In short, cunning is only the mimic of discretion, and may pass upon weak men, in the same manner as vacuity is often mistaken for wit, and gravity for wisdom.

Discus, in antiquity. See Disc.

Discus, in Botany, the middle part of a radiated compound flower, generally consisting of small florets, with a hollow regular petal. It is commonly surrounded by large, plain, or flat, tongue-shaped petals, in the circumference or margin; as in daisy, groundsel, and leopard's-bane; sometimes the circumference is naked, as in cotton-weed and some species of coltsfoot.

Discus Foli, the surface of the leaf.

Discussion, in matters of literature, signifies the clear treating or handling of any particular point, or problem, so as to shake off the difficulties with which it is embarrassed: thus we say, such a point was well discussed, when it was well treated of and cleared up.

Discussion, in Medicine, are such remedies, as, by their subtility, dissolve a stagnating or coagulated fluid, and dissipate the same without an external solution of continuity.

Disdicastic Crystal, in Natural History, a name given by Bartholome, and some others, to a mineral substance, more usually called, from the place whence it was first brought, Iceland crystal. See Mr-Didiscas.

Disease Index.

Disdiapason, or Bisdiaspason, in Music, a compound concord, described by F. Parran, in the quadruple ratio of 4:1, or 8:2.

Disdiapason Diapente, a compound concord in the sextuple ratio of 1:6.

Disdiapason Semi-Diapente, a compound concord in the proportion of 16:3.

Disdiapason Ditone, a compound consonance in the proportion of 10:2.

Disdiapason Semi-Ditone, a compound concord in the proportion of 24:5.

Disease, has been variously defined by physicians, almost every founder of a new system having given a definition of disease, differing in some respects from his predecessors. For a particular account of these definitions, see Medicine.

Of all animals, man is subject to the most diseases; and of men, the studious and speculative are most exposed thereto. Other animals have their diseases; but they are in smaller number; nor are plants without them; though their maladies scarce exceed half a score. The ancients deified their diseases. Some diseases only impair the use of the part immediately affected; as the ophthalmia, gout, &c. Others destroy it entirely; as the gutta serena, palsy, &c. Some affect the whole body; as the fever, apoplexy, epilepsy, &c. Others only impair a part; as the asthmas, colic, dropsy, &c. Some only affect the body; as the gout; others disturb the mind; as melancholy, delirium, &c. Lastly, others affect both the body and mind; as the mania, phreny, &c.

The colder the country, in general, the fewer and the less violent are the diseases. Scheffer tells us that the Laplanders know no such thing as the plague, or fevers of the burning kind, nor are subject to half the distempers we are. They are robust and strong, and live to 60, 70, and many of them to more than 100 years; and at this great age they are not feeble and decrepit as with us; but a man of 60 is able to work or travel as well as a man of 60 with us. They are subject, however, to some diseases more than other nations; thus they have often distempers of the eyes, which is owing to their living in smoke, or being blinded by the snow. Pleurisies and inflammations of the lungs are also very frequent among them; and the small-pox often rages with great violence. They have one general remedy against these and all other internal diseases: this is the root of that sort of moss, as Scheffer expresses it, which they call JertA. They make a decoction of this root in the whey of rein-deer milk, and drink very large doses of it warm, to keep up a breathing sweat; if they cannot get this, they use the stalks of angelica boiled in the same manner: they have not so great an opinion of this as of the other remedy: but the keeping in a sweat, and drinking plentifully of diluting liquor, may go a great way in the cure of their diseases, whether either the one or the other of the drugs have any virtue or not. They cure pleurisies by this method in a very few days; and get so well through the small-pox with it, that very few die of it.

It has been always observed, that people of particular places were peculiarly subject to particular diseases, which
DISEASES OF PLANTS. See AGRICULTURE INDEX.

DISEMBOUGUE. When a ship passes out of the mouth of some great gulf or bay, they call it disembouging. They say also of a river, that at such a place, or after it has run so many leagues, it disembogues itself into the sea.

DISFRANCHISING, among civilians, signifies the depriving a person of the rights and privileges of a free citizen or subject.

DISGUISE, a counterfeit habit. Persons doing unlawful acts in disguise are by our statutes sometimes subjected to great penalties, and even declared felons. Thus, by an act commonly called the black act, persons appearing disguised and armed in a forest or grounds enclosed, or hunting deer, or robbing a warren or a fish-pond, are declared felons.

DISH, in mining, is a trough made of wood, about 28 inches long, four inches deep, and six inches wide; by which all miners measure their ore. If any be taken selling their ore, not first measuring it by the lartmaster’s dish, and paying the king’s duty, the seller forfeits his ore, and the buyer forfeits for every such offence 40s. to the lord of the field or farmer.

DISJUNCTIVE, something that separates or disjoins. Thus, or, neither, &c. which in connecting a discourse, yet separate the parts of it, are called disjunctive conjunctions.

DISK. See Disc.

DISLOCATION, the putting a bone out of joint by some violence, usually called by the physicians luxation.

DISMISSION of a BILL in Chancery. If the plaintiff does not attend on the day fixed for the hearing, his bill is dismissed with costs. It may be also dismissed for want of prosecution, which is in the nature of a non-suit at law, if he suffers three terms to elapse without moving forward in the cause.

DISMOUNTING, in the military art, the act of unhorsing. Thus, to dismount the cavalry, the dragoons, or the like, is to make them alight. To dismount the cannon, is to break their carriages, wheels, and axle trees, so as to render them unfit for service. Horses are also dismounted when they are rendered unfit for service.

DISPARAGEMENT, in Law, is used for the matching an heir, &c. in marriage, below his or her degree or condition, or against the rules of decency. The word is a compound of the privative particle dis, and par, “equal.”

DISPART, in Gunnery, is the setting a mark upon the muzzle ring, or thereofabouts, of a piece of ordnance, so that a sight line taken upon the top of the base ring against the touch-hole, by the mark set on or near the muzzle, may be parallel to the axis of the concave cylinder. The common way of doing this, is to take the two diameters of the base ring, and of the place where the dispar is to stand, and divide the difference between them into two equal parts, one of which will be the length of the dispar which is set on the gun with wax or pitch, or fastened there with a piece of twine or marlin. By means of an instrument it may be done with all possible nicety.

DISPATCH, a letter on some affair of state, or other business of importance, sent with care and expedition, by a courier express. The business of dis...
Mr Shuckford supposes the dispersion to have been dispersion gradual, and to have commenced with the separation of mankind of some companies at the birth of Peleg, and to have been completed 31 years after. According to the calculation of Petavius, the number of inhabitants on the earth at the birth of Peleg amounted to 32,758: Cumberland makes them 30,000; Mr Mede states them at 7000 men, besides women and children; and Mr Whitson, who supposes that mankind now double themselves in 400 years, and that they doubled themselves between the deluge and the time of David in 60 years at a medium, when their lives were six or seven times as long as they have been since, by his computation produces about 2389; a number much too inconsiderable for the purposes of separating and forming distinct nations. This difficulty induced Mr Whitson to reject the Hebrew and to adopt the Samaritan chronology, as many others have done; which, by allowing an interval of 403 years between the flood and the birth of Peleg, furnishes, by the last-mentioned mode of computation, more than 240,000 persons.

As to the manner of the dispersion of the posterity of Noah from the plain of Shinar, it was undoubtedly conducted with the utmost regularity and order. The sacred historian informs us, that they were divided in their lands, every one according to his tongue, according to his family, and according to his nation, Gen. x. 5, 20, 31; and thus, as Mr Mede observes, they were ranged according to their languages, and every nation was ranged by their families; so that each nation had a separate lot, and each family in every nation.

The following abstract will serve to give a general idea of their respective settlements: Japhet, Noah’s eldest son, had seven sons; viz. Gomer, whose descendants inhabited those parts of Asia which lie upon the Ægean sea and Hellespont northward, containing Phrygia, Pontus, Bithynia, and a great part of Galatia. The Galatians, according to Josephus, were called Gomerani; and the Cimmeri, according to Herodotus, occupied this tract of country; and from these Gomerans, Cimmerii, or Celts, Mr Camden derives our ancient Britons, who still retain the name Cymry or Cymru. Magog, the second son of Japhet, was probably the father of the Scythians on the east and north-east of the Euxine sea. Madai planted Media, though Mr Mede assigns Macedonia to his share. Javan was the father of the Grecians about Ionia, whose country lies along upon the Mediterranean sea; the radicles of Javan and Ionia being the same, 75. To Tubal and Mesceeh belonged Cappadocia and the country which lies on the borders of the Euxine sea; and from them, migrating over Caucasus, it is supposed the Russians and Muscovites are descended. And Tiras occupied Thrace. The sons of Shem were five: Elam, whose country lay between the Medes and Mesopotamians, and was called by the Gentile writers Elamitis; and Josephus calls the Elamites the founders of the Persians: Ashur, who was driven out of Shinar by Nimrod, afterwards settled in Assyria, and there built Nineveh, and other cities; Arphaxad, who gave name to the country which Ptolemy calls Arraphacitis, a province of Assyria, though Josephus makes him the father of the Chaldees; Lud, who inhabited and gave name to the country of Lydia about
DISPERSION about the river Meander, remarkable for its windings, of mankind: and Aram, the father of the Syrians. Ham, the youngest son of Noah, had four sons; viz. Cush, whose posterity spread into the several parts of Arabia over the borders of the land of Edom, into Arabia Felix, up to Midian and Egypt; Mizraim, the father of them who inhabited Egypt and other parts of Africa; Phut, to whom Bochart assigns the remaining part of Africa, from the lake of Tritonides to the Atlantic ocean, called Libya: and Canaan, to whom belonged the land of Canaan, whence the Phenicians derived their origin.

Dr Bryant has advanced a new hypothesis on this subject, and supported it with his usual acuteness and learning. He maintains that the dispersion as well as the confusion of tongues was local, and limited to the inhabitants of the province of Babel; that the separation and distribution recorded to have taken place in the days of Peleg, Gen. x. 5, 31, 32, which was the result of divine appointment, occasioned a general migration: and that all the families among the sons of men were concerned in it. The house of Shem, from which the Messiah was to spring, was particularly regarded in this distribution; the portion of his children was near the place of separation; they in general had Asia to their lot; as Japhet had Europe, and Ham the large continent of Africa. But the sons of Chus would not submit to the divine dispensation; they went off under the conduct of Nimrod, and seem to have been for a long time in a roving state. However, at last they arrived at the plains of Shinar, and having ejected Ashur and his sons, who were placed there by divine appointment, seized his dominions, and laid there the foundation of a great monarchy. But afterwards fearing lest they should be divided and scattered abroad, they built the tower of Babel as a land-mark to which they might repair; and probably to answer the purposes of an idolatrous temple, or high altar, dedicated to the host of heaven, from which they were never long to be absent. They only, viz. the sons of Chus or the Cuthites, and their associates from other families, who had been guilty of rebellion against divine authority, and of wicked ambition and tyranny, were punished with the judgment of confounded speech through a failure in labial utterance, and of the dispersion recorded in Gen. x. 8, 9: in consequence of which they were scattered abroad from this city and tower, without any certain place of destination. The Cuthites invaded Egypt or the land of Mizraim in its infant state, seized the whole country, and held it for some ages in subjection: and they extended likewise to the Indies and Ganges, and still farther in China and Japan. From them the province of Cushan or Goshen in Egypt derived its name. Here they obtained the appellation of royal shepherds; and when they were by force driven out of the country, after having been in possession of it for 260 or 280 years, the land which they had been obliged to quit was given to the Israelites, who were also denominatated shepherds, but should not be confounded with the former or the antecedent inhabitants of Goshen.

DISPLAYED, in Heraldry, is understood of the position of an eagle, or any other bird, when it is erect, with its wings expanded or spread forth.

DISPONDEE, in the Greek and Latin poetry, a double spondee or foot, consisting of four long syllables; as mācēnātēs, concludēntēs.

DISPOSITION, in Scots Law, is that deed or writing which contains the scale or grant of any subject; when applied to heritable subjects, it in some cases gets the name of charter, which differs from a disposition in nothing else than a few immaterial forms.

DISPOSITION, in Architecture, the just placing the several parts of an edifice according to their nature and office. See Architecture, No. 31, &c.

DISPOSITION, in Oratory. See Oratory, Part I.

DISPOSITION, in Painting. See Painting.

DISPOSITION, in human nature. — In every man there is something original, that serves to distinguish him from others, that tends to form a character, and to make him meek or fiery, candid or deceitful, resolute or timorous, cheerful or morose. This original bent, termed disposition, must be distinguished from a principle: the latter, signifying a law of human nature, makes part of the common nature of man; the former makes part of the nature of this or that man. Propensity is a name common to both; for it signifies a principle as well as a disposition.

DISQUISITION (from dis, and quero, "I inquire"), an inquiry into the nature, kinds, and circumstances of any problem, question, or topic; in order to gain a right notion of it, and to discourse clearly about it.

DISSECTION, in Anatomy, the cutting up a body with a view of examining the structure and use of the parts. See Anatomy.

Le Gendre observes, that the dissection of a human body, even dead, was held a sacrilege till the time of Francis I. And the same author assures us, he has seen a consultation held by the diviners of Salamanca, at the request of Charles V. to settle the question whether or no it were lawful in point of conscience to dissect a human body in order to learn the structure thereof.

DISSEISIN, in Law, an unlawful dispossessing a person of his lands or tenements.

DISSEPIMENTUM, in Botany, the name by which Linnaeus designates the partitions which in dry seed-vessels, as capsules and pods (siliquea), divide the fruit internally into cells.

DISSENTERS, separatists from the service and worship of any established church.

DISSIDENTS, a denomination applied in Poland to those of the Lutheran, Calvinistic, and Greek profession. The king of Poland engages by the pacta conventa to tolerate them in the free exercise of their religion, but they have often had reason to complain of the violation of these promises. See (History of) Poland.

DISSIMILITUDE, unlikeness or want of similitude. See the article Resemblance and Dissimilitude.

DISSIMULATION, in morals, the act of dissembling, by fallacious appearances, or false pretensions.

Good princes regard dissimulation as a necessary vice; but tyrants consider it as a virtue.

It is apparent that secrecy is often necessary, to oppose those who may be willing to circumvent our lawful intentions. But the necessity of precaution would become very rare, were no enterprises to be formed, but such as could be avowed openly. The frankness with which we could then act, would engage
With respect to dissimulation, three things are to be
observed: 1. That the characters of those are not to
be esteemed, who are reserved and cautious without
distinction. 2. Not to make secrets of unimportant
matters. 3. To conduct ourselves in such manner, as
to have as few secrets as possible.

DISSIPATION, in Physics, an insensible loss or
consumption of the minute parts of the body; or that
flux whereby they fly off, and are lost.

Circle of Dissipation, in Optics, is used for that
circular space upon the retina, which is taken up by
one of the extreme pencils of rays issuing from an
object.

DISSOLVENT, in general, whatever dissolves or
reduces a solid body into such minute parts as to be
sustained in a fluid.

Universal Dissolvent. See the article Alkahest.

DISSOLUTION, in Physics, a discontinuation, or
analysis, of the structure of a mixed body; whereby
what was one, and contiguous, is divided into little
parts, either homogeneous or heterogeneous.

Dissolution, then, is a general name for all reductions
of concrete bodies into their smallest parts, without any
regard either to solidity or fluidity: though in the usual
acceptation of the word among authors, it is restrained
to the reduction of solid bodies into a state of fluidity;
which is more properly expressed by solution, as a branch
dissolution.

According to the opinion of Fr. Tertius de Lanis,
Bohrnave, and some other learned men, the power or
faculty of dissolving is lodged in fire alone.

According to this hypothesis, other fluids commonly
supposed dissolvents, only produce their effect by
means of the fiery spicula they abound with: and even
air, which is judged a powerful menstruum, owes all its
force to the rays of light diffused therein.

Sir Isaac Newton accounts for all dissolutions, and
the several phenomena thereof, from the great
principle of attraction; and, in effect, the phenomena
dissolution furnish a great part of the arguments and
considerations whereby he proves the reality of that
principle. The following is a specimen of that great
author’s way of philosophizing on the subject of dissolu-
tion.

When salt of tartar dissolves by lying in a moist
place, is not this done by an attraction between the
particles of the salt of tartar and those of the water
which float in the air in form of vapours? and why
does not common salt, or saltpetre, or vitriol, do the
like, but for want of such an attraction? And when
aquaforis, or spirit of vitriol, poured on steel filings,
dissolves the filings with a great heat and ebullition;
is not this heat and ebullition effected by a violent
motion of the parts; and does not that motion argue, that
the acid parts of the liquor rush towards the parts of
the metal with violence, and run forcibly into its pores;
till, getting between the utmost particles and the main
mass of metal, they loosen them therefrom, and set them
at liberty to float off into the water? When a solution
of iron in aquafortis dissolves lapsis calaminaria, and lets
the iron; or a solution of copper dissolves iron im-
mersed in it, and lets go the copper; or a solution of
mercury in aquafortis poured on iron, copper, tin, or
Dissolution lead, dissolves the metal, and lets go the mercury;
do not this argue, that the acid particles of the aqua-
fortis are attracted more strongly by the lapsis calami-
naria than by iron; by iron than by copper; by cop-
pper than by silver; and by iron, tin, copper, and lead,
than by mercury? And is it not for the same reason,
that iron requires more aquafortis to dissolve it than
copper, and copper more than the other metals; and
that of all metals iron is dissolved most easily, and is
most apt to rust; and next after iron, copper? When
aquaforis dissolves silver, and not gold; and aqua
regia dissolves gold, and not silver; may it not be said,
that aquafortis is subtle enough to penetrate the pores
of gold as well as of silver, but wants the attractive
force to give it entrance; and the same of aqua regia
and silver? And when metals are dissolved in acid men-
strums, and the acids in conjunction with the metal
act after a different manner, so as that the taste of the
compound is milder than that of the simples, and some-
times a sweet one; is it not because the acids adhere to
the metallic particles, and thereby lose much of their
activity? And if the acid be in too small a proportion
to make the compound dissolvable in water, will it not,
by adhering strongly to the metal, become inactive, and
lose its taste, and the compound become a tasteless
earth? for such things as are not dissoluble by the
moisture of the tongue are insipid.

Dr Freind gives us a mechanical account of dissolu-
tion, in the instance of salt dissolved in water, which is
the most simple operation that falls under this head.
This motion he ascribes to that attractive force, which
is so very extensive in natural philosophy, that there is
no kind of matter but what is under its influence. It
may be observed, says he, that the corpuses of salts,
which are the most simple of any, are withal very mi-
nute, and for their bulk very solid; and therefore
exert a very strong attractive force, which, ceteris pa-
ribus, is proportional to the quantity of matter. Hence
it comes to pass, that the particles of water are more
strongly attracted by the saline particles than they are
by one another: the particles of water, therefore,
cohering but loosely, and being easily moveable, ap-
proach the corpuses of salts, and run, as it were, in
to their embraces; and the motion of them is quicker
or slower, according to their less or greater distances;
the attractive force in all bodies being strongest at the
point of contact. Therefore, if salt be thrown into
the middle of a dish full of water, we shall find the
aquesous particles which are in the middle of the dish
sharp and pungent to the taste, but the water upon the
sides of the vessel almost insipid: so that, when such
a motion once arises, the aquesious particles are carried
with an equal force towards the salts, and the moment
of them is to be estimated from the ratio of their
weight and celerity conjunctly. By the force of this
impulse, they open to themselves a passage into the
pores of the salts, which are very numerous; and at
length so break and divide their texture, that all
cohesion of their parts is destroyed: hereupon, being se-
parated, and removed to a convenient distance from one
another, they are dispersed, and float here and there
about the water.

The simple dissolution of saline substances of every
kind in water, may indeed be plausibly enough ex-
plained
Dissolution. Mained on the hypothesis of attraction; but where the
dissolution is attended with heat, the emission of va-
pour, & c. it seems necessary to seek for some other
principle than mere attraction to solve these phenome-
nas. When diluted oil of vitriol, for instance, is pour-
ved upon iron filings, a great quantity of vapour arises,
which, if it was attempted to be confined, would cer-
tainly break the containing vessel. It is impossible to
imagine any connection between attraction and the emis-
ion of a vapour; and what is still more unaccount-
able, this vapour is inflammable, though neither the
oil of vitriol nor the iron are so by themselves. Anoth-
er very strong objection against the hypothesis of at-
traction may be derived from the phenomena of met-
alllic dissolutions in general; for they do not dissolve
completely in acids, as salts do in water. By dissolu-
tion they are always decomposed, and cannot be re-
coved in their proper form without a good deal of
trouble. One metal, indeed, will very often precipi-
tate another from an acid in its metallic form; but
this is attended with the decomposition of the second
metal; so that this can but no means be reckoned a
fair experiment. But, whatever other method is used,
the dissolved metal is always recovered in form of an
earthy powder, that we could scarcely imagine capable
of ever becoming malleable, and assuming the splendid
appearance of a metal. Now, if there was a strong
attraction between this and the acid, we might very
justly conjecture, that the dissolution happened by
means of that attraction; but so far from this, after
a metal has been dissolved by any acid, and the calx
has been separated from it, it is always difficult, and very
often impossible, to procure a dissolution of the calx
in the same acid. The action of the acid in this case
seems not unlike that of fire upon wood or any other
inflammable substance. Dry wood, thrown into the
fire, burns and flames with great violence; but the
same wood, reduced to ashes, instead of burning, extin-
guishes fire already kindled. In like manner, a piece of
clear metal thrown into an acid, dissolves with great
violence: but the same metal, deprived of its phlo-
gistic principle, and reduced to a calx, cannot be acted
upon by acids, in whatever manner they are applied:
at least, not without the greatest difficulty; and the
more perfect the calx is, i.e. the more completely it
is deprived of its inflammable principle, the greater
the difficulty is of combining it afterwards with an
acid.

Another thing in which the dissolution of metals by
an acid resembles the burning of combustibles by fire,
is, that in both cases there is a separation of the prin-
ciple of inflammability. In the case of oil of vitriol
and iron filings, this is exceedingly obvious; for there
the vapour which arises from the mixture takes fire,
and explodes with great vehemence. In all other cases,
it is very easily proved; for the calx is always capable
of being revivified into metal by the addition of any
substance containing phlogiston. The calces prepared
by fire, and by precipitation from acids, also resemble
one another so much, that in many cases they are scarce
to be distinguished.

These considerations seem to favour the hypothesis
of Dr. Boerhaave; and much more does the following,
namely, that almost all metallic solutions produce some
degree of sensible heat. In some metals this is very
considerable; but the greatest heat producible by an
aqueous solution of any substance is by dissolving quick-
lime in the nitrous acid. The heat here greatly ex-
ceeds that of boiling water. In some dissolutions of
inflammable matters by a mixture of the vitriolic and
nitrous acids, the heat is so great, that the whole mix-
ture takes fire almost instantaneously. Hence the Boer-
haavians think they have sufficient grounds to conclude,
that fire alone is the agent by which all dissolutions are
performed.

These appearances have also been explained on the
principles of attraction; and it has been said that the
heat, &c. were owing to nothing but the violent ac-
tion of the particles of the acid and metal upon each
other (A).

Dissonance, in Music. See Discord.

Disyllable, among grammarians, a word con-
sisting only of two syllables; such as nature, science,
&c.

Distaff, an instrument with which flax is tied
in order to be spun.

Distance, in general, an interval between two
things, either with regard to time or place. See Met-
aphysics.

Accessible Distances, in Geometry, are such as may
be measured by the chain. See Geometry.

Inaccessible Distances, are such as cannot be mea-
ured by the chain, &c. by reason of some river, or the
like, &c. which obstructs our passing from one object
to another. See Geometry.

Distance, in Astronomy. The distance of the sun,
planets, and comets, is found only from their parallax,
as it cannot be found either by eclipses or their dif-
ferent phases; for from the theory of the motions of the
earth and planets we know, at any time, the propor-
tion of the distances of the sun and planets from us;
and the horizontal parallaxes are in a reciprocal propor-
tion to these distances. See Astronomy.

Distaste properly signifies an aversion or dislike
to certain foods; and may be either constitutional, or
owing to some disorder of the stomach.

Distemper, among Physicians, the same with
Disease.

Distemper, in Painting, a term used for the work-
ing up of colours with something besides water or oil.
If the colours are prepared with water, that kind of
painting is called limning; and if with oil, it is called
painting in oil, and simply painting. If the colours are
mixed with size, whites of eggs, or any such proper
glutinous or untouchable matter, and not with oil, then
they say it is done in distemper.

Distension, in general, signifies the stretching
or extending a thing to its full length or breadth.

Distich,
DISTICH, a couplet of verses making a complete sense. Thus hexameter and pentameter verses are disposed in distichs. There are excellent morals in Cato's distichs.

DISTICHIASIS, in Surgery, a disease of the eyelids, when under the ordinary eyelashes there grows another extraordinary row of hairs, which frequently eradicates the former, and, prickling the membrane of the eye, excites pain, and brings on a defluxion.—It is cured by pulling out the second row of hairs with nippers, and cauterizing the pores out of which they issued.

DISTILLATION. For the principles of this process, see Distillation, Supplement.

The objects of distillation, considered as a trade distinct from the other branches of chemistry, are chiefly spirituous liquors, and those waters impregnated with the essential oil of plants, commonly called simple distilled waters. The distilling compound spirits and waters is reckoned a different branch of business, and they who deal in that way are commonly called rectifiers.

This difference, however, though it exists among commercial people, is not at all founded in the nature of the thing; compound spirits being made, and simple spirits being rectified, by the same operations by which they are at first distilled, or with at least very trifling alterations.

The great object with every distiller ought to be, to procure a spirit perfectly flavourless, or at least as well freed from any particular flavour as may be; and in this country the procuring of such a spirit is no easy matter. The only materials for distillation that have been used in large quantity, are malt, and molasses or treacle. Both of these, especially the first, abound with an oily matter, which, rising along with the spirit, communicates a disagreeable flavour to it, and from which it can scarce be freed afterwards by any means whatever.—Some experiments have been made upon carrots, as a subject for the distillers; but these are not as yet sufficiently decisive; nor is it probable that a spirit drawn from carrots would be at all devoid of flavour, more than one drawn from malt.—To dissipate the essential oil which gives the disagreeable flavour to malt spirits, it has been proposed to insipissate the wort into a rob, or thin extract like a syrup; afterwards to thin it with water, and ferment it in the usual manner. This certainly promises great success; there is no subject we know of that is possessed of any kind of essential oil, but what will part with it by distillation or by long boiling. The insipissating of the wort, however, does not seem to be either necessary or safe to be attempted; for, in this case, there is great danger of its contracting an empyreuma, which could never be remedied. The quantity lost by evaporation, therefore, might be occasionally added, with an equal certainty of dissipating the obnoxious oil. Whether the yield of spirit would be as great in this case as in the other, is a question that can by no means be discussed without further experiments. According to a theory adopted by some distillers, namely, that essential oils are convertible into ardent spirits; and that the more oily any subject is, the greater quantity of spirits is obtainable from it; the practice of dissipating the oil before fermentation must certainly be a loss. But we are too little acquainted with the composition of vinous spirits, to have any just foundation for adopting such theories. Besides, it is certain, that the quantity of ardent spirit producible from any substance, malt for instance, very greatly exceeds the quantity of essential oil which can by any means be obtained from the same; nor do we find that those substances, which abound most in essential oil, yield the greatest quantity of spirits. So far from this, fine sugar, which contains little or no essential oil, yields a great deal of ardent spirit.

As to the operation of distilling, those of Directions brewing and fermentation are necessary; but as these concerning are fully treated of under the article BREWING, we shall here only observe, that unless the boiling of the wort, before fermentation, is found to dissipate the essential oil, so as to take away the flavour of the malt, there is no necessity for being at the trouble of that operation. The wort may be immediately cooled and fermented. —The fermentation ought always to be carried on as slowly as possible, and performed in vesseles closely stopped; only having at the bung a valve pressed down by a spring, which will yield with less force than is sufficient to burst the vessele. It should even be suffered to remain till it has become perfectly fine and transparent; as by this means the spirit will not only be superior in quantity, but also in fragrance, pungency, and visosity, to that commonly produced.

With regard to performing the operation of distilling, For distil there is only one general rule that can be given, namely, to let the heat, in all cases, be as gentle as possible. Accidents will be effectually prevented by having the worm of a proper wideness, and by rectifying the spirit in a water bath; which, if sufficiently large, will perform the operation with all the dispatch requisite for the most extensive business. The vessel in which the rectification is performed, ought to be covered with water up to the neck, and to be loaded with lead at the bottom, so that it may sink in the water. Thus the operation will go on as quickly as it was on an open fire, and without the least danger of a miscarriage, nor will it ever be necessary to make the water in the bath come to a boiling heat.

As the end of rectification is to make the spirit clean as well as strong, or to deprive it of the essential oil at once, well as the aqueous part, it will be proper to have regard to this event in the first distillation. For this purpose, the spirit, as it first comes over, should be received into a quantity of cold water; as by this means the connexion betwixt it and the oily matter will be considerably lessened. For the same reason, after it has been once rectified in the water bath, it should be again mixed with an equal quantity of water, and distilled a second time. Thus the spirit will be freed from most of the oily matter, even though it hath been very much impregnated with it at first. It is necessary to observe, however, that by using such a quantity of water, a considerable part of the water will be left in the residuum of each rectification. All these residuums, therefore, must be mixed together, and distilled on an open fire, with a brisk heat, that the remainder of the spirit may be got out.

After the spirit has been distilled once or twice in this manner from water, it may be distilled in a water bath without any addition; and this last rectification will free it from most of the water it contains. But if it is required to be highly dephlegmated, a quantity of pur
always retaining the saccharine quality and rich flavour of the wine from whence it is drawn; but as it grows old, this flavour often becomes aromatic, and is not agreeable to all palates.

"Hence we see that brandies always differ according as they are extracted from different species of grapes. Nor would there be so great a similarity as there is between the different kinds of French brandies, were the strongest wines used for this purpose; but this is rarely the case; the weakest and lowest flavoured wines only are distilled for their spirit, or such as prove absolutely unfit for any other use.

"A large quantity of brandy is distilled in France during the time of the vintage; for all those poor grapes that prove unfit for wine, are usually first gathered, pressed, their juice fermented, and directly distilled. This rids their hands of their poor wines at once, and leaves their casks empty for the reception of better. It is a general rule with them not to distil wine that will fetch any price as wine; for, in this state, the profits upon them are vastly greater than when reduced to brandies. This large stock of small wines, with which they are almost overrun in France, sufficiently accounts for their making such vast quantities of brandy in that country, more than in others which lie in warmer climates, and are much better adapted to the production of grapes.—Nor is this the only fund of their brandies; for all the wine that turns eager, is also condemned to the still; and, in short, all that they can neither export nor consume at home, which amounts to a large quantity; since much of the wine laid in for their family provision is so poor as not to keep during the time of spending.

"Hence many of our English spirits, with proper management, are convertible into brandies that shall hardly be distinguished from the foreign in many respects, provided the operation be neatly performed.

"The common method of rectifying spirits from alkaline salts, destroys their viscosity, and in its stead introduces an urinous or licentious taste. But as it is absolutely necessary to restore, or at least to substitute in its room, some degree of viscosity, several methods have been proposed, and a multitude of experiments performed, in order to discover this great desideratum. But none has succeeded equal to the spirit of nitre; and accordingly this spirit, either strong or dulciified, has been used by most distillers to give an agreeable viscosity to their spirits. Several difficulties, however, occur in the method of using it; the principal of which is, its being apt to quit the liquor in a short time, and consequently depriving the liquor of that viscosity it was intended to give. In order to remove this difficulty, and prevent the viscosity from quitting the goods, the dulciified spirit of nitre, which is much better than the strong spirit, should be prepared by a previous digestion, continued for some time, with alcohol; the longer the digestion is continued, the more intimately will they be blended, and the compound rendered the milder and softer.

"After a proper digestion, the dulciified spirit should be mixed with the brandy, by which the viscosity will be intimately blended with the goods, and not disposed to fly off for a very considerable time.—No general rule can be given for the quantity of this mineral acid requisite to be employed; because different proportions.
Distillation of it are necessary in different spirits. It should, however, be carefully attended to, that though a small quantity of it will undoubtedly give an agreeable viscid, resembling that naturally found in the fine subtle spirits drawn from wines, yet an over large dose of it will not only cause a disagreeable flavour, but also render the whole design abortive, by discovering the imposition. Those, therefore, who endeavour to cover a foul taste in goods by large doses of dulphied spirit of nitre, will find themselves deceived.

But the best, and indeed the only method of imitating French brandies to perfection, is by an essential oil of wine; this being the very thing that gives the French brandies their flavour. It must, however, be remembered, that, in order to use even this ingredient to advantage, a pure tasteless spirit must first be procured; for it is ridiculous to expect that this essential oil should be able to give the agreeable flavour of French brandies to our tewsome malt spirit, already loaded with its own nauseous oil, or strongly impregnated with a licentious taste from the alkaline salts used in rectification. How a pure insipid spirit may be obtained, has already been considered; it only therefore remains to show the method of procuring this essential oil of wine, which is this:

Take some cakes of dry wine lees, such as are used by our hatters; dissolve them in six or eight times their weight of water; distil the liquor with a slow fire, and separate the oil with a separating glass; reserving for the nicest uses only that which comes over first, the succeeding oil being coarser and more resinous—Having procured this fine oil of wine, it may be mixed into a quassience with pure alcohol; by which means it may be preserved a long time fully possessed of all its flavour and virtues; but, without such management, it will soon grow resinos and rancid.

When a fine essential oil of wine is thus procured, and also a pure and insipid spirit, French brandies may be imitated to perfection, with regard to the flavour. It must, however, be remembered, and carefully adverted to, that the essential oil is drawn from the same kind of lees as the brandy to be imitated was procured from; we mean, in order to imitate Cogniac brandy, it will be necessary to distil the essential oil from Cogniac lees; and the same for any other kind of brandy. For, as different brandies have different flavours, and as these flavours are entirely owing to the essential oil of the grape, it would be preposterous to endeavour to imitate the flavour of Cogniac brandy with an essential oil procured from the lees of Bourdeaux wine. When the flavour of the brandy is well imitated by a proper dose of the essential oil, and the whole reduced into one simple and homogeneous fluid, other difficulties are still behind: The flavour, though the essential part, is not, however, the only one; the colour, the proof, and the softness, must also be regarded, before a spirit that perfectly resembles brandy can be procured. With regard to the proof it may be easily hit, by using a spirit rectified above proof: which, after being intimately mixed with the essential oil of wine, may be let down to a proper standard with fair water. And the softness may, in a great measure, be obtained by distilling and rectifying the spirit with a gentle fire: what is wanting of this criterion in the liquor when first made, will be supplied by time; for it must be remem-bered, that it is time alone that gives this property to French brandies; they being at first acid, foul, and fiery. But, with regard to the colour, a particular method is required to imitate it to perfection.

The art of colouring spirits owes its rise to observations on foreign brandies. A piece of French brandy coloured that has acquired by age a great degree of softness and ripeness, is observed at the same time to have acquired a yellowish brown colour; and hence our distillers have endeavoured to imitate this colour in such spirits as are intended to pass for French brandy. And in order to this, a great variety of experiments have been made on different substances. But in order to know a direct and sure method of imitating this colour to perfection, it is necessary we should be informed whence the French brandies themselves acquire their colour. This discovery is very easily made. The common experiment of trying whether brandy will turn blackish with a solution of iron, shows that the colour is owing to some of the resinos matter of the oak cask dissolved in the spirit. There can be no difficulty, therefore, in imitating this colour to perfection. A small quantity of the extract of oak, or the shavings of that wood, properly digested, will furnish us with a tincture capable of giving the spirit any degree of colour required. But it must be remembered, that as the tincture is extracted from the cask by brandy, that is, alcohol and water, it is necessary to use both in extracting the tincture; for each of these dissolves different parts of the wood. Let, therefore, a sufficient quantity of oak shavings be digested in strong spirit of wine, and also at the same time other oak shavings be digested in water; and when the liquors have acquired a strong tincture from the oak, let both be poured off from the shavings into different vessels, and both placed over a gentle fire till reduced to the consistence of treacle. In this condition let the two extracts be intimately mixed together; which may be effectually done by adding a small quantity of lost sugar, in fine powder, and rubbing the whole well together. By this means a liquid essential extract of oak will be procured, and always ready to be used as occasion shall require.

There are other methods in use for colouring brandies; but the best, besides the extract of oak above mentioned, are treacle and burnt sugar. The treacle gives the spirit a fine colour, nearly resembling that of French brandy; but as its colour is dilute, a large quantity must be used; this is not, however, attended with any bad consequences; for notwithstanding the spirit is really weakened, by this addition, yet the bubbed proof, the general criterion of spirits, is greatly mended by the tenacity imparted to the liquor by the treacle. The spirit also acquires from the mixture a sweetish or luscious taste, and a fohness in the mouth; both which properties render it very agreeable to the palates of the common people, who are in fact the principal consumers of these spirits. A much smaller quantity of burnt sugar than of treacle will be sufficient for colouring the same quantity of spirits: the taste is also very different; for instead of the sweetness imparted by the treacle, the spirit acquires from the burnt sugar an agreeable bitterness, and by that means recommends itself to nicer palates, which are offended with a luscious spirit. The burnt sugar is prepared by dissolving a proper quantity of sugar in
a little water, and scorching it over the fire till it acquires a black colour. Either treacle or burnt sugar will nearly imitate the genuine colour of old French brandy; but neither of them will succeed when put to the test of the vitriolic solution.

"The spirit distilled from molasses or treacle is very clean or pure. It is made from common treacle dissolved in water, and fermented in the same manner as the wash for the common malt spirit. But if some particular art is not used in distilling this spirit, it will not prove so vinous as malt spirit, but more flat and less pungent and acid, though otherwise much cleaner tasted, as its essential oil is of a much less offensive flavour. Therefore, if good fresh wine lees, abounding in tartar, be added and duly fermented with the molasses, the spirit will acquire a much greater vinosity and briskness, and approach much nearer to the nature of foreign spirits. Where the molasses spirit is brought to the common proof of length, if it is found not to have a sufficient vinosity, it will be very proper to add some good dulciæd spirit of nitre; and if the spirit be clean worked, it may, by this addition only, be made to pass on ordinary judges for French brandy. Great quantities of this spirit are used in adulterating foreign brandy, rum, and arrack. Much of it is also used alone in making cherry brandy and other drams by infusion; in all which many, and perhaps with justice, prefer it to foreign brandies. Molasses, like all other spirits, is entirely colourless when first extracted; but distillers always give it as nearly as possible the colour of foreign spirits."

If these principles hold good, the imitation of foreign spirits of all kinds must be an easy matter. It will only cost the procuring of some of those substances from which the spirit is drawn; and distilling this with water, the essential oil will always give the flavour desired. Thus, to imitate Jamaica rum, it will only be necessary to procure some of the tops, or other useless parts, of the sugar-canes; from which an essential oil being drawn, and mixed with clean molasses spirit, will give it the true flavour. The principal difficulty must lie in procuring a spirit totally, or nearly free of all flavour of its own. The spirit drawn from the refuse of a sugar-house is by our author recommended as superior to that drawn from molasses: though even this is not entirely devoid of some kind of flavour of its own; nor indeed is that drawn from the best refined sugar entirely flavourless. It is very probable, therefore, that to procure an absolutely flavourless spirit is impossible. The only method, therefore, of imitating foreign spirits is, by choosing such materials as will yield a spirit flavoured as much like them as possible. The materials most recommended by our author in this case, and probably the best that can be used, are raisins. Concerning these he gives the following directions: "In order to extract this spirit, the raisins must be infused in a proper quantity of water, and fermented in the manner already directed. When the fermentation is completed, the whole is to be thrown into the still, and the spirit extracted by a strong fire. The reason why we here direct a strong fire is, because by that means a greater quantity of the essential oil will come over the helm with the spirit, which will render it fitter for the distiller's purpose: for this spirit is commonly used to mix with common malt goods: and it is surprising how far it will go in this respect, ten gallons of it being often sufficient to give adetermining flavour and agreeable vinosity to a whole piece of malt spirits. It is therefore well worth the distiller's while to endeavour at improving the common method of extracting spirits from raisins; and perhaps the following hint may merit attention. When the fermentation is completed, and the still charged with fermented liquor as above directed, let the whole be drawn off with as brisk a fire as possible; but, instead of the cask or can generally used by distillers for a receiver, let a large glass, called by chemists a separating glass, be placed under the nose of the worm, and a common receiver applied to the spout of the separating glass: by this means the essential oil will swim upon the top of the spirit, or rather low wine, in the separating glass, and may be easily preserved at the end of the operation. The use of this limpid essential oil is well known to distillers; for in this resides the whole flavour, and consequently may be used to the greatest advantage in giving that distinguishing taste and true vinosity to the common malt spirits. After the oil is separated from the low wine, the liquor may be rectified in bain marie into a pure and almost tasteless spirit, and therefore well adapted to make the finest compound cordials, or to imitate or mix with the finest French brandies, arracks, &c. In the same manner a spirit may be obtained from cyder. But as its particular flavour is not so desirable as that obtained from raisins, it should be distilled in a more gentle manner, and carefully rectified according to the directions we have already given."

These directions may suffice for the distillation of directions any kind of simple spirits. The distillation of compound ones depends on the observation of the following general rules, which are very easy to be learned and practised.

1. The artist must always be careful to use a well cleansed spirit, or once freed from its own essential oil. For, as a compound water is nothing more than a spirit impregnated with the essential oil of the ingredients, it is necessary that the spirit should have deposited its own.

2. Let the time of previous digestion be proportioned to the tenacity of the ingredients, or the ponderosity of their oil.

3. Let the strength of the fire also be proportioned to the ponderosity of the oil intended to be raised with the spirit.

4. Let only a due proportion of the finest parts of the essential oil be united with the spirit; the grosser and less fragrant parts of the oil not giving the spirit so agreeable a flavour, and at the same time rendering it unsightly. This may in a great measure be effected by leaving out the faints, and making up to proof with fine soft water in their stead.

A careful observation of these four rules will render this part of distillation much more perfect than it is at present. Nor will there be any occasion for the use of burnt alum, white of eggs, isinglass, &c. to fine down cordial waters; for they will presently be fine, sweet, and pleasant tasted, without any further trouble. We shall now subjoin particular receipts for making some.
of those compound waters, or spirits, that are most commonly to be met with, and are in the most general estimation.

14 Receipts for a number of compound spirits.

Strong Cinnamon Water. Take eight pounds of fine cinnamon bruised, 17 gallons of clean rectified spirit, and two gallons of water. Put them into your still, and digest them 24 hours with a gentle heat; after which draw off 16 gallons with a pretty strong heat.—A cheaper spirit, but of an inferior quality, may be obtained by using cassia lignea instead of cinnamon. If you would dulcify your cinnamon water, take double refined sugar in what quantity you please; the general proportion is about two pounds to a gallon; and dissolve it in the spirit, after you have made it up proof with clean water. One general caution is here necessary to be added; namely, that near the end of the operation, you carefully watch the spirit as it runs into the receiver, in order to prevent the fains from mixing with the goods. This you may discover by often catching some of it as it runs from the worm in a glass, and observing whether it is fine and transparent; for as soon as ever the fains begin to rise, the spirit will have an azure or bluish cast. As soon as this alteration in colour is perceived, the receiver must be immediately changed; for if the fains are suffered to mix themselves with the rest, the value of the goods will be greatly lessened. Here we may observe, that the distillers call such goods as are made up proof, double goods; and those below proof, single.

Close water. Take of cloves bruised, four pounds; pimento, or all spice, half a pound; proof spirit, 16 gallons. Digest the mixture 12 hours in a gentle heat, and then draw off 15 gallons with a pretty brisk fire. The water may be coloured red, either by a strong tincture of cochineal, alkanet, or corn-poppy flowers. It may be dulcified at pleasure with double refined sugar.

Lemon water. Take of dried lemon peel, four pounds; clean proof spirit, 10 gallons and a half, and one gallon of water. Draw off ten gallons by a gentle fire, and dulcify with fine sugar.

Citron water. Take of dry yellow rinds of citrons, three pounds; of orange peel, two pounds; nutmegs, bruised, three quarters of a pound; clean proof spirit, ten gallons and a half; water, one gallon. Digest with a gentle heat; then draw off ten gallons in balneo mariae, and dulcify with fine sugar.

Aniseed water. Take aniseed bruised, two pounds; proof spirit, 12 gallons and a half; water, one gallon. Draw off ten gallons with a moderate fire.—This water should never be reduced below proof; because the large quantity of oil with which it is impregnated, will render the goods milky and foul when brought down below proof. But if there is a necessity for doing this, their transparency may be restored by filtration.

Orange water. Take of the yellow part of fresh orange peel, five pounds; clean proof spirit, ten gallons and a half; water, two gallons. Draw off ten gallons with a gentle fire.

Cedrat water. The cedrat is a species of citron, and very highly esteemed in Italy, where it grows naturally. The fruit is difficult to be procured in this country; but as the essential oil is often imported from Italy, it may be made with it according to the followi…
of clean proof spirits. Then take of cinnamon, four ounces; of mace, one ounce; and of cloves, two drachmas. Bruise these spices; put them into an alembic with a gallon of clean proof spirits and two quarts of water, and draw off a gallon with a brisk fire. Add as much of this spicy spirit to your ratafia as will render it agreeable to your palate; about one-fourth is the usual proportion.

Ratafia made according to the above receipt will be of a very rich flavour and elegant colour. It may be rendered more or less of a spicy flavour, by adding or diminishing the quantity of spirit distilled from the spices. Some, in making ratafia, suffer the expressed juices of their fruits to ferment several days: by this means the vinosity of the ratafia is increased; but, at the same time, the elegant flavour of the fruits is greatly diminished. Therefore, if the ratafia is desired stronger or more vinous, it may be done by adding more spirits to the expressed juice; by which means the flavour of the fruits may be preserved, as well as the ratafia rendered stronger. It is also a method with some to tie the spices in a linen bag, and suspend them in the ratafia. But if this method is taken, it will be necessary to augment the quantity of spirit first added to the expressed juice. There is no great difference in the two methods of adding the spices, except that by suspending them in the ratafia the liquor is rendered less transparent.

Dry or sharp Ratafia. Take cherries and gooseberries, of each 30 pounds; mulberries, seven pounds; raspberries, ten pounds. Pick all these fruits clean from their stalks, &c. bruise them, and let them stand two hours; but do not suffer them to ferment. Press out the juice, and to every pint add three ounces of sugar. When the sugar is dissolved, run it through the filtering bag, and to every five pints of liquor add four pints of clean proof spirit; together with the same proportion of spirit drawn from the spices in the foregoing composition.

Common Ratafia. Take of nutmegs, eight ounces; bitter almonds, ten pounds; Lisbon sugar, eight pounds; ambregrise, ten grains; infuse these ingredients three days in ten gallons of clean proof spirit, and filter through a funnel bag for use. The nutmeg and bitter almonds, must be bruised and the ambregrise rubbed with the Lisbon sugar in a marble mortar, before they are infused in the spirit.

Gold Cordial. Take of the roots of angelica, four pounds; raisins stoned, two pounds; coriander seeds, half a pound; caraway seeds and cinnamon, of each half a pound; cloves, two ounces; figs and liquorice root, of each one pound; proof spirit, eleven gallons; water, two gallons. The angelica, liquorice, and figs, must be sliced before they are added. Digest two days; and draw off by a gentle heat till the fants begin to rise; hanging in a piece of linen, fastened to the mouth of the worm, an ounce of English saffron. Then dissolve eight pounds of sugar in three quarts of rose water, and add to it the distilled liquor. This liquor derives its name of gold cordial from a quantity of leaf gold being formerly added to it; but this is now generally disused, as it cannot possibly add any virtue.

Cardamum or All-fours. Take of pimento, caraway, and coriander seeds, and lemon peel, each three pounds; of malt spirits, eleven gallons; water, three gallons. Draw off with a gentle fire, dulcify with common sugar, and make up to the strength desired with clear water. This is a dram greatly used by the poorer sort of people in some countries.

Geneva. There was formerly sold in the apothecaries shops a distilled spirituous water of juniper; but the vulgar being fond of it as a dram, the distillers supplanted the apothecaries, and sold it under the name of Geneva. The common kind, however, is not made from juniper berries, but from oil of turpentine; and indeed it is surprising that people should accustom themselves to drink such liquors for pleasure. The receipt for making this kind of spirit, sold in the gin shops at London, is as follows: Take of the ordinary malt spirits, ten gallons; oil of turpentine, two ounces; bay salt, three handfuls. Draw off by a gentle fire till the fants begin to rise; and make up your goods to the strength required with clear water.

The best kind is made by the following recipe. Take of juniper berries, three pounds; proof spirit, ten gallons; water, four gallons. Draw off by a gentle fire till the fants begin to rise, and make up your goods to the strength required with clean water.

There is a sort of this liquor called Hollands Geneva, from its being imported from Holland, which is greatly esteemed. The ingredients used by the Dutch are the same with those given in the last recipe; only, instead of malt spirits, they use French brandy. But from what has been already observed concerning the nature of these kinds of spirits, it is easy to see, that by the help of a well rectified spirit, geneva may be made in this country at least nearly equal to the Dutch, provided it is kept to a proper age; for all spirituous liquors contract a softness and mellowness by age, impossible to be imitated any other way.

DISTILLERY, the art of distilling brandy and other spirits. This art was first brought into Europe by the Moors of Spain, who, on learning it from the African Moors, who had it from the Egyptians; and the Egyptians are said to have practised it in the reign of the emperor Diocletian, though it was unknown to the ancient Greeks and Romans. See DISTILLATION and FERMENTATION.

DISTINCTION, in Logic, is an assemblage of two or more words, whereby disparate things, or their conceptions, are denoted.

DISTORTION, in Medicine, is when any part of the human body remarkably deviates from its natural shape or position. Distortions of different parts may arise either from a convulsion or palsy; though sometimes a terrible distortion in the shape of the whole body hath arisen merely from carelessness and ill habits. Mr Winslow, in the Memoirs of the Academy of Sciences at Paris, gives a very remarkable account of a lady of quality, whom he had known to be perfectly straight for several years; but who taking afterwards to a sedentary course of life, got a custom of dressing herself very carelessly, and of leaning as she sat, either forwards or to a side. It was not many months before she found it painful and troublesome to stand or sit upright; and soon afterwards she found an inequality in the lower part of the back bone. Alarm'd at this, she consulted the gentleman who gave the account. To prevent the increase of the malady, he ordered.
Distress ordered her to wear a particular sort of jumps instead of stays, and had a pad of proper size applied: but this was soon neglected; and the consequence was, that in a little time the back bone became more and more crooked, and at length bent itself sideways in two contrary directions, so as to represent the figure of the Roman S; and the lady, still refusing to take the proper measures, lost a fourth part of her height; and continued for the remainder of her life, not only crooked from right to left, and from left to right, but oddly folded together, that the first of the false ribs on one side approached very near the crest of the os ilium on that side, and the viscera of the lower belly became strangely pushed out of their regular places to the opposite side; and the stomach itself was so strongly compressed, that whatever she swallowed seemed to her to fall into two separate cavities.

DISTRESS, in its ordinary acceptation, denotes calamity, misery, or painful suffering.

The Contemplation of Distress, a source of pleasure. On this subject we have a very pleasing and ingenious essay by Dr Barnes, in the Memoirs of the Literary and Philosophical Society of Manchester. It is introduced with the following motto.

Suave mari magnō, turbāntibus aquā venīs, E terrī alterius magnō spectatū periculum. Non quia vexari quemquam est iucundum voluptas; Sed quisque ipsa mala coreas, quia cernere suave est.

LUCRETIUS.

"The pleasure here described by the poet, and of which he has mentioned so striking and apposite an instance, may perhaps at first seem of so singular and astonishing a nature, that some may be disposed to doubt of its existence. But that it does exist, in the case here referred to, and in many others of a similar kind, is an undoubted fact; and it may not appear an useless or disagreeable entertainment, to trace its source in the human breast, together with the final cause for which it was implanted there by our benevolent Creator.

"Shall it, may it be said, feel complacency in beholding a scene in which many of my fellow-creatures are agonizing with terror, whilst I can neither diminish their danger, nor, by my sympathy, divide their anguish? At the sight of another's woe, does not my bosom naturally feel pain? Do I not share in his sensations? And is not this strong and exquisite sensibility intended by my Maker to urge me on to active and immediate assistance! These sensations are indeed attended with a noble pleasure, when I can, by friendly attention, or by benevolent communication, soothe the sorrows of the poor mourner, snatch him from impending danger, or supply his pressing wants. But in general, where my sympathy is of no avail to the wretched sufferer, I fly from the spectacle of his misery, unable or unwilling to endure a pain which is not alleviated by the sweet satisfaction of doing good."

"It will be necessary, in answer to these objections, in the first place to prove the reality of the feeling, the cause of which, in the human constitution, we here attempt to explore. Mr Addison, in his beautiful papers on the Pleasures of the Imagination, has observed, "that objects or scenes, which, when real, give disgust or pain, in description often become beautiful and agreeable. Thus, a dunghill may, by the charms of poetic imagery, excite pleasure and entertainment. Scenes of this nature, dignified by apt and striking description, we regard with something of the same feelings with which we look upon a dead monster."

Informe cadaver

Protrahitur: nequem expiri corda tundo
Terribiles oculos, cultum, villosaque setae
Pectora semifierti, atque extinctos fauces ignis.

VIRGIL.

"This (he observes) is more particularly the case, where the description raises a ferment in the mind and works with violence upon the passions. One would wonder (adds he) how it comes to pass, that passions, which are very unpleasant at all other times, are very agreeable when excited by proper description; such as terror, dejection, grief, &c. This pleasure arises from the reflection we make upon ourselves, whilst reading it, that we are not in danger from them. When we read of wounds, death, &c. our pleasure does not rise so properly from the idea, as from our own secret reflections, which the description gives us, as from the secret comparison we make of ourselves with those who suffer. We should not feel the same kind of pleasure, if we actually saw a person lying under the tortures that we meet with in a description."

And yet, upon the principle assigned by this amiable writer, we might feel the same, or even higher pleasure, from the actual view of distress, than from any description; because the comparison of ourselves with the sufferer would be more vivid, and consequently the feeling more intense. We would only observe that the cause which he assigns for this pleasure is the very same with that assigned by Lucretius in our motto. Mr Addison applies it to the description; the poet to the actual contemplation of affecting scenes. In both, the pleasure is supposed to originate in selfishness. But wherever the social passions are deeply interested, as they are here supposed to be, from the pathetic description, or the still more pathetic survey, of the sufferings of another, the sympathetic feelings will of themselves, at once, and previously to all reflection, become a source of agreeable and tender emotions. They will thus dignify and enhance the satisfaction, if any such be felt, arising merely from the consideration of our own personal security. And the more entirely we enter into the scene, by losing all ideas of its being either past or fabulous, the more perfectly we forget ourselves, and are absorbed in the feeling,—the more exquisite is the sensation.

But as our subsequent speculations will chiefly turn upon the pleasure derived from real scenes of calamity, and not from those which are imaginary, it may be expected that we produce instances in proof that such pleasure is felt by persons very different in their taste and mental cultivation.

We shall not mention the horrid joy with which the savage feasts his eyes upon the agonies and contortions of his expiring prisoner—expiring in all the pains which artificial cruelty can inflict! Nor will we recur to the almost equally savage scenes of the Roman, when the majesty of the Roman people could rush, with eagerness and transport, to behold hundreds of gladiators contending.
contending in fatal conflict, and probably more than half the number extended, waltering in blood and writhing in agony, upon the plain. Nor will we mention the Spanish bull feasts; nor the fervent acclamations of an English mob around their fellow creatures, when engaged in furious battle, in which it is possible that some of the combatants may receive a mortal blow, and be hurried in this awful state to the bar of his Judge. Let us survey the multitudes which in every part of the kingdom, always attend an execution. It may perhaps be said, that in all places the vulgar have little of the sensibility and tenderness of more polished bosoms. But, in the last mentioned instance, an execution, there is no exultation in the sufferings of the poor criminal. He is regarded by every eye with the most melting compassion. The whole assembly sympathizes with him in his unhappy situation. An awful stillness prevails at the dreadful moment. Many are wrung with utterable sensations: and prayer and silence declare, more loudly than any language could, the interest they feel in his distress. Should a reprieve come to rescue him from death, how great is the general triumph and congratulation! And probably in this multitude you will find not the mere vulgar herd alone, but the man of superior knowledge and of more refined sensibility; who, led by some strong principle, which we wish to explain, feels a pleasure greater than all the pain, great and exquisite as one should imagine it to be, from such a spectacle.

The man who condemns many of the scenes we have already mentioned as barbarous and shocking, would probably run with the greatest eagerness to some high cliff, overhanging the ocean, to see it swelled into a tempest, though a poor vessel, or even a fleet of vessels, to appear as one part of the dreadful scenery, now lifted to the heavens on the foaming surge, now plunged deep into the fathomless abyss, and now dashed upon the rocks, where they are in a moment shivered into fragments, and, with all their mariners, entombed in the wave. Or, to vary the question a little; Who would not be forward to stand safe, on the top of some mountain or tower, adjoining to a field of battle, in which two armies meet in desperate conflict, though probably thousands may soon lie before him prostrate on the ground, and the whole field present the most horrid scenes of carnage and desolation?

That in all these cases pleasure predominates in the compounded feeling, is plain from hence, because you continue to survey the scene; whereas, when pain became the stronger sensation, you would certainly retire.

Cultivation may indeed have produced some minuter differences in the taste and feelings of different minds. Those whose sensibilities have not been refined by education or science, may feel the pleasure in a more gross and unnatural manner; but not the most polished who do not feel a similar, a kindred pleasure, in the deep wrought distresses of the well imagined scene? Here the endeavour is, to introduce whatever is dreadful or pathetic, whatever can harrow up the feelings, or extort the tear. And the deeper and more tragic the scene becomes, the more it agitates the several passions of terror, grief, or pity—the more intensely it delights, even the most polished minds. They seem to enjoy the various and vivid emotions of contending passions. They love to have the tear trembling in the eye, and to feel the whole soul wrapt in thrilling sensations. For that moment they seem to forget the fiction; and afterwards commend that exhibition most, in which they most entirely lost sight of the author, and of their own situation, and were alive to all the unutterable vibrations of strong or melting sensibility.

Taking it then for granted, that in the contemplation of many scenes of distress, both imaginary and real, a gratification is felt, let us endeavour to account for it, by mentioning some of those principles, woven in the web of human nature, by its benevolent Creator, on which that gratification depends.

Dr Akenside, with his accustomed strength and brilliancy of colouring, describes and accounts for it in the following manner:

"Behold the ways
Of heaven's eternal destiny to man!
For ever just, benevolent, and wise!
That Virtue's awful steps, how'er pursued
By vexing fortune, and intrusive pain,
Should never be divided from her chaste,
Her fair attendant, Pleasure. Need I urge
Thy tardy thought through all the various round
Of this existence, that thy softening soul
At length may learn, what energy the hand
Of Virtue mingleth in the bitter tide
Of Passion, swelling with distress and pain,
To mitigate the sharp, with gracious drops
Of cordial Pleasure. Ask the faithful youth
Why the cold urn of her, whom long he lov'd,
So often fills his arm? so often draws
His lonely footsteps, at the silent hour,
To pay the mournful tribute of his tears?
O! he will tell thee, that the wealth of worlds
Should ne'er seduce his bosom to forego
That sacred hour, when stealing from the noise
Of care and envy, sweet remembrance soothes,
With Virtue's kindest look, his aching breast,
And turns his tears to rapture. Ask the crowd,
Which flies impatient from the village-walk
To climb the neighbouring cliffs, when far below
The cruel winds have hurled upon the coast
Some helpless bark: whilst sacred Pity melts
The general eye, or Terror's icy hand
Smites their distorted limbs, or horrent hair;
Whilst every mother closer to her breast
Catches her child; and, pointing where the waves
Foam through the shattered vessel, shrieks aloud,
As one poor wretch, that spreads his piteous arms
For succour, swallowed by the roaring surge.
As now another, dash'd against the rock,
Drops lifeless down. O dearest thou indeed
No kind endearment here, by nature given,
To mutual terror, and compassion's tears?
No sweetly melting softness, which attracts
O'er all that edge of pain, the social powers,
To this their proper action and their end?"

The poet pursues the sentiment in the same animated imagery, describing the strong, but pleasurable, sensations which the soul feels in reading the sufferings of heroes who nobly died in the cause of liberty and their country.

"When
"When the pious band
Of youths, who sought for freedom, and their sires,
Lie side by side in gore."

Or, in the strong movements of indignation and revenge against the tyrant, who invades their liberty, and enslaves their country.

"When the patriot's tear
Starts from thine eye, and thy extended arm
In fancy hurks the thunderbolt of Jove,
To fire the impious wreath on Philip's brow,
Or dash Octavius from his trophies car;
Say—Does the sacred soul repine to taste
Thy big distress? Or, wouldst thou then exchange
Those heart-ennobling sorrows for the lot
Of him, who sits amid the gaudy herd
Of mute barbarians, bending to his nod,
And bears aloft his gold-invested front,
And says within himself, "I am a king,
And wherefore should the clamorous voice of woe
Intrude upon mine ear?"

The sentiment of this charming and moral poet is, that sympathetic feelings are virtuous, and therefore pleasant. And from the whole, he deduces this important conclusion; that every virtuous emotion must be agreeable, and that this is the sanction and the reward of virtue. The thought is amiable; the conclusion noble: but still the solution appears to us to be imperfect.

We have already said, that the pleasure arising from the contemplation of distressful scenes is a compounded feeling, arising from several distinct sources in the human breast. The kind and degree of the sensation must depend upon the various blendings of the several ingredients which enter into the composition. The cause assigned by Mr. Addison, the sense of our own security, may be supposed so have some share in the mass of feelings. That of Dr. Akenside may be allowed to have a still larger proportion. Let us attempt to trace some of the rest.

There are few principles in human nature of more general and important influence than that of sympathy. A late ingenious writer, led by the fashionable idea of simplifying all the springs of human nature into one source, has in his beautiful theory of Moral Sentiments, endeavoured to analyze a very large number of the feelings of the heart into sympathetic vibration. Though it appears to us most probable, that the human mind, like the human body, possesses various and distinct springs of action and of happiness, yet he has shown, in an amazing diversity of instances, the operation and importance of this principle of human nature. Let us apply it to our present subject.

We naturally sympathize with the passions of others. But if the passions they appear to feel be not those of mere distress alone; if, amidst the scenes of calamity, they display fortitude, generosity, and forgiveness; if, "rising superior to the cloud of ills which covers them," they nobly stand firm, collected, and patient; here is a still higher source of pleasure opens upon us, from complacence, admiration, and that unutterable sympathy which the heart feels with virtuous and heroic minds. By the operation of this principle, we place ourselves in their situation; we feel, as if we were, some share of that conscious integrity and peace which they must enjoy. Hence, as before observed, the pleasure will vary, both as to its nature and degree, according to the scene and characters before us. The shock of contending armies in the field,—the ocean wrought to tempest, and covered with the wreck of shattered vessels,—and a worthy family silently, yet nobly, bearing up against a multitude of surrounding sorrows, will excite very different emotions, because the component parts of the pleasurable sensation consist of very different materials. They all excite admiration; but admiration, how diversified, both as to its degree and its cause! These several ingredients may doubtless be so blended together, that the pleasure shall make but a very small part of the mixed sensation. The more agreeable teints may bear little proportion to the terrifying red or the gloomy black.

In many of the instances which have been mentioned, the pleasure must arise chiefly, if not solely, from the circumstances or accompaniments of the scene. The sublime feelings excited by the view of an agitated ocean, relieve and soften those occasioned by the shipwreck. And the awe excited by the presence of thousands of men, acting as if with one soul, and displaying magnanimity and firmness in the most solemn trial, tempers those sensations of horror and of pain which would arise from the field of battle.

The gratification we are attempting to account for depends also, in a very considerable degree, upon a principle of human nature, implanted in it for the wisest ends; the exercise which it gives to the mind, by rousing it to energy and feeling. Nothing is so insupportable, as that languor and ennu, for the full expression of which our language does not afford a term. How agreeable is it to have the soul called forth to exertion and sensibility, let the gamenter witness, who, unable to endure the lassitude and sameness of unanimated luxury, runs with eagerness to the place where probably await him all the irritation and agony of tumultuous passions.

Again; it is a law of our nature, that opposite passions, when felt in succession, and above all, when felt at the same moment, heighten and increase each other. Ease succeeding pain, certainly after suspense, friendship after aversion, are unspeakably stronger than if they had not been thus contrasted. In this conflict of feelings, the mind rises from passive to active energy. It is roused to intense sensation; and it enjoys that peculiar, exquisite, and complex feeling, in which, as in many articles of our table, the acid and the sweet, the pleasurable and painful, pungencies are so happily mixed together, as to render the united sensation amazingly more strong and delightful.

We have not yet mentioned the principle of curiosity, that busy and active power, which appears so early, continues almost unimpaired, and to which, for the wisest ends, is annexed so great a sense of enjoyment. To this principle, rather than to a love of cruelty, would we ascribe that pleasure which children sometimes seem to feel from torturing flies and lesser animals. They have not yet formed an idea of the pain they inflict. It is, indeed, of unspeakable consequence, that this practice be checked as soon and as effectually as possible, because it is so important, that they learn to connect the ideas of pleasure and pain.
pain with the motions and actions of the animal creation. And to this principle we may also refer no small share of that pleasure in the contemplation of distressful scenes, the springs of which, in the human heart, we are now endeavouring to open.

To curiosity, then—to sympathy—to mental exertion—to the idea of our own security—and to the strong feelings occasioned by viewing the actions and passions of mankind in interesting situations, do we ascribe the gratification which the mind feels from the survey of many scenes of sorrow. We have called it a pleasure; but it will approach towards, or recede from, pleasure, according to the nature and proportion of the ingredients of which the sensation is composed. In some cases, pain will predominate. In others, there will be exquisite enjoyment.

The final cause of this constitution of the human mind is probably, that by means of this strong sensation, the soul may be preserved in continual and vigorous motion—that its feelings may be kept lively and tender—that it may learn to practise the virtues it admires—and to assist those to whom its sympathy can reach—and that it may thus be led, by these social exercises of the heart, to soften with compassion—to expand with benevolence—and generously to assist in every case in which assistance can be given. An end this sufficient,

—“To assert eternal Providence, And justify the ways of God to man.”

DISTRESS, in Law, the seizing or distraining any thing for rent in arrear, or other duty unperformed. The effect of this distress is to compel the party either to repay the things distrained, and contest the taking, in an action of trespass against the distrainer; or rather to oblige him to compound and pay the debt or duty for which he was so distrained.

There are likewise compulsory distresses in actions to cause a person appear in court; of which kind there is a distress personal of one's moveable goods, and the profits of his lands, for contempt in not appearing after summons: there is likewise distress real, of a person's immovable goods. In these cases none shall be distrained to answer for any thing touching their freeholds, but by the king's writ.

Distress may be either finite or infinite. Finite distress is that which is limited by law, in regard to the number of times it shall be made, in order to bring the party to a trial of the action. Infinite distress is that which is without any limitation, being made till the person appear: it is farther applied to jurors that do not appear; as, upon a certificate of assize, the process is venire facias, habeas corpora, and distress infinite.

It is also divided into grand distress and ordinary distress; of these the former extends to all the goods and chattels that the party has within the county. A person, a common right, may distrain for rents and all manner of service or, and where a rent is reserved on a gift in tail, lease for life, or years, &c. though there be no clause of distress in the grant or lease, so as that he has the reversion; but on a feuement made in fee, a distress may not be taken, unless it be expressly reserved in the deed.

DISTRIBUTION, in a general sense, the act of dividing a thing into several parts, in order to the disposing each in its proper place.

DISTRIBUTION, in Architecture, the dividing and disposing the several parts and pieces which compose a building, as the plan directs. See ARCHITECTURE.

DISTRIBUTION, in Rhetoric, a kind of description, whereby an orderly division and enumeration is made of the principal qualities of the subject. David supplies us with an example of this kind, when in the heat of his indignation against sinners, he gives a description of their iniquity: "Their throat is an open sepulchre; they flatter with their tongues; the poison of asps is under their lips; their mouth is full of cursing and lies; and their feet are swift to shed blood."

DISTRIBUTION, in Printing, the taking a form asunder, separating the letters, and disposing them in the cases again, each in its proper cell. See PRINTING.

DISTRICT, in Geography, a part of a province, distinguished by peculiar magistrates, or certain privileges; in which sense it is synonymous with hundred. See HUNDRED.

DISTRIBUTAS in Law, a writ commanding the sheriff, or other officer, that he distrain a person for debt to the king, &c. or for his appearance at a certain day.

DISTRIBUTAS Juratores, a writ directed to the sheriff, whereby he is commanded to distrain upon a jury to appear and to return issues on their lands, &c. for non-appearance. This writ of distraining juratores issues for the sheriff to have their bodies in court, &c. at the return of the writ.

DITCH, a common fence or enclosure in marshes, or other wet land where there are no hedges. They allow these ditches six feet wide against highways that are broad; and against commons, five feet. But the common ditches about enclosures, dug at the bottom of the bank on which the quick is raised, are three feet wide at the top, one at the bottom, and two feet deep. By this means each side has a slope, which is of great advantage; for where this is neglected, and the ditches dug perpendicular, the sides are always washing down: besides, in a narrow-bottomed ditch, if cattle get down into it, they cannot stand to turn themselves to crop the quick: but where the ditch is four feet wide, it should be two and a half deep: and where it is five wide, it should be three deep; and so in proportion.

Ditch-Water is often used as an object for the microscope, and seldom fails to afford a great variety of animalcules. This water very often appears of a yellowish, greenish, or reddish colour; and this is wholly owing to the multitudes of animals of those colours which inhabit it. These animals are usually of the shrimp kind: and Swammerdam, who very accurately examined them, has called them, from the figure of their horns, prince aquaticus arborescens. They copulate in May or June; and are very numerous at that season, that the whole body of the water they are found in, is seen to be of a red, green, or yellowish colour, according to the colours of their bodies. The green thin scum also, so frequently seen on the surface of standing waters in summer, is no other than a multitude of small animalcules of this or some of the other kinds. Dunghill water is not less full of animals than

that
DIT [ 274 ]

that of ditches; and is often found so thronged with animalcules, that it seems altogether alive: it is then so very much crowded with these creatures, that it must be diluted with clear water before they can be distinctly viewed. There are usually in this fluid a sort of eels which are extremely active; and besides these and many other of the common inhabitants of fluids, there is one species found in this which seems peculiar to it: the middle part of them is dark and beast with hairs, but the ends are transparent; their tails are tapering, with a long spring at the extremity, and their motion is slow and evasive. See ANIMALCULE.

DIT, in Fortification, called also foss and moat, a trench dug round the rampart or wall of a fortified place, between the scarpe and counterscarpe. See FORTIFICATION.

DITHYRAMBUS, in ancient poetry, a hymn in honour of Bacchus, full of transport and poetical rage.

This poetry owes its birth to Greece, and to the transports of wine; and yet art is not so exploded, but delicately applied to guide and restrain the dithyrambic impetuosity, which is indulged only in pleasing flights. Horace and Aristotle tell us, that the ancients gave the name of dithyrambus to those verses wherein none of the common rules or measures were observed. As we have now no remains of the dithyrambus of the ancients, we cannot say exactly what their measure was.

DITONE, in Music, an interval comprehending two tones. The proportion of the sounds that form the ditone is 4 : 5, and that of the semitone is 5 : 6.

DITHIHEIDRIA, in Mineralogy, an old term expressive of crystals with twice three sides, or six planes; being formed of two triagonal pyramids joined base to base, without any intermediate prism.

The species of ditrihedria are distinguished by the different figures of these pyramids.

DITANDER. See LEPIDIUM, BOTANY INDEX.

DITTANY. See Dictamnus, BOTANY INDEX.

DITTO, in books of accounts, usually written Do, signifies the afore-mentioned. The word is corrupted from the Italian detto, "the said: as in our law-phrase, "the said premises," meaning the same as were afore-mentioned.

DITTON, HUMPHRY, an eminent mathematician, was born at Salisbury, May 29. 1675. Being an only son, and his father observing him in an extraordinary good capacity, determined to cultivate it with a good education. For this purpose he placed him in a reputable private academy; upon quitting of which he at the desire of his father, though against his own inclination, engaged in the profession of divinity, and began to exercise his function at Tunbridge in the county of Kent, where he continued to preach some years; during which time he married a lady of that place.

But a weak constitution and the death of his father, induced Mr Ditton to quit that profession. And at the persuasion of Dr Harris and Mr Whiston, both eminent mathematicians, he engaged in the study of mathematics; a science to which he had always a strong inclination. In the prosecution of this science, he was much encouraged by the success and applause he received; being greatly esteemed by the chief professors of it, and particularly by Sir Isaac Newton, by whose interest and recommendation he was elected master of the new mathematical school in Christ's Hospital; where he continued till his death, which happened in 1715, in the 40th year of his age, much regretted by the philosophical world, who expected many useful and ingenious discoveries from his assiduity, learning, and penetrating genius.

Mr Ditton published several mathematical and other tracts, as below.—1. Of the Tangents of Curves, Phil. Trans. vol. xxiii.

2. A Treatise on Spherical Catoptrics, published in the Philosoph. Trans. for 1705; from whence it was copied and reprinted in the Acta Eruditorum 1707, and also in the Memoirs of the Academy of Sciences at Paris.

3. General Laws of Nature and Motion; 8vo. 1705. Wolfius mentions this work, and says that it illustrates and renders easy the writings of Galileo, Huygens, and the Principia of Newton. It is also noticed by La Roche, in the Memoires de Literature, vol. viii. page 46.

4. An Institution of Fluxions, containing the first Principles, Operations, and Applications, of that admirable method, as invented by Sir Isaac Newton, 8vo. 1706. This work, with additions and alterations, was again published by Mr John Clarke, in the year 1726.

5. In 1709 he published the Synopsis Algebraica of John Alexander, with many additions and corrections.

6. His Treatise on Perspective was published in 1712. In this work he explained the principles of that art mathematically; and besides teaching the methods then generally practised, gave the first hints of the new method afterwards enlarged upon and improved by Dr Brook Taylor; and which was published in the year 1715.

7. In 1714, Mr Ditton published several pieces both theological and mathematical; particularly his Discourse on the Resurrection of Jesus Christ; and The New Law of Fluids, or a Discourse concerning the Ascent of Liquids, in exact Geometrical Figures, between two nearly contiguous Surfaces. To this was annexed a tract, to demonstrate the impossibility of thinking or perception being the result of any combination of the parts of matter and motion: a subject much agitated about that time. To this work also was added an advertisement from him and Mr Whiston, concerning a method for discovering the longitude, which it seems they had published about half a year before. This attempt probably cost our author his life; for although it was approved and countenanced by Sir Isaac Newton, before it was presented to the Board of Longitude, and the method had been successfully put in practice, in finding the longitude between Paris and Vienna; yet that board then determined against it; so that the disappointment, together with some public ridicule (particularly in a poem written by Dean Swift), affected his health so that he died the ensuing year, 1715.

In an account of Mr Ditton, prefixed to the German translation of his Discourse on the Resurrection, it is said that he had published, in his own name only, another method for finding the longitude; but which Mr Whiston denied. However, Raphael Levi, a learned Jew, who had studied under Leibnitz, informed the German editor, that he well knew that Ditton and Leibnitz had corresponded upon the subject; and that Ditton...
DITTON had sent to Leibnitz a delineation of a machine he had invented for that purpose; which was a piece of mechanism constructed with many wheels like a clock, and which Leibnitz highly approved of for land use; but doubted whether it would answer on ship board, on account of the motion of the ship.

DIVAL, in Heraldry, the herb nightshade, used by such as blazon by flowers and herbs instead of colours and metals, for sable or black.

DIVALIA, in antiquity, a feast held among the ancient Romans, on the 21st day of December, in honour of the goddess Angeronia; whence it is also called Angeronalia. — On the day of this feast, the pontifices performed sacrifice in the temple of Voluptia, or the goddess of joy and pleasure; who, some say, was the same with Angeronia, and supposed to drive away all the sorrows and chagrins of life.

DIVAN, a council chamber or court of justice among the eastern nations, particularly the Turks. — The word is Arabic, and signifies the same with sofa in the Turkish dialect.

There are two sorts of divans; that of the grand signor, called the council of state, which consists of seven of the principal officers of the empire; and that of the grand vizir, composed of six other vizirs or counsellors of state, the chancellor, and secretaries of state, for the distribution of justice.

The word is also used for a hall in the private houses of the orientals. The custom of China does not allow the receiving of visits in the inner parts of the house, but only at the entry, in a divan contrived on purpose for ceremonies.

Travellers relate wonders of the silence and expedition of the divans of the east.

DIVAN-Beghi, the superintendent of justice in Persia, whose place is the last of the six ministers of the second rank, who are all under the aghamadu or first minister. To this tribunal of the divan-beghi lie appeals from the highest by the governors. He has a fixed fund of 50,000 crowns for administering justice. All the sergeants, ushers, &c. of the court are in his service. He takes cognizance of the criminal causes of the chams, governors, and other great lords of Persia, when accused of any fault. There are divan-beghis not only at court and in the capital, but also in the provinces and other cities of the empire. The Alcoran is the sole rule of his administration of justice, which also he interprets at pleasure. He takes no cognizance of civil causes; but all differences arising between the officers of the king's household and between foreign ministers are determined by him.

DIVANDUROW, the name of seven islands which lie a league north of the Maldives, and 24 from the coast of Malabar, almost opposite to Cannanore.

DIVER. See Colymbus, Ornithology Index.

DIVERGENT or DIVERGING LINES, in Geometry, are those which constantly recede from each other.

DIVERGENT Rays, in Optics, are those which, going from a point of the visible object, are dispersed, and continually depart one from another in proportion as they are removed from the object; in which sense it is opposed to convergent. See Optics.

DIVERSIFYING, in Rhetoric, is of infinite service to the orator; it is an accomplishment essential to his character, and may fitly be called the subject of all his tropes and figures. Vossius lays down six ways of diversifying a subject. 1. By enlarging on what was briefly mentioned before. 2. By a concise enumeration of what had been insisted on at length. 3. By adding something new to what is repeated. 4. By repeating only the principal heads of what had been said. 5. By transposing the words and periods. 6. By imitating them.

DIVERSION, in military affairs, is when an enemy is attacked in one place where they are weak and unprovided, in order to draw off their forces from another place where they have made or intend to make an irruption. Thus the Romans had no other way in their power of driving Hannibal out of Italy, but by making a diversion in attacking Carthage.

DIVESTING, properly signifies undressing or stripping off one's garment; in contradistinction from investing.

In law, it is used for the act of surrendering or relinquishing one's effects. By a contract of donation or sale, the donor or seller is said to be dispossessed and divested of his property in such a commodity, and the donee or purchaser becomes invested therewith. See Investiture.

A demise is a general divestiture which the fathers and mothers make of all their effects in favour of their children.

DIVIDEND, in Arithmetic, the number proposed to be divided into equal parts. See Arithmetic, No 14.

DIVIDEND of Stocks is a share or proportion of the interest of stocks erected on the public funds, as the South sea, &c. divided among and paid to the adventurers half yearly.

DIVINATION, the knowledge of things obscure or future, which cannot be attained by any natural means.

It was a received opinion among the heathens, that the gods were wont to converse familiarly with some men, whom they endowed with extraordinary powers, and admitted to the knowledge of their councils and designs. Plato, Aristotle, Plutarch, Cicero, and others, divide divination into two sorts or species, viz. natural and artificial.

The former was so called, because not attained by any rules or precepts of art, but infused or inspired into the diviner, without his taking any further care about it than to purify and prepare himself for the reception of the divine afflatus. Of this kind were all those who delivered oracles, and foretold future events by inspiration, without observing external signs or accidents.

The second species of divination was called artificial, because it was not obtained by immediate inspiration, but proceeded upon certain experiments and observations arbitrarily instituted, and mostly superstition. Of this sort there were various kinds, as by sacrifices, entrails, flame, cakes, flour, wine, water, birds, lots, verses, omens, &c.

In holy Scripture we find mention made of nine different kinds of divination. The first performed by the inspection of planets, stars, and clouds: it is supposed to be the practicals of this whom Moses calls יִנָּה יִנָּה, "cloud," Deuter. chap. xviii. ver. 10. 2. Those whom the prophet calls in the same place מָמֵא
The cabala signifies, in like manner, the knowledge of things that are above the moon, as the celestial bodies and their influences; and in this sense it is the same with judicial astrology, or makes a part of it.

2. Horoscopy, which may also be considered as a part of astrology, is the art by which they draw a figure, or celestial scheme, containing the 12 houses, wherein they mark the disposition of the heavens at a certain moment; for example, that at which a man is born, in order to foretell his fortune, or the incidents of his life. In a word, it is the disposition of the stars and planets at the moment of any person's birth. But as there cannot be any probable or possible relation between the constellations and the human race, all the principles they lay down, and the prophecies they draw from them, are chimerical, false, absurd, and a criminal imposition on mankind.

3. The art of augury consisted, among the ancient Romans, in observing the flight, the singing and eating of birds, especially such as were held sacred. See AUGURY.

4. The equally deceitful art of horuspicy consisted, on the contrary, in the inspection of the bowels of animals, but principally of victims; and from thence predicting grand incidents relative to the republic, and the good or bad events of its enterprises.

5. Aeromancy was the art of divining by the air. This vain science has also come to us from the Pagans; but is rejected by reason as well as Christianity, as false and absurd.

6. Pyromancy is a divination made by the inspection of a flame, either by observing to which side it turns, or by throwing into it some combustible matter, or a bladder filled with wine, or any thing else from which they imagined they were able to predict.

7. Hydromancy is the supposed art of divining by water. The Persians, according to Varro, invented it. Pythagoras and Numa Pompius made use of it; and we still admire the like wonderful prognosticators.

8. Geromancy was a divination made by observing of cracks or clefts in the earth. It was also performed by points made on paper, or any other substance, at a venture; and they judged of future events from the figures that resulted from thence. This was certainly very ridiculous; but it is nothing less so to pretend to predict future events by the inspection of the grounds of a dish of tea or coffee, or by cards, and many other like matters.—Thus have designing men made use of the four elements to deceive their credulous brethren.

9. Chiroomancy is the art which teaches to know, by inspecting the hand, not only the inclinations of a man, but his future destiny also. The fools or impostors who practise this art pretend that the different parts or the lines of the hand have a relation to the internal parts of the body, as some to the heart, others to the liver, spleen, &c. On this false supposition, and on many others equally extravagant, the principles of chiroomancy are founded: and on which, however, several authors, as Robert Fludd an Englishman, Artemidorus, M. de la Chambre, John of Lodagins, and many others, have written large treatises.

10. Phystogonomy, or physiognomancy, is a science that pretends to teach the nature, the temperament, the understanding,
understanding, and the inclinations of men, by the inspection of their countenances, and is therefore very little less frivolous than chirromancy; though Aristotle, and a number of learned men after him, have written express treatises concerning it.

DIVINE, something relating to God. The word is also used, figuratively, for any thing that is excellent, extraordinary, and that seems to go beyond the power of nature and the capacity of mankind. In which sense, the compass, telescope, clocks, &c. are said to be divine inventions: Plato is called the divine author, the divine Plato; and the same appellation is given to Seneca: Hippocrates is called, "the divine old man," divinus senex, &c.

DIVING, the art or act of descending under water to considerable depths, and abiding there a competent time.

The uses of diving are very considerable, particularly in the fishing for pearls, corals, sponges, &c. See Pearl-Fishing, &c.

There have been various methods proposed, and machines contrived, to render the business of diving more safe and easy. The great point is to furnish the diver with fresh air; without which, he must either make a short stay or perish.

Those who dive for sponges in the Mediterranean, help themselves by carrying down sponges ddipt in oil in their mouths. But considering the small quantity of air that can be contained in the pores of a sponge, and how much that little will be contracted by the pressure of the incumbent water, such a supply cannot long subsist the diver. For it is found by experiment, that a gallen of air included in a bladder, and by a pipe reciprocally inspired and expired by the lungs, becomes unfit for respiration in little more than one minute of time. For though its elasticity be but little altered in passing the lungs, yet it loses its vivifying spirit, and is rendered inefficac.

In effect, a naked diver, Dr. Halley assures us, without a sponge, cannot remain above a couple of minutes enclosed in water, nor much longer with one, without suffocating; nor, without long practice, near so long; ordinary persons beginning to stifle in about half a minute. Besides, if the depth be considerable, the pressure of the water on the vessels makes the eyes blood-shot, and frequently occasions a spitting of blood.

Hence, where there has been occasion to continue long at the bottom, some have contrived double flexible pipes, to circulate air down into a cavity, enclosing the diver as with armour, both to furnish air and to bear off the pressure of the water, and give leave to his breast to dilate upon inspiration; the fresh air being forced down one of the pipes with hollows, and returning by the other of them, not unlike to an artery and vein.

But this method is impracticable when the depth surpasses three fathoms; the water embracing the bare limbs so closely as to obstruct the circulation of the blood in them; and withal pressing so strongly on all the junctures where the armour is made tight with leather, that, if there be the least defect in any of them, the water rushes in, and instantly fills the whole engine, to the great danger of the diver's life.

It is certain, however, that people, by being accustomed to the water from their infancy, will at length be enabled, not only to stay much longer under water than the time above mentioned, but put on a kind of amphibious nature, so that they seem to have the use of all their faculties as well when their bodies are immersed in water as when they are on dry land. Most savage nations are remarkable for this. According to the accounts of our late voyagers, the inhabitants of the South sea islands are such expert divers, that when a hair or any piece of iron was thrown overboard, they would instantly jump into the sea after it, and never failed to recover it, notwithstanding the quick descent of the metal. Even among civilized nations, many persons have been found capable of continuing an incredible length of time below water. The most remarkable instance of this kind is the famous Sicilian diver Nicolo Pesce. The authenticity of the account, indeed, depends entirely on the authority of F. Kircher. He assures us that he had it from the archives of the kings of Sicily: but, notwithstanding this assertion, the whole hath so much of the marvellous in it, that we believe there are few who will not look upon it to have been exaggerated. "In the times of Frederic king of Sicily (says Kircher), there lived a celebrated diver, whose name was Nicolas, and who, from his amazing skill in swimming, and his perseverance under water, was surnamed the fish. This man had from his infancy been used to the sea; and earned his scanty subsistence by diving for corals and oysters, which he sold to the villagers on shore. His long acquaintance with the sea, at last, brought it to be almost his natural element. He was frequently known to spend five days in the midst of the waves, without any other provisions than the fish which he caught there, and ate raw. He often swam over from Sicily into Calabria, a tempestuous and dangerous passage, carrying letters from the king. He was frequently known to swim among the gulfs of the Lipari islands, noway apprehensive of danger."

"Some mariners out at sea, one day observed something at some distance from them, which they regarded as a sea monster; but upon its approach it was known to be Nicholas, whom they took into their ship. When they asked him whether he was going in so stormy and rough a sea, and at such a distance from land, he showed them a packet of letters, which he was carrying to one of the towns of Italy, exactly done up in a leather bag, in such a manner as that they could not be wetted by the sea. He kept them thus company for some time in their voyage, conversing, and asking questions; and after eating a hearty meal with them, he took his leave, and, jumping into the sea, pursued his voyage alone."

"In order to aid these powers of enduring in the deep, nature seemed to have assisted him in a very extraordinary manner: for the spaces between his fingers and toes were webbed, as in a goose; and his chest became so very capacious, that he could take in, at once inspiration, as much breath as would serve him for a whole day."

"The account of so extraordinary a person did not fail to reach the king himself; who commanded Nicholas to be brought before him. It was no easy matter to find Nicholas, who generally spent his time in the solitudes of the deep; but, at last, after much searching,
searching, he was found, and brought before his majesty. The curiosity of this monarch had been long excited by the accounts he had heard of the bottom of the gulf of Charybdis; he now therefore conceived, that it would be a proper opportunity to have more certain information. He therefore commanded our poor diver to examine the bottom of this dreadful whirlpool; and as an incitement to his obedience, he ordered a golden cup to be flung into it. Nicholas was not insensible of the danger to which he was exposed; dangers best known only to himself; and therefore he presumed to remonstrate: but the hopes of the reward, the desire of pleasing the king, and the pleasure of showing his skill, at last prevailed. He instantly jumped into the gulf, and was as instantly swallowed up in its bosom. He continued for three quarters of an hour below; during which time the king and his attendants remained on shore, anxious for his fate; but he at last appeared, holding the cup in triumph in one hand, and making his way good among the waves with the other. It may be supposed he was received with applause when he came on shore: the cup was made the reward of his adventure; the king ordered him to be taken proper care of; and, as he was somewhat fatigued and debilitated by his labour, after a hearty meal he was put to bed, and permitted to refresh himself by sleeping.

"When his spirits were thus restored, he was again brought to satisfy the king's curiosity with a narrative of the wonders he had seen; and his account was to the following effect. He would never, he said, have obeyed the king's commands, had he been apprised of half the dangers that were before him. There were four things, he said, which rendered the gulf dreadful, not only to men, but to fishes themselves. 1. The force of the water bursting up from the bottom, which required great strength to resist. 2. The abruptness of the rocks on every side threatened destruction. 3. The force of the whirlpool dashing against those rocks. And, 4. The number and magnitude of the polyhedral fish, some of which appeared as large as a man; and which everywhere sticking against the rocks, projected their fibrous arms to entangle him. Being asked how he was able so readily to find the cup that had been thrown in, he replied, that it happened to be flung by the waves into the cavity of a rock against which he himself was urged in his descent. This account, however, did not satisfy the king's curiosity. Being requested to venture once more into the gulf for further discoveries, he at first refused: but the king, desirous of having the most exact information possible of all things to be found in the gulf, repeated his solicitations; and, to give them still greater weight, produced a larger cup than the former, and added also a purse of gold. Upon these considerations the unfortunate diver once again plunged into the whirlpool, and was never heard of more."

To obviate the inconveniences of diving to those who have not the extraordinary powers of the diver above mentioned, different instruments have been contrived. The chief of these is the diving-bell, which is most conveniently made in the form of a truncated cone, the smaller base being closed, and the larger open. It is to be poised with lead; and so suspended, that the vessel may sink full of air, with its open basis downward, and as near as may be in a situation parallel to the horizon, so as to close with the surface of the water all at once.

Under this covere the diver sitting, sinks down with the included air to the depth desired: and if the cavity of the vessel contain a tun of water, a single man may remain a full hour, without much inconvenience, at five or six fathoms deep. But the lower you go, still the included air contracts itself according to the weight of the water which compresses it: so that at 33 feet deep the bell becomes half full of water, the pressure of the incumbent water being then equal to that of the atmosphere; and at all other depths the space occupied by the compressed air in the upper part of the bell will be to the under part of its capacity filled with water, as 33 feet to the surface of the water in the bell below the common surface thereof. And this condensed air being taken in with the breath soon insinuates itself into all the cavities of the body, and has no ill effect, provided the bell be permitted to descend so slowly as to allow time for that purpose. One inconvenience that attends it, is found in the ears, within which there are cavities which open only outwards, and that by pores so small as not to give admission even to the air itself, unless they be dilated and distended by a considerable force. Hence, on the first descent of the bell, a pressure begins to be felt on the ear; which, by degrees, grows painful, till the force overcoming the obstacle, what constricts these pores yields to the pressure, and letting some condensed air slip in, presently eases ensues. The bell descending lower, the pain is renewed, and again eased in the same manner. But the greatest inconvenience of this engine is, that the water entering it, contracts the bulk of air into a small compass, it soon heats and becomes unfit for respiration; so that there is a necessity for its being drawn up and renewed.

"The invention of this bell," (says Professor Beckmann, Hist. of math.), "is generally assigned to the 17th century. I am of opinion that it was first known before that period. We read, however, that in the time of Aristotle divers used a kind of kettle, to enable them to continue longer under the water; but the manner in which it was employed is not clearly described. The oldest information which we have of the use of the diving-bell in Europe, is that of John Taisnier, who was born in Hainsault in 1509, and had a place at court under Charles V, whom he attended on his voyage to Africa. He relates in what manner he saw at Toledo, in the presence of the emperor and several thousand spectators, two Greeks let themselves down under water, in a large inverted kettle, with a burning light, and rise up again without being wet. It appears that this art was then new to the emperor and the Spaniards, and that the Greeks were caused to make the experiment in order to prove the possibility of it."

"When the English in 1588, dispersed the Spanish fleet, called the Invincible Armada, part of the ships went to the bottom, near the Isle of Mull, on the western coast of Scotland; and some of these, according to the account of the Spanish prisoners, contained great riches. This information excited, from time to time, the avarice of speculators, and gave rise to several attempts
Diving

tempts to procure part of the lost treasure. In the
year 1655, a person was so fortunate as to bring up
some cannon, which, however, were not sufficient to
define the premises. Of these attempts, and the kind
of diving-bell used in them, the reader will find an ac-
count in a work printed at Rotterdam in 1669, and
entitled G. Sinelari Ars nova et magna gravitatis et le-
vitatis. In the year 1680, William Phipps, a native
of America, formed a project for searching and unloading
a rich Spanish ship sunk on the coast of Hispaniola;
and represented his plan in such a plausible manner, that
King Charles II. gave him a ship, and furnished him
with every thing necessary for the undertaking. He
set sail in the year 1683; but being unsuccessful, re-
turned again in great poverty, though with a firm con-
viction of the possibility of his scheme. By a subscrip-
tions promoted chiefly by the duke of Albemarle, the
son of the celebrated Monk, Phipps was enabled, in
1687, to try his fortune once more, having previously
engaged to divide the profit according to the twenty
shares of which the subscription consisted. At first all
his labour proved fruitless; but at last, when his pa-
tience was almost entirely exhausted, he was so lucky as
to bring up from the depth of six or seven fathoms, so
much treasure, that he returned to England with the
value of two hundred thousand pounds sterling.
Of this sum he himself got about sixteen, others say twenty
thousand, and the duke ninety thousand pounds. After
he came back, some persons endeavoured to persuade
the king to seize both the ship and the cargo, under a
pretence, that Phipps, when he solicited for his ma-
jesty’s permission, had not given accurate information
respecting the business. But the king answered, with
much greatness of mind, that he knew Phipps to be an
honest man, and that he and his friends should share the
whole among them had he returned with double the
value. His majesty even conferred upon him the ho-
nour of knighthood, to show how much he was satisfied
with his conduct. We know not the construction of
Phipps’s apparatus: but of the old figures of a diving-
machine, that which approaches nearest to the diving-
bell is in a book on fortification by Lorini; who de-
scribes a box, but entirely exhausted, he was so lucky as
to bring up from the depth of six or seven fathoms, so
much treasure, that he returned to England with the
value of two hundred thousand pounds sterling.
Of this sum he himself got about sixteen, others say twenty
thousand, and the duke ninety thousand pounds. After
he came back, some persons endeavoured to persuade
the king to seize both the ship and the cargo, under a
pretence, that Phipps, when he solicited for his ma-
jesty’s permission, had not given accurate information
respecting the business. But the king answered, with
much greatness of mind, that he knew Phipps to be an
honest man, and that he and his friends should share the

value. His majesty even conferred upon him the ho-
nour of knighthood, to show how much he was satisfied
with his conduct. We know not the construction of
Phipps’s apparatus: but of the old figures of a diving-
machine, that which approaches nearest to the diving-
bell is in a book on fortification by Lorini; who de-
scribes a box, but entirely exhausted, he was so lucky as

The bell I made use of was of wood, containing
about 50 cubic feet in its concavity; and was of the
form of a truncated cone, whose diameter at the top was
three feet, and at the bottom five. This I coated with
lead so heavy that it would sink empty; and I distri-
buted the weight so about its bottom, that it would go
down in a perpendicular direction, and no other. In
the top I fixed a strong but clear glass, as a window,
to let in the light from above; and likewise a cock to
let out the hot air that had been breathed; and below,
about a yard under the bell, I placed a stage which
hung by three ropes, each of which was charged with
about one hundred weight to keep it steady. This
machine I suspended from the mast of a ship by a sprit,
which was sufficiently secured by stays to the mast head,
and was directed by braces to carry it overboard clear
of the ship’s side, and to bring it again within board
as occasion required.

To supply air to this bell when under water, I
caused a couple of barrels of about 36 gallons each to
be caséd with lead, so as to sink empty; each of them
having a bung-hole in its lowest parts to let in the wa-
ter, as the air in them condensed on their descent; and
to let it out again when they were drawn up full from
below. And to a hole in the uppermost part of these
barrels, I fixed a leather trunk or hose well liquored
with bees wax and oil, and long enough to fall below
the bung-hole, being kept down by a weight appen-
ded: so that the air in the upper part of the barrels
could not escape, unless the lower ends of these hose
were first lifted up.

The air-barrels being thus prepared, I fitted them
with tackle proper to make them rise and fall alternate-
ly, after the manner of two buckets in a well; which
was done with so much ease, that two men, with less
than half their strength, could perform all the labour re-
quired; and in their descent they were directed by lines
fastened to the under edge of the bell, the which passed
through rings on both sides the leather hose in each
barrel; so that, sliding down by these lines, they came
readily to the hand of a man who stood on the stage on
purpose to receive them, and to take up the ends of
the hose into the bell. Through these hose, as soon
as their ends came above the surface of the water in
the barrels, all the air that was included in the upper
parts of them was blown with great force into the bell,
whilst the water entered at the bung-holes below, and
filled them; and as soon as the air of one barrel had
been thus received, upon a signal given, that was drawn
up, and at the same time the other descended; and
by an alternate succession, furnished air so quick, and
in so great plenty, that I myself have been one of five
who have been together at the bottom in nine or ten
fathom water, for above an hour and a half at a time.
without any sort of ill consequence; and I might have
continued there as long as I pleased, for any thing that
appeared to the contrary. Besides, the whole cavity of
the bell was kept entirely free from water, so that I
sat on a bench which was diametrically placed near the
bottom, wholly dressed, with all my clothes on. I
only observed, that it was necessary to let down
gradually at first, as about 12 feet at a time; and
then.
Diving. - then to stop and drive out the air that entered, by receiving three or four barrels of fresh air before I descended further. But, being arrived at the depth designed, I then let out as much of the hot air that had been breathed, as each barrel would replenish with cool, by means of the cock at the top of the bell; through whose aperture, though very small, the air would rush with so much violence, as to make the surface of the sea boil, and to cover it with a white foam, notwithstanding the weight of the water over us.

"Thus I found that I could do anything that required to be done just under us; and that, by taking off the stage, I could, for a space as wide as the circuit of the bell lay the bottom of the sea so far dry, as not to be overflows thereon. And, by the glass window, so much light was transmitted, that when the sea was clear, and especially when the sun shone, I could see perfectly to write or read; much more to fasten or lay hold on anything under us that was to be taken up. And, by the return of the air-barrels, I often sent orders written with an iron pen, on small plates of lead, directing how to move us from place to place as occasion required. At other times, when the water was troubled and thick, it would be as dark as night below; but in such cases I have been able to keep a candle burning in the bell as long as I pleased, notwithstanding the great expense of air necessary to maintain flame. - By an additional contrivance, I have found it not impracticable, for a diver to go out of an engine to a good distance from it, the air being conveyed to him with a continued stream, by small flexible pipes, which pipes may serve as a clue, to direct him back again when he would return to the bell."

Plate CLXXVI. fig. 1. shows Dr Halley's diving-bell, with the divers at work. D, the glass which serves as B, the cock for letting out the air which has been breathed. LM the seals. C, one of the air-barrels. P, H, two of the divers. F, another diver at a distance from the bell, and breathing through the flexible tube K. - This diver is supposed to have a head-piece of lead, made to fit quite close about his shoulders; this head-piece was capable of containing as much air as would supply him for a minute or two. When he had occasion for more air, he turned a cock at F, by which means a communication was opened with the air in the bell, and thus he could receive a new supply at pleasure.

Since the invention of this diving machine, there has been one contrivance by Mr Triewald, F. R. S. and military architect to the king of Sweden, which for a single person is in some respects thought to be more eligible than Dr Halley's, and is constructed as follows: AB is the bell, which is sunk by lead weights DD hung to its bottom. This bell is of copper, and tinned all over in the inside, which is illuminated by three strong convex lenses, G, G, G, with copper lids H, H, to defend them. The iron rings or plate E serves the diver to stand on when he is at work; and is suspended at such a distance from the bottom of the bell by the chains F, F, F, that when the diver stands upright, his head is just above the water in the bell, where the air is much better than higher up, because it is colder, and consequently more fit for respiration. But as the diver must always be within the bell, and his head of course in the upper part, the inventor has contrived, that even there, when he has breathed the hot air as well as he can, he may, by means of a spiral copper tube, b, placed close to the inside of the bell, draw the cooler and fresher air from the lowermost parts; for which purpose, a flexible leather tube, about two feet long, is fixed to the upper end of the copper tube at b; and to the other end of this tube is fixed an ivory mouth-piece, by which the diver draws in the air.

The greatest improvement, however, which the diving-bell ever received, or probably can receive, was from the late Mr Spalding of Edinburgh. A section of his improved diving bell is represented in fig. 3. This construction is designed to remedy some inconveniences of Dr Halley's, which are very evident, and very dangerous tendency. These are, 1. By Dr Halley's construction, the sinking or raising of the bell depends entirely on the people who are at the surface of the water; and as the bell even when in the water has a very considerable weight, the raising it not only requires a great deal of labour, but there is a possibility of the rope breaking by which it is raised, and thus every person in the bell would inevitably perish. 2. As there are, in many places of the sea, rocks which lie at a considerable depth, the figure of which cannot possibly be perceived from above, there is danger that some of their ragged prominences may catch hold of one of the edges of the bell in its descent, and thus overset it before any signal can be given to those above, which would infallibly be attended with the destruction of the people in the bell; and as it must always be unknown, before trial, what kind of a bottom the sea has in any place, it is plain, that without some contrivance to obviate this last danger, the descent in Dr Halley's diving bell is not at all eligible.

How these inconveniences are remedied by Mr Spalding's new construction will be easily understood from the following description. - ABCD represents a section of the bell, which is made of wood; e, e, are iron hooks, by means of which it is suspended by ropes Q B F c, and Q A E R e, and Q S, as expressed in the figure; c, c, are iron hooks, to which are appended lead weights, that keep the mouth of the bell always parallel to the surface of the water, whether the machine taken altogether is lighter or heavier than an equal bulk of water. By these weights alone, however, the bell would not sink; another is therefore added, represented at I; and which can be raised or lowered at pleasure, by means of a rope passing over the pulley a, and fastened to one of the sides of the bell at M. As the bell descends, this weight, called by Mr Spalding the balance-weight, hangs down a considerable way below the mouth of the bell. In case the edge of the bell is caught by any obstacle, the balance-weight is immediately lowered down so that it may rest upon the bottom. By this means the bell is lightened, so that all danger of oversetting is removed; for being lighter without the balance-weight, than an equal bulk of water, it is evident that the bell will rise, as well as the length of the rope affixed to the balance-weight will allow it. This weight, therefore, will serve as a kind
We are told of another method put in practice by a gentleman of Devonshire. He has contrived a large case of strong leather, perfectly water-proof, which may hold about half a hoghead of air. This is so contrived, that, when he shuts himself up in this case, he may walk at the bottom of the sea, and go into any part of a wrecked vessel, and deliver out the goods.—This method, we are told, he has practised for many years and has thus acquired a large fortune. It would be a considerable improvement on this machine to condense the air in it as much as possible before the diver descended; as he would thus be furnished with an atmosphere endowed with elasticity sufficient to resist the weight of the water, which otherwise would squeeze his case into much less room than it originally took up. The condensed air also would serve for respiration a much longer time than that which is in its ordinary state. See the article Diving, in the Supplement.

Diving-Bladder, a machine invented by Borelli, and by him preferred, though without any good reason, to the diving-bell. It is a globular vessel of brass or copper, about two feet in diameter, which contains the diver’s head. It is fixed to a goat’s skin habit exactly fitted to his person. Within the vessel are pipes; by means of which a circulation of air is contrived; and the person carries an air-pump by his side by which he can make himself heavier or lighter, as fishes do by contracting or dilating their air-bladder. By this means he thought all the objections to which other diving machines are liable were entirely obviated, and particularly that of want of air; the air which had been breathed, being, as he imagined, deprived of its noxious qualities by circulating through the pipes. These advantages, however, it is evident, are only imaginary. The diver’s limbs, being defended from the pressure of the water only by a goat’s skin, would infallibly be crushed, if he descended to any considerable depth; and from the discoveries now made by Dr Priestley and others, it is abundantly evident, that air, which is once rendered foul by breathing, cannot in any degree be restored by circulation through pipes. Concerning the use of copper machines in general, Mr Spalding favoured us with the following curious observation, namely, That when a person has breathed in them a few minutes, he feels in his mouth a very disagreeable brassy taste, which continues all the time he remains in the vessel; so that, on this account, copper seems by no means an eligible material. This taste most probably arises from the action of the alkaline effusiveness of the body upon the copper; for volatile alkali is a strong dissolvent of this metal; but how these effusiveness volatilize the copper in such a manner as to make the taste of it sensible in the mouth, it is not easy to say.

DIVINITY, properly signifies the nature, quality, and essence of God.

DIVINITY is also used in the same sense with theology.

DIVISIBILITY, that property by which the particles of matter in all bodies are capable of a separation or disunion from each other.

The Peripatetics and Cartesians hold divisibility to be an affection of all matter. The Epicureans, again, allow it to agree to every physical continuum; but

Vol. VII. Part I.
they deny that this affection agrees to all bodies, for the primary corpuscles or atoms they maintain to be perfectly inseparable and indivisible.

As it is evident that body is extended, so it is no less evident that it is divisible; for since no two particles of matter can exist in the same place, it follows, that they are really distinct from each other; which is all that is meant by being divisible. In this sense the least conceivable particle must still be divisible, since it will consist of parts which will be really distinct. To illustrate this by a familiar instance. Let the least imaginable piece of matter be conceived lying on a smooth plane surface, it is evident the surface will not touch it everywhere; those parts, therefore, which it does not touch may be supposed separable from the others, and so on as far as we please; and this is all that is meant when we say matter is infinitely divisible.

The infinite divisibility of mathematical quantity is demonstrated thus geometrically. Suppose the line AC perpendicular to BF; and another, as GH, at a small distance from it, also perpendicular to the same line; with the centres CCC, &c. describe circles cutting the line GH in the points e, e, &c. Now the greater the radius AC is, the less is the part eH. But the radius may be augmented in infinitum; so long, therefore, the part eH may be divided into still less portions; consequently it may be divided in infinitum.

All that is supposed in strict geometry (says Mr. Macaulay) concerning the divisibility of magnitude, amounts to no more than that a given magnitude may be conceived to be divided into a number of parts equal to any given or proposed number. It is true, that the number of parts into which a given magnitude may be conceived to be divided, is not to be fixed or limited, because no given number is so great but a greater may be conceived and assigned; but there is not, therefore, any necessity of supposing the number of parts actually infinite; and if some have drawn very abstruse consequences from such a supposition, yet geometry ought not to be loaded with them.

How far matter may actually be divided, may in some measure be conceived from hence, that a piece of wire gilt with so small a quantity as eight grains of gold, may be drawn out to a length of 13,000 feet, the whole surface of it still remaining covered with gold. We have also a surprising instance of the neatness of some parts of matter from the nature of light and vision. Let a candle be lighted, and placed in an open plain, it will then be visible two miles round; and consequently, was it placed two miles above the surface of the earth, it would fill with luminous particles a sphere whose diameter was four miles, and that before it had lost any sensible part of its weight. A quantity of vitriol being dissolved, and mixed with 5000 times as much water, will tinge the whole; consequently will be divided into as many parts as there are visible portions of matter in that quantity of water. There are perfumes, which, without a sensible diminution of their quantity, shall fill a very large space with their odoriferous particles; which must therefore be of an inconceivable smallness, since there will be a sufficient number in every part of that space sensibly to affect the organ of smelling. Dr. Keill demonstrates, that any particle of matter, how small soever, and any finite space, how large soever, being given, it is possible for that small particle of matter to be diffused through all that space, and to fill it in such a manner, as that there shall be no pore in it whose diameter shall exceed any given line.

The chief objections against the divisibility of matter in infinitum are, that an infinite cannot be contained by a finite; and that it follows from a divisibility in infinitum, either that all bodies are equal, or that one infinite is greater than another. But the answer to these is easy; for the properties of a determined quantity are not to be attributed to an infinite considered in a general sense; and who has ever proved that there could not be an infinite number of infinitely small parts in a finite quantity, or that all infinites are equal? The contrary is demonstrated by mathematicians in innumerable instances. See the article INFINITY, and S. Graevius's Elem. Mathem. 1. i. c. 4.

DIVISION, in general, is the separating a thing into two or more parts.

Mechanical Division signifies that separation which is occasioned in the parts of a body by the help of mechanical instruments.—The mechanical division of bodies does indeed separate them into smaller, homogeneous, similar parts; but this separation cannot extend to the primary integrant molecules of any body; and consequently is incapable of breaking what is properly called their aggregation; also, no union is formed between the divided and dividing bodies, in which respect division essentially differs from dissolution.

Division is not properly a chemical operation. It is only employed preparatorily to facilitate other operations, and particularly solution. For this purpose it is very useful, as it increases the quantity of a surface, and consequently the points of contact of any body.—Different methods are used to divide bodies according to their nature. Those which are tenacious and elastic, as horns and gums, require to be cut, rasped, or filed. Metals, because of their ductility, require the same treatment: but as they are also fusible, they may be quickly and conveniently reduced into grains small enough for most operations, by pouring them, when melted, into water. All brittle bodies may be reduced conveniently into fine parts by being bruised in a mortar with a pestle. Very hard bodies, such as glass, crystals, stones, particularly those of the vitrifiable kind, before they are pounded, ought to be plunged when red hot into water, by which they are split and cracked, and rendered more easily penetrable. Bodies of this kind may also be bruised or ground by means of a hard and flat stone, upon which the matter is to be put, and bruised by another hard stone so small as to be held and moved upon the larger stone with the hand. The larger stone is called a porphyr, from its being generally of that kind of stone; and the operation is called porphyrination. Instead of porphyration, a mill may be used, composed of a hard grit millstone, moving round upon another stone of the same kind, which must be fixed: in the upper stone is a groove or channel, through which the matter to be ground passes. By this method a substance may be more quickly reduced to a fine powder than by porphyration. But these mills can be only employed for considerable quantities of matter.

These methods of mechanically dividing bodies are attended.
attended with some practical inconveniences; the most considerable of which is, that some parts of the dividing instruments are always struck off, and mixed with the matter to be divided. This may greatly affect the operations. For instance, instruments of iron and copper furnish metallic colouring particles, and copper is very prejudicial to health. Porphyry is coloured by a reddish brown matter, which injures the colour of crystal glasses, enamels, and porcelains made with matters ground upon this stone. These matters therefore must be cleansed after their porphyrrization, or else new instruments capable of injuring the divided or divisions ought to be employed. Thus, for the preparation of all medicines to be taken internally, no copper instruments, as mortars, pestles, &c. ought to be used; those made of iron are preferable: and, instead of porphyries, mortars, grinding stones and millstones made of hard and white stones, ought to be employed for substances which are to enter into the composition of enamels, crystal glass, and porcelain, the whiteness of which is a most necessary quality.

DIVISION, in Algebra. See Algebra.

DIVISION, in Arithmetic. See Arithmetic, No. 11.

DIVISIONs of an Army, in the military art, the several brigades and squadrons into which it is cantonned.

DIVISIONs of a Battalion, are the several platoons into which it is divided in marching or firing, each of which is commanded by an officer.

DIVISION, in sea affairs, a select number of ships in a fleet or squadron of men of war, distinguished by a particular flag or pendant, and usually commanded by a general officer. A squadron is commonly ranged into three divisions, the commanding officer of which is always stationed in the centre.

When a fleet consists of 60 sail of the line, that is, of ships having at least 60 cannon each, the admiral divides it into three squadrons, each of which has its divisions and commanding officers. Each squadron has its proper colours, according to the rank of the admiral who commands it, and every division its proper mast. Thus the white flag denotes the first division of France; the white and blue the second; and the third is characterized by the blue. In Britain, the first admiral, or the admiral of the fleet, displays the union flag at the main-top mast head; next follows the white flag with St George’s cross; and afterwards the blue.

The private ships carry pendants of the same colour with their respective squadrons at the mast of their particular divisions; so that the last ship in the division of the blue squadron carries a blue pendant at her mizen-top mast head.

DIVISOR, in Arithmetic. See Arithmetic, No. 11.

DIUM, in Ancient Geography, a town of Chalcidice in Macedonia, near Mount Athos. Also a promontory of Crete, on the north side of the island. A third DIUM, a promontory of Eubera; or a town of that name in Eubera, near the promontory Cnemus, on the north-west side of the island, called also DIA. A fourth DIUM in Pieria of Macedonia, on the west side of the Iasus Thermasious. Strabo and Livy place it on the borders of Pieria to the south, at the foot of Mount Olympus towards Thessaly. That it was a splendid city, appears from Polybius; who relates, that its gymnasion and wall were overthrown by the AEtolians. From which overthrow, however, it again recovered, Alexander adding new splendour to it, by the brass statues cast by Lysippus, and erected there in memory of the slain at the Granicus; an ornament which was continued down to the time of the Romans; who made it a colony, called Dianis. A fifth DIUM beyond Jordan, near Pella in the Parae.

DIVODURUM, in Ancient Geography, a town of the Medmitterici, in Gallia Belgica; situated on the Moselle, on the spot where now Mainz stands; now a city of Lorraine. E. Long. 6° 0'. N. Lat. 49° 16'.

DIVORCE, a breach or dissolution of the bond of marriage. See Marriage, and Law Index.

Divorce is of two kinds: the one dividum matrimonii, which alone is properly divorce; the other, divum et thoro, “a separation from bed and board.”

The woman divorced dividum matrimonii receives all again that she brought with her: the other has a suitable separate maintenance allowed her out of her husband’s effects. The first only happens through some essential impediment, as consanguinity or affinity within the degrees forbidden, pre-contract, impotency, adultery, &c. of which impediments the canon law allows 14, comprehended in these verses:

Error, conditio, votum, cognatio, crimen,
Culius, dispersitas, vis, ordo, ligamen, honestas,
Si sis affinis, si forte coire requisit,
Si parochi et duplicis desit presentia testis,
Raptatus sit mulier, nec parti reddita tuta.

Divorce is a spiritual judgment, and therefore is passed in the spiritual court. Under the old law, the woman divorced was to have of her husband a writing, as St Jerome and Josephus testify, to this effect: I promise, that hereafter I will no claim to thee; which was called a bill of divorce.

Divorce was allowed of in great latitude both among the Pagans and Jews. At Rome, barrenness, age, disease, madness, and banishment, were the ordinary causes of divorce. Sperius Carvilius, between 500 and 600 years after the building of Rome, under the consulship of M. Attilius and P. Valerius, was the first who put away his wife because she was barren; though Plutarch, in his Roman Questions, maintains, that Domitian was the first who permitted divorce. Justinian afterwards added impotence, a vow of chastity, and the profession of a monastic life, as valid reasons of divorce.

The Roman lawyers distinguish between repudium and divortium; making the former to be the breaking of a contract or espousal, and the latter separation after matrimony. Romulus enacted a severe law, which suffered not a wife to leave her husband, but gave the man the liberty of turning off his wife, either upon poisoning her children, counterfeiting his private keys, or for the crime of adultery: but if the husband on any other occasion put her away, he ordered one moiety of his estate for the wife, and the other to the goddess Ceres: besides an atonement to the gods of the earth. However, in later times, the women as well as the men might sue a divorce. The common way of divorcing was by sending a bill to the woman, containing the reasons of separation, and the tender of all her goods which she
she brought with her; and this was called repudium
mittens; or else it was performed in her presence, and
before seven witnesses, and accompanied with the
formalities of tearing the writings, refunding the portion,
taking away the keys, and turning the woman out of
doors.

The Grecian laws concerning divorces were differ-
ent: The Cretans allowed divorce to any man that
was afraid of having too many children. The Spartans
seldom divorced their wives; and it was extremely
scandalous for a woman to depart from her husband.
The Athenians allowed divorce on very small grounds,
by a bill, containing the reason of the divorce, and
approved, if the party appealed, by the chief magistrate;
and women also were allowed to leave their husbands
on just occasions. Persons divorcing their wives were
obliged to return their portions; otherwise, the Athe-
nians laws obliged them to pay nine oboli a month for
alimony. The terms expressing the separation of men
and women from each other were different; the men
were said απάρειαν or απατάω, to dismiss their
wives; but wives, απεδέχετο, to leave their husbands.

The law of Moses (Mr Paley observes), for rea-
sons of local expediency, permitted the Jewish husband
to put away his wife; but whether for every cause, or
for what cause, appears to have been controverted am-
ongst the interpreters of those times. Christ, the
precepts of whose religion were calculated for more
general use and observation, revokes this permission,
as given to the Jews for their hardness of heart, and
promulgates a law which was thenceforward to confine
divorces to the single cause of adultery in the wife:
Whosoever shall put away his wife, except it be for
fornication, and shall marry another, committeth adul-
tery; and whoso-marrieth her which is put away, doth
commit adultery, 1 Mat. xix. 9.

Inferior causes may justify the separation of hus-
band and wife, although they will not authorize such a dis-
solution of the marriage contract as would leave either
at liberty to marry again: for it is that liberty in
which the danger and mischief of divorces generally
consist. The law of this country, in conformity to our
Saviour's injunction, confines the dissolution of the
marriage contract to the single case of adultery in the
wife; and a divorce even in that case can only be
brought about by the operation of an act of parlia-
ment, founded upon a previous sentence in the spiritual
court, and a verdict against the adulterer at common
law: which proceedings taken together compose as com-
plete an investigation of the complaint as a cause can
receive. It has lately been proposed to the legislature to
enact a clause to these acts, restraining the offending
party from marrying with the companion of her crime,
who by the course of proceeding is always known and
convicted; for there is reason to fear, that adulterous
connections are often formed with the prospect of bring-
ning them to this conclusion; at least, when the seducer
has once captivated the affections of a married woman,
he may avail himself of this tempting argument to sub-
due her scruples, and complete his victory; and the le-
gal statute, as the business is managed at present, assists
by its interposition the criminal design of the offenders,
and confers a privilege where it ought to inflict a pu-
nishment. The proposal deserved an experiment; but
something more penal, it is apprehended, will be found
necessary to check the progress of this alarming depra-
vity. Whether a law might not be framed, directing
the fortune of the adulteress to descend as in case of her
natural death; reserving, however, a certain proportion
of the produce of it, by way of annuity, for her subsistence
(such annuity in no case to exceed a certain sum); and
also so far suspending the estate in the hands of the heir,
as to preserve the inheritance to any children she might
bear to a second marriage, in case there was none to
succeed in the place of their mother by the first: whe-
ther such a law would not render female virtue in higher
life lessvincible, as well as the seducers of that virtue
lessurgent in their suit, I would recommend to the de-
liberation of those who are willing to attempt the re-
formation of this important but most incorrigible class
of the community. A passion for splendour, for ex-
clusive amusements and distinctions, is commonly found
in that description of women who would become the
subject of such a law, not less inordinate than their
other appetites. A severity of the kind proposed ap-
plies immediately to that passion. And there is no
room for any complaint of injustice, since the provisions
above stated, with others which might be contrived,
confine the punishment, so far as it is possible, to the
person of the offender; suffering the estate to remain
unto the heir, or within the family of the ancestor from
whom it came, or to attend the appointments of his
will.

Sentences of the ecclesiastical courts, which release
the parties à vinculo matrimonii, by reason of impuberty,
frigidity, consanguinity within the prohibited degrees,
prior marriage, or want of the requisite consent of pa-
tients or guardians, are not dissolutions of the marriage
contract, but judicial declarations that there never was
any marriage; such impediment subsisting at the time
as rendered the celebration of the marriage rite a mere
nullity. And the rite itself contains an exception of
these impediments. The man and woman to be mar-
ried are charged, "if they know any impediment why
they may not be lawfully joined together, to confess
it:" and assured, "that so many as are coupled to-
gether, otherwise than God's word doth allow, are not
joined together by God, neither is their marriage
lawful:" all which is intended by way of solemn no-
tice to the parties, that the vow they are about to make
will bind their consciences and authorize their cohabi-
tation only upon the supposition that no legal impedi-
ment exist.

DIURETICS (from έχω, by, and νερός, "urine") medi-
cines which provoke a discharge by urine.

Such is water drank plentifully; white wine drank
in a morning; alkaline salts of all kinds; sea salt,
sal gemine, nitre, borax, alum, tartar, sal ammonic,
whew, sour milk, lemon juice, &c. Aqueous liquors
are generally diuretic, especially if mixed with salt,
and drank cold. Fermented liquors are the least diu-
retic of all; and the less so, as they are the fatter.
Sharp thin sour wines, Rhenish, &c. as also acid spirits
of vinegar, salt, sulphur, alum, vitriol, &c. asparagus,
bitter almonds, smallage, eryngium, eupatorium, sassa-
fras, &c. are all diuretics.

DIURNAL. in Astronomy, something relating to
day; in opposition to nocturnal, which regards the
night.

DIVUS, DIVA, in antiquity, appellations given to
men
men and women who had been defied, or placed in the number of the gods. See Deification, &c.

Hence it is, that on medals struck for the consecration of an emperor or empress, they give them the title of divus or diva: for example, DIVUS JULIUS. DIOV ANTONINO PIO. DIOV PIO. DIOV CLAUDIO. DIVA FAUSTINA AUG. &c.

DIZZINESS, in Medicine. See Vertigo.

DO, in Music, a note of the Italian scale, corresponding to ut of the common gamut. See Music.

DOBSON, WILLIAM, an eminent English portrait and history painter, born at London in 1610. He served an apprenticeship with one Peck a stationer and picture-dealer; and owed his improvement to the copying some pictures of Titian and Van Dyck, whose manner he always retained. He had further obligations to the latter of these artists; for it is said, that a picture of his painting being exposed at a shop on Snow-hill, Van Dyck passing by was struck with it exceedingly; and inquiring after the author, found him at work in a poor garret. Van Dyck had the generosity to equip him in a manner suitable to his merit. He presented him to King Charles I. who took him under his protection, kept him with him at Oxford all the time his majesty continued in that city, and not only sat to him several times for his picture, but caused the prince of Wales, Prince Rupert, and most of the lords of his court to do so too. Mr Dobson, however, being somewhat loose and irregular in his way of life, was far from improving the many opportunities he had of making his fortune; and died very poor in 1647, at his house in St Martin's Lane.

DOBUNI, or BODUNI; an ancient people of Britain, who possessed the territory which now forms the counties of Oxford and Gloucester. Both the names of this British nation seem to have been derived from the low situation of a great part of the country which they inhabited: for both Deus and Bodun signify "profound" or "low," in the ancient language of Gaul and Britain. The Dobuni are not mentioned among the British nations who resisted the Romans under Julius Caesar, which was probably owing to the distance of their country from the scene of action; and before the next invasion under Claudius, they had been so much oppressed by their ambitious neighbours the Catuvellauni, that they submitted with pleasure to the Romans, in order to be delivered from that oppression. Cogidunus, who was at that time (as his name imports) prince of the Dobuni, recommended himself so effectually to the favour of the emperor Claudius, by his ready submission, and other means, that he was not only continued in the government of his own territories, but had some other states put under his authority. This prince lived so long, and remained so steadily a friend and ally to the Romans, that his subjects, being habituated to their obedience in his time, never revolted, nor stood in need of many forts or forces to keep them in subjection. This is certainly the reason that we meet with so few Roman towns and stations in the country anciently inhabited by the Dobuni. The Durocornovium of Antoninus, and the Corinium of Ptolemy, are believed by antiquaries to have been the same place, the capital of the Dobuni, and situated at Cirencester in Gloucestershire, where there are many marks of a Roman station. Clevum or Glevum, in the

thirteenth iter of Antoninus, stood where the city of Gloucester now stands; and Abone, in the fourteenth iter, was probably situated at Avenin on the Severn. The country of the Dobuni was comprehended in the Roman province Britannia Prima.

DOCETÆ (from DOCTR, to appear), in ecclesiastical history, the followers of Julius Cassianus, one of the Valentinian sect, towards the close of the second century, who revived a notion that had been adopted by a branch of the Gnostics, against whom St John, Ignatius, and Polycarp, had asserted the truth of the incarnation. They believed and taught, as their name imports, that the actions and sufferings of Jesus Christ were not in reality, but only in appearance.

DOCIMASIA, in Greek antiquity, a probation of the magistrates and persons employed in public business at Athens. It was performed publicly in the forum, where they were obliged to give account of themselves and their past life before certain judges. Among several questions proposed to them, we find the following: Whether they had been dutiful to their parents, had served in the wars, and had a competent estate?

DOCIMASTIC ART, a name given to the art of essaying, by operations in small, the nature and quantity of metallic or other matters which may be obtained from mineral or other compound bodies. See Refining and Metallurgy.

DOCIMENUM MARMOR, a name given to the ancients to a species of marble of a bright and clear white, much used in large and sumptuous buildings, such as temples and the like. It had its name from Docimenes, a city of Phrygia, afterwards called Syrmou, near which it was dug, and from whence it was sent to Rome. It was accounted little inferior to the Parian in colour, but not capable of so elegant a polish; whence it was less used by the statuaries, or in other smaller works. The emperor Adrian is said to have used this marble in building the temple of Jupiter; and many of the great works of the Romans are constructed of the same materials.

DOCK, in Botany. See Rumex, Botany Index.

Dock, in the manage, is used for a large case of leather, as long as the dock of a horse's tail, which serves it for a cover. The French call the dock troussequeue. It is made fast by straps to the crupper, and has leathern thongs that pass between his thighs, and along his flanks to the saddle straps, in order to keep the tail tight, and to hinder it from whisking about.

Dock, in maritime affairs, a sort of broad and deep trench formed on the side of a harbour, or on the banks of a river; and commodiously fitted either to build ships or receive them to be repaired and dreamed therein. These sort of docks have generally strong flood-gates to prevent the flux of the tide from entering the dock while the ship is under repair.—There are likewise docks of another kind, called wet docks, where a ship can only be cleaned during the recess of the tide, or in the interval between the time when the tide left her dry aground, and the period when it again reaches her by the return of the flood. Docks of the latter kind are not furnished with the usual floodgates. See the article Dock, Supplement.

Dock-Yards, certain magazines containing all sorts of
Dock-yards, of naval stores and timber for ship-building. In England, the royal dock-yards are at Chatham, Portsmouth, Plymouth, Deptford, Woolwich, and Sheerness. His majesty's ships and vessels of war are generally moored at these ports during the time of peace; and such as want repairing are taken into the docks, examined, and refitted for service.

The principal dock-yards are governed by a commissioner, resident at the port; who superintends all the masters of the officers, artificers, and labourers, employed in the dock-yard and ordinary. He also controls their payments therein; examines their accounts; contracts, and draws bills on the navy-office to supply the deficiency of stores; and, finally, regulates whatever belongs to the dock-yard, maintaining due order in the respective offices.

These yards are generally supplied from the northern crowns with hemp, pitch, tar, rosin, canvas, oak plank, and several other species. See the plan and fitting up of a dock-yard. See the article Dockyards in the Supplement.

Doctor, a person who has passed all the degrees of a faculty, and is empowered to teach or practise the same: thus we say, doctor in divinity, doctor in physics, doctor of law.

The establishment of the doctorate, such as now in use among us, is ordinarily attributed to Iererus, who himself drew up the formulary. The first ceremony of this kind was performed at Bologna, in the person of Bulgarius, who began to profess the Roman law, on that occasion was solemnly promoted to the doctorate, i.e. endowed with juris utriusque doctor. But the custom was soon transferred from the faculty of law to that of theology; the first instance whereof was given in the university of Paris, where Peter Lombard and Gilbert de la Portree, the two chief divines of those days, were created doctors in theology, sacra theologica doctores.

Spelman takes the title of doctor not to have commenced till after the publication of Lombard's sentences, about the year 1400; and affirms, that such as explained what to their scholars were the first that had the appellation of doctors. Others go much higher, and hold Bede to have been the first doctor at Cambridge, and John de Beverley at Oxford, which latter died in the year 721. But Spelman will not allow doctor to have been the name of any title or degree in England till the reign of King John, about the year 1207.

To pass doctor in divinity at Oxford, it is necessary the candidate have been four years bachelor of divinity. For doctor of laws, he must have been seven years in the university to commence bachelor of law; five years after which he may be admitted doctor of laws. Otherwise, in three years after taking the degree of master of arts, he may take the degree of bachelor in law; and in four years more, that of L.L. D. which same method and time are likewise required to pass the degree of doctor in physic.

At Cambridge, to take the degree of doctor in divinity, it is required the candidate have been seven years bachelor of divinity; though in several of the colleges the taking of the bachelor of divinity's degree is dispensed with, and they may go out per saltem. To commence doctor in laws, the candidate must have been five years bachelor of law, or seven years master of arts. To pass doctor in physic, he must have been bachelor in physic five years, or seven years master of arts. A doctor of the civil law may exercise ecclesiastical jurisdiction, though a layman, stat. 37 Hen. VII. cap. 17. sect. 4.

Doctor of the Law, a title of honour among the Jews. The investiture, if we may so say, of this order, was performed by putting a key and table book, in their hands; which is what some authors imagine our Saviour had in view, Luke xi. 52. when, speaking of the doctors of the law, he says, "Wo unto you, doctors of the law, for you have taken away the key of knowledge: you entered not in yourselves, and them that were entering you hindered."

Doctor of the Church, a title given to certain of the fathers whose doctrines and opinions have been the most generally followed and authorized. We usually reckon four doctors of the Greek church, and three of the Latin. The first are St Athanasius, St Basil, St Gregory Nazianzen, and St Chrysostom. The latter are St Jerome, St Augustine, and Gregory the Great. In the Roman breviary there is a particular office for the doctors. It only differs from that of the confessors, by the anthem of the Magnificat, and the lessons.

Doctor, (A.D. 401-449), in the Greek church, is a particular officer, appointed to interpret part of the scriptures. He who interprets the gospels, is called doctor of the Gospel; he who interprets St Paul's Epistles, doctor of the Apostles; he who interprets the Psalms, doctor of the Psalter.

Doctors Commons. See College of Civilians.

DOCUMENT, in Latin, some written monument produced in any thing asserted.

DODARTIA, a genus of plants belonging to the dicotyledon class; and in the natural method ranking under the 40th order, Perservative. See Botany Index.

DODD, DR WILLIAM, an unfortunate English divine, eldest son of the Rev. William Dodd, many years vicar of Bourne in Lincolnshire, was born May 29, 1729. He was sent, at the age of 16, to the university of Cambridge; and admitted in the year 1745 a sizar of Clare-Hall. In 1749-50 he took the degree of B. A. with great honour, being upon that occasion in the list of wranglers. Leaving the university, he improvidently married a Miss Mary Perkins in 1751, was ordained a deacon the same year, priest in 1753, and soon became a celebrated and popular preacher. His first preferment was the lectureship of West-Ham. In 1754 he also was chosen lecturer of St Olave's, Hart-street; and in 1757 took the degree of M. A. at Cambridge. On the foundation of the Magdalen Hospital in 1758, he was a strenuous supporter of that charity, and soon after became preacher at the chapel of it. By the patronage of Bishop Squire, he in 1763 obtained a prebend of Brecon, and by the interest of some city friends procured himself to be appointed one of...
of the king's chaplains; soon after which he had the education of the earl of Chesterfield committed to his care. In 1766 he went to Cambridge and took the degree of LL.D. At this period, the estimation in which he was held by the world was sufficient to give him the expectations of preferment, and hopes of riches and honours; and these might probably have acquired had he possessed a common portion of prudence and discretion. But, impatient of his situation, and eager for advancement, he rashly fell upon means which in the end were the occasion of his ruin. On the living of St George, Hanover Square, becoming vacant, he wrote an anonymous letter to the chancellor's lady, offering 3000 guineas, if by her assistance he was promoted to it. This being traced to him, complaint was immediately made to the king, and Dr Dodd was dismissed with disgrace from his office of chaplain. From this period he lived neglected, if not despised; and his extravagance still continuing, he became involved in difficulties, which tempted him to forge a bond from his late pupil Lord Chesterfield, Feb. 4, 1777, for 4200l. which he actually received: but being detected, he was tried at the Old Bailey, found guilty, and received sentence of death; and in spite of every application for mercy, was executed at Tyburn, June 27, 1777. Dr Dodd was a voluminous writer, and possessed considerable abilities, with little judgment and much vanity. An accurate list of his various writings is prefixed to his "Thoughts in Prison," edit. 1781.

DODDER. See Cusscuta, Botany Index.

DODDRIDGE, PHILIP, D. D. an eminent Presbyterian minister, was the son of Daniel Doddridge an almoner in London, where he was born on the 26th of June 1702; and having completed the study of the classics in several schools, was in 1719 placed under the tuition of the reverend Mr John Jennings, who kept an academy at Kilworth in Leicestershire. He was first settled as a minister at Kilworth, where he preached to a small congregation in an obscure village: but, on Mr Jennings's death, succeeded to the care of his academy; and soon after was chosen minister of a large congregation of Dissenters at Northampton, to which he removed his academy, and where the number of his pupils increased. He instructed his pupils with the freedom and tenderness of a father; and never expected nor desired that they should blindly follow his sentiments, but encouraged them to judge for themselves. He checked any appearance of bigotry and uncharitableness, and endeavoured to cure them by showing what might be said in defence of those principles they disliked. He died at Luton, whether he went for the recovery of his health; and his remains were interred in the burying-ground belonging to the British factory there, and a handsome monument was erected to his memory in the meeting-house at Northampton, at the expense of the congregation, on which is an epitaph written by Gilbert West, Esq. He wrote, 1. Free Thoughts on the most probable means of reviving the Dissenting Interest. 2. The Life of Colonel James Gardiner. 3. Sermons on the Education of Children. 4. The Rise and Progress of Religion in the Soul. 5. The Family Expositor, in 6 vols 4to. &c. And since the author's death, a volume of his hymns has been published, and his Theological Lectures. Several of his works have been translated into Dutch, German, Dodridge and French.

DODECAGON, in Geometry, a regular polygon consisting of twelve equal sides and angles.

DODECAHEDRON, in Geometry, one of the platoic bodies, or regular solids, contained under twelve equal and regular pentagons.

DODECANDRIA, (from δωδεκα, twelve, and ἄνυσ, a man); the name of the eleventh class in Linnaeus's sexual system, consisting of plants with hermaphrodite flowers, that, according to the title, have twelve stamens or male organs. This class, however, is not limited with respect to the number of stamens. Many genera have sixteen, eighteen, and even nineteen, stamens; the essential character seems to be, that in the class in question, the stamens, however numerous, are inserted into the receptacle; whereas in the next class, icosandria, which is as little determined in point of number as the present, they are attached to the inside of the calyx or flower-cup.

The orders of this class, which are six, are founded upon the number of the styles, or female organs. Aethalaba, mangostan, storax, purple loosestrife, wild Syrian rue, and purslane, have only one style; agrimony and heliocarpus have two; burning thorny plant, and bastard rocket, three; ginnis, five; illicium, eight; and house leek, twelve.

DODECAS, a genus of plants belonging to the dodecandria class. See Botany Index.

DODECATHON, a genus of plants belonging to the pentandria class; and in the natural method ranking under the 21st order, Precia. See Botany Index.

DODO. See Didus, Ornithology Index.

DODONA, a town of Theopetra in Epirus, or (according to others) in Thessaly. There was in its neighbourhood a celebrated oracle of Jupiter. The town and temple of the god were first built by Deucalion, after the universal deluge. It was supposed to be the most ancient oracle of all Greece; and according to the traditions of the Egyptians mentioned by Herodotus, it was founded by a dove. Two black doves, as he relates, took their flight from the city of Thebes in Egypt; one of which flew to the temple of Jupiter Ammon, and the other to Dodona, where with a human voice they acquainted the inhabitants of the country that Jupiter had consecrated the ground, which in future would give oracles. The extensive grove which surrounded Jupiter's temple was endowed with the gift of prophecy; and oracles were frequently delivered by the sacred oaks and the doves which inhabited the place. This fabulous tradition of the oracular power of the doves is explained by Herodotus, who observes that some Phoenicians carried away two priestesses from Egypt, one of which went to fix her residence at Dodona, where the oracle was established. It may farther be observed, that the fable might have been founded upon the double meaning of the word oνεος, which signifies doves in most parts of Greece, while in the dialect of the Epipots it implies old women. In ancient times the oracles were delivered by the murmuring of a neighbouring fountain; but the custom was afterwards changed. Large kettles were suspended in the air near a brazen statue, which held a lash in its hand. When the wind blew strong, the

DODONÆA, a genus of plants belonging to the octandria class. See Botany Index.

DODONIAN, (Dodonaeus), in antiquity, an epiteth given to Jupiter, because he was worshipped in a temple built in the forest of Dodona, where was the most famous, and (it is said) the most ancient, oracle of all Greece. See Dodona.

DODONIDES, the priestesses who gave oracles in the temple of Jupiter in Dodona. According to some traditions the temple was originally inhabited by seven daughters of Atlas, who nursed Bacchus. Their names were Ambrosia, Eudora, Pasithoe, Pytho, Plexaure, Cornios, Tythe or Tythe. In the latter ages the oracles were always delivered by three old women; which custom was first established when Jupiter enjoyed the company of Dione, whom he permitted to receive divine honour in his temple at Dodona. The Bœotians were the only people of Greece who received their oracles at Dodona from men, for reasons which Strabo, l. 9. fully explains.

DODRANS, in antiquity, three-fourths of the as. See the article As.

DODSLEY, Robert, an eminent bookseller, and ingenious writer, born at Mansfield in Nottinghamshire, in the year 1703. He was not indebted to education for his literary fame, being originally a livery servant; but his natural genius, and early passion for reading, soon elevated him to a superior station. He wrote an elegant little satirical farce called The Toyshop, which was acted with applause in 1735, and which recommended him to the patronage of Mr Pope. The following year he produced the King and Miller of Mansfield. The profits of these two farces enabled him to commence bookseller, and his own merit procured him eminence in that profession. He wrote some other dramatic pieces, and published a collection of his works in one vol. 8vo, under the modest title of Trifles; which was followed by Public Virtue, a poem in 4to. Mr Doddsley was the author of the Economy of Human Life, a work which acquired considerable celebrity; but for this, it is supposed to have been indebted to the mistaken opinion which long prevailed of its being the production of Lord Chesterfield.

DODWELL, Henry, a very learned controversial writer, born at Dublin, but of English extraction, in 1641. He wrote an incredible number of tracts: but his services were so little acknowledged, that Bishop Burnet and others accuse him of doing more hurt than good to the cause of Christianity, by his indiscreet love of paradoxes and novelties, and thus exposing himself to the scoffs of unbelievers. His pamphlet on the immortality of the soul gave rise to the well-known controversy between Mr Collins and Dr Clark on that subject. He died in 1711.

DOESBURG, a town of the United Provinces, in the county of Zutphen and province of Guelderland. It is small, but well peopled, and very strong both by art and nature, having the river Yssel on one side, and a marsh on the other, only to be approached by a narrow neck of land. E. Longe, 5° 55'. N. Lat. 53° 3'.

DOG, in Zoology, an animal remarkable for its natural docility, fidelity, and affection for his master; which qualities mankind are careful to improve for their own advantage. These useful creatures guard our houses, gardens, and cattle, with spirit and vigilance. By their help we are enabled to take not only beasts, but birds; and to pursue game both over land and through the waters. In some northern countries, they serve to draw sledges, and are also employed to carry burdens. In several parts of Africa, China, and by the West Indian negroes, dogs are eaten, and accounted excellent food. Nay, we have the testimony of Mr Forster, that dogs flesh, in taste, exactly resembles mutton*. They were also used as food by the Romans. See Ame...
creatures as presents.—It is remarkable, however, that almost every kind of British dogs degenerates in foreign countries; nor is it possible to prevent this degeneracy by any art whatever.

For the natural history of the dog, see Canis, Mammalia Index.

Choosing of Dogs.—In order to choose a dog and bitch for good whelps, take care that the bitch come of a generous kind, be well proportioned, having large ribs and flanks; and likewise that the dog be of a good breed and young, for a young dog and an old bitch breed excellent whelps.

The best time for hounds' nitches, or bratches, to be lined in, are the months of January, February, and March. The bitch should be used to a kennel, that she may like it after her whelping, and she ought to be kept warm. Let the whelps be weaned after two months old; and though it be some difficulty to choose a whelp under the dam that will prove the best of the litter, yet some approve that which is last, and account him to be the best. Others remove the whelps from the kennel, and lay them severally and apart one from the other; then they watch which of them the bitch first takes and carries into her kennel again, and that they suppose to be the best. Others again imagine that which weighs least when it sucks to be the best: this is certain, that the lighter whelp will prove the swifter. As soon as the bitch has littered, it is proper to choose them you intend to preserve, and drown the rest: keep the black, brown, or of one colour; for the spotted are not much to be esteemed, though of hounds the spotted are the least valued.

The best hounds are to be chosen by their colours. The white, with black ears, and a black spot at the setting on of the tail, are the most principal to compose a kennel of, and of good scent and condition. The black hound, or the black tanned, or all liver-coloured or all white: the true tabots are the best of the stronger line; the grizzled, whether mixed or unmixed, so they be shag-haired, are the best verminers, and a couple of these are proper for a kennel. In short, take these marks of a good hound: That his head be a middle proportion, rather long than round; his nostrils wide, his ears large, his back bowed; his fillet great, his haunches large, thighs well trussed, ham strait, tail big near the reins, the rest slender; the leg big, the sole of the foot dry, and in the form of that of a fox, with large claws.

Keeping Dogs in Health.—As pointers and spaniels, when good of their kinds and well broken, are very valuable to a sportsman, it is worth while to take some care to preserve them in health. This much depends on their diet and lodging; frequent clean is their kennels, and giving them fresh straw to lie on, is very necessary; or, in summer time, deal shavings, or sand, instead of straw, will check the breeding of fleas. If you rub your dog with chalk, and brush and comb him once or twice a week, he will thrive much the better; the chalk will clear his skin from all greasiness, and he will be the less liable to be mangy. A dog is of a very hot nature: he should therefore never be without clean water by him, that he may drink when he is thirsty. In regard to their food, carrion is by no means proper for them; it must hurt their sense of smelling, on which the excellence Vol. VII. Part I. of these dogs greatly depends. Barley meal, the dross of wheat flour, or both mixed together, with broth or skimmed milk, is very proper food. For change, a small quantity of gravy from which the tallow is pressed by the chandlers, mixed with flour, or sheep's feet well baked or boiled, are a very good diet: and when you indulge them with flesh, it should always be boiled. In the season of hunting your dog, it is proper to feed them in the evening before, and give them nothing in the morning you intend to take them out except a little milk. If you stop for your own refreshment in the day, you should also refresh your dogs with a little bread and milk. It has been already observed that dogs are of a hot constitution; the greatest relief to them in the summer is twitch-grass or dog-grass, which is the same thing. You should therefore plant some of it in a place where you can turn them into every morning: they will feed freely on it to be cured of the sickness they are subject to, and cured of any extraordinary heat of blood: but unless the grass be of this sort, it will have no effect.

Diseases of Dogs.—1. Bites and Stings. If dogs are bitten by any venomous creatures, as snakes, adders, &c. squeeze out the blood, and wash the place with salt and urine; then lay a plaster to it made of calamint, pounded in a mortar, with turpentine and yellow wax, till it come to a salve. If you give your dog some of the juice of calamint to drink in milk, it will be good; or an ounce of treacle dissolved in some sweet wine.

1. Mangy.—Dogs are subject to the mange from being fed too high, and allowed no exercise or an opportunity of refreshing themselves with dog-grass; or by being starved at home, which will cause them to eat the vilest stuff abroad, such as carrion, or even human excrement; or by want of water, and sometimes by not being kept clean in their kennel, or by foundering and melting in their grease. Either of these will heat the blood to a great degree, which will have a tendency to make them mangy. The cure may be effected by giving stone brim-stone powdered fine, either in milk or mixed up with butter, and rubbing them well every day for a week with an ointment made of some of the brimstone and pork lard, to which add a small quantity of oil of turpentine. Or, boil four ounces of quicksilver in two quarts of water to half the quantity; bathe them every day with this water, and let them have some of it to lick till the cure is perfected. Or, a small quantity of trooper's ointment rubbed on the parts on its first appearance will cure it. It will also free lousy puppies from their lice. Or, take two ounces of euphorbium; flour of sulphur, Flinders oil of bay, and soft soap, each four ounces. Anoint and rub your dog with it every other day; give him warm milk, and no water. The cure will be performed in about a week. The following receipt is also said to be efficacious. Take two handfuls of wild cresses, and as much elecampane, and also of the leaves and roots of roeb and sorrel, and two pounds of roots of nodrel: boil all these well together in lye and vinegar; strain the decoction, and put into it two pounds of gray soap, and when it is melted, rub the dog with it four or five days successively, and it will cure him.

3. Poison.—If you suspect your dog to be poisoned...
with nux vomica (the poison usually employed by the warriners, which causes convulsive fits and soon kills), the most effectual remedy, if immediately applied, is to give him a good deal of common salt; to administer which, you may open his mouth, and put a stick across to prevent the shutting it, whilst you cram his throat full of salt, at the same time holding his mouth upwards; and it will dissolve so that a sufficient quantity will be swallowed to purge and vomit him. When his stomach is sufficiently cleared by a free passage obtained by stool, give him some warm broth frequently, to prevent his expiring from faintness; and he will recover.

4. Worms.—Dogs are very frequently troubled with worms; but more particularly whilst they are young. Anything bitter is so nauseous to these worms, that they are very often voided by taking two or three purges of aloes; or (which is the same thing) Scots pills, four or five being a dose for a large dog: this is not to be repeated two or three times in a week. If this does not succeed, you may give him an ounce of powder of tin mixed with butter, in three doses; which seldom fails to cure. Or, of the herb savin, dried and rubbed to powder, give about as much as will lie on a shilling for a dose; which will entirely destroy worms and their seed.

5. Sore Feet.—A pointer ought not to be hunted oftener than two or three days in a week; and unless you take care of his feet, and give him good lodging as well as proper food, he will not be able to perform that through the season. You should therefore, after a hard day's hunting, wash his feet with warm water and salt; and when dry, wash them with warm broth, or beer and butter, which will heal their soreness, and prevent a settled stiffness from fixing.

6. Strains, Blows, or Small Wounds.—If your dog has received any little wounds by forcing through hedges, or gets any lameness from a blow or strain; bathe the wound or grieved part with salt and cold vinegar (for warming it only evaporates the fine spirit); and when dry, if a wound, you may pour in it a little friar's balsam, which will perform the cure sooner than any method hitherto experienced.

7. Coughs and Colds.—Dogs are very subject to a cough, with an extraordinary choking, which is thought to arise generally from a cold or some inward disorder; and probably it is often occasioned by their eating of fish bones. To guard against it, order your servants to throw all such fish bones where the dogs cannot get them. But if the disorder be from a cold, let bleeding be repeated in small quantities if necessary; but if it be what is called the distemper in dogs, and the appear to be very low in spirits, the bleeding is better omitted. Let meat broth, or milk broth warned, be the principal part of his diet, using at the same time the following medicine. Take flour of sulphur, cold drawn linseed oil, and salt petre, of each an ounce; divide it into four doses, giving him one dose every other day, and let him have plenty of clean straw to lie on; or one spoonful of honey daily.

Dog-Madness.—Of this there are no less than seven sorts common among dogs. The chief causes are, high feeding, want of exercise, fulness of blood, and constiveness. As for the two first, you must observe when you hunt them, that they should be better fed than when they rest; and let them be neither too fat nor too lean; but, of the two, rather too lean than too fat, which means they will not only be preserved from madness, but also from the mange and scab: which diseases they will be subject to for want of air, water, or exercise: but if you have but the knowledge to keep them in an even temper, they may live long and continue sound. As for water, they should be left to their own pleasure; but for exercise and diet, it must be ordered according to discretion, observing a medium. Give them once a-week, especially in the heat of the year, five or six spoonfuls of salad oil, which will cleanse them: at other times, the quantity of a hazel nut of mitridate is an excellent thing to prevent diseases. It is also very good to bleed them under the tongue, and behind the ears.

The symptoms of madness are many and easily discerned. When any dog separates himself contrary to his former use, becomes melancholy or droops his head, forbears eating, and as he runs snatches at everything; if he often looks upwards, and his stern at his setting on be a little erect, and the rest hanging down; if his eyes be red, his breath strong, his voice hoarse, and he drivels and foams at the mouth; you may be assured he has this distemper.

The seven sorts of madness are as follows; of which the two first are incurable. 1. The hot burning madness. 2. The running madness. The animals labouring under these are peculiarly dangerous; for all things they bite and draw blood from will have the same distemper; and they generally seize on all they meet with, but chiefly on dogs. Their pain is so great that it soon kills them.—The five curable madmesses are, 3. Sleeping Madness, so called from the dog's great drowsiness, and almost continual sleeping. This is caused by the little worms that breed in the mouth of the stomach, from corrupt humours, vapours, and fumes which ascend to the head; for cure of which, take six ounces of the juice of wormwood, two ounces of the powder of hartshorn burnt, and two drams of agaric; mix all these together in a little white wine, and give it the dog to drink in a drenching horn.

4. Dumb Madness, lies also in the blood, and causes the dog not to feed, but to hold his mouth always wide open, frequently putting his feet to his mouth, as if he had a bone in his throat; to cure this, take the juice of black hellebore, the juice of spatula putrida, and of rue, of each four ounces; strain them well, and put thereto two drachsms of unprepared scammony, and being mixed well together, put it down the dog's throat with a drenching horn, keeping his head up for some time, lest he cast it out again; then bleed him in the mouth, by cutting two or three veins in his gums.

It is said, that about eight drachsms of the juice of an herb called hartshorn or dog's tooth, being given to the dog, cures all sorts of madness.

5. Lank Madness, is so called by reason of the dog's lankness and pining away. For cure, give them a purge as before directed, and also bleed them; but some say there is no cure for it.

6. Rheumatic or slavering madness, occasions the dog's head to swell, his eyes to look yellow, and he will always slavering and drivelling at the mouth. To cure which, take four ounces of the powder of the roots of polypody of the oak, six ounces of the juice of fennel roots,
roots, with the like quantity of the roots of mistletoe, and four ounces of the juice of ivy; boil all these together in white wine, and give it to the dog as hot as he can take it, in a drenching horn.

7. Falling madness, is so termed because it lies in the dog's head, and makes him reel as he goes, and to fall down. For the cure, take four ounces of the juice of bryony, and the same quantity of the juice of peony, with four drachms of stavesacre pulverized; mix these together, and give it the dog in a drenching horn; also let him blood in the ears, and in the two veins that come down his shoulders; and indeed bleeding is necessary for all sorts of madness in dogs.

When a dog happens to be bit by a mad one, there is nothing better than their licking the place with their own tongues, if they can reach it; if not, then let it be washed with butter and vinegar, made lukewarm, and let it afterwards be anointed with Venice turpentine; but, above all, take the juice of the stalks of strong tobacco boiled in water, and bathe the place therewith; also wash him in sea water, or water artificially made salt; give him likewise a little mithridate inwardly in two or three spoonfuls of sack; and so keep him apart; and if you find him after some time still to droop, the best way is to hang him.

Some have asserted their having cured several creatures that have been bit by mad dogs, with only giving them the middle yellow bark of buckthorn, which must be boiled in ale for a horse or cow, and in milk for a dog; but that it must be boiled till it is as bitter as you can take it.

As to the preventive of worming dogs, see WORMING.

Dog-Days. See Canicula.

Dog-Fish. See Squalus, Ichthyology Index.

Dog-Boat. See Apoecynum, Botany Index.

Dog-Wood-Tree. See Piscidia, Botany Index.

DOGE, the chief magistrate in the republic of Venice and Genoa.

The word properly signifies duke, being formed from the Latin dux; as dogate, and dogado, from ducatus, "duchy."

The dogate, or office and dignity of doge, is elective; at Venice the doge is elected for life; at Genoa, only for two years. He is addressed under the title of Serenity, which among the Venetians is superior to that of highness.

The dog is the chief of the council, and the mouth of the republic; yet the Venetians do not go into mourning at his death, as not being their sovereign, but only their first minister. In effect, the doge of Venice is no more than the phantom or shadow of the majesty of a prince; all the authority being reserved to the republic. He only lends his name to the senate; the power is diffused throughout the whole body, though the answers be all made in the name of the doge. If he gives any answers on his own account, they must be very cautiously expressed, and in general terms, otherwise he is sure to meet with a reprimand. So that it is absolutely necessary he be of an easy and pliable disposition.

Anciently the doges were sovereigns; but things are much altered; and at present, all the prerogatives reserved to the quality of doge, are these which follow: He gives audience to ambassadors; but does not give them any answer from himself, in matters of any importance; only he is allowed to answer according to his own pleasure, to the compliments they make to the signory; such answers being of no consequence. The doge, as being first magistrate, is head of all the councils; and the credentials which the senate furnishes its ministers in foreign courts, are written in his name: and yet he does not sign them; but a secretary of state signs them, and seals them with the arms of the republic. The ambassadors direct their dispatches to the doge, and yet he may not open them but in presence of the councilors. The money is struck in the doge's name, but not with his stamp or arms. All the magistrates rise, and salute the doge when he comes into council; and the doge rises to none but foreign ambassadors.

The doge nominates to all the benefices in the church of St Mark; he is protector of the monastery delle Virgone; and bestows certain petty offices of ushers of the household, called Commanders of the Palace. His family is not under the jurisdiction of the master of the ceremonies; and his children may have staff officers, and gondoliers in livery.

His grandeur, at the same time, is tempered with a variety of circumstances, which render it burdensome. He may not go out of Venice without leave of the council; and if he does go out, he is liable to receive affronts, without being entitled to demand satisfaction; and, if any disorder should happen where he was, it belongs not to him, but to the podesta, as being invested with the public authority, to compose it.

The children and brothers of the doge are excluded from all the chief offices of state. They may not receive any benefit from the court of Rome; but are allowed to accept of the cardinalate, as being no benefit, nor including any jurisdiction. The doge may not divest himself of his dignity, for his ease; and after his death, his conduct is examined by three inquisitors, and five correctors, who sift it with great severity.

DÖGGER, a Dutch fishing vessel navigated in the German ocean. It is generally employed in the herring fishery; being equipped with two masts, viz. a main-mast and a mizen-mast, and somewhat resembling a ketch. See the Plates at the article SHIP.

DOGGER, in the English alum works, a name given by the workmen to a sort of stone found in the same mines with the true alum rock, and containing some alum, though not near so much as the right kind. The county of York, which abounds greatly with the true alum rock, affords also a very considerable quantity of these doggers; and in some places they approach so much to the nature of the true rock, that they are wrought to advantage.

DOGMA, a principal maxim, tenet, or settled opinion, particularly with regard to matters of faith and philosophy.

DOGMATICAL, something belonging to a doctrine or opinion. A dogmatical philosopher is one who asserts things positively; in opposition to a sceptic, who doubts of every thing.

DOGMATISTS, a sect of ancient physicians, of which
D O M [ 292 ]

Dogmatists, which Hippocrates was the first author. They are also called logici, "logicians," from their using the rules of logic in subjects of their profession. They laid down definitions and divisions; reducing diseases to certain genera, and those genera to species, and furnishing remedies for them all; supposing principles, drawing conclusions, and applying those principles and conclusions to particular diseases under consideration; in which sense, the dogmatists stand contrasted among empirics and methodists. They reject all medicinal virtues, that they think not reducible to manifest qualities; but Galen hath long ago observed of such men, that they must either deny plain matter of fact, or assign but very poor reasons and causes of many effects they pretend to explain.

DOLCE, CARLO, or CARLINO, a celebrated history and portrait painter, was born at Florence in 1616, and was the disciple of Vignali. This great master was particularly fond of representing pious subjects, though he sometimes painted portraits; and his works are easily distinguished by the peculiar delicacy with which he perfected all his compositions, by a pleasing tint of colour, and by a judicious management of the chiaro scuro. His performance was remarkably slow; and it is reported that his brain was fatally affected by seeing Luca Jordana despatch more business in four or five hours than he could have done in as many months. He died in 1686.

DOLE, in the Saxon and British tongue, signifies a part or portion, most commonly of a meadow where several persons have shares. It also still signifies a distribution or dealing of alms, or a liberal gift made by a great man to the people.

Dole, in Scots Law, signifies a malevolent intention. It is essential in every crime, that it be committed intentionally, or by an act of the will: hence the rule, Crimen dolo contrahitur.

DOLICHOS, a genus of plants belonging to the diadelphus class, and in the natural method under the 32d order, Papilionaceae. See Botany Index.

DOLLAR, or DALLER, a silver coin nearly of the value of the Spanish piece of eight, or French crown. Dollars are coined in different parts of Germany and Holland; and have their diminutions, as semi-dollars, quarter-dollars, &c. See Money Table.

DOLLOND, JOHN, a late eminent optician. See Supplement.

DOLOMIEU, D. G. S. T. a late eminent French mineralogist and geologist. See Supplement.

DOLPHIN. See Delphinus, Cetology Index.

DOLPHIN of the Mast, a peculiar kind of brest, former of plaited cordage, to be fastened occasionally round the masts, as a support to the puddening, whose use is to sustain the weight of the fore and main yards, in case the rigging or chains by which those yards are suspended should be shot away in the time of battle; a circumstance which might render their sails useless at a season when their assistance is extremely necessary. See the article Puddening.

DOM, or DON, a title of honour invented and chiefly used by the Spaniards, signifying air or lord.

This title, it seems, was first given to Pelayo, in the beginning of the eighth century. In Portugal no person can assume the title of don without the permission of the king, since it is looked upon as a mark of honour and nobility. In France it is sometimes used among the religious. It is an abridgment of dominus, from dominus.

DOM and Son, in old charters, signifies full property and jurisdiction.

DOMAIN, the inheritance, estate, or possession of any one. See Demesne.

DOMAR, JOHN, a celebrated French lawyer, born in 1625, who observing the confused state of the laws, digested them in 4 vols 4to, under the title of The Civil Laws in their natural order: for which undertaking, Louis XIV. settled on him a pension of 2000 livres. Domar was intimate with the famous Pascal, who left him his private papers at his death: he himself died in 1696.

DOME, in Architecture, a spherical roof, or a roof of a spherical form, raised over the middle of a building, as a church, hall, pavilion, vestibule, staircase, &c. by way of crowning.

DOME, in Chemistry, the upper part of furnaces, particularly portable ones. It has the figure of a hollow hemisphere or small dome. Its use is to form a space in the upper part of the furnace, the air of which is continually expelled by the fire: hence the current of air is considerably increased, which is obliged to enter by the ash-hole, and to pass through the fire, to supply the place of the air driven from the dome. The form of this piece renders it proper to reflect or reverberate a part of the flame upon the matters which are in the furnace, which has occasioned this kind of furnace to be called a reverberating one. See Furnace.

Dome, or Dom, signifies judgment, sentence, or decree. The homagers oath in the black book of Hereford ends thus: "So help me God at his holy dome, and by my trothee."

DOMENICCHINO, a famous Italian painter, born of a good family at Bologna in 1581. He was at first a disciple of Calvart the Fleming, but soon quitted his school for that of the Caraccis. He always applied himself to his work with much study and thoughtfulness; and never offered to touch his pencil but when he found a proper kind of enthusiasm upon him. His great skill in architecture also procured him the appointment of chief architect of the apostolical palace from Pope Gregory XV.; nor was he without a theoretical knowledge in music. He died in 1641.

DOMESDAY, or Domesday Book, a most ancient record, made in the time of William I. surnamed the Conqueror, and containing a survey of all the lands of England. It consists of two volumes, a greater and a less. The first is a large folio, written on 382 double pages of vellum, in a small but plain character; each page having a double column. Some of the capital letters and principal passages are touched with red ink; and some have strokes of red ink run across them, as if scratched out. This volume contains the description of 31 counties. The other volume is in quarto, written upon 430 double pages of vellum, but in a single column, and in a large but very fair character. It contains the counties of Essex, Norfolk, Suffolk, part of the county of Rutland, included in that of Northampton,
This work, according to the red book in the exchequer, was begun by order of William the Conqueror, with the advice of his parliament, in the year of our Lord 1080, and completed in the year 1086. The reason given for taking this survey, as assigned by several ancient records and historians, was, that very man should be satisfied with his own right, and not usurp with impunity what belonged to another. But, besides this, it is said by others, that now all those who possessed landed estates became vassals to the king, and paid him so much money by way of fee or homage in proportion to the lands they held. This appears very probable, as there was at that time extant a general survey of the whole kingdom, made by order of King Alfred.

For the execution of the survey recorded in domesday book, commissioners were sent into every county and shire, and juries summoned in each hundred, out of all orders of freemen, from barons down to the lowest farmers. These commissioners were to be informed by the inhabitants, upon oath, of the name of each manor, and that of its owner; also by whom it was held in the time of Edward the Confessor; the number of hides; the quantity of wood, of pasture, and of meadow land; how many ploughs were in the demesne, and how many in the tenanted part of it; how many mills; how many fish-ponds or fisheries belonged to it; with the value of the whole together in the time of King Edward, as well as when granted by King William, and at the time of this survey; also whether it was capable of improvement or of being advanced in its value; they were likewise directed to return the tenants of every degree, the quantity of lands then and formerly held by each of them, what was the number of villains or slaves, and also the number and kinds of their cattle and live stock. These inquisitions being made, and the book sent up to the king’s exchequer.

This survey, at the time it was made, gave great offence to the people; and occasioned a jealousy that it was intended for some new imposition. But notwithstanding all the precaution taken by the conqueror to have this survey faithfully and impartially executed, it appears from indisputable authority, that a false return was given in by some of the commissioners: and that, as it is said, out of a pious motive. This was particularly the case with the abbey of Croyland in Lincolnshire, the possessions of which were greatly underrated both with regard to quantity and value. Perhaps more of these pious frauds were discovered, as it is said Ralph Flambard, minister to William Rufus, proposed the making a fresh and more rigorous inquisition; but this was never executed.

Notwithstanding this proof of its falsehood in some instances, which must throw a suspicion on all others, the authority of domesday book was never permitted to be called in question; and always, when it hath been necessary to distinguish whether lands were held in ancient demesne, or in any other manner, recourse was had to domesday book, and to that only, to determine the doubt. From this definitive authority, from which, as from the sentence pronounced at domesday or the day of judgment, there could be no appeal, the name of the book is said to have been derived. But Stowe assigns another reason for this appellation; namely, that domesday book is a corruption of dominus Dei book; a title given it because heretofore deposited in the king’s treasury, in a place of the church of Westminster or Winchester, called dominus Dei. From the great care formerly taken for the preservation of this survey, we may learn the estimation in which its importance was held. The dialogue de Sacrisius says, “Liber ille (domesday) signi regis comes est individuus in thesauro.”

Until lately it has been kept under three different locks and keys; one in custody of the treasurer, and the others in that of the two chamberlains of the exchequer. It is now deposited in the chapterhouse at Westminster, where it may be consulted on paying to the proper officer a fee of 6s. 8d. for a search, and fourpence per line for a transcript.

Besides the two volumes above mentioned, there is also a third made by order of the same king; and which differs from the others in form more than matter. There is also a fourth called domesday, which is kept in the exchequer; which, though a very large volume, is only an abridgement of the others. In the remembrancer’s office in the exchequer is kept a fifth book, likewise called domesday, which is the same with the fourth book already mentioned. King Alfred had a roll which he called domesday; and the domesday book made by William the Conqueror referred to the time of Edward the Confessor, as that of King Alfred did to the time of Ethelred. The fourth book of domesday having many pictures and gilt letters in the beginning relating to the time of King Edward the Confessor, this had led some into a false opinion that domesday book was composed in the reign of King Edward.

DOMESTIC, any man who acts under another, serving to compose his family; in which he lives, or is supposed to live, as a chaplain, secretary, &c. Sometimes domestics is applied to the wife and children; but very seldom to servants, such as footmen, laquers, porters, &c.

DOMESTIC, adj. is sometimes opposed to foreign. Thus “domestic occurrences” signify those events which happen in our own country, in contradistinction to those of which we receive intelligence from abroad.

In its more usual acceptation, the term implies something peculiar to home or household. Thus we speak of domestic happiness or pleasures: meaning the pleasures enjoyed in the bosom of one’s family; in opposition to those found in the bustle of public life, or delusively sought in the haunts of dissipation.

The solace of domestic enjoyment has been coveted by the wisest and greatest of men. Senators and heroes have shut out the acclamations of an applauding world, to enjoy the prattling of their little ones, and to partake the endeavours of family conversation. They know that even their best friends, in the common intercourse of life, were in some degree actuated by interested motives in displaying their affection; that many of their followers applauded them in hopes of reward; and that the giddy multitude, however zealous, were not always judicious in their approbation. But the attentions paid them at their fire side, the smiles which exhilarated
To pursue the observations of an elegant essayist: "The nursery has often alleviated the fatigues of the bar and the senate-house. Nothing contributes more to raise the gently pleasing emotions, than the view of infant innocence, enjoying the raptures of a game at play. All the sentiments of unrestrained nature display themselves to the view, and furnish matter for agreeable reflection to the mind of the philosophical observer. To partake with children in their little pleasures, is by no means unmanly. It is one of the purest sources of mirth. It has an influence in amending the heart, which necessarily takes a tincture from the company that surrounds us. Innocence as well as guilt is communicated and increased by the contagion of example. And the great Author of evangelical philosophy has taught us to emulate the simplicity of the infantine age. He seems indeed himself to have been delighted with young children, and found in them, what he in vain sought among those who judged themselves their superiors, unpolluted purity of heart.

"Among the great variety of pictures which the vivid imagination of Homer has displayed throughout the Iliad, there is not one more pleasing than the family piece, which represents the parting interview between Hector and Andromache. It deeply interests the heart, while it delights the imagination. The hero ceases to be terrible, that he may become amiable. We admire him while he stands completely armed in the field of battle; but we love him more while he is taking off his helmet, that he may not frighten his little boy with its nodding plumes. We are refreshed with the tender scene of domestic love, while all around breathes rage and discord. We are pleased to see the arm, which is shortly to deal death and destruction among an host of foes, employed in caressing an infant son with the embraces of paternal love. A professed critic would attribute the pleasing effect entirely to contrast; but the heart has declared, previously to the inquiries of criticism, that it is chiefly derived from the satisfaction which we naturally take in beholding great characters engaged in tender and amiable employments.

"But after all that is said of the purity and the solidity of domestic pleasures, they unfortunately appear to a great part of mankind, insipid, unmanly, and capable of satisfying none but the weak, the spiritless, the inexperienced, and the effeminate. The pretend ers to wit and modern philosophy are often found to renounce the received opinions of prudent conduct; and, while they affect a superior liberality, to regulate their lives by the most selfish principles. Whatever appears to have little tendency to promote personal pleasure and advantage, they leave to be performed by those simple individuals, who are dull enough, as they say, to pursue the journey of life by the straight road of common sense. It is true, they will allow, that the world must be replenished by a perpetual succession; and it is no less true, that an offspring, once introduced into the world, requires all the care of painful attention. But let the task be reserved for meaner spirits. If the passions can be gratified without the painful consequences of supporting a family, they eagerly seize the indulgence. But the toil of education they leave to those whom they deem fools enough to take a pleasure in it. There will always be a sufficient number, say they, whose folly will lead them, for the sake of a silly passion called virtuous love, to engage in a life of perpetual anxiety. The fool's paradise, they add with derision, will never be deserted.

"Presumptuous are all such pretenders to newly invented systems of life and conduct, it is not to be supposed they will think themselves superior to Cicero. Yet Cicero, with all his liberality of mind, felt the tenderness of conjugal and parental attachment, and acknowledged that, at one time, he received no satisfaction in any company but that of his wife, his little daughter, and, to use his own epithet, his honored young Cicero. The great Sir Thomas More, whom nobody will suspect of narrowness of mind, who by a very singular treatise evinced that he was capable of thinking and of choosing for himself, has left it on record that he devoted a great share of his time, from the united motives of duty and delight, to the amusement of his children.

"It will be objected by those who pretend to have formed their ideas of life from actual observation, that domestic happiness, however pleasing in description, like many a poetic dream, is but an alluring picture, designed by a good heart, and painted in glowing colours by a lively fancy. The constant company, they urge, even of those we love, occasions an insipidity. Insipidity grows into disgust. Disgust, long continued, soured the temper. Pervisiveness is the natural consequence. The domestic circle becomes the scene of dispute. Mutual antipathy is ingenious in devising mutual torment. Sullen silence or malignant remarks fill up every hour, till the arrival of a stranger causes a temporary restraint, and excites that good humour which ought to be displayed among those whom the bonds of affection and blood have already united.

"Experience, indeed, proves that these remarks are sometimes verified. But that there is much domestic misery is no argument that there is no domestic happiness, or that the evil may not be removed. Natural stupidity, natural ill temper, acquired ill habits, want of education, illiberal manners, and a neglect of the common rules of discretion, will render every species of intercourse disagreeable. When those are united by connubial ties who were separated by natural and inherent diversity, no wonder if that degree of happiness which can only result from a proper union, is unknown. In the forced alliance, which the poet of Venusius mentions, of the serpent with the dove, of the tyger with the lamb, there can be no love. When we expatiate on the happiness of the domestic group, we presuppose that all who compose it are originally assimilated by affection, and are still kept in union by discreet friendship. When this is not the case, the ensuring must fall on the discordant disposition of the parties, and not on the essential nature of family intercourse.

"To form, under the direction of prudence, and by the impulse of virtuous love, an early conjugal attachment, is one of the best securities of virtue, as well as the most probable means of happiness. The duties, which are powerfully called forth by the relations of husband..."
DOM [ 295 ] DOM

husband and father, are of that tender kind which in-
spires goodness and humanity. He who beholds a wo-
man whom he loves, and a helpless infant, looking up
to him for support, will not easily be induced to in-
dulge in unbecoming extravagance, or devote himself
to idleness. He who has a rising family to intro-
duce into a vicious world, will be cautious of setting a
bad example, the contagion of which, when it pro-
cceeds from parental authority, must be irresistibly ma-
lignant. Thus many who, in their individual and un-
connected state, would probably have spent a life not
only useless to others, but profligate and careless in it-
self, have become valuable members of the commu-
nity, and have arrived at a degree of moral improve-
ment, to which they would not otherwise have attained.

"The contempt in which domestic pleasures have in
modern times been held, is a mark of profligacy. It
is also a proof of a prevailing ignorance of real enjoy-
ment. It argues a defect in taste and judgment as well
as in morals. For the general voice of the expe-
rrienced has in all ages declared, that the truest happi-
ness is to be found at home."

DOMICILE, in Scots Law, is the dwelling place
where a person lives with an intention to remain.

DOMIFYING, in Astrology, the dividing or dis-
tributing the heavens into 12 houses, in order to erect
a theme, or horoscope, by means of six great circles,
called circles of position.

There are various ways of domifying: that of Regio-
montanus, which is the most common, makes the circles
of position pass through the intersections of the meri-
dian and the horizon: others make them pass through
the poles of the zodiac.

DOMINANT (from the Latin word dominari, "to
rule or govern"), among musicians, is used either as
an adjective or substantive; but these different accep-
tations are far from being indiscriminate. In both
senses it is explained by Rousseau as follows:

The dominant or sensible chord is that which is prac-
tised upon the dominant of the tone, and which intro-
duces a perfect cadence. Every perfect major chord
becomes a dominant chord, as soon as the seventh mi-
nor is added to it.

DOMINANT (subj.). Of the three notes essential to
the tone, it is that which is a fifth from the tonick.—
The tonick and the dominant fix the tone: in it they
are each of them the fundamental sound of a particular
chord; whereas the mediant, which constitutes the mode,
has no chord peculiar to itself, and only makes a
part of the chord of the tonick.

Mr Rameau gives the name of dominant in general
to every note which carries a chord of the seventh, and
distinguishes that which carries the sensible chord by
the name of a tonick dominant; but, on account of the
length of the word, this addition to the name has not
been adopted by artists: they continue simply to call
that note a dominant which is a fifth from the tonick;
and they do not call the other notes which carry a
chord of the seventh dominants, but fundamentals;
which is sufficient to render their meaning plain, and
prevents confusion.

A dominant, in that species of church music which is
called plain-chant, is that note which is most frequently
repeated or beaten, in whatever degree it may be from
the tonick. In this species of music there are domi-
nants and tonicks, but no mediant.

DOMINATION, or DOMINION, in Theology, the
fourth order of angels or blessed spirits in the hierarchy,
reckoning from the seraphim. See ANGEL.

DOMINGO, or ST DOMINGO, the capital of the
island of Hispaniola in the West Indies, is seated in that
part belonging to the Spaniards on the south side of the
island, and has a commodious harbour. The town
is built in the Spanish manner, with a great square in
the middle of it; about which are the cathedral and
other public buildings. From this square run the prin-
cipal streets, in a direct line, they being crossed by
others at right angles, so that the form of the town is
almost square. The country on the north and east side
is pleasant and fruitful; and there is a large navigable
river on the west, with the ocean on the south. It is
the see of an archbishop, an ancient royal audience, and
the seat of the governor. It has several fine churches
and monasteries; and is so well fortified, that a fleet
and army sent by Oliver Cromwell in 1654 could not
take it. The inhabitants are Spaniards, Negroes, Mul-
attoes, Mestices, and Albaracines; of whom about a
sixth part may be Spaniards. From this town the whole
island has generally been named St Domingo. See Do-
mingo, ST, SUPPLEMENT. The river on which it is seat-
ed is called Osama. W. Long. 69° 30'. N. Lat. 18° 25'.

DOMINIC DE GUSMAN, founder of the Domin-
can order of monks, was born at Calaroga in Old Ca-
stile, 1170. He preached with great fury against the
Albigenses, when Pope Innocent III. made a crusade
against that unhappy people; and was inquisitor in
Languedoc, where he founded his order, and got it
confirmed by the Lateran council in 1215. He died
at Bologna in 1221, and was afterwards canonized.
The Dominican order has produced many illustrious
men. See DOMINICANS.

DOMINICA, one of the Caribbe islands, in the
West Indies, about 20 miles long and 16 broad, situat-
ed between 61° and 62° W. Long. and between 15°
and 16° of N. Lat. This island formerly belonged to
the French, but was ceded to Britain by the treaty in
1763. It contains many fertile valleys interspersed
among high and rugged mountains, some of which are
volcanic. It abounds in forests, and has several hot
springs. The value of its imports in 1809 was 161,201.
and of its imports 315,584l. The population in 1809
consisted of 1594 whites, 2822 free persons of colour,
and 22,083 slaves.

This island was reduced, in the year 1778, by the
French, under the marquis de Bouillé, governor of
Martinico. At that time the island, though very well
fortified, had been unaccountably neglected by the
British government, in such a manner as to be almost
entirely destitute of a garrison. The French com-
mmander, therefore, who made a descent with 2000 men,
found only 100 regular forces and a few companies
of militia to oppose him. All resistance therefore be-
ing vain, the only thing the garrison could do was to
procure as favourable terms of capitulation as possible.
These were granted with such readiness as did great
honour to the character of this officer; the inhabitants
experiencing no kind of change except that of trans-
ferring their obedience from Britain to France, being
left unmolested in the enjoyment of all their rights
both.
both civil and religious. The capitulation was strictly observed by the marquis; no plunder or irregularity being allowed, and a pecuniary gratification being distributed among the soldiers and volunteers who accompanied him in the expedition. A hundred and sixty-four pieces of excellent cannon, and twenty-four brass mortars, besides a large quantity of military stores, were found in the place; insomuch that the French themselves expressed their surprise at finding so few hands to make use of them. The marquis, however, took care to supply this defect, by leaving a garrison of 1,500 of the best men he had with him. It was restored to Britain at the conclusion of the peace in 1783.

La DOMINICA, one of the Marquesas islands in the South sea.

DOMINICAL LETTER, popularly called Sunday Letter, one of the seven letters A B C D E F G, used in almanacks, ephemerides, &c. to denote the Sundays throughout the year. See CHRONOLOGY, No. 32. The word is formed from dominica or dominicus dies, "Lord's day, Sunday."

The dominical letters were introduced in the calendar by the primitive Christians in lieu of the sundial letters in the Roman calendar.

DOMINICAL, in church history. The council of Auxerre, held in 528, decreed, that women communicate with their dominical. Some authors contend, that this dominical was a linen cloth, wherein they received the species; as not being allowed to receive them in the bare hand. Others will have it a kind of veil, wherewith they covered the head. The most probable account is, that it was a sort of linen cloth or handkerchief wherein they received and preserved the eucharist in times of persecution, to be taken on occasion at home. This appears to have been the case by the practice of the first Christians, and by Tertullian's book Ad Uxorum.

DOMINICANS, an order of religious, called in some places Jacobins; and in others Predicants or Preaching Friars.

The Dominicans take their name from their founder Dominic de Guzman, a Spanish gentleman, born in 1170, at Calaroga in Old Castile. He was first canon and archdeacon of Osuna; and afterwards preached with great zeal and vehemence against the Albigenses in Languedoc, where he laid the first foundation of his order. It was approved of in 1215 by Innocent III. and confirmed in 1216 by a bull of Honorius III. under the title of St Augustine; to which Dominic added several austere precepts and observances, obliging the brethren to take a vow of absolute poverty, and to abandon entirely all their revenues and possessions; and also the title of Preaching Friars, because public instruction was the main end of their institution.

The first convent was founded at Toulouse by the bishop thereof and Simon de Montfort. Two years afterwards they had another at Paris, near the bishop's house; and some time after a third in the rue St Jacques, (St James's street), whence the denomination of Jacobins.

Just before his death, Dominic sent Gilbert de Fresney, with twelve of the brethren, into England, where they founded their first monastery at Oxford in the year 1221, and soon after another at London. In the year 1276 the mayor and aldermen of the city of London gave them two whole streets by the river Thames, where they erected a very commodious convent, whence that place is still called Black Friars, from the name by which the Dominicans were called in England.

St. Dominic, at first, only took the habit of the regular canons; that is, a black cassock and rochet; but this he quitted in 1219, for that which they now wear, which it is pretended was shown by the blessed Virgin herself to the beatified Renaud d'Orleans.

This order is diffused throughout the whole known world. It has forty-five provinces under the general, who resides at Rome; and 12 particular congregations or reforms, governed by 12 vicars general.

They reckon three popes of this order, above sixty cardinals, several patriarchs, a hundred and fifty archbishops, and about eight hundred bishops; beside masters of the sacred palace, whose office has been constantly discharged by a religious of this order, ever since St. Dominic, who held it under Honorius III. in 1218.

Of all the monastic orders, none enjoyed a higher degree of power and authority than the Dominican Friars, whose credit was great, and their influence universal. But the measures they used in order to maintain and extend their authority were so perfidious and cruel, that their influence began to decline towards the beginning of the sixteenth century. The tragic story of Jetzer, conducted at Bern in 1509, for determining an uninteresting dispute between them and the Franciscans, relating to the immaculate conception, will reflect indelible infamy on this order. See an account of it in Burnet's Travels through France, Italy, Germany, and Switzerland, p. 31. or Mosheim's Eccl. Hist. vol. iii. p. 294. 8vo. They were indeed perpetually employed in stigmatizing with the opprobrious name of heresy numbers of learned and pious men; in encroaching upon the rights and properties of others, to augment their possessions; and in laying the most iniquitous snares and stratagems for the destruction of their adversaries. They were the principal counsellors, by whose instigation and advice Leo X. was determined to the public condemnation of Luther. The papal see never had more active and useful abettors than this order, and that of the Jesuits.

The dogmas of the Dominicans are usually opposite to those of the Franciscans.

There are also nuns or sisters of this order, called in some places Preaching Sisters. These are even more ancient than the friars; St. Dominic having founded a society of religious maids at Prouilles some years before the institution of his order of men; viz. in 1206.

There is also a third order of Dominicans, both for men and women.

DOMINION, (Dominium) in the civil law, signifies the power to use or dispose of a thing as we please.

DOMINION, or Domination. See DOMINATION.

DOMINIS, Mark Antony De, archbishop of Spalatro in Dalmatia at the close of the 13th and beginning of the 15th centuries, was a man whose fickleness in religion proved his ruin. His preferment, instead
of attaching him to the church of Rome, rendered him disaffected to it. Becoming acquainted with our Bishop Bedell, while chaplain to Sir Henry Wotton, ambassador from James I. at Venice, he communicated his books De Republica Ecclesiastica to him; which were afterwards published at London, with Bedell's corrections. He came to England with Bedell; where he was received with great respect, and preached and wrote against the Romish religion. He is said to have had a principal hand in publishing Father Paul's History of the Council of Trent, at London, which was inscribed to James in 1619. But on the promotion of Pope Gregory XIV. who had been his schoolfellow and old acquaintance, he was deluded by Gondomar the Spanish ambassador into the hopes of procuring a cardinal's hat, by which he fancied he should prove an instrument of great reformation to the church. Accordingly he returned to Rome in 1622, recanted his errors, and was at first well received; but he afterwards wrote letters to England, repenting his recantation; which being intercepted, he was imprisoned by Pope Urban VIII. and died in 1625. He was also the author of the first philosophical explanation of the rainbow, which before his time was regarded as a prodigy.

**DOMINION EMINENS**, in Scots Law, that power which the state or sovereign has over private property, and by which the proprietor may be compelled to sell it for an adequate price where public utility requires. See Law Index.

**DOMINUM Directum**, in Scots Law, the right which a superior retains in his lands, notwithstanding the feudal grant to his vassal. See Law Index.

**DOMINUM Utile**, in Scots Law, the right which the vassal acquires in the lands by the feudal grant from his superior. See Law Index.

**DOMINUS**, in ancient times, a title prefixed to a name, usually to denote the person either a knight or a clergyman. See Vice Dominus.

The title was sometimes also given to a gentleman not dubbed; especially if he were lord of a manor. See Dom, Gentleman, and Sire.

In Holland the title dominus is still retained, to distinguish a minister of the reformed church.

**DOMITIAN**, the Roman emperor, son to Vespasian, was the last of the 12 Caesars. See (History of) Rome.

**DON**, or TANAIS, a river of Russia, which takes its rise from the small lake of St John, near Tula, in the government of Moscow, and passing through part of the province of Voronetz, a small portion of the Ukraine-Slobodskain, and the whole province of Azof, divides itself near Tcherkask into three streams, and falls in these separate branches into the sea of Azof. This river has so many windings, is in many parts so shallow, and abounds with such numerous shoals, as to be scarcely navigable, excepting in the spring, upon the melting of the snows; and its mouth is also so choked up with sand, that only flat-bottomed vessels, excepting in the same season, can pass into the sea of Azof. The banks of the Don, and the rivulets which fall into it, are clothed with large tracts of forest, whose timber is floated down the stream to St Demetri and Rostof, where the frigates for the sea of Azof are chiefly constructed. The navigation of the Don, Mr Cox observes, may possibly hereafter be rendered highly valuable, by conveying to the Black sea, the iron of Siberia, the Chinese goods, and the Persian merchant.

Vol. VII. Part I.

**DON** is also the name of a river in Scotland, noticed under the article ABERDEEN; the Old Town being situated near its mouth. See Aberdeen.

**Don Martin de Mayoren**, the name given by the Spaniards to a cluster of islands in the South sea, which were discovered in 1791 by Don F. A. Maurelle. According to the description given of these islands, they abound with tropical fruits and roots, are in a tolerable state of cultivation, and the inhabitants have made some progress in civilization. Their government, manners, and dress, resemble in most points those of the natives of the other South sea islands. In thieves, whether in disposition or dexterity, they seemed inferior to none. In one of these islands Don Maurelle found a good harbour, which he places in 18. 36. S. Lat. and in 177. 48. W. Long.

**DONARIA**, among the ancients, in its primary signification, was taken for the places where the oblations offered to the gods were kept; but afterwards was used to denote the offerings themselves; and sometimes, though improperly, the temples.

**DONATIA**, a genus of plants belonging to the triandria class. See Botany Index.

**DONATION**, (Donatia), an act or contract whereby a man transfers to another either the property or the use of the whole or a part of his effects as a free gift.

A donation, to be valid and complete, supposes a capacity both in the donor and the donee; and requires consent, acceptance, and delivery; and by the French Law regiety also.

**DONATION Mortis Causa**, in Law, a disposition of property made by a person in his last sickness, who apprehending his dissolution near, delivers, or causes to be delivered to another, the possession of any personal goods, to keep in case of his decease. If the donor dies, this gift needs not the consent of his executor; but it shall not prevail against creditors; and it is accompanied with this implied trust, that, if the donor lives, the property shall revert to himself, being only given in prospect of death, or mortis causa. This method of donation seems to have been conveyed to us from the civil lawyers, who borrowed it from the Greeks.

**DONATISTS**, ancient schismatics in Africa, so denominated from their leader Donatus.

This sect arose in the year 311, when, in the room of Mensurius, who died in that year on his return to Rome, Caeclian was elected bishop of Carthage, and consecrated by the African bishops alone, without the concurrence of those of Numidia. The people refused to acknowledge him, and set up Majorinus in opposition; who, accordingly, was ordained by Donatus bishop of Carthage. The Donatists were condemned, in a council held at Rome, two years after their separation; and afterwards in another at Aries, the year following; and were at Milan, before Constantine the Great, in 316, who deprived them of their churches, sent their seditious bishops into banishment, and even punished some of them with death. Their cause was espoused by another Donatus, called the great, the principal bishop of that sect, who, with numbers of his followers, was exiled by order of Constantine. Many of them were punished with great severity. See Circumcelliones. However, after the
DON

Donatsists, the accession of Julian to the throne in 362, they were permitted to return, and restored to their former liberty. Gratian published several edicts against them; and in 377 deprived them of their churches, and prohibited all their assemblies. But notwithstanding the severities they suffered, it appears that they had a very considerable number of churches towards the close of this century; but at this time they began to decline, on account of a schism among themselves, occasioned by the election of two bishops, in the room of Parmenian, the successor of Donatus; one party elected Primian, and were called Primianists, and another Maximian, and were called Maximianists. Their decline was also precipitated by the zealous opposition of St Augustine, and by the violent measures which were pursued against them, by order of the emperor Honorious, at the solicitation of two councils held at Carthage; the one in 404, and the other in 411. Many of them were fined, the bishops were banished, and some put to death. This schism revived and multiplied under the protection of the Vandals, who invaded Africa in 427, and took possession of this province: but it sank again under new severities, when their empire was overthrown in 534. Nevertheless, they remained in a separate body till the close of this century, when Gregory, the Roman pontiff, used various methods for suppressing them; his zeal succeeded, and there are few traces to be found of the Donatists after this period. They were distinguished by other appellations; as Circumcelliones, Montecens or Mountainers, Campites, Rupites, &c. They held three councils, or concilia; one at Cirta in Numidia, and two at Carthage.

The errors of the Donatists, besides their schism, were, 1. That baptism conferred out of the church, that is, out of their sect, was null, and accordingly they rebaptized those who joined their party from other churches, and re-ordained their ministers. 2. That theirs was the only true, pure, and holy church; all the rest of the churches held as profane and fallen.

Donatus seems likewise to have given into the doctrine of the Arians, with whom he was closely allied; and accordingly, St Epiphanius, Theodoret, and some others, accused the Donatists of Arianism; and it is probable that the charge was well founded, because they were patronized by the Vandals, who held that doctrine. But St Augustine, Ep. 185, to Count Boniface, & Haer. 69, affirms, that the Donatists, in this point, kept clear of the errors of their leader.

DONATIVE, (Donativum), a present made by any person; called also gratuity.

The Romans made large donatives to their soldiers. Julia Pia, wife of the emperor Severus, is called on certain medals mater castrorum, because of the care she took of the soldiers, by interposing for the augmentation of their donatives, &c.

Donative was properly a gift made to the soldiers; as consignarium was that made to the people. Salmius, on his notes to Lampridius, in his Life of Heliodorus, mentioning a donative that emperor gave of three pieces of gold per head, observes, that this was the common and legitimate rate of a donative. Cassius, in his notes on the Life of Perinax by Capitolinus, observes, that Pertinax made a promise of 3000 denarii to each soldier; which amounts to upwards of 97 pounds sterling. The same author writes, that the legal donative was 20,000 denarii; and that Donative it was not customary to give less, especially to the praetorian soldiers; that the centurions had double, and Donage the tribunes, &c. more in proportion.

DONATIVE, in the canon law, a benefice given, and collated to a person, by the founder or patron; without either presentation, institution, or induction by the ordinary.

If chapels founded by laymen be not approved by the diocesan, and, as it is called, spiritualized, they are not accounted proper benefices, neither can they be conferred by the bishop but remain to the pious disposition of the founders; so that the founders, and their heirs, may give such chapels without the bishop.

Gwin observes, that the king might of ancient time found a free chapel, and exempt it from the jurisdiction of the diocesan; so may be, by letters patent, give liberty to a common person to found such a chapel, and make it donative, not presentable; and the chanpion, or benefactor, shall be deprived by the founder or his heir, and not by the bishop. And this seems to be the original of donatives in England.

Donatives are within the statute against simony; and if they have cure of souls, within that against pluralities. If the patron of a donative doth not nominate a clerk, there can be no lapse thereof, unless it be specially provided for in the foundation; but the bishop may compel him to do it by spiritual censures. But if it be augmented by Queen Anne's bounty, it will lapse like other presentative livings. 1 Geo. 1. Stat. 2. cap. 10. The ordinary cannot visit a donative, and therefore it is free from proctoration, and the incumbent is exempted from attendance at visitations.

All bishoprics in ancient times were donative by the king. Again, where a bishop has the gift of a benefice, it is properly called a donative, because he cannot present to himself.

DONATORY, in Scots Law, that person to whom the king bestows his right to any forfeiture that has fallen to the crown.

DONATUS, a schismatic bishop of Carthage, founder of the sect of DONATISTS. His followers honoured him like a god. He died about 368.

DONATUS, a famous grammarian, lived at Rome in 354. He was one of St Jerome's masters; and composed commentaries on Terence and Virgil.

DONAWERT, a strong town of Germany. It is situated on the left bank of the Danube, at the influx of the Werritz. It was formerly an imperial city, but is now subject to Bavaria. E. Long. 10. 32. N. Lat. 48. 32.

DONAX, a genus of shells belonging to the bivalves. See CONCHOLOGY Index.

DONCASTER, a market town of Yorkshire, 37 miles south of York. It has been long noted for the manufacture of stockings, knitted waistcoats and gloves. A theatre was erected here in 1795. It contained 6935 inhabitants in 1811. W. Long. 1. 12. N. Lat. 53. 33.

DONEGAL, a county in the north-west of Ireland, bounded on the sea on one side, and the counties of Tyrone and Londonderry on the other. Its greatest length is 90 miles, and breadth 45; and it contains 100,000 English acres. The climate is moist, and it abounds in bogs and mountains. Barley is the chief grain crop, but a great part of the agricultural labour is performed.
DONNE, Dr. John, an excellent poet and divine of the 17th century. His parents were of the Romish religion, and used their utmost efforts to keep him firm to it; but his early examination of the controversy between the church of Rome and the Protestants, at last determined him to adhere to the latter. He travelled into Italy and Spain; where he made many useful observations, and learned their languages to perfection. Soon after his return to England, Sir Thomas Egerton, keeper of the great seal, appointed him his secretary; in which post he continued five years. He marrying privately Anne the daughter of Sir George Moore then chancellor of the garter, and niece to the lord keeper’s lady, was dismissed from his place, and thrown into prison. But he was reconciled to Sir George by the good offices of Sir Francis Wolley. In 1612, he accompanied Sir Robert Drury to Paris. During this time, many of the nobility solicited the king for some secular employment for him. But his majesty, who took pleasure in his conversation, had engaged him in writing his Pseudo Martyr, printed at London in 1610; and he was so highly pleased with that work, that in 1614 he prevailed with him to enter into holy orders; appointed him one of his chaplains, and procured him the degree of doctor of divinity from the university of Oxford. In 1619, he attended the earl of Doncaster in his embassy into Germany. In 1621, he was made dean of St. Paul’s; and the vicarage of St. Dunstan in the West, in London, soon after fell to him. He wrote, besides the above, 1. Devotions upon emergent occasions. 2. The ancient History of the Septuagint, translated from the Greek of Aristotle, quarto. 3. Three volumes of sermons, folio. 4. A considerable number of poems: and other works. His writings show him to be a man of incomparable wit and learning; but his greatest excellence was satire. He had a prodigious richness of fancy, but his thoughts were much debased by his versification.

DONOR, in Law, the person who gives lands or tenements to another in tail, &c.; as he to whom such lands, &c. are given, is the donee.

DOOMSDAY BOOK. See Domesday Book.

DOOR, in Architecture. See Architecture, No. 76.

DOR, the English name of the common black beetle. Some apply it also to the dusty beetle, that flies about hedges in the evening. See Scarabaeus, Entomology Index.

DORADO, in Astronomy, a southern constellation, not visible in our latitude; it is also called xiphias. The stars of this constellation, in Sharp’s Catalogue, are six.

DORCHESTER, the capital of Dorsetshire, situated on the river Frome, on a Roman road, eight miles north of Weymouth. W. Long. 2. 45. N. Lat. 50. 40. It sends two members to parliament; and is a town of great antiquity. The inhabitants amounted to 2,546 in 1811.

DORÉ, or John Doree. See Zeus, Icthyology Index.

DORIA, Andrew, a gallant Genoese sea officer, born in 1466. He entered into the service of Francis I. of France; but preserved that spirit of independence so natural to a sailor and a republican. When the French attempted to render Savona, long the object of jealousy of Genoa, its rival in trade, Doria remonstrated against the measure in a high tone; which bold action, represented by the malice of his courtiers in the most odious light, irritated Francis to that degree, that he ordered his admiral Barbisieux to sail to Genoa, then in the hands of the French troops, to arrest Doria, and to seize his galleys. This rash order Doria got timely hints of; retired with all his galleys to a place of safety; and, while his resentment was thus raised, he closed with the offers of the emperor Charles V. returned his commission with the colours of St. Michael to Francis, and hoisted the Imperial colours. To deliver his country, weary alike of the French and Imperial yoke, from the dominion of foreigners, was now Doria’s highest ambition; and the favourable moment offered. Genoa was afflicted with the pestilence, the French garrison was greatly reduced and ill paid, and the inhabitants were sufficiently disposed to second his views. He sailed to the harbour with 13 galleys, landed 500 men, and made himself master of the gate and the palace with very little resistance. The French governor with his feeble garrison retired to the citadel, but was quickly forced to capitulate; when the people ran together, and levelled the citadel with the ground. It was now in Doria’s power to have rendered himself the sovereign of his country; but with a magnanimity of which there are few examples, he assembled the people in the court before the palace, disclaimed all pre-eminence, and recommended to them to settle that form of government they chose to establish. The people animated by his spirit, forgot their factions, and fixed that form of government which has subsisted ever since with little variation. This event happened in 1528. Doria lived to a great age, respected and beloved as a private citizen; and is still celebrated in Genoa by the most honourable of all appellations, “the father of his country, and the restorer of its liberty.”

DORIC, in general, any thing belonging to the Dorians, an ancient people of Greece, inhabiting near Mount Parnassus. See Doris.

Doric, in Architecture, is the second of the five orders; being that between the Tuscan and Ionic. It is usually placed upon the Attic base, though originally it had no base. See Architecture, No. 43.

At its first invention it was more simple than at present; and when in after times it was more adorned and enriched, the appellation Doric was restrained to this richer manner, and the primitive simple manner was called by a new name, the Tuscan order, which was chiefly used in temples; as the form being more light and delicate, was for porticoes and theatres. The tradition is, that Dorus, king of Achaia, having first built a temple of this order at Argos, which he dedicated to Juno, occasioned it to be called Doric; though others derive its name from its being invented or used by the Dorians.

The moderns, on account of its solidity, use it in large strong buildings; as in the gates of cities and citadels, the outside of churches, and other massy works, where delicacy of ornament would be unsuitable. The gate of Burlington house in Piccadilly is of the Doric order.
DOR [300] DOR

Doric. The most considerable ancient monuments of this order, are the theatre of Marcellus at Rome, wherein the capital, the height of the frize, and its projection, are much smaller than in the modern architecture; and the Parthenion, or temple of Minerva at Athens, in which the short and massy columns bear upon the pavement without a base; and the capital is a simple torus, with its cincture, and a square, plain, and solid abacus.

Doric Cymatium. See Cyma.

Doric Dialect, one of the five dialects, or manners of speaking, which obtained among the Greeks.

It was first used by the Lacedemonians, and particularly those of Argos; thence it passed into Epirus, Libya, Sicily, the islands of Rhodes and Crete. In this dialect, Archimedes and Theocritus wrote, who were both of Syracuse; as likewise Pindar.

In strictness, however, we should rather define Doric, the manner of speaking peculiar to the Dorians, after their recess near Parnassus and Asopus; and which afterwards came to obtain among the Lacedemonians, &c. Some even distinguish between the Lacedemonian and Doric; but in reality, they were the same; setting aside a few particularities in the language of the Lacedemonians; as is shown by Rulandus, in his excellent treatise De Lingua Graeca ex qua Dialectis, lib. v.

Beside the authors already mentioned to have written in the Doric dialect, we might add Archytas of Tarentum, Bion, Callinus, Simonides, Bacchylides, Cypselas, Alcman, and Sophron.

Most of the medals of the cities of Graecia Magna, and Sicily, savour of the Doric dialect in their inscription: witness, AMBARIUSTAN, AIOAOGNITAN, AXOPONTAN, ADTrITAN, HPAXAESTAN, TXANIO, DEMPITAN, KATONIATAN, KONIATAN, TAPOMENITAN, &c. Which shows the countries wherein the Doric dialect was used.

The general rules of this dialect are thus given by the Port Royalists.

D' Hra d'w grand, d't d's et d'l' a fait le Dor. D' fait w; d', w, et d' au fait encore. Oste s de l'infini; et pour le singulier Se sert au feminin du nombre pluriel.

But they are much better explained in the fourth book of Rulandus; where he even notes the minutest differences of the dialects of Sicily, Crete, Tarentum, Rhodes, Lacedemon, Laconia, Macedon, and Thessaly.

The w abounds everywhere in the Doric; but this dialect bears so near a conformity to the Æolic, that many reckon them but one.

Doric Mode, in Music, the first of the authentic modes of the ancients. Its character is to be severe, tempered with gravity and joy; and is proper upon religious occasions, as also to be used in war. It begins D, la, sol, re. Plato admires the music of the Doric mode, and judges it proper to preserve good manners as being masculine; and on this account allows it in his commonwealth. The ancients had likewise their subdoric or hypodoric mode, which was one of the plagal modes. Its character was to be very grave and solemn; it begins with re, a fourth lower than the Doric.

DORING, or DARING, among sportsmen, a term used to express a method of taking larks, by means of a clap-net and a looking-glass. For this sport there must be provided four sticks very straight and light, about the bigness of a pike; two of these are to be four feet nine inches long, and all notched at the edges or the ends. At one end of each of these sticks there is to be fastened another of about a foot long on one side; and on the other side a small wooden peg about three inches long. Then four or more sticks are to be prepared, each of one foot length; and each of these must have a chord of nine feet long fastened to it at the end. Every one should have a buckle for the commodities fastening on to the respective sticks when the net is to be spread.—A cord must also be provided, which must have two branches. The one must be nine feet and a half, and the other ten feet long, with a buckle at the end of each; the rest, or body of the cord, must be 24 yards long. All these cords, as well the long ones as those about the sticks, must be well twisted and of the bigness of one's little finger. The next thing to be provided is a staff of four feet long, pointed at one end, and with a ball of wood at the other, for the carrying these conveniences in a sack or wale.—There should also be carried on this occasion, a spade to level the ground where there may be any little irregularities; and two small rods, each eighteen inches long, and having a small rod fixed with a pack-thread at the larger end of the other. To these are to be tied some pack-thread loops, which are to fasten in the legs of some larks: and there are to be reels to these, that the birds may fly a little way up and down. When all this is done, the looking-glass is to be prepared in the following manner: Take a piece of wood about an inch and a half thick, and cut it in form of a bow, so that there may be about nine inches space between the two ends; and let it have its full thickness at the bottom; that it may receive into it a false piece; in the five corners of which there are to be set in five pieces of looking-glass. These are so fixed, that they may dart their light upwards; and the whole machine is to be supported on a moveable pin, with the end of a long line fixed to it, and made in the manner of the children's plaything of an apple and a plumstone; so that the other end of the cord being carried through a hedge, the barely pulling it may set the whole machine of the glass a turning. This and the other contrivances are to be placed in the middle between the two nets. The larks fixed to the place, and termed calls, and the glittering of the looking glasses as they twist round in the sun, invite the other larks down; and the cord that communicates with the nets, and goes through the hedge, gives the person behind an opportunity of pulling up the nets, so as to meet over the whole, and take every thing that is between them. The places where this sort of sporting succeeds best are open fields remote from any trees and hedges, except one by way of shelter for the sportsman: and the wind should always be either in the front or back; for if it blows sidewise, it prevents the playing of the net.

DORIS, a country of Greece, between Phocis, Thessaly, and Acrania. It received its name from Dorus the son of Deucalion, who made a settlement there. It was called Tetrapolis from the four cities of
DORIS, a genus of animals, belonging to the order of vermes mollusca. See Helminthology Index.

DORMANT, in Heraldry, is used for the posture of a lion, or any other beast, lying along in a sleeping attitude with the head on the fore paws: by which it is distinguished from the couchant, where, though the beast is lying, yet he holds up his head.

DORMER, in Architecture, signifies a window made in the roof of a house, or above the entablature, being raised upon the rafters.

DORMITORY, a gallery in convents or religious houses, divided into several cells, in which the religious sleep or lodge.

DORMOUSE. See Mus and Sciurus, Mammalia Index.

DORONICUM, LEOPARD'S BANE; a genus of plants belonging to the synogenia class; and in the natural method ranking under the 49th order, Compositae. See Botany Index.

DORSAL, an appellation given to whatever belongs to the back. See Dorsum.

DORSET, Thomas Sackville, Lord Buckhurst. See Sackville.

DORSET, Charles Sackville, earl of. See Sackville.

DORSETSHIRE, a county of England, bounded on the south by the English channel, on the north by Somersetshire and Wilts, on the east by Hampshire, and on the west by Devonshire and some part of Somersetshire. It is between 40 and 50 miles long from east to west, and 34 broad from south to north, and contains 248 parishes, and about 775,000 acres. This country enjoys a mild, pleasant, and wholesome air, and a deep, rich, and fertile soil, finely diversified. Towards the north it is level, under the high lands that divide it from Somersetshire, where there are fine arable grounds that will yield large crops of different kinds of grain. But on the south, from the borders of Hampshire by the sea coast, for an extent of almost 20 miles in length, and in some places four or five in breadth, is a heathy common, which renders this county less populous than it otherwise would be. From east to west runs a ridge of hills called the Downs, abounding with sweet and short herbage, which nourishes a vast number of sheep equally esteemed for their flesh and fleece. The country is also very plentifully watered; and in all respects so well suited both for pleasure and profit, that it was distinguished by the Romans above all others. They had more stations and summer camps in Dorsetshire than in any other county. That the Saxons had the same regard for it, is evident from the number of palaces they had in it, the stately mansions they built, and the express directions they gave that their bodies should be interred in those monuments of their piety. This country yields many and very valuable commodities. The quarries in Purbeck and Portland supply stones of different qualities, suited to various uses, and in prodigious quantities, together with some very rich and beautiful marble. The best tobacco-pipe clay in England is also found in this county. The number of inhabitants in 1811 was 124,693. See Dorsetshire, Supplement.

DORSIFEROUS PLANTS, among botanists, such as are of the capillary kind, without stalks, and which bear their seeds on the back side of their leaves.

DORSTENIA, CONTRAFERRA; a genus of plants belonging to the tetradia class; and in the natural method ranking under the 39th order, Scabrae. See Botany Index.

DORSUM, the back, in Anatomy, comprehends all the posterior part of the trunk of the body from the neck to the buttocks. See Anatomy Index.

DORT, or DORDRECHT, a city of Holland, which held the first rank in the assembly of the states. It is seated in a small island formed by the rivers Meuse, Merue, Rhine, and Linghe. The Meuse, on which it stands, gives it a good harbour, and separates it from the islands of Isselmonde and Atlas. It is divided from Beyerland by a canal. The harbour is very commodious for the merchandises which come down the Rhine and the Meuse, which keep it in a flourishing condition. Its strength consists in being surrounded with water. Its walls are old, and defended by round towers. It is very rich, and well built with brick, and had formerly the exclusive right of coinage money. It is at present the staple town for wines, particularly Rhenish. It was detached from the main land in 1421, on the 17th of November, by a flood occasioned by the breaking down of the dike, which overwhelmed 70 villages, and about 100,000 persons. However, by time and the industry of the inhabitants, a great part of the land is recovered. It has two principal canals, namely, the New and Old Haven, by which heavy loaded vessels may enter into the city. Over the Old Haven is a large bridge well built with brick. Dort was almost reduced to ashes in the year 1457; there being then consumed 2000 houses, with the halls, hospital, and church of Notre Dame: but they are now well provided with fire engines and watchmen to prevent the like disaster. This city is famous for the meeting of the clergy called the Synod of Dort, in which the Calvinists obtained a sentence against the Arminians, who were called the Remonstrants. The dispute between the contending parties occasioned strange disorders, skirmishes and murders, in most of the principal cities. Those ministers who would not subscribe to the decree of the synod were banished, of whom there were above 100. E. Long. 4. 36. N. Lat. 51. 39.
Synod of Dort, a national synod, summoned by authority of the states-general, the provinces of Holland, Utrecht, and Overysel excepted, and held at Dort in 1618. The most eminent divines of the United Provinces, and deputies from the churches of England, Scotland, Switzerland, Bremen, Hesse, and the Palatinate, assembled on this occasion, in order to decide the controversy between the Gomarists or Calvinists, and Arminians; the latter of whom were declared corrupters of the true religion. But the authority of this synod was far from being universally acknowledged either in Holland or in England. The provinces of Friesland, Zeeland, Utrecht, Guelderland, and Groningen, could not be persuaded to adopt their decisions; and they were opposed by the authority of Archbishop Laud and King James I. in England. The re-formed churches in France, though at first disposed to give a favourable reception to the doctrines of this famous synod, in process of time espoused doctrines very different from those of the Gomarists; and the churches of Brandenburgh and Bremen would not suffer their doctors to be tied down to the opinions and tenets of the Dutch divines. The liberty of private judgment with respect to the doctrine of predestination and grace, which the spirit that prevailed among the divines of Dort seemed so much adapted to discourage and suppress, acquired new vigour in consequence of the arbitrary proceedings of this assembly.

DORTMUND, a city of Germany, in the circle of Westphalia. It is pretty large, but not well built. Formerly it was one of the Hanse towns. Its territory also was formerly a county, and had lords of its own. It was afterwards an imperial city, but in 1815 was delivered over to Prussia.

DORYPHORI (from δόρα, spear, and φόρος, I bear), an appellation given to the life-guard-men of the Roman emperors. They were held in such high estimation, as frequently to have the command of armies conferred on them.—It was usual also for chief commanders to have their doryphori or life guard to attend them.

DOSE, in Pharmacy, &c. the quantity of a medicine to be taken at one time. The word is formed from the Greek δοσεω, which signifies gift, or a thing given; from δος, do, "I give."

DOSITHFANS, (Dosithai), an ancient sect among the Samaritans in the first century of the Christian era.

Mention is made in Origen, Epiphanius, Jerome, and divers other Greek and Latin fathers, of one Dosithesus the chief of a faction among the Samaritans; but the learned are not at all agreed as to the time wherein he lived. St Jerome, in his dialogue against the Luciferians, places him before our Saviour; whereas in he is followed by Drusius, who in his answer to Serrarius places him about the time of Sennacherib king of Assyria. But Scaliger will have him posterior to our Saviour's time. And in effect Origen intimates him to have been contemporary with the apostles; where he observes, that he endeavoured to persuade the Samaritans, that he was the Messiah foretold by Moses.

He had many followers; and his sect was still subsisting at Alexandria in the time of the patriarch Eulogius, as appears from a decree of that patriarch published by Photius. In that decree, Eulogius accuses Dosithesus of injuriously treating the ancient patriarchs and prophets, and of attributing to himself the spirit of prophecy. He makes him contemporaneous with Simon Magus; and accuses him of corrupting the Pentateuch in divers places, and of composing several books directly contrary to the law of God.

Archbishop Usher takes Dosithesus to be the author of all the changes made in the Samaritan Pentateuch, which he argues from the authority of Eulogius. But we can justly gather from the testimony of Eulogius, that Dosithesus corrupted the Samaritan copies since used by that sect; but that corruption did not pass into all the copies of the Samaritan Pentateuch now in use among us, which vary but little from the Jewish Pentateuch: And in this sense we are to understand that passage in a Samaritan chronicle, where it is said that Dossis, i.e. Dosithesus, altered several things in the law of Moses. The author of that chronicle, who was a Samaritan by religion, adds, that their high-priest sent several Samaritans to seize Dossis and his corrupted copy of the Pentateuch.

Epiphanius takes Dosithesus to have been a Jew by birth, and to have abandoned the Jewish party for that of the Samaritans. He imagines him likewise to have been the author of the sect of the Sadducees: Which seems inconsistent with his being later than our Saviour; and yet the Jesuit Serrarius agrees to make Dosithesus the master of Sadoc, from whom the Sadducees are derived.

Tertullian, making mention of the same Dosithesus, observes, that he was the first who dared to reject the authority of the prophets by denying their inspiration. But he charges that as a crime peculiar to that sectary, which in reality is common to the whole sect, who have never allowed any but the five books of Moses for divine.

DOSER, a sort of basket to be carried on the shoulders of men. It is used in carrying the overplus earth from one part of a fortification to another where it is wanted. There are likewise small carts and wheelbarrows, for the same use.

DOSSIL, in Surgery, is lint made into a cylindrical form, or resembling the shape of dates or olive stones. Dossils are sometimes secured by a thread tied round their middle.

DOTTEREL. See Charadrjus, Ornithology Index.

DOU, or DOUV, GERARD. See Douw.

DOUAY, or DOWAY, GERARD. See Douw.

DOUAY, or DOWAY, a large and strong city of the French Netherlands, situated in E. Long. 3°. N. Lat. 50°. 25. It is situated on the river Scarpe, in a very fertile and pleasant country. The town is large and well fortified, and contains 18,000 inhabitants. You enter it by six gates, and the streets from each of these gates lead to the market-place. Here is a venerable old town-house, adorned with the statues of the earl of Flanders, in which the magistrates used to assemble. Here also were held several county courts for the dependencies of Douay, which contained about 30 villages. The parliament of Douay was at first only a supreme council, established at Tournay in 1668, and erected into a parliament in 1686. But Tournay being taken by the allies in 1709, the parliament was removed to Cambrai; and upon the
the yielding of Tournay to the Austrians by the treaty of Utrecht, the parliament was removed to Douay, where it still continues. This city was erected into an university like that of Louvain by Philip II, because of its being in the middle of so many great cities, and Louvain at so great a distance, that the children on that side of the country were generally sent for their education into France. Before the French revolution it contained 14 colleges, all governed and settled after the manner of those at Louvain; and the schools of philosophy, canon and civil law, and physic, were disposed also after the same manner. There was a considerable seminary here of English Roman Catholics, founded by Philip II. of Spain about the year 1560. There were also a great number of convents; and amongst the rest two English, one of Franciscan friars, the other of Benedictine monks. Douay was taken from the Spaniards by the French king in person in 1669, after a short resistance. That prince made it very strong, and built a fort about a cannon shot below it upon the Scarpe, with sluices, by which the adjacent country could be drowned. The allies laid siege to it in 1710, under the command of the duke of Marlborough; and after a vigorous defence, the town and Fort Scarpe surrendered upon honourable terms. It was retaken by the French in 1712, after the suspension of arms between Great Britain and France.

DOUBLE; two of a sort, one corresponding to the other.

DOUBLE Children, Double Cats, Double Pears, &c. Instances of these are frequent in the Philos. Trans. and elsewhere. See Monster.

Sir John Floyer, in the same Transactions, giving an account of a double turkey, furnishes some reflections on the production of double animals in general. Two turkeys, he relates, were taken out of an egg of the common size, when the rest were all hatched, which grew together by the flesh of the breast-bone, but in all other parts were distinct. They seemed less than the ordinary size, as wanting bulk, nutriment, and room for their growth; which latter, too, was apparently the occasion of their cohesion. For having two distinct cavities in their bodies, and two hearts, they must have arisen from two cicatriculas; and, consequently, the egg had two yolks; which is no uncommon accident. He mentions a dried double chicken in his possession, which, though it had four legs, four wings, &c. had but one cavity in the body, one heart, and one head; and, consequently, was produced from one cicatricula.

So Paresus mentions a double infant, with only one heart, in which case, the original or stamen of the infant was one, and the vessels regular; only, the nerves and arteries towards the extremities dividing into more branches than ordinary, produced double parts.

The case is in the double flowers of plants, occasioned by the richness of the soil. So it is in the eggs of quadrupeds, &c.

There are, therefore, two reasons of duplicity in embryos: 1. The conjoining or connection of two perfect animals; and, 2. An extraordinary division and ramifications of the original vessels, nerves, arteries, &c.

DOUBLE Employment, in Music, a name given by M. Rameau to the two different manners in which the chord of the sub-dominant may be regarded and treated, viz. as the fundamental chord of the sixth superadded, or as the chord of the great sixth, inverted from a fundamental chord of the seventh. In reality, the chords carry exactly the same notes, are figured in the same manner, are employed upon the same chord of the tone, in such a manner, that frequently we cannot discern which of the two chords the author employs, but by the assistance of the subsequent chord, which resolves it, and which is different in these different cases.

To make this distinction, we must consider the diatonic progress of the two notes which form the fifth and the sixth, and which, constituting between them the interval of a second, must one or the other constitute the dissonance of the chord. Now this progress is determined by the motion of the bass. Of these two notes, then, if the superior be the dissonance, it will rise by one gradation into the subsequent chord, the lower note will keep its place, and the higher note will be a superadded sixth. If the lower be the dissonance, it will descend into the subsequent chord, the higher will remain in its place, and the chord will be that of the great sixth. See the two cases of the double employment in Rousseau's Musical Dictionary, Plate D, fig. 12.

With respect to the composer, the use which he may make of the double employment, is to consider the chord in its different points of view, that from thence he may know how to make his entrance to it, and his exit from it; so that having arrived, for instance, at the chord of the superadded sixth, he may resolve it as a chord of the great sixth, and reciprocally.

M. D'Alembert has shown, that one of the chief uses of the double employment is, that we be able to carry the diatonic succession of the gamut even to an octave, without changing the mode, at least whilst we rise; for in descending we must change it. Of this gamut and its fundamental bass, an example will be found in Rousseau's Musical Dictionary, Plate D, fig. 13. It is evident, according to the system of M. Rameau, that all the harmonic successions which result from it, are in the same tone: for, in strictness, no other chords are there employed but three, that of the tonic, that of the dominant, and that of the sub-dominant; as this last, in the double employment, constitutes the seventh from the second note, which is employed upon the sixth.

With respect to what M. D'Alembert adds in his Elements of Music, p. 70, and which he repeats in the Encyclopédie, article Double emploi, viz. that the chord of the seventh re fa la ut, though we should even regard it only as inversion of fa la ut, re, cannot be followed by the chord ut mi sol ut; "I cannot (says Rousseau) be of his opinion in this point.

The proof which he gives for it is, that the dissonance ut of the first cannot be resolved in the second; and this is true, since it remains in its place; but in this chord of the seventh re fa la ut, instead from this chord of the superadded sixth, fa la ut re, it is not ut, but the re, which is the dissonance; which, of consequence, ought to be resolved in ascending upon mi, as it really does in the subsequent chord; so that this procedure in the bass itself is forced, which, from re, cannot without an error return to ut, but ought to ascend to mi, in order to resolve the dissonance.

"M.
The impracticability of imparting tinges to the body of crystals, while in their proper and natural state, and the softness of glass, which renders ornaments made of it greatly inferior in wear to crystal, give inducements to the introduction of colouring the surface of crystal wrought in a proper form, in such a manner, that the surfaces of two pieces so coloured being laid together, the effect might appear the same as if the whole surface of the crystal had been coloured. The crystals, and sometimes white transparent glass so treated, were called doublets; and at one time prevailed greatly in use, on account of the advantages, with respect to wear, such doublets had, when made of crystal, over glass, and the brightness of the colours which could with certainty be given to counterfeit stones this way, when coloured glass could not be procured, or at least not without a much greater expense. Doublets have not indeed the property which the others have, of bearing to be set transparent, as is frequently required in drops of ear-rings and other ornaments: but when mounted in rings, or used in such manner that the sides of the pieces where the joint is made, cannot be inspected, they have, when formed of crystal, the title to a preference to the coloured glass; and the art of managing them is therefore, in some degree, of the same importance with that of preparing glass for the counterfeiting gems; and is therefore properly an appendage to it, as being entirely subservient to the same intention. The manner of making doublets is as follows:

Let the crystal or glass be first cut by the lapidaries in the manner of a brilliant, except that, in this case, the figure must be composed from two separate stones, or parts of stones, formed in the manner of the upper and under parts of a brilliant, if it was divided into a horizontal direction, a little lower than the middle. After the two plates of the intended stone are thus cut, and fitted so exactly that no division can appear when they are laid together, the upper part must be polished ready for setting; and then the colour must be put between the two plates by this method. "Take of Venice or Cyprus turpentine two scruples; and add to it one scruple of the grains of mastich chosen perfectly pure, free from founiness, and previously powdered. Melt them together in a small silver or brass spoon, ladle, or other vessel, and put to them gradually any of the coloured substances mentioned below, being first well powdered; stirring them together as the colour is put in, that they may be thoroughly commixed. Warm then the doublets to the same degree of heat as the melted mixture; and paint the upper surface of the lower part, and put the upper one instantly upon it, pressing them to each other, but taking care that they may be conjoined in the most perfectly even manner. When the cement or paint is quite cold and set, the redundant part of it, which has been pressed out of the joint of the two pieces, should be gently scraped off the side, till there be no appearance of any colour on the outside of the doublets; and they should then be skillfully set; observing to carry the mounting over the joint, that the upper piece may be well secured from separating from the under one. The colour of the ruby may be best imitated, by mixing a fourth part of carmine with some of the finest crimson lake that can be procured.
The sapphire may be counterfeited with very bright Prussian blue, mixed with a little of the above-mentioned crimson lake, to give it a cast of the purple. The Prussian blue should not be very deep coloured, or but little of it should be used: otherwise, it will give a black shade that will be injurious to the lustre of the doublets.

The emerald may be well counterfeited with distilled verdigris, to which is added a little powdered aloe. But the mixture should not be strongly heated, or kept long over the fire after the verdigris is added: for the colour is apt to be soon impaired by it.

The resemblance of the garnet may be made with dragon’s blood; which, if it cannot be procured of sufficient brightness, may be helped by a very small quantity of carmine.

The amethyst may be imitated with the mixture of some Prussian blue with the crimson lake; but the proportions can only be regulated, by direction, as different parcels of the lake and Prussian blue vary extremely in the degree of strength of the colour.

The yellow topazes may be counterfeited by mixing the powdered aloe with a little dragon’s blood, or by good Spanish anatto; but the colour must be very sparingly used, or the tinge will be too strong for the appearance of that stone.

The chrysolite, byacinth, vinegar garnet, sanguine marne, and other such weaker or more dilute colours, may be formed in the same manner, by lessening the proportions of the colours, or by compounding them together correspondently to the hue of the stone to be imitated; to which end it is proper to have an original stone, or an exact imitation of one, at hand when the mixture is made, in order to the more certain adapting the colours to the effect desired: and when these precautions are taken, and the operation is well conducted, it is practicable to bring the doublets so near a resemblance of the true stone, that even the best judges cannot distinguish them, when well set, without a peculiar manner of inspection.

There is, however, an easy method of distinguishing doublets, which is only to behold them betwixt the eye and light, in such a position, that the light may pass through the upper part and corners of the stone; when it will easily be perceived that there is no colour in the body of the stone.

Doublets, a game on dice within tables; the men, which are only 15, being placed thus: Upon the sice, cinque, and quarte points, there stand three men a-piece; and upon the trey, duce, and ace, only two. He that throws highest hath the benefit of throwing first, and what he throws he lays down, and so doth the other; what the one throws, and hath not, the other lays down for him, but on his own account; and thus they do till all the men are down, and then they bear. He that is down first, bears first; and will doubtless win the game, if the other throws not doublets to overtake him: which is sure to do, since he advances or bears as many as the doublets make, viz. eight for two fours.

Doubling, in the military art, is the putting two ranks or files of soldiers into one. Thus, when the word of command is double your ranks, the second, fourth, and sixth ranks march into the first, third, and fifth, so that the six ranks are reduced to three, and the intervals between the ranks become double what they were before.

Doubling, among hunters, who say that a hare doubles, when she keeps in plain fields, and winds about to deceive the hounds.

Doubling, in navigation, the art of sailing round, or passing beyond, a cape or promontory, so as that the cape or point of land separates the ship from her former situation, or lies between her and any distant observer.

Doubling, in naval tactics, the act of enclosing any part of a hostile fleet between two fires, or of cannonading it on both sides.

It is usually performed by the van or rear of that fleet which is superior in number, taking the advantage of the wind, or of its situation, and taking or veering round the van or rear of the enemy, who can scarcely avoid being thrown into general confusion.

Double, or Dubloon, a Spanish and Portuguese coin, being the double of a pistole.

Double, the name of a river of France, which has its source in the mountains of Jura, and falls into the Saone; and also the name of a department which is nearly surrounded by that river.

Doubling, the act of withholding our assent from any proposition, on suspicion that we are not thoroughly apprised of the merits thereof, or from not being able peremptorily to decide between the reasons for and against it. Doubling is distinguished by the schoolmen into two kinds, dubitation sterilis, and dubitation efficae. The former is that where no determination ensues: in this manner the sceptics and academics doubt, who withhold their assent from every thing. See sceptics, &c.

Doubting is followed by judgment, which distinguishes truth from falsehood: such is the doubting of the peripatetics and cartesians. The last in particular perpetually inculcate the deceitfulness of our senses, and tell us that we are to doubt of every one of their reports, till they have been examined and confirmed by reason. On the other hand, the epicureans teach, that our senses always tell truth; and that, if you go ever so little from them, you come within the province of doubting. See cartesians, epicureans, &c.

Doubting, in rhetoric, a figure wherein the orator appears some time fluctuating, and undetermined what to do or say. Tacitus furnishes us with an instance of doubting, almost to a degree of distraction, in those words of Tiberius written to the senate: Quid scribam, P. S. aut quamod scrivam, aut quid omnino non scribam hoc tempore, dixit me deesse pejus perceptum quanal perire quotidie sentio, si scio.

Doucets, or Doulets, among sportsmen, denote the tests of a deer or stag.

Doucine; in architecture, a moulding concave above and convex below, serving commonly as a cymation to a delicate cornice. It is likewise called guila.

Dove. See columba, ornithology index.

Dove-tailing, in carpentry, is the manner of fastening boards together by letting one piece into ano-
DOVER [ 306 ]

The dove-tail is the strongest of the assemblages or joinings; because the tenon, or piece of wood which is put into the other, goes widening to the extreme, so that it cannot be drawn out again, by reason the extreme or tip is bigger than the hole.

DOVER, a borough and port town of England, in the county of Kent, situated in E. Long. 0. 25. N. Lat. 51. 10. It sends two members to parliament, styled barons of the Cinque ports, whereof Dover is the chief. The number of voters is about 1600. It contains 14,845 inhabitants in 1827, and 19,128 in 1841.

By the Romans this town was named Dubris, and by the Saxons Dofra, probably from the British word Dour, which signifies water. The convenience of its situation drew the attention of the Roman governors, who ruled here while they possessed this part of the island; and there still remain indubitable testimonies of their care and respect for this important place. For the defence of the town, the Romans, or, according to some, Arriragus, a British king, his confederate, by cutting out walls with infinite labour in the solid rock, constructed a stony fortress; and, as its venerable remains still prove, erected also a light-house, for the benefit of navigation. The Saxons, Danes, and Normans, had a very high opinion of this place; and when the barons invited over the young prince, afterwards Louis VIII. of France, his father Philip Augustus conceived a bad opinion of the expedition, because the castle and port of Dover were held for King John, though a great part of the kingdom had submitted to Louis. In its most flourishing state, the fortress was impregnable, and the town a very opulent emporium. It had 21 wards, each of which furnished a ship for the public service, 10 gates, 7 parish-churches, many religious houses, hospitals, and other public edifices. The decay of the town was brought on by that of the harbour. To recover this, Henry VIII. spent no less than 63,000l. in constructing piers; and 5000l. in building a castle between this and Folkestone, called Sandgate, where the shore was flat, and the landing easy. Notwithstanding all this expense, however, it was again choked up in the reign of Queen Elizabeth, by whom it was again cleared at a vast expense, so that ships of some hundred tons could enter it. After that time it again declined, notwithstanding of many efforts for its relief, and great assistance from time to time given by parliament for this purpose. At present the harbour is capable of receiving vessels of 400 or 500 tons; and as the packets to France and Flanders are stationed here in time of peace, it is still a place of some consequence, and the people are active and industrious.

DOVER STRAITS, the narrow channel between Dover and Calais, which separates our island from the opposite continent. Britain is supposed by many to have been once peninsulaled, the present straits occupying the site of the isthmus which joined it to Gaul. "No certain cause (says Mr Pennant*) can be given for the mighty convulsion which tore us from this continent; whether it was sent by an earthquake, or whether it was worn through by the continual dashing of the waters, no Pythagorus is left to solve the fortuna locorum:

But it is most probable, that the great philosopher alluded to the partial destruction of the Atlanticus insula, mentioned by Plato as a distant tradition in his days. It was effected by an earthquake and a deluge, which might have rent asunder the narrow isthmus in question, and left Britain, large as it seems at present, the mere wreck of its original size. The Scilly isles, the Hebrides, Orkneys, Shetlands, and perhaps the Faroe islands, may possibly be no more than fragments of the once far-extended region. I have no quarrel about the word island. The little isthmus, compared to the hole, might have been a junction never attended to in the limited navigations of very early times. The peninsula had never been wholly explored, and it passed with the ancients for a genuine island. The correspondency of strata on part of the opposite shores of Britain and France, leaves no room to doubt but that they were once united. The chalky cliffs of Blanccnez between Calais and Boulogne, and those to the westward of Dover, exactly tally: the last are vast and continued; the former short, and the termination of the immense bed. Between Boulogne and Folkstone (about six miles from the latter) is another memorial of the junction of the two countries; a narrow submarine hill, called the Ripope, about a quarter of a mile broad, and ten miles long, extending eastwards towards the Goodwin sands. Its materials are boulderstones, adventitious to many strata. The depth of water on it, in very low ebbs during spring tides, is only fourteen feet. The fishermen from Folkstone have often touched it with a fifteen feet oar; so that it is justly the dread of navigators. Many a tall ship has perished on it, and sunk instantly into twenty-one fathoms water. In July 1782, the Belleisle of sixty-four guns struck, and lay on it during three hours; but, by starting her beer and water, got clear off.

These celebrated straits are only twenty-one miles wide in the narrowest part. From the pier at Dover to that at Calais is twenty-four. It is conjectured, that their breadth lessens, and that they are two miles narrower than they were in ancient times. An accurate observer of fifty years remarks to me, that the increased height of water, from a decrease of breadth, has been apparent even in that space. The depth of the channel at a medium in highest spring tides is about twenty-five fathoms. The bottom either coarse sand or rugged scarps, which have for ages unknown resisted the attrition of the currents. From the straits both eastward and westward is a gradual increase of depth through the channel to a hundred fathoms, till soundings are totally lost or unattended to. The spring tides in the straits rise on an average twenty-four feet, the neap tides fifteen. The tide flows from the German sea, passes the straits, and meets, with a great rippling, the western tide from the ocean between Fairleigh near Hastings and Boulogne; a proof that, if the separation of the land was effected by the seas, it must have been by the overpowering weight of those of the north.

DOVER, a town of Delaware in North America. It is the chief town of the county of Kent in the Delaware state, and is the seat of government. It stands on Jones's creek, a few miles from the Delaware river, and consists of about 100 houses, principally of brick. Four streets intersect each other at right angles, in the centre

*Arctic Zoology, vol. 1, introduction p. ii.
Dover, the centre of the town, whose incendences form a spacious parade, on the east side of which is an elegant state-house of brick. The town has a lively appearance, and drives on a considerable trade with Philadelphia. Wheat is the principal article of export. The landing is five or six miles from the town of Dover.

DOUGLAS, LORD. See (History of Scotland).

. Douglas, Gavin, bishop of Dunkeld in Scotland, was the third son of Archibald earl of Angus, and born in the year 1474. Where he was educated, is not known; but it is certain that he studied theology: a study, however, which did not estrange him from the muses; for he employed himself at intervals in translating into beautiful verse the poem of Ovid de Remedio Amoris. The advantages of foreign travel, and the conversation of the most learned men in France and Germany, to whom his merit produced the readiest access, completed his education. With his superior recommendations and worth, it was impossible he could remain unnoticed. His first preferment was to be provost of the collegiate church of St. Giles in Edinburgh; a place at that time of great dignity and revenue. In the year 1514, the queen mother, then regent of Scotland, appointed Douglas abbot of Aberbrothock, and soon after archbishop of St. Andrews; but the queen’s power not being sufficient to establish him in the possession of that dignity, he relinquished his claim in favour of his competitor Foreman, who was supported by the pope. In 1515, he was by the queen appointed bishop of Dunkeld; and that appointment was soon after confirmed by his holiness Leo X. Nevertheless it was some time before he could obtain peaceable possession of his see. The duke of Albany, who in this year was declared regent, opposed him because he was supported by the queen; and, in order to deprive him of his bishopric, accused him of acting contrary to law in receiving bulls from Rome. On this accusation he was committed to the castle of Edinburgh, where he remained in confinement about a year; but the regent and the queen being at last reconciled, he obtained his liberty, and was consecrated bishop of Dunkeld. In 1517, he attended the duke of Albany to France; but returned soon after to Scotland. In 1521, the disputes between the earls of Arran and Angus having thrown the kingdom into violent commotion, our peregrate retired to England, where he became intimately acquainted with Polydore Virgil the historian. He died in London of the plague in 1522; and was buried in the Savoy. He wrote, 1. The Palace of Honour: a most ingenious poem under the similitude of a vision; in which he paints the vanity and inconstancy of all worldly glory. It abounds with incidents, and a very rich vein of poetry. The palace of happiness, in the picture of Cebes, seems to be the groundwork of it. 2. Aurea Narrationes: a performance now lost; in which, it is said, he explained, in a most agreeable manner, the mythology of the poetic fictions of the ancients. 3. Comedie ab homin sacras: None of which are now to be found. Thirteen Books of Eneades, of the famous poet Virgil, he translated out of Latin verses into Scottish metre, every buke having its particular prologue. Imprinted at London 1553, in 4to; and reprinted at Edinburgh 1710, in folio. The last is the most esteemed of all his works. He undertook it at the desire of Lord Henry Sinclair, a munificent patron of arts in those times: and he completed it in 18 months; a circumstance which his admirers are too fond of repeating to his advantage. David Hume of Godscroft, an author of uncommon merit, and an admirable judge of poetry, gives the following testimony in his favour. “He wrote (says he) in his native tongue divers things; but his chiefest work is his translation of Virgil, yet extant, in verse: in which he ties himself so strictly as is possible; and yet it is so well expressed, that whoever will essay to do the like will find it a hard piece of work to go through with it. In his prologues before every book, where he hath his liberty, he showeth a natural and ample vein of poetry, so pure, pleasant, and judicious, that I believe there is none that hath written before or since but cometh short of him.” It has been said, that he compiled an historical treatise De Rebus Scotiae; but no remain of it hath descended to the present times.

DOUGLAS, the principal town of the isle of Man, and which has lately increased both in trade and buildings. The harbour, for ships of a tolerable burden, is the safest in the island, and is much improved by a fine mole that has been built. Population 2631. W. Long. 3° 25'. N. Lat. 54° 7'.

DOUW, Gerard, a celebrated painter, was born at Leyden in 1613; and received his first instructions in drawing and design from Bartholomew Dolendo an engraver, and also from Peter Couwhorn a painter on glass; but at the age of fifteen he became a disciple of Rembrandt. In that famous school he continued for three years; and then found himself qualified to study nature, the most unerring director.

From Rembrandt he learned the true principles of colouring, and obtained a complete knowledge of the chiaro- scuro: but to that knowledge he added a delicacy of pencil, and a patience in working up his colours to the highest degree of neatness, superior to any other master. He therefore was more pleased with the pictures of Rembrandt which were painted in his youth than those by which he was distinguished in his more advanced age; because the first seemed finished with more care and attention, the latter with more boldness, freedom, and negligence, which was quite opposite to the taste of Douw. But although his manner appears so different from that of his master, yet it was to Rembrandt alone that he owed all that excellence in colouring by which he triumphed over all the artists of his own country.

His pictures are usually of a small size, with figures so exquisitely touched, so transparent, so wonderfully delicate, as to excite astonishment as well as pleasure. He designed every object in nature, and with an exactness so singular, that each object appears as perfect as nature itself, in respect to colour, freshness and force. His general manner of painting portraits, was by the aid of a concave mirror, and sometimes by looking at the object through a frame with many exact squares of fine silk. But the latter custom is disused, as the eye of a good artist seems a more competent rule, though the use of the former is still practised by painters in miniature.

It is almost incredible what vast sums have been given and are given at this day for the pictures of Douw, even in his own country; as also in Italy and every
QUEEN Dowager, is the widow of the king, and as Dowager such enjoys most of the privileges belonging to her as queen consort; but it is not high treason to violate her chastity or conspire her death, because the succession is not endangered thereby; but no man can marry her without special license from the king, on pain of forfeiting his lands and goods. See QUEEN.

DOWER, (Dotarium, Doroarium, or Dos), a portion of lands or tenements which a widow enjoys for term of life from her husband, in case she survives him; and which, at her death, descends to their children. But she must have been the wife of the party at the time of his decease; or not divorced a vinculo matrimonii; nor, if she has eloped from her husband, and lives with an adulterer, shall she be entitled to dower, unless her husband be voluntarily reconciled to her. The widows of traitors are also barred of their dower by 5 and 6 Edw. VI. cap. 11, but not the widows of felons. An alien cannot be endowed, unless she be queen consort. And if a woman levies a fine with her husband, or if a common recovery be had with the husband and wife of the husband's lands, she is barred of her dower.

A widow, clear of these impediments, is by law entitled to be endowed of all lands and tenements, of which her husband was seised in fee simple or fee tail at any time during the coverture; and of which any issue she might have had might by possibility have been heir. See Jointure.

DOWN, a county of Ireland in the province of Ulster; bounded on the east and south by St George's channel; on the west by the county of Armagh; and on the north by the county of Antrim. It lies opposite to the isle of Man, Cumberland, and Westmoreland; and the north part of it fronts the Mull of Galloway in Scotland, and is about 44 miles from it. It is about 44 miles in length and 30 in breadth, and contains about 558,000 English acres. The county of Down contains 60 parishes, and in 1813 the population amounted to 264,450 souls.

This county is rough and full of hills; but the air is temperate and healthy. The soil naturally produces wood, unless constantly kept open and ploughed; and the low grounds degenerate into bogs and moss, where the drains are neglected. But by the industry of the inhabitants it produces good crops of corn, particularly oats; and, where marl is found, barley. This last is exported from Killogh to Dublin. The staple commodity of this county is the linen manufacture. See DOWN, SUPPLEMENT.

DOWN, or Down-Patrick, a town of Ireland, in the county of Down, is one of the most ancient in that kingdom. It is a market town and a bishopric, said to be erected in the fifth century by St Patrick, but is now united to the see of Connor. Within 200 paces of the town, on the ascent of a hill, are the ruins of an old cathedral, remarkable for the tomb of St Patrick the founder, in which they say the bodies of St Bridget and St Columb are also laid. The town, which is seated on the south corner of Lough Coin, now called the lake of Strangford, is adorned with several handsome public buildings. Among the hills, and in many islands, are flights of swans and other water fowl; and the lough abounds with salmon, mulets,
DOX

DOW

d the, and other sea fish. About a mile from this town is St. Patrick's well, which many people frequent to drink at some seasons of the year, and others to perform a penance enjoined them by the Popish priests.—

The linen manufacture is carried on here, as it is in several places in this county. The population is about 5000. W. Long. 50. N. Lat. 54. 23.

DOWN, the fine feathers from the breasts of several birds, particularly of the duck kind.—That of the eider duck is the most valuable. These birds pluck it from their breasts and line their nests with it. We are told that the quantity of down found in one nest more than filled the crown of a hat, yet weighed no more than three quarters of an ounce. Br. Zool.

—Three pounds of this down may be compressed into a space scarcely bigger than one's fist; yet it is afterwards so dilatable as to fill a quilt five feet square. Salern. Orn. p. 416.—That found in the nests is most valued, and termed live down; it is infinitely more elastic than that plucked from the dead bird, which is little esteemed in Iceland. The best sort is sold at 45 fish per pound when cleansed, and at 16 when not cleansed. There are generally exported every year, on the company's account, fifteen hundred or two thousand pounds of both sorts, exclusively of what is privately exported by foreigners. In 1750 the Iceland company sold as much in quantity of this article as amounted to three thousand seven hundred and forty-five banco dollars, besides what was sent directly to Glückstadt.—Fon Troll, p. 145.

DOWN, or hair of plants. See HAIR.

DOWNETON, a borough town of Wiltshire, five miles south of Salisbury. It contained 2624 inhabitants in 1811, and sends two members to parliament.

DOWNHAM, a market town of Norfolk, 10 miles south of Lynn, famous for its good butter; there being 1000, and sometimes 2000, firkins bought here every Monday, and sent up the river Ouse to Cambridge, and thence to London. Population 1771 in 1811.

DOWNS, a bank or elevation of sand, which the sea gathers and forms along its shores; and which serves as a barrier. The word is formed from the French dune, of the Celtic durn, a "mountain." Charles de Visch, in his Compend. Chronolog. Exord. et Progress. Abbat. Claris. B. Maries, de Dunis, says, Vallem repertis arenarum collibus (quas incloa Duyven vocant) undique cinctam.

DOWNS is particularly used for a famous road for ships, along the eastern coast of the county of Kent, from Dover to the North Foreland; where both the outward and homeward bound ships frequently make some stay; and squadrons of men of war rendezvous in time of war.

It affords excellent anchorage; and is defended by the castlet of Deal, Dover, and Sandwich.

DOWRY, the money or fortune which the wife brings her husband in marriage; it is otherwise called dowry, marriage goods, and differs from dowry.

See DOWER.

DOXOLOGY, a hymn used in praise of the Almighty, distinguished by the title of greater and lesser. The lesser doxology was anciently only a single sentence, without response, running in these words, Glory

be to the Father, and to the Son, and to the Holy Ghost, world without end, Amen. Part of the latter clause, As it was in the beginning, is now, and ever shall be, was inserted some time after the first composition. Some read this ancient hymn, Glory be to the Father, and to the Son with the Holy Ghost. Others, Glory be to the Father in or by the Son, and by the Holy Ghost. This difference of expression occasioned no dispute in the church, till the rise of the Arian heresy; but when the followers of Arians began to make use of the latter as a distinguishing character of their party, it was entirely laid aside by the Catholics, and the use of it was enough to bring any one under suspicion of heterodoxy.

The doxology was used at the close of every solemn office. The western church repeated it at the end of every psalm, and the eastern church at the end of the last psalm. Many of their prayers were also concluded with it, particularly the solemn thanksgiving or consecration prayer at the eucharist. It was also the ordinary conclusion of their sermons.

The greater doxology, or angelic hymn, was likewise of great note in the ancient church. It began with these words, which the angels sang at our Saviour's birth, Gloria in excelsis Deo, &c. It was chiefly used in communion service, and in men's private devotions. Both the doxologies have a place in the church of England, the former being repeated after every psalm, and the latter used in the communion service.

DRABA, a genus of plants belonging to the tradynomy class; and in the natural method ranking under the 39th order, Siliquose. See Botany Index.

DRAC, an imaginary being, much dreaded by the country people in many parts of France. The dracs are supposed to be malicious or at least tricksome demons; but, which is very rare, if one of them happens to take a fancy to a man or woman, they are sure to be the better for it. They are still said to lay gold cups and rings on the surface over pits and rivers, as bait to draw women and children in; though their usual dwelling is some old empty house, whence they make excursions in human form, visible or invisible as best suits their purpose. The country folks shudder at the very name of the drac. Some are positive that they have seen
seen him; for happy indeed is that village in which there is not a house executed as the lurking place of this tremendous drac.

DRACÉNA, DRAGON-tree; a genus of plants belonging to the hexandria class. See Botany Index.

DRACHM, a Grecian coin, of the value of seven-pence three farthings. Drachm is also a weight used by our physicians; containing just sixty grains, or three scruples, or the eighth part of an ounce.

DRAÇO, a celebrated lawgiver of Athens. When he exercised the office of archon, he made a code of laws for the use of his citizens, which, on account of their severity, were said to be written in letters of blood. By them idleness was punished with as much severity as murder, and death was denounced against the one as well as the other. Such a code of rigorous laws gave occasion to a certain Athenian to ask of the legislator, why he was so severe in his punishments? And Draco gave for answer, that as the smallest transgression had appeared to him deserving death, he could not find any punishment more rigorous for more atrocious crimes. These laws were at first enforced, but they were often neglected on account of their extreme severity; and Solon totally abolished them, except that one which punished a murderer with death. The popularity of Draco was uncommon, but the gratitude of his admirers proved fatal to him. When once he appeared on the theatre, he was received with repeated applause; and the people, according to the custom of the Athenians, showed their respect to their legislator by throwing garments upon him. This was done in such profusion, that Draco was soon hid under them, and smothered by the too great veneration of his citizens. He lived about 624 years before the Christian era.

DRAÇO, the Dragon, a genus of reptiles belonging to the class of amphibians. See Herpetology Index.

DRAÇO FOLIIGUS, in Meteorology, a fiery exhalation, frequent in marshy and cold countries.

It is most common in summer; and though principally seen playing near the banks of rivers, or in boggy places, yet sometimes mounts up to a considerable height in the air, to the no small terror of the amazèd beholders: it appearance being that of an oblong, sometimes roundish, fiery body, with a long tail. It is entirely harmless, frequently sticking to the hands and clothes of people without injuring them in the least.

DRAÇO, in Astronomy, a constellation of the northern hemisphere; whose stars, according to Ptolemy, are 81: according to Tycho, 32: according to Hevelius, 40: according to Bayer, 33: and according to Mr Flamstead, 80. See Astronomy, No. 406.

DRACOCÉPHALUM, DRAGON’S HEAD; a genus of plants belonging to the didynamia class. See Botany Index.

DRAÇONARIUS, in antiquity, DRAGON-bearer.

Several nations, as the Persians, Parthians, Scythians, &c. bore dragons on their standards; whence the standards themselves were called dracones, “dragons.” The Romans borrowed the same custom from the Parthians; or, as Cassanbon has it, from the Daci; or, as Codin, from the Assyrians.

The Roman dracones were figures of dragons painted in red on the flags, as appears from Ammianus Marcellinus: but among the Persians and Parthians they were, like the Roman eagle, figures in full relief; so that the Romans were frequently deceived, and took them for real dragons.

The soldier who bore the dragon or standard was called by the Romans draconarius; and by the Greeks Ὸαρπαγος and Πραμαγος; for the emperors carried the custom with them to Constantinople.

DRAÇONTIC MONTH, the time of the revolution of the moon from her ascending node, called caput draconis, to her return thither.

DRAÇONTIUM, DRAGONS; a genus of plants belonging to the cynandria class; and in the natural method ranking under the first order, Palmae. See Botany Index.

DRAÇUNCULI, in Medicine, a peculiar eruption, which was supposed to be worms in the muscular parts of the arms and legs, called Guinea worms. These worms were removed by the point of a needle; and to prevent their forming again, the usual custom is to wash the parts with wine and vinegar, with alum, nitre, or common salt, or with a strong lixivium of oak ashes, and afterwards anoint them with an ointment of the common kind used for scabrous eruptions, with a small mixture of quicksilver.

DRAÇUNCULUS. See ARUM, Botany Index.

DRAFF, a name given in some places to the wash given to hogs, and the grain given to cows.

DRAG, in building. A door is said to drag when in opening or shutting it bangs or grates upon the floor.

DRAG, in sea language, is a machine consisting of a sharp, square, iron ring, encircled with a net, and commonly used to take the wheel off from the platform or bottom of the decks.

DRAGOMAN, or DROGMAN, a term of general use through the east for an interpreter, whose office is to facilitate commerce between the orientals and occidentals. These are kept by the ambassadors of Christian nations residing at the Porte for this purpose.

The word is formed from the Arabic targeman or targimam, of the verb targsam, “he has interpreted.” From dragomam the Italians formodragamano and, with a nearer relation to its Arabic etymology, turcimanno; whence the French and our trucheman, as well as dragoman and dromgan.

DRAGON, in Astronomy. See DRACO.

Dragon’s Head and Tail (caput et cauda draconis), are the nodes of the planets; or the two points where in the ecliptic is intersected by the orbits of the planets and particularly that of the moon; making with it angles of five degrees and eighteen minutes. One of these points looks northward; the moon beginning then to have north latitude, and the other southward, where she commences south. Thus her deviation from the ecliptic seems (according to the fancy of some) to make a figure like that of a dragon, whose belly is where she has the greatest latitude; the intersection representing the head and tail, from which resemblance the denomination arises.

But note, that these points abide not always in one place, but have a motion of their own in the zodiac, and retrograde-wise, 3 minutes 11 seconds per day; completing their circle in 18 years 325 days; so that
DRA (311) DRA

DRAGON, in Zoology. See DRACO.

DRAGON'S-BLOOD, a gummi-resinous substance brought from the East Indies, either in oval drops wrapped up in flag leaves, or in large masses composed of smaller tears. It is said to be obtained from the palmipuncus draco, the calamus rotang, the dracena draco, the pterocarpus draco, and several other vegetables.

The writers on the materia medica in general give the preference to the former, though the others are not unfrequently of equal goodness. The fine dragon's blood of either sort breaks smooth, free from any visible impurities, of a dark red colour, which changes upon being powdered into an elegant bright crimson. Several artificial compositions, coloured with the true dragon's blood, or Brazil wood, are sometimes sold in the room of this commodity. Some of these dissolve like gums in water; others crackle in the fire without provoking inflammation; whilst the genuine sanguis draconis readily melts and catches flame, and is not acted on by watery liquors. It totally dissolves in pure spirit, and tinges a large quantity of the menstruum of a deep red colour. It is likewise soluble in expressed oils, and gives them a red hue, less beautiful than that communicated by anchnus. This drug in substance has no sensible smell or taste; when dissolved, it discovers some degree of warmth and pungency. It is usually, but without foundation, looked upon as a gentle astrigent; and sometimes directed as such in antemortem prescription against seminal glects, the flux albus, and other fluxes. In these cases, it is supposed to produce the general effects of resinous bodies, lightly increastring the fluids, and somewhat strengthening the solids. But in the present practice it is very little used either externally or internally.

A solution of dragon's blood in spirit of wine is used for staining marble, to which it gives a red tinge, which penetrates more or less deeply according to the heat of the marble during the time of application. But as it spreads at the same time that it sinks deep, for fine designs the marble should be cold. M. Dufay says, that by adding pitch to this solution the colour may be rendered deeper.

DRAGON FISH, or DRAGONET. See CALLIONTUM, Ichthyology Index.

DRAGON FIG. See LIBELLULA, Entomology Index.

DRAGON SHELL, in Natural History, a name given by some to a species of concamerated patella or limpet. This has a top very much bent; and is of an ash colour on the outside, but of an elegant and bright flesh-colour within. This has been found sticking on the back of a tortoise, as the common limpets do on the sides of rocks; and some have been found affixed to large shells of the pinna marina brought from the East Indies at different times.

DRAG. See DRACONIUM, Botany Index.

DRAGONET, or DRAGON FISH. See CALLIONTUM, Ichthyology Index.

DRAGONNE, in Heraldry. A lion dragonée is where the upper half resembles a lion, the other half going off like the hinder part of a dragon. The same may be said of any other beast as well as a lion.

DRAGOON, in military affairs, a musqueteer mounted on horseback, who sometimes fights or marches on foot, as occasion requires.

Menage derives the word dragoon from the Latin draconarius, which in Vegetius is used to signify soldier. But it is more probably derived from the German dragen or dragen, which signifies to carry; as being infantry carried on horseback.

Dragoons are divided into brigades as the cavalry; and each regiment into troops; each troop having a captain, lieutenant, cornet, quarter-master, two serjeants, three corporals, and two drums. Some regiments have hauthboys. They are very useful on any expedition that requires despatch; for they can keep pace with the cavalry, do the duty of infantry; they encamp generally on the wings of the army, or at the passes leading to the camp; and sometimes they are brought to cover the general's quarters: they march in the front and rear of the army.

The first regiment of dragoons raised in England was in 1681, and called the regiment of dragoons of North Britain. In battle or attacks they generally fight sword in hand after the first fire. Their arms are, a sword, firelock, and bayonet. In the French service, when the dragoons march on foot, their officers bear the pike and the serjeants the halbert, neither of which are used in the English service.

DRAGOONING, one of the methods used by Papists for converting refractory heretics, and bringing them within the pale of the true church.

The following method of dragooning the French Protestants, after the revocation of the edict of Nantz, under Louis XIV. is taken from a French work translated in 1686.

"The troopers, soldiers, and dragoons, went into the Protestants houses, where they marred and defaced their household stuff, broke their looking glasses, and other utensils and ornaments, let their names on the cellars, and threw about their corn and spoiled it. And as to those things which they could not destroy in this manner, threw such as furniture of beds, linen, wearing apparel, plate, &c. they carried them to the market place, and sold them to the Jesuits and other Roman Catholics. By these means the Protestants in Montaubon alone were, in four or five days, stripped of above a million of money. But this was not the worst.

"They turned the dining rooms of gentlemen into stables for their horses; and treated the owners of the houses where they quartered with the highest indignity and cruelty, lashing them about from one to another, day and night, without intermission, not suffering them to eat or drink; and when they began to sink under the fatigue and pains they had undergone, they laid them on a bed, and when they thought them somewhat recovered, made them rise, and repeated the same tortures. When they saw the blood and sweat run down their faces and other parts of their bodies, they sluiced them with water, and putting over their heads kettle drums, turned upside down, they made a continual din upon them till these unhappy creatures lost their senses. When one party of these torturers.
mentors were weary, they were relieved by another, who practised the same cruelties with fresh vigour.

"At Negrepisse, a town near Montaubon, they hung up Isaac Favin, a Protestant citizen of that place, by his armpits, and tormented him a whole night by pinching and tearing off his flesh with pincers. They made a great fire round a boy of about 12 years old, who with his hands and eyes lifted up to heaven cried out "My God, help me!" And when they found the youth resolved to die rather than renounce his religion, they snatched him from the fire just as he was on the point of being burnt.

"In several places the soldiers applied red-hot irons to the hands and feet of men and breasts of women. At Nantz they hung up several women and maids by their feet, and others by their armpits, and thus exposed them to public view stark naked. They bound to posts mothers that gave suck, and let their sucking infants lie languishing in their sight for several days and nights, crying, mourning, and gasping for life. Some they bound before a great fire, and being half roasted, let them go: a punishment worse than death. Amidst a thousand hideous cries and a thousand blasphemies, they hung up men and women by the hair, and some by their feet, on hooks in chimneys, and smoked them with wisps of wet hay till they were suffocated. They tied some under the arms with ropes, and plunged them again and again into wells; they bound others like criminals, put them to the torture, and with a funnel filled them with wine till the fumes of it took away their reason, when they made them say they consented to be Catholics. They stripped them naked, and after a thousand indignities, stuck them with pins and needles from head to foot. They cut and slashed them with knives; and sometimes with red-hot pincers took hold of them by the nose and other parts of the body, and dragged them about the rooms till they made them promise to be Catholics, or till the cries of these miserable wretches, calling upon God for help, forced them to let them go. They beat them with staves, and thus bruised, and with broken bones, dragged them to church, where their forced presence was taken for an abjuration. In some places they tied fathers and husbands to their bed-posts, and before their eyes ravished their wives and daughters with impunity. They blew up men and women with bellows till they burst them. If any to escape these barbarities endeavoured to save themselves by flight, they pursued them into the fields and woods, where they shot at them like wild beasts, and prohibited them from departing the kingdom (a cruelty never practised by Nero or Dioclesian) upon pain of confiscation of effects, the galleys, the lash, and perpetual imprisonment; insomuch that the prisons of the sea-port towns were crammed with men, women, and children, who endeavoured to save themselves by flight from their dreadful persecution. With these scenes of desolation and horror, the Popish clergy feasted their eyes, and made them only a matter of laughter and sport.

"Though my heart aches (says the writer of the piece from which we are transcribing) whilst I am relating these barbarities, yet for a perpetual memorial of the infernal cruelty practised by these monsters I beg the reader's patience to lay before him two other instances, which, if he hath a heart like mine, he will not be able to read without watering these sheets with his tears.

"The first is of a young woman, who being brought before the council, upon refusing to abjure her religion, was ordered to prison. There they shaved her head, singed off the hair from other parts of her body; and having stripped her stark naked, led her through the streets of the city, where many a blow was given her, and stones flung at her; then they set her up to the neck in a tub full of water, where, after she had been for a while, they took her out, and put on her a shift dipht in wine, which, as it dried and stuck to her sore and bruised body, they snatched off again, and then had another ready dipht in wine to clap on her. This they repeated six times, thereby making her body exceeding raw and sore. When all these cruelties could not shake her constancy, they fastened her by her feet in a kind of gibbet, and let her hang in that posture, with her head downward, till she expired.

"The other is of a man in whose house were quartered some of these missionary dragonies. One day, having drank plentifully of his wine, and broken their glasses at every hearth, they filled the floor with the fragments, and by often walking over them reduced them to very small pieces. This done, in the insolence of their mirth, they resolved on a dance, and told their Protestant host that he must be one of their company; but as he would not be of their religion, he must dance quite barefoot; and thus barefoot they drove him about the room, treading on the sharp points of the broken glasses. When he was no longer able to stand, they laid him on a bed, and, in a short time, stripped him stark naked, and rolled him from one end of the room to the other, till every part of his body was full of the fragments of glass. After this they dragged him to his bed, and having sent for a surgeon, obliged him to cut out the pieces of glass with his instruments, thereby putting him to the most exquisite and horrible pains that can possibly be conceived.

"These, fellow Protestants, were the methods used by the most Christian king's apostolic dragonies to convert his heretical subjects to the Roman Catholic faith! These, and many other of the like nature, were the torments to which Louis XIV. delivered them over to bring them to his own church! and as Popery is unchangeably the same, these are the tortures prepared for you, if ever that religion should be permitted to become settled amongst you; the consideration of which made Luther say of it, what every man that knows any thing of Christianity must agree with him in, "If you had no other reason to go out of the Roman church, this alone would suffice, that you see and hear, how contrary to the law of God, they shed innocent blood. This single circumstance shall, God willing, ever separate me from the Papacy. And if I was now subject to it, and could blame nothing in any of their doctrines; yet for this crime of cruelty, I would fly from her communion, as from a den of thieves and murderers."

DRAGS, in the sea language, are whatever hangs over the ship in the sea, as shirts, coats, or the like; and boats, when towed, or whatever else that after
this manner may hinder the ship's way when she sails, are called drags.

DRAIN, a cut or ditch for carrying off water from the soil, to improve it for the purposes of agriculture. In the ten countries of England drains are 20, 30, and sometimes 40 feet wide, carried through the marshy ground to some river or other place capable of discharging the water which they carry out of the fen lands.

DRAINING. For the different methods, see Agriculture Index.

DRAKE, Sir Francis, a celebrated English admiral, was the son of Edmund Drake a sailor, and born near Tavistock in Devonshire, in the year 1545. He was brought up at the expense, and under the care of Sir John Hawkins, who was his kinsman; and, at the age of 18, was purser of a ship trading to Biscay. At 23, he made a voyage to Guinea; and, at 22, had the honour to be made captain of the Judith. In that capacity he was in the harbour of St John de Ulúa, in the gulf of Mexico, where he behaved most gallantly in the glorious actions under Sir John Hawkins, and returned with him to England with great reputation, though not worth a groat. Upon this he projected a design against the Spaniards in the West Indies; which he so sooner published, than he had volunteers enough ready to accompany him. In 1570, he made his first expedition with two ships; and the next year with only one, in which he returned safe, if not with such advantages, as he expected. He made another expedition in 1572, wherein he did the Spaniards some mischief, and gained considerable booties. In these expeditions he was much assisted by a nation of Indians, who then were, and have been ever since, engaged in perpetual wars with the Spaniards. The prince of these people was named Pedro; to whom Drake presented a fine cutlass from his side, which he saw the Indian greatly admired. Pedro, in return, gave him four large wedges of gold; which Drake threw into the common stock, saying, That he thought it but just that such as bore the charge of so uncertain a voyage on his credit, should share the utmost advantage that voyage produced. Then, embarking his men with all the wealth he had obtained, which was very considerable, he bore away for England, where he arrived in August 1573.

His success in this expedition, joined to his honourable behaviour towards his owners, gained him high reputation; and the use he made of his riches, a still greater. For, fitting out three stout frigates at his own expense, he sailed with them to Ireland; where, under Walter earl of Essex, the father of the famous unfortunate earl, he served as a volunteer, and did many glorious actions. After the death of his noble patron, he, returned to England; where Sir Christopher Hatton introduced him to her majesty, and procured him countenance and protection at court. By this means he acquired a capacity of undertaking that grand expedition which will render his name immortal. The first thing he proposed was a voyage into the South seas through the straits of Magellan; which was what hitherto no Englishman had ever attempted. This project was well received at court: the queen furnished

Vol. VII. Part I.
country's glory. This celebrated ship, which had been contemplated many years at Deptford, at length decaying, it was broke up, and a chair, made out of the planks, was presented to the university of Oxford; upon which the famous Abraham Cowley made the following verses:

To this great ship, which round the world has run,  
And match'd in race the chariot of the sun:  
This Pythagorean ship (for it may claim  
Without presumption, so deserve a name,  
By knowledge once, and transformation now)  
In her new shape this sacred port allow.  
Drake and his ship could not have wished, from fate,  
A happier station, or more blest estate:  
For lo! a seat of endless rest is given,  
To her in Oxford, and to him in heaven.  

WORKS, Vol. II.

In the year 1585, he sailed with a fleet to the West Indies, and took the cities of St. Jago, St. Domingo, Carthagena, and St Augustine. In 1587, he went to Lisbon with a fleet of 50 sail; and having intelligence of a great fleet assembled in the bay of Cadiz, which was to have made part of the armada, he with great courage entered that port, and burnt there upwards of 10,000 tons of shipping: which he afterwards merrily called burning the king of Spain's beard. In 1588, when the armada from Spain was approaching our coasts, Sir Francis Drake was appointed vice-admiral under Charles Lord Howard of Effingham, high admiral of England, where fortune favoured him as remarkably as ever: for he made prize of a very large galleon, commanded by Don Pedro de Valdez, who was reputed the projector of this invasion. This affair happened in the following manner: On the 22d of July, Sir Francis observing a great Spanish ship floating at a distance from both fleets, sent his pinnace to summon the commander to yield. Valdez replied, with much Spanish solemnity, that they were 450 strong; that he himself was Don Pedro; and stood much upon his honour; and thereupon propounded several conditions, upon which he was willing to yield. But the vice-admiral replied, that he had no leisure to parley; but if he thought fit instantly to yield, he might; if not, he should soon find that Drake was no coward. Pedro, hearing the name of Drake, immediately yielded, and with 46 of his attendants came on board Drake's ship. This Don Pedro remained about two years Sir Francis Drake's prisoner in England; and when he was released, paid him for his own and his captain's liberties a ransom of 3,500. Drake's soldiers were well recompensed with the plunder of this ship; for they found in it 55,000 ducats of gold, which were divided among them.

A little before this formidable Spanish armament put to sea, the ambassador of his Catholic majesty had the confidence to propound to Queen Elizabeth, in Latin verse, the terms upon which she might hope for peace; which, with an English translation by Dr Fuller, we will insert in this place, because Drake's expedition to the West Indies makes a part of this message. The verses are these:

Te usto ne pegas bello defendere Belgas;  
Quae Dracus eripuit munus restituantur oportet.
Hist. de profectis urbis, in 4to, proves him to have been an able philologist, and gave flattering indications of future eminence. Its intrinsic merit caused it to be reprinted at Frankfort-on-the-Oder, in 1750, by Professor Uhl, accompanied with a life of its learned author. His next work, entitled Disputatio de officio praefectorum praetorio, was published in the year 1707; and ten years after his C. Siliis Italicis Funerorum, in 17 books, to render which perfect and complete, nothing was omitted by this great man; many historical subjects being engraved for the purpose of elucidating the text, to which his own copious and learned annotations most powerfully contributed. It is entitled T. Livii Patavini historiarum ab urbe condita libri, qui super- sunt, omnes. Lugd. Batav. 1738 and 1746; 7 tom.

The preface to this work is very long, and replete with erudition, giving a particular account of all the literary characters who have at different periods commented on the works of Livy. He took the edition of Gronovius for his model, as being in his estimation the most correct; but he made many important alterations on the authority of manuscripts which it is probable Gronovius had either never seen, or not taken the pains to consult. Upon the whole, this edition of Livy is at once the most elaborate, interesting, and instructive, ever given to the world, since into it he has introduced the criticisms of Ducher, Gronovius, Pe- rizonius, and Signorius; in addition to his own, which are certainly fraught with much literature and deep discernment.

DRAMA, a poem containing some certain action, and representing a true picture of human life, for the delight and improvement of mankind. The principal species of the dramas are two, comedy and tragedy. See the subject fully considered in a historical view of the ancient and modern dramas, in the article DRAMA, Supplement.

DRAMATIC, an epithet given to pieces written for the stage. See Poetry.

DRAN, HENRY FRANCIS LE, a French surgeon of distinguished eminence, was born in the year 1685. His father followed the same profession at Paris, and was highly celebrated for his treatment of cancer. Dran had much experience as well as abilities, although his anatomical knowledge was rather circumscribed, and his acquaintance with books was far from being extensive. In 1730, he published in 8vo a valuable work, entitled Parallele des differents Manieres de tirer la Pierre hors de la Veste. In this work he takes a comparative view of the different modes of performing the hazardous operation of lithotomy, preferring the lateral method which was practised by Cheselden. In the year 1731, he published his Observations de Chirurgie, ouvros des Reflexions, in 2 vol. 12mo, which is justly considered as a valuable performance for men who are employed in the practice of surgery. In 1757, appeared his Trait des Reflexions tirées de la Pratique sur les Plaies de Armes à Feu; in which he gives the results of his own practice while in the army, with efficacious methods for the cure of gun-shot wounds. Gatarak translated into English his Trait des Opérations de Chirurgie, to which many interest-
DRAUGHT.

Body of water whose depth is equal to 12 feet, to float
or buoy up a ship on its surface, she is said to draw 12
feet water; and that this draught may be more readily
known, the feet are marked on the stem and stern post,
regularly from the keel upwards.

DRAUGHT-Hooks, are large hooks of iron, fixed on
the cheeks of a cannon carriage, two on each side, one
near the trunnion-hole, and the other at the train, dis-
tinguished by the name of fore and hind draught hooks.
Large guns have draught hooks near the middle trans-
son, to which are fixed the chains that serve to keep
the shafts of the limbers on a march. The fore and
hind hooks are used for drawing a gun backwards or
forwards, by men with strong ropes, called draught-
ropes, fixed to these hooks.

DRAUGHT-Horse, in farming, a sort of coarse-made
horse, destined for the service of a cart or plough.

DRAWBACK, in commerce, certain duties, either
of the customs or of the excise, allowed upon the ex-
portation of some of our own manufactures or upon
certain foreign merchandises, that have paid duty on
importation.

The oaths of the merchants importing and export-
ing are required to obtain the drawback on foreign
goods, affirming the truth of the officers certificate on
the entry, and the due payment of the duties: and
these may be made by the agent or husband of any cor-
poration or company; or by the known servant of any
merchant usually employed in making his entries, and
paying his customs. In regard to foreign goods entered
outward, if less quantity or value be fraudulently ship-
ped out than what is expressed in the exporter’s cer-
tificate, the goods therein mentioned, or their value, are
forfeited, and no drawback to be allowed for the same.
Foreign goods exported by certificate in order to ob-
tain the drawback, not shipped or exported, or relan-
ed in Great Britain, unless in case of distress to save
them from perishing, are to lose the benefit of the
drawback, and are forfeited, or their value, with the
vessel, horses, carriages, &c. employed in the relan-
ding thereof; and the persons employed in the relan-
ding them, or by whose privitry they are relanded, or
into whose hands they shall knowingly come, are to for-
feit double the amount of the drawback. Officers of
the customs conniving at, or assisting in any fraud
relating to certificate goods, besides other penalties, are
to forfeit their office, and suffer six months imprison-
ment without jail or mainprize; as are also masters,
or persons belonging to the ships employed therein.

Bonds given for the exportation of certificate goods to
Ireland must not be delivered up, nor drawback al-
lowed for any goods, till a certificate under the hands and
seals of the collector or comptroller, &c. of the customs
be produced, testifying the landing.

DRAW-Bridge, a bridge made after the manner of a
float, to draw up or let down, as occasions serve, before
the gate of a town or castle. See BRIDGE.

A draw-bridge may be made after several different
ways; but the most common are made with pleysers, twice
the length of the gate, and a foot in diameter. The
inner square is traversed with a cross, which serves for
a counterpoise; and the chains which hang from the
extremities of the pleysers to lift up or let down the
bridge are of iron or brass.

In navigable rivers it is sometimes necessary to make
the middle arch of bridges with two moveable plat-
forms, to be raised occasionally, in order to let the
masts and rigging of ships pass through. This kind
of draw-bridge is represented in Plate CLXVIII. where
AB is the width of the middle arch; AL and BL, the
two piers that support the draw-bridge NO, one
of the platforms of which is raised, and the other let
down, having the beam PQ for its pleyser. To NO
are suspended two moveable braces EH, EH; which
resting on the support E, press against the bracket M,
and thereby strengthen the draw-bridge. These braces
are conducted to the rest by means of the weight S,
pulling the chain SLF.

DRAW-Net, a kind of net for taking the larger sort
of wildfowl, which ought to be made of the best sort
of packthread, with wide meshes; they should be about
two fathoms deep and six long, verged on each side
with a very strong cord, and stretched at each end on
long poles. It should be spread smooth and flat upon
the ground; and strewn over with grass, sedge, or
the like, to hide it from the fowl; and the sportsman
is to place himself in some shelter of grass, fern, or
some such thing.

DRAWING, in general, denotes the action of pull-
ing out, or hauling along; thus we read of tool-
drawing, wire-drawing, &c.

**DRAWING,**

The art of representing the appearances of objects
upon a plane surface, by means of lines, shades,
and shadows, formed with certain materials adapted to
the purpose.

§ 1. Of the proper Materials for Drawing, and the
manner of using them.

The first thing necessary for a beginner is to furnish
himself with proper materials, such as black lead pen-
cils, crayons of black, white, or red chalk, crow-
quill pens, a rule and compasses, camels hair pencils,
and Indian ink. He must accustom himself to hold
the pencil farther from the point than one does a pen
in writing; which will give him a better command
of it, and contribute to render the strokes more free
and bold. The use of the pencil is to draw the first
sketches or outlines of the piece, as any stroke or line
that is amiss may in this be more easily rubbed out
than in any other thing; and when he has made the
sketch as correct as he can with the pencil, he may
then draw carefully the best outline he has got, with
his
his crow-quill pen and ink (A); after which he may discharge the pencil lines, by rubbing the piece gently with the crumb of stale bread or Indian rubber. Having thus got the outline clear, his next work is to shade the piece properly, either by drawing fine strokes with his pen where it requires to be shaded, or by washing it with his pencil and the Indian ink. As to his rule and compasses, they are never, or very rarely to be used, except in measuring the proportions of figures after he has drawn them, to prove whether they are right or not; or in houses, fortifications, and other pieces of architecture.

§ 2. Of Drawing Lines, Squares, Circles, and other regular and irregular Figures.

Having got all these implements in readiness, the first practice must be to draw straight and curve lines, with ease and freedom, upwards and downwards, sideways to the right or left, or in any direction whatever. He must also learn to draw, by command of hand, squares, circles, ovals, and other geometrical figures: for, as the alphabet, or a knowledge of the letters, is an introduction to grammar; so is geometry to drawing. The practice of drawing these simple figures till he is master of them, will enable him to imitate, with greater ease and accuracy, many things both in nature and art. And here it is proper to admonish him, never to be in a hurry: but to make himself perfectly master of one figure before he proceeds to another: the advantage, and even necessity, of this, will appear as he proceeds. Two observations more may be added: 1. That he accustom himself to draw all his figures very large, which is the only way of acquiring a free bold manner of designing. 2. That he practise drawing till he has gained a tolerable mastery of his pencil, before he attempts to shadow any figure or object of any kind whatever.

§ 3. Of Drawing Eyes, Ears, Legs, Arms, Hands, Feet, &c.

As to the drawing of eyes and ears, legs and arms, the learner will have very little more to do than to copy carefully the examples given in Plate CLXXXVII. and CLXXVIII. taken from Sebastian le Clerc's drawing book. But the actions and postures of the hands are so many and various, that no certain rules can be giving for drawing them, that will universally hold good. Yet as the hands and feet are difficult members to draw, it is very necessary, and well worth while, to bestow some time and pains about them, carefully imitating their various postures and actions, so as not only to avoid all lameness and imperfection, but also to give them life and spirit. To arrive at this, great care, study, and practice, are requisite; particularly in imitating the best prints or drawings that can be got of hands and feet (some good examples of which are given in Plate CLXXXVIII.); for, as to the mechanical rules of drawing them by lines and measures, they are not only perplexed and difficult, but also contrary to the practice of the best masters. One general rule, however, may be given (which is universally to be observed in all subjects), and that is, Not to finish perfectly at first any single part, but to sketch out faintly, and with light strokes of the pencil, the shape and proportion of the whole hand, with the action and turn of it; and after considering carefully whether this first sketch be perfect, and altering it wherever it is amiss, you may then proceed to the bending of the joints, the knuckles, the veins, and other small particulars, which, when the learner has got the whole shape and proportion of the hand or foot, will not only be more easily but also more perfectly designed.

§ 4. Of Drawing Faces.

The head is usually divided into four equal parts, (1.) From the crown of the head to the top of the forehead. (2.) From the top of the forehead to the eyebrows. (3.) From the eyebrows to the bottom of the nose. (4.) From thence to the bottom of the chin. But this proportion is not constant; those features in different men being often very different as to length and shape. In a well-proportioned face, however, they are nearly right. To direct the learner therefore in forming a perfect face, his first business is to draw an oval, or rather the form of an egg; in the middle of which, from the top to the bottom, draw a perpendicular line. Through the centre or middle of this line draw a diameter line, directly across from one side to the other of your oval. On these two lines all the features of your face are to be placed as follows: Divide your perpendicular line into four equal parts; the first must be allotted to the hair of the head; the second is from the top of the forehead to the top of the nose between the eyebrows; the third is from thence to the bottom of the nose; and the fourth includes the lips and chin. Your diameter line, or the breadth of the face, is always supposed to be the length of five eyes; you must therefore divide it into five equal parts, and place the eyes upon it so as to leave exactly the length of one eye betwixt them. This is to be understood only of a full front face, Plate CLXXXVII. fig. a; for if it turn to either side, then the distances are to be lessened on that side which turns from you, less or more in proportion to its turning (fig. b b b). The top of the ear is to rise parallel to the eyebrows, at the end of the diameter line; and the bottom of it must be equal to the bottom of the nose. The nostrils ought not to come out farther than the corner of the eye in any face; and the middle of the mouth must always be placed upon the perpendicular line.

§ 5. Of Drawing Human Figures.

When the learner is tolerably perfect in drawing faces, heads, hands, and feet, he may next attempt to draw the human figure at length. In order to which, let him first sketch the head; then draw a perpendicular

(A) The ink made use of for this purpose must not be common but Indian ink; which is much softer than the other, and does not run: by mixing it with water, it may be made to any degree of strength, and used in a pen like common ink.
As to the order and manner of proceeding in drawing the human body, he must first sketch the head; then the shoulders in the exact breadth; then draw the trunk of the body, beginning with the axillae (leaving the arms till afterwards), and then draw down to the hips on both sides; and be sure he observe the exact breadth of the waist. When he has done this, let him then draw that leg which the body stands upon; and afterwards the other which stands loose; then the arms; and last of all the hands.

He must take notice also of the bowings and bendings that are in the body; making the part which is opposite to that which bends correspond to it in bending with it. For instance: If one side of the body bend in, the other must stand out answerable to it; if the back bend in, the belly must stick out; if the knee bend out, the ham must fall in; and so of any other joint of the body. Finally, he must endeavour to form all parts of the figure with truth, and in just proportion; not one arm or one leg bigger or less than the other; nor broad Heraclean shoulders, with a thin and slender waist; nor raw and bony arms, with thick and gouty legs: but let there be a kind of harmonious agreement amongst the members, and a beautiful symmetry throughout the whole figure.

**Proportions and Measures of the Human Body.**

The centre or middle part, between the two extremities of the head and feet of a new born child, is in the navel, but that of an adult is in the pubis; and the practical of dividing the measures of children into four, five, or six parts, whereof the head is one, is made use of by painters and sculptors.

A child of two years old has about five heads in its whole length, but one of four or five years old has near six; about the fifteenth or sixteenth year, seven heads are the proportion or measure, and the centre inclines to the upper part of the pubis. Hence its appears, as the growth of the body advances, there is a gradual approach to the proportion of an adult of near eight heads in the whole length, of which, as mentioned above, the head makes one.

Agreeable to these principles, the following Table is constructed, exhibiting the proportions of the parts of a man and of a woman, as they were fixed by the ancients, and measured by M. Audran from the Apollo Pythinus (Plate CLXXX.) in the garden of the Vatican at Rome, and the Venus Aphrodites (Plate CLXXXI.) belonging to the family of the Medicis. Supposing the figures to stand upright and duly poised on both legs, the whole height of the former is divided into 3½ parts, being 7 heads 3 parts and 6 minutes; and that of the latter into 31 parts, being 7 heads and 3 parts.

Length of the figures
The other most admired antique statues differ a little from these proportions, the Laocoön measuring 7 h. 2 p. 3 m. the Hercules 7 h. 3 p. 7 m. the Pyramus 7 h. 2 p. the Antinous 7 h. 2 p. the Grecian shepherdess 7 h. 3 p. 6 m. and the Mirmillo 8 h. But all their other proportions are allowed to be harmonious and agreeable to the characters of the figures they represent.

The most remarkable differences of the symmetry or proportions of a man and of a woman to be observed from the Table are: First, The shoulders of a man are broader, measuring two heads, and the haunches narrower, measuring 1 h. 1 p. 5 m. whereas the shoulders of a woman measure only 1 h. 3 p. 8 m. and the haunches measure 1 h. 2 p. 3 m. The sternum or breast-bone of a man is longer, measuring 3 p. 8 m. and the sternum of the woman only 3 p. 3 m. On the contrary, the pelvis of a man is less, measuring from the top to bottom only 4 p. whereas the pelvis of a woman measures from the top to the bottom 4 p. 3 m.

It is a leading principle, in which every person conversant in designing has agreed, that without a perfect knowledge of the proportions, nothing can be produced but monstrous and extravagant figures; and it is also universally admitted, that the ancient Greek and Roman sculptors attained the highest success in producing the most perfect models.

The greatest of the modern artists who have examined their figures with attention admit, that several of the ancient sculptors in some degree have excelled nature, they never having found any man so perfect in all his parts as some of their figures are. Their opportunities indeed were great; Greece abounded with beauties; and Rome being mistress of the world, every thing that was curious and beautiful was brought to it from all parts. Their motives were also powerful; religion, glory, and interest. They considered it as a kind of religious worship to give the figures of their gods so much nobleness and beauty as to be able to attract the love and veneration of the people. Their own glory was also concerned, particular honours being bestowed on those who succeeded; and for their fortune they had no further care to take when they once arrived at a certain degree of merit.

Attitudes and Action of the Muscles. If a strong person is to be represented in a vigorous action, such as Hercules, &c. after a suitable proportion to such a figure and the action is designed, the parts or limbs employed in the chiefest force of the action ought to be considered. If the figure is standing, the foot must be placed in a right line, or perpendicular to the trunk or bulk of the body, where the centre of gravity may be placed in equilibrum. This centre is determined by the heel: or, if the figure is upon tiptoe, then the ball of the great toe is in the centre. The muscles of the leg which supports the body ought to be swelled, and their tendons drawn more to extension than those of the other leg, which is only placed so as to receive the weight of the body towards that way to which the action inclines it. For example, suppose Hercules with a club striking at any thing before him towards the left side: Then let his right leg be placed so as to receive the whole weight of the body, and the left loosely touching the ground with his toes. Here the external muscles of the right leg ought to be expressed very strong; but those of the left scarcely appearing, more than if it were in some sedentary posture, except in the present case. The foot being extended, the muscles which compose the calf of the leg are in action and appear very strong; though it is not meant that all the muscles of the right leg, which supports the weight
of the body, ought to be expressed very strong or equally swelled, but those most tumefied which are chiefly concerned in the action or posture that the leg is then in. For example, if the leg or tibia is extended, then the extending muscles placed on the thigh are most swelled: if it is bended, then the bending muscles and their tendons appear most. The like may be observed of the whole body in general when it is put into vigorous action. The Laocoon formerly in the Vatican garden at Rome, now in the Louvre at Paris, furnishes an example of this muscular appearance through the whole; but in the Antinous, Apollo, also in the Louvre, and other figures of the ancients, in postures where no considerable actions are designed, we see their muscles expressed but faintly, or scarcely appearing.

The clavicles or collar-bones, and muscles in general, do not appear in women as in men; nor will any action in which a woman uses her utmost strength occasion such swellings or risings of the muscles to appear as they do in men, since the great quantity of fat placed under the skin of women so clothes their muscles, &c. as to prevent any such appearance.

Effects of the Exertion of the Muscles. The following are the most obvious effects of the exertion of several of the muscles; of those, to wit, which chiefly demand the attention of an artist.

If either of the mastoid muscles (Plate CLXXXII. 1. 1.) act, the head is turned to the contrary side, and the muscle which performs that action appears very plain under the skin.

If the arms are lifted up, the deltoid muscles placed on the shoulders, which perform that action, swell, and make the extremities of the spines of the shoulder-blades (Plate CLXXXIII. 3. 3.), called the tops of the shoulders, appear indented or hollow.

The shoulder-blades following the elevation of the arms, their bases (Plate CLXXXIII. 4. 4.) incline at that time obliquely downwards.

If the arms are drawn down, put forwards, or pulled backwards, the shoulder-blades necessarily vary their positions accordingly. All these particulars are to be learned by consulting the life only; when being well acquainted with what then appears in every action, the artist will be able to form an adequate idea how it ought to be expressed. These circumstances are little known; hence seldom attended to in designing.

When the cubit or fore-arm is bended, the biceps (Plate CLXXXII. 5. 5.) has its belly very much raised, as appears in the left arm. The like may be observed of the triceps (Plate CLXXXIII. 6. 6.) when the arm is extended as observed in the right arm.

The straight muscles of the abdomen (Plate CLXXXII. 7. 7.) appear very strong when rising from a decumbent posture.

The parts of the great serratus muscle (ib. 8. 8.) which are received in the teeth or beginnings of the oblique descending muscle immediately below, are very much swelled when the shoulder on the same side is brought forwards; that serratus muscle then being in action in drawing the scapular forwards.

The long extending muscles of the trunk (Plate CLXXXIII. 9. 9.) act alternately in walking, after this manner: If the right leg bears the weight of the body, and the left is in translation as on tiptoe, the last-mentioned muscles of the back on the left side may be observed to be tumefied on the other side about the region of the loins, and so on the other side.

The trochanter, or outward and uppermost heads of the thigh-bones (Plate CLXXXIII. 10. 10.), vary in their positions in such a manner as no precise observation can explain their several appearances; but the study after the life ought to be carefully attended to.

If the thigh is extended, as when the whole weight of the body rests on that side, the gluteus or buttock muscle (Plate CLXXXIII. 11. 11.) makes a very different appearance from what offers at another time; but if the thigh is drawn backwards, that muscle appears still more and more tumefied.

When the whole leg is drawn upwards forwards, and at the same time the foot is inclined inwards, the upper part of the sartorius muscle (Plate CLXXXII. 12. 12.) appears rising very strong; in other positions of the thigh, that muscle makes a furrowing appearance in its whole progress.

If a man is upon tiptoe, the extending muscles of the leg placed on the fore part of the thigh (Plate CLXXXII. 13. 13.), and those of the foot that compose the calf of the leg (Plate CLXXXIII. 14. 14.) appear very strong, and the long peronæus (Plate CLXXXII. 15.) makes a considerable indentation or furrowing at that time in its progress on the outside of the leg.

Many other remarks might here be offered: but a due attention to nature will soon discover them.

§ 6. Of Light and Shade.

After the learner has made himself in some measure perfect in drawing outlines, his next endeavour must be to shade them properly. It is this which gives an appearance of substance, shape, distance, and distinction, to whatever body he endeavours to represent, whether animate or inanimate. The best rule for doing this is, to consider from what point, and in what direction, the light falls upon the objects which he is delineating, and to let all his lights and shades be placed according to that direction throughout the whole work. That part of the object must be lightest which hath the light most directly opposite to it; if the light falls sideways on the picture, he must make that side which is opposite to it lightest, and that side which is farthest from it darkest. If he is drawing the figure of a man, and the light be placed above the head, then the top of the head must be made lightest, the shoulders next lightest, and the lower parts darker by degrees. That part of the object, whether in naked figures or drapery, or buildings, that stands farthest out, must be made the lightest, because it comes nearest to the light; and the light lost so much of its brightness, by how much any part of the body bends inward, because those parts that so much hinder the lustre and full brightness of the light from striking on those parts that fall in. Titian used to say, that he knew no better rule for the distribution of lights and shadows than his observations drawn from a bunch of grapes. Satins and silks, and all other shining stuffs, have certain glancing reflections, exceeding bright where the light falls strongest. The like is seen in armour, brass pots, or any other glittering metal, where you see a sudden brightness in the middle or centre of the light, which
which discovers the shining nature of such things. Ob-
serve also, that a strong light requires a strong shade,
a fainter light a fainter shade; and that an equal ba-
 lance be preserved throughout the piece between the
lights and shades. Those parts which must appear
round require but one stroke in shading, and that some-
times but very faint; such parts as should appear steep
or hollow, require two strokes across each other, or
sometimes three, which is sufficient for the deepest
shade. Care must be also taken to make the outlines
faint and small in such parts as receive the light; but
where the shades fall, the outline must be strong and
bold. The learner must begin his shadings from the
top, and proceed downward, and use his utmost ende-
vours both by practice and observation to learn how to
vary the shadings properly; for in this consists a great
deal of the beauty and elegance of drawing. Another
thing to be observed is, that as the human sight is
weakened by distances, so objects must seem more or
less confused or clear according to the places they hold
in the piece. Those that are very distant, will be more,
confused, and confused; those that are near and on the foremost
ground,—clear, strong, and accurately finished.

§ 7. Of Drapery.

In the art of clothing the figures, or casting the
drapery properly and elegantly upon them, many things
are to be observed. 1. The eye must never be in doubt
of its object; but the shape and proportion of the part
or limb, which the drapery is supposed to cover, must
appear; at least so far as art and probability will per-
mit: and this is so material a consideration, that many
artists draw first the naked figure, and afterwards put
the draperies upon it. 2. The drapery must not sit
too close to the parts of the body: but let it seem to
flow round, and as it were to embrace them; yet so
as that the figure may be easy, and have a free motion.
3. The draperies which cover those parts that are ex-
posed to great light must not be so deeply shaded as to
seem to pierce them; nor should those members be
crossed by folds that are too strong, lest by this,
too great darkness of the shades the members look as if
they were broken. 4. The great folds must be drawn
first, and then stroked into lesser ones: and great care
must be taken that they do not cross one another im-
properly. 5. Folds in general should be large, and as
few as possible. However, they must be greater or less
according to the quantity and quality of the stuff of
which the drapery is supposed to be made. The quality
of the person is also to be considered in the drapery.
If they are magistrates, their draperies ought to be
large and ample: if country clowns or slaves, they
ought to be coarse and short; if ladies or nymphs,
light and soft. 6. Suit the garments to the body, and
make them bend with it, according as it stands in or
out, straight or crooked; or as it bends one way or
another; and the closer the garment sits to the body,
the narrower and smaller must be the folds. 7. Folds
well imagined give much spirit to any kind of action;
because their motion implies a motion in the acting
member, which seems to draw them forcibly, and
makes them more or less stirring as the action is more
or less violent. 8. An artful complication of folds in
a circular manner greatly helps the effect of foreshort-
ening. 9. All folds consist of two shades, and no
more; which you may turn with the garment at plea-
sure, shadowing the inner side deeper, and the outer
more faintly. 10. The shades in silk and fine linen
are very thick and small, requiring little folds and a
light shadow. 11. Observe the motion of the air or
wind, in order to draw the loose apparel all flying one
way; and draw that part of the garment that adheres
closest to the body before you draw the looser part
that flies off from it; lest, by drawing the loose part
of the garment first, you should mistake the position of
the figure, and place it awry. 12. Rich ornaments,
when judiciously and sparingly used, may sometimes
contribute to the beauty of draperies. But such orna-
ments are far below the dignity of angels or heavenly
figures; the grandeur of whose draperies ought rather
to consist in the boldness and nobleness of the folds,
than in the quality of the stuff or the glitter of orna-
ments. 13. Light and flying draperies are proper only
to figures in great motion, or in the wind: but
when in a calm place, and free from violent action,
their draperies should be large and flowing; that by
their contrast and the fall of the folds, they may ap-
pear with grace and dignity. Thus much for drape-
rries; an example or two of which are given in Plate
CLXXIX. But see further the articles CRAYON and
PAINTING.

§ 8. On the Passions.

The passions, says M. le Brun, are motions of the
soul, either upon her pursuing what she judges to be
for her good, or shunning what she thinks hurtful to
her; and commonly, whatever causes emotion or pas-
sion in the soul, creates also some action in the body.
It is therefore necessary for a painter to know which
are the different actions in the body that express the
several passions of the soul, and how to delineate them.

M. le Brun has been extremely happy in expressing
many of the passions, and the learner cannot study any
thing better than the examples which he has left us of
them. However, as M. de Piles justly observes, it is
always good to keep in mind that each particular demonstrations of them as to fix their ex-
pression to certain strokes, which the painter should
be obliged to make use of as essential and invariable rules.
This (says he) would be depriving the art of that ex-
cellent variety of expression which has no other princi-
ple than diversity of imagination, the number of which
is infinite. The same passion may be finely expressed
several ways, each yielding more or less pleasure in
proportion to the painter's understanding and the spec-
tator's discernment.

Though every part of the face contributes towards
expressing the sentiments of the heart, yet the eye-
brow, according to M. le Brun, is the principal seat of
expression, and where the passions best make them-
selves known. It is certain, says he, that the pupil of
the eye, by its fire and motion, very well shows the a-
gitation of the soul, but then it does not express the
kind or nature of such an agitation; whereas the mo-
tion of the eyebrow differs according as the passions
change their nature. To express a simple passion, the
motion is simple; to express a mixed passion, the mo-
tion is compound: if the passion be gentle, the mo-
tion is gentle; and if it be violent, the motion is so
too. We may observe farther, says he, that there are
two
two kinds of elevation in the eyebrows. One, in which the eyebrows rise up in the middle; this elevation expresses agreeable sensations, and it is to be observed that then the mouth rises at the corners: Another, in which the eyebrows rise up at the ends, and fall in the middle; this motion denotes bodily pain, and then the mouth falls at the corners. In laughter, all the parts agree; for the eyebrows, which fall toward the middle of the forehead, make the nose, the mouth, and the eyes, follow the same motion. In weeping, the motions are compound, and contrary; for the eyebrows fall toward the nose and over the eyes, and the mouth rises that way. It is to be observed also, that the mouth is the part of the face which more particularly expresses the emotions of the heart: for when the heart complains, the mouth falls at the corners; when it is at ease, the corners of the mouth are elevated; and when it has an aversion, the mouth shoots forward, and rises in the middle.

"The head (says M. de Piles) contributes more to the expression of the passions than all the other parts of the body put together. Those separately can only show some few passions, but the head expresses them all. Some, however, are more particularly expressed by it than others: as humility, by hanging it down; arrogance, by lifting it up; languishment, by inclining it to one side; and obstinacy, when with a stiff and resolute air it stands upright, fixed, and still between the two shoulders. The head also best shows our supplications, threatenings, mildness, pride, love, hatred, joy, and grief. The whole face, and every feature, contributes something: especially the eyes; which, as Cicero says, are the windows of the soul. The passions they more particularly discover are, pleasure, languishing, scorn, severity, mildness, admiration, and anger; to which one might add joy and grief, if they did not proceed more particularly from the eyebrows and mouth; but when those two passions fall in also with the language of the eyes, the harmony will be wonderful. But though the passions of the soul are more visible in the lines and features of the face, they often require the assistance also of the other parts of the body. Without the hands, for instance, all action is weak and imperfect; their motions, which are almost infinite, create numberless expressions: it is by them that we desire, hope, promise, call, send back; they are the instruments of threatening, prayer, horror, and praise; by them we approve, condemn, refuse, admit, fear, ask; express our joy and grief, our doubts, regrets, pain, and admiration. In a word, it may be said, as they are the language of the dumb, that they contribute not a little to speak a language common to all nations, which is the language of painting. But to say how these parts must be disposed for expressing the various passions, is impossible; nor can any exact rules be given for it, both because the task would be infinite, and because every one must be guided in this by his own genius and the particular turn of his own studies." See the article Passions, and the Plate there referred to.

The learner may proceed now to make some attempts at drawing flowers, fruits, birds, beasts, and the like; not only as it will be a more pleasing employment, but as it is an easier task, than the drawing of hands and feet, and other parts of the human body, which require not only more care, but greater exactness and nicer judgment. Very few rules or instructions are requisite upon this head: the best thing the learner can do is, to furnish himself with good prints or drawings by way of examples, and with great care and exactness to copy them. If it is the figure of a beast, begin with the forehead, and draw the nose, the upper and under jaw, and stop at the throat. Then go to the top of the head, and form the ears, neck, back, and continue the line till you have given the full shape of the buttock. Then form the breast, and mark out the legs and feet, and all the smaller parts. And, last of all, finish it with the proper shadows. It is not amiss, by way of ornament, to give a small sketch of landscape; and let it be suitable and natural to the place or country of the beast you draw. Much the same may be said with regard to birds. Of these, as well as beasts and other objects, the learner will find many examples among the plates given in this work.

§ 10. Of drawing Landscapes, Buildings, &c.

Of all the parts of drawing, this is the most useful and necessary, and it is what every man may have occasion for at one time or another. To be able, on the spot, to take the sketch of a fine building, or a beautiful prospect; of any curious production of art, or uncommon appearance in nature; is not only a very desirable accomplishment, but a very agreeable amusement. Rocks, mountains, fields, woods, rivers, catacombs, cities, towns, castles, houses, fortifications, ruins, or whatsoever else may present itself to view on our journeys or travels in our own or foreign countries, may be thus brought home, and preserved for our future use either in business or conversation. On this part, therefore, more than ordinary pains should be bestowed.

All drawing consists in nicely measuring the distances of each part of the piece by the eye. In order to facilitate this, let the learner imagine in his own mind, that the piece he copies is divided into squares. For example: Suppose or imagine a perpendicular and a horizontal line crossing each other in the centre of the picture you are drawing from; then suppose also two such lines crossing your own copy. Observe in the original, what parts of the design those lines intersect, and let them fall on the same parts of the supposed lines in the copy: We say, the supposed lines; because though engravers, and others who copy with great exactness, divide both the copy and original into many squares, as below; yet this is a method not to be recommended, as it will be apt to deceive the learner, who will fancy himself a tolerable proficient, till he comes to draw after nature, where these helps are not to be had, when he will find himself miserably defective and utterly at a loss.

If he is to draw a landscape from nature, let him take...
DRAWING.

take his station on a rising ground, where he will have a large horizon; and mark his tablet into three divisions, downwards from the top to the bottom; and divide in his own mind the landscape he is to take, into three divisions also. Then let him turn his face directly opposite to the midst of the horizon, keeping his body fixed, and draw what is directly before his eyes upon the middle division of the tablet; then turn his head, but not his body, to the left hand, and delineate what he views there, joining it properly to what he had done before; and, lastly, do the same by what is to be seen upon his right hand, laying down every thing exactly both with respect to distance and proportion. One example is given on Plate CLXXIX.

The best artists, in drawing their landscapes, make them shoot away one part lower than another. Those who make their landscapes mount up higher and higher, as if they stood at the bottom of a hill to take the prospect, commit a great error: the best way is to get upon a rising ground, make the nearest objects in the piece the highest, and those that are farther off to shoot away lower and lower till they come almost level with the line of the horizon, lessening every thing proportionably to its distance, and observing also to make the objects fainter and less distinct the farther they are removed from the eye. He must make all his lights and shades fall one way, and let every thing have its proper motion: as trees shaken by the wind, the small boughs bending more, and the large ones less: water agitated by the wind, and dashing against ships or boats, or falling from a precipice upon rocks and stones, and spiriting up again into the air, and sprinkling all about: clouds also in the air; now gathered with the winds; now violently condensed into hail, rain, and the like: Always remembering, that whatever motions are caused by the wind must be made all to move the same way, because the wind can blow but one way at once.

Finally, It must be observed, that in order to attain any considerable proficiency in drawing, a knowledge of PERSPECTIVE is absolutely necessary: see that article.

DRAY, a kind of cart used by brewers for carrying barrels of beer or ale; also a sledge drawn without wheels.

DRAY, among sportsmen, denotes squirrel nests built in the tops of trees.

DRAYTON, MICHAEL, an eminent English poet, was born in 1563, of an ancient family in Warwickshire. His propensity to poetry was extremely strong, even from his infancy; and we find the most of his principal poems published, and himself highly distinguished as a poet, by the time he was about 30 years of age. It appears from his poem of Moses's Birth and Miracles, that he was a spectator at Dover of the famous Spanish armada, and it is not improbable that he was engaged in some military employment there. It is certain, that not only for his merit as a writer but his valuable qualities as a man, he was held in high estimation, and strongly patronized by several personages of consequence; particularly by Sir Henry Goodere, Sir Walter Aston, and the countess of Bedford; to the first of whom he owns himself indebted for great part of his education, and by the second he was for many years supported.

His poems are very numerous; and so elegant, that his manner has been copied by many modern writers of eminence since. Among those the most celebrated one is the Poly-Albion, a chorographical description of England, with its commodities, antiquities, and curiosities, in metre of 12 syllables; which he dedicated to Prince Henry, by whose encouragement it was written: and whatever may be thought of the poetry, his descriptions are allowed to be exact. He was styled poet laureat in his time: which, as Ben Johnson was then in that office, is to be understood in a loose sense of approbation as an excellent poet; and was bestowed on others as well as Drayton, without being confined strictly to the office known by that appellation. He died in 1651; and was buried in Westminster abbey among the poets, where his bust is to be seen, with an epitaph penned by Ben Johnson.

DREAMS, are all those thoughts which people feel passing through their minds, and those imaginary transactions in which they often fancy themselves engaged, when in the state of sleep. Scarcely any part of nature is less open to our observation than the human mind in this state. The dreamer himself cannot well observe the manner in which dreams arise or disappear to him. When he awakes, he cannot recollect the circumstances of his dreams with sufficient accuracy. Were we to watch over him with the most vigilant attention, we could not perceive with certainty what emotions are excited in his mind, or what thoughts pass through it, during his sleep. But though we could ascertain these phenomena, many other difficulties would still remain. What parts of a human being are active, what dormant, when he dreams? Why does he not always dream while asleep? Or why dreams he at all? Do any circumstances in our constitution, situation, and peculiar character, determine the nature of our dreams?

We may lay before our readers such facts as have been ascertained concerning dreaming, and the most plausible conjectures that have been offered to explain those particulars, about which we can only conjecture, or have at least hitherto obtained nothing more certain than conjecture.

1. In dreaming, we are not conscious of being asleep. This is well known from a thousand circumstances. When awake, we often recollect our dreams; and we remember on such occasions, that while those dreams were passing through our minds, it never occurred to us that we were separated by sleep from the active world. We are often observed to act and talk in dreaming as if we were busily engaged in the intercourse of social life.

2. In dreaming, we do not consider ourselves as witnessing
witnessing or bearing a part in a fictitious scene: we seem not to be in a similar situation with the actors in a dramatic performance, or the spectators before whom they exhibit, but engaged in the business of real life. All the varieties of thought that pass through our minds when awake may also occur in dreams; all the images which imagination presents in the former state, she is also able to call up in the latter; all the same emotions may be excited, and we are often actuated by equal violence of passion; none of the transactions in which we are capable of engaging while awake is impossible in dreams: in short, our range of action and observation is equally wide in the one state as in the other; and while dreaming, we are not sensible of any distinction between our dreams and the events and transactions in which we are actually concerned in our intercourse with the world.

3. It is said that all men are not liable to dream. Dr. Beattie, in a very pleasing essay on this subject, relates, that he knew a gentleman who never dreamed except when his health was in a disordered state; and Locke mentions that a certain person of his acquaintance was almost a stranger to dreaming till the 26th year of his age; and then began to dream in consequence of having a fever. These instances, however, are too few, and we have not been able to obtain more; and, besides, it does not appear that those persons had always attended, with the care of a philosopher making an experiment, to the circumstances of their sleep. They might dream, but not recollect their dreams on awaking; and they might both dream and recollect their dreams immediately upon awaking, yet afterwards suffer the remembrance of them to slip out of their memory. We do not advance this, therefore, as a certain fact concerning dreaming; we are rather inclined to think it a mistake.

But though it appears to be at no means certain that any of the human race are through the whole of life absolute strangers to dreaming, yet it is well known that all men are not equally liable to dream. The same person dreams more or less at different times; and as one person may be more exposed than another to those circumstances which promote this exercise of fancy, one person may therefore dream more than another. The same diversity will naturally take place in this as in other accidents to which mankind are in general liable.

4. Though in dreams imagination appears to be free from all restraint, and indulges in the most wanton freaks; yet it is generally agreed, that the imaginary transactions of the dreamer bear always some relation to his particular character in the world, his habits of action, and the circumstances of his life. The lover, we are told, dreams of his mistress; the miser of his money; the philosopher rehearses his researches in sleep often with the same pain and fatigue as when awake; and even the merchant, at times, returns to balance his books, and computes the profits of an adventure, when slumbering on his pillow. And not only do the more general circumstances of a person’s life influence his dreams; his passions and habits are nearly the same when asleep as when awake. A person whose habits of life are virtuous, does not in his dreams plunge into a series of crimes; nor are the vicious reformed when they pass into this imaginary world. The choleric man finds himself offended by slight provocations as well in his dreams as in his ordinary intercourse with the world, and a mild temper continues pacific in sleep.

5. The character of a person’s dreams is influenced by his circumstances when awake in a still more accountable manner. Certain dreams usually arise in the mind after a person has been in certain situations. Dr. Beattie relates, that he once, after riding 30 miles in a high wind, passed a part of the succeeding night in dreams beyond description terrible. The state of a person’s health, and the manner in which the vital functions are carried on, have a considerable influence in determining the character of dreams. After too full a meal, or after eating of an unusual sort of food, a person is very apt to be harassed with dreams.

6. In dreaming, the mind for the most part carries on no intercourse through the senses with surrounding objects. Touch a person gently who is asleep, he feels not the impression. You may awaken him by a smart blow; but when the stroke is not sufficiently violent to awake him, he remains insensible of it. We speak softly beside a person asleep without fearing that he overhears us. His eyelids are shut; and even though light should fall upon the eyeball, yet still his powers of vision are not awakened to active exertion, unless the light be so strong as to rouse him from sleep. He is insensible both to sweet and to disagreeable smells. It is not easy to try whether his organs of taste retain their activity, without awakening him; yet from analogy it may be presumed that these too are inactive. With respect to the circumstances here enumerated, it is indifferent whether a person be dreaming or buried in deep sleep.

Yet there is one remarkable fact concerning dreaming, which may seem to contradict what has been here asserted. In dreams we are liable not only to speak aloud in consequence of the suggestions of imagination, but even to get up, and walk about and engage in little enterprises, without awaking. Now, as we are in this instance so active it seems that we cannot be then insensible of the presence of surrounding objects. The sleepwalker is really sensible in a certain degree of the presence of the objects around him; but he does not attend to them with all their circumstances, nor do they excite in him the same emotions as if he were awake. He feels no terror on the brink of a precipice; and in consequence of being free from fear, he is also without danger in such a situation unless suddenly awaked. This is one of the most inexplicable phenomena of dreaming.

There is also another fact not quite consonant with what has been above mentioned. It is said, that in sleep a person will continue to hear the noise of a cataract in the neighbourhood, or regular strokes with a hammer, or any similar sound sufficiently loud, and continued uninterruptedly from before the time of his falling asleep. We know not whether he awakes on the sudden cessation of the noise. The fact is asserted on sufficient evidence: it is curious. Even when awake, if very deeply intent on any piece of study, or closely occupied in business, the sound of a clock striking in the neighbourhood, or the beating of a drum, will
7. Not only do a person's general character, habits of life, and state of health, influence his dreams; but those concerns in which he has been most deeply interested during the preceding day, and the views which have arisen most frequently to his imagination, very often afford the subjects of his dreams. When I look forward with anxious expectation towards any future event, I am likely to dream either of the disappointment or the gratification of my wishes. Have I been engaged through the day, either in business or amusement which I have found exceedingly agreeable, or in a way in which I have been extremely unhappy; either my happiness or my misery is likely to be renewed in my dreams.

8. Though dreams have been regarded among almost all nations through the world, at least in some periods of their history, as prophetic of future events; yet it does not appear that this popular opinion has been established on good grounds. Christianity, indeed, teaches us to believe, that the Supreme Being may, and actually does, operate on our minds, and influence at times the determinations of our will, without making us sensible of the restraint to which we are thus subjected. And, in the same manner, no doubt, the suggestions which arise to us in dreams, may be produced. The imaginary transactions in which we are then engaged, may be such as are actually to occupy us in life; the strange and seemingly incoherent appearances which are then presented to the mind's eye, may allude to some events which are to befall ourselves or others. It is, therefore, by no means impossible, or inconsistent with the general analogy of nature, that dreams should have a respect to futurity. We have no reason to regard the dreams which are related in the Holy Scriptures to have been prophetic of future events, as not inspired by Heaven, or to laugh at the idea of a prophetic dream as absurd or ridiculous.

Yet it would be too much to allow to dreams all that importance which has been ascribed to them by the priesthood among heathen nations, or by the vulgar among ourselves. We know how easily ignorance imposes on itself, and what arts imposture adopts to impose upon others. We cannot trace any certain connexion between our dreams and those events to which the simplicity of the vulgar pretends that they refer. And we cannot, therefore, if disposed to confine our belief to certain or probable truths, join with the vulgar in believing them really referable to futurity.

9. It appears that the brutes are also capable of dreaming. The dog is often observed to start suddenly up in his sleep, in a manner which cannot be accounted for in any other way than by supposing that he is roused by some impulse received in a dream. The same thing is observable of others of the inferior animals. That they should dream, is not an idea inconsistent with what we know of their economy and manners in general. We may, therefore, consider it as a pretty certain truth, that many, if not all, of the lower species are liable to dream as well as human beings.

It appears, then, that in dreaming we are not conscious of being asleep; that to a person dreaming, his dreams seem realities; that though it be uncertain whether mankind are all liable to dreams, yet it is well known that they are not all equally liable to dream: that the nature of a person's dreams depends in some measure on his habits of action, and on the circumstances of his life: that the state of the health too, and the manner in which the vital functions are carried on, have a powerful influence in determining the character of a person's dreams: that in sleep and in dreaming, the senses are either absolutely inactive, or nearly so: that such concerns as we have been very deeply interested in during the preceding day, are very likely to return upon our minds in dreams in the hours of rest: that dreams may be rendered prophetic of future events; and therefore, wherever we have such evidence of their having been prophetic as we would accept on any other occasion, we cannot reasonably reject the fact on account of its absurdity; but that they do not appear to have been actually such, in those instances in which the superstition of nations, ignorant of true religion, has represented them as referring to futurity, nor in those instances in which they are viewed in the same light by the vulgar among ourselves; and, lastly, that dreaming is not a phenomenon peculiar to human nature, but common to mankind with the brutes.

We know of no other facts that have been fully ascertained concerning dreaming. But we are by no means sufficiently acquainted with this important phenomenon in the history of mind. We cannot tell by what laws of our constitution we are thus liable to be so frequently engaged in imaginary transactions, nor what are the particular means by which the illusion is accomplished. The delusion is indeed remarkably strong. One will sometimes have a book presented to him in a dream, and fancy that he reads; and actually enter into the nature of the imaginary composition before him, and even remember, after he awakes, what he knows that he only fancied himself reading (A). Can this be delusion? If delusion, how or for what purposes is it produced? The mind, it would appear, does not, in sleep, become inactive like the body; or at least is not always inactive while we are asleep. When we do not dream, the mind must either be inactive, or the connexion between the mind and the body must be considered as in some manner suspended: and, when we dream, the mind, though it probably acts in concert with the body, yet does not act in the same manner as when we are awake. It seems to be clouded or bewildered, in consequence of being deprived for a time of the service of the senses. Imagination becomes more active and more capricious: and all the other powers, especially judgment and memory, become disordered and irregular in their operation.

Various theories have been proposed to explain what appears here most inexplicable. The ingenious Mr. Baxter,

(A) The writer of this article has been told by a respectable old gentleman of his acquaintance, since dead, that he had frequently dreams of this nature. The fact may therefore be considered as unquestionable.
Baxter, in his Treatise on the Immateriality of the Human Soul, endeavours to prove that dreams are produced by the agency of some spiritual beings, who either amuse or employ themselves seriously in engaging mankind in all those imaginary transactions with which they are employed in dreaming. This theory, however, is far from being plausible. It leads us entirely beyond the limits of our knowledge. It requires us to believe without evidence. It is unsupported by any analogy. It creates difficulties still more inexplicable than those which it has been proposed to remove. Till it appears that our dreams cannot possibly be produced without the interference of other spiritual agents, possessing such influence over our minds as to deceive us with fancied joys, and involve us in imaginary afflictions, we cannot reasonably refer them to such a cause. Besides, from the facts which have been stated as well known concerning dreams, it appears that their nature depends both on the state of the human body and on that of the mind. But were they owing to the agency of other spiritual beings, how could they be influenced by the state of the body? Those must be a curious set of spiritual beings who depend in such a manner on the state of our corporal frame. Better not to allow them existence at all, than to place them in such a dependence.

Wolfius, and after him M. Formey, have supposed, that dreams never arise in the mind, except in consequence of some of the organs of sensation having been previously excited. Either the ear or the eye, or the organs of touch, taste, or smelling, communicate information, somehow, in a tacit, secret manner; and thus partly rouse its faculties from the lethargy in which they are buried in sleep, and engage them in a series of confused and imperfect exertions. But what passes in dreams is so very different from all that we do when awake, that it is impossible for the dreamer himself to distinguish, whether his powers of sensation perform any part on the occasion. It is not necessary that imagination be always excited by sensation. Fancy, even when we are awake, often wanders from the present scene. Absence of mind is incident to the studious: the poet and the mathematician many times forget where they are. We cannot discover from any thing that a person in dreaming displays to the observation of others, that his organs of sensation take a part in the imaginary transactions in which he is employed. In those instances, indeed, in which persons asleep are said to hear sounds; the sounds which they hear are said also to influence, in some manner, the nature of their dreams. But such instances are singular. Since then it appears that the person who dreams is himself incapable of distinguishing either during his dreams, or by recollection when awake, whether any new impressions are communicated to him in that state by his organs of sensation; that even by watching over him, and comparing our observations of his circumstances and emotions, in his dreams, with what he recollects of them after awaking, we cannot, except in one or two singular instances, ascertain this fact; and that the mind is not incapable of acting while the organs of sensation are at rest, and on many occasions refuses to listen to the information which they convey; we may, without hesitation, conclude, that the theory of Wolfius and Formey has been too hastily and incautiously advanced.

Other physiologists tell us, that the mind, when we dream, is in a state of delirium. Sleep, they say, is attended with what is called a collapse of the brain; during which either the whole or a part of the nerves of which it consists, are in a state in which they cannot carry on the usual intercourse between the mind and the organs of sensation. When the whole of the brain is in this state, we become entirely unconscious of existence, and the mind sinks into inactivity: when only a part of the brain is collapsed, as they term it, we are then neither asleep nor awake, but in a sort of delirium between the two. This theory, like the last mentioned, supposes the mind incapable of acting without the help of sensation: it supposes that we know the nature of a state of which we cannot ascertain the phenomena: it also contradicts a known fact, in representing dreams as confused images of things around us, not fanciful combinations of things not existing together in nature or in human life. We must treat it likewise, therefore, as a baseless fabric.

In the last edition of this work, a theory somewhat different from any of the foregoing was advanced in this subject. It was observed, that the nervous fluid, which is allowed to be secreted from the blood by the brain, appears to be likewise absorbed from the blood by the extremities of the nerves. It was further advanced, that as this fluid was to be considered as the principle of sensibility; therefore, in all cases in which a sufficient supply of it was not absorbed from the blood by the extremities of the nerves, the parts of the body to which those nerves belonged, must be, in some degree, deprived of sensation. From these positions it was inferred, that as long as impressions of external objects continue to communicate a certain motion from the sentient extremities of the nerves to the brain, so long we continue awake; and that, when there is a deficiency of this vital fluid in the extremities of the nerves, or when from any other cause it ceases to communicate to the brain the peculiar motion alluded to, we must naturally fall asleep, and become insensible of our existence. It followed of consequence, that, in sleep, the nervous fluid between the extreme parts of the nerves and the brain must either be at rest, or be deficient, or be prevented by some means from passing into the brain; and it was concluded, that whenever irregular motions of this fluid were occasioned by an internal cause, dreaming was produced. In this manner it appeared that we might be deceived with regard to the operation of any of the senses——so as to fancy that we saw objects not actually before us, —to hear imaginary sounds,—to taste,—to feel, and to smell in imagination. The instances of visions which will sometimes arise, and as it were swim before us when awake, though our eyes be shut, tinnitus aurium, which is often a symptom in nervous diseases, and the strange feelings in the case of the amputated limb, were produced in proof of this theory, and applied so as to confirm it.

We are still of opinion, that this theory is more plausible, and goes farther toward explaining the nature of dreaming, and the manner in which dreams are produced, than any other with which we are acquainted. But it must be confessed, upon a review, that even in
in it there is too much supposition. The nature of the nervous fluid is but imperfectly known, and even its existence not very fully ascertained. The nature of the connexion by which the soul and body are united, seems to be almost beyond our comprehension. And till we can apply experiment and observation in a better manner to this branch of physiology, it must undoubtedly remain unknown. To something mysterious in the nature of that connexion, the delusion produced in dreams is in all probability owing.

Amid this uncertainty with respect to the manner in which the powers of mind and body perform their functions in dreaming, it is pleasing to find that we can, however, apply to useful purposes the imperfect knowledge which we have been able to acquire concerning this series of phenomena. Our dreams are affected by the state of our health, by the manner in which we have passed the preceding day, by our general habits of life, by the hopes which we most fondly indulge, and the fears which prevail most over our fortitude when we are awake. From recollecting our dreams, therefore, we may learn to correct many improprieties in our conduct; to refrain from bodily exercises, or from meats and drinks that have unfavourable effects on our constitution; to resist, in due time, evil habits that are stealing upon us; and to guard against hopes and fears which detach us from our proper concerns, and unfit us for the duties of life. Instead of thinking what our dreams may forebode, we may with much better reason reflect by what they have been occasioned, and look back to those circumstances in our past life to which they are owing. The sleep of innocence and health is sound and refreshing; their dreams delightful and pleasing. A disordered body, and a polluted or perturbed mind, are haunted in sleep with frightful, impure, and unpleasing dreams.

Some very beautiful fables have been written both by ancients and moderns in the form of dreams. The Somnium Scipionis is one of the finest of Cicero's compositions. He who shall carefully peruse this piece, with Macrobius's commentary upon it, will acquire from them considerable knowledge of ancient philosophy. In the periodical publications, which have diffused so much elegant and useful knowledge through Britain, the Tatlers, Spectators, Guardians, &c. we find a number of excellent dreams. Addison excelled in this way of writing. The public are now less partial to this species of composition than they formerly were.

Dr. Beattie, in his valuable essay on the subject of dreaming, quotes a very fine one from the Tatler, and gives it due praise.

DREDGING, a process for removing mud and other deposited matters from the beds of rivers, canals, &c. See SUPPLEMENT.

DRELCOURT, CHARLES, minister of the reformed church at Paris, was born at Sedan in 1593, where his father enjoyed a considerable post. He had all the qualifications that compose a respectable clergyman; and though he defended the Protestant cause against the Roman religion, was much esteemed even among the Catholics. He is best known in England by his Consolations against the Fears of Death, which work was translated, and is often printed. He mar-

ried the daughter of a rich merchant at Paris, by whom he had 16 children. His third son, professor of physic at Leyden, was physician to the prince and princess of Orange before their accession to the crown of England. Bayle has given him a high character. Mr. Drelicourt died in 1660.

DRENCH, among farriers, a physical potion for horses. The ingredients for this purpose are to be beat coarsely, and either mingled with a decoction or with wine. Then let all infuse about a quarter of an hour, and give it to the horse with a horn after he has been tied up two hours to the rack.

DREPANE, the ancient name of Corycia, from the curvature of its figure, resembling a sickle.

DREPANE, (Drepumum) in Ancient Geography, a town of Bithynia, situated between the Sinus Astaeus and the Bosphorus Thracius; called Helenopolis by Constantine, in honour of his mother. (Nicephorus Callistus).

DREPANUM, in Ancient Geography, the promontory Rhium in Achaia; so called because bent in the manner of a sickle. Another Drepum on the Arabic gulf, on the side of Egypt. A third on the north side of Crete, situated between Cydonia and the Sinus Amphimallus. A fourth on the west side of Cyprus. A fifth, a promontory of Cyrenaica, on the Mediterranean.

DREPANUM,-i; or Drepana,-orum; a town and port on the west side of Sicily, and to the west of Mount Eryx; Drepanitani the people. Now Trepano, a city and port town on the westmost point of Sicily. E. Long. 12. 8. N. Lat. 38. 0.

DRESDEN, the capital city of the electorate of Saxony in Germany. It is seated on the river Elbe, which divides it into two parts. One part is called Old Dresden, and the other the New Town, in the German language Neustadt. They are joined together by a stone bridge, supported by 19 piers, and 630 paces in length. As this bridge was too narrow for the crowds of people that were continually passing and repassing, King Augustus in 1730, caused two walks for foot passengers to be built, one on each side, in a very wonderful manner; the one for those that go into the city, and the other for those that return back. These are bordered with iron pallissadoes of curious workmanship. This noble bridge was much injured by the French in 1813. Dresden is surrounded by fortifications; and was said to contain 45,000 inhabitants in 1811.

All the buildings of this city are constructed with square freestone, and are almost all of the same height. They have stone from the neighbourhood of Pirna, about ten miles from this city, which is readily brought down the Elbe. In general the houses are high and strong; the streets wide, straight, well paved, clean, and well illuminated in the night; and there are large squares, disposed in such a manner, that Dresden may pass for one of the handsomest cities in the world. The king's palace is a magnificent structure, and abounds in many valuable curiosities both of nature and art. The collection of pictures is reckoned one of the finest that exists, and is valued at 500,000l.

Above 700 men are here constantly employed in the porcelain manufacture, the annual expense of which is estimated at no more than 80,000 crowns; and the manufacture yields to the king 200,000 crowns yearly, besides
Besides the magnificent presents which he occasionally makes, and the large quantity reserved for the use of his household.

The other most considerable article of trade is silver, of which the mines near Erbug produce every 15 days near the value of 20,000 dollars. The metal is brought into the city in ingots, where it is immediately coined and delivered to the proprietors.

The court of Dresden is one of the most remarkable in Europe for splendour and profusion. Six thousand five hundred ducats are yearly allowed for cooking and similar articles, which is nearly twice as much as the king of Prussia allows for the whole expense of his table. The revenues of the king of Saxony are estimated at about 900,000l.; which arise from the taxes on lands, and a capitation on all males as soon as they commence an apprenticeship or begin to work. People of a higher rank are taxed according to their class, and are liable to be called to account if they assume not an exterior appearance correspondent to the extent of their fortune. Every foreigner pays capitation after residing six months in the country. The Jews are taxed at 50, their wives at 30, and their children at 20 dollars. There is also an excise on all estables and liquors; and 10 per cent. is levied out of the incomes of the people.

Though this city lies in a low situation, yet it hath agreeable prospects. It is supplied with a prodigious quantity of provisions, not only out of the neighbour- hood, but from Bohemia, which are brought every market day, which is once a week. E. Long. 13. 34. N. Lat. 51. 12.

**Dressing of Hemp and Flax.** See Flax-Dressing.

*Dressing of Meats,* the preparing them for food by means of culinary fire.

The design of dressing is to loosen the compages or texture of the flesh, and dispose it for dissolution and digestion in the stomach. Flesh not being a proper food without dressing, is alleged as an argument that man was not intended by nature for a carnivorous animal.

The usual operations are roasting, boiling, and stewing.—In roasting, it is observed, meat will bear a much greater and longer heat than either in boiling or stewing; and in boiling, greater and longer than in stewing. The reason is, that roasting being performed in the open air, as the parts begin externally to warm, they extend and dilate, and so gradually let out part of the rarefied included air, by which means the internal succussions, on which the dissolution depends, are much weakened and arrested. Boiling being performed in water, the parts of the flesh are greater, and consequently the succussions to lift up the weight are proportionably stronger, by which means the coction is hastened; and even in this way there are great differences; for the greater the weight of water, the sooner is the business done.

In stewing, though the heat be infinitely short of what is employed in the other ways, the operation is much more quick, because performed in a close vessel, and full; by which means the succussions are oftener repeated, and more strongly reverberated. Hence the force of Paw's digester; and hence an illustration of the operation of digestion.

**Vol. VII. Part I.**
in some seasons of the year it is so shallow near the
town, that the goods must be transported upon rafts
and small flat-bottomed boats.

DRIFT, in Navigation, the angle which the line of
a ship's motion makes with the nearest meridian, when
she drives with her side to the wind and waves, and
is not governed by the power of the helm: it also im-
plies the distance which the ship drives on that line.

A ship's way is only called drift in a storm; and
then when it blows so vehemently as to prevent her
from carrying any sail, or at least restrains her to such
a portion of sail as may be necessary to keep her suffi-
ciently inclined to one side, that she may not be dis-
masted by her violent labouring produced by the tur-
bulence of the sea.

DRIFT, in mining, a passage cut out under the earth
betwixt shaft and shaft, or turn and turn; or a passage
or way wrought under the earth to the end of a meer
of ground, or part of a meer.

DRIFT-Sail, a sail used under water, veered out right
ahead by sheets, as other sails are. It serves to keep
the ship's head right upon the sea in a storm, and to
hinder her from driving too fast in a current.

DRILL, in Mechanics, a small instrument for mak-
ing such holes as punches will not conveniently serve
for. Drills are of various sizes, and are chiefly used
by smiths and turners.

DRILL, or Drill-Box, a name given to an instrument
for sowing land in the new method of horsehoeing
husbandry. See Agriculture Index.

DRILL-Sowing, a method of sowing grain or seed
of any kind, so that it may be at the proper depth in
the earth, which is necessary to its producing health-
ful and vigorous plants. For this purpose a variety of
drill ploughs have been invented and recommended.
See Agriculture Index.

DRILLING is popularly used for exercising sol-
diers. The word is derived from the French driller,
which signifies a raw soldier.

DRIMYS, a genus of plants changed by Murray,
in the 14th edit. of Syst. Veget. to Wintera; which
see in Botany Index.

DRINK, a part of our ordinary food in a liquid
form. See Dietetics, Supplement.

The general use of drink is to supply fluid; facili-
tate solution; in consequence of that, to expede the eva-
cuation of the stomach, and promote the progress of
the aliment through the intestines: for, by the con-
traction of the longitudinal fibres of the stomach, the
pylorus is drawn up, and nothing but fluid can pass;
which, by its bulk, makes a hurried progress through
the intestines, and so determines a greater excretion
by stool, as well then can be absorbed by the lacteals.

Hence a large quantity of common water has been
found purgative; and, ceteris paribus, that aliment
which is accompanied with the largest proportion of
drink, makes the largest evacuation by stool. Here a
question has risen, about where the feculent part
of the aliment is first remarkably collected. It is com-
monly thought to be in the great guts: but un-
doubtedly it often begins in the lower part of the ileum,
especially when the drink is in a small proportion, and
when the progress of the aliment is slow; for when the
contents of the guts are very fluid, they are quickly
pushed on, and reach the great guts before they de-
pose any feculency. Another effect of drink is, to
facilitate the mixture of the lymph, reflect from every
part of the system, with the chyle. In the blood-vess-
els, where all must be kept fluid in order to proper
mixture, drink increases the fluidity, and gives tension,
by its bulk, without concomitant acrimony or too much
elasticity, and so strength and oscillatory motion: hence
drink contributes to sanguification, as sometimes food
gives too dense a nutrient to be acted upon by the
solids; and hence also we can see how drink promotes
the secretions. These are the effects of drink in gen-
eral; but what has been said must be taken with some
limitations: for the more liquid the food, it is sooner
evacuated, and less nourishment is extracted. Hence
drink is, in some degree, opposed to nourishment; and
so, ceteris paribus, those who use least drink are most
nourished.

All the effects of drink above mentioned are produ-
ced by simple water; and it may be said, that other
liquors are fit to drink in proportion to the water they
contain. Water, when used as drink, is often im-
pregnated with vegetable and farinaceous substances;
but, as drinks, these impregnations are of little con-
sequence: they add, indeed, a little nourishment; but
this is not to be regarded in a healthy state. Some-
times we impregnate water with the fructus acido-dul-
ces; and then, indeed, it acquires other qualities, of
considerable use in the animal economy. All drinks,
however, may be reduced to two heads: first, pure
water, or where the additional substances give no ad-
ditional virtue; secondly, the fermentates. Of the first
eminent a place is given to the fluid vitriol, and
"acqua percolata," which has made but little noise in
our own days. In the second, waters are divided into
three kinds: first, the waters of fruit of the most ac-
kalscent aliments, as wine, cider, and ginger beer;
secondly, waters of the most alkalscent stews, as
butter, milk, and sweet waters of fruit; and thirdly,
water of soda, which is the same with many mineral
waters, especially those of Lyons and Dijon. In the
last, the most odorous and the most nauseating are
considered.

Fermented liquors are more or less poigniant to the
taste, and better calculated to quench thirst. Thirst
to be owing to various causes: First, To defect of
fluid in the system, which occasions a scanty secretion
in the mouth, fauces, and stomach; the dryness of
the mouth and fauces will also in this case be increased,
by their continual exposure to the perpetual flux and reflux
of the evaporating air. Secondly, Thirst depends on a
large proportion of solid viscid food. Thirdly, On an
alkalescent aliment, especially if it has attained any
thing of the putrefactive taint. Fourthly, On the heat
of the system; but this seems to operate in the same
manner as the first cause, giving a sense of dryness from
its dissipation of the fluids. The fermented liquors are
peculiarly adapted for obviating all these causes; sti-
mulating the mouth, fauces, and stomach, to throw
out the saliva and gastric liquor by their poignancy;
by their acceescency they are fitted to destroy alkalescent
acrimony, to quench thirst from that cause; by their
fluidity they dilute viscid food; though here, indeed,
they answer no better than common water. In two
ways they promote the evacuation by stool, and pro-
gress through the intestines: first, by their fluidity and
bulk; secondly, by their acceescency, which, uniting
with the bile, forms the peculiar stimulus formerly men-
tioned. Carried into the blood-vessels, in so far as
they retain any of the saline nature, they stimulate the
excretories, and promote urine and sweat; correcting
thus alkalescence, not only by mixture, but dissipation
of the degenerated fluids.

Many physicians, in treating of fermented liquors,
have only mentioned these qualities, rejecting their nutritive virtue, which certainly ought to be taken in; though by expediting the evacuation by stool they make less of the nutritious parts of the aliment to be taken up, and by stimulating the excretories make these nutritious parts to be for a shorter time in the system. All these and many more effects arise from fermented liquors. Their acescency sometimes promotes the disease of ascenecy, by increasing that of vegetables, acting as a ferment, and so producing flatulence, purging, cholera, &c.: so that, with vegetable aliment, as little drink is necessary, the most innocent is pure water; and it is only with animal food that fermented liquors are necessary. In warmer climates, fermentate would seem necessary to obviate alkalescence and heat. But it should be considered, that though fermented liquors contain an acid, yet they also contain alcohol; which, though it adds stimulus to the stomach, yet is extremely hurtful in the warmer climates, and whereby alkalescence prevails in the system. Nature in these climates has given men an appetite for water impregnated with acid fruits, e.g. sherbet: but the use of these needs caution, as in these countries they are apt to shun animal food, using too much of the vegetable, and often thus causing dangerous refrigerations, cholera, diarrhoeas, &c.

Of varieties of fermented liquors. We shall only mention here the chief heads on which these varieties depend. First, They are owing to the quality of the subject, as more or less viscid; and to its capacity also of undergoing an active fermentation, although perhaps the more viscid be more nutritious. Hence the difference between ales and wines; by the first meaning fermented liquors from forinae, by the second from the fruits of plants. It depends, secondly, On the acerbity, acidity, nature, and maturation, of the fruit. Thirdly, The variety depends on the conduct of the fermentation. In general, fermentation is progressive, being at first active and rapid, It attaching the fixed air to the alcohol, at the same time acquiring more acid than before. These qualities of flatulence and acidity remain for some time: but as the fermentation goes on, the liquor becomes more perfect, no air is detached and alcohol is produced; so that fermented liquors differ according to the progress of the fermentation, and have different effects on the system. When fermentation is stopped before it comes to maturity, though naturally it proceeds in this way, yet by addition of new ferment it may be again renewed with a turbid intestine motion.

DRIVERS, Among sportsmen, a machine for driving pheasant pows, consisting of good strong osier wands, such as the basketmakers use; these are to be set in a bundle, and twisted or bound with small osiers in two or three places. With this instrument the sportsman drives whole eyes of young pows into his nets. See the next article.

DRIVING, Among sportsmen, a method of taking pheasant pows. It is thus: The sportsman finds one of the haunts of these birds; and having fixed his nets there, he calls them together by a pheasant call, imitating the voice of the dam; after this he makes a noise with his driver, which will make them run a little way forward in a cluster; and this he is to repeat till he has made sure of them, which an expert sportsman never fails to do, by driving them into his nets.

**Driving**, in Metallurgy, is said of silver, when, in the operation of refining, the lead being burnt away, the remaining copper rises upon its surface in red fiery bubbles.

**Driving**, in the sea language, is said of a ship, when an anchor being let fall will not hold her fast, or prevent her sailing away with the wind or tide. The best help in this case is to let fall more anchors, or to veer out more cable; for the more cable she has out, the safer she rides. When a ship is a-hull or a-try, they say she drives to leeward.

**DROGHEDA**, by the English called Tredah, a town of Ireland, in the province of Leinster and county of Lowth, and situated on the bay of the same name, in W. Long. 6° 17'. N. Lat. 53° 45'. It was formerly very remarkable for its situation and strength. In consequence of this it was much distinguished by the old English monarchs. Edward II granted it a market and fair; and to these were added other great privileges in succeeding ages, particularly the right of coinage. It was bravely defended against the rebels in 1641. After the cessation of arms, it was taken by the duke of Ormond and the earl of Inchquin: but was retaken by Cromwell in 1649. At this time it suffered so much, that for a long time after it remained almost in ruins. The buildings were exceedingly shattered; and the town being taken by storm, not only the garrison, but the inhabitants, men, women, and children, were mostly put to the sword. By degrees, however, it recovered, and is at present a large place, with 15,000 inhabitants. It is a town and county; and sends one member to the imperial parliament. It has a great share of inland trade, and an advantageous commerce with England.

Drogheada is perhaps one of the strongest instances that can be mentioned of the inestimable benefit of a river in any degree navigable; for though the Boyne is not capable of carrying vessels of a greater size than barges or pretty large boats, yet the convenience that this affords of conveying coals by water carriage through a great extent of country, produced an intercourse between this place and Whitehaven in Cumberland, to which the revival of its commerce has been in a great measure owing.

**DROITWITCH**, a town of Worcestershire in England, noted for excellent white salt made from the salt springs in its neighbourhood. It sends two members to parliament. Population 2079. W. Long. 2° 16'. N. Lat. 52° 20'.

**DROMEDARY.** See Camelus, Mammalia

**DROME.** A department of France, on the east side of the Rhone. It contained 253,000 inhabitants in 1815, including 34,000 Protestants. It is hilly, and abounds in wood. Wine is a staple produce, and it imports corn. Valence is the chief town.

**DROMORE.** A town of Ireland, in the county of Down. It is a very ancient town, and the seat of a bishopric. The see was founded by St Colman in the 6th century. It was re-founded by King James I. who, by his charters (now preserved in the Roll office) granted it very great and uncommon privileges.

Among other marks of royal favour, he distinguishes the bishops of this see by the style of ' A. B. by Divine Providence bishop of Dromore,' whereas all other bishops...
DRO

DRO

Droome, bishops in Ireland, except those of Meath and Kildare, are styled, "by Divine Permission." This see, although the least in its extent, is so complete and perfect in its endowment and jurisdiction, that it need not envy the greatest and most opulent.

DRONE, a kind of large bees which make their appearance in hives about the month of May, but never work nor prepare any honey; and are at last all killed by the rest. Under the article BEE, No. 20. et seq. we have given an account of the experiments of Messrs Debraw and Schrach concerning these animals; but in a Treatise upon Bees and their Management by Mr. Bonner near Berwick on Tweed, who has made the management of bees his study for a great number of years, this author dissent from the opinions of the above-mentioned gentlemen for the following reasons, which we shall give in his own words. Having mentioned the opinions of Mr. Debraw concerning the little drones mentioned in the article above mentioned, he proceeds thus:

1. Can it be thought that the prying eyes of multitudes in many generations should have escaped seeing those little drones (they being, according to his account, vastly numerous) thrust their posterior parts into the cells? Yet none ever saw them do it except himself; while many have seen the queen do it, though but a single bee.

2. It is well known the queen is very long behind the wings, wise nature having made her so, in order that she might thrust her posterior part into the cells, and yet her wings scarcely touch them, nor receive the least injury. If, and that they could not do without them, as they are sensitive when they want a queen, and that it is needless to begin work without her; and it might be added that two different kinds of drones in one hive does not appear to be probable, or serve any end.

3. Mr Debraw grants, that without a queen or eggs bees will not begin to work, as well knowing they cannot propagate their species without her; and yet he says, those bees which wanted little drones began to work, and the queen laid eggs, and all went forward till they were not impregnated, and then they gave over work, and deserted the hive. Certainly those saucy creatures would have been as sensible that they wanted drones at the very first, when they were put into the hive, and that they could not do without them, as they are sensitive when they want a queen, and that it is needless to begin work without her; and it might be added that two different kinds of drones in one hive does not appear to be probable, or serve any end.

But I shall narrate some of my own experiments on that head, which will put it, I hope, beyond dispute: On September 1st, I had a hive breeding fast; I took out all her bees (among which were only four large drones, which I killed), and I put them in a hive that had nothing in her but empty combs: I waited ten days, when, by looking between the combs, I saw her have new sealed maggots in her cells. I then took all her bees out, and shook them into a tub full of water, and recovered them gradually; and when recovering, I pressed every one of them, in order to see if I could find any of those little drones, but could not find one; but all and every one of them had stings: they were in number 3000. After which I searched the hive I took them out of, and cut out all her combs that had eggs in them, and found they had new laid eggs, four days old eggs, and maggots in them. I then recovered the queen and all her bees, and put in the same hive again, which had not an egg in her now, and waited another twenty Mr. and saw her in five days working very well; a sure indication she was breeding again. I then turned her up, and cut out one of her brood combs, and saw in it new laid eggs, four days old eggs, and maggots and some young almost fit for emerging out of their cells.

The very same day I made a further experiment: I had a hive which I saw had some brood combs in her, but she had not had a large drone for four weeks before in her; she had not above 500 bees in her, which admired me, because few in number. I took the hive into a close place in my house, in order that not a single bee should escape me; I then took all the bees out of her, and immersed them in water; and when recovering, I pressed every one of them, and each bee had a sting, as in the former experiment.

I think the above experiments may satisfy any judicious person, that there is no such thing in being as little drones, unless in Mr. Debraw's brain. And if Mr. Debraw, who can find 57 in a small swarm of bees, will send me the odd queen, I will send him one of my best hives for them, and he will scarcely think he is ill paid. I add, I never saw a hive in spring, however few bees in her, but she bred some, if she had a queen, though to be sure few in proportion to her bees.

By this time the reader will be very ready, no doubt, to ask me the use of the drones. I beg to be excused on that head, as I have not the least idea of their use in a hive; they do not fecundate the queen, for she can lay and breed too much; she never sees them. Their heat does not appear to me to be necessary for hatching the young, as they are mostly hatched before any are bred in a hive; and when drones are in the hive, the weather is so warm, and so many common bees in it, that they appear to have rather too much heat, by their lying out of the hives often.

I have many times had good hives with few or no drones in them all the year; and Keys is quite wrong when he says a top swarm will not do without drones in her; for I am positive to the contrary, as in the summer 1785. I took off four swarms of mine own in one day with not a single drone in any of them, and they all threw well, and bred drones in themselves about four weeks after.

Although I cannot say what use the drones are of to a hive (unless it be to help away with a great deal of her honey, which they are very good at), yet the best hives have them soonest in the year, they generally appearing in such about the latter end of May, and the bees put a period to their lives about Lammas, at which time I give them all the assistance I can. The way.
way they kill them is thus: They pull and bite them with their teeth, and sting them also. I have seen great havoc made of them in one day, as appeared by their lying dead before the door of the hive. But their most effectual way of killing them is their banishing them from the honeycombs: upon which the drones beak themselves to the under edges of the hives in great numbers, and to the board the hive stands on; and sometimes, though rare, I have even seen them come to the outside of the hive, and cluster there about the bulk of a man's hand. When they are banished thus, they are very dull and lifeless: and I have lifted up a hive from the board, and there they would have been sitting close on it, with scarcely three or four common bees among them; and I have trod to death 40 or more at a time.

"We may now take a view of the disadvantages attending the old, and also Mr Debray's principles on bees, were they true; and next see how a hive of bees may be preserved from coming to ruin, according to my sentiments on them.

1. The old principles on bees say, that without a queen or royal cell in a hive, it will come to ruin. Mr Debray's principles say, that without little drones be in a hive it will come to ruin.

2. I say, if a hive have only new laid eggs in her (which may be easily got the greatest part of the year, in case she have none of her own) and common bees, she will find herself a queen, and so thrive.

"According to the old principle, it is easily seen that, in case a hive lose her queen, when there is no royal cell in her, and no queen can be got to put to her (neither of which can be expected but in June and July), she is entirely ruined.

"According to the Frenchman's scheme, there must be drones in a hive at all times of the year to fumigate the eggs, otherwise the hive is useless. Supposing his sentiments to be true (which, however, can by no means be admitted, seeing there is no such thing as little drones), how perplexed would the owner be to know when there were little drones in the hive! When he wanted to make an artificial swarm, he might bring off a queen and some combs with her; but how come he to know whether there were any, or a sufficient quantity, of little drones among them, as they cannot be distinguished from the commons but by immersion and pressure, which would be intolerably troublesome, and next to killing the bees, and not at all practicable? All that could be done would be to hope the best, that there were little drones in her at any time of the year.

"I say, if a queen die in a hive, and that hive have some new-laid eggs in her, or some put to her, in case she have none of her own, she will nourish up some of these eggs to a queen to herself: and also by taking out a queen and some commons out of a hive (without a single drone, large or small), and putting them in an empty hive, will make a swarm, and the old hive will breed herself a queen again, if she have eggs in her."

DROPS. Fly, a two-winged insect, extremely like the common drone bee, whence also the name.

DROPS, in Meteorology, small spherical bodies which the particles of fluids spontaneously form themselves into when let fall from any height. The spherical figure, the Newtonian philosophers demonstrate to be the effect of corpuscular attraction; for considering that the attractive force of one single particle of a fluid is equally exerted to an equal distance, it must follow that other fluid particles are on every side drawn to it, and will therefore take their places at an equal distance from it, and consequently form a round superficies. See the articles ATTRACTION, FLUID, and RAIN.

DROPS, in Medicine, a liquid remedy, the dose of which is estimated by a certain number of drops.

English Drops, (Gutta Angloica, a name given to a chemical preparation esteemed of great virtue against vapours and lethargic affections, and purchased at 5000l. by King Charles II. from the inventor Dr Goddard. The medicine appeared to be only a spirit drawn by the retort from raw silk, and afterwards rectified with oil of cinnamon, or any other essential oil; and was in reality no better than the common air volatile oleosum, or any of the volatile spirits impregnated with an essential oil, except that it was less disagreeable than any of them to the taste.

DROPSY, in Medicine, an unnatural collection of water in any part of the body. See MEDICINE Index.

DROPSWORT. See FILIPENDULA, BOTANY Index.

Water-Dropswort. See Oenanthe, BOTANY Index.

DROSERA, Ros SOLIS, or Sun-Drew. See BOTANY Index.

DROWNING, signifies the extinction of life by a total immersion in water.

In some respects, there seems to be a great similarity between the death occasioned by immersion in water, and that by strangulation, suffocation by fixed air, apoplexies, epilepsies, sudden faintings, violent shocks of electricity, or even violent falls and bruises. Physicians, however, are not agreed with regard to the nature of the injury done to the animal system in any or all of these accidents. It is indeed certain, that in all the cases above mentioned, particularly in drowning, there is very often such a suspension of the vital powers as to make the appearance of a total extinction of them; while yet they may be again set in motion, and the person restored to life by a much longer submersion than hath been generally thought capable of producing absolute death. It were to be wished; however, that, as it is now universally allowed, that drowning is only a suspension of the action of the vital powers, physicians could as unanimously determine the means by which these powers are suspended, because on a knowledge of these means, the methods to be used for recovering drowned persons must certainly depend.

Dr de Haen, who has written a treatise on this subject, ascribes this diversity of opinion among the physicians to their being so ready to draw general conclusions from a few experiments. Some, having never found water in the lungs, have thought that it never was there; and others, from its presence, have drawn a contrary conclusion. Some have ascribed the death which happens in cases of drowning to that species of apoplexy which arises from a great fulness of the stroma; but this opinion our author rejects, because in 13 dogs which he had drowned and afterwards dissected, no signs of such a fulness appeared. Another reason is drawn from the want of the common marks...
Drowning, of apoplexy on the dissection of the brain, and from the actual presence of water in the lungs. He is of opinion, that the death of drowned persons happens in consequence of water getting into the lungs, and stopping the blood in the arteries. He then discusses the question how far the blowing of air into the lungs is useful in recovering drowned people. If their death is to be ascribed to the water entering the lungs, this practice, he observes, must be hurtful, as it will increase the pressure on the blood-vessels, or may even force the water into them; which, on the authority of Lewis's experiments, he alleges is possible. But, in spite of this reasoning, he asserts, that from experience it has been found useful. He allows, that the practice of suspending drowned people by the feet must be hurtful, by determining the blood too much to the head; but he observes, that remedies in some respects hurtful may be used when the advantages derived from them preponderate; and is of opinion, that the practice above mentioned may be used by agitating the viscera against each other, and thus renewing their motions. Cutting the larynx in order to admit air more freely to the lungs, he reckons to be of little or no use; but acknowledges, however, that it may sometimes prove beneficial on account of the irritation occasioned by the operation.

Dr Cullen, in his Letter to Lord Cathcart concerning the recovery of persons drowned and seemingly dead, tells us, that "From the dissection of drowned men, and other animals, it is known, that very often the water does not enter into the cavity of the lungs, nor even into the stomach, in any quantity to do hurt to the system; and, in general, it is known, that, in most cases, no hurt is done to the organization of the vital parts. It is therefore probable, that the death which ensues, or seems to ensue, in drowned persons, is owing to the stopping of respiration, and to the ceasing, in consequence, of the circulation of the blood, whereby the body loses its heat, and, with that, the activity of the vital principle."

In the Phil. Trans. vol. lxvi. Mr Hunter gives the following theory. The loss of motion in drowning seems to arise from the loss of respiration; and the immediate effect this has upon the other vital motions of the animal, at least this privation of breathing, appears to be the first cause of the heart's motion ceasing. It is most probable, therefore, Mr Hunter observes, that the restoration of breathing is all that is necessary to restore the heart's motion; for if a sufficiency of life still remains to produce that effect, we may suppose every part equally ready to move the very instant in which the action of the heart takes place, their actions depending so much upon it. What makes it very probable, that the principal effect depends upon throwing air into the lungs, is, that children in the birth, who breathe much less than a month of that life which is peculiar to the foetus, lose almost without the disipation for the new life. In such cases there is a total suspension of the actions of life; the child remains to all appearance dead; and would die, if air was not thrown into its lungs, and the first principle of action by that means restored. To put this in a clearer light, Mr Hunter gives the result of some experiments made on a dog in 1755. A pair of double bellows were provided, which were so constructed, that by one action air was thrown into the lungs, and by drowning, the other the air was sucked out which had been thrown in by the former, without mixing them together. The muzzle of these bellows was fixed into the trachea of a dog, and by working them he was kept perfectly alive. While this artificial breathing was going on, the sternum was taken off, so that the heart and lungs were exposed to view. The heart then continued to act as before, only the frequency of its action was greatly increased. Mr Hunter then stopped the motion of the bellows; and observed that the contraction of the heart became gradually weaker and less frequent, till it left off moving altogether; but by renewing the operation, the motion of the heart also revived, and soon became as strong and frequent as before. This process was repeated upon the same dog ten times; sometimes stopping for five, eight, or ten minutes. Mr Hunter observed, that every time he left off working the bellows, the heart became extremely turgid with blood, and the blood in the left side became as dark as that in the right, which was not the case when the bellows were working. These situations of the animal, he observes, seem to be exactly similar to drowning.

Dr Edmund Goodwyn, in a treatise lately published on this subject, has endeavoured to ascertain the effects of submersion upon living animals in a more accurate manner than had hitherto been done. His first care was to determine the symptoms which took place before death; and to observe these, he procured a large glass bell in which the animals were to be immersed. Having inverted, and filled this with water, he put into it several cats, dogs, rabbits, and smaller animals, confining them among the water till they were apparently dead. In these experiments he observed, that immediately after pulse became weak and frequent; there was an apparent anxiety about the breast, and struggling to relieve it. In these struggles the animal rose to the top of the water, throwing out a quantity of air from the lungs. After this the anxiety increases, the pulse becomes weaker, and the struggles more violent; he rises again to the surface, throws out more air from the lungs, and in his efforts to inspire, a quantity of water commonly passes into the mouth. The skin about the face and lips then becomes blue, the pulse ceases, the sphincters are relaxed, and the animal falls down without sense or motion. On dissecting the bodies of drowned animals, our author met with the following appearances: 1. The external surface of the brain was darker, but the vessels of it were not more turgid than usual, nor was there any appearance of extravasation. 2. The pulmonary arteries and veins were filled with black blood, and the lungs themselves contained some frothy liquor. 3. Notwithstanding these symptoms, the right auricle and ventricle were still contracting and dilating; the left sinus venosus and auricle moving feebly, but the left ventricile at rest. 4. The right and left auricles of the heart, the right ventricle, and the left sinus venosus, were filled with black blood; but the last ventricle only half filled with the same, and a quantity of the same black blood was also contained in the smaller branches of the arteries proceeding from the left ventricle.

This investigation was followed by a most careful and
DROWNING. and ingenious inquiry concerning the causes of the symptoms already related. To find out whether or not the entrance of water into the lungs was the cause, or whether water really entered the lungs in these cases or not, he drowned several animals among ink; and by inspecting their bodies, found, that though water really did enter, it was in such small quantity that it could not be supposed capable of producing such violent effects. To ascertain this, however, more exactly than could be done by the ink, he drowned other animals in quicksilver; which, by reason of its not being miscible with the animal fluids, could be more accurately collected. By these it appeared that no more than five drachms of the fluid in which a cat was immersed entered her lungs in the time of drowning; and to determine whether or not this could be the occasion of the animal’s death, he made the following experiment: Having confined a cat in an erect posture, he made a small opening in the trachea, by cutting one of the cartilaginous rings; and through this opening he introduced two ounces of water into the lungs. The only consequences were a difficulty of breathing and weak pulse; but these soon abated, and it lived several hours afterwards without any apparent inconvenience. On strangling it before it was two ounces and a half of water in the lungs. On repeating the experiment with other fluids, he found the difficulty of breathing and alteration in the pulse somewhat greater; but in these instances also they abated in a few hours; and when the animals were strangled, the lungs were found to contain four ounces of fluid.

From all these experiments Dr. Goodwyn draws the following conclusions: 1. A small quantity of fluid usually passes into the lungs in drowning. 2. This water enters the lungs during the efforts to inspire; and mixing with the pulmonary mucus, occasions the frothy appearance mentioned by authors. 3. The whole of this fluid in the lungs is not sufficient to produce the changes that take place in drowning. And hence it follows, that the water produces all the changes that take place in drowning indirectly, by excluding the atmospheric air from the lungs. This naturally leads to an investigation of the uses of respiration, and the effects of the air upon the blood and lungs in that state. 

Doctor Collen’s observations on this subject are as follow. — With respect to the particular means to be employed for the recovery of drowned persons, it is to be observed, in the first place, that such as were recommended and practised, upon a supposition that the air taken into the body, and therefore to be evacuated again, were very unhappily advised. The hanging up of persons by the heels, or setting them upon the crown of the head, or rolling the body upon a cask, were generally practised, upon a supposition altogether false; or upon the supposition, of a case which, if real, is apprehended to be irrecoverable. At the same time, these practices were always attended with the danger of bursting several vessels in the brain or lungs, and of rendering thereby some cases incurable that were not so from the drowning alone. All such practices, therefore, are now very properly disapproved of and forbidden.

In those cases in which the body has not been long in the water, and in which therefore the natural heat is not entirely extinguished, nor the irritability of the moving fibres very greatly impaired, it is possible that a good deal of agitation of the body may be the only means necessary to restore the function of the vital organs; but in other cases, where the heat and irritability have ceased to a greater degree, it is to me very doubtful if much agitation can be safe, and if any degree of it can be useful, till the heat and irritability are in some measure restored. In all cases, any violent concussion cannot be safe, and, I believe, is never necessary. It may be proper here to observe also, that in transporting the body from the place where it is taken out of the water, to the place where it may be necessary for applying the proper means of its recovery, all postures exposing to any improper compression, as that of the body’s being carried over a man’s shoulder, are to be avoided. The body is to be kept stretched out, with the head and upper parts a little raised; and care is to be taken to avoid the neck’s being bent much forward. In this manner, laid upon one side, and upon some straw in a cart, it may be most properly conveyed; and the agitation which a pretty brisk motion of the cart may occasion, will, in most cases, do no harm.

From the account I have given above of the causes,
Drowning, nes, or of the appearances, of death in drowned persons, it is evident, that the first step to be taken for their recovery is to restore the heat of the body, which is absolutely necessary to the activity of the moving fibres. For this purpose, the body, as soon as possible, is to be stripped of its wet clothes, to be well dried, and to be wrapped up in dry, and (if possible) warm coverings: and it is to be wished, in all cases, as soon as the report of a person's being drowned is heard, that blankets should be immediately carried to the water side; so that as soon as the body is got out of the water, the change of covering just now mentioned may be instantly made; or, if the body has been naked when drowned, that it may be immediately dried and defended against the cold of the air. Besides covering the body with blankets, it will be further of advantage, if it can be done without loss of time, to cover the drowned body with a warm shirt or waistcoat immediately taken from a living person.

"When, at the time of a person's being drowned, it happens that the sun shines out very hot, I think there can be no better means of recovering the heat, than by exposing the naked body, in every part, to the heat of the sun; while, at the same time, all other means necessary or useful for the recovery of life are also employed."

"When the heat of the sun cannot be employed, the body should be immediately transported to the nearest house that can be got convenient for the purpose: the fittest will be one that has got a tolerably large chamber, in which a fire is ready, or can be made; and if possible, the house should afford another chamber, in which also a fire can be provided."

"When the drowned body is brought into such house, and care is at the same time taken that no more people are admitted than are absolutely necessary to the service of the drowned person, every endeavour must be immediately employed for recovering the heat of the body, and that by different measures, as circumstances shall direct."

"If, in the neighbourhood of the place, there be any brewery, distillery, dyery, or fabric which gives an opportunity of immediately obtaining a quantity of warm water and a convenient vessel, there is nothing more proper than immersing the body in a warm bath. Even where a sufficient quantity of warm water cannot be had at once, the bath may be still practised, if the accident has happened in or very near a town or village, where a great many fires may be at once employed in heating small quantities of water; for in this way the necessary quantity may be soon obtained. To encourage this practice, it is to be observed, that one part of boiling water is more than sufficient to give the necessary heat to two parts of spring or sea water, as it is not proper to apply the bath at first very warm, nor even of the ordinary heat of the human body, but somewhat under it; and, by the addition of warm water, to bring it gradually to a heat very little above it."

"If the drowned body be of no great bulk, it may be conveniently warmed by a person's lying down in bed with it, and taking it near to their naked body, changing the position of it frequently, and at the same time chafing and rubbing with warm cloths the parts which are not immediately applied to their warm body."

"If none of these measures can be conveniently practised, the body is to be laid upon a bed before a moderate fire, and frequently turned, to expose the different parts of it; and means by the heat of the fire gradually employed, and by rubbing the body well with coarse towels, or other cloths well warmed, pains are to be taken for restoring its heat. This will be promoted by warm cloths applied and frequently renewed under the hands and armpits; and by hot bricks, or bottles of warm water, laid to the feet."

"In the practice of rubbing, it has been proposed to moisten the cloths applied with camphorated spirits, or other such stimulating substances; but I think this must prove an impediment to the rubbing; and I would not recommend any practice of this kind, except perhaps, the application of the virous spirits of sal ammoniac to the wrists and ankles only."

"For recovering the heat of the body, it has been proposed to cover it all over with warm grains, ashes, sand, or salt; and where these, sufficiently warm, are ready at hand, they may be employed; but it is very seldom they can be obtained, and the application might often interfere with other measures that may be necessary."

"All the measures above mentioned must be employed with respect to the use of these, is to observe, that bags of warm and dry salt may be amongst the most convenient applications to the feet and hands of drowned persons; and the quantity necessary for this purpose may be got pretty quickly by heating the salt in a frying pan over a common fire."

"While these measures are taking for recovering the heat, means are at the same time to be employed for restoring the action of the moving fibres. It is well known, that the intestines are the parts of the body which, both from their internal situation and peculiar constitution, retain the longest their irritability; and therefore, that, in drowned persons, stimulants applied may have more effect upon the intestines than upon other parts. The action, therefore, of the intestines is to be supported or renewed as soon as possible; as the restoring and supporting the action of such a considerable portion of moving fibres as those of the intestines, must contribute greatly to restore the activity of the whole system."

"For exciting the action of the intestines, the most proper mean is, the application of their ordinary stimulus of dilatation; and this is most effectually applied, by forcing a quantity of the air into them by the fundament. Even the throwing in cold air has been found useful: but it will certainly be better if heated air can be employed; and further, if that air can be impregnated with something which, by its acrimony also may be powerful in stimulating the intestines."

"From all these considerations, the smoke of burning tobacco has been most commonly applied, and has upon many occasions proved very effectual. This will be most properly thrown in by a particular apparatus, which, for other purposes as well as this, should be in the hands of every surgeon; or at least should, at the public expense, be at hand in every part of the country where drownings are likely to happen. With regard to the use of it, I have to observe, that till the
the tobacco is kindled in a considerable quantity, a
great deal of cold air is blown through the box and
tube; and as that, as hinted above, is not so proper,
care should be taken to have the tobacco very well
kindled, and to blow through it very gently, till the
heated smoke only passes through. If upon certain
occasions, the apparatus referred to should not be at
hand, the measure however may be executed by a com-
mon tobacco pipe, in the following manner: A com-
mon gastery pipe, that has a bag mounted upon it, is
to be introduced into the fundament, and the mouth of
the bag is to be applied round the small end of a to-
bacco pipe. In the bowl of this, tobacco is to be kind-
led; and, either by a playing card made into a tube
and applied round the mouth of the bowl, or by apply-
ing upon this the bowl of another pipe that is empty,
and blowing through it, the smoke may be thus forced
into the intestines, and, in a little time, in a consider-
able quantity.

If none of these means for throwing in the smoke
can be employed, it may be useful to inject warm water
to the quantity of three or four English pints. This
may be done by a common gastery bag and pipe, but
better by a large syringe; and it may be useful to dis-
solve in the water some common salt, in the proportion
of half an ounce to an English pint; and also to add to
it some wine or brandy.

While these measures for recovering the heat of
the body and activity of the moving fibres are em-
ployed, and especially after they have been employed
for some time, pains are to be taken to complete and
finish the business, by restoring the action of the lungs
and heart.

On this subject, I am obliged to my learned and
ingenious colleague Dr Monro, who has made some
experiments for ascertaining the best manner of in-
fating the lungs of drowned persons. By these ex-
periments he finds it may be more conveniently done by
blowing into one of the nostrils, than by blowing into
the mouth. For blowing into the nostril, it is neces-
sary to be provided with a wooden pipe, fitted at one
extremity for filling the nostril, and at the other for
being blown into by a person's mouth, or for receiving
the pipe of a pair of bellows, to be employed for the
same purpose. Dr Monro finds, that a person of or-
dinary strength can blow into such a pipe, with a su-
cient force to inflate the lungs to a considerable de-
gree; and thinks the warm air from the lungs of a liv-
ing person will be most conveniently employed at first;
but when it is not soon effectual in restoring the respi-
ration of the drowned person, and that a longer con-
nuance of the inflation is necessary, it may be proper
to employ a pair of bellows, large enough at once to
contain the quantity of air necessary to inflate the lungs
to a due degree.

Whether the blowing in is done by a person's
mouth, or by bellows, Dr Monro observes, that the
air is ready to pass by the gullet into the stomach; but
that this may be prevented, by pressing the lower part
of the larynx backwards upon the gullet. To persons
of a little knowledge in anatomy, it is to be obser-
vied, that the pressure should be only upon the cric-
oid cartilage, by which the gullet may be straiten-
ed, while the passage through the larynx is not inter-
rupted.

Vol. VII. Part I.
Drowning. colour of the face. It may even be repeated, according to the effect it seems to have in taking off that suffusion; but when the drowned person is in some measure recovered, and some motion of the blood is restored, it will be proper to be very cautious in making this evacuation, and at least to take care not to push it so as to weaken too much the recovering, but still weak, powers of life.

Another measure for recovering the activity of the vital principle, is the application of certain stimulants to the more sensible parts of the body, such as holding the quicklime spirit of sal ammoniac to the nose, or putting a little of it upon a rag into the nostrils. It has been usual to pour some liquids into the mouth; but it is dangerous to pour in a quantity of liquid, till it appear that the power of swallowing is in some measure restored.

When a surgeon is at hand, and is provided with proper apparatus, a crooked pipe may be introduced into the gullet; and by this a gill or two of warm wine may be poured down into the stomach, and probably with advantage. But when no such apparatus is at hand or surgeon to employ it, and the power of swallowing is still doubtful, the trial of pouring liquids into the mouth should be made by a small quantity of warm water alone; and when, from such trial, the power of swallowing shall appear to be recovered, it may then be allowable to favour the further recovery of the person, by pouring in some wine or brandy.—In short, till some marks of the recovery of swallowing and respiration appear, it will not be safe to apply any stimulants to the mouth; excepting that of a few drops of some acid substance to the tongue, and which are not of bulk enough to slide back upon the glottis: I can think of no stimulant more conveniently and safely to be applied to the mouth and nostrils, than a moderate quantity of tobacco smoke blown into them.

Though I do not imagine that drowned persons are ever hurt by the quantity of water taken into their stomach, yet, as a stimulus applied to the stomach, and particularly as the action of vomiting proves a stimulus to the whole system, I can have no objection to the French practice of throwing in an emetic as soon as any swallowing is restored. For this purpose, I would successively throw in some tea-spoonfuls of the ipecacuanha wine; and when it does not interfere with other necessary measures, the fauces may be gently irritated by an oiled feather thrust into them.

With regard to the stimulants, I must conclude with observing, that when a body has lain but for a short time in the water, and that therefore its heat and irritability are but little impaired, the application of stimulants alone has been often found effectual for the recovery: but on the contrary, when the body has lain long in the water, and the heat of it is very much extinguished, the application of any other stimulants than that of tobacco smoke to the intestines can be of very little service; and the application of others ought never to interfere with the measures for recovering heat and the motion of respiration.

With respect to the whole of these practices, I expect, from the principles upon which they are in general recommended, it will be understood that they are not to be soon discontinued, though their effects do not immediately appear. It is obvious, that in many cases, it may be long before the heat of the body, and the activity of the vital principle, can be restored, although in a longer time it may very possibly be accomplished. In fact, it has often happened, that though means employed for one hour have not succeeded, the same continued for two or more hours, have at length had the wished-for effects. It should therefore be a constant rule, in this business, that the proper means should be employed for several hours together; unless it happen that, while no symptoms of returning life appear, the symptoms of death shall, at the same time, go on constantly increasing.

In the whole of the above I have kept in view chiefly the case of drowned persons; but it will be obvious, that many of the measures proposed will be equally proper and applicable in other cases of suffocation; as those from strangling, the damps of mines, the fumes of charcoal, &c.; and a little attention to the difference of circumstances will lead to the measures most proper to be employed.

Mr Hunter, in the before-mentioned paper, differs pretty considerably from De Haen and Dr Cullen. He observes, that when assistance is soon called after immersion, blowing air into the lungs will in some cases effect a recovery; but when any considerable time has been lost, he advises stimulant medicines, such as the vapour of volatile alkali, to be mixed with the air; which may easily be done, by holding spirits of harshtorm in a cup under the receiver of the bellows. And, as applications of this kind to the olfactory nerves tend greatly to rouse the living principle, and put the muscles of inspiration into action, it may probably, therefore, be most proper to have air impregnated in that manner blown into the nose. To prevent the stomach and intestines from being too much distended by the air so injected, the larynx is directed to be gently pressed against the oesophagus and spine.

While this business is going on, an assistant should prepare bed clothes, carefully brought to a proper degree of heat. Heat our author considers as congenial with the living principle; increasing the necessity of action, it increases action: cold, on the other hand, lessens the necessity, and of course the action is diminished: to a due degree of heat, therefore, the living principle, he thinks, owes its vigour. From experiments, he says, it appears to be a law in animal bodies, that the degree of heat should bear a proportion to the quantity of life; as life is weakened, this proportion requires great accuracy, while greater powers of life allow it greater latitudes.

After these and several other observations on the same subject, our author proceeds to more particular directions for the management of drowned people.

If bed clothes are put over the person, so as scarce to touch him, steam of volatile alkali, or of warm balms, may be thrown in, so as to come in contact with many parts of the body. And it might probably be advantageous, Mr Hunter observes, to have steam of the same kind conveyed into the stomach. This, we are told, may be done by a hollow bougie and a syringe; but the operation should be very speedily performed,
Drowning, formed, as the instrument, by continuing long in the
mouth, might produce sickness, which our author says
he would always wish to avoid.

Some of the warm stimulating substances, such as
juice of horseradish, peppermint water, and spirits of
fragrant, are directed to be thrown into the stomach
in a fluid state, as also to be injected by the anus.

Motion possibly may be of service; it may at least be
tried: but as it hath less effect than any other of the
usually prescribed stimuli, is directed to be the last
part of the process.

The same care in the operator, in regulating the
proportion of every one of these means, is here directed,
as was formerly given for the application of heat.

For every one of them, our author observes, may
possibly have the same property of destroying entirely the
feebler action which they have excited, if administered
in too great a quantity: instead, therefore, of increasing
and hastening the operations on the first signs of
returning life being observed, as is usually done, he de-
sires they may be lessened; and advises their increase
to be afterwards proportioned, as nearly as possible, to
the quantity of powers as they arise.

When the heart begins to move, the application of
air to the lungs should be lessened, that, when the
muscles of respiration begin to act, a good deal may be
left for them to do.

Mr Hunter absolutely forbids bloodletting in all such
cases; for as it not only weakens the animal prin-
ciple, but lessens life itself, it must consequently, he ob-
serves, lessen both the powers and dispositions to action.

For the same reason, be is against introducing anything
into the stomach that might produce sickness or
vomiting; and, on the same principle, he says, we
should avoid throwing tobacco fumes, or any other such
articles, up by the anus, as might tend to an evacuation
that way.

The following is a description of instruments recom-
ended for such operations by our author.

First, A pair of bellows, so contrived, with two se-
parate cavities, that, by opening them when applied to
the nostrils or mouth of a patient, one cavity will be
filled with common air, and the other with air suck-
ked out from the lungs, and by shutting them again, the
common air will be thrown into the lungs, and that
sucked out of the lungs discharged into the room.
The pipe of these should be flexible; in length a foot, or a
foot and a half; and, at least, three eighth of an inch in
width. By this the artificial breathing may be con-
tinued, while the other operations, the application of
the stimuli to the stomach excepted, are going on, which
could not be conveniently done, if the nozzles of the
bellows were introduced into the nose. The end next
the nose should be double, and applied to both nostrils.

Secondly, A syringe, with a hollow bougie, or flexible
catheter, of sufficient length to go into the stomach,
and convey any stimulating matter into it, without
affecting the lungs. Thirdly, A pair of small bellows,
such as are commonly used in throwing fumes of tobacco
up by the anus.

Notwithstanding the differences in theory, however,
between the physicians above mentioned, it is certain,
that within these few years great numbers of drowned
people have been restored to life by a proper use of the
remedies we have enumerated, and societies for the re-
covery of drowned persons have been instituted in dif-
ferent places. The first society of this kind was insti-
tuted in Holland, where from the great abundance of
canals and inland seas, the inhabitants are particularly
exposed to accidents by water. In a very few years
150 persons were saved from death by this society; and
many of these had continued upwards of an hour with-
out any signs of life, after they had been taken out of
the water. The society was instituted at Amsterdam
in 1767: and, by an advertisement, informed the in-
habitants of the United Provinces of the methods pro-
to be used on such occasions; offering rewards at the
same time to those who should, with or without success,
use those methods for recovering persons drowned and
seemingly dead. The laudable and humane example
of the Dutch, was followed in the year 1768 by the
magistrates of health in Milan and Venice; afterwards
by the magistrates of Hamburg in the year 1771, by
those of Paris in the year 1772, and by the magistrates
of London in 1774.

The following directions are given for the recovery
of drowned persons by the society at London.

I. As soon as the patient is taken out of the water,
the wet clothes, if the person is not naked at the time
of the accident, should be taken off with all possible
expedition on the spot, unless some convenient house
be very near, and a great coat or two, or some blankets
if convenient, should be wrapped round the body.

II. The patient is to be thus carefully conveyed in
the arms of three or four men, or on a bier, to the
nearest public or other house, where a good fire, if in
the winter season, and a warm bed, can be made ready
for its reception. As the body is conveying to this
place, a great attention is to be paid to the position of
the head; it must be kept supported in a natural and
easy posture, not suffered to hang down.

III. In cold or moist weather, the patient is to be
laid on a mattress or bed before the fire, but not too
near, or in a moderately heated room; in warm and
sultry weather, on a bed only. The body is then to be
wrapped as expeditiously as possible with a blanket,
and thoroughly dried with warm coarse cloths or flan-
nels.

IV. In summer or sultry weather too much air can-
not be admitted. For this reason it will be necessary
to set open the windows and doors, as cool refreshing
air is of the greatest importance in the process of re-
suscitation.

V. Not more than six persons are to be present to
apply the proper means; a greater number will be use-
less, and may retard, or totally prevent, the restoration
of life, by rendering the air of the apartment unwholes-
some. It will be necessary, therefore, to request the
absence of those who attend merely from motives of
curiosity.

VI. It will be proper for one of the assistants, with
a pair of bellows of the common size, applying the pipe
a little way up one nostril, to blow with some force,
in order to introduce air into the lungs: at the same
time the other nostril and the mouth are to be closed by
another assistant, whilst a third person gently presses
the chest with his hands, after the lungs are observed to
be inflated. By pursuing this process, the noxious and
stagnant vapours will be expelled, and natural breath-
ing imitated. If the pipe of the bellows be too large,
the air may be blown in at the mouth, the nostrils at the same time being closed, so that it may not escape that way: but the lungs are more easily filled, and natural breathing better imitated, by blowing up the nostril.

VII. Let the body be gently rubbed with common salt, or with flannels, sprinkled with spirits, as rum or geneva (A). A warming pan heated (the body being surrounded with flannel) may be lightly moved up and down the back. Fomentations of hot brandy are to be applied to the pit of the stomach, loins, &c. and often renewed. Bottles filled with hot water, immersed tiles covered with flannel, or hot bricks, may be efficaciously applied to the soles of the feet, palms of the hands, and other parts of the body. The temples may be rubbed with spirits of hartshorn, and the nostrils now and then tickled with a feather; and snuff, or eau de luce, should be occasionally applied.

VIII. Tobacco fumes should be thrown up the fundament: if a fumigator be not at hand, the common pipe may answer the purpose. The operation should be frequently performed, as it is of importance; for the good effects of this process have been experienced in a variety of instances of suspended animation. But should the application of tobacco smoke in this way not be immediately convenient, or other impediments arise, clusters of this herb, or other acrid infusions with salt, &c. may be thrown up with advantage.

IX. When these means have been employed a considerable time without success, and any brouhew or warm bath can be readily obtained, the body should be carefully conveyed to such a place, and remain in the bath, or surrounded with warm grums, for three or four hours.

If a child has been drowned, its body should be wiped perfectly dry, and immediately placed in bed between two healthy persons. The salutary effects of the natural vital warmth, conveyed in this manner, have been proved in a variety of successful cases.

X. While the various methods of treatment are employed, the body is to be well shaken every ten minutes, in order to render the process of animation more certainly successful; and children, in particular, are to be much agitated, by taking hold of their legs and arms, frequently and for a continuance of time. In various instances agitation has forwarded the recovery of boys who have been drowned, and continued for a considerable time apparently dead.

XI. If there be any signs of returning life, such as sighing, gasping, or convulsive motions, a spoonful of any warm liquid may be administered; and if the act of swallowing is returned, then a cordial of warm brandy or wine may be given in small quantities, and frequently repeated.

XII. Electricity may be tried by the judicious and skilful, as its application neither prevents nor retards the various modes of recovery already recommended; but on the other hand, will most probably tend to render the other means employed more certainly and more expeditiously efficacious. This stimulus bids fair to prove an important auxiliary in cases of suspended animation; and therefore deserves the serious regard and attention of the faculty.

The methods which have been fully described, are to be employed with vigour for three hours or upwards, although no favourable circumstances should arise; for it is a vulgar and dangerous opinion to suppose that persons are irrecoverable, because life does not soon make its appearance; an opinion that has consigned to the grave an immense number of the seemingly dead, who might have been restored to life by resolution and perseverance.

Bleeding is never to be employed in such cases, unless by the direction of one of the medical assistants, or some other gentleman of the faculty who has paid attention to the resuscitating art.

DRUG, a general term for goods of the druggist and grocery kinds, especially those used in medicine and dyeing. See Materia Medica, Pharmacy, and Dyeing.

DRUGGET, in commerce, a stuff sometimes all wool, and sometimes half wool half thread, sometimes corded, but usually plain. Those that have the wool of wool, and the warp of thread, are called threaded druggets; and those wrought with the shuttle on a loom of four marches, as the serges of Mou, Beauvais, and other like stuffs corded, are called corded druggets. As to the plain, they are wrought on a loom of two marches, with the shuttle, in the same manner as cloth, camblets, and other like stuffs not corded.

DRUIDE, or Druids, in Ancient Geography, a very ancient town, the principal place of the Druids or Druidae in Gaul, as they are called (Cæsar, Cicer.). Now Dreux in the Orleannois. Here they met every year in a consecrated grove, according to Cæsar. The town was also called Durocases. W. Long. 1. 21. N. Lat. 48. 45.

DRUIDS, DRUIDS, or DRIUIDE, the priests or ministers of religion among the ancient Celtic or Gauls, Britons, and Germans.

Some authors derive the word from the Hebrew דרַעֵס drususim, or drusim, which they translate contemplatores. Picard, Celtotrop. lib. ii. p. 58. believes the druids to have been thus called from Drus, or Dryus, their leader, the fourth or fifth king of the Gauls, and father of Saron or Naumes. Pliny, Salmantius, Vigenere, &c. derive the name from drvs, oak; on account of their inhabiting, or at least frequenting, and teaching in forests; or perhaps, because, as Pliny says, they never sacrificed but under the oak. But it is hard to imagine how the druids should come to speak Greek. Menage derived the word from the old British drus, "daemon, magician." Borel, from the Saxon dry, "magician;" or rather from the old British dru, or derv, "oak;" whence he takes drus to be derived; which is the most probable supposition. Corop. Be- canus, lib. i. takes drus to be an old Celtic and German word, formed from trosves or trusuis, "a doctor of the

(A) Dr Fothergill of Bath, in a letter to the Register, advises as a potent and active stimulus the patent mustard moistened with spirits.
the truth and the faith," which etymology Vossius
acquiesces in.

The druids were the first and most distinguished or-
der among the Gauls and Britons; they were chosen
out of the best families; and the honours of their birth,
joined with those of their function, procured them the
highest veneration among the people. They were versed
in astrology, geometry, natural philosophy, politics, and
geography; they were the interpreters of religion, and
the judges of all affairs indifferently. Whoever refused
obedience to them was declared impious and accursed.
We know but little as to their peculiar doctrines; only
that they believed the immortality of the soul, and, as
is generally also supposed, the metempsychosis; though
a late author makes it appear highly probable they did
not believe this last, at least not in the sense of the
Pythagoreans.

The chief settlement of the druids in Britain was
in the isle of Anglesey, the ancient Mona, which they
might choose for this purpose, as it is well stored with
spacious groves of their favourite oak. They were
divided into several classes or branches, viz. the vocerri,
bardi, cubages, symnothii or semnothii, and sarondae.
The vocerri are held to have been the priests; the
bardii, the poets; the cubages, the augurs; and the
sarondae, the civil judges and instructors of youth.
As to the semnothii, who are said to have been
immediately devoted to the service of religion, it is prob-
able they were the same with the vocerri. Strabo,
however, (lib. iv. p. 147.) and Picard after him in his
Celtopedia, do not comprehend all these different or-
ders under the denomination of druids, as species un-
der their genus, or parts under the whole; but make
them quite different conditions or orders. Strabo, in
effect, only distinguishes three kinds: bardii, vates, and
druides. The bardii were the poets; the vates, or
seers, (apparently the same with the vocerri), were the priests
and naturalists; and the druidi, beside the study of
nature, applied themselves likewise to morality.

Diogenes Laertius assures us, in his prologue, that
the druids were the same among the ancient Britons
with the sophi or philosophers among the Greeks;
the magi among the Persians; the gymnosophists
among the Indians; and the Chaldeans among the
Assyrians.

Their garments were remarkably long; and, when
employed in religious ceremonies, they always wore a
white surplice. They generally carried a wand in their
hands; and wore a kind of ornament encased in gold
about their necks, called the druid's egg. Their necks
were likewise decorated with gold chains, and their
bands and arms with bracelets; they wore their hair
very short, and their beards remarkably long.

The druid had one chief, or arch-druide, in every
nation, who acted as high priest, or pontifex maximus.
He had absolute authority over the rest; and com-
manded, decreed, punished, &c. at pleasure. At his
death he was succeeded by the most considerable among
his survivors; and, if there were several pretenders,
the matter was ended by an election, or else put to the
decision of arms.

The druids, we have observed, were in the highest
esteem. They presided at sacrifices, and other cere-
monies; and had the direction of every thing relating
to religion. The British and Gaulish youth flocked to
them in crowds to be instructed by them. The children
of the nobility, Mela tells us, they retired with into
caves, or the most desolate parts of forests, and kept
them there sometimes for twenty years under their dis-

cipline. Besides the immortality and metempsychosis,
they were here instructed in the motion of the heavens,
and the course of the stars; the magnitude of the hea-
vens and the earth; the nature of things; the power
and wisdom of the gods, &c. They preserved the mem-
ymory and actions of great men in their verses, which
they never allowed to be wrote down, but made their
pupils get them by heart. In their common course of
learning, they are said to have taught them twenty-
four thousand such verses. By this means their doc-
trines appeared more mysterious by being unknown to
all but themselves; and having no books to recur to,
they were the more careful to fix them in their mem-
ory.

They worshipped the Supreme Being under the name
of Eusus, or Hesus, and the symbol of the oak; and had
no other temple than a wood or a grove, where all their
religious rites were performed. Nor was any person
admitted to enter that sacred recess, unless he carried
with him a chain, in token of his absolute dependence
on the Deity. Indeed, their whole religion originally
consisted in acknowledging, that the Supreme Being,
who made his abode in these sacred groves, governed
the universe; and that every creature ought to obey
his laws, and pay him divine homage.

They considered the oak as the emblem, or rather
the peculiar residence, of the Almighty; and accord-
ingly chaplets of it were worn both by the druids and
people in their religious ceremonies, the altars were
strewed with its leaves, and encircled with its branches.
The fruit of it, especially the mistletoe, was thought to
contain a divine virtue, and to be the peculiar gift of
heaven. It was therefore sought for on the sixth day of
the moon with the greatest earnestness and anxiety;
and when found was hailed with such raptures of joy,
as almost exceeds imagination to conceive. As soon as
the druids were informed of this fortunate discovery,
they prepared every thing ready for the sacrifice under
the oak, to which they fastened two white bulls by
the horns; then the arch-druide, attended by a pro-
digious number of people, ascended the tree, dressed
in white; and with a consecrated golden knife, or
pruning-hook, cropped the mistletoe, which he received
in his sagum or robe, amidst the rapturous exclama-
tions of the people. Having secured this sacred plant, he
descended the tree; the bulls were sacrificed; and the
Deity invoked to bless his own gift, and render it effi-
cacious in those distempers in which it should be ad-
ministered.

The consecrated groves, in which they performed
their religious rites, were fenced round with stones, to
prevent any person's entering between the trees, ex-
cept through the passages left open for that purpose,
and which were guarded by some inferior druids, to
prevent any stranger from intruding into their myste-
reries. These groves were of different forms; some
quite circular, others oblong, and more or less cap-
pacious as the votaries in the districts to which they
belonged were more or less numerous. The area in
the centre of the grove was encompassed with several rows of large oaks set very close together. Within this large circle were several smaller ones surrounded with large stones; and near the centre of these smaller circles were stones of a prodigious size and convenient height, on which the victims were slain and offered. Each of these being a kind of altar, was surrounded with another row of stones, the use of which cannot now be known, unless they were intended as cinctures to keep the people at a convenient distance from the officiating priest.

Suetonius, in his life of Claudius, assures us the druids sacrificed men; and Mercury is said to be the god to whom they offered these victims. Dio. Siculus, lib. vi. observes it was only upon extraordinary occasions they made such offerings; as, to consult what measures to take, to learn what should befall them, &c. by the fall of the victim, the tearing of his members, and the manner of his blood gushing out. Augustus condemned the custom, and Tiberius and Claudius punished and abolished it.

We learn from Caesar, that the druids were the judges and arbiters of all differences and disputes, both public and private: they took cognizance of murders, inheritances, boundaries, and limits; and decreed rewards and punishments. Such as disobeyed their decisions they excommunicated, which was their principal punishment; the criminal being hereby excluded from all public assemblies, and avoided by all the world; so that nobody durst speak to him for fear of being polluted. Strabo observes, they had sometimes interest and authority enough to stop armies upon the point of engaging, and accommodate their differences.

It hath been disputed, whether the druids were themselves the inventors of their opinions and systems of religion and philosophy, or received them from others. Some have imagined, that the colony of Phocians which left Greece and built Marseille in Gaul about the 57th Olympiad, imported the first principles of learning and philosophy, and communicated them to the Gauls and other nations in the west of Europe. It appears, indeed, that this famous colony contributed not a little to the improvement of that part of Gaul where it settled, and to the civilization of its inhabitants. "The Greek colony of Marseille (says Justin) civilized the Gauls, and taught them to live under laws; to build cities and enclose them with walls; to raise corn; to cultivate the vine and olive; and, in a word, made so great a change both in the face of the country and the manners of its inhabitants, that Gaul seemed to be translated into Greece, rather than a few Greeks transplanted into Gaul." But though we may allow that the druids of Gaul and Britain borrowed some hints and embellishments of their philosophy from this Greek colony, and perhaps from other quarters, we have reason to believe that the substance of it was their own. Others have suggested, that the druids derived their philosophy from Pythagoras, who published his doctrines at Crotona in Italy; where he lived in the highest reputation for his virtue, wisdom, and learning, above 20 years. This conjecture is very much confirmed by this remarkable expression of Ammianus Marcellinus, "That the druids were formed into fraternities, as the authority of Pythagoras decreed." It hath been also observed, that the philosophy of the druids bore a much greater resemblance to that of Pythagoras than to that of any of the other sages of antiquity. But it seems probable, that Ammianus meant no more by the above expression than to illustrate the nature of the druidical fraternities, by comparing them to those of the Pythagoreans, which were well known to the Romans; and the resemblance between the Pythagorean and druidical philosophy may perhaps be best accounted for, by supposing, that Pythagoras learned and adopted some of the opinions of the druids, as well as imparted to them some of his discoveries. It is well known, that this philosopher, animated by the most ardent love of knowledge, travelled into many countries in pursuit of it, and got himself admitted into every society that was famous for its learning. It is therefore highly probable in itself, as well as directly asserted by several authors, that Pythagoras heard the druids of Gaul, and was initiated into their philosophy.

From the concurring testimonies of several authors, it appears that physiology, or natural philosophy, was the favourite study of the druids of Gaul and Britain. Cicero tells us, that he was personally acquainted with one of the Gaulish druids, Divitia-druida, the Aeduan, a man of quality in his country, who professed to have a thorough knowledge of the laws of nature, or that science which the Greeks call physics or physiology. According to Diodorus Siculus, Strabo, Cesar, Mela, Ammianus Marcellinus, and others, they entered into many discussions and disputations in their schools, concerning the form and magnitude of the universe in general, and of this earth in particular, and even concerning the most sublime and hidden secrets of nature. On these and the like subjects they formed a variety of systems and hypotheses; which they delivered to their disciples in verse, that they might the more easily retain them in their memories, since they were not allowed to commit them to writing. Strabo hath preserved one of the physiological opinions of the druids concerning the universe; viz. that it was never to be entirely destroyed or annihilated; but was to undergo a succession of great changes and revolutions, which were to be produced sometimes by the power and preponderancy of water, and sometimes by that of fire. This opinion, he intimates, was not peculiar to them, but was entertained also by the philosophers of other nations; and Cicero speaks of it as a truth universally acknowledged and undeniable. "It is impossible for us (says he) to attain a glory that is eternal, or even of very long duration, on account of these deluges and conflagrations of the earth which must necessarily happen at certain periods." This opinion, which was entertained by the most ancient philosophers of many different and very distant nations, was probably neither the result of rational inquiry in all these nations, nor communicated from one of them to others; but descended to them all from their common ancestors of the family of Noah by tradition, but corrupted and misunderstood through length of time. The agreement of the druids with the philosophers of so many other nations in this opinion about the alternate dissolution and renovation of the world, gives us reason to believe, that they agreed with them also in their opinion of its origin from two distinct principles; the one intelligent and omnipotent, which
Druids, which was God; the other inanimate and inactive, which was matter. We are told, by Cæsar, that they had many disquisitions about the power of God; and, no doubt, amongst other particulars, about his creating power. But whether they believed with some that matter was eternal, or with others that it was created; and in what manner they endeavoured to account for the disposition of it into the present form of the universe, we are entirely ignorant, though they certainly had their speculations on these subjects. We are only informed, that they did not express their sentiments on these and like heads in a plain and natural, but in a dark, figurative, and enigmatical manner. This might incline us to suspect, that Pythagoras had borrowed from them his doctrine about numbers, to whose mystick energy he ascribes the formation of all things; for nothing can be more dark and enigmatical than that doctrine. The druids disputed likewise about the magnitude and form of the world in general, and of the earth in particular, of which things they pretended to have a perfect knowledge. We know not what their opinions were about the dimensions of the universe or of the earth, but we have several reasons to make us imagine that they believed both to be of a spherical form. This is visibly the shape and form of the sun, moon and stars, the most conspicuous parts of the universe; from whence it was natural and easy to infer, that this was the form of the world and of the earth. Accordingly this seems to have been the opinion of the philosophers of all nations; and the circle was the favourite figure of the druids, as appears from the form both of their houses and places of worship. Besides these general speculations about the origin, dissolution, magnitude, and form of the world and of the earth, the druids engaged in particular inquiries into the natures and properties of the different kind of substances. But all their discoveries in this most useful and extensive branch of natural philosophy, whatever they were, are entirely lost.

Astronomy also appears to have been one of the chief studies of the druids of Gaul and Britain. "The druids (says Cæsar) have many disquisitions concerning the heavenly bodies and their motions, in which they instruct their disciples." Melia, speaking of the same philosophers, observes, "That they profess to have great knowledge of the motions of the heavens and of the stars." Some knowledge of this science indeed was not only necessary for measuring time in general, marking the duration of the different seasons, regulating the operations of the husbandman, directing the course of the mariner, and for many other persons in civil life; but it was especially necessary for fixing the times and regular returns of their religious solemnities, of which the druids had the sole direction. Some of these solemnities were monthly, and others annual. It was therefore necessary for them to know, with some tolerable degree of exactness, the number of days in which the sun and moon performed their revolutions, that these solemnities might be observed at their proper seasons. This was the more necessary, as some of these solemnities were attended by persons from different and very distant countries, who were all to meet at one place on one day; who must have had some rule to discover the annual return of that day.

The most perceptible division of time by the two great luminaries is into day and night; the former occasioned by the presence of the sun above the horizon, the latter by his absence, which is in some measure supplied by the moon and stars. The druids computed their time by nights, and not by days; a custom which time, they had received from their most remote ancestors by tradition, and in which they were confirmed by their measuring their time very much by the moon, the mistress and queen of night. As the changes in the aspect of that luminary are most conspicuous, they engaged the attention of the most ancient astronomers of all countries, and particularly of the druids, who regulated all their great solemnities, both sacred and civil, by the age and aspect of the moon. "When no unexpected accident prevents it, they assemble upon stated days, either at the time of the new or full moon; for they believe these to be the most suspicious times for transacting all affairs of importance." Their most august ceremony of cutting the mistletoe from the oak by the arch-drum, was always performed on the sixth day of the moon. Nay, they even regulated their military operations very much by this luminary, and avoided, as much as possible, to engage in battle while the moon was on the wane. As the attention of the druids was so much fixed on this planet, it could not be very long before they discovered that she passed through all her various aspects in about thirty days; and by degrees, and more accurate observations, they would find, that the real time of her performing an entire revolution was very nearly 29⅔ days. This furnished them with the division of their time into months, or revolutions of the moon; of which we know with certainty they were possessed. But this period, though of great use, was evidently too short for many purposes, and particularly for measuring the seasons; which they could not fail to perceive depended on the influences of the sun. By continued observation they discovered, that about 12 revolutions of the moon included all the variety of seasons, which began again, and revolved every 12 months. This suggested to them that larger division of time called a year, consisting of 12 lunations, or 354 days, which was the most ancient measure of the year in almost all nations. That this was for some time at least the form of the druidical year, is both probable in itself, and from the following expression of Pliny: "That they began both their months and years, not from the change, but from the sixth day of the moon." This is even a demonstration that their years consisted of a certain number of lunar revolutions, as they always commenced on the same day of the moon. But as this year of 12 lunar months fails 11 days and nearly one-fourth of a day short of a real revolution of the sun, this error would soon be perceived, and call for reformation; though we are not informed of the particular manner in which it was rectified. Various arguments might be collected to make it very probable that the Britons were acquainted with a year exact enough for every purpose of life, when they were first invaded by the Romans; but it will be sufficient to mention one, which is taken from the time and circumstances of that invasion. The learned Dr. Hailey hath demonstrated that Cæsar arrived in Britain, in his first year's expedition, on the 26th day of Aug:
Druuides. and Caesar himself informs us, that at his arrival the harvest was finished, except in one field, which by some means or other was more backward than the rest of the country. This is a proof that the British husbandmen knew and used the most proper seasons for ploughing, sowing, and reaping. The druids, as we are told by Pliny, had also a cycle or period of 30 years, which they called an age, and which commenced likewise on the sixth day of the moon; but that author hath not acquainted us on what principle this cycle was formed, nor to what purpose it was applied. We can hardly suppose that this was the cycle of the sun, which consists of 28 years, and regulates the dominical letters. It is more probable, that while the druids made use of the year of 12 lunar months, and had not invented a method of adjusting it to the real revolution of the sun, they observed that the beginning of this year had passed through all the seasons, and returned to the point from whence it set out, in a course of about 33 years; which they might therefore call an age. Others may perhaps be of opinion, that this 30 years cycle of the druids is the same with the great year of the Pythagoreans, or a revolution of Saturn. Some have imagined that the druids were also acquainted with the cycle of 19 years, which is commonly called the cycle of the moon. But the evidence of this depends entirely on the truth of that supposition, that the Hyperborean island, which is described by Diodorus Siculus, was Britain, or some of the British isles. Among many other surprising things, that author says, concerning the Hyperborean island, "that its inhabitants believed that Apollo descended into their island at the end of every 19 years; in which period of time the sun and moon, having performed their various revolutions, return to the same point, and begin to repeat the same revolutions. This is called by the Greeks the great year, or the cycle of Meton."

We are told both by Caesar and Melis, that the druids studied the stars as well as the sun and moon; and that they professed to know, and taught their disciples, many things concerning the motions of these heavenly bodies. From these testimonies we may conclude that the druids were acquainted with the planets, distinguished them from the fixed stars, and carefully observed their motions and revolutions. If this discovery was the result of their own observations, it would be gradual, and it would be a long time before they found out all the planets. They might perhaps have received some assistance and information from Pythagoras, or from some other quarter. But whether this discovery of the planets was their own, or communicated to them by others, it is highly probable that they were acquainted with the precise number of these wandering stars. Dio Cassius says, that the custom of giving the name of one of the planets to each of the seven days of the week was an invention of the Egyptians, and from them was gradually communicated to all the other nations of the world; and that in his time this custom was so firmly established, not only among the Romans, but among all the rest of mankind, that in every country it appeared to be a native institution. The knowledge of the planets, and perhaps the custom of giving their names to the days of the week, was brought out of Egypt into Italy by Pythagoras, more than 500 years before the beginning of the Christian era; and from thence it could not be very long before it reached Gaul and Britain. But though we have little or no reason to doubt that the druids knew the number and observed the motion of the planets, yet it may be questioned whether they had discovered the time in which they performed their several revolutions. Some of these stars, as Jupiter and Saturn, take so great a number of years in revolving, that it required a very extraordinary degree of patience and attention to discover the precise periods of their revolutions. If we could be certain that the island in which the ancients imagined Saturn lay asleep, was one of the British isles, as Plutarch intimates it was, we might be inclined to think that the British druids were not ignorant of the length of the period in which the planet Saturn performs a revolution. For that same author, in another treatise, tells us, "That the inhabitants of that island kept every thirtieth year a solemn festival in honour of Saturn, when his star entered into the sign of Taurus."

If we could depend upon the above testimony of Plutarch, we should have one positive proof that the druids of the British isles were acquainted with the constellations, and even with the signs of the zodiac; and that they measured the revolutions of the sun and planets, by observing the length of time between their departure from and return to one of these signs. But we have no direct evidence of this remaining in history.

The druids of Gaul and Britain, as well as the ancient philosophers of other countries, had a general plan or system of the universe, and of the dispositions and arrangement of its various parts, in which they instructed their disciples. This is both probable in itself, and is plainly intimated by several authors of the greatest authority. But we cannot be certain whether this druidical system of the world was of their own invention, or was borrowed from others. If it was borrowed, it was most probably from the Pythagoreans, to whom they were the nearest neighbours; and with whom they had the greatest intercourse.

It hath been imagined, that the druids had instruments of some kind or other, which answered the same purposes with our telescopes, in making observations on the heavenly bodies. The only foundation of this very improbable conjecture is an expression of Diodorus Siculus, in his description of the famous Hyperborean island. "They say further, that the moon is seen from that island, as if she was but at a little distance from the earth, and having hills or mountains like ours on her surface." But no such inference can be reasonably drawn from this expression, which in reality merits little more regard than what Strabo reports was said of some of the inhabitants of Spain: "That they heard the hissing noise of the sun every evening when he fell into the western ocean."

The application of the druids to the study of philosophy and astronomy amounts almost to a demonstration that they applied also to the study of arithmetic and geometry. For some knowledge of both these sciences is indispensably necessary to the physiologist and astronomer, as well as of great and daily use in the common affairs of life.

If we were certain that Abaris, the famous Hyperborean philosopher, the friend and scholar of Pythagoras,
Druids were really a British druid, as some have imagined, we should be able to produce direct historical evidence of their arithmetical knowledge. For Iamblicus, in the life of Pythagoras, says, "that he taught Abaris to find out all truth by the science of arithmetical." It may be thought improbable that the druids had made any considerable progress in arithmetic, as this may seem to be impossible by the mere strength of memory without the assistance of figures and of written rules. But it is very difficult to ascertain what may be done by memory alone, when it hath been long exercised in this way. We have had an example in our own age of a person who could perform some of the most tedious and difficult operations in arithmetic by the mere strength of his memory. The want of written rules could be no great disadvantage to the druids, as the precepts of this, as well as of the other sciences, were couched in verse, which would be easily got by heart and long remembered. Though the druids were unacquainted with the Arabic character, which are now in use, we have no reason to suppose that they were destitute of marks or characters of some other kind, which, in some measure, answered the same purposes, both in making and recording their calculations. In particular, we have reason to think, that they made use of the letters of the Greek alphabet for both these purposes. This seems to be plainly intimated by Caesar in the following expression concerning the druids of Gaul: "In almost all other public transactions and private accounts, they make use of the Greek letters." This is further confirmed by what the same authority says of the Helvetii, that they determined the origin, language, and manners, with the Gauls and Britons. "Tables were found in the camp of the Helvetii written in Greek letters, containing an account of all the men capable of bearing arms, who had left their native country, and also separate accounts of the boys, old men, and women." There is historical evidence of the druids being also well acquainted with geometry. "When any disputes arise (says Caesar) about their inheritances, or any controversies about the limits of their fields, they are entirely referred to the decision of their druids." But besides the knowledge of mensuration which this implies, both Caesar and Mela plainly intimate that the druids were conversant in the most sublime speculations of geometry; "in measuring the magnitude of the earth, and even of the world." There are still many monuments remaining in Britain and the adjacent isles, which cannot so reasonably be ascribed to any as to the ancient Britons, and which give us cause to think, that they had made great progress in this useful part of learning, and could apply the mechanical powers so as to produce very astonishing effects. As these monuments appear to have been designed for religious purposes, we may be certain that they were erected under the direction of the druids. How many obelisks or pillars, of one rough unpolished stone each, are still to be seen in Britain and its isles! Some of these pillars are both very thick and lofty, erected on the summits of barrows and of mountains; and some of them (as at Stonehenge) have ponderous blocks of stone raised aloft, and resting on the tops of the upright pillars. We can hardly suppose that it was possible to cut these prodigious masses of stone (some of them above 40 tons in weight) without wedges, or to raise them out of the quarry without levers. But it certainly required still greater knowledge of the mechanical powers, and of the method of applying them, to transport those huge stones from the quarry to the places of their destination; to erect the perpendicular pillars, and to elevate the imposts to the tops of these pillars. If that prodigious stone in the parish of Constantine, Cornwall, was really removed by the forces of nature, and fixed where it now stands (as one of our most learned and diligent antiquaries thinks it was *), it is a demonstration, that the druids could perform the most astonishing feats by their skill in mechanics. That the British druids were acquainted with the principles and use of the balance, we have good reason to believe, not only from the great antiquity of that discovery in other parts of the world, but also from some druidical monuments which are still remaining in this island. These monuments are called Logan Stones, or rocking stones; and each of them consists of one prodigious block of stone, resting upon an upright stone or rock, and so equally balanced, that a very small force, sometimes even that of a child, can move it up and down, though hardly any force is sufficient to remove it from its station. Some of these stones may have fallen into this position by accident, but others of them evidently appear to have been placed in it by art. That the ancient Britons understood the construction and use of wheels, the great number of their war-chariots and other wheel-carriages is a sufficient proof; and that they knew how to combine them together and with the other mechanical powers, so as to form machines capable of raising and transporting very heavy weights, we have good reason to believe. In a word, if the British druids were wholly ignorant of the principles and use of any of the mechanical powers, it was most probably of the screw, though even of this we cannot be certain.

In Germany and in the northern nations of Europe, the healing art was chiefly committed to the old women of every state; but in Gaul and Britain it was entrusted to the druids, who were the physicians as well as the priests of these countries. Pliny says expressly, "That Tiberius Caesar destroyed the druids of the Gauls, who were the poets and physicians of that nation;" and he might have added of the Britons. The people of Gaul and Britain were probably induced to devote the care of their health on the druids, and to apply to these priests for the cure of their diseases, not only by the high esteem they had of their wisdom and learning, but also by the opinion which they entertained, that a very intimate connection subsisted between the arts of healing and the rites of religion, and that the former were most effectual when they were accompanied by the latter. It appears indeed to have been the prevailing opinion of all the nations of antiquity, that all internal diseases proceeded immediately from the anger of the gods; and that the only way of obtaining relief from these diseases was by applying to their priests to appease their anger by religious rites and sacrifices. This was evidently the opinion and practice of the Gauls and Britons, who in some dangerous cases sacrificed one man as the most effectual means of curing another.
That the druids made great use of herbs for medicinal purposes, we have sufficient evidence. They not only had a most superstitious veneration for the mistletoe of the oak, on a religious account, but they also entertained a very high opinion of its medical virtues, and esteemed it a kind of panacea or remedy for all diseases. They call it (says Pliny) by a name which in their language signifies All-heal, because they have an opinion that it cures all diseases. They believed it to be in particular a specific against barrenness, and a sovereign antitoxin against the fatal effects of poisons of all kinds. It was esteemed also an excellent emollient and discutient for softening and discussing hard tumours; good for drying up scrophulous sores; for curing ulcers and wounds; and (provided it was not suffered to touch the earth after it was cut) it was thought to be a very efficacious medicine in the epilepsy or falling sickness. It hath been thought useful in this last calamitous disease by some modern physicians. The pompous ceremonies with which the mistletoe was gathered by the druids have been already described. The selago, a kind of hedge hyssop resembling savin, was another plant much admired by the druids of Gaul and Britain for its supposed medicinal virtues, particularly in all diseases of the eyes. But its efficacy, according to them, depended very much upon its being gathered exactly in the following manner: The person who gathered it was to be clothed in a white robe; to have his feet bare, and washed in pure water; to offer a sacrifice of bread and wine before he proceeded to cut it; which he was to do with his right hand covered with the skirt of his garment, and with a hook of some more precious metal than iron. When it was cut, it was to be received into, and kept in a new and very clean cloth. When it was gathered exactly according to this whimsical ritual, they affirmed that it was not only an excellent medicine, but also a powerful charm and preservative from misfortunes and unhappy accidents of all kinds. They entertained a high opinion also of the herb samulus or marshwort, for its sanative qualities; and gave many directions for the gathering it no less fanciful than those above mentioned. The person who was to perform that office was to do it fasting, and with his left hand; he was on no account to look behind him, nor to turn his face from the herbs he was gathering. It would be tedious to relate the extravagant notions they entertained of the many virtues of the vervain, and to recount the ridiculous mummeries which they practised in gathering and preparing it, both for the purposes of divination and physic. These things may be seen in Plin. Hist. Nat. I. 25. c. 9. from whence we have received all these anecdotes of the botany of the druids. It is easy to see that his information was very imperfect; and that, like many of the other Greek and Roman writers, he designedly represents the philosophy of Gaul and Britain in an unfavourable light. The herb which was called Britannica by the ancients, some of which the great water-dock, and others the coelestraria or scoury-grass, was probably much used in this island for medicinal purposes; as it derived its name from hence, and was from hence exported to Rome and other parts. Though these few imperfect hints are all that we can now collect of the botany of the British druids, yet we have some reason to think that they were not contemptible botanists. Their circumstances were peculiarly favourable for the acquisition of this kind of knowledge. For as they spent most of their time in the recesses of mountains, groves, and woods, the spontaneous vegetable productions of the earth constantly presented themselves to their view, and courted their attention.

The opinions which, it is said, the druids of Gaul and Britain entertained of their anguinus or serpents egg, both as a charm and as a medicine, are romantic and extravagant in a very high degree. This extraordinary egg was formed, as they pretended, by a great number of serpents, interwoven and twined together; and when it was formed, it was raised up in the air by the hissing of these serpents, and was to be caught in a clean white cloth before it fell to the ground. The person who caught it was obliged to mount a swift horse, and to ride away at full speed to escape from the serpents, who pursued him with great rage, until they were stopped by some river. The way of making trial of the genuineness of the egg was no less extraordinary. It was to be encharged in gold, and thrown into a river, and if it was genuine it would swim against the stream. "I have seen (says Pliny) that egg; it is about the bigness of a moderate apple, its shell is a cartilaginous incrustation, full of little cavities, such as are on the legs of the polypus; it is the insignia or badge of distinction of the druids." The virtues which they ascribed to this egg were many and wonderful. It was particularly efficacious to render those who carried it about with them superior to their adversaries in all disputes, and to procure them the favour and friendship of great men. Some have thought that this whole affair of the serpents egg was a mere fraud, contrived by the druids, to excite the admiration and pick the pockets of credulous people, who purchased these wonder-working eggs from them at a high price. Others have imagined that this story of the anguinus (of which there is an ancient monument in the cathedral at Paris) was an emblematical representation of the doctrine of the druids concerning the creation of the world. The serpents, say they, represent the Divine wisdom forming the universe, and the egg is the emblem of the world formed by that wisdom. It may be added, that the virtue ascribed to the anguinus, of giving those who possessed it a superiority over others, and endearing them to great men, may perhaps be intended to represent the natural effects of learning and philosophy. But in so doubtful

3
Druids. a matter every one is at full liberty to form what judgment he thinks proper.

As the influence and authority of the druids in their country, depended very much upon the reputation of their superior wisdom and learning, they wisely applied to the study of those sciences which most directly contributed to the support and advancement of that reputation. In this number, besides those already mentioned, we may justly reckon rhetoric, which was diligently studied and taught by the druids of Gaul and Britain; who to the charms of eloquence were indebted for much of the admiration and authority which they enjoyed. They had indeed many calls and opportunities to display their eloquence, and to discover its great power and efficacy, as when they were teaching their pupils in their schools, when they discoursed in public to the people on religious and moral subjects; when they pleaded causes in the courts of justice; and when they harangued in the great councils of the nation, and at the heads of armies ready to engage in battle, sometimes with a view to inflame their courage, and at other times with a design to allay their fury, and dispose them to make peace. Though this last was certainly a difficult task among fierce and warlike nations, yet such was the authority and eloquence of the druids, that they frequently succeeded in it. "They pay a great regard (says Diodorus Siculus) to their extortions, not only in the affairs of peace, but even of war, and these are respected both by their friends and enemies. They sometimes step in between two hostile armies, who are standing with their swords drawn and their spears extended, ready to engage; and by their eloquence, as by an irresistible enchantment, they prevent the effusion of blood, and prevail upon them to sheath their swords. So great are the charms of eloquence and the power of wisdom even amongst the most fierce barbarians. The British kings and chieftains, who were educated by the druids, were famous for their eloquence. This is evident from the many noble speeches which are ascribed to them by the Greek and Roman writers. For though these speeches may not be genuine, yet they are a proof that it was a well known fact, that these princes were accustomed to make harangues on these and the like occasions. This we are expressly told by Tacitus:—"The British chieftains, before a battle, fly from rank to rank, and address their men with animating speeches, tending to inflame their courage, increase their hopes, and dispel their fears." These harangues were called, in the ancient language of Britain, Bronschity Kah, which is literally translated by Tacitus, Incitamenta Belli, "incentives to war." The genuine posterity of the ancient Britons long retained their taste for eloquence, and their high esteem for those who excelled in that art. "Orators (says Mr. Martin) were in high esteem, both in these islands (the Æbodes) and the continent, until within these forty years. They sat always among the nobles or chiefs of families in the stream or circle. Their houses and little villages were sanctuaries, as well as churches, and they took place before doctors of physic. The orators, after the druids were extinct, were brought in to preserve the genealogy of families, and to repeat the same at every succession of a chief; and upon the occasion of marriages and births, they made epitaphs and panegyries, which the poet or bard pronounced. The orators, by the force of their eloquence, had a powerful ascendancy over the greatest men in their time. For if any orator did but ask the habit, arms, horse, or any other thing belonging to the greatest man in these islands, it was readily granted him; sometimes out of respect, and sometimes for fear of being exclaimed against by a satire, which in those days was reckoned a great dishonour."
